Los Peñasquitos Watershed Management Area Water Quality Improvement Plan Annual Report

Submitted to the San Diego Regional Water Quality Control Board by:

January 2017

Prepared by:

Amec Foster Wheeler Environment & Infrastructure, Inc.

With:

Executive Summary

The Water Quality Improvement Plan (WQIP) provides a comprehensive watershed-based program to improve surface water quality in the Los Peñasquitos Watershed Management Area (WMA), in receiving waters in the Los Peñasquitos River, and at nearby beaches. The Responsible Agencies tasked with implementing the WQIP in the Los Peñasquitos WMA are the City of Del Mar, the City of Poway, the City of San Diego, the County of San Diego, and the California Department of Transportation (Caltrans). Caltrans is regulated under a separate permit from the state water resource control board (Order No. 2012-0011-DWQ). However, Caltrans has voluntarily participated in the WQIPs throughout the San Diego Region.

The Los Peñasquitos WMA encompasses almost 94 square miles of urban land and undeveloped open space extending from the Los Peñasquitos Lagoon beyond Highway 67 to the east. The WMA includes Torrey Pines, Del Mar, Carmel Valley, Sorrento Valley, Mira Mesa, Rancho Peñasquitos, Carmel Mountain, Sabre Springs, and Poway. Small finger canyons drain into three main creeks (Carmel Valley Creek, Los Peñasquitos Creek, and Carroll Canyon Creek) that lead into the Los Peñasquitos Lagoon and ultimately the Pacific Ocean.

This Annual Report provides an update on monitoring and assessment completed during the previous reporting period and highlights the strategies implemented and progress toward meeting goals set for the highest priorities. Significant progress has been made in obtaining WQIP goals. The permit term performance based goals have been achieved for dry weather flow reduction by the City of Del Mar and City of San Diego. The City of Poway has surpassed their turf conversion goal and the County of San Diego has made progress in implementing the WQIP. BMPs have been installed and maintained in the City of San Diego, reducing or preventing pollutants from entering receiving waters.

Water Quality Improvement Plan Process

The WQIP identifies goals and strategies to improve the quality of urban runoff waters. These improvements to water quality are achieved through the consistent process of evaluation, goal setting, and monitoring and reporting, according to the following process:

1. Priority and Highest Water Quality Conditions
2. Sources
3. Goals, Strategies, & Schedules
4. Monitoring & Assessment
5. Adaptive Management Process
6. Annual Reporting

With these distinct steps, the WQIP provides a long-term program to measurably improve overall water quality within the Los Peñasquitos WMA. This Annual Report implements Step (6) of the WQIP Process.

Highest Priority Water Quality Conditions

The WQIP identifies the following conditions/pollutants as highest priorities within the Los Peñasquitos WMA:

- Freshwater discharges during dry weather into the Los Peñasquitos Lagoon
- Transport of sediment from upstream sources (current and historical) during rain events into the Los Peñasquitos Lagoon
- Indicator bacteria as measured during both wet and dry weather at Torrey Pines State Beach near the Los Peñasquitos Lagoon mouth

Monitoring and Assessment

The WQIP Monitoring and Assessment Program plays a key role in the Municipal Separate Storm Sewer System (MS4) Permit's new focus on the outcomes of WQIP program implementation to achieve water quality improvement. The long-term receiving water monitoring and MS4 monitoring program provides information on a wide variety of water quality conditions, including the highest priority water quality conditions (HPWQCs) and the other WMA priority water quality conditions (PWQCs).

Receiving waters were last monitored at the long-term monitoring stations during the October 1, 2014, through September 30, 2015, monitoring year. These historical mass loading stations have been monitored since 2001. This data was present in previous monitoring reports. The Responsible Agencies implemented receiving water monitoring in support of the Sediment and Bacteria Total Maximum Daily Loads (TMDLs). Details are provided in Appendix C and highlights are summarized as follows:

- Sediment TMDL:
  - Suspended sediment concentrations (SSCs) were higher at or near peak flow and during the rising limb of the hydrograph for smaller storms such Events 2 and 3 during the 2015–2016 wet season. For the larger storm (Event 1), SSCs in all three WMA creeks remained high throughout the storm and mostly varied with flow, suggesting that the unusually high flows may have mobilized previously deposited sediments that were stored by in-channel vegetation and streambed.
  - The total 2015–2016 sediment load estimate of 23,500 tons per year is above the final Sediment TMDL waste load allocation (WLA) (2,580 tons per year). This TMDL compliance pathway can be achieved by 2034. Monitoring in previous years has recorded annual sediment loads that were below the WLA.

- Bacteria TMDL:
  - During wet weather, the receiving waters at the Los Peñasquitos River Outlet/Beach achieved a 0 percent single-sample maximum exceedance frequency for fecal coliform and a 13 percent (%) single-sample maximum exceedance frequency for total coliform and *Enterococcus*. FM-100 is in compliance with final wet weather single-sample maximum receiving water limitations (RWLs).
  - During the wet season, which evaluates a combination of both wet and dry weather samples, FM-100 achieved a 0% geometric mean exceedance frequency and is in compliance with final dry weather geometric mean RWLs.
  - During the dry season, when recreational activities occur with more regularity, FM-100 achieved a 0% exceedance frequency and is in compliance with the final dry weather geometric mean RWLs.

The MS4 outfall monitoring program provides information on the estimated amount of pollutants coming from monitored MS4 outfalls. Details of this monitoring program are in Appendix C. The results for samples collected during the October 1, 2015, through September 30, 2016, monitoring year were compared with non-storm water action levels and storm water action levels. In dry weather, non-storm water action levels were met over 74% of the time for multiple consituents. In wet weather, only one storm water action level exceedance for turbidity was recorded for wet weather MS4 outfall discharge monitoring locations within the Los Peñasquitos WMA. The Responsbile Agencies plan to continue implementing the WQIP strategies without modification to realize the rewards of these pollutant reduction benefits and will work toward meeting the goals related to the HPWQCs.

The Illicit Discharge Dectection and Elmination (IDDE) Program found non-storm water discharges and worked to eliminate them throughout the WMA. This program helps with dry weather runoff reductions and is one mechanism to achieve some of the fiscal year (FY) 18 performance-based goals. Table ES-1 provides more information about the implementation of the IDDE program throughout the WMA.

Table ES-1
IDDE Program Summary in the Los Peñasquitos WMA

IDDE Program Action	Total Number in WMA
Non-storm water discharges or illicit discharges investigated	589
Sources of non-storm water discharges identified	501
Non-storm water discharges eliminated	465
Sources of illicit discharges or connections identified	488
Illicit discharges or connections eliminated	456
Number of enforcement actions	484[1]

1. The number of enforcement actions issued does not equal the number of identified illicit discharges or connections because some discharge complaints in the last quarter of FY 16 were still under investigation at the end of FY 16.

IDDE = illicit discharge detection and elimination; WMA = Watershed Management Area

In addition to monitoring in the receiving waters and the MS4, the Responsible Agencies conducted special studies. The Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Study found that areas in the upper portion of Los Peñasquitos Creek and in the upper portions of Carmel Valley Creek may have the potential to serve as a sink for sediment within the WMA that can be mobilized during large storms such as the storm in early January 2016. Aerial deposition sampling determined that aerial deposition of sediment was not a significant contributor to the watershed sediment loads compared with the stream loads. The Sediment Load Reduction Quantification Through Outfall Repair and Relocation for the Los Peñasquitos WMA Study estimated the sediment load associated with erosive discharge from 102 City of San Diego outfalls. The load estimation from these 102 outfalls resulted in a load of 85 tons per year that accounts for approximately 1.4% of the total sediment load for the watershed. Of these 102 outfalls, 42 were identified as “high priority” outfalls. Three types of BMPs were investigated to estimate the amount of the loading that could potentially be reduced or eliminated from the high priority outfalls. The San Diego Regional Reference Streams and Beaches Study provided valuable information for the Bacteria TMDL Reopener.

Strategies

Strategies implemented throughout the WMA deliver proven benefits for addressing multiple pollutants by eliminating sources or treating pollutants already found in urban runoff. Responsible Agencies sponsor stream and beach cleanups, provide turf conversion rebates, and work with the public to educate them on the impacts of their actions on the environment. They have also invested in new street sweeping technologies and are refining their catch basin cleaning methodologies. Many of these actions are above and beyond the requirements of the Jurisdictional Runoff Management Program (JRMP) strategies. Figure ES-1 provides a snapshot of the actions that the Responsible Agencies have taken during the previous monitoring year.

Public Outreach and Source Control

- Provide turf conversion rebates
- Engage in enforcement actions for over-irrigation
- Sponsor beach and river cleanup events

Municipal Control Activities

- Sweep streets using new technologies and on a more frequent basis
- Clean debris out of catch basins
- Build and maintain structural best management practices (BMPs)

Figure ES-1
Los Peñasquitos WMA Strategy Overview

The Los Peñasquitos/Sorrento Restoration Program

One of the goals identified for this WMAs is restoration of 84 acres of salt marsh habitat. The Responsible Agencies have made considerable progress towards the implemenantation of the Los Peñasquitos/Sorrento Restoration Program. Phase I of this project includes removal of sediment and construction of sediment management facilities, repairs to storm drain outfalls, and realignment of creeks in the Los Peñasquitos Lagoon to ease water flow, reduce upstream flooding, and improve habitat conditions, as well as pilot restoration activities. Phase II of this project includes the large-scale restoration of salt marsh habitat in the Lagoon. The City of San Diego has been identified as the Lead Agency and is working in collaboration with the Responsible Agencies, State Parks, the Coastal Conservancy, the Los Peñasquitos Lagoon Foundation, and other stakeholders. Modeling was completed in FY 16 to confirm the preferred alternative for the Lagoon restoration. Additionally, some technical studies such as biological efforts and hydraulic and hydrology reports were completed for Phase I of the project. Next steps for FY 17 include additional modeling, completion of the concept design, and commencement of the public outreach process.

Progress Toward Meeting Goals

To measure progress toward achieving their goals and addressing the HPWQCs, the Los Peñasquitos WMA Responsible Agencies developed numeric goals and schedules. Numeric goals may take a variety of forms, but all forms can quantify a benefit to water quality so that progress toward and achievement of the goals are measurable. During this MS4 Permit term, the Responsible Agencies have defined goals based on actions they are taking to improve water quality in the WMA. Many of the goals are on track or have been met. Table ES-2 summarizes the progress of Responsible Agencies toward meeting their goals during the previous monitoring year.

Table ES-2
Los Peñasquitos WMA Progress Toward Performance-Based Goals (FY 16)

Responsible Agency	Weather (Wet/Dry)	FY 18 Goal	FY 16 Progress
City of Del Mar	Dry	10% reduction of anthropogenic surface dry weather flows that originate within the Del Mar's jurisdictional boundaries	Achieved to Date
City of Poway	Wet and Dry	5% increase from the baseline through turf conversion	Achieved
City of San Diego	Wet and Dry	36 acres of drainage area treated through construction of 9 green infrastructure BMPs	Achieved
	Dry	10% reduction in prohibited dry weather flow from baseline measured at persistently flowing outfalls in the WMA	Achieved to Date
County of San Diego	Wet	Progress toward implementing the WQIP.	In Progress

% = percent; BMP = best management practice; FY = fiscal year; WMA = watershed management area

1 Introduction

The San Diego Regional Water Quality Control Board (Regional Board) regulates discharges from municipal separate storm sewer systems (MS4s) in the San Diego Region *National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer System (MS4) Draining the Watersheds Within the San Diego Region* (MS4 Permit) under Order No. R9-2013-0001, as amended by Order Nos. R9-2015-0001 and R9-2015-0100 (Regional Board, 2015). The MS4 Permit covers portions of San Diego County, southern Orange County, and southwestern Riverside County and regulates Phase I municipalities that own and operate MS4s (i.e., storm drain systems) that discharge storm water (wet weather) runoff and non-storm water (dry weather) runoff to surface waters throughout the San Diego region.

Under the MS4 Permit, the San Diego region is subdivided into 10 watershed management areas (WMAs), which cover the major, natural drainages in the region. The MS4 Permit requires a Water Quality Improvement Plan (WQIP) (Los Peñasquitos WMA Copermittees, 2015) to be developed for each WMA. The San Diego County Copermittees are listed in Table 1a of the MS4 Permit; the Copermittees with jurisdictional area within the Los Peñasquitos WMA are as follows:

- City of Del Mar
- City of Poway
- City of San Diego
- County of San Diego

Each Copermittee, referred to as a Responsible Agency in the WQIP, must comply with the MS4 discharge prohibitions and receiving water limitations outlined in the MS4 Permit through timely implementation of control measures, other actions specified in the MS4 Permit, and adherence to the WQIP.

The California Department of Transportation (Caltrans) is under a separate storm water permit from the State of California to reduce or eliminate the discharge of pollutants to storm drainage systems and receiving waters (Order No. 2012-0011-DWQ). The California Department of Transportation (Caltrans) maintains multiple major transportation corridors. Caltrans has partial responsibility for the implementation of the *Project I—Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)*, Resolution No. R9-2010-0001, referred to as the Bacteria Total Maximum Daily Load, or Bacteria TMDL (Regional Board, 2010) and is therefore included as a Responsible Agency, even though it is not listed in the MS4 Permit as a Copermittee. Caltrans is also a named party in the *Total Maximum Daily Load for Sedimentation in Los Peñasquitos Lagoon*, Resolution No. R9-2012-0033 (Sediment TMDL) expected to be implemented in the next Caltrans NPDES Permit. Caltrans voluntarily participated in WQIPs across the San Diego region.

The goal of the WQIP is to guide the Responsible Agencies' to implement jurisdictional programs, known as Jurisdictional Runoff Management Programs (JRMPs) toward an outcome-based approach and to improve water quality. To accomplish this goal, an adaptive planning and management process will be used to identify the highest priority water quality condition(s) (HPWQC) within a watershed. Responsible Agencies will also implement strategies through the WQIP to achieve improvements in the quality of discharges from storm drain systems and within receiving waters such as creeks, rivers, and beaches. The final WQIP for the Los Peñasquitos WMA can be found on the Project Clean Water website (www.projectcleanwater.org).

The MS4 Permit also requires the Responsible Agencies within each WMA to submit an Annual Report to demonstrate progress toward implementing the WQIPs and corresponding JRMPs. The Annual Report covers two different reporting periods. The first reporting period is from July 1, 2015, through June 30, 2016, for the JRMPs and WQIP strategy implementation. The second reporting period is from October 1, 2015, through September 30, 2016, for monitoring and assessment programs. Progress toward goals may be assessed in either reporting period, depending on the goal metric. This Annual Report addresses the requirements in Provision F.3.b.(3) and other provisions of the MS4 Permit.

Table 1-1 provides an overview of the MS4 Permit requirements that must be addressed and where they are addressed within the Annual Report. The corresponding appendix, provides additional detail regarding the specific MS4 Permit requirements and where they are addressed within the Annual Report.

WQIP = Water Quality Improvement Plan

The Los Peñasquitos WMA WQIP Annual Report for 2015–2016 is structured as follows:

Section 1, Introduction – This section provides an overview of the MS4 Permit, the WQIP, and the Annual Reporting requirements. Includes references to Appendix A:

Appendix A. Crosswalk of Permit Requirements and Annual Report References.

Section 2, Overview of the Los Peñasquitos Watershed Management Area – This section introduces the watershed management area and the priority water quality conditions (PWQCs) of the watershed. The numeric goals and schedules developed to measure progress toward addressing the HPWQCs are presented. Includes references to Appendix B:

Appendix B. Water Quality Improvement Plan Numeric Goals

Section 3, Monitoring and Assessment – This section summarizes the monitoring programs and provides an assessment of the data collected relative to the HPWQCs. Includes references to Appendix C:

Appendix C. Monitoring Results and Assessments

Section 4, Implementation and Progress Toward Achieving Numeric Goals – The section discusses the assessment of the progress toward meeting the numeric goals, with a focus on those numeric goals occurring during the MS4 Permit term. The section also provides an overview of the strategies implemented to meet the numeric goals, the status of implementation, and plans for the coming year. Includes references to Appendix D:

Appendix D. Jurisdictional Runoff Management Program Annual Report Forms, Fiscal Analysis, Updated Best Management Plan (BMP) Manuals, and Jurisdictional Strategies

Section 5, Adaptive Management – This section summarizes the elements of the WQIP's process, which can be changed during the course of MS4 Permit implementation based on monitoring results and new information gathered during the reporting period. Includes references to Appendix E:

Appendix E. Adaptive Management/Modifications

Section 6, Conclusions and Recommendations – This section provides the conclusions and recommendations that are based on the data collected and assessments conducted during implementation of the WQIP in fiscal year (FY) 2015–2016 (FY 16).

Section 7, References – This section lists the sources used to prepare this Annual Report.

2 Overview of Los Peñasquitos Watershed Management Area

The Los Peñasquitos WMA drains an area of approximately 94 square miles in central San Diego County. The southernmost portion of the watershed is just north of Rose Canyon, the northernmost portion is south of Lake Poway, and the easternmost portion is near State Route 67. Five agencies located in the Los Peñasquitos WMA maintain jurisdiction over the land; the land area for each agency is shown in Figure 2-1. Caltrans, along with other non-Phase 1 MS4s dischargers, is regulated under separate permits, as discussed in Section 1 of the Los Peñasquitos WMA WQIP. They have jurisdiction over 2.4 percent (%) of the land are within the WMA. However, Caltrans has voluntarily participated in development of the WQIP to implement the Bacteria and Sediment TMDLs[1].

The Responsible Agencies are responsible for discharges originating from non-MS4 lands outside of their regulatory control (i.e., industrial, agricultural, Phase II, state, federal, and Indian reservation lands) if those pollutants are ultimately discharged from the MS4 of a Responsible Agency. Therefore, Responsible Agencies look to collaborate and improve communication with non-municipal sources and the appropriate regulatory agencies to ensure that these discharges are regulated before they enter the Responsible Agencies' MS4s.

The Los Peñasquitos WMA was divided into four subwatersheds to focus on the receiving waters when selecting PWQCs and implementing the WQIP. These subwatersheds are the Los Peñasquitos Lagoon, Carroll Canyon Creek, Los Peñasquitos Creek, and Carmel Valley Creek.

The Los Peñasquitos Lagoon subwatershed contains a coastal salt marsh lagoon bearing the same name. The lagoon is located in the Torrey Pines State Reserve and ultimately discharges its waters to the Pacific Ocean. The lagoon is one of the few remaining native salt marsh lagoons within the state of California, and many endangered species inhabit the area.

The three remaining subwatersheds each include a stream that flows into the Los Peñasquitos Lagoon. The Carroll Canyon subwatershed is drained by Carroll Canyon Creek; its headwaters originate near the Miramar Reservoir, and once it crosses Highway 805, the creek is referred to as Soledad Canyon Creek or sometimes Sorrento Valley Creek. The Los Peñasquitos Creek is the largest tributary of the Los Peñasquitos Lagoon. Its headwaters extend to the easternmost portion of the WMA just west of Fernbrook, California. The Los Peñasquitos Creek is joined by the Soledad Canyon Creek of the Carroll Canyon subwatershed in Sorrento Valley near Interstate 5 before flowing into the Los Peñasquitos Lagoon. The Carmel Valley Creek subwatershed is drained by a creek bearing the same name. The creek's headwaters begin near Black Mountain and it drains to the northwestern most portion of the Los Peñasquitos Lagoon.

2.1 Los Peñasquitos WMA WQIP

The overarching goal of the Los Peñasquitos WMA WQIP is to further the Clean Water Act’s objective to protect, preserve, enhance, and restore the water quality and designated beneficial uses of waters of the state. This goal will be accomplished through a planning and adaptive management process that identifies the PWQCs and HPWQCs. The Los Peñasquitos WMA WQIP identifies strategies (implemented through JRMPs) to address water quality conditions in the WMA with a particular focus on the PWQCs and the HPWQCs to achieve measurable numeric goals and to improve the quality of MS4 discharges and, in turn, the receiving waters. The Los Peñasquitos WMA WQIP outlines how the Responsible Agencies within the WMA are evaluating water quality conditions, prioritizing those water quality conditions, and using these common priorities to guide jurisdictional and watershed-scale programs to address the HPWQCs.

2.2 Priority and Highest Priority Water Quality Conditions

The WQIP identifies the PWQCs on the basis of an assessment of receiving water conditions, MS4 discharges and their potential impacts, and the sources of pollutants in the watershed. The PWQCs for the Los Peñasquitos WMA are summarized by the beneficial use and pollutant category in Figure 2-2. Details about the PWQC selection process and a full list of the PWQCs are in Appendix A and Appendix F, respectively, of the Los Peñasquitos WMA WQIP.

The HPWQCs are the foundation for establishing the WQIP numeric goals and schedules and selecting water quality improvement strategies to achieve the necessary improvements in the quality of MS4 discharges and/or receiving waters. Table 2-1 details the following conditions/pollutants as highest priorities within the Los Peñasquitos WMA. The HPWQCs are highlighted in bold in Figure 2-2.

Table 2-1
Highest Priority Water Quality Conditions in the Los Peñasquitos WMA

<table>

Intentionally Left Blank

2.3 WQIP Numeric Goals

In the WQIP, the Responsible Agencies identified and developed specific water quality improvement numeric goals and strategies to address the HPWQCs identified within the WMA. The numeric goals (interim and final) and corresponding schedules support implementation of the WQIP and measure reasonable progress toward addressing the HPWQCs. In addition, the Responsible Agencies' monitoring and assessment programs measure progress toward attaining these goals.

The numeric goals for the Los Peñasquitos WMA are presented in detail by jurisdiction in Appendix B.

The goals extend beyond the timeframe of the current MS4 Permit. For this reason, the numeric goals within the WQIP are categorized into three distinct time periods:

1. Interim goals within the five-year MS4 Permit term. These goals are typically specific to each Responsible Agency's jurisdiction.
2. Interim goals based on the interim Bacteria TMDL and Sediment TMDL (Regional Board, 2012) compliance pathways.
3. Final goals based on final Bacteria TMDL and Sediment TMDL compliance options.

The timelines for the Los Peñasquitos WMA bacteria and sediment numeric goals are illustrated in Figure 2-3 and Figure 2-4, respectively.

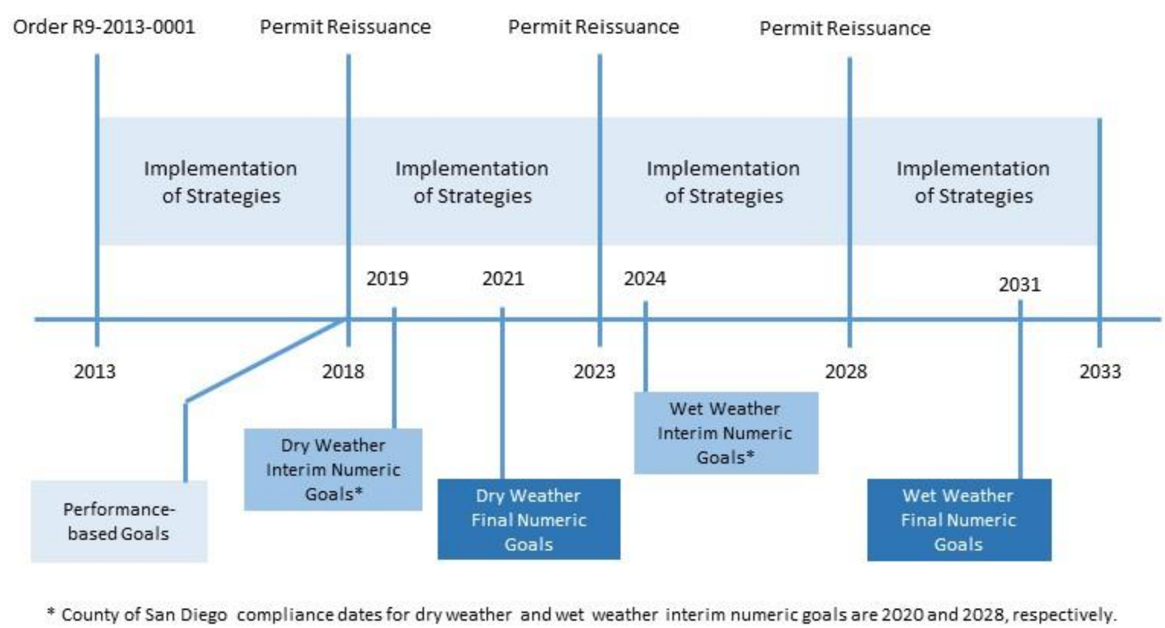

Figure 2-3
Timelines and Relationships for Bacteria TMDL Numeric Goals

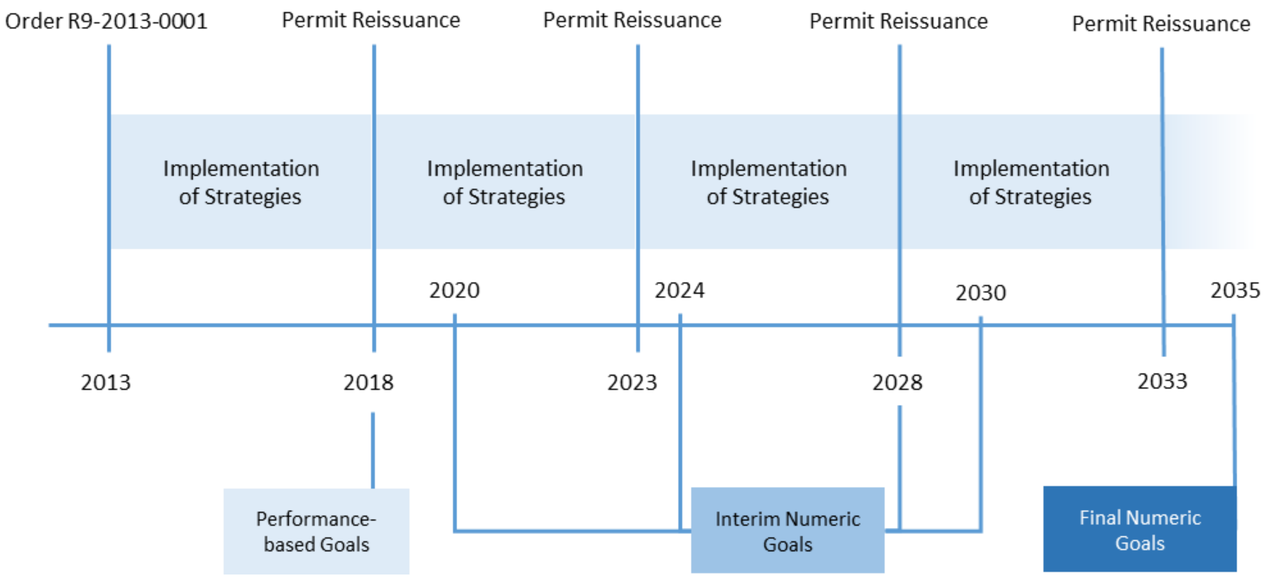

Figure 2-4
Timelines and Relationships for Sediment TMDL Numeric Goals

3 Monitoring and Assessment

The Los Peñasquitos Lagoon is one of the few remaining coastal lagoons in southern California and Torrey Pines State Beach at Del Mar near the Los Peñasquitos Lagoon mouth is a popular state beach. These two important water bodies encompass the HPWQCs in the Los Peñasquitos WMA.

This section discusses the monitoring related to maintaining salt marsh habitat in the Los Peñasquitos Lagoon and water contact recreation uses at the Pacific Ocean Shoreline. Monitoring related to the 2013–2018 MS4 Permit term and interim/final goals is detailed, including tracking of performance-based goals, receiving water monitoring for TMDL compliance, vegetation monitoring in the Los Peñasquitos Lagoon, MS4 monitoring, and special studies.

3.1 Monitoring Related to Performance Based Goals

The Responsible Agencies have established dry and wet weather goals for the 2013–2018 MS4 Permit term. Tables 3-1 and 3-2 summarize the data collected during the 2015–2016 monitoring year to assess progress toward meeting fiscal year (FY) 18 goals.

Table 3-1
Dry Weather Monitoring Related to Performance Based Goals

Jurisdiction	Highest Priority Water Quality Condition	Performance-Based Goal	Monitoring Element
City of Del Mar	Impairment of EST and BIOL in the Los Peñasquitos Lagoon from freshwater discharge Potential impairment of REC-1 along the Pacific Ocean Shoreline at Torrey Pines State Beach at Del Mar from Indicator Bacteria	Reduce anthropogenic surface dry weather flows[1] that originate within Del Mar's jurisdictional boundaries by 10%	Collected flow measurements at selected MS4 outfalls Sampling Days: 2 Field site visits: 15
City of Poway	Impairment of EST and BIOL in the Los Peñasquitos Lagoon due to freshwater discharge Potential impairment of REC-1 along the Pacific Ocean Shoreline at Torrey Pines State Beach at Del Mar due to indicator bacteria	Achieve a 5% increase in turf conversion from the baseline	Tracked the implementation of turf conversion, including turf conversion increase

Jurisdiction	Highest Priority Water Quality Condition	Performance-Based Goal	Monitoring Element
City of San Diego	Impairment of EST and BIOL in the Los Peñasquitos Lagoon due to freshwater discharge Potential impairment of REC-1 along the Pacific Ocean Shoreline at Torrey Pines State Beach at Del Mar due to indicator bacteria	Develop a green infrastructure policy, attain City Council approval, and construct green infrastructure BMPs to improve water quality from 36 acres of drainage area	Tracked the acres of drainage area treated by green infrastructure BMPs
		Reduce the prohibited[2] dry weather flow from baseline measured at persistently flowing outfalls during dry weather by 10%	Collected flow measurements at persistently flowing outfalls. Sampling Days: 37
County of San Diego	Impairment of EST and BIOL in the Los Peñasquitos Lagoon due to freshwater discharge Potential impairment of REC-1 along the Pacific Ocean Shoreline at Torrey Pines State Beach at Del Mar due to indicator bacteria	Eliminate anthropogenic dry weather flows[1] from storm drain outfalls either by aggregate flow volume or the number of persistently flowing outfalls during dry weather	Determine baseline for number and aggregate flow in 2016

1. The term “dry weather flows” excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.
2. Does not include allowable discharges as defined in Provision A and Provision E.2.a of the MS4 Permit.

% = percent; BIOL = biological habitat beneficial use; BMP = best management practice; EST = estuarine habitat beneficial use; MS4 = municipal separate storm sewer system; REC-1 = water contact recreation beneficial use

Table 3-2
Wet Weather Monitoring Related to Performance Based Goals

Jurisdiction	High Priority Water Quality Condition	Performance-Based Goal	Monitoring Element
City of Del Mar	Potential impairment of REC-1 along the Pacific Ocean Shoreline at Torrey Pines State Beach at Del Mar due to indicator bacteria	Reduce anthropogenic surface dry weather flows[1] that originate within Del Mar's jurisdictional boundaries by 10% to address bacteria regrowth contributing during wet weather	Collected flow measurements at selected MS4 outfalls during dry weather Sampling Days: 2 Field site visits: 15
City of Poway	Impairment of EST and BIOL in the Los Peñasquitos Lagoon due to sediment Potential impairment of REC-1 along the Pacific Ocean Shoreline at Torrey Pines State Beach at Del Mar due to indicator bacteria	Achieve a 5% increase in turf conversion from the baseline	Tracked the implementation of turf conversion, including turf conversion increase
City of San Diego	Impairment of EST and BIOL in the Los Peñasquitos Lagoon due to Sediment Potential impairment of REC-1 along the Pacific Ocean Shoreline at Torrey Pines State Beach at Del Mar due to indicator bacteria	Develop a green infrastructure policy, attain City Council approval, and construct green infrastructure BMPs to improve water quality from 36 acres of drainage area	Tracked the acres of drainage area treated by green infrastructure BMPs
County of San Diego	Potential impairment of REC-1 along the Pacific Ocean Shoreline at Torrey Pines State Beach at Del Mar due to indicator bacteria	Implement program strategies to meet FY 18 goal	See Section 4.1.4 for details

1. The term "dry weather flows" excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.

% = percent; BIOL = biological habitat beneficial use; BMP = best management practice; EST = estuarine habitat beneficial use; MS4 = municipal separate storm sewer system; REC-1 = water contact recreation beneficial use

3.2 Monitoring Related to Interm and Final Goals

The Responsible Agencies have implemented the Monitoring and Assessment Program outlined in Section 5 of the Los Peñasquitos WMA WQIP to track progress toward meeting long-term WQIP goals. The program includes receiving water monitoring, MS4 outfall monitoring, and the designated special studies. This section provides an overview of the monitoring conducted to track this progress through this reporting period. The full details of the monitoring results are in Appendix C.

Los Peñasquitos WMA Sediment TMDL Compliance Monitoring Program

The Sediment TMDL Compliance Monitoring Program has two components including a sediment monitoring component for the upper watershed and vegetation monitoring component at the lagoon. The sediment component monitors suspended sediment concentrations (SSC), conducts volumetric streambed sampling and pebble counts for particle-size distribution, and estimates wet weather sediment loads in each of the WMA's three major tributary creeks during wet weather. Bedload samplers were installed with each wet weather event and each sampling location. Pebble counts were conducted prior to the first monitored wet weather event and after each monitored event to document changes in the streambed composition. The vegetation component includes annual vegetation monitoring in the Los Peñasquitos Lagoon to track vegetation changes over time. The Responsible Agencies are collaborating with the Los Peñasquitos Lagoon Foundation to represent the vegetation data in an appropriate and consistent manner.

Section 2.6 of Appendix C provides more information about the sampling performed in the 2015–2016 monitoring year and Attachment B of Appendix C provides the Sediment TMDL Compliance Monitoring Report. The data collected as part of this program will be used to assess the receiving water and lagoon restoration compliance pathways in future years. A summary of the results from the 2015–2016 monitoring year includes the following:

- SSCs were higher at or near peak flow and during the rising limb of the hydrograph for smaller storms such Events 2 and 3 during the 2015–2016 wet season. For the larger storm (Event 1), SSCs in all three WMA creeks remained high throughout the storm and mostly varied with flow, suggesting that the unusually high flows may have mobilized previously deposited sediments that were stored by in-channel vegetation and streambed.
- The total 2015–2016 sediment load estimate of 23,500 tons per year is above the final Sediment TMDL waste load allocation (WLA) (2,580 tons per year). This is one TMDL compliance pathway that can be achieved by 2034. Monitoring in previous years has recorded annual sediment loads that were below the WLA.

Bacteria TMDL Compliance Monitoring Program

The Bacteria TMDL Compliance Monitoring Program monitors bacteria indicators at the historical California Assembly Bill 411 (AB 411) monitoring location in San Diego County at the mouth of the Los Peñasquitos Lagoon. Monitoring occurred as required during both dry and wet weather.

Wet weather monitoring was conducted at the monitoring location during three storm events during the wet season (October 1 through April 30). During the recreation season (April 1 through October 31), samples are collected at monitoring location five times per month consistent with AB 411 requirements, and during dry periods of the wet season (November 1 through March 31) on a monthly basis per Bacteria TMDL requirements. Samples were collected on dry weather days, after an antecedent dry period of 72 hours with less than 0.1 inch of rainfall. Grab samples were collected in a manner consistent with requirements of the AB 411 program and were analyzed for total coliform, fecal coliform, and *Enterococcus*.

Section 2.7 of Appendix C provides more information on the sampling performed in the 2015–2016 monitoring year and Attachment A of Appendix C provides the Bacteria TMDL Compliance Monitoring Report. The data collected as part ofthis program will be used to assess the receiving water compliance pathway in future years. The results of the 2015–2016 monitoring year are summarized as follows:

- ❖ During wet weather, the receiving waters at the Los Peñasquitos River Outlet/Beach achieved a 0% single-sample maximum exceedance frequency for fecal coliform and a 13% single-sample maximum exceedance frequency for total coliform and *Enterococcus*. FM-100 is in compliance with final wet weather single-sample maximum receiving water limitations (RWLs).
- ❖ During the wet season, which evaluates a combination of both wet and dry weather samples, FM-100 achieved a 0% geometric mean exceedance frequency and is in compliance with final dry weather geometric mean RWLs.
- ❖ During the dry season, when recreational activities occur with more regularity, FM-100 achieved a 0% exceedance frequency and is in compliance with the final dry weather geometric mean RWLs.

Los Peñasquitos WMA MS4 Outfall Monitoring

The Responsible Agencies implemented the dry and wet weather MS4 outfall monitoring program, as detailed in Section 5 of the WQIP. The dry weather MS4 monitoring program is a combination of field screening and collection of samples at persistently flowing major outfalls. Field screening includes visual monitoring of all major MS4 outfalls to identify and eliminate sources of persistently flowing non-storm water discharges. This information is also used to track the progress of some of the 2018 MS4 Permit term goals.

Water quality sample collection provides information on the impact of MS4 outfalls on receiving water quality during dry weather. The goal of the wet weather MS4 monitoring program is to identify pollutants in storm water discharges from the MS4s and to guide pollutant source identification efforts by collecting paired water quality samples and flow data. Annually, the data from the dry weather program are compared with the non-storm water action levels and data from the wet weather program are compared with the storm water action levels. During the current monitoring year, in dry weather non-storm water action levels were met over 74% of the time for multiple consituents and in wet weather only one storm water action level exceedance for turbidity was recorded.The data collected as part of this program will be used to assess the MS4 outfall compliance pathway toward reaching interim and long-term goals in future years. Total suspended solids (TSS) concentrations and bacteria indicator concentrations are measured during both dry and wet weather sampling to assess sediment and bacteria concentrations loads, respectively.

Table 3-3 summarizes the number of major outfalls visited during the 2015–2016 monitoring year for each Responsible Agency, along with the dates of the analytical monitoring. The County of San Diego does not have any major outfalls in the Los Peñasquitos WMA, but did monitor 28 minor outfalls twice during this reporting period. No flows were detected at these sites. Sections 3 and 4 of Appendix C provide more information on dry and wet weather MS4 monitoring programs, respectively. Attachments C and D (Dry and Wet Weather Assessments) of Appendix C provide detailed calculations with regard to the these monitoring programs. The data collected as part of this program will be used to assess MS4 compliance pathways in future years.

Table 3-3
Number of Major MS4 Outfalls Monitored During the 2015–2016 Monitoring Year

Jurisdiction	Number of Major Outfalls Visited Per Year				
	Field Screening[1]	Dry Weather Monitoring		Wet Weather Monitoring	
		Number of Sites[2]	Dates	Number of Sites[2]	Dates
City of Del Mar	3 (1)[3]	1	6/30/2016 8/12/2016	1	1/30/2016
City of Poway	30 (37)[3]	5	7/28/2016 7/29/2016 8/2/2016 8/2/2016	3	3/5/2016
City of San Diego	198 (198)[4]	5	2/4/2016 3/16/2016 4/25/2016	1	1/30/2016
County of San Diego	28[5]	0[5]	NA	0[5]	NA

1. Field screening represents the number of major MS4 outfalls visited in the 2015–2016 monitoring year. Total number of major outfalls within each jurisdiction in the WMA is provided in parentheses.
2. Number of sites represents the number of outfalls with priority persistent flows selected for dry weather water quality sampling.
3. For Copermittees with fewer than 125 major outfalls in the WMA, 80% of major outfalls must be screened twice per year.
4. For Copermittees with portions of their jurisdictions in more than one WMA and more than 500 major MS4 outfalls in their jurisdictions, at least 500 major outfalls must be inspected once per year.
5. There are 28 minor outfalls but no major outfalls have been identified within the County of San Diego for this WMA. Therefore, no water quality data was collected by the County of San Diego at major MS4 locations in the Los Peñasquitos WMA.

NA = not applicable

Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Study

The Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Study characterized potential sediment sources contributing to the lagoon by conducting wet weather stream monitoring and dry weather aerial deposition monitoring. Monitoring was conducted concurrently with the Sediment TMDL Monitoring Program, which monitors total sediment loads into the lagoon from the outlet of each of the three subwatersheds. Section 5.1 of Appendix C provides more information on this special study and Attachment E of Appendix C provides the Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Study Final Report.

This study identified reaches within each subwatershed stream reaches that may warrant further investigation. These areas include two reaches within the Carroll Canyon Creek subwatershed including a reach of Carroll Canyon Creek that runs through the gravel mine operations and the immediate reach downstream of the gravel mine. Other reaches are located in the upper portions of both the Los Peñasquitos Creek subwatershed and the Carmel Valley Creek subwatershed. The study found that these areas have the potential to serve as a sink for sediment within the WMA and the sediment can be mobilized during large storms such as the storm in early January 2016. Carmel Valley Creek loads are consistently much smaller than those of the other two subwatersheds, making it a low priority for management measures. The aerial deposition sampling determined that aerial deposition of sediment was not a significant contributor to the watershed sediment loads compared with the stream loads.

Outfall Repair and Relocation Study

The Sediment Load Reduction Quantification Through Outfall Repair and Relocation for the Los Peñasquitos WMA Study was performed in order to assess the current sediment loading to the Los Peñasquitos Lagoon caused by the erosive scour associated with outfall discharge, as well as possible sediment load reductions associated with various BMPs. The load estimations from 102 City of San Diego outfalls resulted in a load of 85 tons per year that accounts for approximately 1.4% of the total sediment load for the watershed. Of these 102 outfalls, 42 were identified as “high priority” outfalls because of their high annual sediment load production.

Three types of BMPs were investigated to estimate the amount of the loading that could potentially be reduced or eliminated. It was determined that the total sediment load modeled could be reduced by implementing the following BMP practices at the 42 high priority outfalls:

- 50% reduction in sediment through outfall relocation (extending storm water conveyance infrastructure from a location near the top of a canyon to one near the valley floor);
- 79% reduction in sediment by installing energy dissipation structures (placing materials below the outfall that reduce the energy of incoming storm flows); and
- 84% reduction in sediment by implementing regenerative storm water conveyance (RSC) practices (a relatively new BMP intended to treat storm water through a series of energy dissipation structures and small retention ponds).

San Diego Regional Reference Streams and Beaches Study

The San Diego Regional Reference Streams and Beach Study (Southern California Coastal Water Research Project [SCCWRP], 2015 and SCCWRP, 2016) characterizes the natural background concentrations of bacteria from natural streams and beaches in a condition minimally disturbed by anthropogenic activities, referred to as a “reference” condition. These data are being used during the Bacteria TMDL Reopener to revisit the Bacteria TMDL numeric targets based on current data and United States Environmental Protection Agency (USEPA) policy, which may lead to revised terms of compliance. The Bacteria TMDL Reopener is in progress and is expected to be completed in 2017. Section 5.2 of Appendix C provides more information on this special study.

Intentionally Left Blank

4 Implementation and Progress Toward Achieving Numeric Goals

The MS4 Permit requires the Responsible Agencies to develop specific water quality improvement numeric goals and strategies to address the HPWQCs identified for the Los Peñasquitos WMA. Each year, the Responsible Agencies assess specific water quality data and programmatic information to gauge progress toward achieving the numeric goals. These assessments provide information to determine whether intended outcomes are being realized or whether adaptations of Responsible Agencies' programs are necessary. This section discusses the strategies that have been implemented during the reporting period and the progress toward achieving specific MS4 Permit term goals for the watershed. Many of the selected strategies necessarily target the WMA HPWQCs, but many address other pollutants as well, providing a multi-benefit approach to implementation.

4.1 Strategies and Schedules

The strategies being implemented by the Responsible Agencies are the activities that enable improvements in water quality to achieve the numeric goals outlined in Section 2.3. Strategy selection considered the following:

- Responsible Agencies emphasized strategies that target HPWQCs and provide multiple benefits.
- Responsible Agencies considered the triple bottom line, evaluating the environmental, economic, and social components of the strategies.
- Strategies that improve and promote cooperation and collaboration between the Responsible Agencies and other governmental agencies (WMA groups, Caltrans, water districts, school districts) and other entities, such as private or non-profit organizations, were also given priority. Responsible Agencies also continually collaborate with internal jurisdictional departments.

The success of the strategies will ultimately be measured against the interim and final numeric goals.

In general, all Responsible Agencies are collectively implementing both JRMP-required[2] and optional nonstructural BMPs throughout the Los Peñasquitos WMA to achieve dry and wet weather load reduction goals. As implementation continues and progress is evaluated, distributed and regional structural BMPs will be implemented as needed to meet interim and final goals as funding becomes available. Figure 4-1 shows the different types of strategies implemented by Responsible Agencies to meet WQIP goals.

[2] Caltrans does not have a JRMP.

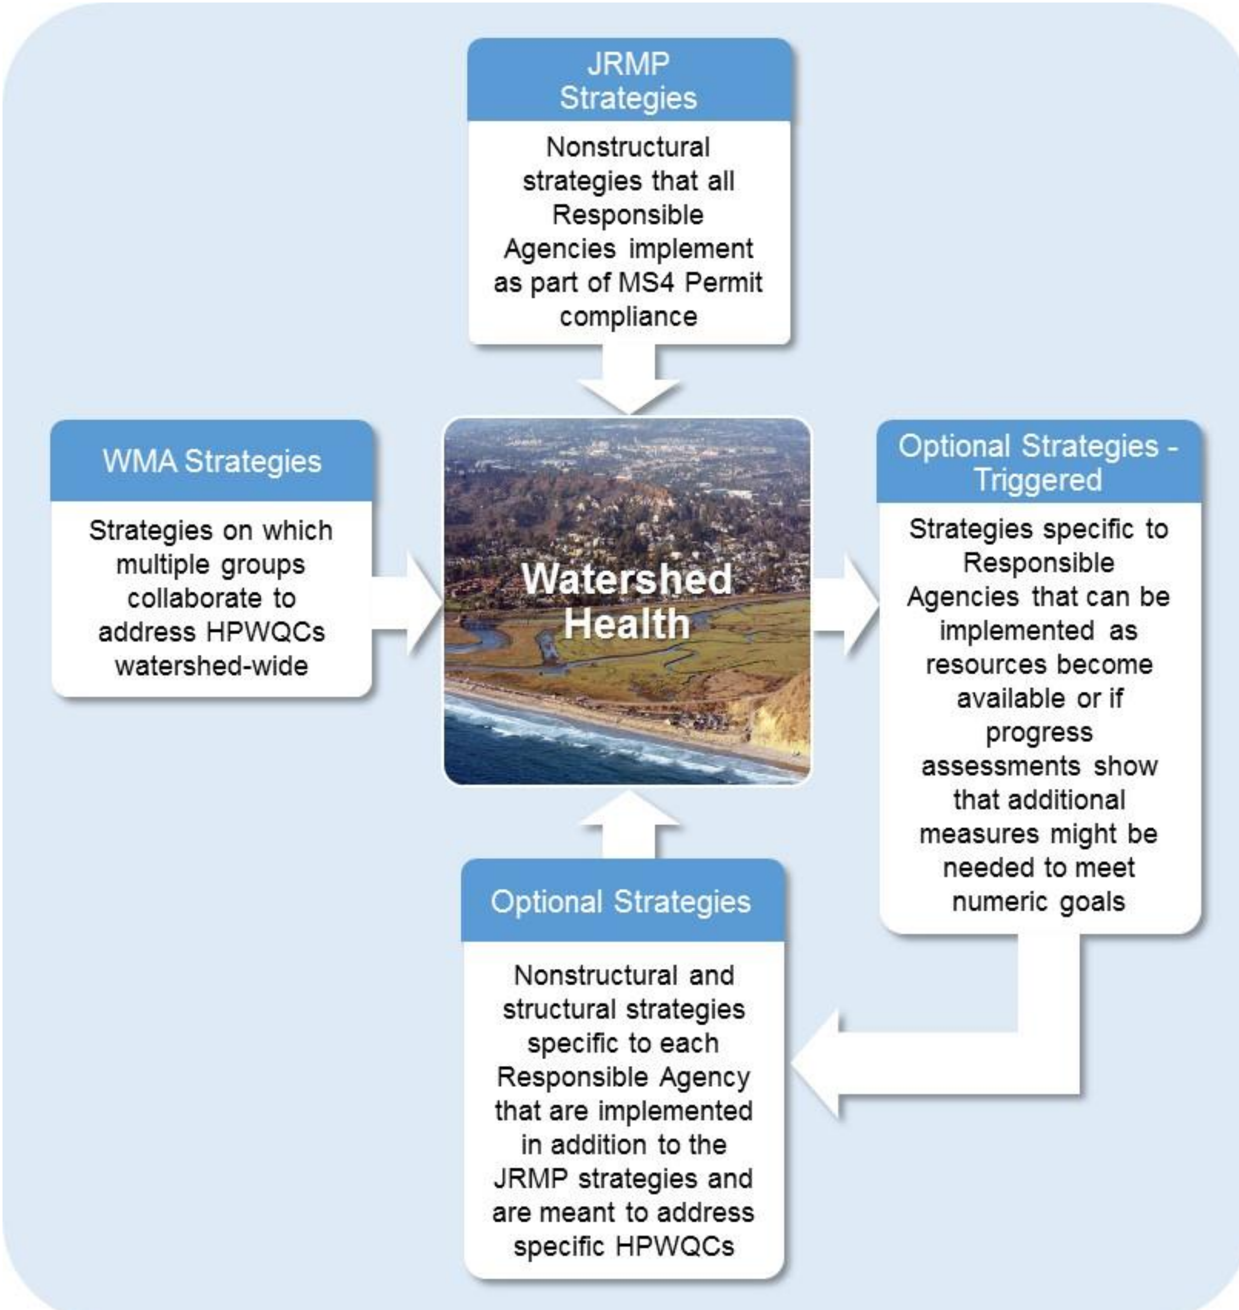

Figure 4-1
Strategies Implemented by Responsible Agencies to Meet WQIP Goals

JRMP strategies implemented by all Responsible Agencies during the reporting period throughout the Los Peñasquitos WMA are summarized by program element in Table 4-1. Detailed jurisdictional strategies are included in Appendix D. Within the detailed strategies tables, information is presented to indicate whether the strategy was implemented during this reporting period, whether it will continue to be implemented during the next reporting period, or whether the strategy will be modified or eliminated for the coming year(s).

Nonstructural strategies reduce pollutant loading to the MS4 by reducing pollutant generation at the source and/or by reducing mobilization of pollutants to the MS4, and either directly or ultimately to receiving waters. Programs designed to attenuate the effects of irrigation runoff, landscaping practices, and pet waste on receiving water quality are primary examples of nonstructural approaches that the Responsible Agencies in the Los Peñasquitos WMA have employed during this MS4 Permit term. The key strategies for each Responsible Agency are described in more detail below in Sections 4.1.1 through 4.1.4, and WMA strategies are presented in Section 4.1.5.

Intentionally Left Blank

Table 4-1
Jurisdictional Runoff Management Program Strategies Implemented in 2015–2016 by All Responsible Agencies

Strategy	Pollutants Addressed						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
Jurisdictional Runoff Management Program (JRMP) (E.2-E.7) Strategies							
E.3 Development Planning							
All Development Projects							
Establish guidelines and standards for all development projects and public low-impact development (LID) best management practices (BMPs); provide technical support related to implementation of source control BMPs to minimize pollutant generation at each project and implement LID BMPs to maintain or restore hydrology of the area or implement easements to protect water quality, where applicable and feasible. Provide education and outreach to the development community regarding requirements of the Municipal Separate Storm Sewer System (MS4) Permit, Water Quality Improvement Plan (WQIP), and BMP updates.	X	X	X	X	X	X	X
Priority Development Projects (PDPs)							
For PDPs, administer a program and provide technical support to other internal departments to ensure implementation of on-site structural BMPs to control pollutants and manage hydromodification by developing storm water development standards and design guidelines. Includes confirmation of design, construction, and maintenance of PDP structural BMPs. Update the BMP Design Manual to determine nature and extent of storm water requirements applicable to development projects and to identify conditions of concern for selecting, designing, and maintaining appropriate structural BMPs.	X	X	X	X	X	X	X

Table 4-1 (continued)
Jurisdictional Runoff Management Program Strategies Implemented in 2015–2016 by All Responsible Agencies

Strategy	Pollutants Addressed						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
E.4 Construction Management							
Administer a program to oversee implementation of temporary BMPs that control sediment and other pollutants during the construction phase of projects. Includes requirements to inspect at appropriate frequencies and effectively enforce requirements through process controlled by other internal departments.			X	X	X	X	
E.5 Existing Development							
Commercial, Industrial, Municipal, and Residential Facilities and Areas							
Administer a program to require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types, and pollutant-generating activities (PGAs), as appropriate. Includes inspection of existing development at appropriate frequencies and using appropriate methods. Update minimum BMPs for existing residential, commercial, and industrial development. Review policies and procedures to ensure discharges from swimming pools meet permit requirements.	X	X	X	X	X	X	X
MS4 Infrastructure							
Implement operation and maintenance activities (inspection and cleaning) for MS4 and related structures (catch basins, storm drain inlets, channels as allowed by resource agencies, detention basins, pump stations, etc.) for water quality improvement and for flood control risk management. Includes inspecting and cleaning catch basins, implementing controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers, and repairing and replacing MS4 components.	X	X	X	X	X		

Table 4-1 (continued)
Jurisdictional Runoff Management Program Strategies Implemented in 2015–2016 by All Responsible Agencies

Strategy	Pollutants Addressed						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
Roads, Streets, and Parking Lots							
Implement operation and maintenance activities for public streets, unpaved roads, paved roads, and paved highways. Implement street sweeping.	X	X	X	X	X		
Pesticides, Herbicides, and Fertilizer BMP Program							
Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education.		X					X
Retrofit and Rehabilitation in Areas of Existing Development							
Develop a strategy and identification of candidate areas of existing development necessary for implementing retrofit projects and facilitate the implementation of such projects.	X	X	X	X	X	X	X
Develop a strategy and identify candidate areas necessary to implement stream, channel, or habitat rehabilitation projects and facilitate implementation of such projects.	X	X	X	X	X	X	X
E.2 Illicit Discharge, Detection, and Elimination (IDDE) Program							
Implement the Illicit Discharge, Detection, and Elimination (IDDE) Program per the JRMP. Requirements include maintaining an MS4 map, using municipal personnel and contractors to identify and report illicit discharges, maintaining a hotline for public reporting of illicit discharges, monitoring MS4 outfalls, and investigating and addressing any illicit discharges.	X	X	X	X	X	X	X

Table 4-1 (continued)
Jurisdictional Runoff Management Program Strategies Implemented in 2015–2016 by All Responsible Agencies

Strategy	Pollutants Addressed						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
E.7 Public Education and Participation (B.3.b(1)(a)(iii))							
Implement a public education and participation program to promote and encourage development of programs, management practices, and behaviors that reduce the discharge of pollutants in storm water prioritized by high-risk behaviors, pollutants of concern, and target audiences. Enhanced school and recreation-based education and outreach, of which may include irrigation reduction issues, integrated pest management (IPM) for residents and businesses, and implementation and education of pet waste program. Promote and encourage implementation of designated BMPs in commercial and industrial areas.	X	X	X	X	X	X	X
E.6 Enforcement Response Plan							
Continue to implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Storm Water Code Enforcement Unit's Standard Operating Procedures (SOPs) – Enforcement Response Plan.	X	X	X				

1. Highest priority water quality conditions are highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters.

4.1.1 City of Del Mar

During FY 16, Del Mar implemented the strategies described in the WQIP. Highlights of strategies implemented by Del Mar to address sediment, bacteria, and freshwater input are described below. The full list of strategies implemented is in Appendix D. Additional strategies being implemented are listed in Table 4-2.

- **Enhanced Dry Weather Patrols and BMP Inspections:** The City of Del Mar implements a proactive patrol of the entire city at least six times per year. City staff patrol municipal, commercial, residential, and construction areas and locations to identify any potential illicit discharges and improper BMP implementation. In addition, treatment control BMPs and all minor and major MS4 outfalls are inspected during patrols. For FY 16 Del Mar conducted 11 city-wide patrols (~monthly) and was able to enforce proper BMP implementation throughout the city.
- **Post-Storm Erosion Monitoring:** The City of Del Mar visually monitored for erosion and completed minor repair and slope stabilization after wet weather events within the City's jurisdiction of the Los Peñasquitos WMA to address sediment.

Table 4-2
Summary of Strategies for the Los Peñasquitos WMA —City of Del Mar

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
Promoted and collaborated with water agencies and other groups to encourage implementation of water conservation programs that improve water quality by reducing over-irrigation with smart products or turf replacement and capturing rain water in residential areas.	X	X	X	X	X	X	X
Continued participating in source reduction initiatives.	X	X	X	X	X	X	X
Proactively monitored for erosion and complete minor repair and slope stabilization as needed.	X	X	X	X	X	X	X
Protected areas that are functioning naturally.	X	X	X	X	X	X	X
Participated in the San Diego Regional Reference Streams and Beaches Study (see Section 3.2 for study details).		X					
Visually inspected all major and minor MS4 outfalls.	X	X	X	X	X	X	X

1. Highest priority water quality conditions are highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters.

MS4 = municipal separate storm sewer system

4.1.2 City of Poway

During FY 16, Poway implemented the strategies described in the WQIP. Key strategies being implemented are listed in Table 4-3. The full list of strategies implemented is in Appendix D.

Table 4-3
Summary of Strategies for the Los Peñasquitos WMA—City of Poway

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
Required implementation of low-impact development (LID) best management practices (BMPs) with all new construction.	X	X	X	X	X	X	X
Promoted Metropolitan Water District of Southern California (MWD) and other groups to encourage implementation of water conservation programs that improve water quality by reducing over-irrigation with smart products or turf replacement and capturing rain water in residential areas.	X	X	X	X	X	X	X
Proactively repaired and replaced corrugated metal pipe municipal separate storm sewer system (MS4) components to provide source control from MS4 infrastructure.	X	X	X		X		
Targeted human behavior in parks and other public areas, including trash reduction or other high-impact behaviors that affect habitat, wildlife, and water quality.	X	X		X			X
Participated in the Los Peñasquitos Watershed Special Study (see Section 3.2 for study details).					X		
Participated in the San Diego Regional Reference Streams and Beaches Study (see Section 3.2 for study details).	X	X			X		
Implemented numerous green infrastructure; multiuse treatment area; stream, channel, and habitat rehabilitation; and other structural projects located throughout the watershed (see Appendix D for a list of specific projects).	X	X	X	X	X	X	X

1. Highest priority water quality conditions are highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters.

4.1.3 City of San Diego

During FY 16, City of San Diego (City) implemented the strategies described in the WQIP. Highlights of strategies implemented by City of San Diego to address sediment, bacteria, and freshwater input are described below. The full list of strategies implemented is in Appendix D. Additional strategies being implemented are listed in Table 4-4.

- **Special Study (New in FY 16):** The Sediment Load Reduction Quantification through Outfall Repair and Relocation for the Los Peñasquitos WMA Study was completed to assess the current sediment loading to the Los Peñasquitos Lagoon caused by erosive scour associated with outfall discharge, as well as possible sediment load reductions associated with various BMP practices. Potential next steps include completing field verifications of the modeled sediment loads and/or monitoring to validate model results. In addition, a cost benefit analysis and evaluation of challenges associated with implementation of BMP practices will be considered. *HPWQC: sediment*

- **Enhanced Street Sweeping and Catch Basin Cleaning (New in FY 16):** The City began steps toward increasing staff and equipment to fully implement enhanced street sweeping and catch basin cleaning. In addition, enhanced street sweeping routes are being developed and a schedule for increasing the number of annual catch basin inspections has been established. *HPWQCs: bacteria, sediment*

- **Structural Strategies:** 113.15 acres of drainage area were treated by green infrastructure features in the Los Peñasquitos WMA. *HPWQCs: bacteria, sediment, flow*

- **Los Peñasquitos Lagoon Restoration Efforts (New in FY 16):** The Los Peñasquitos/Sorrento Restoration Program has been divided into two phases. Phase I of this project includes removal of sediment and construction of sediment management facilities, repairs to storm drain outfalls, and realignment of creeks in the Lagoon to ease water flow, reduce upstream flooding, and improve habitat conditions, as well as pilot restoration activities. Phase II of this project includes a large-scale restoration of salt marsh habitat in the lagoon to meet TDML requirements. The City has been identify as the Lead Agency and is working in collaboration with the Responsible Agencies, State Parks, the Coastal Conservancy, the Los Peñasquitos Lagoon Foundation, and other stakeholders. Modeling was completed in FY 16 to confirm the preferred alternative for the Lagoon restoration. Additionally, several biological technical studies were completed for Phase I of the project. Next steps for FY 17 include additional modeling, completion of the concept design, and commencement of the public outreach process. *HPWQCs: sediment, flow*

Table 4-4
Summary of Strategies for the Los Peñasquitos WMA—City of San Diego

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
Storm Drain Structure Cleaning: 7,087 storm drain structure inspections were conducted, resulting in the cleaning of 1,045 structures and removal of 386.5 tons of debris in the watershed management area (WMA).	X		X	X	X		
New in fiscal year (FY) 16: Enhanced Catch Basin Cleaning Optimization: Enhanced catch basin cleaning is a strategy to address pollutant removal by inspecting catch basins more than the Jurisdictional Runoff Management Program (JRMP)-required minimum of once per year in the Tijuana River, San Diego Bay, and Los Peñasquitos WMAs to meet specific total maximum daily load (TMDL) pollutant removal requirements. In an effort to further optimize its drain cleaning program, the City of San Diego (City) analyzed eight years of catch basin cleaning data and assigned priorities to individual basins based on historical debris removal. This enhancement will allow the City to target high priority drains to maximize pollutant removal while maintaining cost efficiencies.	X		X	X	X		
Street Sweeping: Approximately 21,030 curb miles of roads, streets, highways, medians, parking lots, and operations yards were swept in the WMA.	X	X	X	X	X		
New in FY 16: Median Sweeping: 4,315 median miles were swept citywide.	X	X	X	X	X		
New in FY 16: Targeted Aggressive Street Sweeping Pilot: The City completed a pilot study that quantified the effectiveness of posting limited-hour "no parking" signs on typically non-posted routes. The study found that posting routes resulted in an approximate 50 percent (%) increase in pollutant removal because the sweeper had more access to curbs and gutters. Based on this finding, the City will consider posting additional routes if supported by the community.	X	X	X	X	X		

Table 4-4 (continued)
Summary of Strategies for the Los Peñasquitos WMA—City of San Diego

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
New in FY 16: MS4 Maintenance: In addition to routine maintenance of the MS4, the City repaired or replaced 12 pump stations and modernized another 14 pump stations, closed-circuit television (CCTV) surveyed 28,000 linear feet of pipe in 62 locations citywide, and began the development of the Waterways Maintenance Plan and Channel **Maintenance Prioritization Plan.** To help minimize the risk of flooding in a flood-prone drainage area, the City also installed a 2,400-volt automatic transfer switch and generator to a 130,000 gallon-per-minute pump station, allowing for sustained function in the event of a power outage.	X		X	X	X		
IDDE Program: 353 discharges were reported by the public, 518 cases were investigated, 429 discharges or illicit connections were eliminated, 436 enforcement actions were issued, and 197 escalated enforcement actions were issued in the WMA. **New in FY 16: Launch of the Get It Done App**: This app allows illicit discharges to be reported quickly via any smartphone. Lastly, the Tiger Team (a proactive escalated monitoring and enforcement team that involves multiple City departments and divisions) was developed to identify, locate, and eliminate sources of human specific bacteria in the MS4. Over several months during the reporting year, one problem area within the City was investigated extensively and a source of human-specific bacteria in the MS4 was identified and abated.	X	X	X	X	X	X	X

Table 4-4 (continued)
Summary of Strategies for the Los Peñasquitos WMA—City of San Diego

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
Commercial and Industrial Business Inspections: 1,673 inspections were completed, 276 follow-up inspections were completed, 425 violations were issued, 538 enforcement actions were issued, and 156 escalated enforcement actions were issued in the WMA. In addition, the City conducted property-based inspections that focus on common areas/activities shared among multiple businesses or tenants that generate pollution. A previously conducted pilot study on inspection practices found property-based inspections to be more effective at identifying and resolving water quality issues (e.g., improper trash disposal practices and irrigation runoff, etc.) associated with commercial and industrial businesses.	X	X	X	X	X	X	X
Trash Cleanups: 5 cleanup events were sponsored through community-based organizations and 5,468 pounds of trash and debris were collected in the WMA (see Appendix D for a list of specific projects).				X			
Rebates to Reduce Irrigation Runoff: Rebates were issued to convert 203,599 square feet of turf in the WMA and rebates for rain barrels were issued to capture 772,740 gallons of rainwater citywide.	X	X	X	X	X	X	X
New in FY 16: Offsite Alternative Compliance Program: The City implemented Phase I of the Alternative Compliance Program to give development projects that would require onsite structural best management practices (BMPs) the ability to propose offsite alternative compliance projects. The development of Phase II was also initiated and will include the establishment of an in-lieu fee structure and credit system.	X	X	X	X	X	X	X

Table 4-4 (continued)
Summary of Strategies for the Los Peñasquitos WMA—City of San Diego

Strategy	Multiple Benefits						
	Bacteria[1]	Nutrients	Metals	Trash	Sediment[1]	Flow[1,2]	Habitat/Wildlife
New in FY 16: Bacteria Regrowth Study: The City completed a study to characterize the magnitude and extent of potential *Enterococcus* loading due to regrowth within the City's storm drain system. This study quantifies the amount of bacteria in receiving water samples that are harmless to humans and could potentially be used to refine bacteria water quality standards of the Bacteria TMDL as a part of the Reopener process.	X						

1. Highest priority water quality conditions are highlighted in orange.
2. Flow is defined as storm water and non-storm water discharges to receiving waters, including freshwater inputs.

4.1.4 County of San Diego

During FY 16, County of San Diego (County) implemented the strategies described in the WQIP. Highlights of strategies implemented by the County of San Diego to address sediment, bacteria, and freshwater input are shown below. The full list of strategies implemented is in Appendix D.

- **Residential Area BMPs:** The County encourages BMPs in residential areas. All residential management areas were inspected in FY 16.
- **Water Conservation:** The County collaborates with and promotes the efforts of partner agencies for incentive programs such as rain barrels, water smart irrigation controllers, soil sensors, turf replacement programs, and residential landscape evaluation programs.
- **Green Streets:** The County developed green street retrofit design standards and specifications. Green streets are now being used to meet compliance for all retrofit and redeveloped road projects in the Capital Improvement Projects plan.
- **Public Education:** The County collaborates with the Regional Education Workgroup and Think Blue San Diego Region to develop and distribute educational materials.
- **Trash Generation Studies:** The County is collaborating with the Responsible Agencies to develop baseline trash generation rates.
- **Offsite Alternative Compliance:** The County supports applicant-implemented offsite alternative compliance. The Water Quality Equivalency provides the currency for structural BMPs and some natural system management practices.
- **Irrigation Runoff Prevention Study:** The County undertook a community-based social marketing pilot study on the effectiveness of irrigation runoff prevention materials.
- **Sustainable Landscapes:** The County is implementing a program to encourage landscape retrofits that replace water-intensive turf grass with landscaping that provides several environmental benefits.
- **Rain Barrel Incentives:** The County offers incentives for rain barrel installation by offering discounts on rain barrel purchases as well as rebates for rain barrel installation.

Additionally, the County recently undertook efforts to update its 2007 Low-Impact Development (LID) Handbook[3] to better align with the County's Standard Urban Storm Water Mitigation Plan (SUSMP) and Hydromodification Management Plan (HMP), and to reflect the most current data on LID approaches and their efficacy. For its distinguished efforts, the County was named the recipient of the 2015 Outstanding Innovation in Green Planning and Design Award by the San Diego Chapter of the California Association of Environmental Professionals (AEP), a non-profit organization established in 1974 and dedicated to enforcing and supporting the California Environmental Quality Act (CEQA). Additionally, the County received a similar award in October 2016 for work done during the fiscal year on development of its Guidance on Green Infrastructure, a document outlining tools to uniformly design, install, and maintain LID features in the public right-of-way (Figure 4-3). Additional strategies being implemented are listed in Table 4-5.

Figure 4-3

4.1.5 Optional WMA Strategies

In addition to implementing strategies on a jurisdictional basis, Responsible Agencies may collaboratively implement projects within the WMA that improve water quality, as described in Table 4-6.

Table 4-6
Optional WMA Strategies that Address Sediment, Bacteria, and Freshwater Input

WMA Strategy	Implementation Status Update
WMA-1: Watershed Collaboration for Los Peñasquitos Lagoon Restoration	The Los Peñasquitos/Sorrento Restoration Program has been divided into two phases. Phase I of this project includes removal of sediment and construction of sediment management facilities, repairs to storm drain outfalls, and realignment of creeks in the Lagoon to ease water flow, reduce upstream flooding, and improve habitat conditions, as well as pilot restoration activities. Phase II of this project includes a large-scale restoration of salt marsh habitat in the lagoon to meet total maximum daily load (TDML) requirements. The City has been identified as the Lead Agency and is working in collaboration with the Responsible Agencies, State Parks, the Coastal Conservancy, the Los Peñasquitos Lagoon Foundation, and other stakeholders. Modeling was completed in fiscal year (FY) 16 to confirm the preferred alternative for the Lagoon restoration. Additionally, several biological technical studies were completed for Phase I of the project. Please refer to Figure 4-4.
WMA-2: Los Peñasquitos Wetland Restoration Project	In coordination with Copermittees, Caltrans, and the San Diego Association of Governments (SANDAG) completed environmental and construction phases for various rail and transit, highway, and environmental protection projects.
WMA-3: Collaborative Approach to Irrigation Reduction	Responsible Agencies collaborated with water agencies to continue to implement turf replacement and rain barrel rebate programs. Additionally, various Responsible Agencies implemented irrigation reduction programs to help achieve the State-mandated reduction in water consumption.

Table 4-6 (continued)
Optional WMA Strategies that Address Sediment, Bacteria, and Freshwater Input

WMA Strategy	Implementation Status Update
WMA-4: Offsite Alternative Compliance Option (Watershed Management Area Analysis [WMAA])	Responsible Agencies implemented Phase I of the Alternative Compliance Program to give development projects that would require onsite structural BMPs the ability to propose offsite alternative compliance projects.
WMA-5: Collaboration with the Regional Board	Responsible Agencies continued to collaborate with the Regional Board to include non-Phase I MS4s in general permits, waivers, and waste discharge requirements (WDRs).
WMA-6: Refinement of Water Quality Regulations	Responsible Agencies coordinated with the Regional Board to discuss modifications to the Bacteria TMDL as part of the Reopener process.

Los Peñasquitos/Sorrento Restoration Program

DRAFT

Phase I- targeted for completion by 2023

1 Creek Restoration

Improved flood management within the Sorrento Valley corridor through flood creek enhancement in the upstream portion of the project. Creek enhancements may include improving capacity of existing creeks through removal of accumulated sediment and debris and increasing creek width in combination with sediment management efforts upstream of the Lagoon.

2 Sediment Management Facilities (Sorrento Valley - Phase I) (Conceptual)

Sediment management facilities are being proposed to reduce sediment loading during storm flows and to protect sensitive downstream habitats in the upper Lagoon. The new facilities are intended to address the historic and ongoing sediment deposition that degrades important riparian habitat at the confluence of the canyon creeks and the Lagoon. That deposition also contributes to the unwanted conversion of historic salt marsh in the upper Lagoon. Removal of accumulated sediment and the continued maintenance of the new facilities proposed would protect areas restored downstream.

3 Storm Drain Outfall Connections for Freshwater and Vector Management

Additional connections to the existing storm drain outfalls would reduce ponding of freshwater helping to diminish mosquito breeding habitat.

4 New Creek Alignment and Side Drainage Creek Alignment for Freshwater Management (Sorrento 5 Valley - Phase I) (Conceptual)

Upstream tributaries and existing braided tidal creeks would be reconnected to reduce freshwater ponding and inundation, reduce mosquito breeding habitat and to increase downstream creek capacity. Improving freshwater management would aid in the reduction of invasive vegetation (e.g. Festuca perennis) and other organisms that favor more freshwater and brackish environments. The improvements will also support the re-establishment salt marsh habitat and increase the flood-level flow capacity of the lagoon.

6 Preliminary Salt Marsh Restoration Boundary

Restoration of up to 23 acres of historic salt marsh that has transitioned to brackish and fresh water marsh is being considered as the initial step in the Lagoon restoration effort. As currently envisioned, freshwater management techniques would be implemented to expand current tidal influence through extension of existing tidal braided creeks and creation of tidally influenced overbanks. In addition, improved freshwater conveyance would be established between the extended tidal braided creeks and a new branching creek system. Restoration techniques could include removal of invasive plants and select removal and possible amendment of sediment prior to revegetation to reestablish historical salt marsh habitat. This would be a "pilot" area from which these techniques will be assessed for adaptive management in the restoration areas to the northeast of the railroad. This restoration will also be counted toward the salt marsh restoration goals of the Sediment Total Maximum Daily Load requirement (TMDL) and Water Quality Improvement Plan (WQIP).

Phase II- targeted for completion 2030

7 Salt Marsh Restoration and New Creek Alignment 8 (Carmel Valley- Phase II) (Conceptual)

Freshwater management and salt marsh restoration improvements that may extend tidal braided creeks to reduce ponding and freshwater inundation of the marsh are currently under evaluation. As being considered this effort may also include diversion and beneficial reuse of dry weather flows and existing groundwater seeps into the Lagoon. Freshwater management along with the removal of invasive vegetation would also support the restoration of historic salt marsh and the reduction of mosquito breeding habitat. This effort is being considered in response to salt marsh restoration requirements associated with current TMDL and WQIP goals. The area being evaluated will be subject to sea level rise and potential impacts from that condition is being considered in the current evaluation and modeling.

9 Sediment Management Facilities (Carmel Valley- Phase II) (Conceptual)

Sediment management facilities are proposed to reduce sediment loading during storm flows and to protect sensitive downstream habitats in the upper Lagoon. The new facilities would be necessary to address the historic and ongoing sediment deposition that degrades important riparian habitat at the confluence of the canyon creeks and the Lagoon.

DRAFT

LOS PEÑASQUITOS/SORRENTO RESTORATION PROGRAM

The City of San Diego is leading a long-term restoration plan for the Los Peñasquitos Lagoon. The plan is being developed in partnership with other cities, community leaders, businesses, regulatory agencies and environmental organizations interested in the health of the lagoon and its nearby waterways. The plan envisions improvements to the lagoon that include restoration of salt marsh areas, the removal of sediment and the construction of sediment management facilities, repairs to storm drain outfalls, and realignment of creeks in the lagoon to ease water flow, reduce upstream flooding and to improve habitat conditions.

This guidebook includes a map and description of the work being considered for the restoration effort. Contact information for City staff working to develop the final restoration plan is listed on the back page.

Fact Sheet Describing the Los Peñasquitos/Sorrento Restoration Program

4.2 Calculating Baseline Values for Assessment of Progress Toward Achieving Numeric Goals

Section 4 of the Los Peñasquitos WMA WQIP included several placeholders for baseline values against which Responsible Agencies can gauge progress in achieving numeric goals. The baseline values were calculated for these placeholders in this Annual Report and are summarized in Table 4-7 for Los Peñasquitos Lagoon Health (sediment and freshwater discharge) and in Table 4-8 Pacific Ocean Shoreline Recreation (bacteria).

Table 4-7
Baseline Values for Numeric Goals for Los Peñasquitos Lagoon Health (Sediment and Freshwater Input)

Compliance Pathway	Metric	Agency	Baseline
Wet Weather Sediment			
MS4 Discharges Number of Direct or Indirect Discharges[1] to Receiving Water	Discharges[1]	City of Del Mar	1 discharge[1]
		City of Poway	37 discharges[1]
		City of San Diego	198 discharges[1]
		County of San Diego	0 discharges[1]
Turf Conversion	Area converted	City of Poway	0 square feet of turf converted
Dry Weather Freshwater Discharge			
MS4 Discharges % Irrigation or Other Dry Weather Flow Reduction	Flow	City of Del Mar	Average Annual Flow: 4 gallons per minute Maximum Flow: 7 gallons per minute
		City of Poway	Average Dry Weather Flow[2]: 7.1 gallons per minute Maximum Dry Weather Flow[2]: 11.7 gallons per minute
		City of San Diego	Average Dry Weather Flow[2]: 27.6 gallons per minute Maximum Dry Weather Flow[2]: 305.2 gallons per minute
		County of San Diego	0 discharges based on no dry weather flow observed.

Table 4-7 (continued)
Baseline Values for Numeric Goals for Los Peñasquitos Lagoon Health (Sediment and Freshwater Input)

Compliance Pathway	Metric	Agency	Baseline
Reduce anthropogenic dry weather water flows	Flow	City of Del Mar	Average Annual Flow: 4 gallons per minute Maximum Flow: 7 gallons per minute
Implement runoff reduction programs, including targeted education and outreach, enhanced inspections, rebates, and increased enforcement	Flow	City of San Diego	Average Dry Weather Flow[2]: 27.6 gallons per minute Maximum Dry Weather Flow[2]: 305.2 gallons per minute
Eliminate anthropogenic dry weather flows from storm drain outfalls either by aggregate flow volume or the number of persistently flowing outfalls during dry weather	Flow	County of San Diego	There are no County major outfalls in Los Peñasquitos WMA; however, 28 minor outfalls were observed and no flow was detected during this reporting period

1. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring.
2. Calculated using historical dry weather MS4 outfall data from 2009-2012. Calculations are described in Appendix D.
% = percent; MS4 = municipal separate storm sewer system; WMA = Watershed Management Are

1. Wet weather baseline exceedance rate calculated using targeted and random MS4 wet weather monitoring data from October 1, 2008, through September 30, 2013. Monitoring data were assessed similar to the method outlined in Attachment E.6 of the 2013 MS4 Permit for each monitoring year. The observed wet weather days in exceedance were summed and divided by the total wet weather days in exceedance for the historical 5-year period.
2. Wet weather discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring.
3. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008, through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the fifth sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of dry weather days in exceedance for the historical 5-year period.
4. Dry weather discharges are defined as observed dry weather flows from persistently flowing major MS4 outfalls.
5. Calculated using historical dry weather MS4 outfall data from 2009-2012. Calculations are described in Appendix D.

% = percent; MS4 = municipal separate storm sewer system; WMA = Watershed Management Area;
WQO = water quality objective

4.3 Progress Toward Achieving Numeric Goals

As discussed in Section 2, interim and final numeric goals were established for the watershed as a means of measuring reasonable progress toward addressing the HPWQCs; the goals are included in Appendix B. Performance-based goals are included to measure short-term jurisdictional progress toward achieving these goals, given that sustained water quality improvement is typically demonstrated over a longer timeframe. Performance-based goals are intended to measure an outcome from a strategy or suite of strategies and to provide an interim link to demonstrate reasonable incremental progress in the quality of MS4 discharges and receiving waters by FY 18. The strategies presented have been selected as goals because they are measurable and provide a direct water quality benefit in the near term. Table 4-9 and Table 4-10 summarize progress in FY 16 toward meeting these performance-based goals for Los Peñasquitos Lagoon Health (sediment and freshwater input) and Pacific Ocean Shoreline Recreation (bacteria), respectively.

Table 4-9
Progress Toward FY 18 MS4 Permit Term Goals to Address Los Peñasquitos Lagoon Health (Sediment and Freshwater Input) in FY 16

Responsible Agency	Performance-Based Goal	Weather (Wet/Dry)	Baseline	FY 18 Goal	Progress
Caltrans	Cooperative Implementation Agreement: Achieve compliance units by contributing funds to a cooperative implementation	Wet	N/A	Ongoing[1]	In progress.
Caltrans	Implement Nonstructural BMPs: Continue to implement wet weather nonstructural BMP activities within the watershed	Wet	N/A	Ongoing[1]	In progress.
Caltrans	Implement Structural BMPs: Continue to implement wet weather structural BMP activities for proposed projects within the watershed	Wet	N/A	Ongoing[1]	In progress.
City of Del Mar	Reduce anthropogenic surface dry weather water flows	Dry	Average Annual Flow: 4 gallons per minute Maximum Flow: 7 gallons per minute	Reduce anthropogenic surface dry weather flows that originate within Del Mar's jurisdictional boundaries by 10%	Achieved to date. Average annual flow in FY 16 was 0.75 gallons per minute, representing an approximately 81% reduction from the baseline average flow.

Table 4-9 (continued)
Progress Toward FY 18 MS4 Permit Term Goals to Address Los Peñasquitos Lagoon Health (Sediment and Freshwater Input) in FY 16

Responsible Agency	Performance-Based Goal	Weather (Wet/Dry)	Baseline	FY 18 Goal	Progress
City of Poway	Implement turf conversion	Wet and Dry	0 square feet of turf converted	Achieve a 5% increase from the baseline through turf conversion	Achieved. 214,105 square feet of turf converted.
City of San Diego	Develop a green infrastructure policy, attain City Council approval, and construct green infrastructure BMPs to improve water quality during wet and dry weather	Wet and Dry	0 acres treated in 2002, the year used as baseline in the Bacteria TMDL	Treat 36 acres of drainage area through construction of 9 green infrastructure BMPs	In progress. The City has begun the process for developing a green infrastructure policy. The City has treated 113.15[3] acres of drainage area.
	Implement runoff reduction programs, including targeted education and outreach, enhanced inspections, rebates, and increased enforcement	Dry	Average Dry Weather Flow[2]: 27.6 gallons per minute Maximum Dry Weather Flow[2]: 305.2 gallons per minute	Reduce prohibited dry weather flow by 10% from the baseline measured at persistently flowing outfalls in the WMA	Achieved to date. Average dry weather flow in FY 16 was 11.5 gallons per minute, representing a 58.4% reduction from the baseline average flow.

Table 4-9 (continued)
Progress Toward FY 18 MS4 Permit Term Goals to Address Los Peñasquitos Lagoon Health (Sediment and Freshwater Input) in FY 16

Responsible Agency	Performance-Based Goal	Weather (Wet/Dry)	Baseline	FY 18 Goal	Progress
County of San Diego	Fully implement an accepted WQIP.	Wet	Acceptance of the WQIP by the Regional Board.	Make progress toward implementing the WQIP.	In progress. The County has begun implementation of the WQIP.

1. Caltrans goals, strategies, and schedules vary from those of other responsible agencies to best address typical freeway characterization discharge from Caltrans rights-of-way.
2. Calculated using historical dry weather MS4 outfall data from 2009–2012.
3. 113.15 acres of drainage area are currently being treated by the following projects: Los Peñasquitos Sediment Basin, Del Mar Mesa Neighborhood Park (catchment basins and impervious areas), Miramar Treatment Plant (vegetated swales), Carrol Canyon Road Extension (vegetated swale), Camino Ruiz Neighborhood park (vegetated swale), Breen Park (vegetated swales), Rancho Peñasquitos Skate Park (basins/trenches), Fire Station #47 (vegetated swale), Torrey Del Mar Neighborhood Park (2 vegetated filter strips and 2 vegetated swales), and Hilltop Community Park (2 bioretention facilities).

% = percent; BMP = best management practice; FY = fiscal year; MS4 = municipal separate storm sewer system; TMDL = total maximum daily load;
WMA = Watershed Management Area; WQIP = Water Quality Improvement Plan

Table 4-10
Progress Toward 2018 MS4 Permit Term Goals to Address Pacific Ocean Shoreline Recreation (Bacteria)

Agency	Performance-Based Goal	Weather (Wet/Dry)	Baseline	FY 18 Goal	FY 16 Progress
Caltrans	Reduce dry weather flow: eliminate dry weather flows by implementing control measures to ensure effective prohibition	Dry	N/A	Ongoing	In progress.
Caltrans	Implement dry weather BMPs: implement drought-tolerant landscaping and conversion to smart irrigation controllers within the watershed	Dry	N/A	Ongoing	In progress.
City of Del Mar	Reduce anthropogenic surface dry weather water flows	Dry	Average Annual Flow: 4 gallons per minute Maximum Flow: 7 gallons per minute	Reduce anthropogenic surface dry weather flows that originate within the City's jurisdictional boundaries by 10%	Achieved to date. Average annual flow in FY 16 was 0.75 gallons per minute, representing an approximately 81% reduction from the baseline average flow.
City of Poway	Implement turf conversion	Wet and Dry	0 square feet of turf converted	Achieve a 5% increase from the baseline through turf conversion	Achieved. 214,105 square feet of turf converted.

Agency	Performance-Based Goal	Weather (Wet/Dry)	Baseline	FY 18 Goal	FY 16 Progress
County of San Diego	Fully implement an accepted WQIP	Wet	Acceptance of the WQIP by the Regional Board	Achieve progress toward implementing the WQIP.	In progress. The County has begun implementation of the WQIP.
	Eliminate anthropogenic dry weather flows from storm drain outfalls either by aggregate flow volume or the number of persistently flowing outfalls during dry weather	Dry	County of San Diego has no major outfalls in the Los Peñasquitos WMA; however 28 minor outfalls were observed and no flow was detected during this reporting period	The County of San Diego has no major outfalls in the Los Peñasquitos WMA; however, 28 minor outfalls were observed and no flow was detected during this reporting period	In progress. Baseline established in FY 16.
	MS4 discharges: # of direct or indirect discharges[2] to receiving water	Wet	0 discharges[3]	0 discharges[3]	There are no major outfalls in the County in this WMA.

1. 113.15 acres of drainage area are currently being treated by the following projects: Los Peñasquitos Sediment Basin, Del Mar Mesa Neighborhood Park (catchment basins and impervious areas), Miramar Treatment Plant (vegetated swales), Carrol Canyon Road Extension (vegetated swale), Camino Ruiz Neighborhood park (vegetated swale), Breen Park (vegetated swales), Rancho Peñasquitos Skate Park (basins/trenches), Fire Station #47 (vegetated swale), Torrey Del Mar Neighborhood Park (2 vegetated filter strips and 2 vegetated swales), and Hilltop Community Park (2 bioretention facilities).
2. Calculated using historical dry weather MS4 outfall data from 2009–2012.
3. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring. The County of San Diego does not have any major outfalls in the Los Peñasquitos WMA.

