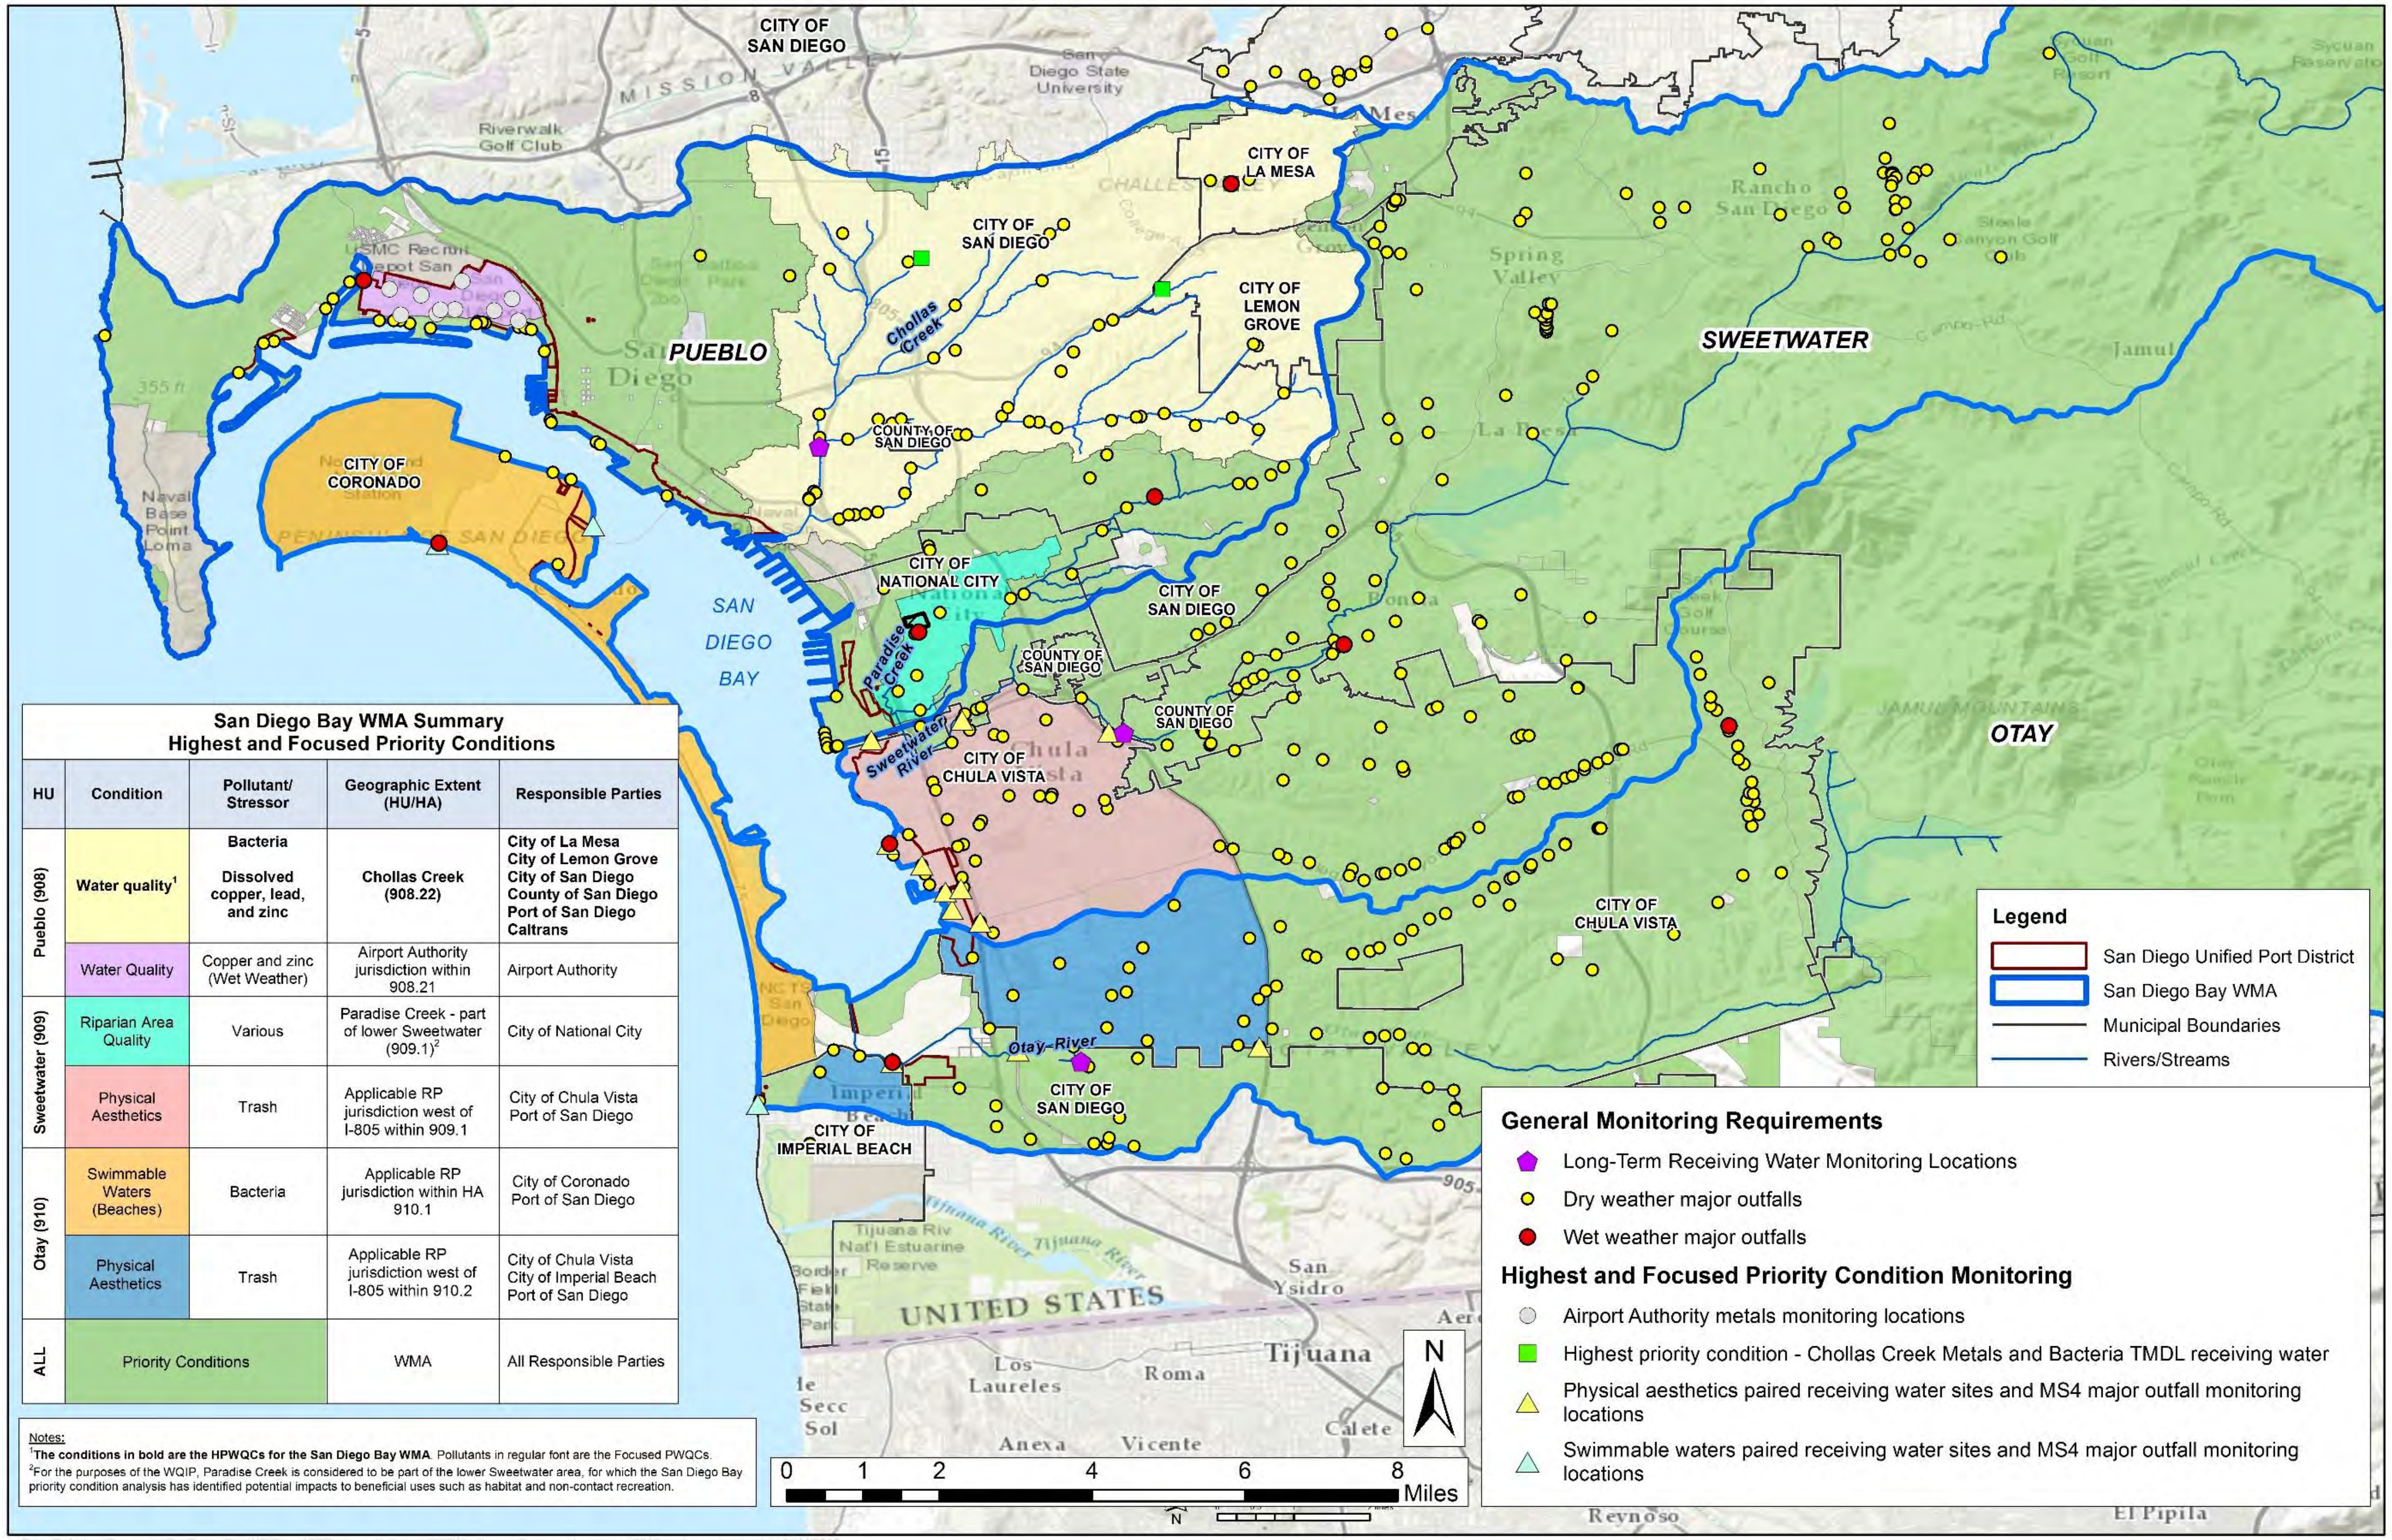
2. Completed under the Ambient Bay and Lagoon Monitoring (ABLM) Program, as part of Bight '13.
3. Airport monitoring for metals will be conducted as part of the Industrial General Permit (IGP) monitoring. Additional constituents are monitored under that program.
4. Monitoring is paired. Receiving Water and MS4 Outfall will be monitored the same day.
5. The AB 411 program monitoring is conducted during the dry season by the County of San Diego Department of Environmental Health (DEH) will be tracked and incorporated into bacteria-related receiving water assessments. Monitoring under AB 411 is not required under Provision D of the Municipal Permit, but bacteria monitoring is required as part of the Bacteria TMDL (Municipal Permit Attachment E.6). AB 411 monitoring may be used to augment RP monitoring and will be reviewed as part of the data assessment. RPs will be doing dry weather monitoring during wet weather season starting in fiscal year (FY) 2016.



San Diego Bay WMA Summary
Highest and Focused Priority Conditions

HU	Condition	Pollutant/ Stressor	Geographic Extent (HU/HA)	Responsible Parties
Pueblo (908)	**Water quality**[1]	**Bacteria** **Dissolved copper, lead, and zinc**	**Chollas Creek (908.22)**	**City of La Mesa** **City of Lemon Grove** **City of San Diego** **County of San Diego** **Port of San Diego** **Caltrans**
	Water Quality	Copper and zinc (Wet Weather)	Airport Authority jurisdiction within 908.21	Airport Authority
Sweetwater (909)	Riparian Area Quality	Various	Paradise Creek - part of lower Sweetwater (909.1)[2]	City of National City
	Physical Aesthetics	Trash	Applicable RP jurisdiction west of I-805 within 909.1	City of Chula Vista Port of San Diego
Otay (910)	Swimmable Waters (Beaches)	Bacteria	Applicable RP jurisdiction within HA 910.1	City of Coronado Port of San Diego
	Physical Aesthetics	Trash	Applicable RP jurisdiction west of I-805 within 910.2	City of Chula Vista City of Imperial Beach Port of San Diego
ALL	Priority Conditions		WMA	All Responsible Parties

Notes:
[1]**The conditions in bold are the HPWQCs for the San Diego Bay WMA**. Pollutants in regular font are the Focused PWQCs.
[2]For the purposes of the WQIP, Paradise Creek is considered to be part of the lower Sweetwater area, for which the San Diego Bay priority condition analysis has identified potential impacts to beneficial uses such as habitat and non-contact recreation.

Figure 1-1
San Diego Bay WMA Monitoring Locations

Intentionally Left Blank

In summary, this Monitoring Results and Assessments Appendix of the San Diego Bay WMA Water Quality Improvement Plan Annual Report includes the following sections.

Section 1, Introduction – Monitoring and Assessment Program – This section provides an overview of the MAP, the monitoring performed during the October 2015 through September 2016 monitoring year, and the assessments included in this appendix.

Section 2, Receiving Water Monitoring – This section describes the monitoring data collected as part of the Receiving Water Monitoring program. Data from various sources are compiled and summarized in this section. The data presented include those collected during the October 2015 through September 2016 monitoring year, as well as data collected previously but not included in the San Diego Bay WMA Transitional Monitoring Assessment report (submitted in January 2016).

Section 3, Non-Storm Water MS4 Outfall Monitoring – This section summarizes the wet weather related MS4 Outfall Discharge Assessments (Provision B.4.b). It includes a comparison with Non-Storm Water Action Limits (NALs) and Municipal Permit required assessments.

Section 4, Storm Water Outfall Monitoring Data – This section summarizes the wet weather related MS4 Outfall Discharge Assessments (Provision B.4.b). It includes a comparison with storm water action limits (SALs) and Municipal Permit-required assessments.

Section 5 Physical Aesthetics Focused Priority Condition Monitoring – This section summarizes the monitoring program and results of the Physical Aesthetics Focused Priority Condition in Sweetwater and Otay hydrologic unit (HU).

Section 6, Swimmable Waters Focused Priority Condition Monitoring – This section summarizes the monitoring program and results of the Swimmable Waters Focused Priority Condition implemented in the Coronado hydrologic area (HA).

Section 7, Special Study and Additional Program Results and Assessments – This section provides an overview of the findings of seven special studies completed or on-going in the San Diego Bay WMA: (1) the San Diego Regional Reference Streams and Beaches Study, (2) the study Addressing Trash, Debris, and Floating Material in Chollas and Paleta Creeks, (3) the San Diego Bay Debris Study, (4) the Pueblo HU Refuse Assessment Program, (5) the Chollas Jurisdictional Boundary Studies for metals and bacteria, and (6) the Riparian Area Selenium Study. The RPs also utilized California Assembly Bill 411 (AB 411) data obtained by the County of San Diego DEH to supplement the Swimmable Waters bacteria monitoring and the Shelter Island Shoreline Park Bacteria TMDL required monitoring.

Section 8, Publicly Available Data – This section provides a summary of the California Environmental Data Exchange Network (CEDEN) data submittal certifications for the October 2015 through September 2016 monitoring year.

2 Receiving Water Monitoring

This section highlights receiving water data collected according to the San Diego Bay WMA MAP. Because this is the first Annual Report to be submitted under the San Diego Bay WMA WQIP, data collected since the acceptance of the Municipal Permit in 2013 will be (1) referenced (if previously submitted to the San Diego Regional Water Quality Control Board [Regional Board]), (2) summarized (if sampling was conducted prior to the October 2015 through September 2016 monitoring year and the data have not been previously submitted to the Regional Board), or (3) reported as part of the October 2015 through September 2016 monitoring year report. Further, the data presented in this appendix will be used to complete the Report of Waste Discharge in December 2017 and the Integrated Assessment (which is detailed in the MAP).

2.1 Long-Term Receiving Water Monitoring

The Transitional Receiving Water Monitoring Program completed during the October 2014 through September 2015 monitoring year met state requirements; no monitoring was conducted during this reporting period. The results of this monitoring were presented in the Transitional Monitoring and Assessment Program Report[2] for the San Diego Bay WMA (2014–2015) (San Diego County Municipal Copermittees, 2016), including water quality monitoring during dry and wet weather, trash assessments, hydromodification monitoring, and bioassessment at the long-term monitoring stations.

2.2 Regional Monitoring

The Bight program is a multi-agency collaborative effort led by the Southern California Coastal Water Research Project (SCCWRP) to assess the ecological condition of the Southern California Bight from a cross-regional perspective.

The core monitoring program consists of sampling for sediment chemistry, sediment toxicity, benthic infauna and invertebrates, and demersal fish that live in the benthic zone. Since the first monitoring event in 1994, sampling has occurred over the course of five-year cycles, generating a long-term data set to monitor overall Bight ecosystem conditions over time.

The goal of the Southern California Bight 2013 Regional Monitoring Survey (Bight ’13) program was to answer three primary questions:

- What are the extent and magnitude of direct impacts from contaminants?
- How do the extent and magnitude of the environmental impacts vary by habitat?
- What is the trend in the extent and magnitude of direct impacts from contaminants?

[2] Transitional Monitoring and Assessment Repot can be found on the Project Cleanwater website: http://www.projectcleanwater.org/index.php?option=com_content&view=article&id=24&Itemid=64

In close coordination with Bight ’13, the San Diego Regional Harbor Monitoring Program (RHMP) included the same primary goals and questions and satisfied the initial monitoring requirements of the State of California Sediment Control Plan for San Diego Bay (San Diego Bay WMA Responsible Parties, 2016). The RHMP provides a comprehensive survey of the quality of water, sediments, and aquatic life on a five-year cycle in four southern California embayments in the San Diego Region: Dana Point Harbor, Oceanside Harbor, Mission Bay, and San Diego Bay.

Sampling of sediments and the water column was conducted during August and September 2013 at 59 sites in San Diego Bay and followed the Bight-approved methodologies (Bight ’13 Contaminant Impact Assessment Committee, 2013). There were 13 freshwater-influenced sites monitored in San Diego Bay as part of the Bight/RHMP monitoring in 2013. The data collected from the 13 freshwater influenced sites satisfied the RPs’ initial screening requirements for sediment quality described in the San Diego Bay MAP. Using the State of California Sediment Quality Objectives (SQO) approach, all of the freshwater-influenced locations in San Diego Bay were determined to be unimpacted or likely unimpacted by anthropogenic influences during the initial screening, with the exception of two sites near the mouth of Chollas Creek. There is a current investigative order (R9-2015-0058) at the mouth and tidally influenced area of Chollas Creek for impaired benthic communities.

The 2013 San Diego Regional Harbor Monitoring Report was provided in the 2015 Transitional Monitoring and Assessment Report in accordance with the Municipal Permit reporting requirements (Bight ’13 Contaminant Impact Assessment Committee, 2013). The full report and appendices are available on the Port of San Diego’s website at https://www.portofsandiego.org/document/environment/regional-harbor-monitoring-program/rhmp-2013.html.

2.3 Storm Water Monitoring Coalition Regional Monitoring Results

The SMC Regional Bioassessment Monitoring Program is a collaborative effort of leading storm water agencies as well as multiple local, state, and federal regulatory agencies in southern California. The SMC monitoring program is designed to generate the data to answer three key management questions:

(1) What is the condition of streams in southern California?

(2) What stressors are associated with poor condition?

(3) Are conditions changing over time?

Data are collected to characterize the benthic macroinvertebrate (BMI) and algae communities, as well as the quality of the physical habitat and water chemistry of each monitoring site. The following sections describe both methodology and results from the SMC monitoring program.

2.3.1 Stream Bioassessment Methods

Three monitoring reaches in the Sweetwater River HU were assessed in May and June of the 2015–2016 monitoring year for the SMC Regional Monitoring Program as described in Table 2-1. Stations included two SMC "condition" sites (Stations 909M24925 and 909M24937) and one “trend” site (Station 909WE0662), all located in the main stem of the Sweetwater River in the upper portion of the watershed, spanning approximately 15 stream miles from upstream of Palo Verde Lake to downstream of Green Valley Falls in Cuyamaca Rancho State Park. Condition sites are those that are selected from the SMC sample draw list each year and are sampled only once during the current five-year cycle (2015–2019) to discern an overall condition estimate of the health of streams in the region. Trend sites are those that have been randomly selected from the preceding five-year SMC cycle (2009–2013) list, and are being sampled each year of the current five-year cycle (2015–2019) to evaluate any overall trends in the health of streams in the region. Data from the San Diego Bay WMA sampling stations will be submitted to the SMC program and will be analyzed within the context of the South Coast Region of California in a five-year summary report produced by SCCWRP at the conclusion of the current 2015–2019 sampling cycle. This report will include any conclusions that may be drawn regarding the improving or worsening condition of the selected trend sites.

Table 2-1
San Diego Bay Storm Water Monitoring Coalition Regional Monitoring Program Bioassessment Sites for 2015–2016

SMC Region	WMA	Stream: Location	Site Type	Station Code	Date Sampled	Latitude/ Longitude
South San Diego	San Diego Bay	Sweetwater River: 0.3 Mile Downstream of Cuyamaca Rancho State Park	Trend (Open)	909WE0662	5/10/2016	32.89957/ -116.58789
		Sweetwater River: 0.4 Mile Upstream of Interstate 8	Condition	909M24925	5/10/2016	32.83849/ -116.63815
		Sweetwater River: 0.3 Mile Upstream of Palo Verde Lake	Condition	909M24937	6/22/2016	32.81829/ -116.71039

Notes:
SMC = Storm Water Monitoring Coalition; WMA = Watershed Management Area

All bioassessments were performed between May 10 and June 22, 2016, during the appropriate index period for the SMC (March through July). Biological condition and physical habitat quality were assessed in the field following the SWAMP bioassessment protocol (Ode et al., 2016) and the SMC 2015–2019 Work Plan (Mazor et al., 2015). The California Rapid Assessment Method (CRAM) followed procedures outlined in *California Rapid Assessment Method for Wetlands, Riverine Wetlands Field Book*, version 6.1 (CRAM, 2013).

Analysis of Benthic Community Data

Benthic community data analyses used standardized assessment tools adopted by SWAMP. BMI were identified in accordance with the Southwest Association of Freshwater Invertebrate Taxonomists (SAFIT) Level 2 requirements. Data were then analyzed to produce two different multi-metric indices (MMI) of overall BMI health: (1) Southern California Index of Biotic Integrity (IBI) (Ode et al., 2005), and (2) the California Stream Condition Index (CSCI) (Mazor et al., 2015), and their associated biological metrics (see Attachment A).

According to the IBI, the BMI community is considered unimpaired (i.e., equivalent to reference condition) when a site scores in the Fair (40-59), Good (60-79), or Very Good (80-100) categories. According to the CSCI, a site is considered unimpaired (i.e., equivalent to reference condition) when a site scores in the Possibly Altered (0.79-0.91) or Likely Intact (>0.92) categories.

2.3.2 Stream Bioassessment Results

Table 2-6 summarizes IBI and CSCI index scores for the benthic community health and riverine wetland condition scores (i.e., CRAM) for the Sweetwater River monitoring locations. More detailed results of the IBI, CSCI, and CRAM are presented in Attachment A. Tables 2-7 through 2-9 summarize physical habitat, analytical chemistry, and algal biomass results, respectively. Algal taxonomy samples including soft-bodied algae and diatoms were collected and submitted to California State University, San Marcos (CSUSM) for taxonomic identification. Algal taxonomy sample processing by CSUSM is scheduled to be completed in spring 2017, followed by data submittal to SCCWRP by CSUSM and reported through the SMC program.

Table 2-6
Summary of the 2016 San Diego Bay WMA Bioassessment Monitoring Site Index Scores

Stream Name	Station Code	IBI Score	IBI Condition Category	CSCI Score	CSCI Condition Category	Overall CRAM Score
Sweetwater River	909WE0662	33	Poor	0.68	Likely Altered	82
	909M24925	36	Poor	0.83	Possibly Altered	89
	909M24937	50	Fair	0.87	Possibly Altered	75

Notes:

CRAM = California Rapid Assessment Method; CSCI = California Stream Condition Index; IBI = Southern California Index of Biotic Integrity

Table 2-7
Summary of the 2016 San Diego Bay WMA Physical Habitat Measures of SMC Bioassessment Monitoring Sites

Physical Habitat Measure[1]	Sweetwater River		
	909WE0662	909M24925	909M24937
Elevation (feet above sea level)	3,822	3,105	1,885
Gradient (% of slope)	0.5	4.0	1.3

Bedrock	1	0	0

Table 2-7 (continued)
Summary of the 2016 San Diego Bay WMA Physical Habitat Measures of SMC Bioassessment Monitoring Sites

Notes:

% = percent; cfs or ft^3/second = cubic feet per second; cm = centimeters; m = meters; mm = millimeters

1. Physical habitat measures are described in detail in the SWAMP bioassessment protocol (Ode et al., 2016)
2. Bankfull width is the estimated width of the stream under a one to two year high flow recurrence interval.
3. Qualitative habitat quality assessment on a 0-20 point scale where 0 represents poor conditions and 20 represents optimal conditions.
4. CPOM = coarse particulate organic matter, a food resource for BMI.

Chlorophyll *a* ($\mu g/cm^2$)	2.73	5.66	3.86
Ash-Free Dry Mass (mg/cm^2)	7.92	5.18	3.17

Notes:

$\mu g/cm^2$ = micrograms per square centimeter; cm^2 = square centimeters; mg/cm^2 = milligrams per square centimeter; mL = milliliters

2.3.3 Stream Bioassessment Discussion

Sweetwater River Below Green Valley Falls (909WE0662)

The uppermost Sweetwater River station (909WE0662) had an IBI score of 33 (Poor) and a CSCI score of 0.68 (Likely Altered) (Table 2-6). The IBI and CSCI scores both indicated a somewhat impaired BMI community (an IBI score of ≤39 is considered impaired and a CSCI score of <0.79 is considered impaired), although the O/E component of the CSCI score rated the site unimpaired with a score of 0.80 (Attachment A). Individual metrics of the BMI community were variable, with some aspects of the community indicating high-quality conditions and others reflecting lower quality community conditions. This variation was likely because the in-stream substrate was not ideal for BMI colonization (discussed below). Indicators of good biotic condition included the presence of intolerant (i.e., sensitive) BMI (5% of the community), including the highly sensitive mayfly, *Ameletus* sp. (15 individuals), the stonefly, *Isoperla* sp. (8 individuals), and two taxa of dixid midges (6 individuals) (Attachment A). Notably, the community lacked Trichoptera (caddisflies) and Coleoptera (beetles) which are typically found in high-quality streams.

According to the CRAM analysis, the riverine wetland condition of the uppermost Sweetwater River site (Figure 2-1) was of good quality with an overall score of 82 of a possible 100 points (Table 2-6). For each of the 14 CRAM attributes, a rating of A through D is given (where a rating of A represents the highest quality conditions). Most of the CRAM attribute metrics at this station scored an A or B, while two attributes (hydrologic connectivity to an active flood plain and number of co-dominant plant species) scored a C (Attachment A).

Figure 2-1
Sweetwater River Site 909WE0662 Looking Upstream

Stream flow at the time of sampling was moderate (0.33 cubic feet per second [cfs]) and the flow habitats were dominated by glide (slow-shallow; 88%) and riffle (fast-shallow; 12%) (Table 2-7). The streambed and riparian corridor were undisturbed and the banks were predicted to be stable under normal stormflows, with some areas potentially vulnerable to erosion under high flows. The vegetation was dominated by native species, and a relatively high percent coverage was observed in all vegetative layers, with a reach-wide overhead canopy cover of 83%. Although macrophytes were very dense and completely covered the stream in one part of the reach, macroalgal and aquatic macrophyte coverages were moderate overall (20% and 50%, respectively). A substantial amount of coarse particulate organic matter (CPOM; a food source for BMI) was present at 95% of the substrate assessment points. The substrate was composed mostly of fibrous roots of macrophytes and willows, fine sediment, and sand (94% combined), and a small percentage of gravel. This substrate composition was not conducive to the colonization of a diverse community of BMI, because many taxa prefer hard substrates and layered cobble.

The results for abiotic water quality and analytical chemistry are presented in Table 2-8. Measured parameters were indicative of reference conditions, where no limitations to BMI colonization would be expected. Because of the chemistry results and the observed poor quality of in-stream physical habitat conditions, the relatively low biotic index scores were likely due to the physical habitat and were not limited by water quality conditions.

Sweetwater River Upstream of Interstate 8 (909M24925)

The middle Sweetwater River site (Figure 2-2) had an IBI score of 36 (Poor) and a CSCI score of 0.82 (Possibly Altered) (Table 2-6). The IBI score indicated a slightly impaired BMI community, while the CSCI score indicated that the benthic community was above the impairment threshold. Breaking down the two components of the CSCI, the O/E rated the community equivalent to reference conditions and was much higher than the pMMI, with scores of 1.07 and 0.59, respectively (Attachment A). The BMI community did not contain any intolerant taxa and the number of EPT was relatively low (4 taxa) with no stoneflies or caddisflies. Of the mayflies present, one type was considered a sensitive EPT (*Centroptilum* sp.), with a tolerance value of 3. The community was dominated by Diptera taxa (true flies), where members of the Family Chironomidae and the black fly, *Simulium* sp., accounted for 63% of the community. Snails (primarily *Physa* sp.) were also present in relatively high numbers and accounted for 28% of the community.

Figure 2-2
Sweetwater River Site 909M24925 Looking Upstream

The riverine wetland condition of the monitoring reach was considered good, with a CRAM score of 89 of 100 possible points (Table 2-6). The site was rated high (A or B) for every attribute of CRAM, with the exception of hydrologic connectivity to an active flood plain, which was rated a C (Attachment A). The gradient of the reach was relatively high (4% slope), flow habitats were diverse, and the flow volume was 0.22 cfs (Table 2-7). The banks were predicted to be stable under high flow conditions and indicators of erosion were not observed. Overhead canopy exhibited 74% coverage across the reach, and macrolagal and aquatic macrophyte cover was somewhat limited with 24% and 17%

cover, respectively. CPOM was detected at 49% of the transect points assessed, which indicated adequate food sources for BMI. The stream substrate was diverse, with boulders identified as the dominant component (31% of the substrate), and all other substrate types composing at least 10% of the substrate. The qualitative assessment of epifaunal substrate quality was 17 of 20 points, indicating optimal habitat for BMI colonization.

The results for abiotic water quality and analytical chemistry indicated that none of the constituents were at levels that would limit the colonization of sensitive BMI (Table 2-8). These results indicate that the low IBI and MMI scores for the benthic community were due to a naturally low diversity of BMI taxa and that the O/E component of the CSCI, which rated the site as Likely Intact, was the best measure of biotic conditions at the site. The site was approximately one mile downstream of low-density housing and three miles downstream of the town of Descanso, and although it is possible that these anthropogenic influences could have contributed to the relatively low diversity of BMI, natural biological variability cannot be ruled out.

Sweetwater River Upstream of Palo Verde Lake (909M24937)

The lower Sweetwater River site (Figure 2-3) had an IBI score of 50 (Fair) and a CSCI score of 0.87 (Possibly Altered) that indicated an unimpaired BMI community by both indices. BMI metrics that indicated a good quality community included a low percentage of non-insects and high diversities of beetle and predator taxa. Relative to reference conditions, the site supported low numbers of EPT and intolerant taxa.

The riverine wetland condition of the monitoring reach was moderate, with an overall CRAM score of 75 out of 100 possible points (Table 2-6). The area surrounding the site was undeveloped open space with a natural streambed and bank. Because of limited and difficult site accessibility, there is likely negligible physical disturbance from humans. The reach received a poor rating (D) for two CRAM attributes related to vegetative biotic structure (number of co-dominant species and vertical biotic structure). The low CRAM scores for these two attributes could be directly related to the naturally rocky topography of the site (i.e., large car-sized boulders piled two to three deep throughout the entire reach), which naturally inhibited plant growth. Additionally, the observed boulder field also influenced both structural patch richness and vegetative horizontal interspersion, which that exhibited attribute scores of “C.”

The streambanks were stable, the gradient was moderate (1.3% slope), and flow volume was 0.01 cfs. The low flow volume at the time of sampling made riffles rare (8% of the flow habitat), although it was apparent that greater flow would enhance the amount of riffles. At the time of sampling, slow-moving glide and pool habitat dominated (53% and 29%, respectively). The rocky topography of the reach provided relatively unique streambed conditions, with very large (i.e., car-sized and larger) boulders stacked upon one another to create cave-like segments of the stream. The 91% canopy cover that was recorded was mostly attributed to rocky overhangs rather than vegetative canopy. The shading effect of the boulders likely inhibited aquatic macroalgae and macrophyte growth within the reach (13% and 1% cover, respectively), while CPOM was detected at 63% of the transect points. The wetted substrate within the reach was dominated by sand (53%), cobble (22%), and boulder (11%).

Figure 2-3
Sweetwater River Site 909M24937 Looking Downstream

The results of the abiotic water quality and analytical chemistry indicated that most of the constituents measured would likely not limit colonization of sensitive BMI, although a few constituents were near levels that could potentially inhibit full colonization. Dissolved oxygen was relatively low with a value of 3.3 milligrams per liter (mg/L), sulfate was 230 mg/L, and specific conductance was 951 micro-Siemens per centimeter (µS/cm) (which equates to a total dissolved solids value of 637 mg/L). The Water Quality Control Plan for the San Diego Basin (Basin Plan) (Regional Board, 1994) lists the Water Quality Objective (WQO) for chloride and total dissolved solids in this hydrologic unit at 250 and 500 mg/L, respectively.

2.3.4 Stream Bioassessment Conclusion

The trend site in Sweetwater River, 909WE0662, the farthest upstream, had a BMI community that was considered impaired according to both the IBI and the CSCI scores, although the site did support several sensitive organisms. The O/E component of the CSCI, however, rated the site unimpaired and there were no water quality constituents measured that would likely have a negative impact on BMI. The instream epifaunal substrate conditions were lacking hard substrates (e.g., cobble or boulder) and were not conducive to colonization by many types of BMI. Physical habitat limitations were the most likely cause of the relatively low index scores of the site.

The middle Sweetwater River site, 909M24925, had a BMI community that was slightly below the IBI impairment threshold, but was rated unimpaired by the CSCI score. EPT taxa diversity was relatively low and there were no highly sensitive organisms collected. The physical habitat was of high quality and the water quality constituents measured were all below Basin Plan benchmarks. The site was downstream of low-density housing and the town of Descanso, which have the potential to negatively impact BMI community quality, although this relationship could not be confirmed.

The lower Sweetwater River site, 909M24937, had a BMI community that was rated unimpaired by both the IBI and the CSCI scores. The community had high beetle diversity but had few sensitive or EPT taxa. The physical habitat was unique, with large boulders covering much of the streambed, which inhibited a dense and diverse riparian vegetative community. Overall, water quality constituents indicated favorable conditions for BMI diversity, with the exception of total dissolved solids (TDS) and sulfate, which were near levels that could potentially impact sensitive BMI.

Certain water quality constituents exhibited a pattern of increasing concentrations from upstream to downstream. Observed increases included ionic and dissolved constituents such as alkalinity, calcium, chloride, and sulfate. For example, sulfate increased from 72 mg/L at the upstream site to 110 mg/L and 230 mg/L at the middle and downstream sites, respectively. These constituents can occur naturally, and may be increasing in concentrations as geology changes through the watershed. Notably, nutrient levels were low at all sites and did not increase substantially from the upper to the lower site, although levels at the middle site (with closer proximity to development) were nominally higher than at the upstream and downstream sites. The lack of increasing nutrient levels in tandem with increasing ionic constituents could support the presumption that geology (and not anthropogenic input) was affecting water quality in this portion of the watershed.

2.4 Hydromodification Regional Monitoring Program

The Hydromodification Monitoring Program (HMP) was initially developed in response to the requirements of the 2007 Municipal Permit. The Monitoring Plan is defined in Chapter 8 of the HMP, and was updated by the San Diego County Regional Copermittees and accepted by the Regional Board in February 2014. The final report for the program is included as Attachment B.

2.5 Chollas Metals TMDL and Bacteria TMDL Monitoring

Monitoring for the Highest Priority Condition was developed to comply with the two TMDLs in effect for Chollas Creek. Sections 2.5.1 and 2.5.2 provide a brief overview of the monitoring programs and results. Full reports of monitoring results are in Attachment C.

2.5.1 Chollas Dissolved Metals and Diazinon TMDL

The Chollas Creek Diazinon and Dissolved Metals TMDLs Compliance Monitoring Program is designed to meet the requirements of Order No. R9-2004-0277 and State Water Resources Control Board (State Board) Resolution No. 2008-00054. To determine

TMDL compliance, the RPs conducted wet weather water quality monitoring at two mass loading stations (MLSs)—Z Street (South Fork of Chollas Creek) and SD8(1) (North Fork of Chollas Creek)—during three wet weather events during the 2015–2016 wet season (October 1 through April 30). MLS information is presented in Table 2-10.

Table 2-10
Chollas Creek TMDL Mass Loading Stations

Mass Loading Station (MLS)	MLS Identification	Latitude	Longitude
South Chollas Creek	Z Street	32.69296	-117.10945
North Chollas Creek	SD8(1)	32.70493	-117.12132

Samples were analyzed for the following TMDL compliance constituents: diazinon, dissolved metals (copper, lead, and zinc), total hardness, and toxicity. Additional constituent analyses were selected by the RPs to track potential water quality contaminants or issues in Chollas Creek.

Compliance was determined by comparing analytical results with applicable water quality criteria set forth in the approved TMDLs for the Chollas Creek hydrologic subarea (HSA), the pesticide criteria of the California Department of Fish and Wildlife (CDFW), and the Aquatic Life Benchmarks of the United States Environmental Protection Agency (USEPA) Office of Pesticide Programs (OPP). The data collected during the 2015–2016 wet season are summarized below by TMDL compliance constituent category. The final report for the Chollas Creek Diazinon and Dissolved Metals TMDL is included as Attachment C.1.

Dissolved Metals

Analytical results for dissolved copper, lead, and zinc were compared with the numeric targets on the basis of the hardness-dependent California Toxics Rule (CTR) set forth in the Chollas Creek Dissolved Metals TMDLs. Results are as follows:

- Chollas South Fork (Z Street)
  - During 3 of 3 wet events, dissolved copper, lead, and zinc concentrations were below acute and chronic WQOs.
- Chollas North Fork (SD8(1)):
  - Dissolved copper concentrations exceeded acute WQOs during 1 of 3 events and exceeded chronic WQOs during 2 of 3 event s.
  - Dissolved lead and zinc concentrations did not exceed acute and chronic WQOs during 3 of 3 events.
- Historical Dissolved Metals Trends:
  - Historical dissolved copper concentrations in Chollas Creek during wet weather monitoring events have fluctuated above and below both the acute and chronic WQOs.

- Historical dissolved lead concentrations have been consistently below the acute WQO and of the same magnitude to the chronic WQO.
- Historical dissolved zinc concentrations at the South Fork have been below the acute and chronic WQOs throughout the compliance monitoring period. Dissolved zinc concentrations at North Fork have fluctuated above and below the acute and chronic WQOs.

The City of San Diego has developed and submitted a Water Effects Ratio Confirmation Study (City of San Diego, 2015b) to the Regional Board for dissolved copper and dissolved zinc at Z Street and SD8(1). If approved, the updated water effects ratios (WERs) would provide for an alternative assessment of compliance with the TMDL waste load allocations (WLAs). The alternative WERs will assess dissolved copper and zinc specific to the ambient water chemistry within Chollas Creek rather than the default WER provided in the CTR.

Diazinon

Diazinon was not reported at concentrations above the method detection limit (MDL) at the Chollas Creek North or South Forks during the three wet weather monitoring events. The USEPA banned the retail sale of diazinon products as of December 31, 2004, because of their adverse health effects on the human nervous system. Since the ban, diazinon concentrations at both Chollas Creek MLSs have shown statistically significant decreasing trends (Weston, 2011).

Toxicity

No acute or chronic toxicity was reported for the samples collected during the 2015–2016 wet season.

2.5.2 Chollas Bacteria TMDL

The 2015–2016 Chollas Creek Bacteria Total Maximum Daily Load (Bacteria TMDL) compliance monitoring is designed to meet the requirements under Resolution No. R9-2010-0001 (Regional Board, 2013b), as incorporated into the Municipal Permit in 2013. The Bacteria TMDL monitoring program assesses the conditions of the receiving waters and has the following objectives:

- Characterize levels of bacteria concentrations at compliance monitoring locations.
- Track progress toward meeting the Bacteria TMDL numeric targets.

A full report of the monitoring results for the Chollas Creek Bacteria TMDL is in Attachment C.2.

Fecal indicator bacteria (FIB) sampling for the compliance monitoring season (October 2015 through September 2016) was conducted at three creek monitoring locations: the North and South Fork MLSs (SD8(1) and Z Street, respectively), and the tidally influenced mouth of Chollas Creek (CTL(1)). Wet weather samples were collected during three storm events on wet weather days (days with 0.2 inch of rainfall or more plus the following 72 hours) within 24 hours of the end of rainfall. Dry weather samples were collected on dry weather days (days with less than 0.1 inch of rainfall observed on each of the previous three days) at least weekly between April 1, 2015, and October 31, 2015, and at least monthly on dry weather days from November 1, 2015, through March 31, 2016. Compliance monitoring locations are presented in Table 2-11 and Figure 2-4.

The Chollas Creek Bacteria TMDL 2015–2016 Compliance Monitoring Report (Attachment C.2) summarizes FIB concentrations and key hydrologic data for the three compliance monitoring locations during the 2015–2016 monitoring season (October 1, 2015 through September 30, 2016). Compliance is determined by comparing analytical results for *Enterococcus* and fecal coliform with applicable receiving water limitations (RWLs), in accordance with the Bacteria TMDL requirements in Attachment E of the Municipal Permit. The RWLs are a combination of numeric targets for bacteria density and allowable exceedance frequencies. The single-sample maximum numeric targets are required to be achieved only during wet weather with a 22% final allowable exceedance frequency and apply only to wet weather days between October 1 and April 30 of each monitoring year. The 30-day geometric mean numeric targets must be achieved with a 0% exceedance frequency, and apply to both dry weather days during the dry season and combined wet and dry weather days during the wet season. The compliance schedule includes interim targets that must be achieved to demonstrate progress prior to attaining full compliance with the TMDL.

Table 2-11
Chollas Creek TMDL Monitoring Stations

Monitoring Location	Monitoring Identification	Latitude	Longitude
Chollas Creek South Fork	Z Street [1]	32.69296	-117.10945
Chollas Creek North Fork	SD8(1) [1]	32.70493	-117.12132
Chollas Creek tidal location downstream of North and South Fork Confluence	CTL(1)	32.69120	-117.12354

Notes:
1. Compliance monitoring location for Bacteria, Diazinon and Dissolved Metals TMDLs.

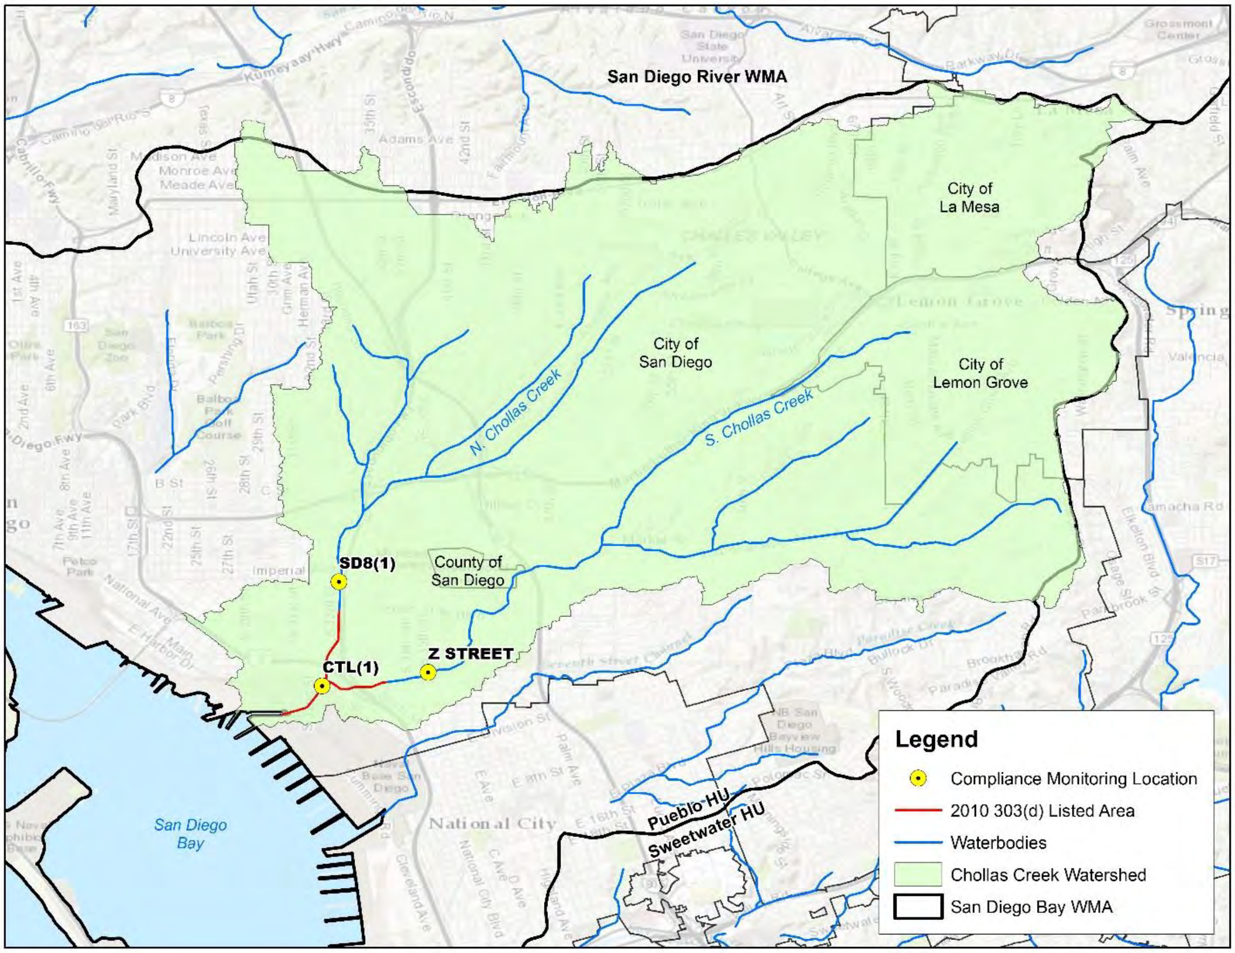

Figure 2-4
Chollas Creek Bacteria TMDL Compliance Monitoring Locations

2.6 Shelter Island Yacht Basin Metals Total Maximum Daily Load Monitoring

The Shelter Island Yacht Basin (SIYB) TMDL identified the City of San Diego (City) as a Responsible Copermittee for MS4 discharges to SIYB and required the City to demonstrate accordance with Shelter Island Dissolved Copper TMDL compliance requirements. The SIYB TMDL monitoring was conducted in fiscal year (FY) 2016 in accordance with the TMDL requirements. The annual report is provided in Attachment D.

2.7 Shelter Island Shoreline Park Bacteria Total Maximum Daily Load Monitoring

2.7.1 Shoreline Park Bacteria TMDL Monitoring Methods

To comply with the Shelter Island Shoreline Park TMDL, wet and dry weather indicator bacteria monitoring was performed during 2015–2016 at one receiving water location at Shelter Island Shoreline Park, EH-200. In addition to bacteria sampling of the receiving water, visual observations were recorded at site EH-200 (the swim beach), as well as four storm drains in the approximate vicinity of the beach. The responsible Copermittee (the Port of San Diego) utilized existing monitoring data collected by the San Diego County Department of Environmental Health (DEH) in accordance with AB 411. The DEH collects receiving water samples at EH-200 weekly during dry weather from April through October. From November 2015 through March 2016, the Port of San Diego collected monthly dry weather receiving water samples at the same location. In addition, the Port of San Diego collected receiving water samples at EH-200 during three wet weather events during 2015–2016. Wet weather samples were collected during the first 24 hours of a storm resulting in at least 0.1 inch of precipitation. Samples are analyzed for total and fecal coliform and *Enterococcus*. A summary of the sampling conducted in compliance with the TMDL is presented in Table 2-12. Results were compared with numeric targets in Attachment E.5 of the 2013 Municipal Permit.

In addition to the TMDL-required indicator bacteria sampling, the Port of San Diego has incorporated sampling for analysis of bacterial deoxyribonucleic acid (DNA) using quantitative Polymerase Chain Reaction (qPCR) with microbial source tracking (MST) markers to determine the genetic origin of *Enterococcus* species in water samples into its monitoring plan. Samples for MST analysis were collected when there were recent FIB WQO exceedances or when potential bacterial sources were observed during TMDL monitoring. This method may be a useful tool to identify sources of *Enterococcus* bacteria at Shelter Island Shoreline Park. *Enterococcus* was the only indicator bacteria to exhibit regular exceedances of WQOs at Shelter Island Shoreline Park during the 2015–2016 monitoring year (11 single-sample *Enterococcus* exceedances, compared with 2 fecal coliform exceedances and 0 total coliform exceedances).

Table 2-12
2015–2016 Shelter Island Shoreline Park Bacteria TMDL Monitoring Locations and Sampling Frequency

Location	Site	Analyte	Wet Weather Event Sampling Frequency	Dry Weather Event Sampling Frequency	
				April through October	November through March
Shelter Island Shoreline Park	EH-200	Total coliform	3 per Season (October through April)	Weekly	Monthly
		Fecal coliform			
		Enterococcus			

2.7.2 Shelter Island Shoreline Park Bacteria TMDL Monitoring Results

Results of dry weather monitoring at site EH-200, including concentrations of the indicator bacteria total coliform, fecal coliform, and *Enterococcus,* are summarized as follows:

- During wet weather, one single-sample exceedance was observed for both total and fecal coliform, while two exceedances were observed for *Enterococcus*.
- A single instance of a non-storm water discharge was observed from storm drains at Shelter Island Shoreline Park. The discharge volume was not large enough to sample. The source was determined to be irrigation runoff from a broken sprinkler head on Port of San Diego municipal property. The sprinkler head was repaired by Port of San Diego staff and a follow-up investigation revealed no irrigation runoff.
- The single-sample WQO exceedances were as follows: 14 for *Enterococcus* (of 55 samples), 2 for fecal coliform (of 45 samples), and 2 for total coliform (of 45 samples).
- A large number of gulls and other birds were observed in and around the receiving water at Shelter Island Shoreline Park, and some evidence of an anthropogenic contribution to the large number of birds (i.e., bird feeding) was observed. Of four bacteria samples collected for MST analysis, all four were positive for gull genetic marker, dog marker was positive in two of the four samples, and human marker was positive in one of the four samples.

The annual monitoring report is provided in Attachment E.

3 Non-Storm Water MS4 Outfall Monitoring

The purpose of this program is to identify non-storm water and illicit discharges within each RP's jurisdiction, determine which discharges are transient flows and which are persistent flows, and prioritize the dry weather MS4 discharges that will be investigated and eliminated. The MS4 Outfall Discharge Monitoring component involves the following types of data collection activities for the San Diego Bay WMA:

- Dry Weather MS4 Outfall Field Screening: inspecting major outfalls during dry weather conditions to identify and prioritize persistently flowing outfalls.
- Dry Weather Persistent MS4 Outfall Discharge Monitoring: testing the discharge for various pollutants and comparing the results with NALs.

3.1 Non-Storm Water MS4 Outfall Monitoring Data

During the 2015–2016 monitoring season (October 2015 through September 2016), the RPs implemented the first year of dry weather outfall discharge monitoring in accordance with Provision D.2.b of the Municipal Permit. The goals of dry weather outfall monitoring are to:

- Identify non-storm water and illicit discharges within its jurisdiction.
- Prioritize dry weather MS4 discharges that will be investigated and eliminated.
- Assess effectiveness of JRMPs toward effectively prohibiting non-storm water discharges into the MS4.

Dry weather outfall data are provided in Attachment F.1. Focused Priority Condition monitoring data are provided in Attachment F.2.

Details of the monitoring methodology are provided in the San Diego Bay WMA MS4 Outfall Monitoring Plan, available on the Project Clean Water website (www.projectcleanwater.org). The following subsections present the results of dry weather discharge monitoring in the San Diego Bay WMA.

To address the Municipal Permit requirements, the RPs determined the number of major MS4 outfalls within their jurisdictions within the WMA, as shown in Table 3-1.

Table 3-1
Number of Major Outfalls in San Diego Bay WMA

Copermittee	Total Number of Major Outfalls	HSA	Number of Major Outfalls per HSA
San Diego Airport Authority[1]	2[2]	908.21	2

**Table 3-1 (continued)
Number of Major Outfalls in San Diego Bay WMA**

Notes:
HSA = hydrologic subarea

1. The Airport Authority has two major outfalls that are tidally influenced and cannot be safely screened or monitored. The nearest safe upstream access points will be screened/monitored as a proxy.
2. For RPs with fewer than 125 major outfalls in the WMA, 80% of total major outfalls must be screened twice per year.
3. For RPs with fewer than 500 but more than 125 major MS4 outfalls in the watershed, 100% of major outfalls must be screened once per year.
4. The City of San Diego has 502 outfalls within the City jurisdiction. The City of San Diego, in accordance with Municipal Permit Provision D.2.a(2).(a).(iv), is required to screen 500 sites city-wide once per year. The City is not required to screen 500 sites within each watershed.
5. Port of San Diego includes 12 proxy sites to major outfalls.

3.2 Non-Storm Water MS4 Outfall Monitoring Data Assessments

Assessments of jurisdictional MS4 monitoring programs were conducted individually by the jurisdictions, and watershed-wide. Per Provision D.4 of the Municipal Permit, assessments include the following:

- Progress of IDDE programs toward effectively prohibiting non-storm water and illicit discharges into the MS4 within Copermittees’ jurisdictions.
- Identification of known and suspected controllable sources (e.g., facilities, areas, land uses, pollutant-generating activities) of transient and persistent flows within the Copermittee’s jurisdiction in the WMA, sources of transient and persistent flows within the Copermittee’s jurisdiction in the WMA that have been reduced or eliminated, and modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory.
- Based on the dry weather MS4 outfall discharge field screening monitoring, the following are assessed and reported:
    - For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identification of the known and suspected sources within the Copermittee’s jurisdiction in the WMA that may cause or contribute to the NAL exceedances.
    - For each Copermittee, calculations or estimates of the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year.

Each Copermittee is required to conduct field screening to determine which non-storm water MS4 outfall discharges are transient or persistent non-storm water flows. Data collected during dry weather MS4 outfall monitoring are used to prioritize the non-storm water MS4 discharges that will be investigated and eliminated.

3.2.1 Classification of Major MS4 Outfalls Within each Copermittee's Jurisdiction

Each major outfall identified in each Copermittee's jurisdiction was classified (Table 3-2) by the following definitions:

- Persistent flow – having flowing, pooled, or ponded water more than 72 hours after a measurable rainfall event of 0.1 inch or greater during the three consecutive most recent monitoring and/or inspection events;
- Transient flow – having flowing, pooled, or ponded water during at least one but not on all three most recent consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation ≥ 0.1 inch;
- Tidal – having persistent or transient flow with ocean tides as the source;
- Dry – having no flowing, pooled, or ponded water during the last three consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation greater than 0.1 inch; and
- Unknown – the site cannot be evaluated, or has not been visited enough times to determine flow status.

Table 3-2
Classification of Major MS4 Outfalls in Dry Weather

Copermittee	Dry	Persistent Flow	Transient Flow	Tidal	Unknown	Total
San Diego Airport Authority	0	0	0	2	0	2
City of Chula Vista	58	68	50	0	23	179
City of San Diego	45	22	24	0	2	93
City of Coronado	3	1	0	2	1	7
County of San Diego	16	28	13	0	0	57
City of Imperial Beach	0	0	0	7	0	7
City of La Mesa	3	0	0	0	0	3
City of Lemon Grove	3	1	0	0	0	4
City of National City	11	7	3	0	0	21
Port of San Diego	40	0	4	8	0	52

Notes:
Each outfall is assigned to only one outfall category. Designations were made at or prior to the start of the monitoring period.

In the San Diego Bay WMA, 42% of the major outfalls were classified as dry, 22% as transient, and 30% as persistently flowing outfalls. Figure 3-1 presents classifications of major MS4 outfalls in the 2015–2016 monitoring year.

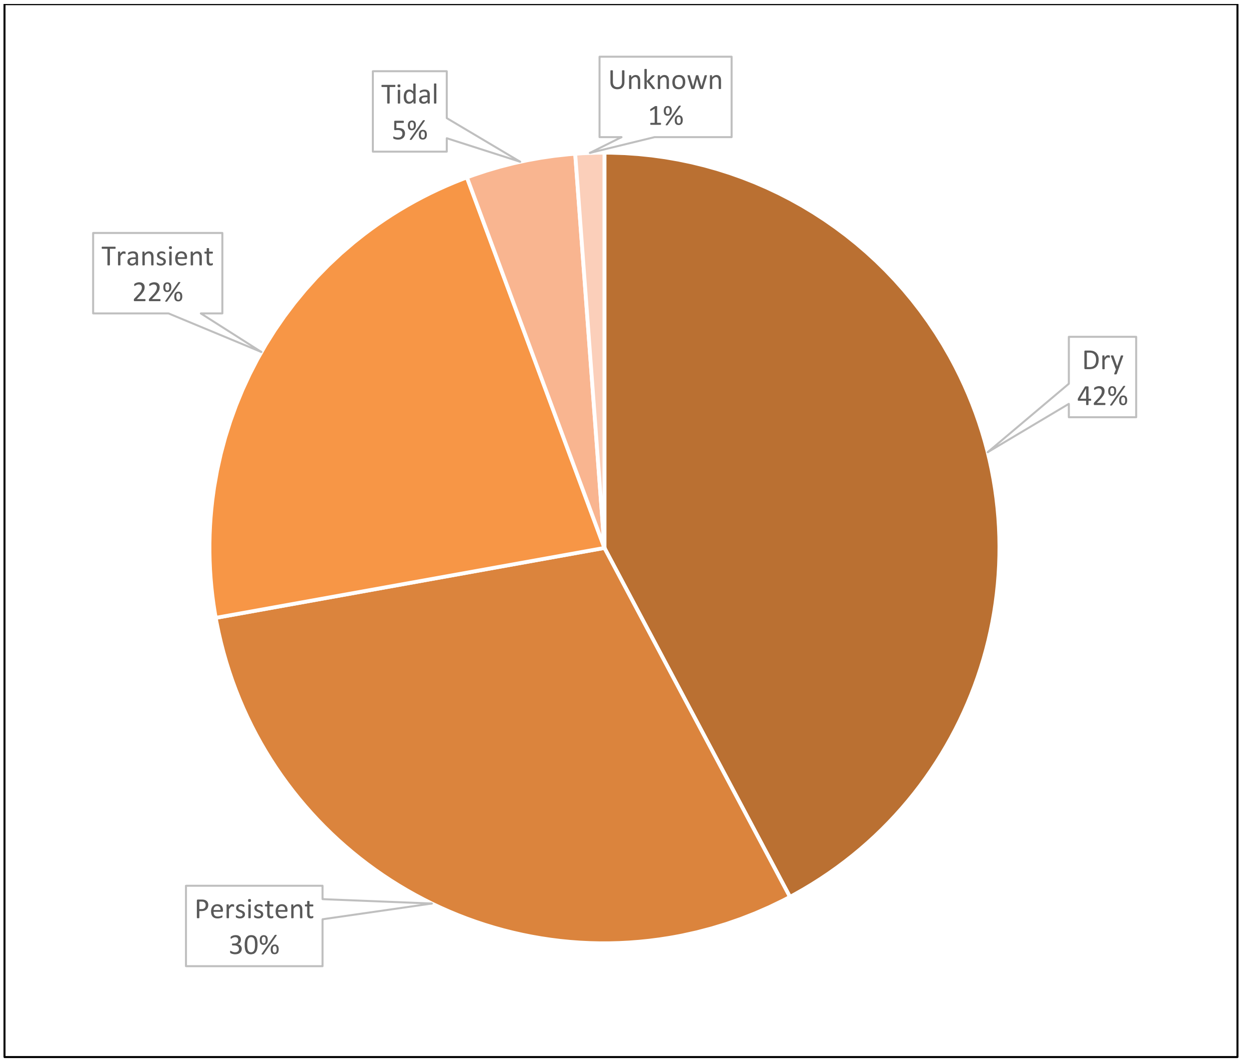

Figure 3-1
Classification of Major Outfalls in San Diego Bay WMA During the 2015-2016 Monitoring Year

3.2.2 Visual Observations at Major MS4 Outfalls

Of 1,252 observations, almost 80% of the visits were observed as dry outfalls. Table 3-3 presents the results of the visual observations at major MS4 outfalls in the San Diego Bay WMA during dry weather in the FY 2016 monitoring year.

Intentionally Left Blank

Table 3-3
Number of Dry Weather Visual Observations in 2015–2016 Monitoring Year

Copermittee	Total	Flowing	Ponded	Tidal	Dry	Unknown
San Diego Airport Authority[1]	4	0	0	4	0	0
City of Chula Vista[2]	190	58	40	0	92	0
City of San Diego[3]	77	20	13	1	43	0
City of Coronado[1]	12	2	0	2	8	0
County of San Diego[1]	175	65	49	0	61	0
City of Imperial Beach[1]	8	0	0	0	8	0
City of La Mesa[1]	6	2	2	0	2	0
City of Lemon Grove[1]	8	2	0	0	6	0
City of National City[1]	35	8	10	0	17	0
Port of San Diego[1,4]	111	5	2	31	72	1
Total	626	162	116	38	309	1

Notes:

1. For RPs with fewer than 125 major outfalls in the WMA, 80% of total major outfalls presented in the table must be screened twice per year.
2. For Responsible Parties with fewer than 500 but more than 125 major MS4 outfalls in the watershed, 100% of major outfalls must be screened once per year.
3. The City of San Diego has 502 outfalls within the City jurisdiction. The City of San Diego in accordance with Municipal Permit Provision D.2.a(2).(a).(iv) is required to screen 500 sites city wide once per year. The City is not required to screen 500 sites within each watershed.
4. Visual observation of unknown status was submerged outfall.

Intentionally Left Blank

3.2.3 Controllable and Non-Controllable Sources of Flow

The Municipal Permit requires classification of sources of runoff during visual observations that result in flowing or ponded water in dry weather. Known, controllable sources of runoff, such as irrigation runoff and residential washing, were identified during these visual observations. Other suspected sources of runoff were noted and may have included items such as broken pipes. Non-controllable runoff sources were also identified during dry weather visual observations and included mostly groundwater seepage. Finally, unidentified sources of runoff were noted during dry weather observations. Table 3-4 presents results of runoff source observations made in the 2015–2016 monitoring year.

Table 3-4
Sources of Dry Weather Flow in 2015-2016 Monitoring Year

Copermittee	Total Number of Observations Investigating Flow Source	Known Controllable Sources	Suspected Controllable Sources	Uncontrollable Sources	Unidentified Sources
San Diego Airport Authority	No Discharges Observed				
City of Chula Vista	109	57	0	36	23
City of San Diego	41	9	6	3	28
City of Coronado	2	2	0	1	0
County of San Diego	46	1	30	0	13
City of Imperial Beach	No Discharges Observed				
City of La Mesa	7	4	0	2	0
City of Lemon Grove	4	0	2	0	2
City of National City	35	10	0	2	25
Port of San Diego	7	2	3	0	2
Total	251	84	42	44	93

3.2.4 Illicit Discharge Detection and Elimination Program Data and Assessment

Non-storm water discharges (NSWDs) that have been reduced or eliminated during the 2015–2016 monitoring year have also been identified and are shown by Copermittee in Table 3-5. Details of these identifications and eliminations, as well as enforcement actions that are part of the IDDE program, are on each Copermittee' s completed JRMP Annual Report forms in Appendix 2.

Table 3-5
Dry Weather Discharges Eliminated in the 2015-2016 Monitoring Year

Copermittee	Number of Identified Discharges	Number of Eliminated Discharges
San Diego Airport Authority	4	4
City of Chula Vista	114	64
City of San Diego	828	819
City of Coronado	48	48
City of Imperial Beach	53	53
County of San Diego	28	28
City of La Mesa	12	7
City of Lemon Grove	7	7
City of National City	39	39
Port of San Diego	8	8
Total	1,141	1,077

3.3 Non-Storm Water Action Level Comparisons

The data collected as part of the dry weather MS4 outfall discharge monitoring were compared with the NALs per Municipal Permit Provision C.1.a.(3). NALs for the Focused Priority Pollutants listed in Table C-3 of the Municipal Permit were calculated using corresponding hardness measurements according to the calculations in 40 Code of Federal Regulations (CFR) 131.38(b)(2). These comparisons are shown in Tables 3-6 through 3-11.

Of the high priority major MS4 outfalls in the San Diego Bay WMA, four major MS4 outfalls flow to bay, harbor, or lagoon and estuary waters, as defined by the Municipal Permit. Of these four high priority major MS4 outfalls, two were in the Port of San Diego and two were in the City of Coronado. Ten of 71 samples exceeded dry weather NAL's in the 2015–2016 monitoring year: four exceedances of dissolved copper, five exceedances of *Enterococcus*, and three exceedances of fecal coliform. Results of NAL comparisons for bay, harbor, and lagoon and estuary waters are provided in Table 3-6.

Note that Imperial Beach has installed dry weather diversions at its outfalls, and therefore did not observe any flow during dry weather monitoring. The San Diego Airport Authority also did not observe any discharges in dry weather; therefore, NAL comparisons do not apply to either RP. The City of La Mesa did not have any outfalls classified as persistent until after the FY 16 monitoring program was completed. No samples were taken in FY 16 and their outfall inventory will be updated accordingly in FY 17.

Intentionally Left Blank

Dissolved Zinc	95 µg/L	8	NA	5	18	29.21	3.3	15.83

Notes:

Bold = exceedance of NAL; NA = data not available; µg/L = micrograms per liter; mg/L = milligrams per liter; MPN/100mL = most probable number per 100 milliliters; NTU = nephelometric turbidity unit; < = Not Detected below Method Detection Limit

1. NALs for bays, harbors, and lagoons/estuaries (seawater) are as provided in Table C-2 and Table C-3 of Provision C.1.(2) of the Permit.
2. Port of San Diego high priority major MS4 outfalls 1271.1, 2172.1, and 2941.1 were dry upon observation or were tidally influenced, and therefore were not sampled in the 2015-2016 monitoring year.
3. This value has been set to the Basin Plan water quality objective for saltwater “designated beach areas” and is not applicable to water bodies that are not designated with the water contact recreation (REC-1) beneficial use.
4. The NAL is reached if more than 10 percent of total samples exceed 400 MPN per 100 ml during any 30 day period.
5. Field measurement reported as result.

Intentionally Left Blank

Of the high priority major MS4 outfalls in the San Diego WMA, 17 had observed flow draining to inland surface waters. The City of Chula Vista monitored a total of five major flowing outfalls, all of which drain to inland surface waters, and one of which was dry upon observation in the 2015-2016 monitoring year. The City of San Diego monitored a total of five major flowing MS4 outfalls that drain to inland surface waters. Two of these outfalls were dry upon observation in the 2015-2016 monitoring year. The County of San Diego monitored five major outfalls during 2015–2016 but collected samples from only four because one of the five County of San Diego highest priority sites, SWT-MS4-021, was dry on all visits. For the 2016–2017 monitoring year, this site will be replaced with the next highest ranking outfall on the County of San Diego's MS4 inventory, MS4-SWT-019. The City of Lemon Grove monitored one major MS4 outfall in the San Diego Bay WMA in the 2015–2016 monitoring year. The City of National City monitored five major flowing outfalls that drain to inland surface waters. A total of 466 of the 582 inland surface water results were below NALs, including 155 non-detect values. NALs were exceeded for concentrations of dissolved copper, *Enterococcus*, fecal coliform, total iron, total manganese, methylene blue active substance (MBAS), pH, total nitrogen, total phosphorous, and turbidity. Some of these analytes are found in groundwater and may be from unidentified groundwater intrusion. Other analytes will be addressed by the strategies developed by the RPs. The San Diego Bay WMA RPs have just begun implementation of the WQIP; they plan to continue implementing the strategies without modification, and will work toward eliminating dry weather flows. Additionally, they have implemented their IDDE programs, as summarized in Section 3.2.4, to identify sources of illicit dry weather discharges.

Intentionally Left Blank

Notes:

Bold = exceedance of NAL; ( ) = Numbers in parentheses adjacent to analytical results are California Toxics Rule (CTR) Freshwater Continuous Concentration Hardness dependent values from 40 CFR 131.38(b)(1) calculated using the receiving water hardness result of the sample (for metals);
** = CTR Freshwater Continuous Concentration Hardness dependent non-storm water action level; µg/L = micrograms per liter; $CaCO_3$ = calcium carbonate; mg/L = milligrams per liter; MPN/100mL = most probable number per 100 milliliters; NA = data not available; NAL = non-storm water action level; NTU = nephelometric turbidity unit; < = Not Detected below Method Detection Limit; < = Not Detected below Method Detection Limit

1. Outfall 433 was visited on 6/28/16 and was dry, therefore only one sample was taken in the 2015-2016 monitoring season.
2. Field measurement reported as result.
3. Hardness value from paired receiving water sample not available. Hardness value from outfall was used to calculate applicable CTR Freshwater Continuous Concentration Hardness dependent values.

Intentionally Left Blank

3.4 Non-Storm Water Volume and Pollutant Load Assessment

Copermittees must assess the non-storm water volumes and pollutant loads collectively discharged from their jurisdictions in the San Diego Bay WMA, per Municipal Permit Provision D.4.b(1)(c). The methodology used to calculate the non-storm water volumes and loads is provided in Attachment F.3.

3.4.1 Identification of Dry Weather Days

The first step in calculating annual non-storm water volumes and pollutant loads is to determine the number of dry weather days in the monitoring year. The number of dry weather days were determined using County of San Diego ALERT station data (https://sandiego.onerain.com). The Bonita ALERT station was selected to represent rainfall conditions in the San Diego Bay WMA. This representative ALERT station was also utilized in Wet Weather MS4 Outfall Discharge Monitoring Assessments, and is the station closest to a majority of wet weather MS4 outfall discharge monitoring stations.

A wet weather day was defined as any day with at least 0.1 inch of measurable rainfall within a 24-hour period, and the subsequent 72 hours. A dry weather day was defined as all other days during the monitoring year (October 1 through September 30). Table 3-12 presents the number of dry weather days identified in the San Diego Bay WMA during the 2015–2016 monitoring season.

Table 3-12
San Diego Bay WMA Dry Weather Days by Month

Month	Number of Days in the Month	Storm Dates	Number of Storm Days	Number of Storm Days +72 Hours	Number of Dry Days
October 2015	31	October 4–5	2	3	26
November 2015	30	November 3 November 10 November 27	3	9	18
December 2015	31	December 11 December 13 December 22 December 25	4	9	18
January 2016	31	January 4–7 January 31	5	3	23
February 2016	29	NA	0	3	26
March 2016	31	March 6–7 March 11 March 29	4	8	19
April 2016	30	April 7 April 9	2	5	23
May 2016	31	May 5–6	2	3	26
June 2016	30	NA	0	0	30
July 2016	31	NA	0	0	31
August 2016	31	NA	0	0	31
September 2016	30	September 20	1	3	26

Notes:
NA = not applicable, no storms recorded

3.4.2 Non-Storm Water Volume Assessment

An estimated annual non-storm water volume was calculated for each persistently flowing major MS4 outfall in each Copermittee's jurisdiction, as is presented in Table 3-13. Calculations of volume were dependent on the availability of flow data for each site. Details of these calculation methods are presented in the Dry Weather Assessment Methodology in Attachment F.3. The methods are summarized as follows:

- Scenario A: If a major MS4 outfall station was visited once during the monitoring year, and a single discrete flow rate was measured, and this flow rate was applied across all dry weather days within the year.
- Scenario B: If a major MS4 outfall station was visited more than once during the monitoring year, and more than one discrete flow rate was measured, monthly dry weather flow volumes were calculated. The monthly flow volume calculation method varied on the basis of whether a flow measurement was logged at the outfall during that month. For calendar months in which the outfall was visited one or more times, the mean of the measured flow rates was applied to all dry weather days within the month. For calendar months in which the outfall was not visited, the mean of all flow rates observed at that site during the calendar year was applied.
- Scenario C: If a major MS4 outfall station was monitored continuously for a period of time longer than a day, a measured daily flow volume was calculated for each monitored day. The mean of these daily flow volumes was applied to all non-monitored dry days.
- Scenario D: If a major MS4 outfall station was not visited during the monitoring year, the mean of annual outfall flow volumes for all monitored stations in the jurisdiction in the WMA was applied. This scenario was not encountered during the 2015–2016 monitoring season.

Within all these scenarios, observations of ponding (i.e., evidence of non-storm water in the MS4, with no connectivity to the receiving water) were assigned a flow rate of zero. If a station was observed to be flowing, but no flow rate was recorded, the average non-zero flow rate for that station was applied to that observation.

The methodology above assumes that a persistently flowing major MS4 outfall is flowing on 100% of dry weather days. This assumption is highly conservative. Additional information is provided in Section 3.4.6.

Table 3-13
2015–2016 Dry Weather Persistent Flow Volumes Collectively Discharged from the MS4 by Jurisdiction

Jurisdiction	Annual Non-Storm Water Volume Estimate (cf)
San Diego Airport Authority	0
City of Chula Vista	5,142,683
City of San Diego	9,302,068
City of Coronado	918,613
City of Imperial Beach	0
County of San Diego	4,800,298
City of La Mesa	3,821[1]
City of Lemon Grove	857,590
City of National City	190,613
Port of San Diego	24,399

Notes:
cf = cubic feet
1. City of La Mesa outfalls discharged the calculated volume, but outfalls were not classified as persistent until after the 2015–2016 monitoring program had ended. La Mesa's dry weather outfall inventory will be updated accordingly in FY 17.

3.4.3 Non-Storm Water Load Assessment

The Copermittees estimated the annual non-storm water pollutant loads collectively discharged from their persistently flowing major MS4 outfalls to receiving waters in the MS4.

A load was calculated for each pollutant required to be analyzed at each high-priority outfall, based on the arithmetic mean of the analytical results from the two dry weather outfall monitoring events at that outfall during the monitoring year. For each non-high-priority persistently flowing outfall in a Copermittee's jurisdiction in the WMA, the mean of that Copermittee's monitored outfall results for each pollutant was applied. For any pollutants not detected at the MDL, a concentration of MDL/2 was applied in calculating the loads. The non-storm water pollutant loads are presented by outfall in Attachment F.4 and by Copermittee in Attachment F.5.

3.4.4 Percent Contribution from Known Sources

Table 3-14 summarizes the estimated percentage of non-storm water volume and load contributions from known sources. This value was calculated by dividing the observed flow rate for each known source by the estimated annual outfall flow volume presented in Section 3.4.2. It was assumed for ease of calculation that the known source was flowing for the entire day on which the source was observed. Additionally, it was assumed that the percent load contribution is equal to the percent flow contribution for each known source.

Table 3-14
Estimated Percent Contribution from Known Sources

Copermittee	Station ID	Observation Date	Known Source	Known Source Flow Rate (cfs)	Known Source Daily Flow Volume (cf)	Annual Outfall Non-Storm Water Flow Volume (cf)	Percent Contribution from Known Source (%)

3.4.5 Percent Contribution from Sources Not Subject to Copermittee Legal Authority

Copermittees did not identify sources not subject to their legal authority within the San Diego Bay WMA during dry weather monitoring.

3.4.6 Dry Weather Assessment Methodology Assumptions and Limitations

Calculation of the Municipal Permit-required assessments necessitates a number of assumptions to translate the monitoring data into conclusions regarding flow volume and load for the entire WMA. These assumptions may introduce potential sources of error, while propagating potential errors inherent to the monitoring data. These assumptions and sources of error are summarized as follows:

- Monitoring Error—Annual non-storm water volumes and pollutants loads are based on the results from dry weather visual observations and dry weather outfall monitoring events. Error in the monitoring data could have the effect of propagating error in all subsequent calculations. Potential sources of error in the monitoring data include the following:
    - o Monitored Flow Selection—The pollutant loading estimations rely on monitoring data from one or more non-storm water visual observations per major MS4 outfall per year. The 2015–2016 monitoring year is the first year of dry weather flow volume and load calculation, and this period generally has represented drought conditions, which can affect the type and volume of non-storm water sources such as irrigation and groundwater. The potential for inter-annual variability is a source of error in both the flow and chemistry data.

- Flow Measurement Method—The MS4 Outfall Monitoring Plan provides different options to determine the non-storm water volume: (1) field-based estimation methods (e.g., “float method” or “bucket and stopwatch method”) and (2) equipment-based flow measurements. The method chosen varies among outfalls and Copermittees, introducing inter-site variability in volume estimations. Field-based estimation methods introduce potential human error in using stopwatches and error in determining volume amounts in non-graduated buckets. The consistent equipment-based flow monitoring approach is more accurate and precise compared with field-based estimation methods. However, this approach introduces variability because of the flow measurement device and sensor type used to account for site-specific conditions, and it can also be cost and time prohibitive across the number of outfalls monitored. Each measurement device and sensor type has an inherent accuracy range (e.g., ±2% accuracy for sub area-velocity [sub-AV] probes). Each flow measurement device and sensor type can also produce slightly different values for the same event, adding a layer of inter-site variability.
- Rainfall Measurement—The accuracy of determining the number of dry days relies on the accuracy of the rainfall measurements representing that outfall. Rainfall measurements were based on the County of San Diego ALERT rain gauge closest to the majority of wet weather outfalls in each WMA, and not site-specific rainfall data. Rainfall totals across the San Diego area can vary widely within a given storm.
- Chemistry Results—An attempt was made to maintain regional consistency in reporting limits (RLs) and MDLs. However, differences in laboratory capabilities can sometimes lead to different RLs and MDLs. This variability can introduce error if constituent concentrations are near or below the MDL for one monitoring event or Copermittee, and the MDL differs for another monitoring event or Copermittee. For the assessment calculations, an attempt was made to account for this type of error by assigning a value of MDL/2 to constituents that were not detected.

- Assessment Methodology Error—The assessments require a series of assumptions and extrapolations regarding the determination of annual volumes and pollutant loadings. Each assumption carries the possibility of error, including the following:
  - Annual Volume Estimation Representativeness—Regardless of the flow measurement method utilized, error is introduced when utilizing the median of more than one field measurement to determine an annual volume estimation. It is assumed that these field measurements are representative of “typical” non-storm water conditions because persistently flowing non-storm water flows are relatively consistent throughout the year. However, this may not be the case, and error could be introduced into these estimations. For example, groundwater base flows can increase during the wet season, increasing dry weather flow rates. Or, alternatively, irrigation and irrigation runoff may increase during the dry season, increasing dry weather flow rates. Unless flow

observations are made throughout the year under a variety of conditions, this seasonal variation may not be captured.

- Annual Volume Estimation Confidence—Based on availability of data, multiple calculation methods are used to estimate annual flow volume. The confidence associated with each estimate varies because different sample sizes are used for each estimate. That is to say, volumes calculated on the basis of continuous flow data are associated with a higher confidence than volumes based on one or two instantaneous flow measurements.

- Annual Pollutant Load Estimations—The annual volume estimation error introduced previously disseminates into the annual pollutant load estimations through calculations discussed in Section 3.4.3. Although persistent non-storm water flows are relatively consistent throughout the year, collecting two grab samples in one year provides a very brief snapshot in time of the pollutant concentration at an outfall, which may not be indicative of typical conditions or pollutant loadings. Additionally, using an arithmetic mean as a “typical” value of pollutant concentrations to estimate pollutant loads can introduce error if the sample size of the mean is too small, as means are sensitive to sample size.

4 Storm Water Discharge Monitoring Data

The purpose of this program is to identify pollutants in storm water discharges from the MS4s, guide pollutant source identification efforts, and track progress in achieving the WQIP goals. The RPs' locations for the wet weather MS4 outfall discharge monitoring component are chosen to be representative of the residential, commercial, industrial, and mixed-use land uses within the San Diego Bay WMA. These locations are monitored during one storm event annually. The wet weather MS4 outfall discharge monitoring is designed to answer the following questions:

- Do wet weather discharge concentrations at MS4 outfalls meet Municipal Permit action levels?
- What is the relative contribution of MS4 outfalls to priority water quality conditions during wet weather?
- How do representative MS4 outfalls discharge concentrations, loads, and flows change over time?

During the 2015–2016 monitoring season, the RPs implemented the first year of the WQIP wet weather outfall discharge monitoring in accordance with Provision D.2.c of the Municipal Permit. The goals of wet weather outfall monitoring are the following:

- Identify pollutants in storm water discharges from the MS4;
- Guide pollutant source identification efforts; and
- Determine compliance with the water quality-based effluent limits (WQBELs) associated with the applicable TMDLs presented in Attachment E of the Municipal Permit.

This monitoring was instated following completion and acceptance of the San Diego Bay WMA WQIP, and built upon the transitional wet weather outfall discharge monitoring completed during the 2013–2014 and 2014–2015 monitoring seasons. Details of the monitoring methodology are provided in the San Diego Bay WMA MS4 Outfall Monitoring Plan, available on the Project Clean Water website (www.projectcleanwater.org).The following subsections present the results of wet weather discharge monitoring in the San Diego Bay WMA, as well as the results of the required Storm water Pollutant Discharge Reduction Assessments.

4.1 Wet Weather Outfall Monitoring Locations

The RPs selected wet weather MS4 outfall discharge monitoring locations from the inventories developed pursuant to Provision D.2.a.(3)(a)(i) of the Municipal Permit for the San Diego Bay WMA:

- At least five wet weather MS4 outfall discharge monitoring locations that are representative of storm water discharges from areas consisting primarily of residential, commercial, industrial, and typical mixed-use land uses present within the San Diego Bay WMA; and

- At least one wet weather MS4 outfall discharge monitoring location for each RP within the San Diego Bay WMA.

The 10 stations monitored during the 2015–2016 monitoring season are presented in Table 4-1. The outfall monitoring locations and their associated drainage area delineations are shown by red circles in Figure 4-1. Each RP monitored its wet weather MS4 outfall discharge monitoring location in the San Diego Bay WMA once during the 2015–2016 monitoring season. Frequencies of monitoring of each MS4 outfall during the past three monitoring season are as follows:

- 2013–2014 (first transitional monitoring season) – 8 outfall stations
- 2014–2015 (second transitional monitoring season) – 9 outfall stations
- 2015–2016 (first WQIP monitoring season) – 10 outfall stations

One outfall, MS4-SDB-6 in Lemon Grove, changed from the 2013–2014 to 2014–2015 transitional year, and outfall MS4-SDB-9 in the Port of San Diego jurisdiction changed from the transitional period 2014–2015 and the WQIP monitoring year 2015–2016.

4.2 Wet Weather Outfall Monitoring Event Field Observations

The San Diego Bay WMA wet weather outfall monitoring locations were monitored once each during the wet season (October 1 2015, through April 30, 2016), during three storm events on January 31, 2016, March 6, 2016, and April 7, 2016. Each location was monitored once, as shown in Table 4-2. Details of the monitoring events, including date and duration of the storm events sampled, rainfall estimates of the storm events, and duration between the storm events sampled and the end of the previous measurable storm event, are also presented in Table 4-2. Hydrographs for each monitored event, displaying event flows and rainfall amounts, are presented in Attachment G.1.

During the wet weather monitoring event, narrative descriptions and field observations were recorded on field data sheets at each wet weather MS4 outfall discharge monitoring location, per the Monitoring and Assessment Program included in the WQIP. Flow was measured using a Hach Sigma 920 flow meter with a sub-AV probe, or similar type device, in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), as described in the San Diego Bay WMA MS4 Outfall Monitoring Plan. Rainfall statistics for each monitored event were based on a nearby San Diego County Flood Control District ALERT station, where the closest ALERT station to each monitoring location was selected. If the closest ALERT station did not have storm event data available, the next closest ALERT station was used.

4.3 Wet Weather Outfall Monitoring Event Analytical Methods

During each wet weather monitoring event, samples were collected according to the procedures described in the San Diego Bay WMA MAP's MS4 Outfall Monitoring Plan.

Grab samples were collected for bacterial indicators and receiving water hardness. A time-weighted composite sample was collected for all other analytes. All samples were collected in accordance with SWAMP protocols and following the quality assurance and quality control procedures in the San Diego Bay WMA MS4 Outfall Monitoring Plan.

In situ turbidity measurements were collected using a YSI 6600 or similar field meter. Automated samples for chemistry were collected using a Sigma 900MAX autosampler with Teflon-lined tubing.

The required analyses were based upon the following four groupings of constituents, per Provision D.2.c(5)(f) of the Municipal Permit:

- Constituents contributing to the Highest Priority Condition identified in the San Diego Bay WMA WQIP;
- Constituents listed as a cause for impairment of receiving waters in the San Diego Bay WMA, as listed on the Clean Water Act (CWA) Section 303(d) list of water quality impaired segments (303(d) List);
- Constituents for implementation plans or load reduction plans (e.g., Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for the San Diego Bay WMA where the RPs are listed as responsible parties under the TMDLs in Attachment E of the Municipal Permit; and
- Applicable SAL constituents listed in Provision C.2 of the Municipal Permit.

For each wet weather outfall station discharging to a fresh water receiving water, receiving water hardness grab samples were also collected. The receiving water hardness results were used to evaluate compliance with the USEPA one-hour maximum concentration criteria for metals, in the case of any SAL exceedances. Section 4.6 discusses SAL exceedances. Receiving water hardness samples were not collected for wet weather outfalls discharging to an ocean receiving water, or to a bay or estuary.

The 2015–2016 wet weather outfall analytical results are presented in Attachment G.2.

4.4 Storm Water MS4 Outfall Monitoring Data Assessment

Per Provision D.4.b.(2)(b)(i) of the Municipal Permit, the RPs are required to use a watershed model or other method to calculate the following:

- The average storm water runoff coefficient for each land use type within the San Diego Bay WMA;
- The volume of storm water and pollutant loads discharged from the monitored MS4 outfalls in the jurisdictions of each RP to receiving waters within the San Diego Bay WMA for each storm event with measurable rainfall greater than 0.1 inch;

- The total flow volume and pollutant loadings discharged from the jurisdictions of each RP within the San Diego Bay WMA over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls; and
- The percent contribution of storm water volumes and pollutant loads discharged from each land use type within each HSA with a major MS4 outfall to receiving waters or within each major MS4 outfall to receiving waters in the jurisdictions of each RP within the San Diego Bay WMA for each storm event with measurable rainfall greater than 0.1 inch.

The methodology followed that of the Transitional Wet Weather MS4 Outfall Discharge Monitoring Work Plan (San Diego County Regional Copermittees, 2015), with the changes listed below. The complete methodology is presented in Attachment G.3. Tables presenting storm water volumes and pollutant loads are included in Attachment G.4. The following subsections present the results of these required assessments.

The calculation of these required assessments comes with a number of assumptions and potential sources of both variability and systematic error. Variability is inherent in environmental monitoring. When using monitoring data within a model, variability can be mitigated by increasing the sample size to decrease the distance between the modeled results and the true value. Systematic error is non-random error caused by biases in either the monitoring or modeling approach. Variability and systematic error both contribute to the overall statistical error of a result. Potential sources of statistical error in this assessment are provided below. The sources of error are subdivided into monitoring error and assessment methodology assumptions, and are listed in order of the errors and assumptions with most potential to impact the results of the assessment to the least impactful errors and assumptions. The potential sources of statistical error include:

- Monitoring Error—Runoff coefficients and pollutant loads are based on the results of wet weather outfall monitoring events. Variability and error in the monitoring data could have the effect of propagating error in all subsequent calculations. Potential sources of variability and error in the monitoring data include the following:
    - *Monitored Storm Selection*—The calculation relies on monitoring data from one storm event per year. Although a range of storm conditions have been targeted over the period of monitoring (2013–2016), this period generally has represented drought conditions. The potential for inter-annual variability is a source of error in both the flow and chemistry data. An additional storm event is added to the historical data set each year, increasing the sample size and leading to greater accuracy of the average over time.
    - *Drainage Area Delineation*—The accuracy of the observed outfall runoff coefficient calculation relies on the accuracy of the drainage area delineation for that outfall. Drainage area delineations were based on the most recent jurisdictional delineation.
    - *Flow Measurement Method*—A consistent flow monitoring approach is described in the San Diego Bay WMA MS4 Outfall Monitoring Plan. However, this approach allows for variability in the flow measurement device and sensor

type used to account for site-specific conditions. Each measurement device and sensor type has an inherent accuracy range (e.g., ±2% accuracy for sub-AV probes). Additionally, each flow measurement device and sensor type can produce slightly different values for the same event, adding a layer of inter-site variability.

- *Rainfall Measurement*—The accuracy of the observed outfall runoff coefficient calculation relies on the accuracy of the rainfall measurement for that event at that outfall. Rainfall measurements were based on the nearest County of San Diego ALERT station rain gauge to each outfall and not site-specific rainfall data. Rainfall totals across the San Diego area can vary widely within a given storm. This error can be mitigated by utilizing onsite rain gauges where feasible.
- *Chemistry Results*—An attempt was made to maintain consistent RLs and MDLs across the monitoring seasons. However, differences in laboratory capabilities can sometimes lead to different RLs and MDLs. This variability can introduce error if constituent concentrations are near or below the MDL one monitoring year, and the MDL changes. For the assessment calculations, an attempt was made to account for this type of error by assigning a value of MDL/2 to constituents that were not detected.

- Assessment Methodology Assumptions—The assessments require a series of assumptions and extrapolations regarding land-use-based runoff coefficients and pollutant concentrations. Each assumption carries the possibility of error, including the following:
    - *Outfall Drainage Area Land Use Representativeness*—While an attempt has been made to select outfall monitoring locations with drainage areas of one primary land use type, the reality of storm water drainage systems in urban and suburban areas is that most monitoring locations are a mixture of multiple land use categories. To calculate the runoff coefficient from each land use category, the observed runoff coefficient is compared with standard values calculated using the San Diego County Hydrology Manual (County of San Diego, 2003). A correction factor based on the ratio of the observed runoff coefficient to the calculated runoff coefficient is then applied to each land use category to derive land use runoff coefficients.
    - *WMA Land Use Representativeness*—Not all land use categories within the WMA are represented in the monitored outfall drainage areas. Therefore, the pollutant concentration and runoff coefficient for one land use are sometimes substituted for another land use. For example, open space pollutant concentrations and runoff coefficients may be used as a proxy for agriculture land use values, in the absence of monitoring data from agricultural land uses. These proxies are summarized in Table 4-5.

- *Land Use Event Mean Concentration (EMC) Assumptions*—Apportioning pollutant loads to each land use type requires an assumption of pollutant concentration in each land use. To calculate a pollutant concentration from each land use category, the observed pollutant concentrations are compared with typical (arithmetic mean) values calculated on the basis of land use studies in the Los Angeles and San Diego areas. A correction factor based on the ratio of the observed pollutant concentration to the calculated typical pollutant concentration is then applied to each land use category to derive land use concentrations. However, literature values did not exist for all pollutants analyzed, and therefore the assumption is made that similar pollutants have similar land use-based concentrations For example, it is assumed that ratios of other dissolved metals concentrations from the analyzed land use categories follow the ratios of dissolved copper concentrations from those land use categories. Additionally, using an arithmetic mean as a “typical” value can introduce error if the sample size of the mean is too small, as means are sensitive to sample size.
- *Observed Outfall Runoff Coefficient Calculation*—Rainfall total, rather than rainfall intensity, of a monitored storm event is considered in these calculations. Storms of higher intensity generally produce more runoff for a given rainfall amount than do storms of lower intensity. Therefore, storms of higher intensity would be expected to exhibit a higher runoff coefficient.

- *Variability of Standard Runoff Coefficient and Pollutant Concentration Values*—The standard runoff coefficients and pollutant concentrations referenced represent a mean. There is, in reality, a range associated with the real-world land use runoff conditions for both runoff coefficient and pollutant concentrations. For example, land use runoff pollutant concentrations can vary on the basis of socioeconomic factors across a single land use category. The 2015 City of San Diego trash study found that median income in the drainage area is a driver for trash conditions at the outfall. It is possible that a similar pattern could be seen in other pollutants (City of San Diego, 2015a).

4.4.1 Land Use Storm Water Runoff Coefficient (D.4.b.(2)(b)(i)[a])

The average storm water runoff coefficient (Runoff “C”) was calculated for each land use type in the WMA, based on data collected through three seasons of wet weather MS4 outfall monitoring (2013–2014, 2014–2015, and 2015–2016). This calculation is based on the measured flow and rainfall values for each monitored outfall (Table 4-2), along with the outfall drainage area characteristics. The monitored outfall drainage areas and associated land uses are shown in Figure 4-2, as well as the outfalls indicated by red circles. The quantity (area and percentage) of each land use type by outfall drainage area is presented in Table 4-3.

1. Water land use excluded from MS4 outfall assessments. Water land use assumed to be a sink for runoff storage.

Intentionally Left Blank

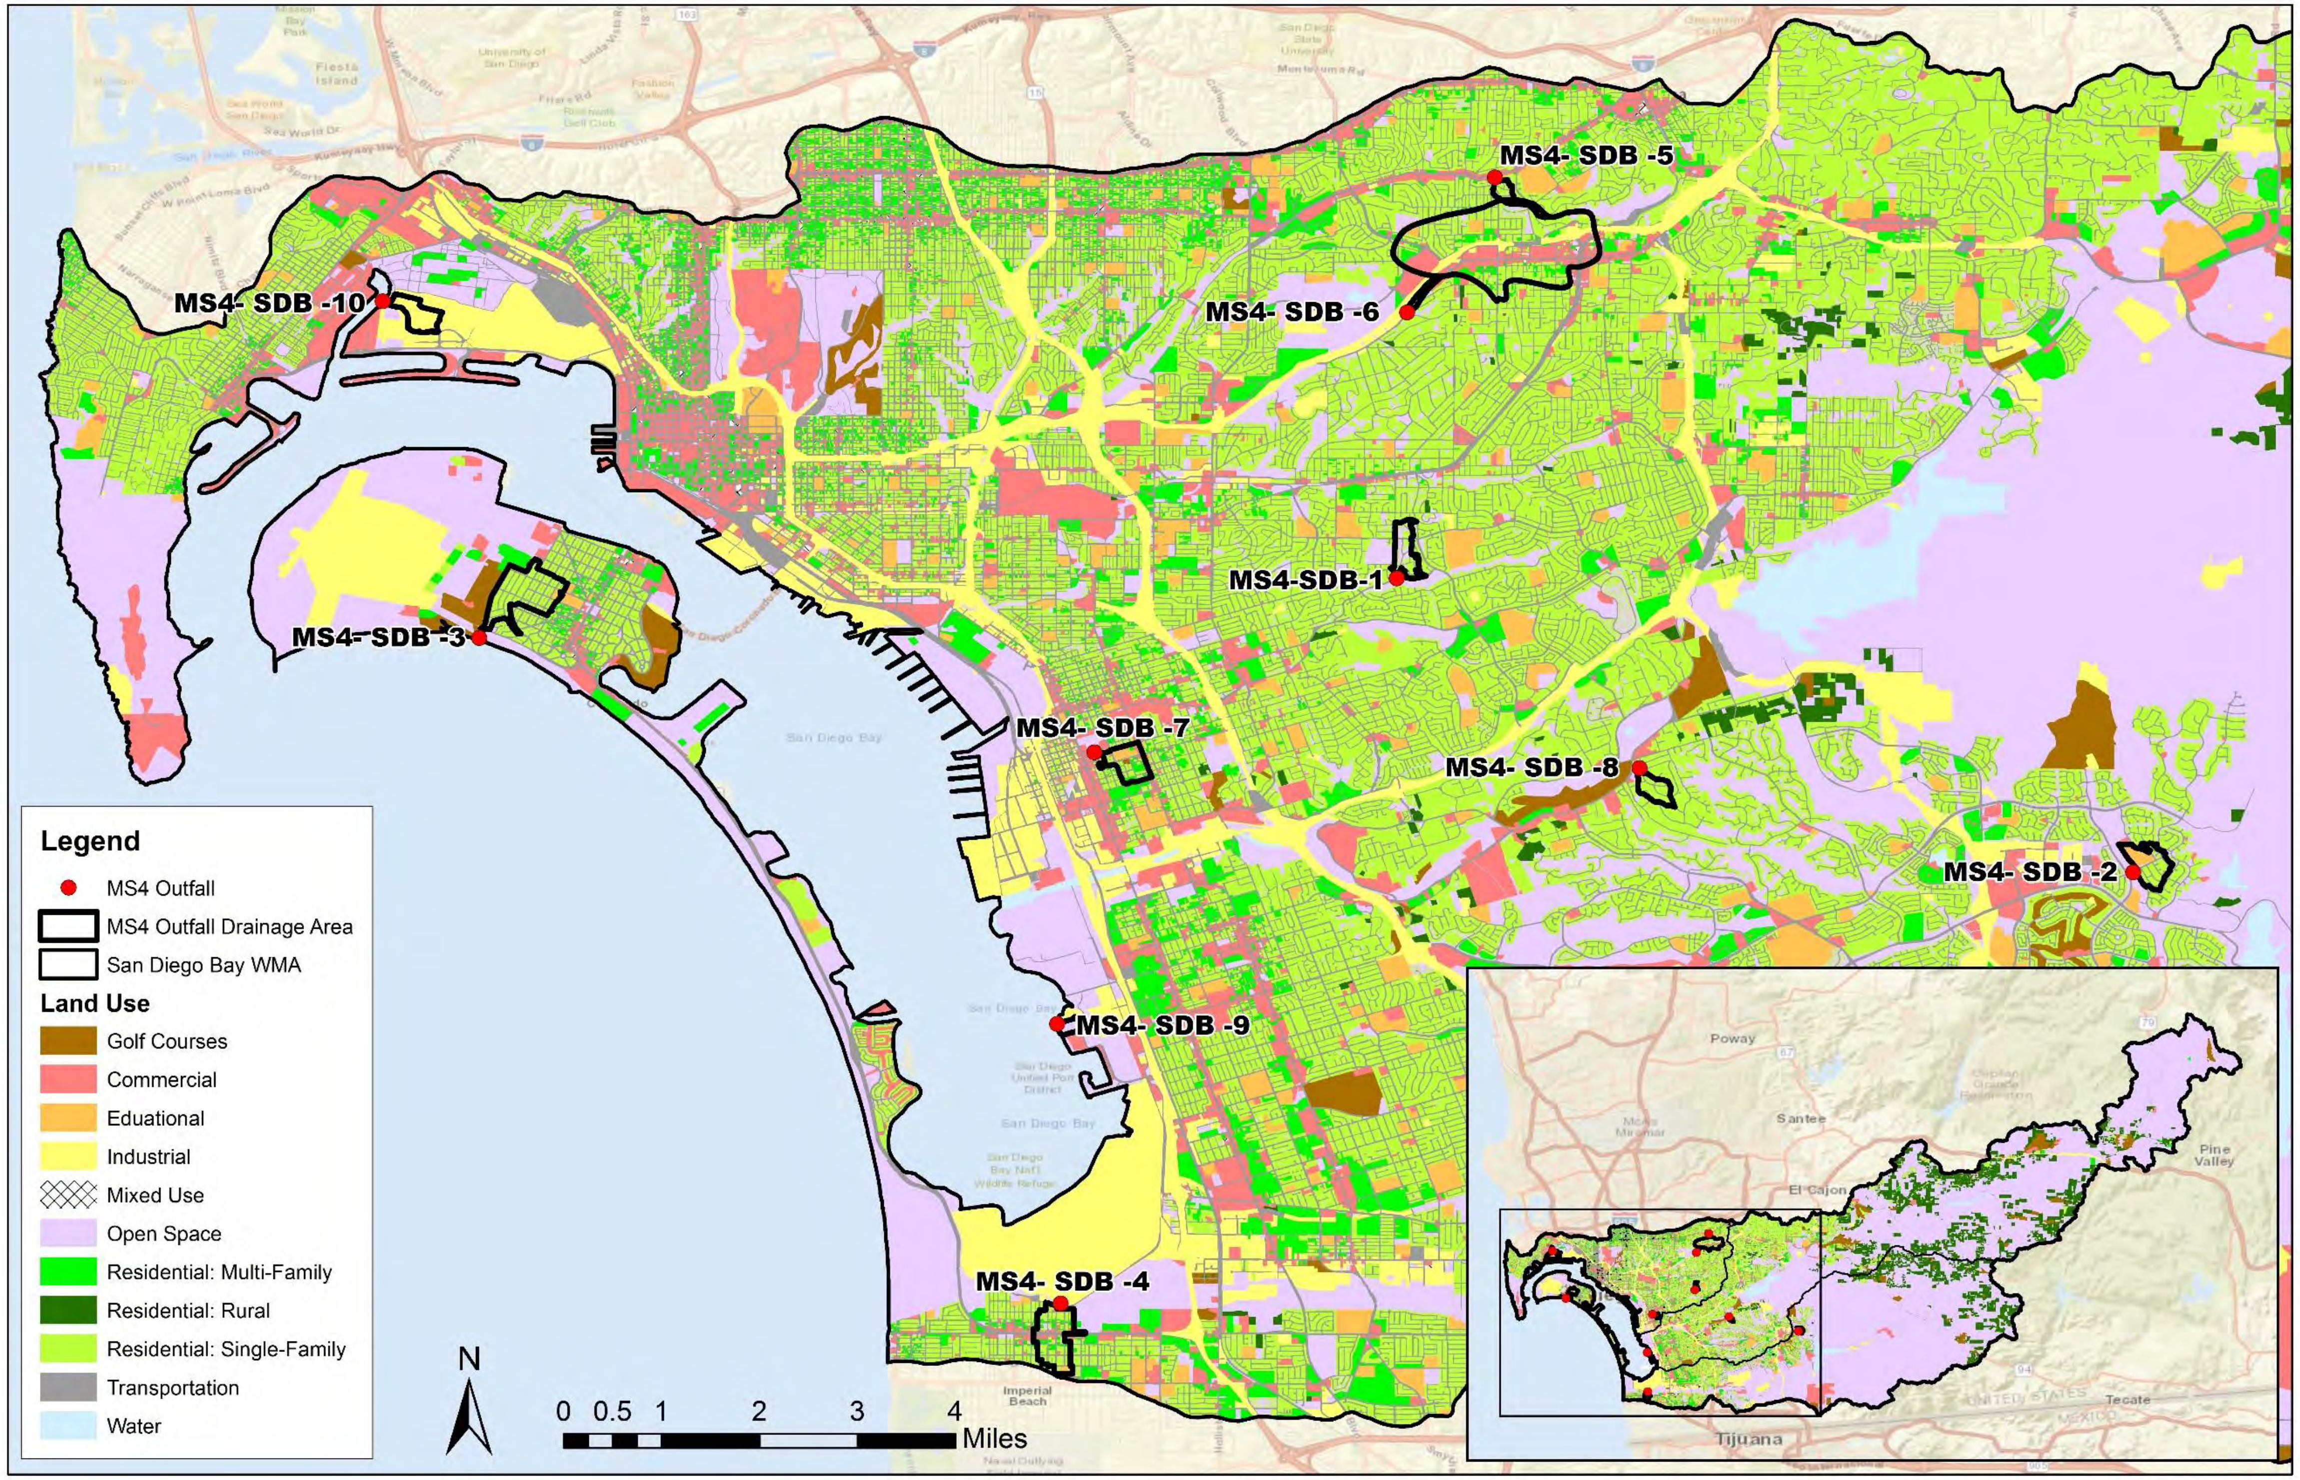

Figure 4-2
San Diego Bay WMA Monitored Outfall Drainage Areas and Associated Land Uses

Intentionally Left Blank

The observed Runoff "C" value was calculated for each outfall, based on the monitored event characteristics (event flow, event rainfall, and outfall drainage area). For outfalls that were monitored in previous years, the observed Runoff "C" value was averaged across all years of monitoring. This value was compared with the expected Runoff "C" value for each outfall, based on runoff coefficients listed in the San Diego County Hydrology Manual (County of San Diego, 2003). The 2015–2016 observed Runoff "C" value for each outfall, as well as the expected Runoff "C" for each outfall, is presented in Table 4-4.

Table 4-4
2015–2016 San Diego Bay WMA Observed Versus Expected Outfall Runoff Coefficients

Monitoring Location	**Observed Runoff "C"**	Hydrology Manual Runoff "**C**" (Expected)
MS4-SDB-1 (City of San Diego)	0.12	0.49
MS4- SDB -2 (City of Chula Vista)	0.67	0.55
MS4- SDB -3 (City of Coronado)	0.38	0.56
MS4- SDB -4 (City of Imperial Beach)	0.34	0.62
MS4- SDB -5 (City of La Mesa)	0.27	0.52
MS4- SDB -6 (City of Lemon Grove)	0.30	0.64
MS4- SDB -7 (City of National City)	0.24	0.62
MS4- SDB -8 (County of San Diego)	0.31	0.52
MS4- SDB -9 (Port of San Diego)	0.22	0.40
MS4- SDB -10 (San Diego Airport Authority)	0.35	0.87

The WMA Runoff "C" value for each land use was calculated using an area-weighted average of all monitored event Runoff "C" values for the monitored wet weather outfalls. To improve the accuracy of the calculation over time, historical (2013–2015) and current (2015–2016) Runoff "C" values were included in the calculation. The historical and 2015–2016 WMA Runoff "C" values for each land use are presented in Table 4-5.

Table 4-5
2015–2016 and Historical San Diego Bay WMA Calculated Land Use Runoff Coefficients

Notes:
1. Agriculture and open space land use types were divided into subgroups based on hydrologic soil type. See http://www.nrcs.usda.gov/wps/portal/nrcs/detail/ny/soils/?cid=nrcs144p2_027279 for more information on hydrologic soil types.
2. Because of limited WMA monitoring data for Agriculture Soil Group A, B, and C land use, Runoff "C" and EMC values based on San Diego Bay WMA monitored outfalls data for Agriculture Soil Group D.
3. Because of limited WMA monitoring data for Open Space Soil Group A land use, Runoff "C" and EMC values based on San Diego Bay WMA monitored outfalls data for Open Space Soil Group B.
4. Runoff "C" and EMC values based on San Diego Bay WMA monitored outfalls data for Open Space-D and Single-Family Residential land use types (averaged).

4.4.2 Monitored MS4 Outfall Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[b])

The volumes of storm water and pollutant loads discharged from the monitored MS4 outfalls to receiving waters in the jurisdictions of RPs within the WMA were calculated for each storm event with measurable rainfall greater than 0.1 inch. The wet season rainfall data for the ALERT station rain gauge closest to each monitoring location were used to calculate the qualifying measured rainfall for each site. Table 4-6 presents the estimated annual wet season storm water volume and pollutant load discharged from each monitored outfall.

4.4.3 Jurisdictional Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[c])

The volumes of storm water and pollutant loads discharged from the jurisdictions of RPs within the WMA over the course of the wet season were calculated for each storm event with measurable rainfall greater than 0.1 inch. The wet season data for the closest ALERT station rain gauge to the outfalls that most represented the WMA were used to report rainfall. Because the San Diego Bay WMA contains more than one ALERT station rain gauge, data from the Bonita rain gauge were used, because this station was closest to a majority of wet season MS4 outfall monitoring stations. Table 4-7 presents the estimated annual wet season storm water volumes and pollutant loads discharged from the jurisdictions of RPs in the San Diego Bay WMA.

Note that jurisdictional pollutant loads were calculated on the basis of the average EMC for constituents across all years of monitoring (2013–2016). Additionally, pollutant loads for constituents that were not monitored in all subwatersheds were based on the land area only within the subwatershed in which the constituent was monitored. These constituents include the following:

- Total and Dissolved Iron: Loads based on land area in Pueblo and Otay subwatersheds only
- Total and Dissolved Mercury: Loads based on land area in Pueblo subwatershed only
- Total and Dissolved Selenium: Loads based on land area in Sweetwater subwatershed only
- Polychlorinated Biphenyls (PCBs): Loads based on land area in Pueblo subwatershed only
- Polycyclic Aromatic Hydrocarbons (PAHs): Loads based on land area in Pueblo subwatershed only

4.4.4 Land Use Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[d])

For each RP within the San Diego Bay WMA, the percent contributions of storm water and pollutant loads discharged from each land use type, within each HSA containing at least one major MS4 outfall, were calculated. As in the jurisdictional load calculations described in Section 4.4.3, the Bonita ALERT station was used to calculate the qualifying measured rainfall for the WMA. The percentages of wet season storm water volume discharged from each HSA with a major outfall in the San Diego Bay WMA are presented by RP jurisdiction in Tables 4-8 through 4-17. The percentages of the wet season storm water volume and pollutant loads discharged from each land use type within each HSA with a major outfall in the San Diego Bay WMA, by RP, are presented in Attachment G.4.

Table 4-8
City of San Diego Percent Contribution of Storm Water Volume, by HSA

HSA	Wet Season Flow Volume (cf)	% Contribution
Jurisdictional HSA 908.10	20,345,206	9%
Jurisdictional HSA 908.22	115,071,820	51%
Jurisdictional HSA 908.31	7,311,727	3%
Jurisdictional HSA 908.32	11,073,759	5%
Jurisdictional HSA 909.12	13,964,136	6%
Jurisdictional HSA 910.20	60,877,018	14%
Jurisdictional HSAs with No Major Outfall[1]	25,749,272	11%
Jurisdictional WMA	224,392,938	100%

4.5 Evaluation of Monitoring Locations

Provision D.4.b.(2)(b)(ii) of the Municipal Permit allows the RPs to modify the wet weather MS4 outfall discharge monitoring locations and frequencies to better identify pollutants in storm water discharges from the MS4s in the WMA.

An analysis of wet weather MS4 outfall monitoring locations was performed in the 2014–2015 Transitional Monitoring and Assessment Report for the San Diego Bay WMA (TMAR) (San Diego County Municipal Copermittees, 2016). The purpose of the recommendations was to improve the effectiveness of MS4 monitoring in meeting the intended Municipal Permit goal (namely to accurately quantify the storm water volume and loads from the various land uses in the WMA). A comparison of the WMA land use with the monitored outfall drainage area land uses was made as part of the evaluation of monitoring locations in the TMAR. The results of this comparison are provided in Table 4-18.

Table 4-18
Land Use Comparison, WMA and Monitored Drainage Areas

Land Use	WMA Area (acres)[1]	WMA Area (%)[1]	Outfalls Area (acres)	Outfalls Area (%)	Percent Difference
Agricultural (Combined)	4,881	3.4%	2	0.3%	-3.1%
Commercial	3,025	2.1%	96	16.3%	14.2%
Educational	1,463	1.0%	9	1.5%	0.5%
Industrial	6,110	4.3%	13	2.2%	-2.1%
Mixed Use	4	0%	0	0%	0%
Open Space (Combined)	79,423	55.7%	71	12.0%	-43.7%
Residential: Multi-Family	1,861	1.3%	58	9.8%	8.5%
Residential: Rural	3,003	2.1%	27	4.6%	2.5%
Residential: Single-Family	12,222	8.6%	211	35.9%	27.3%
Transportation	6,032	4.2%	63	10.7%	6.5%
Total	118,024	–	550	–	–

Notes:
% = percent; WMA = Watershed Management Area
1. Acreage excludes state, federal, and tribal lands

The following conclusions can be drawn from the comparison:

- Overall, the wet weather MS4 outfall monitoring locations are representative of land uses in the WMA.
- Agricultural, industrial, and open space land uses are under-represented in the monitored outfall drainage areas; however, because the intention of monitoring is to characterize drainage from the MS4 (i.e., developed land uses). Drainages from both of these land uses may not be controllable by the RPs. Industrial drainage areas may be recommended for future monitoring.
- Single-family residential and commercial land uses are well represented in the monitored outfall drainage areas.

- It may be beneficial for the MS4 outfall assessments to target outfalls with a single primary land use. However, the nature of storm drain network service areas, particularly in suburban areas, may not facilitate targeting outfalls that represent only one land use.

The evaluation of monitoring frequency includes a comparison of monitored event rainfall conditions with annual rainfall conditions. During the 2015–2016 wet season (October 2015 through April 2016), rainfall totals at ALERT station gauges within the San Diego Bay WMA ranged from 7.99 inches at the Point Loma rain gauge to 24.74 inches at the Descanso CRS rain gauge. All ALERT station rain gauges within the WMA registered more rainfall during the wet season than the official National Weather Service (NWS) rain gauge at San Diego International Airport–Lindbergh Field (7.42 inches). The storms that occurred generally had totals of less than 1 inch of rainfall, although one very large storm, beginning January 4, 2016, produced more than 2 inches of rainfall throughout the WMA. The average wet season storm event rainfall total at the Bonita ALERT station is 0.55 inch. The rainfall totals for all outfall monitoring events were less than this average, although the monitoring events at outfalls MS4-SDB-8 and MS4-SDB-9 on January 31, 2016, approached the average with a rainfall total of 0.52 inch.

It was recommended in the TMAR to target additional monitoring events during average (greater than 0.5 inch) and large (greater than 1 inch) storms. The 2015–2016 sampling targeted two smaller (less than 0.5 inch) and one average storm. It is recommended to continue targeting storm events of various sizes during future wet seasons, to capture a range of data for Runoff “C” calculations, and particularly focus on capturing large rain events.

4.6 Storm Water Action Level Comparisons

The data collected as part of the wet weather MS4 outfall discharge monitoring were compared with the SALs and Highest Priority Condition WQBELs per Municipal Permit Provision D.4.b.(2)(c)(ii). Tables 4-19 and 4-20 summarize SAL and WQBEL exceedances, respectively. Details of these comparisons are shown in Tables 4-21 and Table 4-22, respectively. Three storm water action limit exceedances were recorded for all wet weather MS4 outfall discharge monitoring locations within the San Diego Bay WMA.

Table 4-19
Exceedances of SALs in the 2015–2016 Monitoring Year

Jurisdiction	Monitoring Location	Analyte Exceeding SAL
National City	SDB-7	Turbidity
Port of San Diego	SDB-9	Total Copper
San Diego Airport Authority	SDB-10	Nitrate + Nitrite

At SDB-7 in National City's jurisdiction, the concentration of turbidity exceeded the SALs. At SDB-9 in the Port of San Diego's jurisdiction, concentrations of total copper exceeded the SALs. At SDB-10 in the San Diego Airport Authority's jurisdiction, Nitrate + Nitrite as N concentrations exceeded the SALs. The aforementioned RPs began implementing their WQIP strategies that have primary and secondary pollutant reduction benefits during the 2015–2016 monitoring year. Implementation of the strategies without modification may potentially lead to pollutant reduction benefits related to respective pollutant conditions.

Table 4-20
Exceedances of Bacteria WQBELs in the Chollas Creek Drainage Area in the 2015–2016 Monitoring Year

Jurisdiction	Monitoring Location	Analyte Exceeding SAL
City of La Mesa	SDB-5	*Enterococcus*
City of Lemon Grove	SDB-6	*Enterococcus*; Total Coliforms; Fecal Coliforms

Four Bacteria TMDL WQBEL exceedances were recorded for the wet weather MS4 outfall discharge monitoring locations within the Chollas Creek drainage area in the San Diego Bay WMA. At SDB-5, the concentration of *Enterococcus* exceeded the WQBEL. At SDB-6, the concentrations of *Enterococcus*, total coliforms, and fecal coliforms exceeded the WQBELs. The aforementioned RPs began implementing their WQIP strategies that have primary and secondary pollutant reduction benefits for bacteria during the 2015–2016 monitoring year. RPs plan to continue implementing strategies without modification to realize the rewards of these pollutant reduction benefits and will work toward meeting the goals related to the Highest Priority Condition.

Table 4-21
MS4 Outfall Storm Water Action Level Comparison

Analyte	SAL	Monitoring Location									
		MS4-SDB-1	MS4-SDB-2	MS4-SDB-3	MS4-SDB-4	MS4-SDB-5	MS4-SDB-6	MS4-SDB-7	MS4-SDB-8	MS4-SDB-9	MS4-SDB-10
		City of San Diego	City of Chula Vista	City of Coronado	City of Imperial Beach	City of La Mesa	City of Lemon Grove	City of National City	County of San Diego	Port of San Diego	San Diego Airport Authority
Turbidity	126 NTU	17.4	2.7	4.4	22.2	32.3	39.2	**197**	10.8	42.3	10.5
Total Cadmium	3 µg/L	<0.1	<0.1	<0.1	0.2	<0.1	0.6	1.1	<0.1	0.2	1.1
Total Copper	127 µg/L	22	5.1	43	36	33	18	29	16	**190**	51
Total Lead	250 µg/L	1.7	0.8	0.3	8.9	5.4	10	12	2	4	1.1
Total Zinc	976 µg/L	110	15	78	200	130	120	97	40	160	80
Nitrate + Nitrite as N	2.6 mg/L	0.38	0.49	1.37	0.87	1.03	0.88	1.03	0.56	0.35	**3.14**
Total Phosphorous	1.46 mg/L	0.49	0.2	0.32	0.41	0.32	0.23	0.57	0.25	0.19	0.49

Notes:
Bold = exceedance of SAL
µg/L = micrograms per liter; J = estimate; mg/L = milligrams per liter; ND = not detected; NTU = nephelometric turbidity unit

Intentionally Left Blank

Table 4-22
Chollas Creek Drainage Area MS4 Outfall Water Quality-Based Effluent Limits Comparison

Analyte	WQBEL	Monitoring Location	
		MS4-SDB-5	MS4-SDB-6
		City of La Mesa	City of Lemon Grove
Enterococcus	61 (104[1]) MPN/100mL	>2,419.6	>2,419.6
Total Coliforms	10,000 MPN/100mL	2,400	24,000
Fecal Coliforms	400 MPN/100mL	220	9,000

Notes

> = greater than; MPN/100mL = most probable number per 100 milliliters

Bold = exceedance of WQBEL

1. A single sample maximum of 104 MPN/100mL may be applied as a receiving water limitation for creeks designated as "moderately or lightly used" or less frequent usage in the Basin Plan.

Intentionally Left Blank

5 Physical Aesthetics Focused Priority Condition Monitoring

The RPs initiated data collection for the Physical Aesthetics Focused Priority Condition in November 2015 following completion of the final WQIP. The Physical Aesthetics monitoring program was implemented in Sweetwater and Otay HU to assess trash conditions, as detailed in Appendix K of the San Diego Bay WMA WQIP. Physical aesthetics monitoring was a collaborative effort by the Port of San Diego, City of Chula Vista, and City of Imperial Beach. To conduct the monitoring for the 2015–2016 season, the RPs collaborated on development of a field monitoring sheet, a calibration training, and coordination of field monitoring efforts by each jurisdiction.

5.1 Monitoring and Methods for Physical Aesthetics

The physical aesthetic monitoring program consists of two main components: dry weather MS4 outfall monitoring and paired MS4 outfall and receiving water monitoring. The monitoring locations for both the MS4 outfall and paired MS4 outfall and receiving water monitoring are presented in Figure 5-1. MS4 inspections and predetermined transect lines will also be inspected for trash to characterize the habitat conditions and determine the impact of trash on the MS4.

The RPs continued to conduct dry weather MS4 outfall monitoring under their JRMP programs per the requirements of Provision D.2 of the Municipal Permit. The dry weather MS4 outfall monitoring program includes an assessment of trash at MS4 outfalls during dry weather conditions. Locations are classified as one of five categories, as shown in Table 5-1, based on the amount of trash visually observed at the site. An “optimal” rating indicates that the site has little to no trash. Using this process, the RPs assessed MS4 outfalls within the Focused Priority Condition area to identify the percentage of MS4 outfalls that receive optimal trash assessment scores during each assessment period. Using historical trash assessment data as a baseline, the RPs’ goal is to incrementally increase the percentage of sites consistently meeting the criteria for optimal conditions.

Table 5-1
Scoring System for Trash Assessments during Site Visits

Rating	Description of Rating
Optimal	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
Suboptimal	On first glance, little or no trash visible. After close inspection small levels of trash (~10–50 pieces) evident in evaluated area.
Marginal	Trash is evident in low to medium levels (~51–100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
Submarginal	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100–400). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
Poor	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

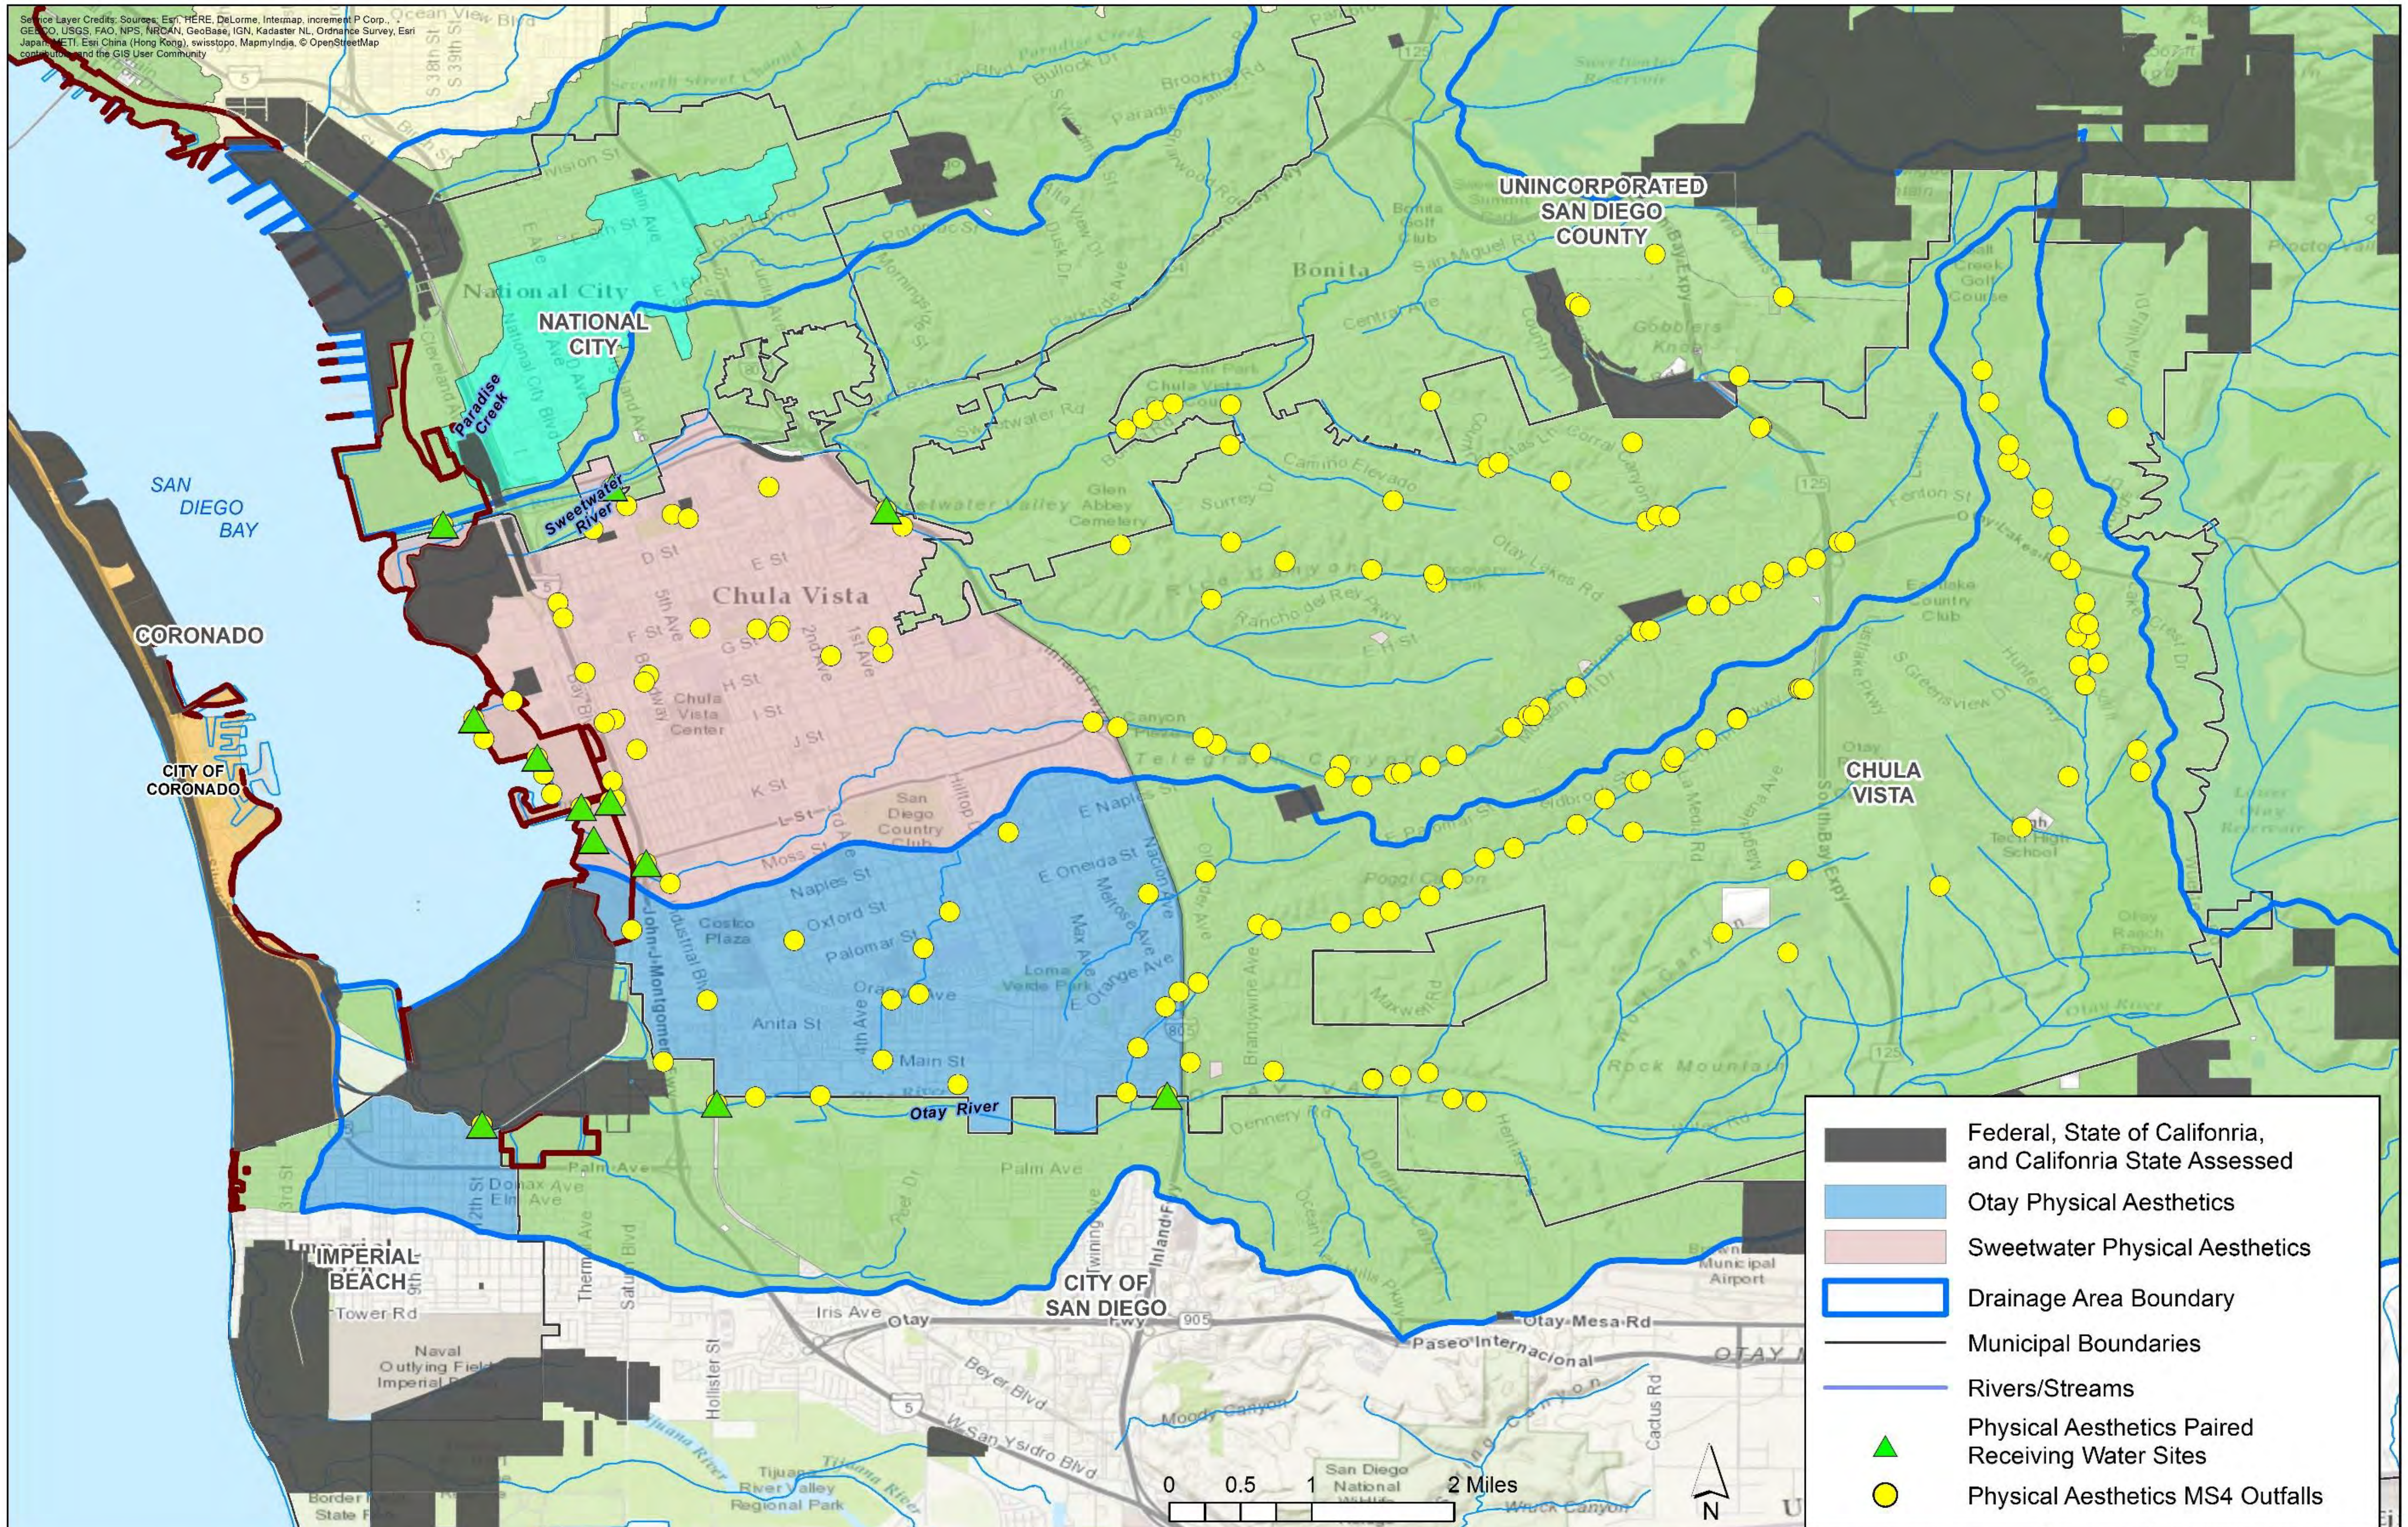

Figure 5-1
Physical Aesthetics Dry Weather MS4 Outfall and Paired Receiving Water Monitoring Locations

Intentionally Left Blank

In FY 2016, the RPs also began a paired monitoring approach at 12 MS4 outfalls. The RPs selected nine sites in the Sweetwater HU and three sites in the Otay HU to assess trash in the receiving water adjacent to the major MS4 outfall. Paired monitoring was conducted during two dry weather events (one dry season [May to September] and one wet season [October to April]) and one wet weather event (event within three days following a storm event with at least 0.2 inch of precipitation) annually. To avoid duplicating the efforts of the dry weather MS4 outfall monitoring program, the RPs conducted the paired dry weather events with outfall monitoring. The RPs coordinated and conducted paired monitoring events as feasible.

Trash assessments are conducted visually using standardized field sheets. The Trash Assessment Form (Attachment H) was designed by the RPs to provide an extensive description of the trash conditions for both dry and wet events for the paired monitoring efforts. A calibration field training session was conducted by the participating RPs on November 12, 2015, to standardize the monitoring and observational procedures completed by each RP for all events.

During site visits, teams used the field form to describe the site characteristics, including primary and secondary land use, public transportation nearby, or the presence of homeless encampments. Descriptions and types of receiving water were also noted on the field forms. If trash was present, field teams were to extensively describe the amount and extent of trash.

Trash type was labeled under 14 different categories, ranging from automotive to fabric/clothing to yard waste. The types of trash present in the evaluated area were to be ranked by volume 1 through 14 (1 is most prevalent – 14 is least prevalent). The route and the source by which the trash got to the site was to be recorded, if known.

5.2 Results of the Physical Aesthetics Monitoring

The RPs completed 86 dry weather visits to 64 MS4 outfall locations during the 2015–2016 monitoring year. Table 5-2 outlines the number of outfalls in each jurisdiction with the Physical Aesthetics Focused Priority Condition area and the number of times the outfall was monitored during dry weather.

Table 5-2
Number of Outfall Locations and Visits in Physical Aesthetics Site Visits

Jurisdiction	Number of Outfalls	Total Number of Outfall Visits
Chula Vista	55	68
Imperial Beach	1	2
Port of San Diego	8	16
Total	64	86

Table 5-3 provides the percentages of each rating for the 86 visits to major outfalls. The complete list of site visits and monitoring results, including trash types, potential trash sources, and routes, is provided in Attachment F.2.

Table 5-3
Percentage of Trash Ratings Observed During Physical Aesthetics Site Visits

Trash Rating[1]	Number of Major MS4 Outfall Visits	Percentage of Outfall Visits
None (0 pieces)	32	37%
Optimal (<10 pieces)	31	36%
Suboptimal (10-50 pieces)	13	15%
Marginal (51-100 pieces)	7	8%
Submarginal (>100 pieces)	3	3%
Poor (>400 pieces)	0	0%
Total	86	100%

Notes:
1. 76% of 58 outfall visits in 909.1 had optimal or better trash ratings; 68% of 28 outfall visits in 910.2 had optimal trash ratings or better. Trash ratings in both HAs were above the baseline of 60%.

More than 73% of the 86 visits of major MS4 outfall locations had “optimal” levels or no trash, defined as less than 10 pieces of trash per the monitoring methodology. Paired monitoring, initiated in FY 2016, noted that the most common trash type found at the MS4 sites was categorized as general packaging or plastic bags, with potential source identifications (IDs) noted as littering or household waste. As stated in the WQIP, trash will be evaluated for each assessment term in FY 2016 and FY 2017 for comparison with the interim FY 2018 goal.

At the receiving water sites, the most prevalent trash was categorized as general packaging with source IDs as transient, household waste, dumping, or littering. Although the RPs are monitoring the receiving water, other non-MS4 sources could contribute to trash in the receiving water. RPs are monitoring the receiving water to potentially demonstrate performance as it relates to strategies to address MS4 discharges. This information will not be used to assess progress towards meeting the focused priority goals.

6 Swimmable Waters Focused Priority Condition Monitoring

The RPs initiated data collection for the Swimmable Waters Focused Priority Condition in November 2015 following completion and submittal to the Regional Board of the final WQIP. The Swimmable Waters monitoring program was implemented in Coronado HA, as detailed in Appendix K of the San Diego Bay WMA WQIP. Data collection for bacterial indicators has proceeded as planned and includes year-round (wet and dry weather) sampling to augment existing data sets, such as the dry weather data collected by the County of San Diego Department of Environmental Health (DEH) for the California Assembly Bill 411 (AB 411) program. The data collected during this reporting period, when combined with data planned for FY 2017, will allow the RPs to begin assessing water quality and progress toward meeting the Swimmable Waters goals.

The monitoring data collected will be evaluated in support of any future BMP decisions and assess effectiveness, should they be necessary, to meet the interim and final goals.

6.1 Monitoring and Methods for Swimmable Waters

Table 6-1 presents the RPs' monitoring approach, frequency, and timing of Swimmable Waters receiving water monitoring for the Coronado HA of the San Diego Bay WMA.

Table 6-1
Swimmable Waters Monitoring Summary

Type	Receiving Water Wet Weather Monitoring	Receiving Water Dry Season, Dry Weather Monitoring	Receiving Water Wet weather season, Dry Weather Monitoring	MS4 Monitoring
Monitoring Approach	Monitor at Tidelands Park and North Beach sites	• Tidelands Park[1]: Current San Diego County Department of Environmental Health (DEH) sites. (No additional monitoring to be done by RPs at these sites during this period) • North Beach: Past DEH site and City of Coronado's current transitional wet and dry monitoring location and dry weather MS4 major outfall monitoring location	• Build upon DEH's dry weather monitoring. Add monitoring during the wet weather season. • Monitoring at Tidelands Park and North Beach sites[2]	• Paired Sampling: Perform MS4 monitoring at all beach sites at same time as monitoring receiving water quality • Sample three wet weather events during wet season at Tidelands Park in conjunction with receiving water, if feasible
Frequency (Number of Monitoring Events)	Annually sample three wet weather events during wet season at Tidelands Park and North Beach sites	• Tidelands Park site: Weekly • North Beach: Past DEH site and City of Coronado's current transitional wet and dry monitoring location and dry weather MS4 major outfall monitoring location	• Monthly at Tidelands Park and North Beach sites[2] (November 1–March 31)	Inspect MS4 monthly, year round
Timing of Monitoring	Sample within 72 hours of a storm (consistent with Bacteria TMDL[3])	During dry weather season (April 1–October 31)	During dry periods, 72 hours or more after storm event	Take sample at MS4 if there is flow/discharge

[3]Regional Board. 2010. *Revised TMDL for Indicator Bacteria, Project I—Twenty Beaches and Creeks in the San Diego Region (including Tecolote Creek)*. Resolution No. R9-2010-0001. Approved February 10, 2010.

Table 6-1 (continued)
Swimmable Waters Monitoring Summary

Notes:

1. The Pacific shoreline of the Coronado HA 910.1 already has an established monitoring plan to assess the receiving water conditions through the South Bay Ocean Outfall Waste Discharge Requirements in Order R9-2014-0071 for the City of San Diego and Order R9-2014-0009 for the International Boundary and Water Commission. These permits establish a joint receiving water monitoring program for the South Bay Ocean Outfall and include weekly surf zone bacteria monitoring at 3 locations along the Coronado HA 910.1. These locations include S12 Carnation Ave (Camp Surf), S8 Silver Strand State Beach, and S9 Avenida del Sol (Hotel del Coronado). In addition, the County of San Diego Department of Environmental Health performs AB411 beach water quality monitoring throughout the year for public health along the Pacific shoreline of the Coronado HA 910.1. The existing beach water quality monitoring is sufficient to assess swimmable waters along the Pacific shoreline of the Coronado HA 910.1 and the San Diego Bay WMA Copermittees are to utilize these data for the Water Quality Improvement Plan Monitoring and Assessment Annual Report.
2. South Bay Ocean Outfall Sites: Weekly surf zone bacteria monitoring at three locations along the Coronado HSA 910.1. These locations include S12 Carnation Ave (Camp Surf), S8 Silver Strand State Beach, and S9 Avenida del Sol (Hotel del Coronado).

Site visits were conducted at the MS4 outfalls selected for Swimmable Water listed in Table 6-2 in FY 2016.

Table 6-2
Sampling Locations for Swimmable Waters (November 2015–September 2016)

Site ID	Type	Location	Jurisdiction	Latitude	Longitude
EH-070[1]	RW	Tidelands Park	Port	32.689930	-117.164190
1203.1	MS4	Tidelands Park	Port	32.690395	-117.164465
1206.1	MS4	Tidelands Park	Port	32.690791	-117.164465
1219.1	MS4	Tidelands Park	Port	32.691713	-117.164085
EH-060[2]	RW/MS4	North Beach	Coronado	32.686650	-117.19340

Notes:

RW = receiving water; MS4 = MS4 Outfall

1. Receiving water monitoring station sampled by the San Diego County DEH for the AB 411 program.
2. Site was historically sampled by the DEH.

6.2 Swimmable Waters Monitoring Overview

The RPs evaluated sampling conditions for the receiving water and/or MS4 outfalls. Each location was visited on 14 occasions from November 2015 through September 2016, as noted in Tables 6-3 and 6-4. The RPs initiated wet weather sampling at two beach locations (EH-070 and EH-060) in the Coronado HA in FY 2016 and three storm events were sampled at each of the two locations. The storms events occurred on November 4, 2015, November 9, 2015[4], January 5, 2016, and March 8, 2016. The complete set of monitoring data collected during this reporting year is presented in Attachment F.2.

At North Beach in Coronado, site visits were conducted to inspect the MS4 outfall and evaluate conditions for sampling on 14 occasions from November 2015 through September 2016. As summarized in Table 6-3, the site visits by the City of Coronado resulted in the following number of samples during the reporting period.

Table 6-3
Summary of City of Coronado Sampling at North Beach
(November 2015 – September 2016)

Type	Number of Site Visits	Receiving Water (Ocean) Samples	MS4 Outfall[1] Samples	Total Samples
Wet Season/Wet Weather	3	3	3	6
Wet Season /Dry Weather	5	5	2	7
Dry Season /Dry Weather	6	6	1	7
Dry Season /Wet Weather	0	0	0	0
Total	14	14	6	20

Notes:
MS4 = municipal separate storm sewer system
1. Per established procedures, outfall is sampled when flowing or ponded water is present.

At Tidelands Park, site visits were also conducted to inspect the MS4 outfall and evaluate conditions for sampling on 14 occasions from November 2015 through September 2016. The number of site visits and sampling events by the Port of San Diego during the reporting period are summarized in Table 6-4.

[4] The first storm event sampling took place by the Port on Nov. 4, 2015 and by the City of Coronado on Nov. 9, 2015.

Table 6-4
Summary of Port of San Diego Sampling at Tidelands Park
(November 2015 – September 2016)

Type	Number of Site Visits	Receiving Water Samples[1]	MS4 Outfall Samples[2]	Total Samples
Wet Season /Wet Weather[3]	3	3	6	9
Wet Season /Dry Weather	5	5	0	5
Dry Season /Dry Weather[1]	6	27	1	28
Dry Season /Wet Weather	0	0	0	0
Total	14	35	7	42

Notes:
MS4 = municipal separate storm sewer system
1. Receiving water monitoring: 26 dry season, dry weather samples were collected by San Diego County Department of Environmental Health (DEH) for the AB 411 program. The Port of San Diego visited the site six times during dry season, dry weather conditions and collected one receiving water sample during one visit.
2. Per established procedures, the outfall is sampled when flowing or ponded water is present. Three outfalls are monitored at Tidelands Park.
3. Samples were collected at all three outfalls on two of the wet weather monitoring events.

6.3 Receiving Water Monitoring and Historical Data Review

Receiving water monitoring related to the Swimmable Waters Focused Priority Condition includes bacterial indicators at two sites, one on the Pacific Ocean at North Beach in the City of Coronado and one on San Diego Bay at Tidelands Park managed by the Port of San Diego. Receiving water monitoring for wet season was initiated at both locations in November 2015. Both dry and wet weather monitoring are slated to continue in the coming reporting year.

A total of 35 receiving water samples were collected during dry and wet seasons at Tidelands Park. Of the 35 receiving water samples collected at Tidelands Park, five samples exceeded Water Quality Objective (WQO) for *Enterococcus*. Of the five (5) ocean samples above the WQO, four (4) were collected during dry weather/dry season conditions and one (1) was collected during a wet season/wet weather event (on November 4, 2015). The number of dry weather receiving water samples exceeding the single sample WQO was below the allowable number of exceedances for 303(d) de-listing consideration based on sample size. For a sample size of 32, the allowable exceedance is five. Four (4), or 12.5%, of the 32 dry weather samples at Tidelands Park beach exceeded *Enterococcus* WQO. For the wet season/wet weather single sample monitoring, *Enterococcus* exceeded WQO during one of the three rain events.

Receiving water monitoring at North Beach was initiated in FY 2016 and is being conducted year-round. For North Beach, there are limited receiving waters (beach/ocean) monitoring data points for the site in the previous few years, because the site is no longer monitored by the County of San Diego DEH under the AB 411 program.

Of the 14 receiving water sampling events in the North Beach Pacific Ocean surf, ten (10) ocean samples were below the *Enterococcus* single sample WQO of 104 MPN/100ml. Of the four (4) ocean samples above the WQO, three (3) were collected during the wet weather period (November 1 through March 31) and one (1) was collected during the dry weather period. Of the four (4) *Enterococcus* samples above the WQO, only one (1) sample was collected during a rain event that included discharge from the MS4 paired with an MS4 outfall sample. The remaining three (3) *Enterococcus* results above the WQO do not appear to be correlated to MS4 outfall discharges.

The wet weather receiving water monitoring data set is limited at both locations because this was the first year in which the monitoring was conducted. As planned, receiving water samples will continue to be collected during dry and wet weather over the next two years so that the RPs can obtain a more robust dataset to adequately assess the interim 2018 goals at Tidelands Park and North Beach.

A delisting feasibility study for Tidelands Park in Coronado (PO-40 optional, COR-39.2) was completed in FY 2016. The study assessed available historical DEH AB 411 monitoring data to determine the number of exceedances of *Enterococcus* WQOs (104 most probable number per 100 milliliters [MPN/100mL]) that have occurred at the receiving water site EH-070 (Tidelands Park) since 1999. Limited receiving waters (beach/ocean) monitoring data are available for the North Beach site, because the site is not currently monitored by the County of San Diego DEH under the AB 411 program.

The purpose of the study was to identify whether the results warrant consideration of removal of the water body from the 303(d) List. Based on the cumulative data from 1999–2014, the site was found to be below allowable exceedances for dry season/dry weather for single-sample, rolling 30-day geometric mean, and monthly geometric mean. These results indicate that the beach segment of Tidelands Park on the 303(d) List could potentially be eligible for delisting in dry weather for *Enterococcus* indicator bacteria. However, limited wet weather monitoring data existed prior to FY 2016. Because of this finding, the RPs will focus on collecting data to demonstrate the current dry weather exceedance rate can be sustained, and collecting additional data to evaluate the exceedance rate during wet weather.

Tidelands Park was given an A grade for the summer dry season, dry weather in the 2015–2016 Heal the Bay report, using data collected in 2014–2015. North Beach was not evaluated by Heal the Bay since no data was available during that time period. Additional data were collected at both sites starting in November 2015 and these data will help track progress toward the goals related to water quality and future report cards (i.e., Heal the Bay) assessments.

http://www.healthebay.org/sites/default/files/BRC_2016_final.pdf.

6.4 MS4 Monitoring

A Tidelands Park MS4 outfall sampling

MS4 outfall monitoring related to swimmable waters includes bacterial indicators at two locations, at North Beach (City of Coronado) and one at Tidelands Park (Port of San Diego). MS4 outfall monitoring is performed when flow or standing water is detected at the outfall. The MS4 monitoring related to the Focused Priority Monitoring was initiated in November 2015 and is slated to continue in the coming reporting year. Storm drain monitoring was performed at the three storm drains in the vicinity of Tidelands Park beach (Table 6-2) during dry weather to detect potential non-storm water discharges. Port of San Diego staff visited the MS4 outfalls at Tidelands Park six times during the dry season (once a month), but found discharge during only one site visit. Port of San Diego staff also visited the sites during wet season/dry weather five times, but no discharges were observed. However, samples were collected at all three outfalls on two of the wet weather monitoring events. The third wet season, wet weather event could not be sampled because of an insufficient amount of effluent.

At North Beach, storm drain monitoring was performed at one storm drain (Table 6-2) during dry weather to detect potential non-storm water discharges. City of Coronado staff visited the MS4 outfalls at North Beach six times during the dry season, but found discharge during only one site visit. The MS4 outfall had ponded water, possibly from storm surge or tidal influence, on two occasions during the five site visits during wet season, dry weather.

North Beach MS4 outfall sampling location

7 Special Study and Additional Program Results and Assessments

Special studies for the San Diego Bay WMA have been selected to further investigate the Highest Priority Conditions and Focused Priority Conditions, including water quality monitoring specifically addressing bacteria and dissolved metals, riparian area habitat quality, and physical aesthetics due to trash. The special studies have been conducted or are on-going, and are summarized below. Studies included the San Diego Regional Streams and Beaches Studies, San Diego Bay Debris Special Study, Creek Refuse Assessment Program in the Pueblo HU, Chollas Jurisdictional Bounty Study for Metals and Bacteria, and the Riparian Area Selenium Study.

7.1 San Diego Regional Reference Streams and Beaches Studies

The San Diego Regional Reference Streams and Beach Studies (SCCWRP, 2015 and SCCWRP, 2016) sought to establish the bacterial concentrations from natural streams and beaches that are minimally disturbed by anthropogenic activities and therefore can be characterized as “reference” conditions. The study also collected nutrients, metals, and toxicity data as secondary constituents. The data generated by this study may be used by the Regional Board in the Bacteria TMDL Reopener to derive reasonable and accurate numeric targets for bacteria on the basis of a reference system approach.

7.1.1 San Diego Regional Reference Streams Study

The goal of the San Diego Regional Reference Stream Study was to characterize the natural background concentrations of bacteria, nutrients, heavy metals, and conventional constituents in undeveloped watershed catchments during wet and dry weather. The goal of this study was to categorize the exceedance frequencies of FIB WQOs by geomorphologic, hydrologic, biotic, and abiotic factors. This summary focuses on presenting the findings for FIB, specifically *Escherichia coli (E. coli)*, *Enterococcus*, and total and fecal coliforms (SCCWRP, 2015).

The study was conducted from January 2012 through May 2015 in San Diego, Orange, and Ventura Counties’ watersheds. Sites were selected to target minimally disturbed streams (reference conditions defined as greater than 93% undeveloped catchment areas with no wildfires in the last three years). Additionally, the sites chosen represented a mix of watershed size and geologic composition (such as sedimentary versus igneous/metamorphic geology). Analysis of human genetic markers was used to eliminate sites or samples with potential human fecal contamination and therefore not representative of reference conditions. Wet weather monitoring consisted of FIB pollutograph sampling during eight storm events at five sites, for a total of 118 samples. During weekly dry weather sampling, 427 FIB samples were collected from 10 intermittent stream sites and were analyzed for bacteria. Samples were also collected biweekly and analyzed for nutrients, trace metals, and other conventional constituents. FIB concentrations and fluctuations were compared with data from previous studies in the region.

The San Diego Reference Stream Study had five major findings:

(1) FIB levels in natural streams likely result from a combination of natural inputs, such as wildlife, birds, and soil erosion and instream bacterial growth facilitated by high summer temperatures, availability of nutrients, and presence of decaying organic matter.

(2) Storm event mean concentration exceedances were low except for *Enterococcus*. Based on seven storms, exceedances of single-sample WQOs were 0% for *E. coli*, fecal coliform, and total coliform. The exceedance frequency for *Enterococcus* on the day of the storm was 87%, compared with 37% for the following three days after the end of the storm. The exceedance frequency increased for both *E. coli* and total coliform to 29% if the pollutograph maximum was used. The number of storm events captured was not sufficient to investigate the effect of geology or watershed size on storm event mean concentrations.

(3) FIB exceedances occurred in natural sites and were highest in summer dry weather (April through August). No exceedances of fecal coliform single-sample WQOs were observed; however, single-sample WQO exceedances of *Enterococcus* were as high as 30%. Annual 30-day geomean exceedance frequencies were 0% for both *E. coli* and fecal coliform, but were 48% and 30% for *Enterococcus* and total coliform, respectively. Exceedance frequencies were highest in the summer, particularly for *Enterococcus*, spiking up to 40% and 68% for single-sample and 30-day geometric mean WQOs, respectively. Using a rolling 30-day geometric mean rather than a monthly mean to calculate exceedance frequencies increased the exceedance frequencies for *Enterococcus* and total coliform as much as 20%.

(4) Temperature, and to a lesser extent, nutrients and organic carbon, was the major factor associated with elevated summer dry weather FIB concentrations and exceedance frequencies. No significant relationships were found between FIB concentrations and watershed size or geology during dry weather. Water column FIB concentrations could not be attributed directly to instream benthic algal biomass as a measure of stream trophic status, which was low and showed no distinct seasonal variation. In contrast, FIB, temperature, organic carbon, and nitrogen measurements spiked at the end of the season, coinciding with the end of stream flow. This cycle occurs naturally; organic carbon and nutrients are increasingly recycled from organic matter as flow diminishes and temperature increases, conditions that coincide with increased FIB concentrations.

(5) Event mean concentration fluctuations during wet weather were found to be 2 to 3 times greater than dry weather FIB fluctuations. Wet and dry weather fluctuations were comparable to those documented in previous southern California regional studies.

7.1.2 San Diego Regional Reference Beaches Study

The goal of the San Diego Regional Reference Beach Study was to characterize natural background concentrations of FIB and determine WQO exceedance frequencies in two "reference" recreational beaches and their adjoining estuary or mixing zone. Two beaches in southern California, San Onofre Creek in San Diego County and Deer Creek in Ventura County, were selected for the Reference Beach Study for dry and wet weather assessments of *Enterococcus*, fecal and total coliforms, and *E. coli*. These locations were selected because the watershed discharging to the beach was determined to be greater than 93% undeveloped and has not been subject to a fire within the last three years. Additionally, both beaches are openly exposed with breaking waves and contain freshwater inputs. Analysis of human genetic markers was used to eliminate sites or samples with potential human contamination and therefore not representative of a reference condition (SCCWRP, 2016).

The San Diego Regional Reference Beach Study was initiated in October 2014 and continued through April 2016. Sampling was conducted in the ocean immediately in front of the inlet or estuary, in the inlet mouth just upstream of the mixing zone, and in the freshwater flowing creek, for a total of three locations at each reference site. Dry weather monitoring was conducted on dry weather days during both wet and dry seasons to characterize baseline conditions throughout the year. Bacteria samples were collected weekly, such that five samples were collected in each 30-day period, to calculate a 30-day dry weather geometric mean. In creeks, dry weather sampling occurred when there was measureable flow at a site. During wet weather, sampling criteria included an antecedent dry period of three or more days and a forecast minimum of 0.20 inch of rainfall. Samples were taken during the day of the storm (defined as within 24 hours of the end of recorded rainfall), and then in days following the day of the storm event. A special study was also conducted to quantify FIB concentrations in the San Onofre estuary. When the estuary was open to tidal exchange, monitoring was extended to collect samples at high and low tides at all sites.

The San Diego Regional Reference Beach Study began during an extended period of drought in the southern California region, which limited the number of samples collected from creeks and during storms, as well as the overall volume of freshwater input to beaches. Dry weather beach sampling achieved the prescribed frequency, but samples from freshwater input sources were limited by extreme drought. From the onset of sampling, San Onofre Creek did not flow during the study period because of the extended drought. Deer Creek began flowing at the end of December 2014 and ceased in early May 2015; Deer Creek did not flow during the 2015–2016 winter dry weather period. In a similar effect, wet weather sampling was limited to only one storm during this study period because of the drought conditions. However human genetic markers were detected and so the results were excluded from the exceedance frequency analysis. The estuary special study was not completed because the San Onofre estuary berm remained closed throughout the study period for all but one storm event, which coincided with a tide in excess of 7 feet. The sampling locations were deemed inaccessible during that event, and so the estuary data collected only characterize concentrations during conditions with a closed estuary mouth.

Although major drought conditions limited the conditions in which data were collected, the Reference Beach Study had several key findings:

(1) The ranges of annual dry weather FIB concentrations at both beaches were considered low. The ranges are comparable to results from previous FIB beach bacteria reference studies that had estuaries closed to tidal exchange (i.e., San Onofre Creek) or flow to the beach without an estuary (i.e., Deer Creek), with WQO exceedance frequencies in the range of 0% to 3.5%. Prolonged drought conditions resulted in intermittent dry weather flow at Deer Creek and no dry weather flow at San Onofre Creek, which provides important context to interpret data on exceedance frequencies.

(2) Concentrations of FIB in the estuary or freshwater mixing zone of both San Onofre and Deer Creeks were typically 1 to 3 orders of magnitude higher compared with their respective beaches, with the highest WQO exceedance frequencies found in San Onofre Creek, and suggesting that dry weather exceedance frequencies may have been greater had the mouth of the estuary been open to tidal exchange and dispersal to the surf zone.

(3) In the San Onofre Creek estuary, the dry weather geometric mean exceedance frequency during summer was 72% for fecal coliform; the dry weather geometric exceedance frequency during summer was 100% for both *Enterococcus* and *E. coli*. Dry weather geometric mean exceedances during wet season months ranged from roughly 55% (for total coliform) to 100% (for *Enterococcus*). The higher WQO exceedance frequencies of San Onofre Creek estuary relative to the mixing zone of Deer Creek could be expected, given the abundance of labile organic matter to support microbial growth as well as the presence of water birds typically found in estuaries.

(4) At both beaches, no significant relationship was found with water temperature, salinity, or antecedent dry days. In contrast to San Onofre Beach, where FIB concentrations declined with the increasing duration of dry weather, the range and mean FIB concentrations in San Onofre Creek estuary increased with increasing antecedent dry days and salinity, suggesting that freshwater input from the ephemeral channel tended to dilute concentrations, rather than serve a source of bacteria to the beach. The slight increase of FIB concentrations as a function of temperature and the lack of surface freshwater input in San Onofre Creek estuary suggest that regrowth may be a factor, which is credible given the organic rich environment of the San Onofre Creek estuary.

7.1.3 Special Study Assessment

Per the Municipal Permit (Provision D.4.c), data resulting from special studies should be used to (1) assess their relevance to the RPs' characterization of receiving water conditions, (2) understand sources of pollutants and/or stressors, and (3) control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters. The San Diego Regional Stream and Beach Reference Studies provide more information on the natural "reference" conditions in streams and beaches.

The key findings of the San Diego Regional Stream Study with regard to the highest priority water quality condition is as follows:

- During dry weather conditions:
  - There are exceedances of FIB WQOs at natural sites for *Enterococcu*s and total coliform (single sample and annual 30-day geomean).
  - These are highest during summer months (April to August).
  - There were no exceedances of the fecal coliform single sample WQOs along with a 0% exceedance frequency of the annual 30-day geomean.
  - *E. coli* also had a 0% exceedance frequency of the annual 30-day geomean.
- During wet weather conditions:
  - Storm event mean concentration exceedances of single sample WQOs were 0% for *E. coli*, fecal coliform, and total coliform, but if the storm maximum pollutograph was included, there were exceedances for *E. coli* and total coliform.
  - For the storm event mean concentration exceedances of single-sample WQOs for *Enterococcus,* the exceedance frequency on the day of the storm was 87%, compared with 37% for the following three days after the end of the storm.
- In summary:
  - *Enterococcus* concentrations can often exceed the WQO in both dry and wet weather conditions in streams with no anthropogenic impacts.
  - Total coliform may also be present in streams, although in lower amounts than *Enterococcus,* in natural conditions at levels high enough to cause exceedances.
  - *E. coli* concentrations exceeded the WQO only during wet weather conditions in the reference watershed streams when the storm peak was incorporated into the event mean concentration.
  - Fecal coliform concentrations did not exceed WQO in dry and wet weather conditions in any reference watershed streams.

The key findings of the San Diego Regional Beaches Study with regard to the Highest Priority Condition were affected by prolonged drought conditions. Despite the fact that no storm water samples were collected, some inferences about bacteria concentrations during dry weather conditions can be made. The ranges of annual dry weather FIB concentrations at both reference beaches were considered low, although this condition has to be considered in the context of intermittent dry weather flow at Deer Creek and no dry weather flow at San Onofre Creek. Concentrations of FIB were one to three times higher in estuary or freshwater mixings zones than at the beaches, meaning that dry weather exceedance frequencies may have been greater had the mouth of the estuary been open to tidal exchange and dispersal to the surf zone. The study provided some insight into the exceedance frequency in estuaries as follows:

- The *Enterococcu*s dry weather annual 30-day geomean exceedance frequency was 100% for the whole year in the San Onofre Creek estuary.
- The total coliform dry weather annual 30-day geomean exceedance frequency was 55% during winter months in the San Onofre Creek estuary.
- The *E. coli* dry weather annual 30-day geomean exceedance frequency was 100% during summer months (April to August) in the San Onofre Creek estuary.
- The fecal coliform dry weather annual 30-day geomean exceedance frequency was 72% during the summer months in the San Onofre Creek estuary.

For reference beaches with both streams and estuaries closed from tidal exchange, *Enterococcus* concentrations exceeded WQOs. Total coliform, *E. coli*, and fecal coliform concentrations exceeding WQOs varied for seasons and waterbody types. Additionally, the variability in dry weather FIB concentrations is less than the variability in wet weather FIB event mean concentrations, confirming the findings of previous studies.

7.2 Addressing Trash, Debris, and Floating Material in Chollas and Paleta Creeks

Pursuant to Section A.4 of the Municipal Storm Water Permit (Regional Board, Order No. R9-2013-0001, as amended by order nos. R9-2015-0001 and R9-2015-0100) and letter from Mr. John H. Robertus dated December 18, 2002 (Regional Board, 2002), requiring technical reports pursuant to California Water Sections 13267, 13225, and 13383 regarding exceedances of Water Quality Objectives for trash, debris, and other floating material in Chollas and Paleta Creeks, the City of San Diego was required to report twice a year on existing and planned BMPs intended to prevent or reduce trash, debris, and floating materials in Chollas and Paleta Creeks. As addressed in the WQIP, the City of San Diego agreed to incorporate the technical report addressing trash, debris, and floating material in Chollas and Paleta Creeks (annual technical report) into the January 2017 WQIP Annual Report. This change in reporting frequency was formally agreed to by the Regional Board in a letter from Mr. David W. Gibson dated February 5, 2014 (Regional Board, 2014). The annual technical report covers the activities conducted during FY 2016 (July 1, 2015, through June 30, 2016) and includes the information summarized in the semi-annual report covering the activities conducted during the first half of FY 2016

(July 1, 2015, through December 31, 2015) that was submitted to the Regional Board on March 15, 2016. The final annual technical report is in Attachment I.

7.3 Trash – San Diego Bay Debris Special Study

The San Diego Bay Debris Study is a special study component under the Southern California Bight 2013 Regional Monitoring Program (Section 2.2). In 2014, the Bight Program began the first-ever comprehensive marine debris survey, which included, for the first time, a coastal embayment special study to assess the connection between land-based sources of debris and transport to the coastal ocean. In southern California, and particularly along the San Diego County coastline, coastal wetlands and bays provide an important connection between upland rivers and the coastal ocean, and the coastal embayments may be a key environmental sink for upland land-based debris. The Study Report covers three projects conducted in San Diego Bay and the contributing watersheds between fall 2014 and spring 2015.

The intent of the San Diego Bay Debris Study is to quantify the abundance and amount of plastic debris in a variety of bay habitats. Study areas include open water areas throughout San Diego Bay, enclosed area such as ports and marinas, intertidal areas (mudflats, salt marshes, sandy beaches, and protective rip-rap shoring), and upland areas in the contributing riverine habitats. Results of this study could be used as a baseline for future studies and for management of efforts to control trash, specifically plastic-based items.

The primary data analyses are intended to answer the following study questions:

- How do the quantities and types of debris in different habitats vary during dry and wet season?
- What are the quantities and types of debris found in San Diego Bay habitats?
- What are the quantities and types of debris found in watersheds flowing to San Diego Bay?
- How do the quantities and types of trash in different San Diego Bay habitats vary by summer and winter dry season?
- What are the quantities and types of trash in San Diego Bay following the first storms of the wet season?
- What types of riverine debris do wet weather flows transport to the bay?
- What species caught in the bay has ingested plastic pieces?

7.4 Trash – Pueblo HU: Creek Refuse Assessment Program Special Study

In 2007, the City of San Diego implemented the Creek Refuse Assessment Program (Refuse Program) to evaluate and record the types and volumes of trash at approximately 800 sites across the City. The Refuse Program was developed to assess trash conditions and provide long-term monitoring data to support watershed planning and monitor trash reduction efforts.

The recent adoption of the Trash Amendments by the State of California necessitated re-evaluating the City's trash monitoring data to identify high trash-accumulation areas and work toward solving the remaining trash issues. The goal of the following evaluations was to help the City reprioritize ongoing trash assessment programs to focus management actions on the high trash-accumulation areas and to provide a summary of the historical data against which future assessment data can be compared. To provide a technical foundation for the trash assessment, persistent trash types were identified in areas of recurring high trash accumulation, as well as common sources, disposal methods, entry routes of trash, and trends in trash volumes over time (City of San Diego, 2015a).

Key findings of the evaluation included the following:

- Of the 12 types of trash in the Refuse Program assessments, the most frequently observed types were food packaging, household items, and plastic bags.
- Trash issues were not evenly distributed across the City. Four hydrologic areas, including the Tijuana Valley, San Diego Mesa, Miramar Reservoir, and Lower San Diego River, were the areas with the highest average trash volumes. The San Diego Mesa Hydrologic Areas could be considered the City's highest priority area for future trash management efforts.
- In addition to land use as a factor to consider regarding trash-accumulating areas, trash volumes tended to be disproportionately large in areas where median incomes are lower in the surrounding communities.
- Open, Industrial, and Park land uses (Parks Open, Industrial Open, Commercial Parks, and Open Industrial), and Transient sources were associated with the highest average trash volumes per site.
- Open, Industrial, Park, and a limited number of Residential (Open Industrial, Open, Commercial Parks, Residential Parks, and Residential) land uses have shown a significant decrease in average volumes over time, suggesting that trash management strategies are working in these areas.
- Residential Industrial, Parks Open, Industrial Open, Commercial Open, Commercial, and Open Parks land uses showed no significant decreases in trash volumes over time, and should be prioritized for future monitoring and assessments.

The final report for the Pueblo HU Creek Refuse Assessment Program Special Study is in Attachment J.

7.5 Chollas – Jurisdictional Boundary Study for Metals

This Jurisdictional Boundary Special Study is a voluntary study completed by the City of San Diego; other jurisdictions in the Chollas Creek hydrologic subarea are not involved in the study. Wet weather monitoring results presented in the Jurisdictional Boundary Special Study monitoring report are above and beyond the compliance monitoring requirements of the Diazinon and Dissolved Metals TMDL in Order No. R9-2004-0277 and State Board Resolution 2008-00054. The purpose of this study is to collect wet weather water quality data at jurisdictional boundary locations to fill data gaps in understanding priority receiving water quality pollutants in the upper watershed in Chollas Creek. Monitoring was conducted during the 2015–2016 wet season in the upper Chollas Creek HSA at the jurisdictional boundaries of the Cities of San Diego and La Mesa, and of the Cities of San Diego and Lemon Grove.

Special Study Monitoring Results

Jurisdictional boundary monitoring was conducted during two wet weather events, October 4, 2015, and March 5, 2016, coinciding with the Diazinon and Dissolved Metals TMDL compliance monitoring program. Sites LG-1 and LM-1 are not compliance sites. LG-1 is located on the South Fork of Chollas Creek; LM-1 is located on the North Fork of Chollas Creek. Water quality samples were analyzed for the TMDL analytes (diazinon, total and dissolved metals [copper, lead, and zinc], and toxicity). Additional analytes (organophosphorus pesticides, organochlorine pesticides, PAHs, PCBs, chloride, sulfate, and general chemistry) as well as the analytes on the 303(d) List (nitrogen, phosphorus, total suspended solids, and particle size distribution) were also analyzed during the monitoring. Analytical results were compared with applicable water quality criteria, including those set forth in the approved TMDLs for the Chollas Creek HSA, pesticide criteria of the CDFW (CDFW 1998, 2000), the USEPA OPP Aquatic Life Benchmarks, and the USEPA National Recommended Aquatic Life Criteria for freshwater.

The data collected during the 2015–2016 wet weather season are summarized below. The results for the 2015–2016 monitoring season are summarized below, including the constituents not detected (Table 7-1), the constituents detected but above the WQOs (Table 7-2), and the detected constituents (Table 7-3).

Table 7-1
Constituents Not Detected in the 2015–2016 Monitoring Year

Site	Constituent
LG-1	Diazinon Methyl-parathion Organochlorine pesticides PAHs (1 of 2 events)
LM-1	TMDL Constituents Diazinon

Notes:
PAH = polycyclic aromatic hydrocarbon; TMDL = total maximum daily load

Table 7-2
Constituents Detected but Below WQOs in the 2015–2016 Monitoring Year

Site	Constituent
LG-1	Dissolved copper, lead, and zinc Acute or chronic toxicity to Ceriodaphnia dubia (C. dubia) Malathion 5 PAHs (1 of 2 events) PCBs Chloride (chronic) Sulfate Dissolved organic carbon
LM-1	Dissolved copper (acute), lead, and zinc Acute or chronic toxicity to *Ceriodaphnia dubia (C. dubia)* Malathion (chronic 1 of 2 events) Methyl-parathion alpha-chlordane gamma-chlordane 7-10 PAHs PCBs Chloride Sulfate Dissolved organic carbon

Notes:
PAH = polycyclic aromatic hydrocarbon; PCB = polychlorinated biphenyl

Table 7-3
Constituents Detected Above WQOs in the 2015–2016 Monitoring Year

Site	Constituent
LG-1	Chloride (acute) Total Nitrogen Total Phosphorus Dichlorvos (acute, 1 of 2; chronic 2 of 2)
LM-1	Dissolved copper (chronic) Malathion (chronic 1 of 2 events) Total Nitrogen Total Phosphorus Dichlorvos (acute, 2 of 2; chronic 1 of 2)

Statistical Relationship Between the Boundary Locations and Compliance Sites

The study included a statistical comparison of historical water quality conditions at the boundary locations (LG-1 and LM-1) related to the downstream compliance monitoring locations. Based on the results of the historical comparative analyses, three statistical significant findings, summarized as follows:

- The dissolved metals comparison showed that dissolved lead and zinc concentrations were significantly greater at LG-1 on the South Fork than at the respective compliance MLS. Also note that dissolved lead and zinc concentrations at LG-1 have consistently been below their respective WQOs, including for both storms in FY 2016.

- The dissolved metals comparison showed no statistically significant difference in median concentrations of dissolved copper, lead, and zinc between LM-1 on the North Fork and the respective compliance MLS.

- Historically, chloride concentrations exceeded the WQO only at the South Fork monitoring location, LG-1. The source of the concentrations of chloride at this location seem to be naturally occurring salt deposits presents in the tertiary marine sedimentary soils located in this area of the watershed. Chloride concentrations were below the USEPA Aquatic Life criteria maximum concentrations (CMC) and criteria continuous concentrations (CCC) for freshwater during both wet weather events at LM-1.

- Overall, the South Chollas Creek monitoring locations appear to have relatively greater concentrations of general chemistry analytes compared with concentrations measured at the North Chollas Creek locations. This relationship is important to note for total hardness, where lower total hardness values yield lower WQOs for dissolved metals. Note that the difference in hardness values between the two branches of Chollas Creek results in different WQOs for hardness-based trace metals.

The final reports for the Jurisdictional Boundary Metals and Bacteria studies are in Attachments K.1 and K.2, respectively.

7.6 California Assembly Bill 411 (AB 411) Data

The San Diego County DEH implements the Beach and Bay Water Quality Monitoring Program to support the statewide program funded by AB 411. This program is commonly referred to as AB 411 monitoring. The AB 411 monitoring program is not required by the Municipal Permit. However, dry weather season receiving water data from two AB 411 beach monitoring stations are used by the RPs to augment their monitoring programs and help assess water quality issues in the San Diego Bay WMA. One of the stations is in the Swimmable Waters Focused Priority Condition area, and one is in the Shelter Island Shoreline Park Bacteria TMDL area. The number of samples taken between October 1, 2015, and September 30, 2016, is presented in Table 7-4.

Table 7-4
San Diego Bay WMA AB411 Data Summary for 2015–2016 Monitoring Year

Site ID	Location	Latitude/ Longitude	Number of Samples per FIB Indicator	Total Number of Samples Oct 2015 to Sept 2016
EH-070	Tidelands Park – Coronado Bayside	32.690/ -117.164	9	27
EH-200	Shelter Island Shoreline Park – San Diego Bay	32.715/ -117.224	10	30

Notes:
FIB = fecal indicator bacteria

The resulting concentrations for *Enterococcus*, fecal coliform, and total coliform samples are discussed in Sections and 2.7 and 6. These data will be reviewed during the Receiving water Assessment completed in the Regional Monitoring and Assessment Report.

7.7 Riparian Area Selenium Study

The objective of the Paradise Creek Selenium Special Study was to collect additional selenium data in the portion of Paradise Creek within Kimball Park to submit a data set to the State Board to support efforts to remove the selenium impairment. In addition, one of National City's WQIP goals is to implement strategies that will lead to the removal of the creek from the 303(d) List.

Total selenium concentrations were below the water quality objective of 5.0 micrograms per liter (µg/L) for all 50 samples collected. This result provides a substantial basis for removing the selenium 303(d) Listing and National City has achieved the current Municipal Permit term WQIP goals of collecting and analyzing 48 samples for selenium, with zero exceedances of the water quality objectives.

The final report for the Riparian Area Selenium Study is in Attachment L.

7.8 Water Quality Objectives

WQOs, or benchmarks, were used to assess monitoring results in the San Diego Bay WMA. The WQOs are derived from several regulatory documents, including the Water Quality Control Plan for the Basin Plan, the CTR, and Title 22 regulations, as applicable. The WQOs may differ depending on condition (i.e., dry weather WQOs may be different from wet weather WQOs). Details of the WQOs used for the assessments in the San Diego Bay WMA are in Attachment M.

8 Publicly Available Data

The Municipal Permit requires the RPs to provide monitoring data and assessment results to the public. The following sections provide the locations where the public may obtain applicable information.

8.1 California Environmental Data Exchange Network (CEDEN) Upload and Retrieval

Provision F.4.a.(6) of the Municipal Permit requires monitoring data collected as part of the San Diego Bay WMA MAP to be uploaded to CEDEN. Data upload confirmations from CEDEN, as required, are included in Attachment N.

CEDEN is a central location for finding and sharing information about California's water bodies and aggregates water quality, aquatic habitat, and wildlife health data. The data are accessible in downloadable forms at www.ceden.org.

Data collected under the San Diego Bay WMA MAP for the October 2015–September 2016 monitoring year will be available in 2017. Data in CEDEN are searchable by date and by location, project, station, or parameter. Data collected as part of the programs described in this Monitoring Results and Assessment Appendix of the San Diego Bay WMA Water Quality Improvement Plan Annual Report can be retrieved using the project names listed in Table 8-1.

Table 8-1

CEDEN = California Environmental Data Exchange Network; TMDL = Total Maximum Daily Load

8.2 Regional Clearinghouse

For the 2015–2016 monitoring year, the RPs are providing the following data and documentation on the Project Clean Water website (www.projectcleanwater.org), which can be accessed by the general public:

- 2015–2016 Annual Report, including all appendices and associated attachments, including:
  - JRMP Annual Report for each RP within the WMA
  - Monitoring Results and Assessment Appendix
  - SMC Bioassessment Summary
  - Shelter Island Yacht Basin TMDL Report
  - Shelter Island Shoreline Park TMDL Report
  - Reports from special studies conducted in the WMA not previously submitted (San Diego Regional Reference Streams and Beaches Study, San Diego Bay Debris Study, Pueblo Creek Refuse Assessment Program, Chollas Jurisdictional Boundary Study for Metals and Bacteria, AB 411 Study, Riparian Area Selenium Study)
  - Monitoring data uploaded to CEDEN, with links to the uploaded data
- BMP Design Manual for each Responsible Party within the WMA and all updated versions with date of update
- Available geographic information system (GIS) data, layers, and/or shapefiles used to develop the maps to support the WQIP, Annual Reports, and JRMPs

APPENDIX 5

ADAPTIVE MANAGEMENT/MODIFICATIONS

Intentionally Left Blank

1 Adaptive Management – Changes to Water Quality Improvement Plan Elements

- A select number of jurisdictions have made minor modifications to their strategies or schedules. A full list of updates is provided in Appendix 2.
- The Airport Authority has proposed a modification to their performance goal for airside street sweeping. For a detailed explanation, see Section 5.1.
- Lemon Grove has added strategy LG-47 to potentially trigger green streets, as seen in Appendix 2.
- National City has added strategy NC-40 to address green infrastructure, as seen in Appendix 2.
- Modifications to the San Diego Bay Watershed Management Area Analysis (WMAA) have been made to designate the portion of the Otay River between Lower Otay Reservoir Dam and I-805 as an exempt river reach, based on technical studies submitted to the watershed group and discussed at a previous Consultation Panel meeting. Revisions were made to Section 4.1.1 (Exempt River Reaches) and Attachment B.2 of the WMAA (Hydromodification Management Exemption Mapping), and technical studies prepared in support of the changes were added as a new Attachment to the WMAA (Attachment B.3). The revised WMAA, showing track changes, and Attachments B.2 and B.3 are provided in Attachment A.

1. Introduction

1.1. Background

On May 8, 2013 the California Regional Water Quality Control Board, San Diego Region adopted Order No. R9-2013-0001; NPDES No. CAS 0109266, National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region (Regional MS4 Permit). The Regional MS4 Permit, which became effective on June 27, 2013, replaces the previous MS4 Permits that covered portions of the Counties of San Diego, Orange, and Riverside within the San Diego Region. There were two main goals for the Regional MS4 Permit:

1. To have more consistent implementation, as well as improve inter-agency communication (particularly in the case of watersheds that cross jurisdictional boundaries), and minimize resources spent on the permit renewal process.
2. To establish requirements that focused on the achievement of water quality improvement goals and outcomes rather than completing specific actions, thereby giving the Copermittees more control over how their water quality programs are implemented.