% = percent; BMP = best management practice; FY = fiscal year; MS4 = municipal separate storm sewer system; TMDL = total maximum daily load;
WMA = Watershed Management Area; WQIP = Water Quality Improvement Plan

5 Adaptive Management

This section summarizes the potential triggers for adaptation of the WQIP and the results of the MS4 Permit adaptive management process for the Los Peñasquitos WMA during the first year of implementation. The adaptive management approach uses an iterative approach to re-evaluate major components of the WQIP based on the requirements of the MS4 Permit. It details how the Responsible Agencies use new data and information to improve the WQIP through updates to priorities, assessments of and adjustments to goals, updates to strategies to meet the latest goals, and updates to the monitoring and assessment program to provide the necessary data to support the process. Responsible Agencies are continually evaluating and assessing the implementation of the WQIP and making minimal modifications to streamline and optimize execution outside the MS4 Permit adaptive management process.

The MS4 Permit describes various triggers that may warrant program adaptation, including exceedances of water quality standards in receiving waters, new information, Regional Board recommendations, and input from the public. Effectiveness assessments of JRMP programs and strategies may also trigger adaptations to the WQIP.

The adaptive management process is used in conjunction with water quality and program data to evaluate whether modifications to numeric goals, schedules, and/or strategies are necessary to achieve compliance with the interim and final compliance numeric goals. MS4 Permit adaptive management triggers are typically implemented either annually or at the end of the MS4 Permit term.

5.1 Potential Triggers for Adaptation

The adaptive management process may be triggered when new information becomes available. New information to be considered includes results of routine monitoring and special studies, new regulatory drivers, results of program effectiveness assessments and progress toward numeric goals, and recommendations from the public and/or Regional Board. Modifications may be made to the PWQCs, goals, strategies, schedules, and/or the Monitoring and Assessment Program (Appendix E). The potential triggers for adaptation to be considered annually in the Annual Report are summarized in Table 5-1.

Table 5-1
Triggers for Adaptive Management Within the WQIP

Trigger[1]	Frequency for Assessment	Potential Area(s) for Adaptation			
		Priority Water Quality Conditions	Goals and Schedules	Strategies and Schedules	Monitoring and Assessment
Exceedances of Non-Storm Water Action Levels or Storm Water Action Levels	Annual			X	X
Special Studies Results	Annual, as results are available		X	X	X
New Regulatory Actions	Annual, as applicable	X	X	X	X
Regional Board Recommendations	Annual, as applicable	X	X	X	X
Program Effectiveness Assessments/ Progress Toward Goals	Annual			X	X

1. The trigger related to the review of receiving water limitations exceedances will now be assessed on a permit term basis in the Regional Monitoring and Assessment Report. Section 5.2 and Appendix E provide more detail.

5.2 WQIP Elements for Adaptation

The Los Peñasquitos WMA WQIP was approved by the Regional Board in February 2016. The Responsible Agencies have just begun to implement the WQIP strategies. Therefore, there have been no adaptations made to the PWQCs, goals, strategies, or schedules, as summarized in Table 5-2. There have been changes to timing of the receiving water limitation exceedance assessment put forth by Provision A.4 and administrative changes to the City of San Diego's strategies. These changes are summarized in Table 5-2 and additional detail is provided in Appendix E.

Table 5-2
2015–2016 WQIP Annual Report Adaptations

Element for Adaptation	2015–2016 Annual Report Adaptation
Priority Water Quality Conditions	There are no adaptations at to the priority water quality conditions at this time. No new regulations, policies, or recommendations from the Regional Board have triggered adaption of this WQIP Element.
Goals and Schedules	The Responsible Agencies are on track to meet their 2018 WQIP goals and do not plan any adaptations to their goals or the related schedules at this time.
Strategies and Schedules	The Responsible Agencies have just begun implementation of their WQIP strategies that have pollutant reduction benefits. They plan to continue implementing the strategies without modification to realize the rewards of these pollutant reduction benefits. The City of Del Mar identified some administrative changes to their strategies that are reflected in Appendix D. The City of San Diego has identified some administrative changes that are reflected in Appendix D and some operational adaptive management efforts in its JRMP included in Appendix D.
Monitoring and Assessment	The adaptive management process was changed to review receiving water limitation exceedances once per permit term, as allowed by the MS4 Permit, and not annually, as outlined in the WQIP.

JRMP = Jurisdictional Runoff Management Program; WQIP = Water Quality Improvement Plan

5.3 Summary of Previous Adaptation and Implementation

The 2015–2016 Los Peñasquitos WMA WQIP Annual Report is the first annual report submitted by the Responsible Agencies. No prior adaptations or updates have been made to either the WQIP or each Responsible Agency's JRMP.

Intentionally Left Blank

6 Conclusions and Recommendations

The Responsbile Agencies have successfully implemented the 2015–2016 program set forth in the WQIP. Progress toward performance-based goals has been achieved. Wet and dry weather water quality monitoring provided an initial data set for assessing and adapting goals and strategies. The conclusions described below highlight the success of the WQIP.

Monitoring and Assessment: The Responsible Agencies successfully completed wet and dry weather MS4 outfall monitoring in 2015–2016 in accordance with Provision D of the MS4 Permit. Monitoring was also conducted for the HPWQCs. The monitoring program and results for 2015–2016 are described in Section 3 and Appendix C. Monitoring and Assessment highlights include:

- Monitoring for the HPWQC – Los Peñasquitos Lagoon: Three storm events were monitored at the subwatershed compliance monitoring locations. Results are as follows:
  - SSCs were higher at or near peak flow and during the rising limb of the hydrograph for smaller storms such Events 2 and 3 during the 2015–2016 wet season. For the larger storm (Event 1), SSCs in all three WMA creeks remained high throughout the storm and mostly varied with flow, suggesting that the unusually high flows may have mobilized previously deposited sediments that were stored by in-channel vegetation and streambed.
  - The total 2015–2016 sediment load estimate of 23,500 tons per year is above the final Sediment TMDL waste load allocation (WLA) (2,580 tons per year). This TMDL compliance pathway can be achieved by 2034. Monitoring in previous years has recorded annual sediment loads that were below the WLA.
- Monitoring for the HPWQC – Pacific Ocean Shoreline: The first year of Bacteria TMDL monitoring at the at the historical San Diego County AB 411 monitoring location at the mouth of the Los Peñasquitos Lagoon (FM-100) was completed for wet and dry weather. Results are as follows:
  - During wet weather, the receiving waters at the Los Peñasquitos River Outlet/Beach achieved a 0% single-sample maximum exceedance frequency for fecal coliform and a 13% single-sample maximum exceedance frequency for total coliform and *Enterococcus*. FM-100 is in compliance with final wet weather single-sample maximum RWLs.
  - During the wet season, which evaluates a combination of both wet and dry weather samples, FM-100 achieved a 0% geometric mean exceedance frequency and is in compliance with final dry weather geometric mean RWLs.
- During the dry season, when recreational activities occur with more regularity, FM-100 achieved a 0% exceedance frequency and is in compliance with the final dry weather geometric mean RWLs.

- MS4 Monitoring: Data collected as part of the MS4 monitoring program were compared to the permit action levels as detailed below:
  - In dry weather, non-storm water action levels were met over 74% of the time for multiple consituents.
  - In wet weather, only one storm water action level exceedance for turbidity was recorded.
- Special Studies: The Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Study found that areas in the upper portion of Los Peñasquitos Creek and in the upper portions of Carmel Valley Creek may have the potential to serve as a sink for sediment within the WMA that can be mobilized during large storms such as the storm in early January 2016. Aerial deposition sampling determined that aerial deposition of sediment was not a significant contributor to the watershed sediment loads compared with the stream loads. The San Diego Regional Reference Streams and Beaches Study provided valuable information for the Bacteria TMDL Reopener. The Sediment Load Reduction Quantification Through Outfall Repair and Relocation for the Los Peñasquitos WMA Study was performed in order to assess the current sediment loading to the Los Peñasquitos Lagoon caused by the erosive scour associated with outfall discharge. Also, the study provided estimates in sediment location reduction provided by three BMP options.

Strategy Implementation: Strategies have been implemented as planned in the WQIP during 2015–2016. Strategies for the HPWQCs are described in Section 4. The following examples highlight efforts by the Responsbile Agencies to improve water quality:

- City of Del Mar: The City of Del Mar proactively implemented its city-wide patrol approach to identify issues or potential issues and ensure proper BMP implementation. Del Mar also conducted visual monitoring after wet weather events to identify areas with erosion. Minor and major repairs and slope stabilization were completed based on the visual monitoring results.
- City of Poway: The City of Poway has implemented a turf replacement program and has successfully converted 214,105 square feet of turf.
- City of San Diego: The City volunteered to be the Lead Agency for the Los Peñasquitos/Sorrento Restoration Program (to help meet restoration of 84 acres of saltwater marsh) and is working in collaboration with the Responsible Agencies, State Parks, the Coastal Conservancy, the Los Peñasquitos Lagoon Foundation, and other stakeholders. Modeling was completed in FY 16 to confirm the preferred alternative for the lagoon restoration. Additionally, several biological technical studies were completed the first phase of the project. Next steps for FY 17 may include additional modeling, completion of the concept design, and commencement of the public outreach process.

- County of San Diego: The County collaborates with and promotes the efforts of partner agencies for incentive programs such as rain barrels, water smart irrigation controllers, soil sensors, turf replacement programs, and residential landscape evaluation programs. The County undertook a community-based social marketing pilot study on the effectiveness of irrigation runoff prevention materials.

Progress Toward Goals: The Responsible Agencies have demonstrated achievement of the performance-based goals planned for 2015–2016, and have either met, surpassed, or demonstrated progress toward achieving the interim numeric goals set for the term of the current MS4 Permit. Goals and performance-based goals achieved include the following:

- BMPs have been installed and maintained in the City of San Diego, reducing or preventing pollutants from entering receiving waters.
- Dry weather flow reduction goals have been surpassed in the City of San Diego.
- Flow reduction goals have been surpassed in the City of Del Mar**.**
- The County has begun implementation of the WQIP.

Provision A						
A.4.a.(2)	If ***exceedance(s) of water quality standards persist in receiving waters*** notwithstanding implementation of this Order, the Copermittees must comply with the following procedures: (2) Upon a **determination** by either the Copermittees or the San Diego Water Board that discharges from the MS4 are **causing or contributing to a new exceedance** of an applicable water quality standard **not addressed** by the Water Quality Improvement Plan, the Copermittees must submit the following updates to the Water Quality Improvement Plan pursuant to Provision F.2.c ***or as part of the Water Quality Improvement Plan Annual Report*** required under Provision F.3.b, unless the San Diego Water Board directs an earlier submittal:	Section 5		X		X
	(a) The water quality improvement ***strategies being implemented that are effective and will continue to be implemented***,	Section 5.2			X	
	(b) ***Water quality improvement strategies (i.e. BMPs, retrofitting projects, stream and/or habitat rehabilitation projects, adjustments to jurisdictional runoff management programs, etc.) that will be implemented*** to reduce or eliminate any pollutants or conditions that are causing or contributing to the exceedance of water quality standards,	Section 5.2				X
	(c) ***Updates to the schedule for implementation*** of the existing and additional water quality improvement strategies, and	Section 5.2				X
	(d) ***Updates to the monitoring and assessment program*** to track progress toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a of this Order;	Section 5.2				X
Provision B						
B.5.a.	a. The **priority water quality conditions** and potential **water quality improvement strategie**s included in the Water Quality Improvement Plan pursuant to Provisions B.2.c and B.2.e ***may be re-evaluated by the Copermittees as needed during the term of this Order as part of the Water Quality Improvement Plan Annual Report***. Re-evaluation and recommendations for modifications to the priority water quality conditions and potential water quality improvement strategies **must be provided in the Report of Waste Discharge**, and must consider the following: (1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan; (2) New information developed when the requirements of Provisions B.2.a-c have been re-evaluated; (3) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality conditions and implementation strategies to address the highest priority water quality conditions; (4) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees; (5) San Diego Water Board recommendations; and (6) Recommendations for modifications solicited through a public participation process.	Section 5		X		X
B.5.b.	b. The water quality improvement goals, strategies and schedules, included in the Water Quality Improvement Plan pursuant to Provisions B.3, ***must be reevaluated and adapted as new information becomes available*** to result in more effective and efficient measures to address the highest priority water quality conditions identified pursuant to Provision B.2.c. ***Re-evaluation of and modifications to the water quality improvement goals, strategies and schedules must be provided in the Water Quality Improvement Plan Annual Report***, and must consider the following:	Section 5	X			X
	(1) Modifications to the **priority water quality conditions** based on Provision B.5.a;	Section 5				X
	(2) Progress toward **achieving interim and final numeric goals** in receiving waters and MS4 discharges for the highest priority water quality conditions in the Watershed Management Area,	Section 4.3				
	(3) Progress toward achieving outcomes according to established schedules;	Section 4.3			X	X
	(4) New policies or regulations that may affect identified numeric goals;					X
	(5) Measurable or demonstrable reductions of non-storm water discharges to and from each Copermittee's MS4;			X		
	(6) Measurable or demonstrable reductions of pollutants in storm water discharges from each Copermittee's MS4 to the MEP;			X

Provision D						
D.1.e.(2)(c)	**Sediment Quality Monitoring** (c) The Copermittees must incorporate a ***Sediment Monitoring Report as part of the Water Quality Improvement Plan Annual Report*** in accordance with the schedule contained in the Sediment Monitoring Plan, unless otherwise directed in writing by the San Diego Water Board Executive Officer. The Sediment Monitoring Report must contain the following information: (i) Analysis: An evaluation, interpretation and tabulation of the water and sediment monitoring data, including interpretations and conclusions as to whether applicable Receiving Water Limitations in this Order have been attained at each sample station; (ii) Sample Location Map: The locations, type, and number of samples must be identified and shown on a site map; and (iii) California Environmental Data Exchange Network: A statement certifying that the monitoring data and results have been uploaded into the California Environmental Data Exchange Network (CEDEN).			X		
D.2.b.(iv)	**Dry Weather MS4 Outfall Discharge Monitoring** (iv) Each Copermittee must document ***removal or re-prioritization of the highest priority persistent flow MS4 outfall monitoring stations identified under Provision D.2.b.(2)(a) in the Water Quality Improvement Plan Annual Report***. Persistent flow MS4 outfall monitoring stations that have been removed must be replaced with the next highest prioritized major MS4 outfall in the Watershed Management Area within its jurisdiction, unless there are no remaining qualifying major MS4 outfalls within the Copermittee's jurisdiction in the Watershed Management Area.			X		
D.4.b.(1)(a)(ii)	**Non-Storm Water Dischargers Reduction Assessments** (a) Each Copermittee must assess and report the ***progress of its illicit discharge detection and elimination program***, required to be implemented pursuant to Provision E.2, toward effectively prohibiting non-storm water and illicit discharges into the MS4 within its jurisdiction as follows: (ii) Based on the data collected pursuant to Provisions D.2.b, the ***assessments required under <u>Provision D.4.b.(1)(c)</u> must be included in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3).***			X		
D.4.b.(1)(b)	(b) Based on the transitional dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.a.(2), each Copermittee must assess and report the following: (i) Identify the known and suspected controllable sources (e.g. facilities, areas, land uses, pollutant generating activities) of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area; (ii) Identify sources of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area that have been reduced or eliminated; and (iii) Identify modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges pursuant to Provision D.2.b.			X		X

Table A1-1 (continued)

Permit Provision	Permit Language	WQIP AR Section	WQIP Appendix: Appendix B Numeric Goals	WQIP Appendix: Appendix C Monitoring	WQIP Appendix: Appendix D Jurisdictional Information	WQIP Appendix: Appendix E Adaptive Management
D.4.b.(1)(c)	(c) Based on the **dry weather MS4 outfall discharge field screening monitoring** required pursuant to Provision D.2.b.(1), each Copermittee must assess and report the following: (i) The assessments required pursuant to Provision D.4.b.(1)(b); (ii) Based on the data collected and applicable NALs in the Water Quality Improvement Plan, rank the MS4 outfalls in the Copermittee's jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action to update the Water Quality Improvement Plan, with the goal of eliminating persistent flow non-storm water discharges and/or pollutant loads in order of the ranked priority list through targeted programmatic actions and source investigations; (iii) For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identify the known and suspected sources within the Copermittee's jurisdiction in the Watershed Management Area that may cause or contribute to the NAL exceedances; (iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b, and utilize a model or other method, to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually. [a] Each Copermittee must calculate or estimate the annual non-storm water volumes and pollutant loads collectively discharged from the Copermittee's major MS4 outfalls to receiving waters within the Copermittee's jurisdiction, with an estimate of the percent contribution from each known source for each MS4 outfall; [b] Each Copermittee must annually identify and quantify (i.e. volume and pollutant loads) sources of non-storm water not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.			X		
	(v) Each Copermittee must review the data collected pursuant to Provision D.2.b and findings from the assessments required pursuant to Provision D.4.b.(1)(c)(i)-(iv) at least once during the term of this Order to: [a] Identify reductions and progress in achieving reductions in non-storm water and illicit discharges to the Copermittee's MS4 in the Watershed Management Area; [b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction, with an estimate, if possible, of the non-storm water volume and/or pollutant load reductions attributable to specific water quality strategies implemented by the Copermittee; and [c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittee in the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction. (vi) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(1)(c)(i)-(v).			X		
D.4.b.(2)(a)	**Storm Water Pollutant Discharge Reduction Assessments** (a) The Copermittees must assess and report the ***progress of the water quality improvement strategies, required to be implemented pursuant to Provisions B and E, toward reducing pollutants in storm water discharges*** from the MS4s within the Watershed Management Area as follows: (ii) Based on the data collected pursuant to Provisions D.2.c, the ***assessments required under <u>Provision D.4.b.(2)(c)</u> must be included in the Water Quality Improvement Plan Annual Reports*** required pursuant to Provision F.3.b.(3).			X		

Table A1-1 (continued)
Crosswalk of MS4 Permit Requirements and Annual Report References

Permit Provision	Permit Language	WQIP AR Section	WQIP Appendix: Appendix B Numeric Goals	WQIP Appendix: Appendix C Monitoring	WQIP Appendix: Appendix D Jurisdictional Information	WQIP Appendix: Appendix E Adaptive Management
D.4.b.(2)(b)	(b) Based on the transitional wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.a.(3) the Copermittees must assess and report the following: (i) The Copermittees must analyze the monitoring data collected pursuant to Provision D.2.a.(3), and utilize a watershed model or other method, to calculate or estimate the following for each monitoring year: [a] The average storm water runoff coefficient for each land use type within the Watershed Management Area; [b] The volume of storm water and pollutant loads discharged from each of the Copermittee's monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; [c] The total flow volume and pollutant loadings discharged from the Copermittee's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls; and [d] The percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea with a major MS4 outfall to receiving waters or within each major MS4 outfall to receiving waters in the Copermittee's jurisdiction within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch.(ii) Identify modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify pollutants in storm water discharges from the MS4s in the Watershed Management Area pursuant to Provision D.2.c.(1).			X		
D.4.b.(2)(c)	(c) Based on the wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.c the Copermittees must assess and report the following: (i) The assessments required pursuant to Provision D.4.b.(2)(b); (ii) Based on the data collected and applicable SALs in the Water Quality Improvement Plan, analyze and compare the monitoring data to the analyses and assumptions used to develop the Water Quality Improvement Plans, including strategies developed pursuant to Provision B.3, and evaluate whether those analyses and assumptions should be updated as a component of the adaptive management efforts pursuant to Provision B.5 for follow-up action to update the Water Quality Improvement Plan; (iii) The Copermittees must review the data collected pursuant to Provision D.2.c and findings from the assessments required pursuant to Provisions D.4.b.(2)(c)(i)-(ii) at least once during the term of this Order to: [a] Identify reductions or progress in achieving reductions in pollutant concentrations and/or pollutant loads from different land uses and/or drainage areas discharging from the Copermittees' MS4s in the Watershed Management Area; [b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters within the Watershed Management Area to the MEP, with an estimate, if possible, of the pollutant load reductions attributable to specific water quality strategies implemented by the Copermittees; and [c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittees in the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters in the Watershed Management Area to the MEP. (iv) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(iii).			X		
D.4.c.	**Special Studies Assessments** c. The Copermittees must ***annually evaluate the results and findings from the special studies developed and implemented pursuant to Provision D.3***, and assess their relevance to the Copermittees' efforts to characterize receiving water conditions, understand sources of pollutants and/or stressors, and control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters in the Watershed Management Area. The Copermittees must ***report the results of the special studies assessments applicable to the Watershed Management Area, and identify any necessary modifications or updates to the Water Quality Improvement Plan based on the results in the Water Quality Improvement Plan Annual Reports*** required pursuant to Provision F.3.b.(3).	Section 2		X		X
D.4.d.	Integrated Assessment of Water Quality Improvement Plan d. As part of the ***iterative approach and adaptive management process*** required for the Water Quality Improvement Plan pursuant to Provision B.5, the Copermittees in each Watershed Management Area must integrate the data collected pursuant to Provisions D.1-D.3, the findings from the assessments required pursuant to Provisions D.4.a-c, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E to assess the effectiveness of, and identify necessary modifications to, the Water Quality Improvement Plan as follows:	Section 5		X		X

D.4.d.(1)	(1) The Copermittees ***must re-evaluate the priority water quality conditions and numeric goals for the Watershed Management Area, as needed, during the term of this Order pursuant to Provision B.5.a.*** The re-evaluation and recommendations for modifications to the priority water quality conditions, and/or numeric goals and corresponding schedules ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. The priority water quality conditions and numeric goals for the Watershed Management Area must be reevaluated as follows: (a) Re-evaluate the receiving water conditions in the Watershed Management Area in accordance with Provision B.2.a; (b) Re-evaluate the impacts on receiving waters in the Watershed Management Area from MS4 discharges in accordance with Provision B.2.b; (c) Re-evaluate the identification of MS4 sources of pollutants and/or stressors in accordance with Provision B.2.d; (d) Identify beneficial uses of the receiving waters that are protected in accordance with Provision D.4.a; (e) Evaluate the progress toward achieving the interim and final numeric goals for protecting impacted beneficial uses in the receiving waters.	Section 5.2		X		X
D.4.d.(2)	(2) The Copermittees ***must re-evaluate the water quality improvement strategies for the Watershed Management Area during the term of this Order pursuant to Provision B.5.b.*** The re-evaluation and recommendations for modifications to the water quality improvement strategies and schedules ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. The water quality improvement strategies for the Watershed Management Area must be re-evaluated as follows: (a) Identify the non-storm water and storm water pollutant loads from the Copermittees' MS4 outfalls in the Watershed Management Area, calculated or estimated pursuant to Provisions D.4.b; (b) Identify the non-storm water and storm water pollutant load reductions, or other improvements to receiving water or water quality conditions, that are necessary to attain the interim and final numeric goals identified in the Water Quality Improvement Plan for protecting beneficial uses in the receiving waters; (c) Identify the non-storm water and storm water pollutant load reductions, or other improvements to the quality of MS4 discharges, that are necessary for the Copermittees to demonstrate that non-storm water and storm water discharges from their MS4s are not causing or contributing to exceedances of receiving water limitations; (d) Evaluate the progress of the water quality improvement strategies toward achieving the interim and final numeric goals identified in the Water Quality Improvement Plan for protecting beneficial uses in the receiving waters.	Section 5.2			X	X
D.4.d.(3)	(3) The Copermittees ***must re-evaluate and adapt the water quality monitoring and assessment program for the Watershed Management Area when new information becomes available to improve the monitoring and assessment program pursuant to Provision B.5.c.*** The re-evaluation and recommendations for modifications to the monitoring and assessment program ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. Modifications to the water quality monitoring and assessment program must be consistent with the requirements of Provision D.1-D.3. The re-evaluation of the water quality monitoring and assessment program for the Watershed Management Area must consider the data gaps identified by the assessments required pursuant to Provisions D.4.a-b, and results of the special studies implemented pursuant to Provision D.4.c	Section 5.2		X		X
Provision E						
E.1.b.	**b.** With the first ***Water Quality Improvement Plan Annual Report*** *required pursuant to Provision F.3.b.(3),* ***each Copermittee must submit a statement certified by its Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative that the Copermittee has taken the necessary steps to obtain and maintain full legal authority*** within its jurisdiction to implement and enforce each of the requirements contained in this Order.	Cert Statement			X	
E.2.d.(4)	(4) Each Copermittee must submit a ***summary of the non-storm water discharges and illicit discharges and connections investigated and eliminated within its jurisdiction with each Water Quality Improvement Plan Annual Report required under Provision F.3.b.(3)*** of this Order.			X		
E.8.c.	**c.** Each Copermittee must submit a ***summary of the annual fiscal analysis with each Water Quality Improvement Plan Annual Report required pursuant to Provision F.3.b.(3)***.				X

Appendix B: Water Quality Improvement Plan Goals

Intentionally Left Blank

The following sections present final and interim numeric goals by jurisdiction.

B.1 City of Del Mar Goals

Del Mar's Water Quality Improvement Plan interim and final goals for wet weather sediment are presented in Tables B-1 and B-2, respectively. Del Mar's Water Quality Improvement Plan numeric goals for wet weather bacteria and dry weather are presented in Tables B-3 and B-4, respectively.

Intentionally Left Blank

Wet Weather Sediment Interim Numeric Goals for the City of Del Mar

Compliance Pathways		Baseline	Goals by Assessment Period and Fiscal Year				
			Current Permit Term (FY14 – FY18)	FY 16–20	FY 21–25	FY 26–30	
MS4 Discharges # of Direct or Indirect Discharges to Receiving Water	Discharges	Average Annual Flow: 4 gallons per minute Maximum Flow: 7 gallons per minute	0	0	0	0	0

1. Denotes TMDL interim and final target.
2. As defined by the Sediment TMDL and Attachment A to Resolution No. R9-2010-0033, this can mean either:
   - Successful restoration of 80% of the 1973 acreage of Lagoon salt marsh habitat (346 acres); or
   - Demonstration that implementation actions are active on and/or affecting 346 acres with continued monitoring to ensure 80% target achievement.
3. The load reduction is based on Sediment TMDL model updates completed during development of the Water Quality Improvement Plan. The interim goals were calculated on the basis of the required percent reductions in the compliance schedule (Attachment A to Resolution No. R9-2010-0033). Calculation of the load reduction includes loading from Phase II MS4s, general construction, and general industrial permittees within the City of San Diego's jurisdiction. Further analysis of loads specific to the City of San Diego may be completed in the future.
4. Reasonable assurance is provided by the compliance analysis described in Section 4.3.2 and Appendix K. The metric used in the compliance analysis is load reduction.

% = percent; FY = fiscal year; WQO = Water Quality Objective
All numeric goals are cumulative from the baseline assessment for each fiscal year.

Or							
MS4 Discharges Implement Accepted Water Quality Improvement Plan		Metric for compliance analysis is MS4 discharge percent load reduction (above). Interim compliance is implementation of strategies and schedule on the basis of analysis results (Appendix I). Final compliance is implementation of BMPs based on analysis results and demonstration of compliance with any of the compliance pathways through monitoring and assessment. See Section 4.3.2 and Appendix K for modeling results.					

Table B-3 (continued)
Wet Weather Numeric Goals for the City of Del Mar

Compliance Pathways	Baseline	Goals by Assessment Period and Fiscal Year
		Current Permit Term (FY14-FY18)
Performance Measures		
Suite of Strategies to Measure Performance During First Permit Term	**Baseline**	**FY18**
Reduce anthropogenic surface dry weather flows[6] to address bacteria regrowth contributing during wet weather	**New:** Average Annual Flow: 4 gallons per minute Maximum Flow: 7 gallons per minute	10% reduction in anthropogenic surface dry weather flows[6] that originate within the City's jurisdictional boundaries

1. Denotes TMDL interim and final target.
2. Denotes existing wet weather frequency as modeled in the Bacteria TMDL. With limited baseline monitoring data available, this goal reflects a reasonable estimate considering the difficulty in demonstrating progress within the receiving water during wet weather in a short amount of time. Furthermore, development and redevelopment of the urban environment has occurred since the Bacteria TMDL baseline loads were calculated in 2001. As such, this goal demonstrates that progress has been made by the Responsible Agencies by maintaining the existing wet weather exceeding frequency.
3. Wet weather baseline exceedance rate calculated using targeted and random MS4 wet weather monitoring data from October 1, 2008 through September 30, 2013. Monitoring data were assessed similar to the method outlined in Attachment E.6 of the 2013 MS4 Permit for each monitoring year. The observed wet weather days in exceedance were summed and divided by the total wet weather days in exceedance for the historical 5-year period.
4. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring.
5. Demonstration of exceedances due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. The term "dry weather flows" excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.

% = percent; FY = fiscal year; WQO = Water Quality Objective
All numeric goals are cumulative from the baseline assessment for each fiscal year.

Intentionally Left Blank

Reduce anthropogenic surface dry weather water flows[6]	**New:** Average Annual Flow: 4 gallons per minute Maximum Flow: 7 gallons per minute	Reduce anthropogenic surface dry weather flows[6] that originate within the City's jurisdictional boundaries by 10%

1. Denotes TMDL interim and final target.
2. Calculated as a 50% reduction in the existing exceedance frequency presented in Appendix H.
3. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008 through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the 5th sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of dry weather days in exceedance for the historical 5-year period.
4. Discharges are defined as observed dry weather flows from persistently flowing MS4 outfalls.
5. Demonstration of exceedances due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. The term "dry weather flow" excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.

% = percent; FY = fiscal year; WQO = Water Quality Objective
All numeric goals are cumulative from the baseline assessment for each fiscal year.

B.2 City of Poway Goals

Poway's Water Quality Improvement Plan interim and final goals for wet weather sediment are presented in Tables B-5 and B-6, respectively. Poway's Water Quality Improvement Plan numeric goals for wet weather bacteria and dry weather are presented in Tables B-7 and B-8, respectively.

Wet Weather Sediment Interim Numeric Goals for the City of Poway

Compliance Pathway	Baseline	Goals by Assessment Period and Fiscal Year
		Current Permit Term (FY14 – FY18)
Performance Measures		
Suite of Strategies to Measure Performance During First Permit Term	**Baseline**	**FY18**
Turf conversion	**New:** 0 square feet of turf converted	5% increase from the baseline through turf conversion

1. Denotes TMDL interim and final target.
2. As defined by the Sediment TMDL and Attachment A to Resolution No. R9-2010-0033, this can either mean:
   - Successful restoration of 80% of the 1973 acreage of Lagoon salt marsh habitat (346 acres); or
   - Demonstration that implementation actions are active on and/or affecting 346 acres with continued monitoring to ensure 80% target achievement.
3. The percent load reduction is based on Sediment TMDL model updates completed during the development of the Water Quality Improvement Plan. The interim goals were calculated on the basis of the required percent reductions in the compliance schedule (Attachment A to Resolution No. R9-2010-0033). Percent load reduction, rather than the mass (or tonnage) of load reduction, was selected as the Water Quality Improvement Plan numeric goal because the mass of sediment reduction is, in part, related to rainfall, which varies year by year. Percent load reduction provides a relative metric that is unaffected by wet or dry water years. Calculation of the percent load reduction includes loading from Phase II MS4s, general construction, and general industrial permittees within the City of Poway's jurisdiction. Further analysis of loads specific to the City of Poway may be completed in the future.
4. Reasonable assurance is provided by the compliance analysis described in Section 4.3.2 and Appendix K. The metric used in the compliance analysis is percent load reduction.
5. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring.

% = percent; FY = fiscal year
All numeric goals are cumulative from the baseline assessment for each fiscal year.

Intentionally Left Blank

		FY35[1]
MS4 Discharges and Receiving Water Implement Accepted Water Quality Improvement Plan	**And**	
	262 acres in 2010 (Sediment TMDL)	Perform monitoring and assessments to demonstrated compliance with the Lagoon restoration goal of 346 acres[2]

1. Denotes TMDL interim and final target.
2. As defined by the Sediment TMDL and Attachment A to Resolution No. R9-2010-0033, this can mean either:
   - Successful restoration of 80% of the 1973 acreage of Lagoon salt marsh habitat (346 acres); or
   - Demonstration that implementation actions are active on and/or affecting 346 acres with continued monitoring to ensure 80% target achievement.
3. The percent load reduction is based on Sediment TMDL model updates completed during the development of the Water Quality Improvement Plan. The interim goals were calculated on the basis of the required percent reductions in the compliance schedule (Attachment A to Resolution No. R9-2010-0033). Percent load reduction, as opposed to the mass (or tonnage) of load reduction, was selected as the Water Quality Improvement Plan numeric goal because the mass of sediment reduction is, in part, related to rainfall, which varies year by year. Percent load reduction provides a relative metric that is unaffected by wet or dry water years. Calculation of the percent load reduction includes loading from Phase II MS4s, general construction, and general industrial permittees within the City of San Diego's jurisdiction. Further analysis of loads specific to the City of San Diego may be completed in the future.

FY = fiscal year

Performance Measures		
Suite of Strategies to Measure Performance During First Permit Term	**Baseline**	**FY18**
Turf conversion	**New:** 0 square feet of turf converted	5% increase from the baseline through turf conversion

1. Denotes TMDL interim and final target.
2. Denotes existing wet weather frequency as modeled in the Bacteria TMDL. With limited baseline monitoring data available, this goal reflects a reasonable estimate considering the difficulty in demonstrating progress within the receiving water during wet weather in a short amount of time. Furthermore, development and redevelopment of the urban environment has occurred since the Bacteria TMDL baseline loads were calculated in 2001. As such, this goal demonstrates that progress has been made by the Responsible Agencies by maintaining the existing wet weather exceeding frequency.
3. Wet weather baseline exceedance rate calculated using targeted and random MS4 wet weather monitoring data from October 1, 2008 through September 30, 2013. Monitoring data were assessed similar to the method outlined in Attachment E.6 of the 2013 MS4 Permit for each monitoring year. The observed wet weather days in exceedance were summed and divided by the total wet weather days in exceedance for the historical 5-year period.
4. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring.
5. Demonstration of exceedances due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.

% = percent; FY = fiscal year; WQO = Water Quality Objective
All numeric goals are cumulative from the baseline assessment for each fiscal year.

Suite of Strategies to Measure Performance During First Permit Term	**Baseline**	**FY18**
Turf conversion	**New:** 0 square feet of turf converted	5% increase from the baseline through turf conversion

1. Denotes TMDL interim and final target.
2. Calculated as a 50% reduction in the existing exceedance frequency presented in Appendix H.
3. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008 through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the 5th sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of dry weather days in exceedance for the historical 5-year period.
4. Discharges are defined as observed dry weather flows from persistently flowing MS4 outfalls.
5. Demonstration of exceedances due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. Dry weather flow baseline calculations were based on Targeted Dry Weather Flow Outfall Monitoring data from 2009 to 2012. Data are only from outfalls with "persistent flow," defined as: “the presence of flowing, pooled, or ponded water more than 72 hours after a measureable rainfall event of 0.1 inch or greater during three consecutive monitoring and/or inspection events. All other flowing, pooled, or ponded water is considered transient.” Persistently flowing annual averages were computed, and an overall average was computed using all data points in this time period and used for comparison. Note, reported flow values of 0 were present and included in the calculations.

% = percent; FY = fiscal year; WQO = Water Quality Objective

All numeric goals are cumulative from the baseline assessment for each fiscal year.

Develop a green infrastructure policy, attain City Council approval, and construct green infrastructure BMPs to improve water quality during wet and dry[9] weather	0 acres treated in 2002, the year used as baseline in the Bacteria TMDL	36 acres of drainage area treated through construction of 9 green infrastructure BMPs[10]		

1. Denotes TMDL interim and final target.
2. Calculated as a 50% reduction in the existing exceedance frequency presented in Appendix H.
3. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008 through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the 5th sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of dry weather days in exceedance for the historical 5-year period.
4. Discharges are defined as observed dry weather flows from persistently flowing MS4 outfalls.
5. Demonstration of exceedances due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. Dry weather flow baseline calculations were based on Targeted Dry Weather Flow Outfall Monitoring data from 2009 to 2012. Data are only from outfalls with "persistent flow," defined as: "the presence of flowing, pooled, or ponded water more than 72 hours after a measureable rainfall event of 0.1 inch or greater during three consecutive monitoring and/or inspection events. All other flowing, pooled, or ponded water is considered transient." Persistently flowing annual averages were computed, and an overall average was computed using all data points in this time period and used for comparison. Note, reported flow values of 0 were present and included in the calculations.
7. City of San Diego rebates include grass replacement, rainwater harvesting, downspout disconnect, and micro-irrigation.
8. Does not include allowable discharges as defined in Provision A and Provision E.2.a of the MS4 Permit.
9. Irrigation runoff reduction programs are the primary strategies for addressing dry weather, freshwater flows, and bacteria loading. However, green infrastructure will treat small storm events, in addition to unabated urban runoff in the short term. Green infrastructure also provides other benefits related to providing natural areas throughout urban development. See Section 4.2.3.1 for additional discussion.
10. The 36 acres of drainage area treated are associated with 9 green infrastructure projects that will be completed by FY18.

% = percent; FY = fiscal year; WQO = Water Quality Objective

All numeric goals are cumulative from the baseline assessment for each fiscal year.

B.4 County of San Diego Goals

The County of San Diego's Water Quality Improvement Plan interim and final goals for wet weather sediment are presented in Tables B-13 and B-14, respectively. The County of San Diego's Water Quality Improvement Plan numeric goals for wet weather bacteria and dry weather are presented in Tables B-15 and B-16, respectively.

1. Denotes TMDL interim and final target.
2. As defined by the Sediment TMDL and Attachment A to Resolution No. R9-2010-0033, this can mean either:
   - Successful restoration of 80% of the 1973 acreage of Lagoon salt marsh habitat (346 acres); or
   - Demonstration that implementation actions are active on and/or affecting 346 acres with continued monitoring to ensure 80% target achievement.
3. The load reduction is based on Sediment TMDL model updates completed during the development of the Water Quality Improvement Plan. The interim goals were calculated on the basis of the required percent reductions in the compliance schedule (Attachment A to Resolution No. R9-2010-0033). Calculation of the load reduction includes loading from Phase II MS4s, general construction, and general industrial permittees within the County of San Diego's jurisdiction. Further analysis of loads specific to the County of San Diego may be completed in the future.
4. Reasonable assurance is provided by the compliance analysis described in Section 4.3.2 and Appendix K. The metric used in compliance analysis is percent load reduction.

% = percent; FY = fiscal year

All numeric goals are cumulative from the baseline assessment for each fiscal year.

	Enterococcus		100%	100%	100%	100%	100%
	Total coliform		100%	100%	100%	100%	100%
Or							
MS4 Discharges Implemented Accepted Water Quality Improvement Plan		Metric for compliance analysis is MS4 discharge percent load reduction (above). Interim compliance is implementation of strategies and schedule (presented in Appendix I) based on analysis results. Final compliance is implementation of BMPs based on analysis results and demonstration of compliance with any of the compliance pathways through monitoring and assessment. See Section 4.3.2 and Appendix K for compliance analysis results.					

1. Denotes TMDL interim and final target. Request moving Interim TMDL Compliance Date from April 4, 2021, (per MS4 Permit Attachment E, 6.c(1)) to April 4, 2028, to allow adequate time to monitor progress through the adaptive management process of the Water Quality Improvement Plan.
2. Progress toward final goals will be monitored and, if implemented programmatic BMPs are not enough to meet compliance, then through the adaptive management process of the Water Quality Improvement Plan, more effective and or additional BMPs, including structural controls, will be considered for implementation. The County of San Diego is concerned that a funding source to construct, operate, and maintain structural controls is not identified, if structural controls are needed to meet compliance.
3. Denotes existing wet weather frequency as modeled in the Bacteria TMDL. With limited baseline monitoring data available, this goal reflects a reasonable estimate considering the difficulty in demonstrating progress within the receiving water during wet weather in a short amount of time. Furthermore, development and redevelopment of the urban environment has occurred since the Bacteria TMDL baseline loads were calculated in 2001. As such, this goal demonstrates that progress has been made by the Responsible Agencies by maintaining the existing wet weather exceeding frequency.
4. Wet weather baseline exceedance rate calculated using targeted and random MS4 wet weather monitoring data from October 1, 2008 through September 30, 2013. Monitoring data were assessed similar to the method outlined in Attachment E.6 of the 2013 MS4 Permit for each monitoring year. The observed wet weather days in exceedance were summed and divided by the total wet weather days in exceedance for the historical 5-year period.
5. Discharges are defined as the number of flowing major MS4 outfalls during wet weather monitoring.
6. Demonstration of exceedances due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.

% = percent; FY = fiscal year; WQO = Water Quality Objective

All numeric goals are cumulative from the baseline assessment for each fiscal year.

See Section 4.3.2 and Appendix K for compliance analysis results.			

Table B-16 (continued)
Dry Weather Numeric Goals for the County of San Diego

Compliance Pathways	Baseline	Goals by Assessment Period and Fiscal Year		
		Current Permit Term (FY14 – FY18)	FY16 – FY20	FY21 – F25
Performance Measures				
Suite of Strategies to Measure Performance During First Permit Term	**Baseline**	**FY18**	**FY20**	**FY21**
Eliminate anthropogenic dry weather flows[6] from storm drain outfalls either by aggregate flow volume or the number of persistently flowing outfalls during dry weather	To be established during FY15–16 using dry weather flow measurements		Reduce by 75%	Reduce by 100% anthropogenic dry weather discharges from storm drain outfalls to the receiving water or meet the WQOs in the storm drain discharges.

1. Denotes TMDL interim and final target. Request moving Interim TMDL Compliance Date from April 4, 2016 (per MS4 Permit Attachment E, 6.c(1)) to April 4, 2020, to allow adequate time to investigate and mitigate dry weather flows through the adaptive management process of the Water Quality Improvement Plan.
2. Calculated as a 50% reduction in the existing exceedance frequency presented in Appendix H.
3. Dry weather baseline exceedance rate calculated using targeted and random MS4 dry weather monitoring data from October 1, 2008 through September 30, 2013. Rolling 5-sample-date geometric means were calculated, beginning with the 5th sample date of each monitoring year. Geometric mean WQOs were applied and the exceedance frequency extrapolated to determine baseline percent of dry weather days in exceedance for the historical 5-year period.
4. Discharges are defined as observed dry weather flows from persistently flowing MS4 outfalls.
5. Demonstration of exceedances due to natural sources includes demonstration that pollutant loads from MS4s are not causing or contributing to exceedances.
6. Here and throughout this table, the term “dry weather flows” excludes groundwater, other exempt or permitted non-storm water flows, and sanitary sewer overflows.

% = percent; FY = fiscal year; WQO = Water Quality Objective

All numeric goals are cumulative from the baseline assessment for each fiscal year.

WQIP	Water Quality Improvement Plan
WQO	water quality objective

1 Monitoring and Assessment Program

The Monitoring and Assessment Program (MAP) for the Los Peñasquitos Watershed Management Area (WMA) is Section 5 of the Water Quality Improvement Plan (WQIP). The MAP incorporates requirements of Provision B and Provision D of the Municipal Separate Storm Sewer System (MS4) Permit, along with the specific monitoring and assessment requirements for the Bacteria and Sediment Total Maximum Daily Loads (TMDLs) listed in Attachment E of the MS4 Permit.

The Monitoring Program includes three major components: (1) the receiving water monitoring program that measures the long-term health of the watershed; (2) the MS4 outfall monitoring program that documents non-storm water flows and measures outfall water quality at select sites during dry and wet conditions; and (3) special studies that investigate the highest priority water quality conditions (HPWQCs). Table 1-1 provides an overview of the monitoring that is planned as part of the Los Peñasquitos WMA MAP and Figure 1-1 shows the locations for the 2015–2016 monitoring year.

This appendix summarizes monitoring data collected during the 2015–2016 monitoring year (October 1, 2015, and September 30, 2016), and data that were not summarized in the 2013–2014 and 2014–2015 Transitional Monitoring and Assessment Program Reports for the Los Peñasquitos WMA. Data include both receiving water and MS4 outfall monitoring data. Monitoring methodologies were summarized in Section 5 of the Los Peñasquitos WMA WQIP and were specified in the associated component Monitoring Plans (Project Clean Water, 2016). These documents provide detailed information regarding monitoring locations, monitoring techniques, constituents sampled, and quality assurance and quality control (QA/QC) requirements.

The Assessment Program for the 2015–2016 monitoring year includes only an annual analysis of the monitoring data collected for the 2015–2016 monitoring year. This appendix describes the MS4 Outfall Discharge Assessments (Provision D.4.b), which evaluate both the dry weather data associated with the illicit discharge detection and elimination (IDDE) program that were collected as part of the Jurisdictional Runoff Management Program (JRMP) program, along with the dry and wet weather MS4 monitoring data collected by the Responsible Agencies. The results of the special studies are also assessed in this appendix. The Receiving Water Assessment (Provision D.4.a) and the Integrated Assessments (D.4.b), as well as assessments of wet weather MS4 outfall discharge temporal trends, will be summarized in the Regional Monitoring and Assessment Report to be submitted with the Report of Waste Discharge in December 2017.

The highlighted cells represent the monitoring that occurred during the October 2015 to September 2016 monitoring year.

1. The MS4 Permit was adopted on May 8, 2013; the MS4 Permit became effective on June 27, 2013. Note that implementation of the programs began when the WQIP was approved in September 2015.
2. Definition of conventionals (conventional parameters) is based on Storm Water Management Program (SWMP) guidelines.
3. Completed under the Transitional Monitoring Program in accordance with MS4 Permit Provisions D.1.a and D.2.a.
4. The 2018 Southern California Bight Regional Monitoring will occur during the summer of 2018 or 2019.
5. The AB 411 program is not required by the MS4 Permit. Responsible Agencies are using the data to track beach water quality conditions related to the highest priority water quality condition for the WMA.
6. Sediment quality monitoring was completed under the 2013 Southern California Bight Regional Monitoring Program.
7. Completed under the Transitional Monitoring Program in accordance with MS4 Permit Provisions D.1.a and D.2.a.
8. Dry weather monitoring at reference streams was completed in spring 2014. Dry weather monitoring at reference beaches began in fall 2014.

AB 411 = California Assembly Bill 411; BMI = benthic macroinvertebrates; FIB = fecal indicator bacteria;
HMP = Hydromodification Monitoring Program; IC/ID = illicit connection and/or illicit discharge;
MS4 = Municipal Separate Storm Sewer System; NA = not applicable; SMC = Southern California Storm water Monitoring Coalition;
TBD = to be determined; TIE = toxicity identification evaluation; TMDL = Total Maximum Daily Load; TRE = toxicity reduction evaluation;
WMA = Watershed Management Area

1.1 2015–2016 Regional Rainfall Summary

Precipitation during the 2015–2016 monitoring year measured at the National Weather Service Lindbergh Field station (GHCND:USW00023188) was compared with average precipitation totals from 1939–2015. The 2015–2016 observed total of 8.18 inches was slightly less than the average annual total of 9.90 inches. Greater than average rainfall amounts were observed in November 2015, January 2016, May 2016, and September 2016. All other months saw less than average rainfall amounts, including February 2016, which saw much less than the historical average for February (0.05 inch vs. 1.8 inches). Figure 1-2 shows the October 2015 through September 2016 monthly rainfall measured at Lindbergh Field, compared with the average monthly and annual rainfall.

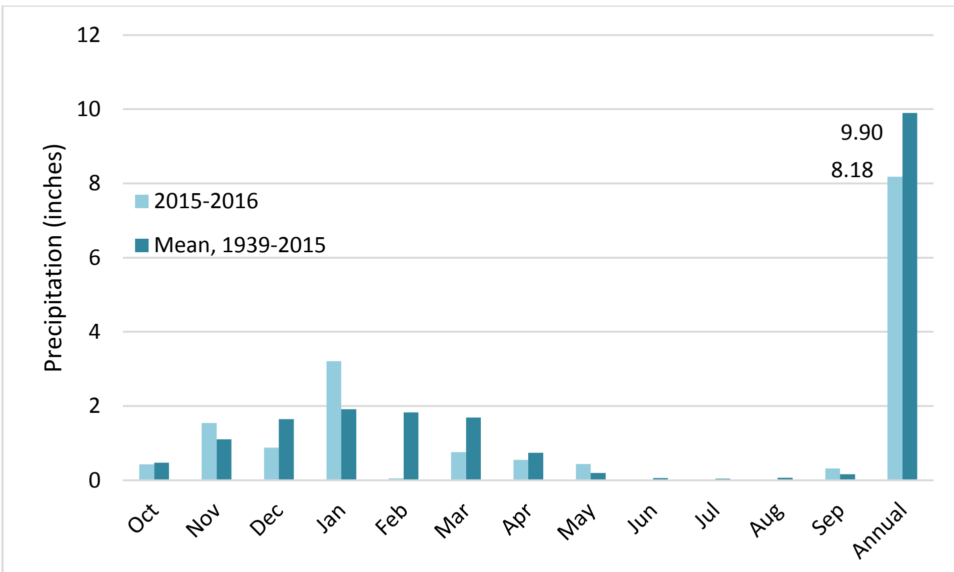

Figure 1-2
2015–2016 Monthly Rainfall vs. Average Monthly Rainfall (Lindbergh Field)

Eighty-four County of San Diego (County) ALERT rain gauges were used to measure rainfall throughout the region during the monitoring year (October 2015 through September 2016). Because the Transitional Monitoring Annual Reports presented rainfall data based on a July through June monitoring year, the July 2015 through September 2015 measured rainfall total is also presented to fill the gap between the end of reporting under the transitional program and the beginning of reporting under the WQIP. Going forward, WQIP Annual Reports will present data based on the October through September monitoring year.

July 2015 through September 2015 regional rainfall totals ranged from less than 0.25 inch in the inland deserts to over 5 inches in the mountains. Totals at the coast ranged from approximately 1 inch near the international border with Mexico to over 3 inches in the Mission Bay area. Rainfall in the Los Peñasquitos WMA was measured at 2.2 inches at the Miramar Lake ALERT station. Figure 1-3 presents regional rainfall totals from July 2015 through September 2015.

October 2015 through September 2016 regional rainfall totals ranged from less than 1 inch in the inland deserts to over 30 inches in the mountains. Totals at the coast ranged from approximately 7 inches near the international border with Mexico to approximately 12 inches in the northern section of the County. Rainfall in the Los Peñasquitos WMA ranged from 12.97 inches at the Miramar Lake ALERT station to 13.89 inches at the Poway ALERT station. Figure 1-4 presents regional rainfall totals from October 2015 through September 2016.

1.2 Monitoring Results and Assessments Appendix Organization

This appendix includes the Monitoring Results and Assessments for the Los Peñasquitos WMA Water Quality Improvement Plan Annual Report and is organized as follows:

Section 1, Monitoring and Assessment Program—This section provides an overview of the MAP, the monitoring performed during the October 2015 through September 2016 monitoring year, annual rainfall summary, and the assessments included in this appendix.

Section 2, Receiving Water Data Summary—This section describes the monitoring data collected as part of the Receiving Water Monitoring program. Data from various sources were compiled and summarized. Some data were collected during the October 2015 through September 2016 monitoring year, while other data were collected previously but not included in the Los Peñasquitos WMA Transitional Monitoring Assessment Report submitted in January 2016.

Section 3, Dry Weather Outfall Assessments and Illicit Discharges—This section summarizes the dry-weather MS4 Outfall Discharge Assessments (MS4 Permit Provision B.4.b). It includes a comparison with non-storm water action levels (NALs) and assessments required by the MS4 Permit.

Section 4, Wet Weather Outfall Assessments—This section summarizes the wet-weather MS4 Outfall Discharge Assessments (MS4 Permit Provision B.4.b). It includes a comparison with storm water action levels (SALs) and assessments required by the MS4 Permit.

Section 5, Special Study Assessments- This section provides an overview of the two special studies completed or in progress in the Los Peñasquitos WMA, including the San Diego Regional Reference Streams and Beaches Studies and the Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Compliance Monitoring Program.

Section 6, California Environmental Data Exchange Network (CEDEN) Certification Statement Summary—This section summarizes the CEDEN data submittal certifications for the October 2015–September 2016 monitoring year.

Intentionally Left Blank

2 Receiving Water Monitoring Data Summary

Section 2 of the Monitoring Results and Assessments Appendix highlights receiving water data collected as part of the Los Peñasquitos WMA MAP. Because this is the first Annual Report to be submitted under the Los Peñasquitos WMA WQIP, data collected since the acceptance of the MS4 Permit in 2013 will be (1) referenced if they have been previously submitted to the San Diego Regional Water Quality Control Board (Regional Board), (2) summarized if sampling was conducted prior to the October 2015 through September 2016 monitoring year and the data have not been previously submitted to the Regional Board, or (3) summarized in graphical and tabular form as part of this Monitoring Results and Assessments Appendix. As discussed in Section 1, MS4 Permit Provision D.4.a.(b) requires Receiving Water Assessments to be completed as part of the Report of Waste Discharge in December 2017. The data presented in this appendix will be used to complete those assessments as well as the Integrated Assessment detailed in the MAP.

2.1 Long-Term Receiving Water and Sediment Quality Monitoring Data

The Transitional Receiving Water Monitoring Program completed during the October 2014 through September 2015 monitoring year fulfilled a number of the requirements for the long-term monitoring outlined in the MAP. The results of this monitoring were presented in the Transitional Monitoring and Assessment Program Report for the Los Peñasquitos WMA (2014–2015) (San Diego County Municipal Copermittees, 2016). Results presented included water quality monitoring during dry and wet weather, trash assessments, hydromodification monitoring, and bioassessment at the long-term monitoring station (LTMS).

As stated in the Los Peñasquitos WMA WQIP, the Southern California Bight 2013 Regional Monitoring Survey (Bight ’13) Monitoring Program satisfied the initial monitoring requirements of the state's Sediment Control Plan. As many as two sites were monitored in the Los Peñasquitos Lagoon in 2013 for the initial screening of sediment quality. Because both sites were found to be likely unimpacted during the initial screening, no follow-up monitoring was conducted. Based on the monitoring and assessment completed, sediment conditions in the Los Peñasquitos Lagoon are generally protective of the beneficial uses (San Diego County Municipal Copermittees, 2014). The Sediment Monitoring Report was provided in the 2015 Transitional Monitoring and Assessment Report in accordance with the MS4 Permit reporting requirements.

2.2 Bight ’13 Regional Monitoring Data

Sediment quality monitoring was conducted during summer 2013 at 22 sites in 9 estuaries and lagoons in the San Diego region under the Bight ’13 (Los Peñasquitos Responsible Agencies, 2015). The sediment quality monitoring included sediment chemistry and toxicity. Bight ’13 was used to fulfill the initial monitoring requirements for the Sediment Quality Monitoring requirement of the MS4 Permit that is summarized in Section 2.1.

2.3 Southern California Storm Water Monitoring Coalition (SMC) Monitoring Data

The SMC bioassessment program has a probabilistic random sampling design, meaning that sites are selected at random within each designated stratum of the County. Four strata are within the County: Northern San Diego (Santa Margarita and San Luis Rey WMAs), Central San Diego (Carlsbad, San Dieguito, and Los Peñasquitos WMAs), Mission Bay/San Diego River (Mission Bay and San Diego River WMAs), and Southern San Diego (San Diego Bay and Tijuana River WMAs). For the 2015–2019 cycle, there are also two different classes of sites: Trend and Condition. Trend sites will be fixed for all five years of the cycle (unless the site goes dry or access is denied) and will be resampled in each of those five years. Condition sites will be different for each year of the five-year term. In the County as a whole, 16 sites are sampled annually: 4 Trend sites and 12 Condition sites.

At the beginning of the 2015–2019 cycle, the Southern California Coastal Water Research Project (SCCWRP) generated two randomized site lists that will be used to select sites for the entire five-year period, one for Trend sites and one for Condition sites. Trend sites are further categorized as “Open” sites (i.e., not urban or agriculture influenced) and “Developed” sites (i.e., with urban or agriculture influence). Of the four Trend sites in the County, two have been allocated as “Open” and 2 as “Developed” sites. Trend sites were selected on a County-wide basis, and were not allocated to a certain number of sites per County stratum. The two “Open” Trend sites are in the San Dieguito and San Diego Bay WMAs, while the two “Developed” Trend sites are in the Carlsbad and Santa Margarita WMAs. These sites will remain fixed and will be resampled each year, unless the sites go dry or are no longer accessible because of lack of landowner permission or other reasons. The Condition sites will change every year, and these sites are allocated as three Condition sites per County stratum. In 2015, the Condition sites were selected by starting at the top of the randomized Condition list for each County stratum and choosing the first three sites able to be sampled, after reconnaissance confirmation. Then, for each subsequent year (i.e., 2016–2019), site selection would start on the list from where the previous year left off and continue down the list to select three new sites. Within each County stratum for each year of the program, the three Condition sites have the potential to fall into any of the WMAs within that stratum. During the spring 2016 reconnaissance efforts, no Condition sites were allocated to the Los Peñasquitos WMA; the three Condition sites were split between the Carlsbad WMA (1) and San Dieguito River WMA (2).

2.4 California Assembly Bill 411 (AB 411) Data

San Diego County Department of Environmental Health (DEH) implements the Beach and Bay Water Quality Monitoring Program to support the statewide program funded by the Beach Safety Act (AB 411). This program is commonly referred to as AB 411 monitoring. There is one AB 411 beach monitoring station in the Los Peñasquitos WMA. The AB 411 monitoring program is not required by the MS4 Permit. Responsible Agencies are using the AB 411 data to track dry weather beach water quality conditions related to the HPWQCs for the watershed (Los Peñasquitos Responsible Agencies, 2015).

The number of samples collected for each fecal indicator bacteria (FIB) indicator (*Enterococcus*, fecal coliform, and total coliform) for the period between October 1, 2015, and July 31, 2015, is presented in Table 2-1.

Table 2-1
Los Peñasquitos WMA AB 411 Data Summary

Site ID	Location[1]	Total Number of Samples		
		Enterococcus	Fecal Coliform	Total Coliform
FM-100	Los Peñasquitos Lagoon	106	105	105

1. Figure 1-1 shows the AB 411 Monitoring Locations.
ID = identification

The concentrations for the FIB indicators are shown in Figures 2-1 through 2-3. These data will be reviewed during the Receiving Water Assessment completed in the Regional Monitoring and Assessment Report.

2.5 Hydromodification Monitoring Program

The Hydromodification Monitoring Program (HMP) was initially developed in response to the requirements of the 2007 MS4 Permit. The Monitoring Plan is defined in Chapter 8 of the HMP, and was updated by the San Diego County Regional Copermittees and accepted by the Regional Board in February 2014. The Effectiveness Assessment of the San Diego HMP Report will be submitted to the Regional Board in December 2016.

The Effectiveness Assessment of the San Diego HMP is intended to determine whether the requirements in the checklist for the Chapter 8 of the HMP were fully met. Monitoring results and program evaluations indicate that the HMP elements are protecting stream physical integrity (Regional Board, 2016). Additionally, the report provides answers regionally to three questions:

1. Do field observations confirm that the HMP appropriately defines the flow rate (expressed as a function of the 2-year runoff event) that initiates the movement of channel bed and bank material? The Effectiveness Assessment determined that the HMP does appropriately define the flow rate that initiates movement of channel bed and bank materials (Regional Board, 2016).

2. Are hydromodification mitigation facilities adequately meeting flow duration design criteria outlined in the HMP? The initial plan for this phase of the assessment was to couple best management practice (BMP) monitoring and channel monitoring. The slow pace of development during the economic recession in the first few years of the project did not allow this to happen. The study plan was changed and one BMP location was monitored during the 2015–2016 wet season for flow. Analysis for this one location over the year showed that significant peak flow attenuation occurred and during the monitored events the BMP performed as designed to prevent hydromodification (Regional Board, 2016).

3. What is the effect of development on receiving water channel cross-section stability downstream of urban development? The Effectiveness Assessment found that there were no major changes in channel stability within the nine monitored sites during the monitoring period, which included a relatively dry period due to drought conditions (Regional Board, 2016).

The report provided details of the small changes in channel geomorphology for the two sites located in the Los Peñasquitos WMA, as summarized in Table 2-2.

Intentionally Left Blank

Table 2-2
Los Peñasquitos WMA HMP Monitoring Site Summary

Site Name and Number	HMP Monitoring Type	Evidence of Erosion/ Deposition?	Repeat Assessment?	Susceptibility Class Changed?	Notes and interpretation. Is change (if observed) indicative of instability in channel or watershed?
Deer Valley RM-1	Reference	Small patches of up to 6 inches of fine sediment depositing in channel	Yes	Yes (Medium to High)	Fine sediment from watershed has formed a thin layer on the channel bed (originally gravel). Appears to be cyclical deposition; fines likely to be washed out in subsequent years. Fine sediment has caused changed classification. Site appears stable.
Flanders UM-2	Urban	~12 inches of upstream erosion and downstream deposition	Yes	No	Gravel pulse passing through site. Cyclical deposition of intermediate size bed–lining material, likely to be washed out in subsequent years. Site appears stable.

Intentionally Left Blank

2.6 Sediment TMDL Monitoring

The Los Peñasquitos Lagoon (Lagoon) has been historically impacted by anthropogenic disturbances that caused excessive sedimentation and degradation of estuarine habitat. As a result, the Lagoon was placed on the Clean Water Act (CWA) Section 303(d) List of Water Quality Limited Segments (303(d) List) for sedimentation and siltation. In response, on June 13, 2012, the Regional Board adopted Resolution Number R9-2012-0033: *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) To Incorporate the Total Maximum Daily Load (TMDL) for Sedimentation in Los Peñasquitos Lagoon* (referred to as the Sediment TMDL) (Regional Board, 2012). This section summarizes the results of the 2015–2016 monitoring year. The Sediment TMDL Monitoring Compliance Report is provided in Attachment A.

2.6.1 Sediment TMDL Monitoring Methodology

The Los Peñasquitos Lagoon WMA Sediment TMDL Compliance Monitoring Program was designed to assess sediment transport within the three major tributaries that flow through the WMA into the Lagoon: Carroll Canyon Creek, Carmel Valley Creek, and Los Peñasquitos Creek (WMA creeks). The Monitoring Program provides data on (1) streambed conditions (particle sizes), (2) suspended sediment concentrations (SSC) during wet weather, (3) sediment delivery potential from the three WMA creeks discharging into the Lagoon, and (4) estimated total sediment loads to the Lagoon.

For vegetation monitoring, the seven vegetation types consistent with the categories historically used in the 2011 California State Parks analysis (California State Parks, 2011) of Lagoon vegetation from 2010 will be evaluated. These seven vegetation categories will be mapped using the methodology described below as part of the Sediment TMDL compliance monitoring to identify where and how changes in habitat are occurring in Los Peñasquitos Lagoon.

This Monitoring and Assessment Appendix summarizes the results of the Monitoring Program during fiscal year (FY) 2016 (July 1 2015, through June 30, 2016), provides a comparison with historical data, and summarizes the results of the monitoring program to determine compliance with the established TMDL.

Monitoring conducted by Amec Foster Wheeler Environment & Infrastructure, Inc. prior to and during the wet season included the following:

- Pre-wet-season (prior to October 1, 2015):
  - Volumetric streambed sampling for particle-size distribution
  - Pre-storm Wolman pebble counts
  - Photo documentation
  - Channel cross-section surveys

- Wet season (October 1, 2015, through April 30, 2016):
  - Storm bedload sampling for particle-size distribution
  - Post-storm Wolman pebble counts
  - Photo documentation
  - Instantaneous water discharge measurements
  - Continuous water discharge monitoring
  - Pollutograph sampling for SSC

During the 2015–2016 wet season, cross-sectional areas of streambeds at the monitoring locations were updated and used to revise the head-versus-flow tables. Multiple field flow measurements using wading rods and StreamPro Acoustic Doppler Current Profilers (ADCPs) were used to verify and calibrate the head-versus-flow tables. The primary change to the head-versus-flow tables was extending the Los Peñasquitos Creek table to higher stages, because the stages measured during the large storms in early January 2016 exceeded the tables previously developed.

2.6.2 Sediment TMDL Monitoring Results

Hydrology and Analysis

Three storm events (storms) were monitored during the 2015–2016 wet season (Table 2-3). Total rainfall during monitored storms was 2.94 inches, representing 31 percent (%) of the 9.48 inches of total wet season rainfall. A total of 21 "wet weather days" (days with more than 0.1 inch of rainfall) were observed, compared with 11 wet weather days in 2013–2014 and 14 wet weather days in 2014–2015.

Table 2-3
Rainfall Amounts for 2015–2016 Monitored Wet Weather Events

Event	Dates	Rainfall Total[1] (inches)
1	January 5–6, 2016	1.55
2	January 31, 2016	0.49
3	March 6–8, 2016	0.90

1. Rainfall was measured at the Los Peñasquitos Creek monitoring location rain gauge, except during the event on January 5-6, 2016, when it was replaced by Carmel Valley Creek monitoring location rain gauge because of equipment malfunction. Rainfall totals reported are only during the monitoring period. Rainfall continued later on the January 6, 2016, after sampling concluded for Event 1.

SSC Results

Data collected during the three storms showed that changes in SSC were strongly controlled by flow. In general, data collected over three wet seasons (2013–2016) indicated that SSCs were higher at or near peak flow and during the rising limb of the hydrograph for smaller storms, suggesting supply-limited sediment transport. This finding is particularly evident in results of the smaller storms (Events 2 and 3) during the 2015–2016 wet season. For the larger storm (Event 1), SSCs in all three WMA creeks remained high throughout the storm and mostly varied with flow, suggesting that the unusually high flows may have mobilized previously deposited sediments that were stored by in-channel vegetation and streambed.

Bedload and Pebble Count Results

Collection of bedload samples was attempted during each monitored event at the three monitoring locations using both trap samplers (installed in streambed) and manual bedload samplers. Bedload sampling proved challenging and samplers were frequently displaced or buried, making it impossible to determine sampled volume. One manual sample was successfully collected during low flow conditions, but may not be representative of the bedload throughout the storm, particularly at peak flow conditions. Visual observations and photos taken pre- and post-storm documented large amounts of cobble and streambed sediment deposited in the concrete-lined portion of Carroll Canyon Creek, but it is not known whether, or how much of, this material was transported into the Lagoon.

Post-storm pebble counts were conducted on six occasions during the 2015–2016 wet season. Results showed that there was a shift toward a higher proportion of sands (i.e., larger particle size) after the series of large rain events in early January 2016 at Carroll Canyon Creek, which typically has higher velocity flows compared with the other two creeks. Pebble count data after Events 2 and 3 show a return to a lower proportion of sands and more fines, likely due to lower intensity storms. This trend is less apparent or not detected in the other two creeks. The lack of a clear shift after the large January 2016 storms is most likely due to the lower velocities observed in these two creeks, but may also be attributable to sediment supply within the creeks (i.e., higher proportion of fines compared to sands upstream).

Sediment Loads from Watersheds During Measured Storms

Flow-weighted event mean concentrations (EMCs) and total sediment load estimates were calculated using SSC and flow data for three storms during the 2015–2016 wet season and the two previous years. In the two previous wet seasons and a previous estimate (Weston Solutions Inc., 2009), Carroll Canyon Creek typically accounted for 80% to 90% of the sediment loads to the Lagoon, with the remaining 10% to 20% supplied mostly by Los Peñasquitos Creek, and a small percentage (1%) by Carmel Valley Creek. Data collected during the 2015–2016 wet season indicated that relative contributions measured this season differ greatly from previous sediment load measurements and estimates, primarily because of unusually intense storms and resulting high flow rates and large flow volumes in Los Peñasquitos Creek. Because of these unusually high flows, Los Peñasquitos Creek accounted for the majority (~60%) of the total sediment load during the 2015–2016 wet season. Carroll Canyon Creek supplied approximately 39%, and Carmel Valley Creek supplied approximately 1%.

These estimated annual sediment loads are preliminary values, based on the limited data set collected during the 2013–2014, 2014–2015, and 2015–2016 wet seasons (nine total events). Data collection during future storm events are required to further refine these sediment load estimates, particularly for non-monitored events.

Estimated Annual Sediment Loads

The annual sediment load (23,500 tons per year) was estimated by multiplying the average of the three daily load estimates at each site (per storm) by the number of wet days per year (21 in 2015–2016) ("average estimation method"). This approach can yield skewed results by averaging a single large event over several smaller events, raising the total estimated load. In an effort to better represent load estimations for non-monitored storms, annual sediment load was also estimated using a regression between maximum one-hour rainfall-intensity and estimated loads during monitored events. The regression relationship between one-hour rainfall intensity and sediment loads was strong in previous wet seasons, but the approach was unreliable with the data from the 2015–2016 wet season, likely because of the unusually high rainfall intensities. The annual sediment load estimates from the rainfall intensity method yielded significantly different results than the average estimation method, leading to uncertainty in the annual sediment load estimates. Using the rainfall intensity method, sediment load for the 2015–2016 wet season was estimated to be 688 tons per year compared with the estimated total of 23,500 tons per year calculated using the average estimation method. Relationships between flow and SSC were investigated, but the relationships were not strong at all monitoring locations, and the approach was not extended further. All three methods present different challenges, and future work will be performed to develop an improved method for estimating annual total sediment loading, primarily focusing on regression relationships between maximum event flow rate and total event sediment load.

Total Sediment Load and Waste Load Allocation (WLA)

Based on monitoring during the 2015–2016 wet season, the total sediment load estimate of 23,500 tons per year is significantly above the WLA allowed by the Sediment TMDL (2,580 tons per year). Continued compliance monitoring at the sediment TMDL locations is planned for FY 17.

2.6.3 Vegetation Monitoring Methodology

The vegetation types in Los Peñasquitos Lagoon are monitored annually, in the fall, to measure changes in the spatial extent of the vegetation types. The monitoring is conducted via aerial photography and/or land-based survey methods that are consistent with the methodology used to calculate the numeric target. Ground truthing (i.e., land-based survey methods) of aerial mapping may be performed to distinguish among vegetation types.

The vegetation mapping uses the preferred vegetation classification that is necessary to document attainment of the Sediment TMDL goals. At the minimum, mapping distinguishes with high confidence between the two major vegetation types called out in the Sediment TMDL, tidal saltmarsh and native-dominated non-tidal saltmarsh.

The Sediment TMDL Staff Report and its attachments (Regional Board, 2012) describe the methods that were used for mapping Los Peñasquitos Lagoon pursuant to the development of the numeric target for Lagoon restoration. Aerial photos were digitized onscreen at a 1:2,500 scale and were mapped into generalized classifications that could be reliably interpreted without field verification. Vegetation monitoring currently utilizes the same methodology. Aerial photographs are taken at the height of the growing season (late summer to early fall) for the monitoring year. Vegetation types are mapped as described, with the polygons for each type totaled to indicate the number of acres of each type that were identified. Changes in vegetation types from the previous mapping efforts are quantified to determine whether progress is being made toward the Sediment TMDL numeric target.

2.6.4 Vegetation Monitoring Results

Vegetation was mapped in the Peñasquitos Lagoon using aerial imagery collected in October 2016 to determine whether progress is being toward the standards set in the TMDL documents.

For the purposes of Sediment TMDL compliance, 33 Western San Diego County Vegetation Classifications were consolidated into the seven Sediment TMDL classifications to develop a provisional crosswalk. These classifications are tidal saltmarsh, non-tidal saltmarsh, non-tidal saltmarsh infested with *Lolium*, freshwater marsh, southern willow scrub/mulefat scrub, herbaceous wetland, and upland. Newly designated acreage for the seven TMDL categories is provided in Table 2-4. The full crosswalk and acreage for the 33 Western San Diego County Vegetation Classifications are provided in Attachment C. An updated map of TMDL vegetation types from the October 2016 aerial survey is in Figure 2-4.

Table 2-4
Los Peñasquitos Lagoon TMDL Vegetation Acreage

TMDL Vegetation and Baseline Vegetation	Baseline Area (Acres)	October 2016 Area (Acres)	Difference from Baseline to 2016 (acres)

2.7 Bacteria TMDL Monitoring

The 2015–2016 Los Peñasquitos WMA Bacteria Total Maximum Daily Load (Bacteria TMDL) compliance monitoring program was designed to meet the requirements of the MS4 Permit. The Bacteria TMDL monitoring program assesses the conditions of the receiving waters and has the following objectives:

- Characterize levels of bacteria concentrations at compliance monitoring locations.
- Track progress toward meeting the Bacteria TMDL numeric targets.

FIB sampling was completed for the compliance monitoring season (October 2015 through September 2016). Dry weather samples were collected at least monthly on dry weather days from November 1, 2015, through March 31, 2016. Dry weather samples were collected at least weekly in October 2015 and from April 1, 2016, through September 30, 2016. Compliance monitoring location information is presented in Table 2-5. The Bacteria TMDL Compliance Report is provided in Attachment B.

Annual Compliance Reports summarize FIB concentrations and key hydrologic data by season. Compliance is assessed by comparing analytical results for *Enterococcus*, fecal coliform, and total coliform with applicable receiving water limitations (RWLs), in accordance with the Bacteria TMDL requirements in Attachment E of the MS4 Permit. The RWLs are a combination of numeric targets for bacteria density and allowable exceedance frequencies. The single-sample maximum numeric targets are required to be achieved only during wet weather with a 22% final allowable exceedance frequency. For dry weather days, the 30-day geometric mean numeric targets must be achieved with a 0% exceedance frequency. The compliance schedule includes interim milestones that must be achieved to demonstrate progress prior to attaining full compliance with the TMDL. Wet weather samples were collected for three wet weather events, including an extreme wet weather event in January 2016 that produced over 5 inches of rainfall as measured at the Miramar Naval Air Station rain gauge.

Table 2-5
TMDL Monitoring Station

Monitoring Location	Monitoring Identification	Latitude	Longitude
Los Peñasquitos River Outlet/Beach	FM-100	32.935074626	–117.261955166

Summary of Results for 2015–2016

Analytical results for total coliform, fecal coliform, and *Enterococcus* at the Los Peñasquitos River Outlet were compared with numeric targets established in the Bacteria TMDL and MS4 Permit. Results are as follows:

- During wet weather, the receiving waters at the Los Peñasquitos River Outlet/Beach achieved a 0% single-sample maximum exceedance frequency for fecal coliform and a 13% single-sample maximum exceedance frequency for total coliform and *Enterococcus*. FM-100 is in compliance with final wet weather single-sample maximum RWLs.
- During the wet season, which evaluates a combination of both wet and dry weather samples, FM-100 achieved a 0% geometric mean exceedance frequency and is in compliance with final dry weather geometric mean RWLs.
- During the dry season, when recreational activities occur with more regularity, FM-100 achieved a 0% exceedance frequency and is in compliance with the final dry weather geometric mean RWLs.

Intentionally Left Blank

3 Dry Weather Outfall Assessments and Illicit Discharges

The purpose of this program is to identify non-storm water and illicit discharges within each Responsible Agency's jurisdiction, determine which discharges are transient flows and which are persistent flows, and prioritize the dry weather MS4 discharges that will be investigated and eliminated. The dry weather MS4 outfall monitoring component involves the following types of data collection activities for the Los Peñasquitos WMA:

- Dry Weather MS4 Outfall Field Screening: inspecting major outfalls during dry weather conditions to identify and prioritize persistently flowing outfalls.
- Dry Weather Persistent MS4 Outfall Discharge Monitoring: testing the discharge for various pollutants and comparing the results with the NALs.

3.1 Non-Storm Water MS4 Outfall Monitoring Data

During the 2015–2016 monitoring season (October 2015 through September 2016), the Responsible Agencies implemented the first year of dry weather outfall discharge monitoring in accordance with Provision D.2.b of the MS4 Permit. The goals of dry weather outfall monitoring are to:

- Identify non-storm water and illicit discharges within each Responsible Agency's jurisdiction.
- Prioritize dry weather MS4 discharges that will be investigated and eliminated.
- Assess effectiveness of JRMP programs toward effectively prohibiting non-storm water discharges into the MS4.

Dry weather data collected at major MS4 outfalls are provided in Attachment D.1. Non-storm water MS4 outfall observations data are provided in Attachment D.2. Attachment E includes a QA/QC summary of the dry weather outfall data collected. Details of the monitoring methodology are provided in the Los Peñasquitos WMA MS4 Outfall Monitoring Plan, available on the Project Clean Water website (Project Clean Water, 2016). The following sections present the results of dry weather discharge monitoring in the Los Peñasquitos WMA.

3.2 Non-Storm Water Action Level Comparisons

Data collected as part of the dry weather MS4 outfall discharge monitoring were compared with NALs per the MS4 Permit. The results are summarized in Tables 3-1 through 3-3.

The MS4 Permit NALs vary according to the receiving water of the MS4 discharge (i.e., there are separate NALs for discharges to ocean surf zone, lagoons/harbors/bays/estuaries, and inland surface waters). In the Ocean Surf Zone (Table 3-1), none of the samples collected had total coliform and fecal coliform concentrations that exceeded their respective NALs. Both samples collected had concentrations of *Enterococcus* that exceeded the NAL.

Table 3-1
NAL Comparison for MS4 Outfalls to Ocean Surf Zone

Parameter	NAL	Monitoring Location	
		City of Del Mar	
		S-12	
		6/30/2016	8/12/2016
Total Coliform	10000/1000 MPN/100 mL*	1600	**30000**
Fecal Coliform	400 MPN/100 mL	50	ND
Enterococcus	104 MPN/100 mL	**1600**	**500**

Bold = exceedance of NAL
MPN/100 mL = most probable number per 100 milliliters; ND = not detected; NAL = non-storm water action level
*The NAL is 1,000 MPN/100mL when the fecal/total coliform ratio exceeds 0.1.

A total of 11 major MS4 outfalls were monitored that flow into inland surface waters. Monitoring results by jurisdiction are shown in Tables 3-2 and 3-3. The City of Poway and City of San Diego monitor six and five major MS4 outfalls, respectively, that flow to inland surface waters in the Los Peñasquitos WMA. The majority of results were below the NALs. A total of 276 of the 366 separate results were below appropriate NALs (including 107 non-detects). NALs were exceeded for concentrations of *Enterococcus*, fecal coliform, iron, manganese, pH, total nitrogen, and total phosphorous, collectively, within these outfalls. Some of these analytes are found in groundwater and may be from unidentified groundwater intrusion. Other analytes will be addressed by the strategies developed by the Responsible Agencies. The Los Peñasquitos WMA Responsible Agencies have just begun implementation of the WQIP. They plan to continue implementing the strategies without modification, and to work toward eliminating dry weather flows. Additionally, they have implemented their IDDE programs, as summarized in Section 3.3.1, to identify sources of illicit dry weather discharges.

3.3 Non-Storm Water MS4 Outfall Monitoring Data Assessments

Assessments of jurisdictional MS4 monitoring programs were conducted individually by the jurisdictions, watershed-wide. Per Provision D.4. of the MS4 Permit, assessments include:

- Progress of IDDE programs toward effectively prohibiting non-storm water and illicit discharges into the MS4 within Copermittees' jurisdictions.
- Identification of known and suspected controllable sources (e.g., facilities, areas, land uses, pollutant-generating activities) of transient and persistent flows within the Copermittee's jurisdiction in the WMA, sources of transient and persistent flows within the Copermittee's jurisdiction in the WMA that have been reduced or eliminated, and modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in Copermittee inventories.
- Based on the dry weather MS4 outfall discharge field screening monitoring, assessment and reporting of the following:
  - For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identification of the known and suspected sources within the Copermittee's jurisdiction in the WMA that may cause or contribute to the NAL exceedances.
  - Calculations or estimates of the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in the Copermittee's jurisdiction identified as having persistent dry weather flows during the monitoring year.

Each Copermittee is required to conduct field screening to determine which non-storm water MS4 outfall discharges are transient or persistent non-storm water flows. Data collected during dry weather MS4 outfall monitoring are used to prioritize the non-storm water MS4 discharges to be investigated and eliminated.

3.3.1 Illicit Discharge Detection and Elimination Program Data and Assessment

Los Peñasquitos WMA Responsible Agencies implemented IDDE program activities to detect and eliminate illicit discharges and improper disposal of wastes into the MS4. A total of 501 non-storm water discharges were detected during the course of the monitoring year. Illicit discharge investigations included visual observations, additional site visits, field sampling, photo documentation, and follow-up/enforcement activities, as appropriate.

In the course of investigating these non-storm water discharges, 465 non-storm water discharges were eliminated, as shown in Table 3-4. The most common source of non-storm water and illicit discharges is generally irrigation runoff. Other significant sources include groundwater seepages, commercial washing activities, chlorinated pool discharges, and illicit discharges/connections.

Intentionally Left Blank

Table 3-4
Dry Weather Discharge Investigations and Discharges Eliminated in the 2015–2016 Monitoring Year

3.3.2 Classification of Major MS4 Outfalls Within each Copermittee's Jurisdiction

To address the MS4 Permit requirements, Responsible Agencies determined the number of major MS4 outfalls within their jurisdictions within the WMA. Table 3-5 provides the number of major outfalls for each Responsible Agency. Each major outfall was classified as follows:

- Persistent – having flowing, pooled, or ponded water more than 72 hours after a measureable rainfall event of 0.1 inch or greater during the three consecutive most recent monitoring and/or inspection events;
- Transient – having flowing, pooled, or ponded water during at least one but not on all three most recent consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation ≥0.1 inch;
- Tidal – having persistent or transient flow with ocean tides as the source;
- Dry – having no flowing, pooled, or ponded water during the previous three consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation ≥0.1 inch; and
- Unknown – site cannot be evaluated, or has not been visited enough times to determine flow status.

In the Los Peñasquitos WMA, 39% of the major outfalls were classified as persistently flowing outfalls. Table 3-6 and Figure 3-1 presents percentages of all classifications of major outfalls in the 2015–2016 monitoring year. No outfalls were classified as tidal during the monitoring period.

Table 3-5
Number of Major Outfalls in Los Peñasquitos WMA

Copermittee	Total Number of Major Outfalls	Number of Major Outfall Stations Visited	Number of Major Outfall Visual Observations	HA Name	HA Number	Number of Major Outfalls per HA
City of San Diego[1]	200	200[3]	205[4]	Miramar Reservoir	906.1	162

County of San Diego[5]	0	NA	NA	NA	NA	NA
Total	**233**	**233**	**273**			

1. The City of San Diego has 502 outfalls within the City jurisdiction. The City of San Diego, in accordance with Provision D.2.a(2).(a).(iv) of the MS4 Permit, is required to screen 500 sites city wide once per year. The City is not required to screen 500 sites within each watershed.
2. For Responsible Agencies with fewer than 125 major outfalls in the WMA, 80% of total major outfalls presented in the table must be screened twice per year.
3. Proxy sites were visited for 109 major outfalls. Proxy sites were visited when field crews were unable to access the outfall.
4. Observations of multiple upstream proxy sites for the same outfall counted as a single observation if they occurred on the same day.
5. County of San Diego has no major MS4 outfalls in the Los Peñasquitos WMA.

HA = hydrologic area; NA = not applicable

Classification of Major Outfalls in Los Peñasquitos WMA

3.3.3 Visual Observations at Major MS4 Outfalls

MS4 outfall visual assessments were performed as required by Table D-5 of the MS4 Permit. Table 3-7 presents the results of visual assessments with regard to trash, including whether trash was observed during each visual observation event, and, if so, the approximate number of pieces of trash. During the 2015–2016 monitoring year, greater than 99% of visual observations indicated no or low (<50 pieces) presence of trash. Additional visual observations are provided in Attachment D.2.

Table 3-7
Trash Assessment Visual Observations in the 2015–2016 Monitoring Year

Copermittee	HA	Number of Major Outfall Visual Observations with Trash Assessments[1]	Number of Observations with No Trash Present	Number of Observations with Trash Present		
				Low (<50 pieces)	Medium (50 to 400 pieces)	High (>400 pieces)
City of San Diego[2]	906.1	180	93	86	1	0
	906.2	41	29	12	0	0
Subtotal		**221**	**122**	**98**	**1**	**0**
City of Del Mar	906.1	15	10	5	0	0
Subtotal		**15**	**10**	**5**	**0**	**0**
City of Poway	906.2	53	30	23	0	0
Subtotal		**53**	**30**	**23**	**0**	**0**
Total		**289**	**162**	**126**	**1**	**0**

1. Trash assessments not conducted for all visual observations. Values in this column may not match total numbers of visual observations in Table 3-5.
2. Trash assessments include observations at multiple upstream proxy sites representing a single outfall. The number of trash assessments is greater than the number of visual observations listed in Table 3-5.

HA = hydrologic area

3.3.4 Controllable and Non-Controllable Sources of Flow

The MS4 Permit requires classification of sources of observed flowing or ponded water in dry weather. Known, controllable sources, such as irrigation runoff and commercial washing activities, were identified by observation. Other suspected sources of flow were noted and may have included pool/spa leaks or overflows. Non-controllable sources were also identified during dry weather visual observations and included mostly groundwater seepage. Unidentified sources of flow were also noted during dry weather visual observations. Tables 3-8 and 3-9 present results of visual observation identifications of controllable and non-controllable sources, respectively, made in the 2015–2016 monitoring year.

Table 3-8
Controllable Sources of Flow Observed in the 2015–2016 Monitoring Year

Copermittee	Number of Flowing or Ponded Observations at Major Outfall[1]	Known Controllable Sources		Suspected Controllable Sources	
		Irrigation Runoff	Other Discharges	Irrigation Runoff	Other Discharges
City of San Diego	123	9	4[2]	42	1[3]
City of Del Mar	13	Source information collected in IDDE program.			
City of Poway	19	11	0	0	0
Total	**156**	**20**	**4**	**44**	**1**

1. Note that the number of flowing or ponded observations may not be the same as the number of Persistent or Transient outfalls in Table 3-8. Some outfall stations were visited more than once.
2. Two commercial washing activities discharges, one curb cut discharge, and one weephole discharge.
3. Suspected pool/spa chlorinated source

Table 3-9
Non-Controllable Sources of Flow Observed in the 2015–2016 Monitoring Year

Copermittee	Known Uncontrollable Sources	Suspected Uncontrollable Sources
	Groundwater Seepage	Groundwater Seepage
City of San Diego	0	0
City of Del Mar	Source information collected in IDDE program.	
City of Poway	0	9
Total	**0**	**9**

Non-storm water discharges (NSWDs) that have been reduced or eliminated during the 2015–2016 monitoring year have also been identified during the visual observations that were conducted by each Copermittee. Table 3-10 presents the number of discharges eliminated through visual outfall monitoring, including the identified sources of eliminated discharges. Additional runoff sources were eliminated through inspection and enforcement action under the Copermittees' IDDE program, as noted in Section 3.3.1.