To achieve the second goal, the Regional MS4 Permit requires that Water Quality Improvement Plans (WQIPs) be developed for each Watershed Management Area (WMA) within the San Diego Region. As part of the development of WQIPs, the Regional MS4 Permit provides Copermittees an option to perform a Watershed Management Area Analysis (WMAA) through which watershed-specific requirements for structural BMP implementation for Priority Development Projects can be developed for each WMA. This report presents the Copermittees' approach and results for the regional elements of the WMAA developed for the San Diego County area.

1.2. Watershed Management Area Analysis (WMAA)

The Regional MS4 Permit, through inclusion of the WMAA, provides an optional pathway for Copermittees to develop an integrated approach for their land development programs by promoting evaluation of multiple strategies for water quality improvement and development of watershed-scale solutions for improving overall water quality in the watershed. The WMAA comprises the following three components as indicated in the Regional MS4 Permit:

1. Perform analysis and develop Geographic Information System (GIS) layers (maps) by gathering information pertaining to the physical characteristics of the WMA (referred to herein as WMA Characterization). This includes, for example, identifying potential areas of coarse sediment supply, present and anticipated future land uses, and locations of physical structures within receiving streams and upland areas that affect the watershed hydrology (such as bridges, culverts, and flood management basins).
2. Using the WMA Characterization results, compile a list of candidate projects that could potentially be used as alternative compliance options for Priority Development Projects. Such projects may include, for example, opportunities for stream or riparian area rehabilitation, opportunities for retrofitting existing infrastructure to incorporate storm

water retention or treatment, or opportunities for regional BMPs, among others. Prior to implementing these candidate projects the Copermittees must demonstrate that implementing such a candidate project would provide greater overall benefit to the watershed than requiring implementation of the onsite structural BMPs. Note, compilation or evaluation of potential projects was not performed as part of this regional effort. Identification and listing of candidate projects will be performed for each WMA through the WQIP process for WMAs that elect to submit the optional WMAA as part of the WQIP.

3. Additionally, using the WMA Characterization maps, identify areas within the watershed management area where it is appropriate to allow for exemptions from hydromodification management requirements that are in addition to those already allowed by the Regional MS4 Permit for Priority Development Projects. The Copermittees shall identify such cases on a watershed basis and include them in the WMAA with supporting rationale to support claims for exemptions.

1.3. Scope of Work for Regional WMAA

In July 2013, the Copermittees elected to fund a regional effort to develop elements of the regional WMAA for the 9 San Diego-area WMAs within the County of San Diego that are currently subject to the Regional MS4 Permit, which include:

- Santa Margarita River (for portion in San Diego County)
- San Luis Rey River
- Carlsbad
- San Dieguito River
- Los Peñasquitos
- Mission Bay & La Jolla Watershed
- San Diego River
- San Diego Bay
- Tijuana River (for portion in San Diego County)

The regional-level information developed through this effort is intended to provide consistency across WMAs and serve as the foundation for developing watershed-specific information for each WMA to be developed through the WQIP process. The regional effort scope of work included:

1. Development of GIS map layers that characterize the WMAs using data previously collected, readily available, and provided by the Copermittees, including:
    a. Description of dominant hydrologic processes, such as areas where infiltration or overland flow likely dominates;
    b. Description of existing streams in the watershed, including bed material and composition, and if they are perennial or ephemeral;
    c. Current and anticipated future land uses;
    d. Potential coarse sediment yield areas; and

   e. Locations of existing flood control structures and channel structures, such as stream armoring, constrictions, grade control structures, and hydromodification or flood management basins.

2. Development of a Microsoft® Excel (Excel) template for use by Copermittees to compile lists of candidate projects for an optional alternative compliance program.
3. Development of additional criteria and analyses to support reinstating the following proposed exemptions that were originally developed in the approved 2011 Final Hydromodification Management Plan but not included in the Regional MS4 Permit unless provided by the Copermittees in the WMAA. In addition, development of the associated Hydromodification Applicability/Exemption Mapping.
   a. Exempt River Reaches including:
      i. San Diego River;
      ii. Otay River;
      iii. San Dieguito River;
      iv. San Luis Rey River; and
      v. Sweetwater River
   b. Stabilized Conveyance Systems Draining to Exempt Water Bodies
   c. Highly Impervious/Highly Urbanized Watersheds and Urban Infill, and
   d. Tidally Influenced Lagoons (where data/study provided)

The scope of work for the regional effort excluded performing analysis within the following areas unless data was readily available, as Copermittees do not have jurisdiction over these areas:

1. State Lands;
2. U.S. Departments of Defense land;
3. U.S. National Forest land;
4. U.S. Department of Interior land and
5. Tribal land

Additional description of excluded areas, for the purposes of the Regional WMAA, is indicated in Section 2.3 Land Uses.

1.4. Project Process

The process for developing the Regional WMAA included close coordination with the Land Development Workgroup (LDW) at key points during the project. The LDW is composed of the 21 San Diego-area Copermittees and serves to develop and implement regional land development plans and programs necessary to support the requirements of the Regional MS4 Permit. The consultant team (Geosyntec Consultants and Rick Engineering Company) presented preliminary project assumptions and methodologies proposed to be used to develop the Regional WMAA to meet the requirements of the Regional MS4 Permit in December 2013. The consultant team incorporated workgroup feedback from this meeting and subsequently presented the preliminary

Regional WMAA project results to the LDW in March 2014, again to receive direction and incorporate input on the preliminary results. Subsequently, the draft report was released to the public in July 2014, by a public workshop that included Consultation Panel members from each of the WMAs on July 29, 2014. This version of the report including all of the input described above is being issued for optional inclusion into the respective WQIP Provision B.3 submittals to the SDRWQCB in December 2014.

1.5. Report Organization

This report is organized as follows:

- Chapter 1 provides the project background and purpose;
- Chapter 2 describes the technical basis for characterizing the WMA;
- Chapter 3 describes the template that can be used by Copermittees to compile the list of candidate projects;
- Chapter 4 summarizes the analyses performed to support reinstating select exemptions from hydromodification control requirements for PDPs;
- Chapter 5 presents the WMAA conclusions;
- Chapter 6 presents the references used for the WMAA;
- Attachment A presents the exhibits and additional supporting information for watershed management area characterization;
- Attachment B presents the exhibits and additional supporting information for hydromodification management applicability/exemptions;
- Attachment C expands on the structure of the geodatabase that hosts the GIS data developed by the WMAA; and
- Attachment D provides a crosswalk between the Regional MS4 Permit requirements for WMAA and this report.

1.6.Terms of Reference

The work described in this report was conducted by Geosyntec Consultants (Geosyntec) and Rick Engineering Company (RICK) on behalf of the County of San Diego and the regional Copermittees.

2. Watershed Management Area Characterization

Watershed health and function are strongly influenced by hydrological and geomorphological processes occurring in the watershed. Both hydrological response and geomorphological response of the watershed are dependent on a variety of physical characteristics of the watershed. To this end, the Regional MS4 Permit specifies a set of data that is required to adequately characterize overall watershed processes as a foundation to enhancing integration and effectiveness of watershed management and water quality programs. The following GIS map layers were developed to characterize the hydrological and geomorphological processes within the San Diego Bay WMA:

- Dominant Hydrologic Processes: A description of dominant hydrologic processes, such as areas where infiltration or overland flow likely dominates;
- Stream Characterization: A description of existing streams in the watershed, including bed material and composition, and if they are perennial or ephemeral;
- Land Uses: Current and anticipated future land uses;
- Potential Critical Coarse Sediment Yield Areas; and
- Physical Structures: Locations of existing flood control structures and channel structures, such as stream armoring, constrictions, grade control structures, and hydromodification or flood management basins.

These GIS layers can be used to:

- Identify the nature and distribution of key macro-scale watershed processes;
- Identify potential opportunities and constraints for regional and sub-regional storm water management facilities that can play a critical role in meeting water quality, hydromodification, water supply, and/or habitat goals within the watershed;
- Assist with determining the most appropriate management actions for specific portions of the watershed; and
- Suggest where further study is appropriate.

2.1. Dominant Hydrologic Processes

The Regional MS4 Permit identifies in the provisions related to the WMAA that a description of dominant hydrologic processes within the watershed must be developed, with GIS layers (maps) as output. The Permit specifically calls for processes "*such as areas where infiltration or overland flow likely dominates*." These particular aspects of the hydrological mechanics of watersheds are particularly important when attempting to understand the macro-scale opportunities for locating projects that take advantage of either capturing overland flow for treatment or for infiltration.

Investigation of the dominant hydrologic processes in the San Diego-area watersheds indicates that evapotranspiration (ET) is the most dominant hydrologic process for the region based on review of a published study (Sanford and Selnick, 2013). ET is the sum of evaporation and plant transpiration in the hydrologic cycle that transports water from land surfaces to the atmosphere. This is conclusion is supported by comparing the 30-year average annual rainfall for the study area (San Diego County east of the peninsular divide) of between 15 and 18 inches per year (San Diego County, 2005) to the average annual ET rates. According to the California Irrigation Management Information System (CIMIS) Reference Evapotranspiration Map (CIMIS, 1999), the study area (within Zones 4, 6, and 9) experiences annual reference ET of 46.6, 49.7 and 59.9 inches, respectively. Therefore, theoretically, if all of the annual precipitation for the San Diego-area watersheds remained stationary where it fell and did not either infiltrate or runoff to local waterbodies where it would be conveyed downstream ultimately to the ocean, it all would be consumed by ET. As such, the effect of ET on the overall hydrologic processes within the San Diego watersheds is a function of the temporal scale over which it acts. Precipitation events often produce runoff in these watersheds, particularly in the urbanized portions, based on the topography and land cover that tend to accelerate the conveyance of runoff downstream rather than collecting, storing, or spreading out that then would maximize the effect of ET.

Because this study is focused on developing information and mapping for the portion of the hydrologic process that informs watershed management decisions, i.e., locating beneficial projects in areas of greatest opportunity, the next tier of dominant hydrologic processes are studied and mapped by this project. As such, the study area was characterized, based on the methodology described in the following section, according to the predicted fate of runoff within the watersheds being either overland flow or infiltration after considering the effects of ET (as well as an intermediate category of interflow). Areas that were mapped as overland flow do not necessarily preclude infiltration but rather indicate the dominant expected process that runoff would experience if not intercepted for the express purpose of infiltrating storm water runoff. The Model BMP Design Manual will provide more detailed guidance and procedures for determining the potential for infiltrating captured storm water at the project level irrespective of the mapping produced in the WMAA. To reiterate, the WMAA mapping is to provide macro-scale processes for high-level analysis and to inform decisions affecting regional scales. Furthermore, the Model BMP Design Manual will indicate the degree to which site-scale BMPs can expect to benefit from ET or how ET is considered in the sizing of BMPs. In brief, typical storm water BMPs only store water for a few days and therefore are not really capable of significant volume disposal through ET. However, pervious area dispersion (i.e., directing storm water runoff to flat areas for spreading and infiltration) has appreciable benefits with regard to ET and is a practice promoted in the BMP Design Manual.

The processes of interest are further defined as follows:

Overland flow: This process can be thought of as the inverse of infiltration; precipitation reaching the ground surface that does not immediately soak in must run over the land surface (thus, "overland" flow). It reflects the relative rates of rainfall intensity and the soil's infiltration capacity: wherever and whenever the rainfall intensity exceeds the soil's infiltration capacity, some overland flow will occur. Most uncompacted, vegetated soils have infiltration capacities of one to several inches per hour at the ground surface, which exceeds the rainfall intensity of even unusually intense storms. In contrast, pavement and hard surfaces reduce the effective infiltration capacity of the ground surface to zero, ensuring overland flow regardless of the meteorological attributes of a storm, together with a much faster rate of runoff relative to vegetated surfaces.

Infiltration and groundwater recharge: These closely linked hydrologic processes are most apparent near ephemeral and perennial conveyances in the San Diego region. Their widespread occurrence is expressed by the common absence of surface-water channels on even steep (undisturbed) hillslopes. Thus, on virtually any geologic material on all but the steepest slopes (or bare rock), infiltration of rainfall into the soil is inferred to be widespread, if not ubiquitous. With urbanization, changes to the process of infiltration are also quite simple to characterize: some (typically large) fraction of that once infiltrating water is now converted to overland flow.

Interflow: Interflow takes place following storm events as shallow subsurface flow (usually within 3 to 6 feet of the surface) occurring in a more permeable soil layer above a less permeable substrate. In the storm response of a stream, interflow provides a transition between the rapid response from surface runoff and much slower stream discharge from deeper groundwater. In some geologic settings, the distinction between "interflow" and "deep groundwater" is artificial and largely meaningless; in others, however, there is a strong physical discrimination between "shallow" and "deep" groundwater movement. Development reduces infiltration and thus interflow as discussed previously, as well as reducing the footprint of the area supporting interflow volume.

The datasets used, methodology for creating the dominant hydrologic processes maps, and the results are described in the sections below.

2.1.1. Datasets Used for identifying dominant hydrologic processes

The following datasets were used in the analysis:

Dataset	Source	Year	Description
Elevation	USGS	2013	1/3rd Arc Second (~10 meter cells) digital elevation model for San Diego County
Soils Data	SanGIS	2013	NRCS (SSURGO) Database for San Diego County downloaded from SanGIS
Land Cover	SanGIS	2013	Ecology-Vegetation layer for San Diego County downloaded from SanGIS
Geology	Kennedy, M.P., and Tan, S.S.	2002	Geologic Map of the Oceanside 30'x60' Quadrangle, California, California Geological Survey, Regional Geologic Map No. 2, 1:100,000 scale.

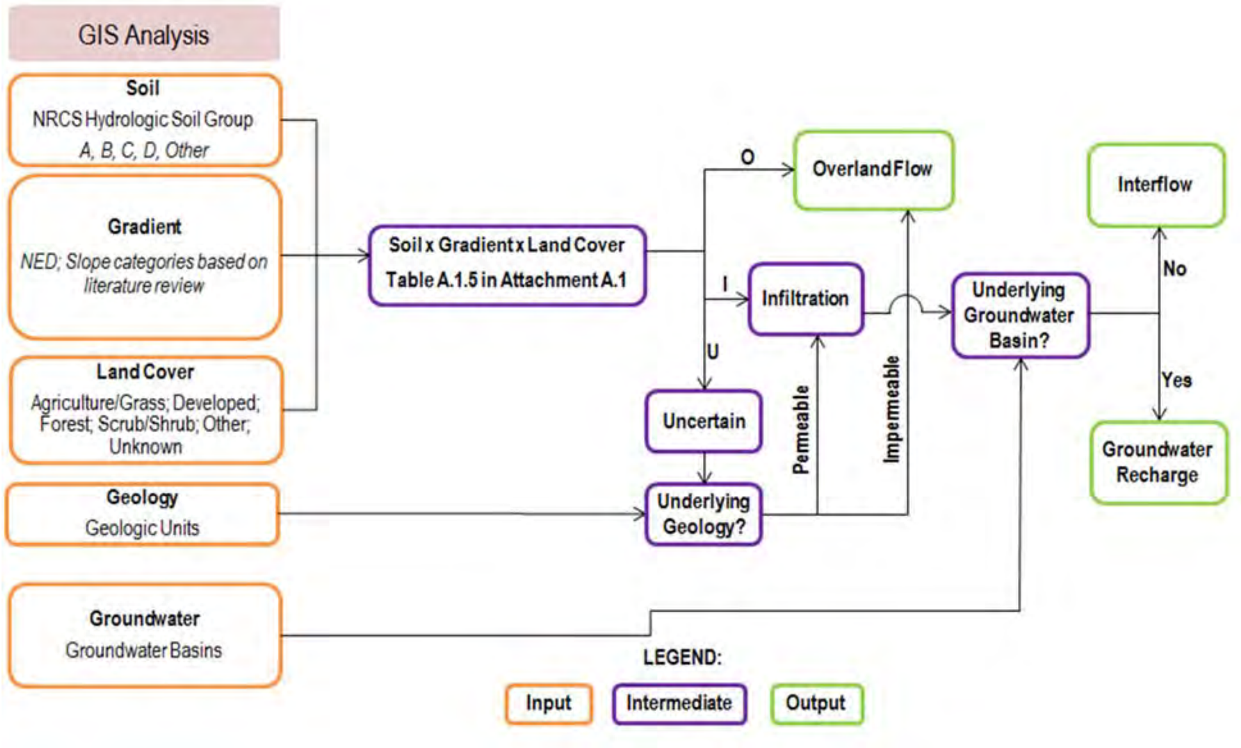
Dataset	Source	Year	Description
	Kennedy, M.P., and Tan, S.S.	2008	Geologic Map of the San Diego 30'x60' Quadrangle, California, California Geological Survey, Regional Geologic Map No. 3, 1:100,000 scale.
	Todd, V.R.	2004	Preliminary Geologic Map of the El Cajon 30'x60' Quadrangle, Southern California, United States Geological Survey, Southern California Aerial Mapping Project (SCAMP), Open File Report 2004-1361, 1:100,000 scale.
	Jennings et al.	2010	"Geologic Map of California," California Geological Survey, Map No. 2 – Geologic Map of California, 1:750,000 scale
Groundwater Basins	SanGIS	2013	Groundwater Basins in San Diego County downloaded from SanGIS

2.1.2. Methodology/Assumptions/Criteria for identifying dominant hydrologic processes

The methodology used to describe dominant hydrologic processes is based on recommendations included in the Southern California Coastal Water Research Project's (SCCWRP) Technical Report 605 titled "Hydromodification Screening Tools: GIS-Based Catchment Analyses of Potential Changes in Runoff and Sediment Discharge" (SCCWRP, 2010). The foundation for this analysis was to incorporate the Report's concept of grouping common hydrologic attributes into Hydrologic Response Units (HRUs). The report states the following:

> *"Grouping common hydrologic attributes across a watershed into a tractable number of Hydrologic Response Units (HRUs: a term first used by England and Holtan 1969) has become a well-established approach for condensing the near-infinite variability of a natural watershed into a tractable number of different elements. The normal procedure for developing HRUs is to identify presumptively similar rainfall–runoff characteristics across a watershed by combining spatially distributed climate, geology, soils, land use, and topographic data into areas that are approximately homogeneous in their hydrologic properties (Green and Cruise 1995, Becker and Braun 1999, Beven 2001, Haverkamp et al. 2005). As noted by Beighley et al (2005), this process of merging the landscape into discrete HRUs is a common and effective method for reducing model complexity and data requirements. Using watershed characteristics to predict runoff is the explicit task of hydrologic models, and there is a host of such models available for application to hydromodification evaluation. For purposes of "screening," however, the goal is simplicity and ease of application even if the precision of the resulting analysis is crude."*

The following process describes the methodology used to define Hydrologic Response Units (HRUs) and then relate the HRUs to the dominant hydrologic processes (i.e., overland flow, interflow, and groundwater recharge) in the San Diego Bay WMA.



The first step is to define the HRUs. Once these are defined, the remaining steps determine the dominant hydrologic process.

1. **Integrate data sets used to determine HRU**: Categories for soil type, gradient, and land cover were defined based on readily available GIS datasets for the region and classifications found in relevant literature, as indicated below. The different combinations of these three categories comprise the distinct HRUs.

   - **Soil Categories**: based on National Resource Conservation Service (NRCS) Hydrologic Soil Group (HSG) classifications, which are commonly used to describe runoff/infiltration potential of soils on a regional scale. These categories include: A, B, C, and D. HSG A soils have the lowest runoff potential, while HSG D soils have the highest runoff potential.

   - **Gradient Categories**: based on slope ranges found in a review of relevant literature identified in Chapter 6. The spatial processing of the slope categories utilized the United States Geologic Survey (USGS) National Elevation Dataset (NED). Slopes were grouped (bins) into the following ranges: 0% to 2%; 2% to 6%; 6% to 10%; and greater than 10%. The 2% and 6% slope thresholds were based on slope ranges included in Table A.1.1 (McCuen, 2005) presented in Attachment A.1. This table provides runoff coefficients as a function of slope, soil group, land cover, and return period and was used for subsequent steps in the mapping effort. The 10% slope threshold was used in SCCWRP's Technical Report 605 (SCCWRP, 2010) and is a logical cutoff since slopes steeper than 10% are assumed to be dominated by overland flow.

- **Land Cover Categories**: were defined using the Ecology Vegetation GIS map layer developed by the City of San Diego, the County of San Diego and SANDAG and downloaded from SanGIS (2013). The vegetation categories in the GIS layer were grouped (Table A.1.2 in Attachment A.1) to match the following categories used in SCCWRP's Technical Report 605 (SCCWRP, 2010): Agriculture/Grass; Developed; Forest; Scrub/Shrub, Other (Water), and Unknown.

2. **Evaluate Land Cover**: Land cover categories for Agriculture/Grass, Forest, Scrub/Shrub and Other were related to land use categories defined in Table A.1.1 as shown in Table A.1.3 in Attachment A.1. Relating a land use category for the Developed land cover category was not necessary because all Developed cover was assumed to have overland flow as its dominant hydrologic process.

3. **Determine Hydrology Characteristics for Land Covers**: For each of the land cover/land use categories listed in Table A.1.3, the ratio of precipitation lost to evapotranspiration (i.e. an evapotranspiration coefficient) was estimated using Table A.1.1 using the process described below. Since precipitation is considered to be the sum of the resulting runoff, infiltration, and evapotranspiration, the coefficients for these three hydrologic pathways sum to one, as indicated below.

   Runoff Coefficient + Infiltration Coefficient + Evapotranspiration Coefficient = 1

   i) **Estimate Evapotranspiration**: To estimate the evapotranspiration (ET) coefficient for each land cover, first the runoff coefficient was identified in Table A.1.1 for the highest runoff potential (i.e., Group D soil and 6%+ slope) and most common storm conditions (i.e., storm recurrence intervals less than 25 years). The infiltration for these high runoff conditions was assumed to be negligible, resulting in an infiltration coefficient of zero. Since the sum of the three coefficients should sum to one, the ET coefficient was assumed to be the remaining difference (i.e., ET Coefficient = 1 – Runoff Coefficient). The ET coefficient calculated for the highest runoff potential was then applied to all soil types and slopes within that land use category. The calculated ET coefficient for each applicable HRU is provided in Table A.1.4 in Attachment A.1. The ET coefficient for HRUs that have a Developed land cover or a gradient greater than 10% were not calculated since these HRUs were assumed to have overland flow as the dominant hydrologic process.

   ii) **Estimate Infiltration**: The infiltration coefficient for each applicable HRU (i.e., combination of soil, gradient, and land cover) was estimated by subtracting both the runoff coefficient, provided in Table A.1.1, and the ET coefficient, calculated in step 3(i), from one (i.e., Infiltration Coefficient = 1 – Runoff Coefficient – ET Coefficient). The calculated infiltration coefficient for each applicable HRU is provided in Table A.1.4 in Attachment A.1.

   iii) **Estimate Runoff**: For each applicable HRU, the runoff coefficient was divided by the infiltration coefficient to obtain a ratio representing the potential for runoff or infiltration. The higher the ratio, the greater the potential for runoff to be a more dominant hydrologic process than infiltration. Similarly, the lower the ratio, the greater the potential for infiltration to be a more dominant hydrologic process than runoff. The calculated runoff to infiltration ratios are provided in Table A.1.4 in Attachment A.1.

4. **Associate Runoff and Infiltration to HRUs**: The following designations were assigned to each applicable HRU based on the runoff to infiltration ratio (i.e., runoff coefficient/infiltration coefficient). These designations were based on best engineering judgment with the underlying assumption that if a runoff or infiltration coefficient is more than 50% greater than its counterpart, then the prevailing process is considered dominant.

   - HRUs with runoff to infiltration ratios greater than 1.5 (3:2 ratio) were assumed to have relatively high runoff and overland flow was considered its dominant hydrologic process. These HRUs are designated by the letter “O” (Overland flow is dominant process) in Tables A.1.4 and A.1.5 in Attachment A.1.

   - HRUs with runoff to infiltration ratios less than 0.67 (2:3 ratio) were assumed to have relatively high infiltration and its dominant hydrologic process was either interflow or groundwater recharge, based on analysis described in subsequent steps. These HRUs are designated by the letter “I” (Interflow is dominant process) in Tables A.1.4 and A.1.5.

   - For HRUs with runoff to infiltration ratios between, and including, 1.5 and 0.67 it was uncertain whether it was dominated by overland flow or infiltration. These HRUs are designated by the letter “U” (Dominant process is uncertain) in Tables A.1.4 and A.1.5.

   - For HRUs that have a Developed land cover or a gradient greater than 10%, the runoff to infiltration ratios were not calculated because these HRUs were assumed to have overland flow as the dominant hydrologic process. These HRUs are designated by the letter “O” (Overland flow is dominant process) in Table A.1.5.

5. **Uncertain HRUs Assignment**: For HRUs with an uncertain designation (“U”) in Table A.1.5 in Attachment A.1, the underlying regional geology (Kennedy and Tan, 2002 & 2008; Todd, 2004 and Jennings et al., 2010) was used to evaluate whether overland flow or infiltration were dominant. If the underlying geology was considered impermeable, then these uncertain areas were considered to have overland flow as its dominant hydrologic process. If the underlying geology was considered permeable, then these uncertain areas were considered to be dominated by infiltration. The determination of whether a geologic unit is impermeable or permeable was based on desktop evaluation and the best professional judgment of a Certified Engineering Geologist (CEG). This analysis was performed in GIS and is illustrated in the flowchart above.

6. **Associate Infiltration HRUs with Known Groundwater Basins**: For HRUs with relatively high infiltration and have a designation of “I” in Table A.1.5 in Attachment A.1,

the presence or absence of a regional groundwater basin (SanGIS, 2013) underlying these areas determined whether the dominant hydrologic process was designated as interflow or groundwater recharge. The groundwater recharge hydrologic process was assigned as dominant for those applicable areas which had an underlying groundwater basin. The interflow hydrologic process was assigned as dominant for those applicable areas which did not have an underlying groundwater basin directly below it. This analysis was performed in GIS and is illustrated in the flowchart above.

7. **Resulting HRU Data:** The resulting GIS map of dominant hydrologic processes was reviewed by engineering professionals familiar with the hydrology in the County of San Diego to confirm that the mapping is consistent with their experience working in the region.

2.1.3. Results for identifying dominant hydrologic processes

The resulting GIS map showing the spatial distribution of dominant hydrologic processes (i.e., overland flow, interflow, and groundwater recharge) within the San Diego Bay WMA is provided in Attachment A.1. An ArcMap document file which presents the results from each step of the methodology is included in Attachment C, as well as a Google Earth KMZ file. Based on this analysis, overland flow is the predominant hydrologic process in all this WMA, which is consistent with the experience of engineering professionals familiar with the hydrology of the County of San Diego.

</table>

2.1.4. Limitations for identifying dominant hydrologic processes

The resulting GIS map layer only lists the dominant hydrological process (i.e., an HRU assigned a dominant process of overland flow can also experience small amounts of infiltration) and provides a useful, rapid framework to perform screening-level analysis that is appropriate for watershed-scale planning studies. When more precise estimates are required for a particular site and subarea it is recommended that this analysis be augmented with site-specific analysis.

2.2. Stream Characterization

For the purpose of WMAA, the Regional MS4 Permit requires a description of existing streams in the watershed, including bed material and composition, and if they are perennial or ephemeral. Under the Regional WMAA, this analysis was prepared for 27 streams throughout the San Diego Region agreed upon by the consultant team and Copermittees. Within the San Diego Bay WMA, stream characterization and detailed mapping is provided for Chollas Creek, Sweetwater River – Reach 1 (San Diego Bay to Sweetwater Reservoir), Sweetwater River – Reach 2 (Sweetwater Reservoir to Loveland Reservoir), Otay River, and Jamul / Dulzura Creek as shown on the exhibit titled "Watershed Management Area Streams" located in Attachment A.2.

2.2.1. Datasets Used for stream characterization

The following data were referenced for the purpose of stream characterization:

- USGS National Hydrography Dataset, downloaded from USGS November 2013
- USGS 7.5-minute quadrangles, compiled image of quadrangles covering San Diego County, various dates
- Floodplains: "National Flood Hazard Layer," provided by Federal Emergency Management Agency October 2012
- Various datasets provided by Copermittees depicting existing storm water conveyance infrastructure within their jurisdictions.
- Aerial photography by Digital Globe dated 2012

2.2.2. Methodology/Assumptions/Criteria for stream characterization

The analysis was prepared by digitizing each of the 27 streams based on review of data listed above. Within the pre-existing datasets depicting streams, floodplains, or infrastructure, no single dataset included a complete, accurate alignment of each stream. Digitizing the streams based on review of all of the data listed above allowed creation of GIS linework with a continuous corrected alignment for each stream. The following data were recorded as GIS attributes for each stream as the stream was digitized:

- River name
- Reach type (engineered or natural, constrained or un-constrained)
- Bed material
- Bank material
- Hydrographic category (perennial or intermittent)

The attributes listed above were collected manually based on interpretation of the reference data. Assumptions used in making the interpretations are listed below. The ***Hydrographic Category*** section below will provide the rationale as to why perennial and intermittent were the hydrographic categories chosen for this WMAA and not perennial and ephemeral.

Note that stream classification was not prepared within areas of Federal/State/Indian lands unless data was readily available. Stream lines were prepared within these areas for continuity, but some data fields were not populated within these areas.

Reach Type

Streams were classified as either engineered or natural, and either constrained or un-constrained. See the exhibit titled, "Watershed Management Area Streams by Reach Type" in Attachment A.2. The purpose of this exercise was to identify whether the stream has been modified by human activity within the stream itself, which may include addition of crossing structures, stabilization of banks, dredging, or any other human activity. This aids the identification of physical structures including stream armoring, constrictions, grade control, and other modifications as required by the Regional MS4 Permit.

Classification of the streams as either "**engineered"** or **"natural"** was based on the following criteria:

<u>Engineered</u>

- A classification of "engineered" was assigned where the stream itself has been modified by human activity.
- All culvert/bridge/pipe crossings either provided in the Copermittes' storm water conveyance system data or clearly visible on the aerial photo have been assigned as engineered within the limits of the crossing.
- If the Copermittees did not provide storm water conveyance system data for the dirt road crossings/dip sections the streams have been assigned as engineered within the limits of the crossing. These crossings may or may not have culverts.
- If the Copermittees' storm water conveyance system data stated the facility is a detention or desilting basin, they were assigned as engineered.
- Golf courses have been assigned as engineered.
- If aerial photography showed large water bodies (lake, pond, irrigation pond, etc.) they were assigned as engineered.
- If the storm water conveyance system data provided by the Copermittees has identified the stream as "rockbs", the assumption has been made that these streams have rocks on their bottom and the sides ("bs"), and have been assigned as engineered.
- Sand mining operations have been assigned as engineered. Sand mining is an operation that is in continuous flux and does not typically result in a discrete, engineered geometry in any given channel cross section until restoration is implemented at the conclusion of the sand mining operation. It is assigned as engineered to acknowledge human alteration of the stream.

<u>Natural</u>

- Streams that have no apparent alteration within the stream itself by human activity have been assigned as natural.

Classification of the streams as either **"constrained"** or **"un-constrained"** was based on the following criteria:

<u>Constrained</u>

- All culvers/bridge/pipe crossings either provided in the Copermittes' storm water conveyance system data or clearly visible on the aerial photo have been assigned as constrained.
- If the Copermittees did not provide storm water conveyance system data for the dirt road crossings/dip sections the streams have been assigned as constrained. These crossings may or may not have culverts.
- If the Copermittees' storm water conveyance system data stated the facility is a detention or desilting basin, they were assigned as constrained.
- Golf courses have been assigned as constrained if located within the Federal Emergency Management Agency (FEMA) floodway based on the "National Flood Hazard Layer" data.
- The USGS National Hydrographic Dataset in their hydrographic category had assigned some reaches as artificial paths. In these situations and if the aerial photography shows large water bodies (lake, pond, irrigation pond, etc.) these streams have been assigned as constrained.
- Sand mining operations located within the FEMA floodway based on the "National Flood Hazard Layer" have been assigned as constrained.

<u>Un-constrained</u>

- Golf courses have been assigned as un-constrained if not located within the FEMA floodway based on the "National Flood Hazard Layer" data.
- Sand mining operations not located within the FEMA floodway based on the "National Flood Hazard Layer" data have been assigned un-constrained.
- If the stream is located within the FEMA floodway based on the "National Flood Hazard Layer" and there is available land in the floodway fringe (the area between the floodway and the 100-yeaer floodplain) the area has been assigned un-constrained. Note that there may be only one side or both sides of the stream with available land in the floodway fringe therefore a note was added as to which side of the stream is constrained and un-constrained.
- If the stream is located within a FEMA 100-year floodplain based on the "National Flood Hazard Layer" data with no floodway and the FEMA floodplain width is not within an existing development or bordered by roads have been assigned as un-constrained.

Bed Material and Bank Material

The following bed and bank materials were identified:

- Concrete
- Riprap
- Pipe / culvert
- Earth

The assumptions made to identify the streams bed and bank materials were based on the following criteria:

- If the data provided by the Copermittees provided information about the stream bed and bank material, the provided data was used for the bed and bank material.
- Generally the data provided by the Copermittees did not identify the crossing type (pipe, box culvert, bridge with or without piers, etc.) or the material (RCP, RCB, earth, riprap, concrete, etc.). In that case, all culvert/bridge/pipe crossings were assigned as pipe/culvert for the bed and bank material.
- If the Copermittees did not provide data for the dirt road crossings/dip sections the bed and bank material have been assigned as pipe/culvert. These crossings may or may not have culverts.
- If the Copermittees' storm water conveyance system data stated the facility is a detention or desilting basin, the bed and bank material have been assigned as earth.
- If aerial photography showed large water bodies (lake, pond, irrigation pond, etc.) they were assigned as earth bed and bank material. The USGS National Hydrographic Dataset in their hydrographic category had assigned some of these types of reaches as artificial paths.
- Sand mining operations within the stream have been assigned as earth for bed and bank material.
- If the Copermittees did not provide data for the stream material the bed and bank material have been assigned based on the aerial photography.

See exhibits titled, "Watershed Management Area Streams by Bed Material" in Attachment A.2.

After stream bed and bank material was classified, earthen reaches were further classified by geologic group. This was accomplished by intersecting the streams with the geologic group layer that had been prepared for use in the dominant hydrologic process and potential coarse sediment yield analyses. The result is displayed in exhibits titled, "Watershed Management Area Streams by Geologic Group" in Attachment A.2.

Hydrographic Category

Streams were classified as "perennial" or "intermittent." See exhibits titled, "Watershed Management Area Streams by Hydrographic Category" in Attachment A.2. Classification was obtained from the USGS National Hydrography Dataset (NHD). The definitions of these categories in the USGS National Hydrography Dataset are:

- **Perennial**: Contains water throughout the year, except for infrequent periods of severe drought.
- **Intermittent**: Contains water for only part of the year, but more than just after rainstorms and at snowmelt.

While the specific Regional MS4 Permit language requested classification of perennial or ephemeral, rather than perennial or intermittent, the data that was referenced in order to classify streams did not include "ephemeral" streams. For reference, the USGS National Hydrography

Dataset definition of "ephemeral" is: "contains water only during or after a local rainstorm or heavy snowmelt." None of the stream reaches in the study were classified as ephemeral in the NHD dataset, therefore none are classified as ephemeral in the WMAA product. The City of San Diego provided a map titled “City of San Diego Stream Survey” dated April 3, 2013 prepared by AMEC that shows streams that are “dry” and streams that are “flowing”. This information in conjunction with the other parameters listed in this section was used to determine if a stream was perennial or intermittent.

USGS NHD includes hydrographic category classification for many of the streams. However data was not available for all reaches of all streams. In order to classify reaches of streams that did not already contain this data in NHD, these assumptions were made:

- The USGS NHD information for the stream hydrographic category has been used when available.
- When USGS NHD has “artificial paths” for portions of the stream, the hydrographic category of the upstream portion of the stream have been assigned to the stream unless other assumptions took precedence.
- If aerial photography shows large waterbody (lake, pond, irrigation pond, etc.) perennial has been assumed for the hydrographic category.
- For ponded areas shown on the aerial photography and if the USGS 7.5-minute quadrangles shows cross hatching for the area, intermittent has been assigned unless the upstream portion of the stream was assigned as perennial pursuant to the USGS National Hydrography Dataset then assigned perennial for the ponded area.
- USGS has a dashed line for intermittent streams. USGS has a solid line for perennial streams. In some situations this information was used to assist in the determination of assigning perennial or intermittent to a stream.

2.2.3. Results for stream characterization

The 27 streams and data are contained in a GIS file titled "SD_Regional_WMAA_Streams" located in Attachment C. The streams are shown in watershed maps included in Attachment A.2.

Summary of Deliverables for Stream Characterization

Format	Item	Description	Location
Report	Title of Figures	• "Watershed Management Area Streams" • "Watershed Management Area Streams by Hydrographic Category" • "Watershed Management Area Streams by Bed Material" • "Watershed Management Area Streams by Geologic Group" • "Watershed Management Area Streams by Reach Type"	Attachment A.2
GIS	Map Group Title	Not Grouped	Attachment C.1
	Map Layer Title	SD_Regional_WMAA_Streams	

Format	Item	Description	Location
	Geodatabase Feature Dataset	Streams	
	Geodatabase Feature Class	SD_Regional_WMAA_Streams	
	Geodatabase Geometry Type	Line	
KMZ [1]	KMZ File Name	SD_Regional_WMAA_Streams	Attachment C.2
[1] To enhance the utilization of this data, the Stream Characterization map is provided in both traditional GIS file format (ESRI software license purchase required) and as a Google Earth KMZ (Keyhole Markup Language/Zipped) file that can be viewed with the free download version of Google Earth (http://www.google.com/earth/).			

In addition to the 27 streams that were subject of detailed analysis, NHD streams have been included on maps and within the geodatabase for reference. The NHD stream alignments have not been corrected and in some cases may be inconsistent with the existing infrastructure. The NHD streams are contained in a GIS file titled, "SD_NHD_Streams."

2.2.4. Limitations for stream characterization

- Only a desktop analysis was performed and no field verification was conducted.
- Infrastructure is only based on storm water conveyance system data provided by Copermittees or clearly visible on aerial photography. If the Copermittee used a numbering or lettering system for describing bed and bank material for example, since the metadata was not provided the bed and bank material could not be verified.
- In some instances concrete channels cannot be identified on aerial photography if it is filled with sediment and/ or vegetation.

2.3.Land Uses

For the purpose of the WMAA, the Regional MS4 Permit requires a description of current and anticipated future land uses. This is presented in the final GIS deliverable as "Land Use Planning" and includes the following representations of land uses in the watersheds: existing land uses, planned land uses, developable lands, redevelopment and infill areas, floodplains, Multiple Species Conservation Program (MSCP) designated areas, and areas not within the Copermittees' jurisdictions (tribal lands, state lands, and federal lands).

2.3.1. Datasets Used for land uses

The following existing regional datasets were referenced to meet this requirement:

- Municipal boundaries: "Municipal_Boundaries" dated August 2012, available from SanGIS/SANDAG
- Ownership: "Parcels" dated December 2013, available from SanGIS/SANDAG
- Existing land use: "SANGIS.LANDUSE_CURRENT" dated December 2012, available from SanGIS/SANDAG (existing land use)
- Planned land use: "PLANLU" (Planned Land Use for the Series 12 Regional Growth Forecast (2050)), dated December 2010, available from SanGIS/SANDAG
- Developable land: "DEVABLE" (Land available for potential development for the Series 12 Regional Growth Forecast), dated December 2010, available from SanGIS/SANDAG
- Redevelopment and infill areas: "REDEVINF" (Redevelopment and infill areas for the Series 12 Regional Growth Forecast), dated December 2010, available from SanGIS/SANDAG
- Floodplains: "National Flood Hazard Layer" provided by Federal Emergency Management Agency October 2012
- Multiple Species Conservation Program (MSCP), total of four datasets available from SanGIS/SANDAG: "MHPA_SD," dated 2012, (Multiple Habitat Planning Areas for City of San Diego); "MSCP_CN," dated 2009 (designations of the County of San Diego's Multiple Species Conservation Program South County Subregional Plan); "MSCP_EAST_DRAFT_CN," dated 2009 (draft East County MSCP Plan); and "Draft_North_County_MSCP_Version_8.0_Categories," dated 2008 (draft North County MSCP Plan)

2.3.2. Methodology/Assumptions/Criteria for land uses

The existing regional datasets for existing land use, planned land use, developable land, redevelopment and infill areas, floodplains, and MSCP designated areas were referenced with no modifications. Areas not within the Copermittees' jurisdictions (tribal lands, state lands, and federal lands) were compiled from SanGIS parcel data (December 2013) based on the "ownership" value. The owners listed below were excluded from the Copermittees jurisdictions and represent the "Federal/State/Indian" layer, which is displayed on various maps included in Attachment A.2.

- Bureau of Land Management
- California Department of Fish and Game
- Indian Reservations
- Military Reservations
- Other Federal

- State
- State of California Land Commission
- State Parks
- U.S. Fish and Wildlife Service
- U.S. Forest Service

When available, relevant data from these areas was included in analyses (e.g., developable land areas within Federal/State/Indian areas). Stream lines were prepared within these areas for continuity. However, stream classification (e.g., bed and bank material) was not prepared within these areas unless data was readily available (e.g., hydrographic category data available from NHD)

2.3.3. Results for land uses

The existing regional datasets are compiled into the Geodatabase in a group titled, "Land Use Planning." Current and anticipated future land uses are depicted in watershed maps included in Attachment C. Federal/State/Indian Lands are also referenced on all other map exhibits included in Attachment A.2.

Summary of Deliverables for Land Uses

2.3.4. Limitations

Some jurisdictions may have compiled GIS land use layers that include more detailed or more current information than the regional datasets available from SanGIS. SanGIS layers were selected for the Regional WMAA to provide consistent land use characterization region-wide, and to provide for repeatability of GIS analyses when a land use layer is required for input data. The definition of non-Copermittee areas identified in this document as "Federal/State/Indian Lands" is for the Regional WMAA. Some WQIPs may define non-Copermittee areas differently.

2.4.Potential Critical Coarse Sediment Yield Areas

The Regional MS4 Permit identifies in the provisions related to the WMAA that potential coarse sediment yield areas within the watershed be identified, with GIS layers (maps) as output. With regard to the function and importance of coarse sediment, SCCWRP Technical Report 667 titled "Hydromodification Assessment and Management in California" states the following:

"Coarse sediment functions to naturally armor the stream bed and reduce the erosive forces associated with high flows. Absence of coarse sediment often results in erosion of in-channel substrate during high flows. In addition, coarse sediment contributes to formation of in-channel habitats necessary to support native flora and fauna."

This report identifies the potential critical coarse sediment yield areas for the San Diego Bay WMA in compliance with this permit provision. The applied datasets and methodologies for identifying the coarse sediment yield areas, along with their respective results, are described in the sections below.

2.4.1. Datasets Used for identifying potential critical coarse sediment yield areas

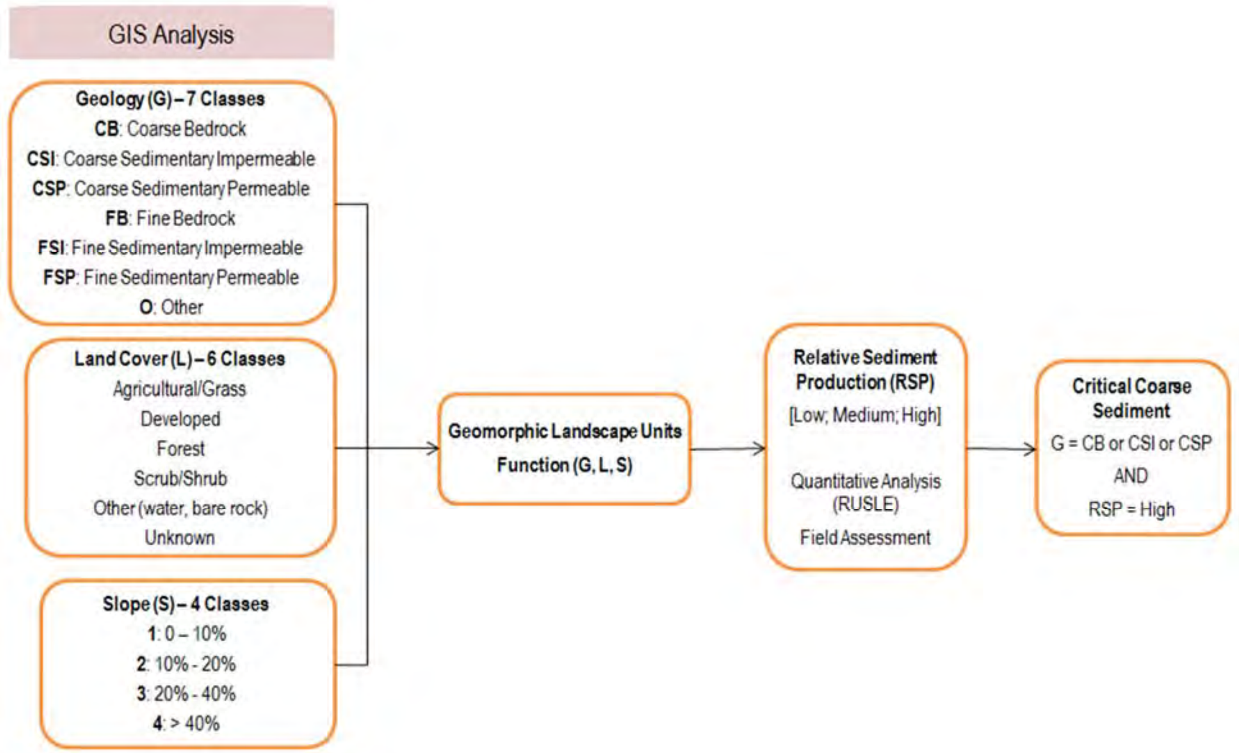
The following datasets were used in the analysis

Dataset	Source	Year	Description
Elevation	USGS	2013	1/3rd Arc Second (~10 meter cells) digital elevation model for San Diego County
Land Cover	SanGIS	2013	Ecology-Vegetation layer for San Diego County downloaded from SanGIS
Geology	Kennedy, M.P., and Tan, S.S.	2002	Geologic Map of the Oceanside 30'x60' Quadrangle, California, California Geological Survey, Regional Geologic Map No. 2, 1:100,000 scale.
	Kennedy, M.P., and Tan, S.S.	2008	Geologic Map of the San Diego 30'x60' Quadrangle, California, California Geological Survey, Regional Geologic Map No. 3, 1:100,000 scale.
	Todd, V.R.	2004	Preliminary Geologic Map of the El Cajon 30'x60' Quadrangle, Southern California, United States Geological Survey, Southern California Areal Mapping Project (SCAMP), Open File Report 2004-1361, 1:100,000 scale.
	Jennings et al.	2010	"Geologic Map of California," California Geological Survey, Map No. 2 – Geologic Map of California, 1:750,000 scale

2.4.2. Methodology/Assumptions/Criteria for identifying potential critical coarse sediment yield areas

The methodology used to identify coarse sediment yield areas is based on Geomorphic Landscape

Unit (GLU) methodology presented in the SCCWRP Technical Report 605 titled "Hydromodification Screening Tools: GIS-Based Catchment Analyses of Potential Changes in Runoff and Sediment Discharge" (SCCWRP, 2010). Geomorphic Landscape Units characterize the magnitude of sediment production from areas through three factors judged to exert the greatest influence on the variability on sediment-production rates: geology types, hillslope gradient, and land cover. The GLU approach provides a useful, rapid framework to identify sediment-delivery attributes of the watershed. The process to integrate these factors into GLUs is indicated in the flow chart below.



The following steps were used to define Geomorphic Landscape Units (GLUs), which were then related to the coarse sediment and critical coarse sediment yield areas in the San Diego Bay WMA.

1. **Integrate data sets used to determine GLU:** Categories for geology, gradient, and land cover were defined based on readily available GIS datasets for the region and classifications found in relevant literature listed in Chapter 6. The different combinations of these categories make up distinct GLUs.

   - **Geologic Categories**: based on methodology listed in Attachment A.4.1 of Attachment A.4. Resulting geologic categories from this analysis are: Coarse Bedrock (CB), Coarse Sedimentary Impermeable (CSI), Coarse Sedimentary Permeable (CSP), Fine Bedrock (FB), Fine Sedimentary Impermeable (FSI), Fine Sedimentary Permeable (FSP), and Other (O). An exhibit showing the regional geology groupings is presented in Attachment A.4.

   - **Land cover categories**: defined using the Ecology Vegetation GIS map layer developed by the City of San Diego, the County of San Diego and SANDAG which were downloaded from SanGIS (2013). The vegetation categories in the GIS layer were grouped (Table A.1.2 in Attachment A.1) to match the following categories used in SCCWRP's Technical Report 605 (SCCWRP, 2010): Agriculture/Grass; Developed; Forest; Scrub/Shrub, Other (Water) and Unknown.

- **Gradient Categories**: based on slope ranges found in a review of relevant literature (GLU methodology applied in California) listed in Chapter 6. The spatial processing of the slope categories utilized the USGS National Elevation Dataset (NED). Slope ranges used include: 0% to 10%, 10% to 20%, 20% to 40%, and greater than 40%.

2. **GLU Union Results**: GIS mapping exercise for the study area resulted in 166 GLUs within the 9 WMAs in San Diego County. Table A.4.2 in Attachment A.4 provides the list of the 166 GLUs.

For implementing hydromodification management performance standards in the Regional MS4 Permit, the Copermittees need to identify Critical Coarse Sediment Yield areas in the study region. To provide information on the identification of Critical Coarse Sediment yield, the study assumed that critical coarse sediment would be generated from GLUs that are composed of geologic units likely to generate coarse sediment (based on the methodology listed in Step 3) and have the potential for high relative sediment production (as estimated using the methodology listed in Step 4).

3. **Define Pertinent Geologic groups**: the geologic groups (Attachment A.4.1) considered in this study to have the potential to generate coarse sediment are Coarse Bedrock (CB), Coarse Sedimentary Impermeable (CSI), and Coarse Sedimentary Permeable (CSP). An exhibit showing the regional geologic grouping is presented in Attachment A.4.

4. **Relate GLU to Sediment Production**: For assigning GLUs with a relative sediment production, the following methodology was utilized:

    - Conducted quantitative analysis to assign relative sediment production. Analysis was performed based on the assumption that sediment production from an area is proportional to the soil loss from the area, as evaluated using standard soil loss equation. Detailed analysis steps are documented in Attachment A.4.2;

    - To validate the quantitative assignment above, a qualitative field assessment was conducted for 40 sites. Site selection and findings from the field assessment is documented in Attachment A.4.3.

    - The result of the field assessment indicated a 65% match between field conditions and the quantitative assignments. The mismatches are attributed to differences in percent land cover as assumed for the quantitative analysis and those observed in the field. As such, the quantitative assignments were considered to be valid for the purposes of assigning relative sediment production.

2.4.3. Results for identifying potential critical coarse sediment yield areas

The resulting GIS maps showing the spatial distribution of geologic grouping and critical coarse sediment yield areas within the San Diego Bay WMA are provided in Attachment A.4. An ArcMap document which presents the results from each step of the methodology is included in Attachment C. Based on this analysis it was estimated that 9.9 % of the study area is a potential critical coarse sediment yield area.

As a result of the regional-scale datasets, and commensurate data resolution, used to map the potential critical coarse sediment yield areas, some areas may have been mapped that in reality do not produce critical coarse sediment as they are existing developed areas. As such, an opportunity for jurisdictions to incorporate more refined data into the preliminary WMAA GIS dataset based on local knowledge and review of current aerial images was provided. The City of National and the County of San Diego provided augmented data in the San Diego Bay WMA for their respective jurisdictional areas.

Summary of Deliverables for Potential Critical Coarse Sediment Yield Areas

Format	Item	Description	Location

[1] To enhance the utilization of this data, the Geomorphic Landscape Unit Analysis is provided in both traditional GIS file format (ESRI software license purchase required) and as a Google Earth KMZ (Keyhole Markup Language/Zipped) file that can be viewed with the free download version of Google Earth (http://www.google.com/earth/).

2.4.4. Limitations for identifying potential critical coarse sediment yield areas

The resulting GIS layers were developed using regional datasets and provide a useful, rapid framework to perform screening-level analysis that is appropriate for watershed-scale planning studies. The methodology used to identify potential coarse sediment yield areas does not account for instream sediment supply and sediment production from mass failures like landslides which are difficult to estimate on a regional scale without performing extensive field investigation. This data set also does not account for potential existing impediments that may hinder delivery of coarse sediment to receiving waters or downstream locations within the watershed as this was beyond the scope of a regional study. Where more precise estimates are required for a particular site or subarea it is recommended that this analysis be augmented with site-specific analysis. It is also recognized that this regional data set is a function of the inherent data resolution and therefore may not conform to all site conditions, or does not reflect changes to particular areas that have occurred since the underlying data was developed. As such, the WMAA data for the potential critical coarse sediment yield areas should be verified in the field according to the procedures outlined in the Model BMP Design Manual and/or jurisdiction specific BMP Design Manual.

2.5. Physical Structures

The Regional MS4 Permit requires the Copermittees to identify information regarding locations of existing flood control structures and channel structures, such as stream armoring, constrictions, grade control structures, and hydromodification or flood management basins with GIS layers (maps) as output, for each WMA being analyzed for the purpose of developing watershed-specific requirements for structural BMP implementation. This study identified the physical structures using a desktop-level analysis for the stream(s) identified in Section 2.2 in compliance with this permit provision.

2.5.1. Approach for identifying physical structures

The intent of this portion of the WMAA project was to provide an initial assessment of the structures of interest for the stream(s) identified in Section 2.2. This desktop-level analysis was conducted primarily as a visual survey of aerial imagery and FEMA flood insurance study (FIS) profiles where available. The collected information was entered into a GIS layer for inclusion into the overall WMAA geodatabase containing the characterization layers required by the Regional MS4 Permit. To support overall WMA characterization, the information derived in this task provides insight into water and sediment movement through the watershed (SCCWRP, 2012), the opportunities and limitations for infrastructure retrofits and also informs efforts to identify appropriate locations for habitat or riparian area rehabilitation in relation to proximate infrastructure. Specific information regarding how the survey was performed and the attributes of the generated data is presented in Attachment A.5. Note that concrete channels, pipes/culverts, riprap or other artificial stream armoring, and basins have also been identified in the linework generated for the streams (see Section 2.2).

2.5.2. Results for identifying physical structures

The resulting GIS mapping provided in Attachment A.5 shows the spatial locations of the physical structures within the mapped stream(s).

Summary of Deliverables for Physical Structures

Report	Figure	Watershed Management Area Streams by Reach Type with Channel Structures	Attachment A.5
GIS	Map Group Layer Name	Channel Structures	Attachment C.1
	Map Layer Title	Channel Structures	
	Geodatabase Feature Dataset	ChannelStructures	
	Geodatabase Feature Class	ChannelStructures	
	Geodatabase Geometry Type	Point	
KMZ [1]	Kmz File Name	ChannelStructures	Attachment C.2

[1] To enhance the utilization of this data, the Physical Structures map is provided in both traditional GIS file format (ESRI software license purchase required) and as a Google Earth KMZ (Keyhole Markup Language/Zipped) file that can be viewed with the free download version of Google Earth (http://www.google.com/earth/).

3. Template for Candidate Project List

The Regional MS4 Permit requires each WMA to use the results from the WMA characterization to compile a list of candidate projects that could potentially be used as alternative compliance options for Priority Development Projects should an agency or jurisdiction opt to develop an alternative compliance program. Copermittees must first conclude that implementing such a candidate project would provide greater overall benefit to the watershed than requiring implementation of structural BMPs onsite prior to implementing these candidate projects as alternative compliance projects.

The Copermittees elected to identify potential candidate projects as a separate effort from this regional project, and therefore the process for identifying candidate projects is not documented in this report. Instead, this project only developed a template, in a spreadsheet format, for use by the Copermittees to compile lists of potential candidate projects. The template is intended to enhance regional consistency of the information that is gathered for candidate projects. The template spreadsheet file was distributed to the Copermittees on January 28, 2014. A table of the template components is indicated below:

Column	Primary Heading	Secondary Heading	Guidance for Completing the Project List
A	Project Identifier	-	Unique identifier for the project.
B	Watershed Management Area	-	Dropdown menu to select the watershed management area the project is located in
C	Hydrologic Area (HA)	-	Dropdown menu to select the hydrologic area the project is located in Select a WMA in column B for HA (Column C) dropdown menu to activate.
D	Hydrologic Subarea (HSA)	-	Dropdown menu to select the hydrologic subarea the project is located in. Select a HA in column C for HSA (Column D) dropdown menu to activate.
E	Jurisdiction	-	Dropdown menu to select the jurisdiction the project is located in. Select a HSA in column D for Jurisdiction (Column E) dropdown menu to activate.
F	Project Name	-	Indicate the name of the project.
G	Ownership	Type	Dropdown menu to select if the project is a public project, private project, or public-private partnership.
H	Ownership	Ownership Information	List the details for the owner.
I	Project Location	Address	List the address of the project site.
J	Project Location	APN	List the APN of the parcel.
K	Project Location	Latitude	List the latitude of the project site.
L	Project Location	Longitude	List the longitude of the project site.
M	Project Origination/ Originator	Name	List the name of the report/organization/individual that provided the idea for the project. Potential origination sources: WQIP, WMAA, JURMPs, WURMPs, CLRPs, IRWM, MSCP, MHPA, Other.

Column	Primary Heading	Secondary Heading	Guidance for Completing the Project List
N	Project Origination/ Originator	Contact Information	Link or report title if the proposed project is from a report [or] contact information if from an organization/individual.
O	Project Category	-	Drop Down menu to select the project category; In addition to the 6 project categories explicitly listed in the Regional MS4 Permit, the drop down menu also has a category "Other project types allowed by the MS4 Permit". Example for “Other” project types are agency CIP programs such as Green Streets, LID conversions (medians, parks), agency filter installation, etc.
P	Specific Project Type	-	List the subcategory of the project; for example, list Regional BMP type (i.e. infiltration basin, wetland, etc.).
Q	Potential Pollutant	-	Identify the potential pollutant(s) that can be treated by the proposed project.
R	Project Size & Parameters	Contributing Drainage Area (acres)	List the contributing drainage area to the project.
S	Project Size & Parameters	Parcel Size (acres)	List the size of the parcel the project is located on.
T	Project Size & Parameters	Project Footprint (acres)	List the size of the project footprint.
U	Project Size & Parameters	Parameters (with units as necessary)	Parameters needed to quantify benefits from the project; i.e. for an infiltration basin, list the water quality volume, long-term infiltration rate, depth of the basin, etc.
V	Regulatory Requirement	-	Indicate if the project is proposed to meet particular regulatory requirement such as TMDL, etc.
W	Project Timeline	-	Indicate if a project must be implemented by certain date to meet a grant deadline or other time commitment.
X	Other Notes	-	List any other relevant notes; for example, when retrofitting existing infrastructure project category is selected, input parameters needed to quantify benefits from existing infrastructure into this column as these will be needed to estimate additional benefits that can be used for alternative compliance. If N/A is selected in any dropdown menus, add additional explanation in here

4. Hydromodification Management Applicability/Exemptions

Hydromodification, which is caused by both altered storm water flow and altered sediment flow regimes, is largely responsible for degradation of creeks, streams, and associated habitats in the San Diego Region. The purpose of the hydromodification management requirements in the Regional MS4 Permit is to maintain or restore more natural hydrologic flow regimes to prevent accelerated, unnatural erosion in downstream receiving waters.

In some cases, priority development projects may be exempt from hydromodification management requirements if the project site discharges runoff to receiving waters that are not susceptible to erosion (e.g., a lake, bay, or the Pacific Ocean) either directly or via hardened systems including concrete-lined channels or existing underground storm drain systems.

The March 2011 Final Hydromodification Management Plan (HMP) identified certain exemptions from hydromodification management requirements by presenting "HMP applicability criteria." The Regional MS4 Permit maintains some of these HMP applicability criteria. However, some of the applicability criteria are not included under the Regional MS4 Permit unless the area or receiving water is mapped in the WMAA. The intent of this Section is to provide mapping of areas exempt from hydromodification management requirements, and provide supporting technical analyses for exemptions that are recommended by the WMAA.

4.1. Additional Analysis for Hydromodification Management Exemptions

This section documents additional analysis performed to further evaluate the following exemptions that were already approved by the San Diego Regional Board with the 2011 Final HMP. This study only provides additional analysis, data, and rationale for supporting or eliminating the following existing exemptions and does not propose or study any new exemptions.

- Exempt River Reaches
- Stabilized Conveyance Systems Draining to Exempt Water Bodies
- Highly Impervious Watersheds and Urban Infill and
- Tidally Influenced Lagoons

4.1.1. Exempt River Reaches

4.1.1.1. History

The March 2011 Final HMP, approved by the SDRWQCB under the 2007 MS4 Permit, provided a potential exemption from hydromodification management requirements for projects discharging runoff directly to certain major river reaches, including a reach of the Otay River and a reach of the Sweetwater River, provided that the outlet elevation of the project's outfall(s) to an identified exempt river reach are between the river bottom elevation and the 100-year floodplain elevation, and properly sized energy dissipation is provided at the outfall(s).

Exempt river systems/reaches from the 2011 Final HMP:

River	Downstream Limit	Upstream Limit
Otay River	Outfall to San Diego Bay	Lower Otay Reservoir Dam
Sweetwater River	Outfall to San Diego Bay	Sweetwater Reservoir Dam

Exemptions related to runoff discharging directly to the above river reaches were based on the flow duration analysis performed for the San Diego River in the Final HMP and the Technical Advisory Committee (formed to provide input on the development of the Final HMP) members' opinion (based on field observations and years of historical perspective) that the above river reaches have very low gradients, were depositional (aggrading), have very wide floodplain areas when in the natural condition and that the effects of cumulative watershed impacts to these reaches is minimal provided that properly sized energy dissipation is provided at outfalls to the rivers.

4.1.1.2. Status under 2013 Regional MS4 Permit

Under the Regional MS4 Permit, exempt river reaches would not qualify for exemption from hydromodification management controls unless the optional WMAA is developed with additional rationale/analyses to support reinstating exemptions to these river reaches. Additional analysis performed as part of the WMAA to evaluate hydromodification management control exemptions to the previously exempt reaches is presented below.

4.1.1.3. Research, Approach and Results

Hydromodification impacts can be caused due to increase in flows, changes in sediment transport capacity and changes in sediment supply to the streams (SCCWRP, 2012). In order to evaluate the cumulative impacts due to development and determine if hydromodification management exemptions can be reinstated for the river reaches that were exempt in the previous permit term erosion potential (Ep) analysis was used to evaluate the increase in flows and changes in sediment transport capacity. In addition, sediment supply potential (Sp) analysis was used to evaluate the changes in sediment supply in this study. In regards to Ep analysis SCCWRP Technical Report 667 "Hydromodification Assessment and Management in California" states:

> *"The underlying premise of the erosion potential approach advances the concept of flow duration control by addressing in-stream processes related to sediment transport. An erosion potential calculation combines flow parameters with stream geometry to assess long term (decadal) changes in the sediment transport capacity. The cumulative distribution of shear stress, specific stream power and sediment transport capacity across*

the entire range of relevant flows can be calculated and expressed using an erosion potential metric, Ep (e.g., Bledsoe, 2002)."

The approach used in this study is explained in detail in Attachment B.1.1.1. The following WMA characterization maps developed in Section 2 were used to select inputs for the exempt river reach analysis:

- Planning land use layers from Section 2.3 were used to estimate the existing impervious area and identify the developable parcels in each watershed. A GIS exercise was performed to identify the developable parcels in each watershed that will be exempt from hydromodification management requirements if the exemption is granted.
- Stream type classification analysis from Section 2.2 was used to select a conservative cross section (segments that are assigned naturally constrained) to be used in analysis for each watershed
- GLU analysis and its associated quantitative analysis described in Section 2.4 were used to determine Sp metric for each watershed. In this study coarse sediment supply changes were limited to changes in hill slope erosion between existing condition and future condition (for parcels that are proposed to be exempt from hydromodification management) of the watershed. It was assumed that the changes in instream sediment supply between existing and future condition for these large depositional river systems are very minimal.

Selection of inputs for the analysis is explained in detail in Attachment B.1.1.2 and results from the analysis are presented in Attachment B.1.1.3 in tabular format. The Ep analysis performed in this study does not account for the following Regional MS4 permit requirements as a conservative assumption. If accounted for, it will result in a smaller Ep than what is currently reported in Attachment B.1.1.3:

- New development priority development projects including projects that are proposed to be exempt from hydromodification management requirements through this WMAA study must implement retention BMPs to the extent feasible if alternative compliance option is not selected or not available.
- Redevelopment priority development projects must mitigate to the pre-developed condition

4.1.1.4. Recommendation

Based on the results from this study reported in Attachment B.1.1.3, the flow duration analysis performed in the Final HMP, and the Technical Advisory Committee (TAC) recommendations provided during the Final HMP development, it is recommended that hydromodification management exemption be reinstated for projects discharging runoff directly to ~~the following~~ two exempt river reaches.

Additionally, subsequent to the publication of the final WMAA for San Diego Bay, a technical study, including hydrologic modeling and an erosion potential analysis supporting a proposed hydromodification management requirements exemption for a portion of the Otay River, was prepared and submitted to the RPs on behalf of developers. The specific portion of the Otay River that the study considered is between the Lower Otay Reservoir Dam and I-805; the RPs with jurisdictional area that drains to this reach are the cities of Chula Vista and San Diego and the County of San Diego. These three agencies commissioned a third-party review of the submitted study, which indicated that the study appeared to meet the relevant Municipal Permit requirements for a hydromodification management exemption. The study prepared by developers and the third-party review of the study were provided to the San Diego Bay Consultation Panel for review and comment. A public Consultation Panel meeting was also held on August 23, 2016 to discuss comments on the study. No comments objecting to the proposed exemption from hydromodification requirements were submitted by the Consultation Panel. Accordingly, the exemption for the Otay River between Lower Otay Reservoir Dam and I-805 has been incorporated into the San Diego Bay WMAA, subject to final approval by the San Diego Regional Water Quality Control Board. The technical study submitted in support of the exemption is included as Attachment B.3.

Exempt river reaches in the San Diego Bay WMA are listed below.~~:~~

River	Downstream Limit	Upstream Limit	Basis
Otay River	Outfall to San Diego Bay	Interstate 805	Original WMAA Analysis
Otay River	Interstate 805	Lower Otay Reservoir Dam	Additional Analysis (See Attachment B.3)
Sweetwater River	Outfall to San Diego Bay	Sweetwater Reservoir Dam	Original WMAA Analysis

Each municipality must define/approve “direct discharge” based on the project site conditions. To qualify for the potential exemption, the outlet elevation must be between the river bottom elevation and the 100-year floodplain elevation and properly designed energy dissipation must be provided. Mapping of these exempt river reaches is presented in Attachment B.2.

~~Additional studies to establish a site-specific allowable Ep metric for the Otay River from East of Interstate 805 to Lower Otay Reservoir Dam, more closely representing actual measured and observed characteristics of this river system, may result in allowing hydromodification management exemptions not currently supported by this desktop assessment which was based on an allowable Ep metric from literature. However, a~~Any future proposed HMP exemptions would need to be approved through the WQIP Annual Update process (Regional MS4 Permit Section F.1.2.c.).

4.1.1.5. Limitations

The analysis and associated recommendations as presented above were based on instream erosion as the primary consideration to support reinstatement of exemptions from hydromodification management controls for discharges directly to these river reaches. While it is recognized that other factors contribute to adverse impacts (e.g., salinity imbalance, pollutants) to instream habitat and resulting biotic integrity, hydromodification management control has traditionally been considered an “umbrella process” that encompasses most of the highest risk stressors (percent sands and fines present, channel alteration, and riparian disturbance) to physical habitat. Beyond demonstrating that instream erosion is not anticipated as a result of reinstating hydromodification management control exemptions for discharges to these river reaches, a focused method for correlating physical and biotic integrity to modified hydrological conditions has not been performed in this analysis, as an assessment method has not yet been developed.

The current assessment methods may yield inconclusive results when attempting to identify causal relationships between degraded instream habitat solely due to increased flows and erosive force from hydromodification. A causal assessment recently conducted in the lower reaches of the San Diego River, conducted as a partnership between the Southern California Coastal Water Research Project (SCCWRP), the City of San Diego, the County of San Diego, and the San Diego RWQCB, focused on stressors potentially responsible for known biological impairment of the river. Once the data of the causal assessment become available, it may be useful in classifying the potential stressors such as altered physical habitat as likely, unlikely, or an uncertain cause to biological impairment.

With respect to adverse impacts to habitat as a result of pollutants entrained in storm water discharges, these areas will still be subject over time to the pollutant control requirements of the Regional MS4 Permit as areas develop or redevelop. The current requirements obligate development to maximize retention of the design storm volume which will mitigate a portion of the volume that would otherwise be controlled with hydromodification management BMPs. In some cases, this offsetting of volume reduction through pollutant control BMPs may exceed the HMP volumes. In addition, the development that occurs within the exempted watershed areas is still required to provide any applicable flood control measures. Risk of flooding as a result of exemption from hydromodification controls is unlikely as the control thresholds are significantly lower (order of magnitude) than flood control requirements implemented to protect life and property.

4.1.2. Stabilized Conveyance Systems Draining to Exempt Water Bodies

There are no stabilized conveyance systems currently recommended for exemption from hydromodification management requirements in the San Diego Bay WMA. If engineered conveyance systems that are stabilized with materials other than concrete, such as riprap, turf reinforcement mat, or vegetation, including rehabilitated stream systems, are identified as potential candidates for exemption, they may be studied and may be recommended exempt if they meet specific criteria presented in the Regional WMAA for this exemption. Refer to the Regional WMAA for the criteria and an example study that was prepared for Forester Creek in the San Diego River WMA. However, any future proposed HMP exemptions would need to be approved through the WQIP Annual Update process (Regional MS4 Permit Section F.1.2.c.).

4.1.3. Highly Impervious/Highly Urbanized Watersheds and Urban Infill

Based on evaluation of the highly impervious/highly urbanized watershed and urban infill exemptions presented in the March 2011 Final HMP, and comparison with more recent research prepared for the Ventura County Hydromodification Control Plan (Ventura County HCP) (Final Draft dated September 2013), resurrection of these exemptions from the March 2011 Final HMP was not recommended by the Regional WMAA. The research prepared in support of the Ventura County HCP determined lower thresholds of additional impervious area (ranging from 0.44% to 1.65%) than the limit presented in the San Diego County Final HMP dated March 2011 (3%). No areas within the San Diego Bay WMA are currently recommended for highly impervious/highly urbanized watershed or urban infill exemption.

4.1.4. Tidally Influenced Lagoons

There are no tidally influenced lagoons recommended for exemption from hydromodification management requirements in the San Diego Bay WMA. Refer to the Regional WMAA for further information regarding this exemption.

5. Conclusions

5.1. Watershed Management Area Characterization

The WMA Characterization data was developed using available regional data to further understand the macro-scale watershed characteristics and processes in the San Diego Bay WMA. The Regional MS4 Permit allows for flexibility in complying with land development requirements when using the information developed in the WMAA to improve water quality planning and implementation associated with land development. This dataset will assist with identifying the opportunities and constraints for projects and management decisions based on a watershed-scale (rather than piecemeal project identification without context within the watershed) and provides Copermittees the ability to exercise the option to create an alternative compliance program that offers the opportunity to develop watershed-specific alternatives to universal onsite structural BMP implementation. The characterization data includes:

Characterization Data	Utilization Potential
Dominant Hydrologic Process: • Overland flow • Infiltration • Interflow	• Identify areas for enhanced infiltration or collection of storm water for treatment • Implement management measures that correspond to pre-development conditions – promotes long-term channel stability and health • Increases understanding of the natural functioning of the watershed and what has been (or is at risk of being) altered by urbanization.
Stream Characterization: • Reach type • Bed material • Bank material • Hydrographic category • Channel Structures	• Preliminary dataset that can be used to conduct stream power evaluations • Identify channel systems for preservation or restoration • Identification of appropriate space for channel processes to occur (e.g., flood plain connectivity) • Insight to sensitivity of receiving stream reach • Indicates the features within channels that affect water and sediment movement through the watershed

Characterization Data	Utilization Potential
Land Use: • Existing • Future	• Foresight (identifies relative risks, opportunities, or constraints) in comparing future to existing land uses, i.e., areas that may be more/less vulnerable to adverse impacts to changes in storm water runoff associated with development • Encourage infill development
Potential Critical Coarse Sediment Yield Areas	• Preservation of areas or function that contributes critical sediment within the watershed to stream armoring/stability • Assist with identifying potentially susceptible stream reaches that require uninterrupted coarse sediment supplies to remain stable • Dual goal of open space conservation

Regarding the identification of the potential critical coarse sediment yield areas in the WMAA using readily available regional datasets, it is anticipated that when more precise estimates for potential critical coarse sediment yield areas are required for a particular site or subarea that this regional study will be augmented with site-specific analysis. Development projects must avoid critical sediment yield areas or implement measures that allow critical coarse sediment to be discharged to receiving waters, such that there is no net impact to the receiving water to meet the requirements of the Regional MS4 permit. As such, projects should consult the Model BMP Design Manual and/or jurisdiction specific BMP Design manual for options to meet the Regional MS4 Permit requirements. It is anticipated that the data will not be static but will be enhanced over time through future studies or field assessments that will refine what is currently a macro-level data set.

5.2. Template for Candidate Project List

It is anticipated the Copermittees that elect to develop alternative compliance programs will conduct a separate exercise to nominate potential candidate projects for inclusion into the WQIPs using the template developed for this project.

5.3. Hydromodification Management Exemptions

Attachment B.2 presents hydromodification management applicability/exemption mapping for the San Diego Bay WMA. The mapping includes receiving waters that are exempt based on the Regional MS4 Permit or recommended exempt based on studies.

Receiving waters that are **exempt** based on the Regional MS4 Permit include:

- The Pacific Ocean
- San Diego Bay
- Lakes and Reservoirs
- Existing underground storm drains or concrete-lined channels draining directly to San Diego Bay or the ocean

Receiving waters or conveyance systems that are **recommended exempt** in the San Diego Bay WMA based on studies that were prepared as part of the Regional WMAA or prepared by others and provided for this purpose include:

- Otay River from Outfall at San Diego Bay to Interstate 805
- Sweetwater River from San Diego Bay to Sweetwater Reservoir Dam
- Existing underground storm drains or concrete-lined channels discharging directly to the above receiving waters. These systems were identified based on MS4 data provided by the Copermittees via the data call. These systems may not represent all discharges to the above receiving waters. Additional systems may be considered exempt if there is no evidence of erosion at the outfall of the conveyance system, and any other criteria determined by the local jurisdiction.

TORY R. WALKER ENGINEERING OTAY RIVER EROSION POTENTIAL ANALYSIS (TRWE STUDY)

December 18, 2015

Boushra Salem
Storm Water Management Section
City of Chula Vista
1800 Maxwell Road
Chula Vista, CA 91911

SUBJECT: OTAY RIVER EROSION POTENTIAL ANALYSIS

Dear Boushra:

Tory R. Walker Engineering (TRWE) has thoroughly analyzed the Erosion Potential (Ep) methodology used to support the proposed hydromodification management exemption for projects directly discharging to the Otay River from west of Interstate 805 (I-805) to San Diego Bay. Results of that study are presented in Appendix J of the September 2015 Revised Water Quality Improvement Plan for the San Diego Bay Watershed Management Area (San Diego Bay WQIP). This methodology, and its results (herein referred to as the WMAA Ep Analysis), did not include reinstatement of an exemption for the river reach upstream of I-805 to Lower Otay Reservoir.

TRWE conducted a more detailed Ep analysis that uses watershed-specific hydrologic modeling, historical imagery review, and field investigation of existing channel conditions to either invalidate, support, or build upon the WMAA Ep Analysis. Our collective efforts (herein referred to as the Otay Ep Analysis) sought to provide a clearer picture of the potential morphological impacts that may or may not result from granting hydromodification exemptions to projects directly discharging to the Otay River when analyzed more scrupulously. We tested the hypothesis that the effects of Savage Dam and the 1916 dam failure have a more profound impact on river morphology than any proposed directly discharging development downstream of Lower Otay Reservoir—an approach that has not yet been taken by any study. We also revised the WMAA Ep Analysis to account for the natural resiliency of the system due to the re-establishment of vegetation over the past 100 years. The Otay Ep Analysis considered the entire Otay River, from the Lower Otay Reservoir to San Diego Bay, and made the following major conclusions:

1. **The Otay River flow duration curve (FDC) demonstrates that the river will not experience significant erosion for the range of storms considered to be geomorphically significant if exemptions are granted for projects directly discharging into the river system;**

2. **Aerial imagery from 1928, 1953, and 2015 demonstrate that the Otay River has remained stable (i.e., in a steady state of dynamic equilibrium) throughout the rapid urbanization of Otay Valley over the past 87 years and has become progressively more stable through the re-establishment of heavy vegetation throughout the system;**

3. **The revised WMAA Ep Analysis demonstrates that no significant erosion occurs within the range of storms considered to be geomorphically significant when critical shear stress values representative of the in-stream conditions are considered.**

Based upon these findings, we recommend that hydromodification exemptions be reinstated for projects directly discharging to the Otay River, from the Lower Otay Reservoir to San Diego Bay. We propose that this study be included as an attachment to the San Diego Bay WMAA, revising the San Diego Bay WQIP.

This recommendation carefully considers the unique nature of the Otay River and directly deals with the erosion potential for the range of storms considered to be geomorphically significant, as is consistent with the both the mission and the desire of the San Diego Regional Water Quality Control Board (Walsh, 2015). We appreciate your time in reviewing our study, and trust you will find that our methods and conclusions are presented in a clear, concise, and understandable fashion.

Sincerely,

Tory R. Walker

[1] Walsh, L. (2015, August 5). General Comments on Final Water Quality Improvement Plans and Notice of Noncompliance.

Natural Watershed versus Developed Watershed with Exemptions

The WMAA Ep Analysis is based on one type of model, and as with all hydrologic models, is most appropriately used in conjunction with field verification and comparison to a watershed-specific hydrologic model. It is further understood that the methodology behind the WMAA Ep Analysis sought to establish a clear and repeatable desktop-based process to analyze the potential of erosion for the range of storms considered to be geomorphically significant. From our review of the WMAA Ep Analysis, we determined that the methodology can indeed be a useful initial screening tool to conservatively assess the possibility of accelerated river channel erosion; it is not, however, a standalone metric for assessing the large, highly urbanized, impounded Otay River system—especially since the WMAA Ep methodology was not developed using data from impounded watersheds (Hawley, Bledsoe, & Stein, 2011). Savage Dam has had, and continues to have, a major influence on the Otay River morphology, yet no accepted exemption analysis has yet fully considered the extent of its effect, nor of its historic failure in 1916. Therefore, TRWE tested the first hypothesis: the *presence* of Savage Dam has a more profound impact on river morphology than any proposed, directly-discharging development downstream of Lower Otay Reservoir.

In order for the San Diego Regional Water Quality Control Board (San Diego Water Board) to accept a conclusion that a conveyance system can be exempt from hydromodification management BMP requirements, the report must include an analysis demonstrating that the natural channel under review would not experience erosion for the range of storms considered to be geomorphically significant (Walsh, 2015), as presented in Attachment 5. It is also the belief of the San Diego Water Board that using a hydrologic baseline that approximates an undeveloped, natural watershed is the only way to facilitate the return of more natural hydrologic conditions to already built-out watersheds, and ultimately improve stream health (San Diego Regional Water Quality Control Board, 2015). Therefore, TRWE used the United States Environmental Protection Agency (EPA) Storm Water Management Model (SWMM) to model the Otay Hydrologic Unit under two unique scenarios: the first scenario approximated the hydrology of the impounded, fully built out Otay Valley watershed (drainage area downstream of Savage Dam) with hydromodification exemptions in place for proposed development areas directly discharging to the Otay River (herein referred to as the Exemption Scenario); the second scenario approximated the hydrology of the *natural, unimpounded* Otay hydrologic unit (herein referred to as the Natural Scenario). The study areas are presented in Figure 1.

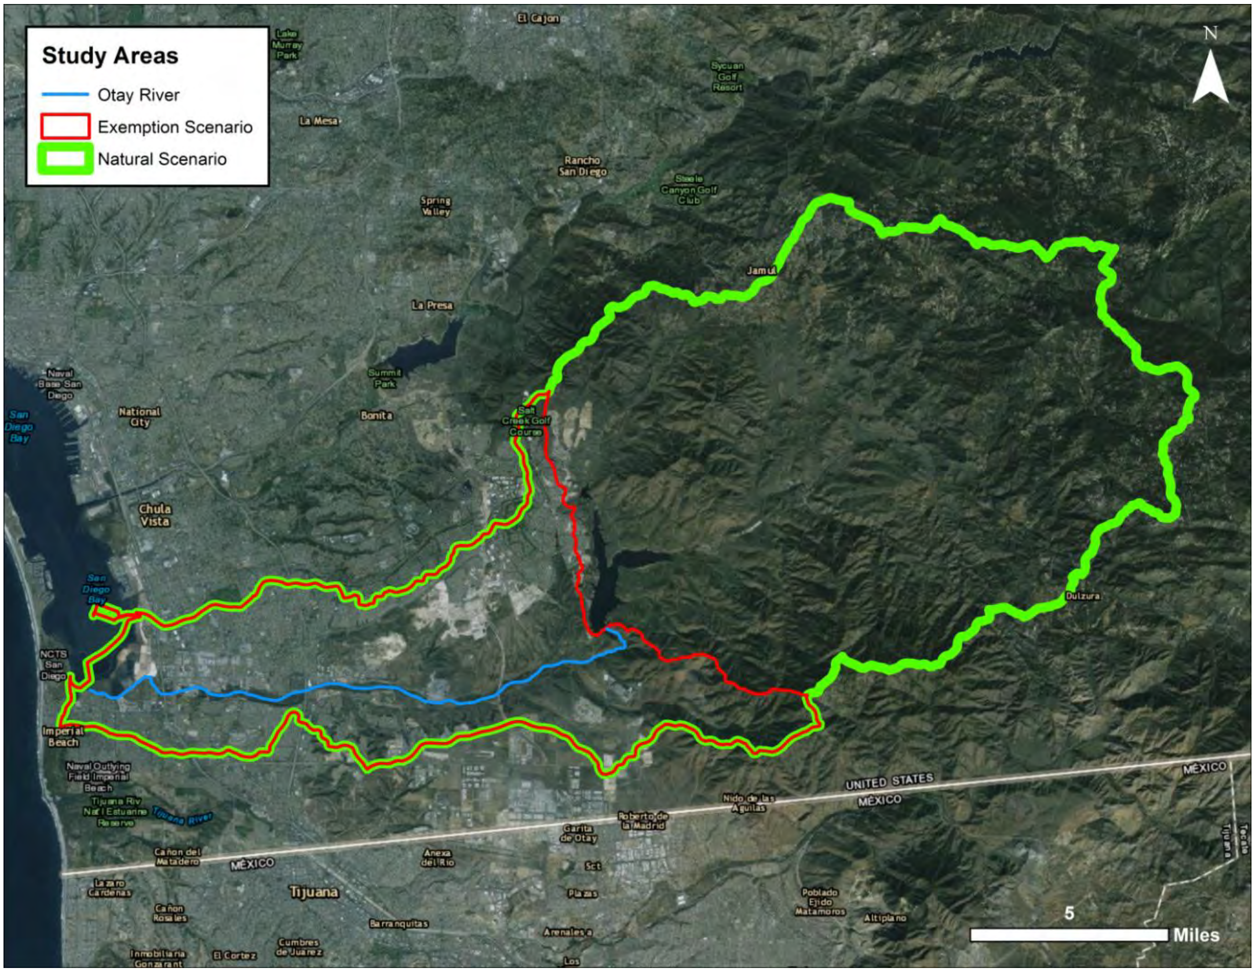

Figure 1: SWMM Study Areas

The Natural Scenario was used as the baseline condition and compared to the Exemption Scenario in order to determine if the latter would produce peak flows and durations that exceed the approximated natural hydrology by more than 10 percent for the range of flows considered to be geomorphically significant (from 10% of Q_2 to Q_{10}), as prescribed by Provision E.3.c.(2)(a) of the 2013 Regional MS4 Permit for all Priority Development Projects (San Diego Regional Water Quality Control Board, 2015). If the model demonstrated that the proposed exemptions would produce neither peak flows nor durations that exceed those of the approximated natural range of geomorphically significant flows by more than 10 percent, then the proposed exemption would meet the Permit's hydromodification management requirements on a watershed-wide scale. If the proposed exemption satisfies the Permit's hydromodification management requirements, then the flows may be considered as non-erosive and therefore warrant exemption as presented by the data.

To generate our model scenarios, we used a combination of geographic information system (GIS) data from the San Diego Geographic Information Source (SanGIS) Regional Data Warehouse (sangis.org), the United States Geological Survey (USGS) National Elevation Dataset (NED) (ned.usgs.gov), and the National Resource Conservation Service (NRCS) Web Soil Survey (WSS) (websoilsurvey.nrcs.usda.gov). First, the drainage areas downstream of Savage Dam were developed for the Exemption Scenario. With Savage Dam in place, areas upstream of Lower Otay Reservoir were neglected in the Exemption Scenario because, for the geomorphically significant range, they do not and will not contribute flows to the Otay River. Areas were first classified as either “Exempt,” “Non Exempt,” or “Developed” for modeling purposes. Exempt and Non Exempt areas are subsets of currently undeveloped areas having planned land uses (SanGIS “Developable_Land” layer) that either directly (Exempt) or indirectly (Non Exempt) discharge into the Otay River. These areas were projected to directly or indirectly discharge based upon a plan set review conducted by the WMAA consultant team. The remaining area that did not classify as either Exempt or Non Exempt was classified as Developed. These three classifications were finally subdivided into lumped hydrologic soil groups to produce the SWMM subcatchment areas, each having area-weighted parameter inputs for percent impervious and slope based upon planned land use (SanGIS “LANDUSE_PLANNED” layer), County of San Diego imperviousness coefficients (County of San Diego, 2010), and USGS 10-meter Digital Elevation Models (DEMs). The width parameter was used as a calibration parameter equal to roughly 18% of the area-to-length ratio using the methodology presented by Smith et al., (2015), provided in Attachment 3. The remaining subcatchment parameters were assigned in accordance with Appendix G of the San Diego Region Model BMP Design Manual (Geosyntec Consultants & Rick Engineering, 2015). For the Natural Scenario, an additional “Impounded” classification was added to the Exempt, Non Exempt, and Developed classifications. Impounded areas are the areas upstream of the dam, subdivided only by hydrologic soil group. Full model parameters are provided in Attachment A.

To simulate the effect of hydromodification management control, we performed research within the San Diego Region in the work documented by Smith et al. (2015). This research determined that geomorphically significant peak flows (Q_2 to Q_{10}), on average, are reduced 43% from the post-developed unmitigated condition to post-developed mitigated condition when hydromodification management controls are implemented. Therefore, in order to simulate hydromodification controls within the model, flows were reduced by 43% where appropriate. In the Exemption Scenario, flow reduction was only applied to the Non Exempt drainage areas in order to allow Exempt areas to produce unmitigated post-developed runoff. In the Natural Scenario, flow reduction was applied to all drainage areas in order to approximate the pre-development flows as would be achieved by implementation of designed hydromodification management control systems. Given that the San Diego Water Board understands that the pre-development hydrology of an area cannot be precisely known, nor do they expect modelers to estimate historical conditions (San Diego Regional Water Quality Control Board, 2015), our approach in approximating the watershed’s pre-development hydrology by using the best available data (projected land use and regional peak flow reductions) is an appropriate methodology that holds the regulatory standard as the baseline condition.

The resulting FDC (Figure 2) illustrates that, for the range of storms considered to be geomorphically significant, flow rates are larger in magnitude and duration for the approximated natural, undeveloped watershed condition than those produced for the impounded, developed watershed condition, even when the hydromodification exemptions are in place for all developable areas directly discharging to the Otay River. It should be noted that these results are conservative in nature due to the fact that the 1916 breach of Savage Dam significantly altered the Otay River morphology, as large segments of the river were scoured to bedrock (Patterson, 1970)—our Natural scenario does not account for flows nor durations that contend with those produced during this catastrophic event. The results demonstrate that Savage Dam has a more significant effect on Otay River's morphology than any proposed development downstream of the reservoir. Therefore, our FDC serves as quantifiable evidence to validate the same conclusion made by the well-versed Technical Advisory Committee (TAC), whom was tasked with providing technical input to the scientific approach and interpretation of results integral to the establishment of numerical flow control standards for the 2011 Hydromodification Management Plan (HMP) (Brown and Caldwell, 2011). The peak flow comparison is provided in Table 1. The flow duration data summary is provided in Attachment A.

Table 1: SWMM Otay River Peak Flow Rate Comparison for the Natural and Exemption Scenarios

Return Period (years)	Natural Scenario Q (cfs)	Exemption Scenario Q (cfs)	Difference (cfs)
10	2567	2272	294

2	1691	1409	283

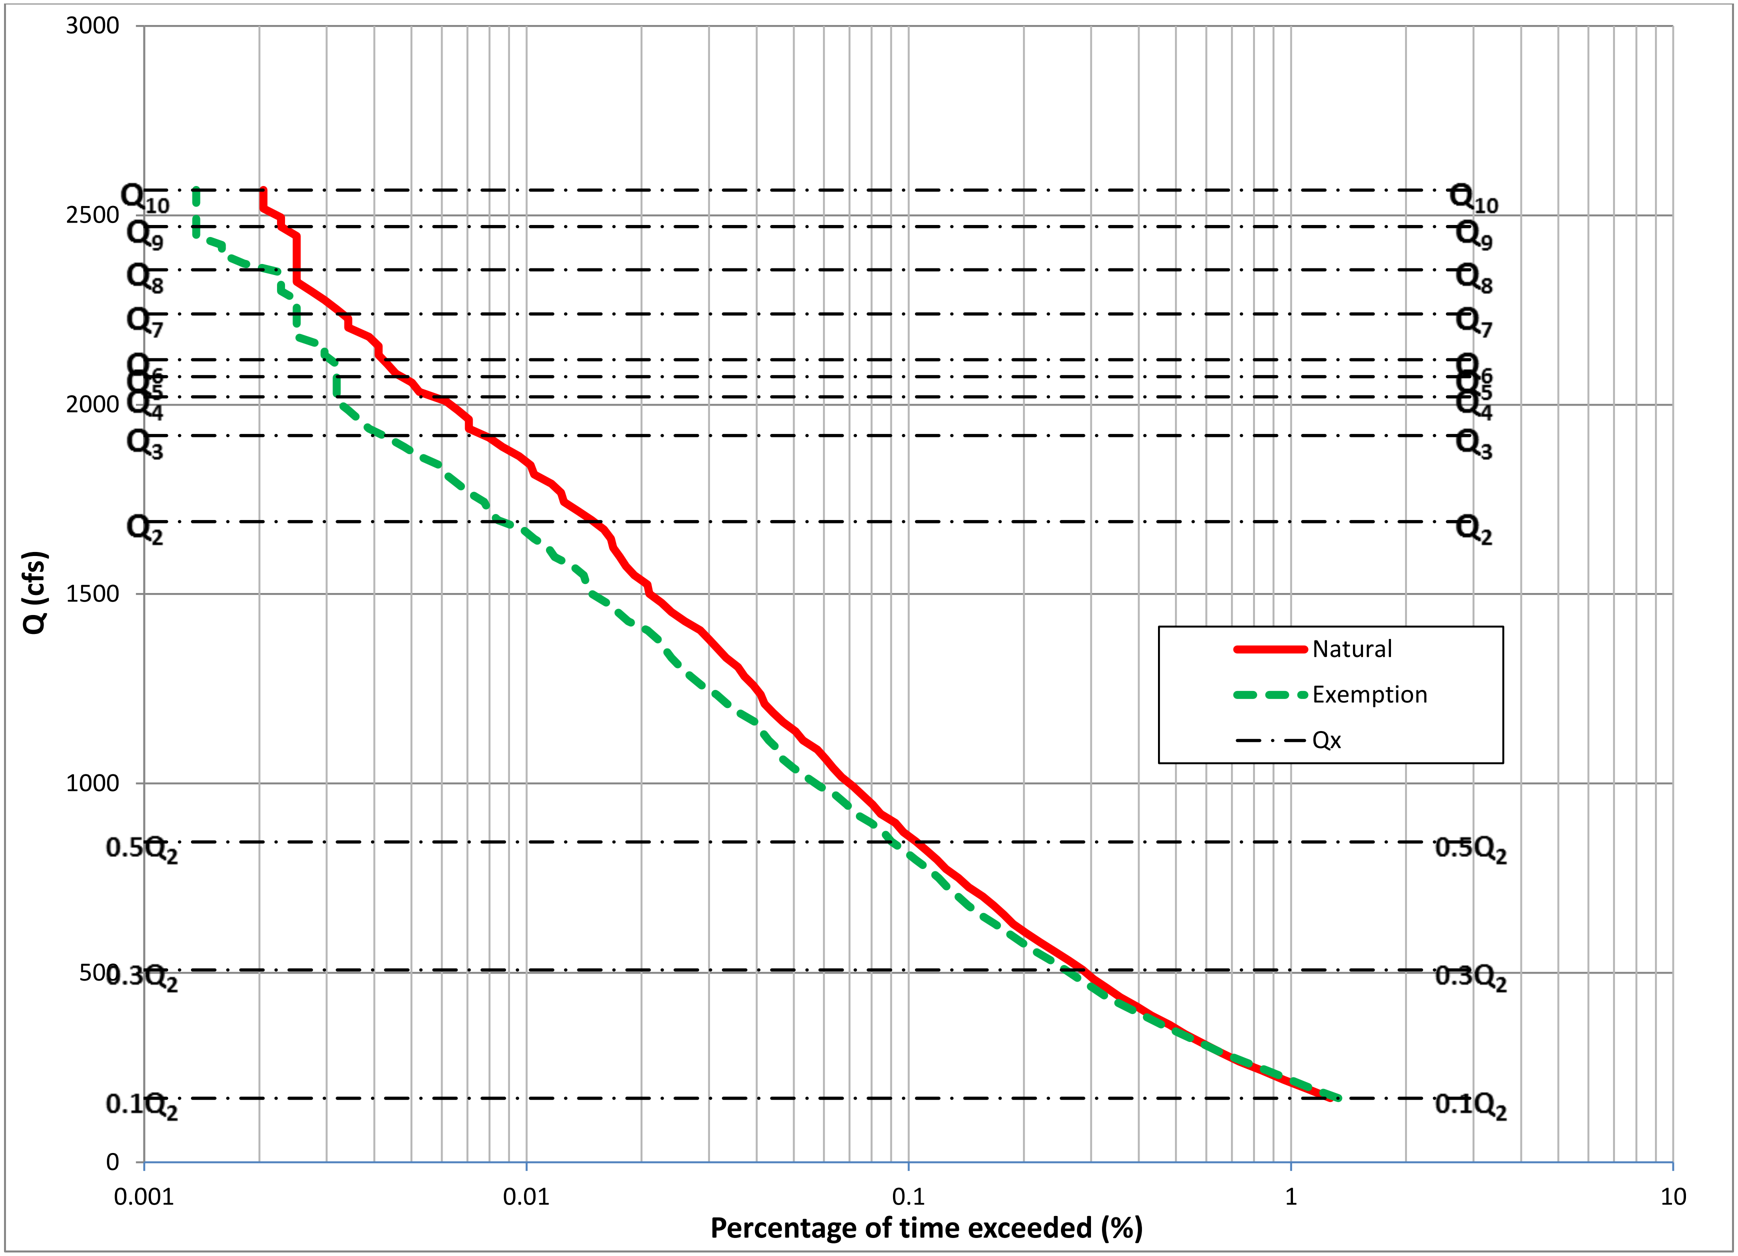

Figure 2: SWMM Otay River Flow Duration Curves for the Natural and Exemption Scenarios

1916 Savage Dam Failure and Historical Photographic Comparisons

We sought to establish multiple lines of evidence to either validate or invalidate our findings. In order to more accurately assess the exemption, we considered not only the *presence* of Savage Dam, but the *effect of its catastrophic failure* in 1916. Therefore, we tested the next hypothesis: the *historic failure* of Savage Dam has a more profound impact on river morphology than any proposed, directly-discharging development downstream of Lower Otay Reservoir. In order to do so, we conducted a historical image review to observe the relationship between urbanization and river morphology dating back to the earliest available aerial imagery (1928) provided by the County of San Diego Department of Public Works. We were also able to obtain stereoscope photographs taken in 1953 from the University of California, Santa Barbara's Aerial Imagery Research Service and a high-resolution 2015 image from Esri. We hypothesized that, due to the 1916 dam failure, the Otay River was extremely hydromodified and therefore has become significantly desensitized to changes in land use. If the photos demonstrate that the river has remained in a steady state of dynamic equilibrium during the course of Otay Valley's urbanization over the past 87 years, then it would be reasonable to acknowledge the river's proper equilibrium state and its resiliency to post-dam failure land use alterations.

The Savage Dam failure is a well-documented catastrophe. The flood of January 27, 1916 caused the rock-fill dam to fail, discharging over 1.7 billion cubic feet into Otay Valley over the course of 2.5 hours. An account of the events leading up to the dam breach and the aftermath in Otay Valley is given by Roy A. Silent (1916):

> Prior to January 15 [1916] the water surface in the Otay reservoir was 96.5 feet above zero contour. From Jan. 16 to 21 at 7 a.m. it had risen 11.8 ft. to a height of 122 ft. 8 in. At this time, water began to run over the spillway. ***From Jan. 21 on, the level continued to rise in spite of the discharge through the spillway. On the morning of Jan. 27 the reservoir was at 124 ft. 9 in., and the spillway was probably discharging in the neighborhood of 1,500*** [cfs] [emphasis added].
>
> The rain on Jan. 27 was extremely heavy, and by noon the water had risen so high that Mr. Weuste, in charge at the dam, deemed it advisable to open the outlet gate. This failed to check the rise, and it was realized that the dam would probably be overtopped before evening. Men were accordingly dispatched to warn residents in the valley to move to higher ground. Word to this effect was also sent out from the telephone exchange at National City. Most of the inhabitants took advantage of this warning.
>
> At 4:45 p.m. the water had reached the top of the dam and had seeped through and filled the boxes that were sunk in the top to allow an examination of the steel core. Water began running down the lower face on the east side of the dam at approximately 4:50 p.m. About this time several spouts or small streams of water appeared on the lower face of the dam, in one instance loosening a large boulder which rolled down to the bottom. From this time on, the destruction was very rapid. The lower face of the fill quickly melted away, thus removing the support from the core wall. At 5:05 p.m. the tension was so great that the steel diaphragm tore from the top at the center, and the

dam opened outward like a pair of gates. The released water rushed through and filled the canyon to a point approximately 20 feet below the top of the dam. The draw-down area extended possibly 200 ft. behind the dam. ***It required 2 ½ hr. for the reservoir to empty*** [emphasis added].

A huge wall of water, variously described as from 6 to 20 ft. high, rushed down the valley, covering the distance from the damsite to Palm City [located just upstream of San Diego Bay]***, about 10 mi., in 48 min., carrying all before it*** [emphasis added]. The total loss of life has amounted to 14 at the present writing (Feb. 8), but there are still several persons missing. The property damage is estimated at $250,000.

A thorough examination of the damsite was made on Jan. 31 and Feb. 1. Practically all the fill was washed completely away. The steel core was deposited in varying-sized sections along the valley, a large part ***being found at Palm City, 10 mi. below the dam*** [emphasis added]. The core wall had torn itself loose from both of the side walls, the foundations remaining intact. An examination of the bottom was impossible, as water to a depth of 8 feet was flowing through a constricted channel in the bottom of the cañon.

Three-quarters of a mile below where the dam had stood a piece of the diaphragm was observed, to which the angle iron forming the bottom of the steel plate was riveted, showing that the extreme bottom had been torn loose. On the west side, behind the remaining core wall, was a small part of the fill, composed of rock of small sizes, none of which was over 1 ½ ft. in diameter and grading from that size to coarse gravel. If this may be considered a fair example of the remainder of the fill, it is easy to understand its melting away as rapidly as described.

The cañon below the dam, prior to the failure, was considerably restricted and filled with large boulders. The action of the water removed all the loose rock and thoroughly stripped to bedrock both sides of the canyon as high as the water reached, the line of demarcation being clearly defined. The stripping was done in a most thorough manner, no particle of soil remaining in any of the niches or crevasses. This area was heavily wooded with brush [emphasis added].

An interesting feature was observed in that for half a mile below the dam in practically every pocket or niche in the rock was to be found a rivet head. An examination of the remaining parts of the steel core showed it to be in a perfect state of preservation, no rust or corrosion being noticeable. The destruction of the plate had taken place for the most part along the riveted seams, though one or two cases in which the sheets had torn were observed.

The reservoir above the dam showed a deposit of silt to a depth of from 5 to 6 ft. in most places, through which the present flow of the river is cutting a channel. The amount of silt deposited cannot be taken as a fair average for reservoirs in this section

> of the country, as much of the water passing into the reservoir was carried by a conduit and was comparatively clear. (Silent, 335-336)

A photograph accommodating Mr. Silent's original narrative is provided in Figure 3.

Figure 3: Canyon Immediately Below Dam, Showing Stripping Action of Water (Silent, 1916)

In addition to Mr. Silent's account, the former Assistant City Manager of San Diego, John L. Bacon, on February 1, 1916 (Baker, 1916):

> The heaviest rainstorm ever recorded in this part of California caused the destruction of the Lower Otay dam at about 5 p.m. on Jan. 27. The rain began on Jan. 14 and continued for six days, with an average precipitation of 1 in. daily. Upon the ground thus thoroughly saturated a second and much heavier rainstorm fell on Jan. 25. The rain gages were inadequate to measure this storm, and the actual rainfall record at the dam is not available. The precipitation on Jan. 27, however, is estimated at about 5 in., a cloudburst occurring about 4 p.m.
>
> The level of the water in the reservoir rose 9 ½ ft. from 7 a.m. to 5 p.m., at which time the dam overflowed. It began to give way about 5 min. later. The destruction was completed in 15 min., the dam being washed away to its foundations all around. The failure evidently started by the water overflowing the crest, washing out the backing of the central core. The break started near the center of the dam, the plates holding back for a time against the sides. Part of the plate was crumpled up and washed down the valley for several miles.

> The floor of the spillway was at an elevation of 124 ft. above the original stream bed, and the elevation of the top of the dam was 134 ft. The spillway was 38 ft. wide at the bottom and 45 ft. wide at the elevation of the dam crest. ***The estimated flow through the spillway when the dam overflowed was 2,000,000,000 gal. daily*** [emphasis added]. The spillway was not blocked in any way. The ¼-in. steel plate core in the dam, with 12 in. of concrete on each side, stopped 2 ft. below the dam crest. The length of the dam crest was 560 ft. and the width of the top 16 ft. The thickness of the dam at the bottom was 400 ft. ***The valley below the dam was swept clear of soil to bedrock, and the banks of the valley show that a wave about 50 ft. high passed down*** [emphasis added]. About 30 lives were lost in the flood.
>
> It is estimated that to replace the dam will cost about half a million dollars. There is ample water for the city's supply stored behind several other dams. Part of the Sweetwater dam was washed out. The Upper Otay dam, an arched concrete structure of horseshoe shape, had a depth of 3 ft. of water flowing over its crest on Thursday, but is safe. The City of San Diego has been cut off from the outside world except by water. No telegraph, telephone or railway lines were in operation. All bridges were washed out, and roads were impassable. (239)

As conveyed by these first-hand accounts, the magnitude of the dam failure was not limited to only areas immediately downstream of the breach but all the way to the mouth. The USGS documented the impacts of the 1916 flood across Southern California and reported the following damages incurred by businesses within Otay Valley (McGlashan & Ebert, 1918):

> *San Diego Consolidated Gas & Electric Co.*—The transmission lines and distribution system along San Diego River were washed out from El Monte to False Bay. There were also ***extensive washouts*** along Sweetwater River at Jamacho and from Sweetwater dam to San Diego Bay, ***on Otay River from Otay dam to San Diego Bay***, and along Tia Juana River from Tia Juana to the Pacific Ocean [emphasis added]. The principal damage was the loss of wood pole lines, copper wire, transformers, and miscellaneous electric-line material. The service in San Diego and immediate vicinity was not seriously interrupted. The lines to the more important towns were reestablished within two weeks, but some of the remote farming districts were without electric service for six weeks or more. The total damage to the gas and electric departments, corrected for value of salvaged material, was $70,527.
>
> *Western Salt Co.*—The losses consisted of ***170 acres of salt ground (which was covered with a deep deposit of silt), 2,500 tons of salt, a large quantity of brine in the ponds***, and injury to machinery [emphasis added]. The total damage was given as $85,500.
>
> *Fenton-Sumpton-Barnes Co.*—The company operates a gravel-washing plant ***in Otay Valley, about a mile from San Diego Bay. This plant was a complete loss, for after the flood there was not an indication on the surface to show its location*** [emphasis added]. The value of this equipment was $35,000. ***In addition, the soil was entirely removed***

> ***from 100 acres of bottom land*** which had been purchased for about $450 per acres [emphasis added]. The business loss was complete from January 27 to May 1. (34)

To put the magnitude of the dam breach into perspective with regard to the geomorphically significant range of flows, we look to the data provided by Silent, Baker, and USGS. In the five days leading up to the dam breach (starting on January 22 to 7 a.m. on January 27, 1916) flows ranging up to approximately 1,600 cfs were *constantly* released through the spillway—a rate that is 33% greater than the FEMA-published instantaneous Q_{10} value for the Otay River at Otay Valley Road (Federal Emergency Management Agency, 2012). Then, for ten straight hours up until the moment the dam breached, flowrates rapidly increased up to 4,700 cfs. Based upon the defined geomorphically significant flow range of Q_2 to Q_{10}, these *pre*-breach spillway flows and durations alone had enough energy to alter the river's morphology in an unnatural way (and likely did so). The morphological impacts caused by these pre-breach spillway flows were unquestionably eclipsed by the 20-50 foot high wall of water caused by the dam failure. When the dam breached at 5:05 p.m. on January 27, 1916, 1.7 billion cubic feet of water were released in 2.5 hours. The mere average flowrate during this 2.5 hour period equates to over 193,000 cfs—a rate that is nearly four times the 500-year FEMA flowrate for the aforementioned location (Federal Emergency Management Agency, 2012). The unnatural force exerted on the river system by these massive flows was devastating to all within the river system, as presented by the firsthand accounts and now confirmed by the hydrologic context. The USGS post-breach photograph is provided in Figure 4.

For additional context, the USGS report also documents that just before failure, the flows entering the reservoir through Jamul Creek reached 18,100 cfs. They describe the 150 foot wide creek as being composed of sand, gravel, and boulders before the flood and rendered "practically clean" afterwards (McGlashan & Ebert, 1918). A photograph of Jamul Creek's devastating scour is provided in Figure 5.

Without question, the 1916 Savage Dam breach had a profound impact on the Otay River, from the reservoir to San Diego Bay. The extent to which the system remains impaired by this catastrophic event is best evidenced through the historic aerial photograph review. Photographs from 1928, 1953, and 2014 are provided in Figure 6, Figure 7, and Figure 8, respectively. These photos are best viewed by scrolling between single page displays in Adobe Acrobat Reader (View → Page Display → Single Page View).

Figure 4: View Downstream at Site of Lower Otay Dam, After Failure (McGlashan & Ebert, 1918)

Figure 5: View Upstream on Jamul Creek after Flood of January 1916 (McGlashan & Ebert, 1918)

Figure 6: 1928 Aerial Photograph of the Otay River (Upstream of I-805) (County of San Diego)

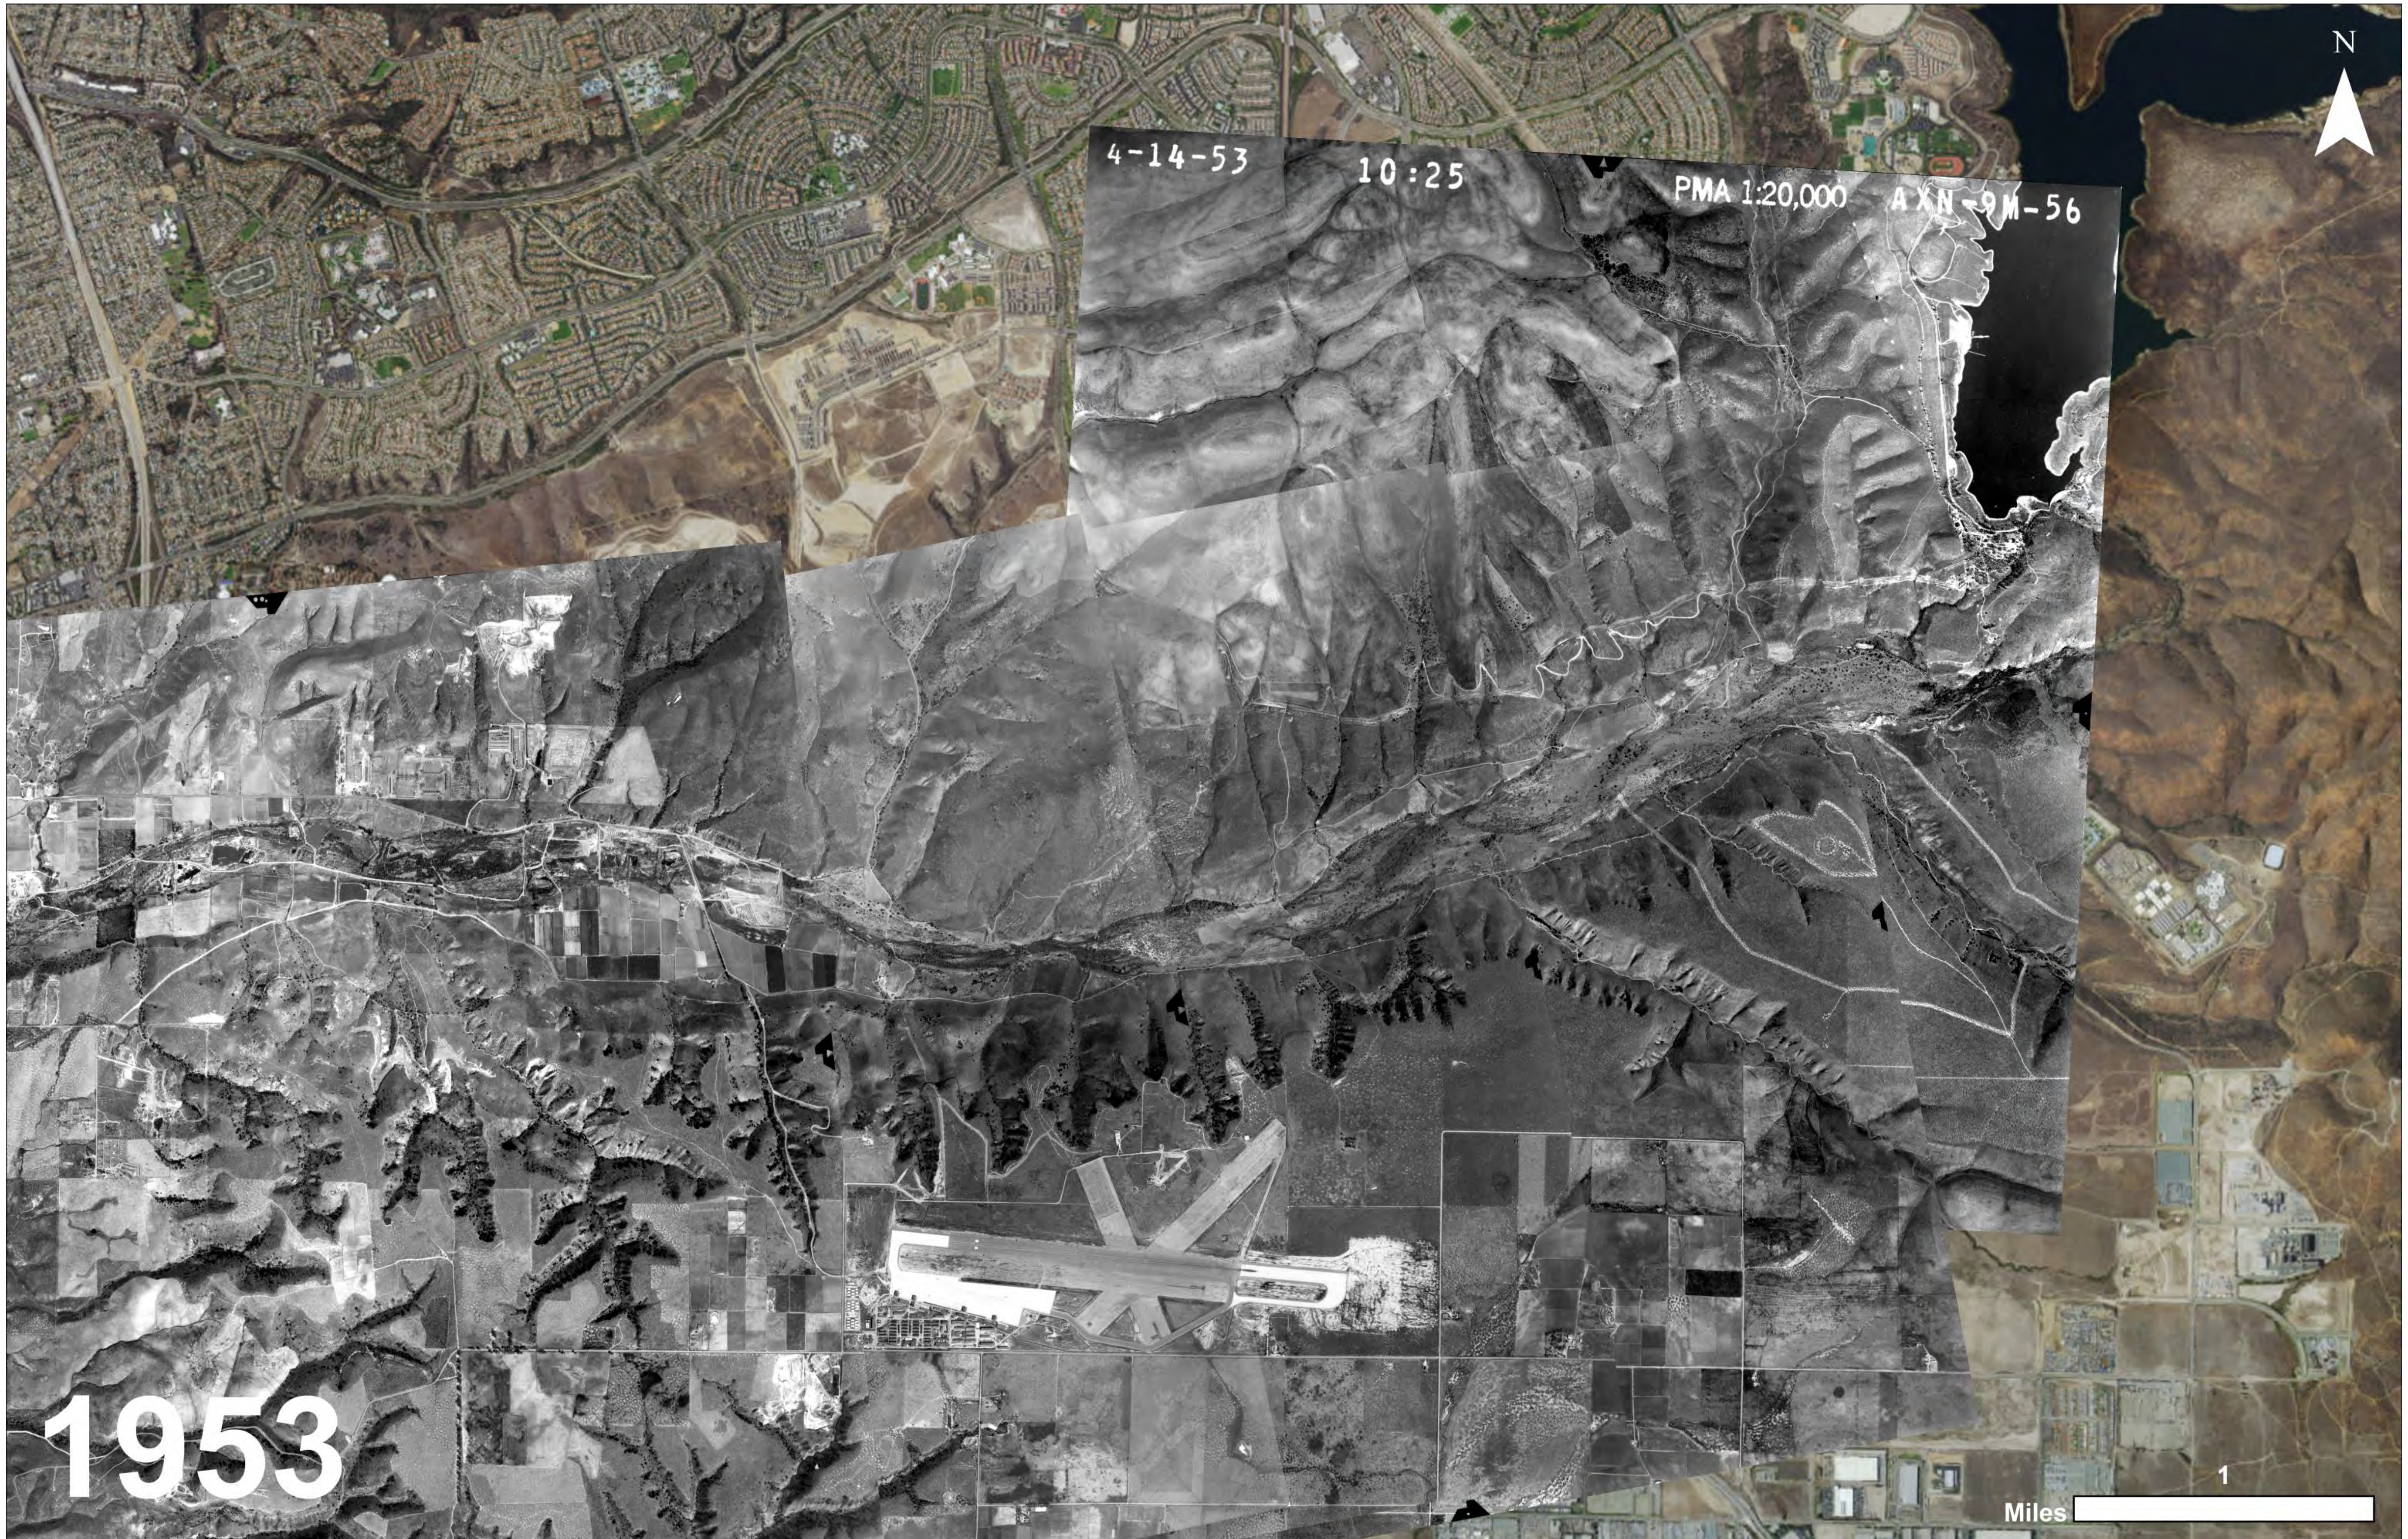

Figure 7: 1953 Aerial Photograph of the Otay River (Upstream of I-805) (University of California, Santa Barbara)

Figure 8: 2015 Aerial Photograph of the Otay River (Upstream of I-805) (Esri)

The aerial image comparison provides valuable insights into the post-failure river morphology. In 1928 (12 years after the breach), the effects of the dam failure are clearly seen: an incised, barren river mostly devoid of vegetation. In the absence of field data, it is reasonable to gather that the old Savage Dam fill material (rocks ranging in size up to 1.5 feet and some boulders) cover the channel bed, with some light re-establishing of brush toward the bank and thalweg. In 1953, the re-establishment of vegetation continues to be clearly seen, as most of the river reach has become covered. Vegetation has migrated from the thalweg toward the floodplain in many areas.

The hydrologic activity occurring between these two instances in time provides several pieces of notable data. First, during the 25 years from 1928 to 1953, San Diego experienced two of its wettest seven years on record: 1940-41 (24.74 inches) and 1951-52 (18.16 inches) to date (San Diego Union-Tribune, 2005). Second, the Lower Otay Reservoir hourly precipitation data from the National Oceanic and Atmospheric Administration (NOAA) recorded hourly rainfall depths of 1.24 inches in 1951 and 1.08 inches in 1952, which are totals equal to the estimated 200 and 100 year hourly rainfall depth for that station, respectively (National Oceanic and Atmospheric Administration, 2014). Lastly, Jamul Creek (the closest available stream station data during this time) discharged a peak of 4,000 cfs in December 1947, which is its second highest peak on record to date (United States Geological Survey, 2015). The fact that the river system did not widen, meander, or scour during that time would suggest that it would take greater than the wettest conditions on record to impact the river channel morphology or degrade the in-stream habitat—conditions certainly outside the Q_2 to Q_{10} flow range.

When these two historic photographs are compared with the modern-day condition, it is evident that the same trend has continued for 87 years: the channel remains stable, while vegetation continues to populate through the riverbed. While the Lower Otay Reservoir hourly precipitation data shows that the area continued to experience wet years from 1953 to 2015 (hourly precipitation depths equal to the 200, 50, and 25 year frequency in 1963, 1964, and 1955, respectively), the channel demonstrates no morphologic changes over the 62 year span. The 1928 river perfectly aligns with the 2015 river at stream bed angle points, ridgelines, boulders, and other geologic features; constricted areas have remained constricted, wide areas have remained wide, and no meandering or incising is evident. Furthermore, contrasting the most recent San Diego County land use data with the earliest available data from 1986, we find that the watershed in these photos (upstream of I-805 to Lower Otay Reservoir) has increased from 11% to 20% impervious cover over the past 30 years. Despite the extreme rainfall events and rapid urbanization, the Otay River has remained in a steady state of dynamic equilibrium and continues to reinforce its bed and bank material *and* support beneficial uses through the re-emergence of vegetation. Therefore, it would be reasonable to presume that the overall river health would benefit from the continued inflows of clean water. We conclude that the dam breach altered the channel in such a way that the more typical range of geomorphic flows has not adversely affected the river morphology, nor degraded the system's beneficial uses, as evidenced by the unwavering channel alignment and progressive re-habitation of natural vegetative species.

Field Investigation and Revised WMAA Ep Analysis

Thus far, the two working hypotheses have been tested and found to be correct: the *presence* and *historic failure* of Savage Dam have had, and continue to have, a more profound impact on river morphology than any proposed directly discharging development downstream of Lower Otay Reservoir. Through the testing of the second hypothesis, we observed the re-establishment of the river's vegetation. As previously stated, hydrologic models are most appropriately used in conjunction with field verification to either validate or invalidate their findings. Therefore, as a final measure, we sought to assess our findings by conducting a field investigation. Field conditions were documented and used to revise the clear and repeatable WMAA Ep Analysis with *field-specific* inputs.

The WMAA Ep Analysis conservatively assumed a highly sensitive relationship between watershed imperviousness and in-channel shear stress. The methodology behind the analysis assumes that accelerated erosion ensues and thus the river system will begin to unravel if the cumulative work performed on any given channel section in the watershed's post-developed condition exceeds the pre-developed condition by more than 5% (Erosion Potential, or Ep > 1.05). This sensitive relationship is likely attributable to the fact that the WMAA Ep methodology was not developed using data from impounded watersheds, and the data that was used did not come from urbanized (>25%) impervious watersheds, but rather from urbanizing (0 to 25% impervious) watersheds. Due to these factors, the erosion potential analysis is implicitly conservative for an impounded system and depends heavily on the watershed imperviousness and the selection of a threshold value at which particle motion occurs at any point along the channel boundary, known as the critical shear stress (τ_c). In the WMAA Ep Analysis, the critical shear stress was conservatively assumed to occur at a flow rate equal to 50% of the 2-year peak flow (Q_2). This "low flow threshold" critical shear stress, which equates to the in-channel shear produced at a flow of $0.5Q_2$, is based upon an assumption of the river channel having "low susceptibility" to accelerated erosion. This very conservative approach assumes a degree of susceptibility to hydromodification within the range of geomorphically significant flows *before* any consideration is given to the river's physical properties, such as soil cohesion, vegetation, or other factors that are to be evaluated in the proper determination of the critical shear stress value (Fischenich, 2001). As a macro-level initial screening of a major river system, the WMAA Ep Analysis includes this implicit factor of safety to an already conservative analysis. The field investigation also sought to investigate this assumption, in addition to testing our initial findings.

On October 21, 2015, the TRWE team investigated the Otay River from just downstream of 27th Street (approximately ¾ mile upstream of Interstate 5) to the confluence with Salt Creek (approximately 2 miles downstream of Savage Dam), with special attention given to three critical cross sections along the reach. These three sections were identified as areas of concern by the WMAA consultant team due to their narrow geometry. We documented the channel boundary conditions at each location. These cross sections (1, 2, and 3) are presented in Figure 9:

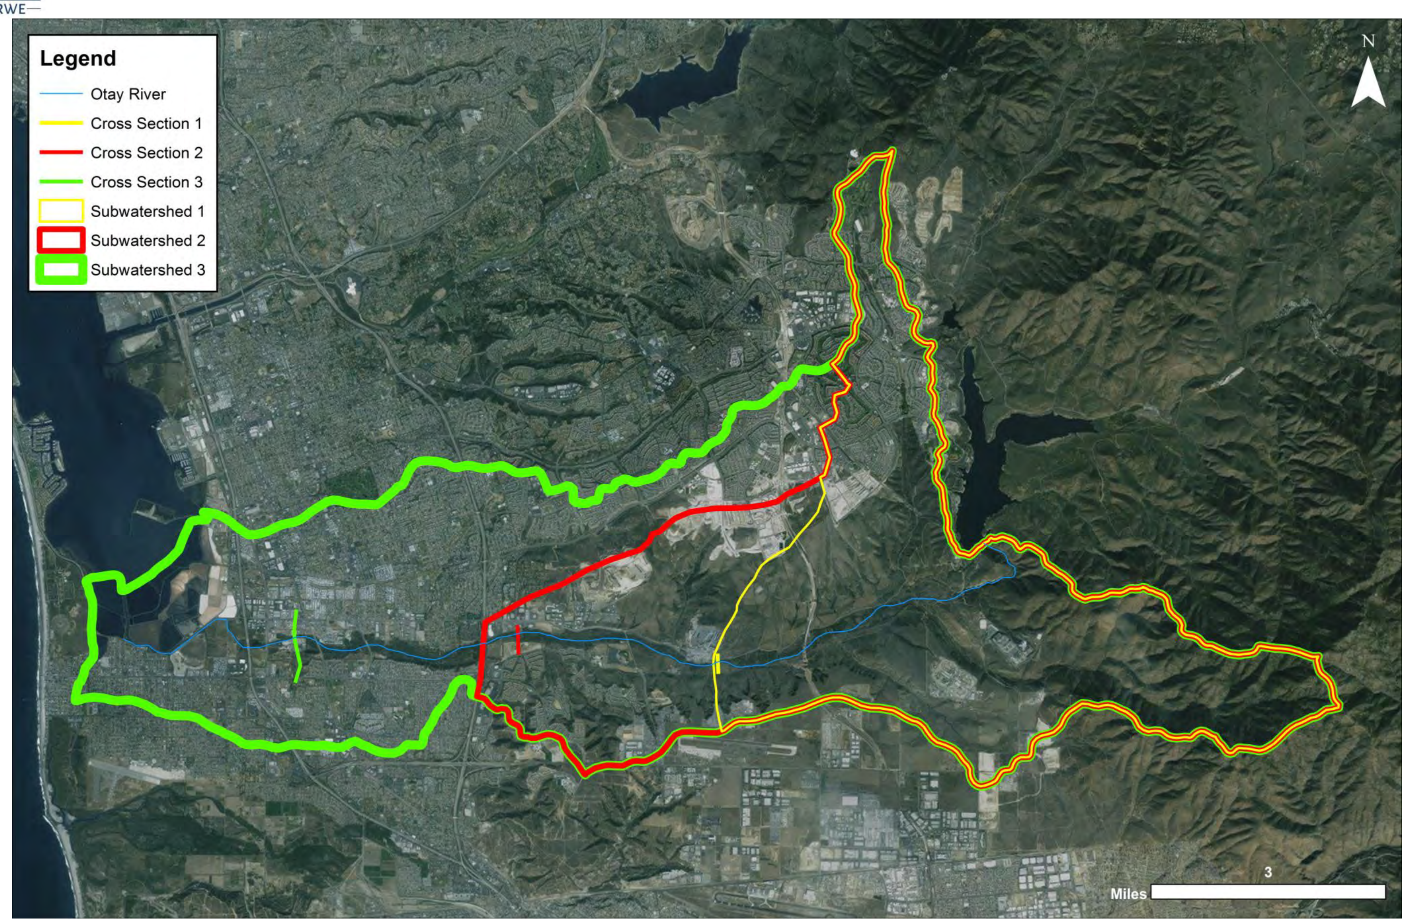

Figure 9: Locations of Cross Sections 1, 2, and 3, Including Upstream Subwatershed Areas

We investigated the boundary conditions at all three cross sections, including additional review at sections in between. We found at all three cross sections, and the areas in between, the river was heavily vegetated with grassland, scrub, meadow, and marsh. Some areas remain scoured to bedrock and still do not support vegetation 100 years after the dam failure, as was the case with Cross Section 1. In all cases, we found no evidence of active scour. Field photos are provided in Figures 10 through 18.

Many of the modern critical shear stress values for uniform, noncohesive channel boundary materials were estimated in 1936 through a series of laboratory flume experiments by A. Shields in his development of what is now known as the Shields criterion. While Shields' estimates are useful for predominantly alluvial or nonvegetated river systems, these theoretical values have little value in assessing the stability of vegetated systems. According to Dr. Craig Fischenich of the U.S. Army Corps Engineer Research and Development Center (ERDC) (2001):

> The presence of vegetation does not render underlying soils immune from erosion, but the critical condition for erosion of a vegetated bank is usually the threshold of failure of the plant stands by snapping, stem scour, or uprooting, rather than for detachment and entrainment of the soils themselves; vegetation failure usually occurs at much higher levels of flow intensity than for soil erosion. (4)

It is well documented that when vegetation establishes itself in a channel, then that channel is capable of handling flow velocities far in excess of that handled by the soil lining alone (1992). A number of recent research efforts have suggested that root systems physically and chemically bind bank soils in place, increasing the critical shear stress (Wynn, 2004). As the research continues, river and stream restoration efforts have produced valuable insight into a wide range of critical shear stress values for different channel materials, including vegetated channels. A prominent study by Dr. Fischenich documents how to assess a channel's stability and also provides a range of critical shear stress values for vegetation-lined channels such as the Otay River (included in Attachment 4). Critical shear stress values of 0.67 pounds per square foot (psf) (shales and hardpan), 0.35 psf (average reeds), and 0.70 psf (short native and bunch grass) are more appropriate assignments for the Otay River based upon the field conditions (Fischenich, 2001); the WMAA Ep Analysis assumed a very conservative critical shear stress value of 0.135 psf not based on the actual boundary conditions. The revised critical shear stress estimates are still fairly conservative, considering that low to average values were selected within the published range.

The MS4 Permit speaks to the significance of a proper critical shear stress assignment in Provision E.3.c.(2)(a)(i) where it states that the channel's low-flow threshold "*must* correspond with the critical channel flow that produces the critical shear stress" (San Diego Regional Water Quality Control Board, 2015). Therefore, we conclude that the revised critical shear stress estimates meet the Permit criteria, as they are appropriate for a wide, vegetated Otay River segment. The revised WMAA Ep Analysis shows that no work occurs at any of the three cross sections for the range of geomorphically significant flows, which is consistent with our observations, the watershed-specific hydrologic modeling and the historical imagery review. The revised WMAA Ep Analysis spreadsheets are provided in Attachment 2.

Executive Summary

The purpose of this study is to use a strict hydrologic assessment to either justify or invalidate the renewal of the current hydromodification exemption for projects draining directly to five river reaches (Otay River, San Diego River, San Dieguito River, San Luis Rey River, and Sweetwater River). These reaches have been exempted by the San Diego County Hydromodification Management Plan (HMP) (San Diego County, 2011), based on the wide-spread perception that existing large upstream reservoirs reduce river discharge and erosion potential to a larger extent than potential increases attributed to downstream land developments. In 2013, the San Diego Regional Water Quality Control Board (SDRWQCB) issued a new Permit that now requires justification of exemptions with further hydrologic analysis.

Accordingly, this study evaluates the hydrology of these five watersheds to determine if the continuance of the exemptions may be justified. A rigorous two-step approach is used to describe the effects of either renewing or revoking the 2011 HMP Exemptions through: (1) Statistical Peak Flow Analysis and (2) US Environmental Protection Agency (EPA) Storm Water Management Model (SWMM) Peak Flow Analysis. The Statistical Peak Flow Analysis uses a combination of observed streamflow measurements and USGS Linear Regression Equations to estimate the 2-year, 5-year, and 10-year peak flows at the mouth of each exempt river reach and describe the influence of the upstream impoundments for “dam-in-place” and theoretical “no dam” conditions. The Statistical Peak Flow Analysis characterizes flow reductions as a result of upstream impoundments and serves as a preface for more detailed peak flow simulations. EPA SWMM is used to determine the relative numerical influence of storm water runoff from project development on peak flows and durations, using continuous rainfall-runoff simulation to estimate the 2-year, 5-year, and 10-year peak flows at the mouth of each exempt river reach. Hydromodification flow controls are simulated for all non-directly discharging developable lands and are conditionally simulated for directly discharging developable lands in order to assess the impact of the hydromodification exemptions on the watershed-wide peak flows. The simulated hydromodification controls are modeled both with and without the presence of the dams to assess the influence of impoundment versus land development.

Both analyses resolve that the upstream impoundment is a very significant factor in peak flow alteration for each watershed. The Statistical Peak Flow Analysis results suggest a 29 to 65% peak flow reduction for each watershed due to upstream impoundment. The SWMM Peak Flow Analysis results suggest that peak flows for each watershed, if exemptions are granted, will remain 22 to 79% less than peak flows corresponding to an undammed watershed condition. These pre- to post-dam ratios are consistent with flow impoundment behavior found in other semi-arid, Mediterranean systems. The SWMM results further suggest that the areas directly discharging to exempt river reaches are less than significant, as evidenced by the near-0% peak flow increase granted by the proposed HMP exemption. Therefore, it is recommended that the exemptions be reinstated along all five river reaches for projects directly discharging to the rivers, due to confirmation of significant impoundment effects and the negligible peak flow increase attributable to those directly discharging developable lands.

1. BACKGROUND & CONTEXT FOR STUDY

A watershed's natural hydrologic state may become severely altered due to land use changes. Hydrologic alterations may include fluctuations to natural stream discharge rates, durations and sediment transport behavior. A stream's physical response to changes in watershed runoff and sediment yield is collectively referred to as hydromodification. The confidence that most hydromodification is highly attributable to changes in land surface—namely urbanization and other development—has recently led to more focused efforts in an attempt to understand and manage these processes.

Hydromodification is occurring in many Southern California creeks and waterways and has become a key element of most stormwater programs in California (Southern California Coastal Water Research Project, 2010). In San Diego, Orange, and Riverside counties, recent storm water regulations have imposed discharge flow and duration control requirements on certain new development and redevelopment projects. As evidenced in 2007 by the San Diego Regional Water Quality Control Board Order No. R9-2007-0001 (the "2007 Municipal Separate Storm Sewer System (MS4) Permit"), the Municipal Copermittees were required to implement a Hydromodification Management Plan (HMP) "...to manage increases in runoff discharge rates and durations from all Priority Development Projects, where such increased rates and durations are likely to cause increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force" (San Diego Regional Water Quality Control Board, 2007). Consequently, in 2007 the Copermittees began to prepare the San Diego County HMP (Brown and Caldwell, 2011). The San Diego County HMP effort continued over the span of two years, consisted of a 14 member Technical Advisory Committee (TAC), and received input from a gamut of private and public stakeholders. The total HMP development effort exceeded one million dollars. The Final 2011 HMP was adopted by the San Diego Regional Water Quality Control Board (San Diego Water Board) on July 14, 2010 through Resolution No. R9-2010-0066 (San Diego Regional Water Quality Control Board, 2010).

The 2011 HMP provides San Diego Copermittees with guidance on hydromodification methods, technical approach, requirements, standards, best management practice (BMP) selection and implementation, monitoring, and exemptions. One such HMP applicability requirement provided exemption rationale for Priority Development Projects (PDPs) directly discharging to five large river reaches in San Diego County (developable lands that directly discharge to the exempt river reaches are herein referred to as Project Lands). The Project Lands within each watershed equate to a considerably small fraction of the total watershed area (less than 5%, as summarized in Table 1). The exempt river reaches are summarized in Table 2 and are shown in Figure 1.

Table 1: Watershed Land Use Distribution (Downstream of Dam)

Reach	Total (ac)	[1]Developable (ac)	[2]Project Lands (ac)	% Developable	%Project Lands
Otay	29,571	4,310	1,412	15%	5%
San Diego	111,014	13,667	1,196	12%	1%
San Dieguito	28,710	4,653	1,055	16%	4%
San Luis Rey	118,846	77,180	4,151	65%	3%
Sweetwater	25,135	1,332	255	5%	1%

[1]Acreages were determined using "Developable Land" GIS data from the SanGIS Regional Data Warehouse.
[2]Acreages were determined through desktop analysis using available MS4 GIS data provided by Copermittees.

Table 2: Summary of Exempt River Reaches as Defined by the 2011 HMP

River	Downstream Limit	Upstream Limit
Otay River	Outfall to San Diego Bay	Lower Otay Reservoir Dam
San Diego River	Outfall to Pacific Ocean	Confluence with San Vicente Creek
San Dieguito River	Outfall to Pacific Ocean	Lake Hodges Dam
San Luis Rey River	Outfall to Pacific Ocean	Upstream river limit of Basin Plan subwatershed 903.1 upstream of Bonsall and near Interstate 15
Sweetwater River	Outfall to San Diego Bay	Sweetwater Reservoir Dam

For all proposed exempt river reaches supported by the 2011 HMP, each has:

- a drainage area in excess of 100 square miles;
- a 100-year flow in excess of 20,000 cubic feet per second;
- significant upstream reservoir flow regulation;
- predominantly wide floodplains and/or stabilized channel areas, and;
- low gradients (less than 1 %)

These factors concurred with field observations and were backed by years of historical perspective and practice from the TAC members (Bowling, Grey, Parra, Walker, & Weeden, 2013). There was a conditional requirement for the river reach exemption: a properly-sized energy dissipation feature must be existing or installed at the respective outfall location. Using the exemption rationale provided within the 2011 HMP, Copermittees were permitted to exempt PDPs from the hydromodification management BMP performance requirements prescribed by the 2007 MS4 Permit (herein referred to as the 2011 HMP Exemptions) so long as said PDPs were listed in the Development Planning section of the Copermittees' Jurisdictional Urban Runoff Management Program Annual Report (JURMP).

The current and succeeding municipal storm water permit, the 2013 MS4 Permit, was adopted on May 8, 2013. Similar to the preceding 2007 MS4 Permit, the 2013 MS4 Permit presents a list of criteria that must all be satisfied in order to grant hydromodification management BMP performance requirement exemptions. However, the 2013 MS4 Permit revised the hydromodification management BMP performance requirement exemption language from the 2007 MS4 Permit as follows:

- The project would discharge into channels that are significantly hardened (e.g., with rip-rap, sackcrete, etc.) downstream to their outfall in bays or the ocean;
- The project would discharge to a channel where the watershed areas below the project's discharge points are highly impervious (e.g. >70%).

The 2013 MS4 Permit conditionally excludes the five exempt river reaches justified by the 2011 HMP—exemptions that were based on prior studies of these rivers, the consensus of the TAC, an extensive public review process, and were approved by the San Diego Regional Board. However, the adopted language within the 2013 MS4 Permit does provide an opportunity to grant hydromodification management BMP performance requirement exemptions. A PDP may be exempt from hydromodification management BMP performance requirements when the project discharges storm water runoff to an area identified by the Copermittees as appropriate for an exemption by the optional Watershed Management Area Analysis (WMAA) incorporated into the Water Quality Improvement Plan (WQIP) pursuant to Provision B.3.b.(4).

This language was included to allow further evaluation of these previously exempt channels, rivers, or highly impervious watershed areas for continued exemption under a WQIP. Thus, a complete new analysis is required under the Watershed Management Area Analysis (Bowling, Grey, Parra, Walker, & Weeden, 2013). The Copermittees have since elected to perform the optional Watershed Management Area Analysis, represented by the County of San Diego (Geosyntec Consultants & Rick Engineering, 2015). The April 2015 San Diego County Regional WMAA uses a geomorphic assessment to evaluate the relationship between Erosion Potential (Ep) and Sediment Supply Potential (Sp). Based upon the instream erosion assessment, the Draft Regional WMAA recommends hydromodification management BMP performance requirement exemptions for PDPs directly discharging to the following river reaches:

Table 3: Summary of Exempt River Reaches as Proposed by the Regional WMAA

River	Downstream Limit	Upstream Limit
Otay River	Outfall to San Diego Bay	Interstate 805*
San Diego River	Outfall to Pacific Ocean	Confluence with San Vicente Creek
San Dieguito River	Upstream edge of the railroad crossing*	Lake Hodges Dam
San Luis Rey River	Outfall to Pacific Ocean	Upstream river limit of Basin Plan subwatershed 903.1 upstream of Bonsall and near Interstate 15
Sweetwater River	Outfall to San Diego Bay	Sweetwater Reservoir Dam

*limit changed from 2011 HMP recommendation

The Copermittees will now be able to grant hydromodification management BMP performance requirement exemptions offered by the 2013 MS4 Permit so long as the exemptions are approved via the WMAA and are incorporated into the WQIP—both of which are subject to the vetted public review and San Diego Water Board approval process.

1.1 Impoundment Characteristics

It is well understood that a river is in dynamic equilibrium with its geomorphic components: quantity of sediment, particle size, water discharge, and slope (Lane, 1955). This relationship, known as the Lane relation, is commonly expressed as:

$$Q_s d_s \propto Q_w S_o$$

Where Q_s is the quantity of sediment, d_s is the sediment particle diameter, Q_w is the water discharge, and S_o is the stream bed slope. This relationship is used to describe the qualitative balance between stream power and the discharge of bed material sediment and not intended to be used as an equation (Bowling, Grey, Parra, Walker, & Weeden, 2013).

Generally, long-term channel forms are naturally defined by frequent bankfull floods, approximately 1 to 2-year events in many cases (Wolman & Miller, 1960; Andrews, 1980). However, anthropogenic disturbances in natural systems invalidate assumptions of stationarity (Milly, et al., 2008). An alteration to one or more of the river equilibrium components will usually result in a feedback response to re-establish river equilibrium. A considerable amount of time may be required to achieve a new equilibrium condition; therefore, the effects of hydromodification may not be immediately observable (Trimble, 1997). In the context of all five exempt river reaches, the common denominators are sediment and flow sequestration due to upstream impoundments. The exact rate of sediment and flow sequestration accomplished by the upstream reservoirs is not well known at the desired temporal resolution. Sedimentation processes in a reservoir are quite complex because of the wide variation in many of the influencing factors (United States Bureau of Reclamation, 1987). Nonetheless, a significant reduction in sediment quantity and water discharge is reasonably assumed due to the steep and elevated nature of the impounded watershed drainage areas.

The exempt river reach impoundment summary is summarized as follows:

Table 4: Exempt River Reach Impoundment Summary

River	Major Impoundment[1]	Constructed	Owner	Miles from Mouth	Capacity (acre-ft)	Impounded Area (mi^2)	Percent Impounded[2]
Otay River	Lower Otay Reservoir	1919[a]	City of San Diego	13.1	49,849	100	70%
San Diego River	El Capitan Reservoir	1935	City of San Diego	28.0	112,807	185	61%
	San Vicente Reservoir	1943	City of San Diego	24.6	242,000[b]	75[b]	
San Dieguito River	Hodges Reservoir	1918	City of San Diego	11.0	30,251	245	89%
	Sutherland Reservoir	1954	City of San Diego	22.0	29,508	55	
San Luis Rey River	Lake Henshaw	1923	Vista Irrigation District	53.6	53,160	205	39%
Sweetwater River[3]	Sweetwater Reservoir	1888	Sweetwater Authority	8.2	28,079	85	82%
	Loveland Reservoir	1945	Sweetwater Authority	28.4	25,387	95	

[1] This study defines a Major Impoundment as a reservoir having storage capacity in excess of 25,000 acre feet and able to spill to the river reach
[2] percentage of total area impounded above downstream-most dam
[3] linear reservoir sequence
[a] originally constructed in 1897; reconstructed in 1919 after 1916 dam breach
[b] project recently completed to double reservoir capacity; overflows through tributary to main reach

1.2 Study Objectives

The objective of this study is to perform a rigorous hydrologic analysis to either justify or invalidate the renewal of the 2011 HMP Exemptions for PDPs on Project Lands using highly relevant and available tools, methods, and data. Due to the strict hydrologic focus of this study, sediment transport is not evaluated. This study used a two-step approach to describe the effects of either renewing or revoking the 2011 HMP Exemptions through: (1) Statistical Peak Flow Analysis, and (2) US Environmental Protection Agency (EPA) Storm Water Management Model (SWMM) Peak Flow Analysis. The analyses are summarized below.

1.2.1 Statistical Peak Flow Analysis

The Statistical Peak Flow Analysis seeks to provide a frame of reference for the SWMM Peak Flow Analysis and to describe the general influence of the upstream impoundments on peak flows by using measured flow gage discharge, peak flow estimation, and reservoir overflow data, where possible, to estimate the 2-year, 5-year, and 10-year peak flows at the mouth of the exempt river reach during:

- the ”dam-in-place” condition, which includes the existence of the upstream reservoir(s);
- the hypothetical “no dam” condition, which seeks to remove the significant impoundment effects induced by the upstream reservoir(s)

1.2.2 SWMM Peak Flow Analysis

As hydromodification is a complex phenomenon established in a large scale range, two possible outcomes can occur: (1) the combined effect of the impoundment and potential development may be more similar to the hypothetical and natural peak flow than simply including hydromodification control for an area already modified by a dam, or (2) the combined effect of the impoundment and potential development could improve the situation in a portion of the range of analysis, but be detrimental in another portion of the range of analysis, in which case an exemption to hydromodification is not recommended. The Statistical Peak Flow Analysis serves as a preface to the more detailed SWMM Peak Flow Analysis and seeks to provide a general agreement between impoundment and peak flow behavior on a watershed-by-watershed basis.

The SWMM Peak Flow Analysis seeks to reinforce the Statistical Peak Flow Analysis. The SWMM Analysis will determine the relative change in peak flows from PDPs on Project Lands using EPA SWMM continuous simulation modeling to estimate the 2-year, 5-year, and 10-year peak flows at the mouth of the exempt river reach during:

- the dam-in-place HMP exemption scenario, which accounts for river impoundment and subjects only non-directly discharging developable lands to hydromodification management BMP performance requirements;
- the dam-in-place full HMP scenario, which accounts for river impoundment and subjects all directly and non-directly discharging developable lands to hydromodification management BMP performance requirements;
- the hypothetical “no dam” HMP exemption scenario, which removes the effect of river impoundment and subjects only non-directly discharging developable lands to hydromodification management BMP performance requirements;

- the hypothetical "no dam" full HMP scenario, which removes the effect of river impoundment and subjects all directly and non-directly discharging developable lands to hydromodification management BMP performance requirements.

If the SWMM Peak Flow Analysis demonstrates that the flows and durations of those flows contributed by the exempt Project Lands are insignificant, then the exemptions are justifiable. Contrarily, if the SWMM Peak Flow Analysis demonstrates that the flows and durations of those flows contributed by the exempt Project Lands are significant, then the exemptions are not justifiable and should be revoked.

2. METHODOLOGIES

2.1 Statistical Peak Flow Analysis

The United States Geological Survey (USGS) records and maintains stream station data for locations along each of the exempt river reaches. The period, quality, and availability of data vary significantly depending upon the river. Instantaneous stream flow measurements are desired in order to most accurately assess the true peak flows occurring within the river channel. Often, reliable flow data recorded prior to impounded flow conditions are not available. Therefore, the best available local USGS instantaneous stream stations were selected to represent earlier conditions.

Typical peak flow estimates (2-, 5-, and 10-year) are derived from annual maximum series data. Accurate peak flow assessment requires knowledge of the river's behavior throughout the water year and over a sufficient period of record, with consideration to the prevailing climate. Southern California's semi-arid Mediterranean climate is characterized by a unique seasonal precipitation, with wet winters and warm, dry summers that can produce multiple low-frequency events within the same year, or none at all. Due to this phenomenon, peak flow analyses developed upon single peak annual events will inevitably omit flows that have a significant influence on Mediterranean river morphology. The ultimate result of using the annual maximum series to determine peak flows for high-frequency events (the 2 and 5-year peaks) in a Mediterranean climate is a gross underestimation of the more probable peak flow frequency. This underestimation is likely more pronounced for the higher frequency events (i.e., the 2 and 5-year peak flows (Brown and Caldwell, 2011)). Therefore, a partial-duration series analysis is used to estimate the 2 and 5-year peak flows in this Statistical Peak Flow Analysis. A partial duration series contains "N" values from "N" years of data. For the 10-year peak flow, the annual maximum series will be used, unless the instantaneous data is found to be erroneous, in which case the partial duration will be used.

The USGS began to record instantaneous (15 minute) flow data in water year (WY) 1988 to present. The present-day instantaneous flow data are used to quantify the peak flow events for each reach by partial duration and annual series analyses. A set of peak flow regression equations are applied to the same drainage area recorded by the USGS stream station to develop a ratio of the measured post-dam peak flow to the peak flow estimation equation value; this ratio is named the flood peak ratio (FPR) in this study.

With the flood peak ratio (FPR) established, the 2-, 5-, and 10-year pre-dam peak flow events are estimated by multiplying the FPR by the regression peak flow estimate derived for the entire watershed-wide area. The process is repeated for each watershed to produce impoundment-free 2-, 5-, and 10-year peak flow estimates. For validation, the impoundment-free peak flows are compared with the measured peak flows for those watersheds with USGS stream stations located at or near the river mouth. For additional reference, the impoundment-free 10-year peak flow is compared to the 10-year peak flow estimates published by the 2012 Federal Emergency Management Agency (FEMA) Flood Insurance Study (FIS) to roughly quantify the relative impact of the upstream impoundments.

USGS regional flood-frequency equations, originally introduced by Waananen and Crippen (1977), are used to estimate flood frequencies in six regions in California (Table 5). These equations relate flood magnitudes of selected frequency to drainage area, precipitation, and altitude (Waananen & Crippen, 1977). These equations (herein referred to as the 1977 USGS Equations) were regressed using available annual peak flow data from 778 USGS stream stations throughout California, 148 of which are located within the South Coast Region concerned with San Diego County. The 1977 USGS Equations are not applicable to sites where the usable storage within the basin exceeds 103 acre feet per square mile, to sites just downstream from large reservoirs, or to streams in urban areas affected substantially by urban development. The relations are primarily used to determine peak discharge values for flow under natural conditions (Waananen & Crippen, 1977). It is noted by a 2004 USGS study of Northern California watersheds that the 1977 USGS Regression equations produce the greatest errors at lower recurrence intervals (2-, 5-, and 10-year) peak flows, which is likely attributable to the lack of more than two decades of peak-flow data at the time of the study (Mann, Rizzardo, & Satkowski, 2004). It is expected that the underestimation would be even more pronounced for southern California's Mediterranean semi-arid climate for the reasons previously discussed.

The 1977 USGS Regression Equations were revised by Gotvald, Barth, Veilleux, & Parrett (2012). These equations (herein referred to as the 2012 USGS Equations) incorporated 30 years of additional annual peak flow data, among other improvements (Gotvald, Barth, Veilleux, & Parrett, 2012). Similarly, the 2012 USGS Regression Equations are specific to one of six hydrologic regions in California. San Diego County is located in the South Coast hydrologic region (Region 5), which was used for the 2-, 5-, and 10-year flood peak analysis. A comparison between the 1977 and 2012 USGS Equations are summarized in Table 5 as follows:

Table 5. 1977 and 2012 USGS Regression Equations for Region 5

Peak Flow	1977 USGS Equation	2012 USGS Equation
2-year	$0.14(DRNAREA)^{0.72}(PRECIP)^{1.62}$	$3.60(DRNAREA)^{0.672}(PRECIP)^{0.753}$
5-year	$0.40(DRNAREA)^{0.77}(PRECIP)^{1.69}$	$7.43(DRNAREA)^{0.739}(PRECIP)^{0.872}$
10-year	$0.63(DRNAREA)^{0.79}(PRECIP)^{1.75}$	$6.56(DRNAREA)^{0.783}(PRECIP)^{1.07}$

DRNAREA, drainage area, in square miles; *PRECIP*, mean annual precipitation, in inches

Drainage area values are estimated with USGS Digital Elevation Map (DEM) analysis using Esri ArcMap. Mean annual precipitation values were estimated using the Parameter-elevation Regressions on Independent Slopes Model Monthly Climate Data for the Continental United States (PRISM) areal statistics for water years 1988-2013 (October 1, 1987 to September 30, 2013) (Daly, 1994, 1997, 2001). PRISM provides an estimation of mean annual precipitation and is noted to have some bias at the monthly scale; however, this product is continuously updated to incorporate point data, a digital elevation model, and expert knowledge of complex climatic extremes, including rain shadows, coastal effects, and temperature inversions. Conterminous U.S. precipitation products can be downloaded from the PRISM Climate Group (http://www.prism.oregonstate.edu/); this study extracted and averaged monthly 4 km pixels for each watershed domain.

The USGS instantaneous stream station data are analyzed to identify individual peak flow events. Individual peak flow events are distinguished by satisfying the following criteria (United States Geological Survey, 1982):

1. Events must be separated by at least five days plus the natural logarithm of the square miles of the drainage area, and;
2. Intermediate flows must drop below 75 percent of the lower of the two separate maximum flows.

For any given time period where a recorded reservoir spill occurred and would have likely influenced the corresponding stream station flow measurement, the potential impacted data is omitted from the instantaneous stream flow record and analysis.

Two of the five river reaches (namely, the San Diego and San Luis Rey rivers) have instantaneous stream gage flow data near the mouth to the Pacific Ocean, where the Statistical Peak Flow Analysis provides an empirical relationship between the urbanized watershed-specific drainage area and partial duration peak flow events downstream of the impoundments. For the three remaining river reaches (namely, the Otay, San Dieguito, and Sweetwater rivers), the USGS stream stations are located upstream of the major impoundments, where the Statistical Peak Flow Analysis provides an empirical relationship between the sparsely developed, watershed-specific drainage area and partial duration peak flow events upstream of the impoundments. For both cases then, the watershed-wide drainage areas are not entirely represented, due to the impoundment in all cases, and due to the absence of a stream station near the mouth in three cases. Hence, these empirical relationships are used in combination with the 2012 USGS regional flood-frequency equations for rural ungaged streams in California to develop a relationship between the empirical and regression estimates on a watershed-wide scale; thus, a methodology is developed for estimating the peak flows at or near the river mouth. This simplified relationship is therefore used to scale the estimated regional flood-frequencies to the watershed-wide extent for each river by developing flood peak ratios (FPRs), defined as:

$$FPR = \frac{Q_{PDS}}{Q_{USGS}} \tag{1}$$

Where:

Q_{PDS} is the partial duration series T-year peak flow, as determined from the stream station instantaneous data record;

Q_{USGS} is the T-year peak flow, as determined by application of the T-year 2012 USGS regression equation to the equivalent stream station drainage area

Assuming a linear watershed-wide relationship between the stream station drainage area peak flows and 2012 USGS Regression peak flows:

$$\frac{Q_{PDS}}{Q_{USGS}} = \frac{Q_{ND}}{Q_{WS}} \tag{2}$$

Where:

Q_{ND} is the T-year estimated “no dam” statistical series peak at the river mouth

Q_{WS} is the 2012 USGS T-year annual peak applied to the entire watershed area

Therefore, the estimated “no dam” peak flow at the river mouth is:

$$Q_{ND} = FPR \times Q_{WS} \tag{3}$$

Figure 1 and Table 6 summarize the information pertinent to this methodology.

2.2 SWMM Peak Flow Analysis

The SWMM Peak Flow Analysis is used to assess the contribution of storm water runoff discharging from Project Lands to the exempt river reaches. Using available USGS and SanGIS land use data, SWMM models the rainfall-runoff relationship for each watershed under a set of different scenarios. The watersheds were modeled under the planned land use (PLU) condition in order to analyze the developed hydrology. Each watershed is modeled to evaluate the direct runoff from Project Lands, both with and without hydromodification management BMP performance requirements in place, and also without the effect of upstream impoundment.

As stated earlier, only PDPs on land directly discharging to the exempt river reaches (Project Lands) could qualify for the 2011 HMP Exemption. Using the “LANDUSE_PLANNED” SanGIS shapefile, developable lands were classified as such if they were geographically contained within the present-day “Developable_Land” SanGIS shapefile. These developable lands were then sub-classified as either directly-discharging (Project Lands) or non-directly discharging (non-exempt developable). Drainage behavior was assessed based upon available storm drain infrastructure databases and best professional judgment. In all likelihood, not all areas classified as Project Lands by this study would be named as such due to site-specific post development hydrology, jurisdictional requirements, and other related factors. When the effect of the dam was to be considered, the total watershed area upstream of the lower-most impoundment was introduced into the model. Areas upstream of the dam were conservatively assumed to be in a fully built-out condition and subject to hydromodification flow control. Since hydromodification management BMPs, when properly designed, effectively maintain the pre-development hydrology, this conservative assumption effectively models the impounded area as having a “natural” overland flow behavior. For all lumped land classification groups, the area was further divided into four sub-areas based upon hydrologic soil group (HSG) as A, B, C, or D.

To simulate the effects of hydromodification management BMPs, we averaged the percent flow reduction achieved by 25 separate hydromodification design projects performed by TRWE for our clients throughout San Diego County. The 25 projects all met the hydromodification management BMP volume and time-based performance requirements, as prescribed in the 2013 MS4 Permit. The average percent flow reduction for the 2-year to the 10-year peak flow was 43%. In nearly all cases, a hydromodification design project will not perfectly match the pre-development flow duration curve. It would not be practical to produce such a finely-tuned design. In order to safely meet hydromodification BMP performance requirements, the final design will typically produce less runoff than the pre-development hydrologic condition. Therefore, a 43% flow reduction is a conservative expectation for the unmitigated to mitigated post-development scenario. Furthermore, given that the 43% flow reduction estimate was developed from projects that met the hydromodification flow duration requirement, the 43%

flow reduction, when applied, can be assumed to satisfy the post-development flow duration component as well.

In order to simulate the effect of hydromodification on a given land use group, the 43% flow reduction was applied via the inflow scale factor for the respective junction node in SWMM. A conceptual SWMM model schematic is provided in Figure 2.

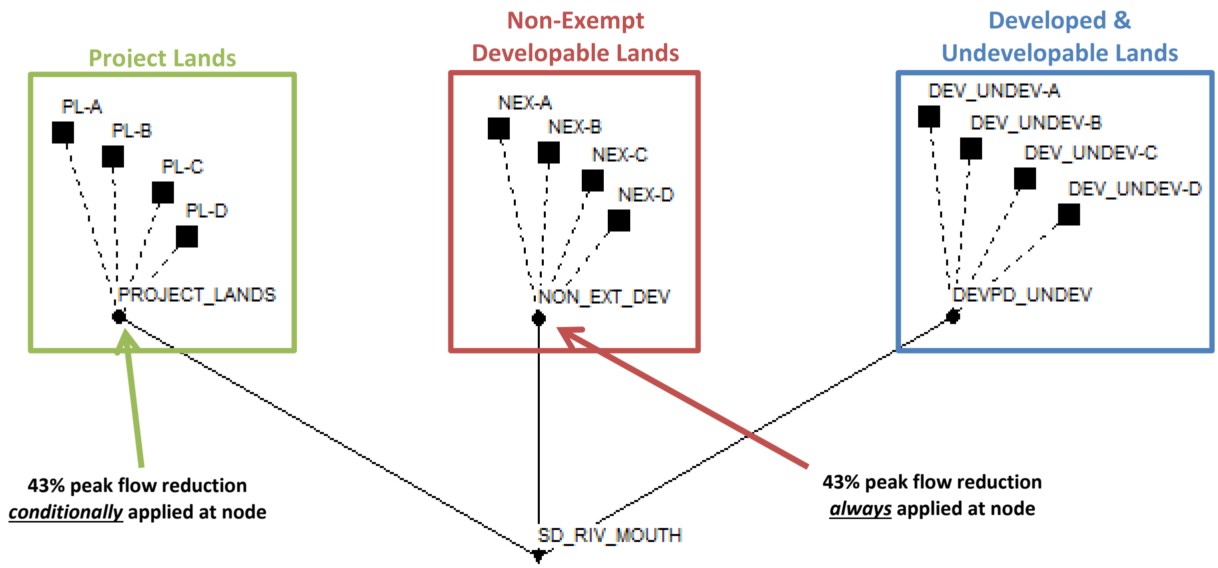

Figure 2: SWMM Model Conceptual Schematic for the San Diego River "Dam-In-Place" Scenario

The rainfall time series provided by the County of San Diego as a work product of the 2011 Final HMP have been analyzed for their accuracy in other studies. It was found that the disaggregation process artificially increases the frequency of the high intensity values (Parra-Rosales, Walker, & Ponce, 2012). Of the 19 rainfall stations produced by the Final 2011 HMP, Parra et al. found Lindbergh and Oceanside to be the most acceptable stations due to the completeness of the original data and quality of data from external stations used to fill data gaps. Therefore, this study used the Oceanside rainfall data for the San Luis Rey Watershed and the Lindbergh rainfall data for the San Diego Watershed. For all other watersheds, an alternate rainfall data source was used, as described below.

Available rainfall data was obtained through coordination with Rand Allan of the San Diego County Flood Control District (SDCFCD). Rainfall stations were selected based on their time format (hourly or finer) and proximity to the study watersheds. Collocated historical hourly and ALERT event-based rainfall stations were combined to make a continuous 50 year record. Natural variability in hourly and daily data exists between stations. Thus, annual values provide a reliable means to estimate precipitation patterns between nearby gages and gages with similar elevation and climatological attributes. To develop continuous precipitation records, a linear regression between SDCFCD stations was used to estimate missing precipitation values and validated on a separate subset of data, where available data exists for both gages. The correlation value (R^2) indicates the ability of the independent variable to predict the dependent variable and ranges from 0 to 1. Only correlations greater than 0.7 were used to guide interpolation of precipitation data. Table 7 summarizes the developed regression equations, the correlation coefficient, and values estimated at each station:

Table 7: Rainfall Station Regression Equations Used for Data Gaps

Independent Station (x)	Dependent Station (y)	Regression Equation[a-h]	Correlation
Kearny Mesa	La Mesa	[1] $y = 0.9813x$	$R^2 = 0.8815$
Poway	Kearny Mesa	[2] $y = 0.9371x$	$R^2 = 0.7993$
Encinitas	San Marcos	[3] $y = 1.0574x$	$R^2 = 0.7260$
Bonita	Sweetwater	[4] $y = 1.0942x$	$R^2 = 0.8734$
Kearny Mesa	Sweetwater	[5] $y = 0.9007x$	$R^2 = 0.7520$
Encinitas	Escondido	[6] $y = 1.3275x$	$R^2 = 0.7720$

a. Kearny Mesa data was used to estimate missing values in **La Mesa**[1] for the period of record for 8/10/1969-3/1/2015. A total of 9447 values (hourly time step) were filled. Note that La Mesa ALERT tipping bucket record begins 9/15/1982, which may account for the number of values filled.
b. Available data from Kearny Mesa was used to estimate missing values in **Poway**[2] for 1/23/1964-2/28/2015. A total of 3278 values (hourly time step) were filled. Note that Poway ALERT tipping bucket record begins 7/19/1982, which may account for the number of values filled. Now, a complete record is available for Poway from 11/1/1962-2/28/2015.
c. Poway data was used to estimate missing values in **Kearny Mesa**[2] for the period of record for 1/22/1964-2/28/2015. A total of 36 values (hourly time step) were filled.
d. Available data from Encinitas was used to estimate missing values in **San Marcos**[3] for 7/1/1963-2/28/2015. A total of 17 values (hourly time step) were filled during this time period. Note that San Marcos ALERT tipping bucket record begins 5/28/1981-3/3/2006 during which, there was 217135 missing values (hourly time step). These values were filled with data from Encinitas. Now, a complete record is available for San Marcos from 11/16/1962-2/28/2015.
e. Kearny Mesa data was used to estimate missing values in **Sweetwater**[5] for the period of record for 2/1/1965-10/30/1992. A total of 765 values (hourly time step) were filled.
f. Available data from Escondido was used to estimate missing values in **Encinitas**[6] for 11/19/1964-2/28/2015. A total of 1862 values (hourly time step) were filled. Now, a complete record is available for Encinitas from 7/1/1963-2/28/2015.
g. Encinitas data was used to estimate missing values in **Escondido**[6] for the period of record for 11/19/1964-2/28/2015. A total of 7761 values (hourly time step) were filled. Note that Encinitas ALERT tipping bucket record begins 7/1/1984, which may account for the number of values filled.

Rainfall data assignment and sources for each watershed are shown in Table 8

Table 8: Select Rainfall Stations for SWMM Peak Flow Analysis

Watershed	Rainfall Station	Record	Elevation (ft)	Source
Otay[1]	Bonita	1975-2015	139	SDCFCD
	Sweetwater[2]	1965-1992	310	SDCFCD
San Diego	Lindbergh[3]	1948-2005	15	Project Clean Water
San Dieguito[1]	Encinitas	1963-2015	250	SDCFCD
	Escondido	1964-2015	660	SDCFCD
	San Marcos	1962-2015	580	SDCFCD
San Luis Rey	Oceanside[3]	1951-2008	30	Project Clean Water
Sweetwater[1]	Bonita	1975-2015	139	SDCFCD
	Sweetwater	1965-1992	310	SDCFCD

[1]Rainfall station rainfall intensity was averaged between rainfall stations and applied uniformly to the entire modeled watershed
[2]No collocated ALERT station
[3]Data downloaded directly from Project Clean Water (http://www.projectcleanwater.org)

The spatial distribution of TRWE sample HMP projects and SDCFCD rainfall stations are illustrated in Figure 3.

2.2.1 Parameters

Physical watershed parameters were estimated using available land use geographic information system (GIS) data from SanGIS. Planned land use classifications were used for all SWMM peak flow analyses, including areas upstream of the dams, which were conservatively assumed to reflect the pre-development hydrology through application of hydromodification flow reduction to the outlet node. Percent imperviousness was determined by using area-weighted averages based upon those values presented in a 2010 County of San Diego imperviousness study. Percent slope was determined by using area-weighted averages based upon relationships between SanGIS land use and the latest USGS National Elevation Dataset (NED) 1/3 arc-second DEM for greater Southern California. The width parameter served as a general calibration parameter for the model using the best available USGS instantaneous stream flow data. Using the relationship between watershed area and river length, a factor was applied to this ratio to match the 5-year peak flow value. The San Diego River station was used to develop this factored relationship due to the completeness of the dataset, the least number of upstream dam overflow events, and location near the river mouth. The remaining SWMM parameters were taken from the San Diego Model BMP Design Manual. General watershed parameters are outlined in Table 9. Specific watershed parameters are provided in Appendix A.

Table 9: SWMM Parameters Used in SWMM Peak Flow Analysis

SWMM Parameter	Description[1]	Value				Source
Area (ac)	Area of the subcatchment.	Watershed-specific				GIS analysis
Width (ft)	Characteristic width of the overland flow path for sheet flow runoff.	Calibrated by factoring the ratio of entire river length to full watershed area to match the PDS-derived San Diego River 5-year peak flow, taken as: $W_{HSG} = 0.184\frac{A_{HSG}}{L_R}$ where: W_{HSG} is the width of the given HSG subcatchment; A_{HSG} is the area of the given HSG subcatchment; L_R is the length of the entire river reach				TRWE
% Slope	Average percent slope of the subcatchment.	Area-weighted average of percent slope by land use				USGS NED 1/3 arc-second DEM
% Imperv	Percent of the land area which is impervious.	Area-weighted average of percent imperviousness by land use				County of San Diego, 2010
N-Imperv	Manning's n for overland flow over the impervious portion of the subcatchment.	0.012				SD Model BMP Design Manual
N-Perv	Manning's n for overland flow over the pervious portion of the subcatchment.	0.15				SD Model BMP Design Manual
D store-Imperv (in)	Depth of depression storage on the impervious portion of the subcatchment.	0.05				SD Model BMP Design Manual
D store-Perv (in)	Depth of depression storage on the pervious portion of the subcatchment.	0.10				SD Model BMP Design Manual
% Zero-Imperv	Percent of the impervious are with no depression storage.	25%				SD Model BMP Design Manual
Subarea Routing	Choice of internal routing of runoff between pervious and impervious areas	OUTLET				SD Model BMP Design Manual
Percent Routed	Percent of runoff routed between subareas.	100%				SD Model BMP Design Manual
Infiltration	Infiltration parameters for the subcatchment.	GREEN_AMPT				SD Model BMP Design Manual
		HSG A	HSG B	HSG C	HSG D	
	GREEN_AMPT: Suction Head (in)	1.5	3.0	6.0	9.0	SD Model BMP Design Manual
	GREEN_AMPT: Initial Deficit (in/hr)	0.33	0.32	0.31	0.30	SD Model BMP Design Manual
	GREEN_AMPT: Developed Conductivity (in/hr)	0.225	0.15	0.075	0.01875	SD Model BMP Design Manual

3. RESULTS

3.1 Statistical Peak Flow Results

Results provided herein are not intended to be used for design purposes, or serve as an exact measurement. The results are solely intended to provide a relative change in peak flow and demonstrate the impact of the upstream impoundment on the peak flow events in each river. The Statistical Peak Flow Analysis results are summarized in Table 10. For those rivers with stream stations located at or near the mouth, the statistical peak flow is compared with the "no dam" peak flows (Table 10, column "Peak[1]"). For those rivers without stream stations located at or near the mouth, the downstream-most available FEMA FIS 10-year peak flows are compared with the "no dam" peak flows. The percent difference or the reduction between the "no dam" and FEMA FIS 10-year peak flows are provided in Table 11. The flow reduction estimates are approximate in nature and are only shown to illustrate significant effects of impoundment on the peak flow events. In developing peak flows for the FIS, FEMA uses an annual series analysis, so it is expected that the percent reductions may be overestimated when used for comparison with a partial duration series analysis.

Table 10: Statistical Peak Flow Results Summary for "No Dam" Peak Flows

River	T-year	Peak[1] (cfs)	A* (mi^2)	P* (in)	Q_{USGS}[b] (cfs)	FPR	A** (mi^2)	P** (in)	Q_{WS}[c] (cfs)	Q_{ND}[d] (cfs)

[1]partial duration series value selected for 2-year and 5-year peak; annual maximum series selected for 10-year
[2] (Federal Emergency Management Agency, 2012)

The Statistical Peak Flow Analysis provides reasonable estimation of river impoundment peak flow reduction. For comparison, a 2005 study focused on the hydrological effects of dams on the Sacramento and San Joaquin Rivers in Northern California found that the 2-year peak flow declined anywhere between 35 to 95% of pre-dam values, while the 10-year peak flow was reduced from 2 to 78% (Kondolf & Batalla, 2005). For further comparison, a 2005 study of the hydrological effects of dams in semi-arid portions of north-eastern Spain (also a Mediterranean climate) found that 22 of 23 rivers showed reductions in 2 and 10-year peak flow by 31 and 33%, respectively, with effects more pronounced in the low-rainfall southern Mediterranean tributaries (Batalla, Gomez, & Kondolf, 2003). Therefore, the results (~29-65% reduction) provided in this study are consistent with flow impoundment behavior found in other semi-arid, Mediterranean systems and supports the assumption of significant flow sequestration in the five river reaches.

3.2 SWMM Peak Flow Results

Results from the SWMM Peak Flow Analysis are provided in Table 12 through Table 16 for the "dam-in-place" condition and Table 17 through Table 21 for the "no dam" condition. The results are estimates of peak flows and relative change for the exempt reaches using a simplified continuous modeling approach. These results are not intended to be used for design purposes.

The 2-, 5-, and 10-year flow rates are conservative estimates due to a number of underlying assumptions. First, the assumption of uniform rainfall over a large watershed may produce higher flows than what would actually be realized in each river. However, baseflow was not considered in peak flow determination. Also, the simple rainfall-runoff model is kinematic in nature, not accounting for complex overland flow behaviors such as runoff diffusion. Finally, the overland flow model does not consider channel routing and subsequent longitudinal spreading of the wave base for more mildly-sloped areas within the watershed, which ultimately produces a lower peak flow due to the attenuation and translation of the outflow hydrograph over space and time. Given these assumptions, it is important to note that the main objectives of this study do not require obtaining precise peak flow values. Instead, this study is focused on the relative change of discharges from Project Lands with and without hydromodification management BMP performance requirements.

Table 12: Otay River SWMM Peak Flows: "Dam-in-Place" Condition

Peak	No HMP BMPs (cfs)	Full HMP (cfs)	HMP Exemption (cfs)	Peak Reduction w/ HMP Exemption	Peak Flow Increase Due to Exemption	Exemption Peak Flow Increase (cfs)

2-year	2,050	2,039	2,041	0.4%	**0.1%**	2
5-year	2,735	2,718	2,722	0.5%	**0.1%**	4
10-year	3,283	3,265	3,269	0.4%	**0.1%**	4

The SWMM Peak Flow Analysis found that if the HMP exemptions were granted (as opposed to "Full HMP"—no exemptions granted), it would increase the 2-, 5-, and 10-year peak flow events by no more than 1.1% in all rivers except Otay, where at most, a 2.3% increase is predicted. It should be noted, in the case of Otay that, though minor, this additional flow has the potential to aid the many river restoration efforts identified in the 2006 Otay River Watershed Management Plan (Aspen Environmental Group, 2006). With the HMP exemptions in place, the SWMM Peak Flow Analysis applied hydromodification flow reduction to all non-directly discharging developable land to produce peak flow reductions ranging between 1.3 to 11% (as opposed to "No HMP"—no hydromodification flow control). This percent reduction is the peak flow "benefit" achieved through application of peak flow control. When modeled without the influence of the dam, the effects of Project Lands are further diminished—the primary reason for the original exemption. It is worth noting that both the modeled dam-in-place and no-dam peak flows produce reasonable matches with those peak flows presented in the Statistical Peak Flow Analysis.

The most notable comparisons are between the "dam-in-place" peak flows with the HMP exemption ("Dam-in-Place" HMP Exemption) versus the "no dam" peak flows with no HMP exemptions ("No Dam" Full HMP) presented in Table 22 through Table 26. These comparisons were made in order to simulate the impact of the proposed exemptions on peak flows versus the impact of the river impoundment on peak flows. These SWMM Peak Flow comparisons suggest that if, in their current impounded state, only Project Lands were exempt from hydromodification management BMP performance requirements, the resulting peak flows would be far less than the unimpounded, pre-development peak flows. The "No Dam" Full HMP scenario was considered to be the best representation of a pre-development watershed (in the absence of pre-Columbian watershed parameters) because the very nature of hydromodification management is to simulate the pre-development hydrologic condition. In other words, if the entire developed portion of a watershed is subject to hydromodification flow and duration control, then it is assumed to simulate the pre-development hydrologic condition.

Due to the conservative modeling approach, in actuality the "Dam-in-Place" HMP Exemption peak flows would likely be even less than those modeled herein due to strict interpretations on what constitutes a directly discharging developable land. An even greater difference between the HMP exemption peak flows and the pre-development peak flows would result. Therefore, the SWMM Peak Flow Analysis confirms that the major river impoundments are the primary source of peak flow reduction and clearly demonstrates that peak flows discharging from exempted Project Lands would remain considerably less than the natural, pre-development peak flows.

4. CONCLUSIONS

All five exempt river reaches are subjected to significant upstream impoundment and are rigorously analyzed with two hydrologic methods. The Statistical Peak Flow Analysis found that the major impoundments reduce peak flows anywhere from 29% to 65% of the unimpounded condition. Similarly, the SWMM Peak Flow Analysis found that the major impoundments reduce peak flows approximately 22% to 79%, depending on the reach and peak flow event. The original assumption of significant flow sequestration in the exempt river reaches made by the 2011 HMP is validated by both the Statistical Peak Flow Analysis and the SWMM Peak Flow Analysis in this study.

The benefit of proper hydromodification management BMP implementation is evidenced by comparison between various HMP scenarios. For all watersheds with more than 1,200 acres of Project Lands, HMP flow controls applied to only non-directly discharging developable lands are projected to achieve peak flow reductions of at least 4%. Furthermore, the projected “cost” of allowing the hydromodification exemptions to stand would increase peak flows by an extremely narrow margin in all reaches. It should be noted that the peak flow reduction estimates presented herein are conservative in nature since all non-directly discharging developed lands will be subject to hydromodification management BMPs in the event any re-development within these areas were to occur, further decreasing any peak flow influence from Project Lands. In reality, the percent peak flow reduction is expected to be even greater.

The results from this analysis suggest that the peak flows from areas directly discharging to exempt river reaches (Otay, San Diego, San Dieguito, San Luis Rey, and Sweetwater River) pose no threat to the erosion potential of the exempt river reaches. If these reaches undergo significant changes (i.e. removal of impoundments), it is recommended that a new hydrologic assessment should be made to determine the resulting implications and continual eligibility for exemption. However, under the current conditions defined in this study, it is clearly demonstrated that the existence of upstream impoundment is the principle factor in peak flow alteration—not developed Project Lands. Changes in peak flows from Project Lands are found to be less than significant. Therefore, it is recommended that the 2011 HMP Exemptions be reinstated for all developable lands directly discharging to the exempt river reaches, so long as the project provides properly designed energy dissipation controls at the outfalls. It is also recommended that hydromodification BMPs be required for non-Project Lands, as these areas account for the majority of the developable land within each watershed and will likely produce the greatest influence on peak flows on these rivers in their current impounded state.

Stability Thresholds for Stream Restoration Materials

Fischenich (2001)

Stability Thresholds for Stream Restoration Materials

by Craig Fischenich[1]

May 2001

Complexity	Value as a Planning Tool	Cost
Low Moderate High	Low Moderate High	Low Moderate High

OVERVIEW

Stream restoration projects usually involve some modification to the channel or the banks. Designers of stabilization or restoration projects must ensure that the materials placed within the channel or on the banks will be stable for the full range of conditions expected during the design life of the project. Unfortunately, techniques to characterize stability thresholds are limited. Theoretical approaches do not exist and empirical data mainly consist of velocity limits, which are of limited value.

Empirical data for shear stress or stream power are generally lacking, but the existing body of information is summarized in this technical note. Whereas shear thresholds for soils found in channel beds and banks are quite low (generally < 0.25 lb/sf), those for vegetated soils (0.5 – 4 lb/sf), erosion control materials and bioengineering techniques (0.5 – 8 lb/sf), and hard armoring (< 13 lb/sf) offer options to provide stability.

STABILITY CRITERIA

The stability of a stream refers to how it accommodates itself to the inflowing water and sediment load. In general, stable streams may adjust their boundaries but do not exhibit trends in changes to their geometric character. One form of instability occurs when a stream is unable to transport its sediment load (i.e., sediments deposited within the channel), leading to the condition referred to as aggradation.

When the ability of the stream to transport sediment exceeds the availability of sediments within the incoming flow, and stability thresholds for the material forming the boundary of the channel are exceeded, erosion occurs. This technical note deals with the latter case of instability and distinguishes the presence or absence of erosion (threshold condition) from the magnitude of erosion (volume).

Erosion occurs when the hydraulic forces in the flow exceed the resisting forces of the channel boundary. The amount of erosion is a function of the relative magnitude of these forces and the time over which they are applied. The interaction of flow with the boundary of open channels is only imperfectly understood. Adequate analytical expressions describing this interaction have not yet been developed for conditions associated with natural channels. Thus, means of characterizing erosion potential must rely heavily upon empiricism.

Traditional approaches for characterizing erosion potential can be placed in one of two categories: maximum permissible velocity, and tractive force (or critical shear stress). The former approach is advantageous in that velocity is a parameter that can be measured within the flow. Shear stress cannot be directly measured – it must be computed from other flow parameters. Shear stress is a better measure of the fluid force on the channel boundary than is velocity. Moreover, conventional guidelines, including ASTM standards, rely upon the shear stress as a

[1] USAE Research and Development Center, Environmental Laboratory, 3909 Halls Ferry Rd., Vicksburg MS 39180

means of assessing the stability of erosion control materials. Both approaches are presented in this paper.

Incipient Motion (Threshold Condition)

As flow over the bed and banks of a stream increases, a condition referred to as the threshold state is reached when the forces tending to move materials on the channel boundary are in balance with those resisting motion. The forces acting on a noncohesive soil particle lying on the bed of a flowing stream include hydrodynamic lift, hydrodynamic drag, submerged weight ($F_w - F_b$), and a resisting force F_r. as seen in Figure 1. The drag is in the direction of the flow and the lift and weight are normal to the flow. The resisting force depends on the geometry of the particles. At the threshold of movement, the resultant of the forces in each direction is zero. Two approaches for defining the threshold state are discussed herein, initial movement being specified in terms of either a critical velocity (v_{cr}) or a critical shear stress (τ_{cr}).

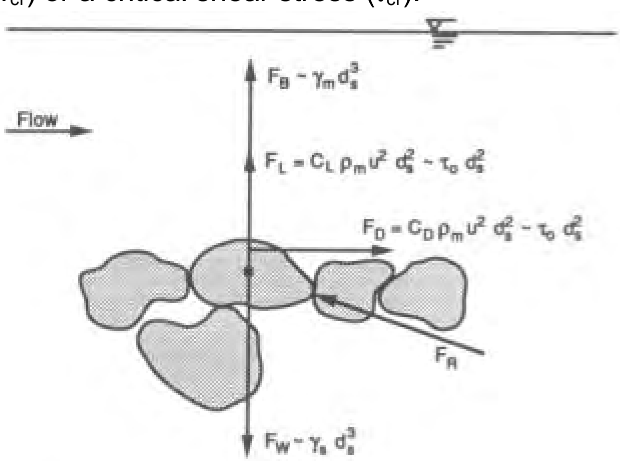

Figure 1. Forces acting on the boundary of a channel (adapted from Julien (1995)).

Critical Velocity

Figure 1 shows that both the lift and the drag force are directly related to the velocity squared. Thus, small changes in the velocity could result in large changes in these forces. The permissible velocity is defined as the maximum velocity of the channel that will not cause erosion of the channel boundary. It is often called the critical velocity because it refers to the condition for the initiation of motion. Early works in canal design and in evaluating the stability of waterways relied upon this method. Considerable empirical data exist relating maximum velocities to various soil and vegetation conditions.

However, this simple method for design does not consider the channel shape or flow depth. At the same mean velocity, channels of different shapes or depths may have quite different forces acting on the boundaries. Critical velocity is depth-dependent, and a correction factor for depth must be applied in this application. Despite these limitations, maximum permissible velocity can be a useful tool in evaluating the stability of various waterways. It is most frequently applied as a cursory analysis when screening alternatives.

Critical Shear Stress

The forces shown in Figure 1 can also be expressed in terms of the shear stress. Shear stress is the force per unit area in the flow direction. Its distribution in steady, uniform, two-dimensional flow in the channel can be reasonably described. An estimate of the average boundary shear stress (τ_o) exerted by the fluid on the bed is:

$$\tau_o = \gamma D S_f \qquad (1)$$

where γ is the specific weight of water, D is the flow depth (~ hydraulic radius), and S_f is the friction slope. Derived from consideration of the conservation of linear momentum, this quantity is a spatial average and may not provide a good estimate of bed shear at a point.

Critical shear stress (τ_{cr}) can be defined by equating the applied forces to the resisting forces. Shields (1936) determined the threshold condition by measuring sediment transport for values of shear at least twice the critical value and then extrapolating to the point vanishing sediment transport. His laboratory experiments have since served as a basis for defining critical shear stress. For soil grains of diameter d and angle of repose ϕ on a flat bed, the following relations can approximate the critical shear for various sizes of sediment:

$$\tau_{cr} = 0.5(\gamma_s - \gamma_w) d \, Tan\phi \quad \text{For clays} \qquad (2)$$

$$\tau_{cr} = 0.25 d_*^{-0.6} (\gamma_s - \gamma_w) d \, Tan\phi \quad \text{For silts and sands} \qquad (3)$$

$t_{cr} = 0.06(l_s - l_w)d\ Tan f$ For gravels and cobbles (4)

Where

$$d_* = d\left[\frac{(G-1)g}{n^2}\right]^{1/3} \qquad (5)$$

γ_s = the unit weight of the sediment
γ_w = the unit weight of the water/sediment mixture
G = the specific gravity of the sediment
G = gravitational acceleration
ν = the kinematic viscosity of the water/sediment mixture

The angle of repose ϕ for noncohesive sediments is presented in Table 1 (Julien 1995), as are values for critical shear stress. The critical condition can be defined in terms of shear velocity rather than shear stress (note that shear velocity and channel velocity are different). Table 1 also provides limiting shear velocity as a function of sediment size. The V_{*c} term is the critical shear velocity and is equal to

$$V_{*c} = \sqrt{gR_hS_f} \qquad (6)$$

Table 1 provides limits best applied when evaluating idealized conditions, or the stability of sediments in the bed. Mixtures of sediments tend to behave differently from uniform sediments. Within a mixture, coarse sediments are generally entrained at lower shear stress values than presented in Table 1. Conversely, larger shear stresses than those presented in the table are required to entrain finer sediments within a mixture.

Cohesive soils, vegetation, and other armor materials can be similarly evaluated to determine empirical shear stress thresholds. Cohesive soils are usually eroded by the detachment and entrainment of soil aggregates. Motivating forces are the same as those for noncohesive banks; however, the resisting forces are primarily the result of cohesive bonds between particles. The bonding strength, and hence the soil erosion resistance, depends on the physio-chemical properties of the soil and the chemistry of the fluids. Field and laboratory experiments show that intact, undisturbed cohesive soils are much less susceptible to flow erosion than are non-cohesive soils.

Vegetation, which has a profound effect on the stability of both cohesive and noncohesive soils, serves as an effective buffer between the water and the underlying soil. It increases the effective roughness height of the boundary, increasing flow resistance and displacing the velocity upwards away from the soil, which has the effect of reducing the forces of drag and lift acting on the soil surface. As the boundary shear stress is proportional to the square of the near-bank velocity, a reduction in this velocity produces a much greater reduction in the forces responsible for erosion.

Vegetation armors the soil surface, but the roots and rhizomes of plants also bind the soil and introduce extra cohesion over and above any intrinsic cohesion that the bank material may have. The presence of vegetation does not render underlying soils immune from erosion, but the critical condition for erosion of a vegetated bank is usually the threshold of failure of the plant stands by snapping, stem scour, or uprooting, rather than for detachment and entrainment of the soils themselves. Vegetation failure usually occurs at much higher levels of flow intensity than for soil erosion.

Both rigid and flexible armor systems can be used in waterways to protect the channel bed from erosion and to stabilize side slopes. A wide array of differing armor materials are available to accomplish this. Many manufactured products have been evaluated to determine their failure threshold. Products are frequently selected using design graphs that present the flow depth on one axis and the slope of the channel on the other axis. Thus, the design is based on the depth/slope product (i.e., the shear stress). In other cases, the thresholds are expressed explicitly in terms of shear stress. Notable among the latter group are the field performance testing results of erosion control products conducted by the TXDOT/TTI Hydraulics and Erosion Control Laboratory (TXDOT 1999).

Table 2 presents limiting values for shear stress and velocity for a number of different channel lining materials. Included are soils, various types of vegetation, and number of different commonly applied stabilization techniques. Information presented in the table was derived from a number of different sources. Ranges of values presented in the table reflect various measures presented within the literature. In the case of manufactured products, the designer should consult the manufacturer's guidelines to determine thresholds for a specific product.

Uncertainty and Variability

The values presented in Table 2 generally relate to average values of shear stress or velocity. Velocity and shear stress are neither uniform nor steady in natural channels. Short-term pulses in the flow can give rise to instantaneous velocities or stresses of two to three times the average; thus, erosion may occur at stresses much lower than predicted. Because limits presented in Table 2 were developed empirically, they implicitly include some off this variability. However, natural channels typically exhibit much more variability than the flumes from which these data were developed.

Sediment load can also profoundly influence the ability of flow to erode underlying soils. Sediments in suspension have the effect of damping turbulence within the flow. Turbulence is an important factor in entraining materials from the channel boundaries. Thus, velocity and shear stress thresholds are 1.5 to 3 times that presented in the table for flows carrying high sediment loads.

In addition to variability of flow conditions, variation in the channel lining characteristics can influence erosion predictions. Natural bed material is neither spherical nor of uniform size. Larger particles may shield smaller ones from direct impact so that the latter fail to move until higher stresses are attained. For a given grain size, the true threshold criterion may vary by nearly an order of magnitude depending on the bed gradation. Variation in the installation of erosion control measures can reduce the threshold necessary to cause erosion.

Table 2. Permissible Shear and Velocity for Selected Lining Materials[1]

Boundary Category	Boundary Type	Permissible Shear Stress (lb/sq ft)	Permissible Velocity (ft/sec)	Citation(s)
Soils	Fine colloidal sand	0.02 - 0.03	1.5	A
	Sandy loam (noncolloidal)	0.03 - 0.04	1.75	A
	Alluvial silt (noncolloidal)	0.045 - 0.05	2	A
	Silty loam (noncolloidal)	0.045 - 0.05	1.75 – 2.25	A
	Firm loam	0.075	2.5	A
	Fine gravels	0.075	2.5	A

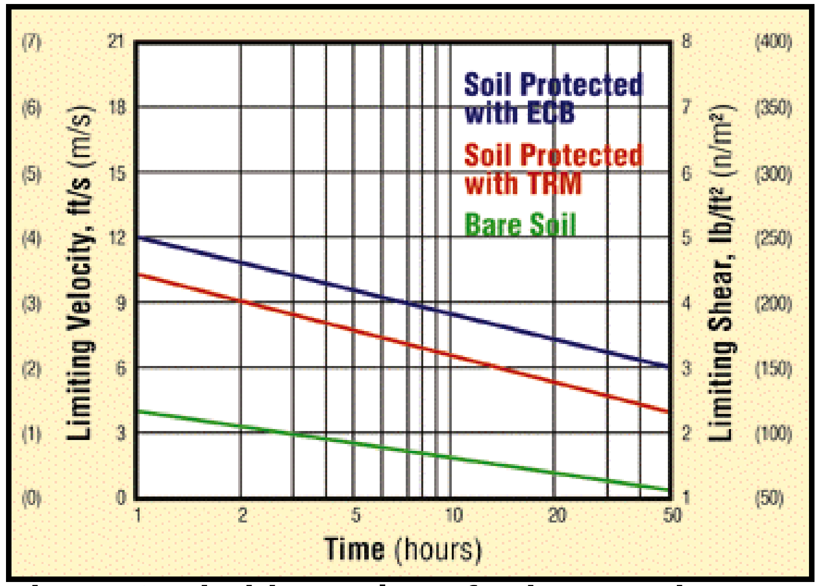

Figure 3. Limiting values for bare and TRM protected soils (from Sprague (1999))

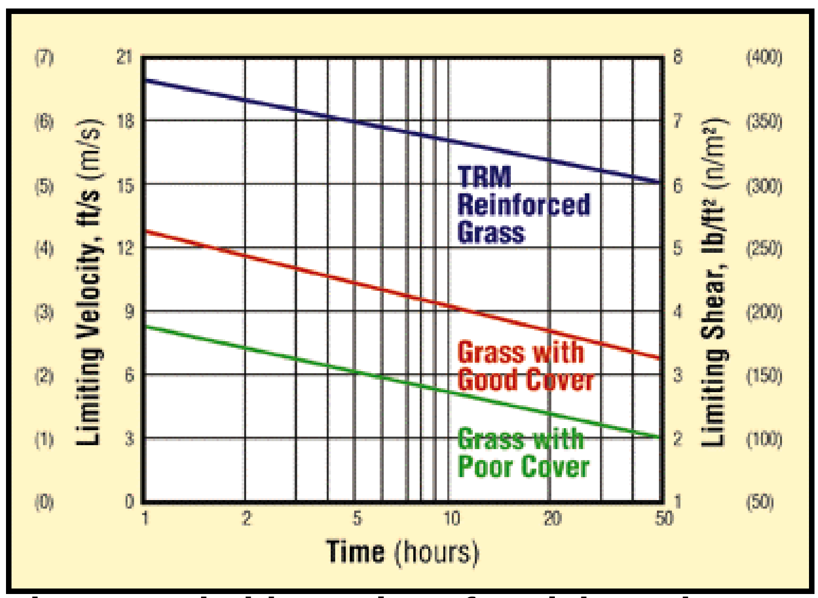

Figure 4. Limiting values for plain and TRM reinforced grass (from Sprague (1999))

Correlations between flow volume and amount of erosion tend to be poor. Multi-peaked flows may be more effective than single flows of comparable or greater magnitude because of the increased incidence of wetting. Flows with long durations often have a more significant effect on erosion than short-lived flows of higher magnitude. Sediment transport analysis can be used to gauge the magnitude of erosion potential in the channel design, but predictive capability is limited.

Sediment Transport

A number of flow measures can be used to assess the ability of a stream to transport sediment. The unit stream power (P_m) is one common approach, and is related to the earlier discussion in that stream power includes both velocity and shear stress as components. Sediment transport (Q_s) increases when the unit stream power (P_m) increases. Unit stream power in turn is controlled by both tractive stress and flow velocity:

$$P_m = v \cdot \tau = v \cdot \gamma_w \cdot D \cdot S_f \tag{7}$$

The total power (P_t) is the product of the unit power times the channel width (W):

$$P_t = P_m \cdot W = v \cdot W \cdot D \cdot \gamma_w \cdot S_f = v \cdot A \cdot \gamma_w \cdot S_f = Q_w \cdot \gamma_w \cdot S_f \tag{8}$$

Stream power assessments can be useful in evaluating sediment discharge within a stream channel and the deposition or erosion of sediments from the streambed. However, their utility for evaluating the stability of measures applied to prevent erosion is limited because of the lack of empirical data relating stream power to stability. The analysis of general streambank erosion is not a simple extension of the noncohesive bed case with an added downslope gravity component. Complication is added by other influencing variables, such as vegetation, whose root system can reinforce bank material and increase erosion resistance. Factors influencing bank erosion are summarized in Table 3.

Table 3. Factors Influencing Erosion

actor	*elevant characteristics*
low properties	lagnitude, frequency and variability of stream discharge; Magnitude and distribution of elocity and shear stress; Degree of turbulence
ediment composition	ediment size, gradation, cohesion and stratification
limate	ainfall amount, intensity and duration; Frequency and duration of freezing
ubsurface conditions	eepage forces; Piping; Soil moisture levels
hannel geometry	Vidth and depth of channel; Height and angle of bank; Bend curvature
iology	'egetation type, density and root character; Burrows
nthropogenic factors	Irbanization, flood control, boating, irrigation

APPLICATION

The stability of a waterway or the suitability of various channel linings can be determined by first calculating both the mean velocity and tractive stress (by the previous equations). These values can then be compared with allowable velocity and tractive stress for a particular ground cover or lining system under consideration (e.g., existing vegetation cover, an erosion control blanket, or bioengineering treatment). Allowable tractive stresses for various types of soil, linings, ground covers, and stabilization measures including soil bioengineering treatments, are listed in Table 2. Additionally, manufacturers' product literature can provide allowable tractive stresses or velocities for various types of erosion control products.

An iterative procedure may be required when evaluating channel stability because various linings will affect the resistance coefficient, which in turn may change the estimated flow conditions. A general procedure for the application of information presented in this paper is outlined in the following paragraphs.

Step 1-Estimate Mean Hydraulic Conditions. Flow of water in a channel is governed by the discharge, hydraulic gradient, channel geometry, and roughness coefficient. This functional relationship is most frequently evaluated using normal depth or backwater computations that take into account principles of conservation of linear momentum. The latter is preferable because it accounts for variations in momentum slope, which is directly related to shear stress. Several models are available to aid the hydraulic engineer in assessing hydraulic conditions. Notable examples include HEC-2, HEC-RAS, and WSP2. Channel cross sections, slopes, and Manning's coefficients should be determined based upon surveyed data and observed or predicted channel boundary conditions. Output from the model should be used to compute main channel velocity and shear stress at each cross section.

Step 2- Estimate Local/Instantaneous Flow Conditions. The computed values for velocity and shear stress may be adjusted to account for local variability and instantaneous values higher than mean. A number of procedures exist for this purpose. Most commonly applied are empirical methods based upon channel form and irregularity. Several references at the end of this paper present procedures to make these adjustments. Chang (1988) is a good example. For straight channels, the local maximum shear stress can be assumed from the following simple equation:

$$t_{\max} = 1.5t \qquad (9)$$

for sinuous channels, the maximum shear stress should be determined as a function of the planform characteristics using Equation 10:

$$t_{\max} = 2.65\, t \left(\frac{R_c}{W}\right)^{-0.5} \qquad (10)$$

where R_c is the radius of curvature and W is the top width of the channel. Equations 9 and 10 adjust for the spatial distribution of shear stress; however, temporal maximums in turbulent flows can be 10 – 20 percent higher, so an adjustment to account for instantaneous maximums should be added as well. A factor of 1.15 is usually applied.

Step 3- Determine Existing Stability. Existing stability should be assessed by comparing estimates of local and instantaneous shear and velocity to values presented in Table 2. Both the underlying soil and the soil/vegetation condition should be assessed. If the existing conditions are deemed stable and are in consonance with other project objectives, then no further action is required. Otherwise, proceed to step 4.

Step 4- Select Channel Lining Material. If existing conditions are unstable, or if a different material is needed along the channel perimeter to meet project objectives, a lining material or stabilization measure should be selected from Table 2, using the threshold values as a guideline in the selection. Only material with a threshold exceeding the predicted value should be selected. The other project objectives can also be used at this point to help select from among the available alternatives. Fischenich and Allen (2000) characterize attributes of various protection measures to help in the selection.

Step 5- Recompute Flow Values. Resistance values in the hydraulic computations should be adjusted to reflect the selected channel lining, and hydraulic condition should be recalculated for the channel. At this point, reach- or section-averaged hydraulic conditions should be adjusted to account for local and instantaneous extremes.
Table 4 presents velocity limits for various channel boundaries conditions. This table is useful in screening alternatives, or as an alternative to the shear stress analysis presented in the preceding sections.

Table 4. Stability of Channel Linings for Given Velocity Ranges

Lining	0 – 2 fps	2 – 4 fps	4 – 6 fps	6 – 8 fps	> 8 fps

Riprap	Appropriate	Appropriate	Appropriate	Appropriate	Appropriate
Concrete	Appropriate	Appropriate	Appropriate	Appropriate	Appropriate

Key:

(green)	Appropriate
(yellow)	Use Caution
(red)	Not Appropriate

Step 6– Confirm Lining Stability.
The stability of the proposed lining should be assessed by comparing the threshold values in Table 2 to the newly computed hydraulic conditions. These values can be adjusted to account for flow duration using Figures 2-4 as a guide. If computed values exceed thresholds, step 4 should be repeated. If the threshold is not exceeded, a factor of safety for the project should be determined from the following equations:

$$FS = \frac{t_{\max}}{t_{est}} \quad or \quad FS = \frac{V_{\max}}{V_{est}} \qquad (11)$$

In general, factors of safety in excess of 1.2 or 1.3 should be acceptable. The preceding five steps should be conducted for every cross section used in the analysis for the project. In the event that computed hydraulic values exceed thresholds for any desirable lining or stabilization technique, measures must be undertaken to reduce the energy within the flow. Such measures might include the installation of low-head drop structures or other energy-dissipating devices along the channel. Alternatively, measures implemented within the watershed to reduce total discharge could be employed.

APPLICABILITY AND LIMITATIONS

Techniques described in this technical note are generally applicable to stream restoration projects that include revegetation of the riparian zone or bioengineering treatments.

ACKNOWLEDGEMENTS

Research presented in this technical note was developed under the U.S. Army Corps of Engineers Ecosystem Management and Restoration Research Program. Technical reviews were provided by Messrs. E.A. (Tony) Dardeau, Jr., (Ret.), and Jerry L. Miller, both of the Environmental Laboratory.

POINTS OF CONTACT

For additional information, contact the author, Dr. Craig Fischenich, (601-634-3449, fischec@wes.army.mil), or the manager of the Ecosystem Management and Restoration Research Program, Dr. Russell F. Theriot (601-634-2733, therior@wes.army.mil). This technical note should be cited as follows:

General Comments on Final Water Quality Improvement Plans and Notice of Noncompliance

Walsh (2015)

August 5, 2015 **Via Email Only**

San Diego County Principal Watershed Copermittees

In reply refer to / attn:
PIN :786088:LWalsh

Subject: General Comments on Final Water Quality Improvement Plans and Notice of Noncompliance

San Diego County Principal Watershed Copermittees:

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board) received the Water Quality Improvement Plans (Plans) from the San Diego County Copermittees (Copermittees) on or before June 26, 2015, as required pursuant to Provision F.1.b.(1) of Order No. R9-2013-0001, *National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region* (Order).

The Plans are the product of more than two years of concentrated Plan development efforts by the Copermittees. These Plans were prepared in phases and the Copermittees received regular input from the San Diego Water Board, industry professionals, non-governmental environmental organizations, and community members as part of feedback from the Water Quality Improvement Consultation Panel groups and the public at large during multiple public workshops. While the San Diego Water Board recognizes this is the first time the Copermittees have prepared such Plans and acknowledges their efforts to comply with the requirements of the Order, some of the Plans did a better job of meeting the requirements of the Order than others.

The San Diego Water Board is confident that once the Plans are in compliance with the requirements of the Order and accepted by the San Diego Water Board, the Copermittees' jurisdictional runoff management programs (JRMPs) will have the greatest potential to achieve significant reductions in pollutant loads in MS4 discharges and improvements in receiving water quality to the level supportive of beneficial uses within the shortest possible time.

In addition to reviewing the Plans for compliance with the requirements of the Order, the San Diego Water Board reviewed the acceptability of the Plans. The Order allows the Copermittees to develop Plans that prioritize the water quality conditions to address sooner rather than later, and to set numeric goals and schedules to address the highest priorities. However, not all proposed priorities, goals, and schedules will be determined acceptable, especially if the San Diego Water Board determines that a Plan will not achieve water quality improvements within a reasonable period of time. While the elements of a Plan may meet the requirements of the Order, those elements must also meet the intent of the Order which is instrumental to achieving the goals of the San Diego Water Board's Practical Vision.

The San Diego Water Board has not yet completed a detailed review of each Plan. At this time, the San Diego Water Board is providing general comments for all the Plans because there are several issues of concern already identified that make the Plans unacceptable, as well as noncompliant with the requirements of the Order. When the detailed reviews are completed the San Diego Water Board staff will schedule a time to meet with the Copermittees for each Watershed Management Area, as soon as practicable and anticipated to be before the end of August 2015, to discuss specific issues that need to be addressed in each Plan. At the meetings, the San Diego Water Board may have Plan-specific comments in addition to the issues identified below.

Until then, the issues identified below must be adequately addressed for the Plans to be considered acceptable by the San Diego Water Board, and to be in compliance with the requirements of Order. Not all of the following comments and areas of noncompliance are applicable to every Plan or to every Copermittee, so the San Diego County Copermittees should review the Plans to determine where the following issues are applicable to their watershed and their jurisdiction.

PRIORITY WATER QUALITY CONDITIONS

1. *Identification of Priority Water Quality Conditions*

Requirements: Provisions B.2.a through B.2.c of the Order require the Copermittees to identify the priority water quality conditions that will be evaluated to determine which of those conditions will be the highest priorities to be addressed by the Plan. Provisions B.2.a through B.2.c require the Copermittees to consider several sources of data and information to identify priority water quality conditions within the Watershed Management Area, and whether there is a potential that MS4 discharges may be causing or contributing to those conditions.

Issues of Concern: Each Plan includes a description of the process to review different sources of data and information, including input from the public, to identify priority water quality conditions. The San Diego Water Board, however, has found the following general issues of concern:

a) In several Plans, the San Diego Water Board did not find a fully inclusive list of all priority water quality conditions (i.e. pollutants, stressors, receiving water conditions) that should have been identified in data and information that were required to be considered pursuant to Provisions B.2.a and B.2.b. Pursuant to

Provision B.2.c.(1), a fully inclusive list was required to be evaluated to identify which of those conditions were the highest threat to receiving water quality, or most adversely affect the quality of receiving waters.

b) In at least one Plan, there was not enough description or information that allowed the San Diego Water Board to determine if all the factors under Provisions B.2.a and B.2.b were adequately considered or not.

c) A few Plans have identified bacteria as a highest priority water quality condition based on the Revised Total Maximum Daily Loads (TMDLs) for Indicator Bacteria, Project I – Twenty Beaches and Creek in the San Diego Region (Beaches and Creeks Bacteria TMDLs), but the segment which the highest priority water quality condition is based on is no longer identified as impaired on the Clean Water Act Section 303(d) List (303(d) List).

Noncompliant Priority Water Quality Conditions: In several Plans, there was a notable absence of one or more pollutants or conditions of concern known to the San Diego Water Board (e.g. trash, hydromodification, benthic alteration, stream or riparian habitat degradation) that were also identified in reports, plans, and data cited and reviewed by the Copermittees (e.g. 2011 Long Term Effectiveness Assessment). In a few Plans, there was also a notable absence of pollutants or conditions of concern identified by the public at workshops or Water Quality Improvement Plan Consultation Panel meetings, and in written comments from stakeholders and the public. The lists developed pursuant to Provision B.2.c.(1) that do not acknowledge and include these notably absent pollutants and conditions of concern are not in compliance with the requirements of Provisions B.2.a-c.

Unacceptable Priority Water Quality Conditions: A few Plans have bacteria as a highest priority water quality condition only because of the Beaches and Creeks Bacteria TMDLs, but there is no longer an impairment identified on the 303(d) List. If there are no strategies proposed to be implemented other than the requirements of Provisions E.2 through E.7 to address bacteria, or there are no load reductions quantified for other pollutants in addition to bacteria, or both, the Plans are not acceptable to the San Diego Water Board.

WATER QUALITY IMPROVEMENT GOALS

2. Final Numeric Goals

Requirements: Provision B.3.a.(1)(a) of the Order requires the Copermittees to include final numeric goals in the Plan to address the highest priority water quality conditions. Each final numeric goal must either demonstrate the discharges from the Copermittees' MS4s will not cause or contribute to exceedances of water quality standards in receiving waters, or the receiving waters are protected from the Copermittees' MS4 discharges, or both (see Provisions B.3.a.(1)(a)(i)-(iii)).

Issues of Concern: Each Plan includes final numeric goals for the highest priority water quality conditions. The San Diego Water Board, however, has found the following general issues of concern:

a) Several Plans include proposed final numeric goals expressed in a manner that is difficult for the San Diego Water Board to determine the final numeric goal is a criterion or indicator capable of demonstrating one or more of the criteria given in Provisions B.3.a.(1)(a)(i)-(iii). In addition, the San Diego Water Board questions how some of these proposed final numeric goals could be measured by the Copermittees.

b) Several proposed final numeric goals appear to be in conflict with the prohibitions and limitations in Provision A of the Order. For example, there are Plans with proposed final numeric goals associated with reducing non-storm water discharges from the MS4s, but the San Diego Water Board cannot determine how achievement of the proposed final numeric goal is in compliance with the requirement to effectively prohibit non-storm water discharges to the MS4 (Provision A.1.b).

c) There are proposed final numeric goals that are difficult for the San Diego Water Board to establish a link between achieving the final numeric goal and addressing the highest priority water quality condition. For example, there are Plans with proposed final numeric goals associated with reducing non-storm water discharges from the MS4s to achieve reductions of pollutants in MS4 discharges (e.g. bacteria) during wet weather and dry weather conditions; however, the MS4 discharge reduction metric (e.g. flow) does not quantify the pollutant reduction that will be achieved during wet weather or dry weather conditions.

d) Some proposed final numeric goals did not meet the criteria of Provision B.3.a.(1)(a), but could be acceptable interim numeric goals.

Noncompliant Final Numeric Goals: Final numeric goals that are not numeric, AND measureable, AND capable of demonstrating the Copermittees' MS4s will not cause or contribute to exceedances of receiving water limitations, or the receiving waters are protected from the Copermittees' MS4 discharges, or both, are not in compliance with the requirements of Provision B.3.a.(1)(a).

Unacceptable Final Numeric Goals: The following proposed final numeric goals are not acceptable to the San Diego Water Board:

a) Final numeric goals that are not consistent or do not demonstrate compliance with the prohibitions and limitations of the Provision A.

b) Final numeric goals with a metric that is unclear about how it will be measured, and lacks any description of, or reference to the data that will be collected to measure the metric.

c) Final numeric goals that do not clearly demonstrate achievement of the final numeric goal will result in MS4 discharges that do not cause or contribute to exceedances of water quality standards in receiving waters, or the receiving waters are protected from the Copermittees' MS4 discharges, or both.

d) Final numeric goals that do not have a metric that clearly demonstrates a link to addressing the highest priority water quality conditions.

3. *Interim Numeric Goals*

Requirements: Provision B.3.a.(1)(b) of the Order requires the Copermittees to include interim numeric goals in the Plan for each final numeric goal. The Copermittees are allowed to propose as many interim numeric goals for each final numeric goal as they determine appropriate (Provision B.3.a.(b)(i)), but must include at least one interim numeric goal that is expressed as a reasonable increment of the final numeric goal. This interim numeric goal is expected to be in the same or a similar metric as the final numeric goal (Provision B.3.a.(b)(ii)). At least one interim numeric goal is required to be established during each 5 year period between the acceptance of the Plan and the achievement of the final numeric goal (Provision B.3.a.(b)(iii)).

Issues of Concern: In at least one Plan, the San Diego Water Board has found proposed final numeric goals that do not have interim numeric goals that are expressed in the same or similar metric as the final numeric goals.

Noncompliant Interim Numeric Goals: Final numeric goals that do not have at least one interim numeric goal expressed as a reasonable increment in the same or similar metric as the final numeric goal are not in compliance with Provision B.3.a.(1)(b)(ii).

WATER QUALITY IMPROVEMENT STRATEGIES

4. *Identification of Potential Water Quality Improvement Strategies*

Requirements: Provision B.2.e of the Order requires the Copermittees to identify potential strategies that can result in improvements to water quality. Provision F.1.a.(2)(f) requires the Copermittees consider revisions to potential water quality improvement strategies they propose in the Plan based on public comments.

Issues of Concern: Most Plans include lists of water quality improvement strategies that may be implemented by the Copermittees. The San Diego Water Board, however, has found the following general issues of concern:

a) In at least one Plan, the San Diego Water Board was not able to locate the list of potential water quality improvement strategies developed during the public participation process in the Plan.

b) In at least one Plan, the San Diego Water Board could not find all the potential water quality improvement strategies suggested or recommended in public comments.

Noncompliant Potential Water Quality Improvement Strategies: Plans that do not identify all potential strategies that were considered for implementation to improve water quality are not in compliance with the requirements of Provision B.2.e. Plans that did not consider all the potential water quality improvement strategies submitted in public comments are also not in compliance with the requirements of Provision B.2.e.

5. Optional Jurisdictional Strategies

Requirements: Provision B.3.b.(1)(b) of the Order requires each Copermittee to identify the optional jurisdictional strategies that will be implemented within its jurisdiction, as necessary, to achieve final numeric goals. Each Copermittee is required to identify water quality improvement strategies that are in addition to the best management practice (BMP) implementation, inspection, enforcement, and education activities that are already required by Provisions E.2 through E.7 (Provision B.3.b.(1)(b)(i)). Optional jurisdictional strategies to encourage or implement retrofit projects and channel and habitat rehabilitation projects are also required to be provided (Provisions B.3.b.(1)(b)(ii) and (iii)). For each optional jurisdictional strategy that a Copermittee includes in the Plan, descriptions of the funds and/or resources needed, and the circumstances needed to trigger implementation of the strategy are also required (Provisions B.3.b.(1)(b)(iv) and (v), respectively).

Issues of Concern: All the Plans lacked enough information for the San Diego Water Board to make a determination that all the requirements of Provision B.3.b.(1)(b) have been met. The San Diego Water Board has found the following general issues of concern:

a) Several Copermittees did not include any proposed optional jurisdictional strategies to be implemented within their jurisdictions, as necessary, to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the maximum extent practicable (MEP), protect beneficial uses of receiving waters from MS4 discharges, or achieve proposed interim and final numeric goals.

b) Most Copermittees did not include an incentive or program to encourage or implement projects to retrofit areas of existing development within its jurisdiction.

Pursuant to Provision E.5.e.(1)(a), every Copermittee is required to identify areas of existing development within its jurisdiction as candidates for retrofitting. Therefore, every Copermittee should have some incentive or program to encourage implementation of retrofit projects in the areas of existing development identified in its JRMP document pursuant to Provision E.5.e.(1)(a), unless there is an acceptable rationale in the Plan describing why it is infeasible to encourage or implement such retrofit projects.

c) Most Copermittees did not include an incentive or program to encourage or implement projects that will rehabilitate the conditions of channels or habitats within its jurisdiction. Pursuant to Provision E.5.e.(2)(a), every Copermittee is required to identify streams, channels, and/or habitats in areas of existing development within its jurisdiction as candidates for rehabilitation. Therefore, every Copermittee should have some incentive or program to encourage implementation of projects to rehabilitate the conditions of channels or habitats within its jurisdiction identified in JRMP document pursuant to Provision E.5.e.(2)(a), unless there is an acceptable rationale in the Plan describing why it is infeasible to encourage or implement such rehabilitation projects.

d) Of the Copermittees that did include proposed optional jurisdictional strategies, adequate information about the funds and/or resources needed to implement the strategy (e.g. plans to be developed, studies to be conducted, data to be collected, personnel needed, equipment needed, administrative structures required, contracts needed, land to be acquired, etc.) was not provided.

e) Of the Copermittees that did include proposed optional jurisdictional strategies, adequate information about the circumstances necessary to trigger implementation of the strategy (e.g. funding availability, obtain approval from city councils, findings from assessments or studies, etc.) was not provided.

f) Many proposed optional jurisdictional strategies did not appear to be a BMP, an incentive, or a program that could be implemented to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the MEP, protect beneficial uses of receiving waters from MS4 discharges, or achieve proposed interim and final numeric goals. Implementation of an optional jurisdictional strategy is expected to result in an improvement of water quality.

Noncompliant Optional Jurisdictional Strategies: The San Diego Water Board found that the proposed optional jurisdictional strategies in the Plans do not comply with the requirements of Provision B.3.b.(1)(b) as follows:

a) A Copermittee that did not propose any optional jurisdictional strategies to be implemented within its jurisdiction, as necessary, to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the MEP, protect beneficial uses of receiving waters from MS4 discharges, or achieve proposed interim and final numeric goals, in addition to the BMP implementation, inspection, enforcement, and education activities that are already required by Provisions E.2 through E.7 is not in compliance with the requirements of Provision B.3.b.(1)(b)(i).

b) Unless acceptable data or rationale are provided in the Plan, a Copermittee that did not propose any incentives or programs to encourage or implement projects to retrofit areas of existing development within its jurisdiction as optional jurisdictional strategies is not in compliance with the requirements of Provision B.3.b.(1)(b)(ii). A Copermittee that has not identified areas of existing development within its jurisdiction as candidates for retrofitting in its JRMP document also is not in compliance with Provision E.5.e.(1)(a), unless acceptable data or rationale is provided.

c) Unless acceptable data or rationale are provided in the Plan, a Copermittee that did not propose any incentives or programs to encourage or implement projects to rehabilitate channels or habitats within its jurisdiction as optional jurisdictional strategies is not in compliance with the requirements of Provision B.3.b.(1)(b)(iii). A Copermittee that has not identified projects to rehabilitate the conditions of channels or habitats within its jurisdiction in its JRMP document also is not in compliance with Provision E.5.e.(2)(a), unless acceptable data or rationale are provided.

d) A Copermittee that does not have any optional jurisdictional strategies in the Plan or has proposed an optional jurisdictional strategy without an adequate description of the funds and/or resources needed to implement the strategy is not in compliance with the requirements of Provision B.3.b.(1)(b)(iv).

e) A Copermittee that does not have any optional jurisdictional strategies in the Plan or has proposed an optional jurisdictional strategy without an adequate description of the circumstances needed to trigger implementation of the strategy is not in compliance with the requirements of Provision B.3.b.(1)(b)(v).

Unacceptable Optional Jurisdictional Strategies: The following proposed optional jurisdictional strategies are not acceptable to the San Diego Water Board:

a) Many proposed optional jurisdictional strategies are described using terms such as “consider”, “evaluate”, “investigate”, or “develop” a BMP, incentive, or program. These terms indicate to the San Diego Water Board that the Copermittee is only preparing for the implementation of a BMP, incentive, or program. Provision B.3.b.(1)(b) requires each Copermittee identify that optional jurisdictional strategies that ***will be*** implemented. Preparation for a strategy does not meet the requirement of a strategy that will be implemented.

b) Many proposed optional jurisdictional strategies describe development of a plan, conducting a special study or an assessment, or collecting data. Plans, special studies, assessments, and data collection are necessary steps to implement a strategy, but are not in and of themselves a strategy that will result in the effective prohibition of non-storm water discharges to the MS4, reduction of pollutants in storm water discharges from the MS4 to the MEP, protection of beneficial uses of receiving waters from MS4 discharges, or achievement of proposed interim and final numeric goals.

c) Several proposed optional jurisdictional strategies appear to be BMP implementation, inspection, enforcement, and education activities that are already being implemented or required to be implemented by the Copermittee pursuant to Provisions E.2 through E.7. Optional jurisdictional strategies are required in addition to the requirements of Provisions E.2 through E.7.

6. ***Watershed Management Area Strategies***

Requirements: Provision B.3.b.(2) of the Order requires the Copermittees to identify Watershed Management Area strategies that will be implemented, as necessary, to achieve final numeric goals. The Copermittees are required to identify regional or multi-jurisdictional scale water quality improvement strategies (Provision B.3.b.(2)(a)). Watershed Management Area strategies to encourage or implement retrofit projects and channel and habitat rehabilitation projects are also required to be provided in the Plan (Provisions B.3.b.(2)(b) and (c)). For each Watershed Management Area strategy that the Copermittees includes in the Plan, descriptions of the funds and/or resources needed, and the circumstances needed to trigger implementation of the strategy are also required (Provisions B.3.b.(2)(d) and (e), respectively).

Issues of Concern: All the Plans lacked enough information about Watershed Management Area strategies to meet the requirements of Provision B.3.b.(2).

Noncompliant Watershed Management Area Strategies: The San Diego Water Board found that the Watershed Management Area strategies in the Plans do not comply with the requirements of Provision B.3.b.(2) as follows:

a) A Plan that did not propose any Watershed Management Area strategies to be implemented on a regional or multi-jurisdictional scale, as necessary, to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the MEP, protect beneficial uses of receiving waters from MS4 discharges, or achieve proposed interim and final numeric goals is not in compliance with the requirements of Provision B.3.b.(2)(a).

b) Unless acceptable data or rationale are provided in the Plan, a Plan that did not propose any incentives or programs to encourage or implement projects to retrofit areas of existing development as a Watershed Management Area strategy is not in compliance with the requirements of Provision B.3.b.(2)(b).

c) Unless acceptable data or rationale are provided in the Plan, a Plan that did not propose any incentives or programs to encourage or implement projects to rehabilitate channels, streams, or habitats as a Watershed Management Area strategy is not in compliance with the requirements of Provision B.3.b.(2)(c).

d) A Plan without Watershed Management Area strategies or a Plan that has a proposed Watershed Management Area strategy without information about the funds and/or resources needed to implement a Watershed Management Area strategy is not in compliance with the requirements of Provision B.3.b.(2)(d).

e) A Plan without Watershed Management Area strategies or a Plan that has a proposed Watershed Management Area strategy without a description of the circumstances needed to trigger implementation of Watershed Management Area strategy is not in compliance with the requirements of Provision B.3.b.(2)(e).

WATER QUALITY IMPROVEMENT SCHEDULES

7. ***Schedules for Achieving Numeric Goals***

Requirement: Provision B.3.a.(2) of the Order requires the Copermittees to develop and incorporate schedules for achieving interim and final numeric goals. Provision B.3.a.(2) requires the schedules to incorporate TMDL compliance dates, incorporate ASBS compliance schedules, and be designed to achieve the interim and final numeric goals in the shortest time practicable taking into account the time required to implement water quality improvement strategies.

Issues of Concern: Each Plan includes schedules to achieve interim and final numeric goals. The San Diego Water Board, however, has found the following general issues of concern:

a) For Plans where the Beaches and Creeks Bacteria TMDLs are applicable and bacteria is the only highest priority water quality condition identified, and only final numeric goals are established for bacteria, the Plan is a Bacteria Load Reduction Plan (BLRP) not a Comprehensive Load Reduction Plan (CLRP). According to the Beaches and Creeks Bacteria TMDLs, the wet weather and dry weather dates for compliance with the final wasteload allocations (WLAs) must be no later than 10 years after the effective date of the TMDLs, which is April 4, 2021. For the Copermittees to have until April 4, 2031 (i.e. 20 years after the effective date of the TMDLs) to achieve the Beaches and Creeks Bacteria TMDLs WLAs, the Plan needs to be a CLRP and incorporate load reduction programs with quantified load reductions for other pollutants of concern in addition to bacteria.

b) Several Plans propose more than 20 years from the date the Plan was submitted to achieve final numeric goals if there are no applicable TMDL compliance dates. Schedules proposing to achieve final numeric goals in more than 20 years appear to be relying primarily on BMP implementation, inspection, enforcement, and education activities that are required to be implemented by the Copermittees pursuant to Provisions E.2 through E.7, with few, if any, commitments to implement optional jurisdictional strategies within the first 10 or more years.

Noncompliant Schedules for Achieving Numeric Goals: There are several Plans that have a proposed date to achieve compliance with the Beaches and Creeks Bacteria TMDLs by April 4, 2031. Unless the Plan includes quantified load reductions for pollutants in addition to bacteria, the April 4, 2031 date to achieve the final numeric goals for bacteria is not in compliance with the requirement to incorporate CLRPs into the Plan pursuant to Attachment E, Specific Provision 6.b.(2)(c)(i).

Unacceptable Schedules for Achieving Numeric Goals: The following proposed schedules to achieve numeric goals are not acceptable to the San Diego Water Board:

a) Schedules of 10 years or more to address only one highest priority water quality condition are not acceptable, unless there is information provided that allows the San Diego Water Board to make a determination that the schedules are clearly based on the time reasonably required to implement proposed optional jurisdictional strategies.

b) Schedules of 10 years or more to achieve final numeric goals without optional jurisdictional strategies proposed to be implemented within the next 5 years are not acceptable.

c) Schedules of 5 years or more to achieve final numeric goals for only addressing one highest priority water quality condition by eliminating unauthorized non-storm water discharges to and from the MS4 without optional jurisdictional strategies proposed to be implemented within the next 5 years are not acceptable.

8. *Schedules for Implementing Strategies*

Requirements: Provision B.3.b.(3) of the Order requires the Copermittees to develop reasonable schedules for implementing the jurisdictional, optional jurisdictional, and Watershed Management Area strategies to achieve interim and final numeric goals. Provision B.3.b.(3) requires the schedules for implementing strategies to describe: 1) when jurisdictional strategies required pursuant to Provisions E.2 through E.7 will be implemented (Provision B.3.b.(3)(a)(i) and (ii)), 2) the shortest practicable time to secure funds and procure resources to initiate implementation of each optional jurisdictional strategy (Provision B.3.b.(3)(a)(iii)), and the shortest practicable time to secure funds and procure resources to initiate implementation of each Watershed Management Area strategy (Provision B.3.b.(3)(b)(i)). The schedules are also required to provide information about whether a strategy is expected to be a continuously implemented strategy (Provisions B.3.b.(3)(a)(iv) and B.3.b.(3)(b)(ii)) or strategy to be completed within a schedule (Provisions B.3.b.(3)(a)(v) and B.3.b.(3)(b)(iii)).

Issues of Concern: Each Plan includes schedules to implement strategies. The San Diego Water Board, however, has found the following general issues of concern:

a) In most Plans there were several proposed strategies that did not have any schedules associated with them, other than "to be determined."

b) Most Plans lacked enough information about the shortest practicable time to secure funds and procure resources of initiate implementation of optional jurisdictional strategies and Watershed Management Area strategies.

c) For several strategies that appeared to be limited timeframe or structural projects, they lacked the information about the anticipated time to complete the project based on a realistic assessment of the shortest practicable time required.

Noncompliant Schedules for Implementing Strategies: The San Diego Water Board found that the schedules in the Plans for implementing strategies do not comply with the requirements of Provision B.3.b.(3) as follows:

a) Strategies that do not have a schedule are not in compliance with the requirements of Provision B.3.b.(3).

b) A Copermittee that does not have any optional jurisdictional strategies or has proposed an optional jurisdictional strategy without a description of the shortest practicable time to secure funds and procure resources to initiate implementation of the optional jurisdictional strategy is not in compliance with the requirements of Provision B.3.b.(3)(a)(iii).

c) A Plan without Watershed Management Area strategies or has a proposed Watershed Management Area strategy without a description of the shortest practicable time to secure funds and procure resources to initiate implementation of the optional jurisdictional strategy is not in compliance with the requirements of Provision B.3.b.(3)(b)(i).

d) Strategies that are expected to be completed within a limited timeframe without information about the anticipated time to complete the project based on a realistic assessment of the shortest practicable time required are not in compliance with the requirements of Provision B.3.b.(3)(a)(v) or B.3.b.(3)(b)(iii).

OTHER ISSUES

9. *Hydromodification Management Exemptions*

Requirements: Provision E.3.c.(2)(d) of the Order describes situations where the Copermittees have the discretion to exempt Priority Development Projects from the hydromodification management BMP performance requirements. Exemptions may be granted to projects that discharge to 1) existing underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean, or 2) conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean. The Copermittees may also propose additional exemptions via the optional Watershed Management Area Analysis.

Issues of Concern: Most Plans proposed additional exemptions via the optional Watershed Management Area Analysis. The San Diego Water Board, however, has found issues of concern with proposed exemptions in Plans for two different Watershed Management Areas:

a) As part of the Watershed Management Area Analysis, the City of Carlsbad included a report entitled "*Hydromodification Exemption Analysis for Select Carlsbad Watersheds*" (Report). Based on the Report, the Copermittees in the Carlsbad Watershed Management Area proposed to add drainage areas upstream of the Buena Vista, Agua Hedionda, and Batiquitos Lagoons as exempt from hydromodification management BMP requirements. Instead of evaluating the drainage areas leading to the lagoons using an erosion potential (or equivalent) analysis, the Report studies the lagoons using the criteria for exemptions outlined in the Hydromodification Management Plan for the San Diego Region (HMP) that was approved by the San Diego Water Board in July, 2010. However, the HMP is predicated on requirements of the previous MS4 permit. When the Order was adopted in 2013, the only exemptions retained were those cited in Provision E.3.c.(2)(d), meaning exemptions are essentially limited to concrete-lined or underground drainage channels. Any additional exemptions, including "non-erodible drainage networks" as described in the Report, must be evaluated from an erosion potential (or equivalent) point of view and included in the optional Watershed Management Area Analysis.

   The Report describes rationale for exempting areas draining to Agua Hedionda and Batiquitos Lagoon, and different rationale for exemptions for areas draining to Buena Vista Lagoon. The discussions regarding the areas draining to Agua Hedionda and Batiquitos Lagoons indicate that these areas may meet the Order's requirement of being concrete lined all the way from the point of discharge to an enclosed embayment (lagoon). However, whether or not drainage conveyances from these areas act like "concrete lined channels" is unclear because the discussion is centered on criteria applicable to the HMP and not the Order.

For Buena Vista Lagoon, the Report states that: "*As long as a project discharges into a non-erodible drainage network that is continuous to a lagoon outlet, it is potentially eligible for a hydromodification exemption*." The Report continues to explain that in drainage areas upstream of Buena Vista Lagoon, "… *the intervening ground is densely vegetated and or naturally armored. The City Engineer found no evidence of erosion at or near the water's edge of the lagoon. Consequently, this area is identified as exempt*…."

In order for the San Diego Water Board to accept a conclusion that a conveyance system can be exempt from hydromodification management BMP requirements, the Report must include an analysis demonstrating that the natural area under review would not experience erosion for the range of storms considered to be geomorphically significant. Although these areas are presented as "naturally armored," because they are not concrete-lined, the systems must be evaluated from an erosion potential (or equivalent) point of view to determine if an exemption is appropriate.

b) In the San Diego River Water Quality Improvement Plan, the Watershed Management Area Analysis includes a proposed methodology for demonstrating that hydromodification management BMPs are not needed upstream of Forrester Creek, a channel stabilized with materials other than concrete. The proposed methodology includes a process for classifying additional channels as "stabilized," and thus allowing exemptions for areas upstream of these channels. The San Diego Water Board is supportive of allowing exemptions for such stabilized channels, provided that the exemptions are supported and the proposed process is clear and repeatable.

The Watershed Management Area Analysis includes a discussion of erosion potential in Forrester Creek under several different flow rates, all of which suggest that Forrester Creek would not experience erosion caused by land development occurring in the upstream watershed, even in a fully built-out condition. The discussion includes analyses using various methods to verify the assertion that the channel is stable in the range of flows considered to be geomorphically significant. Because the discussion includes several lines of evidence, the San Diego Water Board agrees that Forrester Creek can be considered stable and therefore the proposed exemption is appropriate.

The Watershed Management Area Analysis appears to rationalize a more succinct and less rigorous analysis for including exemptions for future proposed channel segments. Absent a similar, thorough, and multiple lines of evidence approach analysis as was included for Forrester Creek, the San Diego Water Board disagrees and cannot support the less rigorous analysis. The San Diego Water Board supports the concept of introducing additional stabilized channel reaches that are exempt from hydromodification management BMP requirements, but only if an erosion potential analysis using continuous simulation modeling demonstrates that the channel segment would not erode in the range of flows determined to be geomorphically significant. Additionally, the analysis would need to include flows expected from a fully-built out watershed condition, and would have to consider erosion potential at the channel's most susceptible location(s). Finally, the criteria and process to qualify for an exemption should be clear so that future proposals for exemptions for additional channel segments include all the required elements.

Unacceptable Hydromodification Management Exemptions: The following proposed exemptions are not acceptable to the San Diego Water Board:

a) Without an appropriate and acceptable analysis of the potential of erosion for the range of storms considered to be geomorphically significant, the additional exemptions proposed for Agua Hedionda Lagoon, Batiquitos Lagoon, and Buena Vista Lagoon are not acceptable.

b) Without an erosion potential analysis using continuous simulation modeling that shows a channel will not erode in the range of geomorphically significant flows for the fully built out condition of the drainage area at the most sensitive channel segment(s) included in the Watershed Management Area Analysis, future proposals for exemptions from the hydromodification management BMP requirements will not be acceptable.

10. *Loma Alta Slough Resolution Implementation Requirements*

Requirements: Provision A.1.b of the Order requires the Copermittees to effectively prohibit non-storm water discharges into the MS4. Provision B.3.a requires the Copermittees to develop interim and final numeric goals and schedules to achieve those goals for the highest priority water quality conditions. Resolution No. R9-2014-0020, a *Resolution of Commitment to an Alternative Process for Achieving Water Quality Objectives for Biostimulatory Substances in Loma Alta Slough* (Resolution), was adopted by the San Diego Water Board on June 26, 2014. The Resolution includes numeric targets, a compliance schedule, and monitoring which are expected to be implemented through the Carlsbad Watershed Management Area Water Quality Improvement Plan (Carlsbad WMA Plan).

Issues of Concern: A number of items in the Carlsbad WMA Plan are not consistent with the Resolution. The San Diego Water Board chose to adopt the Resolution as a practical, measureable, and timely approach for directing actions to remedy the Slough through a productive collaboration with the community to address an important water quality challenge. The Copermittees must implement the elements of the Resolution, or the San Diego Water Board will reinitiate the process of considering adoption of the Phosphorus TMDL for Loma Alta Slough. The San Diego Water Board has found the following issues of concern:

a) The Resolution includes numeric targets for both surface water macroalgal biomass and surface water macroalgal cover, which represent attainment of the biostimulatory water quality objective for Loma Alta Slough. These numeric targets were developed through a multi-year stakeholder process, and were based on special studies specific to the Slough and water quality modeling. The numeric targets are to be achieved by 2023.

According to the source and linkage analysis for which the numeric targets are based, the primary sources of the impairment in Loma Alta Slough are dry-weather discharges from irrigation runoff and other illicit dry weather discharges conveyed by the MS4 to Loma Alta Slough. Nutrient loading, specifically phosphorus, into the Slough from dry weather flows results in excessive algal growth. Further, modeling results cited in the staff report (which served as the technical basis for the Resolution) suggests that reductions of dry weather flows in excess of 96 percent are needed to achieve the targeted reductions in phosphorus loading. As such, the Resolution relies on the Order, specifically the prohibitions of dry weather non-storm water discharges, and development and implementation of a Plan that includes the Loma Alta Creek watershed, to achieve the necessary reductions in phosphorus loading and restore the beneficial uses.

In contrast to the approach for which the Resolution is based, the Carlsbad WMA Plan proposes interim numeric goals that fall short of achieving the prohibitions on dry weather discharges. The Carlsbad WMA Plan describes the interim goals as:

- 50 percent reduction in anthropogenic persistent dry weather flows at the three outfalls addressed through 2018, and
- 25 percent reduction in additional (other outfalls in watershed) anthropogenic persistent flows identified during dry weather monitoring program implemented in 2015 and in subsequent years.

The interim goals as expressed in the Carlsbad WMA Plan are not consistent with the Resolution because there is no mention in the Resolution that the City of Oceanside would only first reduce flows by 50 percent, followed by an additional 25 percent in subsequent years, and no explicit attempt to comply with the requirement to effectively eliminate non-storm water discharges into the MS4. Additionally, Finding 20 of the Resolution states that the City of Oceanside, in a comment letter dated May 5, 2014 committed to:

- Using the numeric targets, developed through the stakeholder process as numeric goals in the Water Quality Improvement Plan for the Loma Alta Creek watershed, and
- Develop and implement a Water Quality Improvement Plan to effectively prohibit the City's non-storm water discharges into the MS4 system.

The San Diego Water Board expects the City of Oceanside to honor its commitment as stated in the letter dated May 5, 2014, and therefore expected the interim and final numeric goals in the Carlsbad WMA Plan to incorporate the prohibition of dry weather non-storm water discharges into the MS4 for reducing phosphorus loading to Loma Alta Slough. Further, there must also be interim numeric goals expressed as an increment toward achieving the final numeric goals.

b) The Carlsbad WMA Plan does not include the required Loma Alta Slough Monitoring Plan. Table 2 of Resolution No. R9-2014-0022 describes the City of Oceanside's *Tentative Proposed Schedule to Address the Eutrophication Impairment in Loma Alta Slough*. According to this Table, in 2015, "*the City was to submit a Water Quality Improvement Plan, including the Loma Alta Slough Monitoring Plan, to the San Diego Water Board.*"

   Section 3.1.4 of the Carlsbad WMA Plan describes a special study whose objectives are "*to develop a water quality monitoring program for the Loma Alta Slough (Slough Monitoring Plan) that will allow the City of Oceanside to track progress toward reducing nutrient discharges into the Slough and eliminate the eutrophication impairment*." The monitoring is to occur every summer from 2016 to 2022.

   In a letter dated May 5, 2014, the City of Oceanside indicated that it would incorporate the slough monitoring requirements proposed in Tentative Investigative Order No. R9-2014-0022 into the Carlsbad WMA Plan[1]. The San Diego Water Board's expectation was that the Slough Monitoring Plan would be fully developed and included in the Carlsbad WMA Plan, as stated in the City's letter and described in Table 2 of the Resolution. The City of Oceanside has not submitted any correspondence to the San Diego Water Board suggesting a need to amend the schedule described in Table 2 since Resolution No. R9-2014-0020 was adopted on June 26, 2014.

Noncompliant Loma Alta Slough Resolution Implementation Requirements: The San Diego Water Board found that the Carlsbad WMA Plan does not comply with the requirements of Provisions A.1.b and B.3.a.(1) as follows:

a) The interim numeric goals as expressed are not consistent with the Resolution and not in compliance with the requirements of Provisions A.1.b and B.3.a.(1)(b).

b) Each final numeric goal that does not have an interim numeric goal expressed as a reasonable increment in the same or similar metric as the final numeric goal is not in compliance with Provision B.3.a.(1)(b)(ii).

Unacceptable Loma Alta Slough Resolution Implementation Requirements: The City of Oceanside committed to incorporating slough monitoring requirements proposed in Tentative Investigative Order No. R9-2014-0022 into the Carlsbad WMA Plan. Without the slough monitoring requirements proposed in Tentative Investigative Order No. R9-2014-0022 in the monitoring and assessment program for the Carlsbad Watershed Management Area, the Carlsbad WMA Plan is not acceptable to the San Diego Water Board.

[1] Tentative Investigative Order No. R9-2014-0022 was replaced by Resolution No. R9-2014-0020.

11. __Items of Additional Concern__

Pursuant to Provision F.1.b.(2), the Copermittees are required to consider revisions to the Plans based on written comments received by the close of the public comment period. Pursuant to Provision F.1.b.(3), the Copermittees are required to submit any revisions to the Plans no later than 60 days after the close of the comment period, or by September 29, 2015.

Pursuant to Provisions E and F.2.a.(2) of the Order each Copermittee was required to update its JRMP document to incorporate the requirements of Provision E concurrently with the submittal of the Plans. Pursuant to Provisions E.3.d and F.2.b.(1) of the Order each Copermittee was also required to update its BMP Design Manual to incorporate the requirements of Provisions E.3.a-d. Each Copermittee's JRMP document updated with the requirements of Provision E became effective with the submittal of the Plans. In addition, each Copermittee must begin implementing its updated BMP Design Manual within 180 days of submittal of the Plans, unless directed otherwise by the San Diego Water Board.

Until the Plans are accepted by the San Diego Water Board, any exemptions to the hydromodification management BMP requirements of Provisions E.3.c.(2)(a)-(c), proposed in the Plans pursuant to Provision B.3.b.(4)(c), are not authorized to be applied to any Priority Development Projects within a Copermittee's jurisdiction. Likewise, a Copermittee is not authorized to implement an Alternative Compliance Program (pursuant to Provision E.3.c.(3)) for any Priority Development Project within its jurisdiction until the optional Watershed Management Area Analysis developed pursuant to Provision B.3.b.(4) has been accepted as part of the Plans.

12. __Potential Future Enforcement Options__

The areas of noncompliance identified herein began on the due date to submit the Plans (June 26, 2015) and may be subject to additional future enforcement by the San Diego Water Board or State Water Resources Control Board, including a potential civil liability assessment of up to $10,000 per day of violation (Water Code section 13385) until the violations are corrected and/or pursue any of the following enforcement actions:

Other Potential Enforcement Options	**Applicable Water Code Sections**
Technical or Investigative Order	Sections 13267 or 13383
Cleanup and Abatement Order	Section 13304
Cease and Desist Order	Sections 13301-13303
Time Schedule Order	Sections 13300, 13308

In addition, the San Diego Water Board may consider revising or rescinding applicable waste discharge requirements, if any, referring the matter to other resource agencies, or referring the matter to the State Attorney General for injunctive relief, as applicable.

The San Diego Water Board is available to assist the Copermittees with refining the Plans to become acceptable, and to be in compliance with the requirements of the Order. In the subject line of any response, please include the information located in the heading of this letter: "in reply refer to." Please contact Wayne Chiu at (619) 521-3354 or Wayne.Chiu@waterboards.ca.gov., or Christina Arias at (619) 521-3351 or Christina.Arias@waterboards.ca.gov with any questions or concerns.

Respectfully,

Laurie Walsh, P.E.

THIRD PARTY REVIEW OF TRWE STUDY

June 29, 2016

City of Chula Vista, Storm Water Management Section
1800 Maxwell Road
Chula Vista, CA 91911

Attention: Boushra Salem

Subject: Review of TRW Otay River Erosion Potential Analysis Technical Memo For the City of Chula Vista, City of San Diego, and County of San Diego

Dear Boushra:

Amec Foster Wheeler has completed a review of the Otay River Erosion Potential Analysis technical memorandum (Otay EP Analysis) that was produced by Tory R. Walker Engineering (TRWE). The Otay EP Analysis, dated December 18, 2015 (included as Attachment A), was supplemented by a clarification e-mail dated June 6, 2016 (Attachment B) and a letter dated May 25, 2016 (Attachment C). The Otay EP Analysis supports a proposed hydromodification management exemption for development projects discharging to the Otay River. The review consisted of the following functions:

1. Review and verify the methodology used for flow analysis and validate the proposed peak flows for pre and post development scenarios;
2. Perform a spot check on GIS data and maps and verify the validity of the data;
3. Review the EPA-Storm Water Management (SWM) Model setup, check the input files and perform a test run for the model. Review the model output files and verify that the output results match the report information; and,
4. Compare the Otay EP Analysis to the San Diego Bay WQIP Watershed Management Area Analysis (WMAA) requirement for an additional study "to establish a site-specific allowable EP metric for the Otay River from East of Interstate 805 to Lower Otay Reservoir Dam, more closely representing actual measured and observed characteristics of this river system".

In addition to the Otay EP Analysis document, the following backup files were obtained for review:

- Digital GIS files used in the document;
- The electronic input and output files for the EPA-SWMM model runs; and
- Electronic copies of spreadsheets for statistical flow analysis, or inputs and outputs for flow data.

The review was conducted by Amec Foster Wheeler Principal Water Resource Engineers: Seth Jelen, P.E. (OR), CFM and Habib Matin, Ph.D, P.E. (OR) and reviewed by Yvana Hrovat, P.E. (CA).

METHODOLOGY, DATA AND SWMM REVIEW

The methodology used for the Otay EP Analysis was reviewed and found to be valid. GIS data and calculated areas, including watershed basin delineations upstream and downstream of Savage Dam, and other attributes were appropriate for the values checked. Subcatchment areas within the watershed were appropriately classified for the SWM models according to the runoff pathway for discharges to the Otay River. Calculations for peak flows were performed on the data and the results agreed with values used in the analysis.

The Otay EP Analysis methodology for flow analysis using the SWM model was in accordance with standard practices. The hydrology of the watershed was modeled under two scenarios: fully developed under the proposed exemption ("exempt condition model"), and pre-development, prior to construction of the Savage Dam ("natural condition model"). Assumptions for the two modeling scenarios were consistent with U.S. EPA guidance and local studies and historical practices.

The exempt condition model used the exempt, non-exempt, and developed subcatchments to model the peak flows from below the Savage Dam to the San Diego Bay under the assumption that exempt areas would not incorporate hydromodification mitigation. The natural condition model used the same subcatchments and added the Otay Reservoir drainage basin (without effects of Savage Dam) as a runoff source.

The models incorporated approximately 50 years of continuous precipitation data to assess runoff flows from each of the specified subcatchment areas. A constant reduction in runoff relative to developed areas of 43 percent (%) was used for all non-exempt and natural subcatchment areas.

On June 6, 2016, TRWE provided clarification of the Otay EP Analysis (Attachment B). According to this clarification, the 43% reduction is the average percent reduction for the Q_2, Q_5, and Q_{10} flow rates, when comparing the post-developed, mitigated (i.e., with hydromodification control) flow rate to the post-developed, unmitigated flow rate observed in actual hydromodification management projects throughout San Diego County. Low-flow (Q_2) and high-flow (Q_{10}) rates at or near 110% were observed during hydromodification management facility design, and these rates constrained the design. High and low flow values near 100% will cause the flow duration curve (FDC) to sag below the pre-developed FDC. The June 6 clarification states, "Since, from a practical design standpoint, the normal behavior of the FDC does not usually allow for the post-developed FDC to mirror the pre-developed FDC closely (due to the unique hydraulics of outflow

Environment & Infrastructure
9177 Sky Park Court • San Diego, CA 92123-4341 USA
Tel: +1 858.278.3600 • Fax: +1 858.278.5300

passing through the outlet structure, causing a "sag" appearance between low and high flow thresholds), it is unlikely that the 110% threshold along the entire curve would change [the design approach.]" To verify that 43% represents a conservative estimate, the SWM model was also run (by TRWE but not verified for this review) using a 20% reduction for non-exempt and natural subcatchments. According to the June 6 clarification, this test run indicated the same conclusions (described below) as the 43% estimate.

The GIS data used to populate the SWM model were reviewed for accuracy. The delineations of the Otay River centerline and Otay Reservoir were validated by comparison to a combination of satellite and aerial imagery included as a part of a 2016 ESRI World Imagery basemap. The watershed delineation was validated by comparison to a topographic baselayer. Land uses provided by the City of San Diego (e.g., schools, residential, Olympic training facility, golf courses, etc.) were checked against aerial imagery in approximately 50 cases.

Exempt, non-exempt, and developed subcatchment delineations were also validated by comparison to the 2016 ESRI World Imagery basemap of satellite and aerial imagery. Exempt parcels were generally located adjacent to the river and did not appear to be fully developed. Non-exempt areas were typically undeveloped and located further from the river, as would be expected for areas that do not directly discharge directly to the river (in contrast to exempt areas). The remaining area was classified as developed. The sum of the subcatchment areas was equal to the total Otay River drainage boundary area.

The Otay EP Analysis included spreadsheets as the input and output files for the SWM model. The input files were appropriately formatted, and were spot-checked for accuracy against the GIS data. For this review, both the natural and exempt condition SWM models were executed using the original input files. The results were compared to the original output files, and were found to be in agreement. The output files for both the Otay EP Analysis and the validation models are included in Attachment D.

As described in the Otay EP Analysis, the SWM models indicated that peak flows under a pre-development scenario (i.e., the natural condition model) were greater than peak flows under an exempt, post-development scenario. Consequently, the analysis indicates that development under the hydromodification exemption would not subject the Otay River to erosion greater than pre-development conditions.

WMAA REQUIREMENTS

The WMAA included in the San Diego Bay WQIP states (Section 4.1.1.4):

Environment & Infrastructure
9177 Sky Park Court • San Diego, CA 92123-4341 USA
Tel: +1 858.278.3600 • Fax: +1 858.278.5300

"Additional studies to establish a site-specific allowable Ep metric for the Otay River from East of Interstate 805 to Lower Otay Reservoir Dam, more closely representing actual measured and observed characteristics of this river system, may result in allowing hydromodification management exemptions…"

The Otay EP Analysis asserts that the construction of the Savage Dam, and its failure in 1916, permanently altered the hydrology of the Otay River. Evidence presented in the analysis includes: (1) historical photos and accounts of the dam failure, and (2) an erosion potential analysis based on a field investigation and following the methodology described in the WMAA. The evidence indicates that since the 1916 dam failure, the Otay River has adapted to a different morphology and has remained stable despite more than 55 years of development.

The MS4 Permit states (E.3.c.(2)(a)(i)), *"In evaluating the range of flows that results in increased potential for erosion of natural (non-hardened) channels, the lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or that erodes the toe of channel banks."* Critical shear stress is the measure of the minimum stress required to move sediment. Hydraulic shear stress is a measure of the shear stress imparted upon the sediment bed by the flow within the channel, and is related to the velocity, turbulence and other hydraulic factors. If the hydraulic shear stress imparted by the flow of the river does not exceed the critical shear stress, then erosion will not occur. The WMAA (WMAA Attachment B.1.1) methodology used a critical shear stress value of 0.135 pounds per square foot (psf) in its evaluation of Otay River west of I-805. Critical shear stress is based on the Reynold's number and characteristics of the sediment properties. Values are presented in a Shield's diagram and typically range from 0.03 to 0.15 (Sedimentation Engineering, Figure 2.46, Manuals and Reports on Sedimentation Engineering Practice- NO 54, American Society of Civil Engineers, 1977). Shield's research was based solely on sediment particles movement, and did not account for the stabilizing effect of vegetation.

The Otay EP Analysis includes spreadsheets that detail the EP analysis following the format of the WMAA. The spreadsheets summarize critical shear stress values, estimated flow rates, durations, watershed acreage, imperviousness, and annual average rainfall depth. The Otay EP Analysis varies from the WMAA analysis by revising the critical shear stress used to evaluate the cross-sections. The Otay EP Analysis conducted a field investigation of three critical cross-sections to determine critical shear stress values that are more applicable to the in-stream condition, and also includes a 2001 "Stability Thresholds for Stream Restoration Materials" publication by Craig Fischenich, which presents ranges of critical shear stresses for given boundary conditions (e.g., vegetation, etc.). The Otay EP Analysis states, "Critical shear stress

Environment & Infrastructure
9177 Sky Park Court • San Diego, CA 92123-4341 USA
Tel: +1 858.278.3600 • Fax: +1 858.278.5300

values of 0.67 pounds per square foot (psf) (shales and hardpan), 0.35 psf (average reeds), and 0.70 psf (short native and bunch grass) are more appropriate assignments for the Otay River based upon the field conditions (Fischenich, 2001)." The analysis concluded that the critical shear stress values are consistent with referenced methodology and literature values, and appear to be appropriate for the vegetated conditions in the existing Otay River. Thus, the Otay EP Analysis demonstrates that a hydromodification exemption is not expected to result in significant erosion within the geomorphically significant range of storms.

In a supplemental letter dated May 25, 2016, TRWE provided the results of a Sediment Supply Potential (Sp) Analysis for the Otay River. An Sp analysis evaluates the quantity of sediment that is potentially available to the river under existing conditions and compares that loading rate to a proposed scenario where exempt parcels would contribute sediment to a lesser degree. The letter describes methodology that matches the WMAA, and provides results in the same format. The Sp Analysis reduced the soil loss estimate under an exemption ("post" soil loss) from 24,364 tons/year to 22,288 tons/year due to an increase in exempt acreage. The Sp number provided in the letter, Sp = 0.91, meets the criteria established in, "Hydromodification Screening Tools: GIS-based Catchment Analyses of Potential Changes in Runoff and Sediment Discharge (SCCWRP Technical Report 605, 2010). The Sp Analysis appears to have been appropriately performed following the WMAA guidelines, however, Amec Foster Wheeler did not verify the calculations because no data were provided with the letter.

Table 1 below summarizes the steps for the exempt river reach analysis in the WMAA. The table briefly describes the requirements for each step, identifies the input data and assumptions, the methodology used in the Otay EP Analysis, and the results of the Amec Foster Wheeler's review.

Environment & Infrastructure

Tel: +1 858.278.3600 • Fax: +1 858.278.5300

Table 1 - Exempt River Reach Analysis Review

Exemption Analysis Step	WMAA Requirements	Key Input Data / Assumptions	Tory R. Walker Engineering Analysis	Amec Foster Wheeler Review
1 – Hydrologic Analysis	Develop flow histogram for existing and future conditions.	Flow duration curve, land use cover & classification, channel slope, and mean annual precipitation.	Hydrologic analysis conducted using SWMM and GIS data, as described in report.	TRWE completed statistical analysis and SWMM modeling to obtain peak flows. Hydrologic evaluation conducted appropriately and in accordance with engineering standards.
2 – Hydraulic Analysis	Critical flow rate of 50% of Q2 for critical shear stress.	Selected critical cross-sections and reach type classification.	Critical shear stress was determined for three cross-sections based on field visits and 2001 “Stability Thresholds for Stream Restoration Materials” (Fischenich, 2001).	TRWE conducted field investigation of the critical cross-sections and provided evidence of the vegetated cover. Cross-section selection and rationale for increased critical shear stress based on vegetated conditions and 2001 Fischenich publication was appropriate.
3 – Work Analysis	Use simplified effective Work equation.	Critical shear stress, effective shear stress, flow velocity, max flow of record, and channel geometry.	Calculated shear stress within each bin was smaller than cross-section critical shear stress; therefore no Work was done in any flow bins.	Calculations verified for specified critical shear stresses. Methodology matched process presented in WMAA report.
4 – Cumulative Work Analysis	Cumulative value of bin analysis for total Work.	Discharge magnitude, range of flows, and flow duration curve.	As describe in Step #3, cumulative work is zero because no Work is done in any individual bin.	Calculations verified for specified critical shear stresses. Methodology matched process presented in WMAA report.
5 – EP Analysis	EP post- / pre-development < 1.05.	Cumulative Work analysis for pre- and post-development conditions.	Determined no change in Erosion Potential between natural and exempt conditions based on results from Step 4.	Concur that no significant erosion would occur within the range of storms considered to be geomorphically significant based on WMAA methodology.
6 – SP Analysis	SP post- / pre-development > 0.90.	RUSLE equation, GLU analysis, and the use of WMAA results for Section 2.4.	SP analysis results in a ratio of 0.91; a value greater than the minimum criteria of 0.90.	Amec Foster Wheeler was unable to verify the input data, but based on the description provided, the SP analysis meets the requirements of the WMAA.

wheeler

Conclusions

The Otay EP Analysis was prepared in accordance with accepted engineering practices and appears to comply with the requirements of the WMAA. The data used in the analysis appeared to be valid, and the SWMM assumptions and output were verified. The historical research and field verification performed for the analysis demonstrate the permanent changes to the Otay River since the 1916 failure of the Savage Dam. The Otay EP Analysis demonstrates that a hydromodification exemption is not expected to result in significant erosion within the geomorphically significant range of storms. The supplemental Sp Analysis appears to have been appropriately performed, however, Amec Foster Wheeler was unable to verify the calculations. Thus, the Otay EP Analysis and supplemental documents demonstrate that the Otay River meets the requirements for a hydromodification exemption.

We appreciate the opportunity to contribute to this research, and look forward to providing you continued assistance as you address the water quality issues in the San Diego Bay.

Sincerely,

Amec Foster Wheeler

Appendix A

Otay River Erosion Potential Analysis Technical Memorandum

December 18, 2015

Boushra Salem
Storm Water Management Section
City of Chula Vista
1800 Maxwell Road
Chula Vista, CA 91911

SUBJECT: OTAY RIVER EROSION POTENTIAL ANALYSIS

Dear Boushra:

Tory R. Walker Engineering (TRWE) has thoroughly analyzed the Erosion Potential (Ep) methodology used to support the proposed hydromodification management exemption for projects directly discharging to the Otay River from west of Interstate 805 (I-805) to San Diego Bay. Results of that study are presented in Appendix J of the September 2015 Revised Water Quality Improvement Plan for the San Diego Bay Watershed Management Area (San Diego Bay WQIP). This methodology, and its results (herein referred to as the WMAA Ep Analysis), did not include reinstatement of an exemption for the river reach upstream of I-805 to Lower Otay Reservoir.

TRWE conducted a more detailed Ep analysis that uses watershed-specific hydrologic modeling, historical imagery review, and field investigation of existing channel conditions to either invalidate, support, or build upon the WMAA Ep Analysis. Our collective efforts (herein referred to as the Otay Ep Analysis) sought to provide a clearer picture of the potential morphological impacts that may or may not result from granting hydromodification exemptions to projects directly discharging to the Otay River when analyzed more scrupulously. We tested the hypothesis that the effects of Savage Dam and the 1916 dam failure have a more profound impact on river morphology than any proposed directly discharging development downstream of Lower Otay Reservoir—an approach that has not yet been taken by any study. We also revised the WMAA Ep Analysis to account for the natural resiliency of the system due to the re-establishment of vegetation over the past 100 years. The Otay Ep Analysis considered the entire Otay River, from the Lower Otay Reservoir to San Diego Bay, and made the following major conclusions:

1. **The Otay River flow duration curve (FDC) demonstrates that the river will not experience significant erosion for the range of storms considered to be geomorphically significant if exemptions are granted for projects directly discharging into the river system;**

2. **Aerial imagery from 1928, 1953, and 2015 demonstrate that the Otay River has remained stable (i.e., in a steady state of dynamic equilibrium) throughout the rapid urbanization of Otay Valley over the past 87 years and has become progressively more stable through the re-establishment of heavy vegetation throughout the system;**

3. **The revised WMAA Ep Analysis demonstrates that no significant erosion occurs within the range of storms considered to be geomorphically significant when critical shear stress values representative of the in-stream conditions are considered.**

Based upon these findings, we recommend that hydromodification exemptions be reinstated for projects directly discharging to the Otay River, from the Lower Otay Reservoir to San Diego Bay. We propose that this study be included as an attachment to the San Diego Bay WMAA, revising the San Diego Bay WQIP.

This recommendation carefully considers the unique nature of the Otay River and directly deals with the erosion potential for the range of storms considered to be geomorphically significant, as is consistent with the both the mission and the desire of the San Diego Regional Water Quality Control Board (Walsh, 2015). We appreciate your time in reviewing our study, and trust you will find that our methods and conclusions are presented in a clear, concise, and understandable fashion.

Sincerely,

Tory R. Walker

Principal

[1]Walsh, L. (2015, August 5). General Comments on Final Water Quality Improvement Plans and Notice of Noncompliance.

Natural Watershed versus Developed Watershed with Exemptions

The WMAA Ep Analysis is based on one type of model, and as with all hydrologic models, is most appropriately used in conjunction with field verification and comparison to a watershed-specific hydrologic model. It is further understood that the methodology behind the WMAA Ep Analysis sought to establish a clear and repeatable desktop-based process to analyze the potential of erosion for the range of storms considered to be geomorphically significant. From our review of the WMAA Ep Analysis, we determined that the methodology can indeed be a useful initial screening tool to conservatively assess the possibility of accelerated river channel erosion; it is not, however, a standalone metric for assessing the large, highly urbanized, impounded Otay River system—especially since the WMAA Ep methodology was not developed using data from impounded watersheds (Hawley, Bledsoe, & Stein, 2011). Savage Dam has had, and continues to have, a major influence on the Otay River morphology, yet no accepted exemption analysis has yet fully considered the extent of its effect, nor of its historic failure in 1916. Therefore, TRWE tested the first hypothesis: the *presence* of Savage Dam has a more profound impact on river morphology than any proposed, directly-discharging development downstream of Lower Otay Reservoir.

In order for the San Diego Regional Water Quality Control Board (San Diego Water Board) to accept a conclusion that a conveyance system can be exempt from hydromodification management BMP requirements, the report must include an analysis demonstrating that the natural channel under review would not experience erosion for the range of storms considered to be geomorphically significant (Walsh, 2015), as presented in Attachment 5. It is also the belief of the San Diego Water Board that using a hydrologic baseline that approximates an undeveloped, natural watershed is the only way to facilitate the return of more natural hydrologic conditions to already built-out watersheds, and ultimately improve stream health (San Diego Regional Water Quality Control Board, 2015). Therefore, TRWE used the United States Environmental Protection Agency (EPA) Storm Water Management Model (SWMM) to model the Otay Hydrologic Unit under two unique scenarios: the first scenario approximated the hydrology of the impounded, fully built out Otay Valley watershed (drainage area downstream of Savage Dam) with hydromodification exemptions in place for proposed development areas directly discharging to the Otay River (herein referred to as the Exemption Scenario); the second scenario approximated the hydrology of the *natural, unimpounded* Otay hydrologic unit (herein referred to as the Natural Scenario). The study areas are presented in Figure 1.

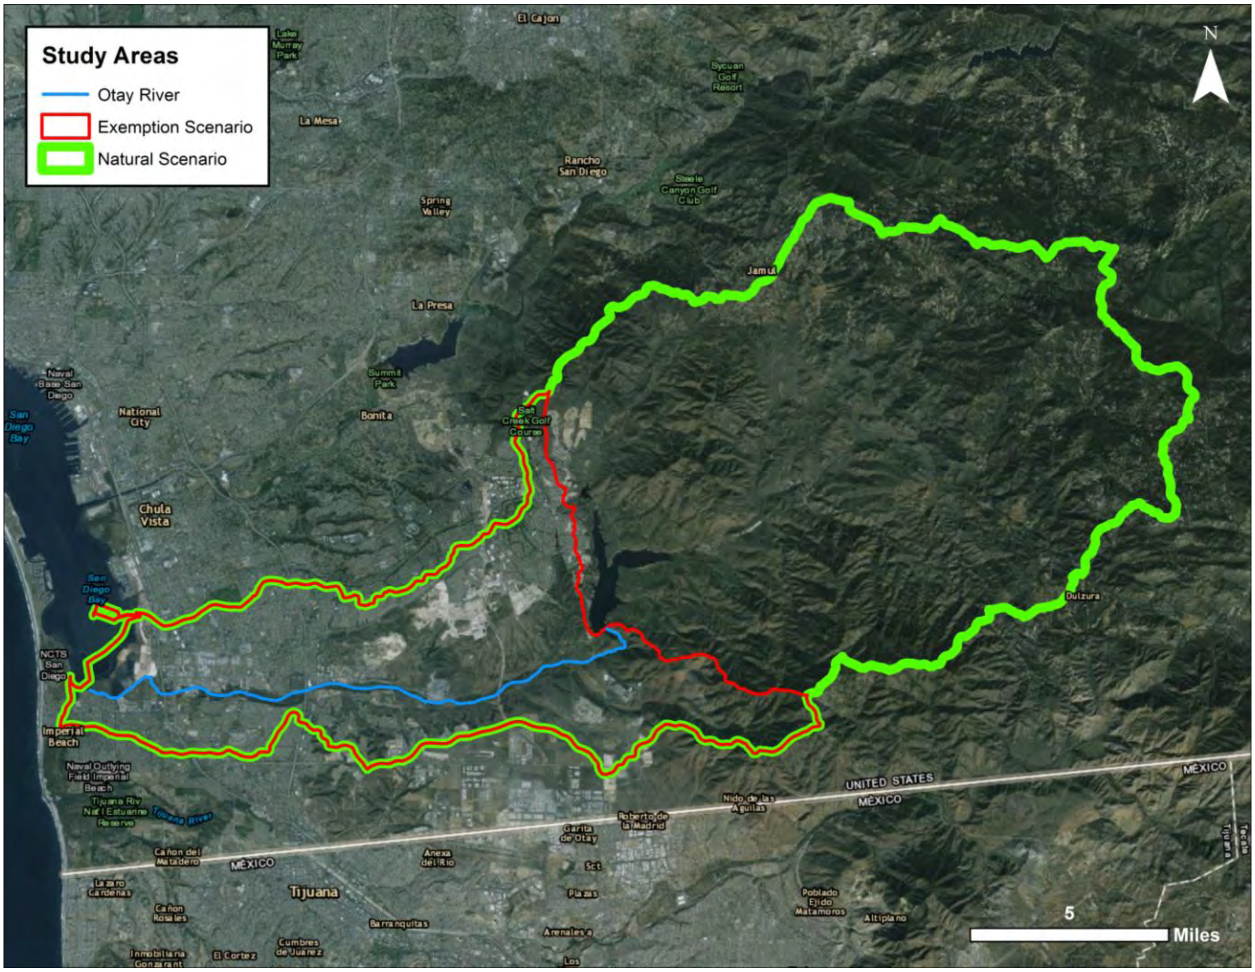

Figure 1: SWMM Study Areas

The Natural Scenario was used as the baseline condition and compared to the Exemption Scenario in order to determine if the latter would produce peak flows and durations that exceed the approximated natural hydrology by more than 10 percent for the range of flows considered to be geomorphically significant (from 10% of Q_2 to Q_{10}), as prescribed by Provision E.3.c.(2)(a) of the 2013 Regional MS4 Permit for all Priority Development Projects (San Diego Regional Water Quality Control Board, 2015). If the model demonstrated that the proposed exemptions would produce neither peak flows nor durations that exceed those of the approximated natural range of geomorphically significant flows by more than 10 percent, then the proposed exemption would meet the Permit's hydromodification management requirements on a watershed-wide scale. If the proposed exemption satisfies the Permit's hydromodification management requirements, then the flows may be considered as non-erosive and therefore warrant exemption as presented by the data.

To generate our model scenarios, we used a combination of geographic information system (GIS) data from the San Diego Geographic Information Source (SanGIS) Regional Data Warehouse (sangis.org), the United States Geological Survey (USGS) National Elevation Dataset (NED) (ned.usgs.gov), and the National Resource Conservation Service (NRCS) Web Soil Survey (WSS) (websoilsurvey.nrcs.usda.gov). First, the drainage areas downstream of Savage Dam were developed for the Exemption Scenario. With Savage Dam in place, areas upstream of Lower Otay Reservoir were neglected in the Exemption Scenario because, for the geomorphically significant range, they do not and will not contribute flows to the Otay River. Areas were first classified as either "Exempt," "Non Exempt," or "Developed" for modeling purposes. Exempt and Non Exempt areas are subsets of currently undeveloped areas having planned land uses (SanGIS "Developable_Land" layer) that either directly (Exempt) or indirectly (Non Exempt) discharge into the Otay River. These areas were projected to directly or indirectly discharge based upon a plan set review conducted by the WMAA consultant team. The remaining area that did not classify as either Exempt or Non Exempt was classified as Developed. These three classifications were finally subdivided into lumped hydrologic soil groups to produce the SWMM subcatchment areas, each having area-weighted parameter inputs for percent impervious and slope based upon planned land use (SanGIS "LANDUSE_PLANNED" layer), County of San Diego imperviousness coefficients (County of San Diego, 2010), and USGS 10-meter Digital Elevation Models (DEMs). The width parameter was used as a calibration parameter equal to roughly 18% of the area-to-length ratio using the methodology presented by Smith et al., (2015), provided in Attachment 3. The remaining subcatchment parameters were assigned in accordance with Appendix G of the San Diego Region Model BMP Design Manual (Geosyntec Consultants & Rick Engineering, 2015). For the Natural Scenario, an additional "Impounded" classification was added to the Exempt, Non Exempt, and Developed classifications. Impounded areas are the areas upstream of the dam, subdivided only by hydrologic soil group. Full model parameters are provided in Attachment A.

To simulate the effect of hydromodification management control, we performed research within the San Diego Region in the work documented by Smith et al. (2015). This research determined that geomorphically significant peak flows (Q_2 to Q_{10}), on average, are reduced 43% from the post-developed unmitigated condition to post-developed mitigated condition when hydromodification management controls are implemented. Therefore, in order to simulate hydromodification controls within the model, flows were reduced by 43% where appropriate. In the Exemption Scenario, flow reduction was only applied to the Non Exempt drainage areas in order to allow Exempt areas to produce unmitigated post-developed runoff. In the Natural Scenario, flow reduction was applied to all drainage areas in order to approximate the pre-development flows as would be achieved by implementation of designed hydromodification management control systems. Given that the San Diego Water Board understands that the pre-development hydrology of an area cannot be precisely known, nor do they expect modelers to estimate historical conditions (San Diego Regional Water Quality Control Board, 2015), our approach in approximating the watershed's pre-development hydrology by using the best available data (projected land use and regional peak flow reductions) is an appropriate methodology that holds the regulatory standard as the baseline condition.

The resulting FDC (Figure 2) illustrates that, for the range of storms considered to be geomorphically significant, flow rates are larger in magnitude and duration for the approximated natural, undeveloped watershed condition than those produced for the impounded, developed watershed condition, even when the hydromodification exemptions are in place for all developable areas directly discharging to the Otay River. It should be noted that these results are conservative in nature due to the fact that the 1916 breach of Savage Dam significantly altered the Otay River morphology, as large segments of the river were scoured to bedrock (Patterson, 1970)—our Natural scenario does not account for flows nor durations that contend with those produced during this catastrophic event. The results demonstrate that Savage Dam has a more significant effect on Otay River's morphology than any proposed development downstream of the reservoir. Therefore, our FDC serves as quantifiable evidence to validate the same conclusion made by the well-versed Technical Advisory Committee (TAC), whom was tasked with providing technical input to the scientific approach and interpretation of results integral to the establishment of numerical flow control standards for the 2011 Hydromodification Management Plan (HMP) (Brown and Caldwell, 2011). The peak flow comparison is provided in Table 1. The flow duration data summary is provided in Attachment A.

Table 1: SWMM Otay River Peak Flow Rate Comparison for the Natural and Exemption Scenarios

Return Period (years)	Natural Scenario Q (cfs)	Exemption Scenario Q (cfs)	Difference (cfs)

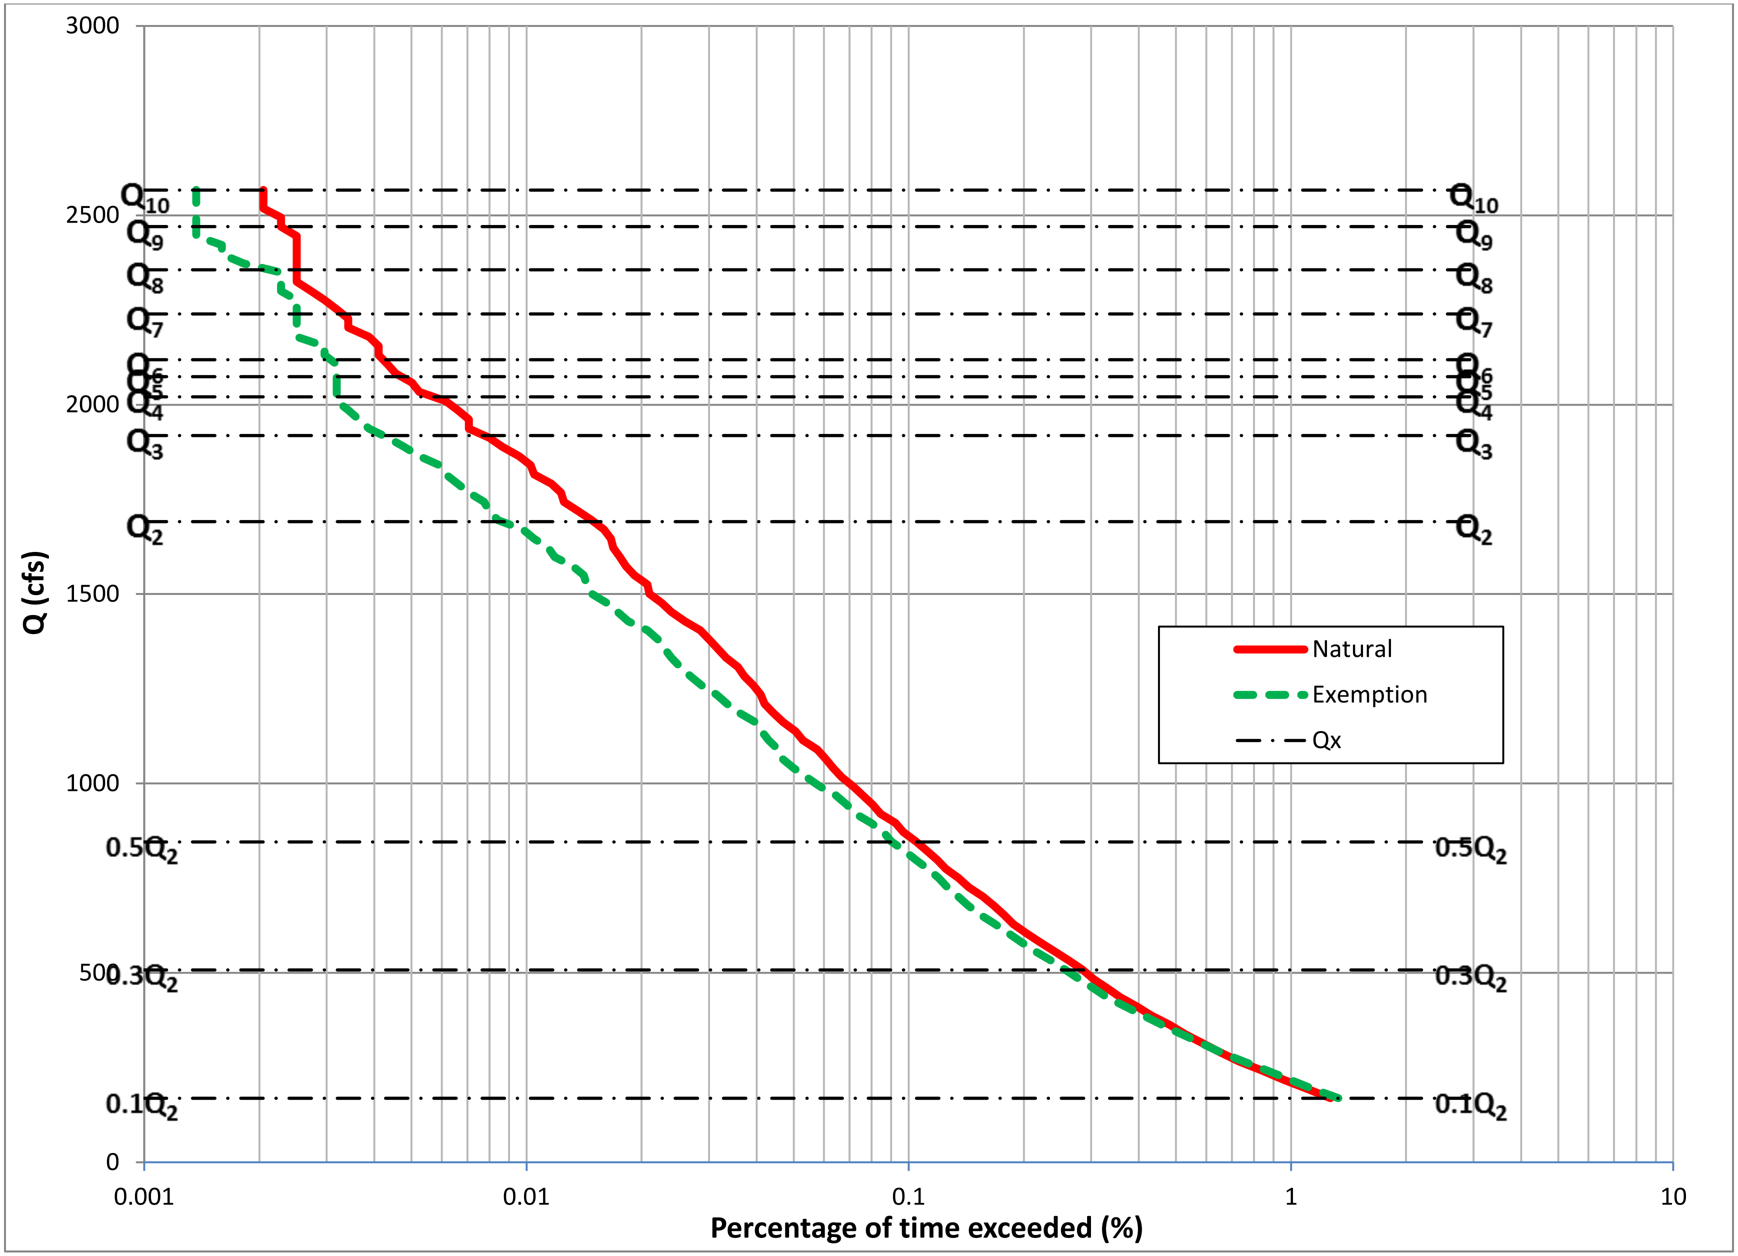

Figure 2: SWMM Otay River Flow Duration Curves for the Natural and Exemption Scenarios

1916 Savage Dam Failure and Historical Photographic Comparisons

We sought to establish multiple lines of evidence to either validate or invalidate our findings. In order to more accurately assess the exemption, we considered not only the *presence* of Savage Dam, but the *effect of its catastrophic failure* in 1916. Therefore, we tested the next hypothesis: the *historic failure* of Savage Dam has a more profound impact on river morphology than any proposed, directly-discharging development downstream of Lower Otay Reservoir. In order to do so, we conducted a historical image review to observe the relationship between urbanization and river morphology dating back to the earliest available aerial imagery (1928) provided by the County of San Diego Department of Public Works. We were also able to obtain stereoscope photographs taken in 1953 from the University of California, Santa Barbara's Aerial Imagery Research Service and a high-resolution 2015 image from Esri. We hypothesized that, due to the 1916 dam failure, the Otay River was extremely hydromodified and therefore has become significantly desensitized to changes in land use. If the photos demonstrate that the river has remained in a steady state of dynamic equilibrium during the course of Otay Valley's urbanization over the past 87 years, then it would be reasonable to acknowledge the river's proper equilibrium state and its resiliency to post-dam failure land use alterations.

The Savage Dam failure is a well-documented catastrophe. The flood of January 27, 1916 caused the rock-fill dam to fail, discharging over 1.7 billion cubic feet into Otay Valley over the course of 2.5 hours. An account of the events leading up to the dam breach and the aftermath in Otay Valley is given by Roy A. Silent (1916):

> Prior to January 15 [1916] the water surface in the Otay reservoir was 96.5 feet above zero contour. From Jan. 16 to 21 at 7 a.m. it had risen 11.8 ft. to a height of 122 ft. 8 in. At this time, water began to run over the spillway. ***From Jan. 21 on, the level continued to rise in spite of the discharge through the spillway. On the morning of Jan. 27 the reservoir was at 124 ft. 9 in., and the spillway was probably discharging in the neighborhood of 1,500*** [cfs] [emphasis added].
>
> The rain on Jan. 27 was extremely heavy, and by noon the water had risen so high that Mr. Weuste, in charge at the dam, deemed it advisable to open the outlet gate. This failed to check the rise, and it was realized that the dam would probably be overtopped before evening. Men were accordingly dispatched to warn residents in the valley to move to higher ground. Word to this effect was also sent out from the telephone exchange at National City. Most of the inhabitants took advantage of this warning.
>
> At 4:45 p.m. the water had reached the top of the dam and had seeped through and filled the boxes that were sunk in the top to allow an examination of the steel core. Water began running down the lower face on the east side of the dam at approximately 4:50 p.m. About this time several spouts or small streams of water appeared on the lower face of the dam, in one instance loosening a large boulder which rolled down to the bottom. From this time on, the destruction was very rapid. The lower face of the fill quickly melted away, thus removing the support from the core wall. At 5:05 p.m. the tension was so great that the steel diaphragm tore from the top at the center, and the

dam opened outward like a pair of gates. The released water rushed through and filled the canyon to a point approximately 20 feet below the top of the dam. The draw-down area extended possibly 200 ft. behind the dam. ***It required 2 ½ hr. for the reservoir to empty*** [emphasis added].

A huge wall of water, variously described as from 6 to 20 ft. high, rushed down the valley, covering the distance from the damsite to Palm City [located just upstream of San Diego Bay]***, about 10 mi., in 48 min., carrying all before it*** [emphasis added]. The total loss of life has amounted to 14 at the present writing (Feb. 8), but there are still several persons missing. The property damage is estimated at $250,000.

A thorough examination of the damsite was made on Jan. 31 and Feb. 1. Practically all the fill was washed completely away. The steel core was deposited in varying-sized sections along the valley, a large part ***being found at Palm City, 10 mi. below the dam*** [emphasis added]. The core wall had torn itself loose from both of the side walls, the foundations remaining intact. An examination of the bottom was impossible, as water to a depth of 8 feet was flowing through a constricted channel in the bottom of the cañon.

Three-quarters of a mile below where the dam had stood a piece of the diaphragm was observed, to which the angle iron forming the bottom of the steel plate was riveted, showing that the extreme bottom had been torn loose. On the west side, behind the remaining core wall, was a small part of the fill, composed of rock of small sizes, none of which was over 1 ½ ft. in diameter and grading from that size to coarse gravel. If this may be considered a fair example of the remainder of the fill, it is easy to understand its melting away as rapidly as described.

The cañon below the dam, prior to the failure, was considerably restricted and filled with large boulders. The action of the water removed all the loose rock and thoroughly stripped to bedrock both sides of the canyon as high as the water reached, the line of demarcation being clearly defined. The stripping was done in a most thorough manner, no particle of soil remaining in any of the niches or crevasses. This area was heavily wooded with brush [emphasis added].

An interesting feature was observed in that for half a mile below the dam in practically every pocket or niche in the rock was to be found a rivet head. An examination of the remaining parts of the steel core showed it to be in a perfect state of preservation, no rust or corrosion being noticeable. The destruction of the plate had taken place for the most part along the riveted seams, though one or two cases in which the sheets had torn were observed.

The reservoir above the dam showed a deposit of silt to a depth of from 5 to 6 ft. in most places, through which the present flow of the river is cutting a channel. The amount of silt deposited cannot be taken as a fair average for reservoirs in this section

> of the country, as much of the water passing into the reservoir was carried by a conduit and was comparatively clear. (Silent, 335-336)

A photograph accommodating Mr. Silent's original narrative is provided in Figure 3.

Figure 3: Canyon Immediately Below Dam, Showing Stripping Action of Water (Silent, 1916)

In addition to Mr. Silent's account, the former Assistant City Manager of San Diego, John L. Bacon, on February 1, 1916 (Baker, 1916):

> The heaviest rainstorm ever recorded in this part of California caused the destruction of the Lower Otay dam at about 5 p.m. on Jan. 27. The rain began on Jan. 14 and continued for six days, with an average precipitation of 1 in. daily. Upon the ground thus thoroughly saturated a second and much heavier rainstorm fell on Jan. 25. The rain gages were inadequate to measure this storm, and the actual rainfall record at the dam is not available. The precipitation on Jan. 27, however, is estimated at about 5 in., a cloudburst occurring about 4 p.m.
>
> The level of the water in the reservoir rose 9 ½ ft. from 7 a.m. to 5 p.m., at which time the dam overflowed. It began to give way about 5 min. later. The destruction was completed in 15 min., the dam being washed away to its foundations all around. The failure evidently started by the water overflowing the crest, washing out the backing of the central core. The break started near the center of the dam, the plates holding back for a time against the sides. Part of the plate was crumpled up and washed down the valley for several miles.

> The floor of the spillway was at an elevation of 124 ft. above the original stream bed, and the elevation of the top of the dam was 134 ft. The spillway was 38 ft. wide at the bottom and 45 ft. wide at the elevation of the dam crest. ***The estimated flow through the spillway when the dam overflowed was 2,000,000,000 gal. daily*** [emphasis added]. The spillway was not blocked in any way. The ¼-in. steel plate core in the dam, with 12 in. of concrete on each side, stopped 2 ft. below the dam crest. The length of the dam crest was 560 ft. and the width of the top 16 ft. The thickness of the dam at the bottom was 400 ft. ***The valley below the dam was swept clear of soil to bedrock, and the banks of the valley show that a wave about 50 ft. high passed down*** [emphasis added]. About 30 lives were lost in the flood.
>
> It is estimated that to replace the dam will cost about half a million dollars. There is ample water for the city's supply stored behind several other dams. Part of the Sweetwater dam was washed out. The Upper Otay dam, an arched concrete structure of horseshoe shape, had a depth of 3 ft. of water flowing over its crest on Thursday, but is safe. The City of San Diego has been cut off from the outside world except by water. No telegraph, telephone or railway lines were in operation. All bridges were washed out, and roads were impassable. (239)

As conveyed by these first-hand accounts, the magnitude of the dam failure was not limited to only areas immediately downstream of the breach but all the way to the mouth. The USGS documented the impacts of the 1916 flood across Southern California and reported the following damages incurred by businesses within Otay Valley (McGlashan & Ebert, 1918):

> *San Diego Consolidated Gas & Electric Co.*—The transmission lines and distribution system along San Diego River were washed out from El Monte to False Bay. There were also ***extensive washouts*** along Sweetwater River at Jamacho and from Sweetwater dam to San Diego Bay, ***on Otay River from Otay dam to San Diego Bay***, and along Tia Juana River from Tia Juana to the Pacific Ocean [emphasis added]. The principal damage was the loss of wood pole lines, copper wire, transformers, and miscellaneous electric-line material. The service in San Diego and immediate vicinity was not seriously interrupted. The lines to the more important towns were reestablished within two weeks, but some of the remote farming districts were without electric service for six weeks or more. The total damage to the gas and electric departments, corrected for value of salvaged material, was $70,527.
>
> *Western Salt Co.*—The losses consisted of ***170 acres of salt ground (which was covered with a deep deposit of silt), 2,500 tons of salt, a large quantity of brine in the ponds***, and injury to machinery [emphasis added]. The total damage was given as $85,500.
>
> *Fenton-Sumpton-Barnes Co.*—The company operates a gravel-washing plant ***in Otay Valley, about a mile from San Diego Bay. This plant was a complete loss, for after the flood there was not an indication on the surface to show its location*** [emphasis added]. The value of this equipment was $35,000. ***In addition, the soil was entirely removed***

> ***from 100 acres of bottom land*** which had been purchased for about $450 per acres [emphasis added]. The business loss was complete from January 27 to May 1. (34)

To put the magnitude of the dam breach into perspective with regard to the geomorphically significant range of flows, we look to the data provided by Silent, Baker, and USGS. In the five days leading up to the dam breach (starting on January 22 to 7 a.m. on January 27, 1916) flows ranging up to approximately 1,600 cfs were *constantly* released through the spillway—a rate that is 33% greater than the FEMA-published instantaneous Q_{10} value for the Otay River at Otay Valley Road (Federal Emergency Management Agency, 2012). Then, for ten straight hours up until the moment the dam breached, flowrates rapidly increased up to 4,700 cfs. Based upon the defined geomorphically significant flow range of Q_2 to Q_{10}, these *pre*-breach spillway flows and durations alone had enough energy to alter the river's morphology in an unnatural way (and likely did so). The morphological impacts caused by these pre-breach spillway flows were unquestionably eclipsed by the 20-50 foot high wall of water caused by the dam failure. When the dam breached at 5:05 p.m. on January 27, 1916, 1.7 billion cubic feet of water were released in 2.5 hours. The mere average flowrate during this 2.5 hour period equates to over 193,000 cfs—a rate that is nearly four times the 500-year FEMA flowrate for the aforementioned location (Federal Emergency Management Agency, 2012). The unnatural force exerted on the river system by these massive flows was devastating to all within the river system, as presented by the firsthand accounts and now confirmed by the hydrologic context. The USGS post-breach photograph is provided in Figure 4.

For additional context, the USGS report also documents that just before failure, the flows entering the reservoir through Jamul Creek reached 18,100 cfs. They describe the 150 foot wide creek as being composed of sand, gravel, and boulders before the flood and rendered "practically clean" afterwards (McGlashan & Ebert, 1918). A photograph of Jamul Creek's devastating scour is provided in Figure 5.

Without question, the 1916 Savage Dam breach had a profound impact on the Otay River, from the reservoir to San Diego Bay. The extent to which the system remains impaired by this catastrophic event is best evidenced through the historic aerial photograph review. Photographs from 1928, 1953, and 2014 are provided in Figure 6, Figure 7, and Figure 8, respectively. These photos are best viewed by scrolling between single page displays in Adobe Acrobat Reader (View → Page Display → Single Page View).

Figure 4: View Downstream at Site of Lower Otay Dam, After Failure (McGlashan & Ebert, 1918)

Figure 5: View Upstream on Jamul Creek after Flood of January 1916 (McGlashan & Ebert, 1918)

Figure 6: 1928 Aerial Photograph of the Otay River (Upstream of I-805) (County of San Diego)

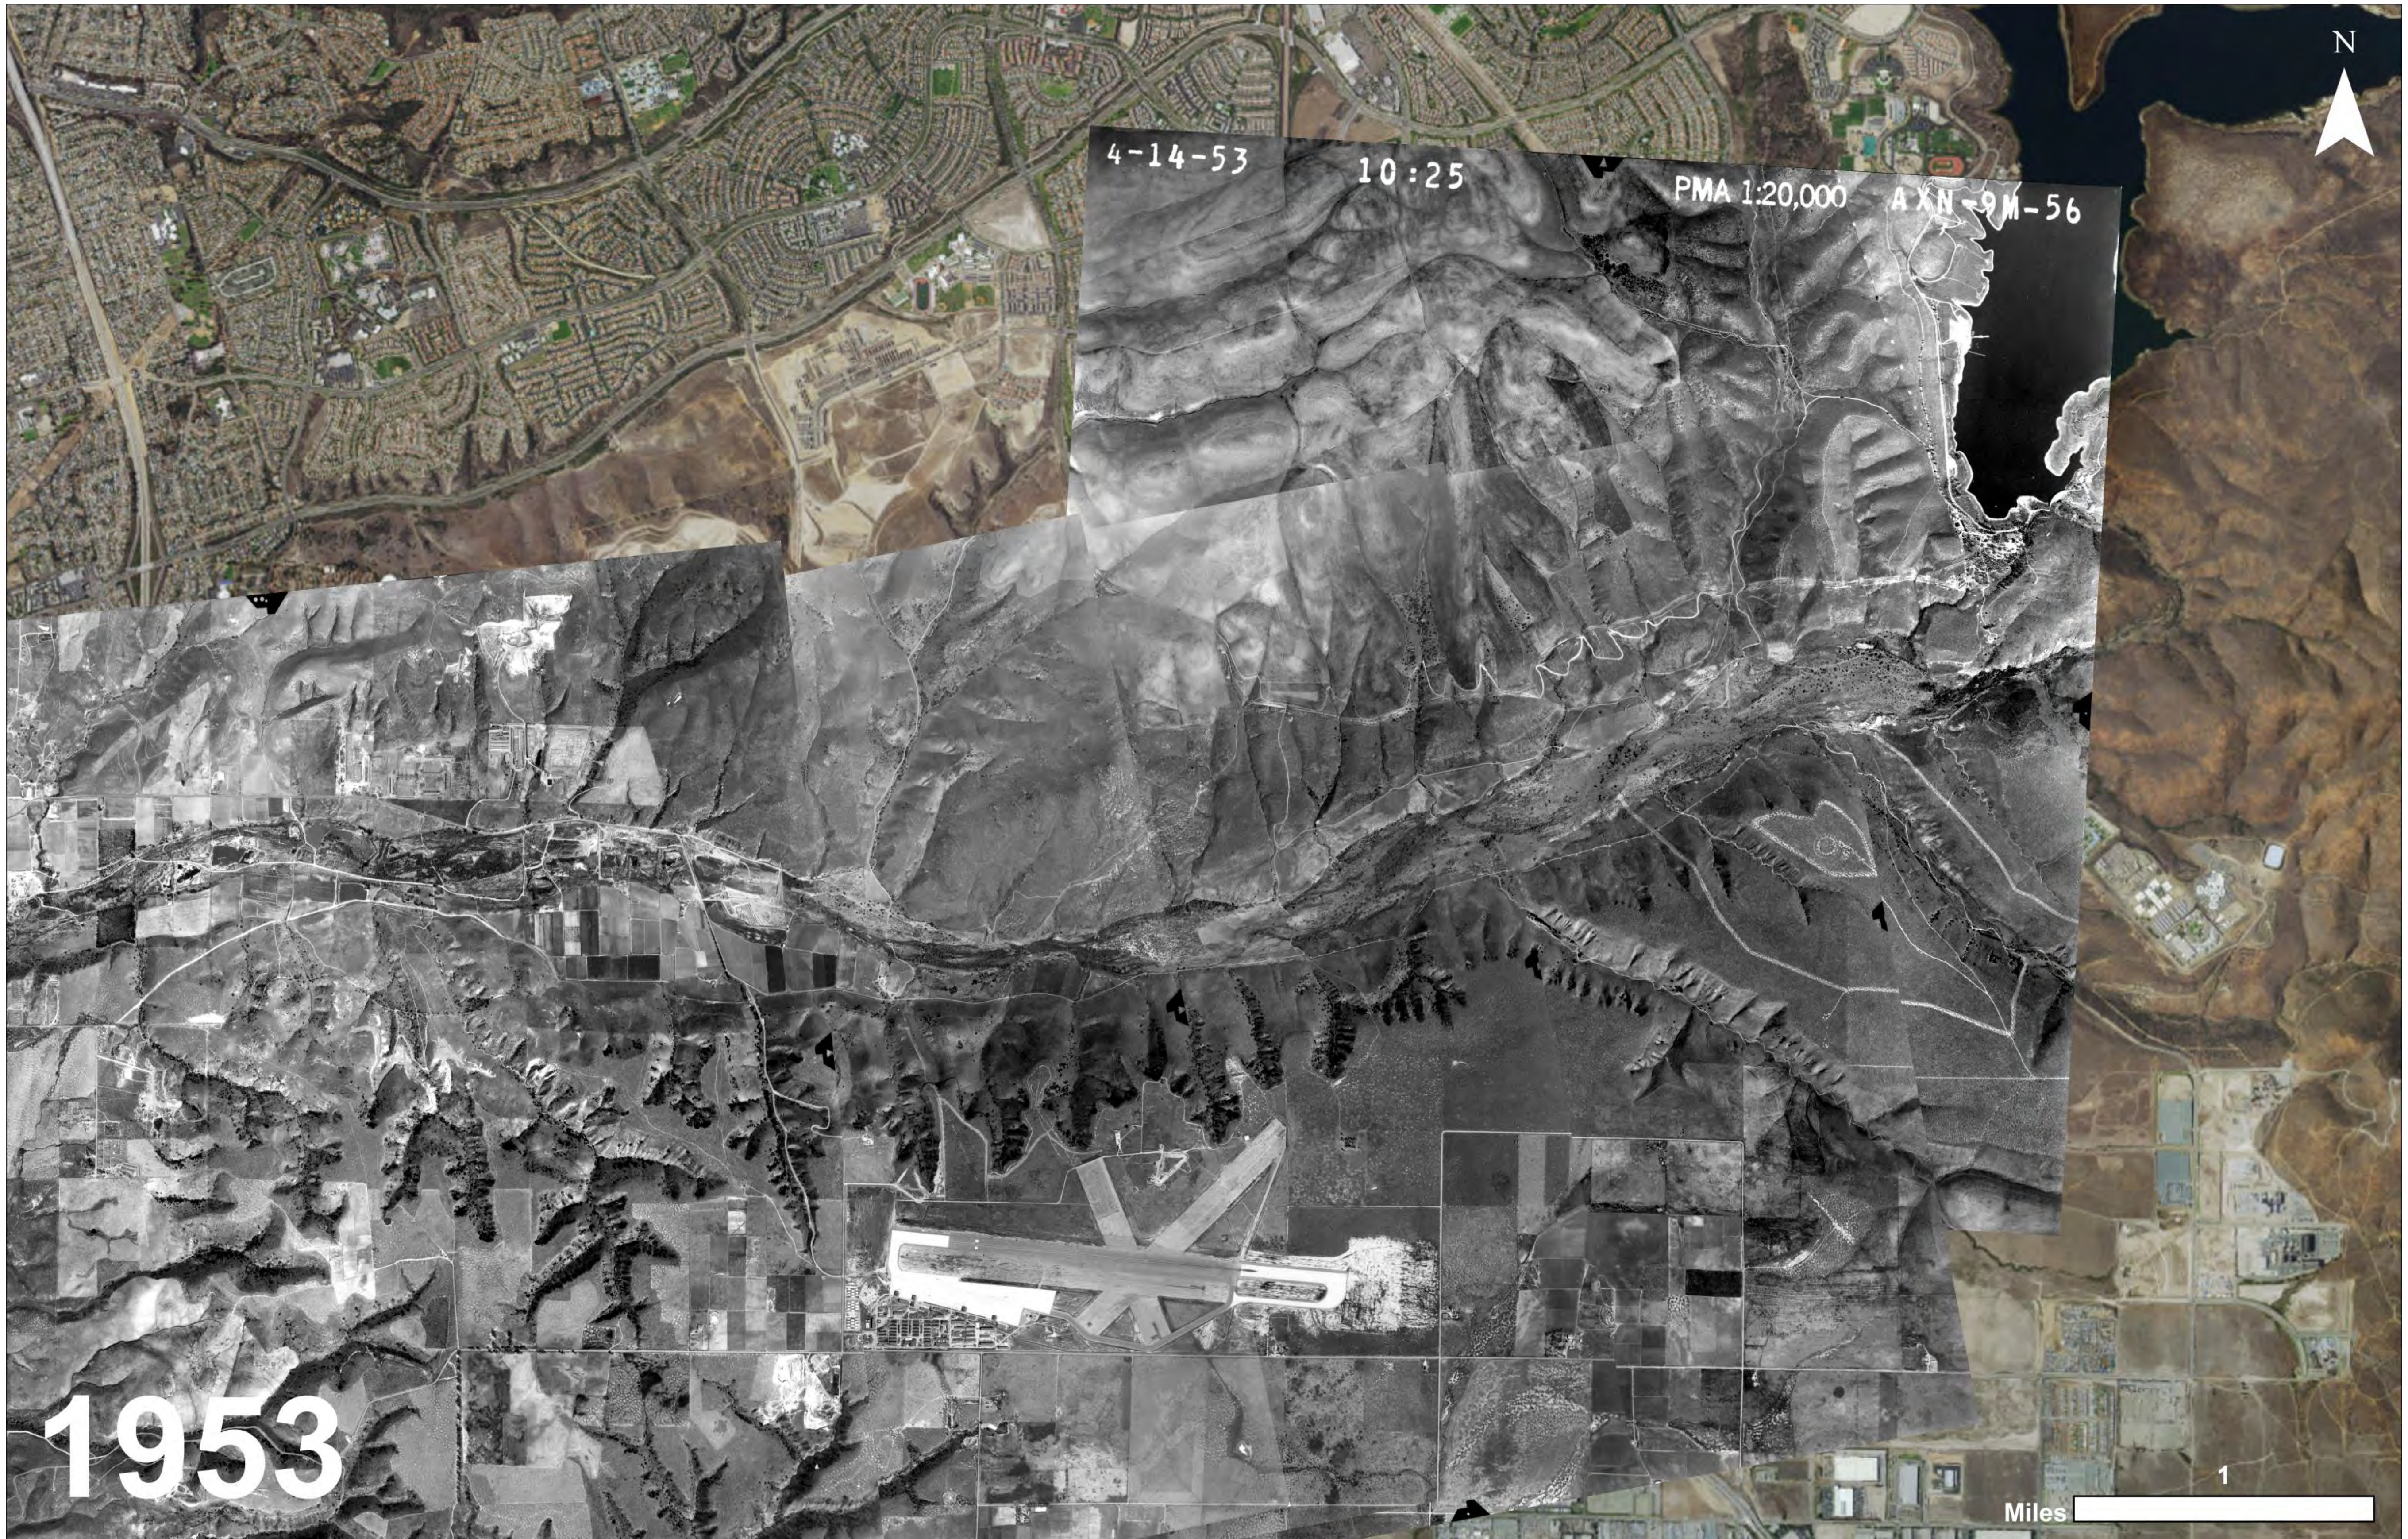

Figure 7: 1953 Aerial Photograph of the Otay River (Upstream of I-805) (University of California, Santa Barbara)

Figure 8: 2015 Aerial Photograph of the Otay River (Upstream of I-805) (Esri)

The aerial image comparison provides valuable insights into the post-failure river morphology. In 1928 (12 years after the breach), the effects of the dam failure are clearly seen: an incised, barren river mostly devoid of vegetation. In the absence of field data, it is reasonable to gather that the old Savage Dam fill material (rocks ranging in size up to 1.5 feet and some boulders) cover the channel bed, with some light re-establishing of brush toward the bank and thalweg. In 1953, the re-establishment of vegetation continues to be clearly seen, as most of the river reach has become covered. Vegetation has migrated from the thalweg toward the floodplain in many areas.

The hydrologic activity occurring between these two instances in time provides several pieces of notable data. First, during the 25 years from 1928 to 1953, San Diego experienced two of its wettest seven years on record: 1940-41 (24.74 inches) and 1951-52 (18.16 inches) to date (San Diego Union-Tribune, 2005). Second, the Lower Otay Reservoir hourly precipitation data from the National Oceanic and Atmospheric Administration (NOAA) recorded hourly rainfall depths of 1.24 inches in 1951 and 1.08 inches in 1952, which are totals equal to the estimated 200 and 100 year hourly rainfall depth for that station, respectively (National Oceanic and Atmospheric Administration, 2014). Lastly, Jamul Creek (the closest available stream station data during this time) discharged a peak of 4,000 cfs in December 1947, which is its second highest peak on record to date (United States Geological Survey, 2015). The fact that the river system did not widen, meander, or scour during that time would suggest that it would take greater than the wettest conditions on record to impact the river channel morphology or degrade the in-stream habitat—conditions certainly outside the Q_2 to Q_{10} flow range.

When these two historic photographs are compared with the modern-day condition, it is evident that the same trend has continued for 87 years: the channel remains stable, while vegetation continues to populate through the riverbed. While the Lower Otay Reservoir hourly precipitation data shows that the area continued to experience wet years from 1953 to 2015 (hourly precipitation depths equal to the 200, 50, and 25 year frequency in 1963, 1964, and 1955, respectively), the channel demonstrates no morphologic changes over the 62 year span. The 1928 river perfectly aligns with the 2015 river at stream bed angle points, ridgelines, boulders, and other geologic features; constricted areas have remained constricted, wide areas have remained wide, and no meandering or incising is evident. Furthermore, contrasting the most recent San Diego County land use data with the earliest available data from 1986, we find that the watershed in these photos (upstream of I-805 to Lower Otay Reservoir) has increased from 11% to 20% impervious cover over the past 30 years. Despite the extreme rainfall events and rapid urbanization, the Otay River has remained in a steady state of dynamic equilibrium and continues to reinforce its bed and bank material *and* support beneficial uses through the re-emergence of vegetation. Therefore, it would be reasonable to presume that the overall river health would benefit from the continued inflows of clean water. We conclude that the dam breach altered the channel in such a way that the more typical range of geomorphic flows has not adversely affected the river morphology, nor degraded the system's beneficial uses, as evidenced by the unwavering channel alignment and progressive re-habitation of natural vegetative species.

Field Investigation and Revised WMAA Ep Analysis

Thus far, the two working hypotheses have been tested and found to be correct: the *presence* and *historic failure* of Savage Dam have had, and continue to have, a more profound impact on river morphology than any proposed directly discharging development downstream of Lower Otay Reservoir. Through the testing of the second hypothesis, we observed the re-establishment of the river's vegetation. As previously stated, hydrologic models are most appropriately used in conjunction with field verification to either validate or invalidate their findings. Therefore, as a final measure, we sought to assess our findings by conducting a field investigation. Field conditions were documented and used to revise the clear and repeatable WMAA Ep Analysis with *field-specific* inputs.

The WMAA Ep Analysis conservatively assumed a highly sensitive relationship between watershed imperviousness and in-channel shear stress. The methodology behind the analysis assumes that accelerated erosion ensues and thus the river system will begin to unravel if the cumulative work performed on any given channel section in the watershed's post-developed condition exceeds the pre-developed condition by more than 5% (Erosion Potential, or Ep > 1.05). This sensitive relationship is likely attributable to the fact that the WMAA Ep methodology was not developed using data from impounded watersheds, and the data that was used did not come from urbanized (>25%) impervious watersheds, but rather from urbanizing (0 to 25% impervious) watersheds. Due to these factors, the erosion potential analysis is implicitly conservative for an impounded system and depends heavily on the watershed imperviousness and the selection of a threshold value at which particle motion occurs at any point along the channel boundary, known as the critical shear stress (τ_c). In the WMAA Ep Analysis, the critical shear stress was conservatively assumed to occur at a flow rate equal to 50% of the 2-year peak flow (Q_2). This "low flow threshold" critical shear stress, which equates to the in-channel shear produced at a flow of $0.5Q_2$, is based upon an assumption of the river channel having "low susceptibility" to accelerated erosion. This very conservative approach assumes a degree of susceptibility to hydromodification within the range of geomorphically significant flows *before* any consideration is given to the river's physical properties, such as soil cohesion, vegetation, or other factors that are to be evaluated in the proper determination of the critical shear stress value (Fischenich, 2001). As a macro-level initial screening of a major river system, the WMAA Ep Analysis includes this implicit factor of safety to an already conservative analysis. The field investigation also sought to investigate this assumption, in addition to testing our initial findings.

On October 21, 2015, the TRWE team investigated the Otay River from just downstream of 27th Street (approximately ¾ mile upstream of Interstate 5) to the confluence with Salt Creek (approximately 2 miles downstream of Savage Dam), with special attention given to three critical cross sections along the reach. These three sections were identified as areas of concern by the WMAA consultant team due to their narrow geometry. We documented the channel boundary conditions at each location. These cross sections (1, 2, and 3) are presented in Figure 9:

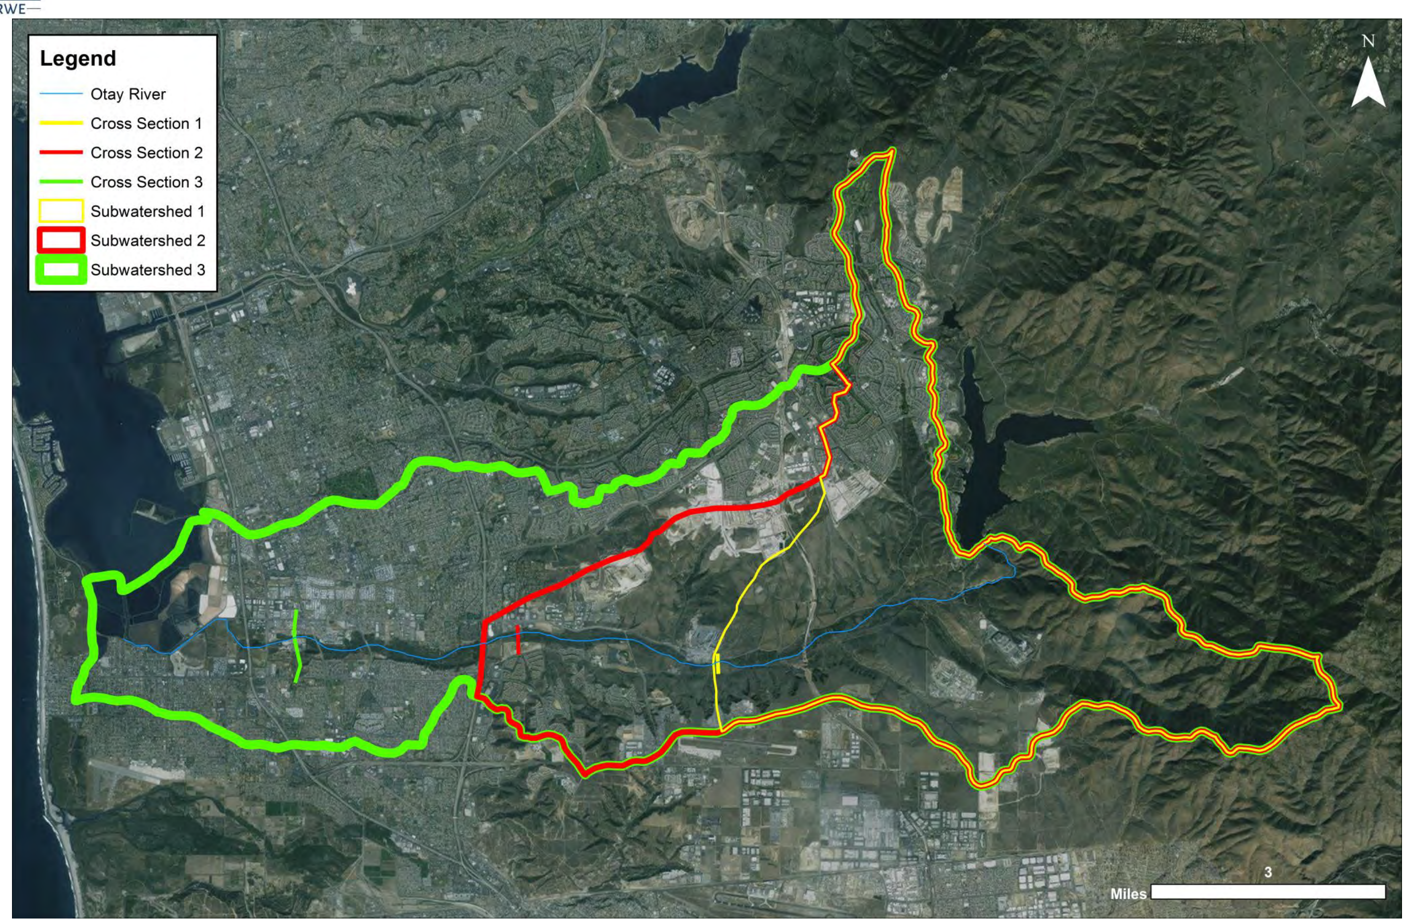

Figure 9: Locations of Cross Sections 1, 2, and 3, Including Upstream Subwatershed Areas

We investigated the boundary conditions at all three cross sections, including additional review at sections in between. We found at all three cross sections, and the areas in between, the river was heavily vegetated with grassland, scrub, meadow, and marsh. Some areas remain scoured to bedrock and still do not support vegetation 100 years after the dam failure, as was the case with Cross Section 1. In all cases, we found no evidence of active scour. Field photos are provided in Figures 10 through 18.

Many of the modern critical shear stress values for uniform, noncohesive channel boundary materials were estimated in 1936 through a series of laboratory flume experiments by A. Shields in his development of what is now known as the Shields criterion. While Shields' estimates are useful for predominantly alluvial or nonvegetated river systems, these theoretical values have little value in assessing the stability of vegetated systems. According to Dr. Craig Fischenich of the U.S. Army Corps Engineer Research and Development Center (ERDC) (2001):

> The presence of vegetation does not render underlying soils immune from erosion, but the critical condition for erosion of a vegetated bank is usually the threshold of failure of the plant stands by snapping, stem scour, or uprooting, rather than for detachment and entrainment of the soils themselves; vegetation failure usually occurs at much higher levels of flow intensity than for soil erosion. (4)

It is well documented that when vegetation establishes itself in a channel, then that channel is capable of handling flow velocities far in excess of that handled by the soil lining alone (1992). A number of recent research efforts have suggested that root systems physically and chemically bind bank soils in place, increasing the critical shear stress (Wynn, 2004). As the research continues, river and stream restoration efforts have produced valuable insight into a wide range of critical shear stress values for different channel materials, including vegetated channels. A prominent study by Dr. Fischenich documents how to assess a channel's stability and also provides a range of critical shear stress values for vegetation-lined channels such as the Otay River (included in Attachment 4). Critical shear stress values of 0.67 pounds per square foot (psf) (shales and hardpan), 0.35 psf (average reeds), and 0.70 psf (short native and bunch grass) are more appropriate assignments for the Otay River based upon the field conditions (Fischenich, 2001); the WMAA Ep Analysis assumed a very conservative critical shear stress value of 0.135 psf not based on the actual boundary conditions. The revised critical shear stress estimates are still fairly conservative, considering that low to average values were selected within the published range.

The MS4 Permit speaks to the significance of a proper critical shear stress assignment in Provision E.3.c.(2)(a)(i) where it states that the channel's low-flow threshold "*must* correspond with the critical channel flow that produces the critical shear stress" (San Diego Regional Water Quality Control Board, 2015). Therefore, we conclude that the revised critical shear stress estimates meet the Permit criteria, as they are appropriate for a wide, vegetated Otay River segment. The revised WMAA Ep Analysis shows that no work occurs at any of the three cross sections for the range of geomorphically significant flows, which is consistent with our observations, the watershed-specific hydrologic modeling and the historical imagery review. The revised WMAA Ep Analysis spreadsheets are provided in Attachment 2.

Executive Summary

The purpose of this study is to use a strict hydrologic assessment to either justify or invalidate the renewal of the current hydromodification exemption for projects draining directly to five river reaches (Otay River, San Diego River, San Dieguito River, San Luis Rey River, and Sweetwater River). These reaches have been exempted by the San Diego County Hydromodification Management Plan (HMP) (San Diego County, 2011), based on the wide-spread perception that existing large upstream reservoirs reduce river discharge and erosion potential to a larger extent than potential increases attributed to downstream land developments. In 2013, the San Diego Regional Water Quality Control Board (SDRWQCB) issued a new Permit that now requires justification of exemptions with further hydrologic analysis.

Accordingly, this study evaluates the hydrology of these five watersheds to determine if the continuance of the exemptions may be justified. A rigorous two-step approach is used to describe the effects of either renewing or revoking the 2011 HMP Exemptions through: (1) Statistical Peak Flow Analysis and (2) US Environmental Protection Agency (EPA) Storm Water Management Model (SWMM) Peak Flow Analysis. The Statistical Peak Flow Analysis uses a combination of observed streamflow measurements and USGS Linear Regression Equations to estimate the 2-year, 5-year, and 10-year peak flows at the mouth of each exempt river reach and describe the influence of the upstream impoundments for “dam-in-place” and theoretical “no dam” conditions. The Statistical Peak Flow Analysis characterizes flow reductions as a result of upstream impoundments and serves as a preface for more detailed peak flow simulations. EPA SWMM is used to determine the relative numerical influence of storm water runoff from project development on peak flows and durations, using continuous rainfall-runoff simulation to estimate the 2-year, 5-year, and 10-year peak flows at the mouth of each exempt river reach. Hydromodification flow controls are simulated for all non-directly discharging developable lands and are conditionally simulated for directly discharging developable lands in order to assess the impact of the hydromodification exemptions on the watershed-wide peak flows. The simulated hydromodification controls are modeled both with and without the presence of the dams to assess the influence of impoundment versus land development.

Both analyses resolve that the upstream impoundment is a very significant factor in peak flow alteration for each watershed. The Statistical Peak Flow Analysis results suggest a 29 to 65% peak flow reduction for each watershed due to upstream impoundment. The SWMM Peak Flow Analysis results suggest that peak flows for each watershed, if exemptions are granted, will remain 22 to 79% less than peak flows corresponding to an undammed watershed condition. These pre- to post-dam ratios are consistent with flow impoundment behavior found in other semi-arid, Mediterranean systems. The SWMM results further suggest that the areas directly discharging to exempt river reaches are less than significant, as evidenced by the near-0% peak flow increase granted by the proposed HMP exemption. Therefore, it is recommended that the exemptions be reinstated along all five river reaches for projects directly discharging to the rivers, due to confirmation of significant impoundment effects and the negligible peak flow increase attributable to those directly discharging developable lands.

1. BACKGROUND & CONTEXT FOR STUDY

A watershed's natural hydrologic state may become severely altered due to land use changes. Hydrologic alterations may include fluctuations to natural stream discharge rates, durations and sediment transport behavior. A stream's physical response to changes in watershed runoff and sediment yield is collectively referred to as hydromodification. The confidence that most hydromodification is highly attributable to changes in land surface—namely urbanization and other development—has recently led to more focused efforts in an attempt to understand and manage these processes.

Hydromodification is occurring in many Southern California creeks and waterways and has become a key element of most stormwater programs in California (Southern California Coastal Water Research Project, 2010). In San Diego, Orange, and Riverside counties, recent storm water regulations have imposed discharge flow and duration control requirements on certain new development and redevelopment projects. As evidenced in 2007 by the San Diego Regional Water Quality Control Board Order No. R9-2007-0001 (the "2007 Municipal Separate Storm Sewer System (MS4) Permit"), the Municipal Copermittees were required to implement a Hydromodification Management Plan (HMP) "...to manage increases in runoff discharge rates and durations from all Priority Development Projects, where such increased rates and durations are likely to cause increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force" (San Diego Regional Water Quality Control Board, 2007). Consequently, in 2007 the Copermittees began to prepare the San Diego County HMP (Brown and Caldwell, 2011). The San Diego County HMP effort continued over the span of two years, consisted of a 14 member Technical Advisory Committee (TAC), and received input from a gamut of private and public stakeholders. The total HMP development effort exceeded one million dollars. The Final 2011 HMP was adopted by the San Diego Regional Water Quality Control Board (San Diego Water Board) on July 14, 2010 through Resolution No. R9-2010-0066 (San Diego Regional Water Quality Control Board, 2010).

The 2011 HMP provides San Diego Copermittees with guidance on hydromodification methods, technical approach, requirements, standards, best management practice (BMP) selection and implementation, monitoring, and exemptions. One such HMP applicability requirement provided exemption rationale for Priority Development Projects (PDPs) directly discharging to five large river reaches in San Diego County (developable lands that directly discharge to the exempt river reaches are herein referred to as Project Lands). The Project Lands within each watershed equate to a considerably small fraction of the total watershed area (less than 5%, as summarized in Table 1). The exempt river reaches are summarized in Table 2 and are shown in Figure 1.

Table 1: Watershed Land Use Distribution (Downstream of Dam)

Reach	Total (ac)	[1]Developable (ac)	[2]Project Lands (ac)	% Developable	%Project Lands
Otay	29,571	4,310	1,412	15%	5%
San Diego	111,014	13,667	1,196	12%	1%
San Dieguito	28,710	4,653	1,055	16%	4%
San Luis Rey	118,846	77,180	4,151	65%	3%
Sweetwater	25,135	1,332	255	5%	1%

[1]Acreages were determined using "Developable Land" GIS data from the SanGIS Regional Data Warehouse.
[2]Acreages were determined through desktop analysis using available MS4 GIS data provided by Copermittees.

Table 2: Summary of Exempt River Reaches as Defined by the 2011 HMP

River	Downstream Limit	Upstream Limit
Otay River	Outfall to San Diego Bay	Lower Otay Reservoir Dam
San Diego River	Outfall to Pacific Ocean	Confluence with San Vicente Creek
San Dieguito River	Outfall to Pacific Ocean	Lake Hodges Dam
San Luis Rey River	Outfall to Pacific Ocean	Upstream river limit of Basin Plan subwatershed 903.1 upstream of Bonsall and near Interstate 15
Sweetwater River	Outfall to San Diego Bay	Sweetwater Reservoir Dam

For all proposed exempt river reaches supported by the 2011 HMP, each has:

- a drainage area in excess of 100 square miles;
- a 100-year flow in excess of 20,000 cubic feet per second;
- significant upstream reservoir flow regulation;
- predominantly wide floodplains and/or stabilized channel areas, and;
- low gradients (less than 1 %)

These factors concurred with field observations and were backed by years of historical perspective and practice from the TAC members (Bowling, Grey, Parra, Walker, & Weeden, 2013). There was a conditional requirement for the river reach exemption: a properly-sized energy dissipation feature must be existing or installed at the respective outfall location. Using the exemption rationale provided within the 2011 HMP, Copermittees were permitted to exempt PDPs from the hydromodification management BMP performance requirements prescribed by the 2007 MS4 Permit (herein referred to as the 2011 HMP Exemptions) so long as said PDPs were listed in the Development Planning section of the Copermittees' Jurisdictional Urban Runoff Management Program Annual Report (JURMP).

The current and succeeding municipal storm water permit, the 2013 MS4 Permit, was adopted on May 8, 2013. Similar to the preceding 2007 MS4 Permit, the 2013 MS4 Permit presents a list of criteria that must all be satisfied in order to grant hydromodification management BMP performance requirement exemptions. However, the 2013 MS4 Permit revised the hydromodification management BMP performance requirement exemption language from the 2007 MS4 Permit as follows:

- The project would discharge into channels that are significantly hardened (e.g., with rip-rap, sackcrete, etc.) downstream to their outfall in bays or the ocean;
- The project would discharge to a channel where the watershed areas below the project's discharge points are highly impervious (e.g. >70%).

The 2013 MS4 Permit conditionally excludes the five exempt river reaches justified by the 2011 HMP—exemptions that were based on prior studies of these rivers, the consensus of the TAC, an extensive public review process, and were approved by the San Diego Regional Board. However, the adopted language within the 2013 MS4 Permit does provide an opportunity to grant hydromodification management BMP performance requirement exemptions. A PDP may be exempt from hydromodification management BMP performance requirements when the project discharges storm water runoff to an area identified by the Copermittees as appropriate for an exemption by the optional Watershed Management Area Analysis (WMAA) incorporated into the Water Quality Improvement Plan (WQIP) pursuant to Provision B.3.b.(4).

This language was included to allow further evaluation of these previously exempt channels, rivers, or highly impervious watershed areas for continued exemption under a WQIP. Thus, a complete new analysis is required under the Watershed Management Area Analysis (Bowling, Grey, Parra, Walker, & Weeden, 2013). The Copermittees have since elected to perform the optional Watershed Management Area Analysis, represented by the County of San Diego (Geosyntec Consultants & Rick Engineering, 2015). The April 2015 San Diego County Regional WMAA uses a geomorphic assessment to evaluate the relationship between Erosion Potential (Ep) and Sediment Supply Potential (Sp). Based upon the instream erosion assessment, the Draft Regional WMAA recommends hydromodification management BMP performance requirement exemptions for PDPs directly discharging to the following river reaches:

Table 3: Summary of Exempt River Reaches as Proposed by the Regional WMAA

River	Downstream Limit	Upstream Limit
Otay River	Outfall to San Diego Bay	Interstate 805*
San Diego River	Outfall to Pacific Ocean	Confluence with San Vicente Creek
San Dieguito River	Upstream edge of the railroad crossing*	Lake Hodges Dam
San Luis Rey River	Outfall to Pacific Ocean	Upstream river limit of Basin Plan subwatershed 903.1 upstream of Bonsall and near Interstate 15
Sweetwater River	Outfall to San Diego Bay	Sweetwater Reservoir Dam

*limit changed from 2011 HMP recommendation

The Copermittees will now be able to grant hydromodification management BMP performance requirement exemptions offered by the 2013 MS4 Permit so long as the exemptions are approved via the WMAA and are incorporated into the WQIP—both of which are subject to the vetted public review and San Diego Water Board approval process.

1.1 Impoundment Characteristics

It is well understood that a river is in dynamic equilibrium with its geomorphic components: quantity of sediment, particle size, water discharge, and slope (Lane, 1955). This relationship, known as the Lane relation, is commonly expressed as:

$$Q_s d_s \propto Q_w S_o$$

Where Q_s is the quantity of sediment, d_s is the sediment particle diameter, Q_w is the water discharge, and S_o is the stream bed slope. This relationship is used to describe the qualitative balance between stream power and the discharge of bed material sediment and not intended to be used as an equation (Bowling, Grey, Parra, Walker, & Weeden, 2013).

Generally, long-term channel forms are naturally defined by frequent bankfull floods, approximately 1 to 2-year events in many cases (Wolman & Miller, 1960; Andrews, 1980). However, anthropogenic disturbances in natural systems invalidate assumptions of stationarity (Milly, et al., 2008). An alteration to one or more of the river equilibrium components will usually result in a feedback response to re-establish river equilibrium. A considerable amount of time may be required to achieve a new equilibrium condition; therefore, the effects of hydromodification may not be immediately observable (Trimble, 1997). In the context of all five exempt river reaches, the common denominators are sediment and flow sequestration due to upstream impoundments. The exact rate of sediment and flow sequestration accomplished by the upstream reservoirs is not well known at the desired temporal resolution. Sedimentation processes in a reservoir are quite complex because of the wide variation in many of the influencing factors (United States Bureau of Reclamation, 1987). Nonetheless, a significant reduction in sediment quantity and water discharge is reasonably assumed due to the steep and elevated nature of the impounded watershed drainage areas.

The exempt river reach impoundment summary is summarized as follows:

Table 4: Exempt River Reach Impoundment Summary

River	Major Impoundment[1]	Constructed	Owner	Miles from Mouth	Capacity (acre-ft)	Impounded Area (mi^2)	Percent Impounded[2]
Otay River	Lower Otay Reservoir	1919[a]	City of San Diego	13.1	49,849	100	70%
San Diego River	El Capitan Reservoir	1935	City of San Diego	28.0	112,807	185	61%
	San Vicente Reservoir	1943	City of San Diego	24.6	242,000[b]	75[b]	
San Dieguito River	Hodges Reservoir	1918	City of San Diego	11.0	30,251	245	89%
	Sutherland Reservoir	1954	City of San Diego	22.0	29,508	55	
San Luis Rey River	Lake Henshaw	1923	Vista Irrigation District	53.6	53,160	205	39%
Sweetwater River[3]	Sweetwater Reservoir	1888	Sweetwater Authority	8.2	28,079	85	82%
	Loveland Reservoir	1945	Sweetwater Authority	28.4	25,387	95	

[1] This study defines a Major Impoundment as a reservoir having storage capacity in excess of 25,000 acre feet and able to spill to the river reach
[2] percentage of total area impounded above downstream-most dam
[3] linear reservoir sequence
[a] originally constructed in 1897; reconstructed in 1919 after 1916 dam breach
[b] project recently completed to double reservoir capacity; overflows through tributary to main reach

1.2 Study Objectives

The objective of this study is to perform a rigorous hydrologic analysis to either justify or invalidate the renewal of the 2011 HMP Exemptions for PDPs on Project Lands using highly relevant and available tools, methods, and data. Due to the strict hydrologic focus of this study, sediment transport is not evaluated. This study used a two-step approach to describe the effects of either renewing or revoking the 2011 HMP Exemptions through: (1) Statistical Peak Flow Analysis, and (2) US Environmental Protection Agency (EPA) Storm Water Management Model (SWMM) Peak Flow Analysis. The analyses are summarized below.

1.2.1 Statistical Peak Flow Analysis

The Statistical Peak Flow Analysis seeks to provide a frame of reference for the SWMM Peak Flow Analysis and to describe the general influence of the upstream impoundments on peak flows by using measured flow gage discharge, peak flow estimation, and reservoir overflow data, where possible, to estimate the 2-year, 5-year, and 10-year peak flows at the mouth of the exempt river reach during:

- the ”dam-in-place” condition, which includes the existence of the upstream reservoir(s);
- the hypothetical “no dam” condition, which seeks to remove the significant impoundment effects induced by the upstream reservoir(s)

1.2.2 SWMM Peak Flow Analysis

As hydromodification is a complex phenomenon established in a large scale range, two possible outcomes can occur: (1) the combined effect of the impoundment and potential development may be more similar to the hypothetical and natural peak flow than simply including hydromodification control for an area already modified by a dam, or (2) the combined effect of the impoundment and potential development could improve the situation in a portion of the range of analysis, but be detrimental in another portion of the range of analysis, in which case an exemption to hydromodification is not recommended. The Statistical Peak Flow Analysis serves as a preface to the more detailed SWMM Peak Flow Analysis and seeks to provide a general agreement between impoundment and peak flow behavior on a watershed-by-watershed basis.

The SWMM Peak Flow Analysis seeks to reinforce the Statistical Peak Flow Analysis. The SWMM Analysis will determine the relative change in peak flows from PDPs on Project Lands using EPA SWMM continuous simulation modeling to estimate the 2-year, 5-year, and 10-year peak flows at the mouth of the exempt river reach during:

- the dam-in-place HMP exemption scenario, which accounts for river impoundment and subjects only non-directly discharging developable lands to hydromodification management BMP performance requirements;
- the dam-in-place full HMP scenario, which accounts for river impoundment and subjects all directly and non-directly discharging developable lands to hydromodification management BMP performance requirements;
- the hypothetical “no dam” HMP exemption scenario, which removes the effect of river impoundment and subjects only non-directly discharging developable lands to hydromodification management BMP performance requirements;

- the hypothetical "no dam" full HMP scenario, which removes the effect of river impoundment and subjects all directly and non-directly discharging developable lands to hydromodification management BMP performance requirements.

If the SWMM Peak Flow Analysis demonstrates that the flows and durations of those flows contributed by the exempt Project Lands are insignificant, then the exemptions are justifiable. Contrarily, if the SWMM Peak Flow Analysis demonstrates that the flows and durations of those flows contributed by the exempt Project Lands are significant, then the exemptions are not justifiable and should be revoked.

2. METHODOLOGIES

2.1 Statistical Peak Flow Analysis

The United States Geological Survey (USGS) records and maintains stream station data for locations along each of the exempt river reaches. The period, quality, and availability of data vary significantly depending upon the river. Instantaneous stream flow measurements are desired in order to most accurately assess the true peak flows occurring within the river channel. Often, reliable flow data recorded prior to impounded flow conditions are not available. Therefore, the best available local USGS instantaneous stream stations were selected to represent earlier conditions.

Typical peak flow estimates (2-, 5-, and 10-year) are derived from annual maximum series data. Accurate peak flow assessment requires knowledge of the river's behavior throughout the water year and over a sufficient period of record, with consideration to the prevailing climate. Southern California's semi-arid Mediterranean climate is characterized by a unique seasonal precipitation, with wet winters and warm, dry summers that can produce multiple low-frequency events within the same year, or none at all. Due to this phenomenon, peak flow analyses developed upon single peak annual events will inevitably omit flows that have a significant influence on Mediterranean river morphology. The ultimate result of using the annual maximum series to determine peak flows for high-frequency events (the 2 and 5-year peaks) in a Mediterranean climate is a gross underestimation of the more probable peak flow frequency. This underestimation is likely more pronounced for the higher frequency events (i.e., the 2 and 5-year peak flows (Brown and Caldwell, 2011)). Therefore, a partial-duration series analysis is used to estimate the 2 and 5-year peak flows in this Statistical Peak Flow Analysis. A partial duration series contains "N" values from "N" years of data. For the 10-year peak flow, the annual maximum series will be used, unless the instantaneous data is found to be erroneous, in which case the partial duration will be used.

The USGS began to record instantaneous (15 minute) flow data in water year (WY) 1988 to present. The present-day instantaneous flow data are used to quantify the peak flow events for each reach by partial duration and annual series analyses. A set of peak flow regression equations are applied to the same drainage area recorded by the USGS stream station to develop a ratio of the measured post-dam peak flow to the peak flow estimation equation value; this ratio is named the flood peak ratio (FPR) in this study.

With the flood peak ratio (FPR) established, the 2-, 5-, and 10-year pre-dam peak flow events are estimated by multiplying the FPR by the regression peak flow estimate derived for the entire watershed-wide area. The process is repeated for each watershed to produce impoundment-free 2-, 5-, and 10-year peak flow estimates. For validation, the impoundment-free peak flows are compared with the measured peak flows for those watersheds with USGS stream stations located at or near the river mouth. For additional reference, the impoundment-free 10-year peak flow is compared to the 10-year peak flow estimates published by the 2012 Federal Emergency Management Agency (FEMA) Flood Insurance Study (FIS) to roughly quantify the relative impact of the upstream impoundments.

USGS regional flood-frequency equations, originally introduced by Waananen and Crippen (1977), are used to estimate flood frequencies in six regions in California (Table 5). These equations relate flood magnitudes of selected frequency to drainage area, precipitation, and altitude (Waananen & Crippen, 1977). These equations (herein referred to as the 1977 USGS Equations) were regressed using available annual peak flow data from 778 USGS stream stations throughout California, 148 of which are located within the South Coast Region concerned with San Diego County. The 1977 USGS Equations are not applicable to sites where the usable storage within the basin exceeds 103 acre feet per square mile, to sites just downstream from large reservoirs, or to streams in urban areas affected substantially by urban development. The relations are primarily used to determine peak discharge values for flow under natural conditions (Waananen & Crippen, 1977). It is noted by a 2004 USGS study of Northern California watersheds that the 1977 USGS Regression equations produce the greatest errors at lower recurrence intervals (2-, 5-, and 10-year) peak flows, which is likely attributable to the lack of more than two decades of peak-flow data at the time of the study (Mann, Rizzardo, & Satkowski, 2004). It is expected that the underestimation would be even more pronounced for southern California's Mediterranean semi-arid climate for the reasons previously discussed.

The 1977 USGS Regression Equations were revised by Gotvald, Barth, Veilleux, & Parrett (2012). These equations (herein referred to as the 2012 USGS Equations) incorporated 30 years of additional annual peak flow data, among other improvements (Gotvald, Barth, Veilleux, & Parrett, 2012). Similarly, the 2012 USGS Regression Equations are specific to one of six hydrologic regions in California. San Diego County is located in the South Coast hydrologic region (Region 5), which was used for the 2-, 5-, and 10-year flood peak analysis. A comparison between the 1977 and 2012 USGS Equations are summarized in Table 5 as follows:

Table 5. 1977 and 2012 USGS Regression Equations for Region 5

Peak Flow	1977 USGS Equation	2012 USGS Equation
2-year	$0.14(DRNAREA)^{0.72}(PRECIP)^{1.62}$	$3.60(DRNAREA)^{0.672}(PRECIP)^{0.753}$
5-year	$0.40(DRNAREA)^{0.77}(PRECIP)^{1.69}$	$7.43(DRNAREA)^{0.739}(PRECIP)^{0.872}$
10-year	$0.63(DRNAREA)^{0.79}(PRECIP)^{1.75}$	$6.56(DRNAREA)^{0.783}(PRECIP)^{1.07}$

DRNAREA, drainage area, in square miles; *PRECIP*, mean annual precipitation, in inches

Drainage area values are estimated with USGS Digital Elevation Map (DEM) analysis using Esri ArcMap. Mean annual precipitation values were estimated using the Parameter-elevation Regressions on Independent Slopes Model Monthly Climate Data for the Continental United States (PRISM) areal statistics for water years 1988-2013 (October 1, 1987 to September 30, 2013) (Daly, 1994, 1997, 2001). PRISM provides an estimation of mean annual precipitation and is noted to have some bias at the monthly scale; however, this product is continuously updated to incorporate point data, a digital elevation model, and expert knowledge of complex climatic extremes, including rain shadows, coastal effects, and temperature inversions. Conterminous U.S. precipitation products can be downloaded from the PRISM Climate Group (http://www.prism.oregonstate.edu/); this study extracted and averaged monthly 4 km pixels for each watershed domain.

The USGS instantaneous stream station data are analyzed to identify individual peak flow events. Individual peak flow events are distinguished by satisfying the following criteria (United States Geological Survey, 1982):

1. Events must be separated by at least five days plus the natural logarithm of the square miles of the drainage area, and;
2. Intermediate flows must drop below 75 percent of the lower of the two separate maximum flows.

For any given time period where a recorded reservoir spill occurred and would have likely influenced the corresponding stream station flow measurement, the potential impacted data is omitted from the instantaneous stream flow record and analysis.

Two of the five river reaches (namely, the San Diego and San Luis Rey rivers) have instantaneous stream gage flow data near the mouth to the Pacific Ocean, where the Statistical Peak Flow Analysis provides an empirical relationship between the urbanized watershed-specific drainage area and partial duration peak flow events downstream of the impoundments. For the three remaining river reaches (namely, the Otay, San Dieguito, and Sweetwater rivers), the USGS stream stations are located upstream of the major impoundments, where the Statistical Peak Flow Analysis provides an empirical relationship between the sparsely developed, watershed-specific drainage area and partial duration peak flow events upstream of the impoundments. For both cases then, the watershed-wide drainage areas are not entirely represented, due to the impoundment in all cases, and due to the absence of a stream station near the mouth in three cases. Hence, these empirical relationships are used in combination with the 2012 USGS regional flood-frequency equations for rural ungaged streams in California to develop a relationship between the empirical and regression estimates on a watershed-wide scale; thus, a methodology is developed for estimating the peak flows at or near the river mouth. This simplified relationship is therefore used to scale the estimated regional flood-frequencies to the watershed-wide extent for each river by developing flood peak ratios (FPRs), defined as:

$$FPR = \frac{Q_{PDS}}{Q_{USGS}} \tag{1}$$

Where:

Q_{PDS} is the partial duration series T-year peak flow, as determined from the stream station instantaneous data record;
Q_{USGS} is the T-year peak flow, as determined by application of the T-year 2012 USGS regression equation to the equivalent stream station drainage area

Assuming a linear watershed-wide relationship between the stream station drainage area peak flows and 2012 USGS Regression peak flows:

$$\frac{Q_{PDS}}{Q_{USGS}} = \frac{Q_{ND}}{Q_{WS}} \tag{2}$$

Where:

Q_{ND} is the T-year estimated “no dam” statistical series peak at the river mouth
Q_{WS} is the 2012 USGS T-year annual peak applied to the entire watershed area

Therefore, the estimated “no dam” peak flow at the river mouth is:

$$Q_{ND} = FPR \times Q_{WS} \tag{3}$$

Figure 1 and Table 6 summarize the information pertinent to this methodology.

2.2 SWMM Peak Flow Analysis

The SWMM Peak Flow Analysis is used to assess the contribution of storm water runoff discharging from Project Lands to the exempt river reaches. Using available USGS and SanGIS land use data, SWMM models the rainfall-runoff relationship for each watershed under a set of different scenarios. The watersheds were modeled under the planned land use (PLU) condition in order to analyze the developed hydrology. Each watershed is modeled to evaluate the direct runoff from Project Lands, both with and without hydromodification management BMP performance requirements in place, and also without the effect of upstream impoundment.

As stated earlier, only PDPs on land directly discharging to the exempt river reaches (Project Lands) could qualify for the 2011 HMP Exemption. Using the "LANDUSE_PLANNED" SanGIS shapefile, developable lands were classified as such if they were geographically contained within the present-day "Developable_Land" SanGIS shapefile. These developable lands were then sub-classified as either directly-discharging (Project Lands) or non-directly discharging (non-exempt developable). Drainage behavior was assessed based upon available storm drain infrastructure databases and best professional judgment. In all likelihood, not all areas classified as Project Lands by this study would be named as such due to site-specific post development hydrology, jurisdictional requirements, and other related factors. When the effect of the dam was to be considered, the total watershed area upstream of the lower-most impoundment was introduced into the model. Areas upstream of the dam were conservatively assumed to be in a fully built-out condition and subject to hydromodification flow control. Since hydromodification management BMPs, when properly designed, effectively maintain the pre-development hydrology, this conservative assumption effectively models the impounded area as having a "natural" overland flow behavior. For all lumped land classification groups, the area was further divided into four sub-areas based upon hydrologic soil group (HSG) as A, B, C, or D.

To simulate the effects of hydromodification management BMPs, we averaged the percent flow reduction achieved by 25 separate hydromodification design projects performed by TRWE for our clients throughout San Diego County. The 25 projects all met the hydromodification management BMP volume and time-based performance requirements, as prescribed in the 2013 MS4 Permit. The average percent flow reduction for the 2-year to the 10-year peak flow was 43%. In nearly all cases, a hydromodification design project will not perfectly match the pre-development flow duration curve. It would not be practical to produce such a finely-tuned design. In order to safely meet hydromodification BMP performance requirements, the final design will typically produce less runoff than the pre-development hydrologic condition. Therefore, a 43% flow reduction is a conservative expectation for the unmitigated to mitigated post-development scenario. Furthermore, given that the 43% flow reduction estimate was developed from projects that met the hydromodification flow duration requirement, the 43%

flow reduction, when applied, can be assumed to satisfy the post-development flow duration component as well.

In order to simulate the effect of hydromodification on a given land use group, the 43% flow reduction was applied via the inflow scale factor for the respective junction node in SWMM. A conceptual SWMM model schematic is provided in Figure 2.

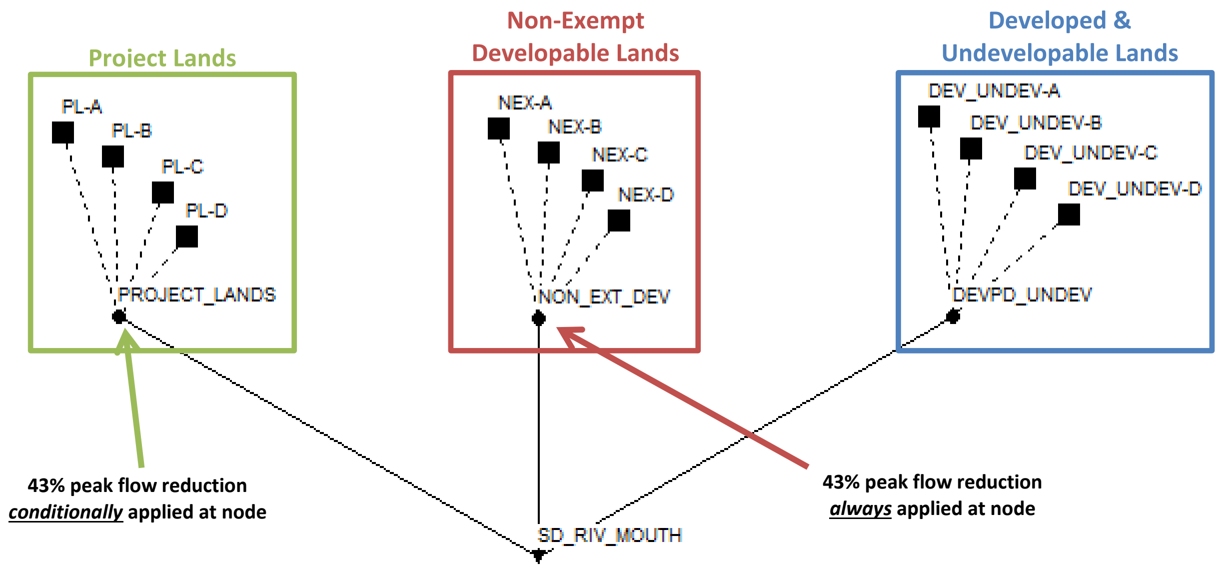

Figure 2: SWMM Model Conceptual Schematic for the San Diego River "Dam-In-Place" Scenario

The rainfall time series provided by the County of San Diego as a work product of the 2011 Final HMP have been analyzed for their accuracy in other studies. It was found that the disaggregation process artificially increases the frequency of the high intensity values (Parra-Rosales, Walker, & Ponce, 2012). Of the 19 rainfall stations produced by the Final 2011 HMP, Parra et al. found Lindbergh and Oceanside to be the most acceptable stations due to the completeness of the original data and quality of data from external stations used to fill data gaps. Therefore, this study used the Oceanside rainfall data for the San Luis Rey Watershed and the Lindbergh rainfall data for the San Diego Watershed. For all other watersheds, an alternate rainfall data source was used, as described below.

Available rainfall data was obtained through coordination with Rand Allan of the San Diego County Flood Control District (SDCFCD). Rainfall stations were selected based on their time format (hourly or finer) and proximity to the study watersheds. Collocated historical hourly and ALERT event-based rainfall stations were combined to make a continuous 50 year record. Natural variability in hourly and daily data exists between stations. Thus, annual values provide a reliable means to estimate precipitation patterns between nearby gages and gages with similar elevation and climatological attributes. To develop continuous precipitation records, a linear regression between SDCFCD stations was used to estimate missing precipitation values and validated on a separate subset of data, where available data exists for both gages. The correlation value (R^2) indicates the ability of the independent variable to predict the dependent variable and ranges from 0 to 1. Only correlations greater than 0.7 were used to guide interpolation of precipitation data. Table 7 summarizes the developed regression equations, the correlation coefficient, and values estimated at each station:

Table 7: Rainfall Station Regression Equations Used for Data Gaps

Independent Station (x)	Dependent Station (y)	Regression Equation[a-h]	Correlation
Kearny Mesa	La Mesa	[1]$y = 0.9813x$	$R^2 = 0.8815$
Poway	Kearny Mesa	[2]$y = 0.9371x$	$R^2 = 0.7993$
Encinitas	San Marcos	[3]$y = 1.0574x$	$R^2 = 0.7260$
Bonita	Sweetwater	[4]$y = 1.0942x$	$R^2 = 0.8734$
Kearny Mesa	Sweetwater	[5]$y = 0.9007x$	$R^2 = 0.7520$
Encinitas	Escondido	[6]$y = 1.3275x$	$R^2 = 0.7720$

a. Kearny Mesa data was used to estimate missing values in **La Mesa**[1] for the period of record for 8/10/1969-3/1/2015. A total of 9447 values (hourly time step) were filled. Note that La Mesa ALERT tipping bucket record begins 9/15/1982, which may account for the number of values filled.

b. Available data from Kearny Mesa was used to estimate missing values in **Poway**[2] for 1/23/1964-2/28/2015. A total of 3278 values (hourly time step) were filled. Note that Poway ALERT tipping bucket record begins 7/19/1982, which may account for the number of values filled. Now, a complete record is available for Poway from 11/1/1962-2/28/2015.

c. Poway data was used to estimate missing values in **Kearny Mesa**[2] for the period of record for 1/22/1964-2/28/2015. A total of 36 values (hourly time step) were filled.

d. Available data from Encinitas was used to estimate missing values in **San Marcos**[3] for 7/1/1963-2/28/2015. A total of 17 values (hourly time step) were filled during this time period. Note that San Marcos ALERT tipping bucket record begins 5/28/1981-3/3/2006 during which, there was 217135 missing values (hourly time step). These values were filled with data from Encinitas. Now, a complete record is available for San Marcos from 11/16/1962-2/28/2015.

e. Kearny Mesa data was used to estimate missing values in **Sweetwater**[5] for the period of record for 2/1/1965-10/30/1992. A total of 765 values (hourly time step) were filled.

f. Available data from Escondido was used to estimate missing values in **Encinitas**[6] for 11/19/1964-2/28/2015. A total of 1862 values (hourly time step) were filled. Now, a complete record is available for Encinitas from 7/1/1963-2/28/2015.

g. Encinitas data was used to estimate missing values in **Escondido**[6] for the period of record for 11/19/1964-2/28/2015. A total of 7761 values (hourly time step) were filled. Note that Encinitas ALERT tipping bucket record begins 7/1/1984, which may account for the number of values filled.

Rainfall data assignment and sources for each watershed are shown in Table 8

Table 8: Select Rainfall Stations for SWMM Peak Flow Analysis

Watershed	Rainfall Station	Record	Elevation (ft)	Source
Otay[1]	Bonita	1975-2015	139	SDCFCD
	Sweetwater[2]	1965-1992	310	SDCFCD
San Diego	Lindbergh[3]	1948-2005	15	Project Clean Water
San Dieguito[1]	Encinitas	1963-2015	250	SDCFCD
	Escondido	1964-2015	660	SDCFCD
	San Marcos	1962-2015	580	SDCFCD
San Luis Rey	Oceanside[3]	1951-2008	30	Project Clean Water
Sweetwater[1]	Bonita	1975-2015	139	SDCFCD
	Sweetwater	1965-1992	310	SDCFCD

[1]Rainfall station rainfall intensity was averaged between rainfall stations and applied uniformly to the entire modeled watershed
[2]No collocated ALERT station
[3]Data downloaded directly from Project Clean Water (http://www.projectcleanwater.org)

The spatial distribution of TRWE sample HMP projects and SDCFCD rainfall stations are illustrated in Figure 3.

2.2.1 Parameters

Physical watershed parameters were estimated using available land use geographic information system (GIS) data from SanGIS. Planned land use classifications were used for all SWMM peak flow analyses, including areas upstream of the dams, which were conservatively assumed to reflect the pre-development hydrology through application of hydromodification flow reduction to the outlet node. Percent imperviousness was determined by using area-weighted averages based upon those values presented in a 2010 County of San Diego imperviousness study. Percent slope was determined by using area-weighted averages based upon relationships between SanGIS land use and the latest USGS National Elevation Dataset (NED) 1/3 arc-second DEM for greater Southern California. The width parameter served as a general calibration parameter for the model using the best available USGS instantaneous stream flow data. Using the relationship between watershed area and river length, a factor was applied to this ratio to match the 5-year peak flow value. The San Diego River station was used to develop this factored relationship due to the completeness of the dataset, the least number of upstream dam overflow events, and location near the river mouth. The remaining SWMM parameters were taken from the San Diego Model BMP Design Manual. General watershed parameters are outlined in Table 9. Specific watershed parameters are provided in Appendix A.

Table 9: SWMM Parameters Used in SWMM Peak Flow Analysis

SWMM Parameter	Description[1]	Value				Source
Area (ac)	Area of the subcatchment.	Watershed-specific				GIS analysis
Width (ft)	Characteristic width of the overland flow path for sheet flow runoff.	Calibrated by factoring the ratio of entire river length to full watershed area to match the PDS-derived San Diego River 5-year peak flow, taken as: $W_{HSG} = 0.184 \frac{A_{HSG}}{L_R}$ where: W_{HSG} is the width of the given HSG subcatchment; A_{HSG} is the area of the given HSG subcatchment; L_R is the length of the entire river reach				TRWE
% Slope	Average percent slope of the subcatchment.	Area-weighted average of percent slope by land use				USGS NED 1/3 arc-second DEM
% Imperv	Percent of the land area which is impervious.	Area-weighted average of percent imperviousness by land use				County of San Diego, 2010
N-Imperv	Manning's n for overland flow over the impervious portion of the subcatchment.	0.012				SD Model BMP Design Manual
N-Perv	Manning's n for overland flow over the pervious portion of the subcatchment.	0.15				SD Model BMP Design Manual
D store-Imperv (in)	Depth of depression storage on the impervious portion of the subcatchment.	0.05				SD Model BMP Design Manual
D store-Perv (in)	Depth of depression storage on the pervious portion of the subcatchment.	0.10				SD Model BMP Design Manual
% Zero-Imperv	Percent of the impervious are with no depression storage.	25%				SD Model BMP Design Manual
Subarea Routing	Choice of internal routing of runoff between pervious and impervious areas	OUTLET				SD Model BMP Design Manual
Percent Routed	Percent of runoff routed between subareas.	100%				SD Model BMP Design Manual
Infiltration	Infiltration parameters for the subcatchment.	GREEN_AMPT				SD Model BMP Design Manual
		HSG A	HSG B	HSG C	HSG D	
	GREEN_AMPT: Suction Head (in)	1.5	3.0	6.0	9.0	SD Model BMP Design Manual
	GREEN_AMPT: Initial Deficit (in/hr)	0.33	0.32	0.31	0.30	SD Model BMP Design Manual
	GREEN_AMPT: Developed Conductivity (in/hr)	0.225	0.15	0.075	0.01875	SD Model BMP Design Manual

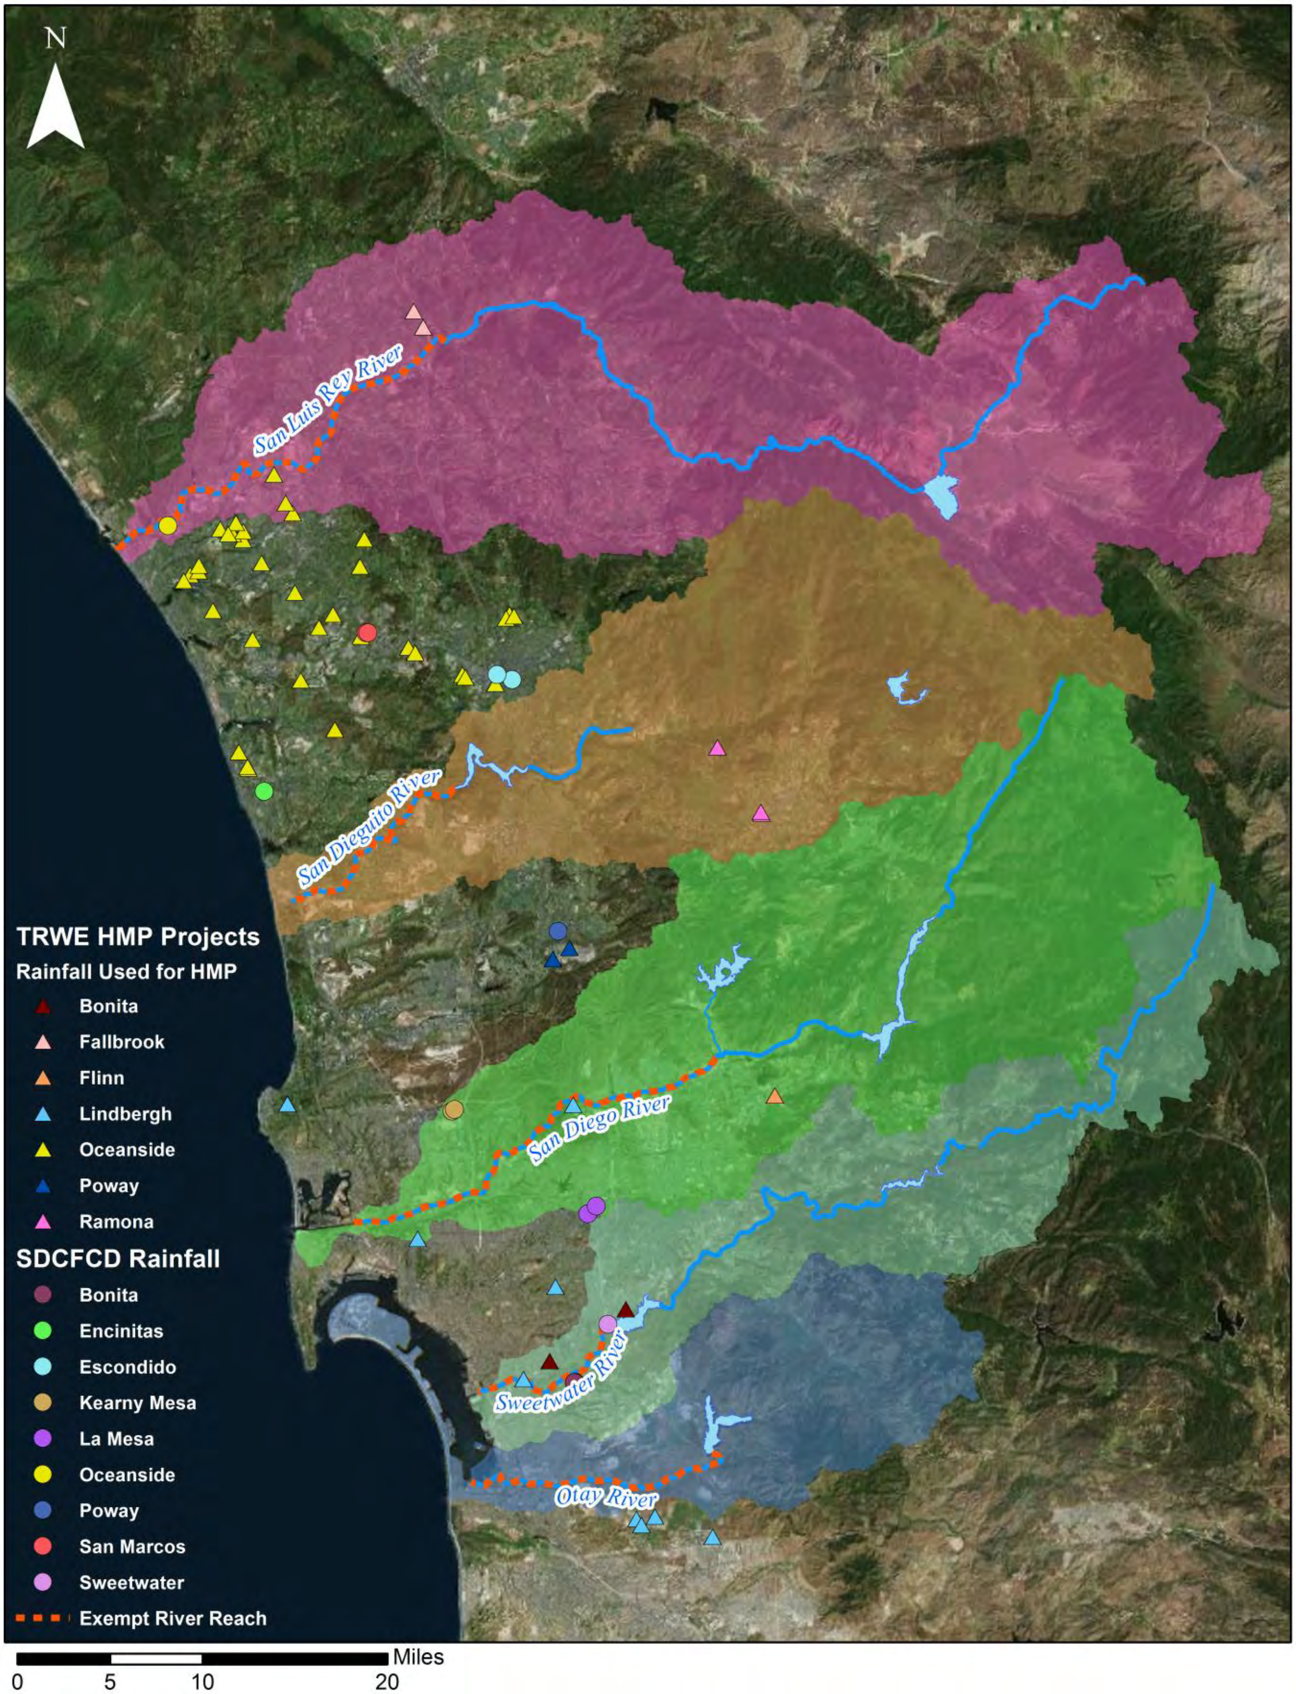

Figure 3. TRWE HMP Project and SDCFCD Rainfall Station Distribution

3. RESULTS

3.1 Statistical Peak Flow Results

Results provided herein are not intended to be used for design purposes, or serve as an exact measurement. The results are solely intended to provide a relative change in peak flow and demonstrate the impact of the upstream impoundment on the peak flow events in each river. The Statistical Peak Flow Analysis results are summarized in Table 10. For those rivers with stream stations located at or near the mouth, the statistical peak flow is compared with the "no dam" peak flows (Table 10, column "Peak[1]"). For those rivers without stream stations located at or near the mouth, the downstream-most available FEMA FIS 10-year peak flows are compared with the "no dam" peak flows. The percent difference or the reduction between the "no dam" and FEMA FIS 10-year peak flows are provided in Table 11. The flow reduction estimates are approximate in nature and are only shown to illustrate significant effects of impoundment on the peak flow events. In developing peak flows for the FIS, FEMA uses an annual series analysis, so it is expected that the percent reductions may be overestimated when used for comparison with a partial duration series analysis.

Table 10: Statistical Peak Flow Results Summary for "No Dam" Peak Flows

River	T-year	Peak[1] (cfs)	A^* (mi^2)	P^* (in)	Q_{USGS}[b] (cfs)	FPR	A^{**} (mi^2)	P^{**} (in)	Q_{WS}[c] (cfs)	Q_{ND}[d] (cfs)

[1]partial duration series value selected for 2-year and 5-year peak; annual maximum series selected for 10-year
[2] (Federal Emergency Management Agency, 2012)

The Statistical Peak Flow Analysis provides reasonable estimation of river impoundment peak flow reduction. For comparison, a 2005 study focused on the hydrological effects of dams on the Sacramento and San Joaquin Rivers in Northern California found that the 2-year peak flow declined anywhere between 35 to 95% of pre-dam values, while the 10-year peak flow was reduced from 2 to 78% (Kondolf & Batalla, 2005). For further comparison, a 2005 study of the hydrological effects of dams in semi-arid portions of north-eastern Spain (also a Mediterranean climate) found that 22 of 23 rivers showed reductions in 2 and 10-year peak flow by 31 and 33%, respectively, with effects more pronounced in the low-rainfall southern Mediterranean tributaries (Batalla, Gomez, & Kondolf, 2003). Therefore, the results (~29-65% reduction) provided in this study are consistent with flow impoundment behavior found in other semi-arid, Mediterranean systems and supports the assumption of significant flow sequestration in the five river reaches.