Table 3-10
Dry Weather Discharges Eliminated in the 2015–2016 Monitoring Year

Copermittee	Number of Eliminated Discharges	Types of Eliminated Discharges
City of San Diego	2	Commercial Washing Activities and Over-irrigation
City of Del Mar	5	Residential and Commercial
City of Poway	0	-
Total	**2**	-

Per MS4 Permit requirements, Responsible Agencies must identify modifications to the field screening monitoring locations and frequencies for the major MS4 outfalls in their inventories. Table 3-11 summarizes these modifications, based on the findings of visual observations during the 2015–2016 monitoring year.

Table 3-11
Modifications to Dry Weather Field Screening Locations and Frequencies

Copermittee	Number of Outfalls Added to Priority Persistent Flow Outfall List	Number of Outfalls Removed from Priority Persistent Flow Outfall List	Number of Outfalls Added to MS4 Inventory	Number of Outfalls Removed from MS4 Inventory
City of San Diego	5	0	0	0
City of Del Mar	0	0	0	0
City of Poway	0	0	0	4[1]
Total	**5**	**0**	**0**	**4**

1. Four outfalls removed from inventory because additional outfalls were discovered to be located downstream.

3.4 Non-Storm Water Volume and Pollutant Load Assessment

Copermittees must assess the non-storm water volumes and pollutant loads collectively discharged from their jurisdictions in the Los Peñasquitos WMA, per MS4 Permit Provision D.4.b(1)(c). The methodology used to calculate the non-storm water volumes and loads is provided in Attachment D.3.

3.4.1 Identification of Dry Weather Days

The first step in calculating annual non-storm water volumes and pollutant loads is to determine the number of dry weather days in the monitoring year. The number of dry weather days was determined using County of San Diego ALERT station data (https://sandiego.onerain.com). The Poway ALERT station was selected to represent rainfall conditions in the Los Peñasquitos WMA. This representative ALERT station was also utilized in Wet Weather MS4 Outfall Discharge Monitoring Assessments, and is the station closest to a majority of wet weather MS4 outfall discharge monitoring stations.

A wet weather day was defined as any day with at least 0.1 inch of measurable rainfall within a 24-hour period, and the subsequent 72 hours. Dry weather days were defined as all other days during the monitoring year (October 1 through September 30). Table 3-12 presents the number of dry weather days identified in the Los Peñasquitos WMA during the 2015–2016 monitoring season.

Table 3-12
Los Peñasquitos WMA Dry Weather Days by Month

Month	Number of Days	Storm Dates	Number of Storm Days	Number of Storm Days +72 Hours	Number of Dry Days
October 2015	31	October 4-5, 2015	2	5	26
November 2015	30	November 3, 2015	3	12	18
		November 15, 2015			
		November 27, 2015

July 2016	31	NA	0	0	31
August 2016	31	NA	0	0	31
September 2016	30	September 20-21, 2016	2	5	25

NA = not applicable, no storms recorded

3.4.2 Non-Storm Water Volume Assessment

An annual non-storm water volume was calculated for each persistently flowing major MS4 outfall in each Copermittee's jurisdiction. The calculation method differed, depending on the availability of flow data for each site. Details of each calculation method are presented in the Dry Weather Assessment Methodology in Attachment D.3.

The methods are summarized as follows:

- Scenario A: If a major MS4 outfall station was visited once during the monitoring year, and a single discrete flow rate was measured, this flow rate was applied across all dry weather days within the year.
- Scenario B: If a major MS4 outfall station was visited more than once during the monitoring year, and more than one discrete flow rate was measured, monthly dry weather flow volumes were calculated. The monthly flow volume calculation method varied on the basis of whether a flow measurement was logged at the outfall during that month. For calendar months in which the outfall was visited one or more times, the mean of the measured flow rates was applied to all dry weather days within the month. For calendar months in which the outfall was not visited, the mean of all flow rates observed at that site during the calendar year was applied.
- Scenario C: If a major MS4 outfall station was monitored continuously for a period of time longer than a day, a measured daily flow volume was calculated for each monitored day. The mean of these daily flow volumes was applied to all non-monitored dry days. This scenario was not encountered during the 2015–2016 monitoring season.
- Scenario D: If a major MS4 outfall station was not visited during the monitoring year, the mean of annual outfall flow volumes for all monitored stations in the jurisdiction in the WMA was applied. This scenario was not encountered during the 2015–2016 monitoring season.

Within all these scenarios, observations of ponding (i.e., evidence of non-storm water in the MS4, with no connectivity to the receiving water) were assigned a flow rate of zero. If a station was observed to be flowing, but no flow rate was recorded, the average non-zero flow rate for that station was applied to that observation. If a station was observed to be flowing, but the flow rate was estimated (e.g., <1 gallon per minute), a value of half the estimated flow rate was applied.

The methodology above assumes that a persistently flowing major MS4 outfall is flowing on 100% of dry weather days. This assumption is highly conservative. Additional limitations to the methodology are listed in Section 3.4.6. Major limitations include assuming that rates of dry weather discharge equal the measured values throughout the entire month or year (depending on the calculation scenario used), as well as assuming that pollutant concentrations can be represented by samples collected just twice per year at five or fewer outfalls per jurisdiction.

Tables 3-13 through 3-15 present the outfalls that were identified as persistently flowing by each Copermittee. The number of visual observations made at these locations during the 2015–2016 monitoring year are also presented, and the numbers of flowing, ponded, and dry observations from these site visits are summarized. Finally, the annual dry weather flow volume modeled from each site is presented, as well as the total dry weather flow volume collectively discharged from persistently flowing sites within each Copermittee's jurisdiction in the WMA.

Note that the County of San Diego has no major MS4 outfalls within the Los Peñasquitos WMA.

3.4.3 Non-Storm Water Load Assessment

The Copermittees estimated the annual non-storm water pollutant loads collectively discharged from their persistently flowing major MS4 outfalls to receiving waters in the MS4.

A load was calculated for each pollutant required to be analyzed at each high priority outfall, based on the arithmetic mean of the analytical results from the two dry weather outfall monitoring events at that outfall during the monitoring year. For each non-high priority persistently flowing outfall in a Copermittee's jurisdiction in the WMA, the mean of that Copermittee's monitored outfall results for each pollutant was applied. For any pollutants not detected at the method detection limit (MDL), a concentration of MDL/2 was applied in calculating the loads. The annual non-storm water pollutant loads collectively discharged from each jurisdiction are presented in Table 3-16. The non-storm water pollutant loads for each persistently flowing major MS4 outfall are presented in Attachment D.4.

1. NAL analyte not required for Ocean Receiving Waters.
2. Laboratory methods for Chromium (III) and Chromium (VI) require filtering the sample; therefore, the dissolved and total fractions of Chromium (III) and Chromium (VI) are equal
3. Nitrite and nitrate can be analyzed separately or together (Table D-7, MS4 Permit)

cf = cubic feet; lb = pounds; MPN = most probable number; N = nitrogen; NR = not required; P = phosphorus; TDS = total dissolved solids; TKN = total Kjeldahl nitrogen; TSS = total suspended solids

3.4.4 Percent Contribution from Known Sources

Table 3-17 summarizes the percentage of non-storm water volume and load contributions from known sources. This value was calculated by dividing the observed flow rate for each known source by the estimated annual outfall flow volume presented in Section 3.4.2. It was assumed that the known source was flowing for the entire day on which the source was observed. Additionally, it was assumed that the percent load contribution is equal to the percent flow contribution for each known source.

Table 3-17
Percent Contribution from Known Sources

Copermittee	Station ID	Observation Date	Known Source	Known Source Flow Rate (cfs)	Known Source Daily Flow Volume (cf)	Annual Outfall Non-Storm Water Flow Volume (cf)	Percent Contribution from Known Source (%)
City of San Diego	DW0024	2/4/2016	Irrigation Runoff	0.09	7,776	1,227,234	0.63%
	DW0025	4/25/2016	Commercial Washing Activities	0.03	2,592	1,388,057	0.19%

		7/27/2016	Irrigation Runoff	< 0.002	86[1]		0.25%

1. Daily Flow Volume was calculated using a flowrate of 0.001 cfs, half of the reporting limit for the City of Poway.

% = percent; cf = cubic feet; cfs = cubic feet per second; ID = identification; NA = not applicable. Modeled annual flow volume for outfall was 0 cfs.

3.4.5 Percent Contribution from Sources Not Subject to Copermittee Legal Authority

Copermittees did not identify sources not subject to their legal authority within the Los Peñasquitos WMA during dry weather monitoring.

3.4.6 Dry Weather Assessment Methodology Assumptions and Limitations

The calculation of the MS4 Permit-required assessments necessitates a number of assumptions to translate the monitoring data into conclusions regarding flow volume and load for the entire WMA. These assumptions may introduce potential sources of error, while propagating potential errors inherent to the monitoring data. These assumptions and sources of error are as follows:

- Monitoring Error—Annual non-storm water volumes and pollutants loads are based on the results of dry weather visual observations and dry weather outfall monitoring events. Error in the monitoring data could have the effect of propagating error in all subsequent calculations. Potential sources of error in the monitoring data include the following:
  - Monitored Flow Selection—The pollutant loading estimations rely on monitoring data from one or more non-storm water visual observations per major MS4 outfall per year. The 2015–2016 monitoring year is the first year of dry weather flow volume and load calculation, and this period generally has represented a drought condition, which can affect the type and volume of non-storm water sources such as irrigation and ground water. The potential for inter-annual variability is a source of error in both the flow and chemistry data.
  - Flow Measurement Method—The MS4 Outfall Monitoring Plan provides different options to determine the non-storm water volume: (1) field-based estimation methods (e.g., “float method” or “bucket and stopwatch method”), and (2) equipment-based flow measurements. The method chosen varies among outfalls and Copermittees, introducing inter-site variability in volume estimations. The field-based estimation methods introduce potential human error in using stopwatches and error in determining volume amounts in non-graduated buckets. The consistent equipment-based flow monitoring approach is more accurate and precise compared with the field-based estimation methods. However, this approach introduces variability through the flow measurement device and sensor type used to account for site-specific conditions, and can also be cost and time prohibitive across the number of outfalls monitored. Each measurement device and sensor type has an inherent accuracy range (e.g., ±2% accuracy for sub area-velocity [sub-AV] probes). Additionally, each flow measurement device and sensor type can produce slightly different values for the same event, adding inter-site variability.
  - Rainfall Measurement—Accuracy in determining the number of dry days relies on the accuracy of the rainfall measurements representing that outfall. Rainfall measurements were based on the County of San Diego ALERT rain gauge

closest to the majority of wet weather outfalls in each WMA, and not site-specific rainfall data. Rainfall totals across the San Diego area can vary widely within a given storm.

- Chemistry Results—An attempt was made to maintain regional consistency in reporting limits (RLs) and MDLs. However, differences in lab capabilities can sometimes lead to different RLs and MDLs. This variability can introduce error if constituent concentrations are near or below the MDL for one monitoring event or Copermittee, and the MDL differs for another monitoring event or Copermittee. For the assessment calculations, an attempt was made to account for this type of error by assigning a value of MDL/2 to constituents that were not detected.

- Assessment Methodology Error—The assessments require a series of assumptions and extrapolations regarding the determination of annual volumes and pollutant loadings. Each assumption carries the possibility of error, including the following:

  - Annual Volume Estimation Representativeness—Regardless of the flow measurement method utilized, error is introduced when utilizing the median of more than one field measurement to determine an annual volume estimation. It is assumed that these field measurements are representative of “typical” non-storm water conditions because persistently flowing non-storm water flows are relatively consistent through the year. However, this may not be the case, and error could be introduced into these estimations. For example, groundwater base flows can increase during the wet season, increasing dry weather flow rates. Or, alternatively, irrigation and irrigation runoff may increase during the dry season, increasing dry weather flow rates. Unless flow observations are made throughout the year under a variety of conditions, this seasonal variation may not be captured.

  - Annual Volume Estimation Confidence—Based on availability of data, multiple calculation methods are used to estimate annual flow volume. The confidence associated with each estimate varies because different sample sizes are used for each estimate. That is to say, volumes calculated based on continuous flow data are associated with a higher confidence than volumes based on one or two instantaneous flow measurements.

  - Annual Pollutant Load Estimations—The annual volume estimation error introduced previously disseminates into the annual pollutant load estimations through calculations discussed in Section 3.4.2. Although persistent non-storm water flows are relatively consistent throughout the year, collecting two grab samples in one year provides a very brief snapshot in time of the pollutant concentration at an outfall, which may not be indicative of typical conditions or pollutant loadings. Additionally, using an arithmetic mean as a “typical” value of pollutant concentrations to estimate pollutant loads can introduce error if the sample size of the mean is too small, as means are sensitive to sample size.

Intentionally Left Blank

4 Wet Weather Outfall Data and Assessments

During the 2015–2016 monitoring season, the first year of wet weather outfall discharge monitoring was conducted in accordance with Provision D.2.c of the MS4 Permit. The goals of wet weather outfall monitoring are the following:

- Identify pollutants in storm water discharges from the MS4;
- Guide pollutant source identification efforts; and
- Determine compliance with the water quality-based effluent limitations (WQBELs) associated with the applicable TMDLs presented in Attachment E of the MS4 Permit.

Wet weather outfall monitoring was initiated following completion and acceptance of the Los Peñasquitos WMA WQIP. This program built upon the transitional wet weather outfall discharge monitoring completed during the 2013–2014 and 2014–2015 monitoring seasons. Details of the monitoring methodology are provided in the Los Peñasquitos WMA MS4 Outfall Monitoring Plan, available on the Project Clean Water website (Project Clean Water, 2016).

This section presents the results of wet weather discharge monitoring in the Los Peñasquitos WMA, as well as the results of the required Storm Water Pollutant Discharges Reduction Assessments (Storm Water Assessments).

4.1 Storm Water Action Level Comparisons

The data collected as part of the wet weather MS4 outfall discharge monitoring were compared with the SALs and HPWQC WQBELs per MS4 Permit Provision D.4.b.(2)(c)(ii). These comparisons are shown in Table 4-1 and Table 4-2, respectively.

One SAL exceedance was recorded for all wet weather MS4 outfall discharge monitoring locations within the Los Peñasquitos WMA. This exceedance was for turbidity at MS4-LPC-1 in the City of Del Mar, with a recorded concentration that was more than four times the SAL value. The City of Del Mar has just begun to implement its WQIP strategies during the 2015–2016 monitoring year and plans to continue implementing the strategies without modification to realize the rewards of these pollutant reduction benefits.

At all 2015–2016 Los Peñasquitos WMA monitoring locations, bacteria concentrations exceeded bacteria WQBELs for wet weather. The WQIP (Los Peñasquitos Responsible Agencies, 2015) outlining the Responsible Agencies' strategies was accepted in fall 2015. The Responsible Agencies have just begun to implement their planned strategies in the 2015–2016 monitoring year and plan to continue to implement them as originally designed.

Table 4-1
MS4 Outfall Storm Water Action Level Comparison

Parameter	SAL	Monitoring Location				
		MS4-LPC-1	MS4-LPC-2	MS4-LPC-3	MS4-LPC-4	MS4-LPC-5
		City of Del Mar	City of Poway	City of Poway	City of Poway	City of San Diego
Total Cadmium	3 µg/L	0.097 J	0.092 J	0.13	0.10	0.53
Total Copper	127 µg/L	89	20	35	22	28
Total Lead	250 µg/L	6.4	2.4	1.7	4.5	1.1
Nitrate + Nitrite as N	2600 µg/L	1800	1700	1700	980	2500
Total Phosphorous	1.46 mg/L	0.54	0.27	0.58	0.42	0.64
Total Zinc	976 µg/L	110	140	130	72	130
Turbidity	126 NTU	**546**	9.7	9.25	10.6	42

µg/L = micrograms per liter; J = estimate; mg/L = milligrams per liter; N = nitrogen; NTU = nephelometric turbidity unit; SAL = storm water action level

Bold value = exceedance of SAL

Table 4-2
MS4 Outfall Water Quality-Based Effluent Limitations Comparison

Parameter	WQBEL	Monitoring Location				
		MS4-LPC-1	MS4-LPC-2	MS4-LPC-3	MS4-LPC-4	MS4-LPC-5
		City of Del Mar	City of Poway	City of Poway	City of Poway	City of San Diego
Enterococcus	61(104*) MPN/100mL	**42,000**	**8,164**	**3,873**	**26,030**	**34,000**
Total Coliforms	10,000 MPN/100mL	**60,000**	**17,000**	**33,000**	**1,600,000**	**280,000**
Fecal Coliforms	400 MPN/100mL	**2,000**	**11,000**	**11,000**	**1,600,000**	**7,200**

MPN/100mL = most probable number per 100 milliliters; WQBEL = water quality-based effluent limitation

Bold value = exceedance of WQBEL; *= A single-sample maximum of 104 MPN/100mL may be applied as a receiving water limitation for creeks designated as “moderately or slightly used” or less frequent usage in the Basin Plan.

4.2 Wet Weather Outfall Monitoring

4.2.1 Wet Weather Outfall Monitoring Locations

Responsible Agencies selected wet weather MS4 outfall discharge monitoring locations from their inventories developed pursuant to Provision D.2.a.(3)(a)(i) of the MS4 Permit for the Los Peñasquitos WMA. These locations were compliant with the MS4 Permit requirements for wet weather outfall site selection, namely:

- ❖ At least five wet weather MS4 outfall discharge monitoring locations that are representative of storm water discharges from areas consisting primarily of residential, commercial, industrial, and typical mixed-use land uses present within the Los Peñasquitos WMA; and
- ❖ At least one wet weather MS4 outfall discharge monitoring location for each Responsible Agency within the Los Peñasquitos WMA.

The five stations monitored during the 2015–2016 monitoring season are presented in Table 4-3. Each wet weather MS4 outfall discharge monitoring location in the Los Peñasquitos WMA was sampled once during the 2015–2016 monitoring season. All five stations were also monitored during the 2014–2015 monitoring season (second transitional monitoring season). Two of the five stations were also monitored during the 2013–2014 monitoring season (first transitional monitoring season). The MS4 outfall stations that changed during the second transitional year were MS4-LPC-3 and MS4-LPC-4 in the City of Poway, and MS4-LPC-5 in the City of San Diego. The outfall monitoring locations and their associated drainage areas are shown in Figure 4-1. Land use types within the drainage area for each location are described in Table 4-5. The representativeness of the outfall drainage areas, relative to the WMA as a whole, is discussed in Section 4.4.

Table 4-3
2015–2016 Los Peñasquitos WMA Wet Weather Outfall Monitoring Locations

Monitoring Location	Responsible Agency	Jurisdictional Identifier	Latitude	Longitude	HA Name	HA Number
MS4-LPC-1	City of Del Mar	S-01	32.93964	-117.25947	Miramar Reservoir	906.1
MS4-LPC-2	City of Poway	286-1755, 1	32.95403	-117.04097	Poway	906.2
MS4-LPC-3[1]	City of Poway	286-1755, 3	32.95467	-117.04841	Poway	906.2
MS4-LPC-4[1]	City of Poway	290-1755, 2	32.96929	-117.03764	Poway	906.2
MS4-LPC-5[2]	City of San Diego	DW839	32.89915	-117.11371	Miramar Reservoir	906.1

1. City of Poway monitoring locations MS4-LPC-3 and MS4-LPC-4 were relocated between the 2013–2014 and 2014–2015 monitoring years. The Jurisdictional Identifiers of the previous monitoring locations are 298-1761, 1 and 286-1767, 1, respectively.
2. City of San Diego monitoring location MS4-LPC-5 was relocated between the 2013-2014 and 2014-2015 monitoring years. The Jurisdictional Identifier of the previous monitoring location is DW289.

HA = hydrologic area

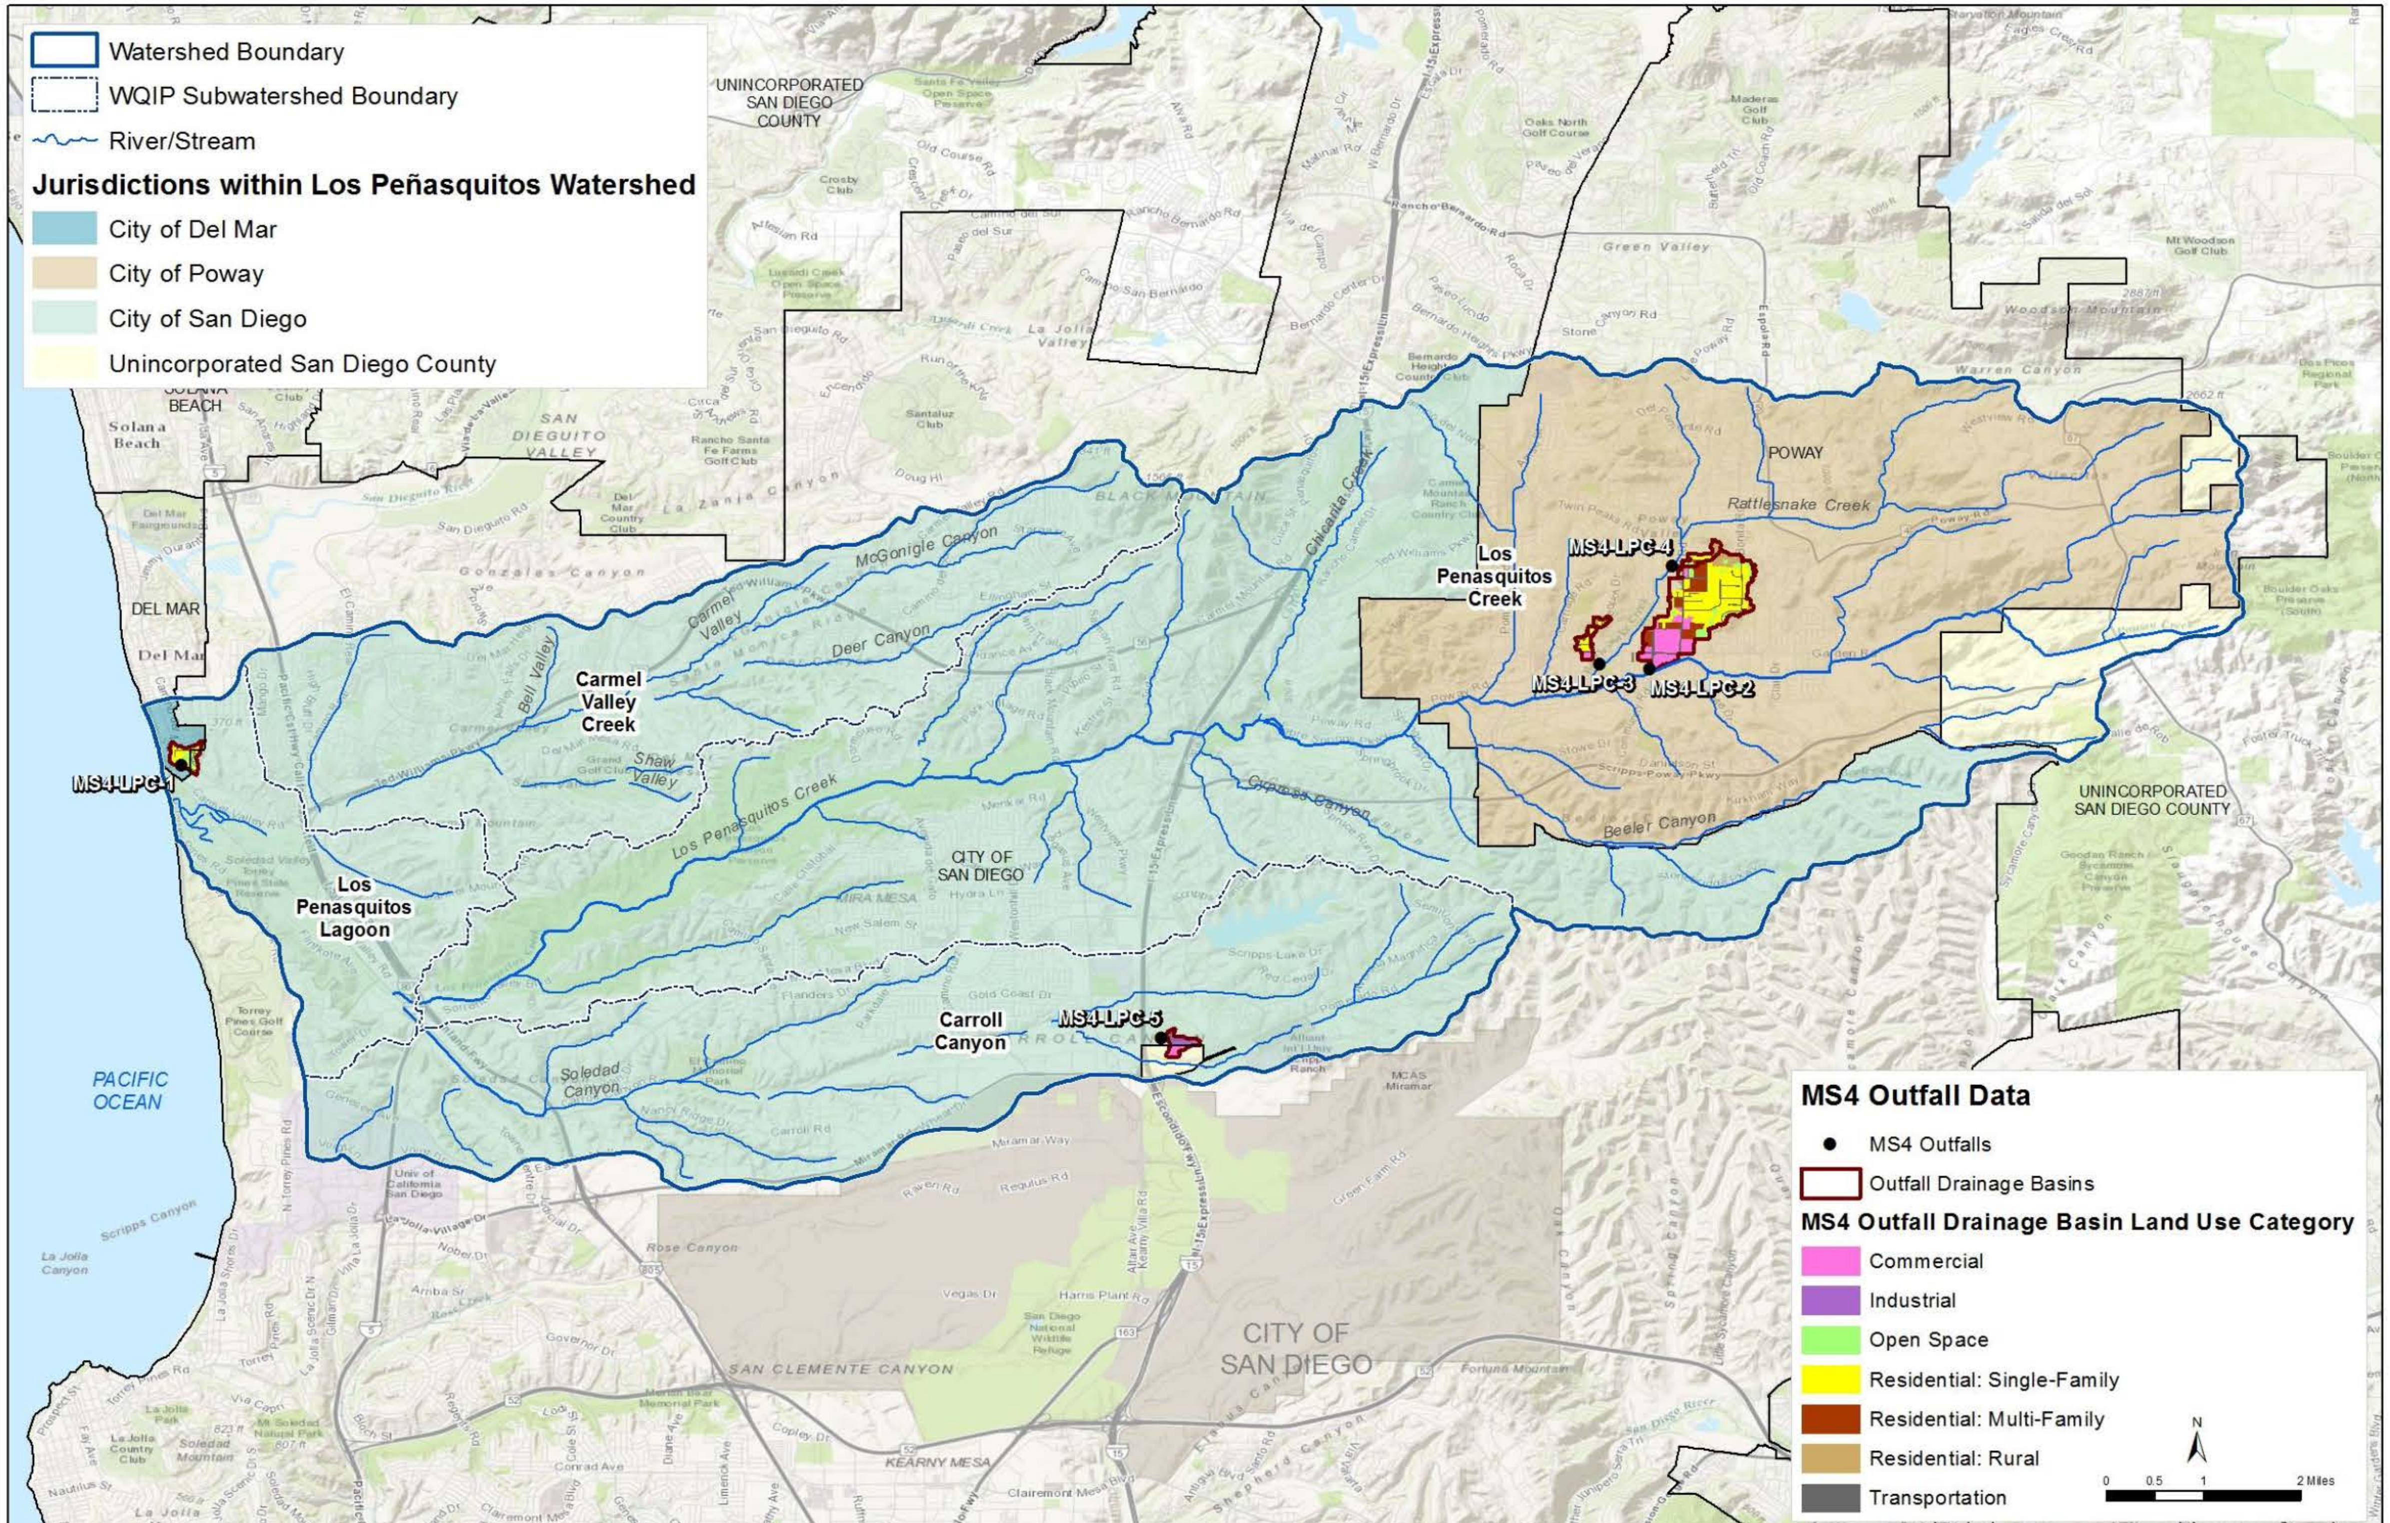

Figure 4-1
Los Peñasquitos WMA Outfall Monitoring Locations

Intentionally Left Blank

4.2.2 Wet Weather Outfall Monitoring Event Field Observations

The Los Peñasquitos WMA wet weather outfall locations were monitored during the wet season (i.e., October 1, 2015, through April 30, 2016), across two storm events on January 31, 2016, and March 6, 2016. Each location was monitored once.

During the wet weather monitoring event, narrative descriptions and field observations were recorded at each MS4 outfall discharge monitoring location. Flow was measured using a Hach Sigma 950 flow meter with a sub-AV probe in accordance with the United States Environmental Protection Agency (USEPA) Storm Water Sampling Guidance Document (EPA-833-B-92-001), as described in the Los Peñasquitos WMA MS4 Outfall Monitoring Plan. Rainfall statistics for each monitored event were based on a nearby San Diego County Flood Control District ALERT station. The closest ALERT station to each monitoring location was selected.

Details, including date and duration of the storm events sampled, rainfall estimates of the storm event, and duration between the storm event sampled and the end of the previous measurable storm event with over 0.1 inch of rainfall, are presented in Table 4-4. Hydrographs for each monitored event, displaying event flows and rainfall amounts, are presented in Attachment F.1.

Table 4-4
2015–2016 Los Peñasquitos WMA Wet Weather Outfall Monitoring Event Field Observations

Monitoring Location	Storm Event Date	ALERT Station	Storm Duration (hours)	Rainfall Depth (inches)	Rainfall Intensity (inches/ hour)	Antecedent Dry Days	Flow Volume (cf)
MS4-LPC-1	1/30/2016	Encinitas	19.3	0.54	0.02803	22	12,137
MS4-LPC-2	3/5/2016	Poway	3.3	0.24	0.07347	15	83,929
MS4-LPC-3	3/5/2016	Poway	3.3	0.24	0.07347	15	24,985
MS4-LPC-4	3/5/2016	Poway	3.3	0.24	0.07347	15	30,458
MS4-LPC-5	1/30/2016	Miramar Lake	24.5	0.75	0.03055	21	50,407

cf=cubic feet

4.2.3 Wet Weather Outfall Monitoring Event Analytical Results

During each wet weather event, samples were collected according to the procedures described in the Los Peñasquitos WMA MS4 Outfall Monitoring Plan.

Grab samples were collected for bacterial indicators and receiving water hardness. The grab samples were collected after the second hour of storm water runoff and before the sixth hour of storm water runoff. If the storm duration was less than two hours, the grab samples were collected as close to the peak flow as possible. A time-weighted composite sample was collected for all other analytes. All samples were collected in accordance with Surface Water Ambient Monitoring Program (SWAMP) protocols and following the quality assurance and quality control procedures outlined in the Los Peñasquitos WMA MS4 Outfall Monitoring Plan.

In situ turbidity measurements were collected using a LaMotte 2020 Portable Turbidity Meter. All other field measurements were collected using YSI Pro Plus Quatro field meter.

The required analyses were based upon the following four groupings of constituents, per Provision D.2.c(5)(f) of the MS4 Permit:

- ❖ Constituents contributing to the HPWQCs identified in the Los Peñasquitos WMA WQIP;
- ❖ Constituents listed as a cause for impairment of receiving waters in the Los Peñasquitos WMA, as listed on the 2010 CWA 303(d) List;
- ❖ Constituents for implementation plans or load reduction plans (e.g., Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for the Los Peñasquitos WMA where the Responsible Agencies are listed as responsible parties under the TMDLs in Attachment E of the MS4 Permit; and
- ❖ Applicable SAL constituents listed in Provision C.2 of the MS4 Permit.

Receiving water hardness samples were collected for each wet weather outfall station discharging to a fresh water receiving water. The receiving water hardness results were used to evaluate compliance with the USEPA one-hour maximum concentration criteria for metals, in the case of any SAL exceedances. Receiving water hardness samples were not collected for wet weather outfalls discharging to an ocean receiving water, or to a bay or estuary.

The 2015–2016 monitoring year wet weather outfall analytical results for the Los Peñasquitos WMA are presented in tabular form in Attachment F.2. Attachment E includes a QA/QC summary of the wet weather outfall data collected.

4.3 Volumes and Loads of Storm Water Discharges

Per Provision D.4.b.(2)(b)(i) of the MS4 Permit, the Responsible Agencies are required to use a watershed model or other method to calculate the following:

1. The average storm water runoff coefficient for each land use type within the WMA;
2. The volumes of storm water and pollutant loads discharged from the monitored MS4 outfalls in the jurisdiction of each Responsible Agency to receiving waters within the WMA for each storm event with measurable rainfall greater than 0.1 inch;

3. The total flow volumes and pollutant loadings discharged from the jurisdiction of each Responsible Agency within the WMA over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls; and
4. The percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea to receiving waters or within each jurisdiction of within the WMA for each storm event with measurable rainfall greater than 0.1 inch.

The following sections present the results of these assessments. The methodology used follows the methodology presented in the Transitional Wet Weather MS4 Outfall Discharge Monitoring Work Plan (San Diego County Regional Copermittees, 2015). Changes from the transitional methodology are noted below. The methodology is presented in Attachment F.3. Complete tables of storm water volumes and pollutant loads are in Attachment F.4.

Calculation of the MS4 Permit-required assessments necessitates a number of assumptions to extrapolate the available monitoring data into watershed-wide estimates of discharge volumes and pollutant loads. These extrapolations introduce potential sources of error in addition to error sources inherent to the monitoring data. A summary of these assumptions and sources of error follows:

- Potential Sources of Error Inherent to Monitoring—Runoff coefficients and pollutant loads are based on the results of wet weather outfall monitoring events. Error in the monitoring data could have the effect of propagating error in all subsequent calculations. Potential sources of error in the monitoring data include the following:
  - *Monitored Storm Selection*—The calculation relies on monitoring data from one storm event per year. Although a range of storm conditions have been targeted over the period of monitoring (2013–2016), this period generally has represented drought conditions. Inter-annual variability in storm duration, intensity, and rainfall depth can be a source of error in both the flow and chemistry data.
  - *Drainage Area Delineation*—The accuracy of the observed outfall runoff coefficient calculation relies on the accuracy of the drainage area delineation for that outfall. Drainage area delineations were based on the most recent jurisdictional delineation. Delineations were based on desktop analysis, and accuracy of the delineations is dependent on the geographic information system (GIS) data layers used.
  - *Flow Measurement Method*—A consistent flow monitoring approach is described in the Monitoring Plan. However, this approach allows for variability in the flow measurement device and sensor type used to account for site-specific conditions. Each measurement device and sensor type has an inherent accuracy range (e.g., ±2% accuracy for sub-AV probes). Additionally, each flow

measurement device and sensor type can produce slightly different values for the same event, adding a layer of inter-site variability.

- *Rainfall Measurement*—The accuracy of the observed outfall runoff coefficient calculation relies on the accuracy of the rainfall measurement for that event at that outfall. Rainfall measurements were based on the nearest County of San Diego ALERT rain gauge to each outfall and not site-specific rainfall data. Rainfall totals across the San Diego area can vary widely within a given storm.

- *Chemistry Results*—An attempt was made to maintain consistent RLs and MDLs across the monitoring seasons. However, differences in lab capabilities can sometimes lead to different RLs and MDLs. This variability can introduce error if constituent concentrations are near or below the MDL one monitoring year, and the MDL changes. For the assessment calculations, an attempt was made to account for this type of error by assigning a value of MDL/2 to constituents that were not detected.

- Potential Sources of Error Inherent to the Assessment Methodology—The assessments require a series of assumptions and extrapolations regarding land-use-based runoff coefficients and pollutant concentrations. Each assumption carries the possibility of error, including the following:

  - *Observed Outfall Runoff Coefficient Calculation*—Total rainfall of a monitored storm event, not accounting for rainfall intensity or duration, is considered in these calculations. Storms of higher intensity generally produce more runoff for a given rainfall amount than storms of lower intensity. Therefore, a storm with an equal total rainfall but a higher intensity than another storm would be expected to exhibit a higher runoff volume or flow rate.

  - *Outfall Drainage Area Land Use Representativeness*—While an attempt has been made to select monitoring locations with drainage areas of one primary land use type, the reality of storm water drainage systems in urban and suburban areas means that most monitoring locations are a mixture of multiple land use categories. To calculate the runoff coefficient from each land use category, the observed runoff coefficient is compared with standard values calculated using the San Diego County Hydrology Manual (County of San Diego, 2003). A correction factor based on the ratio of the observed runoff coefficient to the calculated runoff coefficient is then applied to each land use category to derive land use runoff coefficients.

  - *WMA Land Use Representativeness*—Not all land use categories within the WMA are represented by the monitored outfall drainage areas. Therefore, the pollutant EMCs and runoff coefficient for one land use are sometimes substituted for another land use. For example, open space pollutant concentrations and runoff coefficients may be used as a proxy for agriculture land use values, in the absence of monitoring data from agricultural land uses. These proxies are summarized in Table 4-5.

- *Land Use EMC Assumptions*—Apportioning pollutant loads to each land use type requires an assumption of pollutant concentrations that are "typical" of each land use category. To calculate a pollutant concentration from each land use category, the observed pollutant concentrations are compared with typical (arithmetic mean) values calculated on the basis of land use studies in the Los Angeles and San Diego areas (see Attachment F.3). A correction factor based on the ratio of the observed pollutant concentration to the calculated typical pollutant concentration is then applied to each land use category to derive land use concentrations. Using an arithmetic mean as a "typical" value can introduce error if the sample size of the mean is too small, because means are sensitive to sample size. However, literature values did not exist for all pollutants analyzed, and therefore an additional assumption is made that similar pollutants have similar land-use-based concentrations For example, it is assumed that ratios of other dissolved metals concentrations from the analyzed land use categories follow the ratios of dissolved copper concentrations from those land use categories. This assumes that all dissolved metals behave similarly to dissolved copper, which is not necessarily the case. The full list of assumptions is provided in Attachment F.3.
- *Variability of Standard Runoff Coefficient and Pollutant Concentration Values*—The mean standard runoff coefficients and pollutant concentrations are used in the assessments. In reality, there is a range associated with the real-world land use runoff conditions for both runoff coefficients and pollutant concentrations. For example, land use runoff pollutant concentrations can vary on the basis of socioeconomic factors across a single land use category. The 2015 City of San Diego trash study found that median income of people living in a given drainage area affected trash assessment results at the corresponding outfall. It is possible a similar pattern could be seen for other pollutants (City of San Diego, 2015).

4.3.1 Land Use Storm Water Runoff Coefficient (D.4.b.(2)(b)(i)[a])

The average storm water runoff coefficient ("C") was calculated for each land use type in the WMA, based on data collected through three seasons of wet weather MS4 outfall monitoring (2013–2014, 2014–2015, and 2015–2016). This calculation is based on the measured flow and rainfall values for each monitored outfall (Table 4-2), along with the outfall drainage area characteristics. The quantity (area and percentage) of each land use type by outfall drainage area is presented in Table 4-5. Agriculture and Open Space land uses are subdivided by hydrologic soil group (A, B, C, or D).

1. Water land use excluded from MS4 outfall assessments. Water land use assumed to be a sink for runoff storage.

% = percent; WMA = Watershed Management Area

Intentionally Left Blank

The observed "C" was calculated for each outfall, based on the monitored event characteristics (event flow, event rainfall, and outfall drainage area). For outfalls that were monitored for more than one monitoring season, the Runoff "C" is averaged across all years of monitoring at that outfall. This value was compared with the expected "C" for each outfall, based on runoff coefficients listed in the San Diego County Hydrology Manual (County of San Diego, 2003) The current observed "C" value for each outfall, as well as the expected "C" for each outfall, is presented in Table 4-6.

Table 4-6
2015–2016 Los Peñasquitos WMA Observed vs. Expected Outfall Runoff Coefficients

Monitoring Location	Observed "C"	Hydrology Manual "C"
MS4-LPC-1	0.14	0.50
MS4-LPC-2	0.20	0.58
MS4-LPC-3	0.63	0.57
MS4-LPC-4	0.92	0.49
MS4-LPC-5	0.48	0.83

The WMA "C" for each land use was calculated using an area-weighted average of all monitored event "C" values for the monitored wet weather outfalls. To improve the accuracy of the calculation over time, historical (2013–2015) and current (2015–2016) WMA land use "C" values were included in the calculation. The historical and 2015–2016 WMA "C" values for each land use are presented in Table 4-7.

Table 4-7
Current and Historical Los Peñasquitos WMA Calculated Land Use Runoff Coefficients

Transportation	0.266	0.235	0.266

1. Because of limited WMA monitoring data for agriculture land use, "C" and event mean concentration (EMC) values are based on Los Peñasquitos WMA monitored outfalls data for Open Space with corresponding soil type land use type.
2. Agriculture and Open Space land use types were divided into subgroups based on hydrologic soil type. See http://www.nrcs.usda.gov/wps/portal/nrcs/detail/ny/soils/?cid=nrcs144p2_027279 for more information on hydrologic soil types.
3. "C" and EMC values not calculated. Mixed Use land use represents less than 1 acre of area within the Los Peñasquitos WMA.
4. Open Space-A land use, "C," and EMC values are based on Los Peñasquitos WMA monitored outfalls data for Open Space-B land use type.

4.3.2 Monitored MS4 Outfall Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[b])

The volume of storm water and pollutant loads discharged from the MS4 outfalls to receiving waters in the jurisdictions within the WMA was calculated for each storm event with measurable rainfall greater than 0.1 inch. The wet season rainfall data for the ALERT rain gauge closest to each monitoring location were used to calculate the qualifying measured rainfall for each site. Table 4-8 presents the annual wet season storm water volume and pollutant load discharged from each outfall.

Table 4-8

4.3.3 Jurisdictional Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[c])

The volume of storm water and pollutant loads discharged from the jurisdictions of Responsible Agencies within the WMA over the course of the wet season was calculated for each storm event with measurable rainfall greater than 0.1 inch. The wet season rainfall data for the ALERT rain gauge closest that most represented the WMA were used. Because the Los Peñasquitos WMA contains more than one ALERT rain gauge, data from the Poway rain gauge were used, because this station was closest to a majority of the wet season MS4 outfall monitoring stations. Table 4-9 presents the annual wet season storm water volume and pollutant load discharged from the jurisdictions of Responsible Agencies in the Los Peñasquitos WMA.

Table 4-9

1. The qualifying measured rainfall amount used to calculate monitored outfall flow volumes and pollutant loads for the City of Del Mar and City of San Diego outfall monitoring stations (MS4-LPC-1 and MS4-LPC-5, respectively) was less than the rainfall amount used to calculate jurisdictional flow volumes and pollutant loads for these jurisdictions. The rainfall gauge that most represented the WMA as whole was used for WMA and jurisdictional calculations, while the rainfall gauge that most represented each outfall was used for outfall calculations.

cf = cubic feet; in = inches; lb = pounds; MPN = most probable number; N = nitrogen; P = phosphorus; TDS = total dissolved solids; TKN = total Kjeldahl nitrogen; TSS = total suspended solids

4.3.4 Land Use Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[d])

The MS4 Permit requires the percent contribution of storm water and pollutant loads discharged from each land use type within each hydrologic subarea (HSA) with a major MS4 outfall in the jurisdiction of each Responsible Agency in the Los Peñasquitos WMA be calculated. Because there are no HSAs within the Los Peñasquitos WMA, storm water volumes and pollutant loads were calculated on a hydrologic area (HA) level. The wet season rainfall data for the closest ALERT rain gauge that most represented the WMA were used. As in the jurisdictional load calculations described in Section 4.3.3, the Poway ALERT station data were used to calculate the qualifying measured rainfall for the WMA. Tables 4-10 through 4-13 present, by Responsible Agency jurisdiction, the percentage of the wet season storm water volume discharged from each HA with a major outfall in the Los Peñasquitos WMA. The numerator for this calculation is the wet season flow volume from each HA; the denominator is the total jurisdictional wet season flow volume. The percentages of the wet season storm water volume and pollutant loads discharged from each land use type within each HA with a major outfall in the Los Peñasquitos WMA, by Responsible Agency, are presented in Attachment F.4.

Table 4-10
City of Del Mar Percent Contribution of Storm Water Volume, by HA

HA	Wet Season Flow Volume (cf)	% Contribution
Jurisdictional HA 906.1 – Miramar Reservoir	217,496	100%
Jurisdictional HAs with No Major Outfall	NA	0%
Jurisdictional WMA	**217,496**	**100%**

% = percent; cf = cubic feet; HA = hydrologic area; NA = not applicable; WMA = Watershed Management Area

Table 4-13
County of San Diego Percent Contribution of Storm Water Volume, by HA

HA	Wet Season Flow Volume (cf)	% Contribution
Jurisdictional HAs with No Major Outfall[1]	7,344,905	100%
Jurisdictional WMA	**7,344,905**	**100%**

1. The County of San Diego has jurisdictional land area in HAs 906.1, 906.2, and 906.4, but has no major outfalls in those HAs.

% = percent; cf = cubic feet; HA = hydrologic area; NA = not applicable; WMA = Watershed Management Area

4.4 Evaluation of Monitoring Locations and Frequencies

Provision D.4.b.(2)(b)(ii) of the MS4 Permit allows the Responsible Agencies to modify the wet weather MS4 outfall discharge monitoring locations and frequencies to better identify pollutants in storm water discharges from the MS4s in the WMA.

An analysis of wet weather MS4 outfall monitoring locations was performed in the 2014–2015 Transitional Monitoring and Assessment Report for the Los Peñasquitos WMA (TMAR) (San Diego County Municipal Copermittees, 2016). The purpose of the recommendations provided was to accurately quantify the storm water volume and loads from the various land uses in the WMA to improve the effectiveness of MS4 monitoring in meeting the intended MS4 Permit goal. As part of the evaluation of monitoring locations in the TMAR, the WMA land use was compared with the monitored outfall drainage area land uses. The results of this comparison are provided in Table 4-14.

Table 4-14
Land Use Comparison, WMA and Monitored Drainage Areas

Land Use	WMA Area (acres)[1]	WMA Area (%)[1]	Outfalls Area (acres)	Outfalls Area (%)	% Difference
Agricultural (Combined)	940	1.7%	0	0%	-1.7%
Commercial	2,928	5.2%	96	17.3%	12.1%
Educational	1,323	2.4%	9	1.6%	-0.8%
Industrial	4,625	8.3%	13	2.3%	-6.0%
Mixed Use	4	0%	0	0%	0.0%
Open Space (Combined)	23,277	41.7%	40	7.3%	-34.4%
Residential: Multi-Family	1,829	3.3%	58	10.4%	7.1%
Residential: Rural	2,995	5.4%	27	4.8%	-0.6%
Residential: Single-Family	12,057	21.6%	211	37.9%	16.3%
Transportation	5,797	10.4%	63	11.3%	0.9%
Total	**55,775**	**100%**	**517**	**100%**	**-**

1. Acreage excludes state, federal, and tribal lands; Source: San Diego County MS4 Copermittees, 2015

% = percent

Because the wet weather outfall monitoring locations did not change between the 2014–2015 and 2015–2016 monitoring seasons, the conclusions reached in the TMAR remain valid:

- ❖ The wet weather MS4 outfall monitoring locations are, overall, representative of land uses in the WMA.
- ❖ Open space land uses are under-represented in the monitored outfall drainage areas; however, the intention of monitoring is to characterize drainage from the MS4 (i.e., developed land uses).
- ❖ Single-family residential, multi-family residential, and commercial land uses are well represented in the monitored outfall drainage areas.

The evaluation of monitoring frequency includes a comparison of monitored event rainfall conditions with annual rainfall conditions. During the 2015–2016 wet season (October through April), rainfall totals at ALERT station gauges within the Los Peñasquitos WMA ranged from 11.85 inches at the Miramar Lake rain gauge to 12.87 inches at the Poway rain gauge. Both ALERT station gauges within the WMA registered more rainfall during the wet season than the official National Weather Service (NWS) rain gauge at San Diego International Airport – Lindbergh Field (7.42 inches). The storms that occurred generally had totals of less than 1 inch of rainfall, although one very large storm beginning January 4, 2016, produced more than 4 inches of rainfall throughout the WMA. The average wet season storm event rainfall total at the Poway ALERT station rain gauge is 0.83 inch. The rainfall totals for the monitored storm events were less than this average.

It was recommended in the TMAR to target more monitoring events during average (greater than 0.5 inch) and large (greater than 1 inch) storms. The 2015–2016 sampling targeted one smaller (less than 0.5 inch) and one average storm. It is recommended to continue targeting larger storm events during future wet seasons where feasible, to capture a range of data for “C” calculations.

5 Special Study Assessments

Special studies have been selected to further investigate the HPWQCs in the Los Peñasquitos WMA. The special studies have been conducted and are summarized and assessed in this section. Studies included the Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Compliance Monitoring Program and the San Diego Regional Reference Streams and Beaches Studies. The Outfall Repair and Relocation Study is currently being implemented by the City of San Diego.

5.1 Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Study

Prior to adoption of the Sediment TMDL into the MS4 Permit, the City of San Diego developed a special study to assess sediment sources in the subwatersheds of the Los Peñasquitos WMA (referred to as the Watershed Special Study) (Attachment G). Phase I of the Watershed Special Study focused on monitoring sediment discharge in Carroll Canyon Creek and aerial deposition in the subwatershed. Phase I was conducted during FY 15 (July 1, 2014, through June 30, 2015) and is summarized in this report. In the following year (Phase II), the Watershed Special Study was enhanced by including the Carmel Valley Creek and Los Peñasquitos Creek subwatersheds and was designated as the special study for the Los Peñasquitos WMA during FY 16 (July 1, 2015, through June 30, 2016).

The goal of the Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Study was to characterize potential sediment sources contributing to the Lagoon. It was conducted concurrently with the Los Peñasquitos WMA Sediment TMDL Compliance Monitoring Program (Sediment TMDL Monitoring Program), which monitors total sediment loads into the Lagoon from the outlet of each of the three subwatersheds. Both monitoring programs were designed to provide data on SSC during wet weather conditions, estimated sediment loads, and delivery potential within storm flows. The key questions posed by the Special Study include:

- Wet Season Riverine Monitoring
  - What is the sediment concentration at discrete times throughout a wet weather event hydrograph at points throughout the subwatersheds?
  - What are current sediment load estimates at points throughout the subwatersheds? Is there a greater load from a potential source area?
  - What are the relative wet-weather sediment delivery potentials of each creek?
- Dry Weather Aerial Deposition Monitoring
  - What are the aerial contributions of sediment to the subwatersheds within the WMA?
  - Can airborne sediment particles be associated with specific sources or land uses?

- What is the contribution of aerial sediment deposition relative to wet weather suspended sediment loads observed from the subwatersheds?

5.1.1 Monitoring Overview

Monitoring for Phase II of the special study took place prior to and during the October 1, 2015, through April 30, 2016, wet weather monitoring season. Pre-wet-season (prior to October 1, 2015) monitoring consisted of:

- Volumetric streambed sampling and pebble counts for particle-size distribution
- Cross-section surveys
- Photo documentation

Wet season (October 1, 2015, through April 30, 2016) monitoring consisted of:

- Pollutograph sampling for SSC: continuous flow and precipitation, and discrete SSC samples
- Bedload sampling for particle-size distribution
- Post-storm pebble counts and photo documentation
- Instantaneous flow measurements

FY 16 aerial deposition during dry weather (September 1, 2015, through April 30, 2016) monitoring included:

- Aerial deposition sampling for particulate matter less than or equal to 10 microns in diameter (PM_{10})
- Comparison of two monitoring methods using optical sensors and Federal Reference Method (FRM)

Aerial deposition:

- Three sampling events
  - 2015–2016 monitoring events took place in fall and mid-winter because of planned (February 2016) destruction of Del Mar City Hall, where the reference station was located
- Sampling events consist of three 24-hour sample collection periods at each site: two during weekdays and one during the weekend
- Sampling with both USEPA FRM sampling equipment and optical sensor sampling equipment
  - Comparison of the results between both equipment types for future aerial deposition monitoring consideration

- Three additional aerial deposition monitoring locations were added by the City of San Diego in the Carroll Canyon Creek subwatershed that were monitored in conjunction with the planned locations. Resources for these locations were provided by the City of San Diego, and not through funding approved by the Responsible Agencies.

5.1.2 Monitoring Results

Storm Events

Rainfall data recorded at the Carmel Valley monitoring location (CV-CV) were used as the Watershed Special Study project rainfall data. Wet weather monitoring was conducted for three storm events during Phase II of the Watershed Special Study (2015–2016 wet season) (Table 5-1). Monitored storms in 2015–2016 resulted in 2.93 inches of rainfall, or 28% of the total wet season rainfall (10.33 inches).

Table 5-1
Summary of Monitored Wet Weather Events

Event	Date	Rainfall Total[1] (inches)
1	January 4–6, 2016	1.58
2	January 31, 2016	0.65
3	March 6–8, 2016	0.70

1. Rainfall for the upper WMA areas monitored for the Watershed Special Study was measured at the CV-CV monitoring location.

The storms monitored during the two phases were vastly different in size and intensity, making comparison challenging. Phase I (2014–2015) occurred during drought conditions, and light to moderate, consistent rainfall was observed during storms. Phase II (2015–2016) occurred during an El Niño year and although annual rainfall was below average, storms were generally intense and brief. A series of three particularly intense storms occurred over three days in early January 2016 (the first of which was monitored), as shown in Table 5-1.

For the estimation of annual sediment loads assessed in this project, a count of “wet days” was needed (see Annual Load Estimation below). A wet day is defined as a 24-hour period with at least 0.1 inch of rainfall. During the 2015–2016 wet season, 22 wet days were recorded using the Special Study rainfall data (at CV-CV), compared with 21 wet days recorded using the TMDL Compliance Program rainfall data (at LP), primarily due to orographic factors. For load estimates and comparability with the TMDL Compliance Program monitoring locations, a total of 21 wet days (number of wet days in the lower WMA) was used in the annual load estimation.

Bedload Sampling

Collection of bedload samples was attempted during each monitored event at five of the eight monitoring locations. CC-ML, LP-HV, and CV-CV did not have suitable locations at which to install samplers. Bedload sampling was attempted using both the trap samplers (installed in the streambed), which have been used in previous wet seasons, and manual bedload samplers (where safe access allowed). No samples were successfully collected during the first event. Most samplers were lost or damaged because of the high flows. One sample from CC-TC was collected during the second event and one sample was collected from CC-NR during the third event. However, in each case, samplers were either displaced or partially buried/overfilled upon retrieval, preventing assessment of the amount of material collected and the associated time frame.

Manual bedload sample collection attempts occurred during low flows, when it was safe to enter the stream, and yielded results from CC-AC and CV-CV during the second wet event only. Samples collected and measured from these two sites resulted in load estimates of 0.21 ton per day and 0.015 ton per day, respectively (not significant relative to washload estimated with SSC results). These samples were collected at one point during one storm and may not be representative of a consistent bed movement condition throughout the storm or day, nor of bedload during other non-sampled. This sample collection was an improvement over that of previous monitoring efforts, but further bedload results are required to accurately quantify this factor.

Pebble Count

Six post-storm pebble counts were conducted during the 2015–2016 wet season, showing a general increase in fine material at monitoring locations CC-TC and CC-BM. Results for CC-AC, CC-NR, and LP-NC varied throughout the year, with no apparent trend. No pebble counts were conducted at CC-ML, LP-HV, and CV-CV, because no suitable sampling locations were present.

5.1.3 Suspended Sediment Load Calculations

Annual Load Estimates

The annual suspended sediment load was estimated by multiplying the average of the three daily load estimates at each monitoring location by the number of wet days from the 2014–2015 (14 days) and the 2015–2016 (21 days) monitoring years. Load estimation options are often limited to this type of approach (referred to herein as the “average estimation method”) based on the amount of data. This approach can potentially skew overall estimates in either direction. Alternative approaches were explored in FY 15 by assessing the relationships among rainfall intensity, EMC, and sediment load to determine whether EMC and/or sediment load values can be reasonably estimated on the basis of rainfall intensity. When data from the 2015–2016 wet season were incorporated, the rainfall intensity/sediment load relationships became too weak for use in estimating loads, so the load estimates reported here are calculated using only the average estimation method described above. Although the results may be skewed high, these values are comparable to the TMDL Monitoring Program estimates and facilitate comparisons and assessments of sediment loads within the subwatersheds and into the Lagoon. Considering these differences in rainfall characteristics between wet seasons, comparability between years is limited but the collected data do provide some useful findings.

Sediment Loads from Subwatersheds

In previous monitoring periods (2013–2015), Carroll Canyon Creek contributed most of the sediment to the Lagoon, but during this monitoring period, Los Peñasquitos Creek delivered the highest overall load because of unusually high flows. Sediment concentrations (SSC and EMC) in Los Peñasquitos Creek were relatively low compared with those of the other two subwatersheds, but the large flow volumes from Los Peñasquitos Creek caused a shift in the relative sediment contribution. As usual, overall contribution from Carmel Valley Creek remained small to insignificant (approximately 1% of the annual load estimate) during the monitoring season, thus making this subwatershed the lowest priority for assessing management measures.

Sediment Loads at Areas of Interest

Stream reaches that may warrant further investigation include the reach of Carroll Canyon Creek running through the gravel mine operations and the immediate reach downstream, the upper portion of Los Peñasquitos Creek, and the upper portions of Carmel Valley Creek. The following provides greater detail regarding each of these stream reaches.

During Phase I, the highest suspended sediment loads were calculated at the Arizona Crossing location (CC-AC), at the downstream end of a highly erodible stream reach. However, during Phase II, the highest sediment loads were measured at the North City location (LC-NC) in the upper Los Peñasquitos Creek subwatershed, due to unusually high flows rather than unusually high EMCs.

Based on the Watershed Special Study (Phases I and II), the central portion of Carroll Canyon Creek between the three upper subwatershed monitoring locations and CC-NR appears to be the primary area contributing sediment to the Lagoon via Carroll Canyon Creek. During Phase I, relatively high loads were measured at the CC-AC location, which were then deposited in the channel, as lower loads were estimated downstream at the CC-NR location. During Phase II, relative sediment load contributions shifted, and higher loads were observed at CC-NR compared to CC-AC. These results suggest the large sediment contribution from the reach between the upper monitoring locations and CC-AC is deposited downstream during typical storm events observed in Phase I, and can be mobilized during larger, more intense storms like those observed during Phase II.

Los Peñasquitos Creek

Another area of interest is the upper subwatershed reaches near the LP-HV and LP-NC sites and downstream through the Los Peñasquitos Creek subwatershed. This result may indicate another source reach followed by a large sink, as the load estimates are slightly higher at LP-NC compared to those at the base of the creek. However, data for only one year are available for this subwatershed; therefore, these results and assessments are preliminary.

Carmel Valley Creek

Similar to Los Peñasquitos Creek, load estimates from the upper portion of Carmel Valley Creek were similar (slightly less) than the estimated load at the base of the creek. However, overall load estimates from Carmel Valley Creek are significantly less than those at Los Peñasquitos and Carroll Canyon Creeks. Similar to findings at Los Peñasquitos Creek, this result is based on a limited data set from one year of monitoring. Furthermore, the relatively small loads from this subwatershed make it a low priority for management measures.

SSC Versus Flow Relationships

An alternative approach to assessing sediment sources and loads focused on relationships between SSC and flow rates. A preliminary analysis compared SSC measured during two wet seasons (2014–2016) and the corresponding flow rates for those samples. CC-NR and CC-AC had the strongest SSC versus flow relationships, with coefficient of determination (R^2) values of 0.78 and 0.74, respectively. These sites were also shown to have ample sediment supply upstream, as found in a geomorphic assessment conducted during the 2014 monitoring program (AMEC Environment & Infrastructure, Inc. [now Amec Foster Wheeler], 2014). The reaches upstream of these monitoring locations were characterized by highly erodible banks, with limited armoring within the channel. Hidden Valley also had a relatively strong SSC versus flow relationship (R^2=0.62) over the study period. The other five sites showed poor relationships between SSC and flow. CC-BM (R^2=0.39) and CC-ML (R^2= -0.13) are similar in that samples are taken as flow enters a storm drain.

5.1.4 Aerial Deposition Monitoring

Aerial deposition monitoring results from both FY 15 and FY 16 indicated that airborne particulate matter equal to or less than 10 microns in diameter (PM_{10}) are not a significant source of sediment within the WMA. PM_{10} analytical results from three monitoring events were generally low, either at or near the reporting limits and monitoring results from the two types of monitoring equipment (FRM and optical sensors) indicated similar results. There were marginal increases in concentrations around anthropogenic activities, particularly in the Carroll Canyon Creek subwatershed relative to other monitored locations; however, these slight increases were not consistent or significant, in that results from both types of equipment were low or negligible.

Visual observations at the Carroll Canyon Creek downwind monitoring location, near the Black Mountain SSC monitoring location, discovered significant, visible particle matter deposition on the surfaces of vehicles, roads, and buildings and other surrounding structures. The observed deposition may be due to the high volume of truck traffic at the mining operations adjacent to the monitoring location. Despite these observations, monitoring equipment placed on the roof of a nearby fire department did not show elevated concentrations of PM_{10}. This result indicates that the observed deposition remained localized to the area just outside the gravel mine driveway.

5.1.5 Conclusions and Recommendations

Per the MS4 Permit (Provision D.4.c) data resulting of special studies should be used (1) assess their relevance to the Responsible Agencies' characterization of receiving water conditions, (2) understand sources of pollutants and/or stressors, and (3) control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters. The Sediment TMDL provides more information on sediment sources in the watershed and an initial framework for assessing management measures and focus areas.

Of the three subwatersheds, Carroll Canyon Creek is the primary subwatershed on which to focus resources and management measures. In typical years, Carroll Canyon Creek delivers the highest percentage of sediment load to the Lagoon (80 to 90%), and despite not contributing the highest percentage this year, its estimated SSC EMCs were the highest of the three subwatersheds. The data also show that sediment is deposited in the lower portions of the subwatershed and can be mobilized during large storm events. Management measures that address controlling sources of sediment where possible can drive down SSC concentrations, and ultimately loads.

The aerial deposition sampling shows that aerial sources are not a significant source of sediment within the WMA. The results were all at or below the reporting limits and were negligible in areas near active gravel mines. Resources do not need to be focused on controlling aerial sources of particulate matter.

5.2 San Diego Regional Reference Streams and Beaches Studies

The San Diego Regional Reference Stream and Beach Studies (SCCWRP, 2015 and SCCWRP, 2016) were designed to measure FIB concentrations and loads at streams and beaches that are minimally disturbed by anthropogenic activities; representing "reference" conditions. Nutrients, metals, and toxicity data were also collected. The resulting data may be used by the Regional Board in the Bacteria TMDL Reopener to derive reasonable and accurate numeric targets for bacteria on the basis of a reference system approach.

5.2.1 San Diego Regional Reference Streams Study

The goal of the San Diego Regional Reference Stream Study was to characterize the natural background concentrations of bacteria, nutrients, heavy metals, and conventional constituents in undeveloped watershed catchments during wet and dry weather. To meet the goal, the study was designed to categorize the exceedance frequencies of FIB water quality objectives (WQOs) by geomorphologic, hydrologic, biotic, and abiotic factors. The human-associated microbial source marker was used to exclude sites and samples with potential human fecal contamination, ensuring that the documented exceedance rates are attributable to nonhuman sources. This summary focuses on presenting the findings for FIB, specifically *Escherichia coli (E. coli)*, *Enterococcus*, and total and fecal coliforms.

The San Diego Reference Stream Study had seven major findings:

1. FIB levels in natural streams likely result from a combination of natural inputs, such as wildlife, birds, and soil erosion and instream bacterial growth facilitated by high summer temperatures, availability of nutrients, and presence of decaying organic matter.

2. Storm event mean concentration exceedances were low except for *Enterococcus*. Based on seven storms, exceedances of single-sample WQOs were 0% for *E. coli*, fecal coliform, and total coliform. The exceedance frequency for *Enterococcus* on the day of the storm was 87%, compared with 37% for the following three days after the end of the storm. The exceedance frequency increased for both *E. coli* and total coliform to 29% if the pollutograph maximum was used. The number of storm events captured was not sufficient to investigate the effect of geology or watershed size on storm event mean concentrations.

3. FIB exceedances occurred in natural sites and were highest in summer dry weather (April through August). No exceedances of fecal coliform single sample WQOs were observed; however, single-sample WQO exceedances of *Enterococcus* were as high as 30%. Annual 30-day geomean exceedance frequencies were 0% for both *E. coli* and fecal coliform, but were 48% and 30% for *Enterococcus* and total coliform, respectively. Exceedance frequencies were highest in the summer, particularly for *Enterococcus*, spiking up to 40% and 68% for single-sample and 30-day geometric mean WQOs, respectively. Using a rolling 30-day geometric mean rather than a monthly mean to calculate exceedance frequencies increased the exceedance frequencies for *Enterococcus* and total coliform as much as 20%.

4. Temperature, and to a lesser extent nutrients and organic carbon, was the major factor associated with elevated summer dry weather FIB concentrations and exceedance frequencies.

5. No significant relationships were found between FIB concentrations and watershed size or geology during dry weather.

6. Water column FIB concentrations could not be attributed directly to instream benthic algal biomass as a measure of stream trophic status, which was low and showed no distinct seasonal variation. In contrast, FIB, temperature, organic carbon, and nitrogen measurements spiked at the end of the season, coinciding with the end of stream flow. This cycle occurs naturally; organic carbon and nutrients are increasingly recycled from organic matter as flow diminishes and temperature increases, conditions that coincide with increased FIB concentrations.

7. Event mean concentration fluctuations during wet weather were found to be 2 to 3 times greater than dry weather FIB fluctuations. Wet and dry weather fluctuations were comparable to those documented in previous southern California regional studies.

5.2.2 San Diego Regional Reference Beaches Study

The goal of the San Diego Regional Reference Beach Study was to characterize natural background concentrations of FIB and determine WQO exceedance frequencies at two "reference" recreational beaches and their adjoining estuary or mixing zones. Two beaches in southern California, San Onofre Creek in San Diego County and Deer Creek in Ventura County, were selected for the Reference Beach Study for dry and wet weather assessments of *Enterococcus*, fecal and total coliforms, and *E. coli*. These locations were selected because watersheds discharging to the beaches were more than 93% undeveloped and had not been subject to fires within the previous three years. Additionally, both beaches are openly exposed with breaking waves and contain freshwater inputs. Analysis of human genetic markers was used to eliminate sites or samples with potential human contamination and therefore not representative of reference conditions.

The San Diego Regional Reference Beach Study was initiated in October 2014 and continued through April 2016. Sampling was conducted in the ocean immediately in front of the inlet or estuary, in the inlet mouth just upstream of the mixing zone, and in the freshwater flowing creek, for a total of three locations at each reference site. Dry weather monitoring was conducted during both wet and dry seasons to characterize baseline conditions throughout the year. Bacteria samples were collected weekly, such that five samples were collected in each 30-day period, to calculate a 30-day dry weather geometric mean. In creeks, dry weather sampling occurred when there was measureable flow at a site. During wet weather, samples were collected during and after the storm. A special study was also conducted to quantify FIB concentrations in the San Onofre estuary. When the estuary was open to tidal exchange, monitoring was extended to collect samples at high and low tides at all sites.

The San Diego Regional Reference Beach Study began during an extended period of drought in the southern California region, which limited the number of samples collected from creeks and during storms, as well as the overall volume of freshwater input to beaches. Dry weather beach sampling achieved the prescribed frequency, but samples from freshwater input sources were limited by extreme drought. From the onset of sampling, San Onofre Creek did not flow during the study period because of the extended drought. Deer Creek began flowing at the end of December 2014 and ceased in early May 2015; Deer Creek did not flow during the 2015–2016 winter dry weather period. In a similar effect, wet weather sampling was limited to only one storm during this study period because of the drought conditions. However human genetic markers were detected and so the results were excluded from the exceedance frequency analysis. The estuary special study was not completed because the San Onofre estuary berm remained closed throughout the study period for all but one storm event, which coincided with a tide in excess of 7 feet. The sampling locations were deemed inaccessible during that event, and so the estuary data collected only characterize concentrations during conditions with a closed estuary mouth.

Although drought conditions limited the conditions in which data were collected, the Reference Beach Study had several key findings:

1. The ranges of annual dry weather FIB concentrations at both beaches were considered low. The ranges are comparable to results from previous FIB beach bacteria reference studies that had estuaries closed to tidal exchange (i.e., San Onofre Creek) or flow to the beach without an estuary (i.e., Deer Creek), with WQO exceedance frequencies in the range of 0% to 3.5%. Prolonged drought conditions resulted in intermittent dry weather flow at Deer Creek and no dry weather flow at San Onofre Creek, which provides important context to interpret data on exceedance frequencies.

2. Concentrations of FIB in the estuary or freshwater mixing zone of both San Onofre and Deer Creeks were typically one to three orders of magnitude higher than their respective beaches, with the highest WQO exceedance frequencies found in San Onofre Creek.

3. In the San Onofre Creek estuary, the dry weather geometric mean exceedance frequency during summer was 72% for fecal coliform; the dry weather geometric exceedance frequency during summer was 100% for both *Enterococcus* and *E. coli*. Dry weather geometric mean exceedances during wet season months ranged from roughly 55% (for total coliform) to 100% (for *Enterococcus*). The higher WQO exceedance frequencies of San Onofre Creek estuary relative to the mixing zone of Deer Creek could be expected, given the abundance of labile organic matter to support microbial growth as well as the presence of water birds typically found in estuaries.

4. At both beaches, no significant relationship was found with water temperature, salinity, or antecedent dry days. In contrast to San Onofre Beach, where FIB concentrations declined with the increasing duration of dry weather, the range and mean FIB concentrations in San Onofre Creek estuary increased with increasing antecedent dry days and salinity, suggesting that freshwater input from the ephemeral channel tended to dilute concentrations, rather than be a source of bacteria to the beach. The slight increase of FIB concentrations as a function of temperature and the lack of surface freshwater input in San Onofre Creek estuary suggests that regrowth may be a factor, which is credible given the organic rich environment of the San Onofre Creek estuary.

5.2.3 Conclusions and Recommendations

Per the MS4 Permit (Provision D.4.c) data resulting from special studies should be used to (1) assess their relevance to the Responsible Agencies' characterization of receiving water conditions, (2) understand sources of pollutants and/or stressors, and (3) control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters. The San Diego Regional Stream and Beach Reference Studies characterized FIB levels in reference waterbodies and contributed to the understanding of non-anthropogenic sources of FIB. The data generated by the study are intended to be used by the Regional

Board in the Bacteria TMDL Reopener to derive reasonable and accurate numeric targets for bacteria that account for contributions from natural sources as characterized by the study.

The San Diego Regional Stream Study is directly related to the highest priority water quality condition. The adaptive management process may use the following key findings to inform the Bacteria TMDL Reopener:

- During dry weather conditions (streams):
  - There are exceedances of FIB WQOs at natural sites for *Enterococcu*s and total coliform (single sample and annual 30-day geomean).
  - These are highest during summer months (April to August).
  - There were no exceedances of the fecal coliform single sample WQOs along with a 0% exceedance frequency of the annual 30-day geomean.
  - *E. coli* also had a 0% exceedance frequency of the annual 30-day geomean.
- During wet weather conditions (streams):
  - Storm event mean concentration exceedances of single sample WQOs were 0% for *E. coli*, fecal coliform, and total coliform, but if the storm maximum pollutograph was included, there were exceedances for *E.coli* and total coliform.
  - For the storm event mean concentration exceedances of single sample WQOs for *Enterococcus,* the exceedance frequency on the day of the storm was 87%, compared with 37% for the following three days after the end of the storm.
- In summary for reference streams:
  - *Enterococcus* concentrations can often exceed the WQO in both dry and wet weather conditions in streams with no anthropogenic impacts.
  - Total coliform concentrations exceeded the WQO only during wet weather conditions in the reference watershed streams when the storm peak was incorporated into the event mean concentration.
  - *E. coli* concentrations exceeded the WQO only during wet weather conditions in the reference watershed streams when the storm peak was incorporated into the event mean concentration.
  - Fecal coliform concentrations did not exceed WQO in dry and wet weather conditions in any reference watershed streams.
- During dry weather conditions (beaches):
  - The *Enterococcus* dry weather annual 30-day geomean exceedance frequency was 100% for the whole year in the San Onofre Creek estuary.

  - The total coliform dry weather annual 30-day geomean exceedance frequency was 55% during winter months (October to March) in the San Onofre Creek estuary.
  - The *E. coli* dry weather annual 30-day geomean exceedance frequency was 100% during summer months (April to August) in the San Onofre Creek estuary.
  - The fecal coliform dry weather annual 30-day geomean exceedance frequency was 72% during the summer months in the San Onofre Creek estuary.
- During wet weather conditions (beaches):
  - No wet weather reference samples were analyzed for the beach study because human genetic markers were found in the samples during the one wet weather sampling event.
- In summary for reference beaches:
  - *Enterococcus* dry weather 30-day geomeans were exceeded during the whole year.
  - Total coliform dry weather 30-day geomeans were exceeded during the winter months (October to March).
  - *E. coli* and fecal coliform dry weather 30-day geomeans were exceeded during the summer months.

Concentrations of FIB were one to three times higher in estuary or freshwater mixings zones than at the beaches. For reference beaches with both streams and estuaries closed from tidal exchange, *Enterococcus* exceeded WQOs. Total coliform, *E. coli*, and fecal coliform concentrations exceeding WQOs varied for seasons and waterbody types. Additionally, the variability in dry weather FIB concentrations is less than the variability in wet weather FIB event mean concentrations, confirming the findings of previous studies.

5.3 Outfall Repair and Relocation Study

The Sediment Load Reduction Quantification Through Outfall Repair and Relocation for the Los Peñasquitos WMA Study was performed to assess the current sediment loading to the Los Peñasquitos Lagoon caused by the erosive scour associated with outfall discharge, as well as possible sediment load reductions associated with various BMPs.

The sediment loading analysis method used in this study utilizes the United States Department of Agriculture (USDA) Bank Stability and Toe Erosion Model (BSTEM) to estimate scour potential. The BSTEM simulation of 102 outfalls in the City of San Diego resulted in a total of 1,400 cubic feet (approximately 85 tons) per year of sediment related to erosive discharge in the Los Peñasquitos WMA. The resulting 85 tons per year from the BSTEM analysis for all 102 modeled outfalls account for approximately 1.4% of the total sediment load for the watershed. Of these 102 outfalls, 42 were identified as “high priority” outfalls because of their high annual sediment load production.

Three types of BMPs were investigated to estimate the amount of the loading that could potentially be reduced or eliminated. It was determined that the total sediment load modeled could be reduced by implementing the following BMP practices at the 42 high priority outfalls:

- 50% reduction in sediment through outfall relocation (extending storm water conveyance infrastructure from a location near the top of a canyon to one near the valley floor);
- 79% reduction in sediment by installing energy dissipation structures (placing materials below the outfall that reduce the energy of incoming storm flows); and
- 84% reduction in sediment by implementing regenerative storm water conveyance (RSC) practices (a relatively new BMP intended to treat storm water through a series of energy dissipation structures and small retention ponds).

Potential next steps include completing field verifications of the BSTEM loads and/or monitoring to validate model results. In addition, a cost benefit analysis and evaluation of challenges associated with implementation of BMP practices will be considered.

6 Publicly Available Data

The MS4 Permit requires the Responsible Agencies to provide monitoring data and assessment results to the public. The following sections provide the locations where the public may obtain this information.

6.1 California Environmental Data Exchange Network Upload and Retrieval

Provision F.4.a.(6) of the MS4 Permit requires monitoring data collected as part of the Los Peñasquitos MAP to be uploaded to CEDEN. Certifications from CEDEN confirming data upload as required will be included in Attachment H.

CEDEN is a central location for finding and sharing information about California's waterbodies and aggregates water quality, aquatic habitat, and wildlife health data. The data are accessible in downloadable forms at www.ceden.org.

Data collected under the Los Peñasquitos WMA MAP for the October 2015–September 2016 monitoring year will be available in 2017. Data in the CEDEN are searchable by date and by location, project, station, or parameter. Data collected as part of the programs described in this Monitoring Results and Assessment Appendix of the Los Peñasquitos WMA WQIP Annual Report can be retrieved using the project names listed in Table 6-1.

Table 6-1
Project Names for CEDEN Data Retrieval

Monitoring Program	CEDEN Project Name Field Name "ProjectCode"
MS4 Outfall (Wet and Dry Weather)	MS4_WW_OFM MS4_DW_OFSM
Bacteria TMDL	LosPen_BacteriaTMDL
Sediment TMDL	LP_Sediment_TMDL
Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Monitoring Plan	LP_Special_Study

CEDEN = California Environmental Data Exchange Network; MS4 = Municipal Separate Storm Sewer System;
TBD = to be determined; TMDL = Total Maximum Daily Load

6.2 Regional Clearing House

For the 2015–2016 monitoring year, the Responsible Agencies are providing the following data and documentation on the Project Clean Water website (Project Clean Water, 2016), which can be accessed by the general public:

- 2015–2016 Annual Report, including all appendices and associated attachments, including:
  - JRMP Annual Report for each Responsible Agency within the WMA
  - Monitoring Results and Assessment Appendix
  - SMC Bioassessment Summary
  - Bacteria TMDL Compliance Report
  - Reports from special studies conducted in the WMA not previously submitted (Los Peñasquitos Lagoon TMDL Upper Watershed Sediment Load Monitoring Plan)
- BMP Design Manual for each Responsible Agency within the WMA and all updated versions with date of update
- Monitoring data uploaded to the CEDEN with links to the uploaded data
- Available GIS data, layers, and/or shapefiles used to develop the maps to support the WQIP, Annual Reports, and JRMPs

IMPORTANT NOTICE

EXECUTIVE SUMMARY

Los Peñasquitos Lagoon (Lagoon) has been historically impacted by anthropogenic disturbances. These have caused excessive sedimentation leading to the gradual degradation and loss of estuarine habitat. As a result, the Lagoon was placed on the Clean Water Act Section 303(d) List of Water Quality Limited Segments for sedimentation and siltation. To address these water quality impairments, on June 13, 2012, the San Diego Regional Water Quality Control Board (Regional Board) adopted Resolution Number R9-2012-0033: *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) To Incorporate the Total Maximum Daily Load (TMDL) for Sedimentation in Los Peñasquitos Lagoon* (referred to as the Sediment TMDL) (Regional Board, 2012).

Project Objectives. The Los Peñasquitos Lagoon Watershed Management Area (WMA) Sediment TMDL Compliance Monitoring Program (Monitoring Program) was designed for the Responsible Agencies (RAs) to assess sediment transport within the three major tributaries that flow through the WMA into the Lagoon: Carroll Canyon Creek, Carmel Valley Creek, and Los Peñasquitos Creek. The Monitoring Program provides data on (a) suspended sediment concentration (SSC) during wet weather conditions, (b) estimated sediment loads to the Lagoon for comparison with the Waste Load Allocation (WLA) stated in the Sediment TMDL, and (c) sediment delivery potential within storm flows in the creeks just before they empty into the Lagoon. This report presents the results of monitoring during Fiscal Year 2016 (FY16) (July 1 2015 – June 30, 2016), along with a comparison to historical data collected to date.

Monitoring Elements. Monitoring took place prior to and during the wet season

Pre-wet-season (prior to October 1, 2015) monitoring consisted of:

- Volumetric streambed sampling for particle-size distribution;
- Pebble counts;
- Cross-section surveys; and
- Photodocumentation.

Wet season (October 1, 2015 – April 30, 2016) monitoring consisted of:

- Pollutograph sampling for SSC;
- Bedload sampling for particle-size distribution;
- Post-storm pebble counts and photodocumentation;
- Instantaneous flow measurements; and
- Long-term flow monitoring.

SSC Results. Data collected during the three wet weather events monitored during the 2015–2016 wet season showed fluctuations of SSC that generally correlated with changes in flow. However, when compared to previous seasons, concentrations tended to be higher and to remain higher throughout the storm because of the unusually intense rainfall experienced during this season. In general, data collected from the 2013–2016 monitoring events (three seasons) indicated that SSC concentrations were higher at or just after the times that higher flows were recorded and during the rising limb of the hydrograph, as expected for sediment transport influenced by supply limits. Observations of peak SSC coinciding with peak flow or slightly before peak flow indicates sediment was mainly supplied from surface washoff, driven by precipitation.

These sediment sources were either quickly exhausted during rainfall, or ceased to be mobilized and supplied to the stream when rainfall stopped. This contrasts streams where SSC rises after peak flow, indicating sediment deposits on the bed and banks are mobilized by the increased flow, or eroded on the falling limb of the hydrograph. Data collected during the 2013–2014 and 2014–2015 wet seasons at Los Peñasquitos Creek indicated that SSC concentrations were higher during the earlier portions of the hydrographs, and were lower or not detected at the peak of the hydrograph. However, data collected during the 2015–2016 wet season showed higher sustained sediment concentrations in Los Peñasquitos Creek throughout the storm, particularly for a large storm in early January 2016. This pattern may indicate this large, energetic storm event scoured and transported sediment that was stored in vegetation and on the streambed in the lower portion of Los Peñasquitos Creek.

Estimated Loads. Flow-weighted event mean concentrations (EMCs) and SSC load estimates were calculated using analytical SSC data and flow data. The total estimated load for the three monitored creeks for the 2015–2016 wet season was 23,500 tons per year, which is significantly greater than the WMA's Sediment TMDL WLA of 2,580 tons per year. The unusually high load estimates were driven primarily by a series of large, intense storm events in early January 2016.

Data collected during the 2015–2016 wet season indicated a shift in the dynamics of load inputs to the Lagoon. This is primarily due to the unusually intense storms that occurred this season that produced high flows, particularly in Los Peñasquitos Creek. Carroll Canyon Creek typically accounts for the majority (80 to 90 percent) of the sediment loads to the Lagoon. However, because of these unusually high flows, Los Peñasquitos Creek accounted for approximately 60 percent of the total load this season, despite not showing a similar relative shift in EMCs. Carroll Canyon Creek accounted for approximately 39 percent and Carmel Valley Creek accounted for approximately 1 percent. The relative contributions measured this season differ greatly from data collected over the past two seasons and a previous estimate (Weston Solutions Inc., 2009a) that Carroll Canyon Creek can supply up to 92 percent of the total sediment contribution to the Lagoon.

The estimated annual sediment loads are preliminary values, based on the limited data set collected during the 2013–2014, 2014–2015, and 2015–2016 wet seasons (nine total events). Data collection during future storm events are required to further refine these sediment load estimates, particularly for non-monitored events.