3.2 SWMM Peak Flow Results

Results from the SWMM Peak Flow Analysis are provided in Table 12 through Table 16 for the "dam-in-place" condition and Table 17 through Table 21 for the "no dam" condition. The results are estimates of peak flows and relative change for the exempt reaches using a simplified continuous modeling approach. These results are not intended to be used for design purposes.

The 2-, 5-, and 10-year flow rates are conservative estimates due to a number of underlying assumptions. First, the assumption of uniform rainfall over a large watershed may produce higher flows than what would actually be realized in each river. However, baseflow was not considered in peak flow determination. Also, the simple rainfall-runoff model is kinematic in nature, not accounting for complex overland flow behaviors such as runoff diffusion. Finally, the overland flow model does not consider channel routing and subsequent longitudinal spreading of the wave base for more mildly-sloped areas within the watershed, which ultimately produces a lower peak flow due to the attenuation and translation of the outflow hydrograph over space and time. Given these assumptions, it is important to note that the main objectives of this study do not require obtaining precise peak flow values. Instead, this study is focused on the relative change of discharges from Project Lands with and without hydromodification management BMP performance requirements.

Table 12: Otay River SWMM Peak Flows: "Dam-in-Place" Condition

Peak	No HMP BMPs (cfs)	Full HMP (cfs)	HMP Exemption (cfs)	Peak Reduction w/ HMP Exemption	Peak Flow Increase Due to Exemption	Exemption Peak Flow Increase (cfs)
2-year	1,481	1,378	1,409	4.9%	**2.0%**	31

The SWMM Peak Flow Analysis found that if the HMP exemptions were granted (as opposed to "Full HMP"—no exemptions granted), it would increase the 2-, 5-, and 10-year peak flow events by no more than 1.1% in all rivers except Otay, where at most, a 2.3% increase is predicted. It should be noted, in the case of Otay that, though minor, this additional flow has the potential to aid the many river restoration efforts identified in the 2006 Otay River Watershed Management Plan (Aspen Environmental Group, 2006). With the HMP exemptions in place, the SWMM Peak Flow Analysis applied hydromodification flow reduction to all non-directly discharging developable land to produce peak flow reductions ranging between 1.3 to 11% (as opposed to "No HMP"—no hydromodification flow control). This percent reduction is the peak flow "benefit" achieved through application of peak flow control. When modeled without the influence of the dam, the effects of Project Lands are further diminished—the primary reason for the original exemption. It is worth noting that both the modeled dam-in-place and no-dam peak flows produce reasonable matches with those peak flows presented in the Statistical Peak Flow Analysis.

The most notable comparisons are between the "dam-in-place" peak flows with the HMP exemption ("Dam-in-Place" HMP Exemption) versus the "no dam" peak flows with no HMP exemptions ("No Dam" Full HMP) presented in Table 22 through Table 26. These comparisons were made in order to simulate the impact of the proposed exemptions on peak flows versus the impact of the river impoundment on peak flows. These SWMM Peak Flow comparisons suggest that if, in their current impounded state, only Project Lands were exempt from hydromodification management BMP performance requirements, the resulting peak flows would be far less than the unimpounded, pre-development peak flows. The "No Dam" Full HMP scenario was considered to be the best representation of a pre-development watershed (in the absence of pre-Columbian watershed parameters) because the very nature of hydromodification management is to simulate the pre-development hydrologic condition. In other words, if the entire developed portion of a watershed is subject to hydromodification flow and duration control, then it is assumed to simulate the pre-development hydrologic condition.

Due to the conservative modeling approach, in actuality the "Dam-in-Place" HMP Exemption peak flows would likely be even less than those modeled herein due to strict interpretations on what constitutes a directly discharging developable land. An even greater difference between the HMP exemption peak flows and the pre-development peak flows would result. Therefore, the SWMM Peak Flow Analysis confirms that the major river impoundments are the primary source of peak flow reduction and clearly demonstrates that peak flows discharging from exempted Project Lands would remain considerably less than the natural, pre-development peak flows.

4. CONCLUSIONS

All five exempt river reaches are subjected to significant upstream impoundment and are rigorously analyzed with two hydrologic methods. The Statistical Peak Flow Analysis found that the major impoundments reduce peak flows anywhere from 29% to 65% of the unimpounded condition. Similarly, the SWMM Peak Flow Analysis found that the major impoundments reduce peak flows approximately 22% to 79%, depending on the reach and peak flow event. The original assumption of significant flow sequestration in the exempt river reaches made by the 2011 HMP is validated by both the Statistical Peak Flow Analysis and the SWMM Peak Flow Analysis in this study.

The benefit of proper hydromodification management BMP implementation is evidenced by comparison between various HMP scenarios. For all watersheds with more than 1,200 acres of Project Lands, HMP flow controls applied to only non-directly discharging developable lands are projected to achieve peak flow reductions of at least 4%. Furthermore, the projected "cost" of allowing the hydromodification exemptions to stand would increase peak flows by an extremely narrow margin in all reaches. It should be noted that the peak flow reduction estimates presented herein are conservative in nature since all non-directly discharging developed lands will be subject to hydromodification management BMPs in the event any re-development within these areas were to occur, further decreasing any peak flow influence from Project Lands. In reality, the percent peak flow reduction is expected to be even greater.

The results from this analysis suggest that the peak flows from areas directly discharging to exempt river reaches (Otay, San Diego, San Dieguito, San Luis Rey, and Sweetwater River) pose no threat to the erosion potential of the exempt river reaches. If these reaches undergo significant changes (i.e. removal of impoundments), it is recommended that a new hydrologic assessment should be made to determine the resulting implications and continual eligibility for exemption. However, under the current conditions defined in this study, it is clearly demonstrated that the existence of upstream impoundment is the principle factor in peak flow alteration—not developed Project Lands. Changes in peak flows from Project Lands are found to be less than significant. Therefore, it is recommended that the 2011 HMP Exemptions be reinstated for all developable lands directly discharging to the exempt river reaches, so long as the project provides properly designed energy dissipation controls at the outfalls. It is also recommended that hydromodification BMPs be required for non-Project Lands, as these areas account for the majority of the developable land within each watershed and will likely produce the greatest influence on peak flows on these rivers in their current impounded state.

Stability Thresholds for Stream Restoration Materials

Fischenich (2001)

Stability Thresholds for Stream Restoration Materials

by Craig Fischenich[1]

May 2001

Complexity	***Value as a Planning Tool***	***Cost***
Low Moderate High	Low Moderate High	Low Moderate High

OVERVIEW

Stream restoration projects usually involve some modification to the channel or the banks. Designers of stabilization or restoration projects must ensure that the materials placed within the channel or on the banks will be stable for the full range of conditions expected during the design life of the project. Unfortunately, techniques to characterize stability thresholds are limited. Theoretical approaches do not exist and empirical data mainly consist of velocity limits, which are of limited value.

Empirical data for shear stress or stream power are generally lacking, but the existing body of information is summarized in this technical note. Whereas shear thresholds for soils found in channel beds and banks are quite low (generally < 0.25 lb/sf), those for vegetated soils (0.5 – 4 lb/sf), erosion control materials and bioengineering techniques (0.5 – 8 lb/sf), and hard armoring (< 13 lb/sf) offer options to provide stability.

STABILITY CRITERIA

The stability of a stream refers to how it accommodates itself to the inflowing water and sediment load. In general, stable streams may adjust their boundaries but do not exhibit trends in changes to their geometric character. One form of instability occurs when a stream is unable to transport its sediment load (i.e., sediments deposited within the channel), leading to the condition referred to as aggradation.

When the ability of the stream to transport sediment exceeds the availability of sediments within the incoming flow, and stability thresholds for the material forming the boundary of the channel are exceeded, erosion occurs. This technical note deals with the latter case of instability and distinguishes the presence or absence of erosion (threshold condition) from the magnitude of erosion (volume).

Erosion occurs when the hydraulic forces in the flow exceed the resisting forces of the channel boundary. The amount of erosion is a function of the relative magnitude of these forces and the time over which they are applied. The interaction of flow with the boundary of open channels is only imperfectly understood. Adequate analytical expressions describing this interaction have not yet been developed for conditions associated with natural channels. Thus, means of characterizing erosion potential must rely heavily upon empiricism.

Traditional approaches for characterizing erosion potential can be placed in one of two categories: maximum permissible velocity, and tractive force (or critical shear stress). The former approach is advantageous in that velocity is a parameter that can be measured within the flow. Shear stress cannot be directly measured – it must be computed from other flow parameters. Shear stress is a better measure of the fluid force on the channel boundary than is velocity. Moreover, conventional guidelines, including ASTM standards, rely upon the shear stress as a

[1] USAE Research and Development Center, Environmental Laboratory, 3909 Halls Ferry Rd., Vicksburg MS 39180

means of assessing the stability of erosion control materials. Both approaches are presented in this paper.

Incipient Motion (Threshold Condition)

As flow over the bed and banks of a stream increases, a condition referred to as the threshold state is reached when the forces tending to move materials on the channel boundary are in balance with those resisting motion. The forces acting on a noncohesive soil particle lying on the bed of a flowing stream include hydrodynamic lift, hydrodynamic drag, submerged weight ($F_w – F_b$), and a resisting force F_r. as seen in Figure 1. The drag is in the direction of the flow and the lift and weight are normal to the flow. The resisting force depends on the geometry of the particles. At the threshold of movement, the resultant of the forces in each direction is zero. Two approaches for defining the threshold state are discussed herein, initial movement being specified in terms of either a critical velocity (v_{cr}) or a critical shear stress (τ_{cr}).

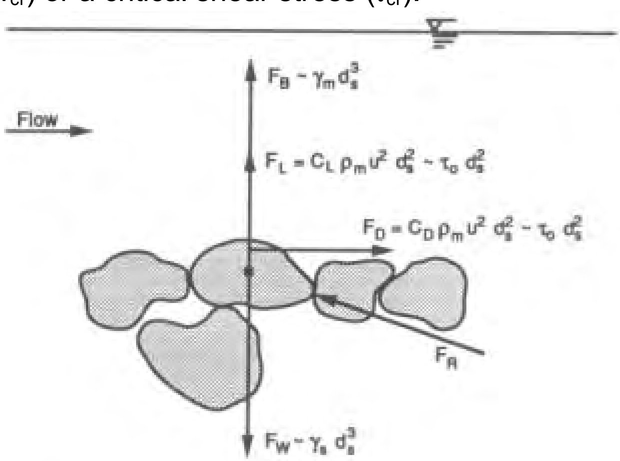

Figure 1. Forces acting on the boundary of a channel (adapted from Julien (1995)).

Critical Velocity

Figure 1 shows that both the lift and the drag force are directly related to the velocity squared. Thus, small changes in the velocity could result in large changes in these forces. The permissible velocity is defined as the maximum velocity of the channel that will not cause erosion of the channel boundary. It is often called the critical velocity because it refers to the condition for the initiation of motion. Early works in canal design and in evaluating the stability of waterways relied upon this method. Considerable empirical data exist relating maximum velocities to various soil and vegetation conditions.

However, this simple method for design does not consider the channel shape or flow depth. At the same mean velocity, channels of different shapes or depths may have quite different forces acting on the boundaries. Critical velocity is depth-dependent, and a correction factor for depth must be applied in this application. Despite these limitations, maximum permissible velocity can be a useful tool in evaluating the stability of various waterways. It is most frequently applied as a cursory analysis when screening alternatives.

Critical Shear Stress

The forces shown in Figure 1 can also be expressed in terms of the shear stress. Shear stress is the force per unit area in the flow direction. Its distribution in steady, uniform, two-dimensional flow in the channel can be reasonably described. An estimate of the average boundary shear stress (τ_o) exerted by the fluid on the bed is:

$$\tau_o = \gamma D S_f \tag{1}$$

where γ is the specific weight of water, D is the flow depth (~ hydraulic radius), and S_f is the friction slope. Derived from consideration of the conservation of linear momentum, this quantity is a spatial average and may not provide a good estimate of bed shear at a point.

Critical shear stress (τ_{cr}) can be defined by equating the applied forces to the resisting forces. Shields (1936) determined the threshold condition by measuring sediment transport for values of shear at least twice the critical value and then extrapolating to the point vanishing sediment transport. His laboratory experiments have since served as a basis for defining critical shear stress. For soil grains of diameter d and angle of repose ϕ on a flat bed, the following relations can approximate the critical shear for various sizes of sediment:

$$\tau_{cr} = 0.5(\gamma_s - \gamma_w) d \, Tan \phi \quad \text{For clays} \tag{2}$$

$$\tau_{cr} = 0.25 d_*^{-0.6} (\gamma_s - \gamma_w) d \, Tan \phi \quad \text{For silts and sands} \tag{3}$$

$\tau_{cr} = 0.06(\gamma_s - \gamma_w)d\ Tan\phi$ For gravels and cobbles (4)

Where

$$d_* = d\left[\frac{(G-1)g}{\nu^2}\right]^{1/3} \quad (5)$$

γ_s = the unit weight of the sediment
γ_w = the unit weight of the water/sediment mixture
G = the specific gravity of the sediment
G = gravitational acceleration
ν = the kinematic viscosity of the water/sediment mixture

The angle of repose φ for noncohesive sediments is presented in Table 1 (Julien 1995), as are values for critical shear stress. The critical condition can be defined in terms of shear velocity rather than shear stress (note that shear velocity and channel velocity are different). Table 1 also provides limiting shear velocity as a function of sediment size. The V_{*c} term is the critical shear velocity and is equal to

$$V_{*c} = \sqrt{gR_hS_f} \quad (6)$$

Table 1 provides limits best applied when evaluating idealized conditions, or the stability of sediments in the bed. Mixtures of sediments tend to behave differently from uniform sediments. Within a mixture, coarse sediments are generally entrained at lower shear stress values than presented in Table 1. Conversely, larger shear stresses than those presented in the table are required to entrain finer sediments within a mixture.

Cohesive soils, vegetation, and other armor materials can be similarly evaluated to determine empirical shear stress thresholds. Cohesive soils are usually eroded by the detachment and entrainment of soil aggregates. Motivating forces are the same as those for noncohesive banks; however, the resisting forces are primarily the result of cohesive bonds between particles. The bonding strength, and hence the soil erosion resistance, depends on the physio-chemical properties of the soil and the chemistry of the fluids. Field and laboratory experiments show that intact, undisturbed cohesive soils are much less susceptible to flow erosion than are non-cohesive soils.

Vegetation, which has a profound effect on the stability of both cohesive and noncohesive soils, serves as an effective buffer between the water and the underlying soil. It increases the effective roughness height of the boundary, increasing flow resistance and displacing the velocity upwards away from the soil, which has the effect of reducing the forces of drag and lift acting on the soil surface. As the boundary shear stress is proportional to the square of the near-bank velocity, a reduction in this velocity produces a much greater reduction in the forces responsible for erosion.

Vegetation armors the soil surface, but the roots and rhizomes of plants also bind the soil and introduce extra cohesion over and above any intrinsic cohesion that the bank material may have. The presence of vegetation does not render underlying soils immune from erosion, but the critical condition for erosion of a vegetated bank is usually the threshold of failure of the plant stands by snapping, stem scour, or uprooting, rather than for detachment and entrainment of the soils themselves. Vegetation failure usually occurs at much higher levels of flow intensity than for soil erosion.

Both rigid and flexible armor systems can be used in waterways to protect the channel bed from erosion and to stabilize side slopes. A wide array of differing armor materials are available to accomplish this. Many manufactured products have been evaluated to determine their failure threshold. Products are frequently selected using design graphs that present the flow depth on one axis and the slope of the channel on the other axis. Thus, the design is based on the depth/slope product (i.e., the shear stress). In other cases, the thresholds are expressed explicitly in terms of shear stress. Notable among the latter group are the field performance testing results of erosion control products conducted by the TXDOT/TTI Hydraulics and Erosion Control Laboratory (TXDOT 1999).

Table 2 presents limiting values for shear stress and velocity for a number of different channel lining materials. Included are soils, various types of vegetation, and number of different commonly applied stabilization techniques. Information presented in the table was derived from a number of different sources. Ranges of values presented in the table reflect various measures presented within the literature. In the case of manufactured products, the designer should consult the manufacturer's guidelines to determine thresholds for a specific product.

Uncertainty and Variability

The values presented in Table 2 generally relate to average values of shear stress or velocity. Velocity and shear stress are neither uniform nor steady in natural channels. Short-term pulses in the flow can give rise to instantaneous velocities or stresses of two to three times the average; thus, erosion may occur at stresses much lower than predicted. Because limits presented in Table 2 were developed empirically, they implicitly include some off this variability. However, natural channels typically exhibit much more variability than the flumes from which these data were developed.

Sediment load can also profoundly influence the ability of flow to erode underlying soils. Sediments in suspension have the effect of damping turbulence within the flow. Turbulence is an important factor in entraining materials from the channel boundaries. Thus, velocity and shear stress thresholds are 1.5 to 3 times that presented in the table for flows carrying high sediment loads.

In addition to variability of flow conditions, variation in the channel lining characteristics can influence erosion predictions. Natural bed material is neither spherical nor of uniform size. Larger particles may shield smaller ones from direct impact so that the latter fail to move until higher stresses are attained. For a given grain size, the true threshold criterion may vary by nearly an order of magnitude depending on the bed gradation. Variation in the installation of erosion control measures can reduce the threshold necessary to cause erosion.

Table 2. Permissible Shear and Velocity for Selected Lining Materials[1]

Boundary Category	Boundary Type	Permissible Shear Stress (lb/sq ft)	Permissible Velocity (ft/sec)	Citation(s)

MAGNITUDE

g discussion dealt with the bsence of erosion, but did not xtent to which erosion might ven flow. If the thresholds Table 2 are exceeded, erosion ected to occur. In reality, even resholds are not exceeded, some ew select locations may occur. which this minor erosion could nificant concern depends in large he duration of the flow, and upon he stream to transport those ents.

n

stated, limits regarding erosion shed by manufacturers for cts are typically developed from short flow durations. They do not ential for severe erosion damage t from moderate flow events over . Studies have shown that w reduces erosion resistance of f erosion control products, as res 2 - 4. A factor of safety plied when flow duration exceeds urs.

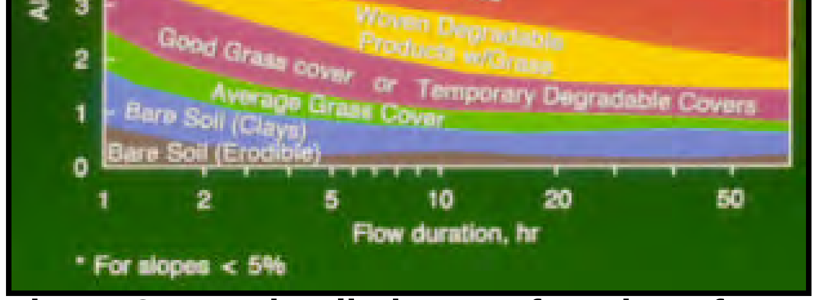

Figure 2. Erosion limits as a function of flow duration (from Fischenich and Allen (2000)).

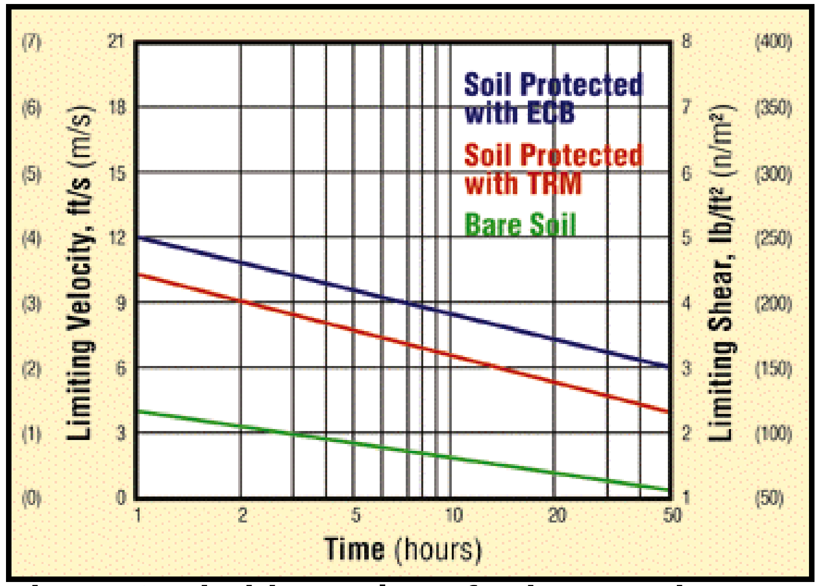

Figure 3. Limiting values for bare and TRM protected soils (from Sprague (1999))

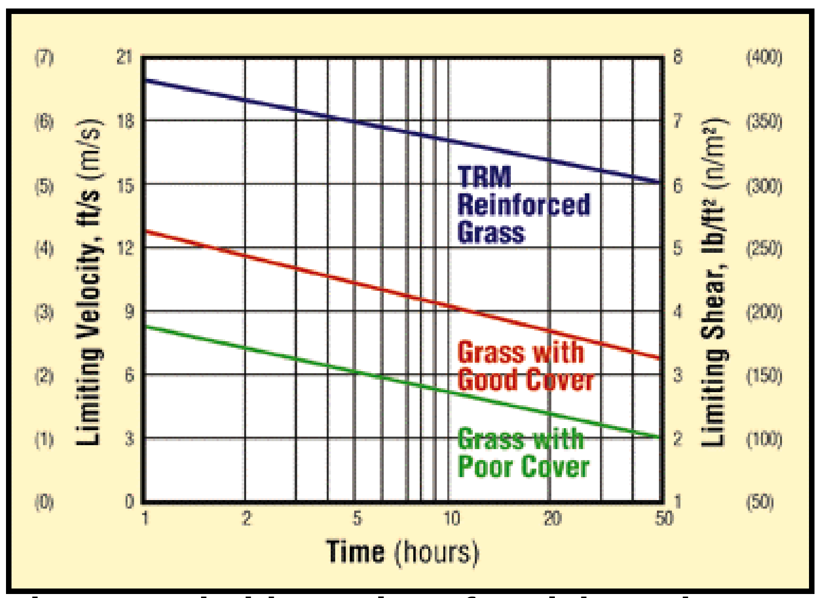

Figure 4. Limiting values for plain and TRM reinforced grass (from Sprague (1999))

Correlations between flow volume and amount of erosion tend to be poor. Multi-peaked flows may be more effective than single flows of comparable or greater magnitude because of the increased incidence of wetting. Flows with long durations often have a more significant effect on erosion than short-lived flows of higher magnitude. Sediment transport analysis can be used to gauge the magnitude of erosion potential in the channel design, but predictive capability is limited.

Sediment Transport

A number of flow measures can be used to assess the ability of a stream to transport sediment. The unit stream power (P_m) is one common approach, and is related to the earlier discussion in that stream power includes both velocity and shear stress as components. Sediment transport (Q_s) increases when the unit stream power (P_m) increases. Unit stream power in turn is controlled by both tractive stress and flow velocity:

$$P_m = v \cdot \tau = v \cdot \gamma_w \cdot D \cdot S_f \quad (7)$$

The total power (P_t) is the product of the unit power times the channel width (W):

$$P_t = P_m \cdot W = v \cdot W \cdot D \cdot \gamma_w \cdot S_f = v \cdot A \cdot \gamma_w \cdot S_f = Q_w \cdot \gamma_w \cdot S_f \quad (8)$$

Stream power assessments can be useful in evaluating sediment discharge within a stream channel and the deposition or erosion of sediments from the streambed. However, their utility for evaluating the stability of measures applied to prevent erosion is limited because of the lack of empirical data relating stream power to stability. The analysis of general streambank erosion is not a simple extension of the noncohesive bed case with an added downslope gravity component. Complication is added by other influencing variables, such as vegetation, whose root system can reinforce bank material and increase erosion resistance. Factors influencing bank erosion are summarized in Table 3.

Table 3. Factors Influencing Erosion

actor	*elevant characteristics*
low properties	lagnitude, frequency and variability of stream discharge; Magnitude and distribution of elocity and shear stress; Degree of turbulence
ediment composition	ediment size, gradation, cohesion and stratification

hannel geometry	Vidth and depth of channel; Height and angle of bank; Bend curvature
iology	egetation type, density and root character; Burrows
nthropogenic factors	Irbanization, flood control, boating, irrigation

APPLICATION

The stability of a waterway or the suitability of various channel linings can be determined by first calculating both the mean velocity and tractive stress (by the previous equations). These values can then be compared with allowable velocity and tractive stress for a particular ground cover or lining system under consideration (e.g., existing vegetation cover, an erosion control blanket, or bioengineering treatment). Allowable tractive stresses for various types of soil, linings, ground covers, and stabilization measures including soil bioengineering treatments, are listed in Table 2. Additionally, manufacturers' product literature can provide allowable tractive stresses or velocities for various types of erosion control products.

An iterative procedure may be required when evaluating channel stability because various linings will affect the resistance coefficient, which in turn may change the estimated flow conditions. A general procedure for the application of information presented in this paper is outlined in the following paragraphs.

Step 1-Estimate Mean Hydraulic Conditions.
Flow of water in a channel is governed by the discharge, hydraulic gradient, channel geometry, and roughness coefficient. This functional relationship is most frequently evaluated using normal depth or backwater computations that take into account principles of conservation of linear momentum. The latter is preferable because it accounts for variations in momentum slope, which is directly related to shear stress. Several models are available to aid the hydraulic engineer in assessing hydraulic conditions. Notable examples include HEC-2, HEC-RAS, and WSP2. Channel cross sections, slopes, and Manning's coefficients should be determined based upon surveyed data and observed or predicted channel boundary conditions. Output from the model should be used to compute main channel velocity and shear stress at each cross section.

Step 2- Estimate Local/Instantaneous Flow Conditions.
The computed values for velocity and shear stress may be adjusted to account for local variability and instantaneous values higher than mean. A number of procedures exist for this purpose. Most commonly applied are empirical methods based upon channel form and irregularity. Several references at the end of this paper present procedures to make these adjustments. Chang (1988) is a good example. For straight channels, the local maximum shear stress can be assumed from the following simple equation:

$$t_{max} = 1.5t \tag{9}$$

for sinuous channels, the maximum shear stress should be determined as a function of the planform characteristics using Equation 10:

$$t_{max} = 2.65\, t \left(\frac{R_c}{W}\right)^{-0.5} \tag{10}$$

where R_c is the radius of curvature and W is the top width of the channel. Equations 9 and 10 adjust for the spatial distribution of shear stress; however, temporal maximums in turbulent flows can be 10 – 20 percent higher, so an adjustment to account for instantaneous maximums should be added as well. A factor of 1.15 is usually applied.

Step 3- Determine Existing Stability.
Existing stability should be assessed by comparing estimates of local and instantaneous shear and velocity to values presented in Table 2. Both the underlying soil and the soil/vegetation condition should be assessed. If the existing conditions are deemed stable and are in consonance with other project objectives, then no further action is required. Otherwise, proceed to step 4.

Step 4- Select Channel Lining Material.
If existing conditions are unstable, or if a different material is needed along the channel perimeter to meet project objectives, a lining material or stabilization measure should be selected from Table 2, using the threshold values as a guideline in the selection. Only material with a threshold exceeding the predicted value should be selected. The other project objectives can also be used at this point to help select from among the available alternatives. Fischenich and Allen (2000) characterize attributes of various protection measures to help in the selection.

Step 5- Recompute Flow Values.
Resistance values in the hydraulic computations should be adjusted to reflect the selected channel lining, and hydraulic condition should be recalculated for the channel. At this point, reach- or section-averaged hydraulic conditions should be adjusted to account for local and instantaneous extremes.
Table 4 presents velocity limits for various channel boundaries conditions. This table is useful in screening alternatives, or as an alternative to the shear stress analysis presented in the preceding sections.

Table 4. Stability of Channel Linings for Given Velocity Ranges

Lining	0 – 2 fps	2 – 4 fps	4 – 6 fps	6 – 8 fps	> 8 fps
Sandy Soils	Use Caution	Not Appropriate	Not Appropriate	Not Appropriate	Not Appropriate
Firm Loam	Use Caution	Use Caution	Not Appropriate	Not Appropriate	Not Appropriate
Mixed Gravel and Cobbles	Appropriate	Use Caution	Use Caution	Not Appropriate	Not Appropriate
Average Turf	Appropriate	Use Caution	Use Caution	Not Appropriate	Not Appropriate
Degradable RECPs	Appropriate	Use Caution	Use Caution	Use Caution	Not Appropriate
Stabilizing Bioengineering	Appropriate	Use Caution	Use Caution	Use Caution	Not Appropriate
Good Turf	Appropriate	Appropriate	Use Caution	Use Caution	Use Caution
Permanent RECPs	Appropriate	Appropriate	Appropriate	Appropriate	Use Caution
Armoring Bioengineering	Appropriate	Appropriate	Appropriate	Appropriate	Use Caution
CCMs & Gabions	Appropriate	Appropriate	Appropriate	Appropriate	Use Caution
Riprap	Appropriate	Appropriate	Appropriate	Appropriate	Appropriate
Concrete	Appropriate	Appropriate	Appropriate	Appropriate	Appropriate

Key:

(green)	**Appropriate**
(yellow)	**Use Caution**
(red)	**Not Appropriate**

Step 6– Confirm Lining Stability.
The stability of the proposed lining should be assessed by comparing the threshold values in Table 2 to the newly computed hydraulic conditions. These values can be adjusted to account for flow duration using Figures 2-4 as a guide. If computed values exceed thresholds, step 4 should be repeated. If the threshold is not exceeded, a factor of safety for the project should be determined from the following equations:

$$FS = \frac{t_{\max}}{t_{est}} \quad or \quad FS = \frac{V_{\max}}{V_{est}} \qquad (11)$$

In general, factors of safety in excess of 1.2 or 1.3 should be acceptable. The preceding five steps should be conducted for every cross section used in the analysis for the project. In the event that computed hydraulic values exceed thresholds for any desirable lining or stabilization technique, measures must be undertaken to reduce the energy within the flow. Such measures might include the installation of low-head drop structures or other energy-dissipating devices along the channel. Alternatively, measures implemented within the watershed to reduce total discharge could be employed.

APPLICABILITY AND LIMITATIONS

Techniques described in this technical note are generally applicable to stream restoration projects that include revegetation of the riparian zone or bioengineering treatments.

ACKNOWLEDGEMENTS

Research presented in this technical note was developed under the U.S. Army Corps of Engineers Ecosystem Management and Restoration Research Program. Technical reviews were provided by Messrs. E.A. (Tony) Dardeau, Jr., (Ret.), and Jerry L. Miller, both of the Environmental Laboratory.

POINTS OF CONTACT

For additional information, contact the author, Dr. Craig Fischenich, (601-634-3449, fischec@wes.army.mil), or the manager of the Ecosystem Management and Restoration Research Program, Dr. Russell F. Theriot (601-634-2733, therior@wes.army.mil).

General Comments on Final Water Quality Improvement Plans and Notice of Noncompliance

Walsh (2015)

August 5, 2015 **Via Email Only**

San Diego County Principal Watershed Copermittees

In reply refer to / attn:
PIN :786088:LWalsh

Subject: General Comments on Final Water Quality Improvement Plans and Notice of Noncompliance

San Diego County Principal Watershed Copermittees:

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board) received the Water Quality Improvement Plans (Plans) from the San Diego County Copermittees (Copermittees) on or before June 26, 2015, as required pursuant to Provision F.1.b.(1) of Order No. R9-2013-0001, *National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region* (Order).

The Plans are the product of more than two years of concentrated Plan development efforts by the Copermittees. These Plans were prepared in phases and the Copermittees received regular input from the San Diego Water Board, industry professionals, non-governmental environmental organizations, and community members as part of feedback from the Water Quality Improvement Consultation Panel groups and the public at large during multiple public workshops. While the San Diego Water Board recognizes this is the first time the Copermittees have prepared such Plans and acknowledges their efforts to comply with the requirements of the Order, some of the Plans did a better job of meeting the requirements of the Order than others.

The San Diego Water Board is confident that once the Plans are in compliance with the requirements of the Order and accepted by the San Diego Water Board, the Copermittees' jurisdictional runoff management programs (JRMPs) will have the greatest potential to achieve significant reductions in pollutant loads in MS4 discharges and improvements in receiving water quality to the level supportive of beneficial uses within the shortest possible time.

In addition to reviewing the Plans for compliance with the requirements of the Order, the San Diego Water Board reviewed the acceptability of the Plans. The Order allows the Copermittees to develop Plans that prioritize the water quality conditions to address sooner rather than later, and to set numeric goals and schedules to address the highest priorities. However, not all proposed priorities, goals, and schedules will be determined acceptable, especially if the San Diego Water Board determines that a Plan will not achieve water quality improvements within a reasonable period of time. While the elements of a Plan may meet the requirements of the Order, those elements must also meet the intent of the Order which is instrumental to achieving the goals of the San Diego Water Board's Practical Vision.

The San Diego Water Board has not yet completed a detailed review of each Plan. At this time, the San Diego Water Board is providing general comments for all the Plans because there are several issues of concern already identified that make the Plans unacceptable, as well as noncompliant with the requirements of the Order. When the detailed reviews are completed the San Diego Water Board staff will schedule a time to meet with the Copermittees for each Watershed Management Area, as soon as practicable and anticipated to be before the end of August 2015, to discuss specific issues that need to be addressed in each Plan. At the meetings, the San Diego Water Board may have Plan-specific comments in addition to the issues identified below.

Until then, the issues identified below must be adequately addressed for the Plans to be considered acceptable by the San Diego Water Board, and to be in compliance with the requirements of Order. Not all of the following comments and areas of noncompliance are applicable to every Plan or to every Copermittee, so the San Diego County Copermittees should review the Plans to determine where the following issues are applicable to their watershed and their jurisdiction.

PRIORITY WATER QUALITY CONDITIONS

1. *Identification of Priority Water Quality Conditions*

Requirements: Provisions B.2.a through B.2.c of the Order require the Copermittees to identify the priority water quality conditions that will be evaluated to determine which of those conditions will be the highest priorities to be addressed by the Plan. Provisions B.2.a through B.2.c require the Copermittees to consider several sources of data and information to identify priority water quality conditions within the Watershed Management Area, and whether there is a potential that MS4 discharges may be causing or contributing to those conditions.

Issues of Concern: Each Plan includes a description of the process to review different sources of data and information, including input from the public, to identify priority water quality conditions. The San Diego Water Board, however, has found the following general issues of concern:

a) In several Plans, the San Diego Water Board did not find a fully inclusive list of all priority water quality conditions (i.e. pollutants, stressors, receiving water conditions) that should have been identified in data and information that were required to be considered pursuant to Provisions B.2.a and B.2.b. Pursuant to

Provision B.2.c.(1), a fully inclusive list was required to be evaluated to identify which of those conditions were the highest threat to receiving water quality, or most adversely affect the quality of receiving waters.

b) In at least one Plan, there was not enough description or information that allowed the San Diego Water Board to determine if all the factors under Provisions B.2.a and B.2.b were adequately considered or not.

c) A few Plans have identified bacteria as a highest priority water quality condition based on the Revised Total Maximum Daily Loads (TMDLs) for Indicator Bacteria, Project I – Twenty Beaches and Creek in the San Diego Region (Beaches and Creeks Bacteria TMDLs), but the segment which the highest priority water quality condition is based on is no longer identified as impaired on the Clean Water Act Section 303(d) List (303(d) List).

Noncompliant Priority Water Quality Conditions: In several Plans, there was a notable absence of one or more pollutants or conditions of concern known to the San Diego Water Board (e.g. trash, hydromodification, benthic alteration, stream or riparian habitat degradation) that were also identified in reports, plans, and data cited and reviewed by the Copermittees (e.g. 2011 Long Term Effectiveness Assessment). In a few Plans, there was also a notable absence of pollutants or conditions of concern identified by the public at workshops or Water Quality Improvement Plan Consultation Panel meetings, and in written comments from stakeholders and the public. The lists developed pursuant to Provision B.2.c.(1) that do not acknowledge and include these notably absent pollutants and conditions of concern are not in compliance with the requirements of Provisions B.2.a-c.

Unacceptable Priority Water Quality Conditions: A few Plans have bacteria as a highest priority water quality condition only because of the Beaches and Creeks Bacteria TMDLs, but there is no longer an impairment identified on the 303(d) List. If there are no strategies proposed to be implemented other than the requirements of Provisions E.2 through E.7 to address bacteria, or there are no load reductions quantified for other pollutants in addition to bacteria, or both, the Plans are not acceptable to the San Diego Water Board.

WATER QUALITY IMPROVEMENT GOALS

2. Final Numeric Goals

Requirements: Provision B.3.a.(1)(a) of the Order requires the Copermittees to include final numeric goals in the Plan to address the highest priority water quality conditions. Each final numeric goal must either demonstrate the discharges from the Copermittees' MS4s will not cause or contribute to exceedances of water quality standards in receiving waters, or the receiving waters are protected from the Copermittees' MS4 discharges, or both (see Provisions B.3.a.(1)(a)(i)-(iii)).

Issues of Concern: Each Plan includes final numeric goals for the highest priority water quality conditions. The San Diego Water Board, however, has found the following general issues of concern:

a) Several Plans include proposed final numeric goals expressed in a manner that is difficult for the San Diego Water Board to determine the final numeric goal is a criterion or indicator capable of demonstrating one or more of the criteria given in Provisions B.3.a.(1)(a)(i)-(iii). In addition, the San Diego Water Board questions how some of these proposed final numeric goals could be measured by the Copermittees.

b) Several proposed final numeric goals appear to be in conflict with the prohibitions and limitations in Provision A of the Order. For example, there are Plans with proposed final numeric goals associated with reducing non-storm water discharges from the MS4s, but the San Diego Water Board cannot determine how achievement of the proposed final numeric goal is in compliance with the requirement to effectively prohibit non-storm water discharges to the MS4 (Provision A.1.b).

c) There are proposed final numeric goals that are difficult for the San Diego Water Board to establish a link between achieving the final numeric goal and addressing the highest priority water quality condition. For example, there are Plans with proposed final numeric goals associated with reducing non-storm water discharges from the MS4s to achieve reductions of pollutants in MS4 discharges (e.g. bacteria) during wet weather and dry weather conditions; however, the MS4 discharge reduction metric (e.g. flow) does not quantify the pollutant reduction that will be achieved during wet weather or dry weather conditions.

d) Some proposed final numeric goals did not meet the criteria of Provision B.3.a.(1)(a), but could be acceptable interim numeric goals.

Noncompliant Final Numeric Goals: Final numeric goals that are not numeric, AND measureable, AND capable of demonstrating the Copermittees' MS4s will not cause or contribute to exceedances of receiving water limitations, or the receiving waters are protected from the Copermittees' MS4 discharges, or both, are not in compliance with the requirements of Provision B.3.a.(1)(a).

Unacceptable Final Numeric Goals: The following proposed final numeric goals are not acceptable to the San Diego Water Board:

a) Final numeric goals that are not consistent or do not demonstrate compliance with the prohibitions and limitations of the Provision A.

b) Final numeric goals with a metric that is unclear about how it will be measured, and lacks any description of, or reference to the data that will be collected to measure the metric.

c) Final numeric goals that do not clearly demonstrate achievement of the final numeric goal will result in MS4 discharges that do not cause or contribute to exceedances of water quality standards in receiving waters, or the receiving waters are protected from the Copermittees' MS4 discharges, or both.

d) Final numeric goals that do not have a metric that clearly demonstrates a link to addressing the highest priority water quality conditions.

3. Interim Numeric Goals

Requirements: Provision B.3.a.(1)(b) of the Order requires the Copermittees to include interim numeric goals in the Plan for each final numeric goal. The Copermittees are allowed to propose as many interim numeric goals for each final numeric goal as they determine appropriate (Provision B.3.a.(b)(i)), but must include at least one interim numeric goal that is expressed as a reasonable increment of the final numeric goal. This interim numeric goal is expected to be in the same or a similar metric as the final numeric goal (Provision B.3.a.(b)(ii)). At least one interim numeric goal is required to be established during each 5 year period between the acceptance of the Plan and the achievement of the final numeric goal (Provision B.3.a.(b)(iii)).

Issues of Concern: In at least one Plan, the San Diego Water Board has found proposed final numeric goals that do not have interim numeric goals that are expressed in the same or similar metric as the final numeric goals.

Noncompliant Interim Numeric Goals: Final numeric goals that do not have at least one interim numeric goal expressed as a reasonable increment in the same or similar metric as the final numeric goal are not in compliance with Provision B.3.a.(1)(b)(ii).

WATER QUALITY IMPROVEMENT STRATEGIES

4. Identification of Potential Water Quality Improvement Strategies

Requirements: Provision B.2.e of the Order requires the Copermittees to identify potential strategies that can result in improvements to water quality. Provision F.1.a.(2)(f) requires the Copermittees consider revisions to potential water quality improvement strategies they propose in the Plan based on public comments.

Issues of Concern: Most Plans include lists of water quality improvement strategies that may be implemented by the Copermittees. The San Diego Water Board, however, has found the following general issues of concern:

a) In at least one Plan, the San Diego Water Board was not able to locate the list of potential water quality improvement strategies developed during the public participation process in the Plan.

b) In at least one Plan, the San Diego Water Board could not find all the potential water quality improvement strategies suggested or recommended in public comments.

Noncompliant Potential Water Quality Improvement Strategies: Plans that do not identify all potential strategies that were considered for implementation to improve water quality are not in compliance with the requirements of Provision B.2.e. Plans that did not consider all the potential water quality improvement strategies submitted in public comments are also not in compliance with the requirements of Provision B.2.e.

5. *Optional Jurisdictional Strategies*

Requirements: Provision B.3.b.(1)(b) of the Order requires each Copermittee to identify the optional jurisdictional strategies that will be implemented within its jurisdiction, as necessary, to achieve final numeric goals. Each Copermittee is required to identify water quality improvement strategies that are in addition to the best management practice (BMP) implementation, inspection, enforcement, and education activities that are already required by Provisions E.2 through E.7 (Provision B.3.b.(1)(b)(i)). Optional jurisdictional strategies to encourage or implement retrofit projects and channel and habitat rehabilitation projects are also required to be provided (Provisions B.3.b.(1)(b)(ii) and (iii)). For each optional jurisdictional strategy that a Copermittee includes in the Plan, descriptions of the funds and/or resources needed, and the circumstances needed to trigger implementation of the strategy are also required (Provisions B.3.b.(1)(b)(iv) and (v), respectively).

Issues of Concern: All the Plans lacked enough information for the San Diego Water Board to make a determination that all the requirements of Provision B.3.b.(1)(b) have been met. The San Diego Water Board has found the following general issues of concern:

a) Several Copermittees did not include any proposed optional jurisdictional strategies to be implemented within their jurisdictions, as necessary, to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the maximum extent practicable (MEP), protect beneficial uses of receiving waters from MS4 discharges, or achieve proposed interim and final numeric goals.

b) Most Copermittees did not include an incentive or program to encourage or implement projects to retrofit areas of existing development within its jurisdiction.

Pursuant to Provision E.5.e.(1)(a), every Copermittee is required to identify areas of existing development within its jurisdiction as candidates for retrofitting. Therefore, every Copermittee should have some incentive or program to encourage implementation of retrofit projects in the areas of existing development identified in its JRMP document pursuant to Provision E.5.e.(1)(a), unless there is an acceptable rationale in the Plan describing why it is infeasible to encourage or implement such retrofit projects.

c) Most Copermittees did not include an incentive or program to encourage or implement projects that will rehabilitate the conditions of channels or habitats within its jurisdiction. Pursuant to Provision E.5.e.(2)(a), every Copermittee is required to identify streams, channels, and/or habitats in areas of existing development within its jurisdiction as candidates for rehabilitation. Therefore, every Copermittee should have some incentive or program to encourage implementation of projects to rehabilitate the conditions of channels or habitats within its jurisdiction identified in JRMP document pursuant to Provision E.5.e.(2)(a), unless there is an acceptable rationale in the Plan describing why it is infeasible to encourage or implement such rehabilitation projects.

d) Of the Copermittees that did include proposed optional jurisdictional strategies, adequate information about the funds and/or resources needed to implement the strategy (e.g. plans to be developed, studies to be conducted, data to be collected, personnel needed, equipment needed, administrative structures required, contracts needed, land to be acquired, etc.) was not provided.

e) Of the Copermittees that did include proposed optional jurisdictional strategies, adequate information about the circumstances necessary to trigger implementation of the strategy (e.g. funding availability, obtain approval from city councils, findings from assessments or studies, etc.) was not provided.

f) Many proposed optional jurisdictional strategies did not appear to be a BMP, an incentive, or a program that could be implemented to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the MEP, protect beneficial uses of receiving waters from MS4 discharges, or achieve proposed interim and final numeric goals. Implementation of an optional jurisdictional strategy is expected to result in an improvement of water quality.

Noncompliant Optional Jurisdictional Strategies: The San Diego Water Board found that the proposed optional jurisdictional strategies in the Plans do not comply with the requirements of Provision B.3.b.(1)(b) as follows:

a) A Copermittee that did not propose any optional jurisdictional strategies to be implemented within its jurisdiction, as necessary, to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the MEP, protect beneficial uses of receiving waters from MS4 discharges, or achieve proposed interim and final numeric goals, in addition to the BMP implementation, inspection, enforcement, and education activities that are already required by Provisions E.2 through E.7 is not in compliance with the requirements of Provision B.3.b.(1)(b)(i).

b) Unless acceptable data or rationale are provided in the Plan, a Copermittee that did not propose any incentives or programs to encourage or implement projects to retrofit areas of existing development within its jurisdiction as optional jurisdictional strategies is not in compliance with the requirements of Provision B.3.b.(1)(b)(ii). A Copermittee that has not identified areas of existing development within its jurisdiction as candidates for retrofitting in its JRMP document also is not in compliance with Provision E.5.e.(1)(a), unless acceptable data or rationale is provided.

c) Unless acceptable data or rationale are provided in the Plan, a Copermittee that did not propose any incentives or programs to encourage or implement projects to rehabilitate channels or habitats within its jurisdiction as optional jurisdictional strategies is not in compliance with the requirements of Provision B.3.b.(1)(b)(iii). A Copermittee that has not identified projects to rehabilitate the conditions of channels or habitats within its jurisdiction in its JRMP document also is not in compliance with Provision E.5.e.(2)(a), unless acceptable data or rationale are provided.

d) A Copermittee that does not have any optional jurisdictional strategies in the Plan or has proposed an optional jurisdictional strategy without an adequate description of the funds and/or resources needed to implement the strategy is not in compliance with the requirements of Provision B.3.b.(1)(b)(iv).

e) A Copermittee that does not have any optional jurisdictional strategies in the Plan or has proposed an optional jurisdictional strategy without an adequate description of the circumstances needed to trigger implementation of the strategy is not in compliance with the requirements of Provision B.3.b.(1)(b)(v).

Unacceptable Optional Jurisdictional Strategies: The following proposed optional jurisdictional strategies are not acceptable to the San Diego Water Board:

a) Many proposed optional jurisdictional strategies are described using terms such as “consider”, “evaluate”, “investigate”, or “develop” a BMP, incentive, or program. These terms indicate to the San Diego Water Board that the Copermittee is only preparing for the implementation of a BMP, incentive, or program. Provision B.3.b.(1)(b) requires each Copermittee identify that optional jurisdictional strategies that ***will be*** implemented. Preparation for a strategy does not meet the requirement of a strategy that will be implemented.

b) Many proposed optional jurisdictional strategies describe development of a plan, conducting a special study or an assessment, or collecting data. Plans, special studies, assessments, and data collection are necessary steps to implement a strategy, but are not in and of themselves a strategy that will result in the effective prohibition of non-storm water discharges to the MS4, reduction of pollutants in storm water discharges from the MS4 to the MEP, protection of beneficial uses of receiving waters from MS4 discharges, or achievement of proposed interim and final numeric goals.

c) Several proposed optional jurisdictional strategies appear to be BMP implementation, inspection, enforcement, and education activities that are already being implemented or required to be implemented by the Copermittee pursuant to Provisions E.2 through E.7. Optional jurisdictional strategies are required in addition to the requirements of Provisions E.2 through E.7.

6. <u>Watershed Management Area Strategies</u>

Requirements: Provision B.3.b.(2) of the Order requires the Copermittees to identify Watershed Management Area strategies that will be implemented, as necessary, to achieve final numeric goals. The Copermittees are required to identify regional or multi-jurisdictional scale water quality improvement strategies (Provision B.3.b.(2)(a)). Watershed Management Area strategies to encourage or implement retrofit projects and channel and habitat rehabilitation projects are also required to be provided in the Plan (Provisions B.3.b.(2)(b) and (c)). For each Watershed Management Area strategy that the Copermittees includes in the Plan, descriptions of the funds and/or resources needed, and the circumstances needed to trigger implementation of the strategy are also required (Provisions B.3.b.(2)(d) and (e), respectively).

Issues of Concern: All the Plans lacked enough information about Watershed Management Area strategies to meet the requirements of Provision B.3.b.(2).

Noncompliant Watershed Management Area Strategies: The San Diego Water Board found that the Watershed Management Area strategies in the Plans do not comply with the requirements of Provision B.3.b.(2) as follows:

a) A Plan that did not propose any Watershed Management Area strategies to be implemented on a regional or multi-jurisdictional scale, as necessary, to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the MEP, protect beneficial uses of receiving waters from MS4 discharges, or achieve proposed interim and final numeric goals is not in compliance with the requirements of Provision B.3.b.(2)(a).

b) Unless acceptable data or rationale are provided in the Plan, a Plan that did not propose any incentives or programs to encourage or implement projects to retrofit areas of existing development as a Watershed Management Area strategy is not in compliance with the requirements of Provision B.3.b.(2)(b).

c) Unless acceptable data or rationale are provided in the Plan, a Plan that did not propose any incentives or programs to encourage or implement projects to rehabilitate channels, streams, or habitats as a Watershed Management Area strategy is not in compliance with the requirements of Provision B.3.b.(2)(c).

d) A Plan without Watershed Management Area strategies or a Plan that has a proposed Watershed Management Area strategy without information about the funds and/or resources needed to implement a Watershed Management Area strategy is not in compliance with the requirements of Provision B.3.b.(2)(d).

e) A Plan without Watershed Management Area strategies or a Plan that has a proposed Watershed Management Area strategy without a description of the circumstances needed to trigger implementation of Watershed Management Area strategy is not in compliance with the requirements of Provision B.3.b.(2)(e).

WATER QUALITY IMPROVEMENT SCHEDULES

7. *Schedules for Achieving Numeric Goals*

Requirement: Provision B.3.a.(2) of the Order requires the Copermittees to develop and incorporate schedules for achieving interim and final numeric goals. Provision B.3.a.(2) requires the schedules to incorporate TMDL compliance dates, incorporate ASBS compliance schedules, and be designed to achieve the interim and final numeric goals in the shortest time practicable taking into account the time required to implement water quality improvement strategies.

Issues of Concern: Each Plan includes schedules to achieve interim and final numeric goals. The San Diego Water Board, however, has found the following general issues of concern:

a) For Plans where the Beaches and Creeks Bacteria TMDLs are applicable and bacteria is the only highest priority water quality condition identified, and only final numeric goals are established for bacteria, the Plan is a Bacteria Load Reduction Plan (BLRP) not a Comprehensive Load Reduction Plan (CLRP). According to the Beaches and Creeks Bacteria TMDLs, the wet weather and dry weather dates for compliance with the final wasteload allocations (WLAs) must be no later than 10 years after the effective date of the TMDLs, which is April 4, 2021. For the Copermittees to have until April 4, 2031 (i.e. 20 years after the effective date of the TMDLs) to achieve the Beaches and Creeks Bacteria TMDLs WLAs, the Plan needs to be a CLRP and incorporate load reduction programs with quantified load reductions for other pollutants of concern in addition to bacteria.

b) Several Plans propose more than 20 years from the date the Plan was submitted to achieve final numeric goals if there are no applicable TMDL compliance dates. Schedules proposing to achieve final numeric goals in more than 20 years appear to be relying primarily on BMP implementation, inspection, enforcement, and education activities that are required to be implemented by the Copermittees pursuant to Provisions E.2 through E.7, with few, if any, commitments to implement optional jurisdictional strategies within the first 10 or more years.

Noncompliant Schedules for Achieving Numeric Goals: There are several Plans that have a proposed date to achieve compliance with the Beaches and Creeks Bacteria TMDLs by April 4, 2031. Unless the Plan includes quantified load reductions for pollutants in addition to bacteria, the April 4, 2031 date to achieve the final numeric goals for bacteria is not in compliance with the requirement to incorporate CLRPs into the Plan pursuant to Attachment E, Specific Provision 6.b.(2)(c)(i).

Unacceptable Schedules for Achieving Numeric Goals: The following proposed schedules to achieve numeric goals are not acceptable to the San Diego Water Board:

a) Schedules of 10 years or more to address only one highest priority water quality condition are not acceptable, unless there is information provided that allows the San Diego Water Board to make a determination that the schedules are clearly based on the time reasonably required to implement proposed optional jurisdictional strategies.

b) Schedules of 10 years or more to achieve final numeric goals without optional jurisdictional strategies proposed to be implemented within the next 5 years are not acceptable.

c) Schedules of 5 years or more to achieve final numeric goals for only addressing one highest priority water quality condition by eliminating unauthorized non-storm water discharges to and from the MS4 without optional jurisdictional strategies proposed to be implemented within the next 5 years are not acceptable.

8. ***Schedules for Implementing Strategies***

Requirements: Provision B.3.b.(3) of the Order requires the Copermittees to develop reasonable schedules for implementing the jurisdictional, optional jurisdictional, and Watershed Management Area strategies to achieve interim and final numeric goals. Provision B.3.b.(3) requires the schedules for implementing strategies to describe: 1) when jurisdictional strategies required pursuant to Provisions E.2 through E.7 will be implemented (Provision B.3.b.(3)(a)(i) and (ii)), 2) the shortest practicable time to secure funds and procure resources to initiate implementation of each optional jurisdictional strategy (Provision B.3.b.(3)(a)(iii)), and the shortest practicable time to secure funds and procure resources to initiate implementation of each Watershed Management Area strategy (Provision B.3.b.(3)(b)(i)). The schedules are also required to provide information about whether a strategy is expected to be a continuously implemented strategy (Provisions B.3.b.(3)(a)(iv) and B.3.b.(3)(b)(ii)) or strategy to be completed within a schedule (Provisions B.3.b.(3)(a)(v) and B.3.b.(3)(b)(iii)).

Issues of Concern: Each Plan includes schedules to implement strategies. The San Diego Water Board, however, has found the following general issues of concern:

a) In most Plans there were several proposed strategies that did not have any schedules associated with them, other than “to be determined.”

b) Most Plans lacked enough information about the shortest practicable time to secure funds and procure resources of initiate implementation of optional jurisdictional strategies and Watershed Management Area strategies.

c) For several strategies that appeared to be limited timeframe or structural projects, they lacked the information about the anticipated time to complete the project based on a realistic assessment of the shortest practicable time required.

Noncompliant Schedules for Implementing Strategies: The San Diego Water Board found that the schedules in the Plans for implementing strategies do not comply with the requirements of Provision B.3.b.(3) as follows:

a) Strategies that do not have a schedule are not in compliance with the requirements of Provision B.3.b.(3).

b) A Copermittee that does not have any optional jurisdictional strategies or has proposed an optional jurisdictional strategy without a description of the shortest practicable time to secure funds and procure resources to initiate implementation of the optional jurisdictional strategy is not in compliance with the requirements of Provision B.3.b.(3)(a)(iii).

c) A Plan without Watershed Management Area strategies or has a proposed Watershed Management Area strategy without a description of the shortest practicable time to secure funds and procure resources to initiate implementation of the optional jurisdictional strategy is not in compliance with the requirements of Provision B.3.b.(3)(b)(i).

d) Strategies that are expected to be completed within a limited timeframe without information about the anticipated time to complete the project based on a realistic assessment of the shortest practicable time required are not in compliance with the requirements of Provision B.3.b.(3)(a)(v) or B.3.b.(3)(b)(iii).

OTHER ISSUES

9. *__Hydromodification Management Exemptions__*

Requirements: Provision E.3.c.(2)(d) of the Order describes situations where the Copermittees have the discretion to exempt Priority Development Projects from the hydromodification management BMP performance requirements. Exemptions may be granted to projects that discharge to 1) existing underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean, or 2) conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean. The Copermittees may also propose additional exemptions via the optional Watershed Management Area Analysis.

Issues of Concern: Most Plans proposed additional exemptions via the optional Watershed Management Area Analysis. The San Diego Water Board, however, has found issues of concern with proposed exemptions in Plans for two different Watershed Management Areas:

a) As part of the Watershed Management Area Analysis, the City of Carlsbad included a report entitled "*Hydromodification Exemption Analysis for Select Carlsbad Watersheds*" (Report). Based on the Report, the Copermittees in the Carlsbad Watershed Management Area proposed to add drainage areas upstream of the Buena Vista, Agua Hedionda, and Batiquitos Lagoons as exempt from hydromodification management BMP requirements. Instead of evaluating the drainage areas leading to the lagoons using an erosion potential (or equivalent) analysis, the Report studies the lagoons using the criteria for exemptions outlined in the Hydromodification Management Plan for the San Diego Region (HMP) that was approved by the San Diego Water Board in July, 2010. However, the HMP is predicated on requirements of the previous MS4 permit. When the Order was adopted in 2013, the only exemptions retained were those cited in Provision E.3.c.(2)(d), meaning exemptions are essentially limited to concrete-lined or underground drainage channels. Any additional exemptions, including "non-erodible drainage networks" as described in the Report, must be evaluated from an erosion potential (or equivalent) point of view and included in the optional Watershed Management Area Analysis.

   The Report describes rationale for exempting areas draining to Agua Hedionda and Batiquitos Lagoon, and different rationale for exemptions for areas draining to Buena Vista Lagoon. The discussions regarding the areas draining to Agua Hedionda and Batiquitos Lagoons indicate that these areas may meet the Order's requirement of being concrete lined all the way from the point of discharge to an enclosed embayment (lagoon). However, whether or not drainage conveyances from these areas act like "concrete lined channels" is unclear because the discussion is centered on criteria applicable to the HMP and not the Order.

For Buena Vista Lagoon, the Report states that: "*As long as a project discharges into a non-erodible drainage network that is continuous to a lagoon outlet, it is potentially eligible for a hydromodification exemption*." The Report continues to explain that in drainage areas upstream of Buena Vista Lagoon, "… *the intervening ground is densely vegetated and or naturally armored. The City Engineer found no evidence of erosion at or near the water's edge of the lagoon. Consequently, this area is identified as exempt*…."

In order for the San Diego Water Board to accept a conclusion that a conveyance system can be exempt from hydromodification management BMP requirements, the Report must include an analysis demonstrating that the natural area under review would not experience erosion for the range of storms considered to be geomorphically significant. Although these areas are presented as "naturally armored," because they are not concrete-lined, the systems must be evaluated from an erosion potential (or equivalent) point of view to determine if an exemption is appropriate.

b) In the San Diego River Water Quality Improvement Plan, the Watershed Management Area Analysis includes a proposed methodology for demonstrating that hydromodification management BMPs are not needed upstream of Forrester Creek, a channel stabilized with materials other than concrete. The proposed methodology includes a process for classifying additional channels as "stabilized," and thus allowing exemptions for areas upstream of these channels. The San Diego Water Board is supportive of allowing exemptions for such stabilized channels, provided that the exemptions are supported and the proposed process is clear and repeatable.

The Watershed Management Area Analysis includes a discussion of erosion potential in Forrester Creek under several different flow rates, all of which suggest that Forrester Creek would not experience erosion caused by land development occurring in the upstream watershed, even in a fully built-out condition. The discussion includes analyses using various methods to verify the assertion that the channel is stable in the range of flows considered to be geomorphically significant. Because the discussion includes several lines of evidence, the San Diego Water Board agrees that Forrester Creek can be considered stable and therefore the proposed exemption is appropriate.

The Watershed Management Area Analysis appears to rationalize a more succinct and less rigorous analysis for including exemptions for future proposed channel segments. Absent a similar, thorough, and multiple lines of evidence approach analysis as was included for Forrester Creek, the San Diego Water Board disagrees and cannot support the less rigorous analysis. The San Diego Water Board supports the concept of introducing additional stabilized channel reaches that are exempt from hydromodification management BMP requirements, but only if an erosion potential analysis using continuous simulation modeling demonstrates that the channel segment would not erode in the range of flows determined to be geomorphically significant. Additionally, the analysis would need to include flows expected from a fully-built out watershed condition, and would have to consider erosion potential at the channel's most susceptible location(s). Finally, the criteria and process to qualify for an exemption should be clear so that future proposals for exemptions for additional channel segments include all the required elements.

Unacceptable Hydromodification Management Exemptions: The following proposed exemptions are not acceptable to the San Diego Water Board:

a) Without an appropriate and acceptable analysis of the potential of erosion for the range of storms considered to be geomorphically significant, the additional exemptions proposed for Agua Hedionda Lagoon, Batiquitos Lagoon, and Buena Vista Lagoon are not acceptable.

b) Without an erosion potential analysis using continuous simulation modeling that shows a channel will not erode in the range of geomorphically significant flows for the fully built out condition of the drainage area at the most sensitive channel segment(s) included in the Watershed Management Area Analysis, future proposals for exemptions from the hydromodification management BMP requirements will not be acceptable.

10. <u>Loma Alta Slough Resolution Implementation Requirements</u>

Requirements: Provision A.1.b of the Order requires the Copermittees to effectively prohibit non-storm water discharges into the MS4. Provision B.3.a requires the Copermittees to develop interim and final numeric goals and schedules to achieve those goals for the highest priority water quality conditions. Resolution No. R9-2014-0020, a *Resolution of Commitment to an Alternative Process for Achieving Water Quality Objectives for Biostimulatory Substances in Loma Alta Slough* (Resolution), was adopted by the San Diego Water Board on June 26, 2014. The Resolution includes numeric targets, a compliance schedule, and monitoring which are expected to be implemented through the Carlsbad Watershed Management Area Water Quality Improvement Plan (Carlsbad WMA Plan).

Issues of Concern: A number of items in the Carlsbad WMA Plan are not consistent with the Resolution. The San Diego Water Board chose to adopt the Resolution as a practical, measureable, and timely approach for directing actions to remedy the Slough through a productive collaboration with the community to address an important water quality challenge. The Copermittees must implement the elements of the Resolution, or the San Diego Water Board will reinitiate the process of considering adoption of the Phosphorus TMDL for Loma Alta Slough. The San Diego Water Board has found the following issues of concern:

a) The Resolution includes numeric targets for both surface water macroalgal biomass and surface water macroalgal cover, which represent attainment of the biostimulatory water quality objective for Loma Alta Slough. These numeric targets were developed through a multi-year stakeholder process, and were based on special studies specific to the Slough and water quality modeling. The numeric targets are to be achieved by 2023.

According to the source and linkage analysis for which the numeric targets are based, the primary sources of the impairment in Loma Alta Slough are dry-weather discharges from irrigation runoff and other illicit dry weather discharges conveyed by the MS4 to Loma Alta Slough. Nutrient loading, specifically phosphorus, into the Slough from dry weather flows results in excessive algal growth. Further, modeling results cited in the staff report (which served as the technical basis for the Resolution) suggests that reductions of dry weather flows in excess of 96 percent are needed to achieve the targeted reductions in phosphorus loading. As such, the Resolution relies on the Order, specifically the prohibitions of dry weather non-storm water discharges, and development and implementation of a Plan that includes the Loma Alta Creek watershed, to achieve the necessary reductions in phosphorus loading and restore the beneficial uses.

In contrast to the approach for which the Resolution is based, the Carlsbad WMA Plan proposes interim numeric goals that fall short of achieving the prohibitions on dry weather discharges. The Carlsbad WMA Plan describes the interim goals as:

- 50 percent reduction in anthropogenic persistent dry weather flows at the three outfalls addressed through 2018, and
- 25 percent reduction in additional (other outfalls in watershed) anthropogenic persistent flows identified during dry weather monitoring program implemented in 2015 and in subsequent years.

The interim goals as expressed in the Carlsbad WMA Plan are not consistent with the Resolution because there is no mention in the Resolution that the City of Oceanside would only first reduce flows by 50 percent, followed by an additional 25 percent in subsequent years, and no explicit attempt to comply with the requirement to effectively eliminate non-storm water discharges into the MS4. Additionally, Finding 20 of the Resolution states that the City of Oceanside, in a comment letter dated May 5, 2014 committed to:

- Using the numeric targets, developed through the stakeholder process as numeric goals in the Water Quality Improvement Plan for the Loma Alta Creek watershed, and
- Develop and implement a Water Quality Improvement Plan to effectively prohibit the City's non-storm water discharges into the MS4 system.

The San Diego Water Board expects the City of Oceanside to honor its commitment as stated in the letter dated May 5, 2014, and therefore expected the interim and final numeric goals in the Carlsbad WMA Plan to incorporate the prohibition of dry weather non-storm water discharges into the MS4 for reducing phosphorus loading to Loma Alta Slough. Further, there must also be interim numeric goals expressed as an increment toward achieving the final numeric goals.

b) The Carlsbad WMA Plan does not include the required Loma Alta Slough Monitoring Plan. Table 2 of Resolution No. R9-2014-0022 describes the City of Oceanside's *Tentative Proposed Schedule to Address the Eutrophication Impairment in Loma Alta Slough*. According to this Table, in 2015, "*the City was to submit a Water Quality Improvement Plan, including the Loma Alta Slough Monitoring Plan, to the San Diego Water Board.*"

   Section 3.1.4 of the Carlsbad WMA Plan describes a special study whose objectives are "*to develop a water quality monitoring program for the Loma Alta Slough (Slough Monitoring Plan) that will allow the City of Oceanside to track progress toward reducing nutrient discharges into the Slough and eliminate the eutrophication impairment*." The monitoring is to occur every summer from 2016 to 2022.

   In a letter dated May 5, 2014, the City of Oceanside indicated that it would incorporate the slough monitoring requirements proposed in Tentative Investigative Order No. R9-2014-0022 into the Carlsbad WMA Plan[1]. The San Diego Water Board's expectation was that the Slough Monitoring Plan would be fully developed and included in the Carlsbad WMA Plan, as stated in the City's letter and described in Table 2 of the Resolution. The City of Oceanside has not submitted any correspondence to the San Diego Water Board suggesting a need to amend the schedule described in Table 2 since Resolution No. R9-2014-0020 was adopted on June 26, 2014.

Noncompliant Loma Alta Slough Resolution Implementation Requirements: The San Diego Water Board found that the Carlsbad WMA Plan does not comply with the requirements of Provisions A.1.b and B.3.a.(1) as follows:

a) The interim numeric goals as expressed are not consistent with the Resolution and not in compliance with the requirements of Provisions A.1.b and B.3.a.(1)(b).

b) Each final numeric goal that does not have an interim numeric goal expressed as a reasonable increment in the same or similar metric as the final numeric goal is not in compliance with Provision B.3.a.(1)(b)(ii).

Unacceptable Loma Alta Slough Resolution Implementation Requirements: The City of Oceanside committed to incorporating slough monitoring requirements proposed in Tentative Investigative Order No. R9-2014-0022 into the Carlsbad WMA Plan. Without the slough monitoring requirements proposed in Tentative Investigative Order No. R9-2014-0022 in the monitoring and assessment program for the Carlsbad Watershed Management Area, the Carlsbad WMA Plan is not acceptable to the San Diego Water Board.

[1] Tentative Investigative Order No. R9-2014-0022 was replaced by Resolution No. R9-2014-0020.

11. Items of Additional Concern

Pursuant to Provision F.1.b.(2), the Copermittees are required to consider revisions to the Plans based on written comments received by the close of the public comment period. Pursuant to Provision F.1.b.(3), the Copermittees are required to submit any revisions to the Plans no later than 60 days after the close of the comment period, or by September 29, 2015.

Pursuant to Provisions E and F.2.a.(2) of the Order each Copermittee was required to update its JRMP document to incorporate the requirements of Provision E concurrently with the submittal of the Plans. Pursuant to Provisions E.3.d and F.2.b.(1) of the Order each Copermittee was also required to update its BMP Design Manual to incorporate the requirements of Provisions E.3.a-d. Each Copermittee's JRMP document updated with the requirements of Provision E became effective with the submittal of the Plans. In addition, each Copermittee must begin implementing its updated BMP Design Manual within 180 days of submittal of the Plans, unless directed otherwise by the San Diego Water Board.

Until the Plans are accepted by the San Diego Water Board, any exemptions to the hydromodification management BMP requirements of Provisions E.3.c.(2)(a)-(c), proposed in the Plans pursuant to Provision B.3.b.(4)(c), are not authorized to be applied to any Priority Development Projects within a Copermittee's jurisdiction. Likewise, a Copermittee is not authorized to implement an Alternative Compliance Program (pursuant to Provision E.3.c.(3)) for any Priority Development Project within its jurisdiction until the optional Watershed Management Area Analysis developed pursuant to Provision B.3.b.(4) has been accepted as part of the Plans.

12. Potential Future Enforcement Options

The areas of noncompliance identified herein began on the due date to submit the Plans (June 26, 2015) and may be subject to additional future enforcement by the San Diego Water Board or State Water Resources Control Board, including a potential civil liability assessment of up to $10,000 per day of violation (Water Code section 13385) until the violations are corrected and/or pursue any of the following enforcement actions:

Other Potential Enforcement Options	**Applicable Water Code Sections**
Technical or Investigative Order	Sections 13267 or 13383
Cleanup and Abatement Order	Section 13304
Cease and Desist Order	Sections 13301-13303
Time Schedule Order	Sections 13300, 13308

In addition, the San Diego Water Board may consider revising or rescinding applicable waste discharge requirements, if any, referring the matter to other resource agencies, or referring the matter to the State Attorney General for injunctive relief, as applicable.

The San Diego Water Board is available to assist the Copermittees with refining the Plans to become acceptable, and to be in compliance with the requirements of the Order. In the subject line of any response, please include the information located in the heading of this letter: "in reply refer to." Please contact Wayne Chiu at (619) 521-3354 or Wayne.Chiu@waterboards.ca.gov., or Christina Arias at (619) 521-3351 or Christina.Arias@waterboards.ca.gov with any questions or concerns.

Subject: RE: Otay River Report - Clarifications

Good Morning Eric,

We have provided clarifications to your questions below (in red):

1. Please direct us to the portion of the report in which the Ep and Sp analysis results are summarized. There was some uncertainty regarding the conclusions of the Ep and Sp analysis. We would like to see a summary of the final Ep thresholds at various locations along the river reach seeking an exemption. The Ep analysis is summarized in the Attachment 2 spreadsheets—exactly the same way the Copermittees presented the original WMAA Ep results in WMAA Attachment B.1.1. The spreadsheets summarize the Ep value (0), as well as critical shear stress values, estimated flow rates, durations, watershed acreage, imperviousness, and annual average rainfall depth. Sp results are summarized in the memo we sent to you on 5/25, which demonstrates the exemptions meet the 0.9 Sp threshold approved by the Copermittees
2. With regard to the Ep and Sp analysis, outline what methodology was the same of the WMAA analysis and what methodology changed. Please outline any changes to the WMAA methodology. Our report uses the exact same methodology for Ep as was used in the WMAA. The only difference between the WMAA Ep analysis and our "Revised" Ep analysis was the critical shear stress value at each cross section. We assigned critical shear stress values that are more descriptive of the in-stream condition, determined as a result of the field investigation

(critical shear stress values referenced from Fischenich publication, Table 2, which we provide in Attachment 4; our field investigation summary and photos are in the report, pages 17-23). Our Sp memo also used the exact same methodology as the WMAA. The only difference was a change to the "post" soil loss estimate, reduced from 24,364 tons/year to 22,288 tons/year (calculated using original source WMAA GIS data), due to an increase in "exempt" acreage.

3. Please summarize assumptions used to estimate critical shear stress and other key parameters in the Ep analysis. A clear summary of the values used for various vegetation and soils conditions would be appreciated. Estimates are provided on page 19 of the report where we state: "Critical shear stress values of 0.67 pounds per square foot (psf) (shales and hardpan), 0.35 psf (average reeds), and 0.70 psf (short native and bunch grass) are more appropriate assignments for the Otay River based upon the field conditions (Fischenich, 2001)." The Fischenich report is provided in Attachment 4, complete with technical details.
4. Is the Sp parameter defined as part of the updated analysis? It was not clear upon initial review. Since the Sp parameter was a key part of the WMAA analysis, exclusion of the parameter would seem to complicate the methodology if a replication of the WMAA methodology was desired to prove a major river reach exemption. See Sp memo dated 5/24/16. Due to the explicit MS4 Permit language, as reinforced by the SD Water Board's General Comments on Final WQIPs and Notice of Noncompliance dated 8/5/15 (provided in Attachment 5), we focused on the potential for erosion (Ep). We now (in a supplemental GIS analysis) analyzed the sediment supply potential (Sp) and demonstrated the exemptions meet the 0.9 threshold approved by the Copermittees.
5. The constant runoff reduction factor (43%) referenced in the report would be consistent with the old 2007 Permit conditions. Since the 2013 Permit now allows 10% increases of flows and durations across the flow threshold range, it does not appear that the 43% factor would be applicable to the new Permit. That said, please briefly describe what effect, if any, this would have on the updated analysis and conclusions. Design practices prove that this is not a concern. Our 43% reduction is the average % reduction for the Q_2, Q_5, and Q_{10} flow rates, when comparing the post-developed-**mitigated** (hydromod control) flow rate to the post-developed-**unmitigated** flow rate for **actual** hydromodification management projects throughout the County. What we (and other experts) observe during hydromodification management facility design is that the low-flow (X% Q_2) and high-flow (Q_{10}) flow rates are often at or near 110%, controlling the entire design. Since the high and low flow values are already at or near 110% the flow rates/durations between these two points along the curve will sag well below the pre-developed FDC. Since, from a practical design standpoint, the normal behavior of the FDC does not usually allow for the post-developed FDC to mirror the pre-developed FDC closely (due to the unique hydraulics of outflow passing through the outlet structure, causing a "sag" appearance between low and high flow thresholds), it is very unlikely that the 110% threshold along the entire curve would change the engineer's approach to design.

   Furthermore, we tested the % flow reduction in SWMM, and found that even with a mere 20% reduction, the FDC still passes the existing pre-to-post developed (mitigated) criteria. Therefore, the 43% peak flow reduction remains a valid—and conservative—estimate.

Please let us know if you have any questions on the above.

Regards,

Tory Walker, PE, CFM, LEED GA

Subject: Otay River Report - Clarifications

Tory – thanks for speaking with us last week regarding the Otay River report.

We request the following clarifications:

1. Please direct us to the portion of the report in which the Ep and Sp analysis results are summarized. There was some uncertainty regarding the conclusions of the Ep and Sp analysis. We would like to see a summary of the final Ep thresholds at various locations along the river reach seeking an exemption.
2. With regard to the Ep and Sp analysis, outline what methodology was the same of the WMAA analysis and what methodology changed. Please outline any changes to the WMAA methodology.
3. Please summarize assumptions used to estimate critical shear stress and other key parameters in the Ep analysis. A clear summary of the values used for various vegetation and soils conditions would be appreciated.
4. Is the Sp parameter defined as part of the updated analysis? It was not clear upon initial review. Since the Sp parameter was a key part of the WMAA analysis, exclusion of the parameter would seem to complicate the methodology if a replication of the WMAA methodology was desired to prove a major river reach exemption.
5. The constant runoff reduction factor (43%) referenced in the report would be consistent with the old 2007 Permit conditions. Since the 2013 Permit now allows 10% increases of flows and durations across the flow threshold range, it does not appear that the 43% factor would be applicable to the new Permit. That said, please briefly describe what effect, if any, this would have on the updated analysis and conclusions.

Thank you for providing this information.

SUBJECT: OTAY RIVER SEDIMENT SUPPLY POTENTIAL ANALYSIS

Dear Boushra:

In reply to the comments made by the sub-committee of the San Diego Bay WQIP Copermittee group, Tory R. Walker Engineering (TRWE) has completed the Sediment Supply Potential (Sp) analysis to support the proposed hydromodification management exemption for projects directly discharging to the Otay River from west of Interstate 805 (I-805) to San Diego Bay. TRWE found that the proposed exemptions result in an Sp value that meets the criteria recommended by the Southern California Coastal Watershed Research Project[1] (SCCWRP). The final soil loss estimates were executed in GIS and are presented in the following table:

Exempt River Reach	Soil Loss (tons/yr.)			Sp (Post/Pre) [Criteria>0.90]
	Pre	Exempt Parcels	Post [Pre – Exempt Parcels]	
Otay River	24,402	2,114	22,288	0.91

The Sp analysis demonstrates that the proposed reduction in bed sediment supply is not expected to have significant effects on stream stability. Therefore, together with the findings from our December 2015 Erosion Potential (Ep) study, the reinstatement of hydromodification exemptions for the Otay River has been justified by the quantitative Ep and Sp criteria adopted by both the Copermittees and the San Diego Regional Water Quality Control Board.

We appreciate your time in reviewing our findings. Please contact us with any questions you may have.

Sincerely,

Tory R Walker

WQBEL	water quality based effluent limitation

Executive Summary

ES.1 INTRODUCTION

This first Water Quality Improvement Plan (WQIP) Annual Report for the San Diego River Watershed Management Area (WMA) (Figure ES-1) was developed in compliance with the Regional municipal separate storm sewer system (MS4) Permit (Permit) (San Diego Regional Water Quality Control Board [Regional Board], 2013). This Annual Report represents the work of the Participating Agencies in the WMA, including the Cities of La Mesa, El Cajon, Santee, and San Diego; the County of San Diego; and the California Department of Transportation (Caltrans). These Participating Agencies implement strategies through their WQIP and Jurisdictional Runoff Management Programs (JRMPs) to achieve improvements in the quality of stormwater (wet weather) and non-stormwater (dry weather) discharges from the MS4 (storm drain system) and, in turn, within the receiving waters by focusing on the highest priority water quality condition (HPWQC) and priority water quality condition(s) (PWQC) within the watershed. Caltrans' participation in the development of the WQIP was voluntary as they are regulated under a separate Permit from the California State Water Resources Control Board. Therefore, while they participated in the WQIP development on certain strategies, they do not participate in the Monitoring and Assessment Programs under the WQIP.

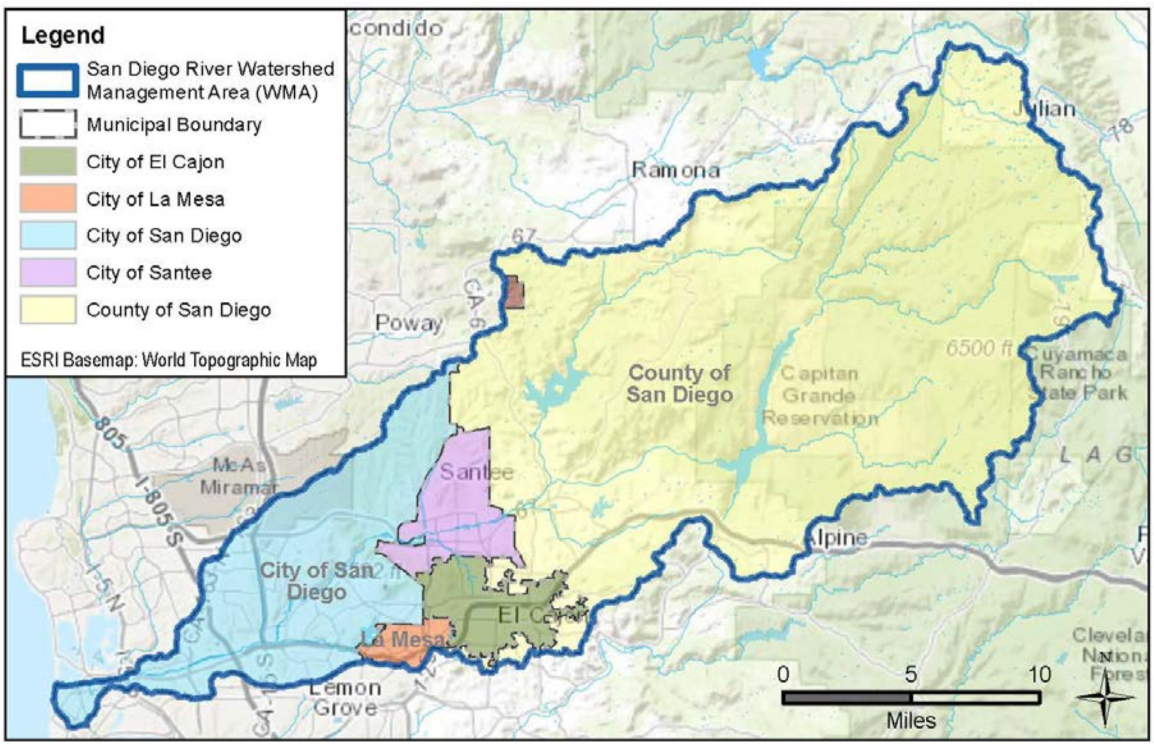

Figure ES-1. The San Diego River Watershed Management Area

The HPWQC and PWQCs for the WMA were identified based on an assessment of receiving water conditions, storm drain outfall discharges and their potential impacts, and the sources of pollutants in the watershed. Using the methodology outlined in the WQIP, bacteria was identified as the HPWQC for the WMA.

HPWQC:
Bacteria (Wet and Dry)

PWQCs:
Eutrophic Conditions, Total Dissolved Solids, Nitrogen, Phosphorus, Index of Biotic Integrity, Total Nitrogen as N (Dry)

ES.2 MONITORING AND ASSESSMENT

The 2015-2016 monitoring year was the first under the Monitoring and Assessment Plan (MAP) of the accepted WQIP that focuses on addressing bacteria. Monitoring results as they relate to bacteria are presented in the following sections, with details provided in the Annual Report. Overall, monitoring results support the selection of bacteria as the HPWQC and provide substantial data to assess progress toward goals.

ES.2.1 Total Maximum Daily Load (TMDL) Monitoring

Bacteria Total Maximum Daily Load (TMDL) sampling was conducted during wet and dry weather at one beach location and four creek locations in accordance with TMDL requirements specified in the Permit. Additional detail is provided in Section 3.1.2.

- Beach location
  - Pacific Ocean Shoreline at Dog Beach **FM-010**
- Creek locations:
  - Forester Creek **SDR-FC1**, **SDR-FC2**
  - Lower San Diego River **SDR-MLS**, **SDR-CDE**

- Interim and final receiving water limitations (RWLs) for indicator bacteria are being achieved at FM-010 except the dry season geometric mean for *Enterococcus*.
- There were also no exceedances of geometric means for fecal coliform at SDR-CDE during the dry and wet seasons and at SDR-FC2 and SDR-MLS during the wet season. Both interim and final RWLs are being met for these analytes at these locations.
- All other results did not meet the interim or final RWLs.

TMDL Monitoring Location SDR-CDE

- Interim numeric targets are not required to be achieved until 2020 for dry weather and 2028 for wet weather; therefore, the exceedances observed during 2015-2016 do not indicate non-compliance at this time.

ES.2.2 Storm Drain Outfall Dry Weather Field Screening

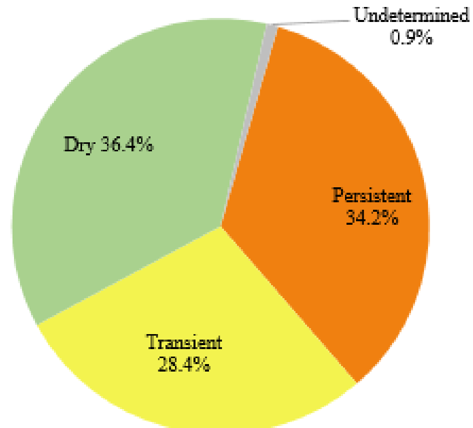
Dry weather field screening is conducted to identify non-stormwater and illicit discharges from the Participating Agencies' major storm drain outfalls, determine which discharges are persistent, and prioritize those discharges that will be investigated and eliminated.

Based on field screening visits and available historical data, the Participating Agencies determined the flow status of each major storm drain outfall as persistent, transient, dry, or undetermined. As defined in the Permit, flow status for a given outfall is "dry" if no flowing or standing water is observed at the outfall over three most recent visits, and "persistent" flow is defined as presence of flowing or standing water upon three most recent visits. Otherwise, the outfall status is classified as "transient." Additional detail is provided in Section 3.2.1.1.

- There was no trash or little trash (less than 50 pieces) during most (95%) of the trash assessments (n = 375) at visited outfalls.
- Outfalls were dry during 49% of routine field screening visits; flowing water was present during 30% of routine visits.
- When flow was observed, the majority (75 of 113) of the flow rates were less than five gallons per minute.

Overall, since the prior monitoring year:

- The number of "dry" outfalls decreased by one.
- Outfalls categorized as "transient" decreased by three.
- Outfalls with "persistent" flow increased by 11.
- The number of "undetermined" outfalls decreased by five.
- No modifications to field screening monitoring locations or frequencies are planned for 2016-2017 in the WMA.



Flow Determinations for Major Storm Drain Outfalls (n=225)

Major storm drain outfalls are prioritized for monitoring by each Participating Agency based on criteria such as persistence of non-stormwater flow, monitoring data results, and the potential threat to receiving water quality. Monitoring was conducted at the highest priority outfalls, which are shown in Figure ES-2. Highest priority storm drain outfall monitoring is described in ES.2.3. These outfalls were also a specific focus for the Illicit Discharge Detection and Elimination (IDDE) investigations by each Participating Agency as described in Section ES.2.5.

ES.2.3 Highest Priority Storm Drain Outfall Dry Weather Monitoring

Analytical monitoring during dry weather was conducted at the highest priority outfalls identified by each Participating Agency. Monitoring locations are shown in Figure ES-2, and results for bacteria in non-stormwater samples at these outfalls are shown in Figure ES-3. Eighty-three % of *Enterococcus* and 71% of fecal coliform results were above non-stormwater action levels (NALs). No re-prioritizations of the highest priority outfalls are planned for 2016-2017 in the WMA. Additional detail is provided in Section 3.2.1.2.

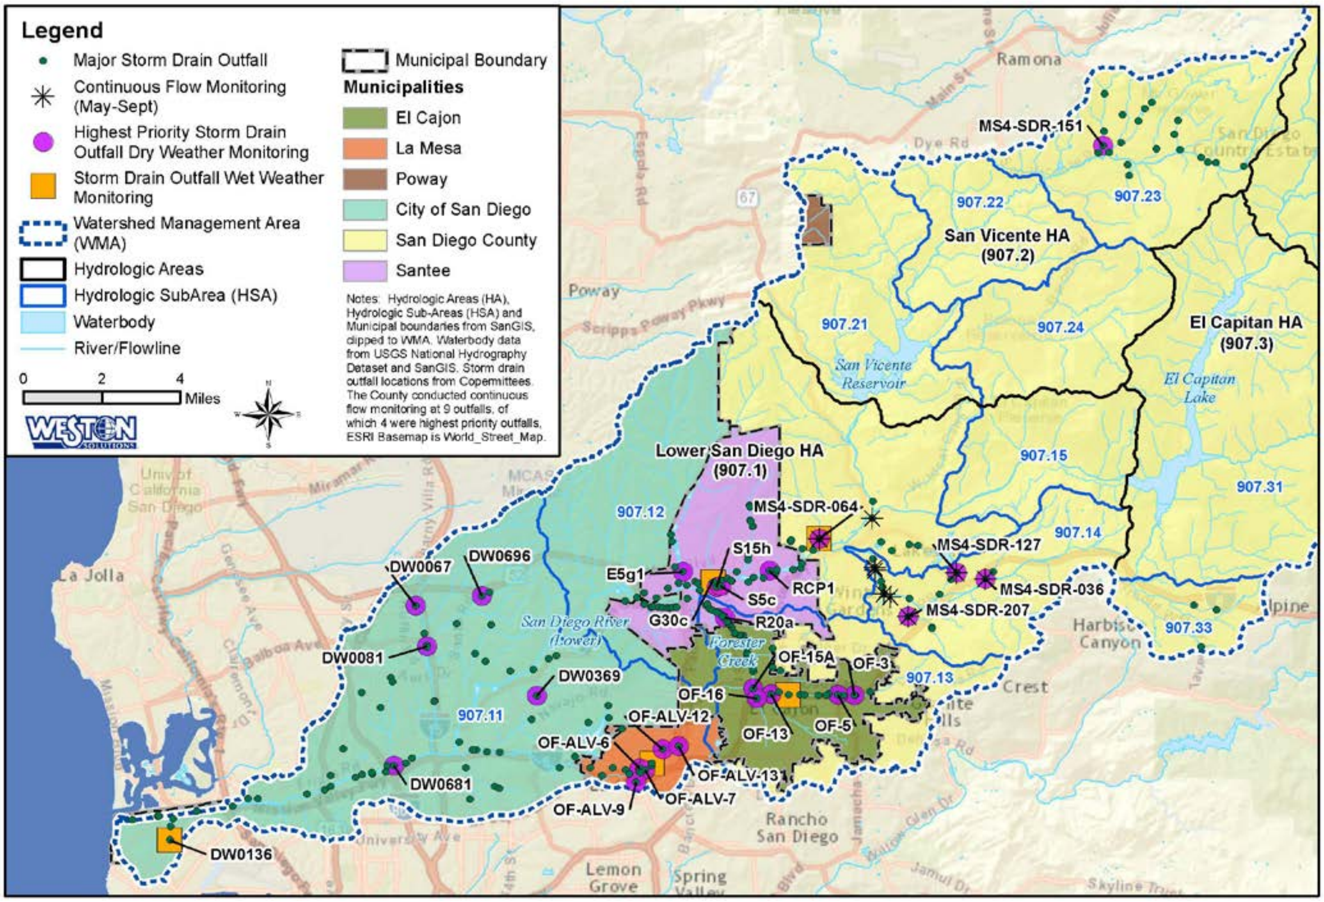


Figure ES-2. 2015-2016 Dry and Wet Weather Storm Drain Outfall Monitoring Locations

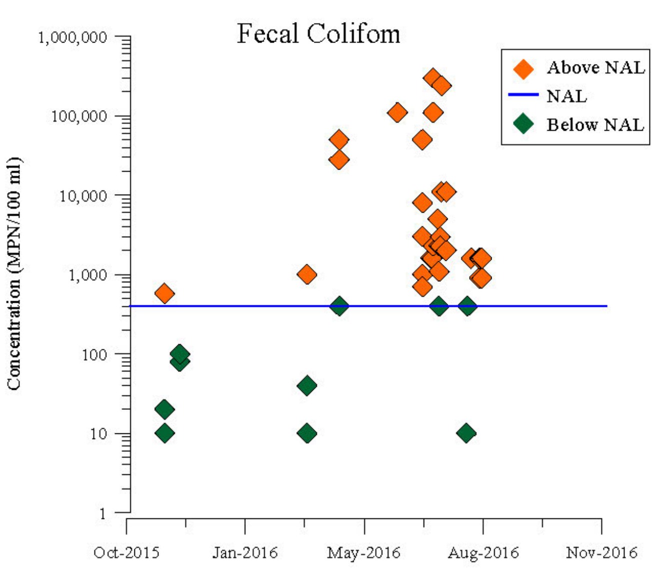

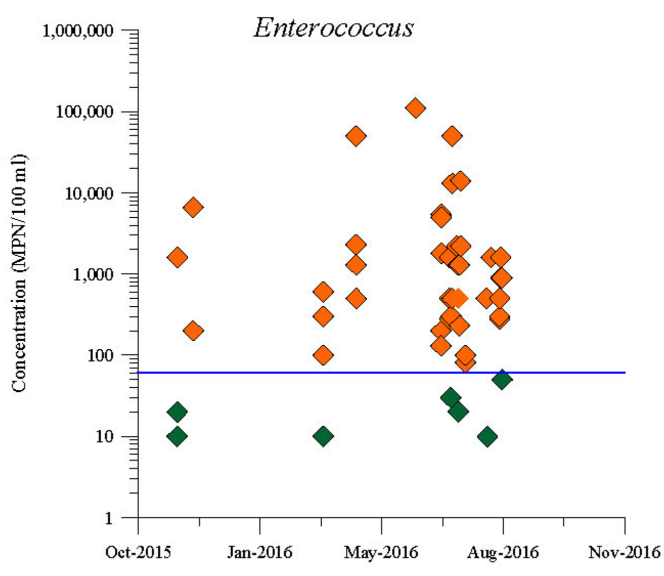

Figure ES-3. Indicator Bacteria Concentrations in Highest Priority Storm Drain Outfall Dry Weather Samples

ES.2.4 Illicit Discharge Detection and Elimination (IDDE) Program

Each Participating Agency's IDDE Program seeks to address and reduce the potential contribution of pollutants from stormwater and non-stormwater discharges through the storm drain system. The highest priority outfalls were a specific focus of IDDE investigations. Additional detail is provided in Section 3.2.1.3.

Flow sources identified through the Participating Agencies' outfall flow investigations included:

- The most common source of non-stormwater flow was irrigation runoff, followed by groundwater.
- Sources were recorded as known or suspected, and identified as controllable or uncontrollable.
- In several cases, the sources of non-stormwater flows investigated were allowable (e.g., groundwater), were reported to enforcement for follow-up actions, or were eliminated.

The City of San Diego and County of San Diego are utilizing flow meters at selected outfalls to assist in source identification.

ES.2.5 Storm Drain Outfall Wet Weather Monitoring

Storm drain outfall wet weather monitoring identifies and quantifies pollutants in stormwater discharges from the storm drain system, guides pollutant source identification efforts, and tracks progress toward achieving wet weather numeric goals set forth in the WQIP. Monitoring locations are shown in Figure ES-2 in Section ES.2.3. Additional detail is provided in Section 3.2.2.

- 100% of *Enterococcus* and fecal coliform concentrations in storm drain outfall wet weather discharges were above the single sample maximum water quality based effluent limitations specified in the Permit for the Bacteria TMDL.

ES.2.6 Special Studies

Special studies conducted in the San Diego River WMA are described in Section 3.3 and included the following:

- Reference Streams and Beaches Studies - provide a scientific basis for updating the "reference" conditions to be considered in evaluating compliance levels in the Bacteria TMDL, and will be useful in the re-evaluation of the Bacteria TMDL.
- Wet Weather Epidemiology Study – demonstrated the applicability of quantitative microbial risk assessment (QMRA) for recreational water risk estimates during wet weather and may facilitate consideration of site-specific water quality criteria.

Wet Weather Epidemiology Study Site – Ocean Beach

ES.3 WATERSHED STRATEGY IMPLEMENTATION AND PROGRESS TOWARD GOALS

The Permit requires the Participating Agencies to select the HPWQC for the WMA and develop strategies and numeric goals to address that HPWQC. Since the acceptance of the WQIP in February 2016, the Participating Agencies have implemented strategies and have begun making progress toward achieving numeric goals for bacteria. Many of the interim goals to be achieved during the current Permit term, which extends to 2018, are expressed in terms of performance measures. Examples of performance measures include the amount of area treated by installation of green infrastructure or percent reduction in dry weather discharge flow rates. Performance measures are helpful as milestones over relatively short timeframes because they are closely linked to reductions in bacteria, and they are subject to less natural variation than water quality monitoring data. Several key strategy types, which address not only bacteria but other PWQC in the watershed, were implemented broadly across the watershed and included the following:

- Preventing wastewater discharges to the storm drain system.
- Trash cleanups.
- Dry and wet weather runoff reduction programs.
- Retrofit and rehabilitation projects.
- Additional monitoring to investigate sources of dry weather flows.

Interim Permit-term goals are applicable to individual jurisdictions, but the collective progress towards achieving these goals also indicates progress on a watershed level. Progress made toward achievement of the interim Permit-term numeric goals is summarized below, with supporting information provided in Table ES-1. Additional detail is provided in Section 4.

Permit Term Numeric Goals for the City of El Cajon:

- Dry Weather Goal: Flow Reduction – **Goal Has Been Achieved**
- Dry Weather Goal: Encampment Removals - **Goal Has Been Achieved**
- Wet Weather Goal: Cleanup Events at Forester Creek – **Goal Has Been Achieved**
- Wet Weather Goal: Pet Waste Management – **On Track to Achieve Goal**

Permit Term Numeric Goals for the County of San Diego:

- Dry Weather Goal: Flow Reduction – **Baseline Estimations are Complete**
- Wet Weather Goal: BMP Implementation – **On Track to Achieve Goals**
- Wet Weather Goal: Distributed BMP Operation and Maintenance – **Goal Has Been Achieved**

Permit Term Numeric Goals for the City of La Mesa:

- Dry and Wet Weather Goal: Alvarado Creek Restoration – **On Track to Achieve Goals**

Permit Term Numeric Goals for the City of Santee:

- Dry and Wet Weather Goal: Bacteria Load Reductions – **On Track to Achieve Goals**

Permit Term Numeric Goals for the City of San Diego:

- Dry and Wet Weather Goal: Green Infrastructure BMPs – **On Track to Achieve Goals**
- Dry Weather Goal: Flow Reduction – **Goal Has Been Achieved**

Table ES-1. Progress Toward Permit Term Numeric Goals in the San Diego River WMA for the 2015-2016 Monitoring Year

City of El Cajon
Dry Weather
• The estimated dry weather flow volume from major outfalls and the percentage of major outfalls with flowing water during dry weather were 58% and 47% lower than the baseline, respectively, during FY 15-16. Both of these numbers represent greater reductions than the Permit-term reduction goal of 10%. • The City performed 18 transient encampment removal events and removed 212.6 cubic yards of trash and debris during FY 15-16. These numbers are greater than the Permit-term goals of five cleanups per year and 25 cubic yards of material removed per year; especially high numbers were achieved in FY 15-16 due to flood prevention cleanups in channels in anticipation of El Niño conditions.
Wet Weather
• The City sponsored two cleanup events at Forester Creek during FY 15-16, in line with the Permit-term goal to complete two per year. Approximately 2,280 lbs. of trash and debris were removed. • The City began planning its expanded pet waste management outreach program during FY 15-16 and is on track to implement it in one focused area or for one homeowners' association by 2018, as required to meet the Permit-term goal.
City of La Mesa
Dry and Wet Weather
• The City started construction of the 900 linear feet of restoration in Alvarado Creek in FY 15-16. The project is scheduled to be completed in FY16-17, which will achieve the City's Permit-term goal.
City of Santee
Dry Weather
• During FY15-16, the City of Santee worked with a local big box business to eliminate a persistent discharge. Regular flow had been observed at an outfall to the San Diego River located close to the Town Center commercial development. Through upstream investigation efforts, the City tracked the flow source to two catch basins and a manhole in the shopping center, which had a total flow rate of about three gallons per minute. Further investigation found that the source of flow to these locations was from swamp coolers in a big box store. The City worked with store management, their corporate office, and legal department to eliminate the flow. Corrections involved the vetting of multiple solutions, with the store deciding on the replacement of the HVAC units, implementing a closed loop plumbing system, and redirecting any excess runoff to the sewer. • The City participated with the sheriff to abate transient encampments, and facilitated the disposal of waste from 22 volunteer based clean up events. The total amount of debris removed from the San Diego River within Santee's jurisdiction was 45.56 cubic yards.
Wet Weather
• The City sent out 1,115 letters to private properties informing them of their responsibility to prevent erosion, and clean out their brow ditches. Public Services staff also prepared for the forecasted El Niño conditions by conducting additional channel maintenance to prevent potential flooding.

Table ES-1. Progress Toward Permit Term Numeric Goals in the San Diego River WMA for the 2015-2016 Monitoring Year

City of San Diego
Dry Weather
• Average dry weather flow was reduced by 46.7% from the calculated baseline average flow, exceeding the Permit-term reduction goal of 10%.
Dry and Wet Weather
• The City implemented green infrastructure projects that treat 43.6 acres of drainage area, which is about 75% of the total of 58.4 acres to be treated by 2018 to meet the FY 18 performance based goal. • In accordance with the requirements of the WQIP, the storm drain discharge baselines to be used for assessing progress toward dry and wet weather jurisdictional numeric goals for bacteria reductions due to be achieved in future permit terms were calculated and are presented in Table A3-9 and Table A3-10 of Appendix 3.
County of San Diego
Dry Weather
• In accordance with the County's commitment in the WQIP, additional dry weather flow data beyond routine major outfall monitoring was collected from storm drain outfalls during the 2015-2016 monitoring year. A baseline was established using that data. In future years, data will be compared to the baseline to assess progress toward the County's flow reduction goal.
Wet Weather
• Planned programmatic (non-structural) BMPs were implemented according to the schedule in the WQIP to reduce bacteria loads. Continued implementation of these non-structural BMPs through FY 17-18 will achieve a Permit-term goal. • BMPs constructed between 2003 and 2009 were operated and maintained to reduce bacteria loads. Continued operation and maintenance of these structural BMPs through FY 17-18 will achieve a Permit-term goal.

ES.4 CONCLUSION

Data collected in the San Diego River WMA during the 2015-2016 monitoring year support the identified priority and highest priority water quality conditions as provided in the WQIP and provide the information necessary to assess progress. Since the acceptance of the WQIP in February 2016, the Participating Agencies have begun implementing their strategies intended to result in achievement of dry and wet weather interim goals for the term of the current Permit, and progress has been demonstrated toward each goal. The strategies implemented by the Participating Agencies and identified in the WQIP focus on reducing bacteria discharges, but also address other pollutants, providing a multi-benefit approach to implementation.

The Participating Agencies will continue to implement these identified strategies, collect additional monitoring and programmatic data, and assess their progress toward goals on an annual basis. New data and information will be utilized as it becomes available to improve the WQIP with updates to priorities, assessments of and adjustments to goals, updates to strategies to achieve the latest goals, and updates to the MAP as necessary through the adaptive management process.

1 Introduction

The San Diego Regional Water Quality Control Board (Regional Board) regulates discharges from municipal separate storm sewer systems (MS4s) (storm drain systems) in the San Diego Region under the Regional MS4 Permit[1] (Permit) (Regional Board, 2013). The Permit covers portions of San Diego County, southern Orange County, and southwestern Riverside County and regulates Phase I municipalities who own and operate storm drain systems, which discharge stormwater (wet weather) runoff and non-stormwater (dry weather) runoff to surface waters throughout the San Diego Region. One of the main goals of the Permit is to focus on water quality improvement outcomes rather than completing specific actions, giving the Participating Agencies more control over how their stormwater programs are implemented.

Within the Permit, the San Diego Region is sub-divided into 10 watershed management areas (WMAs), which cover the major, natural drainages in the region[2]. The Permit requires the development of a Water Quality Improvement Plan (WQIP) for each WMA, which guides the Participating Agencies' Jurisdictional Runoff Management Programs (JRMPs) (their local plans) towards an outcome-based approach and improved water quality. This process is accomplished through an adaptive planning and management method that identifies the highest priority water quality condition(s) (HPWQC) within a watershed and implements strategies through the WQIP and JRMPs to achieve improvements in the quality of discharges from the storm drain system and within the receiving waters.

Participating Agencies within each WMA are required by the Permit to submit an Annual Report to communicate the implementation status and progress of the WQIPs and corresponding JRMPs in meeting the defined numeric goals[3]. This San Diego River WMA Annual Report covers two reporting periods on different schedules. The first is from July 1, 2015 to June 30, 2016 for the JRMPs and WQIP strategy implementation (note that the WQIP was accepted in February 2016), and the second is from October 1, 2015 to September 30, 2016 for monitoring and assessment programs. Progress to achieve goals may be assessed for either reporting period, depending on the goal metric. This Annual Report, the first under the San Diego River WMA's WQIP, addresses the requirements of the Permit. Table 1-1 provides an overview of the Permit requirements that must be addressed by the Annual Report, and where they are discussed within this document. Appendix 1 includes additional detail regarding the specific Permit requirements as well as where they are addressed within the Annual Report[4]. Appendix 2 provides information related to each jurisdiction's JRMP.

[5]Appendix 1 includes additional detail regarding the specific Permit requirements, as well as where they are addressed within the Annual Report.

This San Diego River WMA Annual Report is structured as follows:

1. **Introduction** – Provides an overview of the Regional MS4 Permit, the WQIP, and the Annual Reporting requirements.

   Appendix 1. Crosswalk of Permit Requirements and Annual Report References

   Appendix 2. Jurisdictional Runoff Management Program Annual Report Certifications and Forms, Strategies, and Changes to the Best Management Practices (BMP) Manual (as applicable)

2. **San Diego River WMA Priorities and Numeric Goals** – Introduces the WMA, the priority water quality conditions (PWQC) and HPWQC for the watershed, and the numeric goals and schedules developed to measure progress in addressing the priority conditions.

   Appendix 3. Water Quality Improvement Plan Numeric Goals

3. **Monitoring and Assessment** – Summarizes the monitoring programs and provides an assessment of the data collected.

   Appendix 4. Monitoring Results and Assessments

4. **Implementation and Progress Towards Achieving Numeric Goals** – Provides a detailed assessment of the progress towards achieving the numeric goals, with a focus on those numeric goals occurring during the Permit term. The section also provides an overview of the strategies implemented to achieve the numeric goals, the status of implementation, and plans for the coming year.

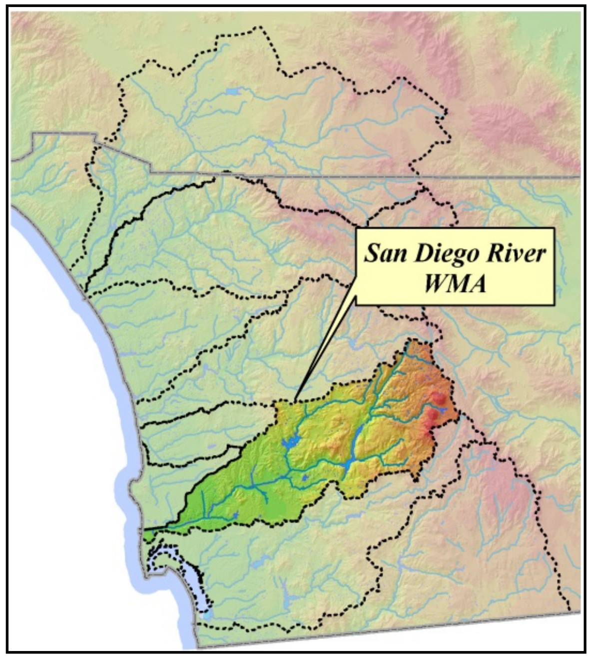
5. **Adaptive Management** – Provides a summary of the elements of the WQIP process that be altered during the course of Permit implementation and any changes that were made as a result of new information realized during the reporting period.

   Appendix 5. Adaptive Management Modifications

6. **Conclusions** – Provides the conclusions that are based on the data collected and assessments conducted during implementation of the WQIP.

7. **References**

2 Overview of San Diego River Watershed



The San Diego River WMA is located in central San Diego County, bordered by the Mission Bay and La Jolla, Peñasquitos, and San Dieguito River WMAs to the north and the San Diego Bay WMA to the south. Major surface water bodies and the municipalities/agencies responsible for stormwater management within the WMA are summarized in Table 2-1. Although the California Department of Transportation (Caltrans) is not a part of the Permit, Caltrans works cooperatively with the Copermittees in accordance with their statewide National Pollutant Discharge Elimination System (NPDES) permit.

The San Diego River WMA (hydrologic unit [HU] 907) encompasses approximately 277,543 acres, or 434 square miles. For the purposes of the San Diego River WMA WQIP, the watershed was separated into upper and lower portions to better focus water quality prioritization JRMP implementation efforts. The upper portion, above the reservoirs, is comprised of the San Vicente (907.2), El Capitan (907.3), and Boulder Creek (907.4) hydrologic areas (HAs), whereas the lower portion, below the reservoirs, is the Lower San Diego (907.1) HA. These HAs are comprised of 14 hydrologic subareas (HSAs).

The San Diego River originates in the Cuyamaca Mountains near Santa Ysabel, over 6,000 feet above sea level along the western border of the Anza Borrego Desert State Park, and extends more than 52 miles across central San Diego County. It ultimately discharges to the Pacific Ocean at Dog Beach in Ocean Beach, a community within the City of San Diego. Additional information is provided in the San Diego River WMA WQIP (Larry Walker Associates et al., 2016). A map of the watershed is shown in Figure 2-1.

Table 2-1. Major Surface Water Bodies and the Municipalities/Agencies Responsible for Stormwater Management within the San Diego River WMA

Hydrologic Unit(s)	Major Surface Water Bodies	Municipalities/Agencies
San Diego River (903.00)	▪ San Diego River ▪ Pacific Ocean	▪ City of El Cajon ▪ City of La Mesa ▪ City of San Diego ▪ City of Santee ▪ County of San Diego ▪ Caltrans[6]

[6]Caltrans is regulated under a separate permit from the State Water Resources Control Board (Order No. 2012-0011 DWQ). However, Caltrans has voluntarily participated in the development of Water Quality Improvement Plans throughout the San Diego Region.

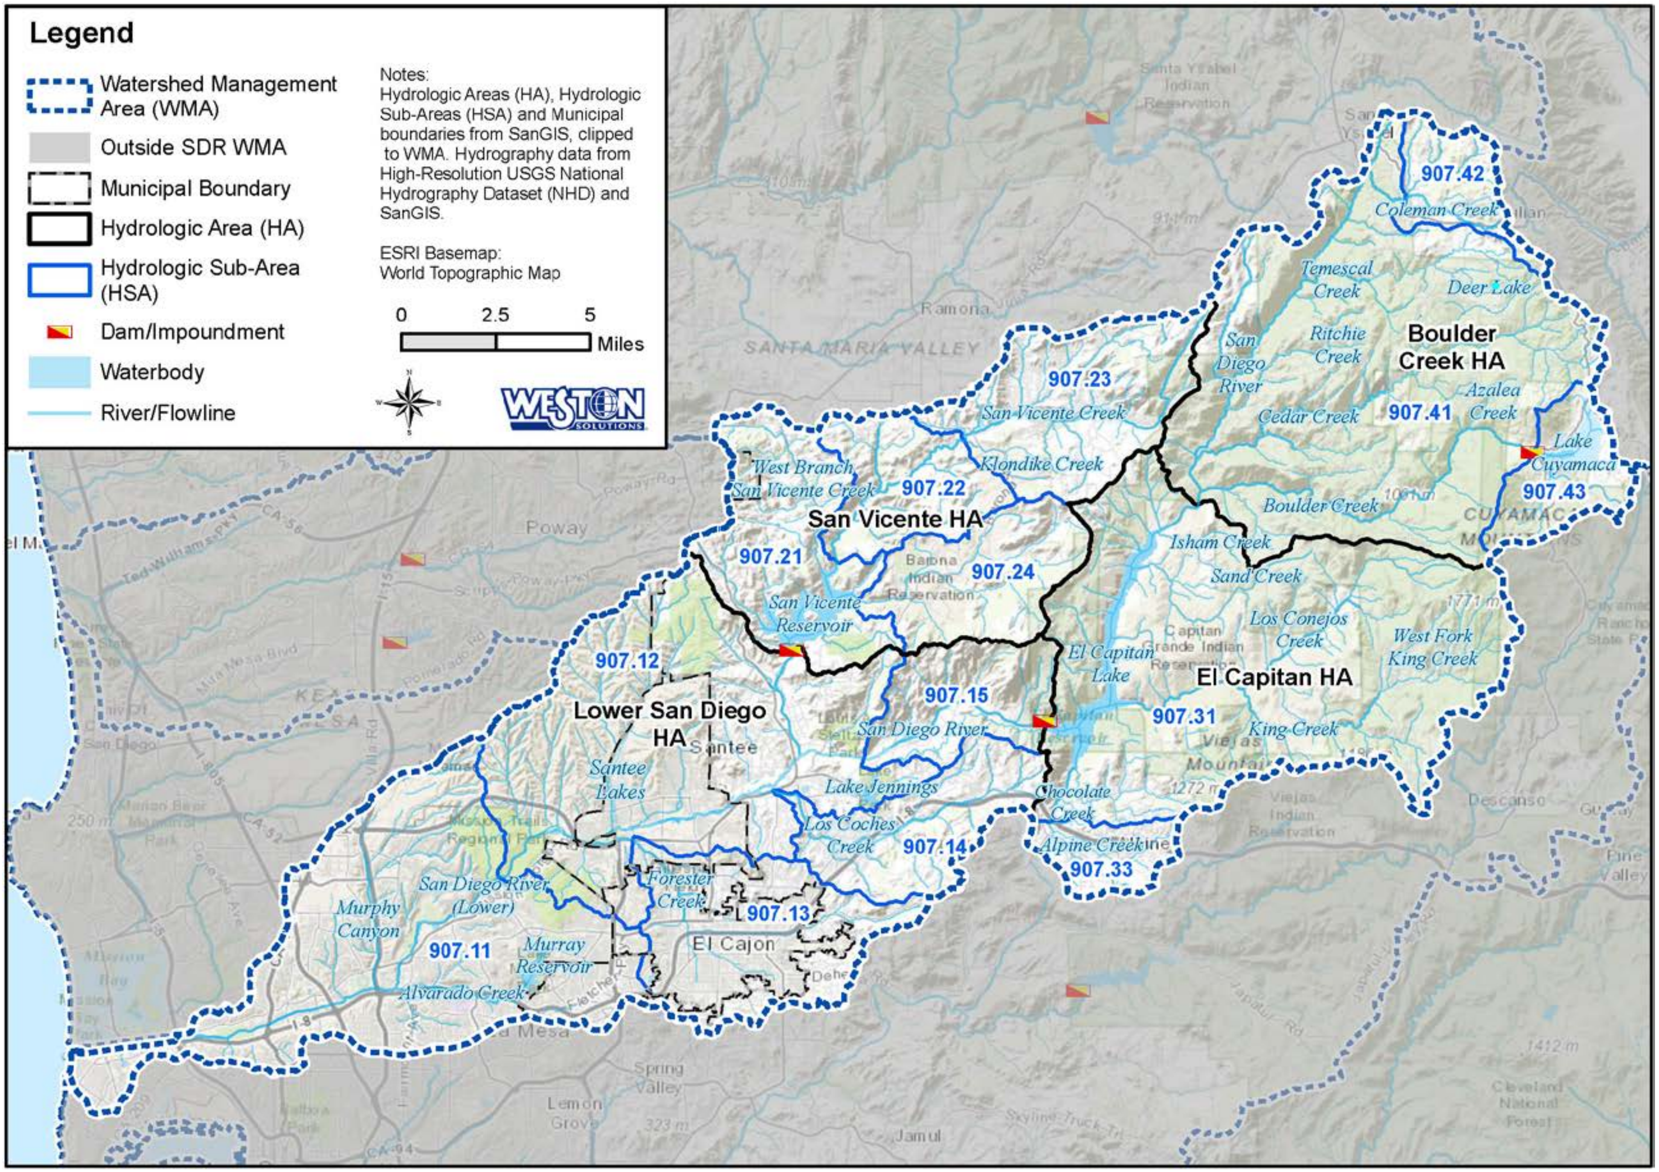


Figure 2-1. San Diego River Watershed Management Area

The total annual rainfall in the San Diego Region during the reporting period (October 2015 through September 2016), as measured at San Diego International Airport-Lindbergh Field, was 8.21 inches. Despite El Niño conditions reported by the National Weather Service (NWS) Climate Prediction Center through the spring of 2016 (National Oceanic and Atmospheric Administration [NOAA], 2016a), this total is below the historical (1939 to 2016) annual mean of 9.85 inches. The majority of the rainfall during the 2015-2016 reporting period fell during November and January, and rainfall was above average for those months (Western Regional Climate Center [WRCC], 2016). Long-term drought conditions persisted in the San Diego region during the 2015-2016 monitoring year, and temperatures were generally above average (NOAA, 2016b).

Annual rainfall at four Alert System Precipitation Gauges (http://sdcfcd.org/whatalert.html) in the San Diego River WMA, all within the Lower San Diego HA, is shown in Figure 2-2. Annual rainfall totals at these stations ranged from 11.87 to 15.63 inches. Precipitation totals at the Alert Stations are provided for the fiscal year (FY) (July 1, 2015 to June 30, 2016) for consistency with the wet weather storm drain outfall assessments presented in Appendix 4. The rainfall total at Lindbergh field for FY 2015-2016 was 10.82 inches (WRCC, 2016).

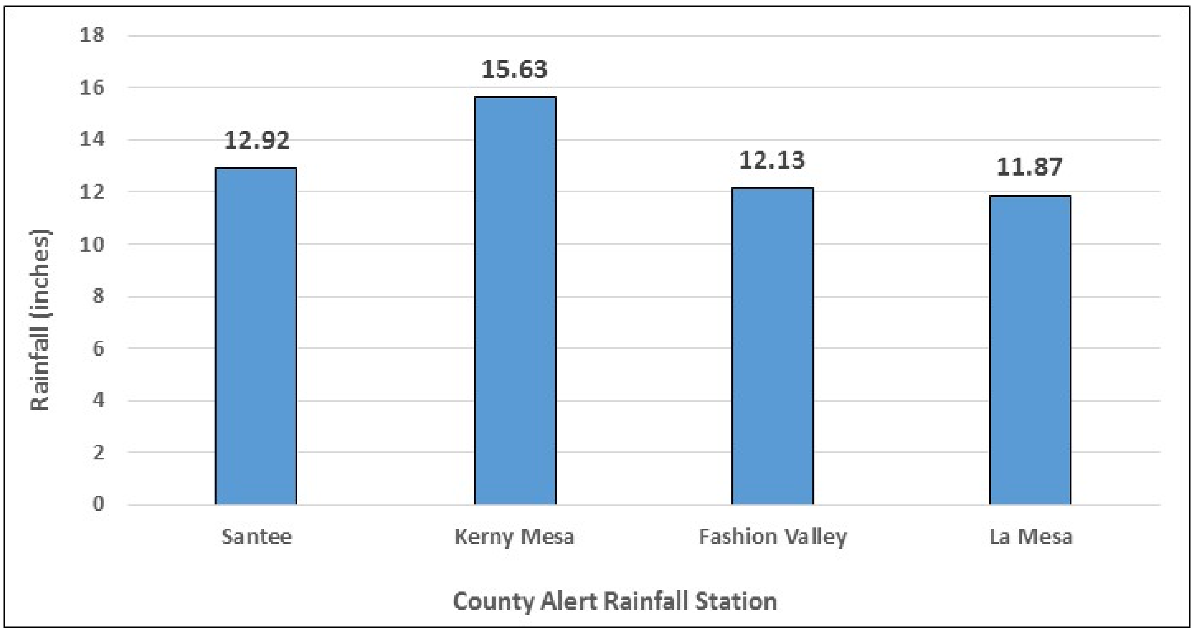

Figure 2-2. Total Precipitation at Four County Alert Weather Stations in the Lower San Diego HA, July 1, 2015 to June 30, 2016

2.1 SAN DIEGO RIVER WATER QUALITY IMPROVEMENT PLAN

The WQIP for the San Diego River WMA identifies strategies that will be implemented through JRMPs to address bacteria in pursuit of measurable numeric goals that will achieve improvements in the quality of storm drain outfall discharges and, in turn, the receiving waters. The WQIP outlines how the Participating Agencies within the watershed are evaluating water quality conditions, prioritizing those water quality conditions, and using these common priorities to guide jurisdictional and watershed scale programs to address the highest priorities.

Figure 2-3 illustrates the general planning, implementation, monitoring, and adaptive management process and the text that follows briefly describes the components of the WQIP.

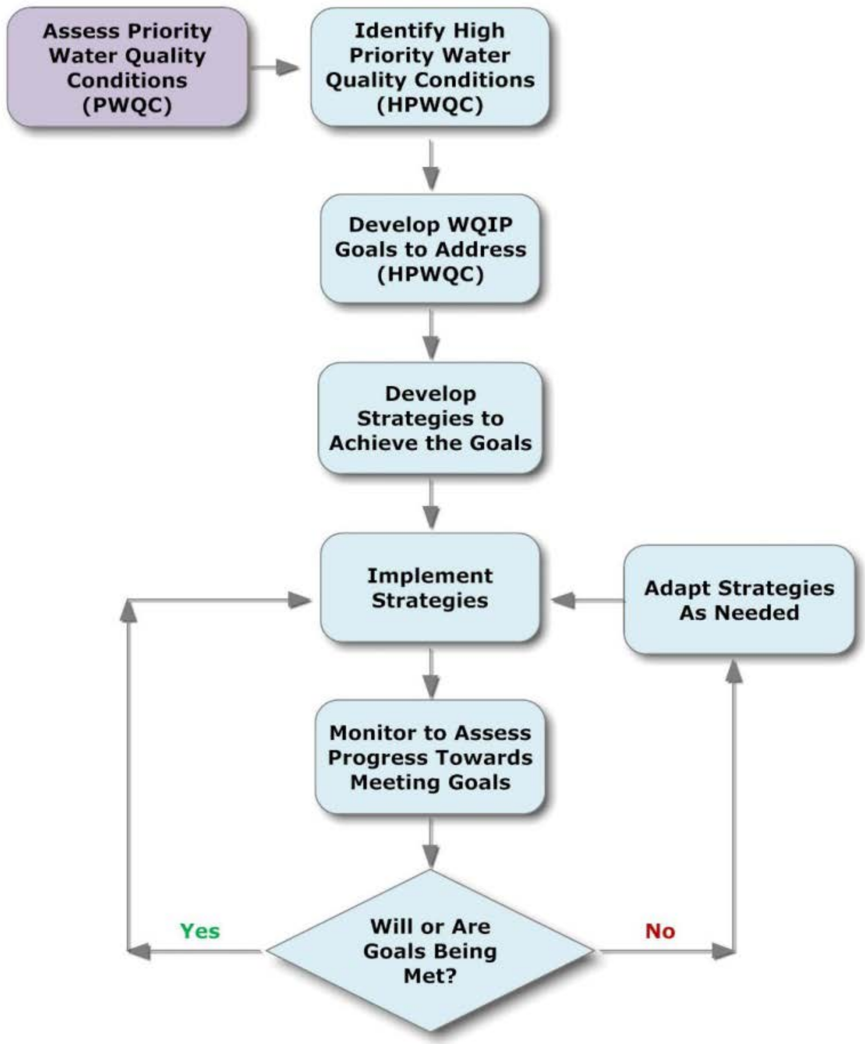

Figure 2-3. Water Quality Improvement Plan Process

The complete WQIP document contains the following components, identified in the 2013 Permit:

- Priority Water Quality Conditions.
- Goals, Strategies, and Schedules.
- Watershed Management Area Analysis (WMAA), which the Permit indicates is optional.

- Monitoring and Assessment Program (MAP), which also documents how the Participating Agencies will comply with the applicable monitoring and assessment portions of the Permit.
- Iterative Approach and Adaptive Management Process.

The complete WQIP was provided to the Regional Board on June 26, 2015. Appropriate revisions were made to address public comments and Regional Board concerns, and a revised WQIP was submitted to the Regional Board for acceptance on September 29, 2015. The Regional Board advised the San Diego River WMA Copermittees on January 7, 2016 that minor deficiencies remained, and provided proposed corrections on January 29, 2016. The Regional Board accepted the revised San Diego River WQIP, with the proposed corrections, on February 12, 2016. WQIP documents can be accessed on the Regional Board website: http://www.waterboards.ca.gov/sandiego/water_issues/programs/stormwater/wqip.shtml.

2.2 PRIORITY AND HIGH PRIORITY WATER QUALITY CONDITIONS

Using the methodology outlined in the WQIP, bacteria was identified as the HPWQC for the San Diego River WMA. The HPWQC and additional priority water quality conditions (PWQCs) for the WMA are summarized in Table 2-2. Each of the water bodies listed in Table 2-2 are located in the Lower San Diego HA except El Capitan Lake and San Vincente Reservoir, which are located in the El Capitan and San Vincente HAs, respectively. Additional information is provided in Section 2 and Appendix 2D of the WQIP.

Table 2-2. San Diego River WMA Priority Water Quality Conditions

Constituent	Wet	Dry	Beneficial Use*	Geographic Area
Highest Priority Water Quality Condition				
Bacteria	X	X	REC-1 (water contact recreation)	Forester Creek, Pacific Ocean Shoreline at San Diego River Outlet, Lower San Diego River
Priority Water Quality Conditions				
Eutrophic Conditions		X	MAR (marine habitat)	Famosa Slough and Channel
Total Dissolved Solids (TDS)		X	IND (industrial service supply)	Forester Creek
			AGR (agricultural supply)	Lower San Diego River
Nitrogen		X	WARM (warm freshwater habitat)	Murray Reservoir, Lower San Diego River
			MUN (municipal and domestic supply)	El Capitan Lake
Phosphorus		X	WARM (warm freshwater habitat)	Lower San Diego River
Index of Biotic Integrity (IBI)		X	WARM (warm freshwater habitat)	Lower San Diego River
Total Nitrogen as N		X	MUN (municipal and domestic supply)	San Vincente Reservoir

* Source: Water Quality Control Plan for the San Diego Region (Basin Plan) (Regional Board, 1994).

Bacteria are important indicators of water quality for recreational users like surfers, swimmers, and beach waders. Indicator bacteria are used as detection surrogates or proxies for pathogens because they are easier and less costly to measure. Allowable bacteria loads for the watershed are defined by the Bacteria Total Maximum Daily Load (TMDL)[7], which requires the Participating Agencies to improve water quality in local waters during both dry weather and wet weather conditions within a 10- and 20-year compliance timeline, respectively (see Section 2.3).

2.3 WATER QUALITY IMPROVEMENT PLAN NUMERIC GOALS

The Participating Agencies identified and developed specific water quality improvement numeric goals and strategies to address bacteria within the WMA. The numeric goals (interim and final) and corresponding schedules support implementation of the WQIP and measure reasonable progress towards addressing bacteria. In addition, the Participating Agencies' monitoring and assessment programs measure progress towards attaining these goals.

The numeric goals for the San Diego River WMA WQIP are designed to demonstrate progress towards compliance with the Bacteria TMDL, which differentiates between wet and dry conditions. Since wet weather bacteria loads are more challenging to control, the wet and dry TMDL targets and load reductions have different schedules. The targets for dry and wet weather are on a 10- and 20-year timeline, respectively. As a result, the goals extend beyond the timeframe of the current Permit. For this reason, the numeric goals within the WQIP are categorized into three distinct time periods:

1. Interim goals within the five-year Permit term. These goals are specific to each Participating Agency's jurisdiction.
2. Interim goals based on the interim Bacteria TMDL compliance pathways.
3. Final goals based on final Bacteria TMDL compliance options.

Attachment E.6 of the Permit outlines interim dry and wet weather TMDL compliance dates of April 4, 2017 and April 4, 2021, respectively. The Permit allows the Participating Agencies to propose alternative schedules. The Participating Agencies proposed moving the interim TMDL compliance dates for dry and wet weather to April 4, 2020 and April 4, 2028, respectively. These dates were proposed to allow adequate time to investigate and mitigate sources of bacteria and to monitor progress and adjust implementation through the adaptive management process. The detailed numeric goals for the San Diego River WMA are presented by jurisdiction in Appendix 3, and the timeline for achievement of these goals is shown in Figure 2-4.

[7]Revised TMDL for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (including Tecolote Creek). Resolution No. R9-2010-0001. Approved February 10, 2010.

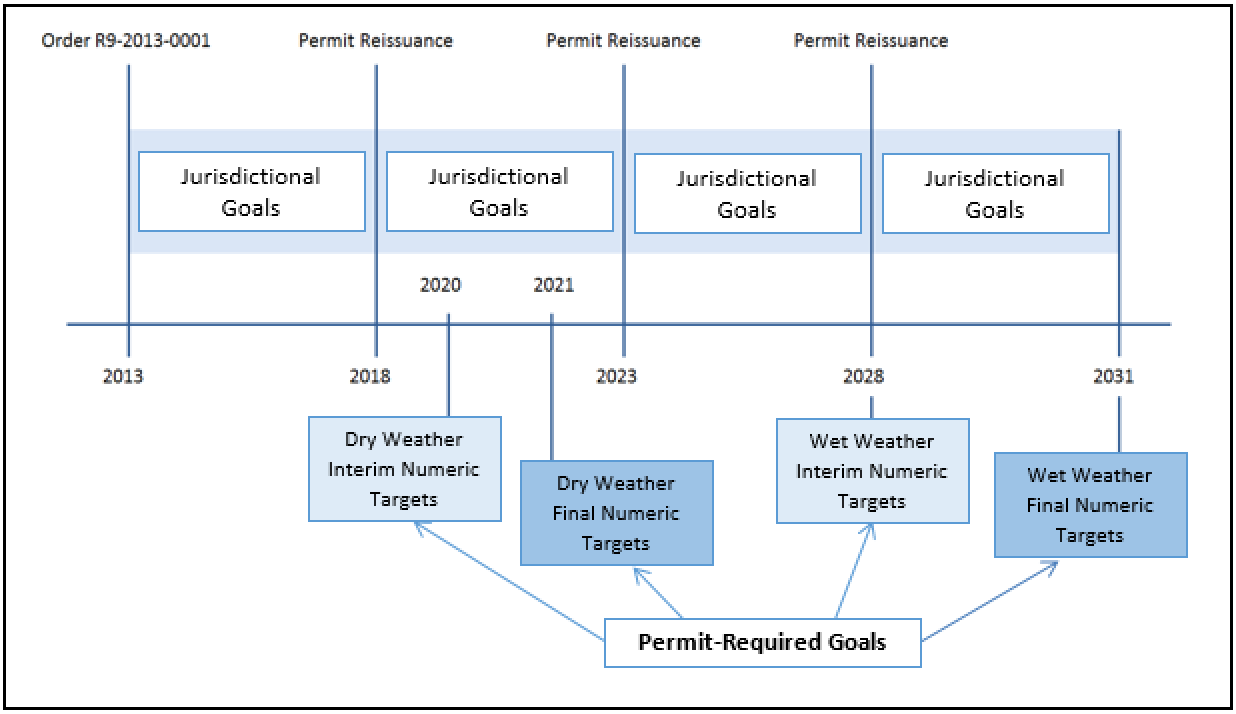

Figure 2-4. Timeline for Achievement of Bacteria TMDL Numeric Targets in the San Diego River WMA

3 Monitoring and Assessment

The Permit requires an outcome-based approach to improve water quality in stormwater and non-stormwater discharges, guided by strategies and goals identified in the WQIP. By conducting multiple types of monitoring activities, the Participating Agencies are collecting data to evaluate progress toward achieving numeric goals, and determine if modifications to stormwater program activities are necessary. Caltrans is not a Participating Agency for the monitoring and assessment program described in this section, as Caltrans is regulated under a separate permit from the State Water Resource Control Board.

This Annual Report assesses the data collected within the San Diego River WMA in combination with the Participating Agencies' management actions to determine what actions are improving the quality of storm water outfall discharges and/or receiving water conditions (Section 4) and where additional actions may be necessary (Section 5).

The Monitoring and Assessment Program includes five major components:

1. Receiving water monitoring that measures the long-term health of the watershed during dry and wet weather conditions;
2. Storm drain outfall discharge monitoring program that investigates illicit non-stormwater flows from outfalls and measures changes in the quality of discharges from the storm drain system during wet weather;
3. Special studies that look further into the sources, pollutants, and/or stressors that contribute to bacteria;
4. Illicit Discharge Detection and Elimination (IDDE) investigations and inspections of potential pollutant sources; and
5. Monitoring to assess progress toward goals and schedules.

This section describes results from the implementation of the MAP for the WMA as they pertain to bacteria. The MAP was developed and implemented to accomplish the following objectives:

1. Measure the progress toward addressing bacteria;
2. Assess the progress toward achieving the numeric goals, strategies, and schedules; and
3. Evaluate each Participating Agency's overall efforts to implement the WQIP.

Because bacteria was identified as the HPWQC for the WMA, monitoring is being conducted to characterize bacteria levels in discharges from storm drain outfalls, to identify potential sources of bacteria, and to assess the effectiveness of strategies designed to address bacteria. Additionally, these programs will generate data to track the PWQCs and the general health and conditions within the watershed.

Monitoring programs where information related to bacteria was collected during the 2015-2016 monitoring year (October 1 – September 30) are shown in Table 3-1. Relevant results from these programs from the 2015-2016 monitoring year are summarized in the sections below, with details provided in Appendix 4. Monitoring program results not directly related to bacteria, such as the Southern California Stormwater Monitoring Coalition (SMC) regional program, are presented in Appendix 4, including results as they relate to other PWQCs.

Table 3-1. Monitoring Programs Relevant to Bacteria for the San Diego River Watershed

Monitoring Program	Supports HPWQC and Summarized Below	
	Yes	No
Receiving Water Monitoring		
Long Term Monitoring at Mass Loading Station[1]		X[2]
Regional (SMC)		X[3]
Sediment Quality		X[3]
TMDL	X	
Storm Drain Outfall Monitoring		
Field Screening	X	
Dry Weather Monitoring	X	
Wet Weather Monitoring	X	
Illicit Discharge Detection and Elimination	X	
Special Studies	X	
Additional Monitoring to Assess Progress toward Goals and/or Strategies		X

[1]HMP monitoring was also conducted regionally. One reference station was located in the San Diego River WMA. The objectives and results of the program are summarized in Appendix 4.

[2]Long-term receiving water monitoring includes bacteria sampling but was conducted during the 2013-2014 monitoring year. Results can be found in the Transitional Monitoring and Assessment Report (WESTON, 2015a).

[3]No bacteria data are collected for these programs.

3.1 RECEIVING WATER MONITORING

The purpose of the receiving water monitoring program is to characterize trends in the chemical, physical, and biological conditions of a receiving water to determine whether beneficial uses are being protected, maintained, or enhanced. An overview of the receiving water monitoring program activities for the San Diego River WMA for the current Permit term is presented in Table 3-2. A summary of the results from each of these programs for the 2015-2016 monitoring year with respect to bacteria is presented below. Additional details and results for programs not related to bacteria in the WMA are presented in Appendix 4.

The receiving water assessments required by the Permit will be addressed in the Regional Monitoring and Assessment Report (RMAR), which will be submitted to the Regional Board in December 2017 with the Report of Waste Discharge (ROWD).

Table 3-2. Elements of Water Quality Improvement Plan Receiving Water Monitoring

Monitoring Programs		Dry	Wet	Monitoring Element	Permit Schedule[a]				
					2013-2014[b]	2014-2015	2015-2016	2016-2017	2017-2018

Bacteria TMDL[d]		X	X	Bacteria	●	●	●	●	●

SMC = Southern California Stormwater Monitoring Coalition; Bight = Southern California Bight Regional Monitoring Program; TIE=Toxicity Identification Evaluation; TRE=Toxicity Reduction Evaluation

a. The Permit was adopted on May 8, 2013, and became effective on June 27, 2013.

b. Completed under the Transitional Monitoring Program.

c. The 2018 Southern California Bight Regional Monitoring will occur during the summer of 2018 or 2019.

d. Includes Forester Creek, Lower San Diego River, and Dog Beach.

3.1.1 Regional Monitoring Participation

Regional monitoring includes studies that provide information to evaluate various aspects of receiving water health on a regional scale. The Participating Agencies participated in the SMC Regional Monitoring Program during the 2015-2016 monitoring year. Because data collected under this program do not include bacteria, results are not included in this section. Detailed results are presented in Appendix 4 and its attachments, including results related to PWQCs.

3.1.2 Total Maximum Daily Load Monitoring

In February 2010, the Regional Board adopted Resolution No. R9-2010-0001, *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) to Incorporate Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)* (Bacteria TMDL) (Regional Board, 2010). This TMDL amendment to the Water Quality Control Plan for the San Diego Region (Basin Plan) (Regional Board, 1994) includes three segments within the San Diego River WMA, Forester Creek, the Lower San Diego River, and the Pacific Ocean Shoreline at San Diego River mouth at Dog Beach. The Participating Agencies within the WMA that are named as responsible in the

TMDL are summarized in Table 3-3. The compliance requirements and monitoring and reporting requirements of the TMDL have been incorporated into Attachment E.6 of the Permit.

Table 3-3. Bacteria TMDL Responsible Agencies in the San Diego River WMA

Waterbody Segment	Responsible Agencies
Forester Creek	▪ City of El Cajon ▪ City of Santee ▪ County of San Diego
Lower San Diego River	▪ City of El Cajon ▪ City of La Mesa ▪ City of Santee ▪ City of San Diego ▪ County of San Diego
Pacific Ocean Shoreline at San Diego River mouth at Dog Beach	

The goal of the Bacteria TMDL is to achieve the necessary pollutant load reductions to restore and protect the designated beneficial use of water contact recreation (REC-1), as it is designated within the Basin Plan. The purpose of the TMDL monitoring program is to assess progress toward achieving compliance with the interim and final TMDL numeric targets. The data collected as part of this program can be used to assess the receiving water compliance pathway toward reaching interim and long-term goals in future years. The data generated are used to address the following questions:

- Are TMDL numeric targets for indicators being met at the compliance monitoring locations?
- Are levels of bacteria decreasing at the compliance monitoring locations?

During the monitoring year (October 1, 2015 through September 30, 2016), sampling was conducted during wet and dry weather at five receiving water monitoring locations: one beach location at the Pacific Ocean Shoreline at Dog Beach (FM-010), and four creek locations, two along Forester Creek in the Santee HSA and two along the Lower San Diego River in the Mission San Diego HSA (Figure 3-1, Table 3-4, Table 3-5). This was the third year of monitoring in accordance with the Bacteria TMDL. Samples were analyzed for the indicator bacteria compliance constituents (fecal coliform and *Enterococcus* for creeks; total coliform, fecal coliform, and *Enterococcus* for beaches) in accordance with the requirements of Attachment E.6 of the Permit.

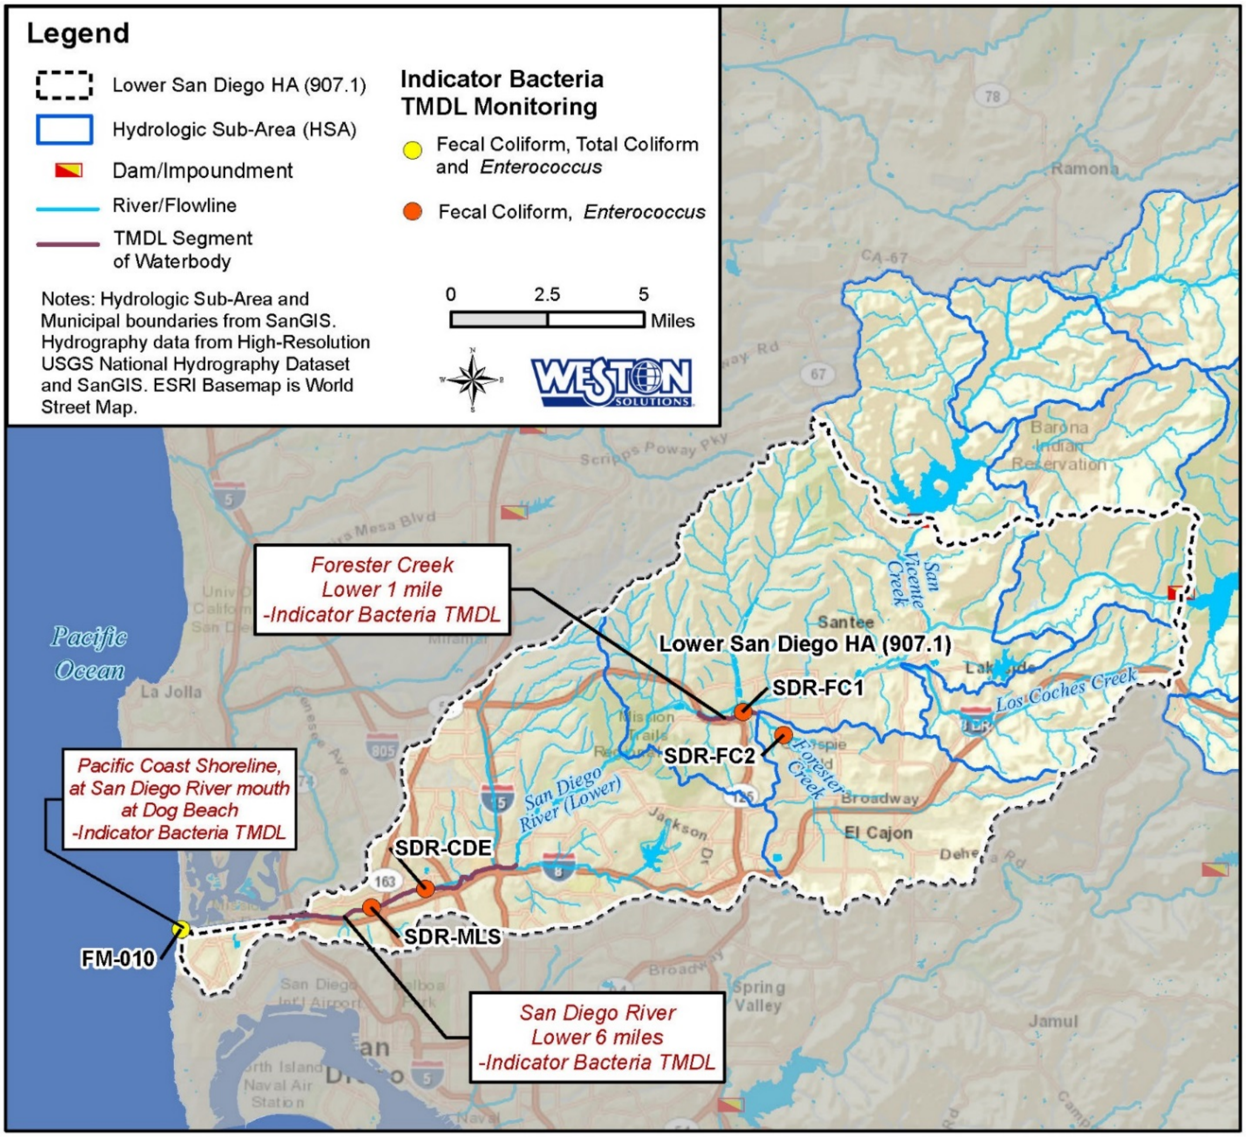

Figure 3-1. Bacteria TMDL Compliance Monitoring Locations in the San Diego River WMA

Table 3-4. 2015-2016 Bacteria TMDL Beach Monitoring Summary for the San Diego River WMA

Season	Date Range	Event Type	Event Frequency	Monitoring Location	Samples Per Site Per Event[a]	Total Number of Samples
2015-2016 Wet Season	10/01/2015-04/30/2015	Wet	Three storm events	FM-010	1	3
	10/01/2015-03/30/2016	Dry	Monthly			6
	04/01/2016-04/30/2016	Dry	Weekly[b]			5
2016 Dry Season	05/01/2016-09/30/2016	Dry	Weekly[b]			25

[a] Quality assurance (QA) or replicate samples not included.
[b] A minimum of 5 samples are collected in a 30-day period.

Table 3-5. 2015-2016 Bacteria TMDL Creek Monitoring Summary for the San Diego River WMA

Season	Date Range	Event Type	Event Frequency	Monitoring Location	Samples Per Site Per Event[a]	Total Number of Samples
2015-2016 Wet Season	10/01/2015-04/30/2015	Wet	Three storm events	SDR-MLS SDR-CDE SDR-FC1 SDR-FC2	1	12
	10/01/2015-03/30/2016	Dry	Monthly			24
	04/01/2016-04/30/2016	Dry	Weekly[b]			20
2016 Dry Season	05/01/2016-09/30/2016	Dry	Weekly[b]			100

[a] Quality assurance (QA) or replicate samples not included.

[b] A minimum of 5 samples are collected in a 30-day period.

Table 3-6 presents the exceedance rates for each indicator bacteria across the five monitored stations within the San Diego River WMA. The exceedances observed during the 2015-2016 monitoring year do not indicate non-compliance with the Permit or the Bacteria TMDL at this time. Progress toward meeting water quality based effluent limitations (WQBELs), in terms of interim and final receiving water limitations, is presented in Table 3-7 for each analyzed constituent at the five monitoring stations. Interim WQBELs are not required to be achieved until 2020 for dry weather and 2028 for wet weather, while final WQBELS must be achieved by 2021 for dry weather and 2031 for wet weather. Based on the sampling data from the 2015-2016 monitoring year, receiving water limitations that have already been achieved are indicated by (●), whereas receiving water limitations that have not yet been achieved are indicated by (X).

In summary, interim and final WQBELs are being met at FM-010 with the exception of the dry season geometric mean for *Enterococcus*. There were also no exceedances of geometric means for fecal coliform at SDR-CDE during the dry and wet seasons, and at SDR-FC2 and SDR-MLS during the wet season. Both interim and final receiving water limitations are being achieved for these analytes at these locations. All other results did not meet the interim or final receiving water limitations, which are not required to be achieved during this Permit term. Additional details are presented in the TMDL report attached to Appendix 4 of this Annual Report.

Table 3-6. 2015–2016 Exceedance Frequency Results: San Diego River WMA

Segment	Monitoring Location	Bacteria TMDL Constituent	2016 Dry Season Geometric Mean (CFU/100 mL)	2015-2016 Wet Season Geometric Mean (CFU/100 mL)	2015-2016 Wet Weather Single-Sample Maximum (CFU/100 mL)
Forester Creek	SDR-FC1	*Enterococcus*	100%	100%	100%
		Fecal Coliform	100%	80%	100%
	SDR-FC2	*Enterococcus*	100%	100%	100%
		Fecal Coliform	52%	0%	100%
San Diego River	SDR-MLS	*Enterococcus*	100%	90%	100%

3.2 STORM DRAIN OUTFALL MONITORING

The purpose of Storm Drain Outfall Monitoring is to evaluate the potential impacts from storm drain outfall discharges on the beneficial uses of a waterbody during dry and wet weather conditions. In addition, under dry conditions, the program is used to assess the ability of jurisdictional and watershed programs to effectively eliminate non-stormwater discharges to waterbodies. The data generated are used to identify and quantify pollutants in discharges, guide pollutant source identification efforts, and track progress towards achieving numeric goals set forth in the WQIP.

An overview of the conducted and planned storm drain outfall monitoring activities for the San Diego River watershed for the current Permit term is presented in Table 3-8.

Table 3-8. Elements of Storm Drain Outfall Monitoring During the Current Permit Term

Monitoring Programs	Dry	Wet	Monitoring Element	Permit Schedule[a]				
				2013-2014[b]	2014-2015	2015-2016	2016-2017	2017-2018
Field Screening	X		Visual: flow condition, presence and assessment of trash in and around the station, IC/IDs, descriptions	●	●	●	●	●
Storm Drain Outfall	X		Field parameters, conventionals, bacteria, nutrients, metals	-	-	●	●	●

Illicit Discharge Detection and Elimination	X		Visual surveys, field parameter testing, analytical testing and follow-up investigations, if warranted	–	–	●	●	●

IC/ID – Illegal connection and illicit discharge

a. The Permit was adopted on May 8, 2013 and became effective on June 27, 2013.

b. Completed under the Transitional Monitoring Program.

The major storm drain outfalls currently included in the storm drain outfall discharge monitoring station inventory for the WMA are shown in Figure A4-3 in Appendix 4.

The number of major outfalls monitored under each element of the Storm Drain Outfall Monitoring Program by each Participating Agency in the WMA is provided in Table 3-9. In accordance with the Permit, Participating Agencies with fewer than 125 major storm drain outfalls in their inventory must conduct field screening at 80% of these major outfalls twice per year. The City of San Diego has more than 500 major storm drain outfalls within its jurisdiction and is required to annually screen 500 of these outfalls city-wide (but not within each watershed) in accordance with the Permit.

Table 3-9. Number of Monitored Major Storm Drain Outfalls per Participating Agency in San Diego River WMA

Participating Agency	Field Screening	Dry Weather Monitoring	Wet Weather Monitoring
County of San Diego	51	5	1
City of El Cajon	33	5	1
City of La Mesa	13	5	1
City of Santee	63	5	1
City of San Diego	65	5	1

3.2.1 Storm Drain Outfall Dry Weather Monitoring

Storm drain outfall dry weather monitoring consisted of dry weather field screening, IDDE investigations, and highest priority storm drain outfall analytical monitoring. These programs are summarized in the following subsections and are described in greater detail in Appendix 4.

3.2.1.1 Dry Weather Field Screening and Outfall Prioritization

Field screening is visual monitoring of major storm drain outfalls as outlined in Table D-5 of the Permit. Field screening observation results included the following:

- Field screening trash assessment results indicated that there was no trash or a low presence of trash during most (95%) of the trash assessments (n = 375) at visited outfalls.
- Flow conditions recorded during routine field screening indicated that 59% of the observations made by the County of San Diego, 60% made by the City of El Cajon, 60% by the City of Santee, 25% made by the City of San Diego, and 8% made by the City of La Mesa indicated dry conditions/no flow. Flow was observed during 30% or less of the visits conducted by each Participating Agency.
- When flow was observed during visual observations, the majority of estimated flow rates were low, with 75 of 113 estimations categorized as less than five gallons per minute.

Based on these field screening visits and historical data as needed and available, the Participating Agencies determined the flow status of each major storm drain outfall as persistent, transient, dry, tidal, or undetermined. The numbers of storm drain outfalls in each category are shown by Participating Agency in Table 3-10. These flow determinations are shown with the locations of the storm drain outfalls in Figure A4-6 in Appendix 4. Overall, since the 2014-2015 monitoring year, the number of undetermined outfalls in the WMA has been reduced from 7 to 2, and the number of outfalls identified as persistent increased by 11 (WESTON, 2016) based on an additional year of field screening. No modifications to field screening monitoring locations or frequencies are planned for the 2016-2017 monitoring year in the San Diego River WMA.

Table 3-10. 2015-2016 Dry Weather Storm Drain Outfall Flow Determinations for the San Diego River WMA

Participating Agency	Persistent	Transient	Dry/ No Flow	Undetermined	Grand Total
County of San Diego	8	17	25	1	51
City of El Cajon	8	7	18	0	33
City of La Mesa	10	2	1	0	13
City of San Diego	35	18	11	1	65
City of Santee	16	20	27	0	63
GRAND TOTAL	**77**	**64**	**82**	**2***	**225**

*One City of San Diego outfall has been tidal on all visits except one when dry, and one County outfall is a new site with only one visit.

The list of prioritized outfalls based on field screening results is maintained and updated as program implementation develops and monitoring occurs. The highest priority outfalls for each jurisdiction in the San Diego River WMA during the 2015-2016 monitoring season are summarized in Table 3-11. These outfalls are also presented in Figure 3-2, which shows the dry and wet weather storm drain outfall monitoring locations in the WMA.

Table 3-11. Highest Priority Outfalls in the San Diego River WMA During the 2015-2016 Monitoring Year

Participating Agency	Station
County of San Diego	MS4-SDR-036, MS4-SDR-064, MS4-SDR-127, MS4-SDR-151, MS4-SDR-207
City of El Cajon	OF-3, OF-5, OF-13, OF-15A, OF-16
City of La Mesa	OF-ALV-6, OF-ALV-7, OF-ALV-9, OF-ALV-12, OF-ALV-13
City of Santee	E5g1, RCP1, R20a, S15h, S5c
City of San Diego	DW0067, DW0081, DW0369, DW0681*, DW0696

*Upstream location sampled.

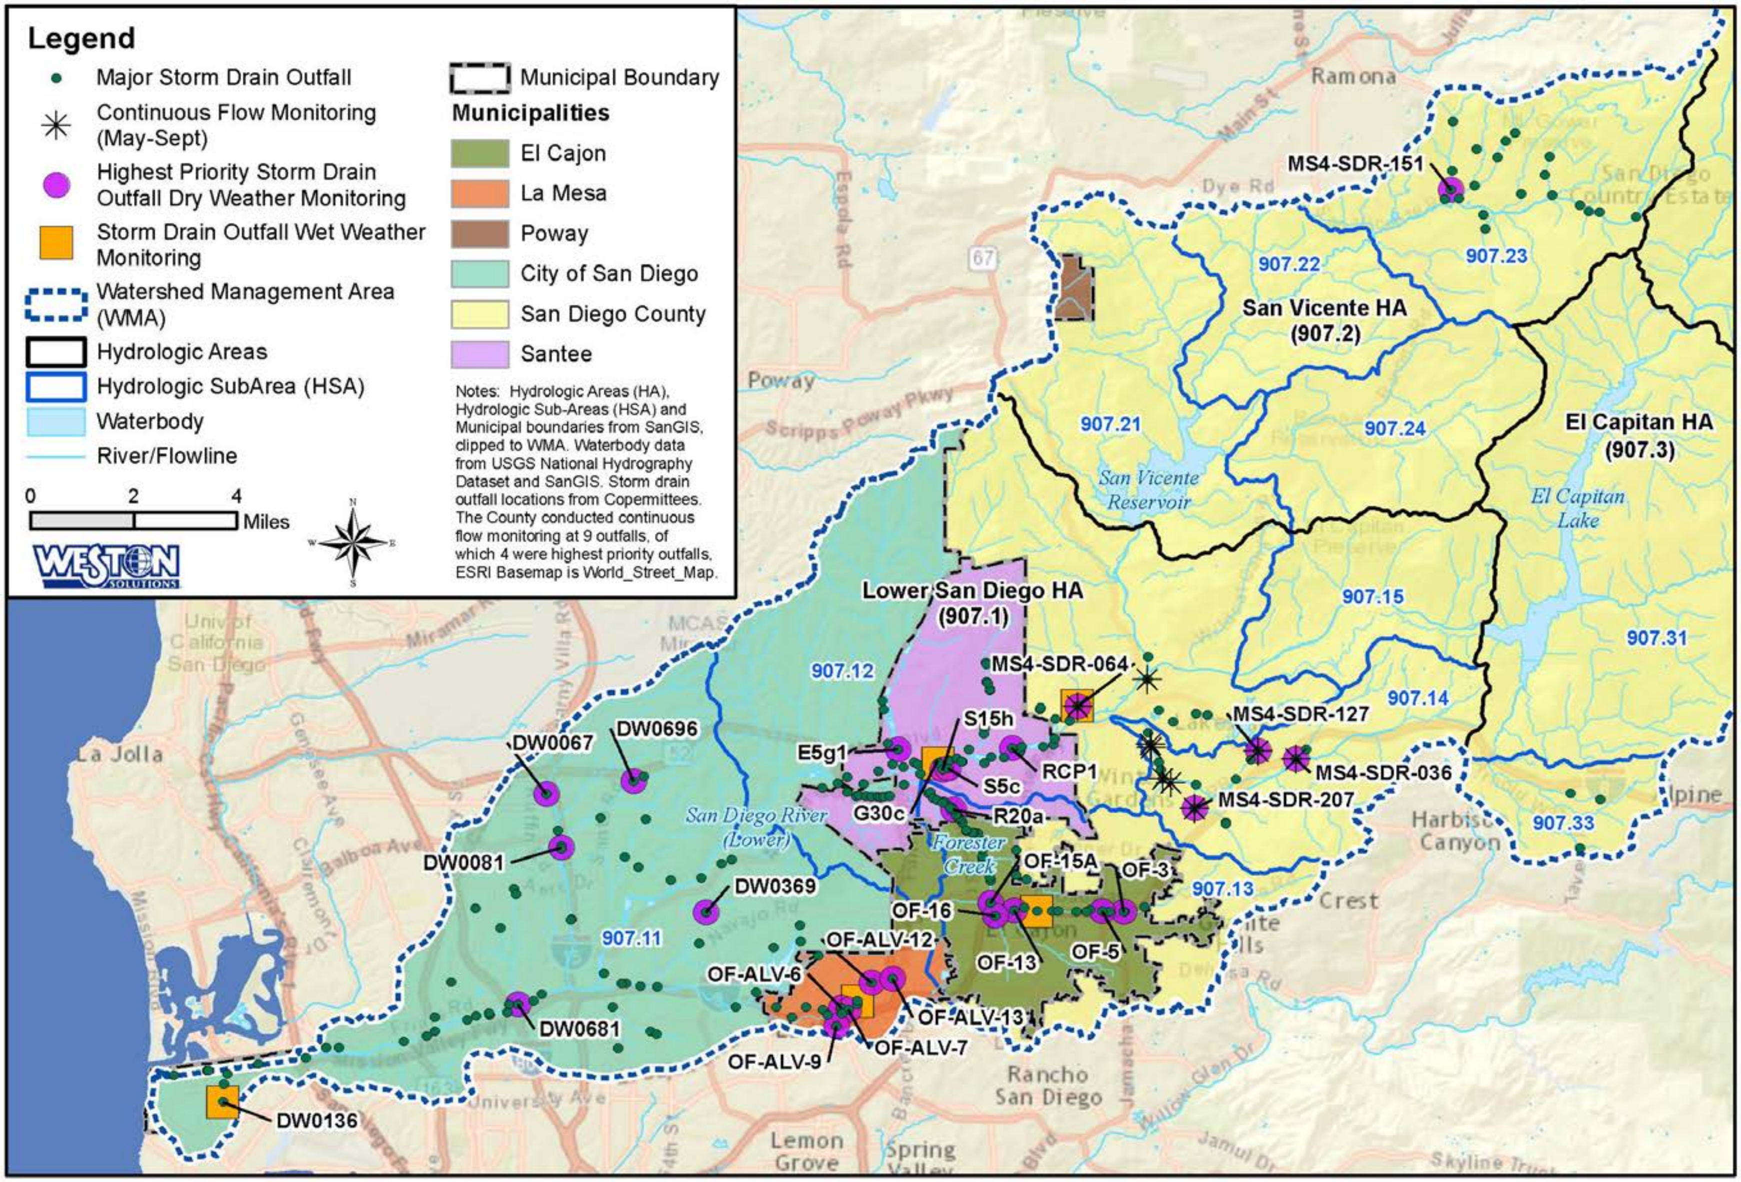

Figure 3-2. 2015-2016 Dry and Wet Weather Storm Drain Outfall Monitoring Locations in the San Diego River WMA

3.2.1.2 Highest Priority Storm Drain Outfall Dry Weather Monitoring

The purpose of the highest priority storm drain outfall dry weather monitoring is to evaluate the potential contribution from storm drain outfall discharges to receiving water quality during dry weather and to assess the ability of programs to effectively eliminate non-stormwater discharges to waterbodies or waterways.

The 2015-2016 monitoring year was the first year of dry weather storm drain outfall analytical sampling under the WQIP MAP, and monitoring was conducted at the highest priority outfalls identified for each Participating Agency in the WMA (Table 3-11). These monitored outfalls are shown in Figure 3-2. Two sampling events were conducted at most outfalls. However, one outfall under the jurisdiction of the County of San Diego and one under the jurisdiction of the City of Santee were sampled only once due to lack of flow. For sampled outfalls, grab samples were collected and analyzed for pH, temperature, conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria and composite samples were collected and analyzed for constituents contributing to the HPWQC, 303(d) List impairments, constituents with non-stormwater action levels (NALs), and those listed in Table D-7 of the Permit. Observational and hydrologic data were also recorded.

Enterococcus concentrations were above the instantaneous maximum (IM) NAL except in both samples from DW0067 and one of two samples collected at OF-5, OF-16, OF-ALV-7, OF-ALV-9, and DW0081. Fecal coliform concentrations were above the IM except in both samples from MS4-SDR-036, OF-ALV-7, DW0067, DW0081, and DW0369 and one of two samples collected at MS4-SDR-207, OF-3, DW0696, and DW0681UP01. Detailed results are presented in Sections 4.2.2 (data) and 4.2.3 (assessments) of Appendix 4. These highest priority outfalls were a specific focus for IDDE investigations during the 2015-2016 monitoring year (Section 3.2.1.3).

No re-prioritizations of the highest priority outfalls are planned for the 2016-2017 monitoring year in the San Diego River WMA. The highest priority outfalls selected for analytical monitoring in 2015-2016 will continue to be monitored until one of the following conditions outlined in the Permit have been met:

- No flowing or standing water observed over the three most recent consecutive visits.
- No exceedances of NALs.
- Identified as a non-stormwater discharge authorized under a separate NPDES permit.

When an outfall fulfills one of these criteria or the threat to water quality has been reduced (as outlined in the Permit), it will be replaced with the next highest priority outfall on the Participating Agency's list for the WMA.

As required by the Permit, annual discharge volumes and non-stormwater pollutant loads were estimated for the persistently flowing outfalls. Dry weather visual observation and field investigation data related to known and/or suspected sources of non-stormwater discharge were used to estimate the percent contribution from each source, including suspected sources. Results are presented in Section 4.2.3 of Appendix 4. The loads derived from highest priority storm drain outfall dry weather monitoring will ultimately be useful in assessing progress to storm drain outfall load reduction goals; the methodology for this assessment is in development.

3.2.1.3 Illicit Discharge Detection and Elimination (IDDE) Program

Based on the results of the dry weather major storm drain outfall monitoring described above, the Participating Agencies conducted investigations to identify sources of flow or NAL exceedances. Where IC/IDs are identified, additional action to address the source(s) is taken. These investigations and source elimination activities related to outfall monitoring are one part of the larger IDDE programs that each Participating Agency has established. The goals of these IDDE programs are as follows:

- Control the contribution of pollutants to and the discharges from the storm drain system within the Participating Agencies' jurisdictions.
- Effectively prohibit non-stormwater discharges to the storm drain system.
- Reduce the discharge of pollutants in stormwater to the maximum extent practicable.

In addition to outfall monitoring and associated source investigations, the IDDE programs also include the following components to prevent, identify, and eliminate IC/IDs:

- Educating the local community about prohibited discharges and how to prevent them. During the 2015-2016 fiscal year, this outreach program included working closely with water utilities to educate communities about outdoor water conservation, including preventing irrigation runoff.
- Operating a public complaint phone hotline and website and investigating the complaints received.
- Inspecting industrial/commercial and municipal facilities, construction sites, and residential areas. In addition to identifying and eliminating IC/IDs where applicable, inspectors also proactively educate responsible parties about how to avoid IC/IDs, such as cleaning outdoor areas by sweeping instead of hosing them off.
- Maintaining the storm drain system and sewer system, which provide opportunities to identify unpermitted connections to the storm drain system, cross connections, and other potential sources of IC/IDs.

Dry weather storm drain outfall source identifications investigations indicated that irrigation runoff was the most commonly identified known or suspected controllable source within the San Diego River WMA. Copermittees identified groundwater infiltration into the storm drain system as the most common uncontrollable source.

In addition to the field screening completed at all outfalls, samples were also taken for analysis at the five highest priority persistently flowing outfalls (Section 3.2.1.1), as described in Section 3.2.1.2. The highest priority outfalls were a focus for IDDE investigations during fiscal year 2015-2016. Figure 3-3 shows the known or suspected flow source types identified at the highest priority outfalls.

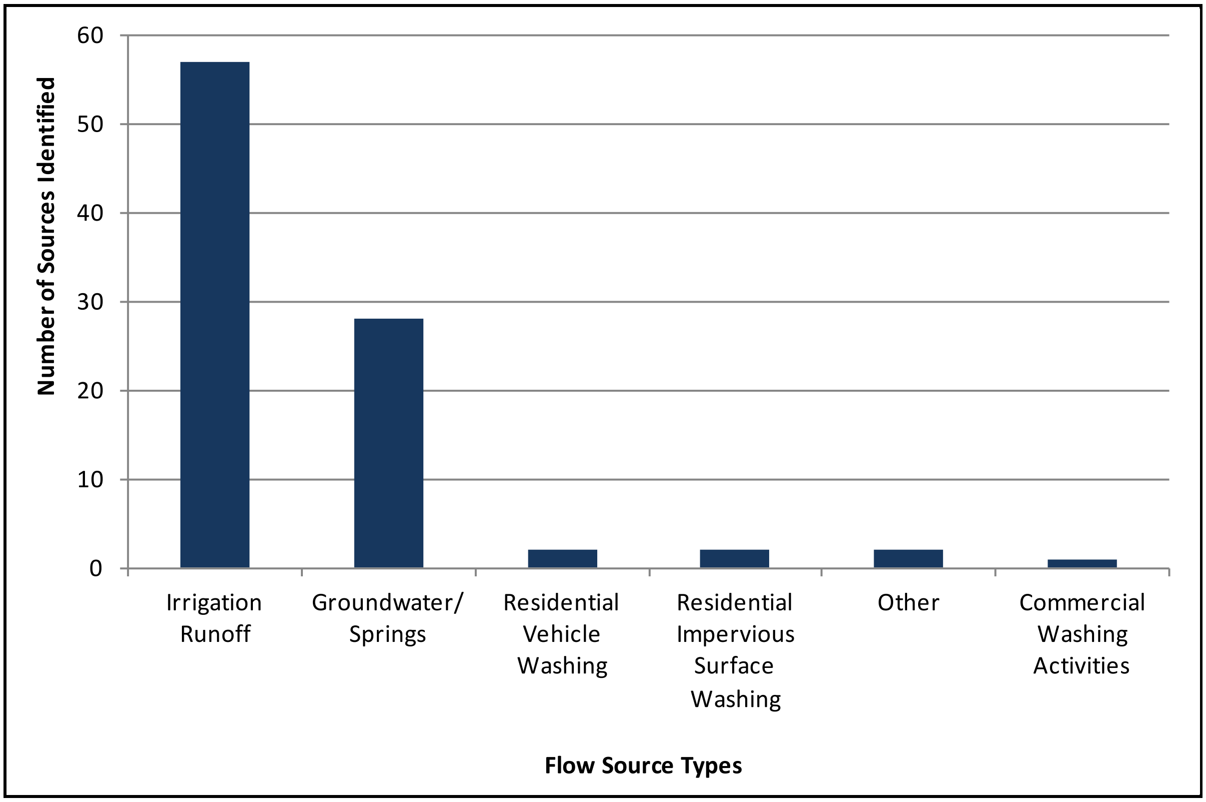

Figure 3-3. Known or Suspected Flow Sources Identified for Highest Priority Storm Drain Outfalls

Additional source investigation activities in the San Diego River WMA include the following:

- The City of San Diego and County of San Diego are utilizing flow meters at selected outfalls in the San Diego River WMA to assist in source identification.
- The Copermittees are investigating potential sources of bacteria from wastewater systems since human sources of bacteria are the highest priority source from a public health perspective.
    - A broken private sewer lateral in the Sports Arena area within the City of San Diego that had been contributing wastewater to the storm drain system was identified and repaired.
    - The City of Santee has been working with Padre Dam Municipal Water District, which is also the owner and operator of the public wastewater conveyance system in Santee, on an investigation of potential exfiltration from the wastewater system to the storm drain system. This investigation focuses in the area around a Bacteria TMDL site in Forester Creek.

The IDDE components listed above are described in more detail in Section 4 and in the jurisdictional strategy tables in Appendix 2. The Copermittees' JRMP Annual Report forms, also included in Appendix 2, list the total numbers of IC/IDs identified and eliminated through all IDDE program activities during the fiscal year. More details about source investigation and elimination specifically related to the storm drain outfall dry weather monitoring component of the IDDE program are described in greater detail in Appendix 4.

3.2.2 Storm Drain Outfall Wet Weather Outfall Monitoring

The purpose of storm drain outfall wet weather monitoring is to identify and quantify pollutants in stormwater discharges from the storm drain system, guide pollutant source identification efforts, and track progress in achieving numeric goals set forth in the WQIP. The Participating Agencies' five monitoring locations were chosen to be representative of the Residential, Commercial, Industrial, and typical Mixed-use land uses within the watershed in accordance with the Permit. Two outfalls were located in the Mission San Diego HSA, two in the Santee HSA, and one in the El Cajon HSA. This is the first year of storm drain outfall wet weather monitoring in accordance with the WQIP MAP. The prior two years of wet weather monitoring were conducted under the transitional monitoring program with a different list of analytical parameters. The storm drain outfall wet weather monitoring stations for the WMA are presented in Table 3-12 with both the station name used in the wet weather monitoring program and the identifier used by the jurisdiction in their storm drain outfall inventory. The monitored outfall locations are shown in Figure 3-2, and the land uses for their drainage areas are shown in Figure A4-8 in Appendix 4. The locations of these outfalls have not been modified since transitional monitoring began during the 2013-2014 monitoring year. Therefore, three years of data have now been collected at all five wet weather storm drain outfall wet weather monitoring locations in the San Diego River WMA.

Table 3-12. Storm Drain Outfall Wet Weather Monitoring Stations in the San Diego River WMA

Storm Drain Outfall Name	Jurisdictional Identifier	Jurisdiction	HSA Name/No.	Latitude	Longitude
MS4-SDR-1	OF-11	City of El Cajon	El Cajon/907.13	32.80256	-116.95808
MS4-SDR-2	OF-ALV-11	City of La Mesa	Mission San Diego/ 907.11	32.77776	-117.01751
MS4-SDR-3	DW0136	City of San Diego	Mission San Diego/ 907.11	32.74773	-117.22927
MS4-SDR-4	G30c	City of Santee	Santee/907.12	32.84501	-116.99122
MS4-SDR-5	MS4-SDR-064	County of San Diego	Santee/907.12	32.86165	-116.94474

Monitoring events were conducted in accordance with the WQIP MAP on December 11, 2015 at MS4-SDR-4; on January 4, 2016 at MS4-SDR-3 and MS4-SDR-5; and on January 31, 2016 at MS4-SDR-1 and MS4-SDR-2. Grab samples were collected and analyzed for pH, temperature, conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria. Composite samples were collected and analyzed for constituents contributing to the HPWQC, 303(d) List impairments, and for constituents with stormwater action levels (SALs). Observational and hydrologic data were also recorded. A summary of analytical results is provided below in relation to bacteria, and detailed results are presented in Appendix 4 Sections 4.2.5 (data) and 4.2.6 (assessments).

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform indicated that the highest concentrations were measured at MS4-SDR-3 in the Mission San Diego HSA (907.11) for *Enterococcus* and at MS4-SDR-5 in the Santee HSA (907.12) for fecal coliform. Concentrations of *Enterococcus* and fecal coliform in wet weather discharges from all five outfalls were above the single sample maximums specified in the Permit for the Bacteria TMDL (WQBELs discharging to freshwater creeks with REC-1 beneficial use). Detailed results for all constituents are provided in Appendix 4. The required assessments are also provided in Appendix 4 and its attachments. The loads derived from storm drain outfall wet weather monitoring will ultimately be useful in assessing progress toward storm drain outfall load reduction goals; the methodology for this assessment is in development. The land-use based assessment required by the Permit was completed for the third year in the San Diego River WMA; a more robust data set was developed for the land-use based assessment of wet weather storm drain outfall discharge, and land-use based event mean concentrations (EMCs) were refined based on three years of monitoring.

3.3 SPECIAL STUDIES SUMMARY

Special studies are conducted to "address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that cause or contribute to highest priority water quality conditions identified in the Water Quality Improvement Plan (Regional Board, 2013)." An overview of the conducted and planned special studies for the watershed for the current Permit term is presented in Table 3-13. Descriptions of the studies and results, where applicable to bacteria, are provided below. An assessment of special study results is presented in Appendix 4.

Table 3-13. Special Studies Occurring Within the San Diego River WMA

Monitoring Programs	Dry	Wet	Monitoring Element	Permit Schedule[a]				
				2013-2014	2014-2015	2015-2016	2016-2017	2017-2018
San Diego Regional Reference Streams and Beaches	X		Field parameters, conventionals, bacteria instantaneous flow	2012-2014	●	–	–	–
			Streams only: nutrients, metals, bioassessment, including physical habitat and chlorophyll a		–	–	–	–

San Diego Wet Weather Epidemiology Study		X	Field parameters, bacteria, human genetic markers, viruses, human health data, flow and precipitation	●	●	●	–	–

a. The Permit was adopted on May 8, 2013 and became effective on June 27, 2013.

3.3.1 San Diego Regional Reference Streams and Beaches Studies

From 2014 to 2016, the Copermittees participated in the San Diego Regional Reference Streams (Tiefenthaler et al., 2015) and Beaches (Tiefenthaler et al., 2016) Studies, which measured levels of indicator bacteria that account for natural sources to establish the background concentrations, or "reference conditions," for streams or beaches minimally disturbed by anthropogenic activities. This reference system approach results in allocation of allowable exceedance days based on the frequencies of exceedance at reference sites with natural sources of bacteria. The results of these studies support the forthcoming re-evaluation of the Bacteria TMDL and numeric target development for future TMDLs. These studies were intended to provide data to support discussions of reasonable, accurate targets for indicator bacteria at Southern California streams and beaches.

3.3.1.1 Reference Streams Study

This study investigated concentrations of indicator bacteria, nutrients, metals, and conventional constituents occurring naturally at reference streams in minimally disturbed watersheds in Southern California during wet and dry weather. Although additional constituents were analyzed, the primary focus of the study was indicator bacteria. The study also sought to categorize exceedance frequencies for indicator bacteria by hydrologic, geomorphologic, biotic, and abiotic factors. Human genetic marker results were used to exclude sites and samples with potential human sources of fecal contamination so that observed exceedance rates were not due to human sources of bacteria. Results are presented in detail in the Technical Report (Tiefenthaler et al., 2015) provided as Attachment 4I to Appendix 4 of this Annual Report.

Findings from the study included the following:

- Indicator bacteria concentrations measured during the study were generally below water quality objectives (WQOs) except for *Enterococcus*, and exceedance frequencies were highest during summer dry weather.
- Wet weather EMC exceedance frequencies were low except for *Enterococcus*. The number of events was not sufficient to determine whether relationships exist between the exceedance frequencies and watershed size and/or geology.
- Temperature was the major factor associated with elevated summer dry weather concentrations of indicator bacteria, although total suspended solids (TSS), nutrients, and organic carbon were also positively correlated. No significant relationships between indicator bacteria concentrations and watershed size or geology were observed during dry weather.
- EMC fluxes (flux was calculated as the ratio of mass loading and watershed area) during wet weather were two to three times greater than during dry weather and were comparable to those described in previous studies.

3.3.1.2 Reference Beaches Study

This study investigated concentrations of indicator bacteria occurring naturally at reference beaches during a period of prolonged drought. Results are presented in detail in the Technical Report (Tiefenthaler et al., 2016) provided as Attachment 4J to Appendix 4 of this Annual Report.

Findings from the study included the following:

- Indicator bacteria concentrations and exceedance frequencies during both winter and summer dry weather were low at both monitored beaches. This is consistent with results from previous studies of beaches with blocked estuary inlets or beaches with flowing creeks and no estuary.
- Indicator bacteria concentrations in the estuary or mixing zone associated with both beaches were one to three orders of magnitude greater than those at the corresponding

beach, and were higher at San Onofre Creek than Deer Creek. Exceedance frequencies were also higher in the estuary associated with San Onofre Creek compared to the mixing zone associated with Deer Creek. This suggests that dry weather exceedance frequencies may have been greater if the estuary had been open to tidal exchange.

- At both study locations, no significant relationships between indicator bacteria and water temperature, salinity, or antecedent dry days were observed, but indicator bacteria concentrations decreased with the number of antecedent dry days at the San Onofre Creek beach and increased with the number of antecedent dry days in the associated estuary. Significant positive correlations were found between total coliform concentrations and water temperature, salinity, and antecedent dry days and between *E. coli* and fecal coliform and salinity in the estuary associated with San Onofre Creek. These correlations indicate that freshwater input from the creek dilutes bacteria concentrations. Regrowth of bacteria may have been a factor at this estuary.
- During the single monitored storm event, indicator bacteria exceedances were common in the San Onofre Beach creek and estuary samples, but exceedances were observed at the beach only on the day of the storm. Since all samples associated with this storm event were positive for human genetic marker, results could not be used to determine natural background exceedance frequencies. However, positive human marker results were rare throughout the study overall, indicating that the study locations may be suitable reference sites.

3.3.2 Wet Weather Epidemiology Study and Quantitative Microbial Risk Assessment

This special study examines the correlation between bacteria levels in stormwater discharges from the San Diego River and the health effects experienced by surfers at Ocean Beach, located near the mouth of the San Diego River. The first phase of the study was performed from January 2014 through March 2015 and included 654 surfers and 10,081 logged surfing sessions. The overall goal of the study was to answer the following four questions:

- Is surfing associated with an increased rate of illness?
- Are illness rates higher when surfing following wet weather compared to dry weather?
- What is the association between water quality and illness following wet weather events?
- What level of water quality corresponds to the same risk of illness as current water quality objectives?

Results indicated that there is an increased risk of illness associated with water contact, and that risk was greater when surfing after a wet weather event compared to during dry weather. The excess risk of illness when entering the ocean in wet weather compared to not entering the ocean was quantified to be 12 surfers per 1,000. An association was established between *Enterococcus* and illness after a wet weather event; however, the risk of illness was found to be lower than that which would be predicted by *Enterococcus* WQOs. An extra 12 illnesses per 1,000 surfers after wet weather ocean exposure was below the most recent water quality guidelines for recreational beaches from the USEPA (2012), which recommends no more than 32 to 36 illnesses per 1,000 swimmers. In addition, a quantitative microbial risk assessment (QMRA) was performed to estimate the risks of gastrointestinal illness from recreational exposure to beaches impacted by storm drain outfall discharges during wet weather. Source tracking work and analysis of pathogen concentrations were conducted, and modeling results were comparable to epidemiological study results. The study demonstrated the applicability of QMRA for recreational water risk estimates during wet weather and may facilitate consideration of site-specific water quality criteria. Additional details are provided in the Technical Report (Schiff et al., 2016) provided as Attachment 4K to Appendix 4 of this Annual Report.

4 Implementation and Progress Towards Achieving Numeric Goals

The Permit requires the Participating Agencies to develop specific water quality improvement numeric goals and strategies to address their HPWQC, which is identified as bacteria for the San Diego River WMA.

Each year, the Participating Agencies assess specific water quality data and programmatic information in order to gauge progress towards achieving the numeric goals. These assessments provide information to determine whether intended outcomes are being realized or whether adaptations of Participating Agencies' programs are necessary. This section discusses the strategies that have been implemented during the reporting period, the progress towards achieving specific Permit term goals for the watershed, and provides an overview of proposed modifications to goals, strategies, and schedules. Data collected per the JRMP and MAP, along with the schedules developed in conjunction with each goal, were used to assess goals. Note that the selected strategies necessarily target bacteria in the watershed, but also address other pollutants as well, providing a multi-benefit approach to implementation.

4.1 STRATEGIES AND SCHEDULES

The strategies being implemented by the Participating Agencies are the mechanisms that enable improvements in water quality to achieve the numeric goals outlined in Section 2 and detailed in Appendix 3. The chosen strategies have been identified and selected based on their likelihood of achieving one or more of several of the following outcomes:

- Effectively prohibiting non-stormwater discharges to the storm drain system (dry weather);
- Reducing pollutants in stormwater discharges from the storm drain system to the maximum extent practicable (wet weather); and/or
- Protecting the beneficial uses of receiving waters from storm drain outfall discharges.

Achievement of these outcomes and the success of the strategies will ultimately be measured against the interim and final numeric goals.

In general, the Participating Agencies are implementing aggressive non-structural BMPs as part of their JRMPs as the initial methods for achieving dry and wet weather load reduction goals. As implementation continues and progress is evaluated, distributed and regional structural BMPs will be implemented as needed to achieve interim and final goals and as funding is available.

4.1.1 Overall Watershed Strategy Implementation Highlights

During FY 2015-2016, the Participating Agencies implemented a broad range of strategies to target bacteria, as well as other constituents such as nutrients and trash. Table 4-1 through Table 4-4 summarize strategies implemented during FY 2015-2016; jurisdictional strategy highlights are described later in this section, and tables presenting all strategies implemented by Participating

Agency are presented in Appendix 2. Several key strategy types were implemented broadly across the watershed and are highlighted below.

- **Preventing wastewater discharges to the storm drain system**. This strategy addresses human sources of bacteria, which are the highest priority from a public health perspective.
  - The City of San Diego organized an interdepartmental team to investigate and eliminate sources of bacteria in areas where microbial source tracking found markers of human bacteria. This team eliminated a wastewater discharge to the storm drain system from a broken restaurant private sewer lateral in the Sports Arena area within the City of San Diego during FY 2015-2016 and will continue additional investigations in the San Diego River Watershed during FY 2016-2017.
  - The City of Santee is working with its local wastewater utility to complete a forensic investigation of potential wastewater contributions to the storm drain system in the vicinity of a Bacteria TMDL monitoring site in Forester Creek.
  - The City of La Mesa conducts smoke testing to check for defects in its wastewater system and is constructing system upgrade projects as a proactive measure to prevent potential discharges from its wastewater system to the storm drain system.
  - The County of San Diego Department of Environmental Health issues enforcement actions for failing septic systems when effluent could reach the storm drain system. Prompt follow up and mitigation is implemented.

- **Trash cleanups**, including volunteer cleanup events and cleanups of trash associated with transient encampments, which remove trash and also address likely sources of bacteria. Over 134,000 pounds of trash were removed through cleanups along local waterways during FY 2015-2016. Cleanups were accomplished in partnership with I Love a Clean San Diego and the San Diego River Park Foundation.

- **Rebate programs**, which help reduce dry and wet weather runoff. Within the City of San Diego and Helix Water District services areas, rebates[8] were issued for more than 111,000 square feet of grass that were converted to lower water use plants and for more than 2,700 rain barrels. The Sustainable Landscapes Program, which will begin active implementation during FY 2016-2017, includes replacing turf with lower water use plants to reduce dry weather runoff and downspout disconnections and soil quality improvement to capture stormwater. The City of Santee and Padre Dam Municipal Water District encouraged participation, and referred customers to the programs and rebates available through the County Water Authority and Southern California Water Smart. The City also created a water conservation and water quality outreach material, which included the posting of rotating messages on the City's digital clock tower in the town's center.

- **Retrofit and rehabilitation projects**, which address most pollutants and also often provide other benefits, such as aesthetic improvement or habitat enhancement.
  - The City of La Mesa has begun construction on a restoration project in Alvarado Creek, a tributary of San Diego River.

[8]Only rebates within the San Diego River WMA were considered for numbers from the City of San Diego. Helix numbers are total for the entire water district, but most of Helix's service area is within the San Diego River WMA.

- o The City of Santee is a finalist for a Proposition 1 grant project through a program administered by the San Diego River Conservancy. The project would install bioretention and trash control BMPs at Mast Park, adjacent to the San Diego River. The BMPs would collectively treat approximately 540 acres.
- o During FY 16, approximately 43.6 acres of drainage area were treated in the City of San Diego by green infrastructure features to meet TMDL water quality standards within the San Diego River, and approximately 14.8 additional acres are expected to be treated by FY 18.
- o During FY 16, the City of San Diego constructed some of the bioretention facilities planned at the Allied Gardens Recreation Area. In accordance with strategy CSD-GI-07, the bioretention is designed to treat a 4.5-acre drainage area.

▪ **Additional monitoring to investigate sources of dry weather flows**, which are a transport mechanism for bacteria and other pollutants. The County of San Diego and the City of San Diego are utilizing continuous flow meters at selected outfalls in the watershed to investigate potential flow patterns. The collected data will be analyzed and used to target source investigation and enforcement activities.

Maintain and improve data tracking methods for existing development inventories where necessary.	•	•	•	•	•	•	•	•	•	•	•
Develop and implement approaches to address the impacts of improper water use and irrigation runoff.	•	•	•	•	•		•	•	•	•	
Improve and/or continue existing pet waste programs.	•	•	•	•	•		•	•	•		
Improve trash management strategies within the watershed.	•	•	•	•	•	•	•				
Develop and implement approaches to reduce the impacts of public and private sanitary sewer systems within the watershed.	•	•	•	•	•		•	•	•		
Improve and implement existing outreach programs to target key sources and pollutants.	•	•	•	•	•	•	•	•	•	•	•
Enhance existing stormwater maintenance programs.	•			•		•	•				
Develop and implement targeted programs to address issues in residential areas.	•	•	•	•	•		•	•	•	•	
Improve existing inspection programs to more efficiently target key sources.	•	•	•	•	•	•	•	•	•	•	•
Actively enforce stormwater and urban runoff requirements for existing development.	•	•	•	•	•		•	•	•	•	•
Identify and facilitate retrofit opportunities in areas of existing development.	•	•	•	•	•	•	•	•	•	•	
Perform strategic monitoring to improve understanding of sources and water quality within the watershed.				•	•		•	•	•	•	•
Improve coordination between agencies.	•	•	•	•	•		•	•	•		

4.1.2 City of El Cajon

Since the San Diego River WQIP was accepted in February 2016, the City of El Cajon has implemented a number of new strategies during FY 2015-2016 aiming to reduce dry weather flows, reduce sources of bacteria, and sponsor community trash cleanup events. El Cajon's strategies, such as enhanced inspection protocols, trash cleanups, community outreach, and water conservation public education are discussed below. These strategies seek to reduce sources of priority water quality conditions such as bacteria, trash, nutrients, and non-stormwater flow.

The City of El Cajon works to reduce trash in the watershed, which also can be a source of bacteria, by cleaning transient encampments and supporting cleanup projects by non-profit groups in the Forester Creek area. During FY 2015-2016, the City of El Cajon performed 18 transient encampment removals and cleanups. A total of 212.6 cubic yards of trash and material were removed during these encampment cleanups. The City also partnered with I Love a Clean San Diego on two trash cleanups at Forester Creek during FY 2015-2016. A total of 63 volunteers collected 2,280 pounds of trash (43 cubic yards). In addition to cleanups, during FY 2015-2016, the City of El Cajon installed 20 inlet filters in areas with high trash volumes, for a total of approximately 100 inlet filters installed throughout the City to date.

The City of El Cajon, in partnership with the San Diego River Park Foundation, was awarded a Disadvantaged Community grant to organize community outreach focused in Forester Creek regarding trash, City recreation, and stormwater pollution. The City of El Cajon partnered with the San Diego River Park Foundation to accomplish this grant project, set to be performed in FY 2016-2017 and 2017-2018. This project aims to provide the framework to engage the disadvantaged community of El Cajon in community-based planning to address both trash issues and lack of recreation access.

The project will involve broad outreach and surveys of community members, as well as engage the community in volunteer-based data collection to further define the trash issues and specific strategies for cleanup. A training program will be created to engage community volunteers in on-the-ground source identification assessments. Teams of volunteers will assess quantities and types of trash entering the creek as dumping, stormwater debris, litter, homeless encampment debris, and other categories as needed. Documentation and analysis will take place at seasonal field assessments along the creek, and following major storm flushing events. Sorting and weighing of trash and debris will provide valuable data for planning future trash capture and prevention projects.

Education is a key component for increasing public awareness of stormwater issues and thereby reducing pollution and flow sources. Water conservation articles were included in the bi-annual City of El Cajon newsletter that is distributed to an estimated 35,000 residents. In addition, the City stormwater employees staffed a booth at five outreach events in the City of El Cajon during FY 2015-2016. Informational water conservation pamphlets were updated and distributed at these events. Since the City performed this outreach related to reducing irrigation runoff, the City has received an increase in hotline calls regarding irrigation runoff, which suggests the irrigation outreach was effective.

The City of El Cajon has combined on-site structural treatment BMP checks with industrial and commercial inspections to reduce inspection set-up time, increase efficiency, and increase the number of inspections. The City's stormwater inspector has been with the program for a number of years and has developed an extensive knowledge base of the City and historical stormwater issues. This consistency allows the City to build on past efforts and minimizes duplicate investigation work. The stormwater inspector has also developed a strong working relationship with businesses in the area while performing industrial and commercial inspections, which allows for better communication and cooperation from businesses.

The City of El Cajon also increased drive-by assessments of residential properties in FY 2015-2016. Particular focus was given to residential neighborhoods close to channels or located in areas with historical stormwater issues. Letters were sent to homeowners in these areas if overwatering, erosion, or other stormwater issues were identified. Once residents are aware that irrigation runoff is not an allowed discharge, they should be more likely to reduce watering times and fix irrigation systems.

4.1.3 City of La Mesa

The City of La Mesa put into practice a number of new strategies during FY 2015-2016, including the Alvarado Creek Restoration project, requiring redevelopment BMPs and increasing residential, commercial, and industrial inspections. La Mesa's programmatic and structural strategies aim to prevent, identify, and eliminate pollutants and non-stormwater flow sources.

In order to restore native habitat, slow and infiltrate flow, and reduce bacteria, the City of La Mesa broke ground on the Alvarado Creek Restoration project in October 2015. Invasive plants such as Mexican fan palm, tamarisk, eucalyptus, and *Arundo* have been removed, after which grading began. The project is scheduled to be completed in December 2016. In total, 900 linear feet of the Alvarado Creek will be restored. Concurrently with the creek restoration work, the City is also replacing a major wastewater line that runs along the creek (Figure 4-1).

Starting next year, the City of La Mesa will replace part of the Alvarado Trunk Sewer, a section of 70-year old sewer pipes near Interstate-8 and the 70th Street Trolley Station. The City does not have any direct indication that there are any leaks from the sewer line that might impact the storm drain system or Alvarado Channel. However, because the pipe is old, replacing the existing pipe is a proactive measure to prevent wastewater leaks from aging infrastructure from reaching the storm drain system or receiving water bodies.

Figure 4-1. Alvarado Creek Restoration

Structural BMPs have also been installed in the City of La Mesa to help reduce stormwater pollutant discharges. An apartment complex near Coleman College with 200 to 300 apartment units installed Silva Cells, impervious pavement, and Filterra units on-site to retain and filter stormwater runoff. In addition, the City partnered with I Love a Clean San Diego to install cigarette ash cans in downtown areas where higher levels of cigarette butt litter had previously been observed, generally around bars and restaurants. The cigarette butt containers are popular with local businesses and their patrons, and there has been a noticeable decrease in cigarette butts along the street and sidewalks.

Industrial and commercial stormwater inspection procedures were updated based on the new City of La Mesa JRMP. The City switched to a property-based inspection approach, which allowed the City to increase the inspection frequency to two to three times per year. As part of the switch to property-based inspections, the City also changed its inspection fee structure. Previously, businesses paid a higher amount, but only in the years they were inspected. The fact that the fee was not consistent each year and was relatively high, in addition to the perception of unfairness when neighboring businesses were not inspected and charged in the same year, created some opposition from the business community. Switching to a property-based inspection approach, in which every business is inspected every year, has allowed for a shift to a lower fee that is the same every year, which has been better received by the business community and has led to a more productive working relationship between businesses and the City's inspector.

The City of La Mesa inspected its entire inventory of residential management areas during FY 2015-2016. The assessment process included driving throughout the residential management areas and noting instances of illicit discharges, trash, erosion, and similar issues. If issues such as overwatering or erosion were seen associated with a residence, the resident was sent a letter to make them aware of the issue and to suggest solutions.

4.1.4 City of San Diego

During FY 15-16, City of San Diego implemented strategies as described in the WQIP. Highlights of strategies implemented by City of San Diego to address bacteria are shown in Figure 4-2. A complete list of strategies planned for implementation within the WMA and the progress made on each strategy during the reporting period are provided in Appendix 2.

Allied Gardens Recreation Area Bioretention

In FY 16 the City constructed some of the bioretention facilities planned at the Allied Gardens Recreation Area. In accordance with strategy CSD-GI-07, the bioretention is designed to treat a 4.5-acre drainage area.

Structural Controls

In FY 16, 43.6 acres of drainage area were treated by green infrastructure features to meet TMDL water quality standards within the San Diego River, and approximately 14.8 additional acres are expected to be treated by FY 18.

Surfer Epidemiological Study

The City participated in preparation of Surfer Epidemiological Study, which tracked illness in surfers at City beaches and identified potential sources of bacteria within the watershed. Information on human health risk and levels of bacteria in the watershed identified in the study may assist in refining the Bacteria TMDL during the re-opener process.

Trash Removal

The City completed trash removal along 5,750 feet of the San Diego River as part of a larger habitat restoration and trash removal project. In accordance with strategy CSD-STRUCT-02, the restoration project will cover 57 acres and is expected to be completed in FY 22.

Figure 4-2. Highlights of City of San Diego Strategies

Additional strategies being implemented are listed in Table 4-5.

Table 4-5. Summary of Strategies for the San Diego River WMA - City of San Diego

Strategy	Multiple Benefits[1]						
	Bacteria[2]	Nutrients	Metals	Trash	Sediment	Flow[3]	Habitat/Wildlife
Storm Drain Structure Cleaning: 5,485 storm drain structure inspections were conducted, resulting in the cleaning of 1,189 structures and removal of 130 tons of debris in the WMA.	•		•	•	•		
New in FY 16: Enhanced Catch Basin Cleaning Optimization: Enhanced catch basin cleaning is a strategy to address pollutant removal by inspecting catch basins more than the JRMP-required minimum of once per year in the Tijuana River, San Diego Bay, and Los Peñasquitos WMAs to meet specific TMDL pollutant removal requirements. In an effort to further optimize its drain cleaning program, the City analyzed eight years of catch basin cleaning data and assigned priorities to individual basins based on historical debris removal. This enhancement will allow the City to target high priority drains to maximize pollutant removal while maintaining cost efficiencies.	•		•	•	•		
Street Sweeping: Approximately 18,182 curb miles of roads, streets, highways, medians, parking lots, and operations yards were swept in the WMA.	•	•	•	•	•		
New in FY 16: Median Sweeping: 4,315 median miles were swept citywide.	•	•	•	•	•		
New in FY 16: Targeted Aggressive Street Sweeping Pilot: The City completed a pilot study that quantified the effectiveness of posting limited-hour "no parking" signs on typically nonposted routes. The study found that posting routes resulted in an approximate 50% increase in pollutant removal because the sweeper had more access to curbs and gutters. Based on this finding, the City will consider posting additional routes if supported by the community.	•	•	•	•	•		
New in FY 16: MS4 Maintenance: In addition to routine maintenance of the MS4, the City repaired or replaced 12 pump stations and modernized another 14 pump stations, closed-circuit television (CCTV) surveyed 28,000 linear feet of pipe in 62 locations citywide, and began the development of the Waterways Maintenance Plan and Channel Maintenance Prioritization Plan. To help minimize the risk of flooding in a flood-prone drainage area, the City also installed a 2,400-volt automatic transfer switch and generator to a 130,000-gallon-per-minute pump station, allowing for sustained function in the event of a power outage.	•		•	•	•		
Illicit Discharge Dectection and Elmination (IDDE) Program: 683 cases were investigated, including 368 discharges reported by the public, 553 illicit discharges or illicit connections were eliminated, and 553 enforcement actions and 349 escalated enforcement actions were issued in the WMA. **New in FY 16: Launch of the Get It Done App**: This app allows illicit discharges to be reported quickly and accurately via any smartphone. Lastly, the Tiger Team (a proactive escalated monitoring and	•	•	•	•	•	•	•

Table 4-5. Summary of Strategies for the San Diego River WMA - City of San Diego

Strategy	Multiple Benefits[1]						
	Bacteria[2]	Nutrients	Metals	Trash	Sediment	Flow[3]	Habitat/Wildlife
enforcement team that involves multiple City departments and divisions) was developed to identify, locate, and eliminate sources of human specific bacteria in the MS4. Over several months during the reporting year, one problem area within the City was investigated extensively and a source of human-specific bacteria in the MS4 was identified and abated.							
Commercial and Industrial Business Inspections: 2,672 inspections were completed, 198 follow-up inspections were completed, 431 violations were identified, 527 enforcement actions were issued, and 172 escalated enforcement actions were issued in the WMA. In addition, the City conducted property-based inspections that focus on common areas/activities shared among multiple businesses or tenants that generate pollution. A previously conducted pilot study on inspection practices found property-based inspections to be more effective at identifying and resolving water quality issues (e.g., improper trash disposal practices and irrigation runoff, etc.) associated with commercial and industrial businesses.	●	●	●	●	●	●	●
Trash Cleanups: Five cleanup events were sponsored through I Love a Clean San Diego that collected a total of 23,887 pounds of trash and debris in the WMA. An additional 102,215 pounds of trash and debris were removed via a partnership with the San Diego River Park Foundation (see Appendix 2 for a list of specific projects).				●			
Rebates to Reduce Irrigation Runoff: Rebates were issued to convert 68,236 square feet of turf in the WMA and rebates for rain barrels were issued to capture 772,740 gallons of rainwater citywide.	●	●	●	●	●	●	●
New in FY 16: Offsite Alternative Compliance Program: The City implemented Phase I of the Alternative Compliance Program to give development projects that would require onsite structural BMPs the ability to propose offsite alternative compliance projects. The development of Phase II was also initiated and will include the establishment of an in-lieu fee structure and credit system.	●	●	●	●	●	●	●
New in FY 16: Bacteria Regrowth Study: The City completed a study to characterize the magnitude and extent of potential *Enterococcus* loading because pf regrowth within the City's storm drain system. This study quantifies the amount of bacteria in receiving water samples that are harmless to humans and would potentially be used to refine bacteria water quality standards of the Bacteria TMDL as a part of the Reopener process.	●						

1. X – Addresses the water quality conditions.
2. Highest priority water quality condition is highlighted in orange.
3. Flow is defined as storm water and non-storm water discharges to receiving waters, including freshwater inputs.

4.1.5 County of San Diego

The County of San Diego put into practice a number of improvements to existing strategies since the San Diego River WQIP was accepted in February 2016, including a focus on increasing efforts to find and address IC/IDs, since reducing dry weather flows is an important part of the County's approach to reducing bacteria during dry weather conditions.

As part of the effort to find and discontinue IC/IDs, the County of San Diego implemented off hours patrolling to identify discharges. Most off-hours patrols were conducted between 8 am and 8 pm during the weekends, but twice County staff patrolled between 5 am and 9 am to identify sources that occurred during the early morning hours. Staff focused their efforts on residential sources, such as irrigation runoff, and patrolled all residential management areas (RMAs) at least once. Each RMA consists of the residential area under the County's jurisdiction in each HSA in the watershed. In addition to the off-hours program, a new residential inspection program was implemented to identify illicit discharges in residential areas.

As part of the program to reduce residential over irrigation and pollutants, the County conducted a pilot study that tested different messages and door hanger styles (Figure 4-3) to see which were most effective at achieving behavior change. Then the County selected the most effective design to target each type of commonly observed activity (e.g., irrigation runoff, erosion). Additionally, the County developed educational materials for home owners' association (HOA) outreach in FY 2015-2016 and plans to implement an educational pilot project in FY 2016-2017. The pilot project will target certain HOAs in drainage areas with priority outfalls. A preliminary list of HOAs has already been compiled.

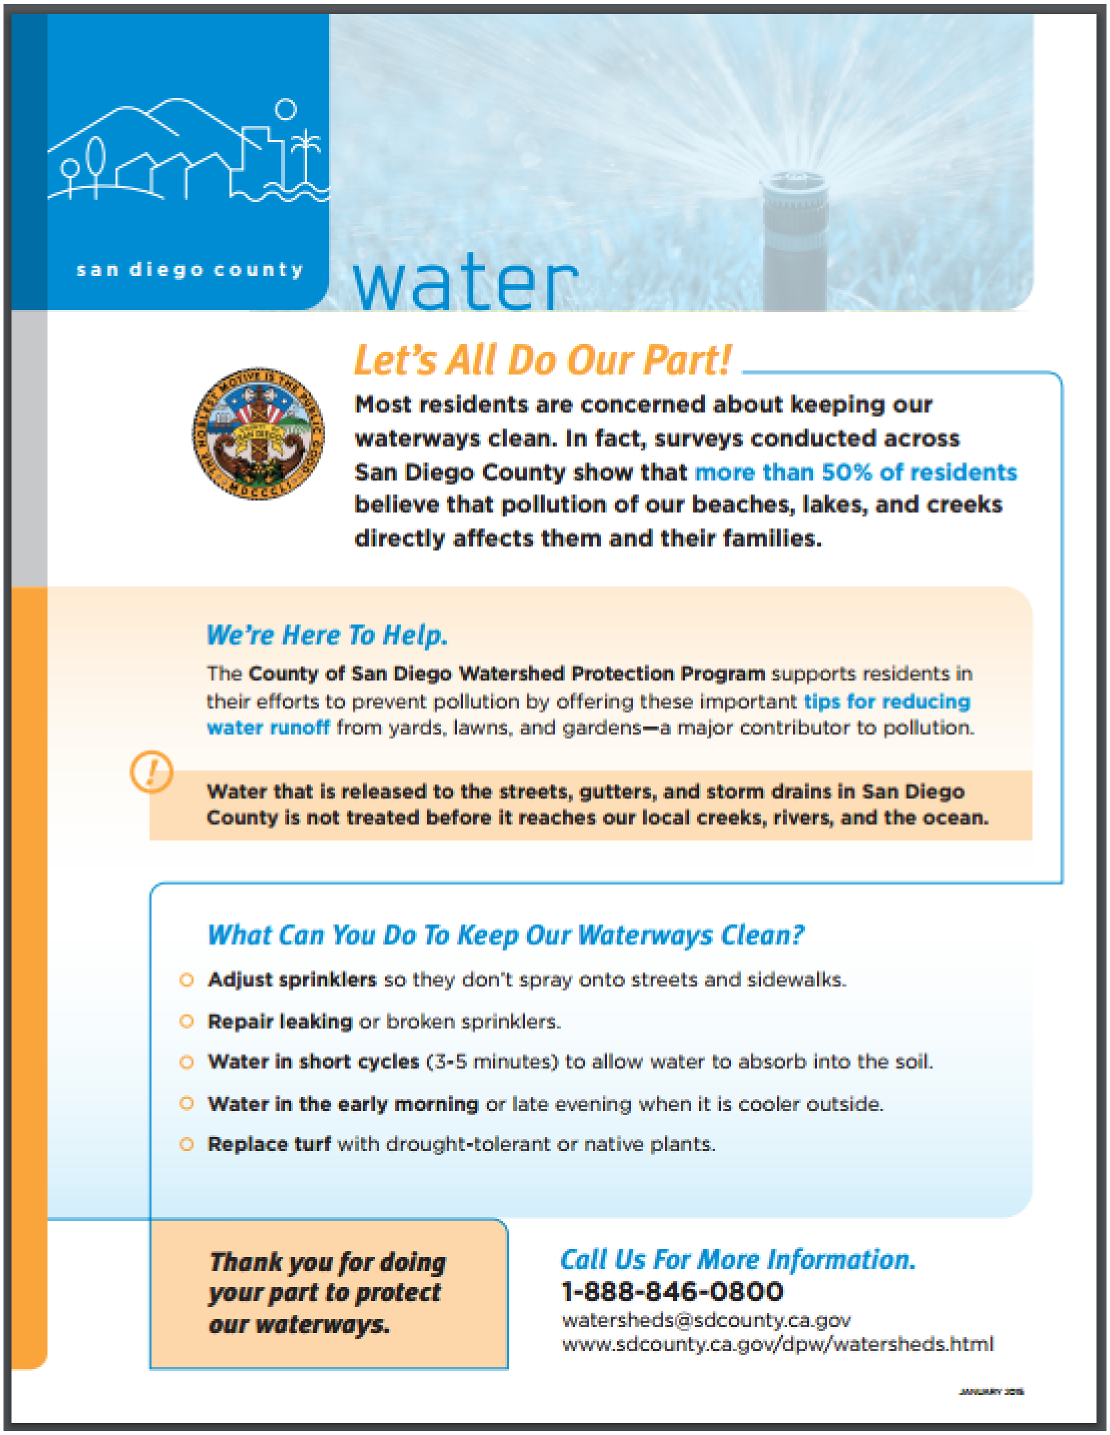

Figure 4-3. Residential Educational Outreach Door Hanger

In another effort to track and identify IC/IDs, the County has installed flow meters at nine outfalls in the San Diego River WMA. The flow data from the outfalls will be analyzed to identify trends or patterns that can help target source identification efforts in the upstream areas. If specific trends or patterns indicating potential IC/IDs are observed, patrolling or targeted investigations will be scheduled during the times when those flows typically occur based on data from the meters.

The County monitors more storm drain outfalls, more frequently than is required by the WQIP. During the 2015-2016 monitoring year, all County major storm drain outfalls were inspected for dry weather flows three or more times, while the Permit requires a minimum of only two visits per year at 80% of the outfalls. Overall, the County completed about 50% more field screening monitoring visits to its major outfalls than required by the Permit. During the 2015-2016 monitoring year, the County also visited 111 smaller storm drain outfalls (outfalls with diameter less than 36 inches) that it has inventoried as part of its Microbial Source Tracking Study (published as Appendix L of the *Transitional Monitoring and Assessment Program Report 2012-2014*, and provided in this report Attachment 4C to Appendix 4). These were inspected for non-stormwater flows approximately once every two months over the monitoring year. The data were collected to better inform the program about the County's progress toward achieving its dry weather storm drain outfall flow reduction goals.

To reduce trash and bacterial sources associated with transient activity, the County of San Diego collaborates with a multi-departmental group, including the Sherriff's Department, to remove and clean up homeless encampments. The County has also partnered with I Love a Clean San Diego on cleanup events, and has partnered with other nonprofit groups upstream of the El Capitan reservoir to remove invasive plants.

As a regional leader in water conservation, the County implements several programs and strategies, both independently and in partnership with other agencies, to help conserve local water supplies. During FY 2015-2016, these efforts included the County conducting two rain barrel distribution events in partnership with other agencies which provided 55-gallon water collection drums to qualifying local citizens. The County has also worked in partnership with local water agencies, including the San Diego County Water Authority under its WaterSmart campaign, to provide assistance within its jurisdiction on the distribution of water conservation educational materials. This effort has included the promotion of available water conservation rebates and incentives including water efficiency audits and other tools to help save water.

Through the County's collaboration with a diverse group of partners, the Sustainable Landscapes Program (SLP)[9] was developed to integrate multiple sustainability concepts and resource benefits for residential-scale urban landscapes (Figure 4-4). The program aims to reduce the amount of potable water applied to the landscape, capture and use rainwater as a resource, and reduce pollutant infiltration into local waterways. The comprehensive approach includes the following:

1. the development of landscape guidelines,
2. residential and professional landscape training courses,
3. technical landscaping assistance including planting and irrigation plans,
4. marketing and outreach,
5. financial incentives for turf conversions, and
6. landscape materials provisions, including mulch and compost/compost tea.

During FY 2015-2016, the SLP partners offered free education and training opportunities to over 1,000 homeowners and professionals throughout San Diego County. All training opportunities align with the San Diego Sustainable Landscape Guidelines, which details best practices and

[9] Information on the San Diego Sustainable Landscape Program can be found at http://sustainablelandscapessd.org/

recommendations for a watershed approach to landscaping. Financial incentives for turf conversions and discounts on landscape material are scheduled to commence in late 2016.

Figure 4-4. Sustainable Landscape Planted with Low Water Plants (San Diego Sustainable Landscape Guidelines)

While bacterial pollution is a priority in the San Diego River Watershed, the County has also taken efforts to address other water quality conditions, such as sediment, nutrients, and habitat quality. In response to a complaint in the Winter Gardens area of Lakeside alleging sediment discharge occurring during a heavy El Niño winter storm, the County contracted with a consultant to conduct a community-based social marketing study of the residents in the area and their behaviors related to erosion and sediment control. The study concluded that although most residents did not perceive soil erosion as a serious problem in the area, many had already planted ground cover on their properties and would be interested in additional resources like the SLP. The County held a number of Sustainable Landscapes workshops throughout the year, including one in the Lakeside area in June 2016. Additionally, the County implemented new rock energy dissipaters at the outfalls of Winter Gardens Elementary School to reduce the velocity of storm water that flows onto the road in an effort to reduce sediment transport. The County also inspected the sewer manholes in the area and determined that they were intact and in good structural condition, and did not pose a threat of sewage infiltration into the storm drain system.

In addition, the County has taken a multi-faceted approach to reduce water consumption and limit dry weather flows through collaboration among departments. In response to drought conditions in the region, the County recently implemented a Water Shortage and Drought Response Plan to reduce water use at its facilities. For example, a collaborative effort between the Departments of Parks and Recreation and General Services resulted in installation of synthetic turf at several parks, including Lakeside Baseball Park and Collier Park Soccer Arena in Ramona (Figure 4-5). Since 2009, Parks and Recreation's installation of high-efficiency irrigation heads and smart irrigation controllers was completed in 20 parks county-wide, which has enabled the County to save over 180 millions of gallons of irrigation water. Other measures taken include, but are not limited to, elimination of regularly scheduled exterior window washing at County facilities and identification of parks and facilities with the potential for recycled water connections.

Figure 4-5. Lakeside Baseball Park (Left) and Collier Park Soccer Arena (Right)

The County is committed to improving training and guidance materials for construction contractors, businesses, and internal staff. The 2007 Low Impact Development (LID) Handbook[10] was updated to better align with the County's Standard Urban Stormwater Mitigation Plan (SUSMP) and Hydromodification Management Plan (HMP), and to reflect the most current data on LID approaches and their efficacy. For its distinguished efforts, the County was named the recipient of the 2015 Outstanding Innovation in Green Planning and Design Award by the San Diego Chapter of the California Association of Environmental Professionals (AEP), a non-profit organization established in 1974 and dedicated to enforcing and supporting the California Environmental Quality Act (CEQA). Additionally, the County received a similar award in October 2016 for work done during the fiscal year on development of its Guidance on Green Infrastructure[11], a document outlining tools to uniformly design, install, and maintain LID features in the public right-of-way (Figure 4-6). The County also increased the number of stormwater inspectors with relevant certifications (QSP/QSD/CSSWI) during FY 2015-2016.

Figure 4-6. Green Infrastructure in the County of San Diego

4.1.6 City of Santee

The City of Santee put into practice a number of new strategies during FY 2015-2016. These strategies seek to reduce bacteria, as well as other pollutants of concern, such as trash and nutrients. To establish a foundation for implementing these new strategies, the City and environmental engineering students from San Diego State University (SDSU) studied the water quality of both stormwater and non-stormwater runoff flowing into the San Diego River at six locations within the City in a partnership called the SAGE Project.

The six sites were chosen based on the the location of a hotspot and the feasibility of placing a structural BMP at the location. This process included a review of existing land use, environment, soil, hydrology, and infrastructure. Samples were analyzed for 10 constituents, including indicator bacteria and nutrients, and results were compared to WQOs outlined in the WQIP. Results indicated that indicator bacteria concentrations were above WQOs at all locations during dry and wet conditions. Phosphate concentrations were above WQOs at all but one location, whereas nitrate concentrations were generally below the WQO. In addition, students re-evaluated the last five years' monitoring data and plotted it onto a GIS heat map (Figure 4-7). This map identified the City's hot spots for both bacteria and nutrients. Combined, this data served to identify pollutant hot spots, and to identify the locations that would serve as valuable candidate sites where alternative or off-site compliance projects could be implemented.

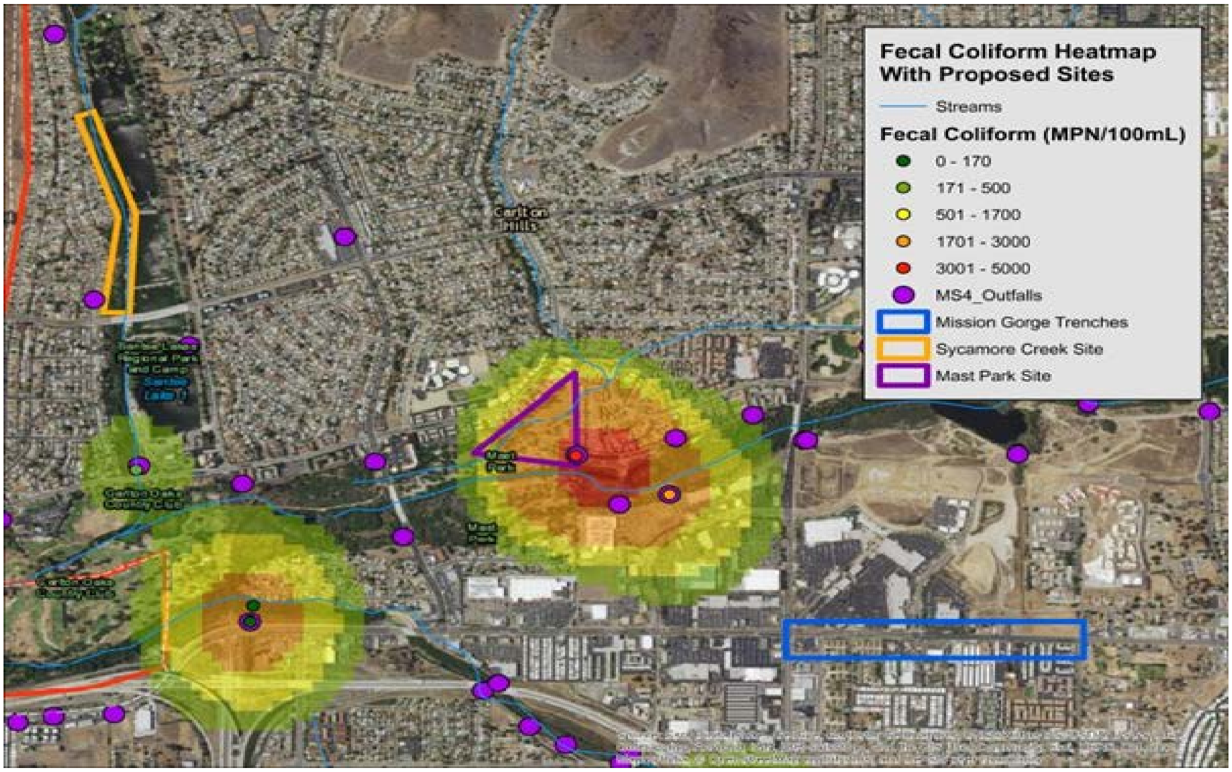

Figure 4-7. GIS Heat Map of SAGE Project Monitoring Data

Based on the review of monitoring data, pollutant hot spots, and upstream investigations, school campuses have been identified as a likely source of nutrients. The City is working with the school districts to establish good housekeeping practices such as landscape maintenance, especially for sports fields. As apart of this effort, the City supported the Santee School Districts successful application to the Drought Response Outreach Program for Schools (DROPS) grant program for a million dollar grant to implement storm water BMPs on school campuses.

The findings from the special studies conducted in partnership with SDSU have served as the foundation for prioritizing and establishing all Storm Water Program efforts. One outcome of theses studies is the implementation of a complete property inspection program. This means that while the City conducts routine inspections of inventoried facilities, the entire property, such as a shopping center/retail strip mall, will also be inspected. This enables the City to look at the big picture concerns at the property and encourages property managers, owners, tenants, and neighbors to work together. For each inspection of a business (tenant), the property manager/owner is notified, a corrective action response is prepared, and all tenants are notified of any concerns identified and best management practice requirements.

Another strategy that has been successfully implemented involves the leveraging of partnerships and resources to achieve water quality improvements. The City of Santee has strengthened relations and formed new partnerships with many community groups and organizations, including the Chamber of Commerce, the YMCA, the Santee School District, various volunteer organizations, and the Padre Dam Municipal Water and Sewer District (Padre Dam). Of note, the City has worked closely with Padre Dam to streamline communication and reporting, leverage resources, and has forged a working relationship on the review of land development projects and water conservation and wastewater issues. Both agencies worked to streamline their plan of action to identify, discontinue, and clean illicit discharges. In addition, Padre Dam is conducting a forensic investigation of the sewer lines that are co-located with a bacterial hotspot near Forester Creek. Planning and coordination started in FY 2015-2016, and the evaluation will be completed FY 2016-2017.

Trash has been identified as a concern in the City of Santee and is a potential contributing source of bacteria to the storm drain conveyance system. This fiscal year, the City mandated that certain new developments and redevelopments install specialized dumpster enclosures as well as drainage insert or trash screen BMPs in private storm drain inlets (Figure 4-8). Trash enclosures are required to be contained on four sides as well as by a roof, with screens between the top of the enclosure walls and the roof to prevent trash from escaping. These requirements apply to all Priority Development Projects as well as certain redevelopment/tenant improvement projects. The City also requires all construction projects, including tenant improvement projects that only have indoor work, to complete construction BMP plans. This requirement helps ensure proper materials and waste management and disposal for such projects.

The City of Santee also worked to reduce trash through many community partnerships. Santee partners with the San Diego River Park Foundation, SDSU volunteers, and religious organizations, among others, to identify high trash areas and organize regular volunteer trash cleanups. Santee Public Works, in partnership with the Sheriff's Department, conducts river sweeps to identify transient encampments. The encampments are given a 72-hour eviction notice. After 72 hours, the City crews remove trash and old belongings.

A couple of notable acheivements were realized this reporting year. The City of Santee was selected as a finalist for a Proposition 1 grant administered by the San Diego River Conservancy to implement stormwater BMPs at Mast Park. The $1.2 million project would include a bioretention area and trash capture BMPs. The total area treated by all proposed BMPs is approximately 540 acres. In addition, significant progress was made toward the goal of eliminating dry weather runoff. As part of a dry weather monitoring investigation, a three gpm flow was tracked from a persistently flowing outfall to a big box store. The City worked with the business to reduce and redirect their swamp cooler discharge from the storm drain into the sewer and eliminate the flow.

CITY OF SANTEE

NEW AND REDEVELOPMENT PROJECTS MINIMUM STORM WATER REQUIREMENTS

New and Redevelopment Projects

All projects must submit a Project Applicability checklist and implement Low Impact Design (LID) to the maximum extent practicable. At minimum, submittals must also address the following:

Trash Management

1. Each property must provide sufficient trash cans (hooded type) throughout the property. All trash and recycling dumpsters must be stored within a fully contained trash enclosure with solid roofing to prevent rain run-on and runoff as well as wind or animal dispersal to the maximum extent practicable. Required signage includes: "No Dumping", and "Keep Lids Closed."

a. *Statewide regulations have been approved by both the U.S. Environmental Protection Agency (EPA) and the California Office of Administrative Law (OAL) to address trash in the environment and waterways. For more information, visit www.waterboards.ca.gov/water_issues/ under Programs, Trash Control.*

b. As of April 1, 2016 all commercial and industrial businesses that generate at least 8 cubic yards (equivalent to two full 4-yard dumpsters) of organic waste are required to separate organic waste from trash and recycling. Organic waste should be kept in a separate leak proof and covered bin within the trash enclosure. Therefore, the trash enclosure must be sized accordingly. For more information regarding this requirement, reference California Assembly Bill No. 1826, Chapter 727.

Outdoor Storage

Hazardous materials may not be stored outdoors. If outdoor storage (non-hazardous) is permitted per zoning code (i.e. Industrial), then the following is required:

1. Submit an inventory and description of all materials to be stored outside to the City.
2. Describe how the outdoor storage area will be covered and contained with permanent controls.
3. All structures must be permitted by the City, and prevent all rain water run-on and run-off.

Landscaping

1. Utilize San Diego native and drought tolerant plantings to maximum extent and install low water-use irrigation systems.
2. Irrigation systems must be installed to prevent overspray and/or runoff.

CITY OF SANTEE

NEW AND REDEVELOPMENT PROJECTS MINIMUM STORMWATER REQUIREMENTS

New and Redevelopment Projects

Storm Drain Inlets

All development projects must comply with full trash capture requirements.

1. All inlets must be fitted with grates, trash baskets, or equivalent proprietary device.
2. The device must be designed to capture debris 5mm or greater, and prevent flooding potential. All inlets must be labeled with concrete stamp, or equivalent, stating "No Dumping—Drains to River."

Residential Developments (with HOA, or more than 10 units)

1. Dog waste stations must be provided throughout the property.
2. Dog waste stations shall include signage to pick up and properly dispose of pet waste.
3. Stations must provide pet waste bags and a covered trash receptacle.

Property Maintenance and Housekeeping

1. All parking lots and private roads must be cleaned as needed, and at least once per year.
   a. Cleaning shall be sufficient to remove oil, grease, food stains, and debris—all wash water must be captured and contained for disposal to a sanitary sewer.
2. Trash containers shall remain covered at all times, and be emptied when full; dumpsters shall not be allowed to overtop.
3. Routine property inspections should be performed to remove stray debris, clean up residual materials, sweep up sediment, and maintain irrigation systems.

For more information regarding storm water regulations, visit www.santeeh2o.org.

Figure 4-8. New and Redevelopment Projects Minimum Stormwater Requirements

4.1.7 Caltrans

Although Caltrans is not a part of the Permit, Caltrans works cooperatively with the Copermittees in accordance with their statewide NPDES permit. Strategies Caltrans has implemented are presented in tabular format in Appendix 2.

4.1.8 Optional Watershed and Jurisdictional Strategies

In addition to the strategies presented above, the Participating Agencies developed optional jurisdictional and watershed strategies. Implementation of the optional strategies contingent on circumstances supported by the need for the additional effort as determined through the adaptive management process, the cost/benefit as compared to other options and strategies, and the availability of funding. Optional watershed strategies for the San Diego River WMA during FY 2015-2016 are presented in Table 4-6. Jurisdictional optional strategy implementation is described in the Participating Agencies' strategy tables, which are provided in Appendix 2.

Detailed jurisdictional strategies, including optional strategies and whether they have been triggered, are included in Appendix 2. Within the detailed strategies tables, information is presented to indicate whether the strategy was implemented during this reporting period, whether it will continue to be implemented during the next reporting period, or whether the strategy will be modified or eliminated for the coming year(s).

Table 4-6. San Diego River Optional Watershed Strategies Implemented during FY 2015-2016.

San Diego River WMA Optional Watershed Strategies	Implementation Timeframe	Collaborating Entities	HPWQC	PWQC			
			Bacteria	Nutrients	Eutrophic Conditions	Total Dissolved Solids	Index of Biotic Integrity
Implement Sustainable Landscapes Program to encourage landscape retrofits.*	FY 2016-17; Continuous until grant funding and incentives are depleted	Water districts, Copermittees, non-profit organizations	●	●	●	●	●
Implement an invasive species (i.e., *Arundo*) removal program in upstream areas, rivers, or tributaries.	FY 2016-18; Continuous until grant funding depleted	Copermittees, non-profit organizations	●	●	●	●	●
Implement wastewater management program to prevent sewer overflows.	FY 2016-2018; Continuous until grant funding depleted.	Copermittees, wastewater agencies	●	●	●	●	●

Note:

* Guideline development and residential/professional training courses were completed in FY 2015-2016; additional program components will begin in FY 2016-2017. See Section 4.5.1 for additional details.

4.2 GOALS FOR THE SAN DIEGO RIVER WATERSHED

As discussed in Section 2, interim and final numeric goals were established for the watershed as a means of measuring reasonable progress towards addressing bacteria and are focused to achieve compliance with the Bacteria TMDL. These goals are outlined in Chapter 3 of the WQIP and in Appendix 3 of this Annual Report, and include six compliance pathways. Each compliance pathway provides an independent option to demonstrate progress and ultimately compliance with the TMDL. Any one of the compliance pathways may be used for assessment purposes; all pathways do not have to be assessed. Each year, the Participating Agencies assess specific water quality data and programmatic information in order to gauge progress towards achieving the numeric goals. These assessments provide information to determine whether intended outcomes are being realized or if adaptations of Participating Agencies' programs are necessary.

This section focuses on the progress that the Participating Agencies have made towards their interim goals established for the Permit term ending in 2018. Progress towards these numeric goals is measured using the water quality and programmatic data collected during the 2015-2016 monitoring year. Progress is summarized in Table 4-7 (for dry weather) and Table 4-8 (for wet weather) and in the following subsections.

4.2.1 Interim Numeric Goals, Permit Term

The San Diego River WQIP was accepted in February 2016, and none of the goals outlined in the WQIP are due to be achieved by the end of FY 2015-2016. The Participating Agencies are demonstrating progress towards goals in the San Diego River WMA through the WQIP implementation option (Pathway 6), which involves executing the jurisdictional strategies outlined in the WQIP to achieve interim and, eventually, final goals. Progress toward the interim numeric goals for the current Permit term is presented in Table 4-7 (dry weather goals) and Table 4-8 (wet weather goals). The completion of baseline estimates are included in the progress assessment for those Participating Agencies that committed to providing baseline information in the 2015-2016 WQIP Annual Report which had not already given in the WQIP.

4.2.1.1 The City of El Cajon

The City of El Cajon is focusing its efforts during the current Permit term primarily on addressing dry weather urban runoff. Based on cumulative assessment reports and monitoring studies focusing on the San Diego Watershed (San Diego River) and Forester Creek, known sources of bacteria include anthropogenic (human and pet contributions), high density areas and industry (multi-family housing, high use areas such as retail centers, and eateries), irrigation runoff (over irrigation, pavement washing), and natural (wildlife) contributors. Based on the urban runoff monitoring program results, historical data show that bacteria and nutrients exceedances occur at major outfalls within the jurisdiction of El Cajon.

Interim dry weather numeric goals for this Permit term and progress towards those goals are presented in Table 4-7. Progress is also shown in Figure 4-9. During dry weather, the City of El Cajon met its goal of achieving a 10% reduction in flow volume or the in the number of flowing outfalls compared to the baseline calculated from 2013-2014 monitoring year data, and will continue to implement their programs to reduce dry weather flows. A second dry weather goal for the Permit term is to increase the number of cubic yards of debris collected from drainage channels to reduce the gross pollutants that may contribute to bacteria loads. Progress was measured by comparing the number of annual transient encampment removal events and associated cubic yards removed to the yearly average of five removal events removing 25 cubic yards of trash and debris. The City of El Cajon exceeded this average during the 2015-2016 monitoring year and will continue cleanups in future fiscal years.

During wet weather, interim goals included sponsoring and coordinating with jurisdictions for bi-annual creek cleanup events in one focused management area and expanding pet waste management outreach to one focused management area or to large properties owners. Progress is described in Table 4-8 and shown in Figure 4-9. The City of El Cajon achieved the first goal by removing a greater amount of solid waste than the per-event average of five cubic yards. For the second goal, the City of El Cajon began planning its pet waste management outreach program and is on track to implement the program within the Permit term.

Permit Term Goal	Baseline Estimation Completed	On Track to Achieve Goal	Permit-Term Goal Achieved
Dry Weather Goal #1: Flow Reduction	✓		✓
Dry Weather Goal #2: Encampment Removals			✓
Wet Weather Goal #1: Cleanup Events at Forester Creek			✓
Wet Weather Goal #2: Pet Waste Management		✓	

Figure 4-9. The City of El Cajon's Progress Towards Permit Term Numeric Goals

4.2.1.2 The City of La Mesa

The City of La Mesa is focusing its current Permit term efforts on performing a creek restoration project encompassing a 900 foot segment of Alvarado Creek. Progress is described in Table 4-7 (dry weather) and Table 4-8 (wet weather) and shown in Figure 4-10. The metric used to demonstrate compliance will be linear feet of structural projects, and the City of La Mesa is on track to achieve its goal during the Permit term.

Permit Term Goal	On Track to Achieve Goal	Permit-Term Goal Achieved
Dry and Wet Weather Goal: Alvarado Creek Restoration	✓	

Figure 4-10. The City of La Mesa's Progress Towards Permit Term Numeric Goals

4.2.1.3 The City of Santee

Interim numeric goals for the Permit term are presented in Table 4-7 (dry weather) and Table 4-8 (wet weather) and progress is shown in Figure 4-11. The Permit term goals are to reduce indicator bacteria loads from storm drain outfalls during dry and wet weather. With only a few months of official program implementation since the WQIP was accepted in February 2016, assessment of pollutant load reductions would be premature at this time. However, The City has a robust program in place to achieve bacteria reductions and has made programmatic progress. A comparison of dry weather major storm drain outfall flow data indicates that progress has been made with regard to eliminating non-stormwater flow. The number of major outfalls at which flowing water was observed during at least one visit decreased by 14% from the 2014-2015 monitoring year to the 2015-2016 monitoring year. In addition, the average observed flow rate at major outfalls decreased by more than half over the same time period. This is largely due to the City eliminating illicit discharges observed during 2014-2015, including an illicit discharge from a development project with an estimated flow rate of 18 gallons per minute (gpm) and a swamp cooler at a commercial facility with a flow rate of approximately three gpm.

The City has also partnered with SDSU to perform additional monitoring to further investigate bacteria and nutrient levels in its jurisdiction and has used that data to help prioritize outfalls for additional investigation. The City is also working with Padre Dam Municipal Water District, the local sewer agency, on a study to assess whether wastewater infrastructure may be contributing bacteria to Forester Creek around identified areas with higher bacteria levels or where human markers have been noted. Based on program implementation to date, the City of Santee has made significant accomplishments and is making progress toward meeting its interim goals, which are due by 2018.

Permit Term Goal	On Track to Achieve Goal	Permit-Term Goal Achieved
Dry Weather Goal: Bacteria Load Reductions	✓	
Wet Weather Goal: Bacteria Load Reductions	✓	

Figure 4-11. The City of Santee's Progress Towards Permit Term Numeric Goals

4.2.1.4 The City of San Diego

The City of San Diego's jurisdictional interim goal for wet and dry weather is to develop and implement a policy requiring the inclusion of green infrastructure features on all suitable City projects, including non-SUSMP projects. This policy will be coordinated with ongoing efforts to update City design manuals and LID standards for public LID BMPs. To guide implementation of the new policy, a green infrastructure program will be initiated in parallel. The program will begin with research and recommendations for ideal methods for green infrastructure project siting and prioritization within the City, but will ultimately result in the construction of additional green infrastructure projects.

FY 18 Performance Based goals for the Permit term and progress toward achieving those goals are presented in Table 4-7 (dry weather) and Table 4-8 (wet weather). Progress is also shown in Figure 4-12 for the wet and dry weather FY 18 Performance Based goal to have 58.4 acres of drainage area treated through construction of four green infrastructure BMPs and in Figure 4-13 for the dry weather FY 18 Performance Based goal to reduce prohibited non-stormwater flow from the City of San Diego's persistently flowing outfalls in the watershed by 10% compared to baseline flows. For the green infrastructure BMP goal, the City has begun the process for developing a green infrastructure policy and implemented projects that treat 43.6 acres of drainage area (75% of the total FY 18 Performance Based goal). Projects that make up the 43.6 acres include the Cabrillo Rain Garden (6 acres) and Park Ridge Structural BMP (37.6 acres). The FY 18 Performance Based goal is expected to be achieved by implementing additional projects that treat 14.8 acres of drainage area, for a total of 58.4 acres (Allied Gardens Bioretention - 4.5 acres, Famosa Slough Bioretention - 10.3 acres) treated by 2018. For the flow reduction goal, average dry weather flow in FY 2015-2016 was 62.8 gallons per minute, representing a 46.7% reduction from the baseline average flow. Therefore, this goal has been achieved.

In accordance with the requirements of the WQIP, the storm drain discharge baselines to be used for assessing progress toward dry and wet weather jurisdictional numeric goals for bacteria reductions due to be achieved in future permit terms were calculated and are presented in Table A3-9 and Table A3-10 of Appendix 3.

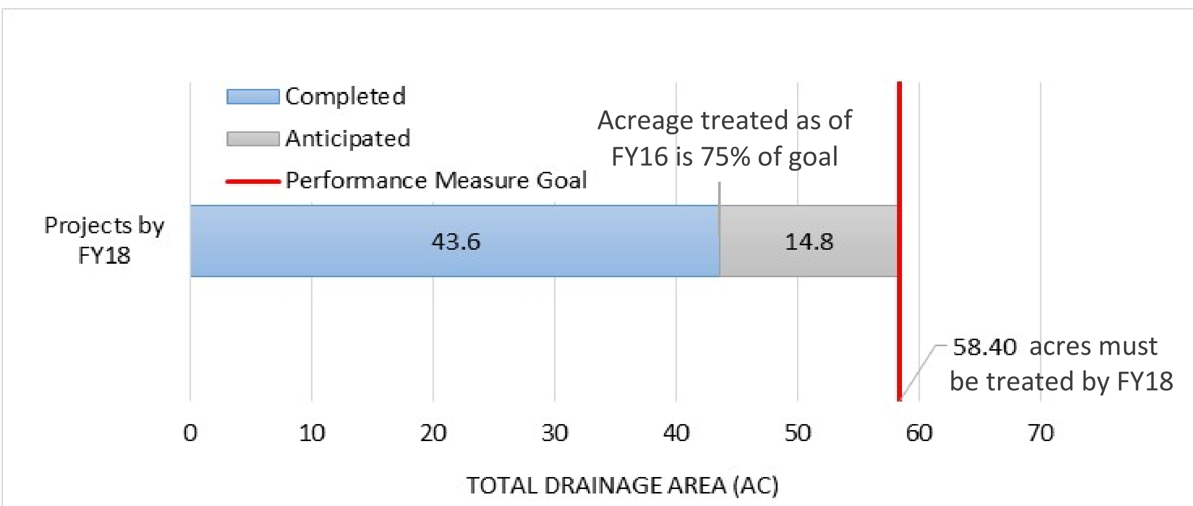

Figure 4-12. The City of San Diego's Progress FY 18 Performance Based Goals – Green Infrastructure BMPs (Wet and Dry Weather)

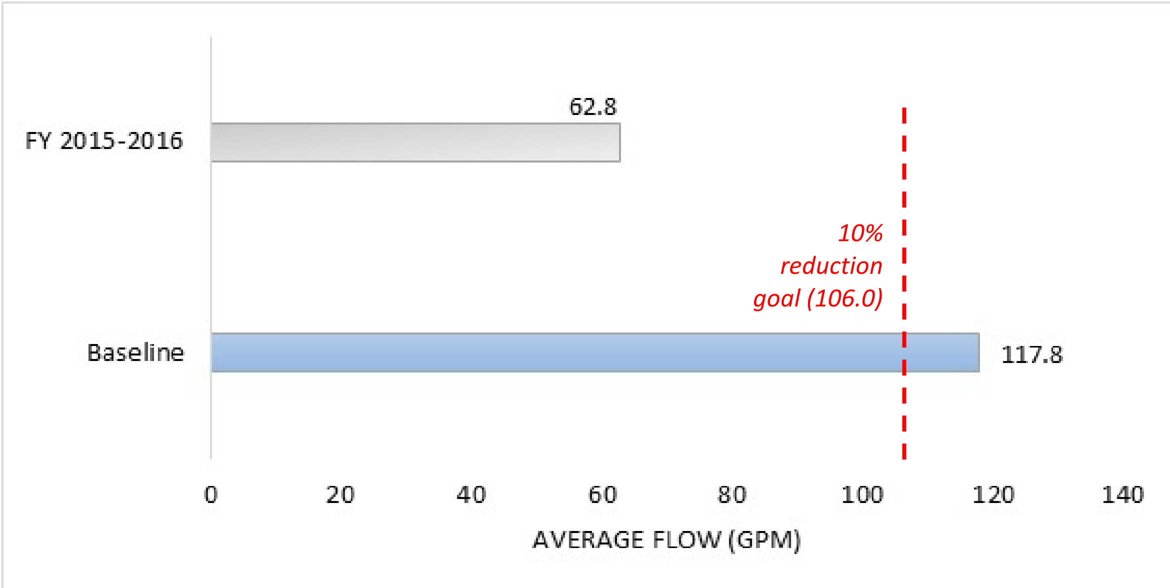

Figure 4-13. The City of San Diego's Progress Towards FY 18 Performance Based Goals – Flow Reduction (Dry Weather)

4.2.1.5 The County of San Diego

The County of San Diego has established dry weather numeric goals for bacteria in the watershed, focusing its efforts on eliminating anthropogenic dry weather discharges from storm drain outfalls to receiving waters through implementation of jurisdictional strategies. The County of San Diego determined the first Permit term will be utilized for planning and feasibility analyses. As such, the County shifted to a more active field program to better locate and abate dry weather flow, and trained staff members to identify and report IC/IDs more effectively. In addition, the County is focusing on reducing flow at persistently flowing storm drain outfalls. The County also has a goal of participating in additional public private partnerships including a small-scale residential incentive program.

Interim numeric goals for the Permit term and progress toward achieving those goals are presented in Table 4-7 (dry weather) and Table 4-8 (wet weather). Progress is also shown in Figure 4-14. The Permit term goal during dry weather is a 20% reduction in aggregate flow volume or in the number of persistently flowing storm drain outfalls. To demonstrate progress toward the goal of reducing and eventually eliminating non-stormwater discharges from the County stormwater conveyance system (see WQIP Table 3-12; Compliance Pathway 6a), dry weather monitoring of outfalls was conducted during 2015-2016 to develop a baseline. To this end, required storm drain outfall monitoring was augmented with additional continuous flow monitoring in a number of outfalls during the dry season to provide a baseline flow metric that accounts for seasonal and daily variations in non-stormwater flows. This detailed flow information will assist in source identification and abatement activities. Furthermore, the County is leveraging these current efforts to meet the Permit requirements to "effectively eliminate" non-stormwater flows in the stormwater conveyance system by 2021. Doing so will allow the County to achieve the Bacteria TMDL goal of stopping "direct or indirect discharges from the Responsible Copermittee's storm drain systems to the receiving waters" in accordance with the Permit.

During the 2014-2015 and 2015-2016 monitoring years, the County of San Diego conducted dry weather field screening monitoring at all of its 51 major storm drain outfalls in the WMA to document the presence of standing or flowing water. These data were used to determine which outfalls have persistent dry weather flows and should be prioritized for their potential impact on the quality of receiving waters per the Permit. During 2015-2016, five of the eight persistently flowing outfalls were identified as highest priority storm drain outfalls and were targeted for additional bi-annual field and analytical monitoring and focused source reduction activities. The County also installed continuous flow monitoring equipment in nine outfalls with persistent or transient flows that included four of the five highest priority outfalls. These nine outfalls were selected based on presence of persistent and transient flows as well as the feasibility of monitoring with consideration for equipment installation, safety, and access. The resulting data are used to measure dry season baseline flows and to screen for cyclical trends in these flows. This information will assist the County in reducing or eliminating non-stormwater flows.

The 2015-2016 monitoring results show that eight (16%) of the 51 major storm drain outfalls had persistent non-stormwater flows. The mean flow rate as measured at the nine outfalls with continuous flow monitoring equipment equaled 1.80 gpm. These preliminary flows represent a baseline against which the County will measure progress toward achieving the goal of reducing and effectively eliminating anthropogenic dry weather flows from the stormwater conveyance system to the receiving waters.

During wet weather, the interim goal for the current Permit term is to implement non-structural BMPs to achieve source reduction of bacteria loads from the storm drain outfalls or to reduce by 1% the baseline bacteria loads from distributed structural BMPs constructed between 2003 and 2009, which are outlined and mapped in Appendix E to WQIP Chapter 3. Since these BMPs were implemented to mitigate anticipated development, they are considered to contribute to the pollutant load reductions achieved under the WQIP. Progress is described in Table 4-8 and shown in Figure 4-14. The County implemented all planned programmatic BMPs and is on track to achieve the first wet weather goal. The County has achieved the second wet weather goal through continued operation and maintenance of the distributed BMPs.

Permit Term Goal	Baseline Estimations Completed	On Track to Achieve Goal	Permit-Term Goal Achieved
Dry Weather Goal: Flow Reduction	✓		
Wet Weather Goal #1: BMP Implementation		✓	
Wet Weather Goal #2: Distributed BMP Operation and Maintenance			✓

Figure 4-14. The County of San Diego's Progress Towards Permit Term Numeric Goals

Table 4-7. Permit Term Dry Weather Numeric Goals

Goal	Metric	Schedule	Baseline Data	Data Collected/Results	Progress
City of El Cajon					
Reduce the volume of dry weather flows or the number of storm drains with dry weather flows by 10%.	% reduction of dry weather flow volume from major outfalls or number of major outfalls with dry weather flows	Achieve during Permit Term (expires June 27, 2018).	The baseline was calculated based on data from monitoring year 2013-2014, the first year that flow data were collected at the major outfalls in the City. The estimated flow volume from major outfalls was 47.4 million gallons, and 45% of major outfalls had flowing water during at least one visit.[a]	Dry weather flow measurements were collected as part of the City's major MS4 outfall monitoring program. The estimated flow volume in monitoring year 15-16 was 20.1 million gallons, and 24% of major outfalls had flowing water during at least one visit.	Reductions of more than 10% in both the estimated flow volume and the percentage of outfalls with flowing water during 15-16, compared to the baseline, were observed. Relatively small amounts of rainfall and statewide mandatory water conservation programs, in addition to the City's strategies, likely contributed to these reductions. While water agencies' mandatory conservation programs are no longer in effect, the City will continue to implement its programs to reduce dry weather flows.
Increase annual transient encampment removal events to a minimum of eight (8) annual events to increase to 40 cubic yards of trash and debris.	The number of annual transient encampment removal events throughout the City's drainage channels.	Achieve during Permit Term (expires June 27, 2018).	Yearly average of five (5) removal events during R9-2007-0001 Permit cycle to help remove 25 cubic yards of trash and debris.	The City performed 18 transient encampment removal events during FY15-16 and removed 212.6 cubic yards of trash and debris. An especially large number of cleanups were completed in FY 15-16 to prepare for El Niño conditions and reduce flood risk.	The City exceeded the average annual goals for the number of cleanups and the volume of trash and debris removed. The total volume of material removed also exceeds the entire Permit term goal of 120 cubic yards (40 cubic yards/year x 3 fiscal years). The City will continue cleanups of transient encampments in future fiscal years.
City of La Mesa					
Perform 900 linear feet of Alvarado Creek Restoration	Linear feet of structural projects	Achieve during Permit Term (expires June 27, 2018).	Existing channel conditions.	The City has started construction of the 900 linear feet of restoration in Alvarado Creek in FY 15-16. Work will be completed before 2018.	The City is on track to achieve the goal for the Permit term due in 2018.
City of Santee					
Loads are reduced by 18.5% for total coliform; 17.4% for fecal coliform; 23.5% for *Enterococcus* from MS4 outfalls	Load reductions in MS4 discharges	Achieve during Permit Term (expires June 27, 2018).	1,727 x 10^{12} MPN during Water Year 2003 (based on modeling). This baseline may require updating as this baseline is not specific to MS4 discharges from the City of Santee only.	The City has developed more strict development requirements and more aggressive requirements for retrofits, performed IDDE investigations, partnered with SDSU to investigate bacteria levels at creek sites in the City's jurisdiction, and is working with Padre Dan Municipal Water District to assess whether wastewater infrastructure is contributing to bacteria levels and whether human marker is present.	The number of major outfalls at which non-stormwater flow was observed during at least one visit decreased by 14% from the 2014-2015 monitoring year to the 2015-2016 monitoring year. The average observed flow rate at major outfalls decreased by more than half over the same time period.
City of San Diego					
Treat 58.4 acres of drainage area through construction of 4 green infrastructure BMPs.	Acres of drainage area treated	Achieve during Permit Term (expires June 27, 2018).	0 acres treated in 2002, the year used as baseline in the Bacteria TMDL.	The City has begun the process for developing a green infrastructure policy.	The City implemented green infrastructure projects that treat 43.6 acres (Cabrillo Rain Garden- 6 acres, Park Ridge Structural BMP -37.6 acres) of drainage area and is expected to achieve the performance measure by implementing additional projects that treat 14.8 acres (Allied Gardens Bioretention-4.5 acre, Famosa Slough Bioretention-10.3 acres) of drainage area for a total of 58.4 acres treated by 2018.
Reduce prohibited dry weather flow from baseline measured at persistently flowing outfalls in the WMA by 10%.	Interim compliance is implementation of strategies and schedule based on analysis results.	Achieve during Permit Term (expires June 27, 2018).	Average Dry Weather Flow[c]: 117.8 gallons per minute.	Average dry weather flow in FY 16 was 62.8 gallons per minute.	Average dry weather flow was reduced by 46.7% from the baseline average flow.

Table 4-7. Permit Term Dry Weather Numeric Goals

Goal	Metric	Schedule	Baseline Data	Data Collected/Results	Progress
County of San Diego					
Reduce by 20% the aggregate flow volume or the number of persistently flowing outfalls.	% reduction of flow volume or number of outfalls with persistent flows	Achieve during Permit Term (expires June 27, 2018).	Data collected as part of the 2015-2016 Dry Weather MS4 Outfall Monitoring and from 9 outfalls with continuous flow monitoring equipment were used to establish the baseline. Eight (16%) of 51 major MS4 outfalls had persistent non-stormwater flows. Using data from all inventoried outfalls (including those less than 36"), 27 of 164 (also 16%) had persistent non-stormwater flows. The mean flow rate at the 9 outfalls with continuous flow monitoring equipment equaled 1.80 gallons per minute (gpm).	In accordance with the County's commitment in the WQIP, dry weather flow data from major MS4 outfalls were collected during the 15-16 monitoring year to establish a baseline.	Data from the 15-16 monitoring year were used to set a baseline. Future years' data will be compared to that baseline.

[a] The City-wide major outfall estimated dry weather flow volume is the sum of the individual outfall flow volumes. The flow volume for each major outfall was estimated by multiplying the average flow rate at each outfall by 330 dry days per year. While the number of dry days each year may change, for the purposes of assessing progress toward this goal, the same number of dry days is used to estimate the flow volume each year for consistency.

[b] Geosyntec Consultants, Technical Memorandum, San Diego River Watershed Water Quality Improvement Plan City of La Mesa – Jurisdictional Load Reduction Summary, October 10, 2014.

[c] Baseline dry weather flow value calculated using FY 16 outfall data from persistently flowing City of San Diego outfalls in the San Diego River WMA and the average reduction in dry weather flow observed in the Los Peñasquitos, San Dieguito River, Chollas Creek, and Mission Bay WMAs. Calculations are described in Appendix 3.

Table 4-8. Permit Term Wet Weather Numeric Goals

Goal	Metric	Schedule	Baseline Data	Data Collected/Results	Progress
City of El Cajon					
Sponsor, coordinate with jurisdictions creek cleanup events in 1 focused management area, bi-annually; segregate and quantify waste materials.	Number of cleanup events	Achieve during Permit Term (expires June 27, 2018).	The number of cleanup events has varied from year to year. The average amount of material removed has been about 5 cubic yards of solid waste (i.e. trash and debris) per cleanup event.	The City sponsored two removal events at Forester Creek during FY15-16 and removed between 7.6 and 9.12 cubic yards (2,280 lbs.) of trash and debris.[a]	Biannual cleanup events were completed in FY 15-16, and the amounts of material removed exceeded the historical averages for cleanup events in the City. Clean The City will continue cleanup events in the next two fiscal years to achieve the WQIP goal.
Expand pet waste management outreach to 1 focused management area; or to large properties' owners (i.e. apartments, commercial facilities).	Number of focused management areas or large properties' owners to which outreach was completed	Achieve during Permit Term (expires June 27, 2018).	Pet waste program not expanded to any new areas.	The City began planning its pet waste management outreach program during FY 15-16.	The City is on track to implement an expanded pet waste management outreach program by 2018.
City of La Mesa					
Perform 900 linear feet of Alvarado Creek Restoration resulting in a 6.3% reduction in bacteria loading from municipal land use [a]	Linear feet of stream restoration	Achieve during Permit Term (expires June 27, 2018).	Existing channel conditions.	The City has started construction of the 900 linear feet of restoration in Alvarado Creek in FY 15-16. Work will be completed before 2018.	The City is on track to achieve the goal for the Permit term due in 2018.
City of Santee					
Loads are reduced by 4.3% for Total Coliform; 4.3% for Fecal Coliform; 4.3% for *Enterococcus* from MS4 outfalls	Load reductions in MS4 discharges	Achieve during Permit Term (expires June 27, 2018).	1,727 x 10^{12} MPN during Water Year 2003 (based on modeling). This baseline may require updating as this baseline is not specific to MS4 discharges from the City of Santee only.	The City has developed more strict development requirements and more aggressive requirements for retrofits, partnered with SDSU to investigate bacteria levels in its jurisdiction, and is working with Padre Dan Municipal Water District to assess whether wastewater infrastructure is contributing to bacteria levels and whether human marker is present.	Santee has partnered with various organizations for regular volunteer trash cleanups. Santee Public Works, in partnership with the Sheriff's Department, conducts bi-monthly sweeps to identify and remove transient encampments.
City of San Diego					
Treat 58.4 acres of drainage area through construction of 4 green infrastructure BMPs.	Acres of drainage area treated	Achieve during Permit Term (expires June 27, 2018).	0 acres treated in 2002, the year used as baseline in the Bacteria TMDL.	The City has begun the process for developing a green infrastructure policy.	The City implemented green infrastructure projects that treat 43.6 acres (Cabrillo Rain Garden- 6 acres, Park Ridge Structural BMP -37.6 acres) of drainage area and is expected to achieve the performance measure by implementing additional projects that treat 14.8 (Allied Gardens Bioretention-4.5 acre, Famosa Slough Bioretention-10.3 acres) acres of drainage area for a total of 58.4 acres treated by 2018.
County of San Diego					
Implement programmatic (non-structural) BMPs to achieve source reduction of bacteria loads from the storm drain outfalls	% bacterial load reduction. Interim compliance is implementation of strategies in accordance with schedule in WQIP.	Achieve during Permit Term (expires June 27, 2018).	1,727 x 10^{12} MPN during Water Year 2003	During FY 15-16 the County implemented all planned programmatic BMPs according to the schedule in the WQIP	The first year of BMP implementation was completed successfully; and the County is on track to achieve the goal via continued BMP implementation through 2018.
Reduce by 1% the baseline bacteria loads from distributed BMPs constructed between 2003 and 2009 during redevelopment.	Implementation and maintenance of BMPs. % bacterial load reduction is based on quantitative model.	Achieve during Permit Term (expires June 27, 2018).	1,727 x 10^{12} MPN during Water Year 2003	BMPs were constructed between 2003 and 2009 and have continued to be operated and maintained.	The County is on track to achieve the goal via continued BMP operation and maintenance through 2018.

5 Adaptive Management

This section presents a summary of the potential triggers for adaptation of the WQIP and the results of the adaptive management process for the San Diego River WMA after the 2015-2016 monitoring year, with additional detail provided in Appendix 5.

Adaptive management entails using an iterative approach to re-evaluate the water quality conditions, priorities, numeric goals, strategies, and schedules based on the requirements of the Permit. The adaptive management process details how the Participating Agencies use new data and information to improve the WQIP through updates to priorities, assessments of and adjustments to goals, updates to strategies to achieve the latest goals, and updates to the monitoring and assessment program to provide the necessary data to support the process.

The Permit describes various triggers that may warrant program adaptation, including exceedances of water quality standards in receiving waters, new information, recommendations from the Regional Board, and public participation. Effectiveness assessments of JRMP programs and strategies may also trigger adaptations to the WQIP. The adaptive management process is used in conjunction with water quality and programmatic data to evaluate whether modifications to numeric goals, schedules, and/or strategies are necessary to achieve compliance with the interim and final compliance numeric goals. The timing of the adaptive management requirements is typically either annually or at the end of the Permit term.

5.1 DRIVERS FOR ADAPTATION

The adaptive management process may be triggered when new information becomes available, including results of routine monitoring and special studies, new regulatory drivers, results of program effectiveness assessments and progress towards numeric goals, and recommendations from the public and/or Regional Board. Modifications may be made to the priority water quality conditions, goals, strategies, schedules, and/or the MAP. The potential triggers for adaptation that must be considered annually are summarized in Table 5-1. The assessments related to each of these potential triggers are included in Appendix 5.

Only one year of monitoring data have been collected under the WQIP's MAP and, with the acceptance of the WQIP in February 2016, the Participating Agencies have been officially implementing the WQIP for less than a year. Therefore, it is too early in the implementation process to have significant feedback necessary to drive the adaptive management process. Continued and further implementation of strategies and collection of additional monitoring and programmatic data is necessary for an evaluation that leads to meaningful adaptive management. The elements considered in the adaptive management process are identified in the section to follow; however, no changes to the WQIP based on the adaptive management process are recommended at this early stage of implementation.

Table 5-1. Causes for Adaptive Management within the Water Quality Improvement Plan

Trigger	Frequency for Assessment	Potential Area(s) for Adaptation			
		Priority Water Quality Conditions	Goals and Schedules	Strategies and Schedules	Monitoring and Assessment
Exceedances of Receiving Water Limitations	Annual			X	X
Exceedances of Non-stormwater Action Levels or Stormwater Action Levels	Annual			X	X
Special Studies Results	Annual, as results are available		X	X	X
New Regulatory Actions	Annual, as applicable	X	X	X	X
Regional Board Recommendations	Annual, as applicable	X	X	X	X
Program Effectiveness Assessments/ Progress Towards Goals	Annual			X	X

5.2 WATER QUALITY IMPROVEMENT PLAN ELEMENTS FOR ADAPTATION

The purpose of this section is to summarize changes to components of the WQIP, including priority water quality conditions, numeric goals, strategies, and/or schedules, if applicable, based on analyses and findings in this 2015-2016 Annual Report. Supporting information for these modifications would be detailed in Appendix 5, if applicable. The potential areas for adaptation were presented in Table 5-1, which also shows the information that may trigger adaptation.

In accordance with the Permit, the priority water quality conditions within the watershed *may* be re-evaluated as needed as part of the annual reporting process. In general, priority and highest priority water quality conditions and numeric goals are established based on longer periods of record compared to a monitoring year and their assessment would most appropriately be conducted following the collection of sufficient data to make scientifically-based decisions. At earliest, such consideration may be given during the preparation of the ROWD, due to the Regional Board in December 2017.

The 2015-2016 monitoring year was the first in accordance with the WQIP's MAP. Receiving water and storm drain outfall discharge monitoring results indicated that no modifications to the priority and highest priority water quality conditions identified by the WQIP are necessary at this time. Further, there have been no new regulatory actions or Regional Board recommendations since the acceptance of the WQIP that would warrant reconsideration of priorities for the San Diego River WMA through the annual reporting process.

On an annual schedule, it is more likely that modifications may be made to strategies and implementation schedules. These elements may require updates on a more frequent basis than the priorities to ensure effective implementation and assessment as the WQIP progresses. Evaluation of the current goals, strategies, and schedules is required by the Permit as part of this Annual Report. The information that may be used to modify these elements of the WQIP through adaptive management is summarized in Table 5-2.

No changes to numeric goals or schedules for achieving them as listed in the WQIP are proposed at this time. Minor administrative changes, including clarifications, correction of typos and errors, and edits to WQIP strategies, are proposed, primarily by the City of San Diego. These modifications are identified as markup to the Participating Agencies tables in Appendix 2. While one year of monitoring data have been collected in accordance with the MAP of the WQIP, only a few months of this time period have been under the accepted WQIP and implementation. The Participating Agencies in the San Diego River WMA have begun implementing their jurisdictional strategies intended to result in achievement of dry and wet weather interim goals for the term of the current Permit. These efforts to date have not identified the need for significant changes and, as described in Section 4, the Participating Agencies are demonstrating progress in implementing the existing strategies. Additional evaluation will be conducted and reported in the ROWD.

Table 5-2. Information Used to Modify Strategies and Schedules

Evidence	WQIP AR Sections	2015-2016 Status	Changes Triggered (Y/N)
Receiving water monitoring results.	Section 3, Appendix 4	No new information pertaining to receiving water exceedances not addressed by the WQIP.	N
Storm drain outfall monitoring results.	Section 3, Appendix 4	NAL and SAL exceedances are consistent with WMA priority constituents.	N
Special studies results.	Section 3, Appendix 4	Data from these studies will be useful for the re-evaluation of the Bacteria TMDL and to facilitate consideration of site-specific water quality criteria for bacteria.	N
New or updated regulations.	Section 5	No new regulatory drivers; adaptive management will be required as new TMDLs are approved and as the Trash Amendments are incorporated into the Permit.	N
Program effectiveness assessments.	Section 5	Additional data will be necessary to supplement 2015-2015 data before program effectiveness can be evaluated.	N
Progress towards achieving numeric goals.	Section 4	Initial results related to program effectiveness indicate that the Participating Agencies have made progress towards achieving each of their dry and wet weather interim goals for the current Permit term.	N

Similar to strategies and schedules, updates to the MAP may be necessary more often than priority water quality conditions and numeric goals and schedules. Changes to the MAP may be triggered by several factors including:

- Modifications to other elements of the WQIP, including priority water quality conditions, numeric goals and schedules, and/or strategies and schedules.
- Identification of data gaps through Permit-required assessments.
- Results of special studies.
- Requests/requirements from the Regional Board.

None of these triggers are applicable to the 2015-2016 monitoring year, and adaptive management of the MAP is not required at this time. Additional assessments are planned for the ROWD, including evaluation of the monitoring data and receiving water limitations.

6 Conclusions

Sections 1 through 5 and their associated appendices present the results and assessment findings derived from the 2015-2016 monitoring year in the San Diego River WMA. This was the first year of monitoring under the accepted WQIP and its associated MAP. The monitoring performed during 2015-2016 in the WMA, which was focused on addressing the HPWQC in the WMA (i.e., bacteria), is summarized in Table 6-1. Although the goals and strategies outlined in the WQIP are focused on bacteria, implementation of the chosen strategies will also improve conditions in relation to the PWQCs and other potential contaminants, providing a multi-benefit approach to implementation.

Table 6-1. Monitoring Conducted during the 2015-2016 Monitoring Year in the San Diego River WMA

Monitoring	Related to HPWQC? (Y/N)
Receiving Water Monitoring*	
SMC Regional Monitoring	N
TMDL	Y
Storm Drain Outfall Monitoring	
Dry Weather Field Screening	Y
Dry Weather Monitoring	Y
Wet Weather Monitoring	Y
Illicit Discharge Detection and Elimination	Y
Special Studies	
Reference Streams and Beaches Study	Y
Wet Weather Epidemiology Study	Y

* HMP monitoring was conducted regionally. One reference station was located in the San Diego River WMA. The objectives and results of the program are summarized in Appendix 4.

A summary of major findings and achievements as they pertain to bacteria is presented in Table 6-2. Detailed results and the related assessments required by the Permit are found in the referenced sections of Appendix 4.

The Participating Agencies implemented a broad range of strategies to target bacteria, as well as other constituents such as nutrients and trash during FY 15-16. Several key strategy types are highlighted below, with details provided for each Participating Agency in Section 4.1.1.

- **Preventing wastewater discharges to the storm drain system**. This strategy addresses human sources of bacteria, which are the highest priority from a public health perspective.
- **Trash cleanups**, including volunteer cleanup events and cleanups of trash associated with transient encampments, which remove trash and also address likely sources of bacteria.
- **Dry and wet weather runoff reduction programs**, which include rebates and actions at Participating Agencies' own facilities.

- **Retrofit and rehabilitation projects**, which address most pollutants and also often provide other benefits, such as aesthetic improvement or habitat enhancement.
- **Additional monitoring to investigate sources of dry weather flows**, which are a transport mechanism for bacteria and other pollutants.
- Increased residential, commercial, and industrial inspections.
- **Community outreach programs,** which inform and engage the community about issues such as water conservation, irrigation runoff, and trash disposal.

The WQIP requires implementation of an adaptive management process, used to evaluate whether updates to priorities, assessments of and adjustments to goals, updates to strategies to achieve the latest goals, and/or updates to the MAP are necessary. This process may be triggered when new information becomes available, including results of routine monitoring and special studies, new regulatory drivers, results of program effectiveness assessments and progress towards numeric goals, and recommendations from the public and/or Regional Board. With the acceptance of the WQIP in February 2016, the Copermittees have been officially implementing the WQIP for less than a year. Therefore, it is too early in the implementation process to have significant feedback necessary to drive the adaptive management process. Continued and further implementation of strategies and collection of additional monitoring and programmatic data is necessary for an evaluation that leads to meaningful adaptive management. Therefore, no changes to the WQIP due to the adaptive management process are recommended at this early stage of implementation. Minor administrative modifications to the strategies have been proposed including clarifications, correction of typos and errors, and edits to selected strategies. The proposed administrative changes are documented in Appendix 2.

Table 6-2. Major Findings and Achievements Related to the Highest Priority Water Quality Condition in the San Diego River WMA for the 2015-2016 Monitoring Year

Monitoring Element	Location of Detailed Results	Major Findings and Achievements
Receiving Water Monitoring		
TMDL	Section 3.1.3 Appendix 4 Section 4.1.6	• Interim and final receiving water limitations are being achieved for: o Fecal coliform wet season geometric mean at SDR-FC2 and SDR-MLS. o Fecal coliform dry and wet season geometric means at SDR-CDE. o All fecal coliform and total coliform goals, and *Enterococcus* wet season geometric mean and single-sample maximum at FM-010. • All other results did not meet the interim or final receiving water limitations which are not required to be achieved during this Permit term. However, because the first interim goals are not required to be achieved until April 2020 per the WQIP, the exceedances observed during the 2015-2016 monitoring year do not indicate non-compliance at this time.
Storm Drain Outfall Monitoring		
Dry Weather Field Screening	Section 3.2.1.1 Appendix 4 Section 4.2.1	• There was no trash or a low presence of trash during most (95%) of the trash assessments (n = 375) at visited outfalls. • Visual observations made during routine field screening visits indicated dry/no flow conditions for 59% of visits for the County of San Diego, 60% of visits for the City of El Cajon, 60% of visits for the City of Santee, 25% of visits for the City of San Diego, and 8% of visits for the City of La Mesa. Flowing water was observed during 30% or fewer of the field screening visits conducted by each jurisdiction. • When flow was observed, the majority of estimated flow rates were low, with 75 of 113 estimations categorized as less than five gallons per minute. • Flow determinations indicated that 77 major storm drain outfalls in the WMA had persistent flow; 64 had transient flow; 82 had dry/no flow conditions, and 2 were undetermined. The number of undetermined outfalls has been reduced from 7 to 2, and the number of persistent outfalls has increased by 11 based on the additional dry weather field screening observations made in the 2015-2016 year. • The highest priority outfalls in each jurisdiction were prioritized for dry weather monitoring.
Highest Priority Storm Drain Outfall Dry Weather Monitoring	Section 3.2.1.2 Appendix 4 Section 4.2.2	• Samples collected from most of the monitored outfalls exceeded the single sample maximum water quality objectives for *Enterococcus* and fecal coliform (HPWQCs in the WMA) and NALs for total nitrogen and total phosphorus (PWQCs in the WMA); this indicates that the HPWQC and PWQCs and the highest priority outfalls for the WMA were properly selected. • Data collected during this first monitoring year were used to estimate the non-stormwater volumes and pollutant loads collectively discharged from the major storm drain outfalls with persistent dry weather flows in each Copermittee's jurisdiction.
Storm Drain Outfall Wet Weather Monitoring	Section 3.2.2 Appendix 4 Section 4.2.5	• Samples collected from all five monitored outfalls exceeded the single sample maximum final effluent limitations for *Enterococcus* and fecal coliform. • A more robust data set was developed for the land-use based assessment of wet weather storm drain outfall discharges and land-use based EMCs were refined based on three years of monitoring.
Illicit Discharge Detection and Elimination Program	Section 3.2.1.3 Appendix 4 Section 4.2.4	• The highest priority outfalls with persistent non-stormwater flows were the focus for IDDE investigations. Irrigation runoff was the most common known or suspected source of dry weather flows, followed by groundwater infiltration.

Table 6-2. Major Findings and Achievements Related to the Highest Priority Water Quality Condition in the San Diego River WMA for the 2015-2016 Monitoring Year

Monitoring Element	Location of Detailed Results	Major Findings and Achievements
Special Studies		
Reference Streams and Beaches Studies	Section 3.3.1.1 Appendix 4 Section 4.3.1	• These studies measured concentrations of indicator bacteria that account for natural sources to establish the background concentrations, or “reference conditions”, for streams and beaches minimally disturbed by anthropogenic activities. Data will support the forthcoming re-evaluation of the Bacteria TMDL and numeric target development for future TMDLs.
Wet Weather Epidemiology Study	Section 3.3.1.2 Appendix 4 Section 4.3.2	• The excess risk of illness when entering the ocean in wet weather compared to not entering the ocean was quantified to be 12 surfers per 1,000. • An association was established between *Enterococcus* concentrations and illness rates fallowing REC-1 (surfing) activates during wet weather; the risk of illness was lower than what is predicted for *Enterococcus* concentrations exceeding the current water quality objectives. • A QMRA was performed to estimate the risks of gastrointestinal illness from recreational exposure to beaches impacted by wet weather storm drain outfall discharges. The study demonstrated the applicability of QMRA for recreational water risk estimates during wet weather and may facilitate consideration of site-specific water quality criteria.
Jurisdictional Programs		
Vary by Jurisdiction	Section 4 Appendix 2	• Participating Agencies in the San Diego River WMA have begun implementing jurisdictional strategies aimed at achieving their interim dry and wet weather goals for current Permit term and are demonstrating progress. This progress includes: o The City of El Cajon is on track to achieve or has already achieved its Permit-term goals. The City has calculated a dry weather flow baseline, demonstrated dry weather flow reductions, performed transient encampment removal events, sponsored cleanup events at Forester Creek, and began planning its pet waste management outreach program. o The City of La Mesa has started construction of the 900 linear feet of restoration in Alvarado Creek, and is on track to achieve the Permit-term goal. o The City of Santee is developing methodology to assess load reductions based on the monitoring data collected under the WQIP will be assessing progress to goals in subsequent reporting cycles. A comparison of dry weather major storm drain outfall flow data shows that average flow rates during the 2015-2016 monitoring year were less than 50% of the flow rates observed during the 2014-2015 monitoring year. o The City of San Diego is on track to achieve or has already achieved its FY 18 Performance Based goals. The City has reduced average dry weather flow from the calculated baseline average flow and has implemented green infrastructure projects treating about 75% of the acres to be treated by 2018 to achieve the FY 18 Performance Based goal. As required of the 2015-2016 Annual Report per the WQIP, the storm drain discharge baselines to be used for assessing progress toward dry and wet weather jurisdictional numeric goals for bacteria reductions due to be achieved in future permit terms were calculated and are presented in Table A3-9 and Table A3-10 of Appendix 3. o The County of San Diego is making progress toward achieving or has already achieved its Permit-term goals. The County has established a baseline for calculating dry weather flow reductions in subsequent years, has implemented non-structural BMPs according the schedule outlined in the WQIP to reduce wet weather bacteria loads, and has operated and maintained previously-constructed BMPs to reduce wet weather bacteria loads.

Provision D						
D.1.e.(2)(c)	**Sediment Quality Monitoring** (c) The Copermittees must incorporate a ***Sediment Monitoring Report as part of the Water Quality Improvement Plan Annual Report*** in accordance with the schedule contained in the Sediment Monitoring Plan, unless otherwise directed in writing by the San Diego Water Board Executive Officer. The Sediment Monitoring Report must contain the following information: (i) Analysis: An evaluation, interpretation and tabulation of the water and sediment monitoring data, including interpretations and conclusions as to whether applicable Receiving Water Limitations in this Order have been attained at each sample station; (ii) Sample Location Map: The locations, type, and number of samples must be identified and shown on a site map; and (iii) California Environmental Data Exchange Network: A statement certifying that the monitoring data and results have been uploaded into the California Environmental Data Exchange Network (CEDEN).	N/A			X	
D.2.b.(2)(b)(iv)	**Dry Weather MS4 Outfall Discharge Monitoring** (iv) Each Copermittee must document ***removal or re-prioritization of the highest priority persistent flow MS4 outfall monitoring stations identified under Provision D.2.b.(2)(a) in the Water Quality Improvement Plan Annual Report***. Persistent flow MS4 outfall monitoring stations that have been removed must be replaced with the next highest prioritized major MS4 outfall in the Watershed Management Area within its jurisdiction, unless there are no remaining qualifying major MS4 outfalls within the Copermittee's jurisdiction in the Watershed Management Area.	Section 3.2.1			X	
D.4.b.(1)(a)(ii)	**Non-Storm Water Dischargers Reduction Assessments** (a) Each Copermittee must assess and report the ***progress of its illicit discharge detection and elimination program***, required to be implemented pursuant to Provision E.2, toward effectively prohibiting non-storm water and illicit discharges into the MS4 within its jurisdiction as follows: (ii) Based on the data collected pursuant to Provisions D.2.b, the ***assessments required under Provision D.4.b.(1)(c) must be included in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3).***	Section 3.2.1			X	
D.4.b.(1)(b)	(b) Based on the transitional dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.a.(2), each Copermittee must assess and report the following: (i) Identify the known and suspected controllable sources (e.g. facilities, areas, land uses, pollutant generating activities) of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area; (ii) Identify sources of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area that have been reduced or eliminated; and (iii) Identify modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges pursuant to Provision D.2.b.	Section 3.2 Section 5.2			X	X

Permit Provision	Permit Language	WQIP AR Section	WQIP Appendix: Appendix 2 Jurisdictional Information	Appendix 3 Numeric Goals	Appendix 4 Monitoring	Appendix 5 Adaptive Management
D.4.b.(1)(c)	(c) Based on the **dry weather MS4 outfall discharge field screening monitoring** required pursuant to Provision D.2.b.(1), each Copermittee must assess and report the following: (i) The assessments required pursuant to Provision D.4.b.(1)(b); (ii) Based on the data collected and applicable NALs in the Water Quality Improvement Plan, rank the MS4 outfalls in the Copermittee's jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action to update the Water Quality Improvement Plan, with the goal of eliminating persistent flow non-storm water discharges and/or pollutant loads in order of the ranked priority list through targeted programmatic actions and source investigations; (iii) For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identify the known and suspected sources within the Copermittee's jurisdiction in the Watershed Management Area that may cause or contribute to the NAL exceedances; (iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b, and utilize a model or other method, to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually. [a] Each Copermittee must calculate or estimate the annual non-storm water volumes and pollutant loads collectively discharged from the Copermittee's major MS4 outfalls to receiving waters within the Copermittee's jurisdiction, with an estimate of the percent contribution from each known source for each MS4 outfall; [b] Each Copermittee must annually identify and quantify (i.e. volume and pollutant loads) sources of non-storm water not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.	Section 3.2.1			X	X
	(v) Each Copermittee must review the data collected pursuant to Provision D.2.b and findings from the assessments required pursuant to Provision D.4.b.(1)(c)(i)-(iv) at least once during the term of this Order to: [a] Identify reductions and progress in achieving reductions in non-storm water and illicit discharges to the Copermittee's MS4 in the Watershed Management Area; [b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction, with an estimate, if possible, of the non-storm water volume and/or pollutant load reductions attributable to specific water quality strategies implemented by the Copermittee; and [c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittee in the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction. (vi) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(1)(c)(i)-(v).	Section 3.2.1 Section 5.1 Section 5.2			X	X
D.4.b.(2)(a)	**Storm Water Pollutant Discharge Reduction Assessments** (a) The Copermittees must assess and report the ***progress of the water quality improvement strategies, required to be implemented pursuant to Provisions B and E, toward reducing pollutants in storm water discharges*** from the MS4s within the Watershed Management Area as follows: (ii) Based on the data collected pursuant to Provisions D.2.c, the ***assessments required under <u>Provision D.4.b.(2)(c)</u> must be included in the Water Quality Improvement Plan Annual Reports*** required pursuant to Provision F.3.b.(3).	Section 3.2.2 Section 5.1			X	X
D.4.b.(2)(b)	(b) Based on the transitional wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.a.(3) the Copermittees must assess and report the following: (i) The Copermittees must analyze the monitoring data collected pursuant to Provision D.2.a.(3), and utilize a watershed model or other method, to calculate or estimate the following for each monitoring year: [a] The average storm water runoff coefficient for each land use type within the Watershed Management Area; [b] The volume of storm water and pollutant loads discharged from each of the Copermittee's monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; [c] The total flow volume and pollutant loadings discharged from the Copermittee's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls; and [d] The percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea with a major MS4 outfall to receiving waters or within each major MS4 outfall to receiving waters in the Copermittee's jurisdiction within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch.(ii) Identify modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify pollutants in storm water discharges from the MS4s in the Watershed Management Area pursuant to Provision D.2.c.(1).	Section 3.2.2 Section 5.1			X	X

D.4.b.(2)(c)	(c) Based on the wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.c the Copermittees must assess and report the following: (i) The assessments required pursuant to Provision D.4.b.(2)(b); (ii) Based on the data collected and applicable SALs in the Water Quality Improvement Plan, analyze and compare the monitoring data to the analyses and assumptions used to develop the Water Quality Improvement Plans, including strategies developed pursuant to Provision B.3, and evaluate whether those analyses and assumptions should be updated as a component of the adaptive management efforts pursuant to Provision B.5 for follow-up action to update the Water Quality Improvement Plan; (iii) The Copermittees must review the data collected pursuant to Provision D.2.c and findings from the assessments required pursuant to Provisions D.4.b.(2)(c)(i)-(ii) at least once during the term of this Order to: [a] Identify reductions or progress in achieving reductions in pollutant concentrations and/or pollutant loads from different land uses and/or drainage areas discharging from the Copermittees' MS4s in the Watershed Management Area; [b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters within the Watershed Management Area to the MEP, with an estimate, if possible, of the pollutant load reductions attributable to specific water quality strategies implemented by the Copermittees; and [c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittees in the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters in the Watershed Management Area to the MEP. (iv) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(iii).	Section 3.2.2 Section 5.1			X	X
D.4.b.(2)(d)	(d) The Copermittees must evaluate all the data collected pursuant to Provision D.2.c, and incorporate new outfall monitoring data into time series plots for each long-term monitoring constituent for the Watershed Management Area, and perform statistical trends analysis on the cumulative long-term wet weather MS4 outfall discharge water quality data set.	Section 3.2.2			X	
D.4.c.	**Special Studies Assessments** c. The Copermittees must ***annually evaluate the results and findings from the special studies developed and implemented pursuant to Provision D.3***, and assess their relevance to the Copermittees' efforts to characterize receiving water conditions, understand sources of pollutants and/or stressors, and control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters in the Watershed Management Area. The Copermittees must ***report the results of the special studies assessments applicable to the Watershed Management Area, and identify any necessary modifications or updates to the Water Quality Improvement Plan based on the results in the Water Quality Improvement Plan Annual Reports*** required pursuant to Provision F.3.b.(3).	Section 3.3			X	X
D.4.d.	Integrated Assessment of Water Quality Improvement Plan d. As part of the ***iterative approach and adaptive management process*** required for the Water Quality Improvement Plan pursuant to Provision B.5, the Copermittees in each Watershed Management Area must integrate the data collected pursuant to Provisions D.1-D.3, the findings from the assessments required pursuant to Provisions D.4.a-c, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E to assess the effectiveness of, and identify necessary modifications to, the Water Quality Improvement Plan as follows:	Section 5.1 Section 5.2			X	X
D.4.d.(1)	(1) The Copermittees ***must re-evaluate the priority water quality conditions and numeric goals for the Watershed Management Area, as needed, during the term of this Order pursuant to Provision B.5.a.*** The re-evaluation and recommendations for modifications to the priority water quality conditions, and/or numeric goals and corresponding schedules ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. The priority water quality conditions and numeric goals for the Watershed Management Area must be reevaluated as follows: (a) Re-evaluate the receiving water conditions in the Watershed Management Area in accordance with Provision B.2.a; (b) Re-evaluate the impacts on receiving waters in the Watershed Management Area from MS4 discharges in accordance with Provision B.2.b; (c) Re-evaluate the identification of MS4 sources of pollutants and/or stressors in accordance with Provision B.2.d; (d) Identify beneficial uses of the receiving waters that are protected in accordance with Provision D.4.a; (e) Evaluate the progress toward achieving the interim and final numeric goals for protecting impacted beneficial uses in the receiving waters.	Section 5.2			X	X

1 City of La Mesa

1.1 ANNUAL REPORT CERTIFICATION

SAN DIEGO RIVER WATERSHED MANAGEMENT AREA, WATER QUALITY IMPROVEMENT PLAN FISCAL YEAR 2015-2016 ANNUAL REPORT STATEMENT OF CERTIFICATION AND LEGAL AUTHORITY ESTABLISHMENT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations [40 CFR 122.22(d)].

I also certify that the City of La Mesa has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements within Order No. R9-2013-001 as amended by Orders R9-2015-0001 and R9-2015-0100.

Executed on the 3rd day of January 2017, at the City of La Mesa.

Leon Firsht
Acting Director of Public Works/City Engineer
City of La Mesa

Date

1.2 ANNUAL REPORT FORM

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM
FY 2015-2016 SAN DIEGO RIVER WATERSHED

I. COPERMITTEE INFORMATION

Copermittee Name: City of La Mesa

Copermittee Primary Contact Name: Joe Kuhn, Storm Water Program Manager

Copermittee Primary Contact Information:
Address: 8130 Allison Ave.
City: La Mesa County: San Diego State: CA Zip: 91942
Telephone: 619.667.1340 Fax: 619.667.1380 Email: jkuhn@ci.la-mesa.ca.us

II. LEGAL AUTHORITY

Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES	[X]
	NO	[ ]
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES	[X]
	NO	[ ]

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE

Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES	[X]
	NO	[ ]
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES	[X]
	NO	[ ]

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM

Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES	[X]
	NO	[ ]

Number of non-storm water discharges reported by the public	7
Number of non-storm water discharges detected by Copermittee staff or contractors	5
Number of non-storm water discharges investigated by the Copermittee	12
Number of sources of non-storm water discharges identified	5
Number of non-storm water discharges eliminated	4
Number of sources of illicit discharges or connections identified	3
Number of illicit discharges or connections eliminated	3
Number of enforcement actions issued	1
Number of escalated enforcement actions issued	0

V. DEVELOPMENT PLANNING PROGRAM

Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES	[X]
	NO	[ ]
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES	[X]
	NO	[ ]
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES	[X]
	NO	[ ]

Number of proposed development projects in review	14
Number of Priority Development Projects in review	14
Number of Priority Development Projects approved	3
Number of approved Priority Development Projects exempt from any BMP requirements	0
Number of approved Priority Development Projects allowed alternative compliance	0
Number of Priority Development Projects granted occupancy	0

Number of completed Priority Development Projects in inventory	15
Number of high priority Priority Development Project structural BMP inspections	15
Number of Priority Development Project structural BMP violations	0
Number of enforcement actions issued (For not returning form by deadline)	4
Number of escalated enforcement actions issued	0

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM
FY 2014-2015

VI. CONSTRUCTION MANAGEMENT PROGRAM

Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001? **YES** ☒ **NO** ☐

Number of construction sites in inventory	13
Number of active construction sites in inventory	13
Number of inactive construction sites in inventory	0
Number of construction sites closed/completed during reporting period	5
Number of construction site inspections	50
Number of construction site violations	4
Number of enforcement actions issued	4
Number of escalated enforcement actions issued	0

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM

Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001? **YES** ☒ **NO** ☐

	Municipal	Commercial	Industrial	Residential
Number of facilities or areas in inventory	33	257	16	0
Number of existing development inspections	13	257	16	0
Number of follow-up inspections	0	35	0	0
Number of violations* Includes Corrective Actions	0	12	0	0
Number of enforcement actions issued	0	12	0	0
Number of escalated enforcement actions issued	0	0	0	0

VIII. PUBLIC EDUCATION AND PARTICIPATION

Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001? **YES** ☒ **NO** ☐

Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001? **YES** ☒ **NO** ☐

IX. FISCAL ANALYSIS

Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001? **YES** ☒ **NO** ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☒ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

Signature: [signature] | Date: 10/5/16

FISCAL ANALYSIS

The City's Sanitation Fund provides most of the funding for the Storm Water Program. There have not been any changes to this funding mechanism during this reporting period. During 2009/2010, a fiscal analysis reporting template was developed collectively by the Copermittees. The City has used this template to report the 2015/2016 expenditures and funding sources in this JURMP Annual Report.

San Diego County Copermittees Fiscal Analysis Report
for Urban Runoff Management Programs

EXPENDITURE SUMMARY

JURISDICTIONAL COMPONENTS	
Administration	$64,159
Development Planning	$14,393
Construction	$30,342

Permit Requirements for Fiscal Analysis

1. Identification of the various categories of expenditures necessary to implement the requirements of this Order; including a description of the specific capital, operation and maintenance, and other expenditures items to be accounted for in each category of expenditures.

See page 1 of fiscal analysis. Watershed costs include costs for development of required submittal.

2. The staff resources needed and allocated to meet the requirements of this Order, including any development, implementation, and enforcement activities required.

Staff resources include:

(1) Storm Water Program Manager and (1) Engineering Technician II dedicated to the storm water protection program. These two employees complete the vast majority of the work associated with the Order. The City also has two local consulting firms who specialize in storm water management under As-Needed contract.

The City also has (1) Engineering Project Manager, and (1) Public Works Inspector II who is part time desiccated to storm water protection. Other City staff including (1) Associate Engineers, (1) Engineering Technician II, (1) Code Compliance Officer and several field public works operation staff may be utilized on an as needed basis for storm water tasks.

3. The estimated expenditures for Provisions E.8.b (1) and E.8.b (2) for the current fiscal year,

See expenditure summary on Page 1. Costs are anticipated to increase over the future fiscal years, and funding estimates will coincide with the development of the WQIP for the City's Watersheds, and the development of the City's new JURMP.

4. The sources of funds that are provided to meet the necessary expenditures described in Provisions E.8.b.(1) and E.8.b.(2), including legal restrictions on the use of such funds, for the current fiscal year and next fiscal year.

See funding summary on Page 2. Funding source is projected to remain similar next fiscal year.

1.3 JURISDICTIONAL STRATEGIES

~~Strikeouts~~ are text edits that have been made up to the current date since the WQIP September 2015 submittal.

Table A2-1. City of La Mesa Jurisdictional Strategies and Implementation Schedules for Illicit Discharge Detection and Elimination Program

San Diego River Illicit Discharge Detection and Elimination Program Strategies City of La Mesa	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Engage the public, jurisdictional staff, and other agency staff to proactively identify and report illicit discharges.					
Utilize municipal personnel and contractors to identify and report illicit discharges and connections.	●	●	A	N/A	City utilized staff and contractors to facilitate program.
Provide enhanced internal training for field staff related to illicit discharges.	X	X	P	N/A	Not conducted this FY.
Facilitate public reporting of illicit discharges and connections via telephone and email.	●	●	A	N/A	None
Clarify regulations ~~Coordinate~~ with Helix Water District regarding water line flushing and discharges to the MS4	◖	◖	A	Minor wording change to make strategy meaning clearer.	None
~~Coordinate with upstream entities to prevent illicit discharges from upstream sources from entering the MS4.~~				La Mesa's jurisdiction borders the watershed boundary, and there is minimal upstream area under other agencies' jurisdictions. Discharges from other agencies such as MTS or Caltrans have not been observed frequently but are dealt with as they arise via strategies described in Section 6 of this table.	None
2. Develop and implement approaches to address the impacts of septic systems within the watershed.					
Investigate and eliminate illicit discharges and connections.	●	●	A	N/A	None

Table A2-1. City of La Mesa Jurisdictional Strategies and Implementation Schedules for Illicit Discharge Detection and Elimination Program

San Diego River Illicit Discharge Detection and Elimination Program Strategies City of La Mesa	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Continue to assist property owners on septic who wish to connect to sewer.	●	●	A	N/A	Residents who wish to connect to sewer are provided the opportunity as permitted.
3. Develop and implement approaches to address the impacts of homeless activities within the watershed.					
Cleanup of encampment sites on public and private lands.	●	●	A	N/A	Public and private cleanup exists through code enforcement and the assistance of the police dept.
Coordination with La Mesa Police Department to perform routine sweeps	●	●	A	N/A	Public and private cleanup exists through code enforcement and the assistance of the police dept.
Perform Channel Restoration on Alvarado Creek.	●	●	A	N/A	In construction.
4. Develop and implement approaches to reduce the impacts of public and private sanitary sewer systems within the watershed.					
Require all Food Service Establishments to install grease removal equipment to prevent fats, oils, and grease from obstructing sewer lines	●	●	A	N/A	Part of the City's FOG Program, which started in 2009.
Increase outreach to facilities and residences generating fats, oils, and grease.	●	●	A	N/A	Outreach is conducted annually through the City's FOG Inspection program.
Implement practices and procedures to prevent/limit infiltration of seepage from sanitary sewers to the MS4.	●	●	A	N/A	The City has several CIP projects in construction which will limit sewer I/I.
Implement practices and procedures to address spills with the potential to enter the MS4 via systematic smoke testing and infiltration studies.	●	●	A	N/A	The City has an I/I program which uses smoke testing to check areas for defects.
Implement sanitary sewer system rehabilitation program (e.g., condition assessments, prioritization, pipe replacement)	●	●	A	N/A	The City currently has a master plan with condition assessments and prioritization schedules.

Table A2-1. City of La Mesa Jurisdictional Strategies and Implementation Schedules for Illicit Discharge Detection and Elimination Program

San Diego River Illicit Discharge Detection and Elimination Program Strategies City of La Mesa	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Investigate and eliminate illicit discharges and connections.	●	●	A	N/A	The City does this through smoke testing and flow monitoring.
5. Implement monitoring programs to provide new information to refine the prioritization of drainage areas.					
Conduct transitional MS4 outfall discharge program to identify persistent/transient flows.	●	●	A	N/A	None
Conduct watershed specific MS4 outfall discharge program to identify persistent/transient flows.	●	●	A	N/A	None
6. Actively educate public on prohibitions related to illicit discharges and connections.					
Investigate and eliminate illicit discharges and connections.	●	●	A	N/A	Completed during inspection and monitoring programs.
Enforce legal authority to ensure all illicit discharges and connections that are identified are eliminated.	●	●	A	N/A	Municipal Code is up to date.

Table A2-2. City of La Mesa Jurisdictional Strategies and Implementation Schedules for Development Planning

San Diego River Development Planning Program Strategies City of La Mesa	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Provide updated materials, enhanced outreach, and training to convey land development requirements.					
Establish criteria designating priority development projects for new development and redevelopment projects.	●	●	A	N/A	The development manual was updated to reflect current regulation.
Update BMP design manual procedures to specify stormwater requirements applicable to development and redevelopment projects, identify and design appropriate BMPs, establish maintenance criteria, and establish alternative compliance options (where implemented).	●	●	A	N/A	The development manual was updated to reflect current regulation.
2. Implement a Watershed Management Area Analysis to develop watershed specific requirements for structural BMP implementation and identify a list of candidate projects that could be used as alternative compliance options for Priority Development Projects.					
Develop and implement a Watershed Management Area Analysis to develop watershed specific requirements for structural BMP implementation.	●	●	A	N/A	Developed for the watershed.
3. Implement an alternative compliance program for Priority Development Projects.					
Implement an alternative compliance program to provide off-site alternatives for pollutant control and hydromodification management.	X	◖	P	N/A	Planned for upcoming years.
4. Implement a post construction BMP program for development projects to ensure proper construction and maintenance.					
Implement source control, LID, and on-site structural controls for all priority development projects.	●	●	A	N/A	The development manual was updated to reflect current regulation.
Implement a program that ensures that all structural BMPs are designed, constructed, and maintained on PDPs.	●	●	A	N/A	The development manual was updated to reflect current regulation.

Table A2-2. City of La Mesa Jurisdictional Strategies and Implementation Schedules for Development Planning

San Diego River Development Planning Program Strategies City of La Mesa	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Inspect all high priority structural BMPs prior to the rainy season for Copermittees.	●	●	A	N/A	Inspected per JURMP requirements.
5. Enforce post construction requirements related to new and redevelopment.					
Require implementation of source control and low impact development (LID) BMPs for all development projects.	●	●	A	N/A	The development manual was updated to reflect current regulation.
Enforce legal authority to ensure all development projects are in compliance with all post construction requirements.	●	●	A	N/A	The development manual was updated to reflect current regulation.
Update ordinances to reflect new land development requirements.	●	●	A	N/A	The development manual was updated to reflect current regulation.

Table A2-4. City of La Mesa Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of La Mesa	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Maintain and improve data tracking methods for existing development inventories where necessary.					
Maintain and update a watershed based inventory of existing development (i.e., commercial, industrial, and municipal facilities and residential areas).	●	●	A	N/A	Contained within the City's JURMP.
2. Develop and implement approaches to address the impacts of improper water use and irrigation runoff.					
Increase outreach regarding over irrigation and the transport of pollutants such as bacteria into the receiving waters.	●	●	A	N/A	Outreach to businesses has occurred during inspections.
Install weather based irrigation controllers in municipal parks.	●	●	A	N/A	IT controllers are active in City Parks.
Coordinate with Helix Water District regarding water conservation programs.	●	●	A	N/A	Related to compliant/violations the City forwards issues to Helix Water, and vice versa.
3. Improve and/or continue existing pet waste programs.					
Continue implementation of pet waste program with Parks, and outreach assistance to HOAs and property managers.	●	●	A	N/A	Pet waste bags are located within City Parks.
Provide focused outreach to residents using kiosks in municipal parks.	●	●	A	N/A	Six kiosks are located within City Parks.
4. Improve trash management strategies within the watershed.					
Coordinate with I Love a Clean San Diego to install cigarette ashcans throughout the downtown area.	●	●	A	N/A	Several ashcans are installed throughout the downtown village area.
Perform trash assessments and outreach targeting multi-family residential land uses.	X	●	P	N/A	Planned for 16-17. Initial work done prior to 2015.
Increase street sweeping frequencies in priority areas.	X	X	P	N/A	Planned.

Table A2-4. City of La Mesa Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of La Mesa	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
5. Develop and implement approaches to reduce the impacts of public and private sanitary sewer systems within the watershed.					
Implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers.	●	●	A	N/A	Systematic testing as well as replacement programs are active.
Perform coordinated inspections for stormwater and FOG at food service establishments.	●	●	A	N/A	The coordinated inspections are completed each year.
6. Improve and implement existing outreach programs to target key sources and pollutants.					
Provide enhanced internal training to parks staff.	●	●	A	N/A	Training given to lead workers.
Provide enhanced internal training to street maintenance staff.	●	●	A	N/A	Training given to lead workers.
7. Develop and implement targeted programs to address issues in residential areas.					
Prioritize residential management areas for focused inspections.	●	●	A	N/A	Program started in 2016.
8. Improve existing inspections programs to more efficiently target key sources.					
Perform evaluations of businesses for exposure to stormwater though increased patrols and inspections.	●	●	A	N/A	Performed through inspection program.

Table A2-4. City of La Mesa Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of La Mesa	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
9. Actively enforce stormwater and urban runoff requirements for existing development.					
Increase coordination with City Code Enforcement where properties are out of compliance.	●	●	A	N/A	Storm Water works closely with code enforcement regarding properties in violation.
Increased enforcement as appropriate as a result of increased business inspections.	●	●	A	N/A	Inspection program
10. Identify and facilitate retrofit opportunities in areas of existing development.					
Install weather based irrigation controllers in municipal parks.	●	●	A	N/A	ET controllers are used in City parks.
11. Improve coordination between agencies.					
Coordinate with Helix Water District regarding water conservation programs.	●	●	A	N/A	City works with Helix regarding enforcement and water waste issues.

Notes:

1.4 MODIFICATIONS TO THE BMP DESIGN MANUAL

The City of La Mesa BMP Design Manual provides guidance for land development and public improvement projects to comply with relevant development planning requirements in the Municipal Permit. The City of La Mesa updated its BMP Design Manual in accordance with Municipal Permit requirements in February 2016; the BMP Design Manual replaced the Standard Urban Stormwater Mitigation Plan (SUSMP). No additional changes to the BMP Design Manual have been made since it went into effect in February 2016. The City of La Mesa BMP Design Manual can be accessed at: www.cityoflamesa.com/index.aspx?NID=988

1.5 MODIFICATIONS TO THE JRMP

No changes were made to the City's JRMP during the 2015-2016 fiscal year.

The Valley of Opportunity

EL CAJON

Incorporated 1912

City Manager

STATEMENT OF CERTIFICATION AND LEGAL AUTHORITY ESTABLISHMENT

SAN DIEGO RIVER WATERSHED MANAGEMENT AREA, WATER QUALITY IMPROVEMENT PLAN FISCAL YEAR 2015-2016 ANNUAL REPORT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations [40 CFR 122.22(d)].

I also certify that the City of El Cajon has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements within Order No. R9-2013-001 as amended by Orders R9-2015-0001 and R9-2015-0100.

Executed on the 9 day of January, 2017, at the City of El Cajon.

Douglas Williford
City Manager

II. LEGAL AUTHORITY

Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES [X] NO [ ]
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES [X] NO [ ]

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE

Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES [X] NO [ ]
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES [X] NO [ ]

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM

Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES [X] NO [ ]

Number of non-storm water discharges reported by the public	75
Number of non-storm water discharges detected by Copermittee staff or contractors*	71 *
Number of non-storm water discharges investigated by the Copermittee	146
Number of sources of non-storm water discharges identified	78
Number of non-storm water discharges eliminated	73
Number of sources of illicit discharges or connections identified	73
Number of illicit discharges or connections eliminated	36
Number of enforcement actions issued	36
Number of escalated enforcement actions issued	17

4 were detected to be invalid reports from the onset.

V. DEVELOPMENT PLANNING PROGRAM

Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES [X] NO [ ]
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES [X] NO [ ]
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?.	YES [X] NO [ ]

Number of proposed development projects in review	261
Number of Priority Development Projects in review	22
Number of Priority Development Projects approved	8
Number of approved Priority Development Projects exempt from any BMP requirements	0
Number of approved Priority Development Projects allowed alternative compliance	0
Number of Priority Development Projects granted occupancy	3

Number of completed Priority Development Projects in inventory	71
Number of high priority Priority Development Project structural BMP inspections	23
Number of Priority Development Project structural BMP violations	0
Number of enforcement actions issued	0
Number of escalated enforcement actions issued	0

ATTACHMENT FISCAL ANALYSIS

FISCAL ANALYSIS SUMMARY 1

1 INTRODUCTION 1

2 GENERAL BUDGET INFORMATION 1

3. FISCAL ANALYSIS RESULTS 2

3.1 EXPENDITURES 2

3.2 FUNDING SOURCES 3

FISCAL ANALYSIS SUMMARY

1 INTRODUCTION

A fiscal analysis of the Jurisdictional Runoff Management Program (JRMP) provides a vital assessment of resources for the current and upcoming Permit Years. This brief summary will incorporate guidance and standards developed collaboratively by the Copermittees and in accordance with the Municipal Permit.

In fiscal year (FY) 2003-04, the City Storm Water staff developed a separate budget from other Public Works wastewater activities sufficient to run the Storm Water Program. The Program continues to be adequately funded through the City's Waste Water Fund.

2 GENERAL BUDGET INFORMATION

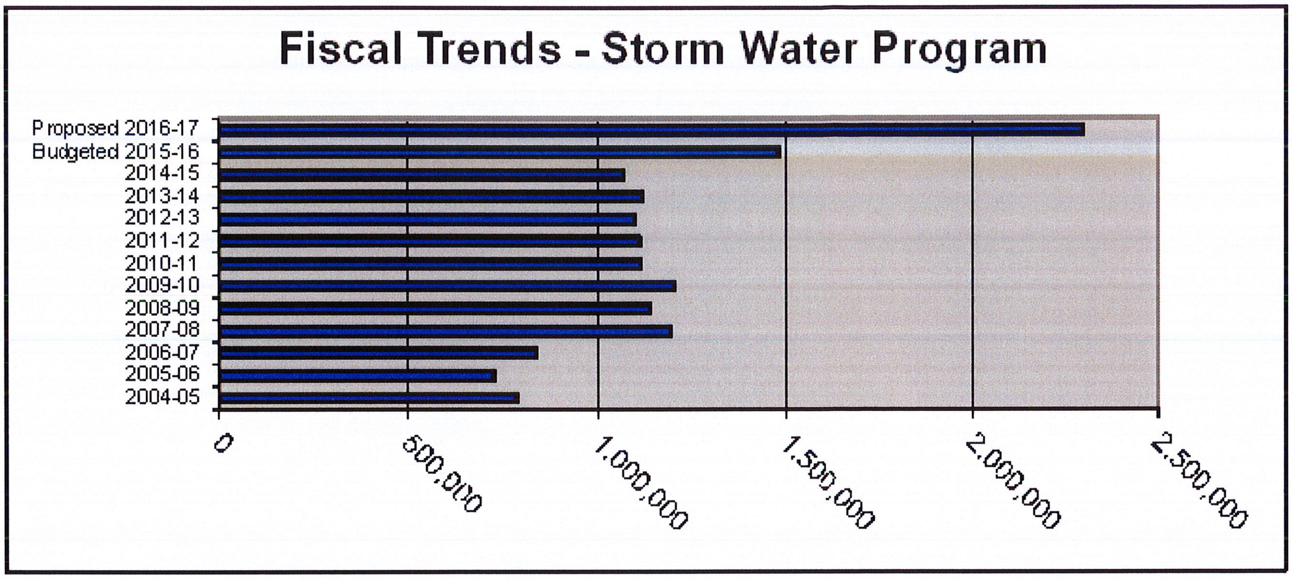
The following table shows actual expenditures from fiscal year 2009-10 through 2015-16, and the estimated fiscal year 2016-17 budget for the City's Urban Runoff Management Program.

Item	09-10	10-11	11-12	12-13	13-14	14-15	15-16	Estimated 16-17
Salaries (including benefits)	$781,174	$765,041	$735,187	$703,136	$689,699	$657,779	$621,543	$1,469,342
Materials, Services and Supplies	$421,181	$335,939	$364,750	$393,440	$426,132	$409,816	$506,344	$828,247
Capital Outlay		$10,873	$10,460					
TOTAL	**$1,202,355**	**$1,111,853**	**$1,110,397**	**$1,096,576**	**$1,115,831**	**$1,067,595**	**$1,127,887**	**$2,297,589**

Budgets have increased gradually since the inception of the Storm Water Program in 2001. The steep increase in the estimated fiscal year 2016-17 budget reflects all estimated costs for the City's JRMP, including expenditures to be incurred by the Storm Water Operations Field

Maintenance Division previously budgeted under wastewater collection. A copy of the budget is located in Appendix A.

The City's Jurisdictional Runoff Management Program funding was sufficient to meet the JRMP requirements in FY 2015-16 and is projected to be sufficient to meet requirements in FY 2016-17. The City has met its projected goal of continuously executing plans, procedures, and processes to implement JRMP requirements and assess the effectiveness of its programs.



3. Fiscal Analysis Results

3.1 Expenditures

The budget for FY 2015-16 included a Storm Water Program Manager, one Senior Engineering Technician, and one Compliance Officer. The estimated budget for FY 2016-17 includes the following positions:

- 1 Storm Water Program Manager
- 1 Senior Engineering Technician
- 1 Compliance Officer
- 1 Maintenance Supervisor
- 3 Street Sweeper Operators
- 3 Storm Drain and Channel Maintenance Equipment Operators
- 3 Maintenance Workers

The City also had an open contract with two consultants to provide as-needed services to ensure the City meets its JRMP implementation requirements.

3.2 Funding Sources

The Storm Water Program will continue to be funded to maintain permit compliance related to permit renewals and other requirements related to the Bacteria Total Maximum Daily Loads (TMDLs) and Trash Amendment. For fiscal year 2015-16 the City completed all inspections, monitoring, plan reviews, complaint investigations, and reporting, as well as other requirements under R9-2013-0001, with existing staff complemented by consultants.

Working efficiently is the goal of the JRMP. By consolidating forms to complete onsite inspections, track enforcement actions, and follow up on complaint/referral information has allowed the City to reduce the amount of time and paper to complete significant portions of the Municipal, Industrial, Commercial, Construction, Land Development Planning, and Residential JRMP Components of the Municipal Permit.

The City of El Cajon has, and will continue to be, an active member of the San Diego River Watershed group and work with the other San Diego River Watershed agencies to achieve the goals and objectives that are part of the Water Quality Improvement Plan and Municipal Permit. Working together will continue to eliminate the potential for duplicative efforts and enhance the effect across a wider range of challenges on a similar geographical area.

No regulatory comments were received for the Fiscal Analysis component of the JRMP for the Annual Report for Fiscal Year 2014-15.

2.3 JURISDICTIONAL STRATEGIES

Table A2-6. City of El Cajon Jurisdictional Strategies and Implementation Schedules for Illicit Discharge Detection and Elimination Program

San Diego River Illicit Discharge Detection and Elimination Program Strategies City of El Cajon	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Engage the public, jurisdictional staff, and other agency staff to proactively identify and report illicit discharges.					
Utilize municipal personnel and contractors to identify and report illicit discharges and connections.	●	●	A	N/A	
Facilitate public reporting of illicit discharges and connections via telephone and email.	●	●	A	N/A	
Coordinate with upstream entities to prevent illicit discharges from upstream sources from entering the MS4. This strategy will need coordination with water agencies.	◖	●	P	N/A	The conversation with water agencies started and it will continue in order to coordinate for better collaboration.
2. Develop and implement approaches to address the impacts of septic systems within the watershed.					
Investigate and eliminate illicit discharges and connections.	●	●	A	N/A	
3. Develop and implement approaches to reduce the impacts of public and private sanitary sewer systems within the watershed.					
Implement practices and procedures to prevent/limit infiltration of seepage from sanitary sewers to the MS4.	●	●	A	N/A	Conducted during continuous maintenance operation program of sanitary sewer system.
Implement practices and procedures to address spills with the potential to enter the MS4.	●	●	A	N/A	
Investigate and eliminate illicit discharges and connections.	●	●	A	N/A	
4. Implement monitoring programs to provide new information to refine the prioritization of drainage areas.					
Conduct transitional MS4 outfall discharge program to identify persistent/transient flows.	●	●	A	N/A	

Table A2-6. City of El Cajon Jurisdictional Strategies and Implementation Schedules for Illicit Discharge Detection and Elimination Program

San Diego River Illicit Discharge Detection and Elimination Program Strategies City of El Cajon	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Conduct watershed specific MS4 outfall discharge program to identify persistent/transient flows.	●	●	A	N/A	
5. Actively educate public on prohibitions related to illicit discharges and connections.					
Investigate and eliminate illicit discharges and connections.	●	●	A	N/A	
Enforce legal authority to ensure all illicit discharges and connections that are identified are eliminated.	●	●	A	N/A	

Notes:
● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented
A – Actual (active implementation), P – Planned (planning stage)

Table A2-7. City of El Cajon Jurisdictional Strategies and Implementation Schedules for Development Planning

San Diego River Development Planning Program Strategies City of El Cajon	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Provide updated materials, enhanced outreach, and training to convey land development requirements.					
Establish criteria designating priority development projects for new development and redevelopment projects.	●	●	A	N/A	
Update BMP design manual procedures to specify stormwater requirements applicable to development and redevelopment projects, identify and design appropriate BMPs, establish maintenance criteria, and establish alternative compliance options (where implemented).	●	●	A	N/A	
2. Develop and implement LID programs to complement standard permit requirements.					
Implement downspout disconnection program for industrial, commercial, and residential projects.	X	◖	P	N/A	This is an optional strategy. The City has partnered with other agencies on their efforts, such as the Sustainable Landscapes program. The City has not yet implemented an incentive program directly funded by the City.
Implement proprietary BMPs where appropriate for industrial, commercial, and residential projects.	●	●	A	N/A	
Implement rainwater harvesting where appropriate for industrial, commercial, and residential projects.	◖	●	P	N/A	The City began to use a development manual that incorporates the implementation of LID BMPs, including rainwater harvesting.

Table A2-7. City of El Cajon Jurisdictional Strategies and Implementation Schedules for Development Planning

San Diego River Development Planning Program Strategies City of El Cajon	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
3. Implement a Watershed Management Area Analysis to develop watershed specific requirements for structural BMP implementation and identify a list of candidate projects that could be used as alternative compliance options for Priority Development Projects.					
Develop and implement a Watershed Management Area Analysis to develop watershed specific requirements for structural BMP implementation.	◖	●	P	N/A	
4. Implement a post construction BMP program for development projects to ensure proper construction and maintenance.					
Implement source control, LID, and on-site structural controls for all priority development projects.	●	●	A	N/A	
Implement a program that ensures that all structural BMPs are designed, constructed, and maintained on PDPs.	●	●	A	N/A	
Inspect all high priority structural BMPs prior to the rainy season.	●	●	A	N/A	
5. Enforce post construction requirements related to new and redevelopment.					
Require implementation of source control and low impact development (LID) BMPs for all development projects.	●	●	A	N/A	

Notes:

● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented

A – Actual (active implementation), P – Planned (planning stage)

Table A2-8. City of El Cajon Jurisdictional Strategies and Implementation Schedules for Construction Management

San Diego River Construction Management Program Strategies City of El Cajon	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Ensure that minimum BMPs are designated and required for construction projects. Prioritize BMPs which address sources of bacteria.					
Require submittal of pollution control plan, construction BMP plan, and/or erosion and sediment control plan for projects requiring local permits involving soil disturbance activities.	●	●	A	N/A	
Review and confirm that the submitted plan is in compliance.	●	●	A	N/A	
Implement or require implementation of BMPs that are site specific, seasonally appropriate, and appropriate to the construction phase year round.	●	●	A	N/A	
Inspect construction sites at an appropriate frequency to require and confirm compliance with local permits and ordinances, as well as the MS4 Permit requirements.	●	●	A	N/A	
Enforce legal authority to ensure inventoried construction projects are in compliance with all requirements.	●	●	A	N/A	

Notes:

● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented

A – Actual (active implementation), P – Planned (planning stage)

Table A2-9. City of El Cajon Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of El Cajon	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Maintain and improve data tracking methods for existing development inventories where necessary.					
Maintain and update a watershed based inventory of existing development (i.e., commercial, industrial, and municipal facilities and residential areas).	●	●	A	N/A	
2. Develop and implement approaches to address the impacts of improper water use and irrigation runoff.					
Provide or expand targeted outreach to home owners associations	●	●	A	N/A	Information was provided to Home Owners Associations, outreach efforts are planned to increase.
3. Improve and/or continue existing pet waste programs.					
Continue implementation of pet waste bag dispensers in public parks	●	●	A	N/A	
4. Improve trash management strategies within the watershed.					
Implement a schedule of operation and maintenance for public streets, unpaved roads, paved roads, and paved highways.	●	●	A	N/A	
5. Develop and implement approaches to reduce the impacts of public and private sanitary sewer systems within the watershed.					
Implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers.	●	●	A	N/A	The City has an aggressive sanitary sewer operation maintenance program.
6. Improve and implement existing outreach programs to target key sources and pollutants.					
Provide targeted outreach via printed materials to residential areas	●	●	A	N/A	It includes, at minimum, a total of four Storm Water articles in the City's Fall/Spring newsletters.

Table A2-9. City of El Cajon Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of El Cajon	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
7. Enhance existing MS4 maintenance programs.					
Implement a schedule of operation and maintenance activities for the MS4 and related structures.	●	●	A	N/A	
Implement dry weather flow diversions (dependent on outcome of Watershed Management Area Analysis and feasibility)	X	◖	P	N/A	This is an optional strategy. Will start the feasibility phase of dry weather diversion in FY 16-17.
8. Develop and implement targeted programs to address issues in residential areas.					
Conduct residential management area focused inspections.	●	●	A	N/A	
9. Improve existing inspections programs to more efficiently target key sources.					
Conduct inspections of inventoried existing development to ensure compliance. Each area/activity inspected once every five years minimum, with equivalent of 20% of inventory inspected annually.	●	●	A	N/A	
10. Actively enforce stormwater and urban runoff requirements for existing development.					
Designate and require minimum set of BMPs required for all inventoried existing development.	●	●	A	N/A	
Enforce legal authority to ensure inventoried existing development facilities and/or areas are in compliance with all requirements.	●	●	A	N/A	
11. Identify and facilitate retrofit opportunities in areas of existing development.					
Identify opportunities and facilitate the implementation of retrofit projects in areas of existing development.	●	●	A	N/A	
Implement green streets (dependent on WMAA results)	X	◖	P	N/A	The City considers green street opportunities as they arise. No qualifying projects during FY 15-16.

Notes:
● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented
A – Actual (active implementation), P – Planned (planning stage)

Table A2-10. City of El Cajon Optional Jurisdictional Strategies and Implementation Schedules

San Diego River Optional Jurisdictional Strategies	Implementation Timeframe	FY15-16	FY16-17	Actual / Planned	Comments
Dry weather flow diversion	FY 15-16 through FY 18-19	X	◖	P	Will start the feasibility phase of dry weather diversion in FY 16-17.
Implement roof runoff rebate program for existing developments (residential and commercial) properties to help encourage the installation of roof runoff structural BMP controls to reduce discharge of pollutant and stressors and stormwater flows.	1st Permit Term 2013-2018; continues through 2nd Permit Term (2018-2023) until funding sources expire	X	◖	P	The City has partnered with other agencies on their efforts, such as the Sustainable Landscapes program. The City has not yet implemented an incentive program directly funded by the City.
Flood Control Channel Rehabilitation Projects (e.g., removal of impervious lining in flood control channel and replacement with pervious, earthen, or vegetated surface)	Once triggered, 4-7 years per project; ongoing operation & maintenance thereafter	Not triggered	If triggered	If triggered	While this strategy has not been triggered, the City continues to evaluate opportunities for potential grant-funded rehabilitation projects.

Notes:
No modifications to optional strategies are proposed.
● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented
A – Actual (active implementation), P – Planned (planning stage)

2.4 MODIFICATIONS TO THE BMP DESIGN MANUAL

The City of El Cajon BMP Design Manual provides guidance for land development and public improvement projects to comply with relevant development planning requirements in the Municipal Permit. The City of El Cajon updated its BMP Design Manual in accordance with Municipal Permit requirements in February 2016; the BMP Design Manual replaced the Standard Urban Stormwater Mitigation Plan (SUSMP). No additional changes to the BMP Design Manual have been made since it went into effect in February 2016. The City of El Cajon BMP Design Manual can be accessed at: http://www.cityofelcajon.us/i-want-to/view/documents-forms-library/-folder-137 . Stormwater requirements for development projects are also included in Chapter 16.60 of the El Cajon Municipal Code, which can be accessed at http://www.qcode.us/codes/elcajon/ ..

2.5 MODIFICATIONS TO THE JRMP

No changes were made to the City's JRMP during the 2015-2016 fiscal year.

3 County of San Diego

3.1 ANNUAL REPORT CERTIFICATION

County of San Diego

STATEMENT OF CERTIFICATION AND LEGAL AUTHORITY ESTABLISHMENT SAN DIEGO RIVER WATERSHED MANAGEMENT AREA, WATER QUALITY IMPROVEMENT PLAN FISCAL YEAR 2015-2016 ANNUAL REPORT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations [40 CFR 122.22(d)].

I also certify that the County of San Diego has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements within Order No. R9-2013-001 as amended by Orders R9-2015-0001 and R9-2015-0100.

Executed on the 6th day of January, 2017, at the County of San Diego.

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM ANNUAL REPORT FORM

FY 2015-2016

I. COPERMITTEE INFORMATION		
I.A Copermittee Name: County of San Diego (PIN 255223)		
I.B Copermittee Primary Contact Name: Todd Snyder		
I.C Copermittee Primary Contact Information: Address: 5510 Overland Avenue, Suite 410 City: San Diego County: San Diego State: California Zip: 92123 Telephone: (858) 694-3672 Fax: (858) 495-5623 Email: Todd.Snyder@sdcounty.ca.gov		
II. LEGAL AUTHORITY		
II.A Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
II.B A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES NO	☒ ☐
III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE		
III.A Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES NO	☒ ☐
III.B If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES NO	☒ ☐
IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM		
IV.A Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
IV.B.1 Number of non-storm water discharges reported by the public	286	
IV.B.2 Number of non-storm water discharges detected by Copermittee staff or contractors	95	
IV.B.3 Number of non-storm water discharges investigated by the Copermittee	375	
IV.B.4 Number of sources of non-storm water discharges identified	115	
IV.B.5 Number of non-storm water discharges eliminated	112	
IV.B.6 Number of sources of illicit discharges or connections identified	85	
IV.B.7 Number of illicit discharges or connections eliminated	84	
IV.B.8 Number of enforcement actions issued	93	
IV.B.9 Number of escalated enforcement actions issued	1	
V. DEVELOPMENT PLANNING PROGRAM		
V.A Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
V.B Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES NO	☒ ☐
V.C If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES NO	☒ ☐
V.D.1 Number of proposed development projects in review	925	
V.D.2 Number of Priority Development Projects in review	237	
V.D.3 Number of Priority Development Projects approved	96	
V.D.4 Number of approved Priority Development Projects exempt from any BMP requirements	0	
V.D.5 Number of approved Priority Development Projects allowed alternative compliance	0	
V.D.6 Number of Priority Development Projects granted occupancy	62	
V.E.1 Number of completed Priority Development Projects in inventory	410	
V.E.2 Number of high priority Priority Development Project structural BMP inspections	691	
V.E.3 Number of Priority Development Project structural BMP violations	170	
V.E.4 Number of enforcement actions issued	170	
V.E.5 Number of escalated enforcement actions issued	0	

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM
FY 2015-2016

VI. CONSTRUCTION MANAGEMENT PROGRAM	
VI. A Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
VI.B.1 Number of construction sites in inventory	2,748
VI.B.2 Number of active construction sites in inventory	2,684
VI.B.3 Number of inactive construction sites in inventory	0
VI.B.4 Number of construction sites closed/completed during reporting period	1,124
VI.B.5 Number of construction site inspections	18,858
VI.B.6 Number of construction site violations	416
VI.B.7 Number of enforcement actions issued	590
VI.B.8 Number of escalated enforcement actions issued	38

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM				
VII.A Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001?				YES ☒ NO ☐
	Municipal	**Commercial**	**Industrial**	**Residential**
VII.B.1 Number of facilities or areas in inventory	a. 263	b. 1,779	c. 150	d.110
VII.B.2 Number of existing development inspections	a. 1,885	b. 974	c. 38	d.468
VII.B.3 Number of follow-up inspections	a. 23	b. 131	c. 12	d.165
VII.B.4 Number of violations	a. 46	b. 279	c. 31	d.346

FISCAL ANALYSIS COMPONENT

1.1. Introduction

This section presents an estimated annual budget for the County's runoff management programs for FY 2015-16.

1.2. Fiscal Analysis Methods

This section continues to utilize the methodologies and standards established in *Fiscal Analysis Method* submitted by the Copermittees in January 2009.

1.3. Fiscal Analysis Results

As shown the County estimated its total FY 2015-16 expenditures at $27,414,216. This fiscal analysis addresses each of the County's Runoff Management Program elements (jurisdictional, watershed, and regional activities) for the current reporting period (FY 2015-16). Expenditures are described by department and major program area. They represent an estimate of the expenditures that the County incurred in meeting its compliance obligations for FY 2015-16. They should not be interpreted as either budgeted or actual expenditures. Because stormwater program expenditures are distributed throughout a considerable number of County programs, a single consolidated "budget" does not exist for the program as a whole. As such, these figures should be considered best estimates of stormwater-related expenditures.

1.3.1 Expenditures

1.3.1.1. Jurisdictional

Table 1.1 presents the County's estimated jurisdictional expenditures for FY 2015-16.

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
1	**ADMINISTRATION**	**$6,840,583**	These costs correspond to the DPW WPP development, administrative oversight, and assessment of the County's stormwater programs. The WPP is responsible for the development of new and augmented County stormwater programs, regulatory reporting, and program assessment. Some administrative costs are associated with other specific functions shown below, but are included here because they could not be separated out.
2	**DEVELOPMENT PLANNING**	**$1,109,654**	
A	**Land Use Planning**	$0	Expenditures not reported for FY 2015-16; included in other elements.
B	**Environmental Review**	$0	Expenditures not reported for FY 2015-16; included in other elements.
C	**Development Project Approval and Verification**	**$1,109,654**	
C1	**Public Projects (CIP)**	$824,219	
	Project Planning and Engineering	$570,229	Costs include: preparing and reviewing plans and specifications for stormwater BMPs, and SWPPP/WPCP review. These costs apply to DPW, DPR, and DGS.
	Compliance Inspection and Enforcement	$15,000	
	BMP Implementation	$238,990	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
C2	**Private Projects**	$285,435	
	Permitting and Licensing	$285,435	This cost covers PDS plan reviews at permitted sites. Total costs are estimated as fixed percentages of annual plan-checking fees.
3	**CONSTRUCTION**	**$4,500,593**	
A	**Public Projects (CIP)**	$2,886,893	Costs include: BMP compliance inspections during construction, and implementation of construction phase BMPs. These costs apply to DPW, DPR, and DGS.
	Compliance Inspection and Enforcement	$1,613,880	
	BMP Implementation	$1,273,013	
B	**Private Projects**	$1,613,700	
	Compliance Inspection and Enforcement	$1,613,700	This cost primarily covers DPW and PDS construction inspections at permitted sites. Total costs are estimated as fixed percentages of inspection program fees.
4	**MUNICIPAL**	**$7,572,297**	
A	**Administration**	$267,805	Expenditures associated with the administrative oversight of the stormwater programs, regulatory reporting, and program assessment of municipal facilities by the DPW - Watershed Protection Program.
B	**Streets, Roads, and Highways Element**	$2,256,091	
	Administration	$291,160	Founded road operations activities include: culvert inspections and cleaning;

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
	Maintenance Inspections	$1,890,813	increased culvert waste disposal costs, street sweeping, installation and maintenance of BMPs and road structures, and the placement of additional controls. 10% of the Maintenance and Inspections and BMP Implementation is reported as Administration cost.
	BMP Implementation	$74,118	
	Other	$0	
C	**MS4 Element**	$1,530,000	
	Administration	$191,000	The combined costs shown here apply across (1) DPW Flood Control -- conversion of existing concrete lined channels to natural bottom channels, updating flood control master plans, increased maintenance of flood control systems, and construction and maintenance of regional treatment BMPs; and (2) DPW Flood Control MS4 Operation & Maintenance -- maintenance on flood control facilities throughout the unincorporated areas of the County, exclusive of facilities within road rights-of-way (included in 4.B above). Other includes the cost of disposal of debris removed from MS4.
	Maintenance Inspections	$1,046,900	
	BMP Implementation	$290,500	
	Other	$2,500	
D	**Solid Waste Facilities Element**	$406,618	
	Administration	$35,047	Costs include Regional Board stormwater permit fees, consultant costs associated with stormwater upgrade and repair projects, and office staff time.
	Maintenance Inspections	$16,922	Costs include staff time to perform site inspections.
	BMP Implementation	$79,149	Costs include stormwater consultant site inspections, sampling/testing and BMP materials.
	Other (construction)	$275,500	Drainage improvement projects and BMP site maintenance projects.
E	**Wastewater Facilities Element**	$187,000	
	Administration	$10,000	This includes costs associated with JRMP report, the sanitary sewer system and facilities including: pump stations, sewage treatment plants and Spring Valley Operations facility. Also includes the cost of BMP design, acquisition,
	Maintenance Inspections	$127,000	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
	BMP Implementation	$50,000	maintenance and monitoring, for wastewater Capital Improvement Projects, and Major maintenance projects, and at various wastewater facilities.
	Other	$0	
F	**Road Stations Element**	$919,867	
	Administration	$83,624	This includes DPW road station operations related to Permit compliance. The Administration cost is determined as 10% of the total costs of maintenance and Inspections and BMP Implementation as reported by the DPW Roads Divisions.
	Maintenance Inspections	$799,414	
	BMP Implementation	$36,829	
	Other	$0	
G	**Fleet Maintenance Element**	$11,722	
	Administration	$1,036	This includes costs associated with operation of the County's fleet maintenance and fueling facilities.
	Maintenance Inspections	$7,392	
	BMP Implementation	$3,294	
	Other	$0	
H	**Municipal Airfields Element**	$338,110	These costs involve site inspections, annual reporting, and maintenance of BMPs at airports, including oversight of tenant operations. The BMP implementation item includes Palomar asphalt cap repairs.
	Administration	$12,737	
	Maintenance Inspections	$0	
	Compliance Inspection and Enforcement	$0	
	BMP Implementation	$300,623	
	Other (sampling and analysis)	$24,750	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
I	**Parks & Recreational Facilities Element**	$1,214,562	
	Administration	$121,362	This includes: coordinating all training requirements, preparing and reviewing reports, and overseeing the overall implementation of the stormwater program for DPR.
	BMP Implementation	$991,603	This includes costs associated with implementation of BMPs at County parks.
	Compliance Inspection and Enforcement	$101,597	Costs are for DPR enforcement of stormwater requirements at County parks.
	Other	$0	
J	**Office Buildings & Other Municipal Facilities Element**	$297,867	
	Administration	$0	DGS conducts a variety of storm water activities including: inspections and clean-up of County-owned, occupied, and leased facilities and vacant lands; maintenance and signage of storm drain inlet inserts and trash dumpsters; placement of inlet filters; maintenance of coverage and containment improvements for on-site supplies and materials; parking lot sweeping and controlled parking lot power washing; and application of erosion and sediment control measures. These costs are exclusive of fleet maintenance and fueling operations.
	Maintenance Inspections	$99,808	
	BMP Implementation	$198,059	
	Other	$0	
	Management of Pesticides, Herbicides, & Fertilizers	$142,656	
	Administration	$142,656	Integrated Pest Control Program within the Department of Agriculture, Weights and Measures (AWM) performs eradication and control of invasive weeds. This program also provides weed control on roadsides, airports, flood control channels,
	Maintenance Inspections	$0	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
	BMP Implementation	$0	sewage treatment plants and inactive landfills. It also provides structural pest control to facilities owned and operated by the county.
	Other	$0	
5	**INDUSTRIAL and COMMERCIAL**	**$1,575,635**	
	Administration	$253,047	DPW and AWM conduct inspections of a variety of businesses in the unincorporated County, provide regulatory oversight of mobile businesses, and conduct follow-up and enforcement of stormwater violations.
	Compliance Inspection and Enforcement	$1,245,279	
	Educational Outreach	$77,309	
	Other expenditures	$0	
6	**RESIDENTIAL**	**$1,205,386**	
	Compliance Inspection and Enforcement	$688,453	DPW conducts complaint investigations for residential sources in the unincorporated County, and conduct follow-up and enforcement of stormwater violations. DPW also operates a regional hotline.
	Educational Outreach	$516,933	Several County departments coordinate and provide outreach to the residential sector and schoolchildren in support of Permit Section D.5 requirements. Costs reported here correspond to DPW only. Funded activities include developing pollution prevention content and providing direct outreach to various target audiences within the general residential and schoolchildren target audiences.
7	**IDDE**	**$321,523**	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

Jurisdictional Worksheet Component			Explanation/Notes
		$321,523	DPW conducts monitoring programs, assesses scientific data, and provides technical and scientific support to other County program staff. They also provide support for all technical and scientific aspects of JRMP development and implementation. These costs are exclusive of the regional monitoring program which is addressed separately under regional costs.
8	**EDUCATION**	**$0**	Education costs are included in other sections as applicable.
9	**PUBLIC PARTICIPATION**	**$0**	Public participation costs are included in other sections as applicable.
10	**SPECIAL INVESTIGATIONS**	**$0**	Expenditures not reported for FY 2015-16; included in other elements.
11	**NON-EMERGENCY FIREFIGHTING**	**$0**	Expenditures not reported for FY 2015-16; included in other elements.
		$23,125,671	

1.3.1.2 Watershed

Table 1.2 presents the County's estimated watershed expenditures for FY 2015-16.

Table 1.2 – Estimated Watershed Expenditures for FY 2015-16

	Santa Margarita WMA	San Luis Rey WMA	Carlsbad WMA	San Dieguito WMA	Peñasquitos WMA	San Diego River WMA	San Diego Bay WMA	Tijuana WMA
Administration	$37,583	$201,492	$82,653	$113,035	$75,309	$105,117	$37,583	$75,309
Cost Share Contribution	$0	$62,494	$46,204	$8,885	$1,062	$68,970	$6,659	$2,346
Watershed Activities	$626,917	$119,390	$14,860	$171,640	$26,423	$125,705	$111,491	$80,300
Other	$0	$0	$0	$0	$0	$0	$0	$0
Total Estimated Watershed Costs	**$664,500**	**$383,376**	**$143,717**	**$293,560**	**$102,794**	**$299,792**	**$155,733**	**$157,955**

1.3.1.3 Regional

Table 1.3 presents the County's estimated regional expenditures for FY 2015-16. This includes only those expenditures associated with the Copermittees' adopted Regional Budget and Work Plan. Other costs associated with regional participation (meeting attendance, etc.) are included within the jurisdictional expenditures presented above.

Table 1.3 – Estimated Regional Expenditures for FY 2015-16

Regional Programs	County Costs
Administration	$0
Cost Share Contribution	$2,087,118
Regional Activities	$0
Other	$0
Total Estimated Regional Costs	**$2,087,118**

1.3.1.4 Total Expenditures

Table 1.4 presents the County's total estimated expenditures for FY 2015-16 (jurisdictional, watershed, and regional).

Table 1.4 – Total Estimated County Expenditures for FY 2015-16

Component / Sub-component	Estimated Expenditures
Jurisdictional	
Administration	$6,840,583
Development Planning	$1,109,654
Construction	$4,500,593
Municipal	$7,572,297
Industrial And Commercial	$1,575,635
Residential	$1,205,386

Total Estimated County Costs	***$27,414,216***

1.3.2 Funding Source

Table 1.5 shows the major sources of funding for the County's urban runoff management programs in FY 2015-16, and describes the legal restrictions applicable to the use of each.

Table 1.5 – Legal Restrictions on the Use of Program Funding

Funding Source	Legal Restrictions
General Fund	There are no restrictions on the use of general fund for County water quality programs and activities except that they must be used only for the purposes for which they are budgeted and allocated by the County Board of Supervisors.
Flood Control District Fees	Revenue generated from these fees must be expended for activities related to flood and storm management.
Developer Deposits / Permit Fees	Deposits / fees may be used only to fund activities related to the work for which the permits are issued.
Gas Tax	Gas Tax is collected by the state and allocated to local government for transportation-related work including maintenance of existing transportation systems and construction of new transportation facilities. These funds may not be used for other purposes.
Sanitary District Fees	Sanitary District Fees are used for work related to the maintenance of sewer lines, pump stations, force mains, and several treatment plants that serve the unincorporated areas. They may be used only for such maintenance-related purposes within the respective sewer district for which they are collected.
Other Funding Sources	Other funding sources collectively account for a relatively small portion of ongoing expenditures. However, all funding for the County's stormwater compliance programs is expended within applicable legal restrictions and limitations.

1.4. Conclusions and Recommendations

The figures presented here are an estimate of the expenditures that the County incurred to meet its compliance obligations for FY 2015-16. For the reasons explained above, they should be considered only best estimates of stormwater-related expenditures.

3.3 JURISDICTIONAL STRATEGIES

Table A2-11. County of San Diego Jurisdictional Strategies and Implementation Information

	Strategies Implemented by Jurisdictions	Implemented in FY16? *(Fully/Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(If None, N/A)*	Planned Implementation into next FY *(Y/N)*
	Illicit Discharge, Detection, and Elimination (IDDE) Program					
1	Maintain stormwater conveyance system map to facilitate IDDE program	●	Updated as needed	N	N/A	Y
2	Utilize municipal personnel and contractors to identify and report Illicit Connections and Discharges	●	IDDE Program	N	N/A	Y
3	Updated focused training for County field staff	●	Updated training for BMP Design Manual and Stormwater Implementers	N	N/A	Y
4	Collect effluent on the ground (EOG), sanitary sewer overflow (SSO) data	●	Approximately 87 EOG complaints related to septic systems and 14 SSO events recorded and responded to throughout the County's jurisdiction.	N	N/A	Y
5	Address septic system failures where observed	●	Suspected septic discharges are reported to DEH HIRT Response line when they occur after hours and DEH Land and Water Quality Division during normal hours. All complaints resolved during 15-16.	N	N/A	Y
6	Facilitate public reporting of ICID via telephone and email	●	Bilingual hotline, dedicated e-mail address, and multiple online reporting tools	N	N/A	Y
7	Refer homeless issue complaints to Sheriff or appropriate jurisdictions	●	Collaborate with multi-departmental group to address homeless encampments	N	N/A	Y
8	Bilingual hotline answered by a live operator (I Love a Clean San Diego) to provide better customer service	●	Bilingual hotline operated by ILACSD	N	N/A	Y
9	Implement practices and procedures to address spills with the potential to enter the storm drain system	●	NOV issued by DEH for failing septic systems when effluent could reach the storm drain. Prompt follow up and mitigation is implemented. Such cases are rare; <5 in 15-16 throughout the County's jurisdiction.	N	N/A	Y
10	Coordinate spill response with responsible sewer agencies	●	Major DEH role is to inform the public of risks associated with sewer spills, conducting sampling, reporting, posting signs, etc.	N	N/A	Y
11	Implement practices and procedures to prevent/limit infiltration of seepage from sanitary sewers	●	If illicit connections are identified as part of an IDDE investigation, investigations are conducted to define and eliminate the source.	N	N/A	Y
12	Coordinate with upstream entities to prevent illicit discharges from upstream sources entering into the storm drain system	●	If illicit connections are identified as part of an IDDE investigation, investigations are conducted to define and eliminate the source. If determined to be from an upstream entity coordination will occur.	N	N/A	Y
13	Utilize municipal personnel and Contractors to monitor stormwater outfalls for discharges of potential ICIDs	●	This is part of the IDDE Program	N	N/A	Y

Table A2-11. County of San Diego Jurisdictional Strategies and Implementation Information

	Strategies Implemented by Jurisdictions	Implemented in FY16? *(Fully/Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(If None, N/A)*	Planned Implementation into next FY *(Y/N)*
14	Develop and implement a strategy for investigating and addressing ICIDs.	●	Focused, collaborative investigations with Planning and Science staff of high priority outfalls.	N	N/A	Y
	Development Planning					
15	Require implementation of source control and Low Impact Development (LID) BMPs for all development projects.	●	The County BMP Design Manual (DM) requires all projects regardless of size and location to implement source control (SC) and SD BMPs. These requirements are captured in the Watershed Protection Ordinance (WPO) and County's BMP DM.	N	N/A	Y
16	Priority Development Projects (PDP): In addition to requirement for all development projects, implement or require implementation of onsite structural BMPs to control pollutants and manage hydromodification for PDPs.	●	The County BMP DM requires all PDPs to implement pollutant control and hydromodification management BMPs. These requirements are captured in the WPO and County's BMP DM.	N	N/A	Y
17	Update BMP Design Manual procedures to specify stormwater requirements applicable to development and redevelopment projects, identify and design appropriate BMPs, establish maintenance criteria, and establish where implemented alternative compliance options.	●	Updated County BMP DM to reflect the Regional Model BMP DM with additional changes to incorporate County implementation practices. BMP DM became effective on February 26, 2015.	N	N/A	N
18	Conduct internal (staff) training on the updated BMP Manual	●	The County conducts internal training every fiscal year and after release of new guidance documents	N	N/A	N
19	Hold external land development workshops targeting the development community	●	The County conducts external training regularly and after release of new guidance documents	N	N/A	N
20	Implement a program that ensures that all structural and Low Impact Development (LID) BMPs are designed, constructed and maintained on Priority Development and Redevelopment Projects.	●	Structural BMPs and LID BMPs are designed and constructed per the BMP Design Manual. In addition, Structural BMPs and LID BMPs at PDPs are tracked for maintenance through inspections and self verification letters.	N	N/A	Y
21	Impose legal authority to ensure all development and redevelopment projects are in compliance with all post construction requirements.	●	The Watershed Protection Ordinance was updated in FY16 to include modifications necessary as the result of the updated Permit and the inclusion of applicant-implement offsite alternative compliance.	N	N/A	Y
22	Update County codes, ordinances, and stormwater design standards consistent with the permit and the updated BMP Manual	●	The Watershed Protection Ordinance was updated in FY16 to include modifications necessary as the result of the updated Permit and the inclusion of applicant-implement offsite alternative compliance. WPO update became effective on February 26, 2016.	N	N/A	N
	Construction Management					
23	Maintain, update and prioritize a watershed based inventory of all projects issued local permits that allow soil disturbing activities.	●	Projects that are issued local permits that allow soil disturbance activities are part of the inventory that is watershed-based.	N	N/A	Y

Table A2-11. County of San Diego Jurisdictional Strategies and Implementation Information

	Strategies Implemented by Jurisdictions	Implemented in FY16? *(Fully/Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(If None, N/A)*	Planned Implementation into next FY *(Y/N)*
24	Require implementation of BMPs that are site specific, seasonally appropriate and appropriate to the construction phase, year round.	●	Every project requires implementation of site specific construction BMPs, seasonally appropriate and appropriate to the construction phase.	N	N/A	Y
25	Impose legal authority to ensure inventoried construction projects are in compliance with all requirements.	●	The Watershed Protection Ordinance is the current legal authority to ensure inventoried construction projects are in compliance with all requirements.	N	N/A	Y
26	Make updates to County ordinances related to construction; reference to existing grading ordinance	●	County ordinances are updated with subsequent Construction General Permit updates; the Watershed Protection Ordinance will be updated as necessary as a result of the future Grading Ordinance Update.	N	N/A	N
27	Provide internal staff training related to construction storm water management.	●	The County conducts construction stormwater training annually, and it targets construction inspectors in DPW-PDCI, PDS-Building, and CIP Inspectors in DPW and DGS.	N	N/A	Y
Existing Development						
28	Maintain and update a watershed-based inventory of existing development (i.e. commercial, industrial, municipal and residential areas).	●	Inventory is tracked in Accela Automation. Database is continually updated to increase accuracy and efficiency.	N	N/A	Y
29	Improve the tracking of watershed based inventories via consolidated database	●	See the comments for Strategy 28 above.	N	N/A	Y
30	Designate a minimum set of BMPs required for all existing development inventories, including special event venues. The designated minimum BMPs must be specific to facility or area types and pollutant generating activities, as appropriate.	●	The JRMP establishes minimum BMPs for all existing development land use types.	N	N/A	Y
31	Create an Equestrian BMP Handbook	X	Handbook created in FY2014-15. Handbook will be revised in FY2016-17 to encompass additional BMPs and be more user-friendly.	N	N/A	Y
32	Require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types and pollutant generating activities, as appropriate.	●	See the comments for Strategy 30 above.	N	N/A	Y
33	Pet waste management and outreach in County Parks.	●	Mutt-mitt dispensers are installed and maintained in many County parks, providing people who are walking their dogs with waste disposal bags to use to pick up after their pets.	N	N/A	Y

Table A2-11. County of San Diego Jurisdictional Strategies and Implementation Information

	Strategies Implemented by Jurisdictions	Implemented in FY16? *(Fully/Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(If None, N/A)*	Planned Implementation into next FY *(Y/N)*
34	Implement a schedule or operation and maintenance activities for the stormwater conveyance system and related structures.	●	Stormwater maintenance is referred to appropriate departments when needed.	N	N/A	Y
35	Implement a schedule of operation and maintenance for County paved and unpaved roads.	●	County Road Crews employ a schedule for maintenance of County Roads.	N	N/A	Y
36	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education, permits, and certifications.	●	1. 450 Facilities throughout the County's jurisdiction received the Agricultural Water Quality Best Management Practices for Pesticides through annual registration notifications. 2. Inspections were conducted at 83 Commercial Ag Facilities throughout the County's jurisdiction.	N	N/A	Y
37	Promote and encourage implementation of designated BMPs in residential areas.	●	Through implementation of strategies described in the JRMP the County encourages the use of BMPs in residential areas. All Residential Management Areas were inspected in FY15-16	N	N/A	Y
38	Conduct inspections of inventoried existing development to ensure compliance	●	Through implementation of strategies described in the JRMP the County encourages the use of BMPs in residential areas.	N	N/A	Y
39	Conduct focused residential inspections based on strategic assessments.	●	Focused, collaborative investigations with Planning and Science staff of high priority outfalls.	N	N/A	Y
40	Develop a residential inspections tracking program via mobile platform - miles, violations, etc.	●	In pilot testing phase. Modifications are being made based on pilot testing phase to increase effectiveness.	N	N/A	Y
41	Improve inspections data tracking through mobile phone applications	●	See comments for Strategy 40 above.	N	N/A	Y
42	Enforce legal authority established for all inventoried existing development to achieve compliance	●	The Watershed Protection Ordinance provides legal authority; see JRMP for additional details.	N	N/A	Y
43	Update county ordinance related to existing development; reference to existing guidance documents	●	Watershed Protection Ordinance was updated; see JRMP for additional details.	N	N/A	N
44	Promote incentive program for BMP retrofits (e.g. water smart irrigation controllers, turf replacements programs, residential landscape evaluation program).	●	The County continues to collaborate with and promote the efforts of partner agencies' incentive programs.	N	N/A	N
45	Collaborate with partner agencies and groups to promote non-County sponsored incentive programs for BMP retrofits, including rain barrels, smart controllers, soil sensors, turf replacement, etc.	●	The County continues to collaborate with and promote the efforts of partner agencies' incentive programs.	N	N/A	Y
46	Identify candidate areas of existing development for stream, channel, and/or habitat rehabilitation projects and facilitate implementation of such projects.	●	N/A	N	N/A	N

Strategies Implemented by Jurisdictions		Implemented in FY16? *(Fully/Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(If None, N/A)*	Planned Implementation into next FY *(Y/N)*
			Outreach and Public Participation			
47	Develop, improve, distribute outreach materials.	●	Improved outreach materials through a focused Community-based Social Marketing approach. Continual improvement of existing materials, including translation into Spanish.	N	N/A	Y
48	Give outreach presentations to elementary, middle, and high school students	●	Offer presentations to elementary, middle, and high schools serving unincorporated communities.	N	N/A	Y
49	Outreach to mobile landscaping service providers	●	Pesticide Regulation Program collaboration with the California Department of Pesticide Regulation on a pilot program to offer workshops for maintenance gardeners. Two workshops were held where attendees were provided training materials and concluded with a pesticide certification exam. Attendees at both workshops had high success rates for the exam.	N	N/A	Y
50	Conduct large residential property pet waste management outreach	X	Unable to implement due to lack of community service organization partners	N	N/A	N
51	Conduct over irrigation outreach pilot study	●	Community-based Social Marketing pilot study on the effectiveness of irrigation runoff prevention materials.	N	N/A	Y
52	Conduct Homeowners Associations Outreach and Coordination Pilot Study	◖	HOA Outreach materials in draft format. Additional development will take place in FY2016-17.	N	N/A	Y
53	Expand Homeowners Associations Outreach and Coordination based on the pilot project within San Luis Rey, San Dieguito, or San Diego River as needed and as funding is identified	X	Additional development may occur based on pilot study in FY2016-17	N	N/A	N
54	Collaborate with watershed partners to develop consistent messaging to targeted audiences such as commercial, residents to conserve water and reduce dry weather flows	●	Collaboration between the Regional Education Workgroup and Think Blue San Diego Region to develop and distribute educational materials such as the "Be the Solution to Pollution" booklet which includes irrigation and runoff reduction measures. Other items developed under this included posters, calendars and coloring books	N	N/A	Y
55	Sponsor Trash Collection Events through public outreach and participation	●	The County sponsors ILACSD to establish cleanup sites at the Coastal Cleanup Day and Creek to Bay events.	N	N/A	Y
56	Educational Workshops on Integrated Pest Management, manure management and others as needed	●	Various workshops presented throughout the year by County staff including UCCE, FHA and contractors.	N	N/A	Y

Table A2-11. County of San Diego Jurisdictional Strategies and Implementation Information

	Strategies Implemented by Jurisdictions	Implemented in FY16? *(Fully/Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(If None, N/A)*	Planned Implementation into next FY *(Y/N)*
57	Partner with Master Gardeners Programs to provide education opportunities on water use and practices for gardening	●	Various workshops presented throughout the year by County staff including UCCE, FHA and contractors.	N	N/A	Y
58	Conduct Effectiveness Surveys on Education & Outreach programs	●	Surveys to determine the efficacy of watershed education to unincorporated elementary, middle, and high schools serving unincorporated communities	N	N/A	Y
	Enforcement Response Plan					
59	Implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Enforcement Response Plan.	●	County implemented the Enforcement Response Plan (ERP) as described in the JRMP.	N	N/A	Y
60	Notify the SDWB by email (RB9_Nonfilers@waterboards.ca.gov) within five (5) calendar days of issuing escalated enforcement to a construction site that poses a significant threat to water quality as a result of violations or other noncompliance	●	County implemented the ERP as described in the JRMP.	N	N/A	Y
61	Notify the SDWB by email (RB9_Nonfilers@waterboards.ca.gov) any persons required to obtain coverage under the statewide Industrial General Permit and Construction General Permit and failing to do so, within five (5) calendar days from the time the Copermittee become aware of the circumstances.	●	County implemented the ERP as described in the JRMP.	N	N/A	Y
	Public Education and Participation					
62	Implement a public education and participation program to promote and encourage development of programs, management practices and behaviors that reduce the discharge of pollutants in storm water prioritized by high risk behaviors, pollutants of concern, and target audiences.	●	The County completes numerous education and public participation programs for diverse target audiences. See JRMP.	N	N/A	Y

Notes:
● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented

Table A2-12. County of San Diego Optional Jurisdictional Strategies and Implementation Information

	Optional Strategies Implemented by Jurisdictions	Implementation Timeframe	Triggers	Resources	Triggered *(Y/N)*	Implemented in FY16 *(Fully/ Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY *(Y/N)*
Provision B.3.b.(1)(b)(i) - BMPs, incentives, or programs that may be implemented that are in addition to requirements of Provision B.3.b.(1)(a)										
1	Implement Sustainable Landscapes Program to encourage landscape retrofits.	FY 2016-17; Continuous until grant funding and incentives are depleted	Implementation of this strategy may be triggered if (1) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (2) all of the necessary resources have been secured. Continue implementation when the funding and incentives items are secured.	Staff resources, Grant funding, Incentive items, Partnerships	No	◖	Not triggered or scheduled to be implemented in FY 15-16, but guideline development and some initial outreach was completed. This work is considered partial implementation. Expanded program implementation is planned in FY 16-17.	N	N/A	Y
2	Implement an incentive program for BMP Retrofits (Public-Private Partnerships - a County sponsored program to offer incentives for rain barrel installation, downspout disconnects from the stormwater system, etc.)	FY 2015-16 Continuous, as resources allow	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) pilot program success; and (4) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Incentive items, Partnerships	No	◖	Not triggered in FY 15-16, but partially implemented. Partner agencies (water districts) offer rebates for rain barrels, and the Sustainable Landscapes program design now includes BMP retrofit components such as downspout disconnection. Free classes in landscape "makeovers" are also an incentive; a professional landscaper will assist with the development of plans, and the guidebook is grant funded (free to residents).	N	N/A	Y
3	Implement a program that provides rebates or incentives for pumping septic systems, with a focus in high risk areas adjacent to waterways (within 600 feet).	Once triggered, Pilot program 1 -2 years, as needed thereafter	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) pilot program success; and (4) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships, Incentive items	No	X	Funding source not identified. All 4 triggers have not been met.	N	N/A	No
4	Identify where sewer and stormwater infrastructure are in close proximity and subsequently, confirm the absence of flow at nearby stormwater MS4 outfall during dry weather.	Once triggered, 2-3 years; one-time	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships	No	N/A, Not Triggered	N/A, Not Triggered	N		

Table A2-12. County of San Diego Optional Jurisdictional Strategies and Implementation Information

Optional Strategies Implemented by Jurisdictions		Implementation Timeframe	Triggers	Resources	Triggered *(Y/N)*	Implemented in FY16 *(Fully/ Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY *(Y/N)*
5	Implement a program for on-site wastewater treatment (septic) systems. May include mapping and risk assessment, inspection, or maintenance practices.	Once triggered, 2-3 years	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) septic systems have been determined to be a pollutant sources to the MS4; and (4) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships	No	◖	Under the Local Area Management Plan (LAMP) for onsite wastewater treatment systems the treatment systems with supplemental treatment are required to be permitted annually. The annual operating permit will define the monitoring and maintenance requirements as specified by the manufacturer and/or qualified professional who designed the system. The LAMP ordinance can be found at: http://www.sandiegocounty.gov/content/dam/sdc/deh/lwqd/RWQCB%20Approved%20LAMP%20Final%202-24-15.pdf	N	N/A	Y
6	Divert persistent dry weather flows from storm drains to sewer	Once triggered, 3-6 years per project	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) permission is granted from sewer agency; and (4) ground water or permitted discharges have been ruled out; and (5) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Engineering design, Environmental review, Permits, Ongoing funding for operation/maintenance	No	N/A, Not Triggered	Diversions are a last resort strategy and will be reviewed for outfalls that are persistently flowing after all other implementation strategies have been exhausted.	N	N/A	N
Provision B.3.b.(1)(b)(ii) - Incentives or programs that may be implemented to encourage or implement projects to retrofit areas of existing development										
7	Implement trash capture program (e.g., retrofit storm drain intakes with trash capture devices)	Baseline study 2-3 years; FY 15-16 implementation as needed and as resources allow	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) baseline study completion and success; and (4) focus areas identification; and (5) detailed inlet inventory of focus areas; and (6) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Equipment, Permits, Ongoing funding for operation/maintenance	No	◖	The County of San Diego is in process of conducting several studies to develop Baseline Trash Generation Rates.	N	N/A	Y

Table A2-12. County of San Diego Optional Jurisdictional Strategies and Implementation Information

Optional Strategies Implemented by Jurisdictions		Implementation Timeframe	Triggers	Resources	Triggered *(Y/N)*	Implemented in FY16 *(Fully/ Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY *(Y/N)*
8	Implement a Green Streets Retrofits Program	Once triggered, 3-7 years per project; ongoing operation & maintenance thereafter	Implementation of this strategy may be triggered on a project-by-project basis if (1) a specified interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) pilot program success; and (4) all of the necessary resources have been secured.	Each green street retrofit project is preliminary estimated to cost an average of $5,500,000 per linear mile of retrofit for construction. Resources include: Staff resources, Grant funding or alternative source, Contractor funding, Engineering or landscaping design, Permits, Environmental review, Right of way acquisition, Ongoing funding for operation/maintenance	No	◖	Design standards and specifications have been developed. Green streets are now being used to meet compliance for all retrofit and/or redeveloped road projects that in the Capital Improvement Projects plan. Pursuing Grant Funding	N	N/A	Y
9	Construct Treatment Control BMPs (retrofits projects)	Once triggered, 4-7 years per project; ongoing operation & maintenance thereafter	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Engineering or landscaping design, Permits, Environmental review, Ongoing funding for operation/maintenance	No	N/A, Not Triggered	N/A, Not Triggered	N	N/A	N

Table A2-12. County of San Diego Optional Jurisdictional Strategies and Implementation Information

	Optional Strategies Implemented by Jurisdictions	Implementation Timeframe	Triggers	Resources	Triggered *(Y/N)*	Implemented in FY16 *(Fully/ Partially/No)*	Comments on Implementation	Proposed Modifications *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY *(Y/N)*
10	Implement an alternative compliance program to enable "offsite" compliance for new and redevelopment projects.	Once triggered, 3-6 years per project	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships, Engineering design , Permits, Environmental review, Right of way acquisition (if needed), Ongoing funding for operation/maintenance	No	◖	Currently applicant implemented offsite alternative compliance is available for use by the development community. The Water Quality Equivalency (WQE) provides the currency for structural BMPs and some natural system management practices (NSMPs). Additional work on the WQE will be conducted during FY17. The County is not currently pursuing a credit system but is participating as a stakeholder on the City of San Diego TAC and as a member of the Western Riverside Coalition of Governments (WRCOG) discussion on offsite alternative compliance.	N	N/A	Y
Provision B.3.b.(1)(b)(iii) - Incentives or programs that may be implemented to encourage or implement projects that will rehabilitate the conditions of channels or habitats										
11	Flood Control Channel Rehabilitation Projects (e.g., removal of impervious lining in flood control channel and replacement with earthen or vegetated surface)	Once triggered, 4-7 years per project; ongoing operation & maintenance thereafter	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (4) engineering design, monitoring, and outreach plans are approved; and (5) all of the necessary resources have been secured.	Project costs vary by size and complexity. Resources include: Staff resources, Grant funding or alternative source, Contractor funding, Partnerships, Engineering design, Permits, Environmental review, Right of way acquisition (if needed), Ongoing funding for operation/maintenance	No	◖	One project has been identified in SDR for retrofit/rehabilitation. Project planning, design and environmental review will begin in FY17.	N	N/A	Y

3.4 MODIFICATIONS TO THE BMP DESIGN MANUAL

The County of San Diego BMP Design Manual (BMP DM) provides guidance for land development and public improvement projects to comply with the 2013 Municipal Separate Storm Sewer System (MS4) Permit (Order No. R9-2013-0001 as amended by R9-2015-0001 and R9-2015-0100). This Manual replaces County of San Diego Standard Urban Stormwater Mitigation Plan (SUSMP). It is focused on project design requirements and related post-construction requirements, not on the construction process itself. No modifications to the BMP DM have been made since its publication on February 2016. The BMP DM is available online on the County of San Diego's website:

http://www.sandiegocounty.gov/content/sdc/dpw/watersheds/DevelopmentandConstruction/BMP_Design_Manual.html.

3.5 MODIFICATIONS TO THE JRMP

The County's Jurisdictional Runoff Management Program (JRMP) was prepared in response to new regulatory requirements adopted by the Regional Water Quality Control Board. The purpose of the JRMP document is to guide implementation of programs and strategies to reduce pollutants discharged from the County's storm drain system to receiving waters. No modifications were made to the JRMP during the 2015-2016 fiscal year. The JRMP is accessible from the Project Clean Water website at: http://www.projectcleanwater.org/index.php?option=com_content&view=article&id=105:jurmp-plan&catid=34

Re: Statement of Legal Authority in Compliance with San Diego Regional Water Quality Control Board Order No. R9-2013-0001

Dear Mr. Gibson:

The City of Santee ("City") hereby submits this statement in its capacity as a Co-Permittee in accordance with Provision E.1 of San Diego Regional Water Quality Control Board Order No. R9-2013-0001, National Pollution Discharge Elimination System ("NPDES") Permit and Waste Discharge Requirements for the Municipal Separate Storm Sewer Systems ("MS4") Draining the Watersheds Within the San Diego Region ("Permit").

STATEMENT OF LEGAL AUTHORITY

The undersigned attorney for the City does hereby state that the City has obtained adequate legal authority to comply with the legal requirements imposed on the City under the Permit, consistent with the requirements set forth in the regulations to the Clean Water Act, 40 CFR [Code of Federal Regulations] 122.26(d)(2)(i)(A-F), and to the extent permitted by State and Federal law and subject to the limitations on municipal action under the California and United States Constitutions. Subject to those limitations, this includes the authority to:

- Prohibit and eliminate all illicit discharges and illicit connections to its MS4 (Santee Municipal Code ("SMC"), § 13.42.060(A) [prohibition and requirement to eliminate].)

- Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity to its MS4 and control the quality of runoff from industrial and construction sites, including industrial and construction sites which have coverage under the statewide General Permit for Discharges of Storm

Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit), as well as to those sites which do not. (SMC, §§ 13.42.095 [industrial], 13.42.090 [construction].)

- Control the discharge of spills, dumping, or disposal of materials other than storm water into its MS4. (SMC, §§ 13.42.060 [prohibition of discharge of pollutants and non-storm water], 13.42.120 [notification of spills].)

- Control through interagency agreements among Copermittees the contribution of pollutants from one portion of the MS4 to another portion of the MS4. (Gov. Code, §§ 37350, 37355 [authority to control city property by contract].)

- Control, by coordinating and cooperating with other owners of the MS4 such as Caltrans, the U.S. federal government, or sovereign Native American Tribes through interagency agreements, where possible, the contribution of pollutants from their portion of the MS4 to the portion of the MS4 within the Copermittee's jurisdiction. (Gov. Code, §§ 37350, 37355 [authority to control city property by contract].)

- Require compliance with conditions in its statutes, ordinances, permits, contracts or orders, or similar means to hold dischargers to its MS4 accountable for their contributions of pollutants and flows. (SMC, §§ 13.42.070 [discharge in violation of permit], 13.42.150 [violations constituting misdemeanors], 13.42.160 [penalties for violation], 13.42.170 [continuing violations], 13.42.200 [administrative enforcement powers].)

- Require the use of BMPs to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP. (SMC, § 13.42.080 [BMPs required to reduce discharge of pollutants].)

- Require documentation on the effectiveness of BMPs implemented to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP. (SMC, §§ 13.42.080 [requiring implementation and maintenance], 13.42.130 [requiring monitoring and documentation].)

- Utilize enforcement mechanisms to require compliance with its statutes, ordinances, permits, contracts, orders, or similar means. (SMC, §§ 13.42.150 [violations constituting misdemeanors], 13.42.160 [penalties for violation], 13.42.200 [administrative enforcement powers].)

- Carry out all inspections, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with its statutes, ordinances, permits, contracts, orders, or similar means and with the requirements of this Order, including the prohibition of illicit discharges and connections to its MS4; the Copermittee must also have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from industrial facilities, including construction sites, discharging into its MS4. (SMC, §§ 13.42.100 [authorizing City to inspect] 13.42.130 [authorizing City to require testing, monitoring and reporting], 13.42.140 [authorizing City to enter and inspect].)

CONCLUSION

Thank you for your attention to this matter. Please do not hesitate to contact the undersigned if you have any questions or need any additional information.

Sincerely,

Rebecca Andrews

Copermittee Primary Contact Information: Address: 10601 Magnolia Avenue City: Santee County: San Diego State: CA Zip: 92071 Telephone: 619-258-4100, x. 177 Fax: 619-562-9376 Email: ctipton@cityofsanteeca.gov		
II. LEGAL AUTHORITY		
Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES NO	☒ ☐
III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE		
Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES NO	☐ ☒
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES NO	☐ ☐
IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM		
Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
Number of non-storm water discharges reported by the public		46
Number of non-storm water discharges detected by Copermittee staff or contractors		84
Number of non-storm water discharges investigated by the Copermittee		84
Number of sources of non-storm water discharges identified		129
Number of non-storm water discharges eliminated		129
Number of sources of illicit discharges or connections identified		82
Number of illicit discharges or connections eliminated		82
Number of enforcement actions issued		23
Number of escalated enforcement actions issued		7
V. DEVELOPMENT PLANNING PROGRAM		
Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board? N/A	YES NO	☐ ☒
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES NO	☐ ☐
Number of proposed development projects in review		13
Number of Priority Development Projects in review		11
Number of Priority Development Projects approved		13
Number of approved Priority Development Projects exempt from any BMP requirements		0
Number of approved Priority Development Projects allowed alternative compliance		0
Number of Priority Development Projects granted occupancy		5
Number of completed Priority Development Projects in inventory		48
Number of high priority Priority Development Project structural BMP inspections		6
Number of Priority Development Project structural BMP violations		4
Number of enforcement actions issued		13
Number of escalated enforcement actions issued		12

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM FY 15/16

VI. CONSTRUCTION MANAGEMENT PROGRAM

Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001? YES ☒ NO ☐

Number of construction sites in inventory	26
Number of active construction sites in inventory	21
Number of inactive construction sites in inventory	5
Number of construction sites closed/completed during reporting period	12
Number of construction site inspections	55
Number of construction site violations	148
Number of enforcement actions issued	18
Number of escalated enforcement actions issued	7

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM

Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001? YES ☒ NO ☐

	Municipal	Commercial	Industrial	Residential
Number of facilities or areas in inventory	17	460	167	0
Number of existing development inspections	3	48	0	
Number of follow-up inspections	5	27		
Number of violations	0	28		
Number of enforcement actions issued	0	21		
Number of escalated enforcement actions issued	0	10		

VIII. PUBLIC EDUCATION AND PARTICIPATION

Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001? YES ☒ NO ☐

Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001? YES ☒ NO ☐

IX. FISCAL ANALYSIS

Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001? YES ☒ NO ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☒ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

FISCAL ANALYSIS 2015/2016

As requested in Municipal Permit (Order No. R9-2013-0001), the City of Santee has prepared the following Fiscal Analysis per section E.8.

A. In response to Permit Section E.8.b.(1): This section reports on the total expenditures in the categories of capital, operation and maintenance, and other expenditure items. Most costs are devoted to operation and maintenance (O&M) expenses, both done by City staff and through outside contracts. See Table 1 for a breakdown summary of budget and expenditures.

1. Estimated expenditures in this category (Capital, O&M, other) for the current fiscal year are: $516,645.
2. The source of funds for the current fiscal year and next fiscal year are primarily General Fund, Flood Control, and Gas Tax.

B. In response to Permit Section E.8.b.(2): This section reports on the staffing resources and expenditures required to meet the requirements of this Order. See Table 1 for a breakdown summary of budget and expenditures.

1. Estimated expenditures in this category (staffing/labor) for the current fiscal year are: $336,213.
2. The source of funds for the current fiscal year and next fiscal year are primarily General Fund, but also include other sources as identified in Table 2.

Regional programs include Copermittee shared costs for monitoring, education, and other regional expenses, as well as the Water Quality Improvement Plan.

The City anticipates using the same funding sources as shown in Table 2, along with Grant Funds received through Prop 84 and Prop 1 for 2016/17.

Table 1: 2015/2016 Estimated Expenditure Summary

Jurisdictional Components	Total
Permit Fee	$17,171
Staff Time/Labor: Development Services	$160,158
Staff Time/Labor: Public Services	$176,055
Dog Station Maintenance	$7,500
Street Sweeping (includes contractor and disposal costs)	$191,412
Storm Drain and Channel Maintenance	$213,600
Specialized Equipment (Public Services)	$3,000
Waste Disposal (volunteer river cleanups)	$6,500
Legal Expenses	$10,500
Miscellaneous Expenses (Supplies, Printing, Postage, apparel, rainy season sand bags, etc.)	$12,261
Monitoring	$49,533
Professional Development	$5,168
Jurisdictional Program Total	**$852,858**

Regional Programs Total (Santee Share)	**$98,460**

Total Program Implementation Costs **Grand Total**	**$951,318**

Table 2: 2015/2016 Funding Source Summary

Funding by Source	Amount
General Fund	$341,972*
Storm Water Business License Fee	$5,141
Administrative Citations	$14,000
Flood Control	$290,016
Gas Tax	$174,264
Total Funding	**$825,393**

** Does not include funding which is secured through developer deposits and fees.*

4.3 JURISDICTIONAL STRATEGIES

~~Strikeouts~~ and blue text are text edits that have been made up to the current date since the WQIP September 2015 submittal.