Total Sediment Load and WLA. Based on monitoring data collected during the 2015–2016 wet season, the total sediment load estimate of 23,500 tons per year is above the WLA allowed by the Sediment TMDL. The unusually high load estimates were driven primarily by a series of large, intense storm events in early January 2016. Continued compliance monitoring at the sediment TMDL locations is planned for Fiscal Year 2017 (FY 17).

1.0 INTRODUCTION

This report summarizes results from the Los Peñasquitos Lagoon Watershed Management Area (WMA) Sediment Total Maximum Daily Load (TMDL) Compliance Monitoring Program (Monitoring Program) that took place during Fiscal Year 2016 (FY16) (July 1, 2015 – June 30, 2016). The Monitoring Program provides data on (a) suspended sediment concentration (SSC) during wet weather conditions, (b) estimated sediment loads to the Lagoon for comparison with the Waste Load Allocation (WLA) stated in the Sediment TMDL, and (c) sediment delivery potential within storm flows in the creeks just before they empty into the Lagoon.

1.1 BACKGROUND AND REGULATORY FRAMEWORK

The Lagoon is a coastal salt marsh lagoon in west-central San Diego County, in southern California. The WMA is approximately 60,500 acres and contains portions of the cities of Poway and Del Mar, unincorporated areas of San Diego County, and the communities of Mira Mesa, Scripps Ranch, Carmel Valley, and Sorrento Valley within the City of San Diego (City). The WMA is drained by three major creeks, Carroll Canyon Creek, Carmel Valley Creek, and Los Peñasquitos Creek, which ultimately discharge into the Lagoon.

Los Peñasquitos Lagoon (Lagoon) has been historically impacted by anthropogenic disturbances. These have caused excessive sedimentation leading to the gradual degradation and loss of estuarine habitat. As a result, the Lagoon was placed on the Clean Water Act Section 303(d) List of Water Quality Limited Segments (303(d) List) for sedimentation and siltation. To address these water quality impairments, in 2012 the San Diego Regional Water Quality Control Board (Regional Board) adopted Resolution Number R9-2012-0033: *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) To Incorporate the Total Maximum Daily Load (TMDL) for Sedimentation in Los Peñasquitos Lagoon* (referred to as the “Sediment TMDL”) (Regional Board, 2012).[2]

The Sediment TMDL has been designed to restore the Lagoon to its mid-1970s condition by assigning the responsible parties a WLA for sediment contributions from the WMA. The responsible parties are (a) the Phase I Municipal Separate Storm Sewer System (MS4) copermittees, (b) the Phase II MS4 permittees, (c) the California Department of Transportation (Caltrans), and (d) the General Construction and General Industrial Storm Water National Pollutant Discharge Elimination System (NPDES) permittees.

The Sediment TMDL designates a single WLA of 2,580 tons per year for the entire WMA contribution, which is assigned collectively to the responsible parties.

The Sediment TMDL has been incorporated into the Order Number R9-2013-0001, as Amended by Order No. R9-2015-0001*, NPDES No. CAS010266, National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal*

[2] The Sediment TMDL was approved by the State Water Resources Control Board on January 21, 2014; by the California Office of Administrative Law (OAL) on July 14, 2014; and by the United States Environmental Protection Agency (USEPA) on October 30, 2014.

Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region (Regional Board, 2015) (referred to as the MS4 Permit) and included in the Water Quality Improvement Plan (WQIP) for the Los Peñasquitos WMA (Amec Foster Wheeler, 2015). The requirements of the Sediment TMDL and the MS4 Permit are to be executed under the WQIP. The WQIP is being implemented by the Cities of San Diego, Poway, and Del Mar, and the County of San Diego, collectively referred to as the Responsible Agencies (RAs).

1.2 CURRENT STUDY

Understanding the mechanics of sediment transport and relative contributions from the WMA's three major creeks will enable the RAs to effectively address the WLAs required under the Sediment TMDL. Amec Foster Wheeler conducted sediment transport sampling and characterization before and throughout the 2015–2016 wet season (October 1, 2015–April 30, 2016). Data collected at these sites provide an estimate of the current loads from the WMA into the Lagoon.

1.3 PROJECT OBJECTIVES

This Monitoring Program was designed to measure flows at each of the three major WMA creeks, monitor suspended sediment concentration (SSC) during three storm events, assess changes in streambed composition throughout FY16 monitoring, and estimate wet weather sediment loads from each of the creeks. The Monitoring Program was designed to answer the following questions:

- What is the sediment concentration at discrete times throughout a storm event hydrograph at the bases of the three major creeks that discharge to the Lagoon?
- What are the estimated current sediment loads from these creeks, and how do they compare to the Sediment TMDL WLA?
- How do the wet weather sediment delivery potentials of each creek compare with each other?

These data will allow comparison of the WMA's current sediment transport conditions to the Sediment TMDL WLA and will help the RAs evaluate potential management measures, such as best management practices (BMPs) and low-impact development (LID).

This page is intentionally blank.

2.0 MONITORING APPROACH AND ANALYTICAL METHODS

This Monitoring Program is a continuation of previous monitoring projects, and uses the same monitoring approach and analyses.[3] The project's monitoring elements are:

Prior to the wet season:

- Volumetric streambed samples for particle-size distribution
- Initial pebble counts and photodocumentation
- Channel cross-sectional surveys

Wet season:

- Continuous flow and rainfall measurements
  - Sampling during three wet weather events
  - SSC pollutograph sampling
- Bedload sampling for particle-size distribution
- Post-storm pebble counts and photodocumentation
- Field flow measurements to calibrate head-versus-flow table (using wading rod and acoustic Doppler current profiler [ADCP] methods)

Figure 2-1 shows the Monitoring Program's monitoring locations and also depicts the Los Peñasquitos Watershed Management Area Sediment Load Special Study (Amec Foster Wheeler, 2016) monitoring locations for reference purposes. These monitoring locations are discussed in detail in the Los Peñasquitos Lagoon Total Maximum Daily Load Sediment Monitoring Final Compliance Monitoring Plan (Amec Foster Wheeler, 2015) (Appendix A).

[3] For brevity, this monitoring report does not include the details of the project's monitoring elements; they are provided in the final *Los Peñasquitos Lagoon Total Maximum Daily Load Sediment Monitoring Final Compliance Monitoring Plan* (Amec Foster Wheeler, 2015), which is provided as Appendix A. This plan discusses vegetation monitoring that will not initiate until fall 2016, and, therefore, is not discussed in this report.

3.0 RESULTS AND DISCUSSION

This section presents the data collected during the 2015–2016 wet season and discusses how the analytical results are used to determine compliance with the Sediment TMDL. Monitoring was conducted during three storm events during the 2015–2016 wet season (October 1 through April 31). Table 3-1 presents the dates and rainfall totals for monitored events. Based on the *San Diego County Hydrology Manual* (County of San Diego, 2003), the 85th percentile, 24-hour storm for the project area is approximately 0.60 inch. The first and third monitored rainfall events were greater than the 85th percentile threshold, while the second was below it.

Table 3-1
Monitored Wet Weather Events

Event	Dates	Rainfall Total[a] (inches)
1	January 5–6, 2016	1.55
2	January 31, 2016	0.49
3	March 6–8, 2016	0.90

a. Rainfall was measured at the Los Peñasquitos Creek monitoring location rain gauge, except during the event on January 5-6, 2016, when it was replaced by Carmel Valley Creek monitoring location rain gauge because of equipment malfunction. Rainfall totals reported are only during the monitoring period. Rainfall continued later on the January 6, 2016, after sampling concluded for Event 1.

3.1 HYDROLOGY AND ANALYSIS

Table 3-2 presents the monthly rainfall totals during the 2015–2016 wet season, as compiled from the onsite rain gauge[4]. Rainfall data were also used to determine the number of “wet” days throughout the year. For the purposes of this project, a wet day is defined as a day with at least 0.1 inch of rainfall. A total of 21 wet days were recorded during the 2015–2016 wet season.

The final number of pollutograph samples selected for analysis varied, depending on the characteristics of each storm event. Table 3-3 summarizes the number of pollutograph samples submitted per monitoring location during the monitored wet weather events.

Figures 3-1 through 3-9 present the event hydrographs showing flow, selected pollutograph samples, and analytical results for SSC analysis at each monitoring location. SSC concentration spikes generally correlate with peaks in storm flow, particularly for Carroll Canyon Creek. Increases in SSC concentrations are related to the start of peak runoff for Carmel Valley and Los Peñasquitos Creeks. Although peak flow typically is most strongly associated with increased SSC, other factors also affect SSC, such as supply fluctuations and limitations, rainfall intensity and the

[4] Rainfall was measured at the Los Peñasquitos Creek monitoring location rain gauge, except during the October 29–November 26, 2015, and January 5–11, 2016, events, when it was replaced by the Carmel Valley Creek monitoring location rain gauge because of equipment malfunction.

associated rate of rise in flow, the preceding baseline flow, sampling timing, and duration of storm flow. Summarized SSC analytical results and laboratory reports are provided in Appendix B.

3.2 BEDLOAD SAMPLE COLLECTION

Collection of bedload samples was attempted during each monitored event at the three monitoring locations. Bedload sampling was conduct using both the trap samplers (installed in streambed), which have been used in previous monitoring years (Fiscal Year 2014 [FY14] [July 1, 2013 – June 30, 2014] and Fiscal Year 2015 [FY15] [July 1, 2014 – June 30, 2015]), and manual bedload samplers.

No bedload samples were successfully collected during the first event. Most samplers were lost or damaged because of the high flows. One bedload sample from each site was collected during the second event and one sample was collected from Carroll Canyon Creek during the third event. However, in each case, samplers were either displaced or partially buried/overfilled upon retrieval, making assessment of the amount of material collected and the associated time frame unreliable.

Manual bedload sample collection attempts occurred during low flows, when it was safe to enter the stream. This method yielded one result from Los Peñasquitos Creek during the second event only. Samples collected and measured from this site resulted in load estimates of 0.0022 ton per day (not significant relative to washload estimated with SSC results). However, this sample was collected at one point during one storm and may not be representative of a consistent bed movement condition throughout the storm or day, nor of bedload during other non-sampled events. Although this sample collection was an improvement over that of previous monitoring efforts, further bedload results are required to accurately quantify this factor.

Visual observations after the first monitored event (January 4-5, 2016), and the subsequent large events (January 6 and 7, 2016) confirmed that a large amount of cobble and streambed material was transported into the concrete-lined portion of Carroll Canyon Creek, but was deposited there and not transported into the Lagoon.

Appendix C provides the bedload particle size analysis for the bedload trap sample. Appendix C also provides the results from the volumetric bedload particle size analysis performed in the pre-wet-season sample at each monitoring location.

3.3 POST-STORM PEBBLE COUNT AND PHOTODOCUMENTATION

Post-storm pebble counts were conducted on six occasions during the 2015–2016 wet season. Results showed that there was a shift toward a higher proportion of sands (i.e., larger particle size) after the series of large rain events in early January 2016 at Carroll Canyon Creek, which typically has higher velocity flows compared with the other two creeks. Pebble count data show a return to a lower proportion of sands and more fines, likely due to lower intensity storms. This trend is less apparent or does not exist for the other two creeks. The lack of a clear shift after the large January 2016 storms is most likely due to the lower velocities observed in these two creeks, but may also be attributable to supplies within the creeks (i.e., higher proportion of fines compared to sands upstream).

For a complete summary and graphs of the pebble count data, refer to Appendix D.

Streambed photographs were taken throughout the wet season at each monitoring location and were compiled into a photograph log in Appendix E.

3.4 EVENT MEAN CONCENTRATION AND SEDIMENT LOAD RESULTS

The annual sediment load was estimated by multiplying the average of the three daily load estimates at each site by the number of wet days per year. In addition, annual sediment load was also estimated using results from a regression between maximum 1-hour rainfall intensity and estimated loads during monitored events (described further in Section 3.5).

Table 3-4 provides the event mean concentrations (EMCs) and sediment load estimates for the monitored events during the 2013–2014, 2014–2015, and 2015–2016 wet seasons.

Based on the monitoring during the 2015–2016 wet season, the annual load estimate of sediment entering the Lagoon from the three creeks is approximately 23,500 tons per year. This total load is significantly greater than the Sediment TMDL WLA of 2,580 tons per year. Data collected during this wet season indicated a shift in the dynamics of load inputs to the Lagoon, likely due to the unusually intense storms that occurred this season that produced high flows, particularly in Los Peñasquitos Creek. Carroll Canyon Creek typically accounts for the majority (80 to 90 percent) of the sediment loads to the Lagoon. However, because of these unusually high flows, Los Peñasquitos Creek accounted for approximately 60 percent of the total load this season. Although SSC results were higher than previous seasons' results at Los Peñasquitos Creek, they were much lower than those at Carroll Canyon Creek. The increase in proportional load from Los Peñasquitos Creek is primarily the result of large flow volumes. Carroll Canyon Creek accounted for approximately 39 percent and Carmel Valley Creek accounted for approximately 1 percent. The relative contributions measured this season differ greatly from data collected over the past two seasons and a previous estimate (Weston, 2009a) that Carroll Canyon Creek can supply up to 92 percent of the total sediment contribution to the Lagoon.

During the 2015–2016 wet season, cross-sectional areas of streambeds at the monitoring locations were updated and used to revise the head-versus-flow tables. Multiple field flow measurements using wading rods and StreamPro ADCPs were used to verify and calibrate the head-versus-flow tables. The primary change to the head versus flow tables was extending the Los Peñasquitos Creek table to higher stages, as the stages measured during the large storms in early January 2016 exceeded the previously developed tables. Appendix F provides further detail on head-versus-flow table development.

Table 3-4
EMC and Sediment Load Monitoring Results

a. Based on the 11 wet days recorded during the 2013–2014 wet season.
b. Based on the 14 wet days recorded during the 2014–2015 wet season.
c. Based on the 21 wet days recorded during the 2015–2016 wet season.
EMC = event mean concentration; mg/L = milligrams per liter
NOTE: for 2014–2015 WMA Estimated Loads, previously the totals for Events 1, 2, and 3 were incorrectly reported as 57, 40.5, and 2.89 tons/day (the total annual estimate was reported correctly as 452 tons/year). This has been corrected to 55, 39.1, and 2.73 tons/day.

3.5 ANALYSIS OF RAINFALL INTENSITY, EMC, AND DAILY SEDIMENT LOAD

A traditional method of annual load estimation includes monitoring a few events (e.g., three per year), and taking the average of the results and applying that average to all wet days during the wet season (referred to herein as the "average estimation method"). This is the approach used to calculate the values in Table 3-4. Load estimation options are often limited to this type of approach based on the amount of data. This approach can potentially skew overall estimates in either direction. For example, as in the case for the 2015–2016 wet season, the high load estimate resulting from the unusually large January event drives up the average load. This elevated averaged gets applied to all wet days, regardless of storm size or intensity, potentially resulting in an overestimation.

In an effort to better represent load estimations for non-monitored storms, alternative approaches were explored last year by assessing the relationships among rainfall intensity, EMC, and sediment load. The analysis looked at whether EMC and/or sediment load values can be reasonably estimated based on rainfall intensity. This type of estimation approach allows for load estimations based on a measured parameter (e.g., rainfall) for a non-monitored storm, rather than simply applying an average of monitored events.

Analysis of data collected during FY14 and FY15 included rainfall intensities, EMC and sediment loads, and the 1-hour maximum rainfall intensity versus EMC and sediment load. Additionally, a regression analysis was used as a part of these analyses as a basis for discarding any statistical outlier data points. Data analysis indicated that there was a stronger relationship between maximum 1-hour rainfall intensity and sediment load compared to that of overall maximum rainfall intensity and sediment load. This approach and estimates are provided in greater detail in Appendix G.

When incorporating data collected during the 2015–2016 wet season, the strength of these relationships decreased and they were deemed unreliable for use in estimating loads. This change is most likely due to the unusually intense storms monitored this wet season, in particular the large, high-intensity storm in early January 2016. Moving forward, the relationships between rainfall intensity and loads, as well as other parameters, will continue to be assessed. The goal is to provide a reliable means of estimating loads for non-monitored events (referred to herein as the "rainfall intensity estimation method"). Figures 3-10, 3-11, and 3-12 present the maximum 1-hour rainfall intensity versus estimated daily sediment load, resulting trend curve, and associated coefficient of determination (R^2) for each monitoring location, based on FY14 and FY15 monitoring data.

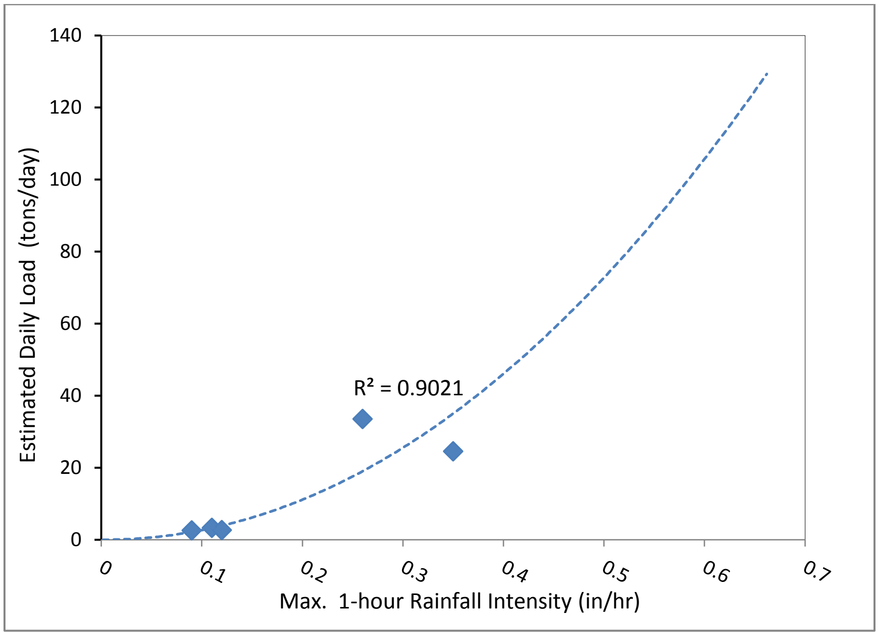

Figure 3-10
Maximum 1-Hour Rainfall Intensity vs. Estimated Daily Load—Carroll Canyon Creek

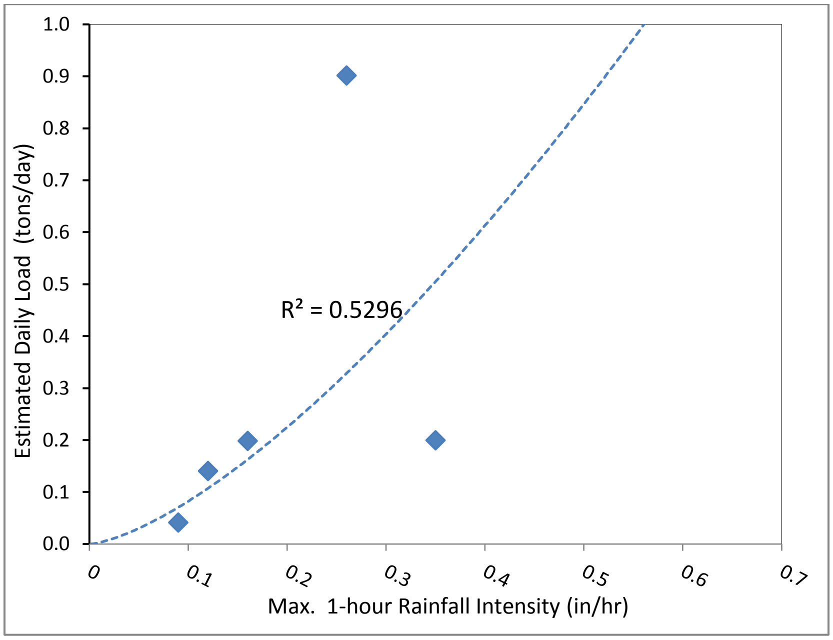

Figure 3-11
Maximum 1-Hour Rainfall Intensity vs. Estimated Daily Load—Carmel Valley Creek

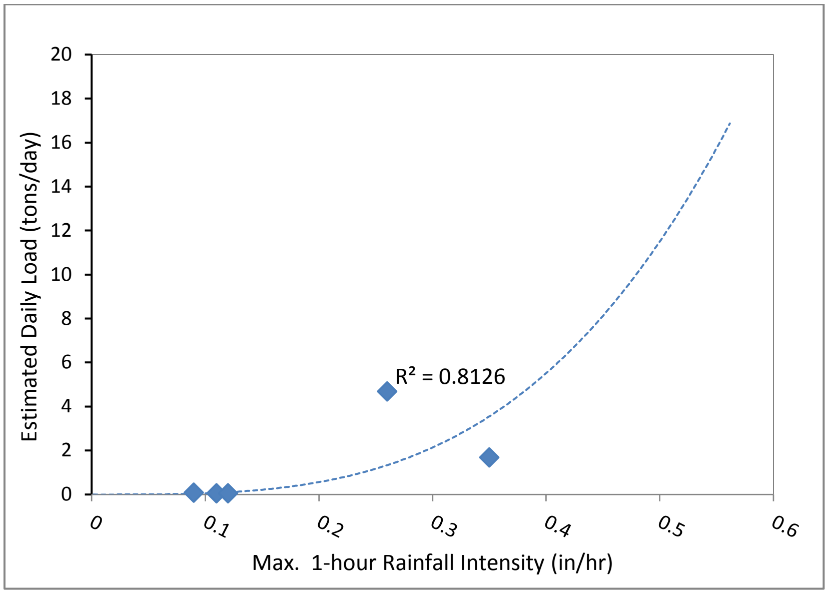

Figure 3-12
Maximum 1-Hour Rainfall Intensity vs. Estimated Daily Load—
Los Peñasquitos Creek

Table 3-5 summarizes the estimated load values based on the rainfall intensity analysis and resulting equations of the curves shown in Figures 3-10 through 3-12. Using these equations, annual load is estimated at 688 tons, which is approximately 24 percent of the 2,850-ton WLA. This method estimated total annual loads as follows:

- Carroll Canyon Creek: 554 tons (approximately 80 percent of the total 2015–2016 annual load and 19 percent of the WLA)
- Carmel Valley Creek: 6.4 tons (approximately 1 percent of the total 2015–2016 annual load, and 0.2 percent of the WLA)
- Los Peñasquitos Creek: 128 tons (approximately 19 percent of the total 2015–2016 annual load, and 4.5 percent of the WLA)

Given the difference between the average estimation method and rainfall intensity estimation methods, there is a clear need for further refinement of load estimation methods for non-monitored storms.

Table 3-5
Annual Load Estimate Method Comparison (FY15 and FY16)

Estimated Annual Loads	Average Estimation Method	Rainfall Intensity Estimation Method
Carroll Canyon Creek 2014–2015 Annual Load (tons/year)	250	376
Carmel Valley Creek 2014–2015 Annual Load (tons/year)	3.80	5.32
Los Peñasquitos Creek 2014–2015 Annual Load (tons/year)	30.6	70.7
Total Estimated Annual Load 2014–2015 (tons/year)	**284**	**452**
Carroll Canyon Creek 2015–2016 Annual Load (tons/year)	554	9,270
Carmel Valley Creek 2015–2016 Annual Load (tons/year)	6.37	191
Los Peñasquitos Creek 2015–2016 Annual Load (tons/year)	128	14,100
Total Estimated Annual Load 2015–2016 (tons/year)	**688**	**23,500**

3.6 ANALYSIS OF SSC AND FLOW

A preliminary analysis compared SSC measured during three wet seasons (2013–2016) and the corresponding flow rates for those samples. Results of this analysis are provided in Figures 3-13, 3-14, and 3-15.

Carroll Canyon Creek and Los Peñasquitos Creek showed similar SSC-versus-flow relationship strengths, with coefficient of determination (R^2) values of 0.66 and 0.69, respectively. These two creeks also showed the strongest relationships between maximum 1-hour rainfall intensity and load estimates, indicating that further in-depth data assessment may help determine a reliable method for predicting sediment transport behavior and estimating loads for non-monitored events. Building on the nine data points collected over the previous three years will provide a more robust data set, offering greater confidence in results of these assessments.

Carmel Valley Creek did not show a relationship between the two variables, likely because of the location of the sampling point, which is at the entrance to a relatively large pool where suspended material may settle out of the water column at variable rates when compared to suspension in flowing sections of other creeks. However, this sampling point is at the transition from the creek to the Lagoon, and is considered representative of what is actually entering the Lagoon. Given the conditions at this sampling point, further data assessment similar to that described above would present many challenges and may not be feasible at the current location. However, Carmel Valley Creek consistently delivers a small fraction of the annual load and is the lowest priority subwatershed on which to focus efforts and resources, so the same level of data analysis may not be needed on Carmel Valley Creek to inform management decisions.

Key elements of further data assessment should include gaining a better understanding of the impacts of varying sediment supply in each creek. The creeks go through changing supply conditions within storms, between storms, and throughout the years. These changes in supply have a direct impact on the ability to determine relationships among storm-related factors such as rainfall intensity and flow rates with sediment transport factors such as SSC and load estimations. In-depth analysis of monitoring data, such as development of flow-duration and load-duration curves, along with other data (e.g., pebble counts), will allow for an understanding of shear stress, probabilities of exceeding conditions, and other related factors that will facilitate reliable estimates of loads throughout the season and determine whether estimated loads are discharging to the Lagoon or settling out prior to reaching the Lagoon.

4.0 CONCLUSIONS AND RECOMMENDATIONS

Data generated during this Monitoring Program provided additional insight into the sediment transport characteristics of Carroll Canyon, Carmel Valley, and Los Peñasquitos Creeks. The Monitoring Program was designed to answer the following questions:

- What is the sediment concentration at discrete times throughout a storm event hydrograph at the bases of the three major creeks that discharge to the Lagoon?
- What are the estimated current sediment loads from these creeks, and how do they compare to the Lagoon's WLA?
- How do the wet weather sediment delivery potentials of each creek compare with each other?

4.1 CONCLUSIONS

Data collected during this wet season indicated a shift in the dynamics of load inputs to the Lagoon, compared to results of previous years. This finding is likely due to the unusually intense storms that occurred this season that produced high flows, particularly in Los Peñasquitos Creek. Carroll Canyon Creek typically accounts for the majority (80 to 90 percent) of the sediment loads to the Lagoon. However, because of these high flows, Los Peñasquitos Creek accounted for approximately 60 percent of the total load this season. Carroll Canyon Creek accounted for approximately 39 percent and Carmel Valley Creek accounted for approximately 1 percent. The relative contributions measured this season differ greatly from data collected over the past two seasons and a previous estimate (Weston, 2009a) that Carroll Canyon Creek can supply up to 92 percent of the total sediment contribution to the Lagoon.

Despite the shift in relative loads observed this season, SSC results in samples collected from Carroll Canyon Creek were consistently greater than those in samples from both Carmel Valley and Los Peñasquitos Creeks. The results of this Monitoring Program further indicate that the high sediment concentrations observed in Carroll Canyon Creek may be originating farther upstream. Sediment concentrations from the other two creeks are relatively low compared to those in Carroll Canyon Creek, and under typical conditions, contribute a smaller portion of the total loading into the Lagoon.

Data collected during the three 2015–2016 wet weather events showed fluctuations of SSC that generally correlated with changes in flow. However, when compared to those of previous seasons, concentrations tended to be higher and to remain higher throughout the storm because of the unusually intense rainfall experienced during this season. In general, data collected from the 2013–2016 monitoring events (three seasons) indicated that SSC was higher at or just after the times that higher flows were recorded and during the rising limb of the hydrograph, as expected for sediment transport that is affected by sediment supply. Data collected during the 2013–2015 seasons at Los Peñasquitos Creek indicated that SSC was higher during the earlier portions of the hydrographs, and SSC was lower or not detected at the peak of the hydrograph. However, data collected during the 2015–2016 season showed higher sustained concentrations at Los Peñasquitos Creek throughout the storm, particularly for the large storm in early January 2016. This result may be due to the high flows releasing and carrying sediments previously entrained within the vegetation and streambed throughout the lower portion of Los Peñasquitos Creek.

The varied levels of SSC relative to flow, as identified by the SSC versus flow analysis, can be explained by various factors. Carmel Valley and Los Peñasquitos Creeks are characterized by lower gradients, armored banks, and thick vegetation. These features are often associated with supply-limited creeks, where the water column is left deprived of sediment even though the creek experiences significantly higher flow. This is particularly true of Los Peñasquitos Creek, where storm event flows are longer and up to six times greater than in Carroll Canyon Creek. Conversely, Carroll Canyon Creek is generally characterized by exposed, erodible banks and less vegetation within the channel and experiences higher velocities compared to Los Peñasquitos and Carmel Valley Creeks.

The relationship between SSC and flow was analyzed to determine their correlation. While SSC was generally shown to increase with higher flows, this correlation showed moderate to weak relationships at the Carroll Canyon and Los Peñasquitos Creek monitoring locations, where R^2 values were 0.65 and 0.67, respectively. Carmel Valley Creek data did not exhibit a reliable relationship between the two parameters. Further analysis of this relationship including other factors such as rainfall intensity, onset of flow, antecedent dry periods, and others may contribute to improved accuracy of estimating loads.

Additional analysis evaluated whether estimated sediment loads for non-monitored events can be based on rainfall intensities. Based on limited data (6 events) collected during the 2013–2014 and 2014–2015 wet seasons, the limited amount of data collected to date indicated that a causal relationship may exist between the maximum 1-hour rainfall intensity and the estimated sediment load for each creek. When incorporating data from the 2015–2016 season, these relationships were not as strong and were not considered to be a reliable avenue for load estimation. This result is likely because of the unusual and intense nature of storms this season, in particular, the large January 2016 event.

Using an average load applied to all non-monitored wet days can misrepresent non-monitored storms. In the case of this season, the unusually high loads for the January 2016 event skew the average to higher loads, which is then applied to storms that are much smaller and/or less intense. To provide some level of comparison of load estimation methods between seasons, the best-fitting curve equations developed over the 2013–2014 and 2014–2015 wet seasons for Carroll Canyon, Carmel Valley, and Los Peñasquitos Creeks were used to estimate loads for the 2015–2016 season. Using this method for estimating the annual sediment load for the 2015–2016 wet season resulted in a total contribution of 688 tons per year compared to the estimated total of 23,500 tons per year calculated using the average of the three monitored events applied to all wet days. Although this alternative assessment approach is in a preliminary stage, this approach, or a similar one, may ultimately provide a more realistic assessment of the annual load. However, the large discrepancy between the load estimates currently using these two methods highlights the clear need for further data assessment to refine load estimations for non-monitored events.

This relationship, along with other alternative estimation approaches, will continue to be assessed moving forward.

4.2 RECOMMENDATIONS

Following are recommendations for the monitoring planned for fiscal year (FY)17 and potentially for later monitoring years as well.

- Continue to monitor at the base of each of the three creeks discharging to the Lagoon. Compliance monitoring for the Sediment TMDL is now required under the WQIP for the Los Peñasquitos WMA (Amec Foster Wheeler, 2015). This includes not only continuing to monitor consistent with this 2015–2016 program, but also monitoring Lagoon vegetation that will begin in fall 2016, as required by the Sediment TMDL. Data gathered under this program will address the goals of both the Sediment TMDL and WQIP.
- Continue to assess storm event load and EMC compared to maximum 1-hour rainfall intensity, a relationship that was shown to be relatively strong for two of the three monitoring locations based on data from 2013–2015. When data were included from 2015–2016, the strength of the relationship decreased, which could be due to the anomalous storms this year, particularly those in early January 2016. Over time, such an assessment may more accurately estimate the annual load, as it is based on empirical data using monitored and non-monitored storm characteristics and direct relationships observed during monitored events, rather than assuming consistent characteristics of every storm within a given year (as assumed when multiplying average load by the number of wet days).
- Perform detailed data analysis using applicable sediment transport methods by utilizing available hydrologic, hydraulic, and geomorphic data for the study reaches. Calibrate the sediment transport prediction with sediment loads collected through previous monitoring efforts. Assessment of data collected during this program over the past three years may be used to develop flow-duration and load-duration curves, assess shear stress within the creeks, and ultimately support sediment transport predictions that provide more accurate annual load estimations.
- Continue to monitor long-term flow throughout the entire year (including the dry season) to provide a data set that (a) increases the accuracy of annual load calculations, (b) increases opportunities to manually measure flows used to validate the head vs. flow tables, and (c) provides greater insight into how these three creeks respond to storm events and the variability throughout the season.
- Continue cross-section surveys at the beginning and end of each wet season to verify or increase the accuracy of head versus flow estimates. Cross-sectional surveys may also be used to assess changes in channel morphology.
- Continue to gauge higher flows during storm conditions to improve head versus flow table verification, which can be done by using a StreamPro ADCP flow

monitor. These measurements, along with stream gauging directly in the creek when it is safe to do so, should be conducted on multiple occasions throughout the season (as budget allows), to validate and calibrate the head-versus-flow table.

- Continue attempting bedload sampling using manual samplers. Attempts to collect bedload samples during storm events monitored between 2012 and 2016 were largely unsuccessful. This failure may be related to the accumulation of debris in the trap samplers. Manual bedload samplers used during the storm event may provide more accurate samples of the bedload transport, because field staff can target specific portions of the creek at various points in the hydrograph (as safe access allows) and accurately time the measurement period. This method provided minimal successful samples in 2015-2016; however, they were successful compared to repeated failures or uncertainties associated with the portable samples. Continued manual bedload sampling efforts will build on data collected this season and provide important data to relate suspended sediment and bedload sediment loads.

1.0 INTRODUCTION

1.1 BACKGROUND

The Los Peñasquitos Watershed Management Area (WMA) encompasses an approximate 94-square-mile drainage area in west-central San Diego County. Within the WMA are the City of Poway, a portion of the City of Del Mar, unincorporated areas of San Diego County, and the City of San Diego communities of Mira Mesa, Scripps Ranch, Carmel Valley, and Sorrento Valley.

The WMA drains a highly urbanized region that supports a variety of water supply, economic, recreational, and habitat-related beneficial uses. The WMA includes four subwatersheds: Carmel Valley Creek, Los Peñasquitos Creek, Carroll Canyon Creek, and Los Peñasquitos Lagoon (the area immediately surrounding the lagoon). For the purposes of this monitoring plan, the three major streams (Carmel Valley Creek, Los Peñasquitos Creek, and Carroll Canyon Creek [also known as Soledad Canyon Creek]) will be referred to collectively as the subwatersheds that are included for monitoring purposes, as these are the primary conveyances that ultimately discharge into Los Peñasquitos Lagoon (Lagoon). The subwatershed of Los Peñasquitos Lagoon is not included in the monitoring under this program.

The Lagoon has incurred a number of anthropogenic disturbances, which have resulted in excessive sedimentation and the gradual degradation and loss of the estuarine habitat. Accordingly, the Lagoon was placed on the 2006 Clean Water Act (CWA) Section 303(d) List of Water Quality Limited Segments (303(d) list) for sedimentation and siltation on June 28, 2007. Under the 303(d) listing, beneficial uses that are most impaired by sedimentation are estuarine habitat and preservation of biological habitats of special significance. Sedimentation in the Lagoon also restricts tidal flows between the Lagoon and the ocean, and degrades critical saltmarsh habitats.

On June 13, 2012, the San Diego Regional Water Quality Control Board (Regional Board) adopted Resolution Number R9-2012-0033, *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) to Incorporate the Total Maximum Daily Load (TMDL) for Sedimentation in Los Peñasquitos Lagoon* (hereinafter referred to as the Sediment TMDL). The Sediment TMDL is designed to restore the Los Peñasquitos Lagoon to its mid-1970s condition. The Sediment TMDL has been approved by the State Water Resources Control Board (State Board) and was approved by the California Office of Administrative Law (OAL) on July 14, 2014, and the United States Environmental Protection Agency (USEPA) on October 30, 2014. This Compliance Monitoring Plan will be adopted to evaluate progress toward meeting TMDL targets and sediment reduction goals.

The Sediment TMDL will be incorporated into the San Diego Regional Municipal Separate Storm Sewer System (MS4) Permit (MS4 Permit) (Order Number R9-2013-0001) (Regional Board, 2013) and will be included in the Water Quality Improvement Plan for the Los Peñasquitos WMA. The requirements of the Sediment TMDL and the MS4 Permit will be addressed in the Los Peñasquitos WMA Water Quality Improvement Plan. The Sediment TMDL monitoring will include watershed and vegetation monitoring. Compliance monitoring requires quantitative evaluations of the sediment load from the watershed to the Lagoon, comparison of results with TMDL numerical targets, assessment of progress toward TMDL goals, consistent reporting of sedimentation levels to Responsible Agencies, and projections of the Lagoon's vegetative habitat diversity and response to decreasing sediment loads.

The Responsible Agencies that are party to the development of the Water Quality Improvement Plan for this WMA are:

- City of Del Mar
- City of Poway
- City of San Diego
- County of San Diego
- California Department of Transportation (Caltrans)

Caltrans has partial responsibility for the implementation of the Sediment TMDL along with the Comprehensive Load Reduction Plan (CLRP) for the TMDL for indicator bacteria, *Project I—Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)*, Resolution No. R9-2010-0001 (Regional Board, 2010), referred to as the Bacteria TMDL. Caltrans is therefore included as a Responsible Agency, but is not listed in the MS4 Permit as a Copermittee. Caltrans is under a separate storm water permit from the State to reduce or eliminate the discharge of pollutants to storm drainage systems and receiving waters (Order No. 2012-0011-DWQ and Amendment Order No. WQ 2014-0077-DWQ) (State Board, 2014 and 2013). Caltrans is voluntarily participating in the development of several Water Quality Improvement Plans across the San Diego region.

Figure 1-1 shows the Los Peñasquitos WMA, subwatershed boundaries, and jurisdictional boundaries.

1.2 MONITORING OBJECTIVES

The purpose of this project is to monitor suspended sediment concentrations (SSC) and estimate wet weather sediment loads in each of the watershed's three major tributary creeks during wet weather. This TMDL Compliance Monitoring Program is designed to answer the following questions:

- What is the ecological health of the Lagoon?
- How is the Lagoon's health changing with time?
- What is the progress toward ultimate restoration of the Lagoon?
- What additional regulatory and implementation actions are needed to restore the Lagoon?

This information will allow Responsible Agencies to assess their progress toward meeting milestones and final load reduction goals in accordance with the TMDL compliance schedule.

1.3 PROJECT ORGANIZATION

The City of San Diego is the municipal government agency that oversees the project. The other municipalities within the WMA will contribute to the program through a Memorandum of Understanding (MOU). The City of San Diego has assigned two staff members to provide project oversight:

- Ruth Kolb will be responsible for policy-related and special study projects.
- Andre Sonksen will be responsible for compliance-related projects at the City of San Diego. Based on those roles, they will both provide project oversight.

Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler) will coordinate sample collection, laboratory analysis, data management, data analysis, and reporting. Amec Foster Wheeler has assigned project responsibilities to several staff members:

- Jeremy Burns will serve as the Amec Foster Wheeler Project Manager, and will be responsible for project coordination and development, scheduling, budget management, and oversight of all project plans and reports.
- Kiernan Brtalik, the Amec Foster Wheeler Project Coordinator and Field Sampling Manager, will be responsible for implementing the monitoring activities, coordinating laboratory work, and developing the project report.
- Carla Scheidlinger will be the Amec Foster Wheeler lead for vegetation monitoring and mapping.
- Dr. Theodore VonBitner will be the Amec Foster Wheeler Quality Assurance Officer, with responsibility for the project quality assurance (QA) and quality control (QC) procedures used during sampling, laboratory analysis, data management, and data analysis.

- Jesse Davis, the Amec Foster Wheeler Health and Safety Officer, will be responsible for implementing the project health and safety plan and related practices.
- Dr. Habib Matin, as part of the Amec Foster Wheeler team, will provide senior principal-level oversight and review during development of this monitoring plan, implementation of sampling, data analysis, and reporting.
- Liz Collins is the manager of Amec Foster Wheeler's material testing laboratory, which will conduct particle size distribution analyses for bedload samples; she will ensure that samples are analyzed in accordance with the methods and QA requirements outlined in this monitoring plan.

Weck Laboratories, Inc. (Weck), located in City of Industry, California, will be responsible for SSC analysis:

- Hai Van Nguyen is the Weck Project Manager and will ensure that samples are analyzed in accordance with the methods and QA requirements outlined in this monitoring plan. The Weck laboratory QA/QC manual is in Appendix A.

Figure 1-2 shows the project organization.

2.0 DESCRIPTION OF MONITORING LOCATIONS

Water quality and sediment will be sampled at one location at the base of each of the three creeks within the project boundary. The monitoring locations are shown in Figure 2-1. Vegetation monitoring will be conducted within the Lagoon and is discussed in detail in Section 5.0

Site names, identifications (IDs), and the geographic coordinates of each creek monitoring location are listed in Table 2-1.

Table 2-1.
Los Peñasquitos WMA Compliance Monitoring Locations

Site Name	Site ID	Latitude	Longitude
Carmel Valley Creek	CV	32.9297	-117.2412
Los Peñasquitos Creek	LP	32.9046	-117.2229
Carroll Canyon Creek	CC	32.8981	-117.2212

Carmel Valley Creek

The Carmel Valley Creek monitoring location is at a culvert that runs below Sorrento Valley Road, south of its intersection with Carmel Valley Road. Long-term flow monitoring data and stream rating curves from this location were incorporated into this monitoring program.

Los Peñasquitos Creek

The Los Peñasquitos Creek monitoring location is the existing San Diego Copermittee Mass Loading Station (MLS) under the Receiving Waters and Urban Runoff Monitoring Program, per Regional Board Order R9-2007-0001 (Regional Board, 2007). This site is at the bridge crossing of Vista Sorrento Parkway, near Sorrento Valley Boulevard. Long-term flow monitoring data and stream rating curves from this location were incorporated into this monitoring program.

Carroll Canyon Creek

The Carroll Canyon Creek monitoring location is approximately 600 feet upstream of the historical San Diego Copermittee Temporary Watershed Assessment Station (LPC-TWAS-1), near 10655 Roselle Street. The TWAS site itself is highly vegetated and full of debris; this condition makes it unsuitable for flow monitoring. Streambed assessments (volumetric sampling, pebble counts, and photo documentation) were conducted approximately 700 feet upstream of this station, where the stream returns to a natural bottom prior to entering the trapezoidal concrete channel. Long-term flow monitoring data and stream rating curves from this location were incorporated into this monitoring program.

3.0 SAMPLING METHODOLOGY

3.1 PRE-STORM SEASON SAMPLING

Sections 3.1.1 through 3.1.3 describe sampling activities for this compliance monitoring program that will be conducted before the wet season (October 1 through April 30) begins.

3.1.1 Volumetric Streambed Sampling

Volumetric stream bed sampling will be conducted at each monitoring location on one occasion prior to the wet season. Two stream bed material samples will be collected at a representative portion along a cross-sectional transect at each monitoring location. Samples will be collected in an area approximately 12 inches by 12 inches in size, and dug down approximately 12 inches, yielding a sample size of approximately 1 cubic foot. If an armor layer of large cobble exists that is distinctly larger than the underlying material grain size, the layers will be sampled separately. Samples will be placed in 5-gallon buckets and will be labeled appropriately. Samples will be transported to Amec Foster Wheeler’s materials testing laboratory and analyzed for particle size distribution.

3.1.2 Pebble Count Before Wet Season

A pebble count will be conducted at each monitoring location prior to the wet season. This data point will be used as the baseline for the season and as a comparison point for the subsequent pebble counts that will be conducted after monitored storms and after non-monitored major storms throughout the wet season. It is anticipated that a total of eight pebble counts will occur throughout the season. The method used will be the sampling frame and template method developed by Bunte and Abt (2001a and 2001b), which uses a minimum of 100 particles and half-phi template (gravelometer) to measure particle sizes. A tape measure will be used to space three sampling transects across riffle sections at each location. The pebble count represents the size of material in the area and can be used to assess the representativeness of the volumetric samples. Site locations will be physically marked and recorded using Global Positioning System (GPS) for subsequent pebble counts throughout the wet season.

3.1.3 Photodocumentation

The stream bed will be documented with photographs taken during dry weather volumetric sample collection and initial pebble counts. Photos will be taken of the stream bed using a 1-square-foot frame placed in three designated locations within each stream. These same points will be photographed during subsequent pebble counts, based on pebble count site markings.

3.2 WET WEATHER MONITORING

Wet weather monitoring will occur during three qualifying rainfall events (storms forecast to produce greater than 0.20 inch of rainfall) during each wet season. Monitoring will consist of pollutograph and bedload sampling, post-storm pebble counts, photodocumentation, and long-term flow monitoring.

3.2.1 Pollutograph Sampling

During each monitored event, water samples will be collected for SSC analysis. A target of 10 pollutograph samples will be collected at each monitoring location (as listed in Table 2-1) during each of the three monitored events. More samples may be collected if storm duration is prolonged. Sampling will be conducted either manually or with automated samplers at each monitoring location. Samples will be collected at equal time intervals or at times adjusted to capture multiple peaks throughout the storm duration. Flow data will be collected throughout the wet season at each monitoring location (Section 3.2.5).

3.2.2 Bedload Sampling

Samplers will be installed per United States Department of Agriculture guidelines (Bunte et al., 2007). Attempts will be made to collect bedload samples during monitoring events at the three monitoring locations. Previous sample collection by Amec Foster Wheeler in other City of San Diego project locations (Flanders Canyon Creek [2011–2012] and Carroll Canyon Creek [2011–2013]) has been successful on limited occasions; however, based on best professional judgment for these previous monitoring efforts, bedload sample collection may be unsuccessful for a given storm event. For the aforementioned studies, the cause of sample failure is unknown. It is hypothesized that flows may redirect around bedload samplers because of stream hydrology or sample exclusion caused by large cobbles.

For these challenged bedload sampling locations, efforts will be made to move the in-stream samplers around in the channel if flows appear to be bypassing the samplers. Bedload samples will be collected using a bedload trap sampler installed at two points across the channel at each site. If primary channels are narrow, only one sampler may be used. If a sampler fills with material during the storm and it is safe to access it, attempts will be made to change the mesh bag. These samples will provide data on material that is moving along the stream bed during storms and is not suspended in the water column. If collection is successful, bedload samples will be analyzed for particle size distribution.

3.2.3 Post-Storm Pebble Count

A pebble count will be conducted at each monitoring location after each monitored storm and after major storms throughout the wet season, as budget permits. See Section 3.1.3 for procedure details.

3.2.4 Photodocumentation

The stream bed will be documented with photographs taken during post-storm pebble counts. Photographs will be taken at the same locations that were photographed during the dry weather volumetric sampling. These photographs will provide a time series of stream bed material changes throughout the season. See Section 3.1.4 for procedure details.

3.2.5 Long-term Flow Monitoring

In addition to storm event monitoring, flow will be measured continuously at each of the monitoring locations. Flow data will be logged at 1-minute intervals during storm events and at 15-minute intervals during non-storm events. Data will be downloaded, twice per month, to confirm that data are being recorded and that the equipment is functioning properly.

3.3 WET WEATHER MONITORING PREPARATION AND LOGISTICS

3.3.1 Weather Tracking

Weather will be tracked for monitoring purposes throughout the wet season (October 1 through April 30). Throughout the wet season, several sources of weather information will be monitored continuously; however, the National Weather Service (NWS) webpage will be the primary source used to determine whether and when to mobilize monitoring crews.

3.3.2 Storm Selection Criteria

The following criteria will be used to determine whether to mobilize, on the basis of forecast data from the NWS, for an impending storm event:

- Storm forecasts must meet criteria at least 48 hours prior to the onset of rainfall;
- A storm must be forecast to produce at least 0.20 inch of rainfall;
- The probability of precipitation must be greater than 60 percent; and
- A storm event must be preceded by at least 72 hours of dry conditions (less than 0.10 inch of precipitation).

The Field Sampling Manager and/or Project Manager may modify the criteria on a storm-by-storm basis in consultation with the City of San Diego.

3.3.3 Staffing and Mobilization

Staffing Plan

Monitoring both the flow characteristics and water quality of storm water requires considerable planning before any actual rain falls. Obtaining representative samples and complete storm data is possible only with trained and alert field teams. The uncertainty of weather forecasts coupled with abrupt changes in the weather can greatly alter the expected workload. It is critical to plan and prepare in advance as many aspects of the field work as possible. A staffing plan that designates personnel and specifies the equipment required for each facet of monitoring will be completed as soon as a potential event has been forecast.

Each monitoring team will consist of two field individuals. The staffing plan will include the following:

- Personnel assigned to each position
- Shift (e.g., startup and relief) and monitoring location designations
- Equipment mobilization requirements
- Communication channels

No field teams will be mobilized for a storm event that would require field sampling or laboratory analysis on federal holidays.

Staffing Positions and Personnel

Storm monitoring tasks require a variety of skills. Amec Foster Wheeler personnel will be assigned to the following positions:

- Project Manager
- Field Sampling Manager
- Field technicians

Project Manager

During storm events, the Project Manager will monitor the status of the storm conditions and communicate with the Field Sampling Manager. The Project Manager must be able to obtain and interpret the most recent weather forecasts to estimate the appropriate timing and duration of the storm. This information will be used to determine the time span between pollutograph sample collections and to make informed decisions regarding the storm status. It is also the responsibility of the Project Manager to notify all personnel of shift start- and end-time changes.

The assigned Project Manager has excellent decision-making and dispatching skills as well as an understanding of the project requirements. If the Project Manager is not available during the storm event, an individual with similar skills will be assigned; however, the Project Manager will be available to answer questions.

Field Sampling Manager

This position requires an understanding of project requirements, sampling procedures, and equipment operations. The Field Sampling Manager must be able to troubleshoot most of the common problems that could be experienced by any of the field teams. The Field Sampling Manager will lead sampling activities, monitor the ability of field teams to safely and effectively complete their shifts, and communicate frequently with the Project Manager to prioritize tasks, request relief teams as needed, and provide onsite weather observations.

The Field Sampling Manager is a technically skilled field supervisor and is the most experienced member of the field team.

Field Technicians

Field technicians are field personnel trained in storm water sample collection and health and safety procedures. They will assist the Field Sampling Manager in storm water sample collection.

Equipment Mobilization

Equipment needed for storm water sampling includes automated sampling equipment, sample containers, safety equipment, personal rain gear, and storm kits. The necessary equipment will be loaded into the appropriate vehicles early in the storm preparation sequence. During the monitoring season, field crews will use safety equipment, personal rain gear, and other monitoring location maintenance equipment.

Table 3-1 lists the contents of a field technician's "field kit."

Table 3-1.
Storm Kit Equipment and Mobilization List

Storm Kit Equipment List	Mobilization List
Flashlights or headlamps	Field notebook
High-quality alkaline batteries for lamps	Paper towels
Maps of all required areas	Cellular phone
Pencils and indelible markers	Personal rain gear
Desiccant (packages and jar)	Digital or disposable camera
Diagonal clipper	Safety gear (see Appendix B, Health and Safety Plan)
Electrical tape	Spare sample labels
Cable ties (assorted sizes)	Sample control paperwork
Utility knife	Spare sets of 1-liter bottle suites for carousel
Ziploc® plastic bags (assorted sizes)	Automated sampling equipment not existing onsite (including appropriate spare batteries)
Nitrile gloves	
Full set of keys (if necessary)	Spoons, trowels, and shovels
	Bedload trap equipment and spare bedload trap nets

Communication Channels

Communication channels must be established for personnel to contact each other before and during the event. The project field notebook will include lists of home, work, and cellular telephone numbers of the Amec Foster Wheeler field team and the work telephone numbers of the primary laboratory contacts and City of San Diego personnel. Cellular telephone communication links to field teams are essential for efficient storm water monitoring because the Project Manager and the Field Sampling Manager will need to track the location and workload of each field team and to prioritize tasks.

Training of Field Personnel

Field personnel will be properly trained in the use of the monitoring equipment and in all appropriate health and safety protocols (Appendix B). Specifically, the following elements will be included in the training of all field personnel:

- Review of health and safety plan
- Classroom training
- Field training (if necessary)

Each field team member will review the Health and Safety Plan (HASP) and consult with the Field Sampling Manager for any questions before mobilization. Classroom and field training will be provided prior to the first monitored storm event to inform field personnel of the project-specific objectives.

3.3.4 Station Preparation

Field Equipment Installation

Each field installation team will consist of two technicians who are knowledgeable about using the storm water samplers. The technicians will also be familiar with equipment siting requirements. The team will deliver and install the enclosure, monitoring equipment, intake tubing, and flow monitoring sensors prior to the onset of the storm season. Any equipment that is not installed or stored on site will be mobilized during pre-storm activities.

Determination of Sampling Time Intervals

Water quality monitoring using pollutograph sampling requires an understanding of forecast storm length to determine the proper time intervals between the targeted ten samples. If automated samplers are used to collect pollutograph samples, the proper time interval must be entered into the automated samplers before the storm starts. Although 10 samples are targeted to be collected throughout the storm, achievement of that target is based on actual storm duration. If the storm ends much earlier than forecast, 10 samples may not be collected; if the storm runs longer than anticipated, more than 10 samples may be collected.

This project requires individual samples per analysis based on analytical methods. One-liter containers will be used to collect water samples for SSC; one container will be filled at each sample collection interval.

Preparation of Automated Equipment

A maintenance program will be performed on each automated sampler before each wet weather event during each wet season. Maintenance will include checking the performance of all the equipment, checking power supplies, inspecting and clearing intake structures, checking the status of the instrumentation desiccant, and performing any necessary equipment repairs to keep the monitoring equipment operational.

Field teams will make sure that the flow-monitoring equipment at all flow-monitoring locations is functional. The equipment will be inspected and then its functionality verified on the field forms.

If automated samplers are used for sample collection, field teams will check that the automated sampler has been reset and that it has been programmed to collect samples based on specified time intervals. The automated sampler will be programmed to collect 10 samples.

Sample Handling

Once samples are collected, the sample bottles will be iced, with sufficient ice maintained around the bottle to ensure that the sample temperature is 6 degrees Celsius or less.

General Inspection of Monitoring Location

The general suitability for installation of monitoring equipment will be surveyed at each location and assessed to determine whether there is debris or trash that could clog or foul equipment. The equipment will be physically observed for potential problems, such as a damaged cable or a kinked hose. When access allows, intake strainers and flow sensors will be visually checked and cleared of debris, if necessary.

3.3.5 Documentation

Each time a monitoring location is visited (whether during a storm or not), the visit will be recorded in the field log. The field data sheets in Appendix C are a guide to ensure that all the required data are obtained. Occasional checks of equipment parameters, such as date, time, and current water level (when safe access allows), will be conducted to verify that the data being recorded is accurate and that any deviations can be addressed in a timely fashion.

The following information will be entered during monitoring location visits during storms:

- Site ID (alphanumeric)
- Date and time
- Monitoring program
- Field team
- Conveyance type
- Weather conditions
- Runoff characteristics
- Equipment condition
- Sample count (if applicable)
- Miscellaneous comments

Additional data will be recorded on the field data sheet at the end of a storm event. The following data will be collected at all stations where applicable:

- Total Flow Volume—Total volume of water that passed the station during the storm
- Pollutograph Sample Count and Collection Times and Flow Rates—Total number of pollutograph samples collected throughout the storm, the time at which each was collected, and the flow rate at the time of sample collection
- Total Rainfall—Total accumulated rainfall (in inches) since the start of the storm, measured each time the rain bucket tips

Flow and rainfall data will be logged by the flow meter and will be downloaded after the storm. However, if downloaded data are lost for any reason, the data recorded on the field data sheet will serve as a secondary data reference.

3.3.6 Field Equipment Installation, Calibration, and Maintenance

Field teams will install the equipment, making sure that all equipment is securely mounted, using stainless-steel hardware. Sampling tubing and wiring will be routed through conduits that will be placed between the monitoring locations and the sampling enclosures. Above-ground instruments will be protected within the monitoring location equipment enclosure. Conduit runs will be buried in short, shallow trenches or secured to other basin features using stainless-steel hardware. Exposed conduit, intakes, and sensors will be securely fastened using stainless-steel brackets, screws, and anchors.

Bedload trap samplers will be installed prior to a monitored event.

Calibration of monitoring equipment will be performed upon installation and during maintenance and pre-storm visits. During wet weather events, the field crew will document the equipment status, which will include:

- Checking the performance of all equipment
- Checking power supplies
- Inspecting and clearing intake structures
- Calibrating equipment, as necessary

Field crews will attempt to address maintenance needs that arise while onsite. If issues remain, field crews will note the nature of the problem and return to perform required maintenance.

3.3.7 Flow Monitoring and Water Quality Monitoring Equipment Specifications

Data-Logging Flow Meter

The Sigma 950 area-velocity-bubbler (AVB) data-logging flow meters measure, calculate, and log flow data, based on a set of continuous measurements and programmed information.

Based on channel type and available historical flow data, water flow at each monitoring location will be measured, using either a head vs. flow table or an AVB probe, which measures water stage and velocity. The flow meter allows programming of the geometry of the conveyance and, based on input from the AVB probe, the flow meter calculates instantaneous flow rates. The flow meters also have inputs for a rain gauge and sampler communication.

Flow meters will have data logging capability that allows the flow meter to be connected to an automated sampler. The flow meter provides a method for controlling (pacing or triggering) the sampler and storing the corresponding sampling data.

The flow meters will measure and log flow levels and rainfall at 1-minute intervals. During storm events, the flow meters convert instantaneous flow into total runoff volume. Storm and hydrological data are electronically stored in the flow meter. The information recorded includes:

- Level, velocity (if applicable), flow, and rainfall data at the programmed logging interval
- Flow rate at the time of each sample
- Time of peak flow rate
- Cumulative rainfall
- Discharge volume totals

Automated Sampler

One of two automated samplers will be used for this project: an American Sigma 900 MAX or a SD900 sampling system. Each system consists of an intake strainer, Teflon-lined intake tubing, flexible silicon pump tubing, a peristaltic pump, a distributor arm, and sample bottles. If manual sample collection is determined to be more practical or successful, the automated samplers will not be used. The decision regarding the method of sample collection will be made on a case-by-case basis by the Field Sampling Manager.

The intake strainers will be securely fastened in a manner that allows sample collection in the estimated middle depth of water column. The intake tubing will be securely fastened to the intake strainer and will be housed in protective conduit to the point where the tubing enters the monitoring equipment enclosure. The intake tubing will be attached to the flexible silicon pump tubing at the sampler. The flexible silicon pump tubing will run through the sampler peristaltic pump into a distributor arm to fill the sample bottles.

Rain Gauges

A tipping bucket rain gauge is configured with a small "bucket" that holds a known amount of rainfall. When the bucket is full, it tips the water out, momentarily closes a switch, and then resets itself and starts the process again. The data logger counts each switch closure and so accumulates rainfall totals. The rain gauges to be used in this monitoring program are manufactured by American Sigma and will tip after every 0.01 inch of rainfall.

Rain gauges are installed at the Los Peñasquitos Creek and Carmel Valley Creek locations. The Carroll Canyon Creek location has trees surrounding the enclosure, not allowing for accurate rainfall measurement. Given the proximity of these sites, only one rain gauge is necessary.

Power

The automated sampling equipment (if used) will be powered by 12-volts direct current (VDC) power sources, either 12-VDC deep-cycle marine batteries or 12-VDC gel cell batteries. At each monitoring station, one battery will power each piece of equipment separately; this reduces the chance of batteries running low on power and also gives redundancy in the power system at the monitoring locations. If a battery fails, the other battery can power all of the equipment until a backup battery can be installed by the field crew.

Equipment Security Housing

All monitoring equipment will be housed in fiberglass or metal equipment enclosures at the monitoring locations, where access allows. The enclosures will be installed for the entire monitoring season.

4.0 ANALYTICAL PROCEDURES

Analytical procedures and laboratory information are provided in Sections 4.1 through 4.5. Table 4-1 provides the analytical methods, units, and reporting limits (RLs). Table 4-2 provides the analytical holding times, container types, and preservation requirements.

Table 4-1.
Analytical Requirements for Water and Sediment Samples

Analysis	Method	Matrix	Units	Reporting Limit
Particle Size Distribution	ASTM C 136/117	Sediment	Millimeters (mm)	NA
Suspended Sediment Concentration	ASTM D 3977	Water	Milligrams per liter (mg/L)	2.0

ASTM = ASTM International
NA = not applicable

Table 4-2.
Analytical Holding Times, Container Types, and Preservation Requirements

Analysis	Method	Matrix	Holding Time	Container Type	Preservation
Particle Size Distribution	ASTM C 136/117	Sediment	None	Mesh bag or bucket	None
Suspended Sediment Concentration	ASTM D 3977	Water	7 days	½-gallon glass	≤6 Degrees Celsius (°C)

ASTM = ASTM International

4.1 VOLUMETRIC SAMPLE ANALYSIS

Two stream bed material samples will be collected at each monitoring location prior to the start of the wet season. Samples will be analyzed for particle size distribution. If a distinct layer of large cobble (i.e., armor layer) exists above smaller grain size material at any sample point, the two layers will be sampled separately. Table 4-1 provides the analytical methods, units, and RLs. Table 4-2 provides the analytical holding times, container types, and preservation requirements.

4.2 WET WEATHER SAMPLE ANALYSIS

Water samples collected will be analyzed for SSC; bedload sediment samples will be analyzed for particle size distribution. Table 4-1 provides the analytical methods, units, and RLs. Table 4-2 provides the analytical holding times, container types, and preservation requirements. SSC was selected for water sample analysis over total suspended solids (TSS) because SSC analysis uses the entire sample volume rather than an aliquot used in TSS analysis. Based on this analytical difference, SSC is considered more representative than TSS of actual sample concentrations, particularly when a sample is composed of larger, heavier particle sizes.

4.3 PEBBLE COUNT

The pebble count procedure measures the size of a random selection of pebbles along a selected stream path to represent the size of material in the area. This procedure does not require collection of samples.

4.4 PHOTODOCUMENTATION

Photodocumentation of the stream bed will occur initially during the dry weather volumetric sample collection. It will also occur following major storm events, when pebble counts are conducted. This procedure does not require collection of samples.

4.5 LABORATORY SELECTION

For volumetric and bedload samples, particle size distribution analyses will be conducted by Amec Foster Wheeler's materials testing laboratory at:

- **Amec Foster Wheeler Environment & Infrastructure, Inc.**
  9177 Sky Park Court, San Diego, CA 92123
  (858) 278-3600 (office); (858) 278-5300 (fax)

For water samples, SSC analysis will be performed by:

- **Weck Laboratories, Inc**.
  14859 East Clark Avenue, City of Industry, CA 91745
  (626) 336-2139 (office); (626) 336-2634 (fax)

4.6 SAMPLE LABELING

Sample bottles and containers will be pre-labeled, to the extent possible, before each monitoring event. Pre-labeling simplifies field activities and leaves only date, time, and sampling personnel names to be filled out in the field. Each sample container provided will be labeled with the following information:

- Sample ID
- Project name
- Event number
- Sample collection date (month/day/year)
- Time of collection (24-hour time)
- Bottle _ of _ (for multi-bottle samples)
- Sampler's initials
- Analysis

Field samples will be labeled as described below. Samples will be labeled, recorded on the chain of custody (COC) form, and then transported to the analytical laboratory.

Each sample collected will be assigned a unique alphanumeric code (sample ID) for tracking. The sample ID will be standardized for all samples and will contain information related to the monitoring location, event, and type of sample. The required sample ID components, applicable to all samples, are:

- Site ID:
  - CV = Carmel Valley Creek
  - LP = Los Peñasquitos Creek
  - CC = Carroll Canyon Creek
- Event Number:
  - DW = Dry weather
  - 1 = First wet weather event
  - 2 = Second wet weather event
  - 3 = Third wet weather event
- Sample Type:
  - PG1–PG10 = Pollutograph number (for water samples)
  - RB or LB = Right bank or left bank (for bedload samples)

4.7 LABORATORY DATA PACKAGE DELIVERABLES

Laboratories will be required to provide a deliverable package within a three-week turnaround time per event. The deliverable package will include a hard copy of the report and electronic data files. The hard copy will include standard narratives identifying any analytical problems, QA/QC exceedances, and corrective actions. Individual data sets may be submitted to Amec Foster Wheeler as either Microsoft Excel workbook files or as Microsoft Access database files.

This page intentionally left blank

5.0 VEGETATION MONITORING

As stated in Section 4 of the Los Peñasquitos WMA Water Quality Improvement Plan (Regional Board, 2014), a numeric target has been set for wetland restoration of the Los Peñasquitos Lagoon. Specifically the target area is defined as “an increasing trend in the total area of tidal saltmarsh and non-tidal saltmarsh toward 346 acres.” The main restoration objective is to convert non-tidal saltmarsh wetland and upland or weed-infested non-tidal saltmarsh wetland habitat areas to “tidal wetland” and “native-dominated non-tidal wetland” habitats. These two vegetation types were identified in the Sediment TMDL for the numeric target. For vegetation monitoring, however, the seven vegetation types consistent with the categories historically used in the 2011 California State Parks analysis (California State Parks, 2011) of Lagoon vegetation from 2010 will be evaluated. These seven vegetation categories will be mapped using the methodology described below as part of the Sediment TMDL compliance monitoring to identify where and how changes in habitat are occurring in Los Peñasquitos Lagoon.

5.1 SEDIMENT TMDL AERIAL IMAGERY VEGETATION TYPE DETERMINATION

The Sediment TMDL Staff Report (Regional Board 2012b) described how the different vegetation types were mapped for the information shown in Figure 5-1 and described in Table 5-1.

Table 5-1.
Los Peñasquitos Lagoon Vegetation Types with Acres and Confidence of Mapping in 2010 (California State Parks, 2011)

	Acres	Confidence in Mapping (2010)
Saltmarsh	217	High (saltmarsh) to Moderate (tidal)
Non-tidal Saltmarsh	45	Moderate (non-tidal) to High (saltmarsh)
Non-tidal Saltmarsh with *Lolium*[1]	67	Moderate
Freshwater Marsh	55	High
Southern Willow Scrub	147	High
Herbaceous Wetland	34	High
Upland	0	High

1. The name of this species was recently changed to Festuca perennis. The original name Lolium perenne will be used throughout this document.

A detailed description of the seven vegetation types and discussion of the confidence in the aerial mapping are provided in the following subsections.

This page intentionally left blank

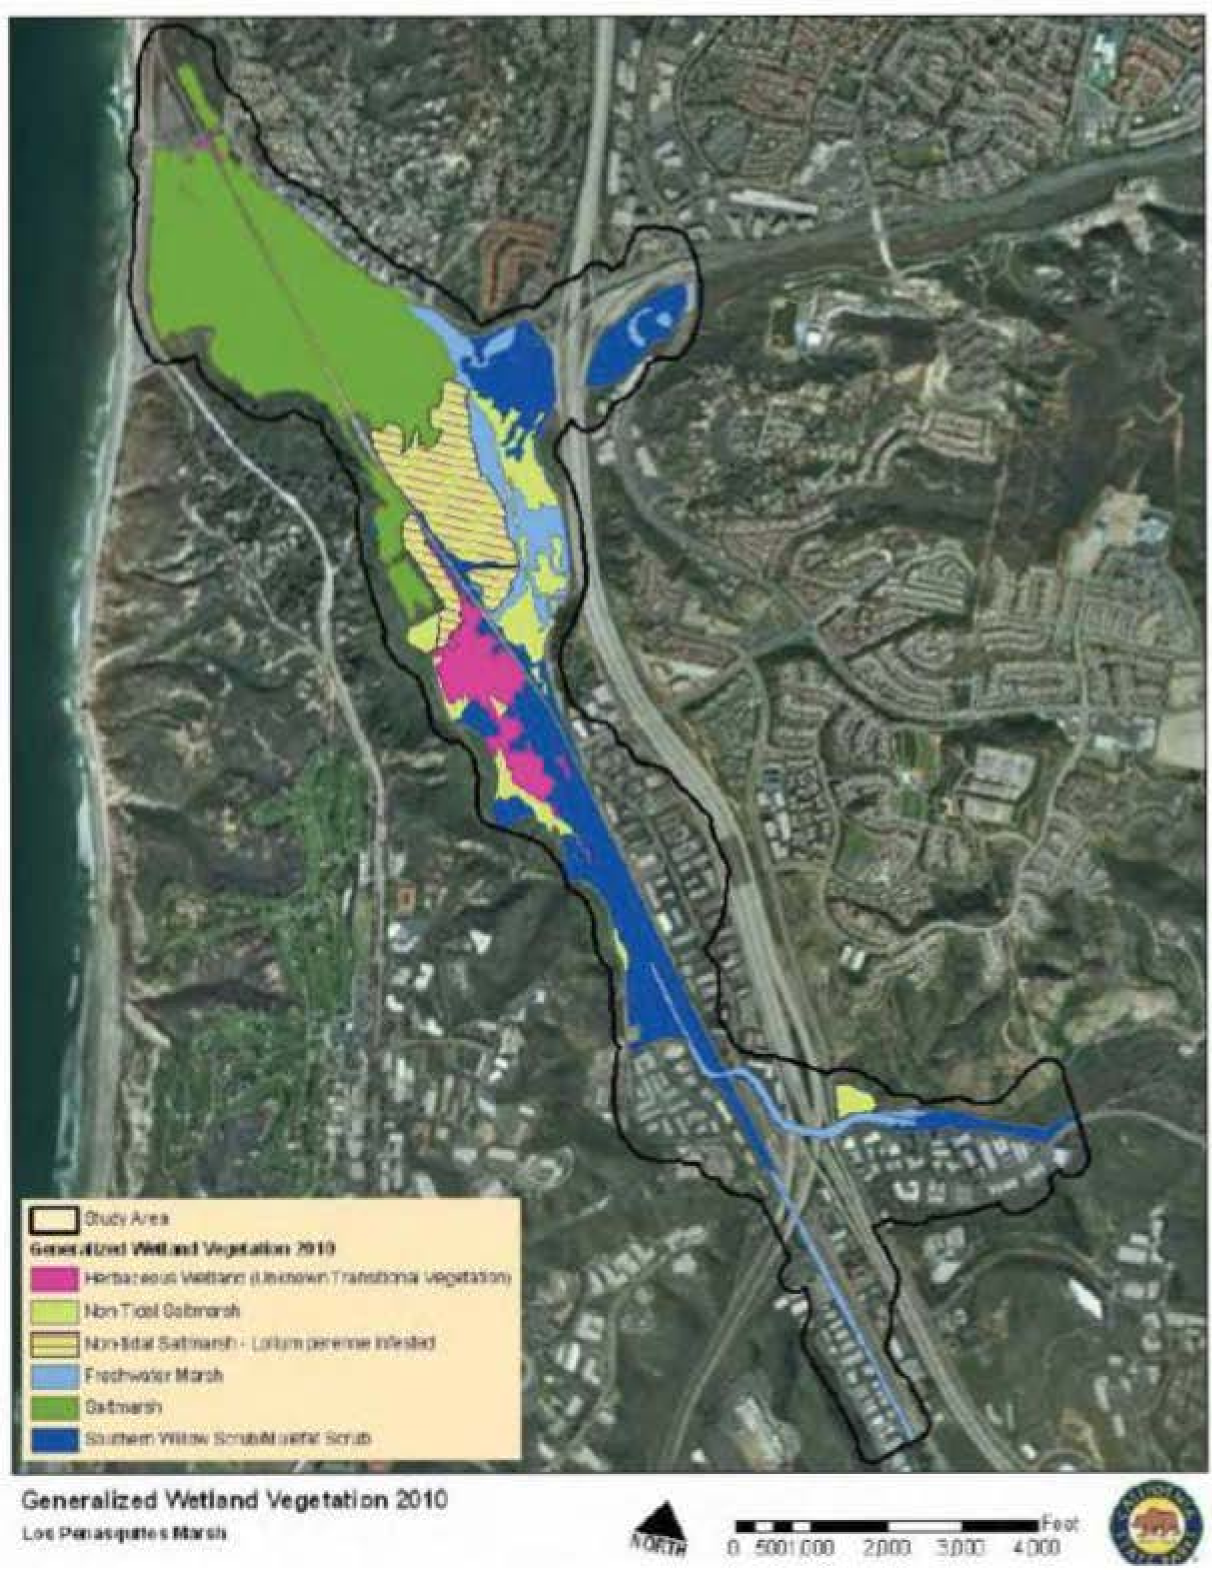

Figure 5-1.
Map of Vegetation in Los Peñasquitos Lagoon 2010

This page intentionally left blank

5.1.1 Saltmarsh

Tidal wetland habitat areas consist of vegetated saltmarsh floodplain where the direct or immediately adjacent hydrology is influenced primarily by tidal flooding hydrology. This type of vegetation exists below 6 feet (mean sea level) in elevation with an obvious tidal connection and no obvious presence of annual grasses or freshwater marsh vegetation. It also includes salt panne, mudflat, and tidal channels, none of which are vegetated (Mendel et al., 2014).

Because of the variety of physical conditions (e.g. elevation, inundation regime, soil texture), tidal saltmarsh habitat supports a diverse range of vegetation sub-types, which will not be distinguished in this mapping and monitoring exercise. Although low marsh may be absent, both marsh plain and high marsh are present.

Image indicators for this type are deep brown and red-orange colors, with smooth textured vegetation. Common species in this type include *Sarcoconia pacifica* (*Salicornia virginica*), *Frankenia grand flora,* and *Jaumea carnosa*.

The mapper found that they could distinguish this type with moderate to high confidence. Confidence that the vegetation was saltmarsh was high; confidence that it was tidal was moderate (Regional Board, 2012a). This is presumably because it is not possible to determine from an air photo the elevation of the area relative to mean sea level. Also, some mixed non-native grasses are found in areas with minimal tidal inundation, which would indicate that these areas intergrade with non-tidal saltmarsh.

5.1.2 Non-tidal Saltmarsh

Non-tidal saltmarsh habitat is defined by the persistence of native-dominant saltmarsh vegetation in areas whose hydrology is not influenced by tides. This type of vegetation exists above 4 feet (mean sea level) in elevation with no obvious tidal connection, but has the presence of annual grasses or freshwater marsh vegetation. This habitat is typically in depressional or historical saltmarsh areas where remnant accrued salts remain in high enough concentrations within soils to sustain salt-tolerant vegetation and to eliminate non-halophytes (Mendel et al., 2014).

Image indicators for this vegetation type are deep brown and red-orange colors with smooth textured vegetation as was found for saltmarsh, but with overall lighter or less intense color than tidal saltmarsh due to there being less moisture. This type may also include unvegetated salt panne, but with no obvious tidal connection. Common species in this type include *Sarcoconia pacifica* (*Salicornia virginica*) and *Frankenia grandiflora*. Vegetation distant from tidal connection has higher cover of *Frankenia salina, which shows as an* orange color in aerials, and includes more brackish species such as *Scirpus maritimus* and *Iva hayesiana*. Based on species composition, this vegetation could be considered cismontane alkali marsh. Non-native plant species are more prevalent within non-tidal habitats than tidal saltmarsh areas but should not be co-dominant. Common non-native plant species may include *Brassica nigra* (black mustard), *Festuca perennis* (Italian rye grass), *Polypogon monspeliensis* (rabbit's foot grass), and *Bromus* spp. (brome grass) (Regional Board, 2012b).

Confidence that the vegetation mapped as such in the image was non-tidal saltmarsh was moderate to high, with high confidence that vegetation was saltmarsh, and moderate confidence it was non-tidal.

5.1.3 Non-tidal Saltmarsh – *Lolium perrene* Infested

This type of vegetation exists above 4 feet (mean sea level) in elevation with no obvious tidal connection. It is dominated by annual grasses, but has presence of saltmarsh vegetation as well. This category is similar to non-tidal saltmarsh habitat but with higher or codominant non-native species cover and distinct functional differences and reductions based primarily on altered and non-native vegetation communities. These areas may experience lower soil salinities or more infrequent freshwater inundation, which would serve to increase the habitat vulnerability to non-native species invasion along the saltmarsh–upland transitional boundaries.

The principal image indicator for this type of vegetation is the straw color of senescent annual grasses. Common species present include *Sarcoconia pacifica* (*Salicornia virginica*), *Frankenia grandiflora,* and *Lolium perenne*. *Bromus diandrus* or other nonnative grasses may be present as well.

Confidence that the vegetation mapped as such in the image was non-tidal saltmarsh *Lolium perrene* infested was moderate.

5.1.4 Freshwater Marsh

This type of vegetation contains typical freshwater marsh species. This marsh habitat has high levels of freshwater influence and is typically found in areas lacking direct tidal influence. Most of the Los Peñasquitos WMA freshwater marshes include areas that experience seasonal freshwater inputs from wet weather and storm water flows. The image indicators were of vegetation that is taller statured, more round-patterned, and of a more pillowy texture than saltmarsh and non-tidal saltmarsh vegetation. This vegetation shows with a lighter color than saltmarsh and non-tidal saltmarsh. It has a smooth texture and light color compared to Southern Willow Scrub/Mulefat Scrub. Common species include *Typha* spp., *Scirpus californica,* and *Scirpus americanus.*

Confidence that the vegetation mapped as such in the image was high.

5.1.5 Southern Willow Scrub/Mulefat Scrub

This vegetation type consists of tall-statured woody vegetation. These habitat areas generally occur in lower elevation regions that direct and capture both overland and subterranean water flows from higher elevation areas; the primary characteristic is defined by the presence of riparian woody vegetation. Image indicators are lumpy texture and bright green color, with presence of shadows. Common species include *Salix lasiolepis (*western willow*) and Baccharis salicifolia (*mulefat*)*.

Confidence that the vegetation mapped as such in the image was high.

5.1.6 Herbaceous Wetland (Unknown or Transitional Vegetation)

This generalized vegetation type may contain a variety of more specific but undifferentiated vegetation types and textures mixed at close scales. Mappers indicated that in these areas, it was difficult to differentiate between vegetation types. Common species in this type may include non-native grasses, some freshwater marsh species, saltmarsh species, *Leymus tritichoides, Scirpus maritimus*, *Anemopsis californica* (yerba mansa), *Euthamia occidentalis* (western goldenrod), and others.

Confidence that the vegetation mapped as such in the image was high, primarily based on location in the Lagoon footprint and the lack of evidence for inclusion in other vegetation types.

5.1.7 Upland Land Cover (Urban, Beach, Dune, Upland Vegetation, etc.)

This type of vegetation is non-wetland. Image indicators are inclusion in areas with urban infrastructure or non-wetland vegetation. Common species are not distinguished.

Confidence that areas mapped as such in the image was high.

5.2 VEGETATION MONITORING METHODOLOGY

5.2.1 Mapping Standards

The vegetation types in Los Peñasquitos Lagoon will be monitored annually, in the fall, starting in 2014, to measure changes in the spatial extent of the vegetation types. The monitoring will be conducted via aerial photography and/or land-based survey methods. The monitoring will be consistent with the methodology used to calculate the numeric target. Ground truthing of aerial mapping “may” be performed to distinguish between vegetation types.

The vegetation mapping will be conducted according to the preferred vegetation classification that is compatible with the documentation of the attainment of the requirements of the Sediment TMDL. At the minimum, mapping will be able to distinguish with high confidence between the two major vegetation types called out in the Sediment TMDL, tidal saltmarsh and native-dominated non-tidal saltmarsh. The current plan is to provide sufficient detail to map to the seven communities described in Section 5.1. This level of mapping will provide a more detailed understanding of the dynamics of the changes in habitat in the Lagoon. Mapping will be done with aerial photographs, using image and mapping standards employed in the Sediment TMDL. Alliance species as described in the most recent Manual of California Vegetation (MCV) (Sawyer et al., 2009) with an appropriate crosswalk to the vegetation types in the Sediment TMDL listed above will be used as a reference, as the MCV is the current standard for vegetation mapping state-wide. This approach may be supplemented with additional input as provided by the City of San Diego and California Department of Fish and Wildlife, prior to the survey. Table 5-2 shows that cross-walk.

Table 5-2.
Crosswalk Between Vegetation Types Identified in the Sediment TMDL and Vegetation Alliances in MCV (MCV Crosswalk, 2009)

Vegetation Type	Potential Alliances (MCV 2009)
Non-Tidal Saltmarsh	*Arthocnemum subterminale*
	Cressa truxillensis-Distichlis spicata
	Distichlis spicata
	Frankenia salina
	Grindelia stricta
	Lasthenia fremontii-distichlis spicata
	Sueda moquinii
	Schoenoplectus americanus
Non-Tidal Saltmarsh with *Lolium*	*Lolium perenne* semi-natural stand
Freshwater Marsh	*Typha*
	Phragmites australis
	Schoenoplectus acutus
	Schoenoplectus californicus
Southern Willow Scrub	*Salix gooddingii*
	Baccharis salicifolia
	Sambucus mexicana
	Salix lasiolepis
	Salix exigua
Herbaceous Wetland	*Atriplex prostrata-Cotula coronopifolia* semi-natural stands
	Sesuvium verrucosum
Upland	Not applicable to Lagoon Vegetation
	California Annual Grassland

MCV = Manual of California Vegetation
TMDL = Total Maximum Daily Load

5.2.2 Mapping Methods

The Sediment TMDL Staff Report and its attachments (Regional Board, 2012b) detail the methods that were used for mapping Los Peñasquitos Lagoon pursuant to the development of the numeric target for Lagoon restoration. Aerial photos were digitized on-screen at a 1:2,500 scale and mapped into generalized classifications that could be reliably interpreted without field verification. Future mapping efforts will utilize the same methodology. Aerial photographs will be taken at the height of the growing season (late summer to early fall) for the year for which monitoring is to be accomplished. Vegetation types will be mapped as described, with the polygons for each type totaled to indicate the number of acres of each type that was identified. Change in each vegetation type from the previous mapping efforts will then be quantified to determine if progress is being made toward the Sediment TMDL numeric target.

5.2.3 Ground Truthing Standards

Although ground truthing was not specified in the Sediment TMDL document, it will be conducted for two reasons. The first is that it will assist in improving the accuracy of the maps, by allowing the mappers to field verify the appearance of various vegetation types in the photographs. Of particular importance will be the ability to distinguish transitions between target and non-target vegetation. Small detection differences over a long vegetation type interface can amount to a considerable number of acres, and those acres of target communities are important to Sediment TMDL compliance. Second, the ground truthing allows for some level of interpretation regarding how and why vegetation changes are occurring. This interpretation will guide any efforts that may need to be made for active restoration to accomplish the numeric target goals.

Ground truthing will be conducted during the first year to increase the confidence level of identification of the tidal and non-tidal saltmarsh communities, which is required for Sediment TMDL compliance. Ground truthing will continue during subsequent years of monitoring until a high level of confidence in vegetation type identification is attained. Ground truthing will be performed using maps that have delineated polygons of vegetation derived from the aerial imagery, with the vegetation type assigned to each polygon. Using information recorded with GPS units, the exact location of the transition from one vegetation type to another will thus be verified in the field. The map will be updated, and the acres of each vegetation type will be recalculated.

The seven vegetation types are listed below, with some discussion of how transitions between a non-target type and a target type could be realized, thus advancing toward attainment of the numeric target of the Sediment TMDL.

- Tidal saltmarsh: This vegetation type should either remain the same or expand for Sediment TMDL compliance. Expansion would be by conversion from a non-tidal saltmarsh type. Such expansion would occur if less sediment were introduced into the Lagoon, or if the connection to the ocean were expanded. Both actions would allow for increased tidal flow into higher Lagoon areas.
- Non-tidal saltmarsh: This category should either remain the same or expand for Sediment TMDL compliance. Expansion would be by conversion from a non-saltmarsh type. Increased tidal flow could introduce enough salinity into areas that were not acquiring new sediment load, converting non-tidal areas to tidal saltmarsh.
- Non-tidal saltmarsh infested with *Lolium*: This type should be converted to saltmarsh without *Lolium* infestation. It is unlikely to convert to tidal saltmarsh unless there is active restoration that would move sediment to lower the marsh surface, or at least to develop channels to allow for flooding with saltwater. This type could also be converted to non-tidal saltmarsh with native species by active control of the *Lolium* using mechanical or chemical methods, followed by appropriate seed introduction. It could also convert to non-tidal saltmarsh dominated by native species if tidal action were increased and sediment introduction decreased, so that soil salinity is increased, making the area less suitable for weedy species and favoring native saltmarsh species.

- Freshwater marsh: This vegetation type should be shown to not be expanding. Reduction of nuisance flows of fresh water could slowly convert some areas to non-tidal saltmarsh, as freshwater supplies diminish. Otherwise, the vegetation type could convert to saltmarsh only with active intervention for sediment removal either by earthmoving or by increasing local scouring from tributary creeks that would carry sediment out to sea.
- Southern willow scrub/mulefat scrub: This vegetation type should not be expanding. It could convert to saltmarsh only with active intervention for sediment removal either by earthmoving or by increasing local scouring from tributary creeks that would carry sediment out to sea.
- Herbaceous wetland: This vegetation type should be shown to not be expanding. It could convert to saltmarsh only with active intervention for sediment removal either by earthmoving or by increasing local scouring that would carry sediment out to sea.
- Upland: No changes would be expected in this area without extensive earthwork to lower the surface into the tidal range. It was not mapped as part of the Lagoon in 2010.

Transects will be used for the ground truthing. They will be positioned strategically to allow for increasing confidence regarding the location of transition zones between mapped vegetation types. Although transects are often used in restoration and monitoring work, there are no general standards for the placement or sampling of transects for vegetation mapping unless such sampling is coupled with additional sampling to identify and describe ecological parameters and processes such as soil characteristics, tidal channels, or elevation changes (Vasey et al., 2002; U.S. Geological Survey [USGS], 2011; South Bay Salt Pond, 2012). This effort would ***not*** identify and describe such parameters; it will be limited to the evaluation of vegetation type. These transects will be referenced to aerial imagery, and their location will be identified by installing permanent endpoints in the field using T-posts or other durable markers. Transect locations will be selected for specific ability to quantify with optimum accuracy the habitat acres of target vegetation types needed to conform to numeric targets for the TMDL.