Table A2-13. City of Santee Jurisdictional Strategies and Implementation Schedules for Illicit Discharge Detection and Elimination Program

San Diego River Illicit Discharge Detection and Elimination Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Engage the public, jurisdictional staff, and other agency staff to proactively identify and report illicit discharges.					
Facilitate public reporting of illicit discharges and connections via telephone and email.	●	●	A		The City created a storm water / water quality general awareness post card and mailed it out to all postal customers in the City.
Coordination with Padre Dam Municipal Water District regarding sanitary sewer overflow notifications and cleanup.	●	●	A		
Coordinate with upstream entities to prevent illicit discharges from upstream sources from entering the MS4.	●	●	A		
Utilize municipal personnel and contractors to identify and report illicit discharges and connections.	●	●	A		Two ICID trainings were conducted which has resulted in an increase in ICID reporting by internal customers.
2. Develop and implement approaches to address the impacts of septic systems within the watershed.					
Routinely conduct river "sweeps" to address homeless encampments ~~twice per month~~.	●	●	A	The City cannot commit resources to achieve the twice per month goal.	The sheriff routinely targets and 'sweeps' problem areas and notifies the City of the timeframe in which the debris can be removed. Due to limited resources, the City is unable to meet the 2 x per month commitment. Instead, the City relies on public reporting, local volunteer groups, and the sheriff to help identify problem areas and more effectively utilize resources for encampment debris removal.

Table A2-13. City of Santee Jurisdictional Strategies and Implementation Schedules for Illicit Discharge Detection and Elimination Program

San Diego River Illicit Discharge Detection and Elimination Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Weekly patrols of known encampment areas.	●	●	A	The City cannot commit resources to achieve the weekly goal.	The sheriff routinely targets and 'sweeps' problem areas and notifies the City of the timeframe in which the debris can be removed. Due to limited resources, the City is unable to meet the 2 x per month commitment. Instead, the City relies on public reporting, local volunteer groups, and the sheriff to help identify problem areas and more effectively utilize resources for encampment debris removal.
Implement Bicycle Patrol Team in conjunction with San Diego County Sherriff's Department.	●	●	A		During this reporting cycle, the Sherriff Department acquired bicycles, trained and assigned staff, and started routine patrols.
Improved coordination between Public Works staff and San Diego County Sherriff's Department.	●	●	A		Both Departments now utilize GPS devices to share and report information.
Provide waste stations for homeless encampments (e.g., portable toilets, trash receptacles)	●	●	P		The City is evaluating viable locations for a pilot program.
Continue coordination of Enforcement Team including the Fire Marshall, Code Enforcement, Storm Water Program Manager, City Attorney, and Sherriff's Department.	●	●	A		The City initiated quarterly meetings for all parties to discuss concerns, review compliance cases, and collaborate on solutions.
3. Develop and implement approaches to reduce the impacts of public and private sanitary sewer systems within the watershed.					
Coordination with Padre Dam Municipal Water District regarding sanitary sewer overflow notifications and cleanup.	●	●	A		
Revise fact sheet for sewer maintenance and coordinate distribution with Padre Dam MWD.	●	●	A		

Table A2-13. City of Santee Jurisdictional Strategies and Implementation Schedules for Illicit Discharge Detection and Elimination Program

San Diego River Illicit Discharge Detection and Elimination Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Implement practices and procedures to prevent/limit infiltration of seepage from sanitary sewers to the MS4.	●	●	P		
Implement practices and procedures to address spills with the potential to enter the MS4.	●	●	A		The City is working to improve this process through outreach, training, and through enhanced coordination with Heartland Fire and the Department of Environmental Health.
In addition to standard JRMP IDDE requirements, proactively investigate and eliminate illicit discharges and connections.	●	●	A		Increased awareness of how to identify and report IC/ID, has resulted in an increase in City staff, contractor, and partner agency reports. As a result, discharges from pools and irrigation are more frequently identified and eliminated.
4. Implement monitoring programs to provide new information to refine the prioritization of drainage areas.					
Conduct transitional MS4 outfall discharge program to identify persistent/transient flows.	●	●	A		
Conduct watershed specific MS4 outfall discharge program to identify persistent/transient flows.	●	●	A		
5. Actively educate public on prohibitions related to illicit discharges and connections.					
Investigate and eliminate illicit discharges and connections.	●	●	A		
Enforce legal authority to ensure all illicit discharges and connections that are identified are eliminated.	●	●	A		The City has and will continue to utilize its Enforcement Response Plan to escalate enforcement actions to achieve compliance in a timely manner.

Table A2-14. City of Santee Jurisdictional Strategies and Implementation Schedules for Development Planning

San Diego River Development Planning Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Provide updated materials, enhanced outreach, and training to convey land development requirements.					
Establish criteria designating priority development projects for new development and redevelopment projects.	●	●	A		
Update BMP design manual procedures to specify storm water requirements applicable to development and redevelopment projects, identify and design appropriate BMPs, establish maintenance criteria, and establish alternative compliance options (where implemented).	●	●	P		
2. Develop and implement LID programs to complement standard permit requirements.					
Require full enclosures for trash areas.	●	●	A		All new and significant redevelopment projects are now required to either retrofit existing, or install new, fully enclosed trash enclosures, with all openings / gaps screened to prevent wind dispersal. Poor waste management and repeat violations also trigger this requirement for existing development.
3. Implement a Watershed Management Area Analysis to develop watershed specific requirements for structural BMP implementation and identify a list of candidate projects that could be used as alternative compliance options for Priority Development Projects.					
Develop and implement a Watershed Management Area Analysis to develop watershed specific requirements for structural BMP implementation.	●	●	A		Developed collaboratively through a regional effort with other Copermittees.

Table A2-14. City of Santee Jurisdictional Strategies and Implementation Schedules for Development Planning

San Diego River Development Planning Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
4. Implement an alternative compliance program for Priority Development Projects.					
Implementation of an alternative compliance program will provide off-site alternatives to restore, retrofit, and rehabilitate. Prioritize areas through “hotspot” identification and those sites that are ideal for retrofit/rehabilitation.	●	●	A		The City partnered with SDSU through the SAGE program to have three separate but complimentary studies completed. One of the identified priority locations was recently submitted and awarded as a grant project.
5. Implement a post construction BMP program for development projects to ensure proper construction and maintenance.					
Implement source control, LID, and on-site structural controls for all priority development projects.	●	●	A		This strategy has been enhanced to include all development (priority and standard).
Implement a program that ensures that all structural BMPs are designed, constructed, and maintained on PDPs.	●	●	A		The City now requires the engineer of record to certify installation of all structural BMPs. This includes a signed and stamped form, along with supporting documentation (receipts, photos) demonstrating installation per specification. This also includes the final landscaping of the feature, not just the structural design and sizing.
Inspect all high priority structural BMPs prior to the rainy season.	●	●	A		

Table A2-14. City of Santee Jurisdictional Strategies and Implementation Schedules for Development Planning

San Diego River Development Planning Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
6. Enforce post construction requirements related to new and redevelopment.					
Require implementation of source control and low impact development (LID) BMPs for all development projects.	●	●	A		At a minimum, all projects, regardless of size, must disconnect impervious surfaces by routing runoff to landscape, eliminate all non-storm water runoff sources, utilize native and drought tolerant plantings, mulch, and irrigation systems, and install full trash enclosures.
Enforce legal authority to ensure all development projects are in compliance with all post construction requirements.	●	●	A		The City has and will continue to enforce the routine maintenance and upkeep of all source and structural BMPs to ensure they remain effective and operating as intended. This includes escalating enforcement actions and utilizing administrative citations to achieve compliance.

Table A2-15. City of Santee Jurisdictional Strategies and Implementation Schedules for Construction Management

San Diego River Construction Management Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Ensure that minimum BMPs are designated and required for construction projects.					
Require submittal of pollution control plan, construction BMP plan, and/or erosion and sediment control plan for projects requiring local permits involving soil disturbance activities.	●	●	A		
Review and confirm that the submitted plan is in compliance.	●	●	A		The City ensures that all projects, including interior remodel projects, demonstrate on their site plan all minimum BMPs required for the activity to be performed.
Maintain, update, and prioritize a watershed based inventory of all projects issued local permits that allow soil disturbing activities.	●	●	A		All projects disturbing soil, whether they qualify for a CGP permit or not, are now included on the City's Construction Site Inventory.
Implement or require implementation of BMPs that are site specific, seasonally appropriate, and appropriate to the construction phase year round.	●	●	A		All projects involving grading are required to attend a pre-grade meeting at City Hall. At this meeting, each project representative and contractor is provided a BMP packet, and a presentation is given highlighting key concepts such as minimum BMPs required at all times, erosion and sediment control, and the inspection – corrective action response process.
Inspect construction sites at an appropriate frequency to require and confirm compliance with local permits and ordinances, as well as the MS4 Permit requirements.	●	●	A		

San Diego River Construction Management Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Enforce legal authority to ensure inventoried construction projects are in compliance with all requirements.	●	●	A		The City has and will continue to utilize its Enforcement Response Plan to escalate enforcement actions to achieve compliance in a timely manner.
Target construction sites with increased enforcement as appropriate, especially related to trash management.	●	●	A		
2. Provide enhanced outreach and coordination to convey construction requirements.					
Provide internal staff training related to construction storm water management.	●	●	A		One construction site compliance training was held for all City Engineers.
Provide public education and outreach targeting the construction industry.	●	●	A		The City routinely emails reminders and updates to all inventoried construction sites throughout the year. The City also provides materials and verbal guidance at each pre-grade meeting. The City's web page and fact sheets have all been updated with construction outreach materials, and the City is working on creating a mock site plan with BMPs for a typical construction site.
Coordination with engineering and building inspection divisions to address SSOs caused by debris in sanitary sewer lines following new construction; review sign off procedures to ensure that debris in lines is avoided.	●	●	P		

Table A2-16. City of Santee Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Maintain and improve data tracking methods for existing development inventories where necessary.					
Maintain and update a watershed based inventory of existing development (i.e., commercial, industrial, and municipal facilities and residential areas).	●	●	P		Staff have started conducting a thorough review and cross-verification of all inventories. This includes a review of current Business Licenses.
2. Develop and implement approaches to address the impacts of improper water use and irrigation runoff.					
Coordinate with Padre Dam Municipal Water District to encourage proper enforcement of water conservation requirements.	●	●	A		Coordination has led to increased reporting/cross reporting of issues, the development of cross messaged material, and dual (combined agency) enforcement actions.
Coordinate with Padre Dam Municipal Water District to provide joint outreach to residents and businesses regarding irrigation practices.	●	●	A		New fact sheets have been created which highlight the cross benefit of water conservation, reduction of water waste, water runoff, and water quality.
Coordinate with Padre Dam Municipal Water District to increase incentive programs	●	●	A		Padre Dam shared some of their regional supplies such as the County Water Authority buckets for cross outreach. Both agencies cross promote the County Water Authority and SoCalWaterSmart for incentive programs.
Coordinate with County of San Diego to promote Sustainable Landscapes Program.	●	●	P		The City hopes to bring workshops to east county by offering City Hall as a venue for classes, coordinating with Padre Dam, and assisting with field trips.

Table A2-16. City of Santee Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Coordinate with Santee School District to improve operations and maintenance of irrigation systems at school facilities	●	●	A		The City supported the successful application for a DROPS grant for Santee Schools. The grant program involves the implementation of rain gardens, bioswales, disconnecting impervious surfaces, and rainwater harvesting. An education and outreach component is included which will teach the students about the projects and how they can be replicated at home. Additionally, through Dry Weather Monitoring, it was identified that discolored runoff was originating from one of the school track and fields. The City worked with the school district to rectify the issue.
Develop education and outreach to reduce over-irrigation.	●	●	A		
Revisions to landscape ordinance	●	●	A		Revisions to the City's Landscape Ordinance were completed this reporting year in conjunction with the drought and water conservation regulations that went into effect. The City utilized this opportunity to reinforce storm water and water quality requirements.
3. Improve and/or continue existing pet waste programs.					
Pet Waste Bag Dispenser Stations in City Parks and Residential Areas	●	●	A		The City operates and maintains over 40 dog stations. Combined, approximately 20,000 bags are dispensed each month.
4. Improve trash management strategies within the watershed.					
Develop and distribute "Keep Lids Closed" stickers for dumpsters.	●	●	P		

Table A2-16. City of Santee Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Target commercial centers for increased enforcement, especially related to trash management.	●	●	A		Several problem areas have been identified through the City's Complete Property Inspection Program. These areas have been addressed through mandatory outreach to tenants, retrofits to trash enclosures, requiring the development and submittal of a Facilities Operations and Maintenance Plan, and escalating enforcement actions.
Coordination with Santee School District for trash management.	●	●	A		
Implement a schedule of operation and maintenance for public streets, unpaved roads, paved roads, and paved highways.	●	●	P		The City will reevaluate and reprioritize its roadway maintenance program in FY17-18. The City plans include a routine assessment and maintenance plan for both private and unpaved roads.
Require sweeping and maintenance of private roads in targeted areas.	●	●	A		New developments with proposed private roads are now required to include routine street and storm drain maintenance as part of their Storm Water Quality Management Operation and Maintenance Plans. In addition, as RMA inspections are completed, should road maintenance deficiencies be identified, the City requires the community/property owner to clean their roadways and implement a routine maintenance plan.
Continue reporting and evaluating volumes of trash removed from illegal dumping activities	●	●	A		The City facilitated the removal of approximately 65,415 pounds of trash.

Table A2-16. City of Santee Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Develop outreach program similar to the "Don't Trash California" campaign, including updates to existing outreach materials.	●	●	P		
Enhance and expand trash cleanups through community-based organizations involving target audiences.	●	●	A		The City supports volunteer organizations by providing clean up materials and tools, and providing waste hauling and disposal services.
5. Develop and implement approaches to reduce the impacts of public and private sanitary sewer systems within the watershed.					
Implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers.	●	●	A		Many of the City's underground storm drain systems have been and are being relined to improve integrity.
Develop a strategy to identify and provide outreach to gray water system owners	●	●	P		
6. Improve and implement existing outreach programs to target key sources and pollutants.					
Increase seasonal specific outreach related to water use via business journals.	●	●	A		The City has initiated outreach though partnerships with the local Chamber of Commerce, and Business Associations.
Enhanced outreach to pool owners and maintenance companies - due to economic downturn, people have stopped maintaining pools, when flushed, may contain bacteria.	●	●	A		All Santee based pool maintenance providers were provided notification and outreach regarding proper maintenance and disposal practices. Outreach materials have also been provided to HOAs and the local pool supply store.
Golf Course - outreach specific to management of landscaping and water use; bio solids use as fertilizer/storage.	●	●	A		

Table A2-16. City of Santee Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
SDR Trail Expansion (City Parks) - interpretive signage; demonstration project for drought tolerant/native landscaping, permeable surfaces, and other LID.	●	●	P		
Improve consistency and content of websites to highlight enforceable conditions and reporting methods.	●	●	A		All Storm Water Program web pages have been refreshed with new content, more tools and resources.
Enhance school and recreation-based education and outreach.	●	●	A		The City has partnered with several of the Santee schools to provide presentation, provide outreach materials such as calendars and coloring books, and cohosted a 4th grade field trip to the Sand Diego River. In addition, the City requires that permitted use special events complete and submit both pre and post event inspections to ensure that BMPs are put into place, and the site is cleaned to pre-event conditions. The City required this documentation for 7 City events and 3 private events.
7. Enhance existing MS4 maintenance programs.					
Prioritized MS4 cleaning program based on land use density and traffic flows.	●	●	P		The City plans to reevaluate and reprioritize the MS4 maintenance program in FY17-18.
Investigate potential to use ultra-violet lights in the MS4.	●	●	P		The City will research and identify opportunities to implement UV on a pilot project, as funding allows.
Implement invasive species removal projects in coordination with San Diego River Conservancy.	●	●	A		

Table A2-16. City of Santee Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
8. Improve existing inspections programs to more efficiently target key sources.					
Prioritize residential management areas for focused inspections.	●	●	A		RMAs have been prioritized based on their proximity to pollutant hot spots.
Provide or expand targeted outreach to homeowners associations.	●	●	P		
Provide targeted outreach via printed materials to residential areas.	●	●	A		In preparation for an anticipated El Nino rainy season, the City mailed out 1,115 notification letters were sent to private property owners explaining the importance of maintaining their private drainage systems, including brow ditches and swales.
Conduct inspections of inventoried existing development to ensure compliance. Each area/activity inspected once every five years minimum, with equivalent of 20% of inventory inspected annually.	●	●	A		
Complete property inspection program	●	●	A		Complete property inspections have commenced at locations directly tributary to a known pollutant 'Hot Spot'.
9. Actively enforce stormwater and urban runoff requirements for existing development.					
Designate and require minimum set of BMPs required for all inventoried existing development.	●	●	A		This was strategy is complete. A new fact sheet has been created, and minimum conditions of approval have been developed.
Increase identification and enforcement of actionable erosion and slope stabilization issues on private property and require stabilization and repair.	●	●	A		

Table A2-16. City of Santee Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Enforce legal authority to ensure inventoried existing development facilities and/or areas are in compliance with all requirements.	●	●	A		
10. Identify and facilitate retrofit opportunities in areas of existing development.					
Develop a strategy to identify opportunities and facilitate the implementation of retrofit projects in areas of existing development.	●	●	A		This strategy was initiated through the partnership with SDSU. To date, efforts have led to the successful award of a grant project, and the incorporation of water quality improvements into existing (pre-planned) Capital Improvement Projects.
Implement green streets depending on WMAA results.	●	●	P		Although a plan is not currently in place, one pilot project was completed as part of the Prospect Avenue Corridor enhancement project.
Coordinate with Padre Dam Municipal Water District to increase incentive programs	●	●	P		The City looks forward to partnering on a rain barrel incentive program.
Coordinate with County of San Diego to promote Sustainable Landscapes Program.	●	●	P		

Table A2-16. City of Santee Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies City of Santee	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
11. Improve coordination between agencies.					
Increased public outreach through external professional organizations (e.g., APWA, ASCE, Chamber of Commerce) - leveraging groups/contacts/newsletter.	●	●	A		The Storm Water Program has forged relationships with the Santee Chamber of Commerce and the East County Manufacturing Association to participate in events, share materials, and provide news article content.
Coordinate with Padre Dam Municipal Water District to encourage proper enforcement of water conservation requirements.	●	●	A		Although the drought alert level has lowered, the City has worked with Padre Dam to cross post information about water conservation and water quality. Both agencies now cross refer citizen complaints/reports as applicable.
Coordinate with Padre Dam Municipal Water District to provide joint outreach to residents and businesses regarding irrigation practices.	●	●	P		
Coordinate with Padre Dam Municipal Water District to increase incentive programs.	●	●	P		The City is planning to partner with Padre Dam to host a rain barrel sales event.
Coordinate with County of San Diego to promote Sustainable Landscapes Program.	●	●	P		

Table A2-17. City of Santee Optional Jurisdictional Strategies and Implementation Schedules

San Diego River Optional Jurisdictional Strategies	Implementation Timeframe	FY15-16	FY16-17	Actual / Planned	Comments
Maintain MS4 map to facilitate implementation of the IDDE Program; add private drainages	FY 15-16 FY 16-17	◖	◖	A	The City has updated its MS4 map. Through a partnership with SDSU, the City has begun identifying and adding private drainage systems to the City's MS4 map and GIS files. To date, efforts have been focused on collecting data in the city's center, where the heart of development is.
Implement Alternative Compliance Program for Priority Development Projects to encourage rehabilitation.	2017-2020	NA	◖	P	The City has and will continue participating in the development of a regional alternative compliance program in partnership with the region's Copermittees. Through a partnership with SDSU, the City has completed an initial review, evaluation, and prioritization of potential candidate sites for off-site improvement projects.
Implement a Green Streets (aka Complete Streets) Program	2017-2020	NA	X	P	The City has implemented one green street as a part of the planned improvements to Prospect Avenue. The City will begin developing strategies to incorporate green streets to its existing Capital Improvement Program in FY2017-2018.

San Diego River Optional Jurisdictional Strategies	Implementation Timeframe	FY15-16	FY16-17	Actual / Planned	Comments
Update standard Conditions of Approval to require all non-PDP redevelopment sites as well as significant tenant improvements to retrofit the entire property to incorporate minimum trash controls (fully covered/contained trash enclosure, inlet retrofits/trash baskets, etc.) and redirecting runoff to pervious areas.	2016-2018	●	●	A	The City has begun implementing this strategy with successful implementation at more than four locations thus far.

Notes:

● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented, NA – Not Applicable

A – Actual (active implementation), P – Planned (planning stage)

4.4 MODIFICATIONS TO THE BMP DESIGN MANUAL

The City of Santee BMP Design Manual provides guidance for land development and public improvement projects to comply with relevant development planning requirements in the Municipal Permit. The City of Santee updated its BMP Design Manual in accordance with Municipal Permit requirements in February 2016; the BMP Design Manual replaced the Standard Urban Stormwater Mitigation Plan (SUSMP). Over the first year of implementation, the City has found clerical errors, formatting errors, and has updated the forms to combined submittals in a form-fillable format. No content changes to the BMP Design Manual have been made since it went into effect in February 2016. The City of Santee BMP Design Manual can be accessed at: www.SanteeH2o.org via the "Development Planning Can Protect Water Quality" link in the left menu bar or via the "New Development" link at the bottom of the page.

4.5 MODIFICATIONS TO THE JRMP

The City made some minor editorial clarifications to its JRMP during the 2015-2016 fiscal year. A copy of the JRMP can be obtained by calling 619-258-4100, x 177.

5 City of San Diego

5.1 ANNUAL REPORT CERTIFICATION

THE CITY OF SAN DIEGO

STATEMENT OF CERTIFICATION

San Diego River Watershed Management Area Water Quality Improvement Plan

2015-2016 Annual Report

I certify, under penalty of law, that this Water Quality Improvement Plan Annual Report submittal and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for known violations.

Andrew Kleis

Drew Kleis

CITY OF SAN DIEGO

SCOTT CHADWICK
CHIEF OPERATING OFFICER

January 27, 2017

Mr. David W. Gibson, Executive Officer
Regional Water Quality Control Board
San Diego Region
2375 Northside Drive, Suite 100
San Diego, CA 92108

Subject: Certification of Adequate Legal Authority

Dear Mr. Gibson:

Pursuant to San Diego Regional Water Quality Control Board Order No. R9-2013-0001, as amended by Order No. R9-2015-0100 (Municipal Permit or Permit), Provision E.1.b, the City of San Diego, as a Copermittee in the above referenced permit, submits this certification of adequate legal authority with the first Water Quality Improvement Plan Annual Report. The City has adequate legal authority to implement and enforce each requirement contained in 40 C.F.R. section 122.26(d)(2)(i)(A)-(F), and the Municipal Permit (including Provision E.1.a(1)-(10)). The San Diego Municipal Code, including the following provisions, provides the City with adequate legal authority as required by the Municipal Permit:

1. Storm Water Management and Discharge Control, sections 43.0301 through 43.0312. These provisions are being amended, although the current version also complies with the requirements of the Municipal Permit.
2. General Construction Permit Authority and Procedures, sections 129.0101 through 129.0120.
3. Grading Regulations, sections 142.0101 through 142.0150.
4. Storm Water Runoff Control and Drainage Regulations, sections 142.0201 through 142.0230.

The City looks forward to working with you and the Regional Board on storm water management matters. If you have any questions, please contact Senior Planner Jim Harry at (858) 541-4353 or email JHarry@sandiego.gov.

Sincerely,

Scott Chadwick
Chief Operating Officer

5.2 ANNUAL REPORT FORM

I. COPERMITTEE INFORMATION			
Copermittee Name: **City of San Diego (San Diego River WMA)**			
Copermittee Primary Contact Name: **Drew Kleis, Deputy Director, Storm Water Division, Transportation & Storm Water Department**			
Copermittee Primary Contact Information:			
Address: **9370 Chesapeake Drive, Suite 100**			
City: **San Diego**	County: **San Diego**	State: **CA**	Zip: **92123**
Telephone: **858-541-4320**	Fax: **858-541-4350**	Email: **Akleis@sandiego.gov**	

II. LEGAL AUTHORITY	
Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	**YES**[1] ☒ **NO** ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	**YES** ☒ **NO** ☐
III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE	
Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	**YES**[1] ☒ **NO** ☐
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	**YES** ☒ **NO** ☐
IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM[2]	
Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	**YES**[1] ☒ **NO** ☐
Number of non-storm water discharges reported by the public	**368**
Number of non-storm water discharges detected by Copermittee staff or contractors	**314**
Number of non-storm water discharges investigated by the Copermittee	**683**
Number of sources of non-storm water discharges identified	**559**
Number of non-storm water discharges eliminated	**553**
Number of sources of illicit discharges or connections identified	**551**
Number of illicit discharges or connections eliminated	**545**[3]
Number of enforcement actions issued	**553**[3]
Number of escalated enforcement actions issued	**349**
V. DEVELOPMENT PLANNING PROGRAM[2]	
Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	**YES**[1] ☒ **NO** ☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	**YES** ☒ **NO** ☐
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	**YES**[4] ☒ **NO** ☐
Number of proposed development projects in review	**233**[5]
Number of Priority Development Projects in review	**21**[6]
Number of Priority Development Projects approved	**61**[7]
Number of approved Priority Development Projects exempt from any BMP requirements	**0**
Number of approved Priority Development Projects allowed alternative compliance	**0**
Number of Priority Development Projects granted occupancy	**32**[8]
Number of completed Priority Development Projects in inventory	**113**[9]
Number of high priority Priority Development Project structural BMP inspections	**1**
Number of Priority Development Project structural BMP violations	**1**[10]
Number of enforcement actions issued	**3**[11]
Number of escalated enforcement actions issued	**1**

VI. CONSTRUCTION MANAGEMENT PROGRAM[2]	
Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001?	YES[1,12] ☒ NO ☐
Number of construction sites in inventory	1,830
Number of active construction sites in inventory	38
Number of inactive construction sites in inventory	188
Number of construction sites closed/completed during reporting period	258
Number of construction site inspections	8,875
Number of construction site violations	78
Number of enforcement actions issued	51
Number of escalated enforcement actions issued	25

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM[2]				
Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001?				YES[1] ☒ NO ☐
	Municipal	Commercial	Industrial	Residential
Number of facilities or areas in inventory	121	10,175 (includes mobile)	513	33[13]
Number of existing development inspections	114	2,573	99	5[13]
Number of follow-up inspections	0	193	5	4
Number of violations	10	420	11	481[13]
Number of enforcement actions issued	16	514	13	365[13]
Number of escalated enforcement actions issued	0	172	0	236

VIII. PUBLIC EDUCATION AND PARTICIPATION	
Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001?	YES[1] ☒ NO ☐
Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001?	YES[1] ☒ NO ☐

IX. FISCAL ANALYSIS	
Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001?	YES[1,14] ☒ NO ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☒ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

[signature]	1/12/17
Signature	Date
Drew Kleis	Deputy Director
Print Name	Title
(858) 541-4320	Akleis@sandiego.gov
Telephone Number	Email

[1] The City of San Diego approved an update to the Jurisdictional Runoff Management Plan (JRMP) in FY 16. The update of the JRMP was done in compliance with Order No. R9-2013-0001.
[2] See the JRMP Annual Report FY 2016 Attachment 1 for a citywide summary of this data.
[3] The number of enforcement actions issued does not equal the number of identified illicit discharges or connections because some discharge complaints in the last quarter of FY 2016 were still under investigation at the end of FY 2016.
[4] The Storm Water Standards Manual (Part 1: BMP Design Manual, and Part 2: Construction BMP Standards) was updated in January 2016.
[5] The number of ongoing Standard and Priority Development Projects in review as of 6/30/16. The Development Services Department processes other types of permits, in addition to those included in the JRMP Annual Report, that are not subject to the requirements of the municipal permit.
[6] The number of ongoing Priority Development Projects in review as of 6/30/16. Only a portion of the projects that the Development Services Department processes qualify as a priority development project.
[7] The number of Priority Development Projects approved in FY 2016.
[8] This number includes the City's Priority Development Projects that received final inspection in FY 2016 as well as certain Priority Development buildings and grading projects that did not require a Certificate of Occupancy, that were completed in FY 2016.
[9] Represents the total number of completed Priority Development Projects in the City's inventory as of the end of FY 2016. These projects include projects entered into the inventory as complete in previous years.
[10] The number of Priority Development Project structural BMP violations included Notices of Violation, Notices of Deficient Maintenance, and Administrative Citations issued to public and private entities within the City's jurisdiction in this watershed.
[11] The number of enforcement actions included Notices of Violation and Notices of Deficient Maintenance issued to public and private entities within the City's jurisdiction in this watershed. The City has achieved compliance at 146 of the 150 sites identified in the San Diego RWQCB's Notice of Violation (Order Number R9-2014-0034). The San Diego RWQCB granted the City an extension to achieve compliance at the remaining four sites by May 26, 2017.
During the process of achieving compliance for the aforementioned 150 identified sites, the City has discovered an additional 74 sites which initially appear to be out of compliance due to varying degrees of circumstances. Each of these potential violations consist of post-construction BMP issues. Continuing the same process as outlined in our quarterly reports to the RWQCB, the City is currently researching each case. After initial research to verify non-compliance or not, we will follow our established procedures to have each site be in conformance to the MS4 permit under which it was permitted.
[12] Responses in this report are based on the City's internal data. Potential program deficiencies were identified by the Board in FY 2016, however, the City has taken steps to correct issues identified by the Board as detailed in the JRMP Annual Report FY 2016 Appendix. The City has implemented several improvements that address the Regional Board's concerns. These improvements ranged from procedural changes to creating multi-language brochures for contractors. Several operating and internal procedures have been refined to improve enforcement actions, add clarity to how sites are inspected, and to better define the staff's roles and expectations.
[13] Existing facilities for residential uses are characterized as Residential Management Areas (RMA), which could include hundreds of residences. When all of the residences in an RMA are inspected by City staff that is only counted as one inspection. However, all individual issues noted at each residence during an RMA inspection is counted as a separate violation and/or enforcement action.
[14] See the JRMP Annual Report FY 2016 Appendix for the FY 2016 Fiscal Analysis.

APPENDIX

1 OPERATIONAL ADAPTIVE MANAGEMENT

In Fiscal Year (FY) 2016 the City of San Diego (City) completed technical and non-technical monitoring, special studies, pilot studies, and various other efforts related to its Storm Water Program. The City gained valuable information that led to effective adaptation of procedures and operations, which ultimately led to more effective implementation of its Storm Water Program and the Jurisdictional Runoff Management Plan (JRMP). The following are operational adaptive management improvements that the City made during FY 2016:

- **Get it Done Application**
  In late FY 2016, the City released the Get it Done Application (App), which provides a modern, efficient method for members of the public to report issues to the City. One of the App's features allows illicit discharges to be reported by taking a photo with a phone that includes Global Positioning System (GPS) coordinates, and uploading it to the App. According to a recent City survey, 83 percent of respondents stated that they did not want to call the City government to report a problem. The new Get It Done App eliminates the need to call the City for various problems, by allowing residents to report issues online, which was the preferred method of 50 percent of survey respondents. The App also allows residents to report problems using their name or anonymously.

- **Phase V Street Sweeping Pilot**
  The City completed the fifth and final pilot study of the Targeted Aggressive Street Sweeping Pilot Program in FY 2016, which tested the effectiveness of posting limited-hour "no parking" signs on traditionally non-posted street sweeping routes. After two years of data collection on two subject routes, the study confirmed the hypothesis that a significant amount of additional debris (48% and 58% over baseline on the subject routes) can be removed from posting no parking signs on traditionally non-posted roadways. Based on this finding, the City will consider posting additional routes if supported by the community.

- **Enhanced Catch Basin Cleaning Optimization**
  Enhanced catch basin cleaning is a strategy to address pollutant removal from the Municipal Separate Storm Sewer System (MS4) in three of the City's six watersheds. While most catch basins are inspected once per year, this strategy involves inspecting catch basins within the specified watersheds between two and four times per year. The optimization study assigned priorities to individual basins and watersheds based on eight years of historic debris removal. This optimization focused efforts by reducing the number of inspections performed per year, while increasing total debris removal from those inspections. This enhancement will allow the City to target high priority drains to maximize pollutant removal while maintaining cost efficiencies. In FY 2016, approximately 2,500 additional catch basin inspections and cleanings (if necessary) were completed in the Chollas Creek area of the San Diego Bay Watershed.

- **Flood Control Pump Stations**
  To help minimize the risk of flooding in flood-prone areas during storm events, the City utilizes a number of pump stations to increase the flow of water through the conveyance network. Considering the pump stations are connected to the electric network, they only

function when power is running. In FY 2016, a 2,400 volt automatic transfer switch and generator were installed at a critical pump station that are capable of pumping 130,000 gallons of water per minute. This significantly decreases the risk of flooding in the related drainage area because the pump station will continue to operate during a storm event. The City also replaced or refurbished 11 other critical pump stations. Additionally, the City modernized operations at 14 pump stations by installing a telemetry system that remotely alerts staff of failures, allowing for a more immediate response.

- **Storm Drain Inspections**
  To help prioritize replacement of corrugated metal piping in the City's conveyance network, the City used closed-circuit televising at 62 locations in FY 2016 to assess pipe conditions. The City assessed the condition of 28,000 linear feet of corrugated metal piping in FY 2016.

- **Property-Based Inspections**
  In FY 2016, the City further committed to implementing property-based inspections to increase the business inspection program's efficiency and effectiveness. A previously conducted pilot study on inspection practices found property-based inspections more effective at identifying and resolving water quality issues (e.g., improper trash disposal practices and irrigation runoff, etc.) associated with commercial and industrial businesses. The inspections are focused on areas and activities associated with businesses that would not otherwise be inspected for storm water compliance. The inspections greatly increase the number of businesses subjected to storm water inspections while focusing on the pollution generating areas and activities without unduly increasing the inspection load of City inspectors. In FY 2016, the City performed 835 property-based inspections that accounted for over 4,700 business inspections.

- **Tiger Team**
  The Tiger Team was established in FY 2016 to identify, locate and eliminate sources of human specific bacteria sources in the MS4. The Transportation & Storm Water Department (TSW) leads this effort in partnership with the Public Utilities Department. After a specific portion of the MS4 with elevated human specific bacteria was identified, the Tiger Team performed escalated enforcement activities through TSW Code Enforcement, MS4 sampling, MS4 sanitary sewer line televising, and MS4 and sanitary sewer cleaning. Over several months during the reporting year, one problem area within the City was investigated extensively and a source of human specific bacteria in the MS4 was identified and abated.

- **Increased Non-Stormwater Discharge Investigations**
  The City received 215 more complaints of non-stormwater discharges in FY 2016. Approximately 81% of the complaints citywide were resolved. A majority of the investigations that were resolved involved irrigation runoff. Cases were unresolved either because the source could not be identified or the source was groundwater.

  The identification and elimination of irrigation efforts in FY 2016 involved the following:
  1) Special irrigation patrols were conducted on a monthly basis. All violating properties were issued notices of violation and/or a citation.
  2) TSW code compliance partnered with the Public Utilities Department. If a complaint of irrigation with runoff was received, a storm water code compliance officer would issue a notice of violation. If the property had multiple complaints,

that property would become part of an irrigation patrol and could result in a citation.

- **Waterways Maintenance Plan**
  The City began development of the Waterways Maintenance Plan in FY 2016, which will replace the Master Storm Water System Maintenance Program, which expires in 2018. The goals of the Plan are to create an overall holistic storm water management strategy with standard mitigation measures and streamlined maintenance approvals. Objectives of the Plan include flood risk reduction, infrastructure sustainability and resource protection and restoration. In addition to technical scoring criteria, the Plan also includes a unique public input metric so that public concerns are given a tangible value. Planning efforts will continue in FY 2017, with implementation beginning in FY 2019.

- **Off-Site Alternative Compliance Program**
  In FY 2016, the City implemented phase I of the Alternative Compliance Program. This gives development projects that would require on-site structural Best Management Practices (BMPs) to comply with pollutant control and hydromodification management the option to propose off-site alternative compliance projects. The development of phase II also began in FY 2016 and includes establishing an in-lieu fee structure and credit system as an alternative to installing on-site stormwater BMPs.

- **Watershed Master Planning**
  To provide the high-resolution data needed to drive systematic and cost-effective implementation of green infrastructure (GI) projects, the City has developed a comprehensive and dynamic Watershed Master Plan (WMP) in the Chollas Creek Watershed that quantifies progress towards water quality goals and incorporates synergies with other municipal programs. The WMP has the capability to dynamically assess the cost-based water quality benefits of specific GI projects against one another and incorporates a robust prioritization logic that realizes the complex nature of implementing retrofit GI facilities within a highly urbanized environment. Ultimately, the output of this project gives the City a project-by-project roadmap that is prioritized to implement high-impact and high-efficiency BMPs first, leaving less desirable projects for later implementation.

- **Bacteria Regrowth Study**
  The bacteria regrowth study currently being completed by the City includes monitoring to characterize the magnitude and extent of potential *Enterococcus* loading due to regrowth within the City's storm drain system. This study will quantify the amount of bacteria in receiving water samples that are harmless to humans and would potentially be used to refine bacteria water quality standards of the Bacteria TMDL as a part of the re-opener process.

- **Los Peñasquitos Lagoon Restoration Project**
  Modeling was completed in FY 2016 to confirm the preferred alternative for the Los Peñasquitos Lagoon Restoration project. The City was identified as the "lead" for the project. The upcoming tasks in FY 2017 include completing the concept design and starting the public outreach process. In coordination with Copermittees, Caltrans and SANDAG completed the environmental and construction phases for various rail and transit, highway, and environmental protection projects.

2 Stormwater Program Accomplishments/Notable Updates

The City continued to implement the key elements of the JRMP. The following are stormwater accomplishments and notable updates that occurred during the FY 2016 reporting period.

- **Water Quality Improvement Plans**

  In FY 2016, the San Diego Regional Water Quality Control Board (Regional Board) accepted the six Water Quality Improvement Plans (WQIPs) that included City jurisdiction. The goal of the WQIPs is to protect, preserve, enhance, and restore the water quality of receiving water bodies. These WQIPs identify the adaptive planning and management process necessary to address the highest priority water quality conditions within a watershed. The WQIPs also identify strategies to achieve improvements in the quality of discharges from the Responsible Agencies' storm drain systems. The City is the lead on the WQIP for the San Dieguito, Los Penasquitos, and Mission Bay watersheds. The City is also a participating agency in the San Diego River, San Diego Bay, and Tijuana River watersheds.

- **JRMP Refinements**

  In FY 2016, the City identified refinements to the JRMP. These refinements were incorporated into the JRMP and will be completed in mid FY 2017. Refinements included minor changes to text to update the discussions of WQIP strategies, updates to the fiscal analysis, updates to the minimum BMPs to address pesticide applications, and updated references to the Storm Water Standards Manual that was adopted in FY 2016. The updated JRMP can be viewed at https://www.sandiego.gov/stormwater/plansreports/jrmp.

- **General Plan and Community Plan Amendments**

  Southeastern San Diego and Encanto Neighborhoods Community Plan Updates:

  The recently adopted Southeastern San Diego and Encanto Neighborhoods Community Plans incorporate language, policies and recommendations concerning the reduction of urban runoff and storm water quality. Stormwater quality plays a significant role in both of these communities since Chollas Creek is a significant feature within both plan areas lead directly to the San Diego Bay. A primary recommendation in both community plans is the restoration and enhancement of the creek, consistent with the Chollas Creek Enhancement Program, which includes the reduction of pollutants that enter the storm water system from nearby uses (see respective Conservation Elements). Specific stormwater language and policies have been adopted for the newly updated Southeastern San Diego and Encanto Neighborhoods Community Plans (adopted October 2015 by City Council).

The following policies have been adopted and will be used to implement BMPs for new development projects in Encanto as an example:

- PLU-53:
  - Facilitate urban gardening as a strategy for creating local healthy food systems and fighting chronic obesity related illnesses, contributing to stormwater retention, and fostering community interaction;
  - Figure 3-4 in the Southeastern San Diego and Encanto Neighborhoods Community Plan illustrates stormwater treatment for streets;
  - Images on page 4-15 in the Southeastern San Diego Encanto Neighborhoods Community Plan illustrate stormwater treatment images;

- P-UD-88: Utilize permeable paving, bioswales, green alleys and/or other stormwater design features that will manage rain water and irrigation runoff while supporting the heavy load vehicles that would service the loading docks and refuse containers;

- Upgrade infrastructure for water and sewer facilities and institute a program to clean the storm drain system prior to the rainy season.

- Install infrastructure that includes components to capture, minimize, and/or prevent pollutants in urban runoff from reaching San Diego Bay and Chollas Creek. (See also Urban Runoff Management in the Conservation and Sustainability Element.)

- P-RE-20: Require that all stormwater and urban runoff drainage be filtered or treated before entering into open space lands.

Draft North Park Community Plan: The draft North Park Community Plan, scheduled to be adopted by City Council in October 2016, also contains specific Stormwater and BMP language in the Conservation Element of the Community Plan as well as in the appendices. The draft North Park Community Plan incorporates language, policies and recommendations concerning the reduction of urban runoff and storm water quality specifically in relation to tree planting as well as “Green Streets”. Specific policies include:

- PF-1.15 Implement water improvements programs so there are systematic improvements and gradual replacement of water and wastewater facilities throughout the community. Also see General Plan PF-F.6 PF-G.2, PFH. 3, and PF-I.1.
  - Implement Green Infrastructure strategies to address storm water runoff throughout North Park.

- SE-3.17 Encourage property owners to design or retrofit landscaped or impervious areas to better capture stormwater runoff.

Draft Uptown and Golden Hill Community Plans: Public review drafts of the community plans for Uptown and Golden Hill plan updates were made available for public review in June 2016. The Conservation Elements of the draft community plans address conservation of the natural resources in each community, including open space, natural habitats, canyon sewer maintenance, and management of water resources and

urban runoff. The Public Facilities, Services and Safety Elements also address water, sewer and stormwater infrastructure. The discussion and policies related to these topics are intended to guide sustainable development practices that will minimize ecological footprints within each community and preserve natural features and resources. The Draft Programmatic Environmental Impact Reports were released in the summer of 2016. Adoption of the community plans are anticipated at the end of 2016.

San Ysidro Community Plan Update: A comprehensive community plan update started in San Ysidro in June of 2010 and aims to reflect the current conditions, improve mobility, include the pedestrian environment, and address quality of life issues. A Community Plan Update Stakeholders Advisory Committee (Advisory Committee) was established as part of the plan update effort and consists of diverse representation from the residents, property owners, various business interests, local community organizations, and not-for-profit groups, and participating public agencies within the plan update boundary. The San Ysidro Community Planning Group, which provides City decision-makers with input and recommendations regarding land use plans and development proposals within the San Ysidro plan boundary, makes up the majority of the Advisory Committee members. The Plan update effort is informed by technical studies and the City's 2008 General Plan which promotes current storm water, urban runoff, and water conservation policies. A discussion draft of the plan was released in June 2014 and a public review draft was released in April 2015 and 2016. The plan includes a Conservation Element as well as a Public Facilities Services and Safety Element, and contains specific policies related to reducing storm water runoff in the San Ysidro Community planning area. The plan is anticipated to be adopted in fall 2016.

- **Notices of Violation**

Treatment Control BMPs Notice of Violation: The City has achieved compliance at 146 of the 150 sites identified in the Regional Board's Notice of Violation (Order Number R9-2014-0034). The Regional Board granted the City an extension to achieve compliance at the remaining four sites by May 26, 2017.

During the process of achieving compliance for the aforementioned 150 identified sites, the City has discovered an additional 74 sites which initially appear to be out of compliance due to varying degrees of circumstances. Each of these potential violations consist of post-construction BMP issues. The City is continuing the same process outlined in its quarterly reports to the Regional Board, and is researching each case. After initial research to verify non-compliance or not, the City will follow its established procedures to achieve compliance at each site as required by the MS4 permit that it was permitted.

Administrative Civil Liability Complaint: The Regional Board conducted an audit of the City's construction management program during the 2014-2015 rainy season, and issued an Administrative Civil Liability Complaint in July 2016 for several alleged violations involving the City's construction oversight and enforcement practices. The City has worked diligently to address their initial concerns, and will continue to evaluate and implement strategies to ensure long-term success.

Since 2011, there has been a steady increase in the number of construction projects citywide. This surge in activity required the City to respond in a manner that would

enable the staff to keep up with the demand and allow the managers to effectively oversee the growth.

Several substantial improvements have been made, ranging from updating our standard procedures and increasing our outreach efforts to improving the City's escalating enforcement practices and issuing Administrative Citations and Administrative Civil Penalties to repeat offenders. In addition, the City established bi-weekly coordination meetings with the Storm Water teams from Public Works, Development Services and TSW to more effectively share up-to-date project information, discuss various strategies, collaborate on solutions, and coordinate enforcement on a more routine basis so that escalated enforcement is effective.

Another significant improvement involves the development of a unified storm water enforcement database. This will ensure collaboration between Resident Engineers (RE) and storm water inspectors while in the field so they will know the full inspection and enforcement history prior to entering a site. This resource is expected to be available in FY 2017.

Updating the Storm Water Standards Manual is another milestone improvement that was completed during FY 2016. The additional clarity that's now provided in the Construction BMP Standards section (Part 2) gives the responsible party increased guidance to help prevent construction activities from adversely impacting water quality downstream.

The frequency of the citywide storm water training has increased and proven to be a key factor in equipping and empowering our staff to properly address various field challenges and confidently communicate concerns and violations to the responsible parties. Some of the trainings included mandatory annual storm water training for the REs, Inspectors and Code Enforcement Officers, as well as training for our operations staff from the Public Utilities Department and TSW Streets Division.

3 FISCAL ANALYSIS

3.1 GENERAL BUDGET INFORMATION

The Storm Water Division is responsible for reporting annually on the jurisdictional, watershed and regional fiscal analyses to the Regional Board in accordance with the regional Fiscal Analysis Method developed by the Copermittees in response to Regional Board Order No. R9-2007-0001 (2007 Permit). During the reporting period, the Storm Water Division collected and analyzed financial information from 23 City departments/divisions through its "Annual Report Form" questionnaire, as well as from within the Storm Water Division. A summary of the findings is included below.

FY 2016 fell within the transitional period, as defined under Regional Board Order No. R9-2013-0001, as amended by Order No. R9-2015-0001 (Municipal Permit). During the transitional period, most of the jurisdictional portions of the City's program continue to follow the requirements of the 2007 Permit, while the JRMP and WQIPs were being developed in response to the current Municipal Permit. The WQIPs were approved by the Regional Board at the end of FY 2016. The expenditures described for FY 2015 therefore reflect costs to comply with the transitional period stormwater requirements in effect during FY 2015, which are a combination of 2007 Permit and current Municipal Permit standards. Since the WQIPs were approved during FY 2016, partial implementation began, but full implementation will commence in FY 2017.

It is expected that the City will begin full implementation of current Municipal Permit requirements during FY 2017. The City will implement the revised JRMP, which updates the City's jurisdictional stormwater program to follow the current Municipal Permit requirements rather than the 2007 Permit requirements. The City's fiscal analysis reporting structure in turn will change, reporting expenditures, and funding sources in the following three main categories: JRMP (jurisdictional), WQIP (watershed), and flood risk management. That structure is consistent with the framework described in the City's Watershed Asset Management Plan (WAMP), the WQIPs to which the City is a party, and the JRMP. FY 2015 is the last year in which JRMP and flood risk management will be lumped together under the heading of "Jurisdictional Component" rather than reported separately.

3.2 FISCAL ANALYSIS METHODS

While the City used the format and guidelines included in the Fiscal Analysis Method for reporting purposes, a few modifications were necessary to address how the City tracks accounts internally. Modifications to the expenditure categories are described in the relevant sections below. In many cases, estimated percentages were used to allocate expenditures into the appropriate municipal permit component categories, including watershed and regional.

3.2.1 Fiscal Analysis Results

3.2.1.1 Expenditures

The City's FY 2016 Transitional JRMP Regional Program total expenditures ($75,934,083) for implementing the Municipal Permit requirements are summarized in Table 1.

Table 1: FY 2016 Jurisdictional, Watershed, and Regional Expenditures Summary

Jurisdictional Component	
Administration	$11,179,605
Development Planning (including public and private projects)	$1,897,784
Construction (including public and private projects)	$632,646
Municipal (including Non-emergency Fire Fighting expenditures)	$30,146,109
Storm Water Division Capital Improvements Program (CIP)	$7,929,308
Industrial and Commercial	$2,001,544
Residential, Education, and Public Participation	$2,159,991
Illicit Discharge Detection and Elimination (IDDE)	$11,339,120
Jurisdictional Total	**$67,286,108**
Watershed Component[1]	
San Dieguito Watershed	$1,105,348
Los Peñasquitos Watershed	$2,061,071
Mission Bay Watershed	$1,242,769
San Diego River Watershed	$680,843
San Diego Bay Watershed	$2,165,456
Tijuana River Watershed	$686,584
Watershed Total	**$7,942,071**
Regional Component	
Total Copermittee Cost Share for the City of San Diego	$342,001
Additional Regional Costs for education efforts, monitoring, document reviews, regional meeting attendance, and special projects	$363,903
Regional Total	**$705,904**
Total Costs	**$75,934,083**

[1] Watershed Component costs do not include Capital Improvements Program (CIP) costs. CIP costs are only included in the Jurisdictional Component's Storm Water Division Capital Improvements Program Category.

Transitional JRMP Expenditures

The City's FY 2016 Citywide expenditures for implementing the jurisdictional Municipal Permit requirements are depicted in Figure 1. Expenditures were provided as actual costs in most cases, and when the actual costs could not be determined, estimates of actual costs were provided. The Storm Water Division used the expenditure categories detailed in the Fiscal Analysis Method for jurisdictional reporting. However, because of implementation overlap with the City's education, public participation, and residential Municipal Permit components, it is difficult to separate out individual component costs. Therefore, the expenditures for residential, education, and public participation are reported as one expenditure category.

A total of $67,286,108 was expended in FY 2016 to implement JRMP activities citywide. This amount includes costs paid by sewer and water rate payers (which are used for sewer and water-related services) and costs reimbursed by project applicants. An overview of the expenditures reflected in this component is described below.

Administration ($11,179,605)

Activities identified in this section represent personnel and non-personnel expenses for administration and contracts, grant management, citywide management, staff training, reporting, and assessment of the Municipal Permit.

Development Planning ($1,897,784)

Activities identified in this section represent personnel and non-personnel expenses for plan check reviews, incorporating BMPs into project designs, BMP Design Manual development, and General Plan updates. This category includes expenses for private and public projects.

Construction ($632,646)

Activities identified in this section represent personnel and non-personnel expenses for plan check review services, field inspections related to grading permits, public improvements, and building activities. This category includes expenses for private and public projects.

Municipal ($30,146,109)

Activities identified in this section represent personnel and non-personnel expenses for street sweeping, storm drain and channel maintenance, BMP implementation, and municipal facility and activity inspections. Additionally, this section includes the expenditures for Fire Department activities not related to emergency firefighting, such as facility inspections, stormwater BMPs, etc.

Capital Improvement Program ($7,929,308)

Activities identified in this section represent personnel and non-personnel expenses for implementation of new construction and planned improvements to existing facilities for storm water management. Projects may include, but are not limited to, the construction, purchase, or major renovation of buildings, utility systems, and other facilities to achieve storm water requirements. In addition, they may also include land acquisitions and roadway projects to install storm water facilities.

Industrial and Commercial ($2,001,544)

Activities identified in this section represent personnel and non-personnel expenses for inspection of industrial and commercial facilities. This also includes personnel and non-personnel expenses for the stormwater components of Food Establishment Wastewater Discharge Program (FEWD) and Industrial Wastewater Control Program (IWCP) inspections.

Residential, Education, and Public Participation ($2,159,991)

Activities identified in this section represent personnel and non-personnel expenses for educational materials, outreach efforts and events, public service announcements (PSAs), household hazardous waste (HHW) and used oil outreach, and community events.

Illicit Discharge Detection and Elimination ($11,339,120)

Activities identified in this section represent personnel and non-personnel expenses for identification and elimination of illicit discharges, enforcing the City's stormwater ordinance and implementation of the administrative civil penalties and citation process, and the urban runoff monitoring program.

Watershed Expenditures

The City's watershed expenditures during FY 2016 for the implementation of the watershed Municipal Permit requirements were provided as actual costs and when the actual costs could not be determined, estimates of actual costs were provided. The Storm Water Division used the expenditure categories (administration, watershed activities, cost share contribution, and other) detailed in the Fiscal Analysis Method for watershed reporting. The watershed expenditures included in this report only capture City expenditures and do not account for any expenditure disbursed by other Copermittees within the watershed(s).

In total, $7,942,071 was expended in FY 2016 for the implementation of citywide watershed activities. This amount includes costs for the implementation of applicable TMDLs along with special studies.

Regional Expenditures

The City's FY 2016 regional expenditures ($705,904) for the implementation of the regional Municipal Permit requirements are primarily the City's share of regional Copermittee stormwater program costs. Additional costs include estimated staff time to attend regional meetings and other related administration costs. The Storm Water Division used the expenditure categories (administration, cost share contribution, regional activities, and other) detailed in the Fiscal Analysis Method for regional reporting. The regional expenditures included in this report only capture City expenditures, and do not account for any expenditure disbursed by other Copermittees in the region.

3.2.1.2 Grant Funding for Special Studies

In addition to resources identified for Municipal Permit requirements, the City actively seeks grants, and other funding sources, for special studies and Capital Improvement Projects. For the most part, funding for these projects may be limited to the projects specified and the City may restrict funding reallocation to other projects. Therefore, these resources are currently not incorporated in calculations for total Municipal Permit requirements expenditures detailed in Section 2.2.1.4 above. Table 2 lists projects that were initiated and/or in progress during FY 2016. It is important to note that the projects span multiple years and the amounts listed below are not just representative of FY 2016.

Table 2: Funding for Special Projects

Funding Source	Project	Amount	Matching Fund Amount	Total Amount[2]
San Diego County Water Authority (SDCWA)	Memorial Park Infiltration Basin Construction	$255,651.00	$295,904.00	$551,555.00
State Water Resources Control Board (SWRCB)	43rd & Logan Monitoring & Assessment	$689,300.00	$85,362.00	$774,662.00
SDCWA	Bannock Avenue Infiltration Construction	$630,500.00	$893,300.00	$1,523,800.00
SWRCB	Southcrest Park Infiltration Project	$1,880,070.00	$777,970.00	$2,658,040.00
Total Grant Funding		**$3.5 million**	**$2.0 million**	**$5.5 million**

2 Amounts span multiple years and not just FY 2016

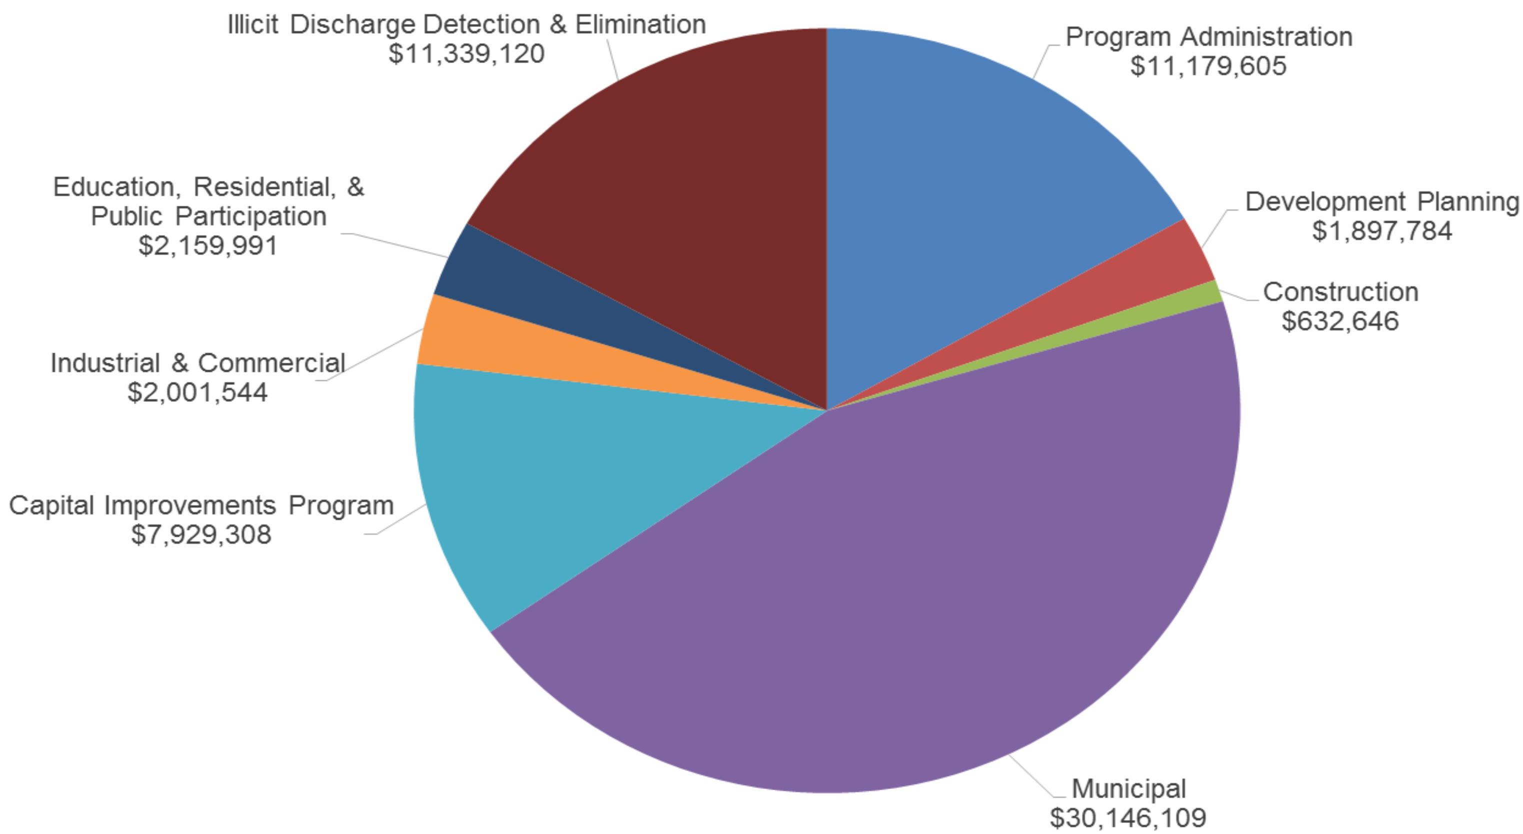

Figure 1: FY 2016 Citywide JRMP Expenditures by Permit Area

This page intentionally blank for printing purposes.

3.2.2 Funding Sources
Citywide implementation of Municipal Permit requirements is funded through four main types of governmental funds: the General Fund, Special Revenue Funds, Enterprise Funds, and Internal Service Funds.

3.2.2.1.1 General Fund
The General Fund is the main fund for the City and is supported by major revenue sources, including property tax, sales tax, transient occupancy tax, and franchise fees. Departments funded by the General Fund provide core community services.

3.2.2.1.2 Special Revenue Funds
Special Revenue Funds account for revenues received for specifically identified purposes. Some of the larger funds that fall under this category include TransNet, Gas Tax, and Special Promotion programs.

3.2.2.1.3 Enterprise Funds
Enterprise Funds are initiated for specific purposes and funded through fees for services. This funding type is designated for the operations, management, maintenance, and development of the department providing the service. For implementation of citywide JRMP activities, activities are funded through the following enterprise funds:

- Airports Fund
- Development Services Enterprise Fund
- Golf Course Enterprise Fund
- Recycling Fund
- Refuse Disposal Fund
- Sewer Revenue Funds
- Water Utility Fund

3.2.2.1.4 Internal Service Funds
Internal Service Funds are comprised of fees for services provided by one City department to another City department or division. For implementation of citywide JRMP activities, activities are funded through the following internal service funds:

- Engineering and Capital Projects Fund
- Equipment Division Funds

This page intentionally blank for printing purposes.

5.3 JURISDICTIONAL STRATEGIES

Administrative Changes for the San Diego River Water Quality Improvement Plan

The City of San Diego is proposing the following administrative changes to the San Diego River Water Quality Improvement Plan. The proposed administrative changes include clarifications, corrections to errors and typos, and other minor edits that only apply to the City of San Diego.

	WQIP Section	Administrative Changes
1	Section 3.2.10 Alternative BMP Implementation Scenario for Refinement of Water Quality Regulations	Included the following text: "Cost comparison between the Primary and Alternative Scenario presented in this section are a snapshot in time and are based on the best information available at the time they were prepared. As program implementation progresses, updates to estimated funding needs are likely to change. For the most recent estimate of funding needs, refer to the WAMP available at the Storm Water Division website, www.sandiego.gov/stormwater/plansreports.
2	Appendix 3B – Jurisdictional Strategies and Funding Needs	Included the following text: "Funding needs presented in this section are a snapshot in time and are based on the best information available at the time they were prepared. As program implementation progresses, updates to estimated funding needs are likely to change. For the most recent estimate of funding needs, refer to the WAMP available at the Storm Water Division website, www.sandiego.gov/stormwater/plansreports.
3	Appendix 3B – Jurisdictional Strategies and Schedules; Table A-1 City of San Diego Jurisdictional Strategies	Refined the text (shown as track changes in red text in Appendix 2) to provide greater clarity and/or to correct errors and typos.
4	Appendix 3B – Jurisdictional Strategies and Schedules; Table A-1 City of San Diego Jurisdictional Strategies	Changed strategy identification numbering system (See Appendix 2).
5	Appendix 3B – Jurisdictional Strategies and Schedules; Table A-1 City of San Diego Jurisdictional Strategies	Structural Strategies, Priority Development Project (PDP) BMPs: All PDP BMPs have been combined into a single strategy for ease of viewing. A table with an updated list of PDP BMPs is included in the WQIP Annual Report (See Appendix 2).
6	Appendix 3B – Jurisdictional Strategies and Schedules; Table A-1 City of San Diego Jurisdictional Strategies	Structural Strategies, Multi Use Treatment Areas (MUTAs): Planned MUTAs that are not yet built have been combined into a single strategy for ease of viewing. The total sum of drainage area treated (level of commitment) has not changed. A table with all structural strategies (MUTAs, Green Infrastructure, Green Streets, etc.) is included in the WQIP Annual Report (See Appendix 2).

Jurisdictional Strategies Tables

The City of San Diego's strategies are detailed in Tables A2-18 to A2-21. ~~Strikeouts~~ and red text are text edits that have been made up to the current date since the WQIP September 2015 submittal.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Jurisdictional Strategies								
Note: Strategy IDs with an asterisk indicate those strategies that are considered "jurisdictional" in the MS4 Permit, but are considered enhancements to the JRMP to target highest priority water quality conditions.								
JRMP (E.2-E.7) Strategies (E.3.b.(1)(a))								
E.3 Development Planning								
All Development Projects								
CSD-JRMP-01	Establish guidelines and standards for all development projects; provide technical support related to implementation of source control BMPs to minimize pollutant generation at each project and implement LID BMPs to maintain or restore hydrology of the area or implement easements to protect water quality, where applicable and feasible le. Includes internal coordination and collaboration between City departments (DSD, PWD, and Engineering) to improve success and long-term benefits of BMPs.	Refer to JRMP Section 4. ~~All high priority projects will be inspected annually prior to the rainy season. 20 percent of all projects will be inspected annually. Maintenance inspections include examination of all structural BMPs at a project to verify that each structural BMP is working, being maintained properly, and is in compliance with all applicable City ordinances and permits.~~ May include providing technical support and consultation for other City departments that review project submittals for compliance with Storm Water Standards Manual requirements. May also include review of City projects for compliance with Storm Water Standards Manual requirements.	Prior to FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Revised Storm Water Standards Manual went into effect on February 16, 2016. FY17 Notes: The Storm Water Standards will be revised to include Critical Coarse Sediment Yield Area mitigation measures that were developed through a TAC process, along with other minor clarifications.
CSD-JRMP-02	Develop Design Standards for Public LID BMPs.	Improve quality of design to ensure efficiency and reliability in public designs.	FY14-FY15	Continuous- As needed	Yes	No Change	Yes	FY16 Notes: Draft Green Infrastructure standard drawings and specifications are currently in the review process. FY17 Notes: Plan to develop more standard drawings and specifications for other green infrastructure components.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-03	Outreach to impacted ~~industry~~ commercial, industrial, municipal, and residential development regarding minimum BMP requirement updates.	~~Affects commercial, industrial, and residential development.~~ May include onsite education at the time of inspections, city staff training, and mailers to business owners and prospective business owners.	FY15	Continuous- As needed	Yes	Revised to clarify strategy.	Yes	<u>FY16 Notes:</u> Sent out monthly business Tax License renewal mass mailings, which included information about storm water BMPs. Violation location information from the Residential Patrol Program is used to target outreach.
CSD-JRMP-04*	Train staff on LID regulatory changes and LID practices.	Formal training is required for all staff involved in development plan review to increase knowledge of LID BMPs. Goal of training associated with LID practices and regulations is to promote LID implementation and to avoid adverse conditions such as trees planted within swales, or planned drainage patterns which obstruct or inhibit LID performance.	FY16	Continuous- As needed	Yes	No Change	Yes	<u>FY16 Notes:</u> Presented at a PWD training to discuss the revised Storm Water Standards Manual. Provided a plan check training for plan reviewers at DSD and PWD staff in May 2016.
CSD-JRMP-05*	Amend municipal code and ordinances, including zoning ordinances, to facilitate and encourage LID opportunities to support compliance with the MS4 Permit and TMDLs in a reasonable manner. Ensure consistency with the City of San Diego's BMP Design Manual. Update the Storm Water Standards Manual accordingly.	Municipal codes and ordinances will be brought to City Council for consideration to encourage LID implementation (e.g., runoff detention and filtration using natural filters and stormwater retention for reuse). LID stormwater management will be encouraged in proposed codes and ordinances associated with development and redevelopment projects, which are brought to City Council for consideration.	FY15	Continuous- As needed	Yes	No Change	No	None
CSD-JRMP-06	Provide technical education and outreach to the development community on the design and implementation requirements of the MS4 Permit and Water Quality Improvement Plan requirements.	Technical education and outreach to the development community includes outreach on design standards, City design manuals, and the WMAA.	Prior to FY16	Continuous- Ongoing	Yes	No Change	Yes	<u>FY16 Notes:</u> Presented the revised draft Storm Water Standards at two public workshops in September 2016.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
Priority Development Projects (PDPs)								
CSD-JRMP-07	For PDPs, administer a program and provide technical support to other City departments to ensure implementation of on-site structural BMPs to control pollutants and manage hydromodification by developing City wide storm water development standards and design guidelines.	Administer a program in coordination with other City departments to promote and confirm a thorough understanding of requirements for implementing structural BMPs that control pollutants and manage hydromodification. Includes requirements to confirm proper design and construction through processes controlled by other City departments. Please see Attachment 1 for details on PDP related BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City enhanced the Storm Water Quality Management Plan (SWQMP) template that was developed as a Copermittee effort for developers to use.
CSD-JRMP-08	Institute a program to verify and enforce maintenance and performance of treatment control BMPs.	Refer to JRMP Section 4.5. The Storm Water Division is responsible for annually verifying that all structural BMPs within its inventory are being properly maintained. The Storm Water Division performs verification through an Annual Maintenance Verification mailing and a direct maintenance inspection program. Parties responsible for maintenance of structural BMPs are required to complete and sign the Annual Maintenance Verification, certifying that the structural BMPs are being properly maintained. Direct maintenance inspections will be performed at all projects for which an Annual Maintenance Verification Form was not completed. All high priority projects will be inspected annually prior to the rainy season. 20 percent of all projects will be inspected annually. Inspect additional BMPs as needed. Medium and low priority projects will not require inspection if they have completed their Annual Maintenance Verification form, unless they are part of the 20 percent of projects that are annually inspected.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY17 Notes: For porous pavement BMPs, staff plan to use an infiltrometer to measure BMP effectiveness.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-09	Update ~~BMP Design Manual procedures~~ Storm Water Standards Manual to determine nature and extent of storm water requirements applicable to development projects and to identify conditions of concern for selecting, designing, and maintaining appropriate structural BMPs.	Refer to JRMP Section 4. Storm Water Standards Manual will be updated in accordance with the Permit and made available on the City's website.	FY15	Continuous every 5 years/ permit cycle	Yes	Revised to clarify strategy.	Yes	FY17 Notes: The Storm Water Standards will be revised to include Critical Coarse Sediment Yield Area mitigation measures that were developed through a TAC process, along with other minor clarifications.
CSD-JRMP-10*	Amend BMP Design Manual for trash areas. Require full four-sided enclosure, siting away from storm drains and cover. Consider the retrofit requirement.	Amend BMP Design Manual and zoning standards/requirements which address reduction of pollutants for common areas of trash build-up (e.g. restaurants, supermarkets, "big box" retail stores with food, pet stores). Most effective method for source control of bacteria and trash is to employ four-sized trash enclosures with a cover over trash areas.	FY15	Completed within schedule	Yes	No Change	Completed	FY16 Notes: Developed a fact sheet on trash enclosures (See Part 1, Appendix E of the Storm Water Standards).
CSD-JRMP-11*	Amend BMP Design Manual for animal-related facilities, such as such as animal shelters, "doggie day care" facilities, veterinary clinics, breeding, boarding and training facilities, groomers, and pet care stores.	Amend BMP Design Manual and zoning requirements (including retrofits) to provide supplemental standards for animal facilities (including animal shelters, dog daycares, veterinary clinics, groomers, pet car stores, and breeding, boarding, and training facilities). Supplemental standards may include requiring covered trash enclosures, identification of landscaped relief areas on site plans, ensuring drainage connections and treatment swales for areas that will not drain to the sanitary sewer, as well as inspection of grading, drainage, and landscaping for outdoor exercise areas.	FY15	Completed within schedule	Yes	No Change	Completed	FY16 Notes: Developed a fact sheet on animal facilities(See Part 1, Appendix E of the Storm Water Standards).
CSD-JRMP-12*	Amend BMP Design Manual for nurseries and garden centers.	Amend BMP Design Manual to provide supplemental standards for plant nurseries and garden centers. Standards will focus on reducing irrigation runoff, and loading of sediment, pesticides, and nutrients. Measures may include: covered outdoor storage, green waste management BMPs, improved irrigation efficiency to reduce dry-weather runoff, and containment of runoff from impervious areas where plants and materials are stored.	FY15	Completed within schedule	Yes	No Change	Completed	FY16 Notes: Developed a fact sheet on nurseries (See Part 1, Appendix E of the Storm Water Standards).

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-13*	Amend BMP Design Manual for auto-related uses.	Amend BMP Design Manual to provide supplemental standards for automotive-related uses to reduce loading of metals, oils, grease, and trash. Measures may include: four-sized covered trash enclosures, and careful review of auto-related usage areas (e.g. garage bays at repair shops) for grading, drainage, and drain connections to sanitary sewer systems.	FY15	Completed within schedule	Yes	No Change	Completed	FY16 Notes: Developed a fact sheet on auto-related facilities (See Part 1, Appendix E of the Storm Water Standards).
CSD-JRMP-14*	~~Develop and administer an alternative compliance program for on-site structural BMP implementation (includes identifying Watershed Management Area Analysis [WMAA] candidate projects). Refer to Section 4.2.5.~~ Offsite Alternative Compliance Option	Refer to JRMP Section 4.2.3.1. WMAA and Water Quality Equivalency Study completed in FY15. Phase I, applicant implemented projects, is anticipated to be in effect by the end of FY16 contingent on Regional Board's approval of the WQIPs. Phase II, the expansion of the program to include other alternative compliance options, is expected to begin in FY16.	FY15	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Phase 1 of the Alternative Compliance Program (ACP) went into effect on 2/16/16. Development on Phase 2 of the ACP, including public involvement via Technical Advisory Committee (TAC) meetings, began during FY16. FY17 Notes: Continue developing Phase 2 of ACP. Topics to discuss include: environmental permitting, long-term facility maintenance, legal agreements and credit tracking, maintenance and permitting rules, and credit tracking and legal rules. Public involvement via TAC meetings will continue.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
E.4 Construction Management								
CSD-JRMP-15	Administer a program to oversee implementation of temporary BMPs that control sediment and other pollutants during the construction phase of projects. Includes requirements to inspect at appropriate frequencies and effectively enforce requirements through process controlled by other City departments.	Refer to JRMP Section 5. Inspections performed by the City or City staff provide verification that each site is in conformance with the Construction Storm Water BMP Performance Standards in the Storm Water Standards Manual. Inspections are tracked to ensure that they meet the minimum inspection frequencies. High priority active and inactive sites are inspected bi-weekly during the rainy season. Medium priority sites are inspected monthly during the rainy season. Low priority sites are inspected as-needed during the rainy season. All sites are inspected as-needed during the dry season. Please see Attachment 1 for details on construction BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None
E.5 Existing Development								
Commercial, Industrial, Municipal, and Residential Facilities and Areas								
CSD-JRMP-17	Administer a program to require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types, and PGAs, as appropriate. Includes inspection of existing development at appropriate frequencies and using appropriate methods.	Refer to JRMP Sections 6, 7, and 8. All industrial and commercial areas are inspected once within ~~the Permit term~~ ~~(~~five years~~)~~. At a minimum, 20 percent of industrial and commercial areas receive onsite inspections every year. Municipal facilities are inspected twice annually, once prior to the rainy season, and once during the rainy season. Residential management areas (RMAs) within the City are to be inspected once within five years ~~the Permit term~~, at a minimum. Please see Attachment 1 for details on updated minimum BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	<u>FY16 Notes:</u> The City began patrols of residential management areas in FY16. See the City's JRMP Annual Report form, also included in Appendix 2, for numbers of inspections, violations, and enforcement actions for all types of existing development.
CSD-JRMP-18	Update minimum BMPs for existing residential, commercial, and industrial development. Specific updates to BMPs include required street sweeping, catch basin cleaning, and maintenance of private roads and parking lots in targeted areas.	Refer to JRMP Appendix IX. Please see Attachment 1 for details on updated minimum BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY15	Continuous every 5 years/ permit cycle	Yes	No Change	Completed	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-19	Outreach to property managers and trash haulers to elevate the emphasis of power washing as a pollutant source.	Emphasis will be placed on non-compliant washing as an enforceable violation. Will occur city-wide in residential, commercial, and industrial areas.	FY15	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: City staff utilized a new fact sheet consistent with updated permit conditions to inform non-compliant power-washing operators of BMP requirements. The fact sheet was also provided to the San Diego Downtown Partnership as part of the Division's education and outreach effort for downtown businesses. FY17 Notes: The City anticipates distributing a comprehensive BMP guidebook to businesses and business district leaders in areas with regular power-washing activities.
CSD-JRMP-20	Implement property based inspections.	Property-based inspections increase awareness and responsibility for individual properties to tackle issues associated with trash, landscapes, and parking areas. Expanding beyond the business-level inspections will achieve different and more effective opportunities for education, outreach, inspection, and enforcement to encourage water conservation strategies. Inspection frequency dependent on type of facility. See CSD-9 for inspection frequency.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Inventoried properties have been mapped in GIS. The City's inspection data management system has also been set up to track and map the properties inspected each fiscal year and over the Permit cycle.
CSD-JRMP-21	Review policies and procedures to ensure discharges from swimming pools meet permit requirements.	Verify and bring to City Council for consideration an update (as needed) for the City's Municipal Code (43.0301) to meet new permit requirements for swimming pool discharges.	FY15	Continuous- As needed	Yes	No Change	Completed	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-22*	Promote and encourage implementation of designated BMPs for residential and non-residential areas.	Landscape-based rebates are a "gateway" for adoption of other beneficial practices and are one of the nonstructural methods which address impacts from single-family residential areas (City of San Diego 2011 program development background study). Residential incentives can include: education and training ~~(neighborhood watershed field days)~~, and aggressive subsidies or rebates for grass replacement and rainwater harvesting. Existing programs will be expanded overall, and ~~also have targeted expansion within specific subwatershed, particularly with highest water quality priority conditions. W~~will occur city-wide in residential, commercial, and industrial areas.	Prior to FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
MS4 Infrastructure								
CSD-JRMP-23	Implementation of operation and maintenance activities (inspection and cleaning) for MS4 and related structures (catch basins, storm drain inlets, channels as allowed by resource agencies, detention basins, pump stations, etc.) for water quality improvement and for flood control risk management.	Refer to JRMP Section 7. Storm drain inlets are inspected ~~at least once per year~~ generally annually, and cleaned when accumulated materials are present. Other MS4 and related structures are inspected as needed.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: 5,485 storm drain inspections were completed in the WMA, and 130 tons of sediment, trash, and debris were removed during storm drain cleaning. In addition to routine maintenance of the MS4, across its entire jurisdiction the City repaired or replaced 12 pump stations and modernized another 14 pump stations, televised 28,000 linear feet of pipe in 62 locations, and began the development of the Waterways Maintenance Plan and Channel Maintenance Prioritization Plan. Removed 2.56 tons of trash from routine open channel trash cleaning and approximately 96 tons each of sediment and trash from channel maintenance activities that required resource agency permits.
CSD-JRMP-28	Proactively repair and replace MS4 components to provide source control from MS4 infrastructure.	In order to limit inflow of pollutants and reduce pollutant loads, proactive measures will be taken to improve, repair, and replace MS4 components. The City of San Diego will start a multi-year program of repairing and replacing storm drain pipes to reduce sediment loading to the MS4. Development of an assessment management program and bond issues will be addressed. Exploration of daylighting pipes will take place where feasible and appropriate.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None
CSD-JRMP-29	Replacement of hard assets.	Includes needed replacement of storm drains and structures.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-30	Coordinate with other City departments (PUD) to implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers.	Refer to JRMP Section 7.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The Tiger Team was established in the FY16 as a joint effort between TSW & PUD to identify and eliminate exfiltration sources from the sanitary sewer system to the MS4. Since the team was created, it has successfully eliminated one major source. FY17 Notes: For FY17, the team is focusing on two sites within the City and are identifying more.
CSD-JRMP-31*	Identify sewer leaks and areas for sewer pipe replacement prioritization.	Risk assessment to include identifying targeted areas (age, location, proximity to MS4), coming up with methodology, pilot, desktop exercise/analysis.	FY16	Continuous- As needed	Yes	No Change	Yes	None
Roads, Streets, and Parking Lots								
CSD-JRMP-32	Implement operation and maintenance activities for public streets, unpaved roads, paved roads, and paved highways.	Refer to JRMP Section 7.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: 17,094 curb miles were swept in the San Diego River watershed management area.
Pesticides, Herbicides, and Fertilizer BMP Program								
CSD-JRMP-37	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education. ~~permits, and certifications.~~	Refer to JRMP Sections 7, 8, and 9.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
Retrofit and Rehabilitation in Areas of Existing Development								
CSD-JRMP-38	Development of a strategy and identification of candidate areas of existing development necessary for implementing retrofit projects and facilitate the implementation of such projects.	Refer to JRMP Appendix XIX. The Offsite Alternative Compliance Program will include methods for identifying and assessing potential retrofit projects in existing development areas. Retrofit project selection will be based upon a variety of factors including proximity to high priority water quality conditions, potential pollutant load removal effectiveness, and feasibility of implementation. The program will include protocols related to funding mechanisms for project construction and long-term maintenance, payment and credit structures, and water quality equivalency standards. Specific retrofit projects are included in the Non-JRMP, Structural Strategies categories.	FY18	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	No Change	NA, Not scheduled to be implemented in FY17	None
CSD-JRMP-39	Development of a strategy and identification of candidate areas necessary to implement stream, channel, or habitat rehabilitation projects and facilitate implementation of such projects.	Refer to JRMP Appendix XIX. The Offsite Alternative Compliance Program ~~(Section 4.2.5.4 and Appendix P)~~ will include methods for identifying and assessing potential stream, channel, or habitat rehabilitation projects in existing development areas. Rehabilitation project selection will be based upon a variety of factors including existing stream or habitat degradation, potential future cumulative stream or habitat impacts, and feasibility of implementation. The program will include protocols related to funding mechanisms for project construction and long-term maintenance, payment and credit structures, and water quality equivalency standards.	FY18	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	Revised to clarify strategy.	NA, Not scheduled to be implemented in FY17	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
E.2 Illicit Discharge, Detection, and Elimination (IDDE) Program								
CSD-JRMP-40	Implement Illicit Discharge, Detection, and Elimination (IDDE) Program per the JRMP. Requirements include: maintaining an MS4 map, using municipal personnel and contractors to identify and report illicit discharges, maintaining a hotline for public reporting of illicit discharges, monitoring MS4 outfalls, and investigating and addressing any illicit discharges.	Refer to JRMP Section 3. ~~The City must visually inspect at least 500 identified and prioritized major MS4 outfalls at least annually during dry weather conditions.~~ Inspections of major MS4 outfalls conducted in response to public reports and staff or contractor reports and notifications may count toward the required visual inspections of MS4 outfall discharge monitoring stations. Please see Attachment 1 for details on how the IDDE Program will address sources causing or contributing to the HPWQC.	Prior to FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: 683 cases were investigated, including 368 reported by the public; 553 illicit discharges or illicit connections were eliminated; and 553 enforcement actions and 349 escalated enforcement actions were issued in the WMA. City-wide, the number of discharges investigated has almost tripled since FY14 (1,186 in FY14 to 3,335 in FY16). The increase is believed to be mainly due to increased reports of irrigation runoff discharges from the public and from PUD.
E.7 Public Education and Participation (B.3.b(1)(a)(iii))								
CSD-JRMP-42	Implement a public education and participation program to promote and encourage development of programs, management practices, and behaviors that reduce the discharge of pollutants in storm water prioritized by high-risk behaviors, pollutants of concern, and target audiences.	Refer to JRMP Section 9.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City continued its extensive education and outreach effort across each of the six watershed areas in the City. This included regular attendance at community events to share education materials and the continuing sponsorship of community clean-up and pollution prevention education events with the City's Non-Governmental Organization partners, including I Love A Clean San Diego and San Diego Coastkeeper.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-43	Continue implementation of a Pet Waste Program.	Pet Waste Program includes outreach on "Scoop the poop", installation of posts for dispensers, distribution of lawn signs, and attendance at dog-related community activities.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Printed and distributed more pet waste signage. FY17 Notes: New bag dispensers will be installed and there will be outreach at community events. More signage will be installed..
CSD-JRMP-44	Promote and encourage implementation of designated BMPs in commercial and industrial areas.	Provide education and outreach on BMPs for commercial businesses and industrial facilities. Will occur city-wide in non-residential areas.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City continued its mandated commercial and industrial facility inspection effort sharing industry specific education materials with business and property owners when BMP deficiencies were discovered. FY17 Notes: The City will continue its inspection and education effort while also introducing alternative compliance strategies for new developments and sharing the updated Storm Water Standards Manual with target audiences
CSD-JRMP-45*	Expand outreach to homeowners' association (HOA) common lands and HOA incentives.	Approaches to consider include: offering incentives to HOAs and maintenance districts to adopt water-conserving/efficiency and stormwater-reduction changes to their landscapes, irrigation, and maintenance; conducting workshops with property managers; providing supplemental standards, inspection, or enforcement for HOA-managed properties.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Finalized updated code compliance fact sheets applicable to common lands activities. Coordinated water conservation pollution prevention incentive programming with PUD

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-46*	Develop an outreach and training program for property managers responsible for HOAs and maintenance districts.	Approaches to engage HOAs and property managers include: conducting workshops with property managers, providing supplemental standards, inspections or enforcement around HOA properties, and offering incentives to HOAs and maintenance districts to adopt changes to landscapes, irrigation, or maintenance which promote water conservation or stormwater reduction. Property managers are also a target for enhanced outreach.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None
CSD-JRMP-48	Enhance school and recreation-based education and outreach.	Develop curriculum and establish distribution in public schools. Includes education on water conservation.	FY15	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City worked with its NGO partners to expand the number of children reached through school-aged education programs. The Division updated curriculum materials for Project Swell in conjunction with San Diego Coastkeeper and provided printed education materials to leaders with the Ocean Discovery Institute in hope of establishing new partnerships with that organization. FY17 Notes: The Division will be expanding the Blue Brigade Middle and High School program sponsored with I Love A Clean San Diego. The Division will also distribute written education materials through the newly completed Ocean Discovery Institute headquarters.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-49	Develop education and outreach to reduce irrigation runoff.	Example approaches to reduce or eliminate irrigation runoff may include: education and outreach, prohibition, enhanced enforcement of existing prohibitions, and pilot projects such as the City of Del Mar's pilot door hanger project.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The Division used communication materials designed to address potential threats from El Nino rains as a new vehicle for educating the public about the need to eliminate irrigation runoff. FY17 Notes: The Division is working with partner agencies and other City operations to develop new education and outreach efforts targeting urban runoff.
CSD-JRMP-50*	Develop and distribute regional training materials for water-using mobile businesses.	Consider development of supplemental standards for mobile businesses including: covered trash enclosures, careful review of washing areas (grading, drainage, landscaping, sanitary sewer system connectivity), and appropriate signage (either through zoning for retrofits or "best fix" approaches, or through BMP Design Manual standards). Businesses may include carpet cleaners, tile installers, plumbers, etc.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: The Division updated its suite of fact sheets related to mobile business activities to bring them up-to-date with current permit requirements.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-51*	Enhance education and outreach based on results of effectiveness survey and changing regulatory requirements.	Use effectiveness surveys to enhance existing education and outreach programs while proactively keeping up with and incorporating changing regulatory requirements.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The Division annually conducts thousands of event-based surveys gathering information about public understanding of pollution prevention and about the City's storm water management efforts. The survey effort continued in FY16 and allowed the Division to update its education materials and strategies based on current findings about public awareness. FY17 Notes: The Division will contract with a new public opinion research firm to perform a statistically valid assessment of general public awareness. The finding from that effort will be combined with the discoveries of the ongoing event survey effort to drive future outreach priorities.
CSD-JRMP-52	Continue to promote and encourage implementation of Integrated Pest Management (IPM) for residents and businesses.	The City will continue to provide education on IPM techniques during presentations and on the City's Think Blue website.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-53*	Improve consistency and content of websites to highlight enforceable conditions and reporting methods.	Websites will be updated to provide a user-friendly format and clarity for stormwater violations, conditions which citizens can and should report, and how to make such reports. Examples of reports for common incidents will be developed and posted which may vary locally and regionally. Photographs of allowable practices as well as illegal practices should be shown for utmost clarity. Displaying hotline numbers prominently on the website and near the photographs of illegal practices will ensure that those seeking to report will be able to do so easily. Also ensure hotline number and website are searchable and can be retrieved by simple internet searches.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City completely revamped its website improving public access and availability of web-based resources including the storm water management and pollution prevention materials developed and posted by the Division. The Division also brought forward the environmental response documents associated with its channel maintenance efforts. These documents include descriptions of water quality protections undertaken by the City allowing the public to view our agency's watershed protection strategies. FY17 Notes: The Division will review and renew the entire portfolio of education materials available for public downloading from the City's website.
E.6 Enforcement Response Plan								
CSD-JRMP-54	Continue to implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Storm Water Code Enforcement Unit's Standard Operating Procedures (SOPs) - Enforcement Response Plan.	Refer to JRMP Appendix XIII.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-55*	~~Increase~~ Focused enforcement of irrigation runoff.	~~Increased~~ Focused enforcement policies against irrigation runoff will be established in tandem with the education and outreach programs on how these actions lead to pollutant loading. By shifting to property-based inspections irrigation runoff can be handled as enforceable violations once the public is well-informed.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Performed irrigation patrols and Residential Management Area Patrols throughout FY16. Also receive referrals from Water Conservation at PUD for over irrigation cases that have runoff entering the curb and gutter.
CSD-JRMP-56*	~~Increase~~ Focused enforcement of water-using mobile businesses.	In addition to education, pollution associated with mobile business sources can be handled through policy, code development, inspections of business practices, and enforcement.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Performed early morning patrols to find mobile sources and over-irrigation to the MS4.
CSD-JRMP-57*	~~Increase~~ Focused enforcement of all minimum BMPs for existing residential, commercial, and industrial development.	~~Increased~~ Focused enforcement of existing development minimum BMPs.	FY16	Continuous- As needed	Yes	Revised to clarify strategy.	Yes	None
CSD-JRMP-58*	~~Increase~~ Focused enforcement associated with property-based inspections.	Shifting inspections from businesses-specific to property-based will increase effectiveness and sense of responsibility and ownership. Education and outreach must be followed up with inspection and enforcement of regulations to encourage proper landscape and water conservation strategies.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None
CSD-JRMP-59*	~~Increase~~ Focused enforcement of sweeping and maintenance of private roads and parking lots in targeted areas.	Refer to Minimum BMPs in JRMP (Appendix IX).	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-60*	~~Increase~~ Focused identification and enforcement of actionable erosion and slope stabilization issues on private property and require stabilization and repair.	Eroding and unstable slope areas on private property (excluding construction sites) will be identified as potential sediment loading sources and subject to enforcement. In the short term, this will target enhanced inspection and enforcement programs to ensure inspectors address erosion and slope instability for the purpose of education.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: City staff completed patrols of construction sites that included sediment discharges. They also began the Residential Patrol Program, which notes and addresses sediment discharges in residential areas.
Non-JRMP Strategies (Optional Strategies, B.3.b(1)(b))								
Nonstructural Strategies								
CSD-NS-02	Investigation and research of emerging BMP technology.	Annually the Construction & Development Standards Group identifies new tasks to conduct literature review, communication with researchers outside of the City, physical testing and experimentation of new or emerging technologies, and other research with the goal of updating tools available for reducing pollutant loads from development and redevelopment sites. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous- As needed	Yes	No Change	Yes	FY16 Notes: Continued monitoring and assessment of the biofiltration basin and curbside filtration units at 43rd and Logan.
CSD-NS-03	Approve and implement a green infrastructure policy.	The City will begin developing a policy in FY16 that will increase the green infrastructure requirements for City CIP projects. This policy will be coordinated with ongoing efforts to update City design manuals and LID design standards for public LID BMPs. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous- As needed	Yes	No Change	Yes	None
CSD-NS-04	Create a manual that outlines right-of-way design standards.	Create a manual that includes flood control performance standards, permanent BMP elements design standards, design standards for green streets and other BMPs, and maintenance access. Provides drainage and streets design standards. Opportunity to merge various existing manuals and provide consistency. Funding and resources were secured for FY2015.	FY15	Completed within schedule	Yes	No Change	Yes	FY17 Notes: Will be published in FY17.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-05	Create a fund that allows habitat acquisition, protection enhancement, and restoration in conjunction with other cooperating entities including community groups, academic institutions, state county, and federal agencies, etc.	This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured, 2) staff resources are identified and secured, 3) partners have been identified and formal MOUs have been developed, and 4) consensus and community support has been achieved. Resources necessary to implement this strategy include a coordinator or manager and maintenance for acquired or restored lands. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. It is anticipated that a minimum of 1 FTE will be needed to implement the program. Once initiated, the time frame for planning to initial implementation is expected to be 3 years. Implementation is in perpetuity as long as funding is retained.	Must be triggered	Continuous as funding allows	Not Triggered	No Change	If Triggered	None
CSD-NS-06	Residential and Commercial BMP: Rain Barrel	The existing PUD rebate program will continue for residential properties and expand for commercial properties for water collection, conservation, and reuse with rain barrels. Will occur city-wide in residential areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Rebates for rain barrels were issued to capture 772,740 gallons of rainwater City-wide.
CSD-NS-07	Residential and Commercial BMP: Grass Replacement	The existing PUD grass replacement cash rebate program will continue and expand for residential and commercial properties. Program encourages a reduction in water use through the conversion of non-artificial grass to water wise plant material, while maintaining a high level of living landscape to benefit the environment. Program does not allow for conversion to artificial turf. Will occur city-wide in residential and commercial areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Rebates were issued to convert 68,236 sq. ft. of turf in the WMA.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-08	Residential and Commercial BMP: Downspout Disconnect	Disconnecting downspouts provide alternate runoff pathways from rooftops, sidewalks, driveways, and roads. Disconnecting downspouts from residential areas to pervious land can allow for depression storage and infiltration. Will occur city-wide in residential and commercial areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Completed downspout redirect guidelines in collaboration with PUD.
CSD-NS-09	Residential and Commercial BMP: Microirrigation	The existing PUD micro-irrigation rebate program will continue and increase for residential and commercial properties. Application of microirrigation aims to improve the efficiency of landscape irrigation through the precise application of water. Will occur city-wide in residential areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Rebates were issued for installing microirrigation for 5,876 sq. ft. of landscaping in the WMA.
CSD-NS-10	Provide Onsite Water Conservation Surveys.	Provide free onsite water conservation surveys to commercial and residential customers to reduce overirrigation and to encourage water conservation. Will occur city-wide in residential and commercial areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-11	Enhance and expand trash cleanups through community-based organizations involving target audiences.	Increase effectiveness and reach of trash/beach cleanups and community based efforts by engaging community groups to self-define and carry-out trash clean-ups. Longstanding partnerships and sponsorships with I Love A Clean San Diego and others are recommended to be continued and enhanced. To effectively target stream clean-up efforts, focus on partnerships with community organizations which provide strong engagement with target audiences and communities. Cleanups target trash, however a reduction in trash also reduces other pollutants such as bacteria and nutrients that can attach to food waste wrappers and yard waste. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY 16 Notes: The City partnered with I Love a Clean San Diego on five clean-ups, which resulted in the removal of 23,887 pounds of trash and debris in the WMA. Additionally, the City partnered with the SD River Park Partnership to remove 102,215 pounds of trash and debris.
CSD-NS-16	Conduct a Comprehensive Benefits Analysis to identify benefits other than water quality that are applicable to each of the specific WQIP strategies.	The analysis identifies which other benefits apply to each strategy, and documents the assumptions making those linkages. The delineation of other benefits to strategies includes a general description of each benefit, and a listing of the assumptions that were made to link those benefits to strategies. In addition, the other benefits are characterized with respect to who is directly affected: the city, local residents, local businesses, or visitors. This analysis may be used as part of the adaptive management process to modify future strategies. Funding and resources were secured for FY2015.	FY15	Completed within schedule	Yes	No Change	No	None
CSD-NS-17	Address and clean up trash from transient encampments with collaboration from the Environmental Services Department, which consults with the Homeless Outreach Team.	Coordinate with the Environmental Services Department, in conjunction with the Homeless Outreach Team, to respond to transient encampment trash complaints. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-18	Continue participating in source reduction initiatives.	Source reduction initiatives are ultimately the most effective measure to remove pollutants from surface waters, where feasible. Bans or progressive phase-outs that may be considered include: leaf blowers, plastic bags, architectural copper (generally a legacy issue), as well as prohibiting or more aggressively regulating vehicle washing. Additional source reduction initiatives to consider include pesticide sales at hardware stores and irrigation supply stores. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City began development of plastic bag ban ordinance. FY17 Notes: Pursuit of City-specific plastic bag ban ordinance will depend on whether Statewide plastic bag ban ballot initiative passes.
CSD-NS-19	Coordinate with Fleet Services to replace City-owned vehicle brake pads with copper-free brake pads as they become commercially available.	Consider legislative mandate and cooperative implementation of copper-free brake pads on city-owned vehicle to reduce pollutant deposition. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council.	FY18	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	No Change	NA, Not scheduled to be implemented in FY17	None
CSD-NS-22	~~Proactively~~ Coordinate with appropriate City Departments that monitor for erosion, and complete minor repair and slope stabilization on municipal property.	~~Actively~~ Coordinate with Streets Division and other appropriate City Departments that identify and repair eroding slopes that may be contributing to sediment loading. Prepare an inventory and assessment of eroding areas and their risk to surface waters. Follow assessment with a schedule for ongoing inspection and stabilization (potentially based on a number or percentage of sites annually). Consider Caltrans program as a template. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None
CSD-NS-23	Conduct special studies.	Special studies will be conducted to gather data to identify pollutant sources, appropriate targets, or other information. Includes collaboration with universities. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: San Diego Regional Reference Streams and Beaches, San Diego Wet Weather Epidemiology Study

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-26	Participate in Reference Watershed Study.	The San Diego Regional Reference Stream Study (currently being conducted by the Southern California Coastal Water Research Project). The study will develop numeric targets that account for "natural sources" to establish the concentrations or loads from streams in a minimally disturbed or "reference" condition. Refer to Section 5.1 for further details. Will occur region-wide. Funding and resources were previously secured.	Prior to FY16	Completed within schedule	Yes	No Change	Completed	FY16 Notes: See Section4.3.1.1 in Appendix 4for more information.
CSD-NS-27	Participate in Reference Beach Study.	The San Diego Regional Reference Beach Study (currently being conducted by the Southern California Coastal Water Research Project) will develop numeric targets that account for "natural sources" to establish the concentrations or loads from the beach in a minimally disturbed or "reference" condition. The purpose of this monitoring program is to advise the public of potential health risks that could occur with water contact recreation at local beaches. DEH will post a health advisory notice or close a beach when FIB results are above REC-1 water quality standards. Will occur region-wide in the Los Peñasquitos, San Dieguito River, Mission Bay, and San Diego River WMAs. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	One time	Yes	Revised to clarify strategy.	Completed	FY16 Notes: See Section 4.3.1.2 in Appendix 4for more information.
CSD-NS-32	Conduct a Storm Water Fee Study~~Cost of Service Study~~.	Conduct a Storm Water Fee Study~~Cost of Service Study~~ that will examine the full cost of flood control and storm water strategies needed to comply with storm water regulations for the City of San Diego. The City of San Diego's Watershed Asset Management Plan will be used as the basis for the study. Funding and resources have been secured for FY2016.	FY16	Completed within schedule	Yes	No Change	Yes	FY16 Notes: Significant progress was made on the fee study; it will be finalized and posted on the City website in FY17. FY17 Notes: Study results to be posted in FY17.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-33	Conduct Sustainable Return on Investment (SROI) analysis to estimate strategies' co-benefits and impacts to the public and the private sector on a common scale.	SROI is an economics-based framework for evaluating quantitative and qualitative performance metrics and monetizing them, if possible, along a triple bottom line (i.e. financial, societal, and environmental). This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured, 2) staff resources are identified and secured, 3) partners have been identified and formal MOUs have been developed, and 4) consensus and community support has been achieved. Resources necessary to implement this strategy include City staff or consulting team. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. The anticipated one-time cost to implement is $115,000. Once initiated, the analysis is expected to be complete in 1 year.	Must be triggered	Completed within schedule	Not Triggered	No Change	If Triggered	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-NS-34	Collaborate with the County, if a County-led regional social services effort is established, to provide sanitation and trash management for individuals experiencing homelessness and determine if the program is suitable and appropriate for jurisdictional needs to meet goals.	Support a non-profit or consortium to provide sanitation services associated with hygiene as well as trash management for persons experiencing homelessness. Rented or purchased shower/sanitary trailers providing mobile showers may be organized at specifically scheduled locations and times. This provision has been proposed as a method for preventing surface water usage for sanitation and bathing, as well as opportunity for outreach and referral by social service agencies. The trash management services will include providing trash bags, trash collection areas, and shower/sanitary facilities at centers which provide daytime shelter to their clients, or on a mobile-basis for known transit camps. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured, 2) staff resources are identified and secured, 3) partners have been identified and formal MOUs have been developed, and 4) consensus and community support has been achieved. Resources necessary to implement this strategy include City staff to coordinate with the regional effort. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. The anticipated cost to implement the strategy includes an initial first year planning cost of $30,000 and implementation is expected to cost $10,000 annually thereafter. Once initiated, development of the program is expected in 1 year. Implementation is in perpetuity as long as funding is available.	Must be triggered	Continuous as funding allows	Not Triggered	No Change	If Triggered	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-NS-37	Participate in an assessment to determine if implementation of an urban tree canopy (UTC) program would benefit water quality and other City goals, where feasible.	Perform a feasibility study to determine if implementing an UTC program would be beneficial to the City's goals. UTC intercepts rainfall through increased coverage of leaves, branches, and stems and reduces runoff from the storm drainage system. Benefits associated with enhancing an UTC include reducing heat island effects and air pollution in addition to aesthetics and community benefits. Where feasible, native trees will be utilized to prevent invasive trees from migrating to open spaces and to conserve water. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured and 2) staff resources are identified and secured. Resources necessary to implement this strategy include City staff or consulting team. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. Once initiated, implementation and assessment is expected in 2 years.	Must be triggered	Completed within schedule	Not Triggered	No Change	If Triggered	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-NS-38	Conduct a feasibility study to test Permeable Friction Course (PFC), a porous asphalt that overlays impermeable asphalt.	Perform an assessment to determine the feasibility of implementing PFC on City streets. PFC, an overlay of porous asphalt, is an innovative roadway material that improves driving conditions in wet weather and water quality. Placed in a layer 25-50mm thick on top of regular impermeable pavement, PFC allows rainfall to drain within the porous layer rather than on top of the pavement. PFC has also been shown to reduce concentrations of pollutants commonly observed in highway runoff. PFC incorporates stormwater treatment into the roadway surface and does not require additional right-of-way. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured and 2) staff resources are identified and secured. Resources necessary to implement this strategy include City staff or consulting team. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. The anticipated cost to implement the strategy is $50,000. Once initiated, implementation and assessment is expected in 2 years.	Must be triggered	Completed within schedule	Not Triggered	No Change	If Triggered	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-39	As opportunities arise and funding sources are identified, protect areas that are functioning naturally by avoiding impervious development and degradation on unpaved open space areas, creating permanent open space protections on undeveloped city-owned land, and accepting privately-owned undeveloped open areas.	This strategy may be implemented if there is interest in participation by the public or private entity with current control of the land. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) identification of partners, if needed (public, private, non-profit), 2) identification of costs and potential sources of funding, 3) final agreement by public or private entity with current control of the land, 4) final agreement by all other participating partners including acceptance by intended land- or asset-owning City department, and 5) funding in place. Resources necessary to implement this strategy include a coordinator or manager and maintenance for acquired lands. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. The time frame for implementation will vary by project. Implementation is in perpetuity as long as funding is available.	Must be triggered	Continuous as funding allows	Not Triggered	No Change	If Triggered	None
CSD-NS-44	Participate in a watershed council or group if one is established.	This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) partners have been identified and formal MOUs have been developed and 2) consensus and community support has been achieved. Resources necessary to implement this strategy include a coordinator or project manager. Projected funding needs may be met through award of a grant, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. Once initiated, development of the program is expected in 2 years. Implementation would be in perpetuity as long as funding is retained.	Must be triggered	Continuous as funding allows	Not Triggered	No Change	If Triggered	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-47	Coordinate with Development Services Department to ~~P~~prohibit introduction of invasive plants in new development and redevelopment projects.	Coordinate with the City's Development Services Department to continue to prohibit introduction of invasive species such as *Arundo donax* and *Cortaderia selloana* for new development or redevelopment projects as specified in the City's municipal code for landscape. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None
CSD-NS-51	Collaboration with the Regional Board.	The Responsible Agencies will work with the Regional Board to identify solutions and address sources of potential water quality impairments. Priorities include 1) enforcement of the Industrial General Permit, 2) enforcement of the Ag Waiver, 3) enforcement of other non-MS4 dischargers, and 4) Bacteria TMDL updates, as appropriate for each WMA. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Funding and resources have been secured for FY16. Funding for future fiscal years is contingent on annual budget approval by each Responsible Agency.	Prior to FY16	Continuous-Ongoing	Yes	City-specific version of WMA strategy.	Yes	FY16 Notes: Provided written comments to the Regional Board, State Water Board, and US Environmental Protection Agency (EPA) regarding proposed rules and regulations.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-53	Refinement of Water Quality Regulations	Collaborate with other Responsible Agencies and the Regional Board to refine the accuracy of regulations to ensure that Non-MS4 dischargers are regulated appropriately. The goal of this exercise is to begin a dialog with the Regional Board that may lead to the following outcomes: 1) Removal of Non-MS4 discharges and the associated BMPs needed to treat those discharges from the Responsible Agencies' burden, 2) amendment of current TMDLs and the MS4 Permit to correctly assign responsibilities for Non-MS4 discharges to the appropriate entities, and 3) strengthening of Non-MS4 NPDES permits that are directly tied to the requirements of existing and future TMDLs. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Resources to implement this strategy include staff time and are currently secured.	Prior to FY16	Continuous-Ongoing	Yes	City-specific version of WMA strategy.	Yes	FY16 Notes: City coordinated with the Regional Board to discuss addressing non-MS4 contributions in TMDL and other water quality regulations.
CSD-NS-60	Coordinate with Development Services Department to implement Sustainable Landscapes Program to encourage landscape retrofits.	Collaborate with other San Diego River WMA Responsible Agencies to implement a Sustainable Landscapes Program. Implementation of this strategy may be triggered if (1) an interim goal has not been met, (2) it has been determined though adaptive management that implementation is necessary, and (3) all of the resources have been identified and secured. The following resources must be secured for each fiscal year that this program is implemented: (1) Partners must be identified and each partner must agree to terms of partnership, (2) funding must be identified and secured by each of the partners for their portion of the overall cost, (3) staff resources must be identified and secured, (4) the scope of the program (target location(s), type and value of incentives, etc.) must be identified, and (5) consensus and community support has been achieved.	Must be triggered	Continuous-Ongoing	Not Triggered	City-specific version of WMA strategy.	If Triggered	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-61	Implement wastewater management program to prevent sanitary sewer overflows.	Collaborate with other San Diego River WMA Responsible Agencies to implement wastewater management strategies targeting Fats, Oils, and Grease (FOG) to reduce sanitary sewer overflows (SSOs). Develop and print guidance materials that address septic system maintenance and FOG management. Conduct workshops, training sessions, and other media outreach. This effort will require community support and partnerships to be established. Resources and funding include Grant funding from Proposition 1. Implementation of this strategy may be triggered if (1) an interim goal has not been met, (2) it has been determined though adaptive management that implementation is necessary, and (3) all of the resources have been identified and secured. The following resources must be secured for each fiscal year that this program is implemented: (1) Partners must be identified and each partner must agree to terms of partnership, (2) funding must be identified and secured by each of the partners for their portion of the overall cost, (3) staff resources must be identified and secured, (4) the scope of the program (target location(s), type and value of incentives, etc.) must be identified, and (5) consensus and community support has been achieved.	Must be triggered	Completed within schedule	Not Triggered	City-specific version of WMA strategy.	If Triggered	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Structural Strategies								
CSD-STRUCT-02	San Diego River Restoration and Trash Removal Project: The City of San Diego will implement a project involving restoration of native habitat and trash removal along 5,750 feet of the San Diego River covering approximately 57 acres. Work on this project is scheduled to begin in 2016 and be completed by 2022.	The City of San Diego will implement a project that will restore native habitat and involve trash removal along 5,750 feet of the San Diego River. The City will be completing the project design and obtaining the necessary permits and approval from City Council in FY 16. The following resources, funds, and steps are needed to implement the project by the end of FY 16: 1) Hire design consultant to develop detailed construction plans and construction cost estimates 2) Complete construction contractor bid and award process for construction phase 3) Construct project 4) Operation and maintenance will be in perpetuity. Funds and staff resources for this function will be approved by City Council as part of the City's annual budget	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Received USACOE Nationwide verification letter and CADFW Streambed Alteration Agreement. FY17 Notes: Planned activities in FY 17 include removal of all trash, non-native vegetation, and illegal encampments from the project area. A temporary irrigation system will be installed, along with native container plants and native seed. Prior to the end of FY 17, the goal is to start the 120 Day Plant Establishment Period.
Green Infrastructure								
CSD-GI-07	Bioretention at Allied Gardens Recreation Area.	Bioretention designed for Allied Gardens Recreation Area to treat a drainage area of 4.5 acres. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY17 Notes: Construction finishing in FY17. See Table A2-19 for a current list of completed and planned Structural Projects.
CSD-GI-08	Bioretention at Famosa Slough.	Bioretention designed for Famosa Slough to treat a drainage area of 10.3 acres. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY17	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	No Change	Yes	FY17 Notes: Design team will investigate project feasibility.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-GI-09	~~20.1~~ 16 acres of bioretention and 4.1 acres of permeable pavement have been identified as potential opportunities for green infrastructure implementation on public parcels to treat an impervious drainage area of 522.33 acres (total drainage area of 1510 ac) with a total storage volume of 23.97 acre-feet.	To meet the San Diego River WMA numeric goals and schedules presented in Section 3, the City of San Diego will implement the following structural strategies. Staggered construction, operation, and maintenance of ~~20.1~~ 16 acres of bioretention and 4.1 acres of permeable pavement to treat an impervious drainage area of 522.33 acres (total drainage area of 1510 ac) with a total storage volume of 23.97 acre-feet. An updated inventory of green infrastructure projects will be maintained in the WQIP Annual Report. The following resources, funds, and steps are needed to implement this strategy: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs; approx $500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project). 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	FY22	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	Revised to clarify strategy.	NA, Not scheduled to be implemented in FY17	See Table A2-19 for a current list of completed and planned Structural Projects.
CSD-GI-14	Cabrillo Heights Rain Garden	Rain garden constructed on Kearny Villa Rd. used to treat a drainage area of 6 acres. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY17 Notes: Increase inspection & cleaning to a minimum of 2 annually. See Table A2-19 for a current list of completed and planned Structural Projects.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Green Streets								
CSD-GS-10	43.61 acres of green streets (35.77 acres of bioretention and 7.84 acres of permeable pavement) have been identified as potential opportunities for green street projects to treat a total drainage area of 10,715.24 acres with a total storage volume of 88.02 acre-feet.	To meet the San Diego River WMA numeric goals and schedules presented in Section 3, the City of San Diego will implement the following structural strategies. Staggered construction, operation and maintenance of 43.61 acres of green streets (35.77 acres of bioretention and 7.84 acres of permeable pavement) to treat a total drainage area of 10,715.24 acres with a total storage volume of 88.02 acre-feet. An updated inventory of green streets projects will be maintained in the WQIP Annual Report. The following resources, funds, and steps are needed to implement this strategy: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs; approx $500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project). 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	FY24	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	Revised to clarify strategy.	NA, Not scheduled to be implemented in FY17	None. Future projects will be listed in Table A2-19.

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Multiuse Treatment Areas								
Infiltration and Detention Basins								
CSD-MUTA-09	Multiuse Treatment Area BMPs in the San Diego River WMA.	To meet the San Diego River WMA numeric goals and schedules presented in Section 3, the City of San Diego will implement the following structural strategies. Modeled MUTA BMPs with footprints of 4.3 acres (ac) in FY19 (total drainage area of 571 ac), 18.6 ac in FY20 (total drainage area of 1309 ac), 5.3 ac in FY21 (total drainage area of 591 ac), and 2.3 ac in FY22 (total drainage area of 315 ac). These can be wetland, infiltration, retention and/or detentions systems. An updated inventory of MUTA projects will be maintained in the WQIP Annual Report. The following resources, funds, and steps are needed to implement this strategy: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs; approx $500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project). 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	FY19, FY20, FY21, FY22	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	Multiple similar strategies were compiled into this new strategy listing to simplify recordkeeping and reporting.	NA, Not scheduled to be implemented in FY17	None. Future projects will be listed in Table A2-19.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Stream, Channel and Habitat Rehabilitation Projects (B.3.b.(1)(b)(iii))								
CSD-MUTA-20	If interim load reduction goals are not met and additional stream, channel, and habitat rehabilitation projects are required, implement as needed.	This strategy may be triggered as 1) funding to address MS4 discharges is identified and secured, 2) staff resources are identified and secured, 3) partners have been identified and formal MOUs have been developed, 4) permits required by regulatory agencies are secured, and 5) recommendations from the community are identified and consensus and community support has been achieved. Will occur in areas identified during feasibility studies. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs; approx $500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project). 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Water Quality Improvement BMPs								
Priority Development Projects (PDPs)								
CSD-PDP-04	Priority Development Project BMPs in San Diego River WMA.	Per the Storm Water Standards Manual, all non-exempt public PDPs are subject to requirements to construct and maintain permanent BMPs. See WQIP Annual Report for updated PDP BMP Inventory. Funding and resources have been secured for PDPs implemented prior to FY16. Funding for PDP BMPs constructed in future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16, FY17	Continuous-Ongoing	Yes	Multiple similar strategies were compiled into this new strategy listing to simplify recordkeeping and reporting.	Yes	See Table A2-20 for a current list of PDP BMPs.
Proprietary BMPs								
~~(Removed)~~	~~3 Drain Inserts in Complex Street Green Mall.~~	~~3 drainage inserts planned for implementation in Complex Street Green Mall. The following resources, funds, and steps are needed to implement this strategy:~~ ~~1) Identify project locations (3-6 months)~~ ~~2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs)~~ ~~3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May)~~ ~~4) Initiate preliminary engineering to narrow project scope (6 months; approx $30K per CIP project)~~ ~~5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs; approx $500K per CIP project)~~ ~~6) Complete construction contractor bid and award process for construction phase (6 months)~~ ~~7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project).~~ ~~8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.~~	~~FY17~~	~~Continuous-Ongoing~~	Cancelled	This project has been cancelled since it is unlikely to provide a significant water quality benefit.	No	This project was originally conceived in 2010. Recent Storm Water Division research has indicated that drainage inserts are not effective at removing pollutants from storm water.

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-WQBMP-03	Park Ridge hydrodynamic separator	A hydrodynamic separator used to treat onsite runoff of 37.6 acres. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY17	Continuous-Ongoing	Yes	No Change	Yes	FY17 Notes: Increase inspection & cleaning to a minimum of 2 annually
Dry Weather Flow Separation and Treatment Projects								
CSD-WQBMP-09	If interim load reduction goals are not met and additional dry weather flow separation and treatment projects are required, implement as needed.	Construction of dry weather flow separation and treatment projects, where identified. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, 3) staff resources are identified and secured, and 4) permits required by regulatory agencies are secured. Will occur in downstream reaches where persistent dry weather flows have been observed. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs; approx $500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project). 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None

Trash Segregation								
CSD-WQBMP-10	If interim load reduction goals are not met and additional trash segregation projects are required, implement as needed.	Construction of trash segregation (Trash Guards, etc.) projects, where identified. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, 3) staff resources are identified and secured, and 4) permits required by regulatory agencies are secured. Will occur in high loading areas city-wide. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs; approx $500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project). 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA Strategies (Optional Strategies, B.3.b.(2))								
WMA-6	Offsite Alternative Compliance Option ~~(WMAA)~~	The WMAA provides alternative compliance methods in lieu of meeting structural BMP design standards and/or hydromodification management criteria on the project site. The San Diego County Copermittees have collectively funded and provided guidance for development of a regional WMAA. Copermittees compiled a list of candidate projects that consider the numeric goals of the WMAs as well as projects previously identified in JRMPs and other regulatory documents. Next steps include submittal of the water quality equivalency standards final document, ~~anticipated in September 2015. Following a public review and Executive Officer approval, anticipated by November 2015,~~ which was submitted and approved in FY 2016. Following this approval, jurisdictions can formally implement an optional Alternative Compliance Program by ~~December 2015~~ February 2016 (time coincident with implementation of standards set forth in the regional BMP Design Manual and local Storm Water Standards Manuals).	Prior to FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Phase 1 of the Alternative Compliance Program (ACP) went into effect on 2/16/16. FY17 Notes: Proposed Water Quality Equivalency (WQE) guideline development for stream restoration.
WMA-9	Collaboration with the Regional Board.	The Responsible Agencies will work with the Regional Board to identify solutions and address sources of potential water quality impairments. Priorities include 1) enforcement of other non-MS4 dischargers and 2) Bacteria TMDL updates. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Funding and resources have been secured for FY16. Funding for future fiscal years is contingent on annual budget approval by each Responsible Agency.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Working with Regional Board to include non-Phase I MS4s in general permits, waivers, and Waste Discharge Requirements (WDRs).

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
WMA-12	Refinement of Water Quality Regulations	The Responsible Agencies will collaborate with the Regional Board to refine the accuracy of regulations to ensure that Non-MS4 dischargers are regulated appropriately. The goal of this exercise is to begin a dialog with the Regional Board that may lead to the following outcomes: 1) Removal of Non-MS4 discharges and the associated BMPs needed to treat those discharges from the Responsible Agencies' burden, 2) amendment of current TMDLs and the MS4 Permit to correctly assign responsibilities for Non-MS4 discharges to the appropriate entities, and 3) strengthening of Non-MS4 NPDES permits that are directly tied to the requirements of existing and future TMDLs. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Resources to implement this strategy include staff time and are currently secured.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: City coordinated with Regional Board to discuss bacteria TMDL addressing non-MS4 contributions.
WMA-21	Coordinate with Development Services Department to implement Sustainable Landscapes Program to encourage landscape retrofits.	Implementation of this strategy may be triggered if (1) an interim goal has not been met, (2) it has been determined though adaptive management that implementation is necessary, and (3) all of the resources have been identified and secured. The following resources must be secured for each fiscal year that this program is implemented: (1) Partners must be identified and each partner must agree to terms of partnership, (2) funding must be identified and secured by each of the partners for their portion of the overall cost, (3) staff resources must be identified and secured, (4) the scope of the program (target location(s), type and value of incentives, etc.) must be identified, and (5) consensus and community support has been achieved.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None

Table A2-18. City of San Diego Jurisdictional Strategies for San Diego River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-22	Implement wastewater management program to prevent sanitary sewer overflows.	Develop and print guidance materials that address septic system maintenance and Fats, Oils, and Grease (FOG) management. Conduct workshops, training sessions, and other media outreach. This effort will require community support and partnerships to be established. Resources and funding include Grant funding from Proposition 1. Implementation of this strategy may be triggered if (1) an interim goal has not been met, (2) it has been determined though adaptive management that implementation is necessary, and (3) all of the resources have been identified and secured. The following resources must be secured for each fiscal year that this program is implemented: (1) Partners must be identified and each partner must agree to terms of partnership, (2) funding must be identified and secured by each of the partners for their portion of the overall cost, (3) staff resources must be identified and secured, (4) the scope of the program (target location(s), type and value of incentives, etc.) must be identified, and (5) consensus and community support has been achieved.	Must be triggered	Completed within schedule	Not Triggered	No Change	If Triggered	None

Table A2-19. City of San Diego Structural BMP Implementation Status for San Diego River WMA

Strategy Number	Strategy	Implementation Approach	Total Drainage Area (Ac)	Implementation Year*	Status	Permit Term Goal**
Green Infrastructure		Total Acres Treated Required for Green Infrastructure:	1,520.50			
CSD-GI-07	Bioretention at Allied Gardens Recreation Area.	Bioretention designed for Allied Gardens Recreation Area to treat a drainage area of 4.5 acres.	4.5	FY16	Construction	✓
CSD-GI-14	Cabrillo Heights Rain Garden	Rain garden constructed on Kearny Villa Rd. used to treat a drainage area of 6 acres.	6	Prior to FY16	Completed	✓
CSD-GI-09	16 acres of bioretention and 4.1 acres of permeable pavement have been identified as potential opportunities for green infrastructure implementation on public parcels to treat an impervious drainage area of 522.33 acres (total drainage area of 1510 ac) with a total storage volume of 23.97 acre-feet.	Staggered construction, operation, and maintenance of 16 acres of bioretention and 4.1 acres of permeable pavement to treat an impervious drainage area of 522.33 acres (total drainage area of 1510 ac) with a total storage volume of 23.97 acre-feet. An updated inventory of green infrastructure projects will be maintained in the WQIP Annual Report.	1,510	FY22	Varies, see below	Varies, see below
	Project Name	Project Description	Total Drainage Area (Ac)	Implementation Year	Status	Permit Term Goal
	Serra Mesa GI	Shawn Ave near Bantam Ave, Palace Dr near Bantam Ave, Larabee Pl	22	FY 19	Design	
	Kearny Mesa GI	Murphy Canyon Road north of Clairemont Mesa Boulevard	255	FY 20	Design	
Green Streets		Total Acres Treated Required for Green Streets:	10,715.24			
CSD-GS-10	43.61 acres of green streets (35.77 acres of bioretention and 7.84 acres of permeable pavement) have been identified as potential opportunities for green street projects to treat a total drainage area of 10,715.24 acres with a total storage volume of 88.02 acre-feet.	Staggered construction, operation and maintenance of 43.61 acres of green streets (35.77 acres of bioretention and 7.84 acres of permeable pavement) to treat a total drainage area of 10,715.24 acres with a total storage volume of 88.02 acre-feet. An updated inventory of green streets projects will be maintained in the WQIP Annual Report.	10,715.24	FY24	*(Overall amounts of projects have been determined through modeling or similar means. Details of specific projects initiated as part of this strategy are entered below once they enter the design stage.)*	
	Project Name	Project Description	Total Drainage Area (Ac)	Implementation Year	Status	Permit Term Goal
	(Projects will be added as they reach the design stage)					
Multiuse Treatment Areas		Total Acres Treated Required for MUTAs:	2,786			
CSD-MUTA-09	Multiuse Treatment Area BMPs in the San Diego River WMA.	Modeled MUTA BMPs with footprints of 4.3 acres (ac) in FY19 (total drainage area of 571 ac), 18.6 ac in FY20 (total drainage area of 1309 ac), 5.3 ac in FY21 (total drainage area of 591 ac), and 2.3 ac in FY22 (total drainage area of 315 ac). These can be wetland, infiltration, retention and/or detentions systems. An updated inventory of MUTA projects will be maintained in the WQIP Annual Report.	571	FY19	*(Overall amounts of projects have been determined through modeling or similar means. Details of specific projects initiated as part of this strategy are entered below once they enter the design stage.)*	
			1,309	FY20		
			591	FY21		
			315	FY22		
	Project Name	Project Description	Total Drainage Area (Ac)	Implementation Year	Status	Permit Term Goal
	(Projects will be added as they reach the design stage)					
Water Quality Improvement BMPs		Total Acres Treated Required for WQI BMPs:	37.6			
CSD-WQBMP-03	Park Ridge hydrodynamic separator	A hydrodynamic separator used to treat onsite runoff of 37.6 acres.	37.6	FY17	Completed	✓

*For additional details, please see the schedule following the City's strategy table in the WQIP.

** Projects with a check in the "Permit Term Goal" column are counted toward the green infrastructure installation goal applicable to the current Permit term. See Table A2-21 for a summary

Table A2-20. City of San Diego Priority Development Project Implementation Status for San Diego River WMA

San Diego River PDP BMP Ledger (CSD-PDP-04)

6 Vegetated Swales in Mission Trails Regional Park E. Fortuna Equestrian Staging Area	6 Vegetated Swales planned for Mission Trails Regional Park E. Fortuna Equestrian Staging Area.	unknown	FY17	Completed	
El Capitan Reservoir	3 drainage inserts planned for implementation in El Capitan Reservoir.	unknown	Prior to FY16	Completed	
Murray Reservoir	5 drainage inserts planned for implementation in Murray Reservoir.	unknown	Prior to FY16	Completed	
San Vicente Reservoir	1 drainage insert planned for implementation in San Vicente Reservoir.	unknown	Prior to FY16	Completed	
Serra Mesa/Kearny Mesa Library	A hydrodynamic separator used to treat onsite runoff at Serra Mesa/Kearny Mesa Library.	unknown	Prior to FY16	Completed	

* Projects with a check in the “Permit Term Goal” column are counted toward the green infrastructure installation goal applicable to the current Permit term. See Table A2-21 for a summary.

Table A2-21. Summary of City of San Diego Priority Structural BMP Implementation Status for San Diego River WMA

Permit Term Goal FY2018	Total Drainage Area (Ac)
Structural BMP Total Acres Treated Required by FY 18	58.40 (Required by FY 18)
Total Completed/Planned BMPs	48.10
Total Completed/Planned PDP BMPs	
Remaining to Goal	10.30
Final Goals FY2031*	**Total Drainage Area (Ac)**
Green Infrastructure Total Acres Treated Required	1,520.50
Total Completed/Planned	287.50
Remaining to Final Amount of Acres Treated	1,233.00
Green Streets Total Acres Treated Required	10,715.24
Total Completed/Planned	0.00
Remaining to Final Amount of Acres Treated	10,715.24
MUTA Total Acres Treated Required	2,786.00
Total Completed/Planned	0.00
Remaining to Final Amount of Acres Treated	2,786.00
WQI BMP Total Acres Treated Required	37.60
Total Completed/Planned	37.60
Remaining to Final Amount of Acres Treated	0.00

*Based on the “MS4 Discharges: Implement Accepted WQIP” compliance pathway. Final compliance is implementation of BMPs based on modeling analysis results.

5.4 MODIFICATIONS TO THE BMP DESIGN MANUAL

In FY16 the City, along with other government agencies, professional engineers and members of the local development community, developed a new Regional Best Management Practices (BMP) Design Manual that conforms to the 2013 Municipal Storm Water Permit (Order No. R9-2013-0001, as amended by R9-2015-0001 and R9-2015-0100). The Manual supersedes the San Diego County-wide Model Standard Urban Runoff Storm Water Management Plan (SUSMP) and provides technical guidance and regional standards for pollutant and flow control requirements for new development and significant redevelopment. The City of San Diego's local version of the BMP Design Manual, the Storm Water Standards Manual, became effective on February 16, 2016.

5.5 MODIFICATIONS TO THE JRMP

The City of San Diego is proposing administrative changes to its JRMP. The updated JRMP can be viewed at https://www.sandiego.gov/stormwater/plansreports/jrmp. These changes are summarized below.

	JRMP Section / Appendix	JRMP Update
1	Executive Summary	Strategy categories and definitions were modified to align with the categories and definitions in the Municipal Storm Water Permit and San Diego Water Board's approved Water Quality Improvement Plans (WQIPs).
2	Section 2.3	In accordance with the Municipal Storm Water Permit, Section 2.3 was updated to state that JRMP updates can be proposed/submitted as part of the WQIP Annual Reports.
3	Section 7.3.13-8	Updated BMP #16 to provide greater clarity.
4	Section 7.3.14	Updated section to include new BMPs for herbicide application.
5	Section 10	Strategy categories and definitions were modified to align with the categories and definitions in the Municipal Storm Water Permit and San Diego Water Board's approved WQIPs. Updated tables, graphs, charts, and text to reflect funding needs to meet the goals and schedules identified in the WQIPs. Added language stating "Estimates of funding needs presented were based on the best information available at the time they were prepared."
6	Sections 7.3.1, 7.3.2, and 7.3.4-15	Updated Minimum BMP language to reflect changes to Appendix IX.

	JRMP Section / Appendix	JRMP Update
7	Section 3, Section 4, Section 5, Section 6, Section 7, Section 8, Section 9	Based on updates made to the categories and definitions of strategies noted above, the "JRMP Strategies Identified in the WQIPs" tables and "Additional Public Education and Participation Program WQIP Strategies" tables for these sections have been updated for consistency. The strategy identification numbering system and text was updated to reflect administrative changes included in the WQIP Annual Reports.
8	Appendix VI- Residential Management Areas and Patrol Protocols	Updated the residential management areas maps and included newly developed patrol protocols.
9	Appendix IX - Minimum BMPs for Residential, Industrial, Commercial, and Municipal Sites/Sources	Updated references to ordinance sections, changed the "Think Blue" references to the Storm Water Division, and made minor changes to some BMP and description wording for clarification.
10	Appendix XIV- Certificate of Adequate Legal Authority	Signed Certificate of Adequate Legal Authority was added.
11	Appendix XX- Water Quality Improvement Plan Strategies	Updated strategies to reflect the administrative changes made to strategies in the Fiscal Year 2016 WQIP Annual Reports.
12	Appendix XXII- Storm Water Division Projected Funding Needs, 2016-2035	Updated Appendix XX to reflect the funding needs to meet the goals and schedules identified in the WQIPs.

STATEMENT OF CERTIFICATION

San Diego River Watershed Management Area Water Quality Improvement Plan 2015-2016 Annual Report

I certify, under penalty of law, that this Water Quality Improvement Plan Annual Report submittal and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for known violations.

BRUCE L. APRIL
Deputy District Director, Environmental

Date

6.2 JURISDICTIONAL STRATEGIES

~~Strikeouts~~ are text edits that have been made up to the current date since the WQIP September 2015 submittal.

Table A2-22. Caltrans Jurisdictional Strategies and Implementation Schedules for Development Planning

San Diego River Development Planning Program Strategies Caltrans	FY15-16	FY16-17	Actual /	Rationale for Modification to the Strategy	Comments
1. Provide updated materials, enhanced outreach, and training to convey land development requirements.					
Stormwater Treatment BMP Technology Report and Stormwater Monitoring and BMP Development Status Report	●	●	A		*Stormwater Monitoring and BMP Development Status Report: Fiscal Year 2015-2016 Update*, September 2015, which provides an update on the status of stormwater treatment technology studies, source control studies (including erosion control studies), and stormwater quality characterization
2. Implement a post construction BMP program for development projects to ensure proper construction and maintenance.					
Implement a program that ensures that all structural BMPs are designed, constructed, and maintained ~~on PDPs~~.	●	●	A	Caltrans implements structural BMPs but does not have Priority Development Projects.	Created a new website application (CT Portal) dedicated for reporting all structural BMPs that were designed, constructed and maintained.
Structural BMPs (which retain water for more than 96 hours) inventory	●	●	A		
Inspect all high priority structural BMPs annually.	●	●	A	Clarified frequency.	
3. Enforce post construction requirements related to new and redevelopment.					
Enforce legal authority to ensure all development projects are in compliance with all post construction requirements.	●	●	A		

Notes:
● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented
A – Actual (active implementation), P – Planned (planning stage)

Table A2-23 Caltrans Jurisdictional Strategies and Implementation Schedules for Construction Management

San Diego River Construction Management Program Strategies Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Ensure that minimum BMPs are designated and required for construction projects.					
Implement or require implementation of BMPs that are site specific, seasonally appropriate, and appropriate to the construction phase year round.	●	●	A		Caltrans continued to track new and/or emerging post-construction stormwater treatment technologies
2. Provide enhanced outreach and coordination to convey construction requirements.					
Provide internal staff training related to construction stormwater management.	●	●	A		During the fiscal year, construction stormwater classes were offered to Construction personnel on stormwater topics.
Provide public education and outreach targeting the construction industry.	●	●	A		
Develop and implement new construction guidance as needed to comply with new Statewide Construction General Permit (CGP)	●	●	A		Full implementation of the CGP occurred in this fiscal year.

Notes:

● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented

A – Actual (active implementation), P – Planned (planning stage)

Table A2-24. Caltrans Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Improve trash management strategies within the watershed.					
Implement "Don't Trash California" campaign.	●	●	A		Caltrans collects trash through several activities that District Maintenance personnel perform on a regular basis. These activities include storm drain maintenance, roadway sweeping, District crew/California Conservation Corps (CCC) trash collection, and the Adopt-A-Highway Program, and public education emphasizing trash and litter prevention.
Implementation of Adopt-A-Highway Statewide Program through coordination with local organizations.	●	●	A		The Caltrans Adopt-A-Highway Program provides an avenue for individuals, organizations, or businesses to help maintain sections of roadside for various activities including litter removal within California's State Highway System.
Report and evaluate trash and litter activities.	●	●	A		
Implement a schedule of operation and maintenance for highways.	●	●	A		The Division of Construction staff continued providing the coordinates of treatment BMPs to facilitate transfer to the Division of Maintenance using a designated handoff form. The Division of Maintenance uses its Integrated Maintenance Management System (IMMS) to track maintenance records of treatment BMPs as provided by the Districts.
Implement highway maintenance activities as required.	●	●	A		

Table A2-24. Caltrans Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
2. Actively educate public on prohibitions related to illicit discharges and connections.					
Implement and annually evaluate public education program.	●	●	A		The Division of Maintenance helps sponsor the California Statewide Litter Collection, Enforcement and Beautification Day event held in the spring on or around Earth Day each year. Caltrans staff volunteers to collect litter and raise public awareness of the issue. Caltrans participates in supporting the California "Keep California Beautiful" campaign with Caltrans' "Protect Every Drop" campaign
Co-sponsor CASQA's Water Quality Newsflash	●	●	A		
Implementation of Statewide Storm Drain Stenciling Program	●	●	A		
Develop and implement Facility Pollution Prevention Plans.	●	●	A		Year- End Performance Report FY 2015-2016, A Summary of Maintenance Activity Storm Water Compliance Reviews, September 2015, which summarizes the stormwater compliance reviews of Maintenance activities. Caltrans is required to develop a Facility Pollution Prevention Plan (FPPP) for each of its maintenance facilities. Each FPPP describes the activities conducted at the facility and the BMPs to reduce or eliminate the discharge of pollutants in stormwater runoff from the facility. All FPPPs will be updated or revised as needed during each year.

Table A2-24. Caltrans Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
Develop and implement guidance to ensure ~~industrial~~ construction activities and facilities are covered by the ~~Industrial~~ Construction General Permit (CGP) as required.	●	●	A	Caltrans does not have facilities subject to the IGP within the watershed, but Caltrans has construction projects subject to the CGP.	Full implementation of the CGP occurred in this fiscal year.
Develop and implement a Municipal Coordination Plan	●	●	A		Caltrans' Municipal Coordination Plan was under development during the reporting period. In the interim, the Districts participated in municipal coordination activities by attending meetings, taking part in special studies, and collaborating with local agencies. District staff attended meetings statewide with municipal stormwater permittees to coordinate public education and outreach, regional planning, and other related activities.
3. Enhance existing maintenance programs.					
Implement a schedule of operation and maintenance activities for related structures.	●	●	A		The Division of Construction staff continued providing the coordinates of treatment BMPs to facilitate transfer to the Division of Maintenance using a designated handoff form. The Division of Maintenance uses its Integrated Maintenance Management System (IMMS) to track maintenance records of treatment BMPs as provided by the Districts.

Table A2-24. Caltrans Jurisdictional Strategies and Implementation Schedules for Existing Development Management

San Diego River Existing Development Program Strategies Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
4. Improve existing inspections programs to more efficiently target key sources.					
Conduct inspections of inventoried existing development to ensure compliance. ~~Each area/activity inspected once every five years minimum, with equivalent of 20% of inventory inspected annually.~~	●	●	A	Frequency stated is from the Phase I municipalities' MS4 Permit. Caltrans conducts inspections in accordance with the requirements of its Permit.	
5. Identify and facilitate retrofit opportunities in areas of existing development.					
Develop a strategy to identify opportunities and facilitate the implementation of retrofit projects in areas of existing development.	●	●	A		

Notes:

● - Fully implemented; ◖ - Partially Implemented, X – Not Implemented

A – Actual (active implementation), P – Planned (planning stage)

APPENDIX 3

Water Quality Improvement Plan Numeric Goals

Appendix 3 Water Quality Improvement Plan Numeric Goals

Compliance with the Bacteria Total Maximum Daily Load (TMDL) may be demonstrated via several methods. Since each compliance pathway provides an independent option to demonstrate progress and ultimately compliance with the TMDL, any one of the following compliance pathways may be used for assessment purposes. The pathways that may be used to demonstrate progress toward the interim and final TMDL goals in the San Diego River Watershed Management Area (WMA or Watershed) are presented below in Table A3-1 and Table A3-2, respectively. These tables, along with additional details regarding these pathways, can be found in Sections 3.1.1 (for interim pathways) and 3.1.2 (for final pathways) of the San Diego River Water Quality Improvement Plan (WQIP). The Participating Agencies have developed individual jurisdictional goals for Pathway 6, which are shown in Tables A3-3 through A3-6, and these numeric goals were used to assess progress in this 2015-2016 WQIP Annual Report.

Table A3-1. Pathways to Achieve Required Interim TMDL Goals

Pathway	Title	Interim Target	Metric	Values to be met		
				Indicator	Dry[c]	Wet
1 OR	Meet bacteria allowable exceedance frequency of receiving water objectives	No exceedances of the interim receiving water limitations;	Exceedance frequencies as measured in receiving waters.	Total Coliform[a]	.28% AEF[d]	46% AEF
				Fecal Coliform	0% AEF	43% AEF
				Enterococcus	1.5% AEF	49%(creeks) 51% (Beaches) AEF
2 OR	No discharge from stormwater drain outfalls	No direct or indirect discharge from the Participating Agencies' storm drain outfalls to the receiving water;	Assessment of presence/absence of flow and connectivity with receiving water.	Flow observations or measurements		
3 OR	Reduce loads at storm drain outfalls	The pollutant load reductions for discharges from the Participating Agencies' outfalls are greater than the required load reduction;	Pollutant load reductions.	Total Coliform	37.02% reduction	17.3% reduction
				Fecal Coliform	34.72% reduction	17.3% reduction
				Enterococcus	46.98% reduction	17.3 % reduction
4 OR	Show Exceedances are from natural sources	Demonstrate that exceedances of final receiving water limitations are due to loads from natural sources	Implement Natural Source Exclusion (NSE) Approach	Monitoring and assessment of receiving water and watershed which supports the NSE approach		
5 OR	No exceedances of final receiving water limitations	There are no exceedances of the final receiving water limitations in the receiving water at, or downstream of Participating Agencies' storm drain outfalls	Assessment of receiving water	Monitoring and assessment of receiving water indicating limitations have not been exceeded		
6	Implement Plan and use adaptive management	The Participating Agencies develop and implement an accepted Plan[b]	Implementation of jurisdictional strategies	Implementation of jurisdictional strategies as developed in accepted Plan and designed to meet interim goals 1, 2 and/or 3.		

a. Receiving water limitations for total coliform only apply to beaches.
b. The Plan must provide reasonable assurance that the interim TMDL compliance requirements in Attachment E of the Permit will be met via implementation, must be accepted by the Regional Board, and must be fully implemented by the Participating Agencies.
c. Dry weather measurements at beaches.
d. AEF - allowable exceedance frequency is the percent of samples that can exceed the single sample maximum of geometric mean and still be in compliance; the AEF is calculated based on the presence of bacteria loading from natural sources.

Table A3-2. Pathways to Achieve Required Final TMDL Goals

Compliance Pathway	Final Target	Final Metric	Measurement: Indicator	Dry Weather			Wet Weather	
1 OR	No exceedances of the final receiving water limitations in the receiving water;	Bacteria concentrations (MPN or CFU/100 ml) and exceedance frequencies in receiving waters are less than or equal to allowable values;		SSM[a]	GM[b]	AEF[c]	SSM	AEF
			Total Coliform[d]	10,000	1,000	0%	10,000	22%
			Fecal Coliform	400	200	0%	400	22%
			Enterococcus (beaches)	104	35	0%	104	22%
			Enterococcus (creeks)	61	33		61	
2 OR	No direct or indirect discharge from the Participating Agencies' storm drain outfalls to the receiving water;	Assessment of presence/absence of flow and connectivity with receiving water;	Flow observations or measurements.					
3 OR	There are no exceedances of the final effluent limitations at the Participating Agencies' storm drain outfalls;	Bacteria concentrations (MPN or CFU/100 ml) and exceedance frequencies in discharges;		Dry			Wet	
				SSM	GM	AEF[e]	SSM	AEF[f]
			Total Coliform[g]	10,000	1,000	0%	10,000	22%
			Fecal Coliform	400	200	0%	400	22%
			Enterococcus (beaches)[h]	104	35	0%	104	22%
			Enterococcus (creeks)[i]	61	33		61	
4 OR	The pollutant load reductions for discharges from the Participating Agencies' storm drain outfalls are greater than or equal to the final load reductions;	Load reductions in discharges are greater than or equal to required load reductions. The calculation requires an understanding of the baseline load, which can be used to estimate a target load reduction;		Percent Reduction (Dry)			Percent Reduction (Wet)[j]	
			Total Coliform	74.03%			34.7%	
			Fecal Coliform	69.44%			34.7%	
			Enterococcus	93.96%			34.7%	
5 OR	Exceedances of the final receiving water limitations in the receiving water are due to loads from natural sources and pollutant loads from the Participating Agencies' storm drain outfalls are not causing or contributing to the exceedances;	Microbial source tracking results as measured in the receiving water downstream of stormwater drain outfalls;	Microbial source tracking results show anthropogenic markers are below the limits of reporting in the receiving water at the time of the exceedance in most samples.					
6	The Participating Agencies develop and implement an adopted Water Quality Improvement Plan that includes a watershed model or other watershed analytical tool(s)	Implementation of jurisdictional strategies designed to meet goals. Use an adaptive management approach to improve implementation of jurisdictional strategies to reach goals.	Implementation of jurisdictional strategies as outlined in the Plan, and of the required monitoring and assessment program.					

a. SSM = single sample maximum or the highest allowable concentration of bacteria contained in one discreet sample

b. GM = geometric mean calculated based on multiple samples over a given time frame as defined by the Ocean Plan

c. AEF = allowable exceedance frequency is the percent of samples that can exceed the single sample maximum of geometric mean and still be in compliance; the AEF is calculated based on the presence of bacteria loading from natural sources

d. Receiving water limitations for total coliform only apply to beaches.

e. For dry weather days, the dry weather bacteria densities must be consistent with the single sample maximum REC-1 water quality objectives in the Ocean Plan for discharges to beaches and the Basin Plan for discharges to creeks and creek mouths.

f. The 22% single sample maximum allowable exceedance frequency only applies to wet weather days.

g. Total coliform effluent limitations only apply to storm drain outfalls that discharge to the Pacific Ocean Shorelines and creek mouths listed in Table 6.0 of Attachment E of Order R9-2013-0001.

h. This enterococcus effluent limitation applies to storm drain discharges to segments of areas of the Pacific Ocean Shoreline listed in Table 6.0 of Attachment E of Order R9-2013-0001.

i. This enterococcus effluent limitation applies to storm drain discharges to segments of areas of the creeks or creek mouths listed in Table 6.0 of Attachment E of Order R9-2013-0001.

j. The baseline loads for the lower watershed were determined through modeling, and are presented in Appendix 3C. Wet weather target load reductions (TLRs) for this Plan were taken from the City of San Diego Phase II Comprehensive Load Reduction Plan (Tetra Tech 2013). Fecal coliform was used to represent all bacteria for the purposes of this modeling. Appendix 3C discusses the use of the load reduction estimates in the City of San Diego Phase II Comprehensive Load Reduction Plan (Tetra Tech 2013) and their relationship to this plan.

The jurisdictional goals identified by the Participating Agencies in the San Diego River WMA to demonstrate progress toward compliance with the Bacteria TMDL are presented below in Table A3-3 through Table A3-12, followed by goals developed by Caltrans. These tables, along with additional details regarding these jurisdictional goals, can be found in Section 3.1.3 of the San Diego River WMA WQIP.

3.1 CITY OF EL CAJON JURISDICTIONAL GOALS

Table A3-3. City of El Cajon Dry Weather Jurisdictional Numeric Goals

Title	Metric	Baseline	Outcome	1st Permit Term Numeric Goals 2013 - 2018	2nd Permit Term Numeric Goals 2018 - 2023	
					TMDL Interim Compliance Date April 4, 2020 [(a)(b)]	TMDL Final Compliance Date April 4, 2021
Reduce controllable dry weather persistent flows	% reduction of flow volume or number of outfalls with flows mitigated from persistently flowing storm drain outfalls.	Baseline will be developed from previous dry weather monitoring data.	Effectively reduce controllable dry weather flow from storm drain outfalls to receiving water.	Reduce the volume of dry weather flows or the number of storm drains with dry weather flows by 10%.	Maintain 10% reduction in flows or the number of storm drains with dry weather flows and expand reduction based on results of previous actions and availability of funds.	Effectively reduce dry weather discharges from storm drain outfalls to the receiving water.
Transient encampment removal events	Increase the number of annual transient encampment removal events throughout the City's drainage channels.	Yearly average of five (5) removal events during R9-2007-0001 Permit cycle to help remove 25 cubic yards of trash and debris.	Increase annual transient encampment removal events to a minimum of eight (8) annual events to increase to 40 cubic yards of trash and debris to help reduce bacterial pollutant loads for total coliform fecal coliform and enterococcus.	Reduce gross pollutants that may contribute to bacteria loads by increasing the number of cubic yards of debris collected from drainage channels.	Continue to conduct a minimum of 8 transient encampment removal events per year and adjust the number of events accordingly to achieve compliance.	Continue to conduct a minimum of 8 transient encampment removal events per year and adjust the number of events accordingly and achieve compliance to achieve compliance with load reduction of 74.03% total coliform, 69.44% fecal coliform and 93.96% enterococcus.

a. Request moving Interim TMDL Compliance Date from April 4, 2018 (per Attachment E, 6.c(1)) to April 4, 2020 to allow adequate time to investigate and mitigate bacteria sources, and monitor progress and adjust implementation through the adaptive management process.

b. Percent Load Reductions reported in Table 6.3 (Final) and Table 6.6 (Interim) of Attachment E to Order R9-2013-0001 are compared to pollutant loads from 2001 and 2002 as noted in the table footnotes.

Table A3-4. City of El Cajon Wet Weather Jurisdictional Numeric Goals

Title	Metric	Baseline	Outcome	1st Permit Term 2013 - 2018	2nd Permit Term 2018 - 2023	3rd Permit Term 2023 - 2028	4th Permit Term 2028 - 2033
						Meet TMDL Interim Compliance Date April 4, 2028 [(a) (b)]	Meet TMDL Final Compliance Date April 4, 2031
Non-structural BMP (Creek Cleanup)	Reduce bacterial loads in Forrester Creek	5 cubic yards of solid waste (i.e. trash and debris) per cleanup event	Reduce trash and debris to help reduce bacteria loads.	Sponsor, coordinate with jurisdictions creek clean-up events in 1 focused management area, bi-annually; segregate and quantify waste materials.	Sponsor, coordinate with jurisdictions creek clean-up events in 1 focused management area, bi-annually; segregate and quantify waste materials.	Sponsor, coordinate with jurisdictions creek clean-up events in 1 focused management area, bi-annually; segregate and quantify waste materials.	Reduce bacteria[(c)] loads by 34.7% from the storm drain outfalls by continued implementation of programmatic Non-structural BMPs.
Non-structural BMP (Pet Waste Outreach)	Reduce bacterial loads in Forrester Creek	5 cubic yards of solid waste (i.e. trash and debris) per event	Reduce trash and debris to help reduce bacteria loads.	Expand pet waste management outreach to 1 focused management area; or to large properties owners (i.e. apartments, commercial facilities).	Expand pet waste management outreach to 1 focused management area; or to large properties owners (i.e. apartments, commercial facilities).	Expand pet waste management outreach to 1 focused management area; or to large properties owners (i.e. apartments, commercial facilities and educational institutions).	Reduce bacteria[(c)] loads by 34.7%from the storm drain outfalls by continued implementation of programmatic Non-structural BMPs.

a. Request moving Interim TMDL Compliance Date from April 4, 2021 (per Attachment E, 6.c(1)) to April 4, 2028 to allow adequate time to investigate and mitigate bacteria sources, and monitor progress and adjust implementation through the adaptive management process.

b. In accordance with Sections 6.b(3)(a)-(e) and 6.c.(3)(a)-(g) of Attachment E to Order R9-2013-0001.

c. Final Wet weather load reduction values as indicated in Table 6.3 of Attachment E to Order R9-2013-0001 for Fecal Coliform and Enterococcus were updated, with San Diego Water Board concurrence, to reflect load reduction modeling utilizing Water Year 2003 (considered an average rainfall year for the SDR Watershed) instead of Water Year 1993 as utilized in the 2010 TMDL model. This updated modeling analysis and the results are presented in the City of San Diego – San Diego River Watershed Comprehensive Load Reduction Plan – Phase II (available from the City of San Diego Storm Water Division website, under Plans and Reports tab at: http://www.sandiego.gov/stormwater/pdf/sdrclrpupdate.pdf). This resulted in the required final load reduction for Fecal Coliform, for example, to change from 53.22% (Table 6.3, Att. E of 2013 Permit) to 34.7%.

3.2 CITY OF LA MESA JURISDICTIONAL GOALS

Table A3-5. City of La Mesa Dry Weather Jurisdictional Numeric Goals

Title	Metric	Baseline	Outcome	1st Permit Term Numeric Goals 2013 - 2018	2nd Permit Term Numeric Goals 2018 - 2023	
					TMDL Interim Compliance Date April 4, 2020 (a)	TMDL Final Compliance Date April 4, 2021(b)
Creek Restoration Project	Linear Feet of Structural Projects	Existing Channel Conditions	Structural Project Completion, Increased CRAM channel assessment value. Higher biologic and habitat integrity.	Perform 900 LF of Alvarado Creek Restoration	Conduct Alvarado Trunk Sewer Main Replacement Project which will replace approx. 0.75 miles of trunk sewer. Reduction in infiltration/exfiltration resulting in reduction in bacteria to meet TMDL Interim Compliance Requirements [Attachment E, 6.c.(3)]	Meet TMDL Final Compliance Requirements [Attachment E, 6.b(3)]

a. Request moving Interim TMDL Compliance Date from April 4, 2018 (per Attachment E, 6.c(1)) to April 4, 2020 to allow adequate time to investigate and mitigate bacteria sources, and monitor progress and adjust implementation through the adaptive management process.

b. In accordance with Sections 6.b(3)(a)-(e) and 6.c.(3)(a)-(g) of Attachment E to Order R9-2013-0001.

Table A3-6. City of La Mesa Wet Weather Jurisdictional Numeric Goals

Title	Metric	Baseline	Outcome	1st Permit Term 2013 - 2018	2nd Permit Term 2018 - 2023	3rd Permit Term 2023 - 2028	4th Permit Term 2028 - 2033
						Meet TMDL Interim Compliance Date April 4, 2028 (a) (b)	Meet TMDL Final Compliance Date April 4, 2031
Creek Restoration Project	Linear Feet of Structural Projects	Existing Channel Conditions	Structural Project Completion. Increased CRAM channel assessment value. Higher biologic and habitat integrity.	Perform 900 Linear Feet of Alvarado Creek Restoration resulting in a 6.3% reduction in bacteria loading form municipal land use.[c]	Conduct Alvarado Trunk Sewer Main Replacement Project which will replace .75 miles of trunk sewer. Reduction in infiltration/ exfiltration, reduction in bacteria.	Comply with any of the TMDL Interim Compliance Requirements [Attachment E, 6.c(3)]	Comply with any of the TMDL Final Compliance Requirements [Attachment E, 6.b(3)]

a. Request moving Interim TMDL Compliance Date from April 4, 2021 (per Attachment E, 6.c(1)) to April 4, 2028 to allow adequate time to investigate and mitigate bacteria sources, and monitor progress and adjust implementation through the adaptive management process.

b. In accordance with Sections 6.b(3)(a)-(e) and 6.c.(3)(a)-(g) of Attachment E to Order R9-2013-0001.

c. Geosyntec Consultants, Technical Memorandum, *San Diego River Watershed Water Quality Improvement Plan City of La Mesa – Jurisdictional Load Reduction Summary*, October 10, 2014

3.3 CITY OF SANTEE JURISDICTIONAL GOALS

Table A3-7. City of Santee Dry Weather Jurisdictional Numeric Goals

Title	Metric	Baseline	Outcome	1st Permit Term Numeric Goals 2013 - 2018	2nd Permit Term Numeric Goals 2018 - 2023	
					TMDL Interim Compliance Date April 4, 2020 [a]	TMDL Final Compliance Date April 4, 2021
MS4 Discharge Load Reduction	Load reductions in MS4 discharges	33.6 x 10^{12} MPN during Water Year 2003 (based on TMDL modeling) [b]	Reach mandatory reduction of dry weather bacteria loading from MS4 discharges identified in Attachment E	Loads[c] are reduced by 18.5% for Total Coliform; 17.4% for Fecal Coliform; 23.5% for Enterococcus from MS4 outfalls	Loads[d] are reduced by 37.02% for Total Coliform (TC), 34.72% for Fecal Coliform (FC), 46.98% for *Enterococcus (Ent)* from the MS4 outfalls	Loads[e] are reduced by 74.03% for Total Coliform (TC), 69.44% for Fecal Coliform (FC), 93.96% *for Enterococcus (Ent)* from the MS4 outfalls

a. In accordance with Permit Provisions 6.b.(3)(a)-(e) and 6.c.(3)(a)-(g) of Attachment E to Order R9-2013-0001.

b. Value from table on page A33 of Attachment A to TMDL Resolution No.R9-2010-0001; monthly value translated in annual load by multiplying by 12, then City of San Diego contribution estimated to be 43% of the overall load (as a proportion of the watershed area) was subtracted.

c. Values calculated as half of the interim goals.

d. Values taken from Table 6.6 of Attachment E to Order R9-2013-0001: Anticipated load reductions for WQIP strategies were modeled using Fecal Coliform (FC) as a surrogate for all Fecal Indicator Bacteria as noted in WQIP Appendices 3C and 3F, therefore target FC load reductions were set according to the largest required indicator bacteria reduction (among TC, FC and *Ent*) to be conservative; *Enterococcus* is the controlling indicator.

e. Values taken from Table 6.3 of Attachment E to Order R9-2013-0001: Anticipated load reductions for WQIP strategies were modeled using Fecal Coliform (FC) as a surrogate for all Fecal Indicator Bacteria as noted in WQIP Appendices 3C and 3F, therefore target FC load reductions were set according to the largest required indicator bacteria reduction (among TC, FC and *Ent*) to be conservative; *Enterococcus* is the controlling indicator.

Table A3-8. City of Santee Wet Weather Jurisdictional Numeric Goals

Title	Metric	Baseline	Outcome	1st Permit Term 2013 - 2018	2nd Permit Term 2018 - 2023	3rd Permit Term 2023 - 2028	4th Permit Term 2028 - 2033
						Meet TMDL Interim Compliance Date April 4, 2028 [a, b]	Meet TMDL Final Compliance Date April 4, 2031
MS4 Discharge Load Reduction	Load reductions in MS4 discharges; or	1,727 x 10^{12} MPN during Water Year 2003 (based on modeling) [c]	Reach mandatory reduction of dry weather bacteria loading from MS4 discharges identified in Attachment E	Loads[d] are reduced by 4.3% for Total Coliform; 4.3% for Fecal Coliform; 4.3% for Enterococcus from MS4 outfalls	Loads[e] are reduced by 8.7% for Total Coliform; 8.7% for Fecal Coliform; 8.7% for Enterococcus from MS4 outfalls	Loads[f] are reduced by 17.3% for Total Coliform; 17.3 for Fecal Coliform; 17.3% for Enterococcus from MS4 outfalls	Loads[g] are reduced by 34.7% for Total Coliform; 34.7% for Fecal Coliform; 34.7% for Enterococcus from MS4 outfalls

a. In accordance with Permit Provisions 6.b.(3)(a)-(e) and 6.c.(3)(a)-(g) of Attachment E to Order R9-2013-0001.

b. Request moving Interim TMDL Compliance Date from April 4, 2017 (per Attachment E, 6.c(1)) to April 4, 2020 to allow adequate time to investigate and mitigate bacteria sources, and monitor progress and adjust implementation through the adaptive management process.

c. Value from modeled baseline load as indicated in Appendix 3C of the WQIP.

d. Values calculated as half of the 2nd Permit Term goals.

e. Values calculated as half of the interim goals

f. Values calculated as half of the final goals

g. Values taken from City of San Diego Phase II CLRP: values deviate from final wet weather load reductions indicated in Table 6.3 of Attachment E to Order R9-2013-0001 because the modeling was updated, with San Diego Water Board concurrence, from Water Year 1993 performed in the 2010 TMDL to Water Year 2003 (considered an average rainfall year for the SDR Watershed) performed in the Phase II CLRP. This resulted in the required final load reduction for Fecal Coliform, for example, to change from 53.22% (Table 6.3, Att. E of 2013 Permit) to 34.7%.

3.4 City of San Diego Jurisdictional Goals

Table A3-9. City of San Diego Dry Weather Jurisdictional Numeric Goals

Compliance Pathways		Baseline	Goals by Assessment Period and Fiscal Year		
			Current Permit Term	FY 16-20	FY 21-25
			FY18	FY19[a]	FY21[a]
Receiving Water % Days Exceeding WQO	Fecal coliform	12.6% Days Exceeding WQO (2002[b])	See performance measures	6.3%	0%
	Enterococcus	19% Days Exceeding WQO (2002[b])		9.5%	0%
	Total coliform (shoreline only)	0.65% Days Exceeding WQO (2010[b])		0.33%	0%
Or					
Storm Drain Discharges % Days Exceeding WQO	Fecal coliform	88% Days Exceeding [c]	See performance measures	0%	0%
	Enterococcus	100% Days Exceeding [c]		0%	0%
	Total coliform (shoreline only)	97% Days Exceeding [c]		0%	0%
Or					
Storm Drain Discharges % Load Reduction	Fecal coliform	0% Load Reduction (2002 TMDL Model)	See performance measures	49.4%	98.8%
	Enterococcus			49.9%	99.9%
	Total coliform (shoreline only)			49.4%	98.8%
Or					
Storm Drain Discharges Implement Accepted Water Quality Improvement Plan		Metric for compliance analysis is storm drain discharge % load reduction (above). Interim compliance is implementation of strategies and schedule based on analysis results (Appendix 3F of the WQIP). Final compliance is implementation of BMPs based on analysis results and demonstration of compliance with any of the compliance pathways through monitoring and assessment. See WQIP Section 3.2.3 and Appendix 3F for modeling discussion.

Table A3-9. City of San Diego Dry Weather Jurisdictional Numeric Goals

Compliance Pathways	Baseline	Goals by Assessment Period and Fiscal Year		
		Current Permit Term	FY 16-20	FY 21-25
		FY18	FY19[a]	FY21[a]

a. Denotes total maximum daily load (TMDL) interim and final water quality-based effluent limitation (WQBEL). An alternative interim dry weather compliance date of April 4, 2019 is proposed as allowed per Attachment E.6.c.(1).

b. The existing exceedance frequency was calculated based on available monitoring data between 1996 and 2002 per Permit requirements and presented in more detail in Appendix 3C. The existing exceedance frequency for total coliform was calculated based on available monitoring data between 2004 and 2010 per Permit requirements and presented in more detail in Appendix 3C.

c. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008 through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the 5th sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of days in exceedance for the historical 5-year period.

d. Demonstration of exceedances of final receiving water limitations due to natural sources includes demonstration that pollutant loads from the stormwater conveyance system are not causing or contributing to exceedances.

e. City of San Diego rebates include grass replacement, rainwater harvesting, downspout disconnect, and micro irrigation.

f. Historic dry weather flow observations in the San Diego River WMA occurred at different outfalls than the FY 15-16 dry weather flow observations. The outfalls observed recently have very different characteristics compared to the outfalls sampled historically, so the average flows for the two time periods are not comparable. To account for this, the baseline dry weather flow for the San Diego River WMA was calculated based on the FY 15-16 outfall data from persistently flowing City of San Diego outfalls in the WMA (average FY 15-16 flow = 62.8 gallons per minute). An average of the reductions in dry weather flow observed for FY 15-16 in the Los Peñasquitos, San Dieguito River, Chollas Creek, and Mission Bay WMAs was calculated (-46.7% change). The same percent change was assumed for the San Diego River WMA, which resulted in a baseline dry weather flow of 117.8 gallons per minute.

g. Does not include allowable discharges as defined in Provision A and Provision E.2.a of the Permit.

% = percent; FY = fiscal year; WQO = Water Quality Objective

Table A3-10. City of San Diego Wet Weather Jurisdictional Numeric Goals

</table>

a. Denotes total maximum daily load (TMDL) interim and final water quality-based effluent limitation (WQBEL). An alternative interim wet weather compliance data of April 4, 2024 is proposed as allowed per Attachment E.6.c.(1).

b. Denotes existing wet weather frequency as modeled in the Bacteria TMDL. With limited baseline monitoring data available, this goal reflects a reasonable estimate considering the difficulty in demonstrating progress within the receiving water during wet weather in a short amount of time. Furthermore, development and redevelopment of the urban environment has occurred since the Bacteria TMDL baseline loads were calculated in 2001. As such, this goal demonstrates that progress has been made by the Participating Agencies by maintaining the existing wet weather exceedance frequency.]

c. Wet weather baseline exceedance rate calculated using targeted and random MS4 wet weather monitoring data from October 1, 2008 through September 30, 2013. Monitoring data were assessed similar to the method outlined in Attachment E.6 of the 2013 MS4 Permit for each monitoring year. The observed wet weather days in exceedance were summed and divided by the total wet weather days in exceedance for the historical 5-year period.

d. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring. Assumed to be all 65 of City's major outfalls in WMA.

e. Demonstration of exceedances of final receiving water limitations due to natural sources includes demonstration that pollutant loads from stormwater conveyance systems are not causing or contributing to exceedances.

3.5 COUNTY OF SAN DIEGO JURISDICTIONAL GOALS

Table A3-11. County of San Diego Dry Weather Jurisdictional Numeric Goals

Compliance Pathway	Title	Metric[a]	Baseline	Final Outcome	1st Permit Term 2013 – 2018	2nd Permit Term 2018 – 2023	
						TMDL Interim Compliance Date April 4, 2020[b]	TMDL Final Compliance Date April 4, 2021
1; or	No Discharge from MS4; or	Discharge from MS4 outfalls; or	To be established during FY 15-16 monitoring	Elimination of flow[k] from MS4 discharges	Flow eliminated from 25% of outfalls or cumulative flow from storm drain outfalls reduced by 25%	Flow eliminated from 50% of outfalls or cumulative flow from storm drain outfalls reduced by 50%	Flow eliminated from 100%[c] of outfalls or cumulative flow from storm drain outfalls reduced by 100%[c]
2; or	Meet TMDL Limits in Receiving Water; or	Bacteria concentrations & exceedance percentage in receiving waters; or	Not applicable	Achievement of WQOs or allowed exceedance percentage for bacteria	None	Bacteria concentrations at the compliance point identified in the Monitoring and Assessment Pan are below the applicable WQO (e.g., 400 MPN/100mL single sample maximum for Fecal Coliform)[l] or TMDL allowed exceedance percentage[d] of 0.28% for Total Coliform; 0% for Fecal Coliform; 1.5% for *Enterococcus*	Bacteria concentrations at the compliance point identified in the Monitoring and Assessment Pan are below the applicable WQO or TMDL allowed exceedance percentage[e] of 0% for Total Coliform, Fecal Coliform and *Enterococcus*
3; or	MS4 Discharge Meets TMDL Limits; or	Bacteria concentrations & exceedance percentage in MS4discharges; or					
4; or	MS4 Discharge Load Reduction; or	Load reductions in MS4 discharges; or	14.4×10^{12} MPN during Water Year 2003 (based on TMDL modeling) [f]	Reach mandatory reduction of dry weather bacteria loading from MS4 discharges identified in Attachment E	Loads[g] are reduced by 18.5% for Total Coliform; 17.4% for Fecal Coliform; 23.5% for Enterococcus from MS4 outfalls[k]	Loads[h] are reduced by 37.02% for Total Coliform (TC), 34.72% for Fecal Coliform (FC), 46.98% for *Enterococcus (Ent)* from the MS4 outfalls[k]	Loads[i] are reduced by 74.03% for Total Coliform (TC), 69.44% for Fecal Coliform (FC), 93.96% *for Enterococcus (Ent)* from the MS4 outfalls[k]
5; or	Exceedance due to Natural Sources; or	Exceedances due to natural sources, and MS4 outfall loads not causing or contributing to exceedances; or	To be established during FY 14-15 monitoring	Elimination of human and dog fecal markers from MS4 discharges and MS4 outfall loads not causing or contributing to exceedances	Number of MS4 outfalls with human and dog fecal markers detected are reduced by 25% and MS4 outfall loads not causing or contributing to exceedances	Number of MS4 outfalls with human and dog fecal markers detected are reduced by 50% and MS4 outfall loads not causing or contributing to exceedances	Number of MS4 outfalls with human and dog fecal markers detected are reduced by 100% [j] and MS4 outfall loads not causing or contributing to exceedances
6	Water Quality Improvement Plan (WQIP)	Implement WQIP	Not Applicable	Implementation of the WQIP in accordance with Attachment E of Permit	Implement WQIP supported by a reasonable assurance as accepted by the San Diego Water Board	Submit and fully implement WQIP, accepted by the San Diego Water Board, which provides reasonable assurance that interim TMDL compliance requirements will be achieved by the interim compliance dates	Develop and implement WQIP as follows: (i) incorporate BMPs required under Permit Provision 6.b.(2)(c) in WQIP (ii) Include analysis to demonstrate that implementation of BMPs required by Provision 6.b.(2)(c) achieves compliance with Specific Provisions 6.b.(3)(a), 6.b.(3)(b), 6.b.(3)(c), 6.b.(3)(d), and/or 6.b.(3)(e) (iii) The results analysis must be accepted San Diego Water Boards as part of the WQIP (iv) Responsible Copermittee continue to implement the BMPs in (i), AND (v) Responsible Copermittee continue to perform specific monitoring and assessments from Provision 6.d to demonstrate compliance with Specific Provisions 6.b.(3)(a), 6.b.(3)(b), 6.b.(3)(c), 6.b.(3)(d), 6.b.(3)(e), and/or 6.b.(3)(f)

Table A3-11. County of San Diego Dry Weather Jurisdictional Numeric Goals

Compliance Pathway	Title	Metric[a]	Baseline	Final Outcome	1st Permit Term 2013 – 2018	2nd Permit Term 2018 – 2023	
						TMDL Interim Compliance Date April 4, 2020[b]	TMDL Final Compliance Date April 4, 2021
WQIP Pathway							
6a	Eliminate anthropogenic dry weather flows [l] from storm drain outfalls	% reduction of flow volume or number of outfalls with persistent flows	To be established FY 15-16 using dry weather flow measurements.	Effectively eliminate anthropogenic dry weather flow from storm drain outfalls to receiving water.	Reduce by 20% the aggregate flow volume or the number of persistently flowing outfalls.	Reduce by 75% the aggregate flow volume or the number of persistently flowing outfalls.	Eliminate 100% anthropogenic dry weather discharges and accompanying bacteria loads from storm drain outfalls to the receiving water.

a. In accordance with Permit Provisions 6.b.(3)(a)-(e) and 6.c.(3)(a)-(g) of Attachment E to Order R9-2013-0001.

b. Request moving Interim TMDL Compliance Date from April 4, 2018 (per Attachment E, 6.c(1)) to April 4, 2020 to allow adequate time to investigate and mitigate bacteria sources, and monitor progress and adjust implementation through the adaptive management process.

c. Goal of 100% flow elimination in accordance with Provision 6.b.(3)(a).

d. Interim dry weather Allowable Exceedance Percentages were calculated based on half the value of the existing 30-day Geometric Mean of exceedance percentages based on beach sample data from 2004 through 2010; Annual Bacteria TMDL Monitoring Report is included in Appendix L of the Transitional Monitoring and Assessment Report for the San Diego River Watershed Management Area (2012-2014) (http://www.projectcleanwater.org/images/stories/Docs/San-Diego-River/SDR_TMAR_2015.zip). From this report, the San Diego River watershed compliance reduction milestones/existing and interim and final exceedance frequencies are provided in Table 1 – 2 on page 1 – 8 (specifically, footnote “a” under the table). The interim and existing exceedance frequency calculation methodology is summarized in section 2.4 on page 2 – 9 of the document.

e. Final dry weather Allowable Exceedance Percentages are from Tables 6.2a, 6.2b, and 6.2c of Attachment E to Order No.R9-2013-0001.

f. Value derived from table on page A33 of Attachment A to TMDL Resolution No.R9-2010-0001 for the San Diego River watershed; monthly value translated in annual load for watershed by multiplying by 12. Baseline load for County of San Diego was calculated as a proportion of County land area to that of the overall watershed, i.e. approximately 24%

g. Values calculated as half of the interim goals.

h. Values taken from Table 6.6 of Attachment E to Order R9-2013-0001: Anticipated load reductions for WQIP strategies were modeled using Fecal Coliform (FC) as a surrogate for all Fecal Indicator Bacteria as noted in WQIP Appendices 3C and 3F, therefore target FC load reductions were set according to the largest required indicator bacteria reduction (among TC, FC and *Ent*) to be conservative; *Enterococcus* is the controlling indicator.

i. Values taken from Table 6.3 of Attachment E to Order R9-2013-0001: Anticipated load reductions for WQIP strategies were modeled using Fecal Coliform (FC) as a surrogate for all Fecal Indicator Bacteria as noted in WQIP Appendices 3C and 3F, therefore target FC load reductions were set according to the largest required indicator bacteria reduction (among TC, FC and *Ent*) to be conservative; *Enterococcus* is the controlling indicator.

j. Goal of 100% of exceedances demonstrated to be due to natural sources in accordance with Provision 6.b.(3)(e).

k. There are a total of 5 compliance points in the San Diego River watershed; Total Coliform is only applicable in the ocean.

l. Flow is defined as all dry weather flows excluding groundwater, other exempt or permitted non-stormwater flows, and sanitary sewer overflows.

Table A3-12. County of San Diego Wet Weather Jurisdictional Numeric Goals

Compliance Pathway	Title	Metric[a]	Baseline	Final Outcome	1st Permit Term 2013 – 2018	2nd Permit Term 2018 – 2023	3rd Permit Term 2023 – 2028	4th Permit Term 2028 – 2033
							Meet TMDL Interim Compliance Date April 4, 2028[b]	Meet TMDL Final Compliance Date April 4, 2031
1; or	No Discharge from MS4; or	Discharge from MS4 outfalls; or	To be established during FY 15-16 monitoring	Elimination of flow from MS4 discharges	Flow eliminated from 10% of outfalls or cumulative flow from storm drain outfalls reduced by 10%	Flow eliminated from 25% of outfalls or cumulative flow from storm drain outfalls reduced by 25%	Flow eliminated from 50% of outfalls or cumulative flow from storm drain outfalls reduced by 50%	Flow eliminated from 100%[c] of outfalls or cumulative flow from storm drain outfalls reduced by 100 %[c]
2; or	Meet TMDL Limits in Receiving Water; or	Bacteria concentrations & exceedance percentage in receiving waters; or	Not applicable	Achievement of allowed exceedance percentage for bacteria	None	None	Bacteria concentrations are below the applicable WQO (e.g., 400 MPN/100mL single sample maximum for Fecal Coliform)[n] or TMDL allowed exceedance percentage [d] of 46% for Total Coliform (Beach); 43% for Fecal Coliform; 49%(creeks) & 51%(beaches) for *Enterococcus*	Bacteria concentrations are below the applicable WQO or TMDL allowed exceedance percentage[e] of 22% for Total Coliform, Fecal Coliform and *Enterococcus*
3; or	MS4 Discharge Meets TMDL Limits; or	Bacteria concentrations & exceedance percentage in MS4discharges; or						
4; or	MS4 Discharge Load Reduction; or	Load reductions in MS4 discharges; or	1,727 x 10^{12} MPN during Water Year 2003 (based on modeling) [f]	Reach mandatory reduction of dry weather bacteria loading from MS4 discharges identified in Attachment E	Loads[g] are reduced by 4.3% for Fecal Coliform; 3.5% for *Enterococcus* from MS4 outfalls	Loads[h] are reduced by 8.7% for Fecal Coliform; 7.1% for *Enterococcus* from MS4 outfalls	Loads[i] are reduced by 17.3 for Fecal Coliform; 14.1% for *Enterococcus* from MS4 outfalls	Loads[j] are reduced by 34.7% for Fecal Coliform; 28.2% for Enterococcus from MS4 outfalls
5; or	Exceedance due to Natural Sources; or	Exceedances due to natural sources, and MS4 outfall loads not causing or contributing to exceedances; or	To be established during FY 14-15 monitoring	Elimination of human and dog fecal markers from MS4 discharges and MS4 outfall loads not causing or contributing to exceedances	Number of MS4 outfalls with human and dog fecal markers detected are reduced by 25%	Number of MS4 outfalls with human and dog fecal markers detected are reduced by 50% and MS4 outfall loads not causing or contributing to exceedances	Number of MS4 outfalls with human and dog fecal markers detected are reduced by 75% and MS4 outfall loads not causing or contributing to exceedances	Number of MS4 outfalls with human and dog fecal markers detected are reduced by 100%[k] and MS4 outfall loads not causing or contributing to exceedances
6	Water Quality Improvement Plan (WQIP)[l]	Implement WQIP	Not Applicable	Implementation of the WQIP in accordance with Attachment E of Permit	Implement WQIP supported by a reasonable assurance as accepted by the San Diego Water Board	Implement WQIP supported by a reasonable assurance as accepted by the San Diego Water Board	Submit and fully implement WQIP, accepted by the San Diego Water Board, which provides reasonable assurance that interim TMDL compliance requirements will be achieved by the interim compliance dates	Develop and implement WQIP as follows: (i) incorporate BMPs required under Permit Provision 6.b.(2)(c) in WQIP (ii) Include analysis to demonstrate that implementation of BMPs required by Provision 6.b.(2)(c) achieves compliance with Specific Provisions 6.b.(3)(a), 6.b.(3)(b), 6.b.(3)(c), 6.b.(3)(d), and/or 6.b.(3)(e) (iii) The results analysis must be accepted San Diego Water Boards as part of the WQIP (iv) Responsible Copermittee continue to implement the BMPs in (i), AND (v) Responsible Copermittee continue to perform specific monitoring and assessments from Provision 6.d to demonstrate compliance with Specific Provisions 6.b.(3)(a), 6.b.(3)(b), 6.b.(3)(c), 6.b.(3)(d), 6.b.(3)(e), and/or 6.b.(3)(f)

Table A3-12. County of San Diego Wet Weather Jurisdictional Numeric Goals

Compliance Pathway	Title	Metric[a]	Baseline	Final Outcome	1st Permit Term 2013 – 2018	2nd Permit Term 2018 – 2023	3rd Permit Term 2023 – 2028	4th Permit Term 2028 – 2033
							Meet TMDL Interim Compliance Date April 4, 2028[b]	Meet TMDL Final Compliance Date April 4, 2031
WQIP Pathway								
6a	Implement Plan with focus on programmatic BMPs and use adaptive management to increase effectiveness	% bacterial load reduction	1,727 x 10^{12} MPN during Water Year 2003	Reduce baseline bacteria loads by 10% from storm drain outfalls to meet TMDL required load reductions.	Implement programmatic (non-structural) BMPs to achieve source reduction of bacteria loads from the storm drain outfalls.	Reduce bacteria loads by 2% from the storm drain outfalls through continued implementation of programmatic BMPs and, based on adaptive management, focus and enhance efforts where needed.	Reduce bacteria loads by an additional 4% (total 6%) from the storm drain outfalls by continued implementation of programmatic BMPs.	Reduce bacteria loads by an additional 4% (total 10%) from the storm drain outfalls by continued implementation of programmatic BMPs.
6b	Structural BMPs[m] (as needed and as funding is available)	% bacterial load reduction based on quantitative model	1,727 x 10^{12} MPN during Water Year 2003	Reduce baseline bacteria loads by 24.7% from storm drain outfalls to receiving water to meet TMDL required load reductions.	Reduce by 1% the baseline bacteria loads from distributed BMPs constructed between 2003 and 2009 during redevelopment.	Reduce bacteria loads by an additional 2% (total 3%) through participation in the public private partnership program. Begin planning & design for additional long-term structural BMPs.	Reduce bacteria loads by an additional 8.8% (total 11.8%) through additional participation in the public private partnership program (5.5%) and reduction through BMPs required through redevelopment (3.3 %); Continue planning & permitting for long-term structural BMPs.	Reduce bacteria loads by 12.9% (total 24.7%) from constructed distributed and regional structural BMPs (10.6%), and participation in the public private partnership program (2.3%).

a. In accordance with Permit Provisions 6.b.(3)(a)-(e) and 6.c.(3)(a)-(g) of Attachment E to Order R9-2013-0001.
b. Request moving Interim TMDL Compliance Date from April 4, 2021 (per Attachment E, 6.c(1)) to April 4, 2028 to allow adequate time to investigate and mitigate bacteria sources, and monitor progress and adjust implementation through the adaptive management process.
c. Goal of 100% flow elimination in accordance with Provision 6.b.(3)(a).
d. Interim wet weather Allowable Exceedance Percentages are from Tables 6.5 of Attachment E to Order No.R9-2013-0001.
e. Final wet weather Allowable Exceedance Percentages are from Tables 6.2a, 6.2b, and 6.2c of Attachment E to Order No.R9-2013-0001.
f. Value from modeled baseline load as indicated in Section 3.1.3.5 of the WQIP.
g. Values calculated as half of the 2nd Permit Term goals.
h. Values calculated as half of the interim goals
i. Values calculated as half of the final goals
j. Final Wet weather load reduction values as indicated in Table 6.3 of Attachment E to Order R9-2013-0001 for Fecal Coliform and *Enterococcus* were updated, with San Diego Water Board concurrence, to reflect load reduction modeling utilizing Water Year 2003 (considered an average rainfall year for the SDR Watershed) instead of Water Year 1993 as utilized in the 2010 TMDL model. This updated modeling analysis and the results are presented in the City of San Diego – San Diego River Watershed Comprehensive Load Reduction Plan – Phase II (available from the City of San Diego Storm Water Division website, under Plans and Reports tab at: http://www.sandiego.gov/stormwater/pdf/sdrclrpupdate.pdf). This resulted in the required final load reduction for Fecal Coliform, for example, to change from 53.22% (Table 6.3, Att. E of 2013 Permit) to 34.7%.
k. Goal of 100% of exceedances demonstrated to be due to natural sources in accordance with Provision 6.b.(3)(e).
l. To meet the final wet weather target load reduction of 34.7% for Fecal Coliform, the County through quantitative modeling has demonstrated a 10% reduction from programmatic BMPs and a 24.7% reduction from structural BMPs. Progress will be monitored and adjustments through adaptive management will be used to update the plan.
m. The County of San Diego is concerned that a long-term funding source is not identified for constructing and maintaining structural BMPs, if structural BMPs are needed to meet compliance.

3.6 CALTRANS

Caltrans storm water flows are not included in the Municipal Stormwater Permit; however, Caltrans is subject to similar requirements through its own stormwater permit (State Water Resources Control Board [SWRCB], 2012). Caltrans has voluntarily contributed to the WQIP effort to provide a consistent and subwatershed-wide approach to meeting applicable TMDL requirements. The baseline strategies are continuously implemented and augmented as resources become available. Attachment IV to the Caltrans Stormwater Permit outlines a methodology for prioritizing stream segments included in TMDLs to which Caltrans is subject. The Permit establishes best management practice (BMP) implementation requirements, evaluated in terms of compliance units. Caltrans is expected to achieve 1,650 compliance units per year through the implementation of retrofit BMPs, cooperative implementation, and post-construction treatment beyond Permit requirements.

Impaired reaches throughout the state will be prioritized on the basis of several factors, including, but not limited to, percent reduction needed, Caltrans drainage area contributing to the reach, and proximity to receiving waters. Reaches with metals TMDLs will likely be prioritized. This prioritization list is currently under negotiation between Caltrans Head Quarters and the State Board.

Caltrans' jurisdiction areas include roadways, land adjacent to roadways, and facilities. Caltrans' jurisdictional strategies specifically focus on BMP implementation to reduce known pollutants within these areas. Caltrans' strategies vary from those of other Participating Agencies (in both type and name) to best address freeway characterization discharges from its right-of-way. Strategies include programs developed by Caltrans Headquarters for statewide execution and District 11 implementation. Caltrans' implementation of strategies with the watershed is dependent on legislative approval. For Bacteria TMDLs, Caltrans is expected to eliminate dry weather flows by implementing control measures to ensure effective prohibition (Provision B.2 of the Stormwater Permit). For wet weather flows, Caltrans is expected to implement control measures or BMPs to prevent discharge of bacteria from the right-of-way; this can be source control and preemptive activities such as street sweeping, cleanup of illegal dumping, and public education on littering. Implementation of these controls is per the TMDL prioritization list.

APPENDIX 4

Monitoring and Assessment Results

Appendix 4 Monitoring and Assessment Results

The purpose of this appendix is to provide the monitoring and assessment results for the 2015-2016 monitoring year for the San Diego River Watershed Management Area (WMA or Watershed). Whereas Section 3 of this Annual Report focuses on the highest priority water quality condition (HPWQC) in the WMA (i.e., bacteria), this appendix will present all of the receiving water and storm drain outfall monitoring data collected during the 2015-2016 monitoring year, including monitoring and assessment results for priority water quality conditions (PWQCs). The PWQCs for the watershed include eutrophic conditions, total dissolved solids (TDS), nitrogen, phosphorus, the Index of Biotic Integrity (IBI), and total nitrogen as N during dry conditions. Also described below are monitoring programs required by the Permit for which no data were collected during the 2015-2016 monitoring year because the monitoring requirement has been met or will be met in future years of the Permit term. Caltrans is not a Participating Agency for the monitoring and assessment program described in this section, as Caltrans is regulated under a separate permit from the State Water Resource Control Board (SWRCB).

4.1 Receiving Water Monitoring

For the San Diego River WMA, the long-term receiving water monitoring and sediment monitoring requirements of the Permit were met during the 2013-2014 monitoring year. Detailed results for all analytes evaluated can be found in the *Transitional Monitoring and Assessment Program Report for the San Diego River Watershed Management Area (2012-2014)* (WESTON, 2015a) and the Sediment Monitoring Report (WESTON, 2015b). Receiving water monitoring in the San Diego River WMA during the 2015-2016 monitoring year included participation in the Southern California Stormwater Monitoring Coalition (SMC) and Hydromodification Monitoring Program (HMP) regional monitoring programs. Total maximum daily load (TMDL) monitoring for indicator bacteria was also conducted in receiving waters during 2015-2016. Receiving water results collected under these programs are summarized below.

The receiving water assessments required by Permit Provision D.4.a will be addressed in the Regional Monitoring and Assessment Report (RMAR), which will be submitted to the Regional Board in December 2017 with the Report of Waste Discharge (ROWD) in accordance with Provision D.4.a.1.(b).

4.1.1 Stormwater Monitoring Coalition Regional Monitoring

Since 2001, the Copermittees have partnered with regulated stormwater municipalities in southern California, the Regional Boards of Southern California, and the Southern California Coastal Water Research Project (SCCWRP) to form the SMC. The goal of the SMC is to develop the technical information necessary to better understand stormwater mechanisms and impacts and develop the tools to improve stormwater decision-making (SMC, 2016).

The Copermittees are continuing to participate in the SMC Regional Freshwater Stream Bioassessment Monitoring Program (SMC Regional Bioassessment Program). In 2015, a new five-year SMC program began that extended the initial survey to answer key management questions about the impacts of stormwater on stream conditions. Several modifications were made to the previous surveys to emphasize detection of trends and to address data gaps. Specifically, monitoring of high-priority stressors (i.e., habitat, nutrients, and ionic composition) was continued, whereas monitoring of low-priority stressors (i.e., water column metals, pyrethroids, and toxicity) was discontinued. Flow regime (hydrologic state checklist derived from Gallart et al. [2010] and water level loggers), vertebrate occurrence, and new stressors of interest (i.e., sediment pyrethroids and toxicity) were added to the list of monitored parameters, although sediment sampling has been deferred until further action by the SMC Executive Committee. In addition, the physical habitat assessment has been enhanced with hydromodification screening (modified from Bledsoe et al., 2010) at unarmored or partially armored condition sites and a channel engineering checklist at all condition sites. The hydromodification screening and channel engineering checklist will also be assessed at trend sites at least once during the five-year study. The trend sites were selected from previously sampled sites under earlier probabilistic surveys in order to estimate changes in regional conditions over time, and the condition sites were selected from a new probabilistic sample draw in order to estimate current regional conditions.

The 2015-2016 monitoring year was the second under the updated 2015-2019 SMC Regional Bioassessment Program. Monitoring was conducted at three condition locations in the San Diego River WMA, 907M23331 in Los Coches Creek in the Coches hydrologic subarea (HSA) (907.14), 907M23327 in Alpine Creek in the Alpine HSA (907.33), and 907M23330 in Cedar Creek in the Inaja HSA (907.41) (Table A4-1, Figure A4-1).

Table A4-1. 2015-2016 Bioassessment Monitoring Locations in the San Diego River WMA

Site ID	Site Type	Land Use	Date Sampled	Latitude	Longitude
907M23327 – Alpine Creek	Condition	Urban	6/8/2016	32.83692	-116.78855
907M23330 – Cedar Creek	Condition	Open	6/9/2016	33.00327	-116.70560
907M23331 – Los Coches Creek	Condition	Urban	6/8/2016	32.83996	-116.90709

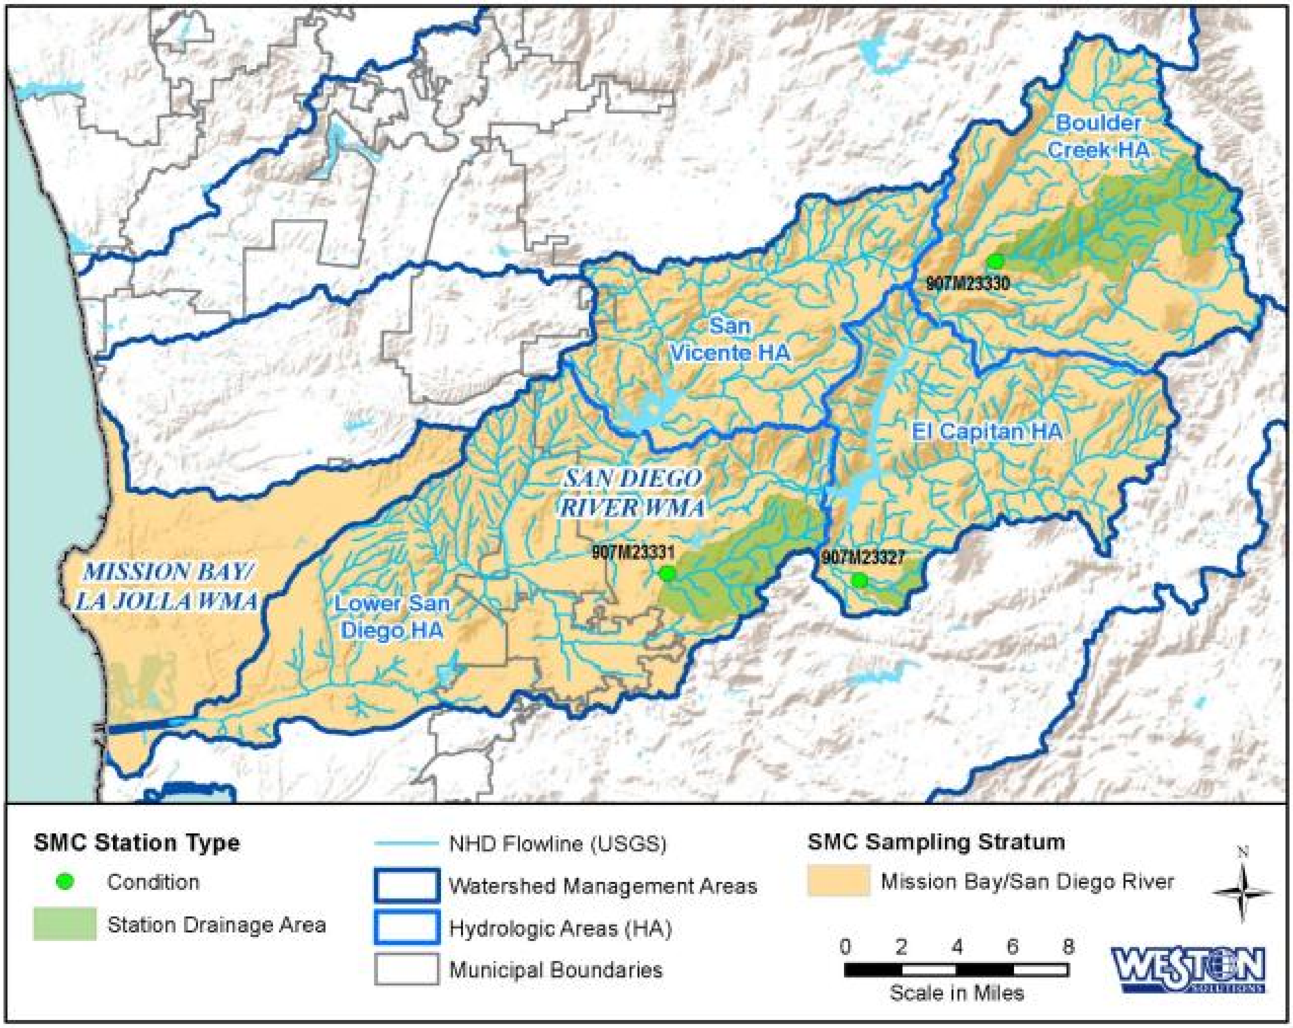

Figure A4-1. 2015-2016 Bioassessment Monitoring Locations in the San Diego River WMA, Mission Bay/San Diego River Stratum

Laboratory analyses included benthic macroinvertebrate (BMI) taxonomy by Ecoanalysts Inc., BMI taxonomic QC analysis by the California Department of Fish and Wildlife (CDFW) Aquatic Bioassessment Laboratory, benthic algae taxonomy by California State University – San Marcos (soft algae and diatoms), and chemistry analyses by Weck Laboratories, Inc. and PHYSIS Environmental Laboratories, Inc. Samples were collected following the protocols outlined in the Bioassessment Survey of the Stormwater Monitoring Coalition (SCCWRP, 2015). BMI data analyses included a taxonomic listing of all BMIs identified in the surveys and calculation of the biological metrics listed in the California Stream Bioassessment Procedure (CSBP). Additionally, the calculation of the California Stream Condition Index (CSCI), an index that rates the overall BMI community quality, was performed. The CSCI is a newly developed analytical tool, finalized in 2013 (Mazor et al., 2016), that is applicable statewide in California and is now being utilized in place of the IBI to assess the health of freshwater streams. The CSCI combines a predictive multi-metric index (pMMI) (a measure of ecological structure) with a predictive observed to expected (O/E) ratio index (a measure of taxonomic completeness), and also incorporates local watershed geology and climate factors. The predictive components of the CSCI scoring tool allow for comparisons of the site being scored to a subset of other sites in California that the CSCI determines to be most similar. Algal data analyses included a taxonomic listing of all taxa identified and calculation of algal metrics and three algal IBIs (Fetscher et al., 2014 and SCCWRP, 2014). These data are typically available in February of the year following the survey (i.e., February 2017).

Bioassessment monitoring results for the Los Coches Creek, Alpine Creek, and Cedar Creek locations are summarized in Table A4-2 (CSCI scores), Table A4-3 (physical habitat assessment scores), and Table A4-4 (chemistry results). Additional data are provided in Attachment 4A to this appendix, including Taxonomic Listing of Benthic Macroinvertebrates (4A-1), Ranked Abundance of Benthic Macroinvertebrates (4A-2), and CSCI Metrics (4A-3). A Quality Assurance/Quality Control (QA/QC) report is provided as Attachment 4A-4. Results are summarized below, and more detailed results will be available in the interim and final reports developed by the SMC Workgroup. Interim reports are expected every one to two years, and the final report produced under the 2015-2019 Workplan is anticipated in Spring 2021 (SCCWRP, 2015).

Whereas data related to bacteria are not collected under the SMC Regional Bioassessment Program, data are collected for nitrogen and phosphorus, which are PWQCs for the watershed. At least one of these nutrients was above the water quality objectives at the Los Coches Creek and Alpine Creek locations, whereas all measured nutrients were below water quality objectives at the Cedar Creek location in the upper watershed.

4.1.1.1 Los Coches Creek

The CSCI score for the Los Coches Creek location, 907M23331, indicated that the benthic community is likely altered. The score was only two points below the possibly intact range (Table A4-2). Taxa richness was only slightly below the predicted taxonomic richness at this location (Attachment 4A-3). The BMI community was dominated by the mayfly *Fallceon sp.* and the crustacean class *Ostracoda* (34% and 17% of the composition of the sample, respectively) (Attachment 4A-2). The numbers of several types of taxa that tend to decrease in response to impairment were below predicted numbers, although some only slightly (the site-specific predicted numbers are those expected if the site was healthy) (Attachment 4A-3). Physical habitat quality as measured by the California Rapid Assessment Method (CRAM) score was moderate (Table A4-3).

Chemistry data was collected for physical and general chemistry, periphyton (ash-free dry mass [AFDM] and chlorophyll-a), and nutrients. Results indicated that total nitrogen and total phosphorus were slightly above benchmarks. All other parameters met water quality objectives, where applicable, although specific conductivity was elevated (Table A4-4). High specific conductance may have an effect on BMI. Specific conductivity is a measurement of the ability of water to conduct electricity where dissolved ions (i.e., Na+, Ca+2, SO4-2, etc.) serve as the conductor (SWRCB Fact Sheet-3.1.3.0(EC)V2e). Thus, specific conductance is related to TDS content. Although the effect of elevated TDS on BMI is variable among different taxa and not well understood, a number of studies have demonstrated a correlation between changes in conductivity/TDS with both altered BMI (Minshall and Minshall, 1978) and algal communities (Leland and Porter, 2000). Results from the first SMC five-year report suggest that elevated TDS is a condition common to the entire region, affecting 76% of stream miles in Southern California (Mazor, 2015).

4.1.1.2 Alpine Creek

At the Alpine Creek location, 907M223327, the CSCI score indicated that the benthic community is very likely altered. The score was one point below the likely altered range (Table A4-2). Taxa richness was below the predicted taxonomic richness at this location (Attachment 4A-3), and the BMI community was dominated by the freshwater snail *Physa sp.* and the crustacean class *Ostracoda* (43% and 35% of the composition of the sample, respectively) (Attachment 4A-2). The numbers of several types of taxa that tend to decrease in response to impairment were below predicted numbers (Attachment 4A-3). Physical habitat quality as measured by the CRAM score was moderate (Table A4-3).

Chemistry results indicated that dissolved oxygen did not meet water quality objectives (concentration was below minimum level), and chloride, sulfate, and total nitrogen were above their respective water quality objectives (concentrations exceeded standards). All other parameters met water quality objectives, where applicable, although specific conductivity was elevated (Table A4-4).

4.1.1.3 Cedar Creek

At the Cedar Creek location, 907M23330, the CSCI score indicated that the benthic community is likely intact (Table A4-2). Taxa richness was above the predicted taxonomic richness at this location (Attachment 4A-3). The highest numbers observed in the BMI community were the mayfly *Callibaetis sp.*, the damselfly *Coenagrionidae*, and the freshwater snail *Physa sp.* (18%, 15%, and 14% of the composition of the sample, respectively) (Attachment 4A-2). The numbers of some taxa that tend to decrease in response to impairment were close to or above predicted numbers (Attachment 4A-3). Physical habitat quality as measured by the CRAM score was moderate, one point below the high range (Table A4-3).

Chemistry results for chloride were above the water quality objective. All other parameters met water quality objectives, where applicable (Table A4-4). The specific conductivity value was below the other two stations in the WMA that received comparatively lower bioassessment scores.

Table A4-2. 2016 CSCI Scores for the San Diego River WMA

StationCode	Count	E	Mean_O	OoverE	MMI	CSCI
907M23331 – Los Coches Creek	672	6.98	6.00	0.86	0.70	0.78
907M23327 – Alpine Creek	675	6.81	5.00	0.73	0.50	0.62
907M23330 – Cedar Creek	653	7.61	8.55	1.12	0.99	1.06

Count - the total number of organisms in the sample; E-the sum of all capture probabilities >0.5 at a site (# of common taxa); Mean_O - The number of common taxa observed at a site; OoverE - O/E as calculated; MMI - the pMMI score, a minimum threshold has not been established, but low values should be considered indicative of degradation; CSCI - the CSCI score, calculated as the average of the O/E and the pMMI. CSCI scores indicate benthic communities that are very likely altered (scores of 0.00 to 0.62), likely altered (0.63 to 0.79), possibly intact (0.80 to 0.91), or likely intact (above 0.92).

Table A4-3. 2016 Physical Habitat Assessment Scores for the San Diego River WMA

Physical Habitat Measures	Los Coches Creek	Alpine Creek	Cedar Creek
	907.14	907.33	907.41
	907M23331	907M23327	907M23330
	6/8/2016	6/8/2016	6/9/2016
Elevation (feet)	160	474	551

<-Results less than the method detection limit.

NS - Not sampled.

[a] Water Quality Objective is based on the San Diego Regional Water Quality Control Plan by watershed for the San Diego Region (Basin Plan), 1994 (with amendments effective on or before April 4, 2011) and may vary by hydrologic area.

[b] Water Quality Objective is based on the criterion continuous concentration (CCC) using water temperature and pH as described in the U.S. EPA, 2013 Aquatic Life Ambient Water Quality Criteria for Ammonia - Freshwater, EPA-822-R-13-001, April 2013.

J - Analyte was detected at a concentration below the reporting limit and above the method detection limit. Reported value is estimated.

Bolded/shaded results do not meet water quality objectives.

4.1.2 Regional Hydromodification Monitoring Program (HMP)

Hydromodification is the potential alteration and erosion of creeks, streams, and natural habitats that may be associated with urbanization of the tributary watershed. A regional Hydromodification Management Plan has been developed to manage increased runoff discharge rates and durations and address impacts to beneficial uses and stream habitat (County of San Diego, 2011). A regional HMP was also developed to evaluate the criteria established in the Hydromodification Management Plan. While only one reference station was located within the San Diego River WMA, the Hydromodification Management Plan criteria will apply to future development in the WMA, and therefore the regional results of this monitoring program are applicable.

The 2011 HMP represents a five-year monitoring program that involved channel sediment transport assessments, and continuous flow monitoring of pre-project, post-project, and reference conditions. An iterative and phased approach was used in implementation of each year of monitoring. The fifth and final year of monitoring was completed in 2015-2016. Results of the HMP are presented in the *Effectiveness Assessment of the San Diego Hydromodification Management Plan*, which is available online at:
http://www.projectcleanwater.org/attachments/article/75/2016_LDW_HMPrpt.pdf.

The results of the HMP indicate that the Hydromodification Management Plan is working as planned. Sediment rating curves were developed based on extensive wet weather monitoring data collected from the 2011-2012 to 2015-2016 wet weather seasons. Analysis of these curves shows that the Plan's channel susceptibility tools appropriately define flow rates that initiate the movement of channel and bank materials (ESA et al., 2016). As shown by monitoring of stream cross sections, no major changes in channel stability were observed to occur within the nine monitored channel sites that were located throughout the San Diego Region. Wet weather data from 2015-2016 indicated that a constructed best management practice (BMP) system worked as designed to prevent hydromodification across a wide range of geomorphically significant conditions. Collectively, this shows that the Plan provides for the protection of the beneficial uses of receiving waters from the effect of hydromodification from new and redevelopment. Based on these findings, the HMP effectiveness assessment monitoring is completed and no additional monitoring is recommended (ESA et al., 2016).

4.1.3 Total Maximum Daily Load Monitoring

In February 2010, the San Diego Regional Water Quality Control Board (Regional Board) adopted Resolution No. R9-2010-0001, *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) to Incorporate Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)* (Bacteria TMDL) (Regional Board, 2010). This TMDL amendment to the Water Quality Control Plan for the San Diego Region (Basin Plan) (Regional Board, 1994) includes three segments within the San Diego River WMA, Forester Creek, the Lower San Diego River, and the Pacific Ocean Shoreline at San Diego River mouth at Dog Beach. The TMDL was approved by the SWRCB on December 14, 2010; by the Office of Administrative Law on April 4, 2011; and by the United States Environmental Protection Agency (USEPA) on June 22, 2011. The TMDL became effective under state law on April 4, 2011, the date of Office of Administrative Law approval. The responsible Agencies within the San Diego River WMA regulated under the Permit include the cities of El Cajon and Santee and the County of San Diego for Forester Creek and the cities of El

Cajon, La Mesa, San Diego and Santee, and the County of San Diego for the Lower San Diego River and Pacific Ocean Shoreline at San Diego River mouth at Dog Beach. The compliance requirements and monitoring and reporting requirements of the TMDL have been incorporated into Attachment E.6 of the Permit.

The goal of the Bacteria TMDL is to achieve the necessary pollutant load reductions to restore and protect the designated beneficial use of water contact recreation (REC-1), as it is designated within the Basin Plan. The purpose of the TMDL monitoring program is to assess progress toward achieving compliance with interim and final TMDL water quality based effluent limitations (WQBELs). Wet and dry weather sampling is conducted each year at the compliance points. The data generated is used to address the following questions:

- Are TMDL numeric targets for indicators being met at the compliance monitoring locations?
- Are levels of bacteria decreasing at the compliance monitoring locations?

Sampling was conducted for the 2015–2016 compliance monitoring year (October 1, 2015 through September 30, 2016) during wet and dry weather at five receiving water monitoring locations: one beach location, Pacific Ocean Shoreline at Dog Beach (FM-010), and four creek locations, two along Forester Creek in the Santee HSA and two along the Lower San Diego River in the Mission San Diego HSA (Table A4-5, Figure A4-2). This was the third year of monitoring in compliance with Provision 6.d of Attachment E of the Permit. A summary of the monitoring conducted is presented in Table A4-6 for creek locations and Table A4-7 for the beach location. Samples were analyzed for the indicator bacteria compliance constituents (fecal coliform and *Enterococcus* for creeks; total coliform, fecal coliform, and *Enterococcus* for beaches) in accordance with the requirements of Attachment E.6 of the Permit. Additionally, *E. coli* which is not a Bacteria TMDL compliance constituent, was sampled at the creek locations. These data are available in the laboratory reports provided in Attachment 4B to this appendix and will be uploaded to the California Environmental Data Exchange Network (CEDEN) as provided in Attachment L.

Table A4-5. 2015-2016 Bacteria TMDL Beach Monitoring Locations in the San Diego River WMA

Site ID	Site Name	Site Type	Latitude	Longitude
SDR-FC1	Forester Creek at Lower Forester Creek	Freshwater Creek	32.83986	-117.00395
SDR-FC2	Lower Forester Creek at Prospect Ave	Freshwater Creek	32.83130	-116.98572
SDR-CDE	Lower San Diego River at Camino Del Este	Freshwater Creek	32.77255	-117.14456
SDR-MLS	San Diego River MLS at Lower San Diego River	Freshwater Creek	32.76515	-117.16863
FM-010	Dog Beach at San Diego River Mouth	Pacific Ocean Shoreline	32.75527	-117.25358

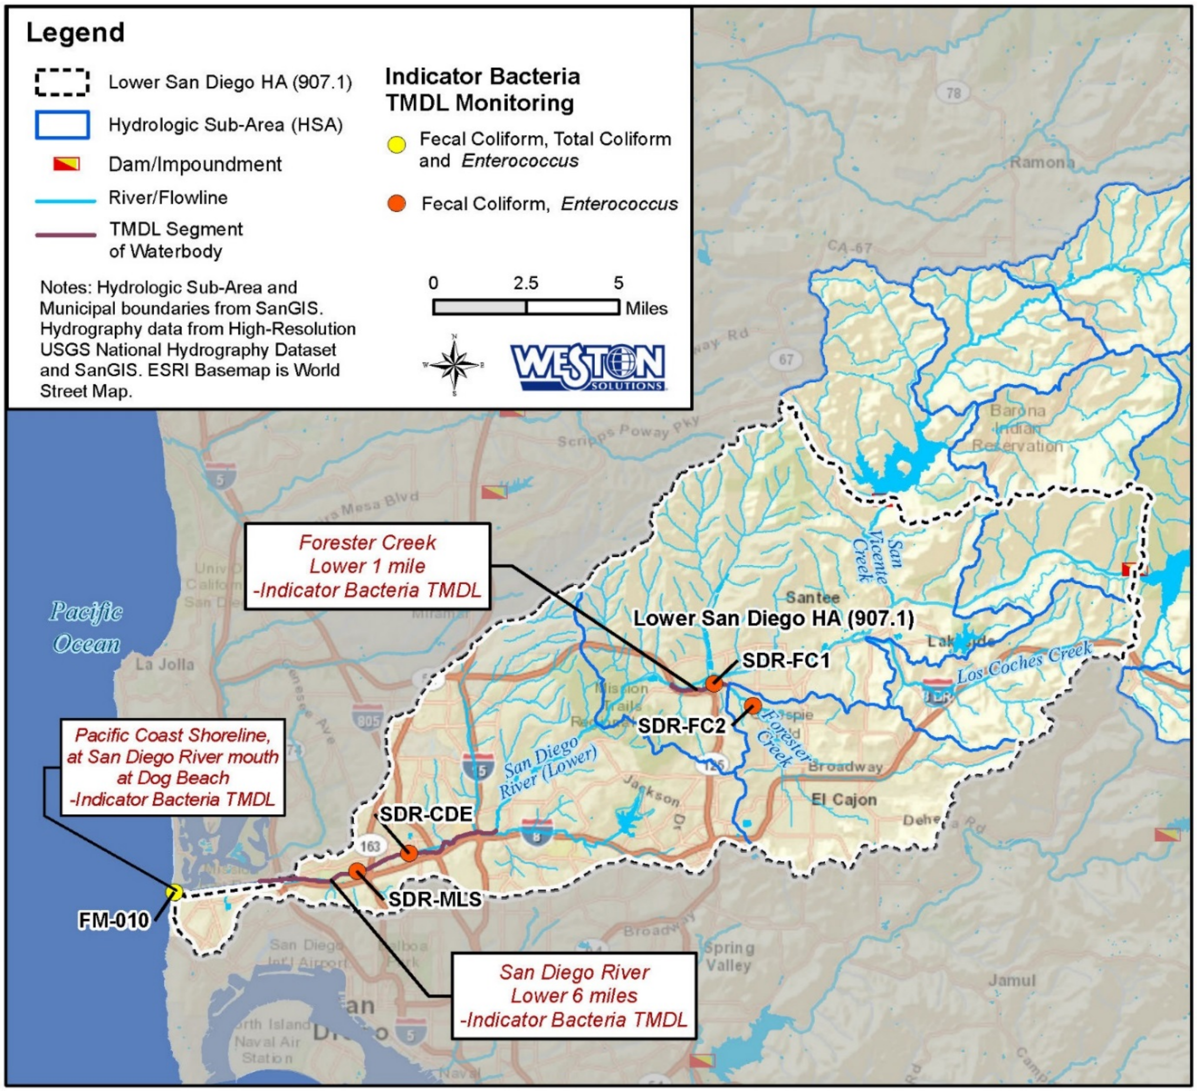

Figure A4-2. Bacteria TMDL Compliance Monitoring Locations in the San Diego River WMA

Table A4-6. 2015-2016 Bacteria TMDL Beach Monitoring Summary for the San Diego River WMA

Season	Date Range	Event Type	Event Frequency	Monitoring Location	Samples Per Site Per Event[a]	Total Number of Samples
2015-2016 Wet Season	10/01/2015-04/30/2015	Wet	Three storm events	FM-010	1	3
	10/01/2015-03/30/2016	Dry	Monthly			6
	04/01/2016-04/30/2016	Dry	Weekly[b]			5
2016 Dry Season	05/01/2016-09/30/2016	Dry	Weekly[b]			25

[a] Quality assurance (QA) or replicate samples are not included in the count.

[b] A minimum of 5 samples are collected in a 30-day period.

Table A4-7. 2015-2016 Bacteria TMDL Creek Monitoring Summary for the San Diego River WMA

Season	Date Range	Event Type	Event Frequency	Monitoring Location	Samples Per Site Per Event[a]	Total Number of Samples
2015-2016 Wet Season	10/01/2015-04/30/2015	Wet	Three storm events	SDR-MLS SDR-CDE SDR-FC1 SDR-FC2	1	12
	10/01/2015-03/30/2016	Dry	Monthly			24
	04/01/2016-04/30/2016	Dry	Weekly[b]			20
2016 Dry Season	05/01/2016-09/30/2016	Dry	Weekly[b]			100

[a] Quality assurance (QA) or replicate samples are not included in the count.

[b] A minimum of 5 samples are collected in a 30-day period.

Table A4-8 presents the exceedance rates for each indicator bacteria across the five monitored stations within the San Diego River WMA. The exceedances observed during the 2015-2016 monitoring year do not indicate non-compliance with the Permit or the Bacteria TMDL at this time. Progress toward meeting WQBELs, in terms of interim and final receiving water limitations, is presented in Table A4-9 for each analyzed constituent at the five monitoring stations. Interim WQBELs are not required to be met until 2020 for dry weather and 2028 for wet weather, while final WQBELS must be met by 2021 for dry weather and 2031 for wet weather. Based on the sampling data from the 2015-2016 monitoring year, receiving water limitations that have already been achieved are indicated by (●), whereas receiving water limitations that have not yet been achieved are indicated by (X).

In summary, interim and final WQBELs are being met at FM-010 with the exception of the dry season geometric mean for *Enterococcus*. There were also no exceedances of geometric means for fecal coliform at SDR-CDE during the dry and wet seasons, and at SDR-FC2 and SDR-MLS during the wet season. Both interim and final receiving water limitations are being achieved for these analytes at these locations. All other results did not achieve the interim or final receiving water limitations. Additional details are presented in the TMDL report provided as Attachment 4B to this appendix, and CEDEN data submittals can be found in Attachment L.

Table A4-8. 2015–2016 Exceedance Frequency Results: San Diego River WMA

Segment	Monitoring Location	Bacteria TMDL Constituent	2016 Dry Season Geometric Mean (CFU/100 mL)	2015-2016 Wet Season Geometric Mean (CFU/100 mL)	2015-2016 Wet Weather Single-Sample Maximum (CFU/100 mL)
Forester Creek	SDR-FC1	*Enterococcus*	100%	100%	100%
		Fecal Coliform	100%	80%	100%
	SDR-FC2	*Enterococcus*	100%	100%	100%
		Fecal Coliform	52%	0%	100%
San Diego River	SDR-MLS	*Enterococcus*	100%	90%	100%
		Fecal Coliform	33%	0%	93%
	SDR-CDE	*Enterococcus*	52%	90%	100%
		Fecal Coliform	0%	0%	94%

● = Receiving water limitations are met; X= Receiving water limitations are not met.

4.2 Storm Drain Outfall Monitoring

As part of the WQIP process, the Participating Agencies in the San Diego River WMA have developed a program to monitor discharges from storm drain outfalls during dry and wet weather that meets the requirements of Provisions D.2.b and D.2.c of the Permit. The purpose of storm drain outfall monitoring is to evaluate the potential impacts from storm drain outfall discharges on the beneficial uses of a waterbody during dry and wet weather conditions. In addition, under dry conditions, the program is used to assess the ability of jurisdictional and watershed programs to effectively eliminate non-stormwater discharges to waterbodies. The data generated are used to identify persistently flowing outfalls, pollutants in discharges, guide pollutant source identification and non-stormwater discharge elimination efforts, and track progress towards achieving numeric goals set forth in the WQIP.

During the 2013-2014 monitoring year, the inventory of major storm drain outfalls discharging directly to a receiving water was developed in accordance with Provision D.2.a.(1) of the Permit, and refinements were made during the 2014-2015 monitoring year. The major storm drain outfalls currently included in the storm drain outfall discharge monitoring station inventory for the San Diego River WMA are shown in Figure A4-3. Storm drain outfall dry weather monitoring locations are also shown in Figure A4-3. Storm drain outfall wet weather monitoring locations and drainage areas are shown on a separate map in Section 4.2.5.

The number of major outfalls monitored under each element of storm drain outfall monitoring by each Participating Agency in the San Diego River WMA is provided in Table A4-10. In accordance with Provision D.2.b.(1) of the Permit, Participating Agencies with fewer than 125 major storm drain outfalls in their inventory must conduct field screening at 80% of these major outfalls twice per year. The City of San Diego has more than 500 major storm drain outfalls within its jurisdiction and is required to annually screen 500 of these outfalls city-wide (but not within each watershed) in accordance with Provision D.2.a.(2)(a)(iv). The number of major outfalls monitored per year is subject to change based on new information, updates to storm drain outfall inventories, changes in transient or persistent flow classifications, and/or changes or updates to the priority water quality conditions over the life of the WQIP.

Table A4-10. Number of Major Storm Drain Outfalls Monitored per Participating Agency

Participating Agency	Field Screening (Provision D.2.b(1))	Dry Weather Monitoring (Provision D.2.b(2))	Wet Weather Monitoring (Provision D.2.c)
County of San Diego	51	5	1
City of El Cajon	33	5	1
City of La Mesa	13	5	1
City of Santee	63	5	1
City of San Diego	65	5	1

Program descriptions, monitoring results, and assessments conducted during the 2015-2016 monitoring year under the Storm Drain Outfall Monitoring Program are presented in the following subsections. Methodology is described in greater detail in the WQIP Monitoring and Assessment Plan (MAP).

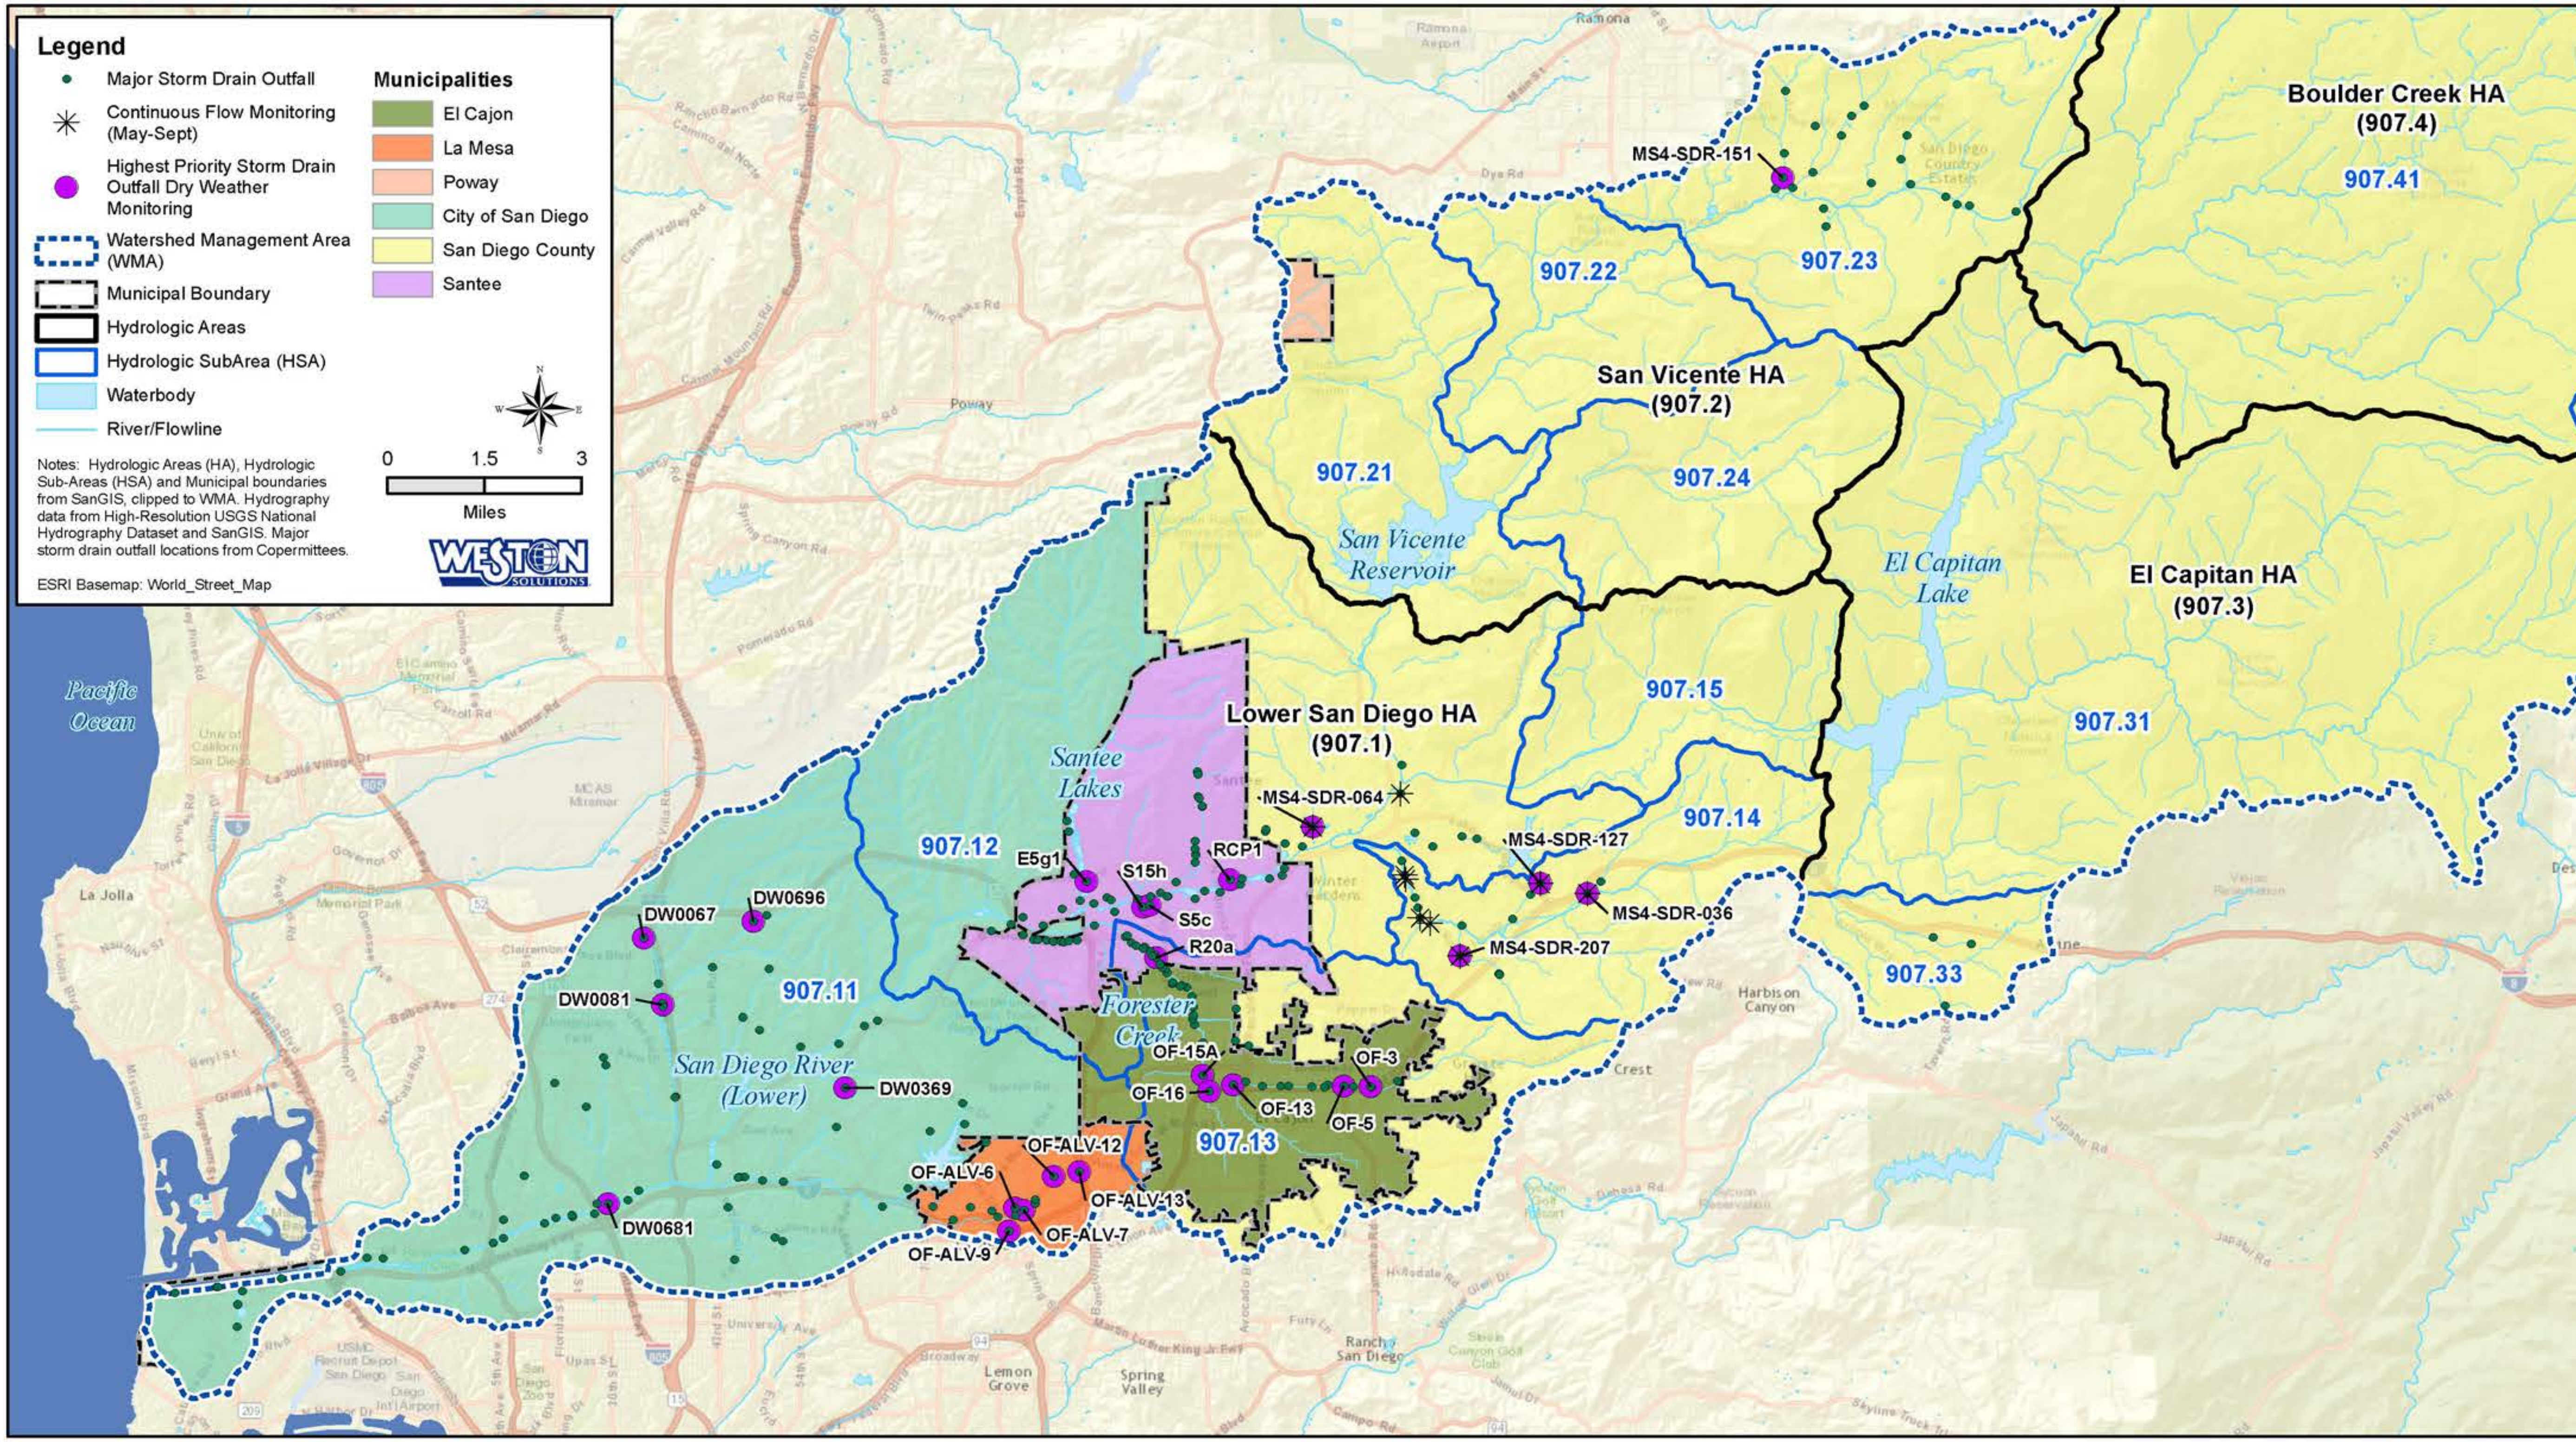

Figure A4-3. Major Storm Drain Outfall Inventory and Highest Priority Storm Drain Outfall Dry Weather Monitoring Station Locations in the San Diego River WMA

4.2.1 *Dry Weather Field Screening and Outfall Prioritization*

Dry weather field screening is visual monitoring of major storm drain outfalls as outlined in Table D-5 of the Permit. Field screening is conducted to identify non-stormwater and illicit discharges, determine which discharges are transient and which are persistent, and prioritize those discharges that will be investigated and eliminated. This program is designed to assess the effectiveness of jurisdictional programs to effectively prohibit non-stormwater discharges. Each Participating Agency performs field screening of a certain number of outfalls on an annual basis to maintain an up-to-date inventory of persistently flowing outfalls and to initiate follow-up investigations that identify and mitigate the source(s). The data collected during field screening are one of the sources of information for the Participating Agencies' Illicit Discharge Detection and Elimination (IDDE) Program (see Section 4.2.4).

The required frequency of field screening varies from once to twice per year depending on the number of major outfalls within the jurisdiction, in accordance with Provision D.2.a.(2)(a) of the Permit. The number of storm drain outfall stations included in dry weather field screening and the total number of visual observations conducted by each Participating Agency during the 2015-2016 monitoring year in the San Diego River WMA are shown in Table A4-11. Dry weather field screening at upstream proxy locations (e.g., manholes) for inaccessible outfalls may result in more than one location representing an outfall, and these upstream locations are included in the station counts and visits. Some source investigations were performed during routine visits and are included in the routine visits column, while others were conducted as separate follow-up visits and are included in the source investigations column.

During the 2015-2016 monitoring year, all County of San Diego major storm drain outfalls were inspected at least twice and up to eight times for dry weather flows. The County also visited 111 smaller storm drain outfalls (outfalls with diameter less than 36 inches) that had been inventoried as part of its Microbial Source Tracking Study, which is provided as Attachment 4C to this appendix. During the 2015-2016 monitoring year, these outfalls, as well as several major storm drain outfalls, were inspected for non-stormwater flows approximately once every two months over the monitoring year. The data were collected to better inform the program about the County's progress toward achieving its dry weather storm drain outfall flow reduction goals.

Table A4-11. Number of Visual Observations Conducted During the 2015-2016 Monitoring Year

Participating Agency	Number of Major Storm Drain Outfalls or Proxy Locations Visited	Number of Routine Visits	Number of Source Investigations	Number of Additional Visits for Other Programs[3]
County of San Diego[1]	53*	106	74 (6 outfalls)	84 (10 stations)
El Cajon[1]	33	54	1	NA
La Mesa[1]	13	22	3 (3 outfalls)	NA
Santee[1]	63	102	3 (3 outfalls)	NA
City of San Diego[2]	69**	80	76 (21 outfalls)	NA

[1] Copermittee with < 125 major outfalls in WMA; 80% of major outfalls must be screened twice/year.
[2] Copermittee in more than one WMA with more than 500 major outfalls total in jurisdiction; 500 outfalls must be screened annually.
[3] Includes flow data but not all visual observations typically conducted during a routine field screening visit.
*Two locations replaced during the monitoring year.
**Three outfalls had more than one proxy location (upstream manhole) visited.

Participating Agencies recorded numerous visual observations regarding outfall and flow characteristics including flow conditions (flowing, ponded, dry, or tidal), whether or not the flow reached the receiving water, whether or not there was a non-stormwater flow source, potential non-stormwater sources, whether the flow source was eliminated, evidence of obvious illicit connections or illicit discharges (IC/ID), whether trash was present and relative amount, and whether there was evidence of illegal dumping. The complete set of visual observations recorded during dry weather field screening visits are provided in Attachment 4D to this appendix, and CEDEN data submittals can be found in Attachment L. The field screening trash assessment results for the San Diego River WMA are summarized in Table A4-12. These trash assessments included some flow source investigation visits to the outfall as well as the routine visits. There was no trash present during 42% of the visits and a low presence of trash (defined as less than 50 pieces) during 53% of the trash assessments at visited outfalls. Approximately 5% of sites had over 50 pieces of trash.

Table A4-12. Dry Weather Field Screening Trash Assessments for the San Diego River WMA

Participating Agency	HSA	No Trash Present	Trash Present		
			Low (<50 pieces)	Medium (50 to 400 pieces)	High (>400 pieces)
County of San Diego	907.12	3	14	5	0
	907.13	0	5	0	0
	907.14	9	22	2	0
	907.23	17	23	0	0
	907.33	1	3	1	1

Santee	907.12	50	40	2	0
	907.13	3	7	1	2
SUB-TOTAL		**53**	**47**	**3**	**2**
City of San Diego	907.11	27	53	4	0
SUB-TOTAL		**27**	**53**	**4**	**0**
GRAND TOTAL		**159**	**197**	**16**	**3**

A summary of the flow conditions (i.e., flowing, ponded, dry, or tidal) at the outfall stations during the 2015-2016 field visits is shown in Figure A4-4, where the stacked bars represent the number of observations in each flow category by Participating Agency. The observations included in this figure are routine visits and follow-up source identification visits to the outfall, but do not include additional visits for other programs. Because some outfalls are visited more than once, the number of observations is greater than the number of actual storm drain outfalls monitored.

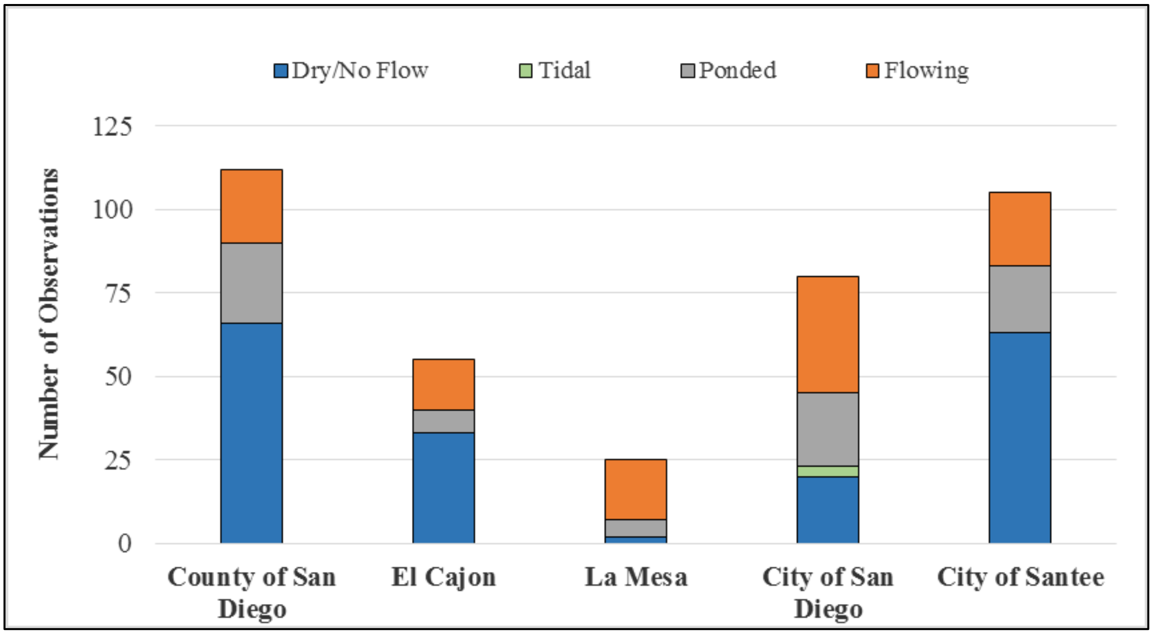

Figure A4-4. Dry Weather Field Screening Flow Observations at Storm Drain Outfall Stations by Participating Agency

During dry weather field screening, Participating Agencies estimated flow rates at stations where flow was present, as required by Table D.5 of the Permit. A compilation of flow estimations recorded by the Participating Agencies in the San Diego River WMA, in gallons per minute (gpm), is presented in Figure A4-5. The majority of flow rates were low, with 75 of 113 estimations categorized as less than five gpm. The observations included in this figure include routine visits and follow-up source identification visits to the outfalls, but do not include additional visits for other programs.

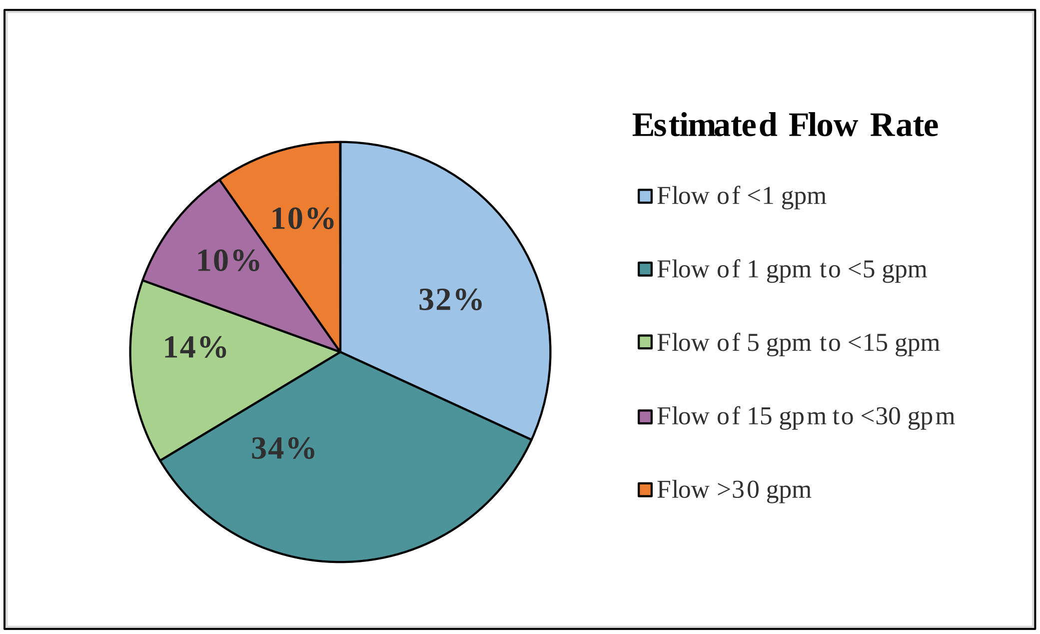

Figure A4-5. Outfall Flow Rate Estimations in the San Diego River WMA

Where an illicit discharge is observed during outfall screening, investigations are performed in an effort to locate the source and eliminate the discharge. In cases where flow sources are known due to historical data, this is listed on the field sheet and the upstream area is briefly checked for additional sources. In cases where discharges are observed, but no obvious illicit discharge was identified as the source, appropriate documentation is recorded, and the locations are prioritized with others for follow-up.

Based on these field screening visits and available historical data, the Participating Agencies determined the flow status of each major storm drain outfall as persistent, transient, dry, tidal, or undetermined. The numbers of storm drain outfalls in each category are shown by Participating Agency and HSA in Table A4-13, and the flow determinations are shown with the locations of the storm drain outfalls in Figure A4-6. As defined in the Permit, flow status for a given outfall is "dry" if no flowing or standing water is observed at the outfall over three most recent visits, and "persistent" flow is defined as presence of flowing or standing water upon three most recent visits. Otherwise, the outfall status is classified as "transient." The undetermined outfall listed for the City of San Diego in Table A4-13 has been tidal on all visits except once when it was dry. Overall, since the prior monitoring year, the number of undetermined outfalls in the San Diego River WMA has been reduced from 7 (WESTON, 2016) to 2, which includes one new site. The number of persistent outfalls has increased by 11 based on the additional dry weather field screening observations made in the 2015-2016 year.

Table A4-13. 2015-2016 Dry Weather Storm Drain Outfall Flow Determinations for the San Diego River WMA

Participating Agency	HSA	Persistent	Transient	Dry/ No Flow	Undetermined	Grand Total
County of San Diego	907.12	2	5	4	0	11

	1472	907.12	No	Transient	Persistent

The list of prioritized outfalls based on field screening results is maintained and updated as program implementation develops and monitoring occurs. These prioritized outfalls were originally outlined in the San Diego River Watershed Storm Drain Outfall Monitoring Plan (Storm Drain Outfall Monitoring Plan), Attachment 4A-5 to the WQIP. The Storm Drain Outfall Monitoring Plan, last revised in January 2015, listed three outfalls as the highest priority persistent outfalls for the City of La Mesa (OF-ALV-5, OF-ALV-8, and OF-ALV-11). Since the approval of the WQIP, the City of La Mesa re-prioritized the persistent outfalls under its jurisdiction because groundwater (i.e., springs or rising ground waters) was determined to be the source of flow to all three of these outfalls. Outfalls with groundwater identified as the primary flow source were placed at a lower priority because, in general, groundwater discharges are not considered to pose a high threat to receiving water quality. Outfalls with prohibited discharges identified as the primary flow source, such as irrigation runoff, or discharges with an unknown flow source, were determined to be high priority sites because these categories of discharges have greater potential to threaten receiving water quality and are more likely to contribute sources of bacteria during dry weather. Of these discharges, the sites with the highest average flow rates are placed at a higher priority.

Except for these changes to the City of La Mesa's highest priority outfalls and the selection of the highest priority outfalls for the City of El Cajon, which had not yet been determined when the Storm Drain Outfall Monitoring Plan was developed, the highest priority outfalls in the San Diego River WMA have not changed. The highest priority outfalls for each jurisdiction in the WMA during 2015-2016 are summarized in Table A4-15. Dry weather field screening records are provided as Attachment 4D to this appendix, and CEDEN data submittals can be found in Attachment L.

Table A4-15. Highest Priority Outfalls during 2015-2016 in the San Diego River WMA during the

Copermittee	HSA	Station	Latitude (NAD83)	Longitude (NAD83)	Dates Sampled

4.2.2 Highest Priority Storm Drain Outfall Dry Weather Monitoring

The purpose of the highest priority storm drain outfall dry weather monitoring is to evaluate the potential contribution from storm drain outfall discharges to receiving water quality during dry weather conditions and to assess the ability of programs to effectively eliminate non-stormwater discharges to waterbodies or waterways.

The 2015-2016 monitoring year was the first year of storm drain outfall dry weather analytical sampling under the WQIP MAP. Storm drain outfall dry weather monitoring was conducted at the highest priority outfalls identified for each jurisdiction in the San Diego River WMA (Table A4-15, Figure A4-3). Sampling was conducted between November 24, 2015 and August 17, 2016, and two sampling events were conducted at most outfalls. One outfall each under the jurisdiction of the County of San Diego and the City of Santee was sampled once due to lack of flow. In-situ measurements were made for pH, temperature, conductivity, dissolved oxygen, and turbidity. Grab samples were collected and analyzed for constituents contributing to the HPWQC, 303(d) List impairments, TMDLs, non-stormwater action levels (NALs), and those listed in Table D-7 of the Permit. Grab samples were also collected from receiving waters to which the sampled outfalls were discharging and analyzed for total hardness, a measurement needed to compare concentrations of metals to NALs that are hardness-dependent (see footnote *a* in Table A4-16). Visual observations were also recorded.

Analytical results for samples collected during dry weather at the highest priority outfalls are summarized by Participating Agency in Table A4-16 through Table A4-20. Results are compared to NALs as provided in the Permit. In accordance with Table C-4 of the Permit, indicator bacteria concentrations are compared to instantaneous maximum value (IM) NALs, and the remaining constituent concentrations, including general and physical chemical constituents, nutrients, and total and dissolved metals, are compared to maximum daily action level (MDAL) NALs. Additional details regarding NALs used in this assessment are provided in Table A4-34. Laboratory and field data collected for highest priority storm drain outfall dry weather monitoring will be uploaded to CEDEN, and data submittals are provided in Attachment L to this appendix.

4.2.2.1 County of San Diego

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform (i.e., the HPWQC in the WMA) indicated that the highest concentrations were measured at MS4-SDR-127 in the Coches HSA (907.14) for *Enterococcus,* MS4-SDR-127 in the Coches HSA and MS4-SDR-151 in the Gower HSA (907.23) for fecal coliform, and MS4-SDR-127 in the Coches HSA for total coliform. Indicator bacteria concentrations were above the *Enterococcus* IM in all samples and were above the fecal coliform IM in all samples except one each from outfalls MS4-SDR-036 and MS4-SDR-207 (both in the Coches HSA) (Table A4-16).

The only existing MDALs that relate to PWQC in the WMA are for total nitrogen and total phosphorus, and each of these PWQC concentrations was measured above the MDAL except total nitrogen in one of two samples from MS4-SDR-151 in the Gower HSA (907.23).

Other constituents in exceedance of MDALs are listed below. Unless noted, exceedances occurred in both samples collected at the outfall.

- MS4-SDR-036: turbidity, MBAS (one sample), total iron, total manganese, dissolved copper (one sample), dissolved iron, dissolved manganese, and dissolved zinc (one sample).
- MS4-SDR-064: pH and total iron (only one sample was collected at this location).
- MS4-SDR-127: dissolved iron (one sample).
- MS4-SDR-151: dissolved oxygen (below the MDAL indicates impairment), turbidity (one sample), total iron, total manganese, and dissolved manganese (one sample).
- MS4-SDR-207: total iron (one sample), total manganese, dissolved manganese.

The remaining constituents were below MDALs, where available.

4.2.2.2 City of El Cajon

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform indicated that the highest concentrations were measured at OF-3 for *Enterococcus*, at OF-15A for fecal coliform, and at OF-13 for total coliform. All of these outfalls are located in the El Cajon HSA (907.13). Indicator bacteria concentrations were above the *Enterococcus* IM in all samples except one each from outfalls OF-5 and OF-16 and were above the fecal coliform IM in all samples except one from outfall OF-3 (Table A4-17).

The only existing MDALs that relate to PWQC in the WMA are for total nitrogen and total phosphorus, and each of these PWQC concentrations was measured above the MDAL except total phosphorus in both samples from OF-13 and one of two samples from OF-16.

Other constituents in exceedance of MDALs are listed below. Unless noted, exceedances occurred in both samples collected at the outfall.

- OF-3: no additional constituents above MDALs.
- OF-5: total iron, total manganese (one sample).
- OF-13: pH (one sample).
- OF-15A: turbidity (one sample), total iron, total manganese, dissolved manganese (one sample).
- OF-16: pH.

The remaining constituents were below MDALs, where available.

4.2.2.3 City of La Mesa

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform indicated that the highest concentrations were measured at OF-ALV-12 for *Enterococcus* and fecal coliform and OF-ALV-9 for total coliform. Indicator bacteria concentrations were above the *Enterococcus* IM in all samples except one each from outfalls OF-ALV-7 and OF-ALV-9 and were above the fecal coliform IM in all samples except both from outfall OF-ALV-7 (Table A4-18). All outfalls are located in the Mission San Diego HSA (907.11).

The only existing MDALs that relate to PWQC in the WMA are for total nitrogen and total phosphorus, and each of these PWQC concentrations was measured above the MDAL.

Other constituents in exceedance of MDALs are listed below. Unless noted, exceedances occurred in both samples collected at the outfall.

- OF-ALV-6: total iron, total manganese.
- OF-ALV-7: pH (one sample) (below the MDAL range indicates impairment), turbidity, total iron, total manganese, dissolved iron (one sample), dissolved manganese.
- OF-ALV-9: total iron, total manganese, dissolved manganese (one sample).
- OF-ALV-12: turbidity, total iron, total manganese, dissolved manganese.
- OF-ALV-13: turbidity, total iron, total manganese, dissolved manganese.

The remaining constituents were below MDALs, where available.

4.2.2.4 City of Santee

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform indicated that concentrations were greater than 1,600 MPN/100 mL at several outfalls in the WMA. These results are not quantifiable above this value because all dilutions were positive. Indicator bacteria concentrations were above the *Enterococcus* IM in all samples except one sample from RCP1 and were above the fecal coliform IM in all samples (Table A4-19).

The only existing MDALs that relate to PWQC in the WMA are for total nitrogen and total phosphorus, and each of these PWQC concentrations was measured above the MDAL except total phosphorus in one of two samples from RCP1 in the Santee HSA (907.12).

Other constituents in exceedance of MDALs are listed below. Unless noted, exceedances occurred in both samples collected at the outfall.

- E5g1: total iron (one sample).
- R20a: no additional constituents above MDALs (only one sample was collected at this location).
- RCP1: no additional constituents above MDALs.
- S5c: total iron (one sample), total manganese, dissolved manganese.
- S15h: total iron (one sample), total manganese (one sample).

The remaining constituents were below MDALs, where available.

4.2.2.5 City of San Diego

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform indicated that the highest concentrations were measured at DW0681 for all three constituents. Indicator bacteria concentrations were above the *Enterococcus* IM in all samples except both samples from DW0067 and one sample from outfall DW0081. Fecal coliform concentrations were below the IM in all samples except one sample each from outfalls DW0696 and DW0681 (Table A4-20). All outfalls are located in the Mission San Diego HSA (907.11).

The only existing MDALs that relate to PWQC in the WMA are for total nitrogen and total phosphorus, and each of these PWQC concentrations was measured above the MDAL.

Other constituents in exceedance of MDALs are listed below. Unless noted, exceedances occurred in both samples collected at the outfall.

- DW0067: turbidity (one sample), total iron (one sample), total manganese (one sample), dissolved copper (one sample).
- DW0081: pH (one sample).
- DW0369: no additional constituents above MDALs.
- DW0696: dissolved oxygen (below the MDAL indicates impairment), total iron (one sample), total manganese, dissolved manganese.
- DW0681: turbidity, total iron, total manganese, dissolved copper (one sample), dissolved manganese (one sample), dissolved zinc (one sample).

The remaining constituents were below MDALs, where available.

< - Results are less than the reporting limit.

NA - Not analyzed.

[1]Laboratory analyzed results were used if analyte was not measured in the field.

J - Results are greater than the method detection limit but below the reporting limit. Reported result is estimated.

(a) Water Quality Benchmark for dissolved metal fractions is based on total hardness and is calculated as described by 40 CFR Part 131.38 (May 18, 2000). The CCC was applied to dry weather results with the exception of Silver for which the CMC was applied as there is no CCC.

(b) If calculated CCC values exceeded the Maximum Contaminant Levels (MCLs) as given in the basin plan, concentrations were compared to the MCLs. No MCLs were exceeded for these constituents.

(c) Instantaneous Maximum for storm drain outfall discharges to inland surface waters with REC-1 beneficial use (Table C-4 of 2013 Permit).

- Reporting limit greater than Instantaneous Maximum NAL.

Bolded/shaded results greater than Maximum Daily Action Level or the Instantaneous Maximum for the Fecal Indicator Bacteria.

< - Results are less than the reporting limit.

NA - Not analyzed.

J - Results are greater than the method detection limit but below the reporting limit. Reported result is estimated.

(a) Water Quality Benchmark for dissolved metal fractions is based on total hardness and is calculated as described by 40 CFR Part 131.38 (May 18, 2000). The CCC was applied to dry weather results with the exception of Silver for which the CMC was applied as there is no CCC.

(b) If calculated CCC values exceeded the Maximum Contaminant Levels (MCLs) as given in the basin plan, concentrations were compared to the MCLs. No MCLs were exceeded for these constituents.

(c) Instantaneous Maximum for storm drain outfall discharges to inland surface waters with REC-1 beneficial use (Table C-4 of 2013 Permit).

- Reporting limit greater than Maximum Daily Action Level.

Bolded/shaded results greater than Maximum Daily Action Level or the Instantaneous Maximum for the Fecal Indicator Bacteria.

< - Results are less than the reporting limit.

NA - Not analyzed.

J - Results are greater than the method detection limit but below the reporting limit. Reported result is estimated.

(a) Water Quality Benchmark for dissolved metal fractions is based on total hardness and is calculated as described by 40 CFR Part 131.38 (May 18, 2000). The CCC was applied to dry weather results with the exception of Silver for which the CMC was applied as there is no CCC.

(b) If calculated CCC values exceeded the Maximum Contaminant Levels (MCLs) as given in the basin plan, concentrations were compared to the MCLs. No MCLs were exceeded for these constituents.

(c) Instantaneous Maximum for storm drain outfall discharges to inland surface waters with REC-1 beneficial use (Table C-4 of 2013 Permit).

e - Estimated value, plate count falls outside recommended reporting limits per EPA method guidelines.

- Reporting limit greater than Maximum Daily Action Level or Instantaneous Maximum NAL.

Bolded/shaded results greater than Maximum Daily Action Level or the Instantaneous Maximum for the Fecal Indicator Bacteria.

4.2.3 *Storm Drain Outfall Dry Weather Monitoring Data Assessments*

Provision D.4.b.(1).(c)(i-vi) of the Permit requires the dry weather storm drain outfall monitoring data assessments summarized in Table A4-21. The information necessary to demonstrate compliance with each Provision is outlined in the following discussion. In instances where compliance has been demonstrated in previous sections of this Annual Report, those sections are referenced.

Table A4-21. Storm Drain Outfall Dry Weather Monitoring Assessments

Assessment	Components	Provision(s)
WQIP Annual Report		
Identify known and suspected controllable sources.	Identify known and suspected controllable sources (e.g., facilities, areas, land uses, pollutant generating activities) of transient and persistent flows.	D.4.b.(1)(b)(i)
Identify sources that have been reduced or eliminated.	Identify sources of transient and persistent flows that have been reduced or eliminated.	D.4.b.(1)(b)(ii)
Identify necessary modifications to monitoring locations and frequencies.	Identify necessary modifications to monitoring locations and frequencies necessary to identify and eliminate sources of persistent flows.	D.4.b.(1)(b)(iii)
Rank and prioritize non-stormwater discharges.	Rank persistently flowing outfalls according to potential threat to receiving water quality.	D.4.c.(1)(c)(ii)
	Produce/update prioritized list of outfalls.	
Identify sources contributing to NAL exceedances.	Identify known and suspected sources that may cause or contribute to exceedances.	D.4.b.(1)(c)(iii)
Estimate volumes and loads of non-stormwater discharges.	Analyze data collected as part of the Permit-required dry weather outfall monitoring. Use a model or other method to calculate and estimate collective persistent non-stormwater discharge volumes and pollutant loads. Specific calculations/estimates include: 1) Annual non-stormwater volumes and loads discharged from the Copermittee's major storm drain outfalls to receiving waters within its jurisdiction, with an estimate of the percent contribution from each known source for each storm drain outfall. 2) Annual identification and quantification (by volume and pollutant load) of sources of discharged non-stormwater not subject to the Copermittee's legal authority.	D.4.b.(1)(c)(iv)
Identify data gaps.	Identify data gaps in the monitoring data necessary to fulfill assessment requirements.	D.4.b.(1)(c)(vi)

Table A4-21. Storm Drain Outfall Dry Weather Monitoring Assessments

Assessment	Components	Provision(s)
Once during Permit Term		
Evaluate progress in achieving non-stormwater volume and load reductions.	Identify reductions and progress in achieving reductions.	D.4.c.(1)(c)(v)
	Assess the effectiveness of WQIP improvement strategies, with estimates of volume and load reductions attributed to specific strategies when possible.	
	Identify modifications necessary to increase the effectiveness of WQIP strategies.	

4.2.3.1 Provision D.4.b.(1)(b)

The dry weather field screening monitoring assessments that were first required by Provision D.4.b.(1)(b)(i-iii) during the transitional monitoring period (2013-2014 and 2014-2015 monitoring years) are required to be continued by Provision D.4.b.(1)(c)(i). The assessments related to (i) and (ii) are described in Section 4.2.4 below. To comply with (iii), the data collected under the dry weather field screening monitoring program (Section 4.2.1) were assessed, and no modifications to field screening monitoring locations or frequencies are planned for the 2016-2017 monitoring year in the San Diego River WMA.

4.2.3.2 Provision D.4.b.(1)(c)(ii)

In addition to continuing the assessments required by Provision D.4.b.(1)(b)(i-iii), the 2015-2016 monitoring year is the first requiring analytical monitoring of storm drain outfall dry weather samples, and the first requiring the assessments of Provision D.4.b.(1)(c)(ii-v).

Provision D.4.b.(1)(c)(ii) requires the prioritization of major storm drain outfalls within each Copermittee's jurisdiction based on the storm drain outfall dry weather monitoring data. These data were presented in Section 4.2.1, and the analytical data collected at the highest priority outfalls for each jurisdiction during the 2015-2016 monitoring year are presented in Table A4-16 through Table A4-20 in Section 4.2.2. After assessing these data, no re-prioritizations are planned for the 2016-2017 monitoring year in the San Diego River WMA. Although the flow determination changed for some outfalls from persistent to transient, high priority outfalls selected for analytical monitoring in 2015-2016 will continue to be monitored until one of the conditions of Provision D.2.b.(2)(b)(ii) have been met (i.e., three consecutive dry visits, no exceedance of NALs, or identified as a discharge authorized under a separate National Pollutant Discharge Elimination System [NPDES] permit). When an outfall fulfills one of these criteria or the threat to water quality has been reduced (per Provision D.2.b.(2)(b)(iii)), it will be replaced with the next highest priority outfall on the Copermittee's list for the WMA. Monitored outfalls that changed from persistent to transient flow determination are shown in Table A4-14. There was one high priority persistent flow monitored outfall that is now identified as having transient flow.

4.2.3.3 Provision D.4.b.(2)(c)(iii)

This Provision requires further investigation into sources at the highest priority outfalls with persistent flows exceeding NALs. The highest priority outfalls are listed for each jurisdiction in Table A4-15, and the analytical results collected at these outfalls are presented in Table A4-16 through Table A4-20.

These highest priority outfalls were a specific focus for IDDE investigations during the 2015-2016 monitoring year. The results from these investigations are presented in Section 4.2.4.2. The most common identified or suspected source of non-stormwater flows was runoff from over-irrigation, which has been acknowledged as a source associated with several types of pollutants including nutrients, bacteria, pesticides, and sediment (Regional Board, 2013). The 2015-2016 highest priority storm drain outfall dry weather monitoring results showed exceedances of NALs for the HPWQC and PWQCs *Enterococcus*, fecal coliform, total nitrogen, and total phosphorus. Concentrations of iron and manganese were also above NALs, and groundwater seepage in addition to over-irrigation were identified or suspected as sources of flows at many of the outfalls. Groundwater can be a natural source of these minerals, and over-irrigation can contribute to rising groundwater and groundwater seepage. There were three exceedances of dissolved copper and two of dissolved zinc NALs at monitored outfalls in the watershed. Investigations identified residential vehicle washing and impervious surface washing as a source of flows at one of these outfalls, and power washing as well as other sources associated with flows at another of these outfalls. Details regarding source investigations are provided in 4.2.4, including a table of sources identified for highest priority outfalls (Table A4-26).

4.2.3.4 Provision D.4.b.(2)(c)(iv)

Persistent dry weather flow was identified by each of the Participating Agencies in the San Diego River WMA. Since persistent flow was observed, the Participating Agencies were required to calculate or estimate the non-stormwater volumes and pollutant loads collectively discharged from these persistently flowing outfalls to receiving waters, and estimate percent contributions from each known source for each outfall. The Participating Agencies are also required to identify and quantify (i.e., volume and pollutant loads) sources of non-stormwater discharge not subject to the Participating Agency's legal authority that are discharged from the major storm drain outfalls, with persistent flow, to downstream receiving waters. Assessment methodology and results are summarized below and are described in greater detail in Attachment 4E. Suspected sources were included in this assessment.

4.2.3.4.1 Discharge Volumes from Persistently Flowing Major Storm Drain Outfalls

For each major storm drain outfall with persistent flow during the 2015-2016 monitoring year, the non-stormwater discharge was modeled by multiplying the total number of dry weather days for the month by a unique instantaneous flow rate for the outfall for that month. The number of dry weather days (i.e., less than 72 hours since rain event of 0.1 inches or more) for each calendar month was determined using rainfall data from the County of San Diego Alert Station 27-La Mesa. For months with field visits, the instantaneous flow measurement recorded for that visit was applied to the month, and if there were multiple field visits within a given month these were averaged and applied to the month (averages included instantaneous flow measurements and zero flow for dry/tidal/ponded conditions). For months where no outfall-specific data was available, the average of all instantaneous flow measurements for the outfall was applied to that month. The annual non-stormwater discharge for each major storm drain outfall represents the sum of cumulative monthly flows. These non-stormwater discharge volumes should considered rough estimates that are based on limited field observations and measurements. When feasible, instantaneous flow measurements are based on the area-velocity method, which applies measured flow depth, width, and velocity. Velocity is often measured using a float. Although multiple velocity measurements may be collected to overcome inherent variability and a roughness factor may be applied to address friction, the float method represents a rough estimation tool for velocity. Where site conditions limit accurate collection of area-velocity field measurements, non-stormwater discharge may be estimated either using a volumetric flow rate method (e.g., filling a container of known volume in a measured interval of time), or best professional judgement based on field observations.

The County of San Diego collected continuous flow monitoring data at seven major storm drain outfalls, and for these outfalls, the continuous flow data was used rather than the instantaneous flow measurements provided by field visits. The continuous flow datasets were adjusted to exclude wet weather days and the subsequent 72-hour wet period and then used to calculate the cumulative monthly discharge for the period when flow was monitored. For months with no continuous flow data, but available visual observation flow data, the monthly discharge was calculated using the approach described above. For months with no outfall-specific flow data, an average of the daily discharge values using the continuous flow dataset was applied to the days of that month.

Table A4-22 presents the estimated annual non-stormwater volume and the average annual discharge calculated for major storm drain outfalls with persistent flow in the San Diego River WMA, by Participating Agency.

Table A4-22. 2015-2016 Non-stormwater Flow Estimates for Major Storm Drain Outfalls with Persistent Flow

Participating Agency	No. Persistently Flowing Major Storm Drain Outfalls	Annual Non-Storm Water Discharge (cf)	Annual Average Discharge by Outfall (cf/outfall)
County of San Diego	8	1,904,441	238,055
City of El Cajon	8	2,172,555	271,569
City of La Mesa	10	782,160	78,216
City of Santee	16	886,596	55,412
City of San Diego	35	45,570,744	1,302,021

cf – cubic feet

4.2.3.4.2 Pollutant Loads for Persistent Flow Outfalls

Pollutant loads were calculated based on whether analytical monitoring data was available for a major storm drain outfall. Loads were calculated as follows:

- <u>Major Storm Drain Outfalls with Parameter-Specific Monitoring Data (High Priority Outfalls):</u> The annual load represents the product of the outfall-specific annual discharge volume and the mean of the measured pollutant concentrations for the major storm drain outfall if two samples were collected.

- Other Persistent Flow Outfalls: Where site-specific monitoring data were not available for a persistently flowing outfall, the pollutant load was calculated by taking the product of the outfall-specific annual discharge volume and the mean pollutant concentration from all the dry weather monitoring events for the jurisdiction for the parameter.

For each persistently flowing outfall, annual non-stormwater pollutant loads were estimated for each monitored constituent. The pollutant load estimates are presented in tables by Participating Agency in Attachment 4E to this appendix.

Dry weather visual observation and field investigation data regarding known and/or suspected sources of non-stormwater discharge were used to estimate percent contributions from each known or suspected source for each persistent flow outfall in accordance with Provision D.4.b.(1)(c)(iv)(a). These percentages are provided by outfall in Table A4-23, and the stormwater volume and pollutant loads based on this source are provided in Attachment 4E to this appendix.

Table A4-23. 2015-2016 Dry Weather Storm Drain Outfall Assessment of Discharge by Known or Suspected Flow Source for Persistently Flowing Major Storm Drain Outfalls

**Additional information can be found in Attachment 4E (Runoff Sources tab).

4.2.3.5 Provision D.4.b.(2)(c)(v)

This Provision requires the Participating Agencies to review the data collected under the storm drain outfall dry weather monitoring program in order to identify pollutant reduction progress, assess water quality improvement strategy effectiveness, and identify modifications necessary to increase effectiveness. This assessment is required once during the Permit term and will be provided in the San Diego River WMA chapter of the RMAR, which is scheduled for submittal to the Regional Board in December 2017.

4.2.3.6 Provision D.4.b.(2)(c)(vi)

No gaps have been identified in the monitoring data. Because the 2015-2016 monitoring year was the first year of monitoring under the WQIP MAP and the first year requiring the assessments outlined in Provision D.4.b.(1)(c)(ii-iv), the collection of additional data may be necessary before the Participating Agencies are able to identify data gaps.

4.2.4 Illicit Discharge Detection and Elimination Program Data and Assessment

Based on the results of the dry weather major storm drain outfall monitoring described above, the Participating Agencies conducted investigations to identify sources of flow or NAL exceedances. Where IC/ID are identified, additional action to address the source(s) is taken. These investigations and source elimination activities related to outfall monitoring are one part of the larger IDDE programs that each Participating Agency has established. The goals of these IDDE programs are as follows:

- Control the contribution of pollutants to and the discharges from the storm drain system within the Participating Agencies' jurisdictions.
- Effectively prohibit non-stormwater discharges to the storm drain system.
- Reduce the discharge of pollutants in stormwater to the maximum extent practicable.

In addition to outfall monitoring and associated source investigations, the IDDE programs also include the following components to prevent, identify, and eliminate IC/IDs:

- Educating the local community about prohibited discharges and how to prevent them. During the 2015-2016 fiscal year, this outreach program included working closely with water utilities to educate communities about outdoor water conservation, including preventing irrigation runoff.
- Operating a public complaint phone hotline and website and investigating the complaints received.
- Inspecting industrial/commercial and municipal facilities, construction sites, and residential areas. In addition to identifying and eliminating IC/IDs where applicable, inspectors also proactively educate responsible parties about how to avoid IC/IDs, such as cleaning outdoor areas by sweeping instead of hosing them off.
- Maintaining the storm drain system and sewer system, which provide opportunities to identify unpermitted connections to the storm drain system, cross connections, and other potential sources of IC/IDs.

The IDDE components listed above are described in more detail in Section 4 of the Annual Report and in the jurisdictional strategy tables in Appendix 2. The Participating Agencies' Jurisdictional Runoff Management Program (JRMP) Annual Report forms, also included in Appendix 2, list the total numbers of IC/IDs identified and eliminated through all IDDE program activities during the fiscal year. More detail about source investigation and elimination specifically related to the storm drain outfall dry weather monitoring component of the IDDE program are presented below.

4.2.4.1 Dry Weather Storm Drain Outfall Source Identification Results

Source investigations associated with storm drain outfall monitoring broadly categorize identified sources as "controllable" and "uncontrollable." Uncontrollable sources include natural sources like groundwater and springs. Controllable and uncontrollable sources are further classified as known and suspected.

Controllable sources, along with information about whether they were eliminated, are presented in Table A4-24. In cases where flow was observed at the outfall, but the source was not directly observed or otherwise definitively identified, Participating Agencies may have identified the sources as "suspected" rather than "known." Suspected sources may require additional investigation to identify them more specifically before they can be reduced or eliminated.

Irrigation runoff was the most commonly identified known or suspected controllable source within the San Diego River WMA. Participating Agencies worked with water districts to address irrigation runoff through water conservation programs, consisting of outreach and enforcement, typically through drought ordinances or other prohibitions of wasting water, where necessary. With the adoption of the new JRMPs toward the end of the 2014-2015 fiscal year, the Participating Agencies also established legal authority to prohibit irrigation runoff as an illicit discharge. Due to these programs and substantial effort from water agencies due to the statewide drought and mandatory conservation requirements, a large number of irrigation runoff incidents were reported to hotlines and investigated. For example, citywide, the City of San Diego stormwater hotline went from receiving about 1,200 calls per year to over 2,800 calls per year; additional reports of irrigation runoff were the main driver of the increase.

The Participating Agencies also identified known or suspected uncontrollable sources of discharge, which are summarized in Table A4-25. As with controllable sources, "known" indicates a higher level of source identification certainty than "suspected." Groundwater infiltration into the storm drain system was the most common uncontrollable source identified.

Table A4-24. Known and Suspected Controllable Sources of Persistent and Transient Flows in the San Diego River WMA

Participating Agency	Known Controllable Sources				Suspected Controllable Sources				
	Commercial Washing Activities	Irrigation Runoff	Vehicle Washing	Other	Irrigation Runoff	Commercial Washing Activities	Residential Vehicle Washing	Residential Impervious Surface Washing	Other
County of San Diego	-	-	-	-	48	-	-	-	1 – Power Washing
City of El Cajon	-	2	1	-	3	1	-	-	-
City of La Mesa	-	7	-	-	-	-	-	-	-
City of Santee	-	17 (4 Eliminated, 1 Reduced)	-	1 – Automotive Activities	-	-	-	-	-
City of San Diego	1 (Eliminated)	8	-	1 – Illicit Connection (Eliminated) 1 – Permit discharge (Eliminated)	21	7 (1 Eliminated)	2	2	1 – Construction related discharges

Table A4-25. Known or Suspected Uncontrollable Sources of Persistent and Transient Flows in the San Diego River WMA

Participating Agency	Known Uncontrollable Source			Suspected Uncontrollable Source		
	Groundwater	Springs	Tidal	Groundwater	Rain Event >72 hours prior	Springs
County of San Diego	-	-	-	13	-	-
City of El Cajon	2[2]	-	-	2	-	-
City of La Mesa	10[2]	-	-	11	-	-
City of Santee	3[2]	-	-	2	-	-
City of San Diego	3	1	5	27[1]	3	1

Notes:

[1] The City of San Diego tested 17 of these locations during the monitoring year and found the water to be uncontaminated (i.e., not exceeding NALs).

[2] Identified as groundwater through additional analytical testing comparing the chemical profile of water in the storm drain system to groundwater, potable water, and, where applicable, recycled water. Depth to groundwater was also investigated and determined to be shallow enough to influence the storm drain system.

4.2.4.2 Source Identification for Highest Priority Outfalls

Each of the Participating Agencies prioritized their outfalls that had persistent flows and identified the five highest priority major outfalls (Section 4.2.1, Table A4-15). In addition to the field screening completed at all outfalls, samples were also taken for analysis at the five highest priority outfalls, as described in Section 4.2.2. The highest priority outfalls were a focus for IDDE investigations during the 2015-2016 monitoring year. Figure A4-7 shows the known or suspected flow source types identified at the highest priority outfalls.

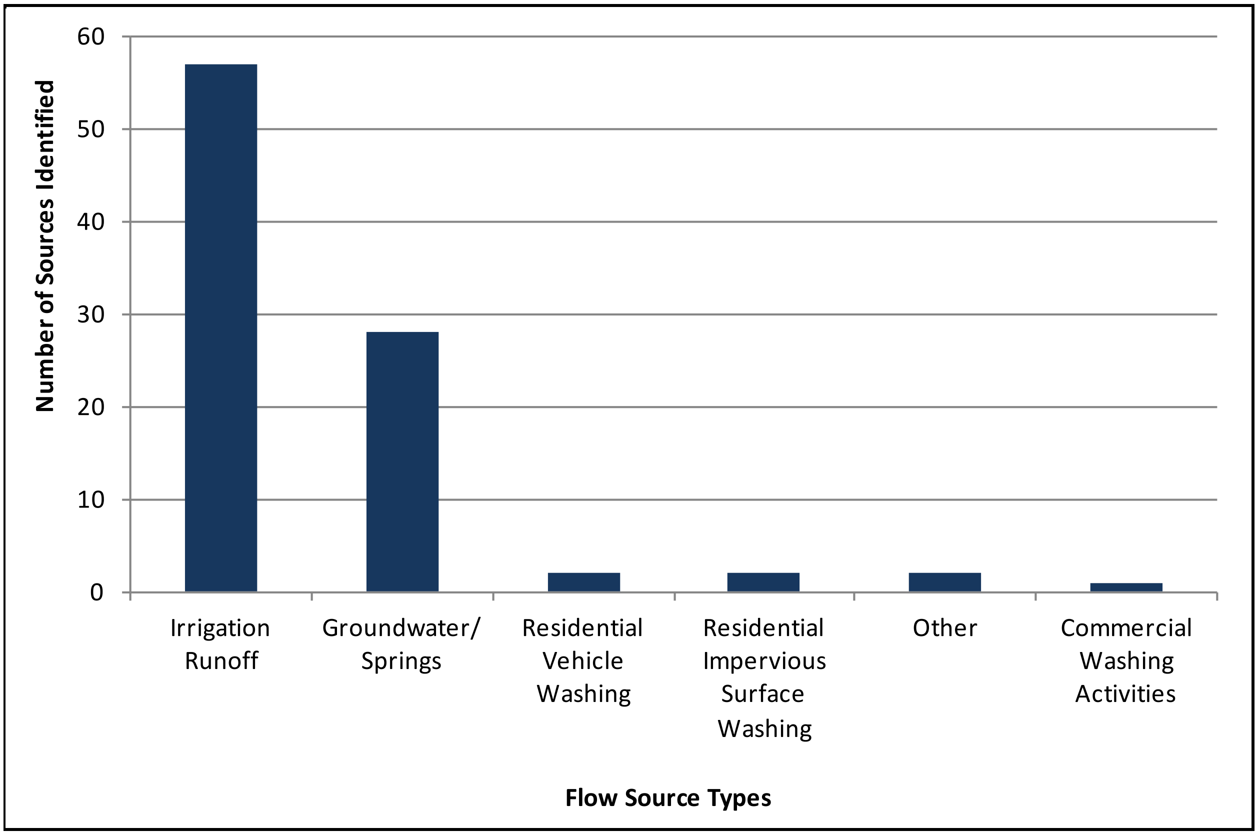

Figure A4-7. Known or Suspected Flow Sources Identified for Highest Priority Storm Drain Outfalls

More details about source investigations and associated source elimination activities at the highest priority outfalls is provided in Table A4-26.

4.2.4.3 Additional Source Investigation Activities

The City of San Diego and County of San Diego are utilizing flow meters at selected outfalls in the San Diego River WMA to assist in source identification. The County has installed flow meters at nine outfalls, and the City plans to install flow meters at four outfalls. The flow meters measure continuous flow at these outfalls, which may allow the Copermittees to target source investigation and elimination activities at particular times when flow rates tend to be higher. For example, irrigation systems are typically turned on at night or in the early morning and can be identified by recurring higher flow rates during this time.

The Copermittees are also investigating potential sources of bacteria from wastewater systems since human sources of bacteria are the highest priority source from a public health perspective. The City of San Diego has formed an interdepartmental team of staff from the Storm Water Division and the Public Utilities Department Wastewater Division to follow up on locations where bacterial source tracking data have indicated potential human sources, which could originate from the sanitary sewer system. To date, efforts have been focused on the San Diego River Watershed. For example, through this team's efforts, a broken private sewer lateral in the Sports Arena area that had been contributing wastewater to the storm drain system was identified and repaired. Similarly, the City of Santee has been working with Padre Dam Municipal Water District (Padre Dam), which is also the owner and operator of the public wastewater conveyance system in Santee, on an investigation of potential exfiltration from the wastewater system to the storm drain system. This investigation focuses in the area around a Bacteria TMDL monitoring site in Forester Creek.

Table A4-26. Highest Priority Persistent Outfall Source Elimination

Jurisdiction	Highest Priority Site ID	Source Investigation Performed?	Type	Runoff Source(s)	Actions Taken or Planned	Status of Elimination/ Identification
City of San Diego	DW0081	Yes	Unpermitted Discharge	Ground water, Other Illicit Discharges or Connections	Codes is working with Navy housing, and Caltrans to get the ultimate flow source found and stopped if possible. Still pending	In Progress
City of San Diego	DW0067	Yes	Unpermitted Discharge	Irrigation Runoff	Sent whole drainage area of DW0067 to residential patrol program RPP-029. Reported to Get it Done website	In Progress
City of San Diego	DW0369	Yes	NPDES Allowable Discharge, Other Permit Discharge, NPDES Allowable Discharge	Uncontaminated infiltration into storm drain system, Rising Groundwater, Springs		In Progress
City of San Diego	DW0681	Yes	Unpermitted Discharge, Other Permit Discharge	Irrigation Runoff, Residential Vehicle Washing, Residential Impervious Surface Washing	Reported to the Water Department and repair was confirmed visually	Eliminated
City of San Diego	DW0696	Yes	Unpermitted Discharge	Irrigation Runoff, Unidentified	Reported to Get it Done website	In Progress
City of La Mesa	OF-ALV-6	Yes	NPDES Allowable Discharge, Unpermitted Discharge	Rising Groundwater, Irrigation Runoff	Additional sampling performed	Identified as groundwater
City of La Mesa	OF-ALV-7	Yes	NPDES Allowable Discharge	Rising Groundwater	Additional sampling performed	Identified as groundwater
City of La Mesa	OF-ALV-9	Yes	Unknown	Unidentified	Continue monitoring and source identification	In Progress
City of La Mesa	OF-ALV-12	Yes	NPDES Allowable Discharge	Rising Groundwater	Analysis of water profile	Identified as groundwater
City of La Mesa	OF-ALV-13	Yes	Unpermitted Discharge, Unknown	Irrigation Runoff, Unidentified	Continue monitoring and source identification	In Progress
City of El Cajon	OF-3	Yes	Unknown	Unidentified		In Progress
City of El Cajon	OF-5	Yes	Unknown	Unidentified	Continue monitoring and source identification	In Progress
City of El Cajon	OF-13	Yes	Unpermitted Discharge	Non-Residential Vehicle Washing, Irrigation Runoff		In Progress
City of El Cajon	OF-15A	Yes	Permitted Discharge	Groundwater	Additional sampling performed	Identified as groundwater
City of El Cajon	OF-16	Yes	Unknown	Unidentified		In Progress
City of Santee	S5c	Yes	Unpermitted Discharge	Irrigation Runoff, Other Illicit Discharges or Connections		In Progress
City of Santee	E5g1	Yes	Unpermitted Discharge	Irrigation Runoff	Educational materials given to apartment complex managers	In Progress
City of Santee	S15h	Yes	Permitted Discharge, Unpermitted Discharge	Rising Groundwater, Other Illicit Discharges or Connections	Additional sampling performed	In Progress
City of Santee	RCP1	Yes	Unpermitted Discharge	Unidentified	Contacted Grossmont Union School District on multiple occasions.	In Progress
City of Santee	R20a	Yes	Unknown	Unidentified	Continue monitoring and source identification	In Progress
County of San Diego	MS4-SDR-064	Yes	Unpermitted Discharge	Over-irrigation		In Progress
County of San Diego	MS4-SDR-127	Yes	Unpermitted Discharge	Irrigation Runoff, Over-irrigation		In Progress
County of San Diego	MS4-SDR-151	Yes	Unpermitted Discharge	Irrigation Runoff, Over-irrigation		In Progress
County of San Diego	MS4-SDR-207	Yes	Unpermitted Discharge	Irrigation Runoff, Over-irrigation, Ground water		In Progress
County of San Diego	MS4-SDR-036	Yes	Unpermitted Discharge	Power Washing, Irrigation Runoff, Over-irrigation		In Progress

4.2.5 Storm Drain Outfall Wet Weather Monitoring

Storm drain outfall wet weather monitoring was conducted at five outfalls in the San Diego River WMA. Five stations representative of storm water discharges from Residential, Commercial, Industrial, and typical Mixed-use land uses were selected from the inventory of major storm drain outfalls, and at least one station was selected for each Participating Agency within the WMA. Two outfalls were located in the Mission San Diego HSA, two in the Santee HSA, and one in the El Cajon HSA. The storm drain outfall wet weather monitoring stations for the San Diego River WMA are presented in Table A4-27 and are shown with corresponding land uses in Figure A4-8. The outfall names for the wet weather monitoring stations differed from the jurisdictional station names in the Participating Agencies' inventories; therefore, both station identifiers are given in Table A4-27. This is the first year of storm drain outfall wet weather monitoring in accordance with the WQIP MAP. The prior two years of wet weather monitoring were under the transitional monitoring program with a different list of analytical parameters. The locations of these outfalls have not been adjusted since transitional monitoring began. Therefore, three years of data have now been collected at all five storm drain outfall wet weather monitoring locations in the San Diego River WMA.

Table A4-27. Storm Drain Outfall Wet Weather Monitoring Stations in the San Diego River WMA

Storm Drain Outfall Name	Jurisdictional Identifier	Jurisdiction	HSA Name/No.	Latitude	Longitude
MS4-SDR-1	OF-11	City of El Cajon	El Cajon/907.13	32.80256	-116.95808
MS4-SDR-2	OF-ALV-11	City of La Mesa	Mission San Diego/ 907.11	32.77776	-117.01751
MS4-SDR-3	DW0136	City of San Diego	Mission San Diego/ 907.11	32.74773	-117.22927
MS4-SDR-4	G30c	City of Santee	Santee/907.12	32.84501	-116.99122
MS4-SDR-5	MS4-SDR-064	County of San Diego	Santee/907.12	32.86165	-116.94474

Sampling at the storm drain outfall wet weather monitoring locations was conducted between December 11, 2015 and January 31, 2016. The rainfall statistics for the monitored event at each outfall, based on nearby Alert station gauges, are presented in Table A4-28. The highest event volumes and peak flow rates were observed during the monitored event at MS4-SDR-2 in the Mission San Diego HSA, and the lowest volumes and flows were observed during the event at MS4-SDR-5 in the Santee HSA. Storm drain outfall wet weather flow data are presented in Attachment 4F to this appendix, and a QA/QC report is provided as Attachment 4G.

Table A4-28. 2015-2016 Rainfall Statistics for Storm Drain Outfall Wet Weather Monitoring Events in the San Diego River WMA

Date	Station Name/ Jurisdictional Identifier	Total Rain (in)	Duration (hours)	Intensity (in/hour)	Antecedent Dry Days	Event Volume (cf)	Peak Flow (cfs)
01/31/2016	MS4-SDR-1/ OF-11	0.51	7.82	0.07	22	42,350	4.61
01/31/2016	MS4-SDR-2/ OF-ALV-11	0.51	7.82	0.07	22	105,153	28.0
01/04/2016	MS4-SDR-3/ DW0136	0.11	7.00	0.02	6	7,866	2.04
12/11/2015	MS4-SDR-4/ G30c	0.36	9.97	0.04	13	32,495	5.33
01/04/2016	MS4-SDR-5/ MS4-SDR-064	0.12	20.4	0.01	6	4,466	0.89

in – inches cf – cubic feet cfs – cubic feet per second

Monitoring was conducted in accordance with the WQIP MAP. Grab samples were collected and analyzed for pH, temperature, conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria, and composite samples were collected and analyzed for constituents contributing to the HPWQC, 303(d) List impairments, and constituents with stormwater action levels (SALs). A receiving water sample was also collected and analyzed for hardness, where feasible. Observational and hydrologic data were also recorded.

Analytical results for samples collected at the five storm drain outfall wet weather monitoring locations are summarized in Table A4-29. Bacteria concentrations are compared to single sample maximum (SSM) effluent limitations from the Bacteria TMDL, and results for the remaining required constituents, including general and physical chemical constituents, nutrients, and total and dissolved metals, are compared to SALs as provided in the Permit and listed in Table A4-34 of this appendix.

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform (i.e., the HPWQC within the WMA) indicated that the highest concentrations were measured at MS4-SDR-3 in the Mission San Diego HSA (907.11) for *Enterococcus* and total coliform and at MS4-SDR-5 in the Santee HSA (907.12) for fecal coliform. Concentrations of *Enterococcus* and fecal coliform in wet weather discharges from all five outfalls were above the SSMs (WQBELs discharging to freshwater creeks with REC-1 beneficial use). The only existing SALs that relate to PWQC in the WMA are for nitrate/nitrite as N and total phosphorus, and each of these PWQC concentrations was measured below the SALs. No other constituent concentrations were above the corresponding SALs.

Laboratory and field data collected for storm drain outfall wet weather monitoring will be uploaded to CEDEN, and data submittals are provided in Attachment L to this appendix.

J - Analyte was detected at a concentration below the reporting limit and above the method detection limit. Reported value is estimated.
Bold/shaded values do not meet Single Sample Maximum Final Effluent Limitations.

4.2.6 Storm Drain Outfall Wet Weather Monitoring Data Assessments

Provision D.4.b.(2).(c) of the Permit requires the storm drain outfall wet weather monitoring data assessments summarized in Table A4-30. The information necessary to demonstrate compliance with each Provision is outlined below. In instances where compliance has been demonstrated in previous sections of this Annual Report, those sections are referenced.

Table A4-30. Storm Drain Outfall Wet Weather Monitoring Assessments

Assessment	Components	Provision(s)
WQIP Annual Report		
Estimate loads and volumes.	Calculate or estimate the average stormwater runoff coefficient for each land use type.	D.4.b.(2).(b)(i)(a)
	Calculate or estimate the volume of stormwater and pollutant loads discharged from each monitored storm drain outfall for each qualifying storm event.	D.4.b.(2).(b)(i)(b)
	Calculate or estimate the total volume and pollutant load discharged from the Copermittee's jurisdiction over the course of the wet season.	D.4.b.(2).(b)(i)(c)
	Calculate or estimate the percent contribution of stormwater volumes and pollutant loads discharged from each land use type within each hydrologic subarea with a major storm drain outfall or each major storm drain outfall for each qualifying storm event.	D.4.b.(2).(b)(i)(d)
	Identify necessary modifications to monitoring locations and frequencies necessary to identify pollutants in stormwater discharges.	D.4.b.(2).(b)(ii)
Evaluate WQIP analysis.	Using data and applicable SALs, evaluate and compare data collected to the analyses and assumptions used to develop the WQIP.	D.4.b.(2).(c)(ii)
	Evaluate whether analyses and assumptions should be updated as a component of the adaptive management efforts.	D.4.b.(2).(c)(ii)
Identify data gaps.	Identify data gaps in the monitoring data necessary to fulfill assessment requirements.	D.4.b.(2).(c)(iv)
Evaluate trends.	Evaluate data collected pursuant to D.2.c, incorporate new data into time-series plots for each long-term monitoring constituent and perform statistical trends analysis on cumulative long-term wet weather data set.	D.4.b.(2)(d)
Once during Permit Term		
Evaluate progress in achieving stormwater pollutant reductions.	Identify reductions and progress in achieving reductions from different land uses and/or drainage areas.	D.4.b.(2).(c)(iii)
	Assess the effectiveness of WQIP improvement strategies, with estimates of volume and load reductions attributed to specific strategies when possible.	
	Identify modifications necessary to increase the effectiveness of WQIP strategies.	

4.2.6.1 Provision D.4.b.(2)(b)

Provision D.4.b.(2)(c)(i) requires that Copermittees continue to conduct the land-use based storm drain outfall wet weather monitoring assessment previously required by the transitional monitoring requirements of Provision D.4.b.(2)(b).

Because the storm drain outfall wet weather monitoring station locations have not been modified, the general approach and land use data and groupings presented in the 2014-2015 monitoring and assessment report (WESTON, 2016) are applicable to the 2015-2016 monitoring year. The technical approach and applicable equations can be found in the Transitional Wet Weather MS4 Monitoring Workplan (WESTON, 2015c). Assessment results are presented in detail by jurisdiction in Attachment 4H to this appendix. As more data are collected and incorporated into the assessment, the results are becoming increasingly representative of the variation in runoff coefficients and constituent concentrations associated with different land uses and wet weather conditions to generate a more robust prediction of jurisdictional loads based on land use.

Data specific to the 2015-2016 monitoring year that were incorporated into this assessment include pollutant volumes and loads at each outfall for the monitored event (Table A4-31) and for the monitoring year (Table A4-32). Updated land use event mean concentration (EMC) summary tables based on three monitoring years of data are included in the detailed assessment results provided as Attachment 4H to this appendix.

In compliance with Provision D.4.b.(2)(b)(ii), the storm drain outfall wet weather monitoring locations and frequencies were evaluated in order to identify modifications that may be considered for implementation in the future. A review of the collective land use data associated with monitored storm drain outfall drainage areas was conducted to determine whether the WMA contains any categories of land use types not represented within the monitored storm drain outfall drainage areas. The results and recommendations were presented in the 2012-2014 transitional monitoring and assessment report (WESTON, 2015a) and remain unchanged for the 2015-2016 monitoring year. The distribution of land use types within the monitored outfall drainage areas closely resembles that of the WMA.

The evaluation of monitoring frequency included a review of the monitoring data to determine how well the data from each monitored storm event represented the wet weather conditions on an annual basis. The total qualifying rainfall characterizing storms greater than 0.1 inch for 2015-2016 was 11.17 inches and 12.13 inches at the La Mesa and Fashion Valley Alert precipitation stations, respectively. These rainfall values are slightly greater than the official regional rainfall average of 10.82 inches (Lindbergh Field). Rainfall patterns varied significantly across the San Diego River WMA, with larger, higher intensity events in the coastal areas. At the Fashion Valley Alert station, three rainfall days had 24-hour totals of greater than one inch (July, September, and November 2015); and in January 2016, over two inches of rainfall was recorded for a 24 hour period. At the La Mesa Alert station, 2015 daily rainfall totals were less than 0.9-inch; and in January 2016, two rainfall days had 24-hour totals of greater than one inch. The storm events monitored in the San Diego River WMA were small to average in size, with rainfall totals of approximately 0.5 inch or less. Moving forward, rainfall intensity as well as storm size will be considered when evaluating forecasted storm events for monitoring, if possible. It has been found that a target of a rainfall intensity of at least 0.05 inch/hour shows a good precipitation response and higher measured Runoff "C" compared to lower intensity storm events. In general, capturing larger events has been less feasible in recent years due to the patterns of rainfall in the region.

2015-2016 storm drain outfall wet weather monitoring results are found in Table A4-29.

4.2.6.2 Provision D.4.b.(2)(c)[ii]

In addition to the land-based assessment presented in Section 4.2.6.1, the 2015-2016 monitoring year is the first requiring the additional assessments of Provision D.4.b.(2)(c)(ii-iv).

Provision D.4.b.(2)(c)(ii) requires the Copermittees to evaluate and compare data collected during the monitoring year to the analyses and assumptions used to develop the WQIP and evaluate whether adaptive management is necessary for updates. The analytical results for samples collected at the five storm drain outfall wet weather monitoring locations in the San Diego River WMA are summarized in Table A4-29 in Section 4.2.5. Results indicated that indicator bacteria concentrations in wet weather discharges from all five monitored outfalls were above the SSMs specified in the Bacteria TMDL. The analyses and assumptions used to develop the WQIP resulted in the selection of bacteria as the HPWQC and in the selection of the five outfalls monitored during wet weather. Because concentrations of indicator bacteria in wet weather discharges from each of these outfalls were above Bacteria TMDL numeric targets, continued monitoring of these outfalls is consistent with the intentions of the WQIP. The Participating Agencies have been officially implementing their strategies to address bacteria under the WQIP for less than one year, and updates through adaptive management are not necessary at this time.

4.2.6.3 Provision D.4.b.(2)(c)[iii]

This Provision requires the Copermittees to review the data collected under the storm drain outfall wet weather monitoring program in order to identify pollutant reduction progress, assess water quality improvement strategy effectiveness, and identify modifications necessary to increase effectiveness. This assessment is required once during the Permit term and will be provided in the RMAR, which is scheduled for submittal to the Regional Board in December 2017.

4.2.6.4 Provision D.4.b.(2)(c)[iv]

No gaps have been identified in the monitoring data. Since the 2015-2016 monitoring year was the first year of monitoring under the WQIP MAP and the first year requiring the assessments outlined in Provision D.4.b.(2)(c)(ii-iii), the collection of additional data will be necessary before the Copermittees are able to identify data gaps.

4.2.6.5 Provision D.4.b.(2)(d)

This provision requires creation of time-series plots for long-term monitoring data collected under Provision D.2.c and a trend analysis on this cumulative long-term storm drain outfall wet weather monitoring data set. This assessment will be addressed when sufficient data (i.e., at least three monitoring years are required for a statistical test) have been collected.

4.3 Special Studies

4.3.1 San Diego Regional Reference Streams and Beaches Studies

The Participating Agencies participated in the San Diego Regional Reference Streams and Beaches Studies from 2014 to 2016, which measured levels of indicator bacteria that account for natural sources to establish the background concentrations, or “reference conditions”, for streams or beaches minimally disturbed by anthropogenic activities. This reference system approach results in allocation of allowable exceedance days based on frequencies of exceedance at reference sites with natural sources of bacteria. The results of these studies support the forthcoming re-evaluation of the Bacteria TMDL and numeric target development for future TMDLs. These studies were intended to provide data to support discussions of reasonable, accurate targets for indicator bacteria at Southern California streams and beaches.

4.3.1.1 Reference Streams Study

This study investigated concentrations of indicator bacteria, nutrients, metals, and conventional constituents occurring naturally at reference streams in minimally disturbed watersheds in Southern California during wet weather (during a storm and the three days following a storm) and dry weather conditions. Although additional constituents were analyzed, the main focus of the study was indicator bacteria. The study also sought to categorize exceedance frequencies for indicator bacteria by hydrologic, geomorphologic, biotic and abiotic factors. Study questions included the following:

- How does the water quality objective exceedance frequency for indicator bacteria vary between wet weather, summer dry weather and winter dry weather?
- How does indicator bacteria vary by stream landscape and site-specific factors, including:
    - Catchment size and geology?
    - Wet weather parameters such as size, timing of storm, and number of antecedent dry days?
    - Dry weather factors such as flow, stream physiochemical parameters (temperature, conductivity, and turbidity), chemical parameters (nutrients, organic carbon, metals, and conventional constituents) and trophic status, as measured by algal abundance?

The sampling locations selected for this study were chosen to meet reference screening criteria and represent varying watershed size and geology. Samples were collected during eight storm events at five locations, and dry weather samples were collected weekly at 10 intermittent stream locations in 10 watersheds in Southern California. Five locations were in San Diego County, three were in Orange County, and two were in Ventura County. In addition to indicator bacteria analysis, samples were collected biweekly and analyzed for nutrients, metals, and conventional constituents. Samples were also analyzed for the presence of human genetic marker in order to eliminate locations with potential human sources of fecal bacteria. The chosen “reference” streams had drainage areas that were at least 95% undeveloped, were relatively homogenous geologically, had year round flow or at least prolonged dry weather flow, did not include drainage areas affected by wildfires, were not included on the 303(d) list, and had no evidence of anthropogenic effects. Findings from the study included the following:

- Indicator bacteria concentrations measured during the study were generally below water quality objectives except for *Enterococcus*, and exceedance frequencies were highest during summer dry weather.
- Wet weather EMC exceedance frequencies were low except for *Enterococcus*. The number of events sampled was not sufficient to determine whether relationships exist between exceedance frequencies and watershed size and/or geology.

- Temperature was the major factor associated with elevated summer dry weather concentrations of indicator bacteria, although total suspended solids (TSS), nutrients, and organic carbon were also positively correlated. No significant relationships between indicator bacteria concentrations and watershed size or geology were observed during dry weather.
- EMC fluxes (flux was calculated as the ratio of mass loading and watershed area) during wet weather were two to three times greater than during dry weather and were comparable to those described in previous studies.

Results are presented in greater detail in the Technical Report (Tiefenthaler et al., 2015, which is provided as Attachment 4I to this appendix.

4.3.1.2 Reference Beaches Study

The reference beaches study investigated concentrations of indicator bacteria occurring naturally at reference beaches during a period of prolonged drought. The goals of this study included the following:

- Quantify concentrations and exceedance frequencies for indicator bacteria at reference beaches during wet and dry weather (natural, background conditions), while evaluating the presence of human genetic marker to determine whether samples were contaminated by human sources.
- Quantify concentrations and exceedance frequencies for indicator bacteria at the associated, minimally-impacted estuary.

The chosen "reference" beaches had minimal human impact with open beaches and breaking waves, received freshwater runoff from a beach or estuary, and received runoff originating from undeveloped watersheds with over 93% open space. The two sites meeting these criteria were San Onofre Creek in San Diego County, which has an associated bar-built estuary, and Deer Creek in Los Angeles County, which has an associated mixing zone. Weekly dry weather sampling was conducted at both locations, and wet weather sampling was conducted over four days for one event at San Onofre Creek (only one storm event breached the creek mouth). Samples during each event were collected at the beach, creek, and the respective estuary or mixing zone. Findings from the study included the following:

- Indicator bacteria concentrations and exceedance frequencies during both winter and summer dry weather were low at both monitored beaches. This is consistent with results from previous studies of beaches with blocked estuary inlets or beaches with flowing creeks and no estuary.
- Indicator bacteria concentrations in the estuary or mixing zone associated with both beaches were one to three orders of magnitude greater than those at the corresponding beach, and were higher at San Onofre Creek than Deer Creek. Exceedance frequencies were also higher in the estuary associated with San Onofre Creek compared to the mixing zone associated with Deer Creek. This suggests that dry weather exceedance frequencies may have been greater if the estuary had been open to tidal exchange.

- At both study locations, no significant relationships between indicator bacteria and water temperature, salinity, or antecedent dry days were observed, but indicator bacteria concentrations decreased with the number of antecedent dry days at the San Onofre Creek beach and increased with the number of antecedent dry days in the associated estuary. Significant positive correlations were found between total coliform concentrations and water temperature, salinity, and antecedent dry days and between *E. coli* and fecal coliform and salinity in the estuary associated with San Onofre Creek. This indicates that freshwater input from the creek dilutes bacteria concentrations. Regrowth of bacteria may have been a factor at this estuary.
- During the single monitored storm event, indicator bacteria exceedances were common in the San Onofre Beach creek and estuary samples, but exceedances were only observed at the beach on the day of the storm. Because all samples associated with this storm event were positive for human genetic marker, results could not be used to determine natural background exceedance frequencies. However, positive human marker results were rare throughout the study overall, indicating that the study locations may be suitable reference sites.

Results are presented in greater detail in the Technical Report (Tiefenthaler et al., 2016), which is provided as Attachment 4J to this appendix.

4.3.2 Wet Weather Epidemiology Study and Quantitative Microbial Risk Assessment

This special study examined the correlation between bacteria levels in stormwater discharges from the San Diego River and the health effects experienced by surfers at Ocean Beach, located near the mouth of the San Diego River. The first phase of the study was performed from January 2014 through March of 2015 and included 654 surfers and 10,081 logged surfing sessions.

The overall goal of the study was to answer four questions:

- Is surfing associated with an increased rate of illness?
- Are illness rates higher when surfing following wet weather compared to dry weather?
- What is the association between water quality and illness following wet weather events?
- What level of water quality corresponds to the same risk of illness as current water quality objectives?

Results indicated that there is an increased risk of illness associated with water contact, and that risk was greater when surfing after a wet weather event compared to during dry weather. The excess risk of illness when entering the ocean in wet weather compared to not entering the ocean was quantified to be 12 surfers per 1,000. An association was established between *Enterococcus* and illness after a wet weather event; however, the risk of illness was found to be lower than that which would be predicted by *Enterococcus* water quality objectives. An extra 12 illnesses per 1,000 surfers after wet weather ocean exposure was below the most recent water quality guidelines for recreational beaches from the USEPA (2012), which recommends no more than 32 to 36 illnesses per 1,000 swimmers.

In addition, a quantitative microbial risk assessment (QMRA) was performed to estimate the risks of gastrointestinal illness from recreational exposure to beaches impacted by wet weather storm drain outfall discharges. Source tracking work and analysis of pathogen concentrations were conducted, and modeling results were comparable to epidemiological study results. The study demonstrated the applicability of QMRA for recreational water risk estimates during wet weather and may facilitate consideration of site-specific water quality criteria.

Additional details can be found in the technical report (Schiff et al., 2016), which is provided as Attachment 4K to this appendix.

4.3.3 Special Studies Assessments

Provision D.4.c of the Permit requires an annual evaluation of special studies results to assess their relevance to the Participating Agencies' characterization of receiving water conditions, understand sources of pollutants and/or stressors, and control and reduce the discharges of pollutants from the storm drain outfalls to receiving waters. This Provision also requires the Participating Agencies to identify modifications and/or updates to the WQIP that are necessary based on special study results.

Results from the special studies outlined above supplement the bacteria data collected under Provisions D.1 (receiving water) and D.2 (storm drain outfalls). Results from these studies may be used in conjunction with data from other studies in re-assessing numeric targets related to bacteria. The Regional Reference Streams and Beaches Study provides a scientific basis for updating the "reference" conditions to be considered in evaluating compliance levels for bacteria, and will be useful in the re-evaluation of the Bacteria TMDL. The Wet Weather Epidemiology Study may facilitate consideration of site-specific water quality criteria for bacteria. Once these re-evaluations occur, adaptive management may be utilized to modify the WQIP.

4.4 Action Levels

The action levels for storm drain outfall samples utilized to evaluate the data collected in the San Diego River WMA are presented in Table A4-34. Suggested analytical methods and reporting limits are presented in Attachment 4A-5d to the WQIP MAP.

Table A4-33. Action Levels for the San Diego River WMA – Storm Drain Outfalls

Analyte	Benchmark Reference	Units	Action Level(s)				Notes
Non-Stormwater Action Levels for Discharges from Storm Drain Outfalls to Ocean Surf Zone							
			AMAL	IM			
Total coliform	Ocean Plan	MPN/100 mL	1000	10,000/1,000			For IM, total coliform density NAL is 1,000 MPN/100 mL when the fecal/total coliform ratio exceeds 0.1.
Fecal coliform	Ocean Plan	MPN/100 mL	200	400			For AMAL, fecal coliform density NAL is 200 MPN/100 mL during any 30 day period.
Enterococcus	Ocean Plan	MPN/100 mL	35	104			IM value has been set to the Basin Plan water quality objective (WQO) for saltwater "designated beach areas".
Non-Stormwater Action Levels for Discharges from Storm Drain Outfalls to Bays, Harbors, and Lagoons/Estuaries							
			AMAL	IM			
Turbidity	Ocean Plan	NTU	75	225			
pH	Ocean Plan	Units	Within limit of 6.0-9.0 at all times				
Fecal coliform	Basin Plan	MPN/100 mL	200	400			AMAL is based on a minimum of not less than five samples for any 30-day period. For IM, the NAL is reached if more than 10 percent of the total samples exceed 400 MPN/100 ml during any 30 day period.
Enterococcus	Basin Plan	MPN/100 mL	35	104			IM value has been set to the Basin Plan WQO for saltwater "designated beach areas" and is not applicable to water bodies that are not designated with water contact recreation (REC-1) beneficial use.
Non-Stormwater Action Levels for Discharges from Storm Drain Outfalls to Inland Surface Waters							
			AMAL	MDAL	IM		
Dissolved Oxygen	Basin Plan	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters				
Turbidity	Basin Plan	NTU	-	20	See MDAL		
pH	Basin Plan	Units	Within limit of 6.5-8.5 at all times				
Fecal Coliform	Basin Plan	MPN/100 mL	200	-	400		AMAL is based on a minimum of not less than five samples for any 30-day period. For IM, the NAL is reached if more than 10 percent of total samples exceed 400 MPN/100 mL during any 20 day period.
Enterococcus	Basin Plan	MPN/100 mL	33	-	61		IM value has been set to the Basin Plan WQO for saltwater "designated beach areas" and is not applicable to water bodies that are not designated with water contact recreation (REC-1) beneficial use.
Total Nitrogen	Basin Plan	mg/L	-	1	See MDAL		
Total Phosphorus	Basin Plan	mg/L	-	0.1	See MDAL		
MBAS	Basin Plan	mg/L	-	0.5	See MDAL		
Iron	Basin Plan	mg/L	-	0.3	See MDAL		
Manganese	Basin Plan	mg/L	-	0.05	See MDAL		
Non-Stormwater Action Levels for Priority Pollutants							
			Freshwater		Saltwater		
			AMAL	MDAL	AMAL	MDAL	
Cadmium	CTR	µg/L	**	**	8	16	
Copper	CTR	µg/L	*	*	2.9	5.8	See footnote.
Chromium III	CTR	µg/L	**	**	-	-	
Chromium VI	CTR	µg/L	8.1	16	41	83	
Lead	CTR	µg/L	*	*	2.9	14	See footnote.

Silver	CTR	µg/L	*	*	1.1	2.2	See footnote.
Zinc	CTR	µg/L	*	*	47	95	See footnote.

Table A4-33. Action Levels for the San Diego River WMA – Storm Drain Outfalls

Analyte	Benchmark Reference	Units	Action Level(s)	Notes
Stormwater Action Levels				
Turbidity	Order No. R9-2013-0001	NTU	126	
Nitrate & Nitrite (Total)	Order No. R9-2013-0001	mg/L	2.6	
Phosphorus (Total P)	Order No. R9-2013-0001	mg/L	1.46	
Cadmium (Total Cd) †	CTR	µg/L	3	See footnote.
Copper (Total Cu) †	CTR	µg/L	127	See footnote.
Lead (Total Pb) †	CTR	µg/L	250	See footnote.
Zinc (Total Zn) †	CTR	µg/L	976	See footnote.

* Action levels designated on a case by case basis.

** Action levels designated on a case by case basis, but calculated criteria are not to exceed MCLs under the CCR, Title 22, Division 4, Chapter 15, Article 4 Section 64431.

The cadmium, Copper, Chromium (III), Lead, Nickel, Silver, and Zinc NALs for storm drain outfall discharges to freshwater receiving waters will be developed on a case-by-case basis on site-specific water quality data (receiving water hardness). For these priority pollutants, refer to 40 CFR 131.38(b)(2).

† Sampling must include a measure of receiving water hardness at each storm drain outfall. If a total metal concentration exceeds the corresponding metals SAL in the table, that concentration must be compared to the CTR and the USEPA 1-hour maximum concentration for the detected level of RW hardness associated with that sample. If it is determined that the sample's total metal concentration for that specific metal exceeds that SAL, but does not exceed the applicable USEPA 1-hr maximum concentration criterion for the measured level of hardness, then the sample result will not be considered above the SAL for that measurement.

4.5 California Environmental Data Exchange Network Data Upload and Retrieval

Provision F.4.a.(6) of the Permit requires that monitoring data collected pursuant to Provision D (Monitoring and Assessment Program Requirements) must be uploaded to the CEDEN, a central location for finding and sharing information about California's waterbodies. CEDEN aggregates water quality, aquatic habitat, and wildlife health data and makes them accessible in downloadable forms at www.ceden.org.

Data in the CEDEN are searchable by date and by location, project, station, or parameter using the "Find Data" functionality of the CEDEN website. The data from the San Diego Region Copermittee Program can be retrieved by identifying the Program as "National Pollutant Discharge Elimination System (NPDES) Program" and Project as "San Diego Region NPDES", which is the parent Project name. Within this overall retrieval, the specific datasets described in this Annual Report can be identified using the project names listed in Table A4-35. Data are limited to those parameters that are currently storable in CEDEN. SMC data are submitted to the SMC Program.

In accordance with the Permit, data collected during the 2015-2016 monitoring year has been submitted to CEDEN and will become available from CEDEN once loaded by the Regional Data Center into the system during 2017. CEDEN data submittals and receipts are provided as Attachment L to this appendix.

Table A4-34. Project Names for CEDEN Data Retrieval

Project Code	Project Name

APPENDIX 5

Adaptive Management/Modifications

Appendix 5 Adaptive Management/Modifications

5.1 TRIGGERS FOR ADAPTIVE MANAGEMENT

The adaptive management process may include modifications to the priority water quality conditions, numeric goals, strategies, and schedules, and/or to the monitoring and assessment program outlined in the Water Quality Improvement Plan (WQIP). This appendix contains analyses and information in support of the adaptive management process. With the acceptance of the WQIP in February 2016, the Copermittees have been officially implementing the WQIP for less than a year. Therefore, it is too early in the implementation process to have significant feedback necessary to drive the adaptive management process. Only one year of monitoring data have been collected under the WQIP Monitoring and Assessment Plan (MAP), and additional monitoring years under the Permit term are necessary for feasible evaluation of the effectiveness of jurisdictional strategies. Minor administrative changes, including clarifications, correction of typos and errors, and edits to WQIP strategies, are proposed, primarily by the City of San Diego. These modifications are documented as markup in the Participating Agencies' strategy tables of Appendix 2. No significant modifications to the MAP are warranted based on data collected during the 2015-2016 monitoring year. The results of the Permit-required assessments of these data are presented in Appendix 4.

5.1.1 Routine Monitoring Results

Results from routine monitoring programs may trigger updates to the WQIP, potentially prompting additions or changes to the strategies that are implemented. The evaluation of monitoring results occurs at two levels:

(1) comparison to receiving water limitations and determination of the influence of municipal separate storm sewer system (MS4) (storm drain system) discharges to any persistent exceedances, and
(2) comparison of dry and wet weather storm drain system discharge data to non-stormwater action levels (NALs) and stormwater action levels (SALs).

5.1.1.1 Receiving Water Limitations

The primary focus of this assessment is on conditions within receiving waters and their relationship to storm drain system discharges. An assessment methodology to determine whether discharges from the storm drain system are potentially sources of pollutants "causing or contributing" to "persistent" receiving water exceedances is currently being developed, and the results of the assessment will be presented in the San Diego River Watershed Management Area (WMA) chapter of the Regional Monitoring and Assessment Report (RMAR) to be submitted with the Report of Waste Discharge (ROWD) in December 2017. Therefore, this trigger for adaptive management pertaining to receiving water exceedances that may not be addressed by the WQIP will be addressed in the next report deliverable, prior to the 2016-2017 WQIP Annual Report.

5.1.1.2 Exceedances of NALs and/or SALs

The primary focus of this assessment is on exceedances of NALs or SALs in storm drain outfall discharges during dry and wet weather, respectively. NALs and SALs are incorporated into the WQIP in order to:

(1) support the development and prioritization of water quality improvement strategies,
(2) assess the effectiveness of the water quality improvement strategies, and
(3) support the detection and elimination of non-stormwater and illicit discharges to the storm drain system (NALs only).

Appendix 4 includes the results of the dry and wet weather storm drain outfall discharge monitoring programs and compares the data to applicable NALs or SALs included in Provision C of the Permit. A summary of these results is presented in Table A5-1, and the locations of the storm drain outfall dry weather monitoring locations (highest priority outfalls) and storm drain outfall wet weather monitoring locations are shown in Appendix 4 in Figures A4-3 and A4-8, respectively. Repeated exceedances for constituents that are not currently addressed by the WQIP may indicate that these constituents warrant further consideration. During the 2015-2016 monitoring year, the NALs most often exceeded in the San Diego River WMA were consistent with those identified by the WQIP as priority water quality conditions, with the exception of iron and manganese.

The comparison of the storm drain outfall monitoring results to NALs and SALs may also be used to guide the adaptation of strategies. If the jurisdictional strategies outlined in Section 4 result in reductions in pollutant loads from outfalls with discharges in exceedance of NALs or SALs, an assessment of the effectiveness of these strategies could be made. To date, only one year of monitoring data have been collected in accordance with the MAP, and the Participating Agencies in the San Diego River WMA have just begun to implement their jurisdictional strategies under the accepted WQIP intended to result in achievement of dry and wet weather interim goals for the term of the current Permit (see Section 4). Additional data will be necessary before an assessment of the effectiveness of these strategies can be made.

Table A5-1. Exceedances of NALs and SALs during the 2015-2016 Monitoring Year in the San Diego River WMA

Constituent	Outfalls with NAL Exceedances	Outfalls with SAL Exceedances[3]
Fecal Coliform[1]	MS4-SDR-064, MS4-SDR-127, MS4-SDR-151, MS4-SDR-207, OF-3, OF-5, OF-13, OF-15A, OF-16, OF-ALV-6, OF-ALV-9, OF-ALV-12, OF-ALV-13, E5g1, R20a, RCP1, S5c, S15h, DW0696, DW0681	OF-11, OF-ALV-11, DW0136, G30c, MS4-SDR-064

Nitrate + Nitrite (total)[2]	N/A	None
Phosphorus (Total P)[2]	N/A	None

1. Applicable to non-stormwater discharges from MS4s to inland surface waters.
2. Applicable for discharges of stormwater from MS4s to receiving waters.
3. Exceeds Single Sample Maximum Final Effluent Limitations (Attachment E.6 of Permit for Bacteria TMDL).

5.1.1.3 Special Studies Results

As part of the MAP, the Participating Agencies are engaged in special studies related to bacteria, the highest priority water quality condition (HPWQC) for the watershed. Results from the special studies outlined in Section 3.3 and Appendix 4 Section 4.3 supplement the bacteria data collected under Provisions D.1 (receiving water) and D.2 (storm drain outfalls). As relevant data, conclusions, and lessons learned become available from these studies, the numeric goals, strategies, schedules, and the MAP may be impacted and may require modification. Additionally, lessons learned and study results from outside the watershed, especially those related to the bacteria impairments, may also be incorporated into the WQIP.

The Regional Reference Streams and Beaches Study provides a scientific basis for updating the “reference” conditions to be considered in evaluating compliance levels for bacteria, and will be useful in the re-evaluation of the Bacteria Total Maximum Daily Load (TMDL). The Wet Weather Epidemiology Study may facilitate consideration of site-specific water quality criteria for bacteria. Once these re-evaluations occur, adaptive management may be utilized to modify the WQIP.

5.1.2 Regulatory Considerations

The purpose of this section is to summarize changes in the regulatory landscape including:

(1) new regulatory actions at the State or local level, and

(2) Regional Board recommendations that must be considered as part of the adaptive management process.

5.1.2.1 New Regulatory Actions

When new regulations or policies are adopted that impact watershed planning and implementation processes, modifications to the WQIP numeric goals, strategies, schedules, and/or MAP may be warranted, and, in some cases, required. For example, an update to the WQIP must be initiated no later than six months following approval of a TMDL Basin Plan Amendment by the Office of Administrative Law and the United States Environmental Protection Agency (USEPA). The trigger applies to TMDLs containing wasteload allocations assigned to Participating Agencies within the watershed during the term of the Order (see Provision F.2.c.(2)). Other examples of regulatory drivers that may trigger modifications to the WQIP include new state policies or plans (e.g., trash, toxicity, biological objectives, bacteria standards updates) and changes resulting from modifications to existing Permit requirements (e.g., as a result of revising a TMDL).

5.1.2.2 Regional Board Recommendations

In cases where the Regional Board makes recommendations for modifications to the WQIP or Jurisdiction Runoff Management Program (JRMP), these recommendations must be considered as part of the adaptive management process. No such recommendations were made during the 2015-2016 monitoring year.

5.1.3 Program Effectiveness Assessments/Progress Toward Numeric Goals

Strategies developed within the WQIP have been incorporated into Participating Agencies' monitoring programs through implementation of their JRMPs. Each Participating Agency is implementing programs that are focused on addressing bacteria in the watershed. As strategy implementation progresses, periodic refinements to the programs may provide additional focus on the specific water quality issues identified in the WQIP. Participating Agencies utilize various assessment methods to determine which program refinements are effective and which are not. In some cases, the program effectiveness assessment results may provide useful information leading to adaption of elements of the WQIP. Where new information is applicable and available, it may be used to modify numeric goals, strategies, schedules, and the MAP.

At this time, only one year of data have been collected in accordance with the MAP and the Participating Agencies have been implementing their jurisdictional strategies under the WQIP, accepted in February 2016, for less than a year. Initial results related to program effectiveness (Section 4.2) indicate that the Participating Agencies have made progress towards meeting their dry and wet weather interim goals for the current Permit term. In most cases they are on track to meet the identified goals during the Permit term and, in some cases, these goals have already been met. Additional data from subsequent monitoring years will be necessary to supplement this data before evaluations leading to adaptive management actions are feasible and modifications to strategies considered.

5.2 ADAPTIVE MANAGEMENT - CHANGES TO WATER QUALITY IMPROVEMENT PLAN ELEMENTS

The potential triggers that may result in adaptive management of the San Diego River WMA WQIP's numeric goals, strategies, schedules, and/or MAP are outlined in Section 5.1. In general, priority and highest priority water quality conditions and numeric goals are established based on longer periods of record compared to a monitoring year and their assessment would most appropriately be conducted following the collection of sufficient data to make scientifically-based decisions. At earliest, such consideration may be given during the preparation of the ROWD, which is due to the Regional Board in December 2017.

The 2015-2016 monitoring year was the first under the accepted WQIP and MAP. Receiving water and storm drain outfall discharge monitoring results indicated that no modifications to the priority and highest priority water quality conditions identified by the WQIP are necessary at this time.

On an annual schedule, it is more likely that modifications may be made to strategies and implementation schedules. These are elements that may require updates on a more frequent basis to ensure effective implementation and assessment as the WQIP progresses. The information that may be used to modify these elements of the WQIP through adaptive management is summarized in Table A5-2. While one year of monitoring data have been collected in accordance with the MAP of the WQIP, only a few months of this time period have been under the accepted WQIP and implementation. The Participating Agencies in the San Diego River WMA began planning and implementing their jurisdictional strategies intended to result in achievement of dry and wet weather interim goals for the term of the current Permit. Sufficient information is not yet available to warrant adaptive management of the water quality strategies and schedules.

Collection of additional data will be necessary to supplement this data before the combined data set can be evaluated and adaptive management considered. Minor administrative changes, including clarifications, correction of typos and errors, and edits to WQIP strategies, are proposed, primarily by the City of San Diego. These modifications are identified as markup to the Participating Agencies' tables in Appendix 2, and the rationale for the each change is also provided in the tables.

Table A5-2. Information Used to Modify Strategies and Schedules

Evidence	WQIP AR Sections	2015-2016 Status	Adaptive Management Required after 2015-2016? (Y/N)
Receiving water monitoring results.	Section 3, Appendix 4	No new information pertaining to receiving water exceedances not addressed by the WQIP.	N
Storm drain outfall monitoring results.	Section 3, Appendix 4	NAL and SAL exceedances are consistent with WMA priority constituents.	N
Special studies results.	Section 3, Appendix 4	Data from these studies will be useful for the re-evaluation of the Bacteria TMDL and to facilitate consideration of site-specific water quality criteria for bacteria.	N
New or updated regulations.	Section 5	No new regulatory drivers; adaptive management will be required as new TMDLs are approved and as the Trash Amendments are incorporated into the Permit.	N
Program effectiveness assessments.	Section 5	Additional data will be necessary to supplement 2015-2016 data before program effectiveness can be evaluated.	N
Progress towards achieving numeric goals.	Section 4	Initial results related to program effectiveness indicate that the Participating Agencies have made progress towards meeting each of their dry and wet weather interim goals for the current Permit term.	N

In addition to the strategies and schedules, it is also feasible that updates to the MAP may be necessary more often than priority water quality conditions and numeric goals and schedules. Changes to the MAP may be triggered by several factors including:

- Modifications to other elements of the WQIP, including priority water quality conditions, numeric goals and schedules, and/or strategies and schedules.
- Identification of data gap through the required assessments under Provision D.4.
- Results of special studies.
- Requests/requirements from the Regional Board.

None of these triggers are applicable to the 2015-2016 monitoring year, and adaptive management of the MAP is not required at this time. Additional assessments are planned for the ROWD, including evaluation monitoring data and receiving water limitations.

San Dieguito River Watershed Management Area Water Quality Improvement Plan Annual Report

Submitted to the San Diego Regional Water Quality Control Board by:

January 2017

Executive Summary

The Water Quality Improvement Plan (WQIP) provides a comprehensive watershed-based program to improve surface water quality in the San Dieguito River Watershed Management Area (WMA), in receiving waters in the San Dieguito River, and at nearby beaches. The Responsible Agencies tasked with implementing the WQIP in the San Dieguito River WMA are the City of Del Mar, the City of Escondido, the City of Poway, the City of San Diego, the City of Solana Beach, and the County of San Diego.

The San Dieguito River WMA encompasses almost 346 square miles of urban land and undeveloped open space extending from the San Dieguito Lagoon in the west to the Volcan Mountains in the east. The WMA includes Del Mar, Solana Beach, Fairbanks Ranch, Rancho Peñasquitos, Rancho Bernardo, Del Dios, Poway, San Pasqual, Ramona, and Santa Ysabel. Small creeks drain downstream into the San Dieguito River, then into the San Dieguito Lagoon, and finally into the Pacific Ocean.

This Annual Report provides an update on monitoring and assessment completed during the previous reporting period and highlights the strategies implemented and progress toward meeting goals set for the highest priorities. Significant progress has been made in obtaining WQIP goals. The permit term performance based goals have been achieved for dry weather flow reduction by the City of Del Mar and City of San Diego. The County of San Diego has establised a baseline flow for persistently flowing major outfalls. Best management practices (BMPs) have been installed and maintained in the City of Escondido, City of San Diego, City of Solana Beach, and County of San Diego, reducing or preventing pollutants from entering receiving waters.

Water Quality Improvement Plan Process

The WQIP identifies goals and strategies to improve in the quality of urban runoff waters. These improvements to water quality are achieved through the consistent process of evaluation, goal setting, and monitoring and reporting, according to the following process:

1. Priority and Highest Water Quality Conditions → 2. Sources → 3. Goals, Strategies, & Schedules → 4. Monitoring & Assessment → 5. Adaptive Management Process → 6. Annual Reporting

With these distinct steps, the WQIP provides a long-term program to measurably improve overall water quality within the San Dieguito River WMA. This Annual Report implements Step (6) of the WQIP Process.

Highest Priority Water Quality Conditions

The WQIP identifies the following conditions/pollutants as highest priorities within the San Dieguito River WMA:

- Indicator bacteria along the Pacific Ocean at the San Dieguito Lagoon Mouth from areas above Lake Hodges when rainfall causes the Lake Hodges dam to overflow.
- Indicator bacteria along the Pacific Ocean at the San Dieguito Lagoon Mouth as measured during both wet and dry weather.

Monitoring and Assessment

The WQIP Monitoring and Assessment Program plays a key role in the Municipal Separate Storm Sewer System (MS4) Permit's new focus on the outcomes of WQIP program implementation to achieve water quality improvement. The long-term receiving water monitoring and MS4 monitoring program provides information on a wide variety of water quality conditions, including the highest priority water quality condition (HPWQC) and the other WMA priority water quality conditions (PWQCs).

Receiving waters were last monitored at the long-term monitoring stations during the October 1, 2014, through September 30, 2015, monitoring year. These historical mass loading stations have been monitored since 2001. This data was present in previous monitoring reports. The Responsible Agencies implemented receiving water monitoring in support of the Bacteria Total Maximum Daily Load (TMDL) at the Pacific Shoreline. Details are provided in Appendix C and highlights are summarized below.

- During wet weather, the receiving waters at the San Dieguito Lagoon Mouth achieved 0 percent (%) single-sample maximum exceedance frequencies for total coliform and fecal coliform. The single-sample maximum for *Enterococcus* was 13.6%. EH-380 is in compliance with interim and final wet weather single-sample maximum receiving water limitations (RWLs) for all three compliance constituents.
- During the wet season, which evaluates a combination of both wet and dry weather samples, EH-380 achieved a 0% geometric mean exceedance frequency for all compliance constituents and is in compliance with interim and final dry weather geometric mean RWLs.
- During the dry season, when recreational activities occur with more regularity, EH-380 achieved a 0% exceedance frequency for all three compliance constituents, and is in compliance with interim and final dry weather geometric mean RWLs.

The MS4 outfall monitoring program provides information on the estimated amount of pollutants coming from monitored MS4 outfalls. Details of this monitoring program are in Appendix C. The results for samples collected during the October 1, 2015, through September 30, 2016, monitoring year were compared with non-storm water action levels and storm water action levels. In dry weather, the non-storm water action levels were met over 75% of the time for multiple consituents. In wet weather, the storm water action levels were met over 90% of the time for all consituents except total copper, nitrate + nitrite, and bacteria indicators. The Responsbile Agencies plan to continue implementing the WQIP strategies without modification to realize the rewards of these pollutant reduction benefits and will work toward meeting the goals related to the HPWQC.

The Illicit Discharge Dectection and Elmination (IDDE) Program found non-storm water discharges and worked to eliminate them throughout the WMA. This program helps with dry weather runoff reductions and is one mechanism to achieve some of the fiscal year (FY) 18 performance-based goals. Table ES-1 provides more information about the implementation of the IDDE program throughout the WMA.

Table ES-1
IDDE Program Summary in the San Dieguito River WMA

IDDE Program Action	Total Number in WMA
Non-storm water discharges or illicit discharges investigated	341
Sources of non-storm water identified	273
Non-storm water discharges eliminated	261
Sources of illicit discharges or connection identified	231
Illicit discharges or connections eliminated	220
Number of enforcement actions	195[1]

1. The number of enforcement actions issued does not equal the number of identified illicit discharges or connections because some discharge complaints in the last quarter of FY 16 were still under investigation at the end of FY 16.
IDDE = illicit discharge detection and elimination; WMA = Watershed Management Area

In addition to monitoring in the receiving waters and the MS4, the Responsible Agencies conducted special studies. The San Diego Regional Reference Streams and Beaches Study is complete and provided valuable information for the Bacteria TMDL[1] Reopener. The San Dieguito River WMA Bacteria Source Identification and Prioritization Special Study assessed sources of bacteria in selected focus areas using the San Diego Bacteria Source Identification and Prioritization Process developed in 2012 as part of the MS4 Permit Report of Waste Discharge process. It provides a framework for the Responsible Agencies to review bacteria sources at MS4 outfalls where water quality-based effluent limit (WQBEL) exceedances occur without implementing costly source identification studies. The study has provided the Responsible Agency a detailed list of sources to investigate if further exceedances are found at the focus area outfalls. Details on the special study assessments are provided in Appendix C.

Strategies

Strategies implemented throughout the WMA deliver proven benefits for addressing multiple pollutants by eliminating sources or treating pollutants already found in urban

[1] *Project I—Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)*, Resolution No. R9-2010-0001.

runoff. Responsible Agencies sponsor stream and beach cleanups, provide turf conversion rebates, and work with the public to educate them on the impacts of their actions on the environment. Many of these actions are above and beyond the requirements of the Jurisdictional Runoff Management Program (JRMP) strategies. Figure ES-1 provides a snapshot of the actions that the Responsible Agencies have taken during the previous monitoring year.

Public Outreach and Source Control

- Provide turf conversion rebates
- Engage in enforcement actions for over-irrigation
- Sponsor beach and river cleanup events

Municipal Control Activities

- Sweep streets using new technologies and on a more frequent basis
- Clean debris out of catch basins
- Build and maintain structural best management practices (BMPs)

Figure ES-1
San Dieguito River WMA Strategy Overview

Hodges Reservoir Nutrient Source Study

In FY 16, the Responsible Agencies completed the Hodges Reservoir Nutrients Evaluation Technical Memorandum, which analyzed available receiving water and MS4 data collected. In addition, the San Dieguito River WMA Responsible Agencies are currently coordinating with the City of San Diego's Public Utilities Department to develop a study plan and associated monitoring plans for the Hodges Reservoir Nutrient Source Study. The goal of this study is to characterize all the sources of nutrients in the Hodges Reservoir and watershed draining to the Hodges Reservoir, including development of a comprehensive conceptual model to guide any future monitoring efforts to fill known data gaps.

Progress Toward Meeting Goals

To measure progress toward achieving their goals and addressing the HPWQC, the San Dieguito River WMA Responsible Agencies developed numeric goals and schedules. Numeric goals may take a variety of forms, but all forms can quantify a benefit to water quality so that progress toward and achievement of the goals are measurable. During this MS4 Permit term, the Responsible Agencies have defined goals based on actions they are taking to improve water quality in the WMA. Many of the goals are on track or have been met. Table ES-2 summarizes the progress of Responsible Agencies toward meeting their goals during the previous year.

Table ES-2
San Dieguito River WMA Progress Toward Performance-Based Goals (FY 16)

Responsible Agency	Weather (Dry/Wet)	FY 18 Goal	Progress
City of Del Mar	Dry	10% reduction of anthropogenic surface dry weather flows that originate within Del Mar's jurisdictional boundaries	Achieved to Date
City of Escondido	Wet	4 acres of drainage area treated through restoration of 1 sediment detention basin in a multiuse treatment area at Eagle Scout (formerly Sand) Lake, Kit Carson Park	Achieved
	Dry	10% anthropogenic dry weather flow reduction at one priority outfall (HDG_102)	In Progress
City of Poway	Dry	5% increase from the baseline through turf conversion	In Progress
City of San Diego	Dry and Wet	10.6 acres of drainage area treated through construction of 2 green infrastructure BMPs	In Progress
	Dry	10% reduction in prohibited dry weather flow from baseline measured at persistently flowing outfalls in the WMA	Achieved to Date
City of Solana Beach	Dry and Wet	40.5 acres of low flows directed to the sanitary sewer through construction of one diverter at high priority outfall Seascape Sur	Achieved
	Dry and Wet	8 acres of drainage area treated through curb cuts along Highway 101	Achieved
County of San Diego	Wet	1% bacteria load reduction from the MS4	In Progress
	Dry	20% reduction anthropogenic dry weather flows	In progress

% = percent; BMP = best management practice; FY = fiscal year; MS4 = municipal separate storm sewer system; WMA = Watershed Management Area

1 Introduction

The San Diego Regional Water Quality Control Board (Regional Board) regulates discharges from municipal separate storm sewer systems (MS4s) in the San Diego Region *National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer System (MS4) Draining the Watersheds Within the San Diego Region* (MS4 Permit) under Order No. R9-2013-0001, as amended by Order Nos. R9-2015-0001 and R9-2015-0100. The MS4 Permit covers portions of San Diego County, southern Orange County, and southwestern Riverside County and regulates Phase I municipalities that own and operate MS4s (i.e., storm drain systems) that discharge storm water (wet weather) runoff and non-storm water (dry weather) runoff to surface waters throughout the San Diego region.

Under the MS4 Permit, the San Diego region is subdivided into 10 watershed management areas (WMAs), which cover the major, natural drainages in the region. The MS4 Permit requires a Water Quality Improvement Plan (WQIP) to be developed for each WMA (San Dieguito River WMA Responsible Agencies, 2015). The San Diego County Copermittees are listed in Table 1a of the MS4 Permit and the Copermittees with jurisdictional areas within the San Dieguito River WMA are as follows:

- City of Del Mar
- City of Escondido
- City of Poway
- City of San Diego
- City of Solana Beach
- County of San Diego

Each Copermittee, referred to as a Responsible Agency in the WQIP, must comply with the MS4 discharge prohibitions and receiving water limitations outlined in the MS4 Permit through timely implementation of control measures, other actions specified in the MS4 Permit, and adherence to the WQIP.

The goal of the WQIP is to guide the Responsible Agencies to implement their individual jurisdictional programs, known as Jurisdictional Runoff Management Programs (JRMPs), toward an outcome-based approach and to improve water quality. To accomplish this goal, an adaptive planning and management process is used to identify the highest priority water quality condition(s) (HPWQC) within the WMA. Responsible Agencies will also implement strategies through the WQIP and JRMPs to achieve improvements in the quality of discharges from storm drain systems to the receiving waters such as creeks, rivers, and beaches. The final WQIP for the San Dieguito River WMA can be found on the Project Clean Water website (www.projectcleanwater.org).

The MS4 Permit also requires the Responsible Agencies within each WMA to submit an Annual Report to demonstrate progress toward implementing the WQIPs and corresponding JRMPs. The Annual Report covers two different reporting periods. The first reporting period is from July 1, 2015, through June 30, 2016, for the JRMPs and WQIP strategy implementation. The second reporting period is from October 1, 2015, through September 30, 2016, for monitoring and assessment programs. Progress toward goals may be assessed in either reporting period, depending on the goal metric. This Annual Report addresses the requirements in Provision F.3.b.(3) and other provisions of the MS4 Permit.

Table 1-1 provides an overview of the MS4 Permit requirements that must be addressed and where they are addressed within the Annual Report. Appendix A provides additional details regarding the specific MS4 Permit requirements and where they are addressed within the Annual Report.

2. Some MS4 Permit Provisions are addressed in JRMPs.

WQIP = Water Quality Improvement Plan; WMA = watershed management area; MS4 = municipal separate storm sewer system

The San Dieguito River WMA WQIP Annual Report for 2015–2016 is structured as follows:

Section 1, Introduction – This section provides an overview of the MS4 Permit, the WQIP, and the Annual Reporting requirements. Includes references to Appendix A:

Appendix A. Crosswalk of Permit Requirements and Annual Report References

Section 2, Overview of San Dieguito River Watershed Management Area – This section introduces the watershed management area, the priority water quality conditions (PWQCs) and the HPWQCs of the watershed. The numeric goals and schedules developed to measure progress toward addressing the HPWQCs are presented. Includes references to Appendix B:

Appendix B. Water Quality Improvement Plan Numeric Goals

Section 3, Monitoring and Assessment – This section summarizes the monitoring programs and provides an assessment of the data collected relative to this HPWQC. Includes references to Appendix C:

Appendix C. Monitoring Results and Assessments

Section 4, Implementation and Progress Toward Achieving Numeric Goals – The section discusses the assessment of the progress toward meeting the numeric goals, with a focus on those numeric goals occurring during the MS4 Permit term. The section also provides an overview of the strategies implemented to meet the numeric goals, the status of implementation, and plans for the coming year. Includes references to Appendix D:

Appendix D. Jurisdictional Runoff Management Program Annual Report Forms, Fiscal Analysis, Updated BMP Manuals, and Jurisdictional Strategies

Section 5, Adaptive Management – This section summarizes the elements of the WQIP's process, which can be changed during the course of MS4 Permit implementation based on monitoring results and new information gathered during the reporting period. Includes references to Appendix E:

Appendix E. Adaptive Management/Modifications

Section 6, Conclusions and Recommendations – This section provides the conclusions and recommendations that are based on the data collected and assessments conducted during implementation of the WQIP in fiscal year (FY) 2015–2016 (FY 16).

Section 7, References – This section lists the sources used to prepare this Annual Report.

2 Overview of San Dieguito River Watershed Management Area

The San Dieguito River WMA drains a 346-square-mile area in central San Diego County. The headwaters of the San Dieguito River WMA are located at the easternmost extent of the WMA, in the Volcan Mountains, and drain to the Pacific Ocean near Del Mar at its western end. Six jurisdictions and Caltrans are located in the San Dieguito River WMA. The amount of land within each jurisdiction is described in Table 2-1 and shown in Figure 2-1. The California Department of Transportation (Caltrans), along with other non-Phase 1 MS4s dischargers, is regulated under separate permits. However, the Responsible Agencies are responsible for discharges originating from these lands outside of their regulatory control if these discharges enter the MS4 of the particular Responsible Agency. The Responsible Agencies look to collaborate and improve communication with non-municipal sources and the appropriate regulatory agencies to ensure that these discharges are regulated before they enter the Responsible Agencies' MS4s.

Table 2-1
Land Area for the San Dieguito River WMA

Responsible Agency	Land Area (Acres)	Percent (%) of Total
San Diego County	176,644	80.3%
City of San Diego	27,345	12.4%
City of Poway	9,011	4.1%
City of Escondido	4,362	2.0%
City of Solana Beach	1,597	0.7%
City of Del Mar	990	0.5%

For the WQIP, the San Dieguito River WMA was divided into three subwatersheds to focus on different (or several) receiving waters when identifying PWQCs and developing the JRMPs. These subwatersheds include the area below Lake Hodges, the area between Lake Hodges and Sutherland Reservoir, and the area above Sutherland Reservoir.

The subwatershed below Lake Hodges is located southwest of Lake Hodges and drains into the San Dieguito Lagoon, which ultimately discharges into the Pacific Ocean. The subwatershed above Lake Hodges contains Lake Hodges, and extends eastward to Sutherland Reservoir. The subwatershed above Sutherland Reservoir is drained by Santa Ysabel Creek, which feeds into the Sutherland Reservoir.

Intentionally Left Blank

2.1 San Dieguito River WMA WQIP

The overarching goal of the San Dieguito River WMA WQIP is to further the Clean Water Act's objective to protect, preserve, enhance, and restore the water quality and designated beneficial uses of waters of the state. This goal will be accomplished through a planning and adaptive management process that identifies the PWQCs and HPWQCs. The San Dieguito River WMA WQIP identifies strategies (implemented through JRMPs to address priority water quality conditions in the WMA with a particular focus on the HPWQC to achieve measurable numeric goals and to improve the quality of MS4 discharges and, in turn, the receiving waters. The San Dieguito River WMA WQIP outlines how the Responsible Agencies are evaluating water quality conditions, prioritizing those water quality conditions, and using these common priorities to guide jurisdictional and watershed-scale programs to address the HPWQC.

2.2 Priority and Highest Priority Water Quality Conditions

The WQIP identifies the PWQCs on the basis of an assessment of receiving water conditions, MS4 discharges and their potential impacts, and the sources of pollutants in the watershed. The PWQCs for the San Dieguito River WMA are detailed in Appendices A and F of the WQIP, and are summarized by the beneficial use and pollutant category in Figure 2-2.

The HPWQC is the foundation for establishing the WQIP numeric goals and schedules and selecting water quality improvement strategies to achieve the necessary improvements in the quality of MS4 discharges and/or receiving waters. Table 2-2 details the following conditions/pollutants as highest priorities within the San Dieguito River WMA. The HPWQC is highlighted in bold in Figure 2-2.

Table 2-2
Highest Priority Water Quality Condition in the San Dieguito River WMA

Highest Priority Water Quality Condition	Potential Stressor	Temporal Extent		Subwatershed
		Dry	Wet	
Potential impairment of water contact recreation beneficial use (REC-1) at Pacific Ocean Shoreline	Indicator bacteria	–	✓	San Dieguito River Above Lake Hodges
Potential impairment of REC-1 at Pacific Ocean Shoreline	Indicator bacteria	✓	✓	San Dieguito River Below Lake Hodges

REC-1 = water contact recreation beneficial use

Intentionally Left Blank

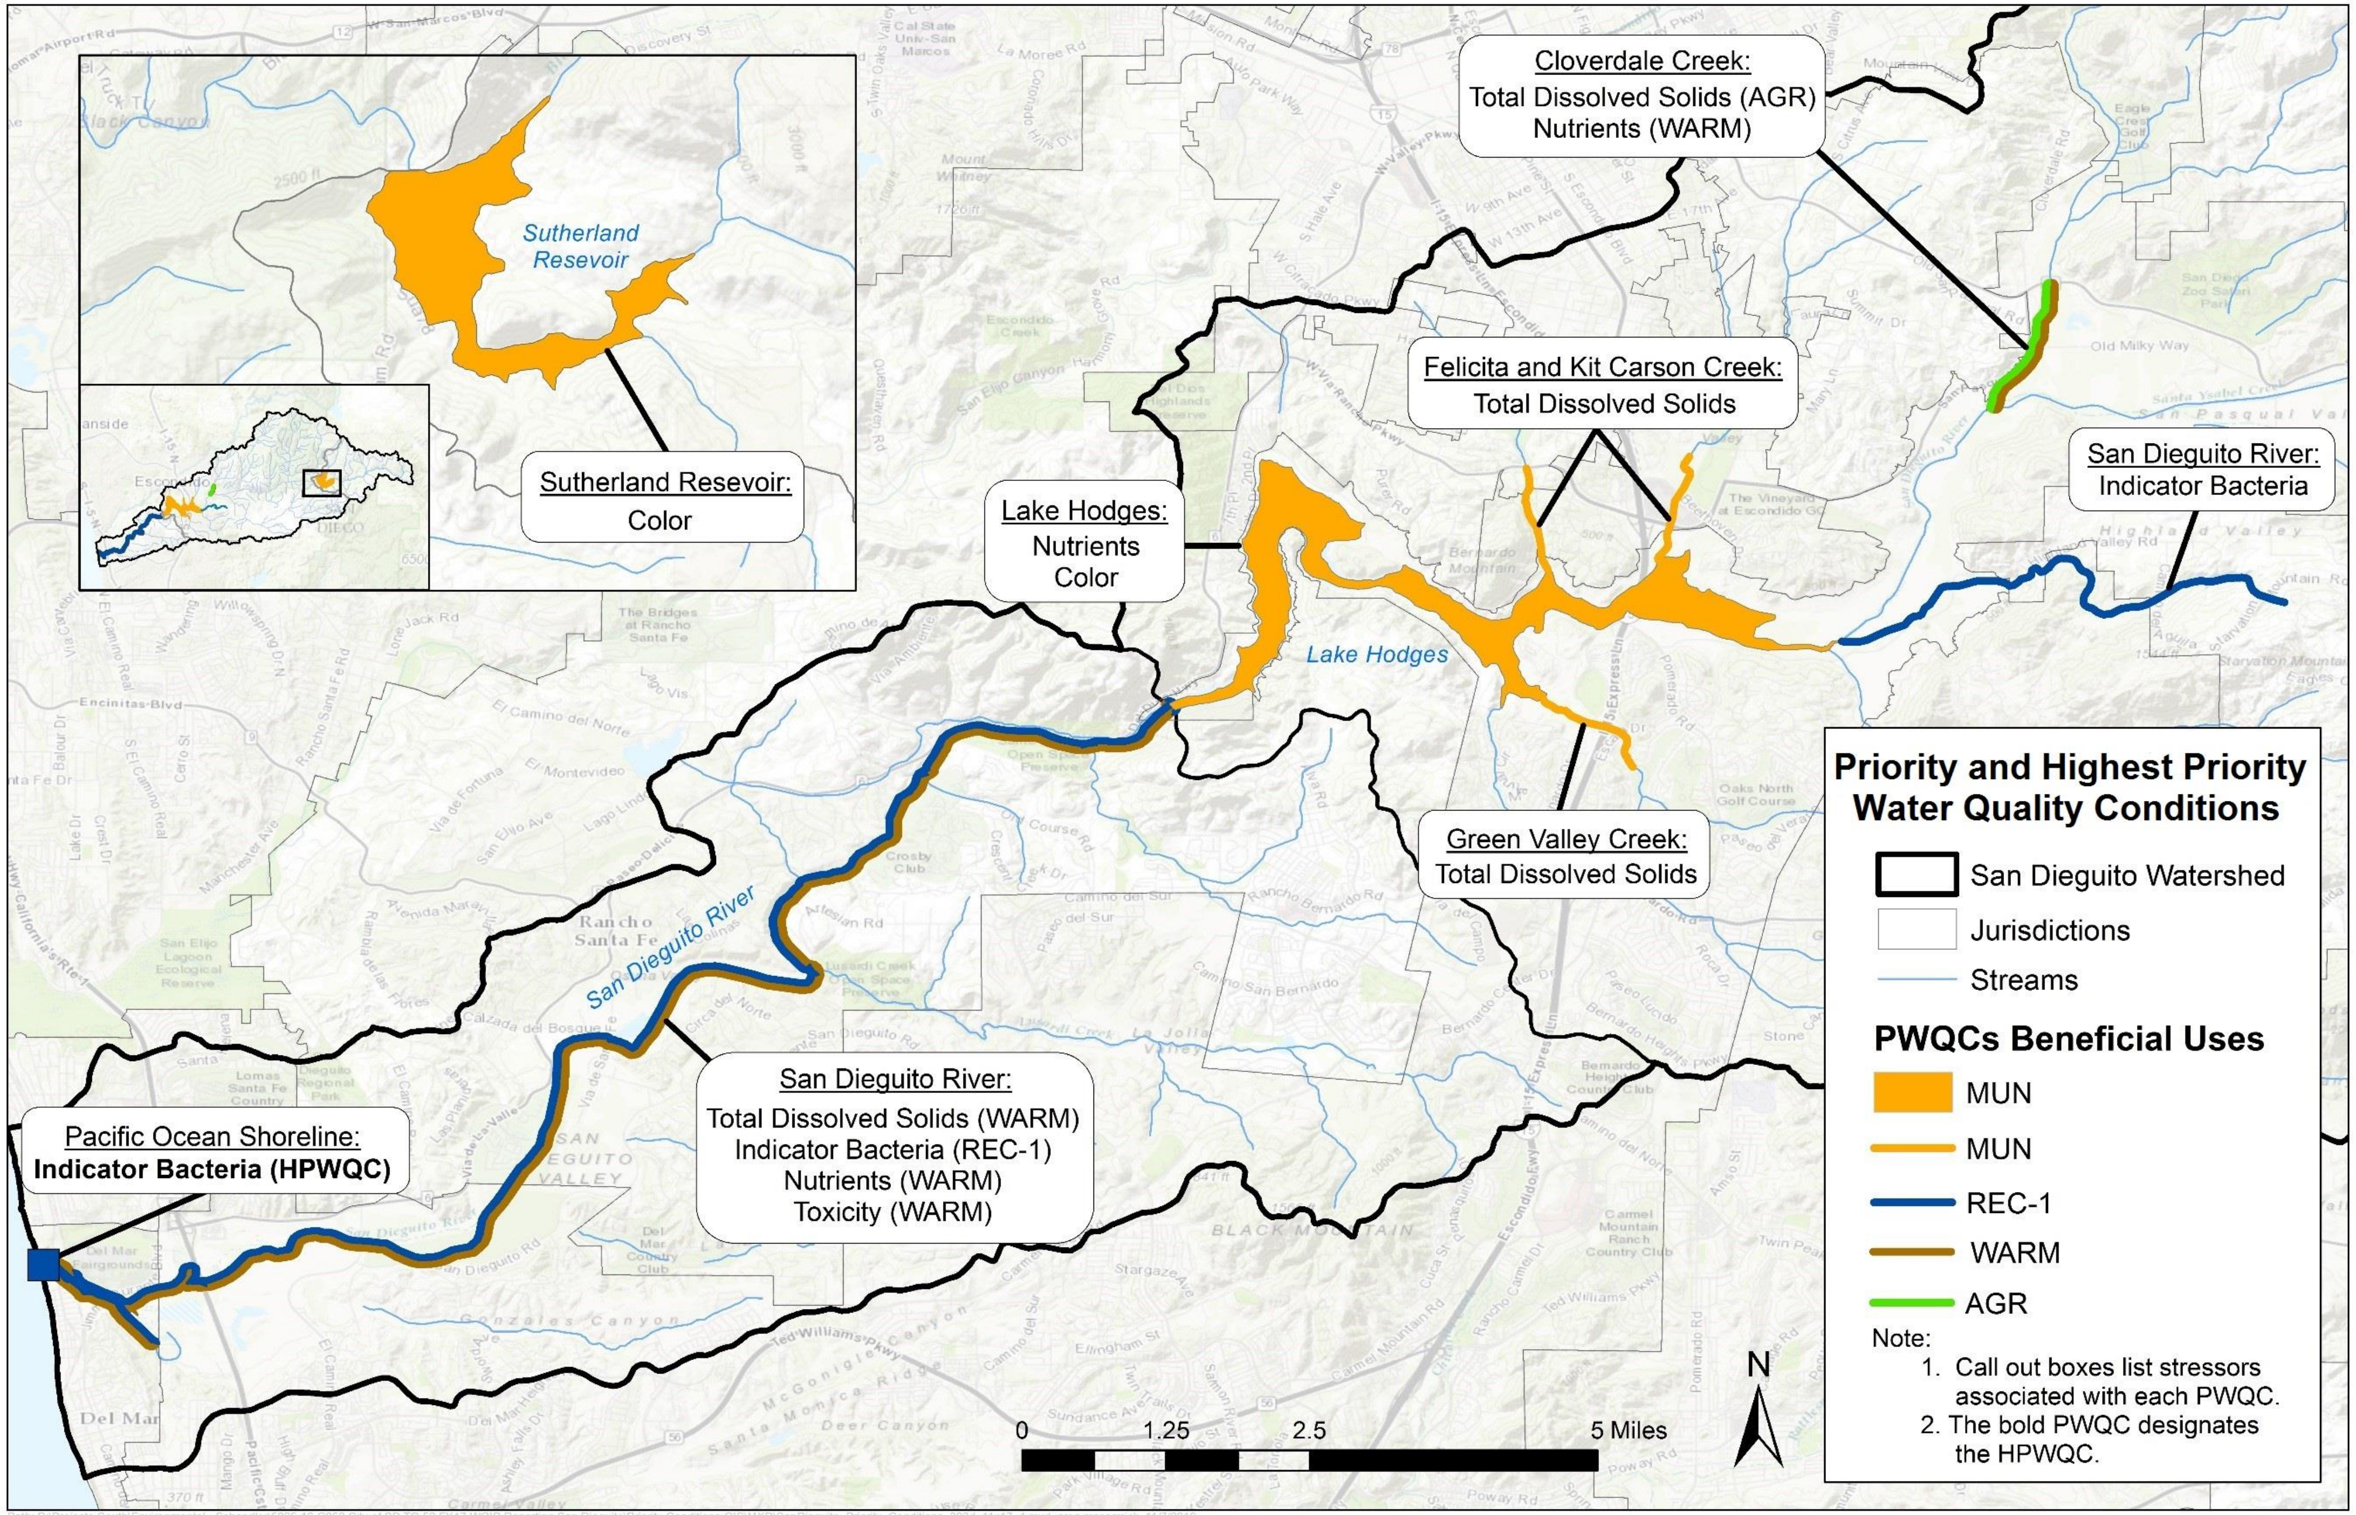

Figure 2-2
San Dieguito River WMA
Priority and Highest Priority Water Quality Conditions

Intentionally Left Blank

2.3 WQIP Numeric Goals

In the WQIP, the Responsible Agencies identified and developed specific water quality improvement numeric goals and strategies to address the HPWQC identified within the WMA. The numeric goals (interim and final) and corresponding schedules support implementation of the WQIP and measure reasonable progress toward addressing the HPWQC. In addition, the Responsible Agencies' monitoring and assessment programs measure progress toward attaining these goals. The numeric goals for the San Dieguito River WMA are presented in detail by jurisdiction in Appendix B.

The numeric goals for the San Dieguito River WMA are presented in detail by jurisdiction in Appendix B.

The goals extend beyond the timeframe of the current MS4 Permit. For this reason, the numeric goals within the WQIP are categorized into three distinct time periods:

1. Interim goals within the five-year MS4 Permit term. These goals are typically specific to each Responsible Agency's jurisdiction.
2. Interim goals based on the interim Bacteria TMDL compliance pathways.
3. Final goals based on final Bacteria TMDL compliance options.

The timeline for the San Dieguito River WMA bacteria numeric goals is illustrated in Figure 2-3.

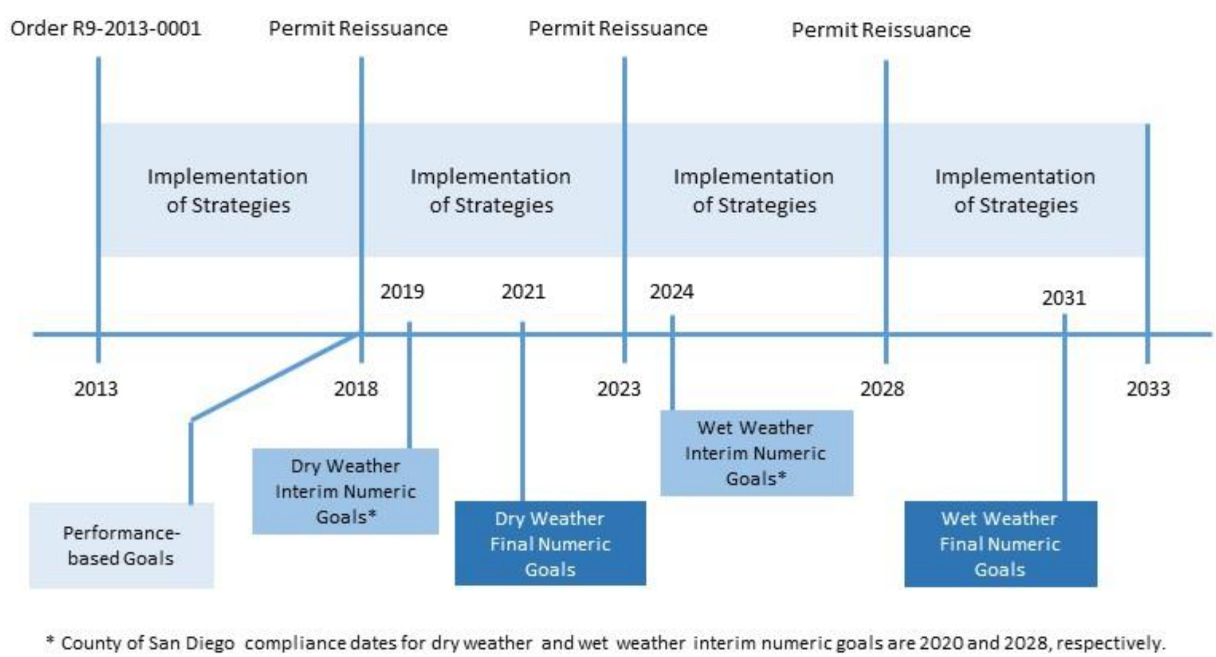

Figure 2-3
Timelines and Relationships for Bacteria TMDL Numeric Goals

Intentionally Left Blank

3 Monitoring and Assessment

The Pacific Shoreline near the San Dieguito Lagoon mouth is a stretch of beach in San Diego County that is a popular recreation destination for residents. The HPWQC at this beach is water contact recreation beneficial use (REC-1) related to the bacteria indicators measured during both dry and wet weather. This section discusses the monitoring related to maintaining contact recreation uses at Pacific Ocean Shoreline near the San Dieguito Lagoon mouth. Monitoring related to the 2013–2018 MS4 Permit term and interim/final goals is detailed.

3.1 Monitoring Related to Performance Based Goals

The Responsible Agencies have established dry and wet weather interim goals for the 2013–2018 MS4 Permit term. Tables 3-1 and 3-2 summarize the data collected during the monitoring year, October 1, 2015, through September 31, 2016, to assess progress toward meeting FY 18 goals.

Table 3-1
Dry Weather Monitoring Related to Performance-Based Goals

Jurisdiction	Performance-Based Goal	Monitoring Element
City of Del Mar	Reduce by 10% anthropogenic surface dry weather flows[1] that originate within Del Mar's jurisdictional boundaries.	Collect flow measurements at selected MS4 outfalls. Sampling Days: 2 Field site visits: 15
City of Escondido	Reduce by 10% dry weather[1] flow in priority drainage area with persistent flow.	Collect flow measurements at a priority MS4 outfall (HDG_102). Sampling Days: 2 Implement month-long dry weather flow from 7/6/16 to 8/8/16 to establish baseline flow information.
City of Poway	Achieve a 5% increase in turf conversion from baseline.	Track the implementation of turf conversion, including turf conversion increase.
City of San Diego	Develop a green infrastructure policy, attain City Council approval, and construct green infrastructure BMPs to improve water quality from 10.6 acres of drainage area.	Track the acres of drainage area treated by green infrastructure BMPs.
	Reduce by 10% the prohibited[2] dry weather flow from baseline measured at persistently flowing outfalls during dry weather.	Collect flow measurements at persistently flowing outfalls. Sampling Days:18

Table 3-1 (continued)
Dry Weather Monitoring Related to Performance-Based Goals

Jurisdiction	Performance-Based Goal	Monitoring Element
City of Solana Beach	Direct 40.5 acres of low flows to the sanitary sewer through construction of 1 diverter at high priority outfall Seascape Sur.	Detail the completion of the diverter, including acres treated.
	Design and construct curb cuts to treat 8 acres of drainage area along Highway 101.	Detail the completion of curb cuts, including acres treated.
County of San Diego	Reduce by 20% the aggregate dry weather flow[1] volume or the number of persistently flowing outfalls during dry weather.	Establish baseline: 1) Collect continuous flow data at 6 persistently flowing major outfall to determine baseline aggregate flow; 2) Identified total number of persistently flowing major outfalls.

1. The term "dry weather flows" excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.
2. Does not include allowable discharges as defined in Provision A and Provision E.2.a of the MS4 Permit.

% = percent; BMP = best management practice; MS4 = municipal separate storm sewer system

Table 3-2
Wet Weather Monitoring Related to Performance Based Goals

Jurisdiction[1]	Performance-Based Goal	Monitoring Element
City of Del Mar	Reduce by 10% anthropogenic surface dry weather flows[2] that originate within Del Mar's jurisdictional boundaries to address bacteria regrowth contributing during wet weather.	Collect flow measurements at selected MS4 outfalls during dry weather. Sampling Days: 2 Field site visits: 15
City of Escondido	Implement and maintain water quality improvement BMPs to target fecal coliform, *Enterococcus*, total coliform, sediment, and nutrients from 4 acres of drainage area.	Confirm the restoration of the BMP, including acres treated by multiuse treatment area.
City of San Diego	Develop a green infrastructure policy, attain City Council approval, and construct green infrastructure 9 BMPs to improve water quality from 10.6 acres of drainage area.	Track the acres of drainage area treated by green infrastructure BMPs.
City of Solana Beach	Direct 40.5 acres of low flows to the sanitary sewer through construction of 1 diverter at high priority outfall Seascape Sur.	Detail the completion of the diverter, including acres treated.
	Design and construct curb cuts to treat 8 acres of drainage area along Highway 101.	Detail the completion of curb cuts, including acres treated.
County of San Diego	Reduce baseline bacteria loads from storm drain outfalls to receiving water by 1%.	Collect bacteria and flow data at MS4 outfalls as part of the wet weather MS4 outfall monitoring program.

1. City of Poway does not have a wet weather performance-based goal.
2. The term "dry weather flows" excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.

% = percent; BMP = best management practice; MS4 = municipal separate storm sewer system

3.2 Monitoring Related to Interm and Final Goals

The Responsible Agencies have initiated a Monitoring and Assessment Program, as outlined in Section 5 of the San Dieguito River WMA WQIP. The purpose of the program is to track progress toward meeting long-term WQIP goals. The program includes monitoring of receiving water and at MS4 outfalls. In addition, two designated special studies are to be completed. This section provides an overview of the monitoring conducted to track progress through this reporting period. The full details of the monitoring results are in Appendix C.

Bacteria Total Maximum Daily Load (TMDL) Compliance Monitoring Program

The Bacteria TMDL (Regional Board, 2010) Compliance Monitoring Program monitors bacteria indicators at the historical San Diego County AB 411 (California Assembly Bill [AB] 411) monitoring location at the mouth of San Dieguito Lagoon. The historical AB411 site is located 25 yards down-current of where ocean currents meet river discharge in ankle-to-knee-deep water. The current AB411 site is at the point where ocean currents meet river discharge in ankle-to-knee-deep water. Monitoring occurred as required during both dry and wet weather.

Wet weather monitoring was conducted at the monitoring location during three storm events during the wet season (October 1 through April 30). However, during the recreation season (April 1 through October 31), samples are collected at the monitoring location five times per month, as consistent with AB 411 requirements, and during dry periods of the wet season (November 1 through March 31) on a monthly basis per the Bacteria TMDL requirements. Dry weather samples were collected after an antecedent dry period of 72 hours with less than 0.1 inch of rainfall. Grab samples were collected in a manner consistent with requirements of the AB 411 program. All samples were analyzed for total coliform, fecal coliform, and *Enterococcus*.

Section 2.6 of Appendix C provides more information on the sampling performed in the 2015–2016 monitoring year and Attachment B of Appendix C provides the BacteriaTMDL Compliance Monitoring Report. The data collected as part of this program will be used to assess the receiving water compliance pathway in future years. A summary of the results from the 2015-2016 monitoring year includes the following:

- ❖ During wet weather, the receiving waters at the San Dieguito Lagoon Mouth achieved 0 percent (%) single-sample maximum exceedance frequencies for total coliform and fecal coliform. The single-sample maximum for *Enterococcus* was 13.6%. EH-380 is in compliance with interim and final wet weather single-sample maximum receiving water limitations (RWLs) for all three compliance constituents.
- ❖ During the wet season, which evaluates a combination of both wet and dry weather samples, EH-380 achieved a 0% geometric mean exceedance frequency for all compliance constituents and is in compliance with interim and final dry weather geometric mean RWLs.

- During the dry season, when recreational activities occur with more regularity, EH-380 achieved a 0% exceedance frequency for all three compliance constituents, and is in compliance with interim and final dry weather geometric mean RWLs.

San Dieguito River WMA MS4 Outfall Monitoring

The Responsible Agencies implemented the dry and wet weather MS4 outfall monitoring program, as detailed in Section 5 of the WQIP. The dry weather MS4 monitoring program is a combination of field screening and collection of samples at persistently flowing major outfalls. Field screening includes visual monitoring of all major MS4 outfalls to identify and eliminate sources of persistently flowing non-storm water discharges. This information is also used to track the progress of some of the 2018 MS4 Permit term goals.

Water quality sample collection provides information on the impact of MS4 outfalls on receiving water quality during dry weather. The goal of the wet weather MS4 monitoring program is to identify pollutants in storm water discharges from the MS4s and to guide pollutant source identification efforts by collecting paired water quality samples and flow data. Annually, the data from the dry weather program is compared with the non-storm water action levels, and data from the wet weather program is compared with the storm water action levels. In dry weather durign the monitoring year, the non-storm water action levels were met over 75% of the time for multiple consituents. In wet weather during the monitoring year, the storm water action levels were met over 90% of the time for all consituents except total copper, nitrate + nitrite, and bacteria indicators.The data collected as part of this program will be used to assess the MS4 outfall compliance pathway toward reaching interim and long-term goals in future years**.** Bacteria indicators are measured during both dry and wet weather MS4 analytical sampling events, and will be used to assess bacteria concentration loads discharging from the MS4 to receiving waters.

Table 3-3 summarizes the number of major outfalls for each Responsible Agency that were sampled during the 2015–2016 monitoring year along with the dates of the analytical monitoring. Sections 3 and 4 of Appendix C provide more information on dry and wet weather MS4 monitoring programs, respectively. Attachments C and D (Dry and Wet Weather Assessments) of Appendix C provide detailed calculations with regard to these monitoring programs. The data collected as part of this program will be used to assess MS4 compliance pathways in future years.

Table 3-3
Number of Major MS4 Outfalls Monitored During the 2015–2016 Monitoring Year

Jurisdiction	Number of Major Outfalls Visited Per Year				
	Field Screening[1]	Dry Weather Monitoring		Wet Weather Monitoring	
		Number of Sites[2]	Dates	Number of Sites[2]	Dates
City of Del Mar	6 (5)[3,4]	3	6/30/16 8/12/16	1	3/5/2016
City of Escondido	3 (3)[3]	1	4/20/2016 8/30/2016	1	3/5/2016
City of Poway	12 (15)[3]	1[5]	7/29//2016 8/2/2016	1	3/6/2016
City of San Diego	42 (42)[6]	5	2/16/2016 2/22/2016 4/5/2016 4/26/2016 6/10/2016	1	1/30/2016
City of Solana Beach	3 (3)[3]	1[7]	6/30/16 8/12/16	1	3/5/2016
County of San Diego	20 (20)[2]	5[8]	3/28/2016 – 4/21/2016 6/30/2016 - 7/7/2016	1	1/31/2016

1. Field screening represents the number of major MS4 outfalls visited in the 2015–2016 monitoring year. Total number of major outfalls within each jurisdiction in the WMA is provided in parentheses.
2. Number of sites represents the number of outfalls with priority persistent flows selected for dry weather water quality sampling.
3. For Responsible Agencies with fewer than 125 major outfalls in the WMA, 80% of major outfalls must be screened twice per year.
4. The City of Del Mar has identified five major outfalls and will also screen an additional non-major outfall.
5. The number of sites has been updated from two sites initially listed in the San Dieguito River WMA WQIP.
6. For Responsible Agencies with portions of their jurisdictions in more than one WMA and more than 500 major MS4 outfalls in their jurisdictions, at least 500 major outfalls must be inspected once per year.
7. City of Solana Beach has a low flow diverter at Fletcher Cove and Seascape Sur. Dry weather sampling is being carried out at Seascape Sur because there is discharge occurring between the diverter at the street and the outfall.
8. The number of sites has been updated from three sites initially listed in the San Dieguito River WMA WQIP.