Figure 5-2 shows the 2010 Los Peñasquitos Lagoon vegetation map with the preliminary location of transects that would assist in refining any changes in the boundaries between target and non-target vegetation types. The exact location of these transects will be determined in the field. Specifically, the transect purpose, by transect number, is as follows:

1. Identify the extent of the conversion of freshwater wetland or southern willow/mulefat scrub to tidal saltmarsh.
2. Identify the extent of the conversion of non-tidal *Lolium* infested marsh tidal to tidal saltmarsh.
3. Same as (2) in a different location.

4. Identify the conversion of freshwater marsh to non-tidal saltmarsh. The area shown is currently infested with *Lolium*; monitoring any reduction in *Lolium* at these interfaces and determining that the reduction can be detected in aerial photographs will be of value.
5. Same as (4) in a different location.
6. Identify the conversion of freshwater marsh to native non-tidal saltmarsh.
7. Identify the conversion of freshwater marsh and of *Lolium* infested non-tidal saltmarsh to native non-tidal saltmarsh.
8. Identify the conversion of herbaceous wetland and non-tidal *Lolium* infested saltmarsh to native non-tidal saltmarsh. These interfaces will become important with time and being able to identify them readily from aerial photographs will be useful.
9. Identify the conversion of southern willow/mulefat scrub and herbaceous wetland to non-tidal saltmarsh. These interfaces will become important with time and being able to identify them readily from aerial photographs will be useful.

5.2.4 Ground Truthing Methods

Data fields for ground truthing along the transects should include dominant species, and total vegetation cover quantified at least to cover class (Daubenmire, 1959). Methods for transect establishment and sampling are as follows:

1. Use the vegetation map generated during the first year of monitoring to select tentative transect locations that will accomplish the monitoring goals described above. Assign preliminary GPS coordinates to each end of each transect so that they can be located in the field.
2. Install the transects in the field, adjusting location and end points to suit actual field conditions. Collect actual GPS coordinates for each endpoint. Install a permanent marker such as a T-post at each end of each transect.
3. Finalize a data collection sheet for use in the field. Data fields will include cover of major species as well as an inventory of species present in a belt along each transect.
    a. A belt transect is a 1-meter-wide band that extends from the transect line to one side of the transect. Class cover for each major species and all species present along it based on 1-meter increments will be recorded (Daubenmire, 1959). This information converts to species cover, total cover, and species richness.
    b. The data sets will indicate when one vegetation type stops and another one begins, and will show how sharp the boundary is between those two types. That boundary can then be placed with great accuracy on the map, which will allow for a clear evaluation of the photographic appearance of each vegetation type evaluated.
4. Update the vegetation map using the data from the transects. Provide a narrative of what the differences were in initial assessment and final assessment, and indicate the image information that should be taken into consideration for future mapping efforts.

6.0 QUALITY ASSURANCE AND QUALITY CONTROL

This section addresses QA/QC activities associated with laboratory analyses.

6.1 WATER SAMPLING QUALITY OBJECTIVES

The laboratory will have written standard operating procedures (SOPs) that specify (for each analytical method) instrument operation and maintenance, determination of method detection limits, QC acceptance criteria, blank requirements, and stepwise procedures. At a minimum, SOPs will be written for the following procedures: sample receipt, control, and disposal; sample preparation; health and safety practices; and corrective action.

The SOPs and all revisions will be available to the analysts in the laboratory. The laboratory will maintain written records of all activities that might affect the quality of the laboratory results.

All instruments will be calibrated and the calibration acceptance criteria will be met before samples are analyzed. For SSC analysis, the balance used will be calibrated on the day of sample analysis in the range of samples.

6.1.1 Measurement Quality Objectives

Measurement Quality Objectives (MQOs) establish acceptable levels of uncertainty for each measurement process conducted during monitoring. Analytical MQOs will be assessed through application of accuracy, completeness, and representativeness parameters, as discussed in this section. For SSC analyses, laboratory duplicates are not conducted because the entire sample is used for analysis, so precision is not measured. Table 6-1 specifies the analytes and specific MQOs for each.

Table 6-1.
Measurement Quality Objectives for Laboratory Analyses

Analyte	Accuracy	Completeness
Particle Size	NA	90%
Suspended Sediment Concentration	90% below RL of 2.0 for each method blank	90%

NA = Not Applicable

Accuracy

Accuracy is defined as the nearness of a result, or the mean of a set of results, to the true or accepted value. Because there are no analyte spikes or laboratory control samples (LCSs) available for SSC analysis, analytical accuracy for SSC analysis is measured only by analysis of method blanks. The goal of accuracy is 90 percent below the RL.

The method blank ensures that the equipment used in preparing the samples is free of contaminants that could interfere with the analysis. For SSC analysis, one method blank will be analyzed per batch or 20 samples, whichever is more frequent.

Completeness

Completeness is a measure of the percentage of project-specific data that are valid. Valid data are obtained when samples are collected and analyzed in accordance with QC procedures outlined in this monitoring plan, and when none of the QC criteria that affect data usability are exceeded. The number of valid results divided by the number of possible individual analyte results, expressed as a percentage, determines the completeness of the data set. The requirement of completeness is 90 percent for samples and is determined using the following equation:

$$Completeness = \frac{Actual\ number\ of\ samples\ collected}{Project\ required\ total\ samples\ to\ be\ collected} * 100$$

Representativeness

Representativeness is a measure of how well the samples represent the area from which they were taken. In order to ensure representativeness in the samples, this study will temporal variability by using automated equipment that collects samples during regular time intervals. Sampling locations were chosen because of their representation of the entire stream channel. Monitoring locations will be inspected to ensure that debris or other outside forces do not inhibit the representativeness of the samples. Representativeness does not have a quantitative MQO.

6.1.2 Corrective Action

Corrective action is taken when an analysis is deemed suspect for some reason, such as high blank concentrations. The corrective action varies somewhat from analysis to analysis, but typically involves:

- Checking the procedure
- Reviewing the documents and calculations to identify any possible error
- Correcting the error
- Re-analyzing the sample, if it is available, to see whether results can be improved
- Completely reprocessing and re-analyzing additional sample material, if it is available

The laboratories have procedures in place to follow when failures occur, will identify the individual(s) responsible for corrective action, and will appropriately document the incident.

6.2 VEGETATION MONITORING QUALITY OBJECTIVES

In the field, data collectors will work in pairs, and each person will independently be able to identify species and to estimate cover class. This provides onsite quality control.

When data sheets are returned to the office, they will be scanned and the data digitized. A preliminary evaluation of data completeness will be made by inspection.

The map specialist will incorporate the field data into revised map polygons and evaluate the photographic signatures for each vegetation type. If this specialist detects apparent discrepancies in the vegetation identifications within a transect, the transect may be resurveyed to resolve the issue.

Based on the results of the initial air photo mapping and the ground truthing verification, a confidence for the aerial identification of each vegetation type will be developed. It is expected that the confidence for mapping the vegetation types from aerial photography will increase with the incorporation of ground truthing results.

6.3 DATA COMPILATION, ANALYSIS, AND REPORTING

6.3.1 Review of data transfer and lab reports

Once field data are collected, field sheets will be checked for accuracy and completeness by the Project Manager. Before submitting samples to the analytical lab, the field technician is responsible for ensuring that all samples are labeled correctly.

COC forms will accompany all samples submitted for laboratory analysis. COC forms will be filled out completely and will include the date, time, and signature of the Amec Foster Wheeler and laboratory employees present during the transfer. The technician making the transfer to the laboratory should make copies of all COC forms for the project records.

Electronic data deliverables (EDDs) and reports received from the lab will be reviewed for accuracy. Once the lab result data has passed QA/QC criteria, summary tables and figures can be created. The summary tables will then be checked against lab reports to confirm that the data has been transferred correctly. Laboratory raw data from 10 percent of monitoring events will be chosen randomly and checked against the original data set. If errors are found during this 10 percent check, they will be corrected and an additional 10 percent will be checked for accuracy. The process will be continued until no errors are found in the data sets.

6.3.2 Training and Certification

Field sampling will be carried out by trained field technicians and sampling managers. Field technicians will have sufficient storm water classroom and field training, as well as preliminary training in health and safety procedures.

The sample analysis will be conducted by Weck Laboratories. Weck is certified under the State of California Environmental Laboratory Accreditation Program (ELAP).

6.3.3 Equipment Maintenance and Calibration

Equipment calibration will be performed upon installation, during maintenance, and during pre-storm visits. The equipment status will be documented during wet weather events to ensure that performance, power, calibration, and intake structures are working properly.

Maintenance will also be addressed as necessary when field crews visit the sites. Any remaining problems with equipment will be documented and perform the required maintenance once they are able to do so, prior to the next sampling event.

Section 3

INTRODUCTION AND SCOPE
(TNI V1:M2 – Sections 1,2,3)

The purpose of this *Quality Assurance Manual (QM)* is to outline the management system for Weck Laboratories, Inc. The QM defines the policies, procedures, and documentation that assure analytical services continually meet a defined standard of quality that is designed to provide clients with data of known and documented quality and, where applicable, demonstrate regulatory compliance.

The *Quality Manual* sets the standard under which all laboratory operations are performed, including the laboratory's organization, objectives, and operating philosophy. The *Quality Assurance Manual* has been prepared to assure compliance with the 2009 TNI Environmental Laboratory Sector Standard – Volume 1 – Management and Technical Requirements for Laboratories Performing Environmental Analysis (EL-V1-M1 through M7-ISO-2009) as well as the DoD Quality Systems Manual for Environmental Laboratories, Version 4, dated 3/19/09. It also covers all applicable requirements, regulations, guidance, and technical standards from the USEPA and State regulatory agencies. This Standard is consistent with ISO/IEC 17025:2005 requirements that are relevant to the scope of environmental testing services and thus, the laboratory operates a quality system in conformance with ISO/IEC 17025:2005(E). In addition, the policies and procedures outlined are compliant with the various accreditation and certification programs listed in Appendix F.

3.1 Scope of Testing

The services provided by this facility include Organic Chemical Analyses, Inorganic Chemical Analyses, Trace Metal analyses, Microbiological Analysis, Physical Analyses and Field services (sampling and simple field determinations).
The laboratory's scope of analytical testing services includes those listed in Appendix E (list of Standard Operating Procedures) and also in the certifications presented in Appendix F.

3.2 Table of Contents, References and Appendices

The Table of Contents is in Section 2 and Appendices are in Section 29.

This *Quality Manual* uses the references included in Modules 1-7 in the 2009 TNI Environmental Laboratory Sector Standard – Volume 1 – Management and Technical Requirements for Laboratories Performing Environmental Analysis.
Other references used in this QM include the following in addition to SW-846, Standard Methods, EPA methods for drinking water and wastewater, ASTM and other recognized sources of analytical methods and guidance documents:

3.3 Glossary and Acronyms Used

Quality control terms are generally defined within the Section that describes the activity.

3.3.1 Glossary

The *Terms and Definitions* Section of Modules 1-7 in the 2009 TNI Environmental Laboratory Sector Standard – Volume 1 – Management and Technical Requirements for Laboratories Performing Environmental Analysis.

Other Terms and Definitions used in the laboratory are the following:

Accreditation body - Authoritative body that performs accreditation.
Aliquot - A discrete, measured, representative portion of a sample taken for analysis.
Analyte - The specific chemicals or components for which a sample is analyzed; it may be a group of chemicals that belong to the same chemical family, and which are analyzed together.
Assessment - The evaluation process used to measure the performance of effectiveness of a system and its elements against specific criteria. It includes any of the following: audit, performance evaluation, peer review, inspection, or surveillance.

Atomization - A process in which a sample is converted to free atoms.
Audit - A documented investigative evaluation used to determine the degree of compliance with established procedures and guidelines, applied to specific analytical processes.
Calibration Range - The range of values (concentrations) between the lowest and highest calibration standards of a multi-level calibration curve. For metals analysis with a single-point calibration, the low-level calibration check standard and the high standard establish the linear calibration range, which lies within the linear dynamic range.
Chain of Custody - An unbroken trail of accountability that verifies the physical security of samples, data and records.
Client - Any individual or organization for whom items or services are furnished or work performed in response to defined requirements and expectations.
Congener - A member of a class of related chemical compounds (e.g., PCBs, PCDDs).
Consensus Standard - A standard established by a group representing a cross-section of a particular industry or trade, or a part thereof.
Continuing calibration verification (CCV) - The verification of the initial calibration that is required during the course of analysis at periodic intervals. Continuing calibration verification applies to both external standard and internal standard calibration techniques, as wells as to linear and non-linear calibration models.
Definitive Data - Analytical data of known quality, concentration, and level of uncertainty. The levels of quality and uncertainty of the analytical data are consistent with the requirements for the decision to be made. Suitable for final decision-making.
Detection Limit (DL) - The lowest concentration or amount of the target analyte that can be identified, measured, and reported with confidence that the analyte concentration is not a false positive value. The smallest analyte concentration that can be demonstrated to be different from zero or a blank concentration at the 99% level of confidence. At the DL, the false positive rate (Type I error) is 1%.
Digestion - A process in which a sample is treated (usually in conjunction with heat) to convert the sample to a more easily measured form.
Dissolved - The concentration of analyte in an aqueous sample that will pass through a 0.45 µm membrane filter assembly prior to sample acidification.
Duplicate - The analysis or measurement of the variable of interest performed identically on two subsamples of the same sample. The results of duplicate analysis are used to evaluate analytical or measurement precision but not the precision of sampling, preservation or storage internal to the laboratory.
Eluent - A solvent used to carry the components of a mixture through a stationary phase.
Elute - To extract; specifically, to remove (adsorbed material) from an adsorbent by means of a solvent.
Elution - A process in which solutes are washed through a stationary phase by a movement of a mobile phase.
Environmental Data - Any measurement or information that describe environmental processes, locations, or conditions; ecological or health effects and consequences; or the performance of environmental technology.
Environmental Monitoring - The process of measuring or collecting environmental data.

False Negative - An analyte incorrectly reported as absent from the sample, resulting in potential risks from their presence.
False Positive - An item incorrectly identified as present in the sample, resulting in a high reporting value for the analyte of concern.
Finding - An assessment conclusion referenced to a NELAC Standard and supported by objective evidence that identifies a deviation from a NELAC requirement. An assessment conclusion that identifies a condition having a significant effect on an item or activity. An assessment finding may be positive or negative and is normally accompanied by specific examples of the observed condition and may be linked to a specific requirement.
Holding Times - The maximum times that samples may be held prior to analysis and still be considered valid or not compromised. The time elapsed from the time of sampling to the time of extraction or analysis, or from extraction to analysis, as appropriate.
Homologue - One in a series of organic compounds in which each successive member has one more chemical group in its molecule than the next preceding member. For instance, CH_3OH (methanol),
C_2H_5OH (ethanol), C_3H_7OH (propanol), C_4H_9OH (butanol), etc., form a homologous series.
Interference, spectral - Occurs when particulate matter from the atomization scatters the incident radiation from the source or when the absorption or emission of an interfering species either overlaps or is so close to the analyte wavelength that resolution becomes impossible.
Instrument Performance Check Solution (IPC) - A solution of the method analyte, used to evaluate the performance of the instrument system with respect to a defined set of method criteria.
Isomer - One of two or more compounds, radicals, or ions that contain the same number of atoms of the same elements but differ in structural arrangement and properties. For example, hexane (C_6H_{14}) could be n-hexane, 2-methylpentane, 3-methylpentane, 2,3-dimethylbutane, 2,2-dimethylbutane.
Limit of Detection (LOD) - An estimate of the minimum amount of a substance that an analytical process can reliably detect. An LOD is analyte and matrix-specific and may be laboratory-dependent. The smallest amount or concentration of a substance that must be present in a sample in order to be detected at a high level of confidence (99%). At the LOD, the false negative rate (Type II error) is 1%.
Limits of Quantitation (LOQ) - The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The lowest concentration that produces a quantitative result within specified limits of precision and bias. The LOQ is set at or above the concentration of the lowest initial calibration standard. Also known as Practical Quantitation Limit or PQL and Method Reporting Limit or MRL.
Laboratory Reagent Blank - An aliquot of reagent water or other blank matrices that are treated exactly as a sample including exposure to all glassware, equipment, solvents, reagents, and internal standards that are used with other samples. The LRB is used to determine if the method analyte or other interferences are present in the laboratory environment, reagents, or apparatus.
Management - Those individuals directly responsible and accountable for planning, implementing, and assessing work.
Management System - System to establish policy and objectives and to achieve those objectives.

Matrix Spike (MS) - Also known as spiked sample or fortified sample, it is a sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. Matrix spikes are used, for example, to determine the effect of the matrix on a method's recovery efficiency.

Matrix Spike Duplicate (MSD) - Also known as fortified sample duplicate, a second replicate matrix spike prepared in the laboratory and analyzed to obtain a measure of the precision of the recovery for each analyte.

Method Detection Limit - One way to establish a Limit of Detection, defined as the minimum concentration of a substance (an analyte) that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte.

Method of Standard Additions (MSA) - A set of procedures adding one or more increments of a standard solution to sample aliquots of the same size in order to overcome inherent matrix effects. The procedures encompass the extrapolation back to obtain the sample concentration. (This process is often called spiking the sample.)

Nonconformance - An indication or judgment that a product or service has not met the requirement of the relevant specifications, contract, or regulation; also the state of failing to meet the requirements.

Quality Assurance Project Plan (QAPP) - A formal document describing the detailed quality control procedures by which the quality requirements defined for the data and decisions pertaining to a specific project are to be achieved.

Quality Control Sample (QCS) - A solution of the method analyte of known concentration, which is used to fortify an aliquot of LRB or sample matrix. The QCS is obtained from a source external to the laboratory and different from the source of the calibration standards. It is used to check either laboratory or instrument performance.

Quantitation Range - The range of values in a calibration curve between the LOQ and the highest successfully analyzed initial calibration standard. The quantitation range lies within the calibration range.

Reporting Limit (RL) - A client-specified lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

Retention Time (RT) - The time between sample injection and the appearance of a solute peak at the detector.

Sample - Portion of material collected for analysis, identified by a single, unique alphanumeric code. A sample may consist of portions in multiple containers, if a single sample is submitted for multiple or repetitive analysis.

Sampling and Analysis Plan (SAP) - See Quality Assurance Project Plan.

Second-source calibration verification (ICV) - A standard obtained or prepared from a source independent of the source of standards for the initial calibration. Its concentration should be at or near the middle of the calibration range. It is done after the initial calibration.

Signal to Noise Ratio - The signal carries information about the analyte, while noise is made up of extraneous information that is unwanted because it degrades the accuracy and precision of an analysis and also places a lower limit on the amount of analyte that can be detected. In most measurements, the average strength of the noise is constant and independent of the magnitude of the signal. Thus, the effect of noise on the relative error of a measurement becomes greater and greater as the quantity being measured (producing the signal) decreases in magnitude.

Standard - Standard samples are comprised of a known amount of standard reference material in the matrix undergoing analysis. A standard reference material is a certified reference material produced by the US National Institute of Standards and Technology (NIST) and characterized for absolute content, independent of analytical test method.

Target Analytes - Analytes specifically named by a client (also called project-specific analytes).

Tuning - A check and/or adjustment of instrument performance for mass spectrometry as required by the method.

Work Cell - A well-defined group of analysts that together perform the method analysis. The members of the group and their specific functions within the work cell must be fully documented.

3.3.1.1 The TNI Standard: Modules 1-7 in the 2009 TNI Environmental Laboratory Sector Standard – Volume 1 – Management and Technical Requirements for Laboratories Performing Environmental Analysis (EL-V1, M1 through M7, ISO-2009).

3.3.2 <u>Acronyms</u>

A list of acronyms used in this document and their definitions are:

AA	-	Atomic Absorption Spectrometry
AB	–	Accrediting Body
ANSI	–	American National Standards Institute
ASQC	–	American Society for Quality Control
ASTM	–	American Society for Testing and Materials
BFB	-	Bromofluorobenzene
Blk	–	Blank
BNA	-	Base, Neutral and Acid Extractables
BOD	-	Biochemical Oxygen Demand
BS	-	Blank Spike, equivalent to LCS and LFB
°C	–	degrees Celsius
cal	–	calibration, Calibration Standard (CAL)
CAR	-	Corrective Action Report
CAS	–	Chemical Abstract Service
CCV	–	Continuing calibration verification
CCC	-	Continuing Calibration Check, equivalent to CCV
CFR	-	Code of Federal Regulations
CI	-	Chemical Ionization
CLP	–	Contract Laboratory Program
COC	–	Chain of custody
COD	–	Chemical Oxygen Demand
CRDL	-	Contract Required Detection Limit
CV	-	Coefficient of Variation
CVAA	-	Cold Vapor Atomic Absorption
DBP	-	Disinfection by Product
DFTPP	-	Decafluorotriphenylphosphine
DLR	-	Detection Limit for Reporting Purposes (established by California)
DO	–	Dissolved oxygen

DOC	**–**	**Demonstration of Capability**
DOD	**-**	**Department of Defense**
DOE	**-**	**Department of Energy**
DOT	**-**	**Department of Transportation**
DQO	**-**	**Data Quality Objectives**
DQI	**-**	**Data Quality Indicators**
DRO	**-**	**Diesel-range Organics**
ECD	**-**	**Electron Capture Detector**
EDD	**-**	**Electronic Data Deliverable**
EI	**-**	**Electron Impact Ionization**
ELAP	**-**	**Environmental Laboratory Accreditation Program**
EPA	**–**	**Environmental Protection Agency**
FIA	**-**	**Flow Injection Analysis**
FID	**-**	**Flame Ionization Detector**
g/L	**–**	**grams per liter**
GC/MS	**–**	**gas chromatography/mass spectrometry**
GPC	**-**	**Gel Permeation Chromatography**
GRO	**-**	**Gasoline Range Organics**
HAA	**-**	**Haloacetic acids**
HDPE	**-**	**High Density Polyethylene**
HPLC	**-**	**High Performance Liquid Chromatography**
HRMS	**-**	**High Resolution Mass Spectrometry**
IC	**-**	**Ion Chromatography**
IC/MS/MS-		**Ion Chromatography Tandem Mass Spectrometry**
ICP	**–**	**Inductively coupled Optical Emission Spectrometry (ICP-OES)**
ICP-MS	**–**	**Inductively coupled plasma-mass spectrometry**
ICV	**–**	**Initial calibration verification**
ICS	**-**	**Interference Check Sample**
ICS	**-**	**Interference Check Sample**
IDL	**-**	**Instrument Detection Limit**
IEC	**-**	**Interelement Correction Factor**
ISE	**-**	**Ion Selective Electrode**
ISO/IEC	**–**	**International Organization for Standardization/International Electrochemical Commission**
lb/in2	**–**	**Pound per square inch**
LC/MS/MS-		**Liquid chromatography Tandem Mass Spectrometry**
LCL	**–**	**Lower Control limit**
LCS	**–**	**Laboratory control sample, equivalent to LFB and BS**
LD	**-**	**Laboratory Duplicates (LD1 and LD2)**
LDR	**-**	**Linear Dynamic Range**
LFB	**–**	**Laboratory fortified blank**
LFM	**-**	**Laboratory Fortified Matrix, equivalent to Matrix Spike (MS)**
LFMD	**-**	**Laboratory fortified Matrix Duplicate, equivalent to MSD**
LIMS	**-**	**Laboratory Information Management System**
LLE	**-**	**Liquid-Liquid Extraction**
LOD	**-**	**Limit of Detection**
LOQ	**-**	**Limit of Quantitation**
LRB	**-**	**Laboratory Reagent Blank**
LWL	**-**	**Lower Warning Limit**
MDL	**–**	**Method detection limit**
MRL	**-**	**Method Reporting Limit or Level, equivalent to RL**

mg/Kg	–	Milligrams per kilogram
mg/L	–	Milligrams per liter
MS	–	Matrix spike, equivalent to LFM
MSD	–	Matrix spike duplicate, equivalent to LFMD
MSDS	–	Material Safety Data Sheet
NELAC	–	National Environmental Laboratory Accreditation Conference
NELAP	–	National Environmental Laboratory Accreditation Program
NIOSH	-	National Institute for Occupational Safety and Health
NIST	–	National Institute of Standards and Technology
NPD	-	Nitrogen-Phosphorus Detector
NPDES	-	National Pollutant Discharge Elimination System
OCP	-	Organochlorine Pesticides
OPP	-	Organophosphorus Pesticides
OSHA	-	Occupational Safety and health Administration
PAH	-	Polynuclear Aromatic Hydrocarbons
PMBS	-	Performance based Measurement System
PCBs	-	Polychlorinated Biphenyls
PCDD	-	Polychlorinated dibenzo-p-dioxins
PCDF	-	Polychlorinated dibenzofurans
PID	-	Photoionization Detector
PQL	-	Practical Quantitation Limit
PT	–	Proficiency Test(ing)
PTP	-	Proficiency Testing Provider
PTPA	–	Proficiency Testing Provider Accreditor
QA	–	Quality Assurance
QAP	-	Quality Assurance Program
QAPP	-	Quality Assurance Project Plan
QC	–	Quality Control
QCS	-	Quality Control Sample
QM	–	*Quality Manual*
RF	–	Response Factor
RL	–	Reporting level
RPD	–	Relative percent difference
RSD	–	Relative standard deviation
RT	-	Retention Time
SCAQMD	-	Southern California Air Quality Management District
SI	-	International System of Units
SIM	-	Selected Ion Monitoring
SOC	-	Synthetic Organic chemical
SOPs	–	Standard operating procedures
SPCC	-	System Performance Check Compounds
SPE	-	solid Phase Extraction
SPME	-	Solid Phase Microextraction
spk	–	Spike
SRM	-	Standard Reference Material
std	–	standard
SUR	-	Surrogate compound
SVOA	-	Semivolatile Organic Analysis
TCD	-	Thermal conductivity Detector
TCLP	-	Toxic Characteristics leaching Procedure
TDS	-	Total Dissolved Solids

TEM	**-**	**Transmission Electron Microscope**
TIC	**-**	**Tentatively Identified Compound**
TKN	**-**	**Total Kjeldahl Nitrogen**
TNI	**-**	**The NELAC Institute**
TOC	**-**	**Total Organic Carbon**
TOX	**-**	**Total Organic Halogens**
TPH	**-**	**Total Petroleum Hydrocarbons**
TRPH	**-**	**Total Recoverable Petroleum Hydrocarbons**
TSS	**-**	**Total Suspended solids (Non-filterable residue)**
UCL	**-**	**Upper control limit**
ug/L	**–**	**micrograms per liter**
UV-Vis	**–**	**Ultraviolet visible light**
UWL	**–**	**Upper Warning Limit**
VOA	**–**	**Volatile organic analysis**
VOC	**–**	**Volatile organic compound**
WET	**–**	**Whole effluent toxicity**
WET	**–**	**Waste Extraction Test (California leaching test for hazardous waste)**
ZHE	**–**	**Zero Headspace extraction**

3.4 Management of the *Quality Manual*

The Quality Assurance Manager is responsible for maintaining the currency of the *Quality Manual*.

The *Quality Manual* is reviewed annually by the Quality Manager and laboratory personnel to ensure it still reflects current practices and meets the requirements of any applicable regulations or client specifications. Sections of the manual are updated by making a change to the Section and then increasing the revision number by one. The cover sheet of the *Quality Manual* (Section 1) must be re-signed and the Table of Contents (Section 2) is updated whenever a Section is updated.

The *Quality Manual* is considered confidential within Weck Laboratories, Inc. and may not be altered in anyway except by approval of the Laboratory Director and Quality Manager. If it is distributed to external users, it is for the purpose of reviewing Weck Labs' management system and may not be used for any other purpose without written permission.

Section 4

ORGANIZATION
(TNI V1:M2 – Section 4.1)

The laboratory is a legally identifiable organization. The laboratory is responsible for carrying out testing activities that meet the requirements of the TNI Standard, the ISO/EIC 17025 Standard, and that meet the needs of the client. Through application of the policies and procedures outlined in this Section and throughout the *Quality Manual*:

- **The laboratory assures that it is impartial and that personnel are free from undue commercial, financial, or other undue pressures that might influence their technical judgment.**
- **Management and technical personnel have the authority and resources to carry out their duties and have procedures to identify and correct departures from the laboratory's management system.**
- **Personnel understand the relevance and importance of their duties as related to the maintenance of the laboratory's management system.**
- **Ethics and data integrity procedures (see Appendix A, Section 5 – "Management" and Section 19 – "Data Integrity Investigations") ensure personnel do not engage in activities that diminish confidence in the laboratory's capabilities.**
- **Confidentiality is maintained.**

4.1 Organization

**The laboratory is a commercial enterprise organized as a California corporation under the legal name Weck Analytical Environmental Services, Inc, DBA Weck Laboratories Inc. The Tax ID number is available upon request, if applicable.
The laboratory operates in the City of Industry, Los Angeles County, California.**

The laboratory's organization chart can be found in Appendix B. Additional information regarding responsibilities, authority and interrelationship of personnel who manage, perform or verify testing is included in Section 5 –"Management" and Section 20 – "Personnel". These Sections also include information on supervision, training, technical management, job descriptions, quality personnel, and appointment of deputies for key managerial personnel.

The laboratory has the resources and authority to operate a management system that is capable of identifying departures from that system and from procedures during testing, and initiates actions to minimize or prevent departures.

4.2 Conflict of Interest and Undue Pressure

The organizational structure indicated above minimizes the potential for conflicting or undue interests that might influence the technical judgment of analytical personnel. In addition, procedures are in place to prevent outside pressures or involvement in activities that may affect competence, impartiality, judgment, operational integrity, or the quality of the work performed at the laboratory.

In order to assist the laboratory technical personnel in performing their duties without detrimental influences, it is the policy of the Company that the laboratory be impartial and that it and its personnel are free from any undue commercial, financial and other pressures which might influence or adversely affect their normal performance having an impact on the quality of the work they produce or their technical judgment. By this policy all laboratory personnel dedicated to technical activities should not be influenced by, or involved in any financial or commercial matter while performing laboratory work. If any employee feels that he or she might be under any kind of pressure as described above, the Laboratory Director must be notified immediately. Additionally, the Laboratory will not engage in any activities that may endanger the trust in its independence of judgment and integrity in relation to its environmental testing.

Section 5

MANAGEMENT
(TNI V1:M2 – Section 4.2)

The laboratory maintains a management system that is appropriate to the scope of its activities.

5.1 Management Requirements

Top management includes the Laboratory Director, Technical Directors, Laboratory Supervisors/Team Leaders and Customer Service/Project Managers and the Quality Assurance Director.

Management's commitment to good professional practice and to the quality of its products is defined in the Quality Policy statement, Section 5.3

Management has overall responsibility for the technical operations and the authority needed to generate the required quality of laboratory operations. Management ensures communication within the organization to maintain an effective management system and to communicate the importance of meeting customer, statutory, and regulatory requirements. Management assures that the system documentation is known and available so that appropriate personnel can implement their part. When changes to the management system occur or are planned, managers ensure that the integrity of the system is maintained.

Management is responsible for carrying out testing activities that meet the requirements of the TNI Standard, the ISO/IEC 17025 Standard, and that meet the needs of the client in relation to other Federal and State requirements, such DoD.

Managers implement, maintain, and improve the management system, and identify noncompliance with the management system of procedures. Managers initiate actions to prevent or minimize noncompliance.

Management ensures technical competence of personnel operating equipment, performing tests, evaluating results, or signing reports, and limits authority to perform laboratory functions to those appropriately trained and/or supervised. This is done by requiring minimum level of education for each position as specified in the corresponding job descriptions, receiving training from senior chemists or lab managers and as described in Section 20 of this QM.

Management is responsible for defining the minimal level of education, qualifications, experience, and skills necessary for all positions in the laboratory and assuring that technical staff have demonstrated capabilities in their tasks.

Training is kept up to date as described in Section 20 – "Personnel" by periodic review of training records and through employee performance review.

Management bears specific responsibility for maintenance of the management system. This includes defining roles and responsibilities to personnel, approving documents, providing required training, providing a procedure for confidential reporting of data integrity issues, and periodically reviewing data, procedures, and documentation. The assignment of responsibilities, authorities, and interrelationships of the personnel who manage, perform, or verify work affecting the quality of environmental tests is documented in Job Descriptions documentation.

Management ensures that audit findings and corrective actions are completed within required time frames.

Designated deputies are appointed by management during the absence of the Laboratory Manager, Technical Manager or the Quality Manager, and always if the absence is more than 15 days.

5.2 Management Roles and Responsibilities

5.2.1 Laboratory Director

The Laboratory Director is responsible for the overall quality, safety, financial, technical, human resource and service performance of the laboratory. The Laboratory Director provides the resources necessary to implement and maintain an effective quality and data integrity program.

5.2.1.1 Responsibilities

The Laboratory Director is responsible for:

a. **Ensuring that personnel are free from any commercial, financial, and other undue pressures that might adversely affect the quality of their work**
b. **Ensuring that all analysts and supervisors have the appropriate education, skills and training to properly carry out the duties assigned to them and ensures that this training has been documented.**
c. **Ensuring that appropriate corrective actions are taken to address analyses identified as requiring such actions by internal and external performance or procedural audits. Procedures that do not meet the standards set forth in the Quality Manual, laboratory SOPs or laboratory policies may be temporarily suspended by the Laboratory Director.**
d. **Reviews and approved all SOPs and policies prior to their implementation and ensures all approved SOPs and policies are provided to laboratory personnel and are adhered to.**
e. **Documenting all relevant analytical and operational activities**
f. **Supervising all personnel**
g. **Performing with the other management staff an annual Management System Review**

h. Ensuring that the laboratory has the appropriate resources and facilities to perform requested work
i. Nominating deputies when the Technical Directors or QA Officer are absent for a prolonged period of time
j. Developing and implementing a proactive program for prevention and detection of improper, unethical or illegal actions and operating in accordance with the Laboratory's documented ethics policy
k. Ensuring that only those outside support services and supplies that are of adequate quality to sustain confidence in the laboratory's tests are used
l. Commitment to meet customer requirements and whenever possible exceed their expectations
m. Commitment to operate in accordance with statutory and regulatory requirements

5.2.2 Quality Assurance Manager (QA Manager)

The QA Manager (or designee) is responsible for the oversight and review of quality control data, but is independent from laboratory operations. The QA manager reports directly to the Officers of the Corporation as indicated in the Organizational chart (Appendix B). The QA Manager's training and proof of experience in QA/QC procedures, knowledge of analytical methods, and the laboratory's management system are available in the personnel records.

5.2.2.1 Responsibilities

The Quality Manager is responsible for:

a. serving as a focal point for QA/QC;
b. arranging or conducting annual internal audits without outside (e.g., managerial) influence;
c. notifying management of deficiencies, and monitoring corrective actions;
d. oversight and review of quality control data;
e. arranging or conducting internal audits annually;
f. monitoring corrective actions;
g. ensuring that the management system related to quality is implemented and followed at all times;
h. have a general knowledge of the analytical test methods for which data review is performed;
i. Ensuring communications take place within the laboratory regarding the effectiveness of the quality system;
j. Using available tools, such as audit and surveillance results, control charts, proficiency testing results, data analysis, corrective and preventive actions, customer feedback, and management reviews in efforts to monitor trends and continually improve the quality system;
k. Stop work as deemed necessary in the event of serious QA/QC issues;
l. monitoring and maintaining laboratory certifications; and
m. keeping this *Quality Manual* current.

5.2.3 Technical Directors

The Technical Director (or designee) is a full-time laboratory staff member and supervises laboratory operations and data reporting. The Technical Director's proof of experience in the fields of accreditation may be found in the personnel records.

If the Technical Director is absent for fifteen (15) calendar days or more, a deputy (see Table 5-1 below) with appropriate qualifications will perform the Technical Directors' duties. Beyond a thirty-five (35) calendar day absence, management will notify the primary accreditation body in writing of the absence of the Technical Director and the appointment of the deputy.

The Technical Director is the technical director of more than one accredited environmental laboratory.

5.2.3.1 Responsibilities

The Technical Manager is responsible for:

a. meeting the general and education requirements and qualifications found in Sections 4.1.7.2 and 5.2.6.1 of the TNI Standard - EL-V1M2-2009;
b. monitoring performance data and the validity of the analyses for the laboratory;
c. Ensuring that sufficient number of qualified personnel are employed to supervise and perform the work of the laboratory;
d. Provide educational direction to laboratory staff;
e. Exercise day-to-day supervision of laboratory operations for the corresponding department
f. Ensuring personnel have the appropriate education and technical background to perform the tests for which the laboratory is accredited.

5.2.4 Lab Supervisors/Team Leaders

The Lab supervisors are full time employees that work under the direction of the Technical Directors and are responsible managing the group or section. Training records and educational background can be found in the personnel records.

5.2.4.1 Responsibilities

The Lab Supervisor/Team leader is responsible for:

a. Reviewing section workload and distribute work among available chemists;
b. Perform secondary data review of data packages;
c. ensuring analytical instruments are performing correctly;
d. Provide educational direction to laboratory staff;
e. Assist the Technical Director in performing day-to-day supervision of laboratory operations for the corresponding department

5.2.5 Customer Service/Project Managers (PM)

The PMs are full time or part-time employees that work under the direction of the Laboratory Director and are responsible for the relationship between the laboratory and the external clients. Training records and educational background can be found in the personnel records.

5.2.5.1 Responsibilities

The PMs are responsible for:

f. **Reviewing final reports for completeness and accuracy prior to be submitted to clients;**
g. **Maintain projects and bids in LIMS accurate and updated;**
h. **Maintain good communications with customers in all aspects related with their projects;**
i. **Make the necessary arrangements for sampling supplies delivery and samples pick up;**
j. **Answer customer technical questions or relate to appropriate lab personnel when needed**
k. **Ensure data deliverables including hard copy reports, EDDs and invoices are accurate and delivered on time**

5.2.6 Laboratory Key Personnel Deputies

The following table defines who assumes the responsibilities of key personnel in their absence:

Table 5-1 Key Personnel Deputies

Key Personnel	Deputy
Laboratory Director	Technical Director Inorganics
QA Manager	Laboratory Director
Technical Director Inorganics	Inorganic Section Group Leader
Technical Director Organics	Organic Section Group Leader
Technical Director Microbiology	Laboratory Director
Technical Director Radiochemistry	Laboratory Director

Note: The designees or deputies are for temporary absence only; for prolonged absence a new person should be appointed to the position on a permanent basis.

5.3 Quality Policy

Management's commitment to quality and to the management system is stated in the Quality Policy below, which is upheld through the application of related policies and procedures described in the laboratory's *Quality Manual*, SOPs and policies.

Weck Laboratories provides qualitative and quantitative data for use in critical decisions relating to the protection of the public and the environment. The data used

for such purposes must be scientifically valid, defensible and of known and documented quality. All environmental testing activities are carried out in such a way as to meet the requirements of the current TNI Standard and to satisfy the needs of the client, the regulatory authorities or organizations providing recognition.

It is our goal to provide our clients with the best possible services, in terms of quality of laboratory work, honesty in our procedures and reporting, efficiency in our turnaround time and reasonable prices for our services and at the same time satisfy the needs of the regulatory authorities and organizations providing recognition.

The management of the laboratory is totally committed to the attainment of the best possible quality of data and instructs and educates the staff on this company policy.

All the necessary resources and materials shall be provided to the personnel of the laboratory in order to meet and/or improve the quality requirements of TNI and consequently of ISO 17025, of the analytical methods performed at the lab and any special requirements from clients.

Our policy is to use good professional practices, to maintain quality, to uphold the highest quality of service, and to comply with the TNI Standard. The laboratory ensures that personnel are free from any commercial, financial, and other undue pressures, which might adversely affect the quality of work. This policy is implemented and enforced through the unequivocal commitment of management, at all levels, to the Quality Assurance (QA) principles and practices outlined in this manual. However, the primary responsibility for quality rests with each individual within the laboratory organization. Every laboratory employee must ensure that the generation and reporting of quality analytical data is a fundamental priority. Every laboratory employee is required to familiarize themselves with the quality documentation and to implement the policies and procedures in their work. All employees are trained annually on ethical principles and procedures surrounding the data that is generated. The laboratory maintains a strict policy of client confidentiality.

The objective of the Quality Assurance Program is to monitor the reliability of the analytical data produced by the Laboratory and to implement effectively the quality control procedures and operations defined for each analysis. The purposes of this program are:

a. **Provide data that is scientifically valid, defensible, and of known and documented quality in accordance with standards developed by TNI and any applicable state or EPA regulations or requirements.**
b. Ensure that analytical results fall between acceptable control limits.
c. Provide mechanisms for corrective action when necessary.
d. Establish standardized practices to provide consistency in the generation of data.
e. Define the quality of each analytical system in terms of accuracy, precision and sensitivity.
f. Identify in the early stages possible problems that may affect data quality.
g. Ensure that all personnel involved with testing and calibration are familiar with the quality documentation;
h. Ensure that all policies and procedures are implemented;

i. Commitment that management will comply with the standard and will continually improve the effectiveness of the management system

5.4 Ethics and Data Integrity System

The laboratory has developed an Ethics and Data Integrity policy for prevention and detection of improper, unethical or illegal actions that is included in Appendix A. The laboratory's Ethics and Data Integrity program, training and investigations are discussed in Section 19 – "Data Integrity Investigations".

A main component of this program is the periodic training and communications that the employees receive from management about the ethics policy and the utmost importance of an honest and ethical behavior in all activities performed at the laboratory.

Proper ethical conduct in the laboratory is strictly enforced. The Company's Code of Ethics is presented to current and prospective employees in both the QA manual and the Employee Handbook.

The Data Integrity Plan, which includes the description of the data integrity procedures, serves to combine the elements currently in place and document further procedures to ensure our compliance with requirements in the TNI standard and from other regulatory agencies.

These procedures include the following elements:

a. data Integrity training
b. signed data integrity documentation for all laboratory employees
c. in-depth, periodic monitoring of data integrity
d. data integrity procedure documentation.

The data integrity procedures are signed and dated by senior management. These procedures and the associated implementation records are properly maintained and made available for assessor review. The data integrity procedures are annually reviewed and updated if necessary by management.

The Data Integrity Plan also provides a mechanism for confidential reporting of data integrity issues in the laboratory. A primary element of the mechanism is to assure confidentiality and a receptive environment in which all employees may privately discuss ethical issues or report items of ethical concern. In instances of ethical concern, the mechanism also includes a process whereby laboratory management is to be informed of the need for any further detailed investigation.

Each employee is required to understand and sign a Data Integrity Agreement, contained in the Data Integrity Plan document. The Laboratory Ethics seminar that is presented as a refresher to current employees on an annual basis and as part of the hiring process for new employees include elements describing examples of improper and illegal actions, how to identify appropriate and inappropriate laboratory and

instrument manipulation practices, guidance for manual integration practices and consequences of unethical or improper behavior.

Punishment for improper, illegal or unethical activities range from suspension to termination, depending on the degree and nature of the unethical activity.

Employees are required and encouraged to bring up to management any improper activities they detect or are suspicious of. Any incident reported is immediately investigated by the management and the person or persons involved are subject to disciplinary actions.

The Management shall also monitor the program for detecting improper, unethical or illegal action by performing internal proficiency testing (single or double blind), reviewing of analytical data post-analysis, performing electronic data audits using special software as Mint Miner® and providing an open door policy for employees to report any suspicious activity without fears.

In order to assist the laboratory technical personnel in performing their duties without detrimental influences, it is the policy of the Company that the laboratory be impartial and that it and its personnel are free from any undue commercial, financial and other pressures which might influence or adversely affect their normal performance having an impact on the quality of the work they produce or their technical judgment. By this policy all laboratory personnel dedicated to technical activities should not be influenced by, or involved in any financial or commercial matter while performing laboratory work. If any employee feels that he or she might be under any kind of pressure as described above, the Laboratory Director must be notified immediately. Additionally, the Laboratory will not engage in any activities that may endanger the trust in its independence of judgment and integrity in relation to its environmental testing.

5.5 Documentation of Management / Quality System

The management system is defined through the policies and procedures provided in this *Quality Manual* and written laboratory Standard Operating Procedures (SOPs) and policies.

5.5.1 Quality Manual

The *Quality Manual* contains the following required items:

5.5.1.1 document title;

5.5.1.2 laboratory's full name and address;

5.5.1.3 name, address (if different from above), and telephone number of individual(s) responsible for the laboratory;

5.5.1.4 identification of all major organizational units which are to be covered by this quality manual and the effective date of the version;

5.5.1.5 identification of the laboratory's approved signatories;

5.5.1.6 the signed and dated concurrence (with appropriate names and titles), of all responsible parties including the quality assurance manager, technical

directors, and the agent who is in charge of all laboratory activities, such as the laboratory director or laboratory manager;

5.5.1.7 the objectives of the management system and contain or reference the laboratory's policies and procedures;

5.5.1.8 the laboratory's official quality policy statement, which shall include management system objectives and management's commitment to ethical laboratory practices and to upholding the requirements of this Standard; and

5.5.1.9 a table of contents, and applicable lists of references, glossaries and appendices.

This *Quality Manual* contains or references all required elements as defined by the TNI Standard - V1:M2, Section 4.2.8.4.

5.5.2 Standard Operating Procedures (SOPs)

Standard operating procedures (SOPs) represent all phases of current laboratory operations (they include an effective date, revision number, and signature of the approving authorities which are the Technical Director of the section involved or the Laboratory Director and QA Manager and are available to all personnel. They contain sufficient detail such that someone with similar qualifications could perform the procedures. There are two types of SOPs used in the laboratory: 1) test method SOPs, which have specific requirements as outlined below, and 2) general use or administrative SOPs which document general procedures.

A list of the SOPs currently in use at the laboratory can be found in Appendix E.

Each accredited analyte or method has an SOP. Sometimes an SOP is a copy of a method, and any additions are clearly described. The laboratory's test method SOPs include the following topics, where applicable, as indicted in the SOP MIS048:

i. identification of the method;
ii. applicable matrix or matrices;
iii. limits of detection and quantitation;
iv. scope and application, including parameters to be analyzed;
v. summary of the method;
vi. definitions;
vii. interferences;
viii. safety;
ix. equipment and supplies;
x. reagents and standards;
xi. sample collection, preservation, shipment and storage;
xii. quality control;
xiii. calibration and standardization;
xiv. procedure;
xv. data analysis and calculations;
xvi. method performance;
xvii. pollution prevention;
xviii. data assessment and acceptance criteria for quality control measures;
xix. corrective actions for out-of-control data;

xx. contingencies for handling out-of-control or unacceptable data;
xxi. waste management;
xxii. references; and
xxiii. any tables, diagrams, flowcharts and validation data.

5.5.3 <u>Order of Precedence</u>

In the event of a conflict or discrepancy between policies, the order of precedence is as follows unless otherwise noted:

1. Quality Manual
2. SOPs and Policies
3. Other (Work Instructions (WI), memos, flow charts, etc.

If there is a Quality assurance Project Plan (QAPP) for a particular project, this will take precedence over the above item just for that particular project.

Section 6

DOCUMENT CONTROL
(TNI V1:M2 – Section 4.3)

This Section describes how the laboratory establishes and maintains a process for document management. Procedures for document management include controlling, distributing, reviewing, and accepting modifications. The purpose of document management is to preclude the use of invalid and/or obsolete documents.

Documents can be SOPs, policy statements, specifications, calibration tables, charts, textbooks, posters, notices, memoranda, software, drawings, plans, etc. These may be on various media, whether hard copy or electronic, and they may be digital, analog, photographic or written.

The laboratory manages three types of documents: 1) controlled, 2) approved, and 3) obsolete.

A controlled document is one that is uniquely identified, issued, tracked, and kept current as part of the management system. Controlled documents may be internal documents or external documents.

An approved document means it has been reviewed and either signed and dated, or acknowledged in writing or by secure electronic means by the issuing authority(ies).

Obsolete documents are documents that have been superseded by more recent versions or are no longer needed.

6.1 Controlled Documents

Documents will be reviewed, revised (as appropriate) and approved for use by appropriate management personnel prior to issue. SOPs are approved by both the Technical Director or Laboratory Director and the QA Manager. Policies and other similar documents are approved by the Laboratory Director alone. The QA Manual is approved by all management personnel (Lab Director, Technical Directors and QA Manager).

Documents are reviewed annually to ensure their contents are suitable and in compliance with the current management systems requirements, and accurately describe current operations.

Approved copies of documents are available to staff at all locations where operations are essential to the effective functions of the laboratory.
The procedure for document control and distribution of documents is detailed in SOP MIS045.

SOPs and other controlled documents are accessible to all analysts electronically as PDF documents located in the laboratory computer network. Each analysis in LIMS has a link to the corresponding SOP for that method.

The QA Manager or Laboratory Director will update the controlled documents by keeping in the active folder the current documents and moving to the "obsolete" folder the documents that have been replaced. The new document will have the date it is effective and the revision number while the old document with a prior revision number will be considered obsolete starting with the date the new revision becomes effective.

Controlled internal documents are uniquely identified with 1) a unique name or number identification 2)date of issue, 3) revision identification, 4) page number, 5) the total number of pages (or a mark to indicate the end of the document), and 6) the signatures of the issuing authority (i.e. management) that approve documents after reviewing for accuracy.

A master list of controlled internal documentsis maintained that includes distribution, location, and revision dates. A master list of controlled external documents is also maintained that includes title, author, copyright date, and date of publication, and location. The controlled document list is maintained electronically by the QA Manager and is updated as needed and reviewed annually for accuracy.

6.1.1 Document Changes to Controlled Documents

6.1.1.1 Paper Document Changes

Document changes are approved by the original approving authority.

The document management process allows for handwritten modifications to documents if the modifications are not substantial. The date and approval is documented with the modifications and these changes are tracked by the QA Manager who will redistribute the modified document to its users.

All document modifications are approved. Changes that are not process modifications but clarifications may be performed without revision. Approval is required. The modified document is then copied and distributed, and obsolete documents are removed according to the master list of controlled documents.

Amendments/modifications to documents are incorporated into a new revision and reissued when the document is reviewed and updated on or before its scheduled review cycle.

A reason for the modification or change is provided as historical information in the revised document as an appendix.

6.1.1.2 Electronic Document Changes

Suggested revisions to electronic documents are presented to the QA Manager or Laboratory Director for review and approval. Changes to electronic documents are approved through electronic means such as an email notification for interested parties.

Where practical, the altered text or new text in the draft is identified during the revision or review process to provide for easy identification of the modifications.

6.2 Obsolete Documents

All invalid or obsolete documents are removed from general distribution, or otherwise prevented from unintended use.

Obsolete documents retained for legal use or historical knowledge preservation are appropriately marked and retained. Obsolete documents are identified as being obsolete by management. All copies of the obsolete document are collected from employees according to the master distribution list and destroyed; the original copy or a remaining copy is clearly marked "Old" or "Obsolete" on the front cover and kept in a folder properly identified as containing old or obsolete documents. They are retained for 10 years or as required by regulations or clients from the date they became obsolete in the area designated for document storage.
Electronic documents that have being identified obsolete or old are also moved to a computer directory or folder clearly identified as such.

Section 7

REVIEW OF REQUESTS, TENDERS AND CONTRACTS
(TNI V1:M2 – Section 4.4)

The review of all new work assures that oversight is provided so that requirements are clearly defined, the laboratory has adequate resources and capability, and the test method is applicable to the customer's needs. This process assures that all work will be given adequate attention without shortcuts that may compromise data quality.

Contracts for new work may be formal bids, signed documents, verbal, or electronic. The client's requirements, including the methods to be used, must be clearly defined, documented and understood. Requirements might include target analyte lists, project specific reporting limits (if any), project specific quality control requirements (if any), turnaround time, and requirements for data deliverables. The review must also cover any work that will be subcontracted by the laboratory.

7.1 Procedure for the Review of Work Requests

The Client Service Manager in conjunction with the Technical Directors or Laboratory Director determines if the laboratory has the necessary accreditations, physical, personnel and information resources, including schedule, equipment and deliverables to meet the work request. The purpose of this review of capability is to establish that the laboratory's personnel have the skills and expertise necessary for the performance of the tests in question. The review may encompass results of earlier participation in interlaboratory comparisons or proficiency testing and/or the running of trial environmental test or calibration programs using samples or items of known value in order to determine uncertainties of measurement, detection limits of confidence limits, or other essential quality control requirements. The current accreditation status of the laboratory is also reviewed. The laboratory then informs the client of the results of this review if it indicates any potential conflict, deficiency, lack of appropriate accreditation status, or inability on the laboratory's part to complete the client's work.

Other aspects to be evaluated and reviewed include whether or not the appropriate test method is selected and capability of meeting the clients' requirements, contractual obligations, bonding issues and payment terms, method capabilities, analyte lists, reporting limits, quality control limits turnaround time feasibility, QA/QC issues, formal laboratory quote, final report formatting, electronic deliverable documents, time required to keep sample in house and final sample disposal requirements.

The Client Services Manager or designated staff will discuss and resolve any differences between the request or tender and the contract before any work commences in order to assure that each contract is acceptable both to the laboratory and the client. A contract may be any written or oral agreement to provide a client with environmental testing or other laboratory services.

Records of reviews, including any significant changes, shall be maintained either as written documents in the project/client folder, in forms of emails received and sent or in other electronic documentation such as electronic files in the client computer folders or LIMS. Records shall also be maintained of pertinent discussions with a client relating to the client's requirements or the results of the work during the period of execution of the contract.

For review of routine and other simple tasks, the date and the identification (e. g. the initials) of the person in the laboratory responsible for carrying out the contracted work are considered adequate.

For repetitive routine tasks, the review need be made only at the initial enquiry stage or on granting of the contract for on-going routine work performed under a general agreement with the client, provided that the client's requirements remain unchanged. For new, complex or advanced environmental testing, a more comprehensive record should be maintained.

The review shall also cover any work that is subcontracted by the laboratory.

The client shall be informed of any deviation from the contract. If a contract needs to be amended after work has commenced, the same contract review process shall be repeated and any amendments shall be communicated to all affected personnel.

If there is any suspension of accreditation, revocation of accreditation, or voluntary withdrawal of accreditation during the time the contract is in effect, this must be reported to the client

The review process is repeated when there are amendments to the original contract by the client. The participating personnel are given copies of the amendments. The amendments are maintained electronically in the project information area of LIMS.

7.2 Documentation of Review

Records are maintained for every contract or work request, when appropriate. This includes pertinent discussions with a client relating to the client's requirements or the results of the work during the period of execution of the contract. The information if in the form of hard copies, is maintained in folders kept by the assigned Project Manager, this will also include phone logs, communications and faxes. Electronic records, such as emails, PDF files, word processing documents, spreadsheets and charts are kept electronically in the "Office_PM" section of the file server under the client's folder and project subfolder.

Section 8

SUBCONTRACTING OF ENVIRONMENTAL TESTS
(TNI V1:M2 – Section 4.5)

A subcontract laboratory is defined as a laboratory external to this laboratory, or at a different location than the address indicated on the front cover of this manual, that performs analyses for this laboratory.

A subcontracted laboratory will be used only if Weck Laboratories does not have the capability of performing the requested test, because of unforeseen reasons (e. g. workload, need for further expertise or temporary incapacity) or if the client specifically requests a particular analysis to be subcontracted.

For DoD related work, only subcontracted laboratories accredited by DoD or its designated representatives will be used. Subcontracted laboratories must receive project-specific approval from the DoD client before any samples are analyzed.

When subcontracting analytical services, the laboratory assures work requiring accreditation is placed with an appropriately accredited laboratory or one that meets applicable statutory and regulatory requirements for performing the tests.

The laboratory will ensure that the subcontract laboratory understands the requirements and will meet the same commitments made to the client by the primary laboratory.

8.1 Procedure

The Client Service Manager maintains a list of subcontractors.

A register for all subcontractors that are routinely used by the laboratory is kept on file including copies of the certifications and analyte list among other documents. This information is maintained by the Client Services Manager and is kept at the main office and electronically in the "Marketing-Sales" folder of the file server under subcontractor information.

The certificate and analyte list are reviewed by the Client Services Manager to ensure the subcontracting laboratory has the appropriate accreditation to do the work.

The Client Services Manager or the Project Manager involved notifies the client of the intent to subcontract the work in writing or by verbal communications. When possible, the laboratory gains the approval of the client to subcontract their work prior to implementation, preferably in writing.

The laboratory performing the subcontracted work is identified in the final report and a copy of the subcontractor's report is kept in file in case the client requests it at a later time.

The laboratory assumes responsibility to the client for the subcontractor's work, except in the case where a client or a regulating authority specified which subcontractor is to be used.

More detailed procedures for subcontracting laboratory work are in SOP MIS041.

Section 9

PURCHASING SERVICES AND SUPPLIES
(TNI V1:M2 – Section 4.6)

The laboratory ensures that purchased supplies and services that affect the quality of environmental tests are of the required or specified quality, by using approved suppliers and products.

The laboratory has procedures for purchasing, receiving, and storage of supplies that affect the quality of environmental tests.

Weck Laboratories, Inc. only uses those outside support services and supplies that are of adequate quality to sustain confidence in the laboratory's tests. Services and supplies that may affect the quality of environmental tests include, but are not limited to, balance calibration, solvents, standards, and sample containers; their records include the following, where applicable:

- **Date of receipt;**
- **Expiration date;**
- **Source;**
- **Lot or serial number;**
- **Calibration and verification records**
- **Certifications.**

9.1 Procedure

The Technical Directors review and approve the supplier of services and supplies and approves technical content of purchasing documents prior to ordering.

Specific procedures to evaluate, select and monitor suppliers of materials and services as well as required documentation are detailed in the corresponding SOP (MIS042).

Evaluation of suppliers is accomplished by ensuring the supplier ships the product or material ordered and that the material is of the appropriate quality by signing packing slips or other supply receipt documents. The purchasing documents contain the data that adequately describes the services and supplies ordered. The description may include type, class, grade, identification, specifications or other technical information.

The supplies received are inspected for breakage, leaks or any other damage. The supplies and chemicals are checked for Expiration date, concentration, grade and other relevant information. The supplies received are stored according to manufacturer's recommendations, laboratory SOPs or test method specifications.

Any documents received with the supplies and services including specifications, certificates of analyses, warranties, maintenance records, calibration records etc are kept on file as follows:

- **Certificates of standards are scanned and stored in the file server under by department and date, kept by the section leaders**
- **Records for instrument repair services are kept with each instrument maintenance records by the main analyst assigned to the instrument**
- **Records for balance calibration services, thermometers and other equipment requiring periodic calibration are kept in binders in the QA department by the QA Manager.**

The purchased supplies and reagents that affect the quality of the tests are not used until they are inspected or otherwise verified as complying with requirements defined in the test method.

9.2 Approval of Suppliers

The QA Manager maintains a list of approved suppliers, which is included in the SOP for Outside support Services and Supplies MIS042.

The evaluation procedure for approving vendors is described in the above mentioned SOP.

Section 10

SERVICE TO THE CLIENT
(TNI V1:M2 – Section 4.7)

The laboratory collaborates with clients and/or their representatives in clarifying their requests and in monitoring laboratory performance related to their work. Each request is reviewed to determine the nature of the request and the laboratory's ability to comply with the request within the confines of prevailing statutes and/or regulations without risk to the confidentiality of other clients.

10.1 Client Confidentiality

The laboratory confidentiality policy is to not divulge or release any information to a third party without proper authorization. Third party requests for data and information are referred to the client. Data and records identified as proprietary, privileged, or confidential are exempt from disclosure.

All electronic data (storage or transmissions) are kept confidential, based on technology and laboratory limitations, as required by client or regulation.

The client is the person or entity who requested the analyses. Any information or data is only released to third parties with written permission from a properly authorized representative of the client. This information includes, but is not limited to COCs, Certificates of Analysis, raw data, bench sheets, electronic information and sample results.
In addition no information pertaining to clients is posted in public areas where the access is not restricted.

Access to laboratory records and LIMS data is limited to authorized laboratory personnel except with the permission of the QA Officer or Laboratory Director. NELAC-related records are made available to authorized accrediting authority personnel.

10.2 Client Support

Communication with the client, or their representative, is maintained to provide proper instruction and modification for testing. Technical staff is available to discuss any technical questions or concerns the client may have.

The client, or their representative, may be provided reasonable access to laboratory areas for witnessing testing, provided that the laboratory ensures confidentiality to other clients.

Delays or major deviations to the testing are communicated to the client immediately. Communications are verbal, via telephone or in writing via email, fax or letter and are performed normally by the Project Manager assigned to that client or in some cases by the Client Services Manager or Laboratory Director.

The laboratory will provide the client with all requested information pertaining to the analysis of their samples. An additional charge may apply for additional data/information that was not requested prior to the time of sample analysis or previously agreed upon.

10.3 Client Feedback

The laboratory seeks both negative and positive feedback following the completion of projects and periodically for ongoing projects. Feedback provides acknowledgement, corrective actions where necessary, and opportunities for continuous improvement.

Negative customer feedback is documented as a customer complaint (see Section 11 – "Complaints").

The following are specific situations for which immediate clarification or feedback is required from the client:

- **The client has specified incorrect, obsolete, or improper methods;**
- **Methods require modification to ensure achievement of project-specific objectives contained in planning documents (e.g., difficult matrix, poor-performing analyte);**
- **Project-planning documents (e.g., Quality Assurance Project Plan (QAPP) or Sampling and Analysis Plan (SAP)) are missing or requirements in the documents (e.g., action levels, detection and quantification capabilities) require clarification; or**
- **The laboratory has encountered problems with sampling or analysis that may impact results (e.g., improper preservation of sample).**

Customer feedback are obtained by Project Managers that maintain regular communication with the clients, by the Client Services Manager, who contacts different client to ask about the development of each project and by survey conducted by external agencies such as ACIL Seal of Excellence in which the Laboratory participates on regular basis.

Section 11

COMPLAINTS
(TNI V1:M2 – Section 4.8)

The purpose of this Section is to assure that customer complaints are addressed and corrected. This includes requests to verify results or analytical data. Complaints provide the laboratory an opportunity to improve laboratory operation and client satisfaction.

Complaints by customers or other parties are reviewed by management and an appropriate action is determined. All customer complaints are documented by the person receiving the complaint and addressed to the responsible manager.

If it is determined that the complaint has merit, the procedures outlined in Section 14 – Corrective Action are utilized. If it is determined that a complaint is without merit, it is documented, and the client is contacted by the person who received the complaint or the Client Services Manager.

A complaint such as a concern that data is repeatedly late should be reviewed for preventive action (see Section 15 – "Preventive Action") to minimize a future occurrence.

Section 12

CONTROL OF NON-CONFORMING ENVIRONMENTAL TESTING WORK
(TNI V1:M2 – Section 4.9)

Non-conforming work is work that does not meet acceptance criteria or requirements. Nonconformances can include departures from standard operating procedures or test methods or unacceptable quality control results (see Section 27 – "Quality Assurance for Environmental Testing"). Identification of non-conforming work can come through customer complaints, quality control, instrument calibration, evaluating consumable materials, staff observation, final report review, management reviews and internal and external audits.

12.1 Exceptionally Permitting Departures from Documented Policies and Procedures

Requests for departures from laboratory procedures are approved by the QA Manager in agreement with the Laboratory Director and documented. The specific procedures are described in SOP MIS044. Planned departures from procedures or policies do not require audits or investigations.

12.2 Non-Conforming Work

The lab policy for control of non-conforming work is to identify the non-conformance, determine if it will be permitted, and take appropriate action. All employees have the authority to stop work on samples when any aspect of the process does not conform to laboratory requirements.

The responsibilities and authorities for the management of non-conforming work are detailed in SOP MIS044. The procedure for investigating and taking appropriate corrective actions of non-conforming work are described in Section 14 – "Corrective Actions". Section 14.3 describes procedures for Technical Corrective Actions. Formal corrective action procedures must be followed for non-conforming work that could reoccur (beyond expected random QC failures) or where there is doubt about the laboratory's compliance to its own policies and procedures.

The investigation and associated corrective actions of non-conforming work involving alleged violations of the company's Ethics and Data Integrity policies must follow the procedures outlined in Section 19 – "Data Integrity Investigations".

The laboratory evaluates the significance of the non-conforming work, and takes corrective action immediately. The customer is notified if their data has been impacted. The laboratory allows the release of non-conforming data only with approval by the QA Manager or appropriate Technical Director or their designee on a case-by-case basis. Non-conforming data is clearly identified in the final report (see Section 28 – "Reporting the Results").

The discovery of a nonconformance for results that have already been reported to the customer must be immediately evaluated for significance of the nonconformance,

its acceptability to the customer, and determination of the appropriate corrective action.

Corrective action for routine, non-recurring exceedances can be documented on raw data worksheets, logbooks, e-mail, a database or other documents. More serious corrective actions (non-conforming work that could reoccur or where there is doubt that the laboratory is in compliance with its own policies and procedures) will require a more formal corrective action process that usually includes the use of a corrective action report.

12.3 Stop Work Procedures

In some cases it might necessary to stop work until the issue is corrected; the procedure to stop work and to evaluate when this is necessary is detailed in SOP MIS044.

Resumption of work after work has been stopped is authorized by the QA Manager in consultation with the Laboratory Director.

Section 13

IMPROVEMENT
(TNI V1:M2 – Section 4.10)

Improvement in the overall effectiveness of the laboratory management system is a result of the implementation of the various aspects of the laboratory's management system: quality policy and objectives (Section 5 – "Management"); internal auditing practices (Section 17 – "Internal Audits"); the review and analysis of data (Section 27 – "Quality Assurance for Environmental Testing"); the corrective action (Section 14 – "Corrective Action") and preventive action (Section 15 – "Preventive Action") process; and the annual management review of the quality management system (Section 18 – "Management Reviews") where the various aspects of the management/quality system are summarized, and evaluated and plans for improvement are developed.

During the Management review other aspects of the laboratory operation are evaluated; these include On Time Delivery, PT performance, re-issuing reports, numbers and types of corrective actions, Audit performance, complaints, control charting, customer feedback, etc.

Section 14

CORRECTIVE ACTION
(TNI V1:M2 – Section 4.11)

Corrective action is the action taken to eliminate the causes of an existing non-conformity, defect, or other undesirable situation in order to prevent recurrence.

Deficiencies cited in external assessments, internal quality audits, data reviews, customer feedback/complaints, control of nonconforming work or managerial reviews are documented and require corrective action. Corrective actions taken are appropriate for the magnitude of the problem and the degree of risk.

14.1 General Procedure

The laboratory uses forms to document and track corrective actions. The form used to document corrective as well as the procedures involved are in SOP MIS016.

The SOPs specify conditions during and after analysis that may automatically trigger corrective action or optional procedures. These conditions may include dilution of samples, additional sample extract cleanup, and automatic reinjection/reanalysis when certain QC criteria are not met.

Any QC sample result outside of acceptance limits requires corrective action, which may be document in worksheets, LIMS, etc. and not necessarily in the corrective Action form. Once the problem has been identified and addressed, corrective action may include the reanalysis of samples, or appropriately qualifying the results.

The data reviewers or supervisors will identify the need for corrective action and are responsible for initiating corrective action on routine data reviews where a nonconformance is found that could reoccur (beyond expected random QC failures) or where there is doubt about the compliance of the laboratory to its own policies and procedures. The Technical Director will approve the required corrective action to be implemented by the laboratory staff. The QA Manager will ensure implementation and recording of the corrective action.

All deficiencies are investigated and a corrective action plan is developed and implemented if determined necessary. The implementation is monitored for effectiveness.

14.1.1 Cause Analysis

When failures due to systematic errors have been identified, the first step of the corrective action process starts with the initial investigation and determination of root cause(s) of the problem. Records are maintained in the corrective action binder and the corrective action reports computer folder where electronic copies of the Corrective Action Reports are kept of nonconformances requiring corrective action to show that the root cause(s) was investigated, and includes the results of the investigation.

Where there may be non-systematic errors and as such the initial cause is readily identifiable or expected random failures (e.g. failed quality control), a formal root cause analysis is not performed and the process begins with selection and implementation of corrective action (also see Section 14.3 "Technical Corrective Actions").

14.1.2 Selection and Implementation of Corrective Actions

Where uncertainty arises regarding the best approach for analysis of the cause of exceedances that require corrective action, appropriate personnel will recommend corrective actions that are appropriate to the magnitude and risk of the problem and that will most likely eliminate the problem and prevent recurrence

The QA Manager or the appropriate Technical Director ensure that corrective actions are discharged within the agreed upon time frame.

14.1.3 Monitoring of Corrective Action

The QA Manager will monitor implementation and documentation of the corrective action to assure that the corrective actions were effective.
The procedures for the implementation of corrective action are detailed in SOP MIS016.

14.2 Additional Audits

Where the identification of nonconformances or departures from normal lab procedures cast doubt on the laboratory's compliance with its own policies and procedures, or on its compliance with the TNI Standard, the laboratory ensures that the appropriate areas of activity are audited in accordance with Section 17 – "Internal Audits" as soon as possible.

In many cases, the additional audits are follow-ups after the corrective action has been implemented to ensure it is effective. These are done when a serious issue or risk to the laboratory have been identified.

14.3 Technical Corrective Action

Sample data associated with a failed quality control are evaluated for the need to be reanalyzed or qualified. Unacceptable quality control results are documented, and if the evaluation requires cause analysis, the cause and solution are recorded (also see Section 12 – "Control of Nonconforming Environmental Testing Work"*).* Analysts routinely implement corrective actions for data with unacceptable QC measures. First level correction may include re-analysis without further assessment. If the test method SOP addresses the specific actions to take, they are followed. Otherwise, corrective actions start with assessment of the cause of the problem.

Corrective action for non-systematic errors or expected random failures is documented in as specified in SOP MIS016. Corrective actions for nonconformances

that may reoccur (beyond expected random QC failures) or where there is concern that the laboratory is not in compliance with its own policies and procedures require that a corrective action report be completed (see Section 14.1) and may trigger an Internal Audit to be performed on that area of the laboratory.

Technical Directors review corrective action reports and suggest improvements, alternative approaches, and procedures where needed.

If the data reported are affected adversely by the nonconformance, the affected data is clearly identified in the report and the customer is notified.

Section 15

PREVENTIVE ACTION
(TNI V1:M2 – Section 4.12)

Preventive action is a pro-active process to identify opportunities for improvement rather than a reaction to the identification of problems or complaints.

Preventive action includes, but is not limited to: review of QC data to identify quality trends, regularly scheduled staff quality meetings to ensure staff is knowledgeable in quality procedures, review of client feedback to look for improvement opportunities, review of proficiency testing data to look for analytes that were nearly missed, annual managerial reviews, scheduled instrument maintenance and other actions taken to prevent problems.

When improvement opportunities are identified or if preventive action is required, action plans are developed, implemented and monitored to reduce the likelihood of the occurrence of nonconformities.

Procedures for preventive actions include the initiation of such actions and subsequent monitoring to ensure that they are effective.

All personnel have the authority to offer suggestions for improvements and to recommend preventive actions, however management is responsible for implementing preventive action.

laboratory has also implemented a Management of Change process. This process is designed to formally review any changes that are planned for the laboratory and look for potential issues that might arise. Issues are minimized through the development of preventive measures. Changes that are considered under this type of process include the installation of a new LIMS, key personnel changes, building renovations, addition/deletion of an accreditation, addition of a new technology that requires new instrumentation, etc. The process is evaluated by all Management personnel that will be affected in any way with the change and they take a decision on the convenience or not of implementing the change. The opinions of other laboratory personnel involved are also requested and evaluated.

Section 16

CONTROL OF RECORDS
(TNI V1:M2 – Section 4.13)

Records are a subset of documents, usually data recordings that include annotations, such as daily refrigerator temperatures posted to a laboratory form, lists, spreadsheets, or analyst notes on a chromatogram. Records may be on any form of media, including electronic and hard copy. Records allow for the historical reconstruction of laboratory activities related to sample-handling and analysis.

The laboratory maintains a record system appropriate to its needs, records all laboratory activities, and complies with applicable standards or regulations as required. Records of original observations and derived data are retained to establish an audit trail. Records help establish factors affecting the uncertainty of the test and enable test repeatability under conditions as close as possible to the original.

16.1 Records Maintained

Records of all procedures to which a sample is subjected while in the possession of the laboratory are kept. The laboratory retains all original observations, calculations and derived data (with sufficient information to produce an audit trail), calibration records, personnel records and a copy of the test report for a minimum of five years from generation of the last entry in the records. At a minimum, the following records are maintained by the laboratory to provide the information needed for historical reconstruction:

i) **all raw data, whether hard copy or electronic, for calibrations, samples and quality control measures, including analysts' worksheets and data output records (chromatograms, strip charts, and other instrument response readout records);**

ii) **a written description or reference to the specific method(s) used, which includes a description of the specific computational steps used to translate parametric observations into a reportable analytical value (a copy of all pertinent Standard Operating Procedures);**

iii) **laboratory sample ID code;**

iv) **date of analysis;**

v) **time of analysis is required if the holding time is seventy-two (72) hours or less, or when time critical steps are included in the analysis (e.g., extractions and incubations);**

vi) **instrumentation identification and instrument operating conditions/parameters (or reference to such data);**

vii) **all manual calculations (including manual integrations);**

viii) analyst's or operator's initials/signature or electronic identification;

ix) sample preparation, including cleanup, separation protocols, incubation periods or subculture, ID codes, volumes, weights, instrument printouts, meter readings, calculations, reagents;

x) test results (including a copy of the final report);

xi) standard and reagent origin, receipt, preparation, and use;

xii) calibration criteria, frequency and acceptance criteria;

xiii) data and statistical calculations, review, confirmation, interpretation, assessment and reporting conventions;

xiv) quality control protocols and assessment;

xv) electronic data security, software documentation and verification, software and hardware audits, backups, and records of any changes to automated data entries;

xvi) method performance criteria including expected quality control requirements;

xvii) proficiency test results;

xviii) records of demonstration of capability for each analyst;

xix) a record of names, initials, and signatures for all individuals who are responsible for signing or initialing any laboratory record;

xx) correspondence relating to laboratory activities for a specific project;

xxi) corrective action reports;

xxii) preventive action records;

xxiii) copies of internal and external audits including audit responses;

xxiv) copies of all current and historical laboratory SOPs, policies and *Quality Manuals*;

xxv) sample receiving records (including information on any interlaboratory transfers);

xxvi) sample storage records;

xxvii) data review and verification records;

xxviii) personnel qualification, experience and training records;

xxviv) archive records; and

xxviv) management reviews.

16.2 Records Management and Storage

The laboratory maintains a record management system for control of laboratory notebooks, instrument logbooks, standards logbooks, and records for data reduction, validation, storage, and reporting. Most records are maintained electronically as computer files, others are kept in appropriate binders. Data is recorded immediately and legibly in permanent ink (data generated by automated data collections systems is recorded electronically.) Corrections are initialed and dated with the reason noted for corrections other than transcription errors. A single line strikeout is used to make corrections so that the original record is not obliterated. The original record is not obliterated. Correction on electronic records is made by the addition of notes or by audit trails.
Electronic records are kept according to the procedures described in SOP MIS045. Data backups are routinely performed according to SOP MIS003. Records, including electronic records, are easy to retrieve, legible, and protected from deterioration or damage; held secure and in confidence; and are available to accrediting bodies for a minimum of five years or as required by regulation or contract. Records that are stored only on electronic media are supported by the hardware and software necessary for their retrieval. Access to protected records is limited to the QA Manager or Laboratory Director and the personnel they authorize to prevent unauthorized access or amendment.

Additional information regarding control of data is included in Section 22.5 – "Control of Data".

Procedures for identification, collection, indexing, access, filing, storage, maintenance and disposal of quality and technical records are found in SOP MIS045.

A document control system is used to ensure that all personnel have access to current policies and procedures at all times. Documents, which are managed by this system, include this Quality Manual, reports from internal audits and management reviews as well as records of corrective and preventive actions, all SOPs, policy statements, procedures, specifications, calibration tables, charts, textbooks, posters, notices, memoranda, software, drawings, plans, etc. The system consists of a document review, revision and approval system, and document control and distribution. The documents may be on various media, whether hard copy or electronic, and they may be digital, analog, photographic or written.

All quality documents (this manual, SOPs, policies, etc.) are reviewed and approved by the QA Officer, the Technical Directors and the Laboratory Director. Such documents are revised whenever the activity described changes significantly. All documents are reviewed at least every 5 years, with the exception of the QA Manual, which is reviewed annually.

More detailed procedures related to Document Control are specified in the corresponding SOP (MIS045).

If records are archived electronically as PDF files through scanning of hardcopy records and both are kept, the electronic copy is used for long term storage of vital records. The accuracy of the scanning procedure is verified upon the scan is completed to make sure all pages were properly copied and are legible. Storage of vital records is maintained by the IT manager to allow minimal access only to authorized personnel.

Archived information and access logs are protected against fire, theft, loss, environmental deterioration, vermin, and in the case of electronic records, electronic or magnetic sources. Archived records have limited access and are checked out through an access log. Records are archived on site.

In the event that the laboratory transfers ownership or goes out of business, records are maintained or transferred according to client instructions. Appropriate regulatory and state legal requirements concerning laboratory records shall be followed.

16.3 Legal Chain of Custody Records

Evidentiary sample data are used as legal evidence. Procedures for evidentiary samples can be found in SOP MIS038.

Section 17

AUDITS
(TNI V1:M2 – Section 4.14)

Audits measure laboratory performance and verify compliance with accreditation/ certification and project requirements. Audits specifically provide management with an on-going assessment of the management system. They are also instrumental in identifying areas where improvement in the management/quality system will increase the reliability of data. Audits are of four main types: internal, external, performance, and system. Section 17.5 discusses the handling of audit findings.

17.1 Internal Audits

Annually, the laboratory prepares a schedule of internal audits to be performed during the year. These audits verify compliance with the requirements of the management/quality system, including analytical methods, SOPs, the *Quality Assurance Manual*, ethics policies, data integrity, other laboratory policies, and the TNI Standard.

The internal audit program shall address all elements of the quality system, including all of the environmental testing activities.

The internal system audits include an examination of laboratory documentation and records on sample receiving, sample log-in, sample storage, chain-of-custody procedures, sample preparation and analysis, instrument operating records, etc. Specific records that are subject to review are detailed in the corresponding SOP for performing audits and data review (SOP MIS014).

It is the responsibility of the QA Manager to plan and organize audits as required by the schedule and requested by management. These audits are carried out by trained and qualified personnel who are, wherever resources permit, independent of the activity to be audited.

The auditor should not be the person responsible for the work being audited or be the supervisor of the person responsible for the work. The auditor should have the necessary qualifications to review the area being audited and use a checklist approved by the Quality Manager.

In addition to the scheduled internal audits, it may sometimes be necessary to conduct special audits as a follow-up to corrective actions, PT results, complaints, regulatory audits or alleged data integrity issues. These audits address specific issues.

The area audited, the audit findings, and corrective actions are recorded. Audits are reviewed after completion to assure that corrective actions were implemented and effective. This review may occur during the next scheduled audit unless findings are observed that cast doubt on the validity of data. Corrective actions that warrant sooner review cannot wait for the next scheduled audit.

17.2 External Audits

It is the laboratory's policy to cooperate and assist with all external audits, whether performed by clients or an accrediting body. Management ensures that all areas of the laboratory are accessible to auditors as applicable and that appropriate personnel are available to assist in conducting the audit.

17.2.1 Confidential Business Information (CBI) Considerations

During on-site audits, on-site auditors may come into possession of information claimed as business confidential. A business confidentiality claim is defined as "a claim or allegation that business information is entitled to confidential treatment for reasons of business confidentiality or a request for a determination that such information is entitled to such treatment." When information is claimed as business confidential, the laboratory must place on (or attach to) the information at the time it is submitted to the auditor, a cover sheet, stamped or typed legend or other suitable form of notice, employing language such as "trade secret", "proprietary" or "company confidential". Confidential portions of documents otherwise non-confidential must be clearly identified. CBI may be purged of references to client identity by the responsible laboratory official at the time of removal from the laboratory. However, sample identifiers may not be obscured from the information.

17.3 Performance Audits

Performance audits may be Proficiency Test Samples, internal single-blind samples, double-blind samples through a provider or client, or anything that tests the performance of the analyst and method.

Proficiency Test Samples are discussed in Section 27 – "Quality Assurance for Environmental Testing"*.*

17.4 System Audits

The Laboratory's management system is audited though annual management reviews. Refer to Section 18 – "Management Reviews" for further discussion of management reviews.

17.5 Handling Audit Findings

Internal or external audit findings are responded to within the time frame agreed to at the time of the audit. The response may include action plans that could not be completed within the response time frame. A completion date is established by management for each action item and included in the response.

The responsibility for developing and implementing corrective actions to findings is the responsibility of the Technical Directors or Lab supervisor corresponding to the particular section of the lab. Corrective actions are documented through the corrective action process described in Section 14 – "Corrective Actions".

Audit findings that cast doubt on the effectiveness of the laboratory operation to produce data of known and documented quality or that question the correctness or validity of sample results must be investigated. Corrective action procedures described in Section 14 – "Corrective Action" must be followed. Clients must be notified in writing if the investigation shows the laboratory results have been negatively affected and the clients requirements have not been met. The client must be notified within 30 days after the laboratory discovers the issue. Laboratory management will ensure that this notification is carried out within the specified time frame.

All investigations that result in findings of inappropriate activity are documented and include any disciplinary actions involved, corrective actions taken, and all appropriate notifications of clients. See Section 19 (Data Integrity Investigation) for additional procedures for handling inappropriate activity.

Section 18

MANAGEMENT REVIEWS
(TNI V1:M2 – Section 4.15)

At least once per year, laboratory executive management (top management) conducts a review of the quality system and environmental testing activities to ensure its continuing suitability and effectiveness and to introduce any necessary changes or improvements in the quality system and laboratory operations. The management review is a separate activity from the internal audit and records of review findings and actions are maintained.

18.1 Management Review Topics

The following are reviewed to ensure their suitability and effectiveness:

- **the suitability of policies and procedures;**
- **reports from managerial and supervisory personnel;**
- **the outcome of recent internal audits;**
- **corrective and preventive actions;**
- **assessments by external bodies;**
- **the results of interlaboratory comparisons or proficiency tests;**
- **changes in the volume and type of the work;**
- **customer feedback;**
- **complaints;**
- **recommendations for improvement;**
- **other relevant factors, such as quality control activities, resources, and staff training.**

18.2 Procedure

The procedure on how to conduct the managerial review is described in SOP MIS030.

Findings and follow-up actions from management reviews are recorded. Management will determine appropriate completion dates for action items and ensure they are completed within the agreed upon time frame.

Section 19

DATA INTEGRITY INVESTIGATIONS
(TNI V1:M2 – Section 4.16)

In addition to covering data integrity investigations, this Section covers all topics related to ethics and data integrity policies, procedures and training.

Weck Laboratories, Inc. is committed to ensuring the integrity of its data and providing valid data of known and documented quality to its clients. The elements in Weck Laboratories' Ethics and Data Integrity program include:

- **Documented data integrity procedures signed and dated by top management.**
- **An Ethics and Data Integrity Policy signed by all management and staff at the time of employment (see Appendix A). This policy is signed, dated and distributed by the President of the Company**
- **Annual data integrity training.**
- **Procedures for confidential reporting of alleged data integrity issues.**
- **An audit program that monitors data integrity (see Section 17 – "Audits") and procedures for handling data integrity investigations and client notifications.**

Proper ethical conduct in the laboratory is strictly enforced. The Company's Code of Ethics (Appendix A) is presented to current and prospective employees in both the QA manual and the Employee Handbook.

In order to assist the laboratory technical personnel in performing their duties without detrimental influences, it is the policy of the Company that the laboratory be impartial and that it and its personnel are free from any undue commercial, financial and other pressures which might influence or adversely affect their normal performance having an impact on the quality of the work they produce or their technical judgment. By this policy all laboratory personnel dedicated to technical activities should not be influenced by, or involved in any financial or commercial matter while performing laboratory work. If any employee feels that he or she might be under any kind of pressure as described above, the Laboratory Director must be notified immediately. Additionally, the Laboratory will not engage in any activities that may endanger the trust in its independence of judgment and integrity in relation to its environmental testing.

19.1 Ethics and Data Integrity Procedures

The Ethics and Data Integrity Policy provides an over view of the program. Written procedures that are considered part of the Ethics and Data Integrity program include:

- **Ethics and Data Integrity Policy (see Appendix A)**
- **Manual integration procedures (SOP MIS039)**
- **Implementation of Business Ethics and Data Integrity Policy (SOP MIS043)**
- **Corrective action procedures (SOP MIS016 and Section 14 of this *QAM*)**

Management reviews data integrity procedures yearly and updates these procedures as needed.

19.2 Training

Data integrity training is provided as a formal part of new employee orientation and a refresher is given annually for all employees. Employees are required to understand that any infractions of the laboratory data integrity procedures shall result in a detailed investigation that could lead to very serious consequences including immediate termination, debarment or civil/criminal prosecution. This is discussed in the Ethics and Data Integrity Policy that every employee is required to sign upon commencement of employment. Attendance for required training is monitored through a signature attendance sheet.

An agenda is provided to each trainee prior to the training class. Data integrity training emphasizes the importance of proper written narration on the part of the analyst with respect to those cases where analytical data may be useful, but are in one sense or another partially deficient. The following topics and activities are covered:

- **organizational mission and its relationship to the critical need for honesty and full disclosure in all analytical reporting;**
- **how and when to report data integrity issues;**
- **record keeping;**
- **training, including discussion regarding all data integrity procedures;**
- **data integrity training documentation;**
- **in-depth data monitoring and data integrity procedure documentation; and**
- **specific examples of breaches of ethical behavior such as improper data manipulations, adjustments of instrument time clocks, and inappropriate changes in concentrations of standards.**
- **guidelines for manual integration practices**
- **consequence of unethical or improper behavior**

When contracted technical or support personnel are used, the QA Manager or Laboratory Director are responsible for ensuring that they are trained to the laboratory's management system and data integrity procedures, competent to perform the assigned tasks, and appropriately supervised.

Topics covered are provided in writing and provided to all trainees.

19.3 Confidential Reporting of Ethics and Data Integrity Issues

The Data Integrity Plan also provides a mechanism for confidential reporting of data integrity issues in the laboratory. A primary element of the mechanism is to assure confidentiality and a receptive environment in which all employees may privately discuss ethical issues or report items of ethical concern. In instances of ethical concern, the mechanism also includes a process whereby laboratory management is to be informed of the need for any further detailed investigation.

Employees are required and encouraged to bring up to management any improper activities they detect or are suspicious of. Any incident reported is immediately investigated by the management and the person or persons involved are subject to disciplinary actions

19.4 Investigations

All investigations resulting from data integrity issues are conducted confidentially. They are documented and notifications are made to clients who received any negatively affected data that did not meet the client's data quality requirements. Procedures for investigation are included in SOP MIS043.

The Management shall also monitor the program for detecting improper, unethical or illegal action by performing internal proficiency testing (single or double blind), reviewing of analytical data post-analysis, performing electronic data audits using special software as Mint Miner® and providing an open door policy for employees to report any suspicious activity without fears.

The procedures for investigations are described in SOP MIS043.

Section 20

PERSONNEL
(TNI V1:M2 – Section 5.2)

Weck Laboratories, Inc. employs competent personnel based on education, training, experience and demonstrated skills as required. The laboratory's organization chart can be found in Appendix B.

20.1 Overview

All personnel are responsible for complying with all quality and data integrity policies and procedures that are relevant to their area of responsibility.

All personnel who are involved in activities related to sample analysis, evaluation of results or who sign test reports, must demonstrate competence in their area of responsibility. Appropriate supervision is given to any personnel in training and the trainer is accountable for the quality of the trainees work. Personnel are qualified to perform the tasks they are responsible for based on education, training, experience and demonstrated skills as required for their area of responsibility.

The laboratory provides goals with respect to education, training and skills of laboratory staff. These goals are outlined in the Job Descriptions for each laboratory position. Training needs are identified at the time of employment and when personnel are moved to a new position or new responsibilities are added to their job responsibilities. Ongoing training, as needed, is also provided to personnel in their current jobs. The effectiveness of the training must be evaluated before the training is considered complete.

Contracted personnel, when used, must meet the same competency standards and follow the same policies and procedures that laboratory employees must meet.

20.2 Job Descriptions

Job descriptions are available for all positions that manage, perform, or verify work affecting data quality, and are located in the Personnel binder and also under personnel records in the file server as electronic files. An overview of top management's responsibilities is included in Section 5 – "Management".

Job descriptions include the specific tasks, minimum education and qualifications, skills, and experience required for each position.

20.3 Training

All personnel are appropriately trained and competent in their assigned tasks before they contribute to functions that can affect data quality. It is management's

responsibility to assure personnel are trained. Training records are used to document management's approval of personnel competency. The date on which authorization and/or competence is confirmed is included.

Training records are maintained by the QA Manager and include evidence of acknowledgement that each employee has read, understood, and is committed to follow the current versions of the established Standard Operating Procedures and Analytical Method Protocols, which relates to his/her job responsibilities. The Training records show evidence of the revisions of the SOPs the employees have reviewed. Each employee demonstrates initial proficiency and demonstrates continued proficiency on a yearly basis by acceptable performance on Laboratory Control Samples (LCS), successful analysis of blind samples or by analyzing in parallel a sample analyzed by a trained or re-trained analyst. The training records of the analysts are organized by analyst and kept with personnel files. They include initial and continuing training, continuing education, participation in technical conferences or seminars and internal training activities.

20.3.1 Training for New Staff

Initial training for new employees is performed by experienced personnel with management guidance and includes the observation of the QC procedures described in this manual.

New staff members are given the New Employee Training as specified in SOP MIS035.

20.3.2 Ongoing Training

Staff members are given the following ongoing training:

All staff members are given refresher data integrity training and are required to sign off on the Ethics and Data Integrity Policy if they had not done so previously. The training is documented on a training attendance sheet that outlines what was covered during the training.

Ongoing training consists of:

- The employee attests, through signature, that they have read, understood, and agree to perform the latest version of the *Quality Assurance Manual* and any SOPs or policies that the analyst is responsible for following.
- Annually, the analyst shows continued proficiency in each method they perform by obtaining acceptable performance on Laboratory Control Samples (LCS), successful analysis of blind samples or by analyzing in parallel a sample analyzed by a trained or re-trained analyst.
- Attending training related to job function as applicable.
- Maintaining training documentation in the employees training record

The company has a policy that encourages all technical personnel to participate in technical seminars, conferences and scientific meetings involving innovative analytical technologies, new instrumentation and software applied to

environmental testing. Records of this participation are maintained in the personnel files. The management of the laboratory shall formulate the goals with respect to the education, training and skills of the laboratory personnel.

Section 21

ACCOMODATIONS AND ENVIRONMENTAL CONDITIONS
(TNI V1:M2 – Section 5.3)

21.1 Environmental

The laboratory facility is designed and organized to facilitate testing of environmental samples. Environmental conditions are monitored to ensure that conditions do not invalidate results or adversely affect the required quality of any measurement. Such environmental conditions include physical space, energy sources, lighting, temperature, workbenches, ventilation, utilities, access and entryways to the laboratory, sample receipt area(s), sample storage area(s), chemical and waste storage area(s); data handling and storage area(s), humidity, biological sterility, dust, sound and vibration levels.

The laboratory has backup power supplies to keep operating the most critical areas of the lab such as computer systems, telephones, sample storage and some laboratory equipment for short holding time samples.

If the laboratory environment is required to be controlled by a method or regulation, the adherence is monitored, controlled and recorded as per SOPs, such as is the recording of temperature during TCLP extraction and monitoring biological sterility and other environmental effects, as appropriate to the technical activities concerned.

Environmental tests are stopped when the environmental conditions jeopardize the results.

21.2 Work Areas

Work areas may include access and entryways to the laboratory, sample receipt area, sample storage area, sample process area, instrumental analysis area, chemical and waste storage area and data handling and storage area.

Access to, and use of, areas affecting the quality of the environmental tests is controlled by restriction of areas to authorized personnel only. See Section 21.4 below.

The laboratory work spaces are adequate for their use, and appropriately clean to support environmental testing and ensure an unencumbered work area.

The Laboratory is segregated into different areas for operations that are not compatible with each other. This separation prevents contamination of low levels of common laboratory solvents in the volatile organics analyses and maintains culture handling or incubation areas segregated from other areas. The access to the volatile organics laboratory, which is isolated from other areas of the laboratories and has a separate air system and microbiology laboratory is restricted to appropriate personnel only; signs to that effect are posted on the entry doors of

these areas. Electronic balances are located away from drafts and doorways, and mounted on marble slabs or special tables in areas where their use is not affected by vibration. Biological sterility is monitored using air blanks for plate counts or density plates according to the SOPs for bacteriological test methods. Biological work areas are cleaned and sterilized between uses.

For microbiology, floors and work surfaces are non-absorbent and easy to clean and disinfect. Work surfaces are adequately sealed and are cleaned periodically in order to be free from dust accumulation. Plants, food, and drink are prohibited from the laboratory work area. The company will procure to improve the condition of the facilities whenever possible and make plans for future expansions or improvements.

In order to prevent cross-contamination, samples suspected of containing high concentrations of target analytes shall be isolated from other samples. Samples or extracts designated for volatile organics analysis are stored in separate refrigerators located in volatile organics area, completely segregated from all other samples and extracts. Samples suspected of containing high concentrations of volatile organics are further isolated from other volatile organics samples and samples for volatile organic analysis in potable water are kept in designated refrigerator.

When the project requires it, travel blanks, used as storage blanks, are kept with the samples until the moment of analysis to determine whether or not cross-contamination occurred. The procedures for evaluation of storage blanks, as well as other considerations for incompatible activities as detailed in the SOP MIS036.

Adequate measures are taken to ensure good housekeeping in the laboratory and to ensure that any contamination does not adversely affect data quality.

21.3 Floor Plan

A floor plan can be found in Appendix C.

21.4 Building Security

The laboratory is kept secure during off hours with an alarm, locked doors and locked entry gate.

A Visitor's Logbook is maintained for every visitor to sign in and out. Visitors must be accompanied by laboratory personnel when in secure areas.

Signs are used to designate secure areas.

Segregated areas are only accessible to authorized personnel, with signs posted, such as the volatile organics laboratory and clean rooms.

Section 22

ENVIRONMENTAL METHODS AND METHOD VALIDATION
(TNI V1:M2 – Section 5.4 and Sections 1.4, 1.5 and 1.6 of Technical Modules TNI V1:M 3-7)

Methods and/or procedures are available for all activities associated with the analysis of the sample including preparation and testing. For purposes of this Section, "method" refers to both the sample preparation and determinative methods.

Before being put into use, a test method is confirmed by a demonstration of capability or method validation process.

All methods are published or documented. Deviations from the methods are allowed only if the deviation is documented, technically justified, authorized by management and accepted by the customer

The methods and procedures used at the laboratory are the appropriate ones for all environmental tests within its scope. These include sampling, handling, transport, storage and preparation of samples, and, where appropriate, an estimation of the measurement uncertainty as well as statistical techniques for analysis of environmental test and/or calibration data.

The methods used at the laboratory, including methods for sampling, must meet the needs of the client and are appropriate for the environmental tests it undertakes. These analytical procedures currently in use are based on the methodology approved by the regulatory agencies, such as EPA and State Agencies.

The Laboratory maintains Standard Operating Procedures (e.g., SOPs, Laboratory Method Manual) that accurately reflect all phases of current laboratory activities such as assessing data integrity, corrective actions, handling customer complaints, and all test methods. The SOPs provide all information needed to perform the different analytical tasks in accordance with regulatory requirements and in a consistent and controlled manner following the guidelines described in this QAP manual. All technical SOPs (e.g., sample preparation, analytical procedures, sample storage, sample receipt, etc.) are reviewed for accuracy and adequacy annually and whenever method procedures change, and updated as appropriate. Copies of all SOPs, both electronic and paper, are accessible to all personnel. Each SOP has an alphanumeric code that indicates the section it belongs, the number that identifies it, the revision number, the effective date and the signature of the QA Officer, Technical Director or Laboratory Director.

If other documents besides laboratory generated SOPs (i.e. equipment manuals, copies of published methods, etc.) are used as Standard Operating Procedures, they must be written in a way that they can be used as written and any changes, including the use of a selected option must be documented and included in the laboratory's SOP manual. For DoD related work, where published methods are specified as required for a project, requirements

contained within that method shall be followed and any modifications to existing method requirements will require project-specific approval by DoD personnel.

SOPs are written in a standardized format and with standardized contents, as indicated in SOP MIS048.

A current list of the Standard Operating Procedures in use is in Appendix E.

22.1 Method Selection

A reference method is a method issued by an organization generally recognized as competent to do so. (When ISO refers to a standard method, that term is equivalent to reference method.) When a laboratory is required to analyze a parameter by a specified method due to a regulatory requirement, the parameter/method combination is recognized as a reference method.

The laboratory will use methods that meet the needs of the customer. Such methods will be based on the latest edition of the method unless it does not meet the needs of the customer.

The laboratory selects methods that are appropriate to the customer needs. When the regulatory authority mandates or promulgates methods for a specific purpose, only those methods will be used.

If a method proposed by a customer is considered to be inappropriate or out-of-date, the customer is informed and the issue resolved before proceeding with analysis of any samples (see Section 7 – Review of Requests, Tenders and Contracts).

The analytical procedures currently in use are based on the methodology approved by the EPA, the California Department of Health Services, the AIHA, DoD and other regulatory agencies.

When a method is not specified by the customer, or the proposed method is inappropriate, the laboratory will select a method that is appropriate to the end use of the data:

- **If the data are to be submitted to a regulatory authority, the method(s) specified by the regulatory authority will be used.**
- **For drinking water compliance a method will be selected from those specified in 40 CFR Part 141, or the applicable state regulations.**
- **For NPDES permits, the method will be selected from those specified in 40 CFR Part 136.**
- **If the end use of the data is not regulatory or if the regulatory authority does not specify a method, the laboratory will determine the customer needs in terms of reporting level (e.g., LOD, LOQ), bias (e.g., screening versus quantitative) and the laboratory capabilities and capacity. Based on these criteria, the laboratory will select an appropriate method based on the following hierarchy:**

- **Resources from published in regional, national or international standards**
- **Methods published by other technical organizations such as ASTM, Standard Methods or AOAC**
- **Methods develop by the instrument manufacturer**
- **Laboratory –developed methods.**

In some cases, Weck Laboratories can perform analyses that are not specifically described in the guidelines cited above. In these cases, the following approach is taken:

- **Review other sources of test methods such as AOAC, ASTM, Pesticide Manual, and methods mandated by the applicable regulatory authorities to find a suitable method for the matrix and analyte in question.**
- **Review Methods published in international, regional or national standards.**
- **Review methods developed by instrument manufacturers**
- **Produce a modification of a standard test procedure for similar parameter or matrix**
- **Develop a special method in house suitable for the particular problem**

For these special situations the analytical procedure is discussed with the client and performed upon the client's approval. Whenever possible, the same QA/QC guidelines as for standard methods are used, but the laboratory may deviate from these guidelines if necessary. All communications between the laboratory and the customer are documented.
Most methods in use at the laboratory are described in the following publications:

- **Tests Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, current edition,**
- **Methods for Chemical Analysis of Water and Wastewater, EPA-600/4-79-020.**
- **Standard Methods for the Examination of Water and Wastewater, current approved edition, APHA, AWWA, WPCF.**
- **Criteria for Identification of Hazardous and Extremely Hazardous Wastes, California Code of Regulations Title 22.**
- **Methods for Organic Chemical Analysis of Municipal and Industrial Wastewater EPA-600/4-82-057.**
- **Recommended Methods of Analysis for the Organic components required for AB1803, 5th Edition Revised April 1986.**
- **Draft Method for Total Petroleum Hydrocarbons and Total Organic Lead, LUFT Methods, California Department of Health Services.**
- **Methods for the Determination of Organic Compounds in Finished Drinking Water and Raw Source Water - EPA 500 series.**
- **NIOSH Manual of Analytical Methods, US Department of Health and Human Services.**
- **Laboratory Methods of Analysis for Enforcement samples, SCAQMD, 1986.**
- **Stationary Source Test Methods, Air Resources Board, 1990.**
- **OSHA Analytical Methods Manual, 2nd Ed., U.S. Dept. of Labor, 1990.**

Reference methods for all analytical procedures are kept in the Laboratory Office. Copies of specific methods are also in the corresponding sectors where the analyses are performed.

22.2 Laboratory-Developed Methods

If the laboratory develops a method, the process of designing and validating the method is carefully planned and documented.

The Laboratory in some instances will develop methods for its own use; in this case this is considered a planned activity and will be assigned to qualified personnel equipped with adequate resources. All personnel involved in the method design, development and implementation will be in constant communication during all stages of development. Plans are also updated as development proceeds.

Once the method is satisfactorily developed a validation process takes place before it is implemented and used.

For multi-analyte methods, the laboratory uses a standard set of target analytes but those target analytes identified by the client on a project specific basis will be analyzed. If project-specific information is not available, then the standard list of analytes or the list published in the method is used

22.3 Method Validation

Validation is the confirmation, by examination and objective evidence, that the particular requirements for a specific intended use are fulfilled.

At a minimum, reference methods are validated by performing an initial demonstration of capability. Additional requirements are discussed for each technology.

All methods that are not reference methods are validated before use. The validation is designed so that the laboratory can demonstrate that the method is appropriate for its intended use. All records (e.g., planning, method procedure, raw data and data analysis) shall be retained while the method is in use. Based on the validation process, the laboratory will make a statement in the corresponding SOP of the intended use requirements and whether or not the validated method meets the use requirements.

Method validation and Demonstration of Capability procedures can be found in:

- **Appendix J - Chemistry**
- **Appendix K - Microbiology**
- **Appendix L - Radiochemistry**

22.4 Estimation of Analytical Uncertainty

Analytical Uncertainty: A subset of Measurement Uncertainty that includes all laboratory activities performed as part of the analysis.

When requested, the laboratory will provide an estimate of the analytical uncertainty as determined by the procedure described in SOP MIS047.

22.5 Control of Data

To ensure that data are protected from inadvertent changes or unintentional destruction, the laboratory uses procedures to check calculations and data transfers (both manual and automated).

Some instruments have a computerized data reduction and calculation, such as GC, GC/MS, HPLC, LC/MS, ICP, ICP-MS and automated wet chemistry analyzers. The protocols to perform these tasks are described in the corresponding SOPs and the computer programs used for data reduction are validated before use and checked periodically by manual calculations.

- **Data entry maintains integrity during the analytical process and it is kept confidential.**
- **Data storage is performed on real time as the data is collected in local hard drives of computers connected to the analytical instruments**
- **Data processing is done by the analysts using the software from the instruments**
- **Data transmission is performed directly from instruments to the LIMS by a Data Tool software**

Results for analyses that are performed manually or with instruments that do not have controlling software are entered in appropriate bench sheets or directly in LIMS by the analysis. Results are reviewed by supervisor or peer.

Additional information can be found in Section 16 – "Control of Records".

22.5.1 Computer and Electronic Data Requirements

The laboratory assures that computers, user-developed computer software, automated equipment, or microprocessors used for the acquisition, processing, recording, reporting, storage, or retrieval of environmental test data are:

- **documented in sufficient detail and validated as being adequate for use;**
- **protected for integrity and confidentiality of data entry or collection, data storage, data transmission and data processing;**
- **maintained to ensure proper functioning and are provided with the environmental and operating conditions necessary to maintain the integrity of environmental test data; and**

- **held secure including the prevention of unauthorized access to, and the unauthorized amendment of, computer records. Data archive security is addressed in Section 16 – "Control of Records" and building security is addressed in Section 21- "Accommodations and Environmental Conditions".**

  Procedures are described in SOP MIS037.

The laboratory uses spreadsheets to calculate final results from the raw data. Before reporting any results derived from these programs, the laboratory shall validate the underlying calculations and the

If any changes are made to the spreadsheet program, the laboratory revalidates the entire system before reporting results.

In addition, the algorithms all spreadsheet calculations or other programs that are used to reduce raw data to a reported value will be verified upon first use and annually thereafter to ensure that the process produces accurate results.

Data from all electronic media are backed up daily to ensure that data are not lost. The backed up copies are stored out of premises by IT Manager.

After the spreadsheet is validated, the calculations are protected from inadvertent manipulations.

Procedures for electronic backups are described in SOP MIS003.

22.5.2 Data Reduction

Some instruments have a computerized data reduction and calculation, such as GC/MS, HPLC, GC and ICP. The protocols to perform these tasks are described in the corresponding SOPs and the computer programs used for data reduction are validated before use and checked periodically by manual calculations.

Internal data review consists of a tiered or sequential system of verification, consisting of at least three tiers, with each check performed by a different person. The three tiers include a 100% review of the entire data package and completion of corresponding Data Review Checklist the analyst, then a 100% verification review by a technically qualified person, such as a supervisor or another chemist, experienced in that particular method or procedure, who checks for proper integration of peaks, identification of compounds, QC, etc. The third review is mainly an administrative one, to check for accuracy and completeness, typically performed by the Project Manager in charge of that project. The procedures used for performing the data review are detailed in the SOP MIS018.

If a discrepancy is noted in any stage of the reviewing process, the package is returned to the primary analyst for corrective action. For analyses that do not have automatic data reduction, the analyst performs the necessary calculations to obtain the final result, and then the results are reviewed as indicated above.

All information used in the calculations (e.g., raw data, calibration files, tuning records, results of standard additions, interference check results, sample response, and blank or background correction protocols) as well as sample preparation information (e.g., weight or volume of sample used, percent dry weight for solids, extract volume, dilution factor used) are recorded in order to enable reconstruction of the final result.

The results of the quality control sample analysis are reviewed, and evaluated before data are reported.

After the results are entered into the LIMS, the third tier is completed and if no discrepancies are encountered they are released for reporting.

If electronic audit trail functions are available, they must be in use at all times, and associated data must be accessible. If the instrument does not have an audit trail, the integrity of the data is documented as described in SOP MIS043 Implementation of the Business Ethics and Data Integrity Policy.

The laboratory has manual integration procedures that must be followed when integrating peaks during data reduction. The manual integration procedures are described in SOP MIS039.

The laboratory procedures for use of significant figures are described in SOP MIS012 and in each analytical method SOP.

All raw data must be retained electronically in hard drives or storage boxes if it is printed material for seven years. The storage location is the second story of the laboratory building but could be moved to another location if necessary. Records are maintained as described in Section 16 – “Control of Records”.

22.5.3 Data Review Procedures

Data review procedures are located in Section 23.4 – “Data Review”.

Section 23

CALIBRATION REQUIREMENTS
(TNI V1:M2 – Sect 5.5 and Section 1.7 of Technical Modules TNI V1:M 3-7)

23.1 General Equipment Requirements

The Laboratory is furnished with all items of sampling, measurement and test equipment required for the correct performance of the environmental tests (including sampling, preparation of samples, processing and analysis of environmental data).

All equipment and software used for testing and sampling are capable of achieving the accuracy required for complying with the specifications of the environmental test methods as specified in the laboratory SOPs.

Equipment is operated only by authorized and trained personnel (see Section 20 – "Personnel"*)*.

The laboratory has procedures for the use, maintenance, handling and storage of equipment and they are readily available to laboratory personnel.

Manuals provided by the manufacturer of the equipment provide information on use, maintenance, handling and storage of the equipment. The laboratory maintains an equipment table that includes additional information on storage location. The laboratory also has an SOP to summarize planned equipment maintenance (MIS055). These procedures ensure proper functioning of the equipment and prevent contamination or deterioration.

All equipment is calibrated or verified before being placed in use to ensure that it meets laboratory specifications and relevant standard specifications. The calibration procedures are specified in each method SOP and calibration records are as required and kept as electronic files in the corresponding folder of the computer system.

Documents detailing the receipt and specification of analytical equipment are retained. A history of the maintenance record of each system serves as an indication of the adequacy of maintenance schedules and parts inventory. As appropriate, the maintenance guidelines of the equipment manufacturer are followed. When maintenance is necessary, it is documented either in logbooks in the instrument work area or as electronic records in LIMS.

Test equipment, including hardware and software, are safeguarded from adjustments that would invalidate the test result measurements by limiting access to the equipment and using password protection where possible (see Section 22.5 – "Control of Data"*)*.

Equipment that has been subject to overloading, mishandling, given suspect results, or shown to be defective or outside specifications is taken out of service. The equipment is isolated to prevent its use or clearly labeled as being out of service until it has been shown to function properly. If it is shown that previous tests are affected, then procedures for nonconforming work are followed and results are documented (see Section 12 – "Control of Nonconforming Environmental Testing Work" and Section 14 – "Corrective Action").

Older instruments shall be replaced with newer ones or updated if possible as technology improves and efforts shall be made to provide a greater degree of automation and security in analytical instruments.

The Laboratory does not use any equipment outside the permanent control of the laboratory.

Each item of equipment and software used for testing and significant to the results is uniquely identified. Records of equipment and software are maintained. This information includes the following:

- **a) identity of the equipment and its software;**
- **b) manufacturer's name, type identification, serial number or other unique identifier;**
- **c) checks that equipment complies with specifications of applicable tests;**
- **d) current location;**
- **e) manufacturer's instructions, if available, or a reference to their location;**
- **f) dates, results and copies of reports and certificates of all calibrations, adjustments, acceptance criteria, and the due date of next calibration;**
- **g) maintenance plan where appropriate, and maintenance carried out to date; documentation on all routine and non-routine maintenance activities and reference material verifications;**
- **h) any damage, malfunction, modification or repair to the equipment;**
- **i) date received and date placed into service (if available); and**
- **j) condition when received, if available (new, used, reconditioned).**

The list of equipment that is currently in service at the laboratory can be found in Appendix H.

Glassware is cleaned to meet the sensitivity of the method. Any cleaning and storage procedures that are not specified by the method are documented in laboratory records or SOPs.

23.2 Support Equipment

Support Equipment includes, but is not limited to: balances, ovens, refrigerators, freezers, incubators, water baths, temperature measuring devices, volumetric

dispensing devices (such as Eppendorf®, or automatic dilutor/dispensing devices) and thermal/pressure sample preparation devices.

All support equipment is maintained in proper working order. Records are kept for all repair and maintenance activities, including service calls. The procedure used for calibration is described in SOP MIS031.

Lab Support equipment is also calibrated or verified annually using NIST traceable references when available, over the entire range of use. The results of such calibration must be within the specifications required in the application for which the equipment is used, if not, the equipment is either removed from service until repaired or a correction factor is applied to it, if applicable.

All raw data records are retained to document equipment performance. These records include logbooks, data sheets, or equipment computer files.

23.2.1 Support Equipment Maintenance

Regular maintenance of support equipment, such as balances and fume hoods is conducted at least annually.

Maintenance on other support equipment, such as ovens, refrigerators, and thermometers is conducted on an as needed basis.

Records of maintenance to support equipment are documented in Instrument Maintenance Logs. The logbooks are sometimes one per instrument or a logbook/record for a group of instruments that are housed in the same laboratory area and can be kept either electronically in the laboratory computer network or as hard copy.

Table 23-2 describes the maintenance performed on laboratory support equipment.

Table 23-1 Summary of Support Equipment Calibration And Maintenance

Instrument	Activity	Frequency	Documentation
Balance	1. Clean 2. Check alignment 3. Service Contract	1. Before use 2. Before use 3. Annually	Worksheet/log book Post annual service date on balance
ASTM Class 1Weights	1. Only use for the intended purpose 2. Use plastic forceps to handle 3. Keep in case 4. Re-calibrate	1. Every year if weight is used for daily checks. 2. Every 5 years if weight is used only to check working standard weights which are then used for the daily checks.	Keep certificate

Table 23-1 Summary of Support Equipment Calibration And Maintenance			
Instrument	**Activity**	**Frequency**	**Documentation**
Working Standard Weights	1. Used to check balances before their use.	Every 6 months.	Worksheet / logbook
NIST Traceable Thermometer	Accuracy determined by an accredited weights and measurement laboratory.	Every 5 years.	Keep certificate
Thermometers: 1. Glass and electronic 2. Dial thermometers 3. IR thermometer	Check at the temperature used, against a reference NIST certified thermometer	1. Annually for glass and electronic 2. Quarterly for dial and IR thermometers	Calibration factor and date of calibration on thermometer and worksheet/log book
pH electrometers	Calibration: 1. pH buffer aliquot are used only once 2. Buffers used for calibration will bracket the pH of the media, reagent, or sample tested.	Before use	Worksheet/log book
pH probe	Maintenance: Use manufacturer's specifications	As needed	Worksheet/log book
Spectrophotometer	1. Keep cells clean 2. Check wavelength settings with color standards	Annually	Post service date on instrument
Automatic or digital type pipettes	Calibrate for accuracy and precision using reagent water and analytical balance	Quarterly	Worksheet/logbook
Refrigerators, Freezers, and BOD incubators	1. Thermometers are immersed in liquid to the appropriate immersion line 2. The thermometers are graduated in increments of 1°C or less	Temperatures are recorded each day in use	Worksheet/log book

Table 23-1 Summary of Support Equipment Calibration And Maintenance

Instrument	Activity	Frequency	Documentation
Sterilizer	1. Use a maximum-temperature-registering thermometer or a continuous recording device. 2. Use spore strips or ampoules. 3. In house maintenance of autoclave or service contract. 4. Hot air ovens must maintain a stable temperature of 170°C - 180°C for at least two hours	1. Each cycle 2. One sterilizing cycle per month. 3. Once per year	Worksheet/log book
Microbiological incubators, and water baths	1. Thermometers in each unit are immersed in liquid to the appropriate immersion line 2. The thermometers will be graduated in increments of 0.5°C (0.2°C increments for tests which are incubated at 44.5°C) or less	Temperature of incubators and water baths will be recorded twice a day for each day in use with readings separated by at least four hours	Worksheet/log book
DO electrometer	Calibrate as specified in SOP	Before use	Worksheet/log book
DO probe	Maintenance as specified by manufacturer	As needed	Worksheet/log book
Conductivity Meters	Maintenance as specified by manufacturer	As needed	Worksheet/log book
Block Digesters	Verify that the temperature measured by the instrument measurement device is accurate	Daily	Worksheet/log book
Portable Field equipment	Maintenance as specified by manufacturer	As needed	Worksheet/log book

23.2.2 Support Equipment Calibration

Calibration requirements for analytical support equipment are found in Tables 23-3 and 23-4.

All support equipment is calibrated or verified annually over the entire range of use using NIST traceable references where available. The results of the calibration of

support equipment are within specifications or (1) the equipment is removed from service until repaired, or (2) records are maintained of correction factors to correct all measurements. If correction factors are used this information is clearly marked on or near the equipment.

Support equipment such as balances, ovens, refrigerators, freezers, and water baths are verified with a NIST traceable reference if available, each day prior to use, to ensure operation is within the expected range for the application for which the equipment is to be used

Volumetric dispensing devices (except Class A glassware and Glass microliter syringes) are checked for accuracy on a quarterly basis.

For microbiology analyses records for autoclaves used in the laboratory are required for the following:

- **initial performance of the autoclave functional properties (supplied by the installer);**
- **temperature demonstration of sterilization continuous monitoring device or maximum registering temperature;**
- **for every cycle, record date, contents, maximum temperature reached, pressure, time in sterilization mode, total run time, and analysts initials;**
- **quarterly check of autoclave timing device against a stopwatch; and**
- **annual maintenance checks to include a pressure check and calibration of temperature device.**

The type of calibration, frequency and acceptance criteria for laboratory support equipment, including equipment used for microbiology analyses is specified in SOP MIS031.

23.3 Analytical Equipment

23.3.1 Maintenance for Analytical Equipment

All equipment is properly maintained, inspected, and cleaned.

Maintenance of analytical instruments and other equipment may include regularly scheduled preventive maintenance or maintenance on an as-needed basis. Instrument malfunction is documented in the Instrument Maintenance logs, either in hardcopy or as electronic records, which become part of the laboratory's permanent records. A description of what was done to repair the malfunction and proof of return to control are also documented in the log.

A description of the laboratory instrumentation maintenance can be found in SOP MIS055

23.3.2 Instrument Calibration

Information on instrument calibration can be found in Appendix J (Chemistry), Appendix K (Microbiology) and Appendix L (Radiochemistry).

Initial instrument calibration and continuing instrument calibration verification are an important part of ensuring data of known and documented quality. If more stringent calibration requirements are included in a mandated method or by regulation, those calibration requirements override any requirements outlined here or in laboratory SOPs. Generally, procedures and criteria regarding instrument calibrations are provided in the SOPs corresponding to each test method.

All instruments are calibrated in accordance with the respective SOPs and/or method of analysis. The typical calibration procedure consists of an initial calibration, performed by running a series of standards and calculating the response by using either the response factors or by linear or polynomial regression analysis. This is followed by a calibration verification. All calibration procedures are thoroughly documented.

When an initial instrument calibration is not performed on the day of analysis, it is verified by analyzing CCVs standards using the following criteria, unless something different is specified in the corresponding SOPs or QAPP:

- The concentration of the CCV standard shall be from the low-calibration standard to the midpoint of the calibration range;
- The source of the CCV standard should be the same as the source for the initial calibration standard(s); and
- The baseline for evaluating the CCV is the initial calibration curve, except for the evaluation of retention times in organic chromatographic methods, which may be based on comparison with the retention times in the initial CCV.

When the method specifies to run CCVs at specific sample intervals, the count of these samples shall be of field samples only.

When a CCV fails to fall within acceptance limits then CCVs and all samples analyzed since last successful calibration verification are re-analyzed. If reanalysis is not possible, the client is notified prior to reporting data associated with a noncompliant CCV and if data are reported, appropriate qualifiers are used and if further clarification is needed this is explained in the case narrative. The exception to this is when a CCV fails with high bias, but the field samples remain not detected.

In all cases, the validity of the standards used in the initial calibration is verified using an independently prepared calibration verification solution. For all chemical determinations in which standards are involved for calibration, it is the policy of the company to use a secondary reference material (second source) obtained from a second manufacturer or lot if the lot can be demonstrated from the manufacturer as prepared independently from other lots. Traceability shall be to a national standard, when commercially available. If not commercially available, it can be prepared in-house. This secondary reference can be an LCS or other standard run to verify the integrity of the primary standard. Ideally, the secondary reference will be prepared identically to the calibration standards (i.e. if the calibration standard

is directly injected without preparation, then directly injecting the reference standard removes any biases present by any field sample preparation steps).

When project-specific or method-specific requirements do not exist:

- **The initial calibration verification shall be successfully completed prior to analyzing any samples;**
- **The use of a standard from a second lot is acceptable when only one manufacturer of the standard exists (note: manufacturer refers to the producer of the standard, not the vendor); and**
- **The concentration of the second source standard shall be at or near the midpoint of the calibration range. Acceptance criteria for the initial calibration verification must be at least as stringent as those for the continuing calibration verification.**

Specific analyses' calibrations are checked more frequently. Some instruments, such as TOX analyzers have built-in calibration features. The internal calibration of these instruments is monitored daily for accuracy.

Some calibration curves for spectrophotometric methods are very stable over a long period of time, however it is the policy of the Laboratory to perform a new initial calibration curve even if the continuing calibration check meets specified criterion, in any of the following events:

- **At least every three years**
- **When the instrument is moved to a different location**
- **If any maintenance that can affect the calibration has been performed**
- **If the analysts judges it necessary for special projects or different range of calibration**

Spectrophotometers are also subject to wavelength calibration which it shall be performed at least annually, according to the procedure described by the manufacturer in the instrument manual or other documentation.

All results are calculated based on the response curve from the initial calibration and generally not quantitated from any continuing instrument calibration verification unless otherwise required by regulation, method, or program. The results are bracketed by calibration standards which cover the entire quantitation range for each analyte. Any data reported below the lower-limit of quantitation is considered to have an increased quantitative uncertainty and consequently it is reported using defined qualifiers or flags or explained in the case narrative. The highest calibration standard is the highest concentration for which quantitative data are to be reported. Any data reported above this highest standard is considered to have an increased quantitative uncertainty and it is reported as an estimated value using the defined data qualifiers or explained in the case narrative, unless the sample can be diluted and re-run within the limits of the initial calibration curve.

The following is the criteria used for the acceptance of an initial calibration, unless specified differently in the analytical methods:

- **Use the average response factor (RF) if the percent relative standard deviation (%RSD) of the points is less than 20%. In this case, linearity through the origin is assumed.**

- **If the %RSD is greater than 20%, linearity through the origin cannot be assumed and a linear regression, a weighed linear regression or a non-linear regression can be used. The acceptance criteria for linear regression are a coefficient of correlation (r) equal or greater than 0.99 and for non-linear regression the coefficient of determination (COD) or r^2 equal or greater than 0.99. In both cases, the curve is not to be forced through the origin nor is the origin used as another point. The sample results must be within the first and last standards.**
- **It is recommended and a good practice (but not mandatory un less the SOP specifies that) to back calculate the data points in which case a deviation of less than 20% is considered acceptable (could be as great as 50% for low level points is the system is pushed to the lowest possible limits)**
- **The number of data points to construct the initial calibration curve shall be obtained from the analytical method employed. If no criteria are specified, the laboratory shall construct initial calibration curves using a minimum of five calibration points for organic analytes and three calibration points for inorganic analytes and IH samples. All reported target analytes and surrogates (if applicable) shall be included in the initial calibration. Reported results for all target analytes shall be quantified using a multipoint calibration curve; surrogates are calibrated according to each analytical method requirements, unless there are project specific requirements in which case these are followed. It is not permitted to exclude calibration points unless there is technical justification for it.**
- **The lowest standard shall be at or below the reporting limit for the method and at or below the regulatory limit/decision level if known by the laboratory.**
- **The lowest calibration standard must be above the detection limit. Noted exceptions: for turbidity analysis and for instrument technology (such as ICP or ICP/MS) with validated techniques from manufacturers or methods employing standardization with a zero point and a single point calibration standard:**

  - **Prior to the analysis of samples the zero point and single point calibration must be analyzed and the linear range of the instrument must be established by analyzing a series of standards, one of which must be at the lowest quantitation level.**
  - **Zero point and single point calibration standard must be analyzed with each analytical batch.**
  - **A standard corresponding to the lowest quantitation level must be analyzed with each analytical batch and must meet established acceptance criteria.**
  - **The linearity is verified at a frequency established by the method and/or the manufacturer.**
  - **If a sample within an analytical batch produces results above its associated single point standard then one of the following should occur:**
    - **analyze reference material at or above the sample value that meets established acceptance criteria for validating the linearity; dilute the sample such that the result falls below the single point calibration concentration (when sufficient sample volume permits);**
    - **Report the data with an appropriate data qualifier and/or explain in the case narrative.**

- § For metals analysis with a single-point calibration, a sample result may be reported up to 90% of the linear dynamic range (LDR). All samples exceeding this value must be diluted to within the LDR.

If the initial calibration fails, the analysis procedure is stopped and evaluated. For example, a second standard may be analyzed and evaluated or a new initial calibration curve may be established and verified. In all cases, the initial calibration must be acceptable before analyzing samples. If samples cannot be reanalyzed, data associated with an unacceptable initial instrument calibration must be reported with appropriate data qualifiers.

When an initial calibration is not performed on the day of the analysis, a calibration verification check standard is analyzed at the beginning and at the end of each batch. An exception to this policy is for internal standard methods (e.g., most organic methods). For these analyses, the calibration check is only analyzed at the beginning of the analytical sequence or analytical batch. The concentration of this calibration check is specified in each method SOP and whenever possible is varied within the established calibration range.

Sufficient raw data records are retained electronically as printouts to permit reconstruction of the continuing instrument calibration verification, e.g., test method, instrument, analysis date, each analyte name, concentration and response, calibration curve or response factor, or unique equations or coefficients used to convert instrument responses into concentrations. Continuing calibration verification records explicitly connect the continuing verification data to the initial instrument calibration by listing in the quantification report the initial calibration file that was used for the calculation.

When intermediate checks are needed to maintain confidence in the calibration status of the equipment, these checks shall be carried out according to each Standard Operating Procedure for the analytical method.

Where calibrations give rise to a set of correction factors, the laboratory shall have procedures to ensure that copies (e.g., in computer software) are correctly updated.

If the continuing instrument calibration verification results obtained are outside established acceptance criteria, corrective actions are performed. If routine corrective action procedures fail to produce a second consecutive (immediate) calibration verification within acceptance criteria, the following options are available:

- § Demonstrate performance after corrective action with two consecutive successful calibration verifications
- § Perform a new initial instrument calibration.

If acceptable performance has not been demonstrated, sample analyses shall not occur until a new initial calibration curve is established and verified. However, sample data associated with an unacceptable calibration verification may be reported as qualified data under the following special conditions:

- **When the acceptance criteria for the continuing calibration verification are exceeded high, i.e., high bias, and there are associated samples that are non-detects, then those non-detects may be reported.**
- **When the acceptance criteria for the continuing calibration verification are exceeded low, i.e., low bias, those sample results may be reported if they exceed a maximum regulatory limit/decision level or if the samples are not for regulatory compliance and accurate values are not required by the customer.**

Section 24

MEASUREMENT TRACEABILITY
(TNI V1:M2 – Section 5.6)

Measurement quality assurance comes in part from traceability of standards to certified materials.

All equipment used affecting the quality of test results are calibrated prior to being put into service and on a continuing basis (see Section 23 – "Calibration Requirements"). These calibrations are traceable to national standards of measurement where available.

If traceability of measurements to SI units is not possible or not relevant, evidence for correlation of results through interlaboratory comparisons, proficiency testing, or independent analysis is provided.

24.1 Reference Standards

Reference standards are standards of the highest quality available at a given location, from which measurements are derived.

Reference Standards, such as ASTM Class 1 weights, are used for calibration only and for verification on unless it is shown that their performance as reference standards will not be invalidated.

Reference standards, such as ASTM Class 1 weights, are calibrated by an entity that can provide traceability to national or international standards. The following reference standards are sent out to be calibrated to a national standard as indicated in Section 23 – "Calibration Requirements":

- **Class 1 weights.**
- **NIST traceable reference thermometers.**

24.2 Reference Materials

Reference materials are substances that have concentrations that are sufficiently well established to use for calibration or as a frame of reference.

Reference materials, where commercially available, are traceable to national standards of measurement, or to Certified Reference Materials, usually by a Certificate of Analysis.

Purchased reference materials require a Certificate of Analysis where available. If a reference material cannot be purchased with a Certificate of Analysis, it is verified by analysis and comparison to a certified reference material and/or demonstration of capability for characterization.

Internal reference materials, such as working standards or intermediate stock solutions, are checked as far as is technically and economically practical against a second source independent from it an known to be of high quality

Working standards or intermediate stock solutions are checked against a second source at first time of use. When a second source is not available, a vendor certified different lot is accepted as a second source. In most cases, the analysis of an Initial Calibration Verification (ICV) standard or a Laboratory Control Sample (LCS) can be used as a second source confirmation. Working standards and intermediate stock solutions are given expiration dates when they are prepared based on method or regulatory requirements. These standards are used up or disposed of by the expiration date.

Additional working standards such as working class weights or internal thermometers are checked using the frequency summarized in SOP MIS031.

24.3 Transport and Storage of Reference Standards and Materials

The laboratory handles and transports reference standards and materials in a manner that protects the integrity of the materials. Reference standard and material integrity is protected by separation from incompatible materials and/or minimizing exposure to degrading environments or materials.

Reference standards and materials are stored according to manufacturer's recommendations, method SOP requirements and separately from samples. The frequency of preparation is specified in each method SOP and the receipt, storage and preparation of solutions is detailed in SOP MIS004.

24.4 Labeling of Reference Standards, Reagents, and Reference Materials

The laboratory has procedures for purchase, receipt and storage of standards, reagents and reference materials. Purchase procedures are described in Section 9 – "Purchasing Services and Supplies" and receipt and storage procedures are described in SOP MIS004.

Expiration dates can be extended if the reference standard or material's integrity is verified. The extended date may not be beyond the expiration date of the referenced standards used to re-verify. The verification process involves analyzing the expiring standard against a valid standard and obtaining a deviation of not more than 5%.

The reagents and chemicals used in the laboratory are obtained from reputable suppliers that have proven consistency over the years. Purity specifications are chosen based on the analysis and this is always verified by the routine analysis of solvent blanks, method blanks and check standards. In methods where the purity of reagents is not specified, analytical reagent grade are used. Reagents of lesser purity than those specified by the test method are not used. Upon receipt of reagents, the labels on the container are checked to verify that the purity of the

reagents meets the requirements of the particular test method. Such information is documented in the corresponding section of the LIMS.

The following are some of the reagents used:

- Solvents used for Gas Chromatography and GC/MS are “organic residue analysis” grade.
- Methanol used for volatile organics by GC or GC/MS is “Purge and Trap” grade.
- All inorganic chemicals are “reagent grade” or better, depending of the requirement.
- Nitric acid used for preparation of standards for ICP/MS analysis is “trace metals”.

The quality (e.g., purity) specifications for all standards and reagents (including water) are documented in SOP MIS004.

The quality of reagent water sources used for microbiological analyses is monitored for trace metals, TKN, TOC and bacteria content. The results are documented in the corresponding logbook kept at the Microbiological Lab. On daily basis, the quality of reagent water is monitored by performing method blanks and system blanks for all tests that require water and the results documented with the analytical batch. If the reagent water does not meet method specific requirements a corrective action procedure is initiated.

The concentration of titrants is verified in accordance with written laboratory procedures (SOPs) and documented in the Standardization log book kept in the Wet Chemistry section of the Laboratory.

24.4.1 Stock Standards, Reagents, Reference Materials and Media

Records for all standards, reagents, reference materials, and media include:

- the manufacturer/vendor name (or traceability to purchased stocks or neat compounds)
- the manufacturer’s Certificate of Analysis or purity (if supplied)
- the date of receipt
- recommended storage conditions

The information is recorded and the materials are given a unique identification number as described in SOP MIS004.

If the original container does not have an expiration date provided by the manufacturer or vendor it is not required to be labeled with an expiration date. If an expiration date is provided, it must be labeled with the expiration date.

In methods where the purity of reagents is not specified, analytical reagent grade is used. If the purity is specified, that is the minimum acceptable grade. Purity is verified and documented according to Section 9 – “Purchasing Services and Supplies” and to SOP MIS004.

24.4.2 Prepared Standards, Reagents, Reference Materials and Media

Records for standards, reagents, reference materials, and media preparation include:

- traceability to purchased stock or neat compounds
- reference to the method of preparation
- date of preparation
- an expiration date after which the material shall not be used (unless its reliability is verified by the laboratory)
- preparer's initials (if prepared)

This information is recorded as per SOP MIS004.

All containers of prepared standards, reagents, or materials are labeled with a unique ID and an expiration date. The unique ID is determined by the LIMS system and consists of 7 digits being the first digit the year, then two digits for the month and the last four digits are correlative numbers from 0001 to 9999. Each container must be uniquely identified even if it is the same sample in each container.

Prepared reagents are verified to meet the requirements of the test method through the analysis of blanks.

Section 25

COLLECTION OF SAMPLES
(TNI V1:M2 – Section 5.7)

Most samples processed at the laboratory are collected by clients or their representatives. When required, Weck Laboratories can provide technical assistance for sample collection and handling and can prepare and provide the necessary coolers, reagent water, sample containers, preservatives, sample labels, custody seals, COC forms, ice, and packing materials required to properly preserve, pack, and ship samples to the laboratory.

Weck Laboratories field personnel conduct sampling of wastewater and potable water for projects that require this service. Our personnel do not perform industrial hygiene sampling. Sampling procedures are described in the following SOPs: MIS002 and MIS010

In order to assure the quality of the entire analytical process, Weck Laboratories works closely with field personnel employed by the client to meet general QA criteria and if available specific criteria as per the QAPP.

The procedures to obtain subsamples, such as obtaining sample aliquots, are documented in each analytical SOP that requires it.

Where the client requires deviations, additions or exclusions from the documented sampling procedure, these are recorded in detail in the case narrative of the work order and reported with the analytical report. They are also communicated to the appropriate personnel.

In the instances that the laboratory does not perform the sampling and whenever possible, all sampling information, such as name of sampler, company that employs the sampler, sampling procedure, etc. is recorded in the sampling section of each work order and reported to the client. All other pertinent sampling information and relevant data for operations relating to sampling that forms part of the environmental testing that is undertaken is also recorded and reported with the analytical report.

25.1 Sampling Containers

The laboratory offers clean sampling containers for use by clients. The sample containers are obtained and managed as specified in SOPs MIS007 and MIS028.

25.1.1 Preparing Container Orders

Containers (containing any required preservatives) are provided to the client upon request.

Bottle orders are processed by the Project Managers as per Client's instructions and information provided for the site (whether the site is chlorinated to provide sampling containers with the correct preservation, etc.). The LIMS has a facility in the Project Management section to generate the bottle orders which is done by the PMs after entering the necessary information, such as due date, bottle type and number of bottles. The Shipping Department checks schedules daily for bottle due to be delivered and mode of delivery (FEDEX, Courier, etc) and ship accordingly. If

special instructions or required the bottle order form is printed put and brought to shipping with the special written instructions. For rush orders due in less than 48 hrs, the PM needs to verbally notify shipping to take the necessary steps to complete the order on time.

25.1.2 Sampling Containers, Preservation Requirements, Holding Times

Sampling container, preservation and holding time requirements can be found in Appendix I of this QA Manual and in Appendix 1 of SOP MIS001.

If preservation or holding time requirements are not met, the procedures in Section 12 – "Control of Nonconforming Environmental Testing Work" are followed.

25.2 Sampling Plan

The laboratory uses sampling plans provided by clients or prepared in consultation with the client. The plan must include any factors that must be controlled to ensure the validity of the test. Sampling plans and written sampling procedures are used for sampling substances, materials or products for testing. The plan and procedures are made available at the sampling location.

The laboratory's procedures for dealing with nonconformances are used when the client requests any deviations from the sampling plan or sampling procedures. The requests are documented and included in the final test report.

25.3 Sampling Records

The following relevant sampling data are recorded: sampling procedure used, the date and time of sampling, the identification of the sampler, environmental conditions (if relevant), the sampling location, and the statistics upon which the sampling procedures are based.

Section 26

HANDLING SAMPLES AND TEST ITEMS
(TNI V1:M2 – Section 5.8 and Section 1.7 of Technical Modules TNI V1:M 3-7)

26.1 Sample Receipt

When samples are received at the laboratory, chain-of-custody is reviewed, condition is documented, samples are given unique identifiers, and they are logged into the sample tracking system.

26.1.1 Chain of Custody

The chain of custody or sample submission sheets from the field are reviewed. This documentation is completed in the field and provides a written record of the handling of the samples from the time of collection until they are received at the laboratory. Section 25 – "Collection of Samples" outlines what information is needed on this record. The chain of custody form also provides information on what type of testing is being requested and can act as an order for laboratory services in the absence of a formal contract. An example chain of custody form can be found in Figure 26-1. Chain of custody and any additional records received at the time of sample submission are scanned and maintained by the laboratory in the form of electronic records.

26.1.1.1 Legal Chain of Custody

When full Legal/Evidentiary Chain of Custody protocols are required, COC records are used to establish an intact, continuous record of the physical possession, storage and disposal of sample containers, collected samples, sample aliquots, and sample extracts or digestates, The COC records account for all time periods associated with the samples. The COC records identify all individuals who physically handled individual samples. The COC forms remain with the samples during transport or shipment. If shipping containers and/or individual sample containers are submitted with sample custody seals, and any seals are not intact, the lab shall note this on the chain of custody. Other documents pertaining to the transport of the samples, such as receipts from common carriers are kept as part of the documentation.
When evidentiary samples, subsamples, digestates or extracts are transferred to another party they are subject to the requirements of legal chain of custody. These samples are kept in a locked area or refrigerator with the key in possession of the designated sample custodian

26.2 Sample Acceptance

Procedures for opening shipping containers and examining samples are provided in SOP MIS001.

The laboratory has a sample acceptance policy that is made available to sample collection personnel. An example is provided in Figure 26-2. It emphasizes the need for use of water resistant ink, providing proper documentation (to include sample ID, location, date and time of collection, collector's name, preservation type, sample type and any special remarks about the sample), labeling of sample containers to include a unique sample ID, use of appropriate containers, adherence to holding times, and sample volume requirements. In addition the laboratory has nonconformance/corrective action procedures to handle samples that don't meet the requirements above or show signs of damage, contamination or inadequate preservation. Data will be appropriately qualified where samples are reported that do not meet sample acceptance requirements.

If any of the requirements for the sample acceptance policy are not met, the client is notified immediately by the Project Manager or Lab Supervisor, and the irregularity is documented:

- If the client acknowledges the irregularity and instructs the laboratory to continue with analysis; the decision to proceed is documented either on the COC , LIMS or other lab receipt documents and samples accepted and if needed the data is qualified in the final report
- If the client does not acknowledge the irregularity the samples are rejected; also the client may agree that samples need to be rejected.
- If the irregularity is noted in samples submitted for bacteriological analysis for compliance purposes, the samples are rejected without exception.

When a request for a new project is received involving multiple samples or tests that have a short holding time the Management is notified. The Management staff with the assistance of the appropriate technical personnel evaluates the project and calculates the resources needed to complete it within the turnaround time required and the holding times, taking into consideration the volume of work in house and/or expected.

If it is determined that the new project will not affect the proper completion of jobs already in house and that the laboratory has the resources (personnel, equipment and facilities) necessary to accommodate the new project, this is accepted.

If the Management or any of the technical staff involved thinks that the new job will create problems in terms of reduced quality of work, completion out of specified or required time, or any other detrimental situation, the new project is not accepted and the client notified. If there are alternatives, such as postponement, modification of sampling schedules or partial subcontracting to another lab in order to accommodate the project, this is proposed to the client.

26.2.1 Preservation Checks

The preservation verification is detailed in SOP MIS001; the following common preservation checks are performed and documented upon receipt:

26.2.1.1 *Thermal preservation:*

a) For temperature preservation, the temperature must be within ± 2°C of the required temperature unless otherwise stated. For samples that require preservation at 4°C, the acceptable range is from just above freezing to 6°C.

b) Samples that are delivered to the lab the same day as they are collected are likely not to have reached a fully chilled temperature. This is acceptable if the samples were received on ice and the chilling process has begun.

c) Record on the receipt form if ice is present and the temperature.

26.2.1.2 *Chlorine checks:*

d) Laboratories that receive samples from potable water supplies (including source water) that have a demonstrated history of acceptable preservation may check a sample from each client at a frequency of once per month if:

i) the laboratory can show that the received sample containers are from their laboratory;

ii) sufficient sodium thiosulfate was in each container before sample collection to neutralize at minimum 5 mg/l of chlorine for drinking water and 15 mg/l of chlorine for wastewater samples;

iii) one container from each batch of laboratory prepared containers or lot of purchased ready-to-use containers is checked to ensure efficacy of the sodium thiosulfate to 5 mg/l chlorine or 15 mg/l chlorine as appropriate and the check is documented;

iv) chlorine residual is checked in the field and actual concentration is documented with sample submission.

26.2.1.3 *pH checks:*

e) The pH of samples requiring acid/base preservation is checked upon sample receipt or upon initiation of analysis, except for volatile organic analysis.

26.3 Sample Identification

Samples, including subsamples, extracts and digestates, are uniquely identified in a permanent chronological record in the LIMS database to prevent mix-up and to document receipt of all sample containers.

Samples are assigned sequential numbers that reference more detailed information kept in the LIMS. The sample identification number contains seven digits such as "YMDD###"

Where:
Y correspond to the last digit of the current year

M	corresponds to the month using a letter, for example "A" being January, "B", February and so forth
DD	Corresponds to the two numerical digits for the month
###	A three digit subsequent number from 001 to 999 automatically assigned by the system

The detailed description of the sample identification is listed in SOP MIS001

The following information is included in the sample receipt screen of the LIMS:

- Client or project name
- Date and time of receipt at lab
- Unique laboratory identification number
- Signature or initials of person making the entries

In addition, the following information is maintained and linked to the log-in record:

- Date and time of sampling linked to the date and time of laboratory receipt.
- Unique field identification number linked to the laboratory sample ID
- Analyses requested (including applicable approved method numbers) linked to the laboratory sample ID.
- Comments regarding rejection (if any).

All documentation received regarding the sample, such as memos or chain of custody, are scanned and retained as electronic copies in the computer system.

26.4 Sample Aliquots / Subsampling

In order for analysis results to be representative of the sample collected in the field, the laboratory has subsampling procedures. These procedures are described in SOP MIS026.

26.5 Sample Storage

Storage conditions are monitored for any required criteria, verified, and the verification recorded in logbooks.

Samples that require thermal preservation are stored under refrigeration that is +/-2°C of the specified preservation temperature unless regulatory or method specific criteria require something different. For samples with a specified storage temperature of 4°C, storage at a temperature above the freezing point of water to 6°C is acceptable.

Samples are held secure, as required. Samples are accessible only to laboratory personnel.

Samples are stored apart from standards, reagents, food or potentially contaminating sources, and such that cross-contamination is minimized. All

portions of samples, including extracts, digestates, leachates, or any product of the sample is maintained according to the required conditions.

Samples for volatile organic analyses are stored in segregated refrigerators kept in the volatile organics laboratory completely segregated from other samples.

Sample storage is described in Section 2.11 of SOP MIS001

26.6 Sample Disposal

Samples are retained for a minimum of thirty days from report date unless otherwise instructed by the client or if the samples are part of litigation or have been received under legal/evidentiary requirements, in which case the disposal of the physical sample is accomplished with the concurrence of the affected legal authority.

After the retention period samples are either returned to the client or properly disposed of according to Federal, State and local regulations.
Procedures are described in SOP MIS051 for the disposal of samples, digestates, leachates, and extracts.

26.7 Sample Transport

Samples that are transported under the responsibility of the laboratory, where necessary, are done so safely and according to storage conditions. This includes moving bottles within the laboratory. Specific safety operations are addressed outside of this document.

Sample shipping procedures are described in SOP MIS007.

SPECIAL REQUIREMENTS / BILLING INFORMATION

COC v

Figure 26-2

Example Sample Acceptance Policy

- **Proper, full, and complete documentation, including the sample identification, the location, date and time of collection, collector's name, preservation type, sample type and any special remarks concerning the sample. This information must be fully documented in the chain of custody record. See Figure 26-1.**
- **Unique identification of samples using durable labels completed in indelible ink on all sample containers.**
- **Use of appropriate sample containers and preservatives as per table in SOP MIS001 – Appendix 1.**
- **All samples have adequate holding time to be analyzed (SOP MIS001 - Appendix 1).**
- **If no previous special arrangements were made, parameters that are "field" analysis (i.e. pH, residual chlorine, etc.) will be analyzed within 24 hours from arrival at the laboratory. Samples that arrive at the laboratory after 4 PM on Friday or on the weekend will be analyzed no later than the next business day after receipt (Monday unless a holiday).**
- **Adequate sample size for all analysis requested.**
- **Special instructions and additional information required to perform the analysis properly (i.e., time, flow rate, etc.).**
- **Procedures that are used when samples show signs of damage or contamination.**
- **Samples received at the required temperature (usually $\leq$ 6 ^{o}C, but above freezing) or with evidence of chilling process started (received "on ice") if they were collected the same day as received at the lab.**

Section 27

QUALITY ASSURANCE FOR ENVIRONMENTAL TESTING *(TNI V1:M1, V1:M2 – Section 5.9 and Section 1.7 of Technical Modules TNI V1:M 3-7)*

Weck Laboratories, Inc. has procedures for monitoring the validity of the testing it performs. The qualities of test results are recorded in a computerized database contained within the LIMS system and in such a way that trends are detectable, and where practicable, are statistically evaluated. To evaluate the quality of test results, the laboratory utilizes the following:

a) Use of certified reference materials or cultures and/or internal quality control using secondary reference materials
b) Control charting
c) Participation in proficiency testing programs, interlaboratory comparisons and round robin programs
d) Replicate testing using same or different methods
e) Retesting of retained samples
f) Correlation of results for different characteristics of a sample (for example, total phosphate should be greater than or equal to orthophosphate).
g) Confirmation analyses comparison to historical data

In addition to procedures for calibration, the laboratory monitors quality control measurements such as blanks, laboratory control samples (LCS), matrix spikes (MS), duplicates, surrogates and internal standards to assess precision and accuracy. Proficiency Testing samples are also analyzed to assess laboratory performance.

Quality control samples are processed in the same manner as field samples. They are analyzed and reported with their associated field samples. Quality control data are analyzed and, when found to be outside pre-defined criteria, action is taken to correct the problem and to prevent incorrect results from being reported. Data associated with quality control data outside of criteria and still deemed reportable will be qualified so the end user of the data may make a determination of the usability of the data - see Section 28 – "Reporting of Results".

For additional guidance on batch-specific QC samples, refer to the Quality Assurance Matrix contained in the Uniform Federal Policy for Quality Assurance Project Plans (UFP-QAPP).

27.1 Essential Quality Control Procedures

The quality control procedures specified in test methods are followed by laboratory personnel. The most stringent of control procedures is used in cases where multiple controls are offered. If it is not clear which is the most stringent, that mandated by test method or regulation is followed.

For test methods that do not provide acceptance criteria for an essential quality control element or where no regulatory criteria exist, acceptance criteria are developed following the criteria established for another similar method or similar technology. In some specialized projects, the client may set criteria and this should be stated. These limits can be found in the analytical methods SOPs and also in LIMS.

Written procedures to monitor routine quality controls including acceptance criteria are located in the test method SOPs and in LIMS, except where noted, and include such procedures as:

- **use of laboratory control samples and blanks to serve as positive and negative controls for chemistry methods;**
- **use of laboratory control samples to monitor test variability of laboratory results;**
- **use of calibrations, continuing calibrations, certified reference materials and/or PT samples to monitor accuracy of the test method;**
- **measures to monitor test method capability, such as limit of detection, limit of quantitation, and/or range of test applicability, such as linearity;**
- **use of regression analysis, internal/external standards, or statistical analysis to reduce raw data to final results;**
- **use of reagents and standards of appropriate quality and use of second source materials as appropriate;**
- **procedures to ensure the selectivity of the test method for its intended use;**
- **measures to assure constant and consistent test conditions, such as temperature, humidity, rotation speed, etc., when required by test method;**
- **use of sterility checks for equipment, media and dilution water for microbiology; and**
- **use of positive and negative culture controls for microbiology.**
- **For Radiochemistry: Measures to monitor test method capability, such as Minimum Detectable Activity.**

27.2 Internal Quality Control Practices

Analytical data generated with QC samples that fall within all prescribed acceptance limits indicate the test method is deemed to be in control.

QC samples that fall outside QC limits indicate the test method are deemed to be out of control (nonconforming) and that corrective action is required and/or that the data are qualified (see Section 12 – "Control of Nonconforming Environmental Testing Work" and Section 14 - "Corrective Actions").

Detailed QC procedures and QC limits are included in test method standard operating procedures (SOPs), or where unspecified in the SOPs, are detailed in LIMS.

All QC measures are assessed and evaluated on an on-going basis, so that trends are detected.

27.2.1 General Controls

The following general controls are used:

27.2.1.1 Positive and Negative Controls such as:

a) Blanks (negative)
b) Laboratory control sample (positive)
c) Sterility checks and control cultures (positive and negative).

27.2.1.2 Selectivity is assured through:

a) absolute and relative retention times in chromatographic analyses;

b) two-column confirmation when using non-specific detectors;

c) use of acceptance criteria for mass-spectral tuning (found in test method SOPs);

d) use of the correct method according to its scope assessed during method validation; and

e) use of reference cultures (positive and negative) from a recognized manufacturer (where applicable).

27.2.1.3 Consistency, Variability, Repeatability, and Accuracy are assured through:

a) proper installation and operation of instruments according to manufacturer's recommendations or according to the processes used during method validation;

b) monitoring and controlling environmental conditions (temperature, access, proximity to potential contaminants);

c) selection and use of reagents and standards of appropriate quality; and

d) cleaning glassware appropriate to the level required by the analysis as demonstrated with method blanks (SOP MIS028).

e) For microbiology, glassware care includes use of borosilicate glassware, use of detergents designed for laboratory use, testing each day for alkaline or acid residue with bromothymol blue, and conduct of the Inhibitory Residue test when the detergent is changed or annually, whichever is more frequent.

f) following SOPs and documenting any deviation, assessing for impact, and treating data appropriately;

g) testing to define the variability and/or repeatability of the laboratory results, such as replicates;

h) use of measures to assure the accuracy of the test method, including calibration and/or continuing calibrations, use of certified reference materials, proficiency test samples, or other measures; and

i) use of duplicate plate counts on positive samples (microbiology only).

27.2.1.4 Test Method Capability (also see Section 22 – "Environmental Methods and Method Validation") is assured through:

a) establishment of the limit of detection "minimum detectable activity" for Radiochemistry work;

b) establishment of the limit of quantitation or reporting level; and/or

c) establishment of the range of applicability such as linearity.

27.2.1.5 Data reduction is assured to be accurate by:

a) selection of appropriate formulae to reduce raw data to final results such as regression;

b) following specific procedures for data reduction such as manual integration procedures;

c) periodic review of data reduction processes to assure applicability;

d) microbiological calculations, data reduction, and statistical interpretations specified by each test method; and

e) for Radiochemistry work, results reported with its measurement uncertainty. Reports indicate whether the uncertainty is combined standard or expanded uncertainty.

27.2.1.6 Sample Specific controls are used to evaluate the effect of sample matrix on the performance of the selected analytical method (not a measure of laboratory performance):

Examples:

- Matrix Spike and Matrix Spike Duplicate (MS/MSD)
- Surrogate Spikes
- Sample Duplicates

27.2.1.7 The following tables summarize the key elements of a quality control system for a laboratory performing chemistry and microbiology testing.

Table 27-1 Essential Quality Control Elements for Chemistry			
Item	**Frequency**	**Acceptance Criteria**	**Corrective action**

Table 27-6 Essential Quality Control Elements for Radiochemistry			
Item	**Frequency**	**Acceptance Criteria**	**Corrective action**
Negative Control (Method Blank)	1/batch	Method specific or reporting limit	Qualify data and take corrective action
Positive Control (Laboratory Control Sample)	1/batch	Method specific or determined by laboratory	Reprocess, reanalyze, or qualify data.
Matrix Duplicates *Note : Samples are designed as data quality indicators for a specific sample using the designated method. These controls alone are not used to judge a laboratory's performance.*	Per method requirement	Method specific or determined by laboratory	Corrective action and qualify data

27.2.2 Specific Controls

27.2.2.1 Method Blanks

Method blanks are processed along with and under the same conditions as the associated samples to include all steps in the method. A method blank must be analyzed at a minimum of one per preparation batch. When no separate preparation method is used the batch is defined as the environmental samples that are analyzed with the same method and personnel, using the same lots of reagents, not to exceed the analysis of twenty environmental samples, not including method blanks, LCS, matrix spikes and matrix duplicates. The matrix of the method blank must be similar to the associated samples and be free from any analytes of interest. Method blanks are not required for some analyses such as pH, conductivity, flash point and temperature.

The method blank is used to assess the preparation batch for possible contamination during the preparation and processing steps. The method blank is processed along with and under the same conditions as the associated samples to include all steps of the analytical procedure.

Contaminated blanks are identified according to the acceptance limits in the test method SOPs or laboratory documentation.

Blanks are prepared and analyzed in the following situations, or whenever there is a need to obtain further information:

- **A blank is extracted for every batch and type of matrix for analysis of semi-volatile organics by GC, GC/MS or HPLC.**
- **A blank is carried through all the digestion procedures for analysis of metals by AA, ICP or ICP-MS for every batch of samples and type of matrix for each instrument used.**
- **A blank is carried through the leaching procedures (TCLP, EP TOX, and WET) using the same extraction fluid, bottles and agitators as the samples.**
- **System/Reagent blanks are analyzed at the beginning of the day prior to calibration, after a high level standard, after changing matrix and after samples that are known or suspected to be very concentrated.**
- **Reagent blanks are analyzed for all wet chemistry determinations involving titrations or spectrophotometry and their value are subtracted from the reading of the samples, if appropriate.**
- **Blanks for mobility procedures (TCLP, ZHE, EP TOX, and WET) are analyzed by the appropriate method.**
- **Additional field and trip blanks are prepared and analyzed where required or whenever requested by the client**

Sometimes the blanks may show detectable amounts of target analytes. In these cases the source of the contamination must be investigated and measures taken to correct, minimize or eliminate the problem if:

- **The blank contamination is at or above the reporting limit and exceeds a concentration greater than 1/10 of the measured concentration of any sample in the associated sample batch or**
- **The blank contamination exceeds the concentration present in the samples and is greater than 1/10 of the specified regulatory limit.**
- **The blank contamination otherwise affects the sample results as per the test method requirements or the individual project data quality objectives.**
- **For DoD samples, in addition to the above, the method blank will be considered contaminated for a particular target analyte if it concentrations exceeds ½ the reporting limit unless is a common laboratory contaminant such as acetone, methylene chloride, MTBE, zinc and aluminum, among others.**

If the method blank is contaminated as described above, then the affected samples shall be reprocessed in a subsequent preparation

batch, qualified or voided, except when sample results are unaffected by the blank contamination (non-detects or other analytes) in which case the results are reported unqualified. If insufficient sample volume remains for reprocessing, the results shall be reported with appropriate data qualifiers.

27.2.2.2 Laboratory Control Samples

Laboratory Control Samples (LCS) are also known as LFBs or Blank Spikes, are prepared from analyte free water or other clean matrix, and spiked with verified and known amounts of analytes for the purpose of establishing precision or bias measurements.

Laboratory control samples are analyzed at a frequency mandated by method, regulation, or client request, whichever is more stringent. The standard frequency of LCS preparation and analysis is one per analytical batch or as otherwise stated in a laboratory SOP. Exceptions would be for those analytes where no spiking solution is available, such as TSS, TDS, Total Volatile Solids, Total Solids, pH, color, odor, temperature, dissolved oxygen or turbidity. When no separate preparation method is used the batch is defined as the environmental samples that are analyzed with the same method and personnel, using the same lots of reagents, not to exceed the analysis of twenty environmental samples, not including method blanks, LCS, matrix spikes and matrix duplicates.

The LCS is a quality system matrix, known to be free of analytes of interest, spiked with known and verified concentrations of analytes. The matrix spike (Sect. 27.2.2.3) may be used in place of this control as long as the acceptance criteria are as stringent as for the LCS. Alternatively the LCS may consist of a media containing known and verified concentrations of analytes or as Certified Reference Material (CRM). All analyte concentrations shall be within the calibration range of the methods.

The analytes to be spiked in the LCS are specified in the test method SOP. In some cases a client may specify a list of analytes for spiking and the request is handled using the laboratory's nonconformance procedures.

In the absence of specified spiking components the laboratory shall spike per the following:

- **For those components that interfere with an accurate assessment such as spiking simultaneously with technical chlordane, toxaphene and PCBs, the spike should be chosen that represents the chemistries and elution patterns of the components to be reported.**
- **For those test methods that have extremely long lists of analytes, a representative number may be chosen. The analytes selected should be representative of all analytes reported. The following criteria shall be used for determining the minimum number of analytes to be**

spiked. However, the laboratory shall insure that all targeted components are included in the spike mixture over a 2-year period:

a) For methods that include 1-10 targets, spike all components.
b) For methods that include 11-20 targets, spike at least 10 compounds or 80% of the total, whichever is greater.
c) For methods with more than 20 targets, spike at least 16 components.

The results of laboratory control samples (LCS) are calculated in percent recovery or other appropriate statistical technique that allows comparison to established acceptance criteria. The calculation used is as follows:

$$\%R = \frac{AV}{TV} \times 100$$

Where
AV = Analyzed Value
TV = True Value

The individual LCS is compared to the acceptance criteria as published in the mandated test method, or where there are no established criteria, the laboratory establishes limits as described below. If found to be outside of these criteria, there is an indication that the analytical system is "out of control". Any affected samples associated with an out of control LCS shall be reprocessed for re-analysis or the results reported with appropriate data qualifying codes. Note: Samples that are not detected (ND) may be reported with an LCS that failed with high bias, but any qualifier may only be used for two consecutive batches before the problem must be corrected.

Where there are no established criteria, internal criteria are generated based on recoveries of past LCSs.
To determine these criteria, at least 30 data points generated under the same analytical process are used and the upper and lower acceptance limits are calculated as the "Mean + 3 SD" and "Mean – 3 SD" respectively, where SD is the standard deviation. These statistically derived limits must:

- **Meet the limits specified by the project or as stated in the method, if available;**
- **Should be updated on an annual basis, or as stated in the method, and re-established after major changes in the analytical process (e.g., new instrumentation);**
- **Should not exclude failed LCS recovery data and statistical outliers from the calculation, unless there is a documented and scientifically valid reason.**

Control charts generated from the LIMS are used to detect trends and prevent out-of-control conditions. Control limits are continually monitored for shifts in mean recovery, changes in standard deviation, and development of trends.

If a large number of analytes are in the LCS, it becomes statistically likely that a few will be outside control limits. This may not indicate that the system is out of control, therefore corrective action may not be necessary. Upper and lower marginal exceedance (ME) limits can be established to determine when corrective action is necessary. A ME is defined as being beyond the LCS control limit (3 standard deviations), but within the ME limits. ME limit is 4 standard deviations around the mean. The number of allowable marginal exceedances is based on the number of analytes in the LCS. If more analytes exceed the LCS control limits than is allowed, or if any one analyte exceeds the ME limits, the LCS fails and corrective action is necessary. This marginal exceedance approach is relevant for methods with long lists of analytes. It will not apply to target analyte lists with fewer than 11 analytes. Certain projects, such as DoD work do not allow any target analyte to exceed its LCS control limits, even marginally and if this happens the batch is considered not acceptable .

The number of allowable marginal exceedances is as follows:

1) >90 analytes in LCS, 5 analytes allowed in ME of the LCS control limit;
2) 71-90 analytes in LCS, 4 analytes allowed in ME of the LCS control limit;
3) 51-70 analytes in LCS, 3 analytes allowed in ME of the LCS control limit;
4) 31-50 analytes in LCS, 2 analytes allowed in ME of the LCS control limit;
5) 11-30 analytes in LCS, 1 analytes allowed in ME of the LCS control limit;
6) <11 analytes in LCS, no analytes allowed in ME of the LCS control limit;

Marginal exceedances must be random. If the same analyte exceeds the LCS control limit repeatedly (i.e. 2 out of 3 consecutive LCS), it is an indication of a systemic problem. The source of the error must be located and corrective action taken.

The procedure to monitor the application of marginal exceedance allowance to the LCS to ensure random behavior consist of establishing a data base with all exceedances and compare the analytes affected on quarterly basis to verify is not the same analyte having the problem.

27.2.2.3 Matrix Spikes and Matrix Spike Duplicates

Matrix Spikes and Matrix Spike Duplicates (MS/MSD) are environmental samples fortified with a known amount of analyte to help assess the effect of the matrix on method performance. These controls alone are not used to judge laboratory performance. The information from these controls is sample/matrix specific and would not normally be used to determine the validity of the entire batch

The frequency of the analysis of matrix specific samples is determined as part of a systematic planning process (e.g., Data Quality Objectives) or as specified by the required mandated test method or SOP and it is at a minimum, one per batch of 20 samples or less, per matrix type.

The components to be spiked are the ones specified by the mandated test method or laboratory SOP. Any permit specified analytes, as specified by regulation or client requested analytes shall also be included. Matrix spikes are not performed for analytes for which spiking solutions are not available such as, solids determinations (total suspended, total dissolved, total volatile), pH, color, odor, temperature, dissolved oxygen, BOD, COD or turbidity. If there are no specified components, the following guideline is used:

§ For those components that interfere with an accurate assessment such as spiking simultaneously with technical chlordane, toxaphene and PCBs, the spike should be chosen that represents the chemistries and elution patterns of the components to be reported.

§ For those test methods that have extremely long lists of analytes, a representative number may be chosen using the following criteria for choosing the number of analytes to be spiked, but alternating them in order to ensure that all targeted components are included in the spike mixture over a 2 year period.
    i. For methods that include 1-10 targets, spike all components;
    ii. For methods that include 11-20 targets, spike at least 10 components or 80% of the total, whichever is greater;
    iii. For methods with more than 20 targets, spike at least 16 components.

Some project may require MS/MSD to be performed on their samples (i.e. DoD) in which case these are used for the entire batch if it also contains samples from other clients.

The requirements for MS/MSD are not applicable to all methods (e.g., asbestos, certain air-testing samples, classic chemistry, and industrial hygiene samples). Additional MS/MSDs may be required on a project-specific basis.

The calculations of percent recoveries and relative percent difference (RPD) are performed by the following procedures:

$$\%R = \frac{AV}{TV} \times 100$$

Where

AV = Spike Result – Sample Result

TV = True Value

$$RPD = \frac{|S - D|}{\frac{(S + D)}{2}} \times 100$$

***Where*:**

S=Sample Concentration
D=Duplicate Concentration

Where there are no established criteria, the laboratory uses the mean plus or minus three standard deviations as the control limits for MS/MSD as described in section 27.2.2.2. Some projects may have specific criteria such as DoD work that require that the results of all MS/MSDs must be evaluated using the same acceptance criteria used for the LCS.

For MS/MSD results outside established criteria corrective action is documented or the data are reported with appropriate data qualifying codes. Only the data from the spiked sample is qualified. Poor performance in a matrix spike generally indicates a problem with the sample composition, and not the laboratory analysis and is reported to the client whose sample was used for the spike with the appropriate data qualifiers or in the case narrative to assist in data assessment.

The corrective action for organics may be to evaluate the LCS for comparison and note in the narrative that there may be a matrix interference present. The data to be qualified is only that of the parent sample.

27.2.2.4 Surrogate Spikes

Surrogate spikes are substances with chemical properties and behaviors similar to the analytes of interest used to assess method performance in individual samples. Surrogates are added to all samples (in test methods where surrogate use is appropriate) prior to sample preparation or extraction.

Surrogate recovery results are compared to the acceptance criteria as published in the mandated test method or laboratory SOP, specified in the project by the client or lab generated if there are no established criteria. Acceptance limits generated at the laboratory are established based on a minimum of 30 valid data points by calculating the mean and standard deviation, the upper limit is set at "mean + 3SD" and the lower limit at "Mean – 3SD".

Surrogate results outside the acceptance criteria are evaluated for the effect indicated for the individual sample results. A corrective action is initiated which is guided by the data quality objectives or other site specific requirements. Results reported from analyses with surrogate

recoveries outside the acceptance criteria include appropriate data qualifiers

The recovery for a surrogate is calculated using the following equation:

$$\% \text{Recovery} = \frac{\textit{ConcentrationFound}}{\textit{ConcentrationAdded}}\, x100\%$$

Where:

Concentration found = Result obtained after analysis
Concentration added = Amount of surrogate spiked

27.3 Proficiency Test Samples or Interlaboratory Comparisons

27.3.1 Compliance to Accreditation Requirements

The laboratory analyzes at least two TNI-compliant PT samples per calendar year for each accreditation Fields of Proficiency Testing (FoPT) for which the laboratory is accredited. An exception is made for analytes where there is no PT available from any PTPA approved PT provider at least twice per year. In these cases the lab will run the PTs in the minimum time frame the PTs are available and not at all if they are not available.

For DoD related work, PT samples are obtained from a Proficiency Testing Oversight Body (PTOB)/Proficiency Testing Provider Accreditor (PTPA)-approved PT Provider.

Additional analytes or experimental analytes are analyzed based on specific regulatory program requirements and special client requests at the stipulated frequency such as perchlorate and hexavalent chromium for California ELAP certification and NDMA for certain client requests performed once a year.

The successive PTs are analyzed at least five months apart and no more than 7 months apart unless the PT is being used for corrective action to maintain or reinstate accreditation, in which case the dates of successive PT samples for the same accreditation FoPT is at least fifteen days apart.

The goal for PT results is obtaining 100% of all analytes within acceptable limits. When there are results out of the acceptance range, corrective action is initiated to prevent the error from reoccurring. A report with the documentation of the corrective action is also filed.

The following are the proficiency testing programs in which the laboratory currently participates on regular basis:

- Drinking water analysis: WS Studies
- Wastewater analysis: WP studies
- Hazardous waste and soil
- Bacteriological Performance Evaluation Study.

- **Radiochemistry**

27.3.2 PT Sample Handling, Analysis and Reporting

The laboratory does not share PT samples with other laboratories, does not communicate with other laboratories regarding current PT sample results, and does not attempt to obtain the assigned value of any PT sample from the PT provider.

Proficiency Testing (PT) samples are treated as typical samples in the normal production process where possible, including the same analysts, preparation, calibration, quality control and acceptance criteria, sequence of analytical steps, number of replicates, and sample log-in. PT samples are not analyzed multiple times unless routine environmental samples are analyzed multiple times. Where PT samples present special problems in the analysis process, they will be treated as laboratory samples where clients have special requests.

The type, composition, concentration and frequency of quality control samples analyzed with the PT samples are the same as with typical samples.

Prior to the closing date of a study, laboratory personnel do not:

- **Subcontract analysis of a PT sample to another laboratory being run for accreditation purposes.**
- **Knowingly receive and analyze a PT for another laboratory being run for accreditation purposes.**
- **Communicate with an individual from another laboratory concerning the analysis of the PT sample.**
- **Attempt to find out the assigned value of a PT from the PT Provider.**

The laboratory's procedure for handling low level PT samples is explained in SOP MIS015.

The laboratory institutes corrective action procedures for failed PT samples following the guidelines in Section 14 – "Corrective Action" and SOP MIS015.

Retention of PT records is similar to that maintained for regular environmental samples. In addition the lab maintains a copy of the online data entry summary when the PT results are submitted online.

27.4 Data Review

The laboratory reviews all data generated in the laboratory for compliance with method, laboratory and, where appropriate, client requirements.

Initially, the analyst reviews data for acceptability of quality control measures and accuracy of the final result(s).

After the initial review, a second reviewer, a technically qualified person, such as a supervisor or another chemist, experienced in that particular method or procedure considers all manual transfers and calculations of data in detail and spot checks all electronic transfers of data.

Final reports are compared to raw data either directly or through several reviewed steps.

Internal data review consists of a tiered or sequential system of verification, consisting of at least three tiers, with each check performed by a different person. The three tiers include a 100% review of the entire data package and completion of corresponding Data Review Checklist the analyst, then a verification review by a technically qualified person, such as a supervisor or another chemist, experienced in that particular method or procedure, who checks for proper integration of peaks, identification of compounds, QC, data qualifiers, electronic transfer of data (if not performed automatically), etc. The third review is mainly an administrative one, to check for accuracy and completeness, typically performed by the Project Manager in charge of that project. The procedures used for performing the data review are detailed in the SOP MIS018.

If a discrepancy is noted in any stage of the reviewing process, the package is returned to the primary analyst for corrective action. For analyses that do not have automatic data reduction, the analyst performs the necessary calculations to obtain the final result, and then the results are reviewed as indicated above.

All information used in the calculations (e.g., raw data, calibration files, tuning records, results of standard additions, interference check results, sample response, and blank or background correction protocols) as well as sample preparation information (e.g., weight or volume of sample used, percent dry weight for solids, extract volume, dilution factor used) are recorded in order to enable reconstruction of the final result.

Section 28

REPORTING THE RESULTS
(TNI V1:M2 – Section 5.10)

The result of each test performed is reported accurately, clearly, unambiguously, and objectively and complies with all specific instructions contained in the test method.

Laboratory results are reported in a test report or "Certificate of Analysis" that includes all the information requested by the client and necessary for the interpretation of the test results and all information required by the method used. This report could be either as a hard copy or an electronic data transfer or other electronic format.

Data are reported without qualification if they are greater than the lowest calibration standard, lower than the highest calibration standard, and without compromised sample or method integrity.

28.1 Test Reports

The report format has been designed to accommodate each type of test performed and to minimize the potential for misunderstanding or misuse.

The laboratory does not issue multiple reports for the same samples where there is different information on each report unless required to meet regulatory needs and approved by the Quality Manager.

Each test report generated contains the following information:

a) a title, such as "Certificate of Analysis";

b) the name, address and phone number of the laboratory and name of the contact person (project Manager);

c) unique identification of the test report, such as a serial number, on each page and a pagination system that ensures that each page is recognized as part of the test report and a clear identification of the end of the report, such as 3 of 10;

d) the name and address of the client;

e) the identification of the method used;

f) a description of, the condition of, and unambiguous identification of the sample(s) tested, including the client identification code and client project name and number if available;

g) the date of sample receipt when it is critical to the validity and application of the results, date and time of sample collection, dates the tests were performed,

the time of sample preparation and analysis if the required holding time for either activity is less than or equal to 72 hours;

h) reference to the sampling plan and procedures used by the laboratory where these are relevant to the validity or application of the results;

i) the test results, units of measurement, an indication of when results are reported on any basis other than as received (e.g. dry weight), failures identified (Data Qualifiers list - Appendix G);

j) the name, function, and signature or an equivalent electronic identification of the person authorizing the test report, and the date of issue;

k) where relevant, a statement to the effect that the results relate only to the samples;

l) Any non-accredited tests or parameters shall be clearly identified as such to the client when claims of accreditation to this Standard are made in the analytical report or in the supporting electronic or hardcopy deliverables; and

m) A statement that the report shall not be reproduced except in full without written approval of the laboratory.

Exceptions to this standard approach for reporting are allowed with the approval of the QA Manager and should be documented; for DoD related work, both date and time of preparation and analysis are considered essential information, regardless of the length of the holding time, and shall be included as part of the laboratory report. If the time of the sample collection is not provided, the laboratory must assume the most conservative time of day (i.e., earliest).

28.2 Supplemental Test Report Information

When necessary for interpretation of the results or when requested by the client, test reports include the following additional information:

a) deviations from, additions to, or exclusions from the test method, information on specific test conditions, such as environmental conditions, and any non-standard conditions that may have affected the quality of the results, and any information on the use and definitions of data qualifiers;

b) a statement of compliance/non-compliance when requirements of the management system are not met, including identification of test results that did not meet the laboratory and regulatory sample acceptance requirements, such as holding time, preservation, etc.;

c) where applicable and when requested by the client, a statement on the estimated uncertainty of the measurement;

d) where appropriate and needed, opinions and interpretations. When opinions and interpretations are included, the basis upon which the opinions and interpretations are documented. Opinions and interpretations are clearly marked as such in the test report.

e) additional information which may be required by specific methods or client;

f) qualification of results with values outside the calibration range as appropriate.

In addition to the items above, for test reports that contain the results of sampling, the following is provided when necessary for the interpretation of the results and if the information is available:

a) the date and time of sampling;

b) unambiguous identification of the material sampled;

c) the locations of the sampling;

d) a reference to the sampling plan and procedures used;

e) details of any environmental conditions during sampling that may affect the interpretations of the test results;

f) any standard or other specification for the sampling method or procedure, and deviations, additions to or exclusions from the specification concerned.

28.3 Environmental Testing Obtained from Subcontractors

Test results obtained from tests performed by subcontractors are clearly identified on the test report by subcontractor name and/or accreditation number.

The subcontractors report their results in writing or electronically. A copy of the subcontractors report is made available to the client if requested.

28.4 Electronic Transmission of Results

All test results transmitted by telephone, fax, telex, e-mail, or other electronic means comply with the requirements of the TNI Standard and associated procedures to protect the confidentiality and proprietary rights of the client (see Section 22- "Environmental Methods and Method Validation").

28.4.1 Electronic Data Deliverables

The IT Manager and Project Manager coordinate report generation using Promium Element DataSystem LIMS with assistance from the Office Assistant. The reporting requirements and the process to generate reports are described in Standard Operating Procedure MIS053. However, since each client may require their own format, SOP MIS053 generally addresses how to verify the EDD to insure its accuracy and agreement with the final report. Weck Laboratories, Inc. makes a concerted effort, whenever possible, to reduce the amount of hand entering of data to avoid transcription errors. Results from the instruments are electronically processed into the LIMS using Promium's Data Tool or various other electronic means (typically Microsoft Excel).