In addition to the dry weather MS4 field screening and monitoring, the County of San Diego has also installed continuous flow monitoring equipment at four of the five of its highest priority major MS4 outfalls with persistent non-storm water flows and two additional major outfalls with persistent non-storm water flows. The equipment was installed during the dry season (May through September) to more closely monitor dry weather discharge rates from these outfalls for non-storm water flow rates and volumes and to potentially identify cyclical trends or increases in non-storm water flows. This information can be used to help San Diego County reduce or eliminate non-storm water flows to address its 2018 MS4 Permit term goal.

San Diego Regional Reference Streams and Beaches Study

The San Diego Regional Reference Streams and Beach Study (Southern California Coastal Water Research Project [SCCWRP], 2015 and SCCWRP, 2016) characterizes the natural background concentrations of bacteria from natural streams and beaches in a condition minimally disturbed by anthropogenic activities, referred to as a “reference” condition. These data are being used during the Bacteria TMDL Reopener to revisit the Bacteria TMDL numeric targets based on current data and United States Environmental Protection Agency (USEPA) policy, which may lead to revised terms of compliance. The Bacteria TMDL Reopener is in progress and is expected to be completed in 2017. Section 5.1 of Appendix C provides more information on these special studies.

San Dieguito River WMA Bacteria Source Identification and Prioritization Process Special Study

The San Dieguito River Responsible Agencies conducted a Bacteria Source Identification and Prioritization Special Study. This study assessed sources of bacteria in selected focus areas using the San Diego Bacteria Source Identification and Prioritization Process developed in 2012 as part of the MS4 Permit Report of Waste Discharge process. The focus area drainages were selected because of elevated *Enterococcus* concentrations and known dry weather flows. The focus areas also allowed participating Responsible Agencies to identify bacteria sources to target in their jurisdictions.

The study used geospatial data, water quality data, and the prioritization process to determine potential bacteria sources in selected focus areas. This process can serve as a framework for the Responsible Agencies to review bacteria sources at MS4 outfalls where water quality-based effluent limit (WQBEL) exceedances occur without implementing costly source identification studies. It may also lead potentially to modification or enhancement of WQIP strategies in these focus areas.

Each Responsible Agency now has a detailed list of sources to investigate if further exceedances are found at the focus area outfalls. Specific actions include continued frequent city-wide patrols within the City of Del Mar and assessment of data, including determination in whether specific focus areas will need to be established in the future. The City of Escondido will be filling an identified data gap and evaluating the top potential source in the jurisdiction’s focus area (septic tanks) to determine the number of registered septic tanks within city limits. The Responsible Agencies will continue to implement planned WQIP strategies in the focus area. Section 5.2 of Appendix C provides more information on this special study.

4 Implementation and Progress Toward Achieving Numeric Goals

The MS4 Permit requires the Responsible Agencies to develop specific water quality improvement numeric goals and strategies to address the HPWQC identified for the San Dieguito River WMA. Each year, the Responsible Agencies assess specific water quality data and programmatic information to gauge progress toward achieving the numeric goals. These assessments provide information to determine whether intended outcomes are being realized or whether adaptations of the programs are necessary. This section discusses the strategies that have been implemented during the reporting period and the progress toward achieving specific permit term goals for the watershed. Many of the selected strategies necessarily target the WMA HPWQC, but many address other pollutants as well, providing a multi-benefit approach to implementation.

4.1 Strategies and Schedules

The strategies being implemented by the Responsible Agencies are the activities that enable improvements in water quality to achieve the numeric goals outlined in Section 2. The success of the strategies will ultimately be measured against the WQIP interim and final numeric goals.

In general, all Responsible Agencies are collectively implementing both JRMP-required and optional nonstructural best management practices (BMPs) throughout the San Dieguito River WMA to achieve dry and wet weather load reduction goals. As implementation continues and progress is evaluated, distributed and regional structural BMPs will be implemented to meet interim and final goals as needed and as funding becomes available. Figure 4-1 shows the different types of strategies implemented by Responsible Agencies to meet WQIP goals.

JRMP strategies implemented by all Responsible Agencies during the reporting period throughout the San Dieguito River WMA are summarized by program element in Table 4-1. Detailed jurisdictional strategies are included in Appendix D. Within the detailed strategies tables, information is presented to indicate whether the strategy was implemented during this reporting period, whether it will continue to be implemented during the next reporting period, or whether the strategy will be modified or eliminated for the coming year(s).

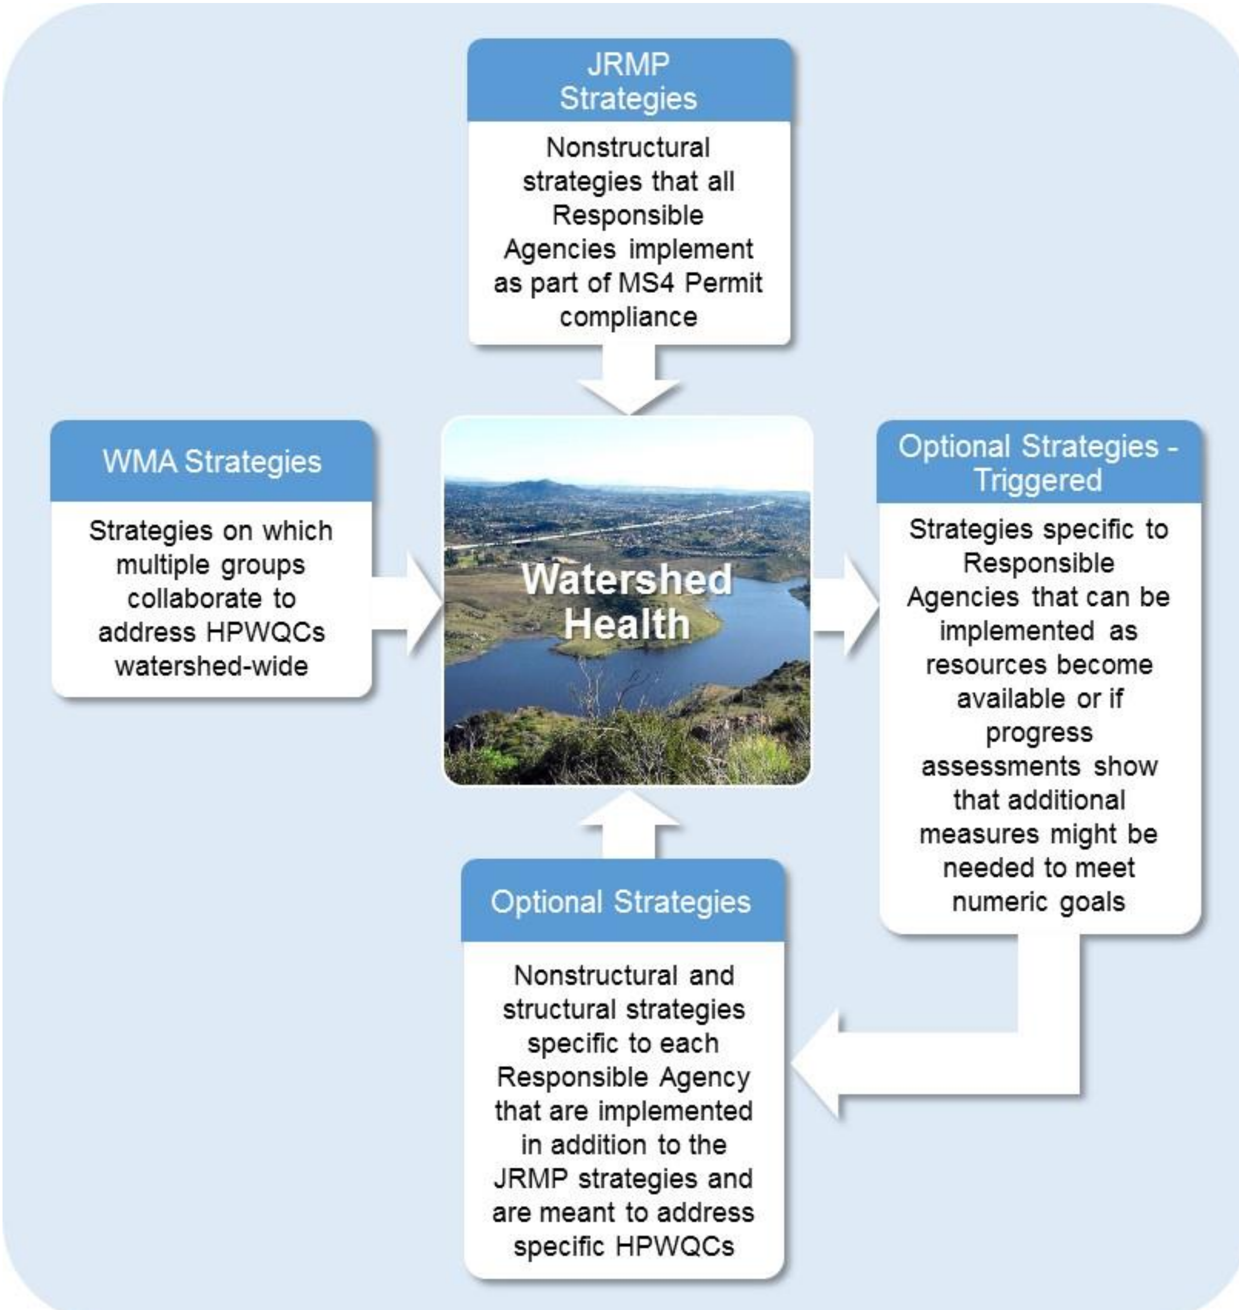

Figure 4-1
Strategies Implemented by Responsible Agencies to Meet WQIP Goals

Table 4-1
Jurisdictional Runoff Management Program Strategies Implemented in 2015–2016 by All Responsible Agencies

Strategy	Pollutants Addressed						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
Jurisdictional Runoff Management Program (JRMP) (E.2-E.7) Strategies							
E.3 Development Planning							
All Development Projects							
Establish guidelines and standards for all development projects and public low-impact development (LID) best management practices (BMPs); provide technical support related to implementation of source control BMPs to minimize pollutant generation at each project and implement LID BMPs to maintain or restore hydrology of the area or implement easements to protect water quality, where applicable and feasible. Provide education and outreach to the development community regarding requirements of the Municipal Separate Storm Sewer System (MS4) Permit, Water Quality Improvement Plan (WQIP), and BMP updates.	X	X	X	X	X	X	X
Priority Development Projects (PDPs)							
For PDPs, administer a program and provide technical support to other internal departments to ensure implementation of onsite structural BMPs to control pollutants and manage hydromodification by developing storm water development standards and design guidelines. Includes confirmation of design, construction, and maintenance of PDP structural BMPs. Update the BMP Design Manual to determine the nature and extent of storm water requirements applicable to development projects and to identify conditions of concern for selecting, designing, and maintaining appropriate structural BMPs.	X	X	X	X	X	X	X

Table 4-1 (continued)
Jurisdictional Runoff Management Program Strategies Implemented in 2015–2016 by All Responsible Agencies

Strategy	Pollutants Addressed						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
E.4 Construction Management							
Administer a program to oversee implementation of temporary BMPs that control sediment and other pollutants during the construction phase of projects. Includes requirements to inspect at appropriate frequencies and effectively enforce requirements through process controlled by other internal departments.			X	X	X	X	
E.5 Existing Development							
Commercial, Industrial, Municipal, and Residential Facilities and Areas							
Administer a program to require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types, and pollutant-generating activities (PGAs), as appropriate. Includes inspection of existing development at appropriate frequencies and using appropriate methods. Require minimum BMPs for existing residential, commercial, and industrial development. Implement policies and procedures to ensure discharges from swimming pools meet permit requirements.	X	X	X	X	X	X	X

Table 4-1 (continued)
Jurisdictional Runoff Management Program Strategies Implemented in 2015–2016 by All Responsible Agencies

Strategy	Pollutants Addressed						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
MS4 Infrastructure							
Implement operation and maintenance activities (inspection and cleaning) for MS4 and related structures (catch basins, storm drain inlets, channels as allowed by resource agencies, detention basins, pump stations, etc.) for water quality improvement and for flood control risk management. Includes inspecting and cleaning catch basins, implementing controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers, and repairing and replacing MS4 components.	X	X	X	X	X		
Roads, Streets, and Parking Lots							
Implement operation and maintenance activities for public streets, unpaved roads, paved roads, and paved highways. Implement street sweeping.	X	X	X	X	X		
Pesticides, Herbicides, and Fertilizer BMP Program							
Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education.		X					X
Retrofit and Rehabilitation in Areas of Existing Development							
Develop a strategy and identification of candidate areas of existing development necessary for implementing retrofit projects and facilitate the implementation of such projects.	X	X	X	X	X	X	X
Develop a strategy and identify candidate areas necessary to implement stream, channel, or habitat rehabilitation projects and facilitate implementation of such projects.	X	X	X	X	X	X	X

Table 4-1 (continued)
Jurisdictional Runoff Management Program Strategies Implemented in 2015–2016 by All Responsible Agencies

Strategy	Pollutants Addressed						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
E.2 Illicit Discharge, Detection, and Elimination (IDDE) Program							
Implement the Illicit Discharge, Detection, and Elimination (IDDE) Program per the JRMP. Requirements include maintaining an MS4 map, using municipal personnel and contractors to identify and report illicit discharges, maintaining a hotline for public reporting of illicit discharges, monitoring MS4 outfalls, and investigating and addressing any illicit discharges.	X	X	X	X	X	X	X
E.7 Public Education and Participation (B.3.b(1)(a)(iii))							
Implement a public education and participation program to promote and encourage development of programs, management practices, and behaviors that reduce the discharge of pollutants in storm water prioritized by high-risk behaviors, pollutants of concern, and target audiences. Enhanced school and recreation-based education and outreach, of which may include irrigation reduction issues, integrated pest management (IPM) for residents and businesses, and implementation and education of pet waste program. Promote and encourage implementation of designated BMPs in commercial and industrial areas.	X	X	X	X	X	X	X

Table 4-1 (continued)
Jurisdictional Runoff Management Program Strategies Implemented in 2015–2016 by All Responsible Agencies

Strategy	Pollutants Addressed						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
E.6 Enforcement Response Plan							
Continue to implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Storm Water Code Enforcement Unit's Standard Operating Procedures (SOPs) – Enforcement Response Plan.	X	X	X				

1. Highest priority water quality condition is highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters.

Intentionally Left Blank

Nonstructural strategies reduce pollutant loading to the MS4 by reducing pollutant generation at the source and/or by reducing mobilization of pollutants to the MS4, and either directly or ultimately to receiving waters. Programs designed to diminish the impacts of irrigation runoff, landscaping practices, and pet waste on receiving water quality are primary examples of nonstructural approaches that Responsible Agencies in the San Dieguito River WMA have employed during this permit term. The key strategies for each Responsible Agency are presented in Sections 4.1.1 through 4.1.6, and WMA strategies are presented in Section 4.1.7.

4.1.1 City of Del Mar

During FY 16, Del Mar implemented the strategies described in the WQIP. Highlights of strategies implemented by Del Mar to address bacteria are shown in Figure 4-2. The full list of strategies implemented is in Appendix D. Additional strategies being implemented are listed in Table 4-2.

Septic System Maintenance

Septic systems have the potential to be a source of bacteria if not properly operated and maintained. During FY 16, the City of Del Mar reviewed data to determine which properties have septic systems (onsite wastewater treatment system). In June 2016, letters were sent to the identified properties along with an educational information sheet explaining how to protect and maintain septic systems.

Storm Runoff

The City of Del Mar operates two storm runoff pumps in the northern coastal portion of the City: 27th Street and 29th Street. The 27th and 29th Street pumps collect and pump storm water to the sanitary sewer for the first 30 minutes of a wet weather event reducing the amount of potential pollutants reaching the receiving water.

Patrols to Eliminate Potential Pollutant Sources

The City of Del Mar implements a proactive patrol of the entire city at least six times per year. City staff patrol municipal, commercial, residential, and construction areas and locations to identify any potential illicit discharges and improper BMP implementation. In addition, treatment control best management practices (TCBMPs) and all minor and major MS4 outfalls are inspected during patrols. For FY 16, Del Mar conducted 11 city-wide patrols (~monthly) and were able to enforce proper BMP implementation throughout the city.

Figure 4-2
Highlights of Del Mar Strategies

Table 4-2
Summary of Strategies for the San Dieguito River Watershed Management Area—City of Del Mar

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
Promoted and collaborated with water agencies and other groups to encourage implementation of water conservation programs that improve water quality by reducing over-irrigation with smart products or turf replacement and capturing rain water in residential areas.	X	X	X	X	X	X	X
Continued participating in source reduction initiatives.	X	X	X	X	X	X	X
Implemented a program to require septic system maintenance practices.	X	X		X			X
Participated in the San Diego Regional Reference Streams and Beaches Study (see Section 3.2 for study details).		X					
Participated in the San Dieguito River WMA Bacteria Source Identification and Prioritization Process Special Study (see Section 3.2 for study details).		X					
Visually inspected all major and minor MS4 outfalls.	X	X	X	X	X	X	X

2. Flow is defined as storm water and non-storm water discharges to receiving waters.

MS4 = municipal separate storm sewer system; WMA = watershed management area

4.1.2 City of Escondido

During FY 16, Escondido implemented the strategies described in the WQIP. Highlights of strategies implemented by Escondido to address bacteria are shown in Figure 4-3. The full list of strategies implemented is in Appendix D. Additional strategies being implemented are listed in Table 4-3.

- ❖ Implemented the mitigation plan for the Regional General Permit 94 for channel maintenance throughout Escondido. The 4.44-acre project in Kit Carson Park resulted in removing 67 exotic trees and other invasive vegetation, and planting 742 native riparian container trees and applying 22 pounds of cottonwood-willow woodland seed mix.
- ❖ Conducted a comprehensive review of inventoried structural BMPs associated with Priority Development Projects.
- ❖ Transitioned storm water program existing developments inspections, to the City's asset management program (Cityworks) for improved scheduling, tracking, and reporting.

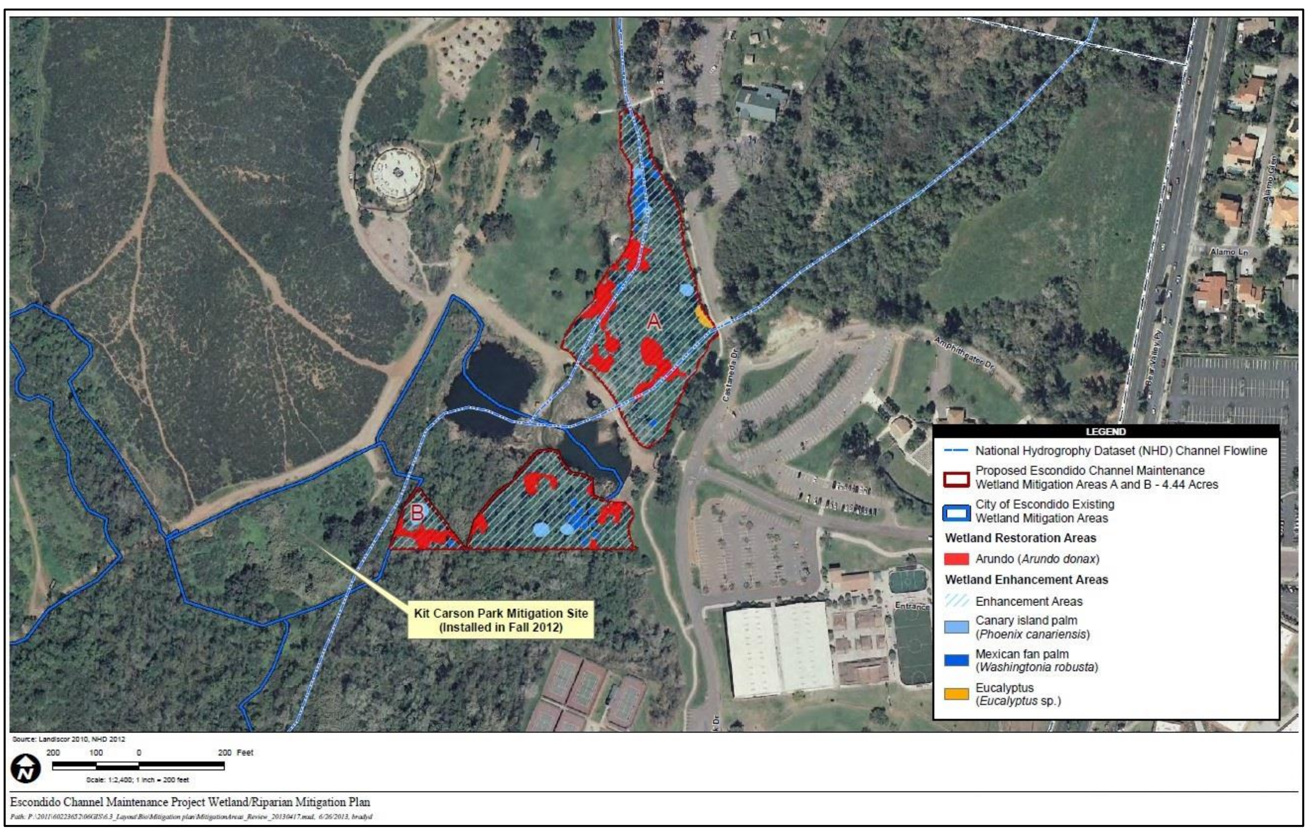

Figure 4-3
Highlights of Escondido Strategies

Table 4-3
Summary of Strategies for the San Dieguito River Watershed Management Area—City of Escondido

	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
Participated in the San Diego Regional Reference Streams and Beaches Study (see Section 3.2 for study details).	X	X	X	X	X	X	X
Participated in the San Dieguito River WMA Bacteria Source Identification and Prioritization Process Special Study (see Section 3.2 for study details).	X	X	X	X	X	X	X
The City conducted a City-wide hydraulic study to identify potential retrofit projects that could be used in an alternative compliance program.	X	X	X	X	X	X	X

1. Highest priority water quality condition is highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters.

WMA = watershed management area

4.1.3 City of Poway

During FY 16, Poway implemented the strategies described in the WQIP. Highlights of strategies implemented by Poway to address bacteria are shown in Table 4-4. The full list of strategies implemented is in Appendix D.

Table 4-4
Summary of Strategies for the San Dieguito River Watershed Management Area—City of Poway

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
Required implementation of low-impact development (LID) best management practices (BMPs) with all new construction.	X	X	X	X	X	X	X
Promoted Metropolitan Water District of Southern California (MWD) and other groups to encourage implementation of water conservation programs that improve water quality by reducing over-irrigation with smart products or turf replacement and capturing rain water in residential areas.	X	X	X	X	X	X	X
Proactively repaired and replaced corrugated metal pipe municipal separate storm sewer system (MS4) components to provide source control from MS4 infrastructure.	X	X	X		X		
Targeted human behavior in parks and other public areas, including trash reduction or other high-impact behaviors that affect habitat, wildlife, and water quality.	X	X		X			X
Participated in the San Diego Regional Reference Streams and Beaches Study (see Section 3.2 for study details).	X	X			X		
Reconfigured the Department of Public Works (DPW) waste yard to reduce pollutants/runoff.	X		X	X			X

1. Highest priority water quality condition is highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters.

4.1.4 City of San Diego

During FY 16, City of San Diego implemented the strategies described in the WQIP. Highlights of strategies implemented by City of San Diego are described below. The full list of strategies implemented is in Appendix D. Additional strategies being implemented are listed in Table 4-5.

- **Special Study (New in FY16):** The City of San Diego and other Responsible Agencies in the WMA completed the San Dieguito River WMA Bacteria Source Identification and Prioritization Special Study to assess sources of bacteria in the watershed. The study allowed the Responsible Agencies to prioritize potential sources of bacteria in unique focus areas using existing monitoring and geospatial data. In addition, the study may be used by the Responsible Agencies to tailor and modify strategies in these focus areas.

- **Hodges Reservoir Efforts (New in FY16):** The City of San Diego's Public Utilities Department secured $2.9 million in Proposition 84 funding for the Lake Hodges Natural Treatment System Project. This project is designed to create a biofiltration wetland at Hodges Reservoir to improve water quality. The wetland will also provide habitat and species conservation benefits, in addition to recreational opportunities.

  Also, the City of San Diego's Public Utilities Department and other Responsible Agencies completed the Lake Hodges Nutrients Evaluation Tech Memo, which summarizes the results of an analysis of receiving water and MS4 data collected. Because the analysis was inconclusive, the Responsible Agencies have begun developing a conceptual model of nutrient sources in the subwatershed surrounding Hodges Reservoir, and a Study Plan, Monitoring Plan, and Quality Assurance and Project Plan (QAPP) for the Hodges Reservoir Nutrient Source Study. When implemented, the study will be able to quantify the Responsible Agencies' nutrients load in the Above Lake Hodges subwatershed to better inform their water quality strategies.

- **Structural Strategies:** 0.8 acre of drainage area was treated by green infrastructure features, and approximately 9.86 additional acres are expected to be treated by FY 18 in the WMA.

Table 4-5
Summary of Strategies for the San Dieguito River Watershed Management Area—City of San Diego

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
Storm Drain Structure Cleaning: 2,438 storm drain structure inspections were conducted, resulting in the cleaning of 286 structures and removal of 125.2 tons of debris in the WMA.	X		X	X	X		
New in FY 16: Catch Basin Cleaning Optimization: In an effort to further optimize its drain cleaning program, the City of San Diego (City) analyzed eight years of catch basin cleaning data and assigned priorities to individual basins based on historical debris removal. This enhancement will allow the City to target high priority drains to maximize pollutant removal while maintaining cost efficiencies.	X		X	X	X		
Street Sweeping: Approximately 2,878 curb miles of roads, streets, highways, medians, parking lots, and operations yards were swept in the WMA.	X	X	X	X	X		
New in FY 16: Median Sweeping: 4,315 median miles were swept citywide.	X	X	X	X	X		
New in FY 16: Targeted Aggressive Street Sweeping Pilot: The City completed a pilot study that quantified the effectiveness of posting limited-hour "no parking" signs on typically nonposted routes. The study found that posting routes resulted in an approximate 50% increase in pollutant removal because the sweeper had more access to curbs and gutters. Based on this finding, the City will consider posting additional routes if supported by the community.	X	X	X	X	X		
New in FY 16: MS4 Maintenance: In addition to routine maintenance of the MS4, the City repaired or replaced 12 pump stations and modernized another 14 pump stations, CCTV surveyed 28,000 linear feet of pipe in 62 locations citywide, and began the development of the Waterways Maintenance Plan and Channel **Maintenance Prioritization Plan**. To help minimize the risk of flooding in a flood-prone drainage area, the City also installed a 2,400-volt automatic transfer switch and generator to a 130,000 gallon-per-minute pump station, allowing for sustained function in the event of a power outage.	X		X	X	X		

Table 4-5 (continued)
Summary of Strategies for the San Dieguito River Watershed Management Area—City of San Diego

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
IDDE Program: 119 discharges were reported by the public, 171 cases were investigated, 140 discharges or illicit connections were eliminated, 141 enforcement actions were issued, and 69 escalated enforcement actions were issued in the WMA. **New in FY 16: Launch of the Get It Done App**: This app allows illicit discharges to be reported quickly via any smartphone. Lastly, the Tiger Team (a proactive escalated monitoring and enforcement team that involves multiple City departments and divisions) was developed to identify, locate, and eliminate sources of human specific bacteria in the MS4. Over several months during the reporting year, one problem area within the City was investigated extensively and a source of human-specific bacteria in the MS4 was identified and abated.	X	X	X	X	X	X	X
Commercial and Industrial Business Inspections: 314 inspections were completed, 14 follow-up inspections were completed, 49 violations were issued, 58 enforcement actions were issued, and 23 escalated enforcement actions were issued in the WMA. In addition, the City conducted property-based inspections that focus on common areas/activities shared among multiple businesses or tenants that generate pollution. A previously conducted pilot study on inspection practices found property-based inspections to be more effective in identifying and resolving water quality issues (e.g., improper trash disposal practices and irrigation runoff, etc.) associated with commercial and industrial businesses.	X	X	X	X	X	X	X
Trash Clean Ups: 4 cleanup events were sponsored through community-based organizations and 24,674 pounds of trash and debris were collected in the WMA (see Appendix D for a list of specific projects).				X			
Rebates to Reduce Irrigation Runoff: Rebates were issued to convert 61,032 square feet of turf in the WMA and rebates for rain barrels were issued to capture 772,740 gallons of rainwater citywide.	X	X	X	X	X	X	X

Table 4-5 (continued)
Summary of Strategies for the San Dieguito River Watershed Management Area—City of San Diego

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
New in FY 16: Offsite Alternative Compliance Program: The City implemented Phase I of the Alternative Compliance Program to give development projects that would require onsite structural BMPs the ability to propose offsite alternative compliance projects. The development of Phase II was also initiated and will include the establishment of an in-lieu fee structure and credit system.	X	X	X	X	X	X	X
New in FY 16: Bacteria Regrowth Study: The City completed a study to characterize the magnitude and extent of potential *Enterococcus* loading because of regrowth within the City's storm drain system. This study quantifies the amount of bacteria in receiving water samples that are harmless to humans and could potentially be used to refine bacteria water quality standards of the Bacteria TMDL as a part of the Reopener process.	X						

1. Highest priority water quality condition is highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters.

% = percent; BMP = best management practice; CCTV = closed-circuit television; FY = fiscal year;
IDDE = illicit discharge detection and elimination; MS4 = municipal separate storm sewer system;
TMDL = total maximum daily load; WMA = watershed management area

4.1.5 City of Solana Beach

During FY 16, Solana Beach implemented the strategies described in the WQIP. The full list of strategies implemented is in Appendix D.

The City of Solana Beach worked diligently during the reporting period to implement planned strategies to address the San Dieguito River WMA's HPWQC of indicator bacteria along with other associated pollutants. Many of these strategies were effective in identifying and managing potential sources of pollutants and will continue to be carried out during the next reporting period, as described in Figure 4-4. Additional strategies being implemented are listed in Table 4-6.

Progress Toward Numeric Goals

During FY 16, the City of Solana Beach completed both jurisdictional water quality improvement numeric goals ahead of schedule. Solana Beach installed a low-flow diverter at Seascape Sur (an identified persistently flowing outfall), diverting 2.5 million gallons of discharge since October 2014. Solana Beach also completed installation of curb cuts along Highway 101, which treats 8.62 acres of the drainage area.

Patrols to Eliminate Pollutant Sources

Solana Beach conducted patrols of the entire City, including all residential areas, commercial and industrial facilities, and treatment control BMPs. Solana Beach actively managed potential sources of pollutants, working directly with property owners to effectively address 18 issues of discharge. Solana Beach has deemed this approach to be effective in eliminating pollutant sources and will continue implementation during the next reporting period on a bimonthly basis.

Outfall Inspections

Solana Beach inspected all outfalls throughout the City, both minor and major, to identify any persistently flowing outfalls. Solana Beach has only one persistently flowing outfall, and will continue to inspect all outfalls on a bimonthly basis to identity any new sources of discharge that could contribute to bacteria pollution in receiving waters.

Prioritizing Sewer Line Replacement Projects

Solana Beach continued implementation of an aggressive sewer infrastructure replacement program and CCTV surveyed 20% of the sewer infrastructure during the reporting period. The results led to a prioritized list of sewer line replacement projects. Solana Beach invests approximately $500,000 in sewer replacement projects per year in an effort to reduce any seepage of bacteria from leaky sewer lines into groundwater or potentially the MS4.

Figure 4-4
Highlights of City of Solana Beach Strategies

Table 4-6
Summary of Strategies for the San Dieguito River Watershed Management Area—City of Solana Beach

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
Promoted and encouraged implementation of designated best management practices (BMPs) at residential areas.	X	X	X	X	X	X	X
Promoted and encouraged implementation of designated BMPs in commercial areas.	X	X	X	X	X	X	X
Continued participating in source reduction initiatives.	X			X			
Began program development and analysis for capturing trash and debris, to minimize its impact on receiving waters.	X			X	X		
Participated in the San Diego Regional Reference Streams and Beaches Study (see Section 3.2 for study details).	X						
Participated in the San Dieguito River Watershed Management Area (WMA) Bacteria Source Identification and Prioritization Process Special Study (see Section 3.2 for study details).	X						
Implemented other projects, including several green infrastructure, water quality improvement BMP, and dry weather flow separation and treatment projects (see Appendix D for a list of specific projects).	X	X	X	X	X	X	X

1. Highest priority water quality condition is highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters.

4.1.6 County of San Diego

During FY 16, County of San Diego (County) implemented the strategies described in the WQIP. Highlights of strategies implemented by the County of San Diego to address sediment, bacteria, and freshwater input are shown below. The full list of strategies implemented is in Appendix D.

- **Residential Area BMPs:** The County encourages BMPs in residential areas. All residential management areas were inspected in FY 16.
- **Water Conservation:** The County collaborates with and promotes the efforts of partner agencies for incentive programs such as rain barrels, water smart irrigation controllers, soil sensors, turf replacement programs, and residential landscape evaluation programs.
- **Green Streets:** The County developed green street retrofit design standards and specifications. Green streets are now being used to meet compliance for all retrofit and redeveloped road projects in the Capital Improvement Projects plan.
- **Public Education:** The County collaborates with the Regional Education Workgroup and Think Blue San Diego Region to develop and distribute educational materials.
- **Trash Generation Studies:** The County is collaborating with the Responsible Agencies to develop baseline trash generation rates.
- **Offsite Alternative Compliance:** The County supports applicant-implemented offsite alternative compliance. The Water Quality Equivalency provides the currency for structural BMPs and some natural system management practices.
- **Irrigation Runoff Prevention Study:** The County undertook a community-based social marketing pilot study on the effectiveness of irrigation runoff prevention materials.
- **Sustainable Landscapes:** The County is implementing a program to encourage landscape retrofits that replace water-intensive turf grass with landscaping that provides several environmental benefits.
- **Rain Barrel Incentives:** The County offers incentives for rain barrel installation by offering discounts on rain barrel purchases as well as rebates for rain barrel installation.

Additionally, the County recently undertook efforts to update its 2007 Low-Impact Development (LID) Handbook[2] to better align with the County's Standard Urban Storm Water Mitigation Plan (SUSMP) and Hydromodification Management Plan (HMP), and to reflect the most current data on LID approaches and their efficacy. For its distinguished efforts, the County was named the recipient of the 2015 Outstanding Innovation in Green Planning and Design Award by the San Diego Chapter of the California Association of Environmental Professionals (AEP), a non-profit organization established in 1974, and dedicated to enforcing and supporting the California Environmental Quality Act (CEQA). Additionally, the County of San Diego received a similar award in October 2016 for work done during the fiscal year on development of its Guidance on Green Infrastructure, a document outlining tools to uniformly design, install, and maintain LID features in the public right-of-way (Figure 4-5). Additional strategies being implemented are listed in Table 4-7.

Figure 4-5
LID Incorporated into a Roadway Median

Table 4-7
Summary of Strategies for the San Dieguito River Watershed Management Area—County of San Diego

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment	Flow[2]	Habitat/Wildlife
Began implementing the Sustainable Landscapes Program to encourage landscape retrofits.	X	X	X		X	X	X
Began implementing an incentive program for best management practice (BMP) retrofits (Public-Private Partnerships – a County-sponsored program to offer incentives for rain barrel installation, downspout disconnects from the storm water system, etc.).	X	X	X	X	X	X	

1. Highest priority water quality condition is highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters.

4.1.7 Optional WMA Strategies

In addition to implementing strategies on a jurisdictional basis, Responsible Agencies are collaboratively implementing projects within the WMA that improve water quality, as described in Table 4-8.

Table 4-8
Optional WMA Strategies

WMA Strategy	Implementation Status Update
WMA-4: Collaborative Approach to Irrigation Reduction	Responsible Agencies collaborated with water agencies to continue to implementing turf replacement and rain barrel rebate programs. Additionally, various Responsible Agencies implemented reduction programs to help achieve the State-mandated reduction in water consumption.
WMA-6: Offsite Alternative Compliance Option (Watershed Management Area Analysis [WMAA])	Responsible Agencies implemented Phase I of the Alternative Compliance Program to give development projects that would require onsite structural best management practices (BMPs) the ability to propose offsite alternative compliance projects.
WMA-7: Collaboration with the Regional Board	Collaborated with the Regional Board to include non-Phase I municipal separate storm sewer systems (MS4s) in general permits, waivers, and Waste Discharge Requirements (WDRs).
WMA-14: Participation as a Stakeholder in the San Diego Integrated Regional Water Management (IRWM) Program as Appropriate	Hodges Reservoir Natural Treatment System was awarded $2.9 million in grant funding. This project will create a biofiltration wetland at Hodges Reservoir to improve water quality. The wetland also will provide habitat and species conservation benefits, in addition to recreational opportunities. – More information on IRWM efforts is available at http://www.sdcwa.org/more-31-million-awarded-water-projects-san-diego-region#sthash.5sYifWjP.dpuf.

4.2 Calculating Baseline Values for Assessment of Progress Toward Achieving Numeric Goals

Section 4 of the San Dieguito River WMA WQIP included several placeholders for baseline values to help Responsible Agencies determine progress in achieving numeric goals. These baseline values were calculated for this annual report and are summarized in Table 4-9.

Table 4-9
Baseline Values for Numeric Goals for Pacific Ocean Shoreline Recreation (Bacteria)

Compliance Pathway	Metric	Agency	Baseline
Wet Weather Bacteria			
MS4 Discharges % Days Exceeding WQO	Fecal coliform	All Responsible Agencies	98%[1]
	Enterococcus		100%[1]
	Total coliform		100%[1]
# of Direct or Indirect MS4 Discharges[2] to Receiving Water	Discharges[2]	City of Del Mar	6 discharges[2]
		City of Escondido	3 discharges[2]
		City of Poway	15 discharges[2]
		City of San Diego	42 discharges[2]
		City of Solana Beach	3 discharges[2]
		County of San Diego	20 discharges[2]
Reduce anthropogenic surface dry weather flows to address bacteria regrowth contributing during wet weather		City of Del Mar	<u>Average Annual Flow:</u> 0.81 gallons per minute <u>Maximum Flow:</u> 1.5 gallons per minute
Design and install diverters at high priority outfalls to treat first flush and low flows		City of Solana Beach	0 acres of low flow diverted to the sanitary sewer
Design and construct curb cuts to redirect water from traditional drainage areas to permeable surfaces		City of Solana Beach	0 acres of drainage area treated

Table 4-9 (continued)
Baseline Values for Numeric Goals for Pacific Ocean Shoreline Recreation (Bacteria)

Compliance Pathway	Metric	Agency	Baseline
Dry Weather Bacteria			
MS4 Discharges % Days Exceeding WQO	Fecal coliform	City of Del Mar	82%[3]
	Enterococcus	City of San Diego	100%[3]
	Total coliform	City of Solana Beach	100%[3]
# of Direct or Indirect MS4 Discharges[4] to Receiving Water	Discharges[4]	City of Del Mar	6 discharges[4]
		City of San Diego	42 discharges[4]
		City of Solana Beach	3 discharges[4]
Reduce anthropogenic surface dry weather flows		City of Del Mar	Average Annual Flow: 0.81 gallons per minute Maximum Flow: 1.5 gallons per minute
Reduce anthropogenic dry weather flow in priority drainage area with persistent flow by performing special strategies, including property-based inspections for residents and commercial areas		City of Escondido	Average Flow: 6.2 gallons per minute Maximum Flow: 37 gallons per minute
Turf conversion		City of Poway	0 square feet of turf converted
Implement runoff reduction programs such as education and outreach, enhanced inspections, rebates, and increased enforcement		City of San Diego	Average Annual Flow[5]: 38.6 gallons per minute Maximum Flow[5]: 224.4 gallons per minute
Design and install diverters at high priority outfalls to treat first flush and low flows		City of Solana Beach	0 acres of low flow diverted to the sanitary sewer
Design and construct curb cuts to redirect water from traditional drainage areas to permeable surfaces		City of Solana Beach	0 acres of drainage area treated

Table 4-9 (continued)
Baseline Values for Numeric Goals for Pacific Ocean Shoreline Recreation (Bacteria)

Compliance Pathway	Metric	Agency	Baseline
Dry Weather Bacteria			
MS4 Discharges % Days Exceeding WQO	Fecal coliform	County of San Diego	82%[2]
	Enterococcus	County of San Diego	100%[2]
	Total coliform	County of San Diego	100%[2]
# Direct or Indirect MS4 Discharges[2] to Receiving Water	Discharges[2]	County of San Diego	20 discharges[5]
Eliminate anthropogenic dry weather flows from storm drain outfalls either by aggregate flow volume or the number of persistently flowing outfalls during dry weather		County of San Diego	10 of 20 major MS4 outfalls have persistent dry weather flows; average flow rate as measured with continuous flow monitoring equipment = 8.614 gallons per minute

1. Wet weather baseline exceedance rate calculated using targeted and random MS4 wet weather monitoring data from October 1, 2008, through September 30, 2013. Monitoring data were assessed similar to the method outlined in Attachment E.6 of the 2013 MS4 Permit for each monitoring year. The observed wet weather days in exceedance were summed and divided by the total wet weather days in exceedance for the historical 5-year period.
2. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring.
3. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008, through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the fifth sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of dry weather days in exceedance for the historical 5-year period.
4. Discharges are defined as observed dry weather flows from persistently flowing MS4 outfalls.
5. Calculated using historical dry weather MS4 outfall data from 2009–2012.

% = percent; MS4 = municipal separate storm sewer system; WQO = water quality objective; # = number

4.3 Progress Toward Achieving Goals for the San Dieguito River WMA

As discussed in Section 2, interim and final numeric goals were established for the watershed as a means of measuring reasonable progress toward addressing the HPWQC; the goals are included in Appendix B. Performance-based goals are included to measure short-term jurisdictional progress toward achieving these goals, given that sustained water quality improvement is typically demonstrated over a longer timeframe. Performance-based goals are intended to measure an outcome from a strategy or suite of strategies, and to provide an interim link to demonstrate reasonable incremental progress in the quality of MS4 discharges and receiving waters by FY 18. The strategies or suite of strategies presented have been selected as goals because they are measurable and provide a direct water quality benefit in the near term. Table 4-10 summarizes progress in FY 16 toward meeting these performance-based goals.

Intentionally Left Blank

Table 4-10
Progress Toward Performance-Based Goals to Address Pacific Ocean Shoreline Recreation (Bacteria)

Agency	Performance-Based Goal	Weather (Wet/Dry)	Baseline	FY18 Goal	Progress
City of Del Mar	Reduce anthropogenic surface dry weather water flows	Dry	Average Annual Flow: 0.81 gallon per minute Maximum Flow: 1.5 gallons per minute	Reduce anthropogenic surface dry weather flows[5] that originate within Del Mar's jurisdictional boundaries by 10%	Achieved to date. Average dry weather flow in FY 16 was 0.3 gallon per minute, representing an 80% reduction from the baseline average flow.
City of Escondido	Implement and maintain water quality improvement BMPs to target fecal coliform, *Enterococcus*, total coliform, sediment, and nutrients	Wet	N/A	Treat 4 acres of drainage area through restoration of 1 sediment detention basin in a multiuse treatment area at Eagle Scout (formerly Sand) Lake, Kit Carson Park	Achieved. Project implemented in January 2014. Observational monitoring and minor maintenance conducted in FY 16.
	Reduce anthropogenic dry weather flow in priority drainage area with persistent flow by performing special strategies, including property-based inspections for residents and commercial areas	Dry	Average Flow: 6.2 gallons per minute Maximum Flow: 37 gallons per minute	Reduce anthropogenic dry weather flow at one priority outfall (HDG_102)by 10%	In progress. Performed study to determine baseline flow.

Table 4-10 (continued)
Progress Toward Performance-Based Goals to Address Pacific Ocean Shoreline Recreation (Bacteria)

Agency	Performance-Based Goal	Weather (Wet/Dry)	Baseline	FY18 Goal	Progress
City of Poway	Implement turf conversion	Dry	0 square feet of turf converted	Increase the baseline through turf conversion rate by 5%	In progress. There were no turf conversion projects in the WMA in FY 16.
City of San Diego	Develop a green infrastructure policy, attain City Council approval, and construct green infrastructure BMPs to improve water quality during wet and dry weather	Wet and Dry	0 acres treated in 2002, the year used as baseline in the Bacteria TMDL	Treat 10.6 acres of drainage area through construction of 2 green infrastructure BMPs[2]	In progress. The City has begun the process for developing a green infrastructure policy. The City implemented green infrastructure that treats 0.8 acre of drainage area (Del Mar Heights Rd Median) and is expected to exceed the performance-based goal by implementing additional projects that treat 9.86 acres of drainage area (Callado Road Green Street) for a total of 10.66 acres treated by 2018.

Table 4-10 (continued)
Progress Toward Performance-Based Goals to Address Pacific Ocean Shoreline Recreation (Bacteria)

Agency	Performance-Based Goal	Weather (Wet/Dry)	Baseline	FY18 Goal	Progress
City of San Diego (continued)	Implement runoff reduction programs, including targeted education and outreach, enhanced inspections, rebates, and increased enforcement	Dry	Average Dry Weather Flow[1]: 38.6 gallons per minute Maximum Dry Weather Flow[1]: 224.4 gallons per minute	Reduce prohibited dry weather flow from baseline measured at persistently flowing outfalls in the WMA by 10%	Achieved to date: Average dry weather flow in FY 16 was 13.8 gallons per minute, representing a 64.2% reduction from the baseline average flow.
City of Solana Beach	Design and install diverters at high priority outfalls to treat first flush and low flows	Wet and Dry	0 acres of low flow diverted to the sanitary sewer	Direct 40.5 acres of low flows to the sanitary sewer through construction of one diverter at high priority outfall Seascape Sur	Achieved. Since installation in October 2014, 2.5 million gallons of water have been diverted to the sanitary sewer. Diverter diverts low flows as well as first flushes.
	Design and construct curb cuts to redirect water from traditional drainage areas to permeable surfaces	Wet and Dry	0 acres of drainage area treated	Treat 8 acres of drainage area through curb cuts along Highway 101	Achieved. 8.627 acres of drainage area treated through Highway 101 project.

Table 4-10 (continued)
Progress Toward Performance-Based Goals to Address Pacific Ocean Shoreline Recreation (Bacteria)

Agency	Performance-Based Goal	Weather (Wet/Dry)	Baseline	FY18 Goal	Progress
County of San Diego	Reduce baseline bacteria loads from storm drain outfalls to receiving water	Wet	*Enterococcus* Load for MS4-SDC-6 = 1.25E+10^{13} MPN/year	Reduce bacteria load from the MS4 by 1%	In progress. Currently 3.38E+10^{14}(3)
	Eliminate anthropogenic dry weather flows from storm drain outfalls either by aggregate flow volume or the number of persistently flowing outfalls during dry weather	Dry	50% of major outfalls have persistent dry weather flows; average flow rate as measured at outfalls with continuous flow monitoring equipment is 8.614 gallons per minute	Reduce by 20%	In progress. Baseline was established during 2015–2016 monitoring year.

1. Calculated using historical dry weather MS4 outfall data from 2009-2012. Calculations are described in Appendix D.
2. Taken from Table 5-29 of the Transitional Monitoring and Assessment Program Report for the San Dieguito River Watershed Management Area (2012-2014) (San Dieguito River WMA Copermittees, 2015)
3. The total flow volume during the 2015-2016 monitoring year was approximately 2 times larger than total flow during the baseline year. This may contribute to an increased annual load at MS4-SDC-6.

% = percent; BMP = best management practice; FY = fiscal year; MPN = most probable number; MS4 = municipal separate storm sewer system; N/A = not applicable; TMDL = total maximum daily load; WMA = Watershed Management Area

5 Adaptive Management

This section summarizes the potential triggers for adaptation of the WQIP and the results of the MS4 Permit adaptive management process for the San Dieguito River WMA during the first year of implementation. The adaptive management approach uses an iterative approach to re-evaluate major components of the WQIP, based on the requirements of the MS4 Permit. It details how the Responsible Agencies use new data and information to improve the WQIP through updates to priorities, assessments of and adjustments to goals, updates to strategies to meet the latest goals, and updates to the monitoring and assessment program to provide the necessary data to support the process. Responsible Agencies are continually evaluating and assessing the implementation of the WQIP and making minimal modifications to streamline and optimize execution outside the MS4 Permit adaptive management process.

The MS4 Permit describes various triggers that may warrant program adaptation, including exceedances of water quality standards in receiving waters, new information, Regional Board recommendations, and input from the public. Effectiveness assessments of JRMP programs and strategies may also trigger adaptations to the WQIP.

The adaptive management process is used in conjunction with water quality and program data to evaluate whether modifications to numeric goals, schedules, and/or strategies are necessary to achieve compliance with the interim and final compliance numeric goals. MS4 Permit adaptive management triggers are typically implemented either annually or at the end of the MS4 Permit term.

5.1 Potential Triggers for Adaptation

The adaptive management process may be triggered when new information becomes available. New information to be considered includes results of routine monitoring and special studies, new regulatory drivers, results of program effectiveness assessments and progress toward numeric goals, and recommendations from the public and/or Regional Board. Modifications may be made to the PWQCs, goals, strategies, schedules, and/or the Monitoring and Assessment Program (Appendix E). The potential triggers for adaptation to be considered annually in the Annual Report are summarized in Table 5-1.

Table 5-1
Triggers for Adaptive Management Within the WQIP

Trigger[1]	Frequency for Assessment	Potential Area(s) for Adaptation			
		Priority Water Quality Conditions	Goals and Schedules	Strategies and Schedules	Monitoring and Assessment
Exceedances of Non-Storm Water Action Levels or Storm Water Action Levels	Annual			X	X
Special Studies Results	Annual, as results are available		X	X	X
New Regulatory Actions	Annual, as applicable	X	X	X	X
Regional Board Recommendations	Annual, as applicable	X	X	X	X
Program Effectiveness Assessments/ Progress Toward Goals	Annual			X	X

1. The trigger related to the review of receiving water limitations exceedances will now be assessed on a permit term basis in the Regional Monitoring and Assessment Report. Section 6.2 and Appendix E provide more detail.

5.2 WQIP Elements for Adaptation

The San Dieguito River WMA WQIP was approved by the Regional Board in February 2016. The Responsible Agencies have just begun to implement the WQIP strategies. Therefore, there have been no adaptations made to the PWQCs, goals, strategies, or schedules, as summarized in Table 5-2. There have been changes to timing of the receiving water limitation exceedance assessment put forth by Provision A.4 and administrative changes to the City of San Diego's strategies. These changes are summarized in Table 5-2 and additional information is provided in Appendix E.

Table 5-2
2015–2016 WQIP Annual Report Adaptations

Elements for Adaptation	2015–2016 Annual Report Adaptation
Priority Water Quality Conditions	There are no adaptations at to the priority water quality conditions at this time. No new regulations, policies, or recommendations from the Regional Board have triggered adaption of this WQIP Element.
Goals and Schedules	The Responsible Agencies are on track to meet their 2018 WQIP goals and do not plan any adaptations to their goals or the related schedules at this time.
Strategies and Schedules	The Responsible Agencies have just begun implementation of their WQIP strategies that have pollutant reduction benefits. They plan to continue implementing the strategies without modification to realize the rewards of these pollutant reduction benefits. Escondido's JRMP is being updated and re-submitted concurrent with this WQIP Annual Report. The changes to the JRMP are mostly related to changes in the final approved WQIP for the Carlsbad Watershed Management Area. In the process of reviewing the JRMP for resubmittal, several clarifications, corrections, and updates were made, but no notable changes were made to strategies presented in this WQIP. A summary table of the changes is included in Appendix D. The City of San Diego has identified some administrative changes that are reflected in Appendix D and some operational adaptive management efforts in it JRMP included in Appendix D.
Monitoring and Assessment	The adaptive management process was to review receiving water limitation exceedances once per permit term, as allowed by the MS4 Permit, and not annually, as outlined in the WQIP.

JRMP = Jurisdictional Runoff Management Program; WQIP = Water Quality Improvement Plan

5.3 Summary of Previous Adaptation and Implementation

The 2015–2016 San Dieguito River WMA WQIP Annual Report is the first annual report submitted by the Responsible Agencies. No prior adaptations or updates to either the WQIP or each Responsible Agency's JRMP exist.

Intentionally Left Blank

6 Conclusions and Recommendations

The Responsbile Agencies have successfully implemented the 2015–2016 program set forth in the WQIP. Progress toward performance-based goals has been achieved. Wet and dry weather water quality monitoring provided an initial data set for assessing and adapting goals and strategies. The conclusions described below highlight the success of the WQIP.

Monitoring and Assessment: The Responsible Agencies successfully completed wet and dry weather MS4 outfall monitoring in 2015–2016 in accordance with Provision D of the MS4 Permit. Monitoring was also conducted for the HPWQC. The monitoring program and results for 2015–2016 are described in Section 3 and Appendix C. Monitoring and assessment highlights include:

- ❖ Monitoring for the HPWQC: The first year of Bacteria TMDL monitoring at the at the historical San Diego County AB 411 monitoring location at the mouth of the San Dieguito Lagoon (EH-380) was completed for wet and dry weather. Results are as follows:
  - ➢ During wet weather, the receiving waters at the San Dieguito Lagoon Mouth achieved 0% single-sample maximum exceedance frequencies for total coliform and fecal coliform. The single-sample maximum for *Enterococcus* was 13.6%. EH-380 is in compliance with interim and final wet weather single-sample maximum RWLs for all three compliance constituents.
  - ➢ During the wet season, which evaluates a combination of both wet and dry weather samples, EH-380 achieved a 0% geometric mean exceedance frequency for all compliance constituents and is in compliance with interim and final dry weather geometric mean RWLs.
  - ➢ During the dry season, when recreational activities occur with more regularity, EH-380 achieved a 0% exceedance frequency for all three compliance constituents, and is in compliance with interim and final dry weather geometric mean RWLs.
- ❖ MS4 Monitoring: Data collected as part of the MS4 monitoring program were compared to the permit action levels as detailed below:
  - ➢ In dry weather, the non-storm water action levels were met over 75% of the time for multiple consituents.
  - ➢ In wet weather, the storm water action levels were met over 90% of the time for all consituents except total copper, nitrate + nitrite, and bacteria indicators.
- ❖ Special Studies: The San Diego Regional Reference Streams and Beaches Study provided valuable information for the Bacteria TMDL Reopener. The San Dieguito River WMA Bacteria Identification and Prioritization Process Special Study provides a framework for the Responsible Agencies to review bacteria sources at MS4 outfalls where WQBEL exceedances occur without implementing costly source

identification studies. Each Responsible Agency now has a detailed list of sources to investigate if further exceedances are found at the focus area outfalls.

- ❖ Hodges Reservoir: The Responsible Agencies are coordinating with the City of San Diego's Public Utilities Department to develop a study plan and associated monitoring plans for the Hodges Reservoir Nutrient Source Study. The goal of this study is to characterize all the sources of nutrients in the Hodges Reservoir and watershed draining to the Hodges Reservoir. The study will include development of a comprehensive conceptual model to guide any future monitoring efforts to fill known data gaps.

Strategy Implementation: Strategies have been implemented as planned in the WQIP during 2015–2016. Strategies for the HPWQC are described in Section 4. The following examples highlight efforts by the Responsbile Agencies to improve water quality:

- ❖ City of Del Mar: The City of Del Mar proactively implemented its City-wide patrol approach to identify issues or potential issues and ensure proper BMP implementation. The City of Del Mar also operated two pumps to divert storm runoff to the sanitary sewer during the first 30 minutes of a wet weather event.
- ❖ City of Escondido: The City of Escondido implemented the mitigation plan for the Regional General Permit 94 for channel maintenance throughout the city. The 4.44-acre project in Kit Carson Park removed 67 exotic trees and invasive vegetation, planted 742 native riparian container trees, and applied 22 pounds of cottonwood-willow woodland seed mix.
- ❖ City of Poway: The City of Poway now requires the implementation of LID BMPs with all new construction within the City. They also have proactively repaired and replaced corrugated metal pipe MS4 components to provide source control from MS4 infrastructure.
- ❖ City of San Diego: The City of San Diego has substantially increased its enforcement activities to reduce irrigation runoff. It launched the Get It Done App which allows illicit discharges to be reported quickly and accurately via any smartphone. In addition, the Tiger Team (a proactive escalated monitoring and enforcement team that involves multiple City departments and divisions) was developed to identify, locate, and eliminate sources of human specific bacteria in the MS4. To help address nutrients in the Hodges Reservoir, the City of San Diego's Public Utilities Department secured $2.9 million in Proposition 84 funding for the Lake Hodges Natural Treatment System Project. This project is designed to create a biofiltration wetland at the Hodges Reservoir to improve water quality. The wetland will also provide habitat and species conservation benefits, in addition to recreational opportunities.
- ❖ City of Solana Beach: The City of Solana Beach implemented an aggressive sewer infrastructure replacement program. As part of this program, approximately 20% of the City's sewer infrastructure is surveyed during the reporting period using CCTV technology. The results led to a prioritized list of sewer line replacement projects.

Solana Beach invests approximately $500,000 in sewer replacement projects per year in an effort to reduce any seepage of bacteria from leaky sewer lines into groundwater or potentially the MS4.

- County of San Diego: The County of San Diego collaborates with and promotes the partner agencies' incentive programs such as rain barrels, water smart irrigation controllers, soil sensors, turf replacement programs, and residential landscape evaluation programs. The County also undertook a community-based social marketing pilot study on the effectiveness of irrigation runoff prevention materials.

Progress Toward Goals

The Responsible Agencies have either met, surpassed, demonstrated progress toward achieving, or have plans to achieve the performance-based goals for the current MS4 Permit term. Performance-based goals achieved include the following:

- BMPs have been installed and maintained in the City of Escondido, City of San Diego, City of Solana Beach, and County of San Diego, reducing or preventing pollutants from entering receiving waters.
- Dry weather flow reduction goals have been surpassed in the City of Del Mar and the City of San Diego.
- The County of San Diego established the baseline number of persistently flowing major outfalls and has established the baseline flow of these outfalls.

Provision A						
A.4.a.(2)	If ***exceedance(s) of water quality standards persist in receiving waters*** notwithstanding implementation of this Order, the Copermittees must comply with the following procedures: (2) Upon a **determination** by either the Copermittees or the San Diego Water Board that discharges from the MS4 are **causing or contributing to a new exceedance** of an applicable water quality standard **not addressed** by the Water Quality Improvement Plan, the Copermittees must submit the following updates to the Water Quality Improvement Plan pursuant to Provision F.2.c ***or as part of the Water Quality Improvement Plan Annual Report*** required under Provision F.3.b, unless the San Diego Water Board directs an earlier submittal:	Section 5		X		X
	(a) The water quality improvement ***strategies being implemented that are effective and will continue to be implemented***,	Section 5.2			X	
	(b) ***Water quality improvement strategies (i.e. BMPs, retrofitting projects, stream and/or habitat rehabilitation projects, adjustments to jurisdictional runoff management programs, etc.) that will be implemented*** to reduce or eliminate any pollutants or conditions that are causing or contributing to the exceedance of water quality standards,	Section 5.2				X
	(c) ***Updates to the schedule for implementation*** of the existing and additional water quality improvement strategies, and	Section 5.2				X
	(d) ***Updates to the monitoring and assessment program*** to track progress toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a of this Order;	Section 5.2				X
Provision B						
B.5.a.	a. The **priority water quality conditions** and potential **water quality improvement strategie**s included in the Water Quality Improvement Plan pursuant to Provisions B.2.c and B.2.e ***may be re-evaluated by the Copermittees as needed during the term of this Order as part of the Water Quality Improvement Plan Annual Report***. Re-evaluation and recommendations for modifications to the priority water quality conditions and potential water quality improvement strategies **must be provided in the Report of Waste Discharge**, and must consider the following: (1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan; (2) New information developed when the requirements of Provisions B.2.a-c have been re-evaluated; (3) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality conditions and implementation strategies to address the highest priority water quality conditions; (4) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees; (5) San Diego Water Board recommendations; and (6) Recommendations for modifications solicited through a public participation process.	Section 5		X		X
B.5.b.	b. The water quality improvement goals, strategies and schedules, included in the Water Quality Improvement Plan pursuant to Provisions B.3, ***must be reevaluated and adapted as new information becomes available*** to result in more effective and efficient measures to address the highest priority water quality conditions identified pursuant to Provision B.2.c. ***Re-evaluation of and modifications to the water quality improvement goals, strategies and schedules must be provided in the Water Quality Improvement Plan Annual Report***, and must consider the following:	Section 5	X			X
	(1) Modifications to the **priority water quality conditions** based on Provision B.5.a;	Section 5				X
	(2) Progress toward **achieving interim and final numeric goals** in receiving waters and MS4 discharges for the highest priority water quality conditions in the Watershed Management Area,	Section 4.3				
	(3) Progress toward achieving outcomes according to established schedules;	Section 4.3				
	(4) New policies or regulations that may affect identified numeric goals;					X
	(5) Measurable or demonstrable reductions of non-storm water discharges to and from each Copermittee's MS4;			X

The water quality improvement monitoring and assessment program, included in the Water Quality Improvement Plan pursuant to Provision B.4, ***must be reevaluated and adapted when new information becomes available***. Re-evaluation and recommendations for modifications to the monitoring and assessment program, pursuant to the requirements of Provision D, ***may be provided in the Water Quality Improvement Plan Annual Report***, but must be provided in the Report of Waste Discharge.	Section 5		X		X
Provision D						
D.1.e.(2)(c)	**Sediment Quality Monitoring** (c) The Copermittees must incorporate a ***Sediment Monitoring Report as part of the Water Quality Improvement Plan Annual Report*** in accordance with the schedule contained in the Sediment Monitoring Plan, unless otherwise directed in writing by the San Diego Water Board Executive Officer. The Sediment Monitoring Report must contain the following information: (i) Analysis: An evaluation, interpretation and tabulation of the water and sediment monitoring data, including interpretations and conclusions as to whether applicable Receiving Water Limitations in this Order have been attained at each sample station; (ii) Sample Location Map: The locations, type, and number of samples must be identified and shown on a site map; and (iii) California Environmental Data Exchange Network: A statement certifying that the monitoring data and results have been uploaded into the California Environmental Data Exchange Network (CEDEN).			X		
D.2.b.(iv)	**Dry Weather MS4 Outfall Discharge Monitoring** (iv) Each Copermittee must document ***removal or re-prioritization of the highest priority persistent flow MS4 outfall monitoring stations identified under Provision D.2.b.(2)(a) in the Water Quality Improvement Plan Annual Report***. Persistent flow MS4 outfall monitoring stations that have been removed must be replaced with the next highest prioritized major MS4 outfall in the Watershed Management Area within its jurisdiction, unless there are no remaining qualifying major MS4 outfalls within the Copermittee's jurisdiction in the Watershed Management Area.			X		
D.4.b.(1)(a)(ii)	**Non-Storm Water Dischargers Reduction Assessments** (a) Each Copermittee must assess and report the ***progress of its illicit discharge detection and elimination program***, required to be implemented pursuant to Provision E.2, toward effectively prohibiting non-storm water and illicit discharges into the MS4 within its jurisdiction as follows: (ii) Based on the data collected pursuant to Provisions D.2.b, the ***assessments required under <u>Provision D.4.b.(1)(c)</u> must be included in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3).***			X		
D.4.b.(1)(b)	(b) Based on the transitional dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.a.(2), each Copermittee must assess and report the following: (i) Identify the known and suspected controllable sources (e.g. facilities, areas, land uses, pollutant generating activities) of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area; (ii) Identify sources of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area that have been reduced or eliminated; and (iii) Identify modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges pursuant to Provision D.2.b.			X		X

Table A-1 (continued)

Permit Provision	Permit Language	WQIP Annual Report Section	WQIP Appendix: Appendix B Numeric Goals	WQIP Appendix: Appendix C Monitoring	WQIP Appendix: Appendix D Jurisdictional Information	WQIP Appendix: Appendix E Adaptive Management
D.4.b.(1)(c)	(c) Based on the **dry weather MS4 outfall discharge field screening monitoring** required pursuant to Provision D.2.b.(1), each Copermittee must assess and report the following: (i) The assessments required pursuant to Provision D.4.b.(1)(b); (ii) Based on the data collected and applicable NALs in the Water Quality Improvement Plan, rank the MS4 outfalls in the Copermittee's jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action to update the Water Quality Improvement Plan, with the goal of eliminating persistent flow non-storm water discharges and/or pollutant loads in order of the ranked priority list through targeted programmatic actions and source investigations; (iii) For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identify the known and suspected sources within the Copermittee's jurisdiction in the Watershed Management Area that may cause or contribute to the NAL exceedances; (iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b, and utilize a model or other method, to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually. [a] Each Copermittee must calculate or estimate the annual non-storm water volumes and pollutant loads collectively discharged from the Copermittee's major MS4 outfalls to receiving waters within the Copermittee's jurisdiction, with an estimate of the percent contribution from each known source for each MS4 outfall; [b] Each Copermittee must annually identify and quantify (i.e. volume and pollutant loads) sources of non-storm water not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.			X		
	(v) Each Copermittee must review the data collected pursuant to Provision D.2.b and findings from the assessments required pursuant to Provision D.4.b.(1)(c)(i)-(iv) at least once during the term of this Order to: [a] Identify reductions and progress in achieving reductions in non-storm water and illicit discharges to the Copermittee's MS4 in the Watershed Management Area; [b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction, with an estimate, if possible, of the non-storm water volume and/or pollutant load reductions attributable to specific water quality strategies implemented by the Copermittee; and [c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittee in the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction. (vi) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(1)(c)(i)-(v).			X		
D.4.b.(2)(a)	**Storm Water Pollutant Discharge Reduction Assessments** (a) The Copermittees must assess and report the ***progress of the water quality improvement strategies, required to be implemented pursuant to Provisions B and E, toward reducing pollutants in storm water discharges*** from the MS4s within the Watershed Management Area as follows: (ii) Based on the data collected pursuant to Provisions D.2.c, the ***assessments required under <u>Provision D.4.b.(2)(c)</u> must be included in the Water Quality Improvement Plan Annual Reports*** required pursuant to Provision F.3.b.(3).			X		

Table A-1 (continued)

Permit Provision	Permit Language	WQIP Annual Report Section	WQIP Appendix			
			Appendix B Numeric Goals	Appendix C Monitoring	Appendix D Jurisdictional Information	Appendix E Adaptive Management
D.4.b.(2)(b)	(b) Based on the transitional wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.a.(3) the Copermittees must assess and report the following: (i) The Copermittees must analyze the monitoring data collected pursuant to Provision D.2.a.(3), and utilize a watershed model or other method, to calculate or estimate the following for each monitoring year: [a] The average storm water runoff coefficient for each land use type within the Watershed Management Area; [b] The volume of storm water and pollutant loads discharged from each of the Copermittee's monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; [c] The total flow volume and pollutant loadings discharged from the Copermittee's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls; and [d] The percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea with a major MS4 outfall to receiving waters or within each major MS4 outfall to receiving waters in the Copermittee's jurisdiction within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch.(ii) Identify modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify pollutants in storm water discharges from the MS4s in the Watershed Management Area pursuant to Provision D.2.c.(1).			X		
D.4.b.(2)(c)	(c) Based on the wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.c the Copermittees must assess and report the following: (i) The assessments required pursuant to Provision D.4.b.(2)(b); (ii) Based on the data collected and applicable SALs in the Water Quality Improvement Plan, analyze and compare the monitoring data to the analyses and assumptions used to develop the Water Quality Improvement Plans, including strategies developed pursuant to Provision B.3, and evaluate whether those analyses and assumptions should be updated as a component of the adaptive management efforts pursuant to Provision B.5 for follow-up action to update the Water Quality Improvement Plan; (iii) The Copermittees must review the data collected pursuant to Provision D.2.c and findings from the assessments required pursuant to Provisions D.4.b.(2)(c)(i)-(ii) at least once during the term of this Order to: [a] Identify reductions or progress in achieving reductions in pollutant concentrations and/or pollutant loads from different land uses and/or drainage areas discharging from the Copermittees' MS4s in the Watershed Management Area; [b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters within the Watershed Management Area to the MEP, with an estimate, if possible, of the pollutant load reductions attributable to specific water quality strategies implemented by the Copermittees; and [c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittees in the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters in the Watershed Management Area to the MEP. (iv) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(iii).			X		
D.4.c.	**Special Studies Assessments** c. The Copermittees must ***annually evaluate the results and findings from the special studies developed and implemented pursuant to Provision D.3***, and assess their relevance to the Copermittees' efforts to characterize receiving water conditions, understand sources of pollutants and/or stressors, and control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters in the Watershed Management Area. The Copermittees must ***report the results of the special studies assessments applicable to the Watershed Management Area, and identify any necessary modifications or updates to the Water Quality Improvement Plan based on the results in the Water Quality Improvement Plan Annual Reports*** required pursuant to Provision F.3.b.(3).	Section 3.2		X		X
D.4.d.	Integrated Assessment of Water Quality Improvement Plan d. As part of the ***iterative approach and adaptive management process*** required for the Water Quality Improvement Plan pursuant to Provision B.5, the Copermittees in each Watershed Management Area must integrate the data collected pursuant to Provisions D.1-D.3, the findings from the assessments required pursuant to Provisions D.4.a-c, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E to assess the effectiveness of, and identify necessary modifications to, the Water Quality Improvement Plan as follows:	Section 5.2		X		X

D.4.d.(1)	(1) The Copermittees ***must re-evaluate the priority water quality conditions and numeric goals for the Watershed Management Area, as needed, during the term of this Order pursuant to Provision B.5.a.*** The re-evaluation and recommendations for modifications to the priority water quality conditions, and/or numeric goals and corresponding schedules ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. The priority water quality conditions and numeric goals for the Watershed Management Area must be reevaluated as follows: (a) Re-evaluate the receiving water conditions in the Watershed Management Area in accordance with Provision B.2.a; (b) Re-evaluate the impacts on receiving waters in the Watershed Management Area from MS4 discharges in accordance with Provision B.2.b; (c) Re-evaluate the identification of MS4 sources of pollutants and/or stressors in accordance with Provision B.2.d; (d) Identify beneficial uses of the receiving waters that are protected in accordance with Provision D.4.a; (e) Evaluate the progress toward achieving the interim and final numeric goals for protecting impacted beneficial uses in the receiving waters.	Section 5.2		X		X
D.4.d.(2)	(2) The Copermittees ***must re-evaluate the water quality improvement strategies for the Watershed Management Area during the term of this Order pursuant to Provision B.5.b.*** The re-evaluation and recommendations for modifications to the water quality improvement strategies and schedules ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. The water quality improvement strategies for the Watershed Management Area must be re-evaluated as follows: (a) Identify the non-storm water and storm water pollutant loads from the Copermittees' MS4 outfalls in the Watershed Management Area, calculated or estimated pursuant to Provisions D.4.b; (b) Identify the non-storm water and storm water pollutant load reductions, or other improvements to receiving water or water quality conditions, that are necessary to attain the interim and final numeric goals identified in the Water Quality Improvement Plan for protecting beneficial uses in the receiving waters; (c) Identify the non-storm water and storm water pollutant load reductions, or other improvements to the quality of MS4 discharges, that are necessary for the Copermittees to demonstrate that non-storm water and storm water discharges from their MS4s are not causing or contributing to exceedances of receiving water limitations; (d) Evaluate the progress of the water quality improvement strategies toward achieving the interim and final numeric goals identified in the Water Quality Improvement Plan for protecting beneficial uses in the receiving waters.	Section 5.2			X	X
D.4.d.(3)	(3) The Copermittees ***must re-evaluate and adapt the water quality monitoring and assessment program for the Watershed Management Area when new information becomes available to improve the monitoring and assessment program pursuant to Provision B.5.c.*** The re-evaluation and recommendations for modifications to the monitoring and assessment program ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. Modifications to the water quality monitoring and assessment program must be consistent with the requirements of Provision D.1-D.3. The re-evaluation of the water quality monitoring and assessment program for the Watershed Management Area must consider the data gaps identified by the assessments required pursuant to Provisions D.4.a-b, and results of the special studies implemented pursuant to Provision D.4.c	Section 5.2		X		X
Provision E						
E.1.b.	**b.** With the first ***Water Quality Improvement Plan Annual Report*** *required pursuant to Provision F.3.b.(3),* ***each Copermittee must submit a statement certified by its Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative that the Copermittee has taken the necessary steps to obtain and maintain full legal authority*** within its jurisdiction to implement and enforce each of the requirements contained in this Order.	Cert Statement			X	
E.2.d.(4)	(4) Each Copermittee must submit a ***summary of the non-storm water discharges and illicit discharges and connections investigated and eliminated within its jurisdiction with each Water Quality Improvement Plan Annual Report required under Provision F.3.b.(3)*** of this Order.			X		

Table A-1 (continued)
Crosswalk of MS4 Permit Requirements and Annual Report References

Permit Provision	Permit Language	WQIP Annual Report Section	WQIP Appendix			
			Appendix B Numeric Goals	Appendix C Monitoring	Appendix D Jurisdictional Information	Appendix E Adaptive Management
E.8.c.	**c.** Each Copermittee must submit a ***summary of the annual fiscal analysis with each Water Quality Improvement Plan Annual Report required pursuant to Provision F.3.b.(3)***.				X	
Provision F						
F.1.b.(6)	(6) During implementation of the Water Quality Improvement Plan the Copermittees must ***correct any deficiencies in the Plan identified by the San Diego Water Board in the updates submitted with the Water Quality Improvement Plan Annual Report*** following a request by the Board to do so.	Section 5.2				X
F.2.a.(2)	(2) Each Copermittee must update its jurisdictional runoff management program document to incorporate the requirements of Provision E concurrent with the submittal of the Water Quality Improvement Plan. Each Copermittee must ***correct any deficiencies in the jurisdictional runoff management program document based on comments received from the San Diego Water Board in the updates submitted with the Water Quality Improvement Plan Annual Report;***				X	X
F.2.a.(3)	(3) Each Copermittee must submit ***updates to its jurisdictional runoff management program, with the supporting rationale for the modifications, either in the Water Quality Improvement Plan Annual Report*** required pursuant to Provision F.3.b.(3), or as part of the Report of Waste Discharge required pursuant to Provision F.5.b	Section 5			X	X
F.2.b.(1)	(1) Each Copermittee must update its BMP Design Manual to incorporate the requirements of Provisions E.3.a-d concurrent with the submittal of the Water Quality Improvement Plan. Each Copermittee must ***correct any deficiencies in the BMP Design Manual based on comments received from the San Diego Water Board in the updates submitted with the Water Quality Improvement Plan Annual Report;***	Section 5.2			X	
F.2.b.(2)	(2) Any ***future updates to the BMP Design Manual*** made after it update pursuant to Provision F.2.b.(1) is completed must be consistent with the requirements of Provisions E.3.a-d and ***must be submitted as part of the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b; and				X	
F.2.c.(1)(c)	(c) The Copermittees for each Watershed Management Area ***must submit 1) proposed updates to the Water Quality Improvement Plan and supporting rationale, and 2) recommendations received from the public and the Water Quality Improvement Consultation Panel and the rationale for the requested updates, either in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b.	Section 5.2				X
F.3.b.(3)(a-f)	(3) Water Quality Improvement Plan Annual Reports - The Copermittees for each Watershed Management Area must ***submit a Water Quality Improvement Plan Annual Report for each reporting period no later than January 31*** of the following year. The annual reporting period consists of two different periods: 1) July 1 to June 30 of the following year for the jurisdictional runoff management programs, 2) October 1 to September 30 of the following year for the monitoring and assessment programs. The Water Quality Improvement Plan Annual Reports must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Each ***Annual Report must include the following***:	See below				
	(a) The receiving water and MS4 outfall discharge monitoring data collected pursuant to Provisions D.1 and D.2, summarized and presented in tabular and graphical form;	Section 3.2		X		
	(b) The progress of the special studies required pursuant to Provision D.3, and the findings, interpretations and conclusions of a special study, or each phase of a special study, upon its completion;	Section 3.2		X		
	(c) The findings, interpretations and conclusions from the assessments required pursuant to Provision D.4;			X		
	(d) The progress of implementing the Water Quality Improvement Plan, including, but not limited to, the following: (i) The **progress toward achieving the interim and final numeric goals** for the highest water quality priorities for the Watershed Management Area;	Section 4.3

Appendix B: Water Quality Improvement Plan Numeric Goals

Intentionally Left Blank

The following sections present final and interim numeric goals by jurisdiction.

B.1 City of Del Mar Goals

Del Mar's Water Quality Improvement Plan interim and final goals for wet and dry weather are presented in Tables B-1 and B-2, respectively.

Intentionally Left Blank

Table B-1
Wet Weather Numeric Goals for the City of Del Mar

Compliance Pathways		Baseline	Goals by Assessment Period and Fiscal Year				
			Current Permit Term (FY14—FY18)	FY 16–20	FY 21–25	FY 26–30	FY 31–36
			FY18	FY19	FY24[1]	FY29	FY31[1]
Receiving Water % Days Exceeding WQO	Fecal coliform	43% Days Exceeding WQO (2002 TMDL Model)	See performance measures.	43%[2]	33%	25%	22%
	Enterococcus	49% Days Exceeding WQO (2002 TMDL Model)		49%[2]	36%	26%	22%
	Total coliform	43% Days Exceeding WQO (2002 TMDL Model)		43%[2]	33%	25%	22%
Or							
MS4 Discharges % Days Exceeding WQO	Fecal coliform	**New:** 98%[3]	See performance measures.	22%	22%	22%	22%
	Enterococcus	**New:** 100%[3]		22%	22%	22%	22%
	Total coliform	**New:** 100%[3]		22%	22%	22%	22%
Or							
MS4 Discharges % Load Reduction	Fecal coliform	0% Load Reduction (2002 TMDL Model)	See performance measures.	0.5%	0.7%	1.0%	1.5%
	Enterococcus			2.5%	3.9%	6.0%	7.7%
	Total coliform			1.2%	2.2%	3.2%	4.3%

Table B-1 (continued)
Wet Weather Numeric Goals for the City of Del Mar

Compliance Pathways		Baseline	Goals by Assessment Period and Fiscal Year: Current Permit Term (FY14—FY18) FY18	FY 16–20 FY19	FY 21–25 FY24[1]	FY 26–30 FY29	FY 31–36 FY31[1]
Or							
# of Direct or Indirect MS4 Discharges to Receiving Water	Discharges	**New:** 1 discharge[4]	See performance measures.	0	0	0	0
Or							
% of Exceedances of Final Receiving Water WQOs Due to Natural Sources[5]	Fecal coliform	Unknown at this time. A detailed source study that differentiates between human and non-human sources would be needed to establish the baseline.	100%	100%	100%	100%	100%
	Enterococcus		100%	100%	100%	100%	100%
	Total coliform		100%	100%	100%	100%	100%
Or							
MS4 Discharges Implement Accepted Water Quality Improvement Plan		Metric for compliance analysis is MS4 discharge % load reduction (above). Interim compliance is implementation of strategies and schedule (presented in WQIP Appendix I) based on analysis results. Final compliance is implementation of BMPs based on analysis results and demonstration of compliance with any of the compliance pathways through monitoring and assessment. See WQIP Section 4.3.2 for compliance analysis results.					

Table B-1 (continued)
Wet Weather Numeric Goals for the City of Del Mar

Compliance Pathways	Baseline	Goals by Assessment Period and Fiscal Year Current Permit Term (FY14—FY18)
Performance Measures		
Suite of Strategies To Measure Performance During First Permit Term	**Baseline**	**FY18**
Reduce anthropogenic surface dry weather flows[6] to address bacteria regrowth contributing during wet weather	**New:** Average Dry Weather Flow: 0.81 gallons per minute Maximum Dry Weather Flow: 1.5 gallons per minute	10% reduction in anthropogenic surface dry weather flows[6] that originate within the City's jurisdictional boundaries

1. Denotes TMDL interim and final target.
2. Denotes existing wet weather frequency as modeled in the Bacteria TMDL. With limited baseline monitoring data available, this goal reflects a reasonable estimate considering the difficulty in demonstrating progress within the receiving water during wet weather in a short amount of time. Furthermore, development and redevelopment of the urban environment has occurred since the Bacteria TMDL baseline loads were calculated in 2001. As such, this goal demonstrates that progress has been made by the Responsible Agencies by maintaining the existing wet weather exceedance frequency.
3. Wet weather baseline exceedance rate calculated using targeted and random MS4 wet weather monitoring data from October 1, 2008 through September 30, 2013. Monitoring data were assessed similar to the method outlined in Attachment E.6 of the 2013 MS4 Permit for each monitoring year. The observed wet weather days in exceedance were summed and divided by the total wet weather days in exceedance for the historical 5-year period.
4. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring.
5. Demonstration of exceedances due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. The term "dry weather flows" excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.

% = percent; FY = fiscal year; WQO = water quality objective

All numeric goals are cumulative from the baseline assessment for each fiscal year.

Intentionally Left Blank

Table B-2 (continued)
Dry Weather Numeric Goals for the City of Del Mar

Compliance Pathways	Baseline	Goals by Assessment Period and Fiscal Year
		Current Permit Term (FY14–FY18)
Performance Measures		
Suite of Strategies To Measure Performance During First Permit Term	**Baseline**	**FY18**
Reduce anthropogenic surface dry weather flows[6]	**New:** Average Dry Weather Flow: 0.81 gallons per minute Maximum Dry Weather Flow: 1.5 gallons per minute	Reduce anthropogenic surface dry weather water flows[6] that originate within the City's jurisdictional boundaries by 10%

1. Denotes TMDL interim and final target.
2. The existing exceedance frequency was calculated on the basis of available monitoring data between 1996 and 2002 per MS4 Permit requirements and presented in more detail in Appendix H.
3. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008 through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the 5th sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of dry weather days in exceedance for the historical 5-year period.
4. Discharges are defined as observed dry weather flows from persistently flowing MS4 outfalls.
5. Demonstration of exceedances of final receiving water limitations due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. The term "dry weather flows" excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.

% = percent; FY = fiscal year; WQO = water quality objective

All numeric goals are cumulative from the baseline assessment for each fiscal year.

% of Exceedances of Final Receiving Water WQOs Due to Natural Sources[5]	Fecal coliform	Unknown at this time. A detailed source study that differentiates between human and non-human sources would be needed to establish the baseline.	100%	100%	100%	100%	100%
	Enterococcus		100%	100%	100%	100%	100%
	Total coliform		100%	100%	100%	100%	100%

Table B-7 (continued)
Wet Weather Numeric Goals for the City of San Diego

Compliance Pathways	Baseline	Goals by Assessment Period and Fiscal Year Current Permit Term (FY14–FY18)
Performance Measures		
Suite of Strategies To Measure Performance During First Permit Term	**Baseline**	**FY18**
Develop a green infrastructure policy, attain City Council approval, and construct green infrastructure BMPs to improve water quality during wet and dry weather	0 acres treated in 2002, the year used as baseline in the Bacteria TMDL	10.6 acres of drainage area treated through construction of 2 green infrastructure BMPs[6]

1. Denotes TMDL interim and final target.
2. Denotes existing wet weather frequency as modeled in the Bacteria TMDL. With limited baseline monitoring data available, this goal reflects a reasonable estimate considering the difficulty in demonstrating progress within the receiving water during wet weather in a short amount of time. Furthermore, development and redevelopment of the urban environment has occurred since the Bacteria TMDL baseline loads were calculated in 2001. As such, this goal demonstrates that progress has been made by the Responsible Agencies by maintaining the existing wet weather exceedance frequency.
3. Wet weather baseline exceedance rate calculated using targeted and random MS4 wet weather monitoring data from October 1, 2008 through September 30, 2013. Monitoring data were assessed similar to the method outlined in Attachment E.6 of the 2013 MS4 Permit for each monitoring year. The observed wet weather days in exceedance were summed and divided by the total wet weather days in exceedance for the historical 5-year period
4. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring.
5. Demonstration of exceedances of final receiving water limitations due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. The 10.6 acres of drainage area treated are associated with 2 green infrastructure projects that will be completed by FY18.

% = percent; FY = fiscal year; WQO = water quality objective

All numeric goals are cumulative from the baseline assessment for each fiscal year.

Intentionally Left Blank

Wet Weather Numeric Goals for the City of San Diego

Compliance Pathways	Baseline	Goals by Assessment Period and Fiscal Year Current Permit Term (FY14–FY18)
Performance Measures (Applicable Below and Above Lake Hodges)		
Suite of Strategies To Measure Performance During First Permit Term	**Baseline**	**FY18**
Develop a green infrastructure policy, attain City Council approval, and construct green infrastructure BMPs to improve water quality during wet and dry weather	0 acres treated in 2002, the year used as baseline in the Bacteria TMDL	10.6 acres of drainage area treated through construction of 2 green infrastructure BMPs[6]
Implement runoff reduction programs such as education and outreach, enhanced inspections, rebates[7], and increased enforcement	**New:** Average Dry Weather Flow[8]: 38.6 gallons per minute Maximum Dry Weather Flow[8]: 224.4 gallons per minute	10% reduction in prohibited[9] dry weather flow from baseline measured at persistently flowing outfalls in the WMA

Table B-8 (continued)
Wet Weather Numeric Goals for the City of San Diego

1. Denotes TMDL interim and target.
2. The existing exceedance frequency was calculated on the basis of available monitoring data between 1996 and 2002 per MS4 Permit requirements and presented in more detail in Appendix H.
3. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008 through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the 5th sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of dry weather days in exceedance for the historical 5-year period.
4. Discharges are defined as observed dry weather flows from persistently flowing MS4 outfalls.
5. Demonstration of exceedances of final receiving water limitations due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. The 10.6 acres of drainage area treated are associated with 2 green infrastructure projects that will be completed by FY18.
7. City of San Diego rebates include grass replacement, rainwater harvesting, downspout disconnect, and micro-irrigation.
8. Dry weather flow baseline calculations were based on Targeted Dry Weather Flow Outfall Monitoring data from 2009 to 2012. Data are only from outfalls with "persistent flow," defined as: “the presence of flowing, pooled, or ponded water more than 72 hours after a measureable rainfall event of 0.1 inch or greater during three consecutive monitoring and/or inspection events. All other flowing, pooled, or ponded water is considered transient.” Persistently flowing annual averages were computed, and an overall average was computed using all data points in this time period and used for comparison. Note, reported flow values of 0 were present and included in the calculations.
9. Does not include allowable discharges as defined in Provision A and Provision E.2.a of the MS4 Permit.

% = percent; FY = fiscal year; WQO = water quality objective

All numeric goals are cumulative from the baseline assessment for each fiscal year.

B.5 City of Solana Beach Goals

City of Solana Beach's Water Quality Improvement Plan interim and final goals for wet and dry weather are presented in Tables B-9 and B-10, respectively.

Eliminate anthropogenic dry weather flows[6] from storm drain outfalls either by aggregate flow volume or the number of persistently flowing outfalls during dry weather	10 of 20 major MS4 outfalls have persistent dry weather flows; average flow rate as measured with continuous flow monitoring equipment = 8.614 gallons per minute	Reduce by 20%	Reduce by 75%	Reduce by 100% anthropogenic dry weather discharges from storm drain outfalls to the receiving water or meet the WQOs in the storm drain discharge.

1. Denotes TMDL interim and final target. Request moving Interim TMDL Compliance Date from April 4, 2016 (per MS4 Permit Attachment E, 6.c(1)) to April 4, 2020, to allow adequate time to investigate and mitigate dry weather flows through the adaptive management process of the Water Quality Improvement Plan.
2. The existing exceedance frequency was calculated on the basis of available monitoring data between 1996 and 2002 per MS4 Permit requirements and presented in more detail in Appendix H.
3. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008 through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the 5th sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of dry weather days in exceedance for the historical 5-year period.
4. Discharges are defined as observed dry weather flows from persistently flowing MS4 outfalls.
5. Demonstration of exceedances of final receiving water limitations due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. Here and throughout this table, the term "dry weather flows" excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.

% = percent; FY = fiscal year; WQO = water quality objective
All numeric goals are cumulative from the baseline assessment for each fiscal year.

1 Monitoring and Assessment Program

The Monitoring and Assessment Program (MAP) for the San Dieguito River Watershed Management Area (WMA) is Section 5 of the Water Quality Improvement Plan (WQIP). The MAP incorporates requirements of Provision B and Provision D of the Municipal Separate Storm Sewer System (MS4) Permit (San Diego Regional Water Quality Control Board, 2013) along with the specific monitoring and assessment requirements for the Bacteria Total Maximum Daily Load (TMDL) in Attachment E of the MS4 Permit.

The Monitoring Program includes three major components: (1) the receiving water monitoring program that measures the long-term health of the watershed; (2) the MS4 outfall monitoring program that documents non-storm water flows and measures outfall water quality at selected sites during dry and wet conditions; and (3) special studies that further investigate the highest priority water quality conditions (HPWQCs). Table 1-1 provides an overview of the monitoring that is planned as part of the San Dieguito River WMA MAP and Figure 1-1 shows the locations for the 2015–2016 monitoring year.

This appendix summarizes monitoring data collected during the 2015–2016 monitoring year (October 1, 2015, and September 30, 2016), and data that were not summarized in the 2013–2014 and 2014–2015 Transitional Monitoring and Assessment Program Reports for the San Dieguito River WMA. Data include both receiving water and MS4 outfall monitoring data. Monitoring methodologies were summarized in Section 5 of the San Dieguito River WMA WQIP and were specified in the associated component Monitoring Plans (Project Clean Water, 2016). These documents provide detailed information regarding monitoring locations, monitoring techniques, constituents sampled, and quality assurance/quality control (QA/QC) requirements.

The Assessment Program for the 2015–2016 monitoring year includes only an annual analysis of the monitoring data collected for the 2015–2016 monitoring year. This appendix describes the MS4 Outfall Discharge Assessments (Provision D.4.b), which evaluate both the dry weather data associated with the illicit discharge detection and elimination (IDDE) program collected as part of the Jurisdictional Runoff Management Program (JRMP) program, along with the dry and wet weather MS4 monitoring data collected by the Responsible Agencies. The results of the special studies are also assessed in this appendix. The Receiving Water Assessment (Provision D.4.a) and the Integrated Assessments (D.4.b), as well as assessments of wet weather MS4 outfall discharge temporal trends, will be summarized in the Regional Monitoring and Assessment Report to be submitted with the Report of Waste Discharge in December 2017.

AB 411 = California Assembly Bill 411; BMI = benthic macroinvertebrates; FIB = fecal indicator bacteria; GIS = geographic information system; HMP = Hydromodification Monitoring Program; IC/ID = illicit connection and/or illicit discharge; ID = identification; MS4 = Municipal Separate Storm Sewer System; NA = not applicable; SMC = Southern California Storm water Monitoring Coalition; TBD = to be determined; TIE = toxicity identification evaluation; TMDL = Total Maximum Daily Load; TRE = toxicity reduction evaluation; WMA = Watershed Management Area

The highlighted cells represent the monitoring that occurred during the October 2015 to September 2016 monitoring year.

1. The MS4 Permit was adopted on May 8, 2013; the MS4 Permit became effective on June 27, 2013. Note that implementation of the programs began when the WQIP was approved in September 2015.
2. Definition of conventionals (conventional parameters) is based on Storm Water Management Plan (SWMP) guidelines.
3. Completed under the Transitional Monitoring Program in accordance with MS4 Permit Provisions D.1.a and D.2.a.
4. The 2018 Southern California Bight Regional Monitoring will occur during the summer of 2018 or 2019.
5. The AB 411 program is not required by the MS4 Permit. Responsible Agencies are using the data to track beach water quality conditions related to the highest priority water quality condition for the WMA.
6. Sediment Quality Monitoring was completed under the 2013 Southern California Bight Regional Monitoring Program.
7. Completed under the Transitional Monitoring Program according to MS4 Permit Provisions D.1.a and D.2.a.
8. Dry weather monitoring at reference streams was completed in spring 2014. Dry weather monitoring at reference beaches began in fall 2014.

1.1 2015–2016 Regional Rainfall Summary

Precipitation during the 2015–2016 monitoring year measured at the National Weather Service Lindbergh Field station (GHCND:USW00023188) was compared with average precipitation from 1939–2015. The 2015–2016 observed total of 8.18 inches was slightly less than the average annual total of 9.90 inches. Greater than average rainfall amounts were observed in November 2015, January 2016, May 2016, and September 2016. All other months saw less than average rainfall amounts, including February 2016, which saw much less than the average February (0.05 inch vs. 1.8 inches). Figure 1-2 shows the October 2015 through September 2016 monthly rainfall measured at Lindbergh Field, compared with the average monthly and annual rainfall.

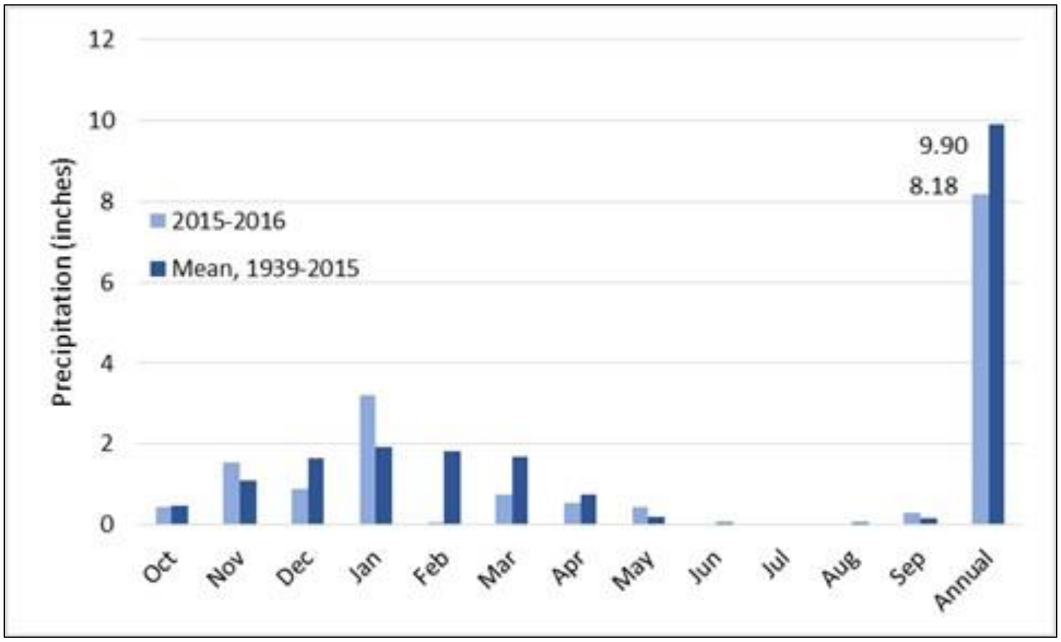

Figure 1-2
2015–2016 Monthly Rainfall vs. Average Monthly Rainfall (Lindbergh Field)

Eighty-four County of San Diego (County) ALERT rain gauges were used to measure rainfall throughout the region during the monitoring year (October 2015 through September 2016). Because the Transitional Monitoring Annual Reports presented rainfall data based on a July through June monitoring year, the July 2015 through September 2015 measured rainfall is also presented to fill the gap between the end of reporting under the transitional program and the beginning of reporting under the WQIP. Going forward, WQIP Annual Reports will present data based on the October through September monitoring year.

July 2015 through September 2015 regional rainfall totals ranged from less than 0.25 inch in the inland deserts to over 5 inches in the mountains. Totals at the coast ranged from approximately 1 inch near the international border with Mexico to over 3 inches in the Mission Bay area. Rainfall in the San Dieguito River WMA ranged from 1.73 inches at the Sutherland Reservoir ALERT station to 5.10 inches at the Ramona ALERT station. Figure 1-3 presents regional rainfall totals from July 2015 through September 2015.

October 2015 through September 2016 regional rainfall totals ranged from less than 1 inch in the inland deserts to over 30 inches in the mountains. Totals at the coast ranged from approximately 7 inches near the international border with Mexico to approximately 12 inches in the northern section of the county. Rainfall in the San Dieguito River WMA ranged from 12.05 inches at the Rancho Bernardo ALERT station to 18.17 inches at the Witch Creek ALERT station. Figure 1-4 presents regional rainfall totals from October 2015 through September 2016.

1.2 Monitoring Results and Assessments Appendix Organization

This appendix includes the monitoring results and assessments for the San Dieguito River WMA WQIP Annual Report and is organized as follows:

Section 1, Monitoring and Assessment Program—This section provides an overview of the MAP, the monitoring performed during the October 2015 through September 2016 monitoring year, annual rainfall summary, and the assessments included in this appendix.

Section 2, Receiving Water Data Summary—This section describes the monitoring data collected as part of the Receiving Water Monitoring program. Data from various sources were compiled and summarized. Some data were collected during the October 2015 through September 2016 monitoring year, while other data were collected previously but not included in the San Dieguito River WMA Transitional Monitoring Assessment Report submitted in January 2016.

Section 3, Dry Weather Outfall Assessments and Illicit Discharges—This section summarizes the dry weather MS4 Outfall Discharge Assessments (MS4 Permit Provision B.4.b). It includes a comparison with non-storm water action levels (NALs) and assessments required by the MS4 Permit.

Section 4, Wet Weather Outfall Assessments—This section summarizes the wet weather MS4 Outfall Discharge Assessments (MS4 Permit Provision B.4.b). It includes a comparison with storm water action levels (SALs) and assessments required by the MS4 Permit.

Section 5, Special Study Assessments—This section provides an overview of the three special studies completed or in progress in the San Dieguito River WMA, including the San Diego Regional Reference Streams and Beaches Studies, the San Dieguito River WMA Bacteria Source Identification and Prioritization Process Special Study, and the Proposed Nutrient Load Characterization for Lake Hodges Study.

Section 6, California Environmental Data Exchange Network (***CEDEN) Certification Statement Summary***—This section provides a summary of the CEDEN data submittal certifications for the October 2015 through September 2016 monitoring year.

Intentionally Left Blank

2 Receiving Water Monitoring Data Summary

Section 2 of the Monitoring Results and Assessments Appendix highlights receiving water data collected as part of the San Dieguito River WMA MAP. Because this is the first Annual Report to be submitted under the San Dieguito River WMA WQIP, data collected since the acceptance of the MS4 Permit in 2013 will be (1) referenced if they have been previously submitted to the Regional Board, (2) summarized if sampling was conducted prior to the October 2015 through September 2016 monitoring year and the data have not been previously submitted to the Regional Board, or (3) summarized in graphical and tabular form as part of this Monitoring Results and Assessments Appendix. As discussed in Section 1, the MS4 Permit Provision D.4.a.(b) requires Receiving Water Assessments to be completed as part of the Report of Waste Discharge in December 2017. The data presented in this appendix will be used to complete those assessments as well as the Integrated Assessment detailed in the MAP.

2.1 Long-Term Receiving Water and Sediment Quality Monitoring Data

The Transitional Receiving Water Monitoring Program completed during the October 2014 through September 2015 monitoring year fulfilled a number of the requirements for long-term monitoring outlined in the MAP. The results of this monitoring were presented in the Transitional Monitoring and Assessment Program Report for the San Dieguito River WMA (2014–2015) (San Diego County Municipal Copermittees, 2016). Results presented included water quality monitoring during dry and wet weather, trash assessments, hydromodification monitoring, and bioassessment at the long-term monitoring stations (LTMS).

As stated in the San Dieguito River WMA WQIP, the Southern California Bight 2013 Regional Monitoring Survey (Bight ’13) Monitoring Program satisfied the initial monitoring requirements of the state's Sediment Control Plan. Up to three sites were monitored in the San Dieguito Lagoon in 2013 for the initial screening of sediment quality. Follow-up monitoring was conducted in summer 2014 to further characterize one site that was possibly impacted. Based on the monitoring and assessment completed, sediment conditions in San Dieguito Lagoon are generally protective of the beneficial uses and are typical of a tidally influenced shallow lagoon (San Diego County Municipal Copermittees, 2014). The Sediment Monitoring Report was provided in the 2015 Transitional Monitoring and Assessment Report in accordance with the MS4 Permit reporting requirements.

2.2 Bight ’13 Regional Monitoring Data

Sediment quality monitoring was conducted during summer 2013 at 22 sites in nine estuaries and lagoons in the San Diego region under Bight ’13 (San Dieguito Responsible Agencies, 2015a). The sediment quality monitoring included sediment chemistry and toxicity. Bight ’13 was used to fulfill the initial monitoring requirements for the Sediment Quality Monitoring requirement of the MS4 Permit that is summarized in Section 2.1.

2.3 Southern California Storm Water Monitoring Coalition (SMC) Monitoring Data

The SMC was formed in 2001 by cooperative agreement of the Phase I municipal storm water National Pollutant Discharge Elimination System (NPDES) lead permittees, the NPDES regulatory agencies in southern California, and the Southern California Coastal Water Research Project (SCCWRP). The purpose of the SMC was to develop the technical information necessary to better understand storm water mechanisms and impacts, and then develop the tools that will effectively and efficiently improve storm water decision making. One area of interest for the SMC was in developing a regional coordinated bioassessment monitoring program for wadeable streams that brought together the various disparate bioassessment programs being performed in southern California. Up until this point, efforts were minimally coordinated and provided only limited information about the health of streams in the region as a result of an emphasis on end-of-watershed monitoring.

To attain a more holistic understanding of the biological health region's watersheds, the SMC initiated a regional bioassessment monitoring program in 2009 using multiple indicators of ecological health, including benthic macroinvertebrates, benthic algae, riparian wetland condition, water chemistry, water column toxicity, and physical habitat.

The SMC bioassessment monitoring program was designed to address three main questions:

1. What is the biological condition of perennial streams in the region?
2. What stressors are associated with poor condition?
3. Are conditions changing over time?

Participation in regional monitoring programs as required under Provision D.1.e.(1) of the MS4 Permit was accomplished through reallocation of permit-required monitoring efforts, and allowed the SMC to develop a cooperative sampling program that was efficient and cost-effective for participants.

Many participants are currently involved in the SMC program:

- County of Los Angeles Department of Public Works
- County of Orange Public Works
- County of San Diego Copermittees
- Riverside County Flood Control and Water Conservation District
- San Bernardino County Flood Control District
- Ventura County Watershed Protection District
- San Gabriel River Regional Monitoring Program
- California Department of Fish and Wildlife
- California Regional Water Quality Control Board, Santa Ana Region

- California Regional Water Quality Control Board, Los Angeles Region
- California Regional Water Quality Control Board, San Diego Region
- State Water Resources Control Board

2.3.1 Stream Bioassessment Methods

Three monitoring reaches were assessed for the SMC Regional Monitoring Program in the San Dieguito River WMA in the 2015–2016 monitoring year (Table 2-1). They include two SMC "Condition" sites identified as 905M21725 in the main stem of the San Dieguito River and 905M21737 in Lusardi Creek, a tributary to the San Dieguito River. Condition sites are those that are randomly selected from the SMC sample draw list each year and are sampled only once during the current five year cycle (2015–2019) to discern an overall condition estimate of the health of streams in the region. The third SMC site, identified as 905PS0026 in upper Santa Ysabel Creek, was considered a "Trend" site and had been previously sampled during the preceding five-year SMC cycle (2009–2013), as well as in 2015. Trend sites are those that have been randomly selected from the preceding five-year SMC cycle (2009–2013) list, and are being sampled each year of the current five year cycle (2015–2019) to evaluate any overall trends in the health of streams in the region. Data from these sites will also be submitted to the SMC program and will be analyzed within the context of the South Coast Region of California.

Table 2-1
San Dieguito River WMA Storm water Monitoring Coalition Regional Monitoring Program Bioassessment Sites for 2015–2016

SMC Region (WMA)	Stream: Location	Site Type	Station Code[1]	Date Sampled	Latitude/ Longitude
Central San Diego (San Dieguito)	Santa Ysabel Creek: In Pamo Valley	Trend (Open)	905PS0026	May 5, 2016	33.10706/ -116.86739
	San Dieguito River: Near the end of Artesian Road	Condition	905M21725	May 17, 2016	33.01796/ -117.17811
	Lusardi Creek: Downstream of Camino del Sur	Condition	905M21737	May 17, 2016	33.00405/ -117.15264

1. Locations can also be found on Figure 1-1.
SMC = Southern California Storm Water Monitoring Coalition; WMA = Watershed Management Area

All bioassessments were performed between May 5 and May 17, 2016, during the appropriate index period for the SMC (May 1 through July 30). Biological condition and physical habitat quality were assessed in the field using the bioassessment protocol adopted by the Surface Water Ambient Monitoring Program (SWAMP) of the California State Water Resources Control Board (SWRCB): *Standard Operating Procedures for the Collection of Field Data for Bioassessments of California Wadeable Streams: Benthic Macroinvertebrates, Algae, and Physical Habitat* (Ode, et al., 2016) and the SMC 2015–2019 Work Plan (Mazor, 2015a). The California Rapid Assessment Method (CRAM) scoring followed procedures outlined in *California Rapid Assessment Method for Wetlands, Riverine Wetlands Field Book* (CRAM, 2013).

2.3.1.1 Benthic Community Sampling and Analysis

The sampling team delineated a 150-meter stream “reach” from which samples were collected. The sampling reach was divided into 11 main transects (A, B, C…K) spaced at 15-meter intervals. Transects were established perpendicular to the direction of stream flow (labeled A through K from downstream to upstream), and marked with flags along the stream bank. Inter-transects were established between the 11 main transects (AB, BC, CD…JK), equidistant from the adjacent down and upstream transects and also flagged along the stream bank. Beginning at the downstream end of the sampling reach and progressing upstream, macroinvertebrate and algae samples were collected at each main transect.

Benthic biological community data analysis followed standardized assessment tools adopted by SWAMP. Benthic macroinvertebrates (BMI) were identified according to Southwest Association of Freshwater Invertebrate Taxonomists (SAFIT) Level 2 requirements. These data were then analyzed to produce various biological metrics and two different multi-metric indices (MMI) of overall BMI health: (1) Southern California Index of Biotic Integrity (IBI) (Ode et al., 2005), and (2) the California Stream Condition Index (CSCI) (Mazor et al., 2015c).

The recently developed CSCI is included in this appendix to provide a comparative assessment of the BMI communities of the monitoring stations. The CSCI combines two indices of biological condition: (1) a predictive multi-metric index of biotic integrity (pMMI), and (2) a ratio of observed taxa at a site to the expected taxa at a site (O/E); it is calculated as a mean of individual pMMI and O/E scores. This combination improves the accuracy over using the two individually, because both have limitations when assessing unusual BMI assemblages or sites with unique natural conditions.

2.3.1.2 Physical Habitat Data Collection

Measurements of physical habitat characteristics were performed to document local conditions that may affect the stream environment. At each main transect, three measurements of stream size are collected, including wetted width, bankfull width, and bankfull height (each to the nearest centimeter). Wetted width is defined as the width of streambed that is inundated with water at the time of sampling, while bankfull width is defined as the distance between the apparent limits of the stream banks under normal 1- to 2-year storm-flow conditions. Bankfull height is measured from the water level to the height of the bank at bankfull dimensions.

Once these stream size measurements were collected, particle size was recorded at five points along each transect and inter-transect. A measure of overhead canopy cover was taken from the center of each main transect with a handheld densiometer. Riparian vegetation on each bank, human influence, and instream habitat complexity were all recorded using a categorical scoring system.

Following physical habitat observations at each transect, a series of reach-wide characteristics were recorded, including stream sinuosity, gradient, and flow. Sinuosity is a measure of how much a stream meanders, and is expressed as the ratio of actual channel length to straight line reach length. Stream gradient (i.e., slope) was determined across the sampling reach with a hand level and stadia rod using standard surveying practices.

The final habitat characterization task included scoring each station for three parameters: epifaunal cover, sediment deposition, and channel alteration. Stations were scored from 0 to 20 for each of these parameters, with 0 indicating poor conditions and 20 indicating optimal conditions.

2.3.1.3 Water Quality Sample Collection

Prior to entering the stream, the field team collected both water quality (i.e., pH, dissolved oxygen, specific conductivity, temperature, and turbidity) and analytical chemistry samples at the downstream end of the sampling reach. Water quality was assessed using YSI® handheld field meters that had been precalibrated prior to use in the field.

Analytical samples were collected in precleaned bottles provided by the analytical laboratory. When the analytical methods did not require a chemical preservative, the sample bottle was used directly to collect the sample. If the analytical method required preservation, a precleaned bottle was used as a secondary container to collect the sample, which was then transferred to the laboratory-provided analytical container.

Manual grab samples were collected by inserting the precleaned bottle upsidedown into the channel and then inverting at the approximate midway point in the water column with the container opening facing upstream.

2.3.1.4 CRAM Wetland Condition Data Collection

CRAM analysis requires evaluation of the assessment reach in terms of four attributes: buffer and landscape context, hydrology, physical structure, and biotic structure. Each of these attributes is further described as follows:

- Buffer and landscape context – Assesses a riverine system in terms of the continuity of the buffer within 500 meters upstream and downstream and the quality of the buffer immediately surrounding the assessment reach. This attribute measures the ability of wildlife to enter the riparian corridor buffer and easily move within it along the wetland area within 500 meters of the assessment reach. Buffer is defined as an area in a natural or seminatural state that is not currently dedicated to anthropogenic uses that would detract from its ability to protect the assessment reach from stress or disturbance.

- ❖ Hydrology – Assesses the water source and quality, as well as the channel stability and its connection to the surrounding flood plain.
- ❖ Physical structure – Assesses the availability of various habitat patch types and topographical complexity of the channel that indicate the capacity of the riverine system to support characteristic flora and fauna.
- ❖ Biotic structure – Assesses horizontal and vertical plant structure, which measures the number of distinct plant zones in plan-view and the amount of vertical overlap of plant canopy layers. In addition, the species dominance and composition of the plant community within the assessment reach are assessed.

While an overall CRAM numerical score is produced, there is no official threshold or categorical condition rating system for wetland health (i.e., high, medium, low wetland health) based on the overall CRAM score. However, the overall CRAM score can be compared with the distribution of scores from the regional or statewide dataset of ambient surveys for the specific type of wetland being assessed (i.e., riverine nonconfined in this case). The overall condition of a specific wetland can therefore be assessed within the context of a regional distribution as a percentile of such scores collected during similar ambient surveys.

2.3.2 Stream Bioassessment Results

Table 2-2 summarizes IBI and CSCI index scores for the benthic community health and riverine wetland condition scores (i.e., CRAM). More detailed results and additional information on the IBI, CSCI, and CRAM are presented in Attachment A. Tables 2-3 and 2-4 summarize physical habitat and analytical chemistry results, respectively.

Table 2-2
Summary of San Dieguito River WMA Bioassessment Monitoring Site Index Scores, 2016

Stream Name	Station Code	IBI Score	IBI Condition Category	CSCI Score	CSCI Condition Category	Overall CRAM Score	CRAM Score Percentile[1]

Santa Ysabel Creek in Pamo Valley (905PS0026)

Santa Ysabel Creek (905PS0026) had an IBI score of 44 (Fair) and a CSCI score of 0.75 (Likely Altered). The IBI rating indicated an unimpaired BMI community (an IBI score of less than or equal to [≤] 39 is considered impaired), while the CSCI score indicated slightly lower quality biotic conditions (a CSCI score of less than [<] 0.79 is considered impaired). Individual metrics of the BMI community were variable, with some aspects of the community indicating high quality conditions (e.g., a high diversity of beetles) while others did not (e.g., a high percent of tolerant taxa and a low number of Ephemeroptera, Plecoptera, and Trichoptera EPT) taxa). The site did support some sensitive BMI, albeit in low abundance.

Figure 2-1
Santa Ysabel Creek (905PS0026) Transect F Looking Downstream

The riverine wetland condition of Santa Ysabel Creek, shown in Figure 2-1, was of good quality according to the CRAM analysis, with an overall CRAM score of 86 of a possible 100 points. Every CRAM attribute metric scored an A or B, the two highest rating categories. The CRAM score at Santa Ysabel Creek fell into the 85th percentile of the ambient survey distribution within the County, indicating that this site scored better than 85 percent of all nonconfined riverine sites that have been assessed within the County during ambient monitoring surveys.

Stream flow at the time of sampling was low and some short segments of the monitoring reach were dry. The streambed and riparian corridor were mostly undisturbed, with some evidence of cattle grazing upstream of the monitoring reach and an unpaved forest service road approximately 50 meters south of the streambed. The banks were predicted to be stable under normal stormflows, but some areas would be vulnerable to erosion under high flows. The vegetation was dominated by native species, with good coverage in all vegetative layers, and a reach-wide overhead canopy cover of 62 percent (%).

Macroalgal and aquatic macrophyte coverage were moderate, with a substantial amount of coarse particulate organic matter (CPOM) (a food source for BMI) in the streambed. The substrate was dominated by sand (66%) and cobble (18%). Flow habitats primarily consisted of glides (shallow, slow) and pools (deep, slow).

The results of the physical water quality and analytical chemistry are presented in Table 2-8. None of the measured parameters were at levels that would limit BMI colonization, with the possible exception of dissolved oxygen (DO), which had a value of 3.6 milligrams per liter (mg/L). Specific conductance was slightly elevated relative to most reference streams, with a value of 1,370 micro-Siemens per centimeter (µS/cm).

San Dieguito River at Artesian Road (905M21725)

The San Dieguito River site had IBI and CSCI scores that indicated a degraded BMI community. The site had an IBI score of 13 (Very Poor) and a CSCI score of 0.62 (Very Likely Altered). All metrics of the BMI community consistently indicated poor biotic integrity. The community was dominated by Dipteran taxa (true flies), which composed 67% of the taxa; a single EPT taxon was collected (*Baetis adonis*) and no beetles. There were no sensitive BMI collected, although many taxa had moderate tolerance values (TV = 4-6) which indicated that the site was likely not exposed to severe chemical pollutants.

The riverine wetland condition of the San Dieguito River monitoring reach was moderate, as shown in Figure 2-2, with a CRAM score of 75 of 100 possible points. The site was rated high for buffer and most vegetation characteristics (slightly elevated percent invasive species), but was rated lower for water source and diversity of habitat types (i.e., structural patch richness and topographic complexity). The CRAM score at the San Dieguito River site fell into the 30th percentile of the ambient survey distribution within the County, indicating that this site scored better than 30 percent of all non-confined riverine sites that have been assessed within the County during ambient monitoring surveys.

The reach was in a low gradient segment of the river, and flow was dominated by glide habitat (97%) with a flow volume of 0.3 cubic feet per second (cfs). The banks were predicted to be stable under normal 1- to 2-year storm events, but many areas would be vulnerable to erosion under high flows, and it is possible that in a year with heavy rainfall, some of the aquatic macrophyte growth could be scoured from the streambed to expose more cobble substrate. Overhead canopy exhibited 60% coverage across the reach and macrolagal cover was nearly absent. Aquatic macrophytes were very abundant within the streambed, sometimes forming dense stands with a mix of cattails, sedges, and watercress. CPOM was detected at 95% of the transect points assessed. Substrate was composed primarily of fine sediments and roots of the aquatic macrophytes, with some small sections of cobble.

Figure 2-2
San Dieguito River (905M21725) Transect K Looking Upstream

The results of the physical water quality and analytical chemistry indicated that chloride and sulfate concentrations were slightly elevated above that typically observed in reference streams of southern California, at 780 mg/L and 380 mg/L, respectively. These two analytes were identified in the SMC Regional Monitoring Program report to be high priority regional stressors to BMI (Mazor, 2015b), with the potential to limit BMI colonization. The concentration of dissolved oxygen was also relatively low, with a value of 2.7 mg/L.

Lusardi Creek Downstream of Camino del Sur (905M21737)

The Lusardi Creek site was sampled in duplicate for BMI, as required under the SMC Regional Monitoring Program. The site exhibited IBI and CSCI scores that indicated a moderately degraded BMI community for both duplicate samples. The site had IBI scores of 24 and 21 (Poor) and CSCI scores of 0.59 and 0.67 (Very Likely Altered and Likely Altered, respectively). BMI metrics indicated that some aspects of the community were in moderate condition, with a total of four EPT taxa that included the sensitive caddisfly, *Tinodes* sp. The community also had relatively high IBI metric scores for the percent of non-insect taxa, plus an overall low abundance of non-insect individuals, further indicating relatively good biotic conditions relative to typical urban influenced streams.

The riverine wetland condition of the Lusardi Creek monitoring reach was good, shown in Figure 2-3, with an overall CRAM score of 82 of 100 possible points. The site was in an undeveloped open space preserve with a natural streambed and bank and a limited-access, unpaved road just south of the stream. The reach was rated low for three CRAM attributes, including water source (typical in an urbanized setting), a low hydrologic connectivity to the active floodplain, and limited vertical biotic structure (overlap of plant canopy layers). The CRAM score at the Lusardi Creek site fell into the 67th percentile of the ambient survey distribution within the County, indicating that this site scored better than 67% of all nonconfined riverine sites that have been assessed within the County during ambient monitoring surveys.

Figure 2-3
Lusardi Creek (905M21737) Transect F Looking Upstream

The banks showed evidence of a relatively recent fire, but were otherwise dominated by native vegetation. Flow volume was 0.3 cfs, and the 1.7% stream gradient made riffle habitat abundant (23% of the flow habitat within the reach). The rocky geology of the reach created mostly stable banks, but likely inhibited the establishment of tall riparian vegetation, with canopy cover directly over the stream comprising only 17% of the reach. Macroalgal and aquatic macrophyte reach-wide coverage was 27% and 43%, respectively, and CPOM was observed at 64% of the transect points. With five of the seven general substrate types exceeding 10% coverage, substrate types were diverse; however, the dominant types were roots (25%) and bedrock (20%).

The results of the physical water quality and chemistry analysis indicated that chloride and sulfate concentrations were slightly elevated above those typically observed in reference streams of southern California, at 810 mg/L and 400 mg/L, respectively, and could potentially limit BMI colonization. A specific conductance of 3,668 µS/cm was also measured, which is above the known tolerance of many sensitive BMI. The DO concentration was higher at this stream (6.8 mg/L) than at the other two streams monitored, likely a result of the increased riffle flow habitat.

2.4 California Assembly Bill 411 (AB 411) Data

San Diego County Department of Environmental Health (DEH) implements the Beach and Bay Water Quality Monitoring Program to support the statewide program funded by the Beach Safety Act (AB 411). This program is commonly referred to as AB 411 monitoring. There are three AB 411 beach monitoring stations in the San Dieguito River WMA. The AB 411 monitoring program is not required by the MS4 Permit. Responsible Agencies are using the AB 411 data to track dry weather beach water quality conditions related to the HPWQC for the watershed (San Dieguito Responsible Agencies, 2015a).

The number of samples for the period between October 1, 2015, and July 31, 2015, collected for each fecal indicator bacteria (FIB) indicator (E*nterococcus*, fecal coliform, and total coliform) is presented in Table 2-5.

Table 2-5
San Dieguito River WMA AB411 Data Summary

Site ID	Location[1]	Total Number of Samples		
		Enterococcus	Fecal Coliform	Total Coliform
EH-360	15th Street near outlet	48	47	47
EH-380	San Dieguito River outlet	116	115	115
EH-390	Seascape near outlet	28	28	28

1. Figure 1-1 shows the locations of the AB 411 Monitoring Locations.

ID = identification

The concentrations for the FIB indicators are shown in Figures 2-4 through 2-12. These data will be reviewed during the Receiving Water Assessment completed in the Regional Monitoring and Assessment Report.

2.5 Hydromodification Monitoring Program

The Hydromodification Monitoring Program (HMP) was initially developed in response to the requirements of the 2007 MS4 Permit. The Monitoring Plan is defined in Chapter 8 of the HMP, and was updated by the San Diego County Regional Copermittees and accepted by the Regional Board in February 2014. The Effectiveness Assessment of the San Diego HMP Report was submitted to the Regional Board in December 2016.

The Effectiveness Assessment of the San Diego HMP attempts to determine whether the requirements were fully met in the checklist in Chapter 8 of the HMP. Monitoring results and program evaluations indicate that the HMP elements are protecting stream physical integrity (Regional Board, 2016). Additionally, the report provides answers regionally to three questions:

1. Do field observations confirm that the HMP appropriately defines the flow rate (expressed as a function of the 2-year runoff event) that initiates the movement of channel bed and bank material? The Effectiveness Assessment determined that the HMP does appropriately define the flow rate that initiates movement of channel bed and bank materials (Regional Board, 2016).

2. Are hydromodification mitigation facilities adequately meeting flow duration design criteria outlined in the HMP? The initial plan for this phase of the assessment was to couple BMP monitoring and channel monitoring. The slow pace of development during the economic recession in the first few years of the project did not allow for this to happen. The study plan was changed and one best management practice (BMP) location was monitored during the 2015–2016 wet season for flow. Analysis for this one location over the year showed that significant peak flow attenuation occurred and, during the monitored events, the BMP performed as designed to prevent hydromodification (Regional Board, 2016).

3. What is the effect of development on receiving water channel cross-section stability downstream of urban development? The Effectiveness Assessment found that there were no major changes in channel stability within the nine monitored sites during the monitoring period, which included a relatively dry period due to drought conditions (Regional Board, 2016).

The report provided details of the small changes in channel geomorphology for the five sites located in the San Dieguito WMA, as summarized in Table 2-6.

Intentionally Left Blank

Table 2-6
San Dieguito River WMA HMP Monitoring Site Summary

Site Name and Number	HMP Monitoring Type	Evidence of Erosion/ Deposition?	Repeat Assessment?	Susceptibility Class Changed?	Notes and interpretation. Is change (if observed) indicative of instability in channel or watershed?
Ramona RH-1	Reference	2–4 inches of deposition in long profile, no change in cross-section	Yes	No	Fine sediment from watershed has formed a thin layer on the channel bed over original bed (also sand). Appears to be cyclical deposition, potentially sheet wash from the surrounding former floodplain terrace, likely to be washed out in subsequent years. Site appears stable.
Schoolhouse RH-2	Reference	9–18 inches of fine sediment deposition in channel	Yes	No	No significant fine sediment from watershed (potential fire effects). Deposition is pronounced enough to potentially cause channel infilling/avulsion and lateral migration within the valley floor. Potentially unstable site in medium term.
Bear Valley DH-2	Development	Up to 9 inches of erosion over a short reach	Yes	No	Local scour set against overall influx of fine sediment (potentially from development upstream). Possible migration of outside bend and infilling/avulsion of downstream channel.

Table 2-6 (continued)
San Dieguito River WMA HMP Monitoring Site Summary

Site Name and Number	HMP Monitoring Type	Evidence of Erosion/ Deposition?	Repeat Assessment?	Susceptibility Class Changed?	Notes and interpretation. Is change (if observed) indicative of instability in channel or watershed?
MDS DH-3	Development	Development 6-12 inches of upstream erosion, 6-12 inches of deposition downstream	Yes	No	Upstream sections of channel have eroded due to watershed runoff, depositing sediment in culvert backwater. Incision and channel widening occurring between two grade controls. Site appears moderately unstable in medium term.
Saratoga UH-1	Urban	Upstream headcut migration and downstream deposition	Yes	No	Headcut migrating through reach causing upstream incision and downstream deposition. Headcut likely to proceed until arrested by grade control. Site appears unstable.

HMP = Hydromodification Monitoring Program; Source: (Regional Board, 2016)

2.6 Bacteria TMDL Monitoring

The 2015–2016 San Dieguito River Hydrologic Unit (HU) Bacteria Total Maximum Daily Load (Bacteria TMDL) compliance monitoring program was designed to meet the requirements of the MS4 Permit. The Bacteria TMDL monitoring program assesses the conditions of the receiving waters and has the following objectives:

- ❖ Characterize levels of bacteria concentrations at compliance monitoring locations.
- ❖ Track progress toward meeting the Bacteria TMDL numeric targets.

FIB sampling was completed for the compliance monitoring season (October 2015 through September 2016). Wet weather samples were collected between October 1, 2015, and April 30, 2016, within the first 72 hours of the end of rainfall for three wet weather events. Dry weather samples were collected at least weekly in October 2015 and from April 2016 through September 2016, and at least monthly on dry weather days from November 1, 2015, through March 31, 2016. Compliance monitoring location information is presented in Table 2-7. The Bacteria TMDL Compliance Monitoring Report is provided in Attachment B.

Annual Compliance Reports summarize FIB concentrations and key hydrologic data by season. Compliance is assessed by comparing analytical results for *Enterococcus*, fecal coliform, and total coliform with applicable receiving water limitations (RWLs), in accordance with the Bacteria TMDL requirements in Attachment E of the MS4 Permit. The RWLs are a combination of numeric targets for bacteria density and allowable exceedance frequencies. The single-sample maximum numeric targets are required to be achieved only during wet weather with a 22% final allowable exceedance frequency. For dry weather days, the 30-day geometric mean numeric targets must be achieved with a 0% exceedance frequency. The compliance schedule includes interim milestones that must be achieved to demonstrate progress prior to attaining full compliance with the TMDL. Wet weather samples were collected for three wet weather events.

Table 2-7
TMDL Monitoring Station

Monitoring Location	Monitoring Identification	Latitude	Longitude
San Dieguito Lagoon Mouth	EH-380	32.975	–117.271

Summary of Results for 2015–2016

Analytical results for total coliform, fecal coliform, and *Enterococcus* at San Dieguito Lagoon Mouth were compared with numeric targets established in the Bacteria TMDL and MS4 Permit. Results are as follows:

- ❖ During wet weather, total coliform and fecal coliform did not exceed their corresponding single-sample limits (exceedance frequency = 0% for both constituents); *Enterococcus* exceeded its single sample limit of 104 most probable number per 100 milliliters (MPN/100 mL) at a rate of 13.6%. Therefore, EH-380 is in compliance with interim and final wet weather single-sample maximum RWLs for all three constituents.

- During the wet season, which evaluates a combination of both wet and dry weather samples, EH-380 achieved a 0% geometric mean exceedance frequency for all compliance constituents and is in compliance with interim and final dry weather geometric mean RWLs.
- During the dry season, when recreational activities occur with more regularity, EH-380 achieved a 0% exceedance frequency for all three compliance constituents, and is in compliance with interim and final dry weather geometric mean RWLs.

3 Dry Weather Outfall Assessments and Illicit Discharges

The purpose of this program is to identify non-storm water and illicit discharges within each Responsible Agency's jurisdiction, determine which discharges are transient flows and which are persistent flows, and prioritize the dry weather MS4 discharges that will be investigated and eliminated. The dry weather MS4 outfall monitoring component involves the following types of data collection activities for the San Dieguito River WMA:

- Dry Weather MS4 Outfall Field Screening: inspecting major outfalls during dry weather conditions to identify and prioritize persistently flowing outfalls.
- Dry Weather Persistent MS4 Outfall Discharge Monitoring: testing the discharge for various pollutants and comparing the results to the NALs.

3.1 Non-Storm Water MS4 Outfall Monitoring Data

During the 2015–2016 monitoring season (October 2015 through September 2016), the Responsible Agencies implemented the first year of dry weather outfall discharge monitoring in accordance with Provision D.2.b of the MS4 Permit. The goals of dry weather outfall monitoring are to:

- Identify non-storm water and illicit discharges within each Responsible Agency's jurisdiction.
- Prioritize dry weather MS4 discharges that will be investigated and eliminated.
- Assess effectiveness of JRMPs toward effectively prohibiting non-storm water discharges into the MS4.

Dry weather outfall data are provided in Attachment C.1. Attachment D includes a QA/QC summary of the dry weather outfall data collected. Details of the monitoring methodology are provided in the San Dieguito River WMA MS4 Outfall Monitoring Plan, available on the Project Clean Water website (Project Clean Water, 2016). The following subsections present the results of dry weather discharge monitoring in the San Dieguito River WMA.

3.2 Non-Storm Water Action Level Comparisons

Data collected as part of the dry weather MS4 outfall discharge monitoring were compared with NALs per the MS4 Permit. The results are summarized in Tables 3-1 through 3-5.

The MS4 Permit NALs vary according to the receiving water of the MS4 discharge (i.e., there are separate NALs for discharges to ocean surf zone, lagoons/harbors/bays/estuaries, and inland surface waters). As summarized in Table 3-1, three dry weather MS4 outfall discharge monitoring locations flow to ocean surf zone receiving waters. In three of the four samples collected, the total coliform and fecal coliform concentrations did not exceed the NALs, and concentrations of *Enterococcus* in all samples exceeded the NAL. Note that sites within the City of Del Mar's jurisdiction were dry during at least one monitoring event and no sample was collected. For the site within the City of Solana Beach's jurisdiction, a low flow diverter has been installed.

However, persistent flows at the outfall are still being originated from a small area downstream of the low flow diverter. Further studies are planned to determine the source of flow.

Table 3-1
NAL Comparison for MS4 Outfalls to Ocean Surf Zone

Analyte	NAL	Monitoring Location			
		City of Del Mar[1]		City of Solana Beach	
		S-05[2,3]	S-07[4]	S-25	
		8/12/2016	6/30/2016	8/12/2016	6/30/2016
Total Coliform	10000/1000* MPN/100 mL	30	**1600**	1600	8000
Fecal Coliform	400 MPN/100 mL	4	**1600**	23	40
Enterococcus	104 MPN/100 mL	**1400**	**500**	**280**	**5000**

*The NAL is 1,000 MPN/100mL when the fecal/total coliform ratio exceeds 0.1.

1. The City of Del Mar originally identified stations S-06 and S-07 as its highest priority persistently flowing outfalls in the San Dieguito River WMA WQIP. However, S-06 was dry during site visits on both 6/30/16 and 8/12/16 and no sample could be collected.
2. Site S-05 is not classified as a major MS4 outfall. Outfall diameter is less than 36 inches.
3. Site S-05 was classified as a persistently flowing outfall and sampled beginning 8/12/16. As the outfall does not qualify as a major MS4 outfall, this sampling is voluntary.
4. Site S-07 was dry during the second outfall monitoring event on 8/12/16. No sample was collected.

Bold = exceedance of NAL
µg/L = micrograms per liter; MPN/100 mL = most probable number per 100 milliliters; NAL = non-storm water action level

One major MS4 outfall, DW0033, flows to the San Dieguito Lagoon. This outfall is within the jurisdiction of the City of San Diego (City). As summarized in Table 3-2, two samples were collected from DW0033. With the exception of *Enterococcus* and dissolved copper, all results were detected below the appropriate NALs. The City has just begun implementation of its WQIP strategies, focused primarily on bacteria and low flow reduction, during the 2015–2016 monitoring year. The City plans to continue implementing the strategies without modification and work towards eliminating dry weather flows.

Table 3-2
NAL Comparison for MS4 Outfalls to Lagoon and Estuary Waters

Analyte	NAL	Monitoring Location	
		DW0033	
		City of San Diego	
		2/16/2016	4/5/2016

Bold = exceedance of NALµg/L = micrograms per liter; MPN/100 mL = most probable number per 100 milliliters; NTU = nephelometric turbidity unit; ND = not detected

Eleven major MS4 outfalls that flow into inland surface waters were monitored (Tables 3-3 through 3-5): one outfall each in the City of Escondido and the City of Poway (Table 3-3), four outfalls in the City of San Diego (Table 3-4), and five major outfalls in the County (Table 3-5). A total of 293 of the 396 results were below appropriate NALs (including 160 non-detects). The NALs were exceeded for dissolved oxygen, copper, *Enterococcus*, fecal coliform, iron, manganese, methylene blue active substance (MBAS), total nitrogen, total phosphorous, and turbidity collectively within these outfalls. Some of these analytes are found in groundwater and may be from unidentified groundwater intrusion. Other analytes will be addressed by the strategies developed by the Responsible Agencies. The San Dieguito River WMA Responsible Agencies have just begun implementation of the WQIP; they plan to continue implementing the strategies without modification, and work toward eliminating dry weather flows. Additionally, they have implemented their IDDE programs, as summarized in Section 3.3.1, to identify sources of illicit dry weather discharges.

3.3 Non-Storm Water MS4 Outfall Monitoring Data Assessments

Assessments of jurisdictional MS4 monitoring programs were conducted individually by the jurisdictions, and watershed-wide. Per Provision D.4. of the MS4 Permit, assessments include the following:

- Progress of IDDE programs toward effectively prohibiting non-storm water and illicit discharges into the MS4 within Copermittees' jurisdictions.
- Identification of known and suspected controllable sources (e.g., facilities, areas, land uses, pollutant-generating activities) of transient and persistent flows within the Copermittee's jurisdiction in the WMA, sources of transient and persistent flows within the Copermittee's jurisdiction in the WMA that have been reduced or eliminated, and modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in Copermittee inventories.
- Based on the dry weather MS4 outfall discharge field screening monitoring, assessment and reporting of the following:
    - For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identification of the known and suspected sources within the Copermittee's jurisdiction in the WMA that may cause or contribute to the NAL exceedances.
    - Calculations or estimates of the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in the Copermittee's jurisdiction identified as having persistent dry weather flows during the monitoring year.

Each Copermittee is required to conduct field screening to determine which non-storm water MS4 outfall discharges are transient or persistent non-storm water flows. Data collected during dry weather MS4 outfall monitoring are used to prioritize the non-storm water MS4 discharges that will be investigated and eliminated.

3.3.1 Illicit Discharge Detection and Elimination Program Data and Assessment

The San Dieguito River WMA Responsible Agencies implemented IDDE program activities in effort to detect and eliminate illicit discharges and improper disposal of wastes into the MS4. The Responsible Agencies initiated 341 IDDE inspections, during which 273 non-storm water discharges were discovered. 231 of these non-storm water discharges were classified as illicit discharges or connections. Illicit discharge investigations included visual observations, additional site visits, field sampling, photo documentation, and follow-up/enforcement activities, as appropriate.

In the course of investigating these non-storm water and illicit discharges, 261 non-storm water discharges, or 96 percent, were eliminated, as shown in Table 3-6. The most common source of illicit discharges is generally irrigation runoff. Other significant sources include groundwater seepages, commercial washing activities, chlorinated pool discharges, and illicit discharges/connections.

Table 3-6
Dry Weather Discharge Investigations and Discharges Eliminated in the 2015–2016 Monitoring Year

Copermittee	Number of IDDE Investigations Initiated	Number of Sources of Non-Storm Water Discharges Identified	Number of Non-Storm Water Discharges Eliminated	Number of Sources of Illicit Discharges or Connections Identified	Number of Illicit Discharges or Connections Eliminated

IDDE = illicit discharge detection and elimination

Intentionally Left Blank

3.3.2 Classification of Major MS4 Outfalls Within each Copermittee's Jurisdiction

To address the MS4 Permit requirements, the Responsible Agencies determined the number of major MS4 outfalls within their jurisdictions within the WMA. Table 3-7 lists the number of major outfalls for each Responsible Agency within the San Dieguito River WMA. Each major outfall was classified as follows:

- Persistent – having flowing, pooled, or ponded water more than 72 hours after a measurable rainfall event of 0.1 inch or greater during the three most recent consecutive monitoring and/or inspection events;
- Transient – having flowing, pooled, or ponded water during at least one but not on all three most recent consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation ≥0.1 inch;
- Tidal – having persistent or transient flow with ocean tides as the source;
- Dry – having no flowing, pooled, or ponded water during the previous three consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation ≥0.1 inch; and
- Unknown – site cannot be evaluated, or has not been visited enough times to determine flow status.

In the San Dieguito River WMA, 47% of the major outfalls were classified as persistently flowing outfalls. Table 3-8 and Figure 3-1 present percentages of all classifications of major outfalls in the 2015–2016 monitoring year. No outfalls were classified as tidal during the monitoring period.

Table 3-7
Number of Major Outfalls in San Dieguito River WMA

Total	**89**	**89**	**233**			

1. The City of San Diego has 502 outfalls within the City jurisdiction. The City of San Diego, in accordance with Provision D.2.a(2).(a).(iv) of the MS4 Permit, is required to screen 500 sites City-wide once per year. The City is not required to screen 500 sites within each watershed.
2. Includes visits to one or more upstream proxy sites for 16 outfalls. Proxy sites were visited when outfall was inaccessible to field crews.
3. For Responsible Agencies with fewer than 125 major outfalls in the WMA, 80% of total major outfalls presented in the table must be screened twice per year.
4. Total includes five major outfalls as well as one non-major outfall (S-05) that is monitored voluntarily.
5. 66 observations were made at major outfalls within the WMA, plus an additional 14 observations at non-major outfall S-05.

HSA = hydrologic subarea

3.3.3 Visual Observations at Major MS4 Outfalls

MS4 outfall visual assessments were performed as required by Table D-5 of the MS4 Permit. Table 3-9 presents the results of visual assessments relating to trash, including whether trash was observed during each visual observation event, and, if so, the approximate number of pieces of trash. During the 2015-2016 monitoring year, greater than 99% of visual observations indicated no or low (<50 pieces) presence of trash. Additional visual observations are provided in Attachment C.2.

Table 3-9
Trash Assessment Visual Observations in the 2015–2016 Monitoring Year

Copermittee	HSA	Number of Major Outfall Visual Observations with Trash Assessments[1]	Number of Observations with No Trash Present	Number of Observations with Trash Present

	Total	**234**	**136**	**91**	**2**	**0**

1. Trash assessments not conducted for all visual observations. Values in this column may not match total numbers of visual observations in Table 3-7.
2. Visual observations sometimes included more than one upstream proxy site for a given outfall on a single site visit. All observations counted here.

> = greater than; < = less than; HSA = hydrologic subarea

3.3.4 Controllable and Non-Controllable Sources of Flow

MS4 Permit requirements call for the classification of sources of observed flowing or ponded water in dry weather. Known, controllable sources, such as irrigation runoff and residential washing, were identified by observation. Other suspected sources of flow were noted and may have included items such as broken pipes. Non-controllable sources were also identified during dry weather visual observations and included mostly groundwater seepage. Unidentified sources of flow were also noted during dry weather visual observations. Tables 3-10 and 3-11 present results of visual observation identifications of controllable and non-controllable sources, respectively, made in the 2015–2016 monitoring year.

Table 3-10
Controllable Sources of Flow Observed in the 2015-2016 Monitoring Year

Copermittee	Number of Flowing or Ponded Observations at Major Outfall[1]	Known Controllable Sources		Suspected Controllable Sources	
		Irrigation Runoff	Other Discharges	Irrigation Runoff	Other Discharges
City of San Diego	51	2	3[2]	15	3[3]
City of Del Mar	19	Source information collected in IDDE program.			
City of Escondido	3	0	0	1	0
City of Poway	3	3	0	0	0
City of Solana Beach	6	Source information collected in IDDE program.			
County of San Diego	26	3	0	57	10[4]
Total	**108**	**8**	**3**	**73**	**13**

1. Note that the number of flowing or ponded observations may not be the same as the number of Persistent or Transient outfalls presented in Table 3-8. Some outfall stations were visited more than once.
2. One pool/spa chlorination discharge, one construction-related discharge, one backflow leak of water utility line discharge.
3. One pumped ground water (uncontaminated) discharge, two water line break underground discharges.
4. One residential washing discharge, three other illicit discharges, six commercial washing activity discharges.

Table 3-11
Non-Controllable Sources of Flow Observed in the 2015–2016 Monitoring Year

Copermittee	Known Uncontrollable Sources	Suspected Uncontrollable Sources
	Groundwater Seepage	Groundwater Seepage
City of San Diego	1	5
City of Del Mar	Source information collected in IDDE program.	
City of Escondido	0	1
City of Poway	0	0
City of Solana Beach	Source information collected in IDDE program.	
County of San Diego	0	11
Total	**1**	**17**

Non-storm water discharges (NSWDs) that have been reduced or eliminated during the 2015–2016 monitoring year have also been identified during the visual observations that were conducted by each Copermittee. Table 3-12 presents the number of discharges eliminated through visual outfall monitoring, including the identified sources of eliminated discharges. Additional runoff sources were eliminated through inspection and enforcement action under the Copermittees' IDDE program, as noted in Section 3.3.1.

Table 3-12
Dry Weather Discharges Eliminated in the 2015–2016 Monitoring Year

Copermittee	Number of Eliminated Discharges	Types of Eliminated Discharges
City of San Diego	1	Water Department Backflow Leak
City of Del Mar	40	Residential and Commercial
City of Escondido	0	NA
City of Poway	0	NA
City of Solana Beach	27	Residential and Commercial
County of San Diego	0	NA
Total	**68**	NA

NA = not applicable

Per MS4 Permit requirements, Responsible Agencies must identify modifications to the field screening monitoring locations and frequencies for the major MS4 outfalls in their inventories. Table 3-13 summarizes these modifications, based on the findings of visual observations during the 2015–2016 monitoring year.

Table 3-13
Modifications to Dry Weather Field Screening Locations and Frequencies

Copermittee	Number of Outfalls Added to Priority Persistent Flow Outfall List	Number of Outfalls Removed from Priority Persistent Flow Outfall List	Number of Outfalls Added to MS4 Inventory	Number of Outfalls Removed from MS4 Inventory
City of San Diego	5	0	1	0
City of Del Mar	0	0	0	0
City of Escondido	0	0	0	1[1]
City of Poway	0	0	0	1[2]
City of Solana Beach	1	0	0	0
County of San Diego	0	0	0	0
Total	**6**	**0**	**1**	**2**

1. Station HDG_101 found to not be an outfall.
2. Station 54 removed from inventory. Found to be upstream of another outfall.

MS4 = municipal separate storm sewer system

3.4 Non-Storm Water Volume and Pollutant Load Assessment

Copermittees must assess the non-storm water volumes and pollutant loads collectively discharged from their jurisdictions in the San Dieguito River WMA, per MS4 Permit Provision D.4.b(1)(c). The methodology used to calculate the non-storm water volumes and loads is provided in Attachment C.3.

3.4.1 Identification of Dry Weather Days

The first step in calculating annual non-storm water volumes and pollutant loads is to determine the number of dry weather days in the monitoring year. The number of dry weather days was determined using County of San Diego ALERT station data (https://sandiego.onerain.com). The Rancho Bernardo ALERT station was selected to represent rainfall conditions in the San Dieguito River WMA. This representative ALERT station was also utilized in Wet Weather MS4 Outfall Discharge Monitoring Assessments, and is the station closest to a majority of wet weather MS4 outfall discharge monitoring stations.

A wet weather day was defined as any day with at least 0.1 inch of measurable rainfall within a 24-hour period, and the subsequent 72 hours. Dry weather days were defined as all other days during the monitoring year (October 1 through September 30). Table 3-14 presents the number of dry weather days identified in the San Dieguito River WMA during the 2015–2016 monitoring season.

Table 3-14
San Dieguito River WMA Dry Weather Days by Month

NA = not applicable, no storms recorded

3.4.2 Non-Storm Water Volume Assessment

An annual non-storm water volume was calculated for each persistently flowing major MS4 outfall in each Copermittee's jurisdiction. The calculation methods used differed, depending on the availability of flow data for each site. Details of each calculation method are presented in the Dry Weather Assessment Methodology in Attachment C.3. The methods are summarized as follows:

- ❖ Scenario A: If a major MS4 outfall station was visited once during the monitoring year, and a single discrete flow rate was measured, this flow rate was applied across all dry weather days within the year.
- ❖ Scenario B: If a major MS4 outfall station was visited more than once during the monitoring year, and more than one discrete flow rate was measured, monthly dry weather flow volumes were calculated. The monthly flow volume calculation method varied based on whether a flow measurement was logged at the outfall during that month. For calendar months in which the outfall was visited one or more times, the mean of the measured flow rates was applied to all dry weather days within the month. For calendar months in which the outfall was not visited, the mean of all flow rates observed at that site during the calendar year was applied.
- ❖ Scenario C: If a major MS4 outfall station was monitored continuously for a period of time longer than a day, a measured daily flow volume was calculated for each monitored day. The mean of these daily flow volumes was applied to all non-monitored dry days.
- ❖ Scenario D: If a major MS4 outfall station was not visited during the monitoring year, the mean of annual outfall flow volumes for all monitored stations in the jurisdiction in the WMA was applied. This scenario was not encountered during the 2015–2016 monitoring season.

Within all these scenarios, observations of ponding (i.e., evidence of non-storm water in the MS4, with no connectivity to the receiving water) were assigned a flow rate of zero. If a station was observed to be flowing, but no flow rate was recorded, the average non-zero flow rate for that station was applied to that observation.

This methodology assumes that a persistently flowing major MS4 outfall is flowing on 100% of dry weather days. This assumption is highly conservative. Additional limitations to the methodology are listed in Section 3.4.6. Major limitations include assuming that rates of dry weather discharge equal the measured values throughout the entire month or year (depending on the calculation scenario used), as well as assuming that pollutant concentrations can be represented by samples collected just twice per year at five or fewer outfalls per jurisdiction.

Tables 3-15 through 3-20 present the outfalls that were identified by each Copermittee as persistently flowing. The number of visual observations made at these locations during the 2015–2016 monitoring year is also presented, and the number of flowing, ponded, and dry observations from these site visits is summarized. Finally, the annual dry weather flow volume modeled from each site is presented, as well as the total dry weather flow volume collectively discharged from persistently flowing sites within each Copermittee's jurisdiction in the WMA.

3.4.3 Non-Storm Water Load Assessment

The Copermittees estimated the annual non-storm water pollutant loads collectively discharged from their persistently flowing major MS4 outfalls to receiving waters in the MS4.

A load was calculated for each pollutant required to be analyzed at each high priority outfall, based on the arithmetic mean of the analytical results from the two dry weather outfall monitoring events at that outfall during the monitoring year. For each non-high priority persistently flowing outfall in a Copermittee's jurisdiction in the WMA, the mean of that Copermittee's monitored outfall results for each pollutant was applied. For any pollutants not detected at the method detection limit (MDL), a concentration of MDL/2 was applied in calculating the loads. The annual non-storm water pollutant loads collectively discharged from each jurisdiction are presented in Table 3-21. The non-storm water pollutant loads for each persistently flowing major MS4 outfall are presented in Attachment C.4.

3.4.4 Percent Contribution from Known Sources

Table 3-22 summarizes the percentage of non-storm water volume and load contributions from known sources. This value was calculated by dividing the observed flow rate for each known source by the estimated annual outfall flow volume presented in Section 3.4.2. It was assumed that the known source was flowing for the entire day on which the source was observed. Additionally, it was assumed that the percent load contribution is equal to the percent flow contribution for each known source.

Intentionally Left Blank

Table 3-22
Percent Contribution from Known Sources

Copermittee	Station ID	Observation Date	Known Source	Known Source Flow Rate (cfs)	Known Source Daily Flow Volume (cf)	Annual Outfall Non-Storm Water Flow Volume (cf)	Percent Contribution from Known Source (%)
City of San Diego	DW0033	9/16/2016	Irrigation Runoff	0	0	49,550	0%

Intentionally Left Blank

3.4.5 Percent Contribution from Sources Not Subject to Copermittee Legal Authority

Copermittees did not identify sources not subject to their legal authority within the San Dieguito River WMA during dry weather monitoring.

3.4.6 Dry Weather Assessment Methodology Assumptions and Limitations

Calculation of the MS4 Permit-required assessments necessitates a number of assumptions to translate the monitoring data into conclusions regarding flow volume and load for the entire WMA. These assumptions may introduce potential sources of error, while propagating potential errors inherent to the monitoring data. These assumptions and sources of error are summarized as follows:

- Monitoring Error—Annual non-storm water volumes and pollutants loads are based on the results from dry weather visual observations and dry weather outfall monitoring events. Error in the monitoring data could have the effect of propagating error in all subsequent calculations. Potential sources of error in the monitoring data include the following:
  - Monitored Flow Selection—The pollutant loading estimations rely on monitoring data from one or more non-storm water visual observations per major MS4 outfall per year. The 2015–2016 monitoring year is the first year of dry weather flow volume and load calculation, and this period generally has represented a drought condition, which can affect the type and volume of non-storm water sources such as irrigation and groundwater. The potential for inter-annual variability is a source of error in both the flow and chemistry data.
  - Flow Measurement Method—The MS4 Outfall Monitoring Plan provides different options to determine the non-storm water volume: (1) field-based estimation methods (e.g., “float method” or “bucket and stopwatch method”), and (2) equipment-based flow measurements. The method chosen varies among outfalls and Copermittees, introducing inter-site variability in volume estimations. The field-based estimation methods introduce potential human error in using stopwatches and error in determining volume amounts in non-graduated buckets. The consistent equipment-based flow monitoring approach is more accurate and precise compared with the field-based estimation methods. However, this approach introduces variability through the flow measurement device and sensor type used to account for site-specific conditions, and can also be cost and time prohibitive across the number of outfalls monitored. Each measurement device and sensor type has an inherent accuracy range (e.g., ±2% accuracy for sub area-velocity [sub-AV] probes). Additionally, each flow measurement device and sensor type can produce slightly different values for the same event, adding inter-site variability.
  - Rainfall Measurement—Accuracy in determining the number of dry days relies on the accuracy of the rainfall measurements representing that outfall. Rainfall

measurements were based on the County of San Diego ALERT rain gauge closest to the majority of wet weather outfalls in each WMA, and not site-specific rainfall data. Rainfall totals across the San Diego area can vary widely within a given storm.

- Chemistry Results—An attempt to maintain regional consistency in reporting limits (RLs) and MDLs was made. However, differences in lab capabilities can sometimes lead to different RLs and MDLs. This variability can introduce error if constituent concentrations are near or below the MDL for one monitoring event or Copermittee, and the MDL differs for another monitoring event or Copermittee. An attempt was made to account for this type of error by assigning constituents that were not detected a value of MDL/2 for the purposes of the assessment calculations.

- Assessment Methodology Error—The assessments require a series of assumptions and extrapolations regarding the determination of annual volumes and pollutant loadings. Each assumption carries the possibility of error, including the following:

  - Annual Volume Estimation Representativeness—Regardless of the flow measurement method utilized, error is introduced when utilizing the median of more than one field measurement to determine an annual volume estimation. It is assumed that these field measurements are representative of “typical” non-storm water conditions because persistently flowing non-storm water flows are relatively consistent through the year. However, this may not be the case, and error could be introduced into these estimations. For example, groundwater base flows can increase during the wet season, increasing dry weather flow rates. Or, alternatively, irrigation and irrigation runoff may increase during the dry season, increasing dry weather flow rates. Unless flow observations are made throughout the year under a variety of conditions, this seasonal variation may not be captured.

  - Annual Volume Estimation Confidence—Based on availability of data, multiple calculation methods are used to estimate annual flow volume. The confidence associated with each estimate varies because different sample sizes are used for each estimate. That is to say, volumes calculated on the basis of continuous flow data are associated with a higher confidence than volumes based on one or two instantaneous flow measurements.

  - Annual Pollutant Load Estimations—The annual volume estimation error introduced previously disseminates into the annual pollutant load estimations through calculations discussed in Section 3.4.3. Although persistent non-storm water flows are relatively consistent throughout the year, collecting two grab samples in one year provides a very brief snapshot in time of the pollutant concentration at an outfall, which may not be indicative of typical conditions or pollutant loadings. Additionally, using an arithmetic mean as a “typical” value of pollutant concentrations to estimate pollutant loads can introduce error if the sample size of the mean is too small, as means are sensitive to sample size.

4 Wet Weather Outfall Data and Assessments

During the 2015–2016 monitoring season, the first year of wet weather outfall discharge monitoring was conducted in accordance with Provision D.2.c of the MS4 Permit. The goals of wet weather outfall monitoring are the following:

- Identify pollutants in storm water discharges from the MS4;
- Guide pollutant source identification efforts; and
- Determine compliance with the water quality-based effluent limitations (WQBELs) associated with the applicable TMDLs presented in Attachment E of the MS4 Permit.

Wet weather outfall monitoring was initiated following completion and acceptance of the San Dieguito River WMA WQIP. This program built upon the transitional wet weather outfall discharge monitoring completed during the 2013–2014 and 2014–2015 monitoring seasons. Details of the monitoring methodology are provided in the San Dieguito River WMA MS4 Outfall Monitoring Plan, available on the Project Clean Water website (Project Clean Water, 2016).

This section presents the results of wet weather discharge monitoring in the San Dieguito River WMA, as well as the results of the required Storm Water Pollutant Discharge Reduction Assessments.

4.1 Storm Water Action Level Comparisons

The data collected as part of the wet weather MS4 outfall discharge monitoring were compared with the SALs and HPWQC WQBELs per MS4 Permit Provision D.4.b.(2)(c)(ii). These comparisons are shown in Table 4-1 and Table 4-2, respectively.

Three storm water action level exceedances were recorded for all wet weather MS4 outfall discharge monitoring locations within the San Dieguito River WMA. Two of these exceedances were for nitrate + nitrite as N at SDC-1 in the City of Del Mar, and one at SDC-2 in the City of Escondido. In addition, the total copper concentration slightly exceeded the storm water action level at SDC-1. During the 2015–2016 monitoring year, the City of Del Mar and City of Escondido have just begun implementation of their WQIP strategies that have primary and secondary pollutant reduction benefits for metals and nutrients. They plan to continue implementing the strategies without modification to realize the rewards of these pollutant reduction benefits. Previous monitoring efforts indicated sources of elevated copper may include copper roofing and rain gutters, copper pipes, and brake dust from transportation corridors through copper brake pad wear.

Table 4-1
MS4 Outfall Storm Water Action Level Comparison

Analyte	SAL	Monitoring Location					
		SDC-1	SDC-2	SDC-3	SDC-4	SDC-5	SDC-6
		City of Del Mar	City of Escondido	City of Poway	City of San Diego	City of Solana Beach	County of San Diego
Total Cadmium	3 µg/L	0.32	ND	ND	0.073 J	0.20	ND
Total Copper	127 µg/L	**130**	22	8.2	31	44	10
Total Lead	250 µg/L	11	0.71	0.46	3.9	2.9	0.29
Nitrate + Nitrite as N	2,600 µg/L	**2,700**	**4,900**	470	830	1,000	1,600
Total Phosphorous	1.46 mg/L	1.0	0.25	0.16	0.31	0.44	0.43
Total Zinc	976 µg/L	490	33	15	63	220	33
Turbidity	126 NTU	41.1	5.27	5.55	24.5	51.6	29.3

Bold = exceedance of SAL
µg/L = micrograms per liter; J = estimate; mg/L = milligrams per liter; MS4 = municipal separate storm sewer system;
N = nitrogen; ND = not detected; NTU = nephelometric turbidity unit; SAL = storm water action level

There were numerous exceedances of the Bacteria TMDL WQBELs during the 2015–2016 monitoring year for the wet weather MS4 outfall discharge monitoring locations in the San Dieguito River WMA. For *Enterococcus,* concentrations for all samples exceeded the WQBEL. In four of the six total coliform samples and five of the six fecal coliform samples, concentrations exceeded the respective WQBELs. During the 2015–2016 monitoring year, the Responsible Agencies have just begun to implement their WQIP strategies that have primary and secondary pollutant reduction benefits for bacteria. They plan to continue implementing the strategies without modification to realize the rewards of these pollutant reduction benefits and will work toward meeting the goals related to the HPWQC. Additionally, results for the first year of Bacteria TMDL monitoring indicate that the receiving water is in compliance with both interim and final wet weather receiving water limitations.

Table 4-2
MS4 Outfall Water Quality-Based Effluent Limitations Comparison

Analyte	WQBEL	Monitoring Location					
		SDC-1	SDC-2	SDC-3	SDC-4	SDC-5	SDC-6
		City of Del Mar	City of Escondido	City of Poway	City of San Diego	City of Solana Beach	County of San Diego
Enterococcus	61 (104[1]) MPN/100mL	**6,131**	**1,607**	**7,701**	**6,800**	**9,208**	**6,800**
Total Coliforms	10,000 MPN/100mL	**70,000**	**28,000**	**220,000**	3,400	**1,600,000**	10,000
Fecal Coliforms	400 MPN/100mL	**7,900**	**28,000**	**3,300**	**520**	**31,000**	280

1. A single sample maximum of 104 MPN/100mL may be applied as a receiving water limitation for creeks designated as "moderately or lightly used" or less frequent usage in the Basin Plan.

Bold = exceedance of WQBEL

MPN/100mL = most probable number per 100 milliliters; MS4 = municipal separate storm sewer system;

WQBEL = water quality-based effluent limitation

4.2 Wet Weather Outfall Monitoring

4.2.1 Wet Weather Outfall Monitoring Locations

Each Responsible Agency selected wet weather MS4 outfall discharge monitoring locations from their inventories developed pursuant to Provision D.2.a.(3)(a)(i) of the MS4 Permit for the San Dieguito River WMA. These locations were compliant with the MS4 Permit requirements for wet weather outfall site selection:

- ❖ At least five wet weather MS4 outfall discharge monitoring locations that are representative of storm water discharges from areas consisting primarily of residential, commercial, industrial, and typical mixed-use land uses present within the San Dieguito River WMA; and
- ❖ At least one wet weather MS4 outfall discharge monitoring location for each Responsible Agency within the San Dieguito River WMA.

The six stations monitored during the 2015–2016 monitoring season are presented in Table 4-3. Each wet weather MS4 outfall discharge monitoring location in the San Dieguito River WMA was sampled once during the 2015–2016 monitoring season. All six stations were also monitored during the 2014–2015 monitoring season (second transitional monitoring season). Five of the six stations were also monitored during the 2013–2014 monitoring season (first transitional monitoring season). The MS4 outfall station that changed from the first to second transitional year was MS4-SDC-3 in the City of Poway. The outfall monitoring locations and their associated drainage areas are shown in Figure 4-1. Land use types within the outfall drainage area for each location are described in Table 4-5.

Table 4-3
2015–2016 San Dieguito River WMA Wet Weather Outfall Monitoring Locations

Monitoring Location	Responsible Agency	Jurisdictional Identifier	Latitude	Longitude	HSA Name	HSA Number
MS4-SDC-1	City of Del Mar	S-06	32.95995	-117.26826	Rancho Santa Fe	905.11
MS4-SDC-2	City of Escondido	HDG_102	33.06951	-117.07136	Del Dios	905.21
MS4-SDC-3[1]	City of Poway	306-1761, 1	33.00932	-117.02583	Green	905.22

MS4-SDC-6	County of San Diego	COSD MS4 SDG01	33.00303	-117.11602	La Jolla	905.12

1. Monitoring location MS4-SDC-3 was relocated between the 2013–2014 and 2014–2015 monitoring years. The Jurisdictional Identifier of the previous monitoring location is 306-1749.1.

HSA = hydrologic subarea

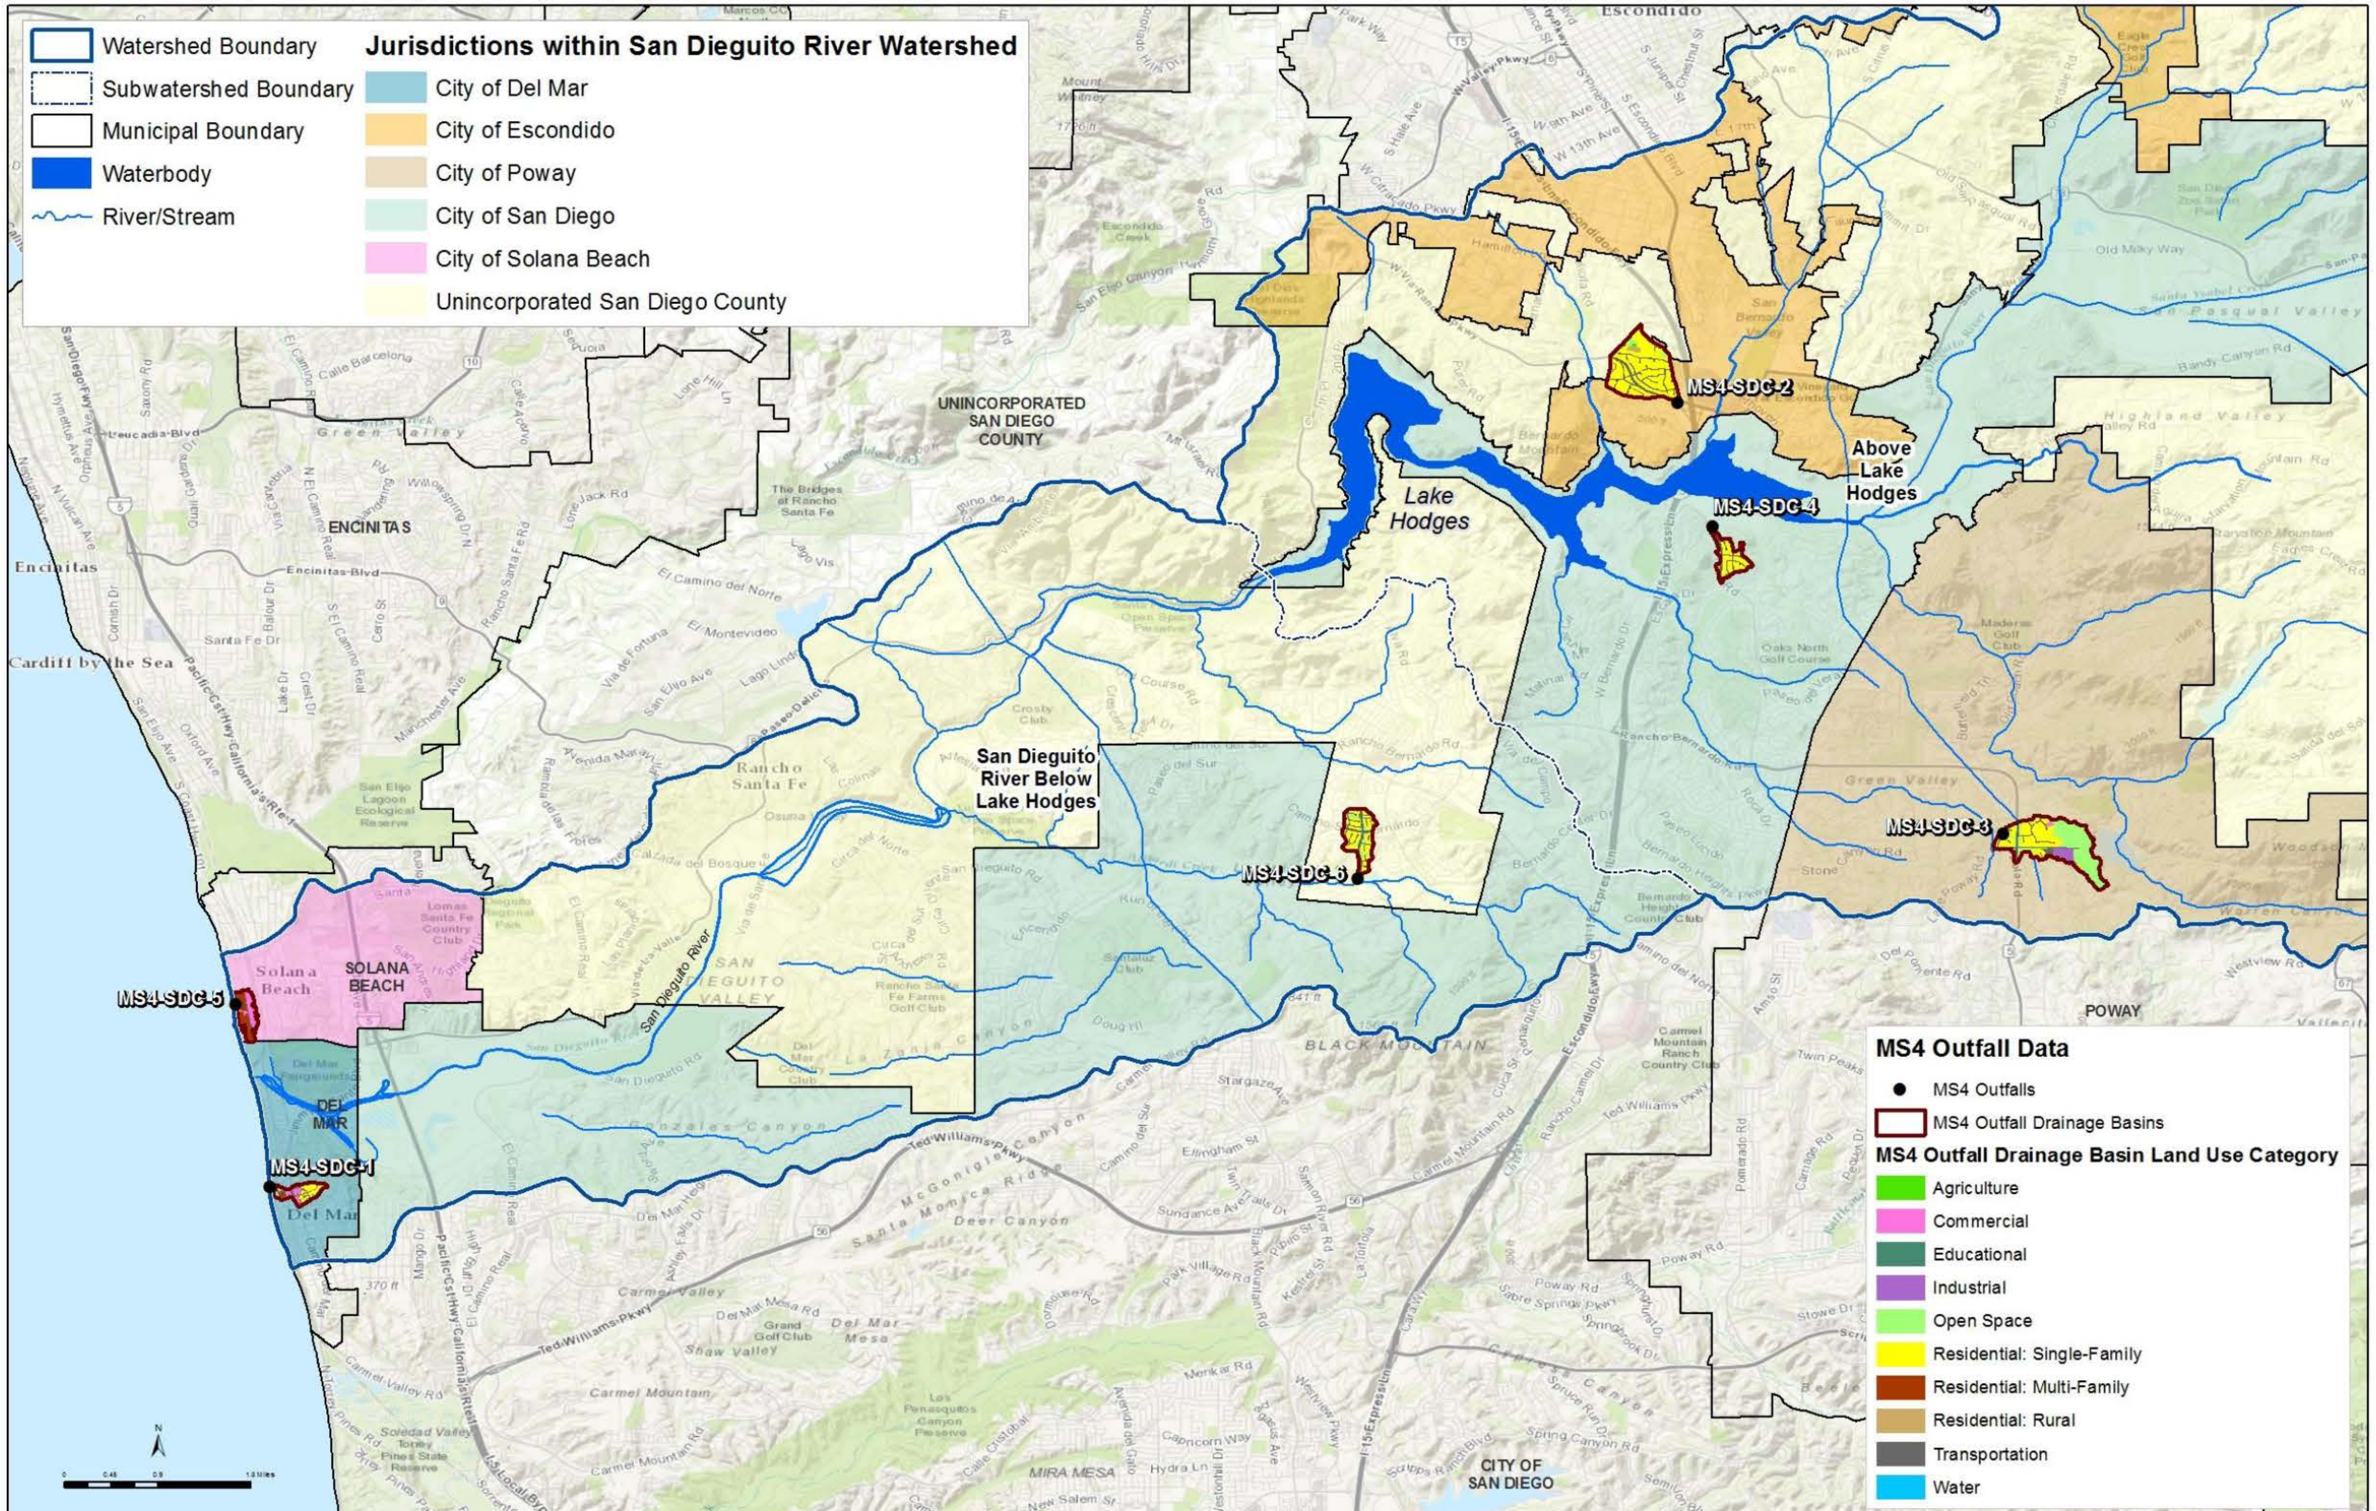

Figure 4-1
San Dieguito River WMA Wet Weather Outfall Monitoring Locations

Intentionally Left Blank

4.2.2 Wet Weather Outfall Monitoring Event Field Observations

The San Dieguito River WMA wet weather outfall locations were monitored during the wet season (i.e., October 1, 2015, through April 30, 2016), across two storm events on January 31, 2016, and March 6, 2016. Each location was monitored once.

During the wet weather monitoring event, narrative descriptions and field observations were recorded at each MS4 outfall discharge monitoring location. Flow was measured using a Hach Sigma 950 flow meter with sub-AV probe in accordance with the United States Environmental Protection Agency (USEPA) Storm Water Sampling Guidance Document (EPA-833-B-92-001), as described in the San Dieguito WMA MS4 Outfall Monitoring Plan. Rainfall statistics for each monitored event were based on a nearby San Diego County Flood Control District ALERT station. The closest ALERT station to each monitoring location was selected.

Details, including date and duration of the storm events sampled, rainfall estimates of the storm event, and duration between the storm event sampled and the end of the previous measurable storm event with over 0.1 inch of rainfall, are presented in Table 4-4. Hydrographs for each monitored event, displaying event flows and rainfall amounts, are presented in Attachment E.1.

Table 4-4
2015–2016 San Dieguito River WMA Wet Weather Outfall Monitoring Event Field Observations

Monitoring Location	Storm Event Date	ALERT Station	Storm Duration (hours)	Rainfall Depth (inches)	Rainfall Intensity (inches/ hour)	Antecedent Dry Days	Flow Volume (cf)
MS4-SDC-1	3/5/2016	Encinitas	12	0.27	0.0225	16	2,714

cf=cubic feet

4.2.3 Wet Weather Outfall Monitoring Event Analytical Results

During each wet weather event, samples were collected according to the procedures described in the San Dieguito River WMA MS4 Outfall Monitoring Plan.

Grab samples were collected for bacterial indicators and receiving water hardness. The grab samples were collected after the second hour of storm water runoff and before the sixth hour of storm water runoff. If the storm duration was less than two hours, the grab samples were collected as close to the peak flow as possible. A time-weighted composite sample was collected for all other analytes. All samples were collected in accordance with SWAMP protocols and following the QA and QC procedures outlined in the San Dieguito River WMA MS4 Outfall Monitoring Plan.

In situ turbidity measurements were collected using a LaMotte 2020 Portable Turbidity Meter. All other field measurements were collected using YSI Pro Plus Quatro field meter.

The required analyses were based upon the following four groupings of constituents, per Provision D.2.c(5)(f) of the MS4 Permit:

- Constituents contributing to the HPWQC identified in the San Dieguito River WMA WQIP;
- Constituents listed as a cause for impairment of receiving waters in the San Dieguito River WMA, as listed on the 2010 Clean Water Act (CWA) Section 303(d) List of Water Quality Limited Segments (303(d) List);
- Constituents for implementation plans or load reduction plans (e.g., Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for the San Dieguito River WMA where the Responsible Agencies are listed as responsible parties under the TMDLs in Attachment E of the MS4 Permit; and
- Applicable SAL constituents listed in Provision C.2 of the MS4 Permit.

Receiving water hardness samples were collected for each wet weather outfall station discharging to a fresh water receiving water. The receiving water hardness results were used to evaluate compliance with the USEPA one-hour maximum concentration criteria for metals, in the case of any SAL exceedances. Receiving water hardness samples were not collected for wet weather outfalls discharging to an ocean receiving water, or to a bay or estuary.

The 2015–2016 monitoring year wet weather outfall analytical results for the San Dieguito River WMA are presented in tabular form in Attachment E.2. Attachment D includes a QA/QC summary of the wet weather outfall data collected.

4.3 Volumes and Loads of Storm Water Discharges

Per Provision D.4.b.(2)(b)(i) of the MS4 Permit, the Responsible Agencies are required to use a watershed model or other method to calculate the following:

1. The average storm water runoff coefficient for each land use type within the WMA;

2. The volume of storm water and pollutant loads discharged from the monitored MS4 outfalls in the jurisdiction of each Responsible Agency to receiving waters within the WMA for each storm event with measurable rainfall greater than 0.1 inch;
3. The total flow volume and pollutant loadings discharged from the jurisdiction of each Responsible Agency within the WMA over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls; and
4. The percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea to receiving waters or within each jurisdiction of within each major MS4 outfall to receiving waters in the Copermittee's jurisdiction within the WMA for each storm event with measurable rainfall greater than 0.1 inch.

The following sections present the results of these assessments. The methodology used follows the methodology presented in the Transitional Wet Weather MS4 Outfall Discharge Monitoring Work Plan (San Diego County Regional Copermittees, 2015). Changes from the transitional methodology are noted below. The methodology is presented in Attachment E.3. Complete tables of storm water volumes and pollutant loads can be found in Attachment E.4.

The calculation of the MS4 Permit-required assessments necessitates a number of assumptions to extrapolate the available monitoring data into watershed-wide estimates of discharge volumes and pollutant loads. These extrapolations introduce potential sources of error in addition to error sources inherent to the monitoring data. A summary of these assumptions and sources of error follows:

- ❖ Potential Sources of Error Inherent to Monitoring—Runoff coefficients and pollutant loads are based on the results from wet weather outfall monitoring events. Error in the monitoring data could have the effect of propagating error in all subsequent calculations. Potential sources of error in the monitoring data include the following:
  - ➢ Monitored Storm Selection—The calculation relies on monitoring data from one storm event per year. Although a range of storm conditions have been targeted over the period of monitoring (2013–2016), this period generally has represented drought conditions. Inter-annual variability in storm duration, intensity, and rainfall depth, in can be a source of error in both the flow and chemistry data.
  - ➢ Drainage Area Delineation—The accuracy of the observed outfall runoff coefficient calculation relies on the accuracy of the drainage area delineation for that outfall. Drainage area delineations were based on the most recent jurisdictional delineation, some of which were based on desktop analysis of GIS data layers. The accuracy of this delineation depends upon the accuracy of the underlying data layers.

  - Flow Measurement Method—A consistent flow monitoring approach is described in the Monitoring Plan. However, this approach allows for variability in the flow measurement device and sensor type used to account for site-specific conditions. Each measurement device and sensor type has an inherent accuracy range (e.g., ±2% accuracy for sub-AV probes). Additionally, each flow measurement device and sensor type can produce slightly different values for the same event, adding a layer of inter-site variability.

  - Rainfall Measurement—The accuracy of the observed outfall runoff coefficient calculation relies on the accuracy of the rainfall measurement for that event at that outfall. Rainfall measurements were based on the nearest County of San Diego ALERT rain gauge to each outfall and not site specific rain data. Rainfall totals across the San Diego area can vary widely within a given storm.

  - Chemistry Results—An attempt to maintain consistent RLs and MDLs across the monitoring seasons was made. However, differences in lab capabilities can sometimes lead to different RLs and MDLs. This variability can introduce error if constituent concentrations are near or below the MDL one monitoring year, and the MDL changes. For the assessment calculations, an attempt was made to account for this type of error by assigning a value of MDL/2 to constituents that were not detected.

- Potential Sources of Error Inherent to the Assessment Methodology—The assessments require that a series of assumptions and extrapolations be made regarding land use based runoff coefficients and pollutant concentrations. Each assumption carries the possibility of error, including the following:

  - Observed Outfall Runoff Coefficient Calculation—Total rainfall of a monitored storm event, not accounting for rainfall intensity or duration, is considered in these calculations. Storms of higher intensity generally produce more runoff for a given rainfall amount than storms of lower intensity. Therefore, a storm with an equal total rainfall but a higher intensity than another storm would be expected to exhibit a higher runoff volume or flow rate.

  - Outfall Drainage Area Land Use Representativeness—While an attempt has been made to select outfall monitoring locations with drainage areas of one primary land use type, the reality of storm water drainage systems in urban and suburban areas is that most monitoring locations are a mixture of multiple land use categories. To calculate the runoff coefficient from each land use category, the observed runoff coefficient is compared to standard values calculated using the San Diego County Hydrology Manual (County of San Diego, 2003). A correction factor based on the ratio of the observed runoff coefficient to the calculated runoff coefficient is then applied to each land use category to derive land use runoff coefficients.

- WMA Land Use Representativeness—Not all land use categories within the WMA are represented by the monitored drainage areas. Therefore, the pollutant concentration and runoff coefficient for one land use are sometimes substituted for another land use. For example, Open Space pollutant event mean concentrations (EMCs) and runoff coefficients may be used as a proxy for agriculture land use values, in the absence of monitoring data from agricultural land uses. These proxies are summarized in Table 4-5.

- Land Use EMC Assumptions—Apportioning pollutant loads to each land use type requires an assumption of pollutant concentrations that are "typical" of each land use category. To calculate a pollutant concentration from each land use category, the observed pollutant concentrations are compared with typical (arithmetic mean) values calculated on the basis of land use studies in the Los Angeles and San Diego areas (see Attachment E.3). A correction factor based on the ratio of the observed pollutant concentration to the calculated typical pollutant concentration is then applied to each land use category to derive land use concentrations. Using an arithmetic mean as a "typical" value can introduce error if the sample size of the mean is too small, because means are sensitive to sample size. However, literature values did not exist for all pollutants analyzed, and therefore an additional assumption is made that similar pollutants have similar land-use-based concentrations For example, it is assumed that ratios of other dissolved metals concentrations from the analyzed land use categories follow the ratios of dissolved copper concentrations from those land use categories. This assumes that all dissolved metals behave similarly to dissolved copper, which is not necessarily the case. The full list of assumptions is provided in Attachment E.3.