28.5 Amendments to Test Reports

Material amendments to a test report after it has been issued are made only in the form of another document or data transfer. All supplemental reports meet all the requirements for the initial report and the requirements of this *Quality Manual*.

Amended test reports include the statement, "Supplement to Certificate of Analysis, identification number' or an equivalent form of wording to assure they can be differentiated from other test reports.

When it is necessary to issue a complete new report, the new report is uniquely identified and contains a reference to the original that it replaces.

Appendix A

Ethics and Data Integrity Policy

Weck Laboratories, Inc. has developed a proactive program for prevention and detection of improper, unethical or illegal actions. A main component of this program is the periodic training and communications that the employees receive from management about the ethics policy and the utmost importance of an honest and ethical behavior in all activities performed at the laboratory.

Proper ethical conduct in the laboratory is strictly enforced. The Company's Code of Ethics is presented to current and prospective employees in both the QA manual and the Employee Handbook.

The Data Integrity Plan, which includes the description of the data integrity procedures, serves to combine the elements currently in place and document further procedures to ensure our compliance with requirements in the TNI standard and from other regulatory agencies.

These procedures include the following elements:

- **data Integrity training**
- **signed data integrity documentation for all laboratory employees**
- **in-depth, periodic monitoring of data integrity**
- **data integrity procedure documentation.**

The data integrity procedures are signed and dated by senior management. These procedures and the associated implementation records are properly maintained and made available for assessor review. The data integrity procedures are annually reviewed and updated if necessary by management.

The Data Integrity Plan also provides a mechanism for confidential reporting of data integrity issues in the laboratory. A primary element of the mechanism is to assure confidentiality and a receptive environment in which all employees may privately discuss ethical issues or report items of ethical concern. In instances of ethical concern, the mechanism also includes a process whereby laboratory management is to be informed of the need for any further detailed investigation.

Each employee is required to understand and sign a Data Integrity Agreement, contained in the Data Integrity Plan document. The Laboratory Ethics seminar that is presented as a refresher to current employees on an annual basis and as part of the hiring process for new employees include elements describing examples of improper and illegal actions, how to identify appropriate and inappropriate laboratory and instrument manipulation practices, guidance for manual integration practices and consequences of unethical or improper behavior.

Punishment for improper, illegal or unethical activities range from suspension to termination, depending on the degree and nature of the unethical activity.

Employees are required and encouraged to bring up to management any improper activities they detect or are suspicious of. Any incident reported is immediately investigated by the management and the person or persons involved are subject to disciplinary actions.
The Management shall also monitor the program for detecting improper, unethical or illegal action by performing internal proficiency testing (single or double blind), reviewing of analytical data post-analysis, performing electronic data audits using special software as Mint Miner® and providing an open door policy for employees to report any suspicious activity without fears.

In order to assist the laboratory technical personnel in performing their duties without detrimental influences, it is the policy of the Company that the laboratory be impartial and that it and its personnel are free from any undue commercial, financial and other pressures which might influence or adversely affect their normal performance having an impact on the quality of the work they produce or their technical judgment. By this policy all laboratory personnel dedicated to technical activities should not be influenced by, or involved in any financial or commercial matter while performing laboratory work. If any employee feels that he or she might be under any kind of pressure as described above, the Laboratory Director must be notified immediately. Additionally, the Laboratory will not engage in any activities that may endanger the trust in its independence of judgment and integrity in relation to its environmental testing.

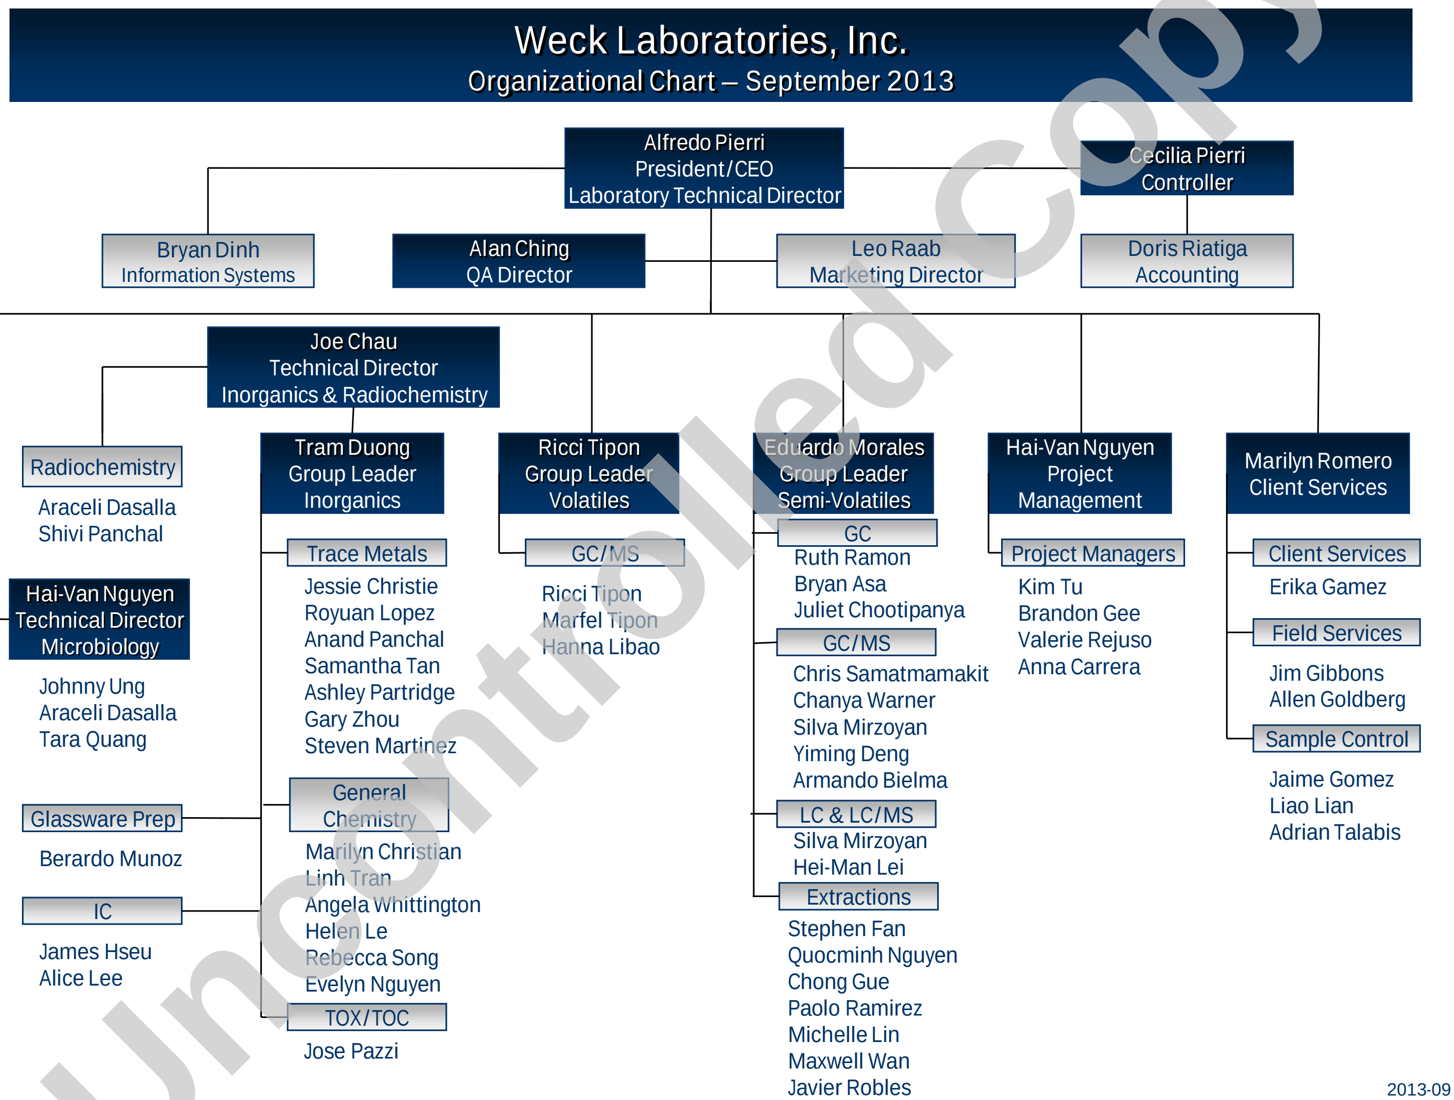
CODE OF ETHICS

Weck Laboratories, Inc. is committed to ensuring the integrity of our data and meeting the quality needs of our clients. We pledge to manage our business according to the following principals:

- **To produce results that are technically sound and legally defensible;**
- **To assert competency only for work for which adequate equipment and personnel are available;**
- **To present services in a confidential, honest, and forthright manner;**
- **To have a clear understanding with the client as to the extent and kind of services to be rendered;**
- **To provide employees with guidelines and an understanding of the ethical and quality standards required in this industry;**
- **To operate facilities in a manner that protects the environment and the health and safety of employees and the public;**
- **To obey all pertinent federal, state, and local laws and regulations;**
- **To continually improve product and service quality;**
- **To treat employees equitably, acknowledge their scientific contributions, and provide them with opportunities for professional growth and development;**
- **To recognize and respond to community concerns; and**
- **To deal openly, honestly, and fairly in all business and financial matters with employees, clients and the public.**

Appendix B

Laboratory Organization Chart and Resumes of Key Personnel



RESUMES OF KEY PERSONNEL

Name	Position
Alfredo Pierri	President – Laboratory Director
Alan Ching	Director of QA - QA Officer
Joe Chau	Technical Director Inorganics/Radiochemistry and Safety Officer
Hai-Van Nguyen	Technical Director Microbiology - Senior Project Manager
Ricci Tipon	Technical Director Volatile Organics
Marilyn Romero	Customer Service Manager
Tram Duong	Inorganic Section Group Leader
Eduardo Morales	Organic Section Group Leader

ALFREDO E. PIERRI

Title

President, Laboratory Director

Education

M.S. (equiv.) - University of Buenos Aires, Argentina, 1978. Organic Chemistry

- University of California, Los Angeles
Certificate in Hazardous Materials Control and Management, 1991 - 1993

Affiliations

American Chemical Society, member
American Council of Independent Laboratories (ACIL), member
The NELAC Institute, member
AOAC, member

Professional Experience

Jan/1987 to Present	**Weck Laboratories, Inc., City of Industry, CA** **Full Service Environmental Testing laboratory**
Sep/1984 to Dec/1986	**SCS Engineers, Long Beach, CA** **Environmental Testing laboratory**
Jul/1979 to Aug/1984	**Argentina Atomic Energy Commission, Buenos Aires** **Government Agency – Research and Development**

Mr. Pierri has extensive experience in analytical chemistry. Most of his work in this field has been in the application and development of instrumental methods of analysis for organic analytes using GC, GC/MS, HPLC, IR and UV-Visible spectrometry. He has also worked in Spectrometric techniques for metals analysis such as Atomic Absorption with flame and graphite furnace and Inductively Coupled Plasma with Optical Emission and Mass Spectrometry.

Since 1984 he has been working exclusively in the environmental field obtaining in 1993 the certification as Registered Environmental Assessor (REA-04975) from the California Environmental Protection Agency.

As Laboratory Director, Mr. Pierri is responsible for all laboratory operations including the supervision of the overall performance of the laboratory, revision of analytical reports and Quality Assurance Program, provision of technical assistance and direction to laboratory personnel and consulting with clients about technical and regulatory issues.

Mr. Pierri is well acquainted in all aspects of environmental regulations at Federal and State level, providing consulting services and guidance to clients in regulatory compliance and chemical treatment issues as well as understanding and interpreting analytical data.

Other relevant experience and projects in which Mr. Pierri has participated are as follows:

- **For over 22 years provided Project Management for large environmental monitoring projects for wastewater treatment plants, desalination plants, groundwater studies, potable water compliance monitoring and unregulated contaminants studies managed by the EPA such as ICR, UCMR 1 and UCMR 2. These projects required dealing with significant technical issues, regulatory compliance and innovative analytical methods.**
- **Characterization of wastes to be classified as hazardous as per State of California and Federal Regulations.**
- **Developing of analytical methods for emerging contaminants in water using GC/MS, LC/MS and other analytical techniques and writing the operating procedures.**
- **Identification and selection of new laboratory equipment for the laboratory**
- **Determination of contamination in soil and groundwater due to leaking underground storage tanks.**
- **Design and implementation of a Quality Assurance Program based on NELAC requirements for the laboratory, writing of the QA manual and training of laboratory personnel.**
- **Developing and implementation of an Ethics Training Program for the Laboratory, writing the documentation and training course for laboratory employees.**
- **Interpretation of analytical data and compliance with regulations for drinking water for different potable water purveyors in Southern California.**
- **Compliance for wastewater discharges with local regulatory agencies and NPDES permits.**
- **Consulting services to industrial clients on pre-treatment of effluents in order to minimize organic matter and solids and reduce costs in taxes imposed by POTWs.**
- **Identification of unknown materials by chemical and physical methods.**
- **Implementation of a LIMS and use of personal computers for data acquisition, handling, and reporting.**
- **Teaching of Analytical Organic Chemistry at University Level for MS program.**

Participation in Seminars and Conferences

Over the years, Mr. Pierri has participated in innumerable conferences and technical meeting involving environmental testing, environmental policy and remediation.

He has been speaker in several conferences and technical meetings related to environmental monitoring in general and emergent contaminants in particular.

ALAN CHING

Title

Director of Quality Assurance/QA Manager

Education

B.S. - Chu Hai College, Hong Kong, 1985
Chemistry
Shangai University of Technology, China
Analytical Chemistry Courses 1978 - 1981

M.S. - California Polytechnic University, Pomona
Analytical Chemistry, 1997

Professional Experience

Oct/1990 to Present	**Weck Laboratories, Inc., City of Industry, CA** **Full Service Environmental Testing laboratory**
Jan/1985 to Jun/1989	**Dinippon Ink and Chemical, Sheng Zheng, China** **Chemical Manufacturing Company**

Mr. Ching' primary experience is in the organic analysis field although he has performed as bench chemist inorganic and metal analyses as well. At Weck Labs, he has hands on experience in GC, GC/MS, HPLC and organic extractions.
Mr. Ching has developed many analytical procedures for volatile organic compounds, pesticides, herbicide and semivolatile organic analysis.
As lab supervisor, Mr. Ching has provided training and technical advice to bench chemists in the organic section.
Mr. Ching has also served in the past as QA Manager being instrumental in developing the QA/QC program, obtaining accreditation under NELAC for the laboratory, writing the QA Manual and monitoring its implementation.
Mr. Ching also provides technical support to clients in the areas of Quality Assurance, analytical chemistry and regulatory compliance.

Other relevant experience and projects in which Mr. Ching has participated are as follows:

- **Project Management for ICR, UCMR 1 and UCMR 2 analysis, including method development, interaction with Utilities and reporting to the EPA.**

- **Analysis of environmental samples for metals, and other elements by atomic absorption and ICP spectrometry using flame, hydride generation, cold vapor and graphite furnace.**

- **Hazardous waste characterization by different analytical techniques.**

- **Maintenance and troubleshooting of GC, GC/MS and HPLC instrumentation.**
- **Separation and detection of four different arsenic compounds using ion exchange chromatography and UV detection. (Master's degree project).**
- **Development of new methods for UCMR testing and other emergent contaminants**
- **Developing a comprehensive QA/QC program for the Laboratory in compliance with NELAC and ISO 17025.**

Participation in Seminars and Conferences

Mr. Ching regularly attends many technical meeting regarding technical and regulatory issues. He has participated in NELAC conferences and other meeting related to Quality Assurance and regulatory compliance issues.

JOE CHAU

Title

Technical Director Inorganic

Education

B.S. - California Polytechnic University, Pomona, CA, 1988
Electrical Engineering

B.S. - California Polytechnic University, Pomona, CA, 1988
Chemistry, Industrial Option

- University of California, Irvine
Certificate in Hazardous Materials Control and Management, 1991

Professional Experience

Sep/1989 to Present	**Weck Laboratories, Inc., City of Industry, CA** **Full Service Environmental Testing laboratory**
Sep/1988 to Sep/1989	**Lights of America, Walnut, CA** **Electrical Engineering**

Mr. Chau has extensive experience in environmental analysis, especially for inorganic and physical parameters.
He has been working as analytical chemist for inorganic and wet chemistry determinations, metal analyses by Flame and Graphite furnace AA, ICP, ICP-MS and Cold vapor AA and AF.
Mr. Chau has been instrumental in developing analytical methods for trace metal analyses in a variety of matrices, including brines and sea water. He has also developed for the laboratory especially methods for physical parameters, metal speciation and non-routine determinations.
As lab supervisor, Mr. Chau has provided guidance, technical advice and training to bench chemists and other lab personnel and has managed lab operations to improve logistics such as sample receiving and project management

Mr. Chau is an expert in spectroscopic analysis and provides advice to clients about technical and QA/QC issues.

Other relevant experience and projects in which Mr. Chau has participated are as follows:

- **Coordination of monitoring projects that requires large number of analysis on short turnaround time for metals.**

- **Supervision of lab personnel for the Inorganic Section**

- **Development of analytical procedures for the determination of environmental samples by ICP-MS in particularly difficult matrices**

- **Develop of methods by atomic fluorescence and amalgamation for ultra trace level analysis of mercury.**
- **Design of a clean room and develop protocols for its operation for analysis of trace metals in ambient waters and ultra trace levels of mercury**
- **Maintenance and troubleshooting of spectroscopy instrumentation.**
- **Design and improvement of sample digestion procedures for metal analysis to reduce contamination and improve recoveries.**
- **Development of analytical methods for speciation analysis of metals, including the use of hyphenated analytical techniques.**

Participation in Seminars and Conferences

During his time at Weck Laboratories, Mr. Chau has participated in many technical and user meetings provided by spectroscopy equipment manufacturers, such as Perkin Elmer, Thermo and Agilent.
He routinely participates in technical conferences about environmental analysis, where technical issues, new techniques and regulatory subjects are discussed; they include NEMC, NELAC and Pittcon, among others.

HAI-VAN NGUYEN

Title

Senior Project Manager – Technical Director Microbiology

Education

B.S. - California Polytechnic University, Pomona, CA, 2000
Biology, Minor in Chemistry

University of California, Irvine, CA, 2008
Environmental management Certificate Program

Professional Experience

Apr/2000 to Present **Weck Laboratories, Inc., City of Industry, CA**
Full Service Environmental Testing laboratory

Ms. Nguyen has extensive experience in the environmental laboratory. She has been a bench chemist for inorganic, bacteriological testing, HPLC, GC and GC/MS, which has given her a well rounded view of the operation of the environmental laboratory in all its aspects. Other important tasks completed include assisting the QA Manager in preparing SOPs and updating the program.
As Technical Director for Microbiology she oversees the department and provides training to analysts.
Ms. Nguyen is also very well versed in compliance regulations for potable water and wastewater programs, as well as interpretation of analytical data.
In her position as Senior Project Manager, she has managed many large environmental projects for potable water, wastewater and groundwater investigations, proving consulting to clients and interacting with regulatory agencies.

Other relevant experience and projects in which Ms. Nguyen has participated are as follows:

- **Managing testing projects for large clients.**
- **Assisting the QA Manger in supervising and designing QA/QC operations.**
- **Writing and upgrading of SOPs.**
- **Evaluation and reviewing analytical data for inorganic analysis, HPLC, GC, GC/MS and wet chemistry methods.**
- **Reviewing analytical data for microbiological determinations and providing technical support to analysts.**

Participation in Seminars and Conferences

Ms. Nguyen regularly participates in technical seminars and meeting regarding regulatory compliance issues.

RICCI TIPON

Title

Group Leader – Technical Director GC/MS volatiles

Education

B.S. - University of the Philippines at Los Banos, 1986
Microbiology

Professional Experience

Aug/1996 to Present	**Weck Laboratories, Inc., City of Industry, CA** **Full Service Environmental Testing laboratory**
Apr/1996 to Aug/1996	**RCH Laboratories, Dominguez, CA** **Wastewater testing Laboratory**
Jul/1992 to Apr/1996	**LVD Phils, Inc., Philippines** **Pharmaceutical Manufacturing Company**

**Ms. Tipon has extensive experience in the analysis of volatile organic compounds by GC/MS using purge and trap as the front end. She provides troubleshooting and maintenance of instruments, training of analysts and develops and improves analytical methods used for volatile organic constituents in potable water, wastewater, groundwater and soil.
Ms. Tipon has also experience in the analysis of semivolatile organics by GC and GC/MS and helps in performing secondary data review of analytical batches for these techniques.
As a microbiologist, Ms. Tipon provides consulting to lab personnel in the Microbiology department.**

Other relevant experience and projects in which Ms. Tipon has participated are as follows:

- **Microbiological determinations in environmental samples**
- **Review data packages generated by GC/MS for volatile and semivolatile organics**
- **Development of analytical methods for trace level contaminants in water by Purge and Trap and GC/MS**
- **GC/MS troubleshooting and maintenance**
- **Analysis of water, wastewater, soil and hazardous waste samples by GC/MS for volatile organics**
- **Analysis of air samples by GC/MS.**

MARILYN ROMERO

Title

Customer Service Manager - Project Coordinator

Education

Mt. San Antonio College, Walnut, CA. AA, Liberal Arts, 1991

Certification

Grade II Water Treatment Operator CA DHS

Professional Experience

Mar/1985 to Present	**Weck Laboratories, Inc., City of Industry, CA** **Full Service Environmental Testing laboratory**

Ms. Romero has extensive experience in customer service providing assistance to large and medium size environmental testing projects with logistic support and report preparation. She has also successfully provided Project Management to a large number of potable water and wastewater testing projects.
Ms. Romero is also very knowledgeable about environmental regulations, especially in the field of potable water testing.

Other relevant experience and projects in which Ms. Romero has participated are as follows:

- **Sample log-in including verification of proper containers, storage conditions, holding times and documentation. Sample custodian**
- **Preparation of analytical reports using LIMS and other computer programs.**
- **Customer support for environmental analysis.**
- **Archival and retrieval of analytical results and related documentation.**
- **Project Management**

TRAM DUONG

Title

Group Leader – Inorganic Section

Education

B.S. - University of Southern California, 1998
Nursing Minor Biology

Professional Experience

Jul/2000 to Present **Weck Laboratories, Inc., City of Industry, CA**
Full Service Environmental Testing laboratory

Ms. Duong is responsible for the supervision of the section performing metal analyses (ICP, ICP-MS, and CVAA) and wet chemistry determinations. She performs training of personnel, troubleshooting and maintenance of equipment and data review.
As a bench chemist, Ms. Duong became very familiar with the operation of all instrumentation within her section and has been instrumental in selecting and setting up new lab equipment.
Ms. Duong duties also involve scheduling daily tasks and performing data reviews. She also assists the Technical Director with tasks related to the section and interacts with the QA Manager.

Other relevant experience and projects in which Ms. Duong has participated are as follows:

- **Developing analytical methods by ICP and ICP-MS for environmental samples.**
- **Improving analytical methods by optimizing conditions for different analytical methods.**
- **Writing Standard Operating Procedures for newly developed methods and recertifying current SOPs.**
- **ICP and ICP-MS troubleshooting and maintenance**

Participation in Seminars and Conferences

Mr. Duong regularly attends user meetings and technical seminars for subjects related with his field.

EDUARDO MORALES

Title

Group Leader – GC/MS semivolatiles

Education

B.S. - California State University, Los Angeles, 2001
Biochemistry

Professional Experience

Jul/1999 to Present **Weck Laboratories, Inc., City of Industry, CA**
Full Service Environmental Testing laboratory

Mr. Morales is responsible for the operation and maintenance of GC, GC/MS and extraction equipment used for semivolatile organic analysis. Over the years he has developed many methods for emergent contaminant testing using non-routine GC/MS techniques such as MS/MS, CI and PTV.
Mr. Morales also provides training for new analysts in the field of GC and GC/MS and has been involved in the decisions for purchasing new instruments for the section. He also provides secondary reviews on data packages produced in his section.

Other relevant experience and projects in which Mr. Morales has participated are as follows:

- **Developing of methods for ultra trace level analysis of NDMA and other nitrosamines by Liquid-Liquid and Solid Phase extractions coupled with GC/MS in various forms.**
- **Improving GC/MS analytical methods by optimizing conditions.**
- **Writing Standard Operating Procedures for newly developed methods.**
- **GC/MS troubleshooting and maintenance**
- **Developing of methods for emergent contaminants and low level pesticides.**

Participation in Seminars and Conferences

Mr. Morales regularly attends user meetings and technical seminars for subjects related with his field.

ORG046	3	Feb-02	3500	Sample Preparation and Extraction for Hazardous Waste Samples, EPA Method 3500B
ORG047	3	Feb-02	3510	Separatory Funnel Liquid-Liquid Extraction, EPA Method 3510B
ORG048	3	Feb-02	3550	Ultrasonic Extraction, EPA Method 3550B
ORG049	2	Feb-02	3580	Waste Dilution Procedure, EPA Method 3580A
ORG050	3	Mar-02	5030	Purge-and-Trap Extraction Procedure, EPA 5030B
ORG056	2	Feb-02	3520	Continuous Liquid-Liquid Extraction Procedure, EPA Method 3520C
ORG058	5	Mar-02	8082	Analysis of Polychlorinated Biphenyl's (PCBs) in Liquid and Solid Matrices by GC-ECD, EPA Method 8082
ORG059	2	May-12	1666	Determination of Volatile Organic Compounds Specific to the Pharmaceutical Industry by Isotope Dilution GC/MS, EPA Method 1666
ORG060	4	Apr-12	624	Analysis of Volatile Organic Compounds in Wastewater by GC/MS, EPA Method 624
ORG062	7	May-10	9020B	Determination of Total Organic Halides in Water by Adsorption-Pyrolysis-Titrimetric Method, EPA Method 9020B
ORG063	3	Jul-02	9020M	Determination of Total Halogens and Total Extractable Organic Halides in Solid and Oil Matrices, EPA Method 9020B Modified
ORG064	3	Mar-02	608	Analysis of Organochlorine Pesticides and PCBs in Wastewater by GC-ECD, EPA Method 608.
ORG065	13	Oct-09	1625M	Determination of Ultra Low Levels of N-Nitrosodimethylamine (NDMA) by Continuous L-L Extraction and Isotopic Dilution GC/MS. EPA Method 1625C Mod
ORG066	3	Apr-12	8270SIM	Determination of Low Levels of PAHs in Water and Solid Matrices by GC/MS in SIM Mode, EPA Method 8270C-SIM
ORG067	4	May-12	5035	Determination of Volatile Organic Compounds in Soil by Closed-System Purge and Trap and GC/MS, EPA 5035/8260
ORG069	6	May-08	7199	Analysis of Hexavalent Chromium by Ion Chromatography, EPA Method 7199

ORG071	3	Apr-08	8015B - Alc	Analysis of Alcohols by GC-FID, EPA Method 8015B
ORG072	2	Mar-02	515.3	Analysis of Chlorinated Acid Herbicides in Water by Microextraction and GC-ECD, EPA Method 515.3
ORG073	3	Sep-01	505	Analysis of Chlorinated Pesticides and PCBs in Drinking Water by Microextraction and GC-ECD, EPA Method 505
ORG074	3	Mar-10		Identification of Target Analytes via Retention Time
ORG075	2	Mar-01	552.2	Analysis of Haloacetic Acids by Microextraction and GC-ECD, EPA 552.2
ORG076	2	031/2002	maint	Instrument Maintenance for Organic Analysis
ORG077	4	May-08	218.6	Analysis of Hexavalent Chromium in Water by Ion Chromatography, EPA 218.6
ORG078	2	May-12	524.2M	Analysis of tert-butyl alcohol (TBA) in drinking water by EPA 524.2M
ORG079	2	Jun-11	LUFT GC/MS	Analysis of Volatile Gasoline Range Petroleum Hydrocarbons (C_6 to C_{10}) and BTEX-MTBE in soil and water samples by Purge and Trap and GC/MS, LUFT Method
ORG080	1	Jan-02	528	Analysis of Phenols in Drinking Water by SPE and GC/MS, EPA Method 528
ORG081	1	Jan-02	526	Analysis of Selected SVOA in Drinking Water by SPE and GC/MS, EPA Method 526
ORG083	2	Jan-10	TCP-PT	Analysis of Low Levels of 1,2,3-Trichloropropane by Purge and Trap and GC/MS SIM mode, SRL Method
ORG085	2	Aug-07	556	Analysis of Aldehydes by Microextraction and GC-ECD, EPA Method 556
ORG086	1	Jul-02	3535	Solid Phase Extraction Procedures - Manual and Automated, EPA Method 3535
ORG087	3	Jul-11	300.1	Analysis of Low Levels of Oxyhalides by Ion chromatography, EPA Method 300.1
ORG088	2	May-08	532	Analysis of Diuron and Linuron in Water by SPE and HPLC-UV, EPA Method 532
ORG090	2	Aug-12	8270SIM	Determination of Low Levels of Phenols compounds in Water and Solid Matrices by GC/MS in SIM Mode, EPA Method 8270C-SIM
ORG091	3	Jun-08	326	Analysis of Low Level Chlorite, Chlorate and Bromate by Ion Chromatography and Post-column derivatization, EPA Method 326
ORG092	2	Jan-08	OSHA 20M	Analysis of Hydrazine by HPLC, OSHA Method 20M (Modified)
ORG094	2	May-09	8316	Analysis of Acrylamide by HPLC, EPA Method 8316
ORG095	1	Sep-05	1614M	Analysis of PBDEs by isotopic dilution GC/MS-EI, EPA Method 1614 Modified
ORG096	1	Nov-06	orgtin	Determination of Low Levels Organotins by GC-MS.
ORG097	2	Apr-10	332	Analysis of Low Level Perchlorate by IC-MS/MS, EPA Method 332.0
ORG099	3	Apr-10	331	Analysis of Low Level Perchlorate by LC-MS/MS, EPA Method 331.0
ORG100	2	Mar-08	535	Analysis of Chloroacetanilide/acetamide Herbicides by LC/MS, EPA Method 535
ORG101	1	Mar-06	521	Analysis of Nitrosamines by SPE-GC/MS/MS EPA Method 521
ORG102	2	Mar-08	527	Analysis of Pesticides and Flame Retardants by SPE-GC/MS EPA Method 527
ORG103	2	Nov-08	529	Analysis of Explosives by SPE-GC/MS EPA Method 529
ORG104	1	May-06	9056	Analysis of Iodide by Ion Chromatography, EPA Method 9056
ORG107	1	Oct-06	6850	Analysis of Perchlorate at Low Levels in water and soil matrices by LC-MS/MS, EPA Method 6850
ORG108	1	Jan-07	556M	Analysis of Aldehydes in Solid/Soil by GC-ECD, EPA Method 556 Modified
ORG109	1	Sep-07	1671	Analysis of Triethanolamine by Direct Injection and GC-FID

ORG110	1	Dec-07	D7065	Analysis of Alkyl Phenols and Alkyl Phenol Ethoxylates by L-L extraction and GC/MS full scan and SIM, ASTM Method D7065
ORG111	2	Mar-09	1694M	Analysis of Pharmaceuticals, Personal Care Products and Endocrine Disruptive Compounds LC-MS/MS.
ORG113	1	May-08	632M	Determination of Diuron in solid matrices
ORG114	1	Jun-08	IC/MS/MS	Analysis of 4-Chlorobenzenesulfonic acid (pCBSA) by IC/MS/MS
ORG115	1	Aug-09	525.2	Determination of organophosphorous pesticides in drinking water by liquid-solid extraction and capillary column GC/MS, via EPA Method 525.2
ORG116	1	Aug-08	8316M	Analysis of Acrylamide by LC/MS/MS
ORG117	1	Dec-11	GCMS CI	Analysis of Pyrethroid Pesticides in Water and Soil/Sediment by Extraction and GC/MS in NCI mode and SIM
ORG118	2	Apr-11	537	Analysis of Perfluorinated Compounds in Water by LC-MS/MS
ORG119	1	Aug-09	607M	Analysis of NDMA and DMN and Bromacil by EPA Method 607 modified
ORG120	1	May-09	SM6040D	Analysis of MIB and Geosmin by on line SPME and GC/MS/MS, SM6040D
ORG121	1	Dec-10	LC/MS-MS	Analysis of Bicine by LC/MS-MS
ORG122	1	May-11	8270M-QQQ	Analysis of Low Level Pesticides by Tandem GC/MS/MS
ORG123	1	Nov-10	8270M-QQQ	Screening for PCB congeners by Tandem GC/MS/MS
ORG124	1	Jul-11	522	Determination of 1,4-Dioxane in Drinking Water by SPE and GC/MS SIM
ORG125	1	Jul-11	524.3	Determination of Volatile Organics in Water by Purge & Trap and GC/MS
ORG126	1	Sep-11	539	Determination of Hormones in water by SPE and LC/MS/MS
ORG127	2	Apr-12	1613M	Analysis of 2,3,7,8-TCDD in Drinking Water by Tandem GC/MS/MS, EPA Method 1613 Modified
ORG128	1	May-09	Algal Toxins	Analysis of Algal Toxins in Water by LC/MS/MS
ORG129	1	May-09	Melamine	Analysis of Melamine in Water by LC/MS
ORG130	1	Dec-11	218.7	Analysis of Hexavalent Chromium in Drinking Water by IC with Post-Column Derivatization and UV Detection
ORG131	1	Aug-12	SM5310B	Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) by Combustion, SM 5310B
ORG132	2	Nov-12	9060M	Total Organic Carbon (TOC) and Inorganic Carbon (IC) in Soil and Solid Matrices by Dry Combustion and NIR detection, EPA Method 9060 modified
ORG133	1	Nov-12	USP<643>	Total Organic Carbon (TOC) for Equipment Cleaning Validation by Direct Swab Combustion, USP <467>
ORG134	1	Dec-12	LCMS	Analysis of nicotine by LC/MS/MS
ORG135	1	Jan-13	RSK175	Analysis Hydrocarbons and COS in water by Headspace and GC-FID/TCD by Method RSK-175
ORG136	1	Mar-13	8270M-QQQ	Determination of Low Levels of PAHs in Water by SPE and tamdem GC/MS/MS, EPA Method 8270 Modified-QQQ
ORG137	1	Aug-13	524.4	Determination of Volatile Organics in Water by Purge & Trap using nitrogen as purge gas and GC/MS

Updated 09/30/13

Appendix F

Laboratory Accreditation / Certification / Recognition

Weck Laboratories, Inc. maintains the following certifications and accreditations with numerous state and national entities:

Organization	Certificate Number
NELAP (CA Accrediting Body)	**04229CA**
State of California ELAP	**1132**
USEPA – UCMR 2 Accreditation	**CA00211**
State of Nevada	**CA211-2004-41**
State of Hawaii	**N/A**
State of New Jersey	**CA015**
Guam Environmental Protection Agency	**09-007r**
Los Angeles County Sanitation Districts	**10143**
South Coast Air Quality Management District	**93LA107**

The certificates and parameter lists (which may differ) for each organization may be found in the company web page at http://www.wecklabs.com/Resources/Certifications.aspx

If accreditation is terminated or suspended, the laboratory will immediately cease to use the certificate number reference in any way and inform clients impacted by the change.

Appendix G

Data Qualifiers

Qualifier	Description
B	Blank contamination. The analyte was found in the associated blank as well as in the sample.
B-01	This analyte was found in the method blank, which was possibly contaminated in the lab during preparation. The reporting limit was raised due to the contamination.
B-04	Analyte was found in the travel blank, which was possibly contaminated in the lab during preparation. The batch was accepted since this analyte was not detected for all the samples in the batch.
B-06	This analyte was found in the method blank, which was possibly contaminated during sample preparation. The batch was accepted since this analyte was either not detected or more than 10 times of the blank value for all the samples in the batch.
B-07	This analyte was found in the method blank at levels above the MDL but below the reporting limit.
B-08	Analyte is found in the method blank, which was possibly contaminated during sample preparation.
B-field	No field blank was either received or specified in this batch. Therefore, samples were analyzed without field blank.
BOD-01	The sample dilutions set-up for the BOD analysis did not meet the oxygen depletion criterion of at least 2 mg/l, therefore the reported result is an estimated value only.
BOD-02	The sample dilutions set up for the BOD analysis did not meet the criterion of a residual dissolved oxygen of at least 1 mg/l, therefore the reported result is an estimated value only.
BOD-03	The sample dilutions set-up for the BOD analysis did not meet the final DO reading with a value of equal or greater than 1 mg/l, therefore the reported result is an estimated value only.
BR	Analyte was found in the method blank, which was possibly contaminated in the lab during preparation. The reporting limit was raised to account for the contamination.
BS-01	The recovery of this analyte in the BS/LCS was over the control limit due to a possible contamination. The batch was accepted based on another acceptable BS and/or MS and MSD that meet the BS criteria.
BS-03	The recovery of this analyte in the BS/LCS was outside the control limits. The sample result was accepted based on another acceptable BS/LCS and/or MS and MSD that meet BS criteria.

BS-04	The recovery of this analyte in LCS or LCSD was outside control limit. Sample was accepted based on the remaining LCS, LCSD or LCS-LL.
BS-H	The recovery of this analyte in the BS/LCS was over the control limit. Sample result is suspect.
BS-L	The recovery of this analyte in the BS/LCS was below the control limit. Sample result is suspect.
CN-1	See case narrative for an explanation of results.
CN-2	See Case Narrative
COD_Cl	COD result is analyzed with chloride correction.
DI_WET	On Deionized Water W.E.T extract (STLC).
DryWt	The result is in dry weight basis.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate (CLP E-flag).
E-01	The concentration indicated for this analyte is an estimated value above the calibration range.
FILT	The sample was filtered prior to analysis.
FP	Formation Potential
GB-Ad	Adjusted Gross Beta equal to total Gross Beta activity minus Potassium-40 activity
HC-02	Hydrocarbon pattern present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
I-03	Low internal standard recovery possibly due to matrix interference or leak in system. The result is suspect.
I-05	Low internal standard recovery possibly due to matrix interference. The result is suspect.
J	Detected but below the Reporting Limit; therefore, result is an estimated concentration.
J-01	No J value detected.
K-40	Potassium-40 calculated based on the concentration of total potassium in mg/L multiplied by the factor 0.82 to convert to activity in pCi/L.
M	Sample result is matrix suspect.
M-01	Result is not valid due to high sample background
M-02	Due to the nature of matrix interferences, sample was diluted prior to preparation. The MDL and MRL were raised due to the dilution.
M-03	Due to insufficient sample volume, sample was diluted prior to preparation. The MDL and MRL were raised due to the dilution.
M-04	Due to the nature of matrix interferences, sample extract was diluted prior to analysis. The MDL and MRL were raised due to the dilution.
M-05	Due to the nature of matrix interferences, sample was diluted prior to analysis. The MDL and MRL were raised due to the dilution.

M-06	Due to the high concentration of analyte inherent in the sample, sample was diluted prior to preparation. The MDL and MRL were raised due to this dilution.
M-07	Due to high concentration of solid particles in the sample, a smaller volume was used for analysis. The MDL and RL were raised due to this dilution.
MIC-2	Result is suspect due to QC failure.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
MS-02	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
MS-03	Multiple analyses indicate the percent recovery is out of acceptance limits due to a possible matrix effect.
MS-04	Visual evaluation of the sample indicates the RPD or QC spike is above the control limit due to a non-homogeneous sample matrix.
MS-05	The spike recovery and/or RPD were outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
MS-06	Due to noted non-homogeneity of the QC sample matrix, the MS/MSD did not provide reliable results for accuracy and precision. Sample results for the QC batch were accepted based on LCS/LCSD percent recoveries and RPD values.
MS-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
MS-08	Due to the nature of matrix interferences, sample was diluted prior to analysis. The MS/MSD could not be quantitated due to the dilution. The batch was accepted based on acceptable LCS recovery.
MS-09	The recoveries of MS/MSD are not valid due to high sample background
MS-10	Due to insufficient sample, LCS/LCSD were analyzed in place of MS/MSD.
MS-11	The QC limits for MS/MSD are not applicable due to positive sample background.
MS-4X	The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
MS-BG	The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to sample background. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
O-02	This result was analyzed outside of the EPA recommended holding time.
O-04	This analysis was performed outside the EPA recommended holding time.

O-05	The extraction for this analyte was performed outside of the EPA recommended holding time.
O-07	Sample date and/or time not provided by client. Therefore, default date and/or time has been entered. The analysis may be outside of recommended holding time.
O-08	The original extraction and/or analysis of this sample yielded QC recoveries outside acceptance criteria. It was re-extracted/re-analyzed after the recommended maximum hold time.
O-09	This sample was received with the EPA recommended holding time expired.
O-10	The original analysis of this sample yielded QC recoveries outside acceptance criteria. It was re-analyzed after the recommended maximum hold time.
O-11	The sample was originally analyzed within holding time. However, it required a dilution and the re-analysis was performed after the recommended holding time had expired.
O-12	The sample was originally analyzed within holding time. However, it was reanalyzed without dilution that exceeded the recommended holding time.
O-14	This analysis was requested by the client after the holding time was exceeded.
O-15	The sample was received with the recommended holding time nearly expired. It was analyzed as soon as possible but the maximum holding time was slightly exceeded.
O-21	This sample was analyzed 1 hour past the EPA recommended holding time.
O-22	This sample was analyzed 2 hours past the EPA recommended holding time.
O-25	This sample was received unpreserved and with the recommended holding time for preservation of 48 hours expired.
P-01	Low recovery due to preservative. Sample data accepted based on passing LCS result.
P-2	Sample received without proper preservation and was preserved at the lab upon receiving.
P-3	The sample was preserved with ascorbic acid, but the pH was >2 possibly due to no, or insufficient preservation with HCl. The sample was not analyzed within 24 hours, as required by method for sample with pH>2.
P-5	Due to the nature of the sample matrix a 1:10 dilution was necessary to perform a corrosivity measurement.
Q	One or more quality control criteria failed.
Q-01	The recovery of this analyte in QC sample was outside control limits. Sample was justified as ND based on the low level standard at or below the reporting limit.
Q-02	Low recovery of this analyte in the QC sample. The analysis of the low level standard produced acceptable recovery indicating that the sample result might be accurately reported as Not Detected.

Q-08	High bias in the QC sample does not affect sample result since analyte was not detected or below the reporting limit.
Q-09	This analyte bias high in QC sample. A fresh spiking solution is going to be prepared.
Q-10	This analyte has high bias in QC sample, the result is suspect.
Q-11	This analyte is low in QC sample, the result is suspect.
Q-12	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on the percent recoveries and/or other acceptable QC data.
Q-H-1	High bias, data was accepted since sample was not detected.
Q-L-03	This analyte is low in QC sample. Sample data is accepted based on acceptable CCVs.
Q-R-01	Analyses are not controlled on RPD values from sample concentrations less than the reporting limit. QC batch accepted based on LCS and/or LCSD QC results.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
QR-04	The RPD value for the MS/MSD was outside of QC acceptance limits however both recoveries were acceptable. The QC batch was accepted based on acceptable results for the recoveries and RPD for the LCS and LCSD.
QR-BS	The RPD value for the BS/BSD (LCS/LCSD) was outside of QC acceptance limits however both recoveries were acceptable. The QC batch was accepted based on acceptable results for the recoveries of the BS (LCS) and BSD (LCSD).
R-01	The Reporting Limit for this analyte has been raised to account for matrix interference.
R-02	Elevated Reporting Limits due to limited sample volume.
R-03	The RPD is not applicable for result below the reporting limit (either ND or J value).
R-04	Due to foaming, the sample was diluted prior to analysis. The reporting limits were raised due to the dilution.
R-05	The sample was diluted due to the presence of high levels of non-target analytes resulting in elevated reporting limits.
R-06	Sample was diluted prior to extraction due to high sample concentration, reporting limit was raised due to the dilution.
R-MS	Results reported using MS/MS as the primary detector.
RAD-1	Gross Alpha: DLR (Detection Limits for Purposes of Reporting) = 3 pCi/L, and MCL (Maximum contaminant Level) = 15 pCi/L.
RAD-2	Gross Beta: DLR (Detection Limits for Purposes of Reporting) = 4 pCi/L, and MCL (Maximum contaminant Level) = 50 pCi/L.

RAD-3	The elevated counting error and MDA was caused by smaller sample aliquot used for analysis due to matrix effect (high TDS).
S-01	The surrogate recovery could not be calculated due to sample dilution required from high analyte concentration and/or matrix interferences.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
S-03	High surrogate recovery for this sample is possibly due to a sample matrix effect. The data was accepted since all target analytes were not detected.
S-04	The surrogate recovery for this sample is outside of established control limits due to possible sample matrix effect.
S-05	Surrogate recovery was below acceptance limit possibly due to matrix effect. Sample data was justified as acceptable since all target analytes were still not-detected or below the reporting limits when adjusted accordingly to surrogate recovery.
S-06	The recovery of this surrogate is outside control limits due to sample dilution required from high analyte concentration and/or matrix interference's.
S-07	Surrogate recovery out of acceptance limits for this sample is possibly due to sample matrix effect, confirmed by re-extracting and/or re-analyzing the sample.
S-08	No surrogate recovery, possibly surrogate spiking was missed.
S-09	Wrong amount spiked, quantification is not accurate
S-10	Surrogate recovery outside method QC limits due to extraction related problems
S-11	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
S-AC	Acid surrogate recovery outside of control limits due to a possible matrix effect. The data was accepted based on valid recovery of remaining two acid surrogates.
S-BLK	Surrogate recovery outside of control limits for Method Blank. The data was accepted since all target analytes were not detected
S-BN	Base/Neutral surrogate recovery outside of control limits due to a possible matrix effect. The data was accepted based on valid recovery of remaining two base/neutral surrogates.
S-BS	Surrogate recovery outside of control limits for LCS. The data was accepted based on valid recovery of the target analytes.
S-DUP	Duplicate analysis confirmed surrogate failure due to matrix effects.
S-GC	Surrogate recovery outside of control limits due to a possible matrix effect. The data was accepted based on valid recovery of the remaining surrogate.
S-HI	High surrogate recovery was confirmed as a matrix effect by a second analysis.

S-LOW	Low surrogate recovery confirmed as a matrix effect by a second analysis.
S-MS	Surrogate recovery outside of control limits for MS/MSD. The data was accepted based on valid recovery of the target analytes.
S-MS1	Surrogate recovery outside of acceptance window confirmed as matrix effect by analysis of MS/MSD on this sample.
S_ABC	Analysis subcontracted to Aquatic Bioassay & Consulting Laboratories, Inc., non NELAP certified, but is ELAP certified (ELAP Certificate 1907)
S_AIR	Analysis subcontracted to Air Technology Laboratories, Inc., NELAP Certificate # E87847
S_Associat	Analysis subcontracted to Associated Laboratories, NELAP Certificate 04232CA.

SeeAtt	See Attachment
Supp	This result has been revised from the original report.

T-AgBaH	The sample was treated with Silver, Barium and H+ cartridges to minimize chloride and sulfates interferences prior to analysis.
T-AgBaHRP	The sample was treated with Silver, Barium, H+, and Organics cartridges to minimize chloride, sulfates, and organic interferences prior to analysis.
T-AgH	The sample was treated with silver and H+ cartridges to minimize chloride interferences prior to analysis.
T-BaH	The sample was treated with Ba and H cartridges to reduce sulfates background interferences.
TIC	Tentatively Identified Compound using mass spectrometry. The reported concentration is relative concentration based on the nearest internal standard. If the library search produces no matches at, or above 85%, the compound is reported as unknown.
U-01	The sample was received without the proper preservation.
U-02	The sample was received at the lab without proper preservation. However, the sample was then preserved at the lab.

Appendix I

Summary of Sampling Container, Preservation and Holding Time Requirements

				Preservative (chill all [8], unless noted)					
Test Name	**Matrix**	**Bottle Type**	**Bottle size**	**Unchlorinated Water (Raw)**	**Chlorinated Water (Treated)**	**Soil/Solid**	**Holding Time until start of analysis**	**Analytical Technique**	**Analytical Method**
1,2,3-TCP	Water	Amber Glass	2 x 40 mL	HCl	Ascorbic/HCl		14 days	GC/MS Isot. Dil.	EPA 524.2SIM
1,4-Dioxane	Water	Amber Glass	2 x 1 L (*)	None	None		7 days	GC/MS Isot. Dil.	EPA 8270M
Acrolein/Acrylonitrile	Water	Glass	2 x 40 mL	None	Thiosulfate		3 Days	GC/MS	EPA 624/8260B
Alcohols	Water	Glass	1 x 40 mL	None	None		14 days	Dir. Inj./FID	EPA 8015B
Aldehydes	Water	Amber Glass	2 x 40 mL	$CuSO_4$	$NH_4Cl/CuSO_4$		7 Days	GC/ECD	EPA 556
Aldehydes	Water	Glass	1 L (*)	None	None		3 days	HPLC-UV	EPA 8315
Aldehydes[1]	Soil/Solid	Glass	4 oz			None	3 days	HPLC-UV	EPA 8315
Alkalinity, Total	Water	Poly	250 mL		None		14 Days	Titration	SM2320B
Anions by IC (F^-, Cl^-, SO_4^{2-})	Water	Poly	250 mL	None	None		28 days	IC	EPA 300.0
Anions by IC (NO_2^-, NO_3^-, PO_4^{3-})	Water	Poly	250 mL	None	None		48 hours	IC	EPA 300.0
Arsenic speciation	Water	Poly	250 mL	EDTA/acetic acid	EDTA/acetic acid		14 Days	Resin-ICP/MS	EPA 200.8
Asbestos-Sub	Water	Poly	1 L	None	None		48 Hours	TEM	EPA 100.1/.2-Sub
Bacteria-Coliform - solid/sludge/soil	Soil/solid	Glass-Sterile	4 oz			None	N/A	MTF	SM 9221B
Bacteria-Coliform - Wastewater	Water	Poly-Sterile	125 mL	Thiosulfate	Thiosulfate		6 hours	MTF	SM 9221B
Bacteria-Coliform - Drinking Water	Water	Poly-Sterile	125 mL	Thiosulfate	Thiosulfate		24 Hours	Colilert P/A or enumeration	SM 9223B
Bacteria-Enterococcus - Wastewater	Water	Poly-Sterile	125 mL	Thiosulfate	Thiosulfate		6 Hours	Enumeration Quantitray	Enterolert
Bacteria-Heterotrophic Plate Count	Water	Poly-Sterile	125 mL	Thiosulfate	Thiosulfate		24 Hours	Pour Plate Method	SM 9215B
BOD	Water	Poly	1 L	None	None		48 Hours	DO Probe	SM 5210B
BOD, Carbonaceous	Water	Poly	1 L	None	None		48 Hours	DO Probe	SM 5210
Bromate	Water	Amber Glass	40 mL	EDA	EDA		28 Days	IC	EPA 300.1
Bromate- Low Level	Water	Amber Glass	40 mL	EDA	EDA		28 Days	IC	EPA 326
Bromide	Water	Poly	250 mL	None[7]	None[7]		28 Days	IC	EPA 300.0

Test Name	Matrix	Bottle Type	Bottle size	Preservative (chill all (8), unless noted) Unchlorinated Water (Raw)	Chlorinated Water (Treated)	Soil/Solid	Holding Time until start of analysis	Analytical Technique	Analytical Method
Bromide-Low Level	Water	Amber Glass	40 mL	None	None		28 Days	IC	EPA 300.1
Carbamates	Water	Amber Glass	1 x 40 mL	MCAA	MCAA/thiosulfate		28 Days	HPLC	EPA 531.1
COD	Water	Poly	250 mL	H_2SO_4	H_2SO_4		28 Days	Colorimetric	EPA 410.4
Chloral Hydrate	Water	Glass	2 x 60 mL	Sulfite/buffer	Sulfite/buffer		14 days	GC/ECD	EPA 551.1
Chlorate	Water	Amber Glass	40 mL	EDA	EDA		28 Days	IC	EPA 300.1
Chloride	Water	Poly	250 mL	None(7)	None(7)		28 Days	IC	EPA 300.0
Chlorine Dioxide	Water	Amber Glass	250 mL	None	None		24 Hours	Colorimetric	SM 4500CLO2D
Chlorine Residual	Water	Amber Glass	250 mL	None	None		15 Minutes(2)	Colorimetric	SM 4500CL-G
Chlorite	Water	Amber Glass	40 mL	EDA	EDA		14 Days	IC	EPA 300.1
Chlorophyll-a	Water	Amber Poly	2 x 1 L	None			48 Hours	Spectrophotometric	SM 10200H
Chromium, Hexavalent	Water	Poly	250 mL	$(NH_4)_2SO_4$ buffer pH 9.3-9.7	$(NH_4)_2SO_4$ buffer pH 9.3-9.7		24 Hours	Spectrophotometric	SM3500CR-D
Chromium, Hexavalent	Water	Poly	250 mL	$(NH_4)_2SO_4$ buffer pH 9.3-9.7	$(NH_4)_2SO_4$ buffer pH 9.3-9.7		24 Hours	IC	EPA 7199
Chromium, Hexavalent	Soil/solid	Glass	4 oz	None	None		30 days	Spectrophotometric	EPA 3060/7196
Chromium, Hexavalent (low-level)	Water	Poly	250 mL	$(NH_4)_2SO_4$ buffer pH 9.3-9.7	$(NH_4)_2SO_4$ buffer pH 9.3-9.7		24 Hours (DW) 28 days (WW)	IC	EPA 218.6
Chromium, Hexavalent (low-level)	Soil/solid	Glass	4 oz	None	None		30 days	IC	EPA 3060/7199
Color	Water	Glass	500 mL	None	None		48 Hours	Visual	SM2120B
Conductivity (Specific Conductance)	Water	Poly	250 mL	None	None		28 Days	Electrometric	SM2510B
Cyanide	Water	Poly	500 mL	NaOH	NaOH/ascorbic		14 Days	FIA-Colorimetric	EPA 335.2/335.4
Dioxin-Sub	Water	Glass	2 x 1 L	None	None		1 year	HR GC/ MS	EPA 1613/8290
Dioxin-Sub	Soil/Solid	Glass	4 oz	None	None		1 year	HR GC/ MS	EPA 8280/8290
Diquat/Paraquat	Water	Amber poly	1 L	None	Thiosulfate		7 Days	HPLC	EPA 549.2
Disinfection by-products	Water	Glass	2 x 60 mL	Sulfite/buffer	Sulfite/buffer		14 days	GC/ECD	EPA 551.1
Diuron	Water	Amber Glass	1 L (*)	None	None		7 days	HPLC/UV	EPA 632

				Preservative (chill all [8], unless noted)					
Test Name	Matrix	Bottle Type	Bottle size	Unchlorinated Water (Raw)	Chlorinated Water (Treated)	Soil/Solid	Holding Time until start of analysis	Analytical Technique	Analytical Method
Diuron-UCMR	Water	Amber Glass	1 L (*)	$CuSO_4$/Trizma	$CuSO_4$/Trizma		14 days	HPLC/UV	EPA 532
EDB and DBCP	Water	Glass	2 x 40 mL	None	Thiosulfate		14 Days	GC/ECD	EPA 504.1
Endothall	Water	Amber Glass	250 mL	None	None		7 days	GCMS	EPA 548.1

Notes:
(1): Formaldehyde and acetaldehyde only.
(2): This is field test; if requested to be performed at the lab it will be done ASAP.
(3): Samples can be received unpreserved and preserved at the lab at least 24 hours before analysis.
(4): Al,Sb,As,Ba,Be,B,Cd,Ca,Na,Mg,K,Cr,Co,Cu,Fe,Pb,Li,Mn,Mo,Ni,Se,Ag,Sr,Tl,Ti,V,Zn
(5): Preserve at the lab with Nitric acid to pH <2 and wait 24 hours before analysis starts.
(6): No headspace required or preferably EPA Method 5035 sample collection. Consult the laboratory for special requirements.
(7): No cooling required.
(8): Chill samples to $\leq$ 6ºC, but above freezing.
(*): Needs extra bottles for QA/QC for certain projects.

Effective as of 7/15/11

Appendix J

Chemistry

J.1 Method Validation

Reference methods are validated by determining the LOD and/or LOQ by procedures outlined below, and determining precision and bias by using the demonstration of capability procedures.

Non-standard methods, laboratory-designed/developed methods, standard methods used outside their intended scope are validated prior to their use. The validation shall be as extensive as is necessary to meet the needs of the given application or field of application using quality control procedures and acceptance criteria that are consistent with those of similar standard methods or technology. At a minimum, quality control procedures must address:

- Calibration;
- Interferences/contamination (method blanks, calibration blanks);
- Analyte identification;
- Selectivity;
- Sensitivity (LOD and/or LOQ);
- Precision and Bias.

Based on the intended use, the laboratory establishes quality control acceptance criteria for precision, accuracy, selectivity (if applicable). In addition, the action level (compliance level, project decision level, etc.) is used to establish the LOQ and/or LOD.

a) Limit of Detection (LOD)

The Limit of Detection (LOD) is the laboratory's estimate of the minimum amount of an analyte in a given matrix that an analytical process can reliably detect in their facility.

LODs are not required for any component for which spiking solutions or quality control samples are not available, such as temperature and pH, or, when test results are not to be reported to the LOD (versus the limit of quantitation or working range of instrument calibration). Where an LOD study is not performed, the laboratory may not report a value below the Limit of Quantitation.

The laboratory will select methods with LODs that are expected to meet the intended data use.

LODs are determined in samples that represent the quality system matrices to be evaluated. All sample processing/preparation steps and all determinative steps are used to validate the method for all targeted analytes. The representative quality system matrix will be free from the target analytes of interest or interfering analytes that impact the LOD.

When the method or applicable regulation specifies a LOD study, only the specified method will be used. The laboratory will document the process used to derive the LOD and will retain all the supporting data.

When providing compliance data under 40-CFR Part 136 or equivalent delegated state programs, the laboratory follows 40 CFR Part 136, Appendix B, and uses the method detection limit (MDL) derived from the procedure as the LOD. The procedures are described in SOP MIS032.

The laboratory uses the procedure described in SOP MIS032 to determine the LOD for the method:

Once the LOD has been determined the validity of the LOD is verified by a detection (value above zero) for each target analyte in a quality control sample of a representative quality system matrix. The concentration of the analytes in the sample will be no more than 3 times the derived LOD unless the test contains multiple analytes. In the latter case, the concentration of the target analytes will be no greater than 4 times the LOD. This verification will be performed on each instrument that is used for the test.

LODs are performed/repeated:

- **before reporting the LOD for a given analyte**
- **any time there is a change that affects how the method is performed or**
- **when there is a change in instrumentation that affects the sensitivity of the analysis.**

LODs are verified annually for each quality system matrix/technology/analyte combination and quarterly for DoD related work.

b) <u>Limit of Quantitation</u>

The Limit of Quantitation (LOQ) is an estimate of the minimum amount of a substance that can be reported with a specified degree of confidence.

If an LOD study is not performed, concentration values less than the Limit of Quantitation are not reported but are appropriately flagged.

LOQs are not required for components or properties for which spiking solutions or QC samples are not available. These include temperature, pH, etc.

An LOQ study includes all sample processing and analysis steps in the analytical method. The study is performed in each quality system matrix for which the test will be performed. The procedure is documented and all supporting data are retained. The resulting LOQ will be above the LOD (if determined).

The LOQ is determined by the procedure specified in SOP MIS032 and it must be above the LOD is one has been determined for that particular analyte/method/matrix and must be above or equal to the lowest calibration point if a multi-point calibration curve is used.

The laboratory will verify the LOQ by the analysis of a QC sample containing the analytes of concern at a concentration of 1 to 2 times the derived (claimed) LOQ. The LOQ is considered verified if recovery of each analyte is within the laboratory's acceptance limits, or the client's data quality objectives.

The LOQ will be verified annually (quarterly for DoD related work) for each quality system matrix, technology and analyte unless the LOD was determined or verified.

c) Precision and Bias

Precision is the degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves. Precision is usually expressed as standard deviation, variance, or range, in either absolute or relative terms.

Bias is the systematic error that contributes to the difference between the mean of a significant number of test results and the accepted reference value.

Precision and bias using non-reference, modified reference or laboratory-developed methods are established using the procedure outlined below and compared to the criteria established by the client (when requested), the method, or the laboratory.

Precision and bias are determined by processing samples through all phases of the method (sample preparation, cleanup, analysis, etc.) and are evaluated across the analytical calibration range of the method. This study is performed for all quality system matrices for which the test is to be used.

Precision is determined by the demonstration of capability procedure described below.

Precision is assessed through the calculation of relative percent differences (RPD) and relative standard deviations (RSD) for replicate samples. For analyses that have detectable levels of analytes (for example inorganic analyses), laboratory precision is usually assessed through the analysis of a sample/sample duplicate pair and field duplicate pairs. For analyses that frequently show no detectable levels of analytes (e.g., organic analyses), the precision is usually determined through the analysis of matrix spike/matrix spike duplicates (MS/MSD) and field duplicate samples.

d) Selectivity

Selectivity is the capability of a test method or instrument to respond to a target substance or constituent in the presence of non-target substances (EPA-QAD).

The laboratory evaluates selectivity through procedures defined in the test method SOPs.

Absolute retention time and relative retention time aid in the identification of components in chromatographic analyses and to evaluate the effectiveness of a

column to separate constituents. Acceptance criteria for retention time windows are documented in the corresponding method SOP or in the SOP ORG074.

A confirmation shall be performed to verify the compound identification when positive results are detected on a sample from a location that has not been previously tested by the laboratory. Such confirmations shall be performed on organic tests such as pesticides, herbicides, or acid extractable or when recommended by the analytical test method except when the analysis involves the use of a mass spectrometer. Confirmation is required unless stipulated in writing by the client. The confirmation is documented in the bench sheets and/or the LIMS.

When reporting data for methods that require analyte confirmation using a secondary column or detector, project-specific reporting requirements shall be followed. If project-specific requirements have not been specified, the reporting requirements in the method are followed. If the method does not include reporting requirements, the results from the primary column or detector are reported, unless there is a scientifically valid and documented reason for not doing so.

Results that are unconfirmed, or for which confirmation was not performed, shall be identified in the test report, using appropriate data qualifier flags, and explained in the narrative. The laboratory shall use method-specified acceptance criteria for analyte confirmation. If method-specific criteria do not exist, the analyte confirmation is performed as specified in SOP MIS052.

Other procedures for evaluating selectivity are described in the analytical methods, which may include mass spectral tuning, ICP inter-element interference checks, sample blanks, spectrochemical absorption or fluorescence profiles, co-precipitation evaluations, and electrode response factors. Acceptance criteria for mass spectral tuning are contained in the corresponding analytical method SOPs.

J.2 Demonstration of Capability

Demonstration of Capability (DOC): A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision.

Before reporting any data with a given method, a satisfactory DOC is performed. Thereafter, each analyst demonstrates continuing proficiency through the procedures outlined in Ongoing Demonstration of Capability.

The laboratory has several methods that meet the requirements of EL-V1M4-2009, Section 1.6.1, paragraph 3 of the TNI Standard (methods that have been in use at the laboratory for over one year prior to applying for accreditation and there has been no significant changes in instrument type, personnel or test method) and is demonstrating capability through the use of on-going DOCs (see below). Records to indicate that the requirements of the cited paragraph have been met are available for review.

a) Initial Demonstration of Capability (IDOC)

An IDOC is performed:

- **Before using any method**
- **Each time there is a change in instrument type, personnel or method and**
- **If the laboratory or analysts has not performed the method in a twelve-month period.**

The IDOC(s) for each analyst is documented electronically as spreadsheets in the QC\IDCs folder under each analytical method with different tabs for different analysts. The document identifies the analyst(s) involved in preparation and/or analysis; matrix; analyte(s), class of analyte(s), or measured parameter(s); the method(s) performed; the laboratory-specific SOP used for analysis (including revision number); the date(s) of analysis; and a summary of the results used to calculate the mean recovery and standard deviations.

All raw data, preparation records, and calculations for each IDOC are retained and are available for review.

For new methods that need to be implemented, a validation procedure is documented before they are used in the laboratory. Appropriate method validation techniques include the following:

- **Testing of reference standards or reference materials;**
- **Comparison of results to those achieved using other validated, standard methods**
- **Interlaboratory comparisons.**

When the above techniques are not feasible, the following options are used:

- **Systematic assessment of factors that could influence the result; and/or**
- **Assessment of the precision and bias of the result based on the science of the method and practical experience.**

When the method specifies a procedure to be followed, only those procedures will be used. If no procedures are specified the laboratory uses its own procedure, which is documented in SOP MIS034.

b) <u>Ongoing Demonstration of Capability</u>

After the demonstration of capability is completed, on-going proficiency is maintained and demonstrated at least annually. Each analyst is expected to consistently meet the QC requirements of the method, the laboratory SOP, client requirements and/or the TNI Standard. Ongoing DOCS are documented in spreadsheets under each department in the QC\IDC folder of the computer system and all records related to the demonstration are retained.

The laboratory uses any of the following procedures to demonstrate ongoing DOC:

a) acceptable performance of a blind sample (single blind to the analyst). This can be PT sample or other blind sample prepared by QA personnel or obtained from external source. Successful analysis of a blind performance sample on a similar method using the same technology (e.g., GC/MS volatiles by purge and trap for Methods 524.2, 624 or 8260) would only require documentation for one of the test.;
b) another initial DOC; perform this as per SOP MIS034
c) at least four (4) consecutive laboratory control samples with acceptable levels of precision and accuracy, as specified by the method or using lab generated acceptance limits. The laboratory shall tabulate or be able to readily retrieve four (4) consecutive passing laboratory control samples (LCS) for each method for each analyst each year; The four LCSs used for demonstration of ongoing capability must be obtained within a period of no more than 3 months and the date of the last one used as demonstration of ongoing capability.
d) a documented process of analyst review using quality control (QC) samples. QC samples can be reviewed to identify patterns for individuals or groups of analysts and determine if corrective action or retraining is necessary; or
e) if a) through d) are not technically feasible, then analysis of real-world samples with results within predefined acceptance criteria (as defined by the laboratory or method) shall be performed.

J.3 Calibration

Section 23.2.2 includes information on calibration of support equipment. This Section covers calibration of analytical equipment.

Initial instrument calibration and continuing instrument calibration verification are an important part of ensuring data of known and documented quality. If more stringent calibration requirements are included in a mandated method or by regulation, those calibration requirements override any requirements outlined here or in laboratory SOPs. Generally, procedures and criteria regarding instrument calibrations are provided in the SOPs for each analytical method.

J.3.1 Initial Instrument Calibration

- **Records:**

Initial instrument calibration includes calculations, integrations, acceptance criteria, and associated statistics. All instruments are calibrated in accordance with the respective SOPs and/or method of analysis. The typical calibration procedure consists of an initial calibration, performed by running a series of standards and calculating the response by using either the response factors or by linear or polynomial regression analysis. This is followed by a calibration verification. All calibration procedures are thoroughly documented.

Sufficient raw data records are collected to allow reconstruction of the initial instrument calibration. These include, at a minimum, calibration date, test method, instrument, analysis date, analyte names, analysts signature or initials,

concentration and response, calibration curve or response factor, or unique equation or coefficient used to reduce instrument responses to concentration. Calibration date and expiration date (when recalibration is due) is documented for equipment requiring calibration, where practicable (see Section 23.1).

- **Number of Standards and Concentrations:**

  If the reference or mandated method does not specify the number of calibration standards to use, the minimum number is three, not including blanks or a zero standard.

  For instrumentation where single point calibration is recommended by manufacturer's instructions, such as with some ICP and ICP/MS technologies (with a zero and single point calibration), the following apply:

  a) **For single point plus zero blank calibrations, the zero point and the single point standard are analyzed prior to the analysis of samples, and the linear range of the instrument established by analyzing a series of standards, one of which is at the lowest quantitation level.**
  b) **Zero blank and single point calibration standards are analyzed with each analytical batch for methods where they are specified.**
  c) **A standard corresponding to the limit of quantitation is analyzed with each analytical batch and must meet established acceptance criteria when using single point plus zero blank calibrations.**
  d) **The linearity of single point plus zero blank calibrations is verified at a frequency established by the method or the manufacturer.**

  The lowest calibration standard is the lowest concentration for which quantitative results can be reported without qualification. The lowest calibration standard is at or below the Limit of Quantitation (LOQ) and is greater than the Limit of Detection. Results that are less than the LOQ are considered to have increased uncertainty, and are either reported with a qualifier code or explained in the case narrative.

  The highest calibration standard is the highest concentration for which quantitative results can be reported. Data reported exceeding the highest calibration standard without dilutions is considered to have increased uncertainty and are reported with a qualifier code or reanalyzed and explained in the case narrative.

- **Evaluation, Verification and Corrective Action**

  All initial instrument calibrations are verified with a standard obtained from a second source or lot if the lot can be demonstrated from the manufacturer as prepared independently from other lots. Traceability shall be to a national standard, when commercially available. If not commercially available, it can be prepared in-house.

The following is the criteria used for the acceptance of an initial calibration, unless specified differently in the analytical methods, the criteria used are appropriate to the calibration technique:

- **Use the average response factor (RF) if the percent relative standard deviation (%RSD) of the points is less than 20%. In this case, linearity through the origin is assumed.**
- **If the %RSD is greater than 20%, linearity through the origin cannot be assumed and a linear regression, a weighed linear regression or a non-linear regression can be used. The acceptance criteria for linear regression are a coefficient of correlation (r) equal or greater than 0.99 and for non-linear regression the coefficient of determination (COD) must be equal or greater than 0.98. In both cases, the curve is not to be forced through the origin nor is the origin used as another point. The sample results must be within the first and last standards.**
- **The number of data points to construct the initial calibration curve shall be obtained from the analytical method employed. If no criteria are specified, the laboratory shall construct initial calibration curves using a minimum of five calibration points for organic analytes and three calibration points for inorganic analytes and IH samples. All reported target analytes and surrogates (if applicable) shall be included in the initial calibration. Reported results for all target analytes shall be quantified using a multipoint calibration curve; surrogates are calibrated according to each analytical method requirements, unless there are project specific requirements in which case these are followed. It is not permitted to exclude calibration points unless there is technical justification for it.**
- **The lowest standard shall be at or below the reporting limit for the method and at or below the regulatory limit/decision level if known by the laboratory.**
- **The lowest calibration standard must be above the detection limit. Noted exceptions: for turbidity analysis and for instrument technology (such as ICP or ICP/MS) with validated techniques from manufacturers or methods employing standardization with a zero point and a single point calibration standard:**
  - **Prior to the analysis of samples the zero point and single point calibration must be analyzed and the linear range of the instrument must be established by analyzing a series of standards, one of which must be at the lowest quantitation level.**
  - **Zero point and single point calibration standard must be analyzed with each analytical batch.**
  - **A standard corresponding to the lowest quantitation level must be analyzed with each analytical batch and must meet established acceptance criteria.**
  - **The linearity is verified at a frequency established by the method and/or the manufacturer.**
  - **If a sample within an analytical batch produces results above its associated single point standard then one of the following should occur:**
    - **analyze reference material at or above the sample value that meets established acceptance criteria for validating the linearity; dilute the sample such that the result falls below the**

single point calibration concentration (when sufficient sample volume permits);
- § Report the data with an appropriate data qualifier and/or explain in the case narrative.
- § For metals analysis with a single-point calibration, a sample result may be reported up to 90% of the linear dynamic range (LDR). All samples exceeding this value must be diluted to within the LDR.

Where appropriate, the laboratory has manual integration procedures (SOP MIS039) that are adhered to when evaluating calibration data.

Any samples that are analyzed after an unacceptable initial calibration are re-analyzed or the data are reported with qualifiers, appropriate to the scope of the unacceptable condition (see Section 12 – "Control of Nonconforming Environmental Testing").

Quantitation is always determined from the initial calibration unless the test method or applicable regulations require quantitation from the continuing instrument calibration verification.

Corrective actions are performed when the initial calibration results are outside acceptance criteria. Calibration points are not dropped from the middle of the curve unless the cause is determined and documented. If the cause cannot be determined, the calibration curve is re-prepared. If the low or high calibration point is dropped from the curve, the working curve is adjusted and sample results outside the curve are qualified.

Specific analyses' calibrations are checked more frequently. Some instruments, such as TOX analyzers have built-in calibration features. The internal calibration of these instruments is monitored daily for accuracy.

Some calibration curves for spectrophotometric methods are very stable over a long period of time, however it is the policy of the Laboratory to perform a new initial calibration curve even if the continuing calibration check meets specified criterion, in any of the following events:
- At least every three years
- When the instrument is moved to a different location
- If any maintenance that can affect the calibration has been performed
- If the analysts judges it necessary for special projects or different range of calibration

Spectrophotometers are also subject to wavelength calibration which it shall be performed at least annually, according to the procedure described by the manufacturer in the instrument manual or other documentation.

J.3.2 Continuing Instrument Calibration

- Records

The calculations and associated statistics for continuing instrument calibration are included or referenced in the test method SOP.

Sufficient raw data records are retained to allow reconstruction of the continuing instrument calibration verification. Continuing instrument calibration verification records connect the continuing verification date to the initial instrument calibration.

Where appropriate, the laboratory has manual integration procedures (SOP MIS039) that are adhered to when evaluating calibration data.

- Frequency

  Calibration is verified for each compound, element, or other discrete chemical species. For multi-component analytes, such as aroclors, chlordane, toxaphene, or total petroleum hydrocarbons, a representative chemically related substance or mixture is used.

  Calibration verifications are performed:

  - at the beginning and end of each analytical batch, except for instances when an internal standard is used. For methods employing internal standards, one verification is performed at the beginning of the analytical batch. Some methods have more frequent CCV requirements (see specific SOPs). Many inorganic methods require the CCV to be analyzed after every 10 samples.
  - whenever it is expected that the analytical system may be out of calibration or might not meet verification acceptance criteria.
  - when the time period for calibration or the most recent calibration verification has expired.
  - for all analytical systems that have a calibration verification requirement. Requirements can be found in the method SOPs. Many inorganic methods require the CCV to be analyzed after every 10 samples.

- Evaluation, Verification and Corrective Actions

  The validity of the initial calibration is verified prior to sample analysis by use of a continuing instrument calibration verification (CCV) standard.

  The acceptance criteria, unless something different is specified in the corresponding SOPs or QAPP, is the following:

  - The concentration of the CCV standard shall be from the low-calibration standard to the midpoint of the calibration range;
  - The source of the CCV standard should be the same as the source for the initial calibration standard(s); and
  - The baseline for evaluating the CCV is the initial calibration curve, except for the evaluation of retention times in organic chromatographic methods, which may be based on comparison with the retention times in the initial CCV.
  - The actual acceptance ranges for CCVs are specified in each method SOP

When the method specifies that CCVs shall be run at specific sample intervals, the count of these samples shall be of field samples only.

When a CCV fails to fall within acceptance limits then CCVs and all samples analyzed since last successful calibration verification are re-analyzed. If reanalysis is not possible, the client is notified prior to reporting data associated with a noncompliant CCV and if data are reported, appropriate qualifiers are used and if further clarification is needed this is explained in the case narrative. The exception to this is when a CCV fails with high bias, but the field samples remain not detected.

Corrective action is initiated for CCV results that are outside of acceptance criteria (see Section 12 – "Control of Nonconforming Environmental Testing").

J.3.3 Unacceptable Continuing Instrument Calibration Verifications

If routine corrective action for continuing instrument calibration verification fails to produce a second consecutive (immediate) calibration verification within acceptance criteria, then a new calibration is performed or acceptable performance is demonstrated after corrective action with two consecutive calibration verifications.

For any samples analyzed on a system with an unacceptable calibration, some results may be useable if qualified and under the following conditions:

a) If the acceptance criteria are exceeded high (high bias) and the associated samples are below detection, then those sample results that are non-detects may be reported as non-detects.

b) If the acceptance criteria are exceeded low (low bias) and there are samples that exceed the maximum regulatory limit, then those exceeding the regulatory limit may be reported.

Appendix K

Microbiology

K.1 Method Validation

Microbiological methods are validated according to the following:

a) Accuracy – The methods are validated for accuracy by using at least one (1) known pure reference culture at the anticipated environmental conditions, and compare the method results to that of a reference method.
b) Precision – Is validated by performing at least ten (10) replicate analyses with both the proposed and reference method, using the target microorganisms of choice. The results shall show that the methods are not statistically different.
c) Selectivity (sensitivity) – By verifying all responses in at least ten (10) samples using mixed cultures that include the target organism(s), and at varying concentrations (microbial identification testing or equivalent processes may be used). Calculate the number of false positive and false negative results.

The laboratory will compare the results of these tests with the data quality objectives stated by the client. The data from the above tests must be equal to or better than the stated DQOs. A statement comparing the client DQOs against the above-mentioned QC measures will be included in the validation records.

The laboratory will confirm the validation by participating in a proficiency test program with acceptable results and retain the records of the validation for five years past the date of last use of the method.

K.2 Demonstration of Capability (DOC)

Demonstration of Capability: A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision.

Before reporting any data with a given method, a satisfactory initial DOC (IDOC) is performed. Thereafter, each analyst will demonstrate continuing proficiency through the procedures outlined in Ongoing Demonstration of Capability.

The laboratory has several methods that meet the requirements of EL-V1M5-2009, Section 1.6.1, paragraph 3 of the TNI Standard and is demonstrating capability through the use on-going DOCs (see below). Records to indicate that the requirements of the cited paragraph have been met are available for review. The methods are: Total Coliforms and E. Coli by SM9223B, Total Coliforms by SM9221B, Fecal Coliforms by SM9221E and Heterotrophic Plate Count by SM9215B.

a) <u>Initial Demonstration of Capability (IDOC)</u>

An IDOC is performed:

- before using any method;

- each time there is a change in instrument type, personnel or method; and
- if the laboratory or analysts has not performed the method in a twelve-month period.

The IDOC(s) for each analyst is documented electronically in the QC\IDC folder of the computer system. The document identifies the analyst(s) involved in preparation and/or analysis; matrix; analyte(s), class of analyte(s), or measured parameter(s); the method(s) performed; the laboratory-specific SOP used for analysis (including revision number); the date(s) of analysis; and a summary of the results used to calculate the mean recovery and standard deviations.

All raw data, preparation records, and calculations for each DOC are retained and are available for review.

When methods specify a procedure to be followed, only those procedures will be used. If no procedures are specified the laboratory uses its own procedure, which is documented in the corresponding SOP.

The procedure for IDOC for Microbiological methods is as follows:

a) The target organism(s) is diluted in a volume of clean quality system matrix (a sample in which no target organisms or interferences are present at concentrations that will impact the results of a specific method). This matrix shall be sterile phosphate or sterile peptone solution unless specified by the manufacturer. Prepare at least four (4) aliquots at the concentration specified, or if unspecified, to the countable range for plate methods or working range for most probable number (MPN) type methods.
b) At least four (4) aliquots shall be prepared and analyzed according to the method either concurrently or over a period of days.
c) Using all of the results, convert these results to logarithmic values, then calculate the mean recovery and standard deviation of the log converted results in the appropriate reporting units for each organism of interest. When it is not possible to determine mean and standard deviations, such as for presence/absence, the laboratory shall assess performance against established and documented criteria.
d) For qualitative tests, acceptable performance in a blind study, either internally or externally generated, may be used to meet this Standard, provided that the study consists of a minimum of a blank, a negative culture, and a positive culture for each target organism or metabolite (e.g. b-glucuronidase in E. coli.).
e) Compare the information from c) above to the corresponding acceptance criteria for precision and accuracy in the method (if applicable) or in laboratory-generated acceptance criteria (if there are not established mandatory criteria). If all parameters meet the acceptance criteria, the analysis of actual samples may begin. If any one of the parameters does not meet the acceptance criteria, the performance is unacceptable for that parameter.
f) When one or more of the tested parameters fail at least one of the acceptance criteria, the analyst shall proceed according to i) or ii) below.
    i) Locate and correct the source of the problem and repeat the initial DOC for all parameters of interest beginning with b) above.

ii) Repeat the initial DOC for all parameters that failed to meet criteria.

g) Repeated failure, however, confirms a general problem with the measurement system. If this occurs, locate and correct the source of the problem and repeat the test for all organisms of interest beginning with b).

The organisms used *Escherichia coli* for positive total coliform and fecal coliform bacteria source, *Enterobacter aerogenes* for positive total coliform and negative fecal coliform bacteria and *Pseudomonas aeruginosa* for negative total coliform and negative fecal coliform bacteria

For enumeration, since it is hard to determine the amount of bacteria in the source, a senior chemist or the Microbiology Technical Director makes a serial dilution of bacteria source and run it side by side with the chemist performing the IDOC; the results from the senior chemist are used as True Value.

For Heterotrophic Plate Count (HPC) real samples are used to perform IDOCs. The chemist performing the IDOC runs the samples side by side with a senior chemist or supervisor and record their findings in comparison to result of the senior chemist.

b) <u>Ongoing Demonstration of Capability</u>

After the demonstration of capability is completed, on-going proficiency is maintained and demonstrated at least annually. Each analyst is expected to consistently meet the QC requirements of the method, the laboratory SOP, client requirements and/or the TNI standard. Ongoing DOCS are documented as electronic files in spreadsheets located in the folder QC\IDC of the computer system, and all records related to the demonstration are retained.

The laboratory uses the following procedure to demonstrate ongoing DOC:

a) Performing another initial demonstration of capability
b) Analysis of one sample or clean matrix that is fortified with a known quantity of the target organism, with results meeting the laboratory acceptance criteria for accuracy and, where applicable to the testing technique, also meeting the observational details expected for the presumptive, confirmed and completed phases defined in the method.
c) Analysis of one sample in duplicate for each target organism and test, with results meeting the laboratory acceptance criterion for precision.
d) Acceptable results for one-single-blind proficiency test sample for target organisms in each field of accreditation.
e) Performance of an alternate adequate procedure for the field of accreditation, the procedure and acceptance criteria being documented in the laboratory's quality system.
f) A documented process of analyst review using QC samples. QC samples can be reviewed to identify patterns for individuals or groups of analysts and determine if corrective action or retraining is necessary; or
g) if a) through f) are not technically feasible, then analysis of real-world samples with results within predefined acceptance criteria (as defined by the laboratory or method) shall be performed.

K.3 Calibration

Section 23.2.2 includes information on calibration of support equipment. This section covers calibration of analytical equipment.

The laboratory has methods that describe how the support equipment such as conductivity meters, oxygen meters, pH meters, hygrometers, and other similar equipment are calibrated and verified. These are found in logbooks or as electronic records.

The laboratory is not currently using continuous monitors but if these monitors are used in the future they will be verified at least once per month. If the verification fails, an initial calibration is performed and verified. If the instrument is taken off-line, an initial calibration and verification is performed before returning to service.

K.3.1 Specific Equipment Requirements

- **Autoclave**

  The laboratory initially evaluates the performance of each autoclave before first use by establishing its functional properties and performance by the procedures described in SOP MIS031.

  Autoclaves meet specified manufacturer's temperature tolerances. Pressure cookers shall not be used for sterilization of growth media.

  With each use:

  - **The laboratory ensures that the sterilization temperature is reached by u**sing a maximum registering thermometer.
  - **The laboratory records date, contents, maximum temperature reached, pressure, time in sterilization mode, total run time (may be recorded as time in and time out) and analyst's initials.**
  - **Temperature sensitive tape is used with the contents of each autoclave run to indicate that the autoclave contents have been processed.**

  On a monthly basis, when the autoclave is in use, the laboratory verifies that the autoclave is effectively sterilizing the contents by using BT Sure Biological indicator, Geobacillus stearothermophilus, for steam sterilization at 121°C, kills in a normal cycle time as lactose based media.
  The autoclave mechanical timing device is checked quarterly against a stopwatch and the actual time elapsed documented.

  Autoclave maintenance, which is performed internally, is performed annually. The activities include a pressure check and verification of temperature device.

- **Volumetric Equipment**

Equipment with movable parts such as automatic dispensers, dispensers/diluters, and mechanical hand pipettes are verified for accuracy quarterly.

Equipment such as filter funnels, bottles, non-Class A glassware, and other containers with volumetric markings (including sample analysis vessels) are verified once per lot prior to first use. The volume of the disposable volumetric equipment, such as sample bottles, and disposable pipettes are checked once per lot. The verification is either volumetric or gravimetric depending on the volume measured, acceptance range is 5%.

- UV instruments Used for Sanitization

  UV instruments for sanitation are not used in the lab. If put in operation they will tested quarterly for effectiveness by using uvcide strips.

  Bulbs would be replaced when the output is less than 70% of original for light tests or if count reduction is less than 99% for a plate containing 200 to 300 organisms.

- Water Baths and Incubators
  The laboratory initially establishes the uniformity of temperature distribution in incubators and water baths by placing calibrated thermometer in different areas of the water batch or incubator.

  On each day of use, the temperature of incubators and water baths is recorded twice a day, at least four hours apart.

- Ovens Used for Sterilization

  Ovens are not currently used at the laboratory for sterilization. If they were used, they would be checked for sterilization effectiveness monthly with the appropriate biological indicator. Records would be maintained for each cycle that include date, cycle time, temperature, contents and analyst's initials

Appendix L

Radiochemistry

L.1 Method Validation

Reference methods are validated by determining the minimum detectable activity as outlined below, and precision and bias using an initial demonstration of capability.

The laboratory will compare the results of these tests with the data quality objectives stated by the client. The data from the above tests must be equal to or better than the stated DQOs. A statement comparing the client DQOs against the above-mentioned QC measures will be included in the validation records.

The laboratory will confirm the validation by participating in a proficiency test program with acceptable results and retain the records of the validation for five years past the date of last use of the method.

a) Detectable Activity

1. Minimum Detectable Activity (MDA)

The laboratory will determine the MDA of a method by a procedure that reflects instrument limitations and the intended data use. When the method requires a specific procedure for determining the MDA, only that procedure will be used.

MDAs are determined in samples that represent the quality system matrices to be evaluated. All sample processing/preparation steps and all determinative steps are used to validate the method for all targeted analytes. The representative quality system matrix will be free from the target analytes of interest or interfering analytes that impacts the MDA.

For all quality systems (except drinking water), the MDA represents the estimate of the smallest true activity (or activity concentration) of an analyte that ensure a 95% probability of detection.

For the Safe Drinking Water Act (SDWA) (drinking water quality system matrix), the MDA (SDWA “detection limit”), the MDA is equal to the concentration of analyte that can be counted with a precision of 100% at the 95% confidence level (1.96σ where σ is the standard deviation of the net counting rate of the sample). The SDWA detection limit (MDA) is equivalent to the concentration at which the relative standard deviation of the measurement due to counting statistics is 1/1.96. The laboratory shall ensure that the determined MDA meets (or is lower than) the published detection limits published in 40 CFR Part 141.25.

b) Precision and Bias

Precision is the degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves. Precision is usually expressed as standard deviation, variance, or range, in either absolute or relative terms.
BIAS is the systematic error that contributes to the difference between the mean of a significant number of test results and the accepted reference value.

Precision and bias for non-reference, modified reference or laboratory-developed methods are established using the procedure outlined below and compared to the criteria established by the client (when requested), the method, or the laboratory.
Precision and bias are determined by processing samples through all phases of the method (sample preparation, cleanup, analysis, etc.). This study is performed for all quality system matrices for which the test is to be used.

The following is the procedure use to evaluate precision and bias:

1. **Analyze QC samples in triplicate containing the analytes of concern at or near the MDA, at a level near ten (10) times the MDA, and at a mid-range concentration.**
2. **Process these samples on different days as three (3) sets of samples through the entire measurement system for each analyte of interest.**
3. **Each day one QC sample at each concentration is analyzed. A separate method blank shall be subjected to the analytical method along with the QC samples on each of the three (3) days.**
4. **For each analyte, calculate the mean recovery for each day, for each level over days, and for all nine (9) samples. Calculate the relative standard deviation for each of the separate means obtained.**
   The precision value that is determined is compared against uncertainly estimates. The precision at each testing level must be statistically greater than the maximum combined standard uncertainty of measurement at the testing level.

c) <u>Measurement of Uncertainty</u>

The laboratory will report the measurement uncertainly of all radioactive tests. The report will explain the uncertainty and will include:

- **An indication of whether the uncertainty is the combined standard uncertainty (“one sigma”) or an expanded uncertainty; and**

- **If expanded, an indication of the coverage factor (k) and optionally the approximate level of confidence.**

The laboratory uses the a procedure to determine the uncertainly consistent with ISO Guide 98: 1995, Guide to the Expression of Uncertainty in Measurement (GUM), and The recommendations of Chapter 19 of the Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) Volume I (EPA 402-B-04-001A), Volume II (EPA 402-B-04-001B), Volume III (EPA 402-B-04-001C), July 2004.

d) **Selectivity**

The laboratory will evaluate selectivity using the checks established in the method.

L.2 Demonstration of Capability (DOC)

Demonstration of Capability: A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision.

Before reporting any data with a given method, a satisfactory initial DOC (IDOC) is performed. Thereafter, each analyst will demonstrate continuing proficiency through the procedures outlined in Ongoing Demonstration of Capability.

The laboratory has several methods that meet the requirements of EL-V1M4-2009, section 1.6.1 paragraph 3 of the TNI standard and is demonstrating capability through the use on-going DOCs (see below). Records to indicate that the requirements of the cited paragraph have been met are available for review. The methods are: EPA 900.0, SM7110C, EPA 20.8 and SM7500-Rn.

a) **Initial Demonstration of Capability (IDOC)**

An IDOC is performed:

- Before using any method,
- Each time there is a change in instrument type, personnel or method, and
- If the laboratory or analysts has not performed the method in a twelve-month period.

The IDOC(s) for each analyst is documented <Where?>. The document identifies the analyst(s) involved in preparation and/or analysis; matrix; analyte(s), class of analyte(s), or measured parameter(s); the method(s) performed; the laboratory-specific SOP used for analysis (including revision number); the date(s) of analysis; and a summary of the results used to calculate the mean recovery and standard deviations.

All raw data, preparation records, and calculations for each DOC are retained and are available for review.

When methods specify a procedure to be followed, only those procedures will be used. If no procedures are specified the laboratory uses its own procedure, as follows:

a) The analyte(s) will be diluted in a volume of clean quality system matrix (a sample in which no target analytes or interferences are present at concentrations that will impact the results of a specific method) sufficient to prepare four (4) aliquots at a laboratory specified concentration. Where gamma-ray spectrometry is used to identify and quantify more than one analyte, the laboratory control sample shall contain gamma-emitting radionuclides that represent the low (e.g., 241Am), medium (e.g., 137Cs)

and high (e.g., 60Co) energy range of the analyzed gamma-ray spectra. As indicated by these examples, the nuclides need not exactly bracket the calibrated energy range or the range over which nuclides are identified and quantified.

b) **At least four (4) aliquots shall be prepared and analyzed according to the method either concurrently or over a period of days.**
c) **Using all of the results, calculate the mean recovery in the appropriate reporting units and the standard deviations of the population sample (in the same units) for each parameter of interest. When it is not possible to determine mean and standard deviations, such as for presence/absence and logarithmic values, the laboratory shall assess performance against established and documented criteria.**
d) **Compare the information from (c) above to the corresponding acceptance criteria for precision and accuracy in the method (if applicable) or in laboratory-generated acceptance criteria (if there are not established mandatory criteria). If all parameters meet the acceptance criteria, the analysis of actual samples may begin. If any one of the parameters does not meet the acceptance criteria, the performance is unacceptable for that parameter.**
e) **When one or more of the tested parameters fail at least one of the acceptance criteria, the analyst shall proceed according to i) or ii) below.**
   i) **Locate and correct the source of the problem and repeat the test for all parameters of interest beginning with b) above.**
   ii) **Beginning with b) above, repeat the test for all parameters that failed to meet criteria.**
f) **Repeated failure, however, confirms a general problem with the measurement system. If this occurs, locate and correct the source of the problem and repeat the test for all compounds of interest beginning with b).**
g) **When an analyte not currently found on the laboratory's list of accredited analytes is added to an existing accredited method, an initial DOC shall be performed for that analyte. When analytes are added to gamma-ray spectrometry and quantified this is not required.**

b) **<u>Ongoing Demonstration of Capability</u>**

After the demonstration of capability is completed, on-going proficiency is maintained and demonstrated at least annually. Each analyst is expected to consistently meet the QC requirements of the method, the laboratory SOP, client requirements and/or the TNI standard. Ongoing DOCS are documented in the QC\IDC folder of the network computer system, and all records related to the demonstration are retained.

The laboratory uses the following procedure to demonstrate ongoing DOC:

a) **Performing another initial demonstration of capability**
b) **Acceptable results for one-single-blind proficiency test sample (may be applied to similar methods using the same technology).**
c) **Having at least four (4) consecutive laboratory control samples with acceptable levels of precision and accuracy. The laboratory shall determine the acceptable limits for precision and accuracy prior to analysis. The**

laboratory shall tabulate or be able to readily retrieve four (4) consecutive passing LCS for each method for each analyst each year;

d) Performance of an alternate adequate procedure for the field of accreditation, the procedure and acceptance criteria being documented in the laboratory's quality system.

f) A documented process of analyst review using QC samples. QC samples can be reviewed to identify patterns for individuals or groups of analysts and determine if corrective action or retraining is necessary; or

g) if a) through f) are not technically feasible, then analysis of real-world samples with results within a predefined acceptance criteria (as defined by the laboratory or method) shall be performed.

L.3 Calibration

Section 23.2.2 includes information on calibration of support equipment. This section covers calibration of analytical equipment.

The calibration of the radiation counting equipment is performed as specified in the methods SOPS and following instrument manufacturer's instructions.

1. INTRODUCTION

The purpose of the Laboratory Quality Assurance Manual is to provide a framework to outline the quality systems at Eurofins Air Toxics, Inc.

1.1 Our Unique Promise of Value

Eurofins Air Toxics is the global leader in the The NELAC Institute (TNI) National Environmental Laboratory Accreditation Program (NELAP) for accredited vapor-phase environmental analytical laboratory services, and is also ISO/IEC 17025:2005 accredited for environmental chamber chemical emissions testing and associated analytical laboratory services.

Eurofins Air Toxics supports public and private sectors, including engineering and consulting firms, manufacturers, industry, government, retailers and others by offering a wide variety of certified air methods as well as emissions testing of consumer and building products and materials. Eurofins Air Toxics provides unmatched quality, capacity, and technical expertise to deliver an outstanding service experience to clients worldwide.

1.2 Mission Statement

Eurofins Air Toxics, Inc. is an analytical and environmental laboratory specializing in the analysis of vapor-phase contaminants and air quality parameters. Our business is guided by four key principles:

1) Providing unmatched data integrity
2) Establishing long-term relationships
3) Delivering quality client service
4) Exceeding client expectations

1.3 Quality Policy

The Executive Management Group recognizes quality as a key element of the laboratory's standard of service. This group supports the laboratory's commitment to quality as defined by NELAP and ISO 17025.

The Quality Policy Statement gives employees clear requirements for producing analytical data that is scientifically valid, legally defensible, accurate, impartial, and of known and documented quality, through strict adherence to the Quality Policy Statement. The Quality Assurance Officer wrote the Quality Policy Statement with final approval from the Technical Director. The policy cannot be revised without the Technical Director and Quality Assurance Officer's approvals. Employees are trained on the components of the Quality Policy Statement during their orientation. All employees sign the statement as agreement to implement the policy in all aspects of their work. The statement is as follows:

We strive to provide the highest quality data achievable by:

- Describing clearly and accurately all activities performed; documenting "real time" as the task is carried out; understanding that it is never acceptable to "back date" entries; and should additional information be required at a later date, the actual date and by whom the notation is made must be documented.
- Providing accountability and traceability for each sample analyzed through proper sample handling, labeling, preparation, instrument calibration/ qualification, analysis, and reporting; establishing an audit trail that identifies date, time, analyst, instrument used, instrument conditions, quality control samples (where appropriate and/or required by the method), and associated standard material.
- Emphasizing a total quality management process and commitment to continuous improvement that provides accuracy; strict compliance with agency regulations and client requirements, giving the highest degree of confidence; and understanding that meeting the requirements of the next employee in the work-flow process is just as important as meeting the needs of the external client.
- Providing thorough documentation and explanation to qualify reported data that may not meet all requirements and specifications but is still of use to the client, and understanding this occurs only after discussion with the client on the data limitations and acceptability of this approach.
- Responding immediately to indications of questionable data, out-of-specification occurrences, equipment malfunctions, and other types of laboratory problems with investigation and applicable corrective action; and documenting these activities completely, including the reasons for the decisions made.
- Providing a work environment that ensures accessibility to all levels of management and encourages questions and expressions of concern to management regarding quality issues.

We each take personal responsibility to provide this quality product while meeting the company's high standards of integrity and ethics, understanding that improprieties, such as failure to conduct the required test, manipulation of test procedures or data, or inaccurate documentation, will not be tolerated. Intentional misrepresentation of activities performed is considered fraud and is grounds for termination.

1.4 Statement of Values

At Eurofins Air Toxics, we strive to be the BEST in everything that we do. Our very existence is based on our continued ability to provide innovative, dependable, and cost-effective environmental services to our clients. We CARE about our clients as well as our co-workers and manage our daily activities to build relationships based on mutual TRUST, HONESTY, and RESPECT. We are LEADERS in our field and accept the risks associated with building new frontiers in our professional lives. Our strength comes from our TEAMS for through them we can achieve our goals.

1.5 Certifications, Accreditations, and Registration

Accreditation/Certification is the process by which an agency or organization evaluates and recognizes a laboratory as meeting certain predetermined qualifications and/or standards. It is the one generally accepted method by which a laboratory such as ours can demonstrate its capability of generating acceptable, professional, quality test results in those areas in which it claims competence. To this end, we have actively sought accreditation by organizations offering it in areas relevant to our technical expertise. We strive to ensure that the facility, equipment, procedures, records, and methods used by Eurofins Air Toxics laboratory in the testing of environmental samples are in compliance with the requirements of these standards.

Appendix C lists accreditations held by Eurofins Air Toxics, Inc. in support of environmental and product testing work. Current copies of all scopes of accreditation are kept on file in the Quality Assurance Department.

2. ORGANIZATION AND PERSONNEL

2.1 Organizational Structure

Eurofins Air Toxics' management organization includes six core areas: Operations, Information Technology (IT), Client Services, Research, Sales and Marketing, and Finance and Administration. The management staff includes executives, directors, managers, and group leaders. Each operating area is lead by a manager and/or a group leader. In the absence of a member of the laboratory and operational management team, deputies are appointed as follows:

Position	Deputy
President	Technical Director or appointee
Technical Director	Quality Assurance Manager or appointee
Quality Assurance Manager	Technical Director or appointee
Laboratory Director	Technical Director or appointee
Vice President of VOC Materials Testing	Technical Director or appointee
Managers/Group Leaders	Laboratory Director

Eurofins Air Toxics' senior executives and managers are committed to following and assuring compliance with the TNI Standard as defined in this Laboratory Quality Assurance Manual (LQAM). Each manager is responsible for implementing and maintaining systems as they affect their teams and for participating in their respective role in the management systems as outlined in the LQAM.

An Organizational Chart is presented in Appendix D of this manual. This organizational structure is created in a way to avoid any potential for conflicts of interest or undue pressure that might influence the technical judgment of analytical personnel.

2.2 Management Responsibilities

Management and/or supervisor is defined as group leaders, managers, and directors, and positions above those. The following is a list of management responsibilities:

- Personnel hiring and training
- Supervision of personnel
- Ensuring quality of data produced
- Resources allocation
- Directing daily work operations, including scheduling of work
- Maintaining awareness of technical development and regulatory requirements
- Assessing laboratory capacity and workload
- Contributing to the continuous improvement of the laboratory operation
- Providing resources to ensure a safe work environment

- Providing resources to ensure a work environment free of undue pressures
- Communicating problems and concerns to senior and executive management to enlist a higher level of support for corrections and continuous improvement, ensuring compliance with the requirements of NELAP and ISO 17025
- Ensuring that corrective actions are carried out in an appropriate and agreed upon time frame

The Technical Director ensures that the laboratory's policies and objectives for quality of testing services are documented in this quality manual. The Technical Director must assure that the manual is communicated to, and understood and implemented by all personnel concerned.

2.3 Overview of the Quality Assurance Program

The Quality Assurance (QA) Department is responsible for developing planned activities the purpose of which is to provide assurance to all levels of management that a quality program is in place within the laboratory, and that it is functioning in an effective manner that is consistent with the requirements of NELAP and ISO 17025. Although Eurofins Air Toxics is a wholly owned subsidiary of Eurofins Scientific, the Quality Assurance and quality systems described in this manual are specific to Eurofins Air Toxics.

2.3.1 Quality Assurance Manager

The Quality Assurance Manager ensures that the quality system is followed at all times. The QA Manager reports directly to the Technical Director in order to maintain independence from business operating units and facilitate communications regarding quality-related issues. The QA Manager has no direct supervisory responsibility for the generation of technical data to avoid any conflict of interest in administrating the QA program. The QA Manager has the final authority to stop work that compromises the laboratory's integrity or data quality. The situation must be investigated and appropriate corrective action must be put in place before the QA Manager will authorize the resumption of work. The specific duties of the QA Manager are communicated in job description format.

2.4 Quality Assurance Responsibilities

The Quality Assurance team is responsible for implementing and maintaining Quality Assurance procedures throughout the laboratory. This is accomplished via coordination and dissemination of internal and external assessment information, review of Standard Operating Procedures (SOPs) to document variances taken to published methods, monitoring of the Quality Assurance Manual to ensure consistency with actual practices, maintenance of an ongoing Corrective Action Program with quarterly reports to the senior management team, a leadership role in employee training, data review, and other quality control-related programs.

The QA team is free from any commercial, financial, or production pressures when making assessments or decisions regarding the quality of work produced or effectiveness of the quality systems.

2.5 Communication of Quality Issues to Management

Communication between the Quality Assurance (QA) team and other management teams occurs on a regular basis (typically via bi-weekly status meetings). Information regarding outstanding corrective action items, upcoming assessments, assessment results, and/or general observations are discussed and documented via a database of agenda notes. The QA databases along with the Laboratory Information Management System (LIMS) database are used to compile a Quarterly Quality Assurance Status Report, which is distributed to the senior management team for review.

2.6 Personnel Qualifications and Responsibilities

Full resumes and specific position descriptions for all personnel are located in Human Resources (HR) Department files. In addition, department managers have copies of position descriptions for their staff.

2.6.1 Executive Team

President: Provides leadership that ensures the founding mission and core values of the company are put into practice. The President leads programs relating to the development of long-range strategy, quality systems, financial infrastructure and sales. The President also provides day-to-day leadership and management of programs for overseeing the processes and resources necessary for establishing long-range service objectives, plans, and policies in cooperation with the Board of Directors. The President is responsible for the measurement and effectiveness of both internal and external processes by providing accurate and timely feedback on the operating condition of the company. In addition, the President directs the definition and operation of the laboratory production by fostering a success-oriented and accountable environment within the company.

Technical Director: Provides oversight for the quality systems and technical performance of the laboratory, and manages technical support, the project management team, and the QA Manager. The Technical Director is responsible for developing products and solutions to meet client and industry needs, and also oversees the validation process of current and new products to ensure quality objectives are met and documented as defined.

Laboratory Director: Responsible for managing the operations of the laboratory, profit/loss relating to operations, laboratory efficiency improvement in software and instrument automation, and serves as the primary interface between finance, HR, IT, and sales/marketing. The Laboratory Director has the overall responsibility of ensuring customer satisfaction goals are met while elevating the skill and training of key technical staff as well as assuring that state-of-the-art instrumentation and capital assets are in place to meet global customer needs.

Vice President of VOC Materials Testing: Responsible for the promotion and demonstration of expertise in chamber testing, product emissions, and indoor air quality (IAQ), providing scientific leadership in these areas. Represents Eurofins Air Toxics on technical committees and at technical conferences and trade shows as they relate to the promotion and demonstration of expertise in chamber emissions testing and IAQ. Has the overall responsibility for establishing and maintaining a strategy and business plan for the emissions and product testing markets in the U.S.

2.6.2 Management Team:

Laboratory management and personnel are free from any commercial, financial, or production pressures when making technical judgments or decisions regarding the quality of work produced.

Information Technology Manager: Oversees all aspects of software engineering and development, database administration, and network administration. The IT manager is instrumental in designing and implementing model work-flow processes, defining user requirements, and proposing software design and implementation to satisfy long-term company business goals. This role provides established policies and procedures to ensure continuous database and server environment integrity and reliability.

Quality Assurance Manager: Responsible for overseeing the quality systems in the laboratory. Key to the Quality Assurance role is a focus on continuous improvement through effective monitoring of systems and evaluation of non-compliance and corrective actions. To support the quality systems, the Quality Assurance Manager leads the internal and external audit programs, negotiates audit resolution, and oversees the effectiveness of the Corrective Action Report (CAR) program. The QA Manager is tasked with providing timely feedback to front-line managers and bench staff regarding quality programs and also a big-picture assessment to senior management. Additionally, the QA Manager ensures required documentation and certifications are current and accurate, including regulatory accreditations, the LQAM, and SOPs.

Managers/Group Leaders: Responsible for day-to-day operations of the laboratory or specific departments. The Group Leaders oversee technical operations, sample analysis, data entry, report generation, provision of resources, and other related areas. In addition, they are responsible for employee management and review. Group Leaders report directly to the Laboratory Director. Managerial decisions are made by the Laboratory Director in their absence.

2.6.3 Laboratory Staff and Responsibilities

It is the primary responsibility of laboratory staff to produce quality data within the framework of each individual method and within the parameters of the laboratory's quality control guidelines. It is also the responsibility of staff to identify existing problems or inefficiencies, and to improve the processes of the laboratory whenever possible. Duties for these personnel typically include:

- Sample preparations
- Performance of analytical tests
- Calibrations, operation, and maintenance of instruments
- Standard and reagent preparation
- Sample storage
- Data entry
- Data package preparation

2.7 Training

The experience and training received by personnel is of great importance to Eurofins Air Toxics' clients and regulatory agencies. Accurate training documentation is the responsibility of both employees and their supervisors. On a routine basis, the supervisor reviews and signs training documentation to verify that it is complete and current.

Each laboratory analyst being trained to perform a new analysis is required to perform an initial Demonstration of Capability (DOC) and meet the requirements for accuracy and precision before working independently on the test methods. Typically this is accomplished by the successful analysis of at least four aliquots of a laboratory quality control sample. However, there are certain tests that are not required by the mandated test method or regulation to perform the above procedure (e.g., PM10). In this case, the analyst's proficiency demonstration is satisfied by documentation of having read, understood, and agreed to follow the SOP, specific department or method forms and procedures, and observation by scientist or senior analyst.

Management personnel are responsible for planning ongoing professional growth and development activities for an employee through on-the-job training and/or internal and external training courses so that an employee can maintain a current skill set to match job responsibilities.

An annual performance review based on job accountabilities, objective measures, and pre-defined standards is completed by management personnel for each employee. This assessment is documented and maintained. Input is obtained from other managerial personnel as needed.

2.7.1 New Hire Training

New employees learn about personnel and safety policies as well as business strategies through a formal process administered by our Human Resources Department and the Safety Committee. All new employees are also required to attend the Quality Assurance Orientation course. Completion of this course is documented in the employee's Training Record. The course outline includes:

- Introduction to QA
- Definitions of SOPs and LQAM
- How to use CARS
- Logbook protocol
- Chain-of-custody procedures

- Training Documentation
- Overview of Eurofins Air Toxics classes including Ethics and Integrity courses
- Overall Training Record organization and upkeep

New employee training continues with review and signing of the Eurofins Air Toxics Ethics Policy (Form F1.56), a review of the Quality Assurance Manual, and signing of the Quality Policy. Upon completion of those, employees move on to analytical method training if required for their position. Other non-testing training materials may be required by the departments.

In general, the laboratory staff reviews the department's SOPs and/or the regulatory method as well as the instrument manual. The employee will then observe while an experienced analyst prepares samples and operates the instrument. Training includes sample handling and preparation, documentation protocols, calibration procedures, QC requirements, data management, data reporting and troubleshooting.

2.7.2 Ongoing Training

After successful completion of the initial Demonstration of Capability, all laboratory staff must demonstrate continued proficiency. Whenever there is a change in test method, instrument method type, and/or personnel a new DOC must be performed. At least once per year, each analyst must demonstrate continued proficiency on assigned technical methods. The QA Department notifies personnel via e-mail whenever a new SOP is generated or a current SOP is updated. Employees responsible for that method or procedure must read the new or updated SOP within 30 days and document the review in the LIMS SOP Tracker module. In addition, the Laboratory Quality Assurance Manual and the Chemical Hygiene Plan must be annually reviewed by all employees.

Employees are re-trained if an issue or investigation warrants that it is a necessary corrective action. Management provides direction as to when employee re-training is required, and to the extent of the re-training.

2.8 Employee Safety

Laboratory staff may, on occasion, be exposed to handling of solvents, compressed gases, calibration standards, or other hazards. Eurofins Air Toxics designates an assigned Safety Officer and several staff members who comprise the Safety Committee. Some members are 40-hour OSHA-trained and respirator-fitted.

Employee education in the safe handling and disposal of these materials is accomplished as follows:

- Each new employee is given a safety tour of the facility within the first two days of employment. Documentation of this orientation appears in the employee's Training Record.
- The Safety Committee meets frequently to discuss safety concerns and ways of improving safety in the work place.
- The Safety Committee schedules ongoing safety training throughout the year.
- If special precautions must be taken to perform a method, a safety section is included in the method SOP or in a stand-alone SOP which discusses protocols and other measures for risk reduction through exposure prevention.
- Safety Data Sheets (SDSs), formerly Material Safety Data Sheets (MSDS), are maintained for each chemical used on-site. The SDSs are accessible to personnel in the library area immediately outside the standards room and/or electronically through the chemical inventory database (CISpro) at all times. SDSs are also accessible on the Internet from product vendors.
- The Safety Committee members are assigned to duties that include hazardous waste disposal, incident or spill management, scheduling staff training, safety site assessments, Chemical Hygiene Plan review, and the overall leadership of the Safety Program.

2.9 Client Services/Project Management Responsibilities

The Project Management group is responsible for organizing and managing client projects. Clients are assigned a Project Manager who serves as their primary contact. It is the Project Manager's responsibility to act as client advocate by communicating client requirements to laboratory personnel and ensuring that clients provide complete information needed by the laboratory to meet those requirements. All client verbal and electronic communications are documented by the project managers in the LIMS Contacts module. In addition to information management, project management responsibilities include:

- Coordinating and preparing proposals in conjunction with technical staff, including review of project-specific documents and negotiations of variance requests

- Documentation of project requirements
- Coordinating and communicating turnaround-time (TAT) requirements
- Scheduling sample submissions, sample containers, and sample pickup via Eurofins Air Toxics courier service
- Informing clients of deviation from their contract

2.10 Confidentiality

Strict confidentiality is maintained in all of Eurofins Air Toxics dealings with clients. All employees are required to protect company data, including client names and/or test results from disclosure to any third party. This policy is presented to employees in SOP #99 and during their orientation period.

Clients are promptly notified if their data is subpoenaed or requested by a regulatory or legal body.

In order to ensure the confidentiality of our systems and procedures within the laboratory, it is Eurofins Air Toxics' policy to restrict the distribution of our internal procedures to clients. Clients are, however, permitted to review the laboratory's procedures while on-site as part of an audit or visit. Based on this policy, the laboratory requests that any document viewed is not shared or made available to any third parties without the permission of Eurofins Air Toxics.

2.11 Operational Integrity

All employees sign an Employee Ethics Statement on their first day of employment. Employees responsible for generating, handling, or reviewing laboratory data understand that Eurofins Air Toxics' mission is to perform all work with the highest level of integrity. Shortcuts or generating results to suit a client's purpose, rather than adhering to good scientific practices, is not considered acceptable under any circumstances. Any violation of the laboratory ethics policy results in a detailed investigation that could lead to termination. Examples of violations of data integrity are listed below:

- Knowingly recording inaccurate data
- Fabrication of data without performing the work needed to generate the information; this includes creating any type of fictitious data or documentation
- Time travel or adjusting clocks on computerized systems to make it appear that data was acquired at some time other than the actual time

- Manipulation of data for the express purpose of passing systems suitability or quality control criteria
- Selective use of data generated, or not using data that was legitimately generated to impact the outcome of a test
- Executing significant deviations from approved test methods and procedures without prior approval from Eurofins Air Toxics management and/or the client

If an issue does arise which could compromise data integrity, personnel are instructed to perform the following activities:

- Clearly document the situation and maintain all data generated. There is a big difference between poor judgment and fraud. Fraud usually involves intent to conceal an action taken. Therefore, the more documentation that is maintained the less likely an action is considered fraudulent if further scrutinized. All documentation of the inquiry and subsequent disciplinary actions will be maintained by both the Technical Director and the Human Resources Department for at least five years.
- When out-of-specification results or quality control-type issues are detected, all supporting data and relative background information must be documented and presented for management review. Problem resolution and client contact, as applicable, must also be documented.
- Any questionable situations and decisions must be reviewed with a supervisor.
- Questionable or uncomfortable issues are brought directly to QA Manager or a member of the QA Department as part the QA "open door" policy. If an employee desires to remain anonymous, he or she is encouraged to report to the designated laboratory staff ombudsman. The designated ombudsman will meet separately with management and the employee involved, ensuring anonymity.

3. BUILDINGS AND FACILITIES

3.1 Facility

The Eurofins Air Toxics laboratory occupies approximately 35,000 square feet of space in Folsom, California, including 7,000 square feet of office space. The single-story building is custom-designed to suit the specifications of an air laboratory. Design criteria included floor plans to accommodate segregation of conflicting tests and provide an environment that is conducive for cross-functional work teams. The main instrumentation laboratory is based on an "open" concept in which walls were removed to promote a sense of community and teamwork. Wide hallways with alcoves were designed to encourage congregation and discussion. The number of private offices was minimized so that barriers between management and staff are absent. Elements of the quality system are evident throughout the facility design. The facility's map is provided in Appendix F.

3.2 Security

Security at Eurofins Air Toxics is maintained through a controlled access system. Representatives of State, Federal, and private entities have access to the laboratory facility and records during normal business hours. Guests and employees must enter/exit through Sample Receiving or the reception area. All visitors must sign in and out upon arrival and departure. After work hours, the building is secured and linked to a commercial security agency. The security system is equipped with perimeter alarms, motion sensors, and speakers that monitor background sounds. Heat-activated fire alarms are monitored by an outside agency. A fire alarm also activates the security system. Security and controlled access protocols are described in SOP #30.

4. DOCUMENT CONTROL

4.1 Controlled Documents at Eurofins Air Toxics

It is Eurofins Air Toxics' policy to restrict the distribution of internal procedures to clients, and we discourage the distribution of company confidential documents outside of the facility. Clients are permitted to review our procedures while on-site as part of an audit or visit. Any documents that are distributed are only done so with the approval of QA.

4.1.1 Quality Policy Manual and Company Policies

Eurofins Air Toxics' Quality policies and Quality Systems must comply with all State and Federal requirements for those programs for which the laboratory maintains accreditation.

All Eurofins Air Toxics employees are required to read the Quality Assurance Manual within 30 days of release of the latest version and maintain current documentation in their Training Record binders. The Quality Assurance Manual is available to all employees electronically on a shared server located at O:\QA\LQAM. A hard copy is also available in the QA department.

4.1.2 Laboratory Standard Operating Procedures (SOPs)

The SOPs at Eurofins Air Toxics detail the work processes used on a regular basis that are to be conducted and followed within the organization. They document the way activities are to be performed to facilitate consistent conformance to technical and quality system requirements and to support data quality. These SOPs can be administrative or technical. All employees should maintain a record of review of the most current SOPs.

4.1.3 Work Instructions (at the department level)

The intent of these procedures or documents is to define in greater detail the specific "how to". The level of detail in these documents must be sufficient so any appropriately trained person can perform the task accurately.

4.1.4 Logbooks, Forms, and Instructions

The intent of these documents is to provide documented evidence to support Eurofins Air Toxics quality systems and operations. They are used as part of regular laboratory operations to record necessary information.

4.2 Document Approval, Issue, Control, and Maintenance

The Quality Assurance Department is responsible for the approval, issue, control, and maintenance of all documents that are part of the laboratory's quality systems including, but not limited to, the Quality Assurance Manual (LQAM), Standard Operating Procedures (SOPs), Logbooks, Forms and Instructions, Certificates of Analysis (C of As), and calibration and training documents.

All documents issued to personnel in the laboratory as part of the quality system shall be reviewed and approved for use by Technical Director, Laboratory Director, and Quality Assurance Manager prior to use.

The LQAM and SOPs are reviewed to ensure they remain accurate and current. The frequency of review is either annual at the least or as needed, depending on the procedure. Upon generation of new or updated documents, all copies of obsolete documents are removed from the laboratory and its computer network, then archived or destroyed as appropriate. Pertinent staff members are notified of the updates. A new revision number is assigned to the LQAM or SOP at every review.

All technical changes must have the approval of the Technical Director, the Laboratory Director or Vice President of VOC Materials Testing, and the Quality Assurance Manager.

Detailed instructions regarding document control and how to write SOPs are available in SOPs #46 and #119.

4.3 Laboratory Logbooks and Forms

Procedures are in place to ensure that all data is traceable, authentic, complete, and retrievable. Logbooks, forms, and instructions are created and distributed by the Quality Assurance Department as needed. Used logbooks are returned to QA for archival. The QA Department maintains a master index to uniquely number and identify each logbook and form distributed. Logbooks can contain blank or preformatted pages. They are bound and uniquely identified, and have sequentially pre-numbered pages.

4.4 Archival and Storage of Documents

The majority of documents at Eurofins Air Toxics are stored electronically. Documents which remain in hard-copy format include chain-of-custody forms (COCs), Data Review Checklists, scanned packets (run logs, spectral defenses, manual integrations, etc.), FedEx/UPS air and freight bills, and most logbooks. All other hard-copy documentation is stored in its specific workorder folder. The hard-copy workorder folder is placed in a bar-coded storage box for long-term storage. Bar codes are maintained in an inventory log. An off-site company archives the boxes using the bar-coding system. The storage company provides one-day retrieval service upon request.

Used logbooks are returned to Quality Assurance for archival and remain in the QA Department for no less than five years.

5. SAMPLE HANDLING

5.1 Sample Collection

It is the responsibility of the client to submit representative and/or homogeneous and properly preserved samples of the system from which they are collected. In all cases, field sampling personnel are ultimately responsible for having expertise and knowledge in air sampling methodology or product/materials collection protocols sufficient to ensure that the defensibility of the data will not be compromised due to deficiencies in the field sampling, handling, or transportation. General information regarding the proper use of sampling media provided by Eurofins Air Toxics is available as a resource for field personnel. The laboratory provides sample containers, chain-of-custody forms, sampling labels, chemical ice packs (if appropriate), shipping containers, custody seals (per client request), and a copy of the Sample Acceptance Policy.

Air sampling media provided by a qualified vendor or prepared by the laboratory for field use is certified for cleanliness. The laboratory's media cleaning process is typically verified using batch certification protocols. Individually certified canisters are also available per specific client request.

5.2 Sample Receipt and Entry

5.2.1 Sample Receipt

Samples can be received at the laboratory during normal laboratory operating hours. Receipt occurs in one of three ways:

- Commercial courier
- Eurofins Air Toxics courier service
- Personal delivery

Upon arrival at the laboratory, samples are received and inspected following Eurofins Air Toxics' Sample Acceptance Policy as outlined in SOP #50. This SOP establishes specific guidelines for sample acceptance, which are generally accepted practices under U.S. Environmental Protection Agency (USEPA), Department of Defense (DoD), ISO, and NELAP protocols.

5.2.2 Sample Entry

As soon as is practical after sample receipt, the samples are entered into LIMS. Samples awaiting log-in are stored in temporary holding areas, at appropriate storage conditions to maintain sample integrity.

At the time of entry, the LIMS system assigns a unique laboratory sample number to each sample. This number is sequentially assigned, then a label is generated and is attached to the sample container.

A sample acknowledgment in the form of a Sample Receipt Confirmation prints from LIMS for each sample delivery group (SDG), which is the same number as the workorder. This notification is sent to the client to confirm sample receipt and entry.

5.2.3 Sample Rejection Policy

Any time a sample is received in a condition that does not meet the method requirements, if there is doubt about the suitability of items received, if items do not conform to the description provided, or the testing required is not clear or specified, the condition of the sample is clearly documented on a Sample Discrepancy Report (SDR). The SDR is delivered to the Project Manager for review and communicated to the client as needed. Directions on next steps, which may include canceling the sample or proceeding with qualifiers and/or narrative, are documented on the SDR. Details are outlined in SOP#50.

5.3 Sample Identification and Tracking

A sample label is generated for each sample, and in addition to the assigned Eurofins Air Toxics' sample number the following information is printed on the label: workorder number, laboratory sample ID, and, if needed, a sample release date. For canister analysis, the label is not affixed directly to the canister but attached with a tag.

To ensure traceability of results, the unique sample number assigned is used to identify the sample in all laboratory data documentation, including logbooks, instrument printouts, and final reports.

5.4 Sample Storage

After entry into LIMS, samples are placed in an assigned and identified storage location until needed for analysis. Room temperature, refrigerated, and freezer storage are available, and samples are stored in accordance with regulatory, method, or client directions. The LIMS system is used to assign storage locations for bar-coded media, which promotes orderly storage of samples. Sample storage locations for sorbent and condensate samples requiring refrigeration are monitored for accurate temperature control.

When a canister, bag, or product sample is scheduled for analysis, the analyst obtains custody of the sample by scanning the canister tag or sticker bar code as well as the bar-coded destination location of each individual sample. The scanned information is electronically transmitted to LIMS to reflect the custody of canister and bag samples at all times. All other media samples are logged into the Internal Extractable Sample Tracking Logbook and the pertinent storage area.

5.5 Sample Return/Disposal

Samples are released for disposal upon satisfactory completion of analysis unless prior contractual arrangements have been made. Product samples are held for a minimum of 30 days after satisfactory completion of the analysis, unless otherwise specified by the customer. The release of samples is electronically documented in the LIMS tracking system via scanning of the canisters and bags. This ensures verification of completion of all analyses including all samples in each workorder. Samples are released following the procedures outlined in SOP #63.

Sample disposal varies based on the sampling media. Whole air samples are vented through a charcoal scrubber, while liquid samples are disposed of according to procedures noted in SOP #24.

5.6 Chain of Custody

Samples received by the laboratory must be documented using a chain-of-custody (COC) form and relinquished following standard EPA-approved guidelines, including the following:

- Unique sample name or number
- Location, date, and time of collection
- Canister number (if applicable)
- Collector's name
- Preservation type (if applicable)
- Matrix or product type
- Any special remarks

Additional information may be required depending on the requested analysis.

A copy of the signed COC will be e-mailed to the client in conjunction with the Sample Receipt Confirmation.

Once a sample is received by the laboratory, the internal chain-of-custody procedure is followed.

Disclaimer: *Eurofins Air Toxics assumes no real or implied responsibility or liability for client-related field sampling and shipping activities. It is the responsibility of the individual client to ensure that referenced methodologies are followed with respect to sample collection and shipment to the laboratory. Air sampling media and equipment should only* *be used by experienced field engineers. It is the ultimate responsibility of the client to be knowledgeable both in sample preservation requirements as well as relevant State, Federal, and international shipping requirements. Any time a chemical substance is collected using Eurofins Air Toxics media, the client bears sole responsibility for understanding and abiding by the laws involving shipment of potentially hazardous substances by common carrier.*

6. TECHNICAL REQUIREMENTS – TRACEABILITY OF MEASUREMENTS

6.1 Reagents and Solvents

The reliability of Eurofins Air Toxics' analytical results can be directly affected by the quality of reagents used in the laboratory. Procedures are in place to control labeling, storing, and evaluation of these materials. All purchased supplies, reagents, solvents, and standards are verified as acceptable and meeting criteria for analysis prior to use. The Eurofins Air Toxics' Chemical Hygiene Plan (CHP) provides safety information in regard to the storage and handling of laboratory chemicals. All reagent certificates and Safety Data Sheets (SDSs) are retained by the laboratory (see section 2.8).

6.2 Calibration Standards

Written calibration procedures are required, where applicable, for all instruments and equipment used in the laboratory. The source and accuracy of standards used for calibration purposes are integral to obtaining quality data. Requirements for calibration are provided in each analytical method including specifications for the standard used. Calibration measurements made by the laboratory must be traceable to national standard of measurement (e.g., NIST) where available. Certificates of Analysis are maintained for each material, as applicable.

Standards are usually purchased from commercial suppliers either as neat (pure) compounds or as solutions with certified concentrations. The accuracy and quality of these purchased standards are documented on the C of A, and hard-copy certificates are maintained on file in the laboratory. Upon receipt at Eurofins Air Toxics, material is labeled with a date of receipt and stored appropriately.

Stock standard solutions are recorded in the proper standard logbook and are assigned a unique standard code number. When a working standard is prepared, the compound(s), standard code number, date prepared, analyst, expiration date, and solvent are noted in the working standard logbook. All working standards are kept in containers and at temperatures that will not alter their integrity. All containers are clearly labeled with concentrations, unique standard code number, and expiration date. Standards are not to be used in the laboratory past their expiration date.

6.3 Equipment and Instrumentation

The laboratory is equipped with all equipment and instrumentation required for testing the scope of work it supports. All equipment and instrumentation is maintained in proper working order. Eurofins Air Toxics' major equipment capabilities are summarized in the table below:

Major Instrumentation

Number	Instrumentation
24	GC-MS
7	Gas Chromatographs with various detectors (TCD, PID, FID, SCD, ECD)
2	HPLC-UV
11	Air Concentrators
7	Automated Thermal Desorption Units
3	Liquid Auto-samplers
1	Extractors
60	119 L Dynamic Environmental Chambers
1	Micro-chamber/Thermal Extractor
1	Air Generator
1	Industrial Air Compressor
1	Air Humidification System

6.3.1 General Requirements

- Equipment and instrumentation are assigned a unique identifier designation to identify them within the data documentation.
- An equipment logbook is established in conjunction with installation and is readily available to document all incidents that pertain to the equipment and instruments as they occur.
- All test, measuring, and inspection of laboratory systems, equipment, and instruments used at Eurofins Air Toxics are routinely calibrated and maintained in accordance with applicable Standard Operating Procedures.
- A member of the technical group, or another designated individual, performs routinely scheduled maintenance and calibration of laboratory equipment as required by laboratory procedures. These activities are documented.

- If appropriate standards or expertise for calibration or maintenance are not available in-house, the operation is conducted by an outside service firm.
- All equipment taken out of service is tagged accordingly.

6.3.2 Standard Operating Procedures

Information regarding operation, maintenance, and calibration of equipment and instrumentation are found in respective SOPs. The procedures include a routine schedule for preventative maintenance and calibration as applicable, along with acceptance criteria and remedial action to be taken in the event of failure. These procedures are maintained in the document control system and reviewed on a regular basis to verify they remain current and accurate. Equipment manuals are also available to provide additional information with regard to operations and maintenance.

6.3.3 Maintenance

- Equipment maintenance is performed as either a preventative or corrective operation.
- Preventative maintenance procedures and schedules for each piece of equipment are assigned where applicable. Preventative maintenance operations are performed by an analyst, scientist, senior scientist, or contracted manufacturer's representative or service firm personnel. Documentation is maintained for the procedures performed as part of the preventative maintenance operation. It is the responsibility of Group Leaders to ensure that a preventative maintenance schedule is addressed by a procedure where appropriate and is followed.
- A supply of commonly needed replacement parts is maintained by the laboratory.

6.3.4 Calibration

- Calibration is the establishment of, under specified conditions, the relationship between the values/response indicated by a measuring instrument or system and the corresponding known/certified values associated with the standard used. Some types of calibrations are performed within a set of frequency (e.g., daily), while others provide intermediate checks to ensure that the instrument response has not changed significantly.

- All measuring and testing equipment having an effect on the accuracy, precision, or validity of calibrations and tests are calibrated and/or verified on an ongoing and routine basis. Methods for calibration of instruments and equipment vary widely with the nature of the device and the direction given by analytical procedures, department procedures, or manufacturer recommendations. Frequency of calibration can also depend on additional factors, including robustness of the instrument or equipment and the frequency of use.
- Calibration information is recorded in a logbook that is associated with the instrument/equipment and/or a calibration certificate is maintained and/or data printouts are generated to document the activity.
- Calibration measurements are traceable to national standard of measurement (e.g., NIST) where available. Physical standards, such as NIST-certified weights or thermometers are re-certified on a routine basis. Calibration certificates are maintained on file, where applicable, to indicate the traceability to national standard of measurement.
- Calibration failures are documented in the logbook for the instrument and/or within the data printouts from the instrument.
- After repair, adjustments, or relocation that could affect instrument response, calibration/verification activities are performed, as applicable, before the unit is returned to service.
- Analytical data is not reported from instrumentation or equipment that fails to meet calibration requirements.

6.4 Computerized Systems and Computer Software

6.4.1 Computer Usage

Eurofins Air Toxics provides computer equipment for employees to use as a tool in performing their work. Computer equipment is the property of Eurofins Air Toxics and is to be used in accordance with defined terms and conditions. The laboratory’s goal is to provide standard hardware and software that meets the needs of the user.

6.4.1.1 Physical security of computer systems: It is company policy to protect computer hardware, software, and data documentation from misuse, theft, unauthorized access, and environmental hazards. All of the laboratory servers are housed in a locked office, which maintains favorable environmental conditions to allow for optimal server performance. Access to the laboratory's networks is granted by the Systems Administrator or Information Technology (IT) Manager. Network access is tightly controlled for the entire company. Users maintain individual network accounts and are allowed to access specific areas of the network based on the privileges assigned to them. A user is granted access to only those areas needed to fulfill his or her job function.

6.4.1.2 Passwords: All software used to reduce sample data or generate sample reports is password-protected; users are granted rights to these systems based on a "read/write/none" privilege system. The following procedures apply regardless of what system(s) is being utilized:

- Passwords must be kept confidential.
- Users must log-out of a system when not in use to prevent unauthorized access.
- Forgotten passwords can only be reset by the IT Department or by an appropriate System Administrator.
- Network passwords automatically expire every 90 days. The computer prompts a user to change the password when the expiration date nears.

6.4.1.3 Computer viruses: Eurofins Air Toxics continuously monitors its computer network for computer viruses. Anti-virus software is employed to detect viruses on the Windows network. Employees must report any virus concerns to the IT department as soon as possible. Employees who share files between their home computer and the laboratory should install anti-virus software on their home computer. If an employee does not have such software, the laboratory can suggest various no-cost anti-virus software products.

6.4.1.4 Internet and e-mail System: The e-mail system is used primarily for Eurofins Air Toxics business purposes. The Employee Handbook provides additional information in regard to system usage. Employee access to the Internet is restricted to those employees who have a business need for it. All employees have access to e-mail. All Internet and e-mail activity is subject to monitoring. All messages created, sent, or received over the Internet are property of Eurofins Air Toxics and can be regarded as public information. E-mail and Website filtering software is utilized.

6.4.1.5 Software Policy:

Eurofins Air Toxics' Software Policy is as follows:

- Copyright laws protect software, and Eurofins Air Toxics' intent is to abide by all software agreements.
- Software purchases must be formally requested and approved by management, IT Department, and/or validation personnel, as necessary.
- All software is used in accordance with applicable license agreements.
- Employees are not to install any software on computer(s) unless authorized by the IT Department.
- Employees must not give software to outsiders (e.g., clients, contractors, etc.), unless approval is granted by management.
- Users must not make copies of any licensed software or related documentation without permission. Any user that illegally reproduces software is subject to civil and criminal penalties including fines and imprisonment.

6.4.1.6 Computer system backup, data restoration, and data archival: All data systems are backed up on a daily, weekly, and monthly basis using a modified "grandfather-father-son" (GFS) rotation protocol. Specifically, these backups are conducted on the servers responsible for all laboratory production data files and databases (i.e., Project Management files, analytical data, audit trails, Quality Assurance documents, etc.). A daily incremental backup is scheduled to run each night Monday through Saturday. The daily incremental backup is limited to files modified the same day. On Sunday, a weekly full backup of all files on each server is completed. At the end of each month, a full backup of each data system is conducted. This monthly backup tape is then placed in permanent storage. The permanent historical backup tapes are stored in an off-site data storage facility. Data is not removed from the server until at least three permanent monthly backup tapes have been created. This ensures that no archived data will be lost due to corruption of the magnetic tape. A more comprehensive description of the laboratory's electronic data archiving system can be found in SOP #55.

6.4.1.8 Remote access to computer systems: With special permissions, employees are able to remotely connect to the laboratory computer network through a VPN system. When logging in, users are authenticated with their Windows account and password.

6.4.2 System and software verification: Before each new computer system or significant modification of an existing system is implemented in the laboratory, the following requirements must be met:

- Required documents – Describe the required system functionality and specification (e.g., Software Development Change Control, Change Control Log, IT Logic New Rule or Rule Update)
- Design documents – System overview, screen design, report layout, data description, system configuration, file structure, and module design
- Testing documentation for system development/verification – structural testing of the internal mechanisms and user testing of the installation and system qualification.

7. PURCHASING EQUIPMENT AND SUPPLIES

7.1 Procurement

The primary materials procured by the laboratory are analytical instrumentation and software, media and reagents including standards, carrier gases and cryogens, miscellaneous laboratory supplies, computer hardware and software, and service contracts.

Control of the purchase of these items and services is maintained using a standard purchase order system described in SOP #105 and outlined below:

- Purchase requests must be approved by a director or manager.
- An assigned purchase order (PO) number is entered along with the date, vendor, and requester.
- An evaluation of the supplier is conducted to determine whether it has been deemed a qualified vendor.
- Requires that upon receipt or delivery of services the product is inspected by the purchasing agent and compared to the packing slip and/or request for services.
- Each PO is matched with invoices prior to payment to insure that purchased items or services were delivered as expected.

Purchasing documents are maintained by the Accounting Department, calibration certificates are maintained by the Quality Assurance Department, and Certificates of Analysis for reagents and media are maintained by laboratory personnel.

7.2 Supplier Evaluation

Suppliers and vendors are evaluated in accordance with SOP #105 to assure that the quality of the products purchased meet the quality expectations of Eurofins Air Toxics, Inc. and do not interfere in the quality of testing. A laboratory database is maintained with a list of approved vendors.

8. ANALYTICAL METHODS

8.1 SCOPE OF TESTING

Soil vapor, landfill gas, indoor and outdoor ambient air, source (stack) emissions, and other types of air-phase samples are analyzed in accordance with official published methods or validated in-house methods. Method modifications made by Eurofins Air Toxics, Inc. are detailed in a summary of modifications table in the method SOP. Measurement and analysis of volatile organic compound (VOC) emissions from products using environmental chambers are performed in accordance with the relevant ASTM, EPA, and ISO methods. Specific operational and assessment parameters required for product compliance to voluntary and regulatory labels and testing are outlined in documents such as CDPH/EHLB SM V1.1 (CA 01350), ANSI/BIFMA M7.1, and AgBB.

The methods used by Eurofins Air Toxics are approved by a broad range of regulatory agencies.

A list of methods covered under the laboratory's NELAP accreditation can be found in the table in section 8.2.

Eurofins Air Toxics specializes in and has expertise with the following types of projects:

- Vapor Intrusion investigations
- Environmental assessments
- Remediation system monitoring (soil vapor extraction)
- Landfill gas characterization
- Source emissions testing
- Soil vapor surveys
- Ambient air monitoring
- Indoor air quality (IAQ)
- Material emissions using environmental chambers

Appendix E contains summaries for each commonly performed analytical procedure in the laboratory. Each summary contains the following information:

- A brief method description
- Laboratory variances to method compendium or other regulatory reference methodologies
- Tables containing analyte lists, Reporting Limits (RLs), Limits of Quantitation (LOQs), and quality control (QC) acceptance criteria
- A table of calibration and QC procedures

This Quality Assurance Manual references methods in a general manner; specific procedures used by the laboratory can be found in the method-specific SOPs.

8.2 Analytical Test Methods

Eurofins Air Toxics' NELAP-certified analytical methods, parameters, instrumentation, sampling media, holding times, and SOP numbers are summarized in the table below:

Method	Parameter	Type	Sampling Container	Holding Time in days	Eurofins Air Toxics SOP #
TO-14A/TO-3	BTEX/TPH	GC/FID/PID	Summa Canister Tedlar Bag	30 3	43
TO-4A/TO-10A	Pesticides/PCBs	GC/ECD	PUF	7	26
TO-11A	Aldehydes/ Ketones	HPLC/UV	DNPH Cartridge	14	11
TO-12	Non-methane Organic Carbon (NMOC)	GC/FID	Summa Canister Tedlar Bag	30 3	36
TO-13A	PAHs/ Semi-volatiles	GC/MS	XAD/PUF	7	3/10
TO-14A/TO-15	VOCs	GC/MS	Summa Canister Tedlar Bag	30 3	6/38/83/114
TO-17	VOCs	GC/MS	Sorbent Tube	30	5/109/110/ 112/122
ASTM D-1946	Fixed Gases, CH_4, C_2+	GC/TCD/FID	Summa Canister Tedlar Bag	30 3	08
ASTM D-1945	Fixed & Natural Gases	GC/TCD/FID	Summa Canister Tedlar Bag	30 3	54
ASTM D-5504	Sulfur Gases	GC/SCD	Tedlar Bag	24 hours	13
PM10/TSP	Particulate Matter	Mass	Quartz Filter	14	66

8.3 Method Validation

As part of the initial test method evaluation for new standard methods, analytical runs must be performed the same way an analyst would perform an initial Demonstration of Capability (DOC) to evaluate precision and bias along with a Method Detection Limit (MDL) study as applicable.

Non-standard methods, including laboratory-developed methods, standard methods outside their intended scope or application, and requested changes to existing instrumentation will follow a planned process explained in detail in SOP #107 and outlined below:

- Measurement Quality Objectives (MQOs) – should be clearly outlined prior to validation.

- Development of Test Plan – Technical Director and assigned personnel are responsible for the development of such plan.
- Validation – Implementation of the test plan with documentation of all results will be reviewed by the Technical Director.
- Review and Approval – Review of performance against the MQOs, supporting documents, and written procedures is performed by the Technical Director. After approval, the QA Manager reviews for completeness and finalizes the method for production.

8.4 Procedural Deviations

Eurofins Air Toxics communicates and addresses procedural deviations in the following ways:

- Modifications to standard methods made by Eurofins Air Toxics are detailed in a summary of modifications table in the analytical method SOP. The modification table is also included in the laboratory narrative of the final data report.
- Differences between a project request and laboratory standard protocol are documented in a variance table created by the laboratory's project chemist for submission with the proposal to the client. Agreement is documented by the client's initials and date in the approval column or with written documentation from the client that all variances have been approved.
- If a sample received did not meet the established criteria for quality testing, the Sample Receiving Department will issue a Sample Discrepancy Report (SDR), and the Project Manager will communicate the discrepancy to the client. If the client still wants the sample to be processed, the discrepancy will be narrated in the final report.
- Other analytical procedural deviations that are within allowable variations established for every method and listed in the method SOPs are discussed with the client, and if accepted the sample results will be reported with a narrative of the deviation and the affected result will be flagged accordingly.
- Analytical procedural deviations that are not within allowable variations and directly affect the sample result will require the initiation of a Corrective Action Report request.

The Corrective Action Program is explained in detail in section 12 of this Quality Manual.

9. INTERNAL QUALITY CONTROL CHECKS

9.1 Laboratory Quality Control Samples and Acceptance Criteria

9.1.1 Blanks: For the whole air methods for which no sample preparation step is required, a blank is a designated sample designed to monitor for contamination originating from the analytical system. The Laboratory Blank is comprised of clean, humidified air or nitrogen. A Laboratory Blank is analyzed after any applicable standards and prior to the analysis of project samples. A blank is also analyzed in the event saturation-level concentrations are incurred to demonstrate that contamination does not exist. The blank and the field samples are treated with the same internal standards and surrogate standards and carried through the entire analytical procedure. For methods requiring a sample preparation step (e.g., TO-11A and TO-13A), a Laboratory Blank is prepared using un-sampled media and extracted alongside the batch of field samples. Ideally, blanks demonstrate that no artifacts were introduced during the preparation and/or analysis process. The specific acceptance criterion for each test is given in the analytical method and is usually based on the required Reporting Limit (RL).

9.1.2 Surrogates: Surrogates are organic compounds that are chemically similar to the analytes of interest but are not naturally occurring in environmental samples. For GC-MS methods and some GC methods, the recovery of the surrogate standard is used to monitor for unusual matrix effects and gross sample processing errors, and to provide a measure of recovery for every sample matrix. When required by the analytical method, surrogates are spiked into all the field and QC samples to monitor analytical efficiency by measuring recovery on an individual sample basis. The percent recovery is determined and compared to the acceptance criteria. Acceptance criteria limits are set as required by the method or based on a statistical determination from laboratory data.

9.1.3 Matrix Spikes: Matrix spikes are not required QC for whole air samples collected in Summa canisters. Accurately spiking target compounds into an evacuated canister prior to deployment in the field for sample collection or post-sample collection is neither practical nor technically appropriate. Therefore, matrix spiking is performed only on samples submitted as part of a sampling train, such as condensates, or on extractable samples, provided they are submitted in duplicate for matrix spike and in triplicate for the matrix spike duplicate. It is the responsibility of the client to provide additional samples to fulfill any method requirements regarding matrix spikes. When applicable, matrix and matrix duplicate spiking is performed using a subset of target analytes. Recoveries and demonstrated reproducibility values that do not meet the acceptance criteria are flagged and explained in the laboratory narrative.

9.1.4 Laboratory Control Samples: Laboratory control samples (LCS) are samples of known composition that are analyzed with each batch of samples to demonstrate laboratory accuracy. The LCS is prepared by fortifying clean matrix with known target concentrations. In the case of non-extracted batches, the LCS is generally analyzed daily prior to sample analysis, but could also serve as an end check standard. Percent recovery is calculated and compared to acceptance criteria, which are set as required by the method or based on a statistical determination from laboratory data.

9.1.5 Sample Duplicates and Laboratory Control Sample Duplicates: A duplicate is a second aliquot of a sample that is treated identically to the original to determine precision of the test. To compare the values for each compound, the relative percent difference (RPD) is calculated by dividing the difference between the numbers by their average. Precision for analytes that are not typically found in environmental samples is determined by analyzing a pair of Laboratory Control Samples (LCS), and comparing the RPD for the spiked compounds. The acceptance criteria are described as a maximum for the RPD value as required by the method or based on a statistical determination from laboratory data.

9.1.6 Internal Standards: Internal standards (IS) are organic compounds that are chemically similar to the analytes of interest but are not naturally occurring in environmental samples. For extractable methods and when required by the method, IS are added to every field and QC sample typically after extractions but prior to analysis. For all GC-MS methods an IS blend is introduced into each standard and blank to monitor the stability of the analytical system. Comparison of the peak area of the IS is used for quantitation of target analytes. The IS peak area and retention time also provide a check for changes in the instrument response and chromatographic performance. The acceptance criteria are stipulated in the analytical method.

9.1.7 Second Source Check: A second source check is analyzed using either the Laboratory Control Sample (LCS) and/or an Initial Calibration Verification (ICV). The second source is a standard that is made from a solution or neat compound purchased from a different vendor than that used for the calibration standards. For some organic custom mixes, the same vendor but a different lot and preparation is used. This ensures that potential problems with a vendor supply would be evident in the analysis. Some areas of the laboratory use continuing calibration verification standards as a second source from the initial calibration.

9.2 Quality Control Sample Frequency and Corrective Action

Each analytical method defines the frequency for required quality control (QC) samples. A summary is provided in Appendix E. The corrective action required when a QC result fails to meet acceptance criteria is also given. If the method reference requires the use of specific limits, the laboratory uses the published limits that are documented as part of the analytical method. Many methods require that each laboratory determine their own acceptance criteria based on statistics from performance of the method. In these cases, the limits are available to the analyst and are entered into the laboratory computerized QC system described in SOP #48. Statistically determined acceptance criteria are frequently subject to change as the laboratory recalculates its control limits. Due to their dynamic nature, acceptance criteria are not included in this manual.

9.3 Quality Control Charts

Quality control (QC) results entered into the computer are used to generate control charts that are plotted via computer and can be accessed at any time by all analysts and by the Quality Assurance Department. The system charts results from surrogates and laboratory control samples. These charts provide a graphical method for monitoring precision and bias over time. The computerized quality control system is used to report QC data to clients and to collect data for assessment of precision and accuracy statistical limits.

9.4 Measurement Uncertainty

As stated in ISO 17025, “All uncertainty components which are of importance in a given situation shall be taken into account using appropriate methods of analysis” (5.4.6.3).

This means the laboratory must determine the uncertainty contribution of all steps in the testing process such as equipment, calibration, standards, reagents, preparation, etc. Since, in most methods, the laboratory control sample (LCS) goes through the entire process of preparation to analysis, all factors that would contribute to uncertainty is evident through the LCS results. As such, LCSs are performed with every batch of samples where appropriate for the method.

Measurement uncertainty is calculated as two times the standard deviation of the LCS recoveries for the group and date range of data points selected for all applicable methods. This is reported as a percentage. Reports for uncertainty shall be generated and submitted to the Quality Assurance Department for review on an annual basis. At this point, it is not necessary to apply or report the uncertainty determination with sample results. When a client requests the measurement uncertainty it is applied by multiplying the determined analyte concentration by the uncertainty percentage.

10. ASSURING QUALITY OF TEST RESULTS

10.1 Data Management

At a minimum, data management is initiated when Eurofins Air Toxics receives samples from the client. More often, the process begins with client communication of their needs and requirements for a specific project and/or testing. The Project Managers are responsible for entering this information into the client services modules of LIMS. Upon receipt of the samples, a unique tracking number is generated based on this information in the project profile. At this point, computer technology becomes an integral part of tracking the samples through laboratory operations.

10.2 Data documentation

Analytical data generated in the laboratory is collected through the associated data system or is manually documented in bound logbooks. Analysts review data as it is generated to determine that the instruments and systems are performing within specifications. If any problems are observed during an analytical run or the testing process, corrective action is taken and documented.

Procedures are in place to ensure that all data is traceable, authentic, and complete. The following general requirements outline the Eurofins Air Toxics' system for logbooks, notebooks, and documentation recording:

- Observations, data, and calculations are recorded at the time they are made and are identifiable to the specific task.
- Entries are legible, signed, and dated.
- Errors are corrected in a manner that does not obliterate the original entry, initialed, and dated.
- Blank pages or substantial portions of pages which are left blank are crossed out to eliminate the possibility of data entry at a later date.

- Logbook pages and instrument printouts are signed and dated to indicate completion.
- At periodic intervals the Quality Assurance Department checks equipment/instrument logbook entries and temperature recordings for completeness, legibility, and conformance to procedures.
- At a minimum, the following is recorded as part of data documentation:
  - Date of analysis/operation
  - Initials/date of analyst performing test/operation
  - Identification of client sample(s) and material(s) analyzed
  - Materials, reagents, and standards used to perform the test/operation
  - Method used to perform test/operation
  - Equipment/instrumentation used to perform test/operation
  - Deviations, planned or unplanned, from the analytical method
  - Signature/date of person reviewing data documentation
- For computer-generated data, the following information is recorded:
  - Samples(s) analyzed/operations performed
  - Date of analysis/operation
  - Unique instrument identification
  - Name or initial/date of person operating the instrument
  - Name or initial/date of person reviewing data
  - Any manual notation, interpretations, or integrations made on instrument printouts are signed, dated, and reviewed.

10.3 Data Calculations

Most instruments either include or are connected to a data system programmed to perform calculations needed to reduce the raw data to a reportable form. All calculations are maintained in the instrument manuals and/or as part of the analytical method.

In many cases, data from the local instrument system are uploaded directly to LIMS for review and reporting. This direct upload eliminates the need to re-type data and any associated source of transcription errors from the analytical scheme.

Some instruments report data that require application of additional factors before the data is in final form. Analysts input these additional factors into the laboratory sample management system, where final calculations are performed.

10.4 Reporting Limits

It is important to ascertain the Limit of Quantitation (LOQ) that can be achieved by a given method, particularly when the method is commonly used to determine trace levels of analyte. The USEPA has established one method for determining Method Detection Limits (MDLs) from which LOQs can be extrapolated, which is summarized in the laboratory procedures.

MDLs are verified or determined annually on each instrument and are the basis for the LOQ used in the default reporting format. Because MDLs change each time they are re-evaluated, they are not included in this manual but are available at the laboratory and available to clients upon request.

For DoD-certified methods and compounds, quarterly evaluation of the LOQ and determination of Limit of Detection (LOD) is performed. The LOQ evaluation entails the calculation of precision and accuracy at the LOQ or Reporting Limit. The LOD for each compound is determined by analyzing a calibration standard or set of standards between the MDL and LOQ. The LOD is assigned the concentration at which the peak meets the signal-to-noise criteria.

The Reporting Limit used to determine whether a result is significant and reported as detectable is dependent upon agency and client requirements. A variety of formats are available and include use of the MDL, LOD, LOQ, method-specified limits, and project-specific limits.

10.5 Data Review

Final review and verification of the data is performed by a trained analyst or scientist using the sample results and quality control information entered into the laboratory sample management system. Another tool used for data review involves the use of proprietary in-house data validation software to review every data point generated and to alert the reviewer when manual integrations occur. The software is also programmed to report each analyte that does not meet acceptance criteria in the quality control and/or sample(s).

After determining that all necessary requirements for valid data are met, the reviewer electronically approves the data by updating the “Report Approved By” status with their initials. This action applies the electronic signature of the Technical Director. The computer is programmed with a list of approved reviewers for each test, and the system is password-protected to ensure that only qualified individuals verify the data.

10.6 Data Qualification

Data qualifiers are used to provide additional information about the results reported. The most typical use for data qualifiers is for results that fall below the quantitation limit. The data systems used to generate and report results are programmed to flag values in this range as estimated.

Other qualifiers are applied to advise data users of any validation issues associated with the data. The laboratory makes every effort to meet all of the requirements for generation of data. Occasionally, data is generated that does not meet all the method requirements due to sample matrix or other analytical problems. If the test cannot be repeated, or re-analysis would not yield more useable data, qualified data is reported. Qualifiers can be in the form of comments on the analytical report or flags applied to the results.

10.7 Data Reporting

When each analysis is completed, reviewed, and verified, a report is generated. The client receives a copy of the report containing the results of the analysis, plus comments added by the analyst when necessary. The report contains the electronic signature of the Technical Director. Copies of the reports and associated supporting raw data are retained in the Eurofins Air Toxics' archives.

Eurofins Air Toxics offers a variety of data levels and formats, from a basic report of sample and QC results only (Level II) to a comprehensive data package including all supporting quality control information and raw sample data (Level IV). The client directs the selection of report type. Various electronic formats are also available, formatted to client-specific file structure and sent via e-mail, direct upload, Website access, or commercial courier.

Client confidentiality of Eurofins Air Toxics' Web data is ensured by the use of a secured firewall Internet environment coupled with the use of a user ID and password to gain log-in access to the system.

If amendments to a final report are required due to omissions, errors, or additional requests, a workorder reissue is initiated. All reissues receive a unique workorder number to distinguish them from the original issue. Reissued reports require a reason for the reissue and date of the reissue in the laboratory narrative. The laboratory maintains all supporting documentation for the revision including corrections, additions, or deletions relative to the original report.

10.7.1 Reporting the Results

Analytical reports are printed with a cover page that summarizes all samples in that group. This page lists the Eurofins Air Toxics' assigned sample number and the corresponding client description. The cover page identifies the laboratory contact person's name and the laboratory's phone number in case there is a question about the report. Within this package, each page is uniquely identified and paginated. Analytical test results which meet all the requirements of NELAP and ISO 17025 are noted as so in the footer of the summary cover page.

10.8 Data Storage, Security, and Archival

Eurofins Air Toxics has documented procedures and instructions for the identification, collection, access, filing, storage, maintenance, and disposal of data records. Records are in the form of hard-copy paper records, electronic data files, magnetic tape, and CD-ROMs.

Eurofins Air Toxics maintains records to demonstrate conformance to specified requirements and the effective operation of its quality systems. Records are stored and maintained in such a way that they are readily retrievable in facilities that provide a suitable environment to minimize deterioration or damage and prevent loss. Retention time for the records is in accordance with NELAP's minimum five-year requirement and/or specific procedures or instructions.

The laboratory maintains all documentation necessary for historical reconstruction of data, as follows:

- Analysis reports
- Data logbooks
- Instrument printouts
- Correspondence and client files
- Instrument and equipment logbooks
- Quality Assurance records
- Corporate documents
- Electronic records

11. AUDITS AND INSPECTIONS

11.1 Internal Quality Assurance Audits

Internal audits are performed by trained Quality Assurance personnel following a schedule planned yearly by the Quality Assurance Manager or at any time by the request of management. The audits cover all quality systems including but not limited to documentation practices, training, and adherence to current SOPs and methodology.

The following areas are identified to be audited by Quality Assurance:

a. Operations
b. Support Services
c. Sample Receiving and Login
d. Project Management and Sales
e. Information Technology (IT)
f. Quality Assurance

A written report with findings, observations, and/or recommendations is presented to the audited personnel, the team leaders, and management by the auditor. Responses to findings and observations are then submitted to the Quality Assurance Department within 30 days.

All audit notes, documentation, and reports are scanned and filed on the QA network drive.

11.2 Management Review System

A review of the laboratory's systems is performed by senior management on a biannual basis to evaluate effectiveness, identify areas requiring improvement, and establish timelines and accountability in addressing agreed-upon action items. This review includes internal assessment of the quality program and laboratory operations and external assessment through client feedback and audits. Four types of reports are generated by management or designated personnel:

11.2.1 **Quality Assurance Status Report:** Summarizes the results of internal and external assessments, the numbers and types of Corrective Action Reports (CARs) generated, status of any outstanding CARs, a summary of client inquiries received, proficiency tests (PT) results, and the number and types of reissued sample reports.

11.2.2 **Production Status Report:** Summarizes performance against key metrics such as turnaround time, details changes in sample mix and sample numbers, and outlines resource needs.

11.2.3 **Client Assessment Report:** Summarizes feedback from clients based on daily communication with project management and sales team as well as feedback collected by a third party as part of our Client Satisfaction Index (CSI) determination.

11.2.4 **Safety Assessment Report:** Outlines the safety incidents and "near misses" for the quarter and lists site assessment deficiencies.

The reports and records of the meetings are stored on a secure drive with management-only access for a minimum of five years.

11.3 Client Audits and Agency Inspections

Clients may audit our facility as assurance that their objectives are being met and that the laboratory is compliant with all applicable regulations, data quality, and project requirements.

Client audits can range from a laboratory tour to an intensive inspection of technical operations, procedures, regulatory compliance, and/or review of specific projects. Clients can only review data that pertains to their projects, and a non-disclosure agreement must be signed as per SOP #99.

Inspections can be performed by investigators or auditors from the USEPA, DoD, state and other regulatory agencies, third party accreditors (ACLASS), or regulatory agencies outside of the U.S.

The Quality Assurance Department is assigned the responsibility of hosting and working with agency and client representatives.

The Quality Assurance role includes:

- Escorting the investigator(s)
- Ensuring all questions are answered promptly and accurately
- Making note of all unresolved issues
- Informing management of the audit status and outcome
- Responding to the audit report
- Ensuring that appropriate corrective action is completed

11.4 Proficiency Testing Program

11.4.1 Proficiency Testing Samples (TNI/DoD)

Proficiency testing (PT) samples are used to measure analytical accuracy, precision, and report completeness. To be accredited under TNI and DoD-ELAP, the laboratory contracts with an outside approved PT sample provider in each field of testing (FOT). Testing is limited by availability of samples that meet NELAP and DoD-ELAP criteria (noted below). The provider must be a NIST-accredited PT provider. It may be necessary to participate in more than one proficiency testing program to be evaluated for multiple interdependent analyte groups. Currently, Eurofins Air Toxics participates in PT programs for EPA Method TO-15, which is ISO 17025 compliant, TO-13A, TO-17 VI, formaldehyde and emissions testing. In each calendar year, the laboratory will complete a minimum of one PT sample for each analyte or interdependent analyte group.

The following policies apply to laboratory PT sample analysis and reporting:

- The samples shall be analyzed and reported to the PT provider within 45 calendar days of receipt or the specific deadline specified by the PT provider.
- The PT sample is received and logged into an electronic sample receiving database in the same fashion as field samples.
- The laboratory must follow the PT provider's instructions for preparing the PT sample.
- The laboratory management and bench chemist ensure that the PT samples are prepared, analyzed, and reported in the same fashion as field samples using the same staff, equipment, and methods.
- Initial and continuing calibrations for the PT sample are analyzed at the same frequency of field samples.
- The PT sample cannot undergo duplicate or replicate analyses that would not ordinarily be performed on field samples. The PT sample result cannot be derived from averaging the results of multiple analyses unless specifically called for in the reference method.
- The PT sample can only be analyzed on equipment leased or owned by the company and handled only by bona fide employees of the company.
- The analysis of PT samples by temporary or contract employees is explicitly forbidden.

- The laboratory shall not subcontract any PT sample or portion.
- The laboratory shall not knowingly receive any PT sample or portion from another laboratory.
- The laboratory shall not communicate in any fashion with another laboratory concerning the PT sample or results.
- The laboratory shall not attempt to obtain the PT sample result prior to reporting.
- The PT sample reporting forms provided by the sample provider will be used to report the results and will be maintained in the laboratory's record system.
- The laboratory shall maintain copies of all written, printed, and electronic records relating the analysis or reporting of the PT sample for a period of five years or as required by the applicable regulatory program.
- A CAR will be generated any time an analyte result fails the PT assessment. A copy of the PT results will be sent to the accrediting agency, and associated corrective action summary will be sent upon request.
- The laboratory authorizes provider to release any PT assessment information to the accrediting agency.
- The QA Manager must sign the PT results form and, by so doing, attests that the sample was analyzed and reported in the same fashion as a field sample and followed the PT provider instructions for preparation.
- The laboratory must notify its primary accrediting agency and any other agencies under reciprocity that it has enrolled with a particular PT provider.
- The laboratory must notify its primary accrediting agency and any other agencies under reciprocity in the event it wishes to change PT providers.
- For each analyte or interdependent analyte group for which proficiency is not available, the certified laboratory will establish, maintain, and document the accuracy and reliability of its procedures through a system of internal quality management.
- Results of any failed PT samples are summarized in the Quarterly QA Status Report.

11.4.2 Proficiency Testing Samples (Non-NELAP/DoD)

Occasionally proficiency testing (PT) samples are submitted along with field samples by private clients. The laboratory processes and reports the samples in the same fashion as field samples. When the client notifies the laboratory that one or more analytes appear to have failed, the report is processed through the normal Client Inquiry Corrective Action Process. The QA Manager will carry out an assessment and investigation into the circumstances surrounding the proficiency results, including aspects relating to how the client prepared the sample for submission. The outcome of the assessment will be documented as a CAR and maintained on file for a period of five years. Results of any failed external PT samples are summarized in the Quarterly QA Status Report.

12. CORRECTIVE AND PREVENTIVE ACTION

12.1 Laboratory Investigations and Corrective Action

The Quality Assurance (QA) Department manages the Corrective Action Program and maintains the Corrective Action tracking database using the c.Support software program. A Corrective Action Report is initiated any time sample results are affected by non-conformance with established SOPs or program requirements, any time an external assessment results in a finding, any time there is a failed proficiency evaluation sample, and when a client inquiry results in a quality finding. The expectation is that any CAR should be resolved within 30 days.

The client is notified if there is an issue that could potentially affect the quality of sample results. The communication with the clients is recorded.

The software program tracks all parts of the CAR system: root cause investigation, immediate corrective action, long-term corrective action, and preventive action. It also tracks client communications regarding the incident. The QA Manager reviews all opened CARs for completeness and resolution.

Detailed information about the CAR process is described in SOP #61.

13. SERVICE TO CLIENTS

The Project Management System is defined in SOP #1. The following are brief descriptions of the elements comprising project management systems.

13.1 Review of Work Requests, Tenders, and Contracts

Eurofins Air Toxics places great importance on understanding client requirements for a project. The laboratory ensures, to the best of our ability, that client and project requirements are outlined and understood prior to acceptance of the project, including required laboratory accreditations and nonstandard work requests. All inconsistencies are discussed and addressed with both the client and the technical laboratory staff before the project is initiated and samples arrive. This is achieved in various ways, including the review of client work plans, Request for Proposals (RFPs) project Quality Assurance Project Plans (QAPPs), requested analytical methods and protocols, business contracts, and quality agreements. A key client contact is assigned to oversee each project. Communication between the client and Eurofins Air Toxics technical staff is coordinated through the Project Managers. The Project Management group relays any project changes or modifications to the technical group. They also relay issues encountered by the laboratory back to the client.

13.2 Timely Delivery

Evaluating laboratory capacity, assignment of resources, and ability to perform specific projects is a joint responsibility between the Technical Director and the Laboratory Director. Eurofins Air Toxics recognizes that one of the most important aspects of the services offered is turnaround time.

To ensure timely delivery, many analysts are cross-trained to perform a variety of tests, and there is redundant equipment available in the laboratory creating operation flexibility for routine work. Larger projects are reviewed against capacity estimates before a bid is submitted in order to meet a client's schedule.

Management regularly monitors the status of turnaround time including those projects that have exceeded a current turnaround time. Proactive communication regarding potentially missed deadlines is expected from the laboratory management to the Project Managers to keep the client informed of report delivery status.

Any changes to the established timeline by the client or the laboratory must be communicated to the client or laboratory as soon as possible. Upon communication of changes, a new timeline is established and agreed upon by both parties.

13.3 Subcontracting

Occasionally, Eurofins Air Toxics subcontracts analyses to other laboratories if the requested testing is not routinely performed in our laboratory. Testing is only subcontracted with the client's knowledge and approval. Subcontract laboratories are selected based on their qualifications. If tests require a specific agency certification, only an appropriately certified laboratory will be used.

LABORATORY QUALITY ASSURANCE MANUAL

(LQAM)

Appendix A

Terms and Definitions

(nine total pages including this cover)

Current as of March 5, 2014

TERMS AND DEFINITIONS

Accuracy: The degree of agreement between an observed value and an accepted reference value.

Active sampling: The process of collecting a sample using pump or vacuum source to pull a known volume of vapor through a sorbent cartridge, filter, or liquid impinger.

Ambient air: Outdoor air (also can include indoor air).

Analyte: The substance or component for which a sample is analyzed to determine its presence or quantity.

APH (air-phase hydrocarbons): Aliphatic and aromatic fractions identified in vapor-phase samples.

Approved: The determination by a state or federal accrediting agency that a certified laboratory may analyze for an analyte under the specified method.

Assessment: The process of inspecting, testing, and documenting findings for purposes of certification or to determine compliance.

ASTM International (formerly known as American Society for Testing and Materials)**:** Organization which develops international voluntary consensus-based standards.

Bag: An air-sampling container consisting of inert polymeric material.

Batch: A group of analytical samples (≤ 20) of the same matrix processed together, including extraction, concentration, and analysis using the same process, staff, and reagents.

BFB (4-Bromofluorobenzene): Compound used to verify that the mass spectrometer meets the tuning requirements of the method. Also can be used as an internal standard or surrogate.

Blank samples: Negative control samples used to assess potential contamination from sampling procedures or analytical processes. They can be field blanks or laboratory blanks.

BTEX: Benzene, toluene, ethylbenzene, and xylenes

Canister: A stainless steel spherical air-sampling device consisting of Summa polished or glass-lined internal walls and a leak-tight on/off valve.

Certificate of Analysis (C of A): An authenticated document, issued by an appropriate authority, that assures a regulated product has met its product specification and quality.

Chain of Custody (COC): The chronological documentation of the custody of an environmental sample from the time it is taken until it is disposed.

Contamination: The effect caused by the introduction of a target analyte from an outside source into the test system.

Continuing Calibration Verification (CCV): A component of Quality Control used to verify instrument linearity with respect to the Initial Calibration (ICAL). A CCV is analyzed at the beginning of every analytical sequence and then periodically depending on the method. Certain methods also include a CCV in every analytical sequence as an End Check.

Control charts: Statistical tools for monitoring the performance of a particular task on a continuing basis. The control chart is prepared for each test parameter after 20 determinations have been performed. The mean is plotted with the warning limits being $\pm 2s$ and the control limits being $\pm 3s$ (s = Standard deviation).

Corrective action: An action taken to eliminate the cause(s) of an existing nonconformity, defect, or other undesirable situation in order to prevent recurrence.

Corrective Action Report: See NCCAR.

Data reduction: A qualitative and quantitative evaluation of the documentation and procedures associated with environmental measurements to verify that the resulting data are of acceptable quality.

Demonstration of Capability: A procedure to establish the ability of the analyst to generate analytical results by a specific method and meet measurement quality objectives.

Detection Limit (DL): The smallest analyte concentration that can be demonstrated to be different from zero or a blank concentration with 99% confidence.

%Difference (%D): A measure of precision between the expected value and the actual value, typically used to measure performance of the daily CCV RRF as compared to the Initial Calibration average RRF.

DoD: U.S. Department of Defense

Duplicate sample: A sample collected for checking the preciseness of the sampling process. Duplicate samples are collected at the same time and from the same source as the study samples.

Equipment Blank: A sample that is known not to contain the target analyte, used to check the cleanliness of sampling devices. It is collected in a sampling container from a clean sample collection device and returned to the laboratory as a sample.

Field Blank: A sample that is known not to contain the target analyte, used to check for analytical artifacts or contamination introduced by sampling and analytical procedures. It is taken to the sampling site and exposed to sampling conditions, then returned to the laboratory and treated as an environmental sample.

Field Duplicate: A sample collected at the same time from the same source but submitted and analyzed as a separate sample.

GC (gas chromatograph): Analytical instrumentation used to resolve complex mixtures into individual peaks for identification and quantitation. Separation is achieved as chemicals are retained at varying rates by the column phase.

Holding time: The maximum time that a sample may be held prior to preparation or analysis.

HPLC (high-pressure liquid chromatography): A form of liquid chromatography used to separate compounds that are dissolved in solution (also known as high-performance liquid chromatography).

Impinger: A glass vessel used to contain collection solution through which a stream of air is bubbled for sampling purposes.

Initial Calibration (ICAL): Demonstration of a linear response to different concentrations of calibration standards within a defined range.

Initial Calibration Verification (ICV): Verifies the Initial Calibration using a different source standard from the one used for Initial Calibration.

Initial Demonstration of Analytical Capability: The procedure described in USEPA 40 CFR 136 Appendix A, used to determine a laboratory's accuracy and precision in applying an analytical method.

Instrument Blank: A sample that is known not to contain the target analyte, processed through the instrumental steps of the measurement process and used to determine the absence of instrument contamination prior to analysis of field samples.

Instrument Detection Limit (IDL): The concentration of the analyte that produces a signal greater than five times the signal-to-noise ratio of the instrument.

Interference: The effect on the final result caused by the sample matrix.

Internal Standard (IS): A measured amount of a certain compound added after preparation or extraction of a sample.

Ketones: Any of a class of organic compounds characterized by a carbonyl group attached to two carbon atoms.

Key Personnel: The laboratory director, technical director, quality assurance manager, and team leader, all of whom meet the requirements of the NELAP rule.

Laboratory Control Sample (LCS): An independent second source reference standard that goes through the same pretreatment and preparation procedures as the samples. It validates the accuracy of the Initial Calibration.

Laboratory Duplicate: An aliquot of the same sample that is prepared and analyzed at the same time.

Laboratory Information Management System (LIMS): A laboratory's electronic data system that collects, analyzes, stores, and archives records and documents.

Limit of Detection (LOD): The smallest concentration of a substance that must be present in a sample in order to be detected at the DL with 99% confidence.

Limit of Quantitation (LOQ): The smallest concentration that produces a quantitative result with known and recorded precision and bias.

Matrix: The component or substrate (e.g., surface water, drinking water, air, liquid waste) which contains the analyte(s) of interest.

Matrix Spike (MS): A sample prepared to determine the effect of the matrix on a method's recovery efficiency by adding a known amount of the target analyte to a specified amount of matrix sample for which an independent estimate of the target analyte concentration is available. It is used to evaluate accuracy.

Matrix Spike Duplicate (MSD): Duplicate of the matrix spike sample. Results are compared with MS to determine precision.

Mass spectrometer (MS): Analytical instrumentation used to identify and quantify chemicals utilizing spectral fragmentation patterns based on chemical structures.

Measurement uncertainty: Measurement uncertainty is the estimation of potential errors in a measurement process and is expressed as $\pm$ 2X(*s*) of the historical mean of LCS recoveries.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero as determined from analysis of a sample containing the analyte in a given matrix (40 CFR Part 136, Appendix B, July 1995).

NCCAR (Non-conformance/Corrective Action Report): A report that identifies, communicates, tracks, and resolves a non-conformance.

NIST: National Institute of Standards and Technology

NMOC: Non-methane organic compounds

OSHA: Occupational Safety and Health Administration

PAHs (polycyclic aromatic hydrocarbons): Hydrocarbons made up of fused aromatic ring molecules.

Passive sampling: Sample collection conducted without the use of mechanical pumps or vacuums. Collection relies on principle of diffusion.

PCBs (polychlorinated biphenyls): Biphenyl compounds with chlorine atoms positioned on the benzene rings.

ppbv: parts per billion by volume

ppmv: parts per million by volume

Practical Quantitation Limit (PQL): A synonym for the standard of lowest concentration contained in the Initial Calibration. It is the smallest concentration of the analyte that can be reported with a specific degree of confidence.

Precision: The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves. Precision is usually expressed as standard deviation, variance or a range, in either absolute or relative terms.

Preservation: The temperature control or the addition of a substance to maintain the chemical or biological integrity of the target analyte.

Proficiency Testing (PT): A means to evaluate a laboratory's performance under controlled conditions relative to a given set of criteria, through analysis of unknown samples provided by an external source.

Proficiency Test (PT) sample: A sample, the composition of which is unknown to the laboratory and is provided to test whether the analyst/laboratory can produce analytical results within specified acceptance criteria.

Quality Assurance (QA): An integrated system of activities involving planning, quality control, reporting, and quality assessment and improvement to ensure that the product meets defined standards of quality with a stated level of confidence.

Quality Assurance Project Plan (QAPP): An orderly assemblage of detailed procedures designed to produce data of sufficient quality to meet the data quality objectives for a specific data collection activity.

Quality Control (QC): A procedure or set of procedures intended to ensure that a product or performed service adheres to a defined set of quality criteria.

%R: %Recovery

Relative Percent Difference (RPD): A measure of precision between two measurements calculated by dividing the absolute value of the difference between the measurements by their average and expressed as a percentage.

Reporting Limit (RL): The smallest concentration of an analyte that can be measured with a stated probability of significance. All Initial Calibrations contain a standard at the Reporting Limit. The Reporting Limit is never less than the Practical Quantitation Limit (PQL).

Reporting Limit verification: A re-quantification of the lowest concentration data point of an Initial Calibration to test the percent recovery of each component. Analyte recovery should be between 50–150% to verify detection limit accuracy.

Relative Standard Deviation (RSD): A measure of precision often used to evaluate linearity of an Initial Calibration. The relative response factor is calculated at each calibration level, and the RSD is calculated by dividing the standard deviation by the average value.

RRF: Relative Response Factor

RT: Retention Time

Safety Data Sheet (SDS): A technical document that contains information on the chemical make-up, use, storage, handling, emergency procedures, and potential health effects related to a hazardous material (formerly Material Safety Data Sheets).

Selectivity: The capability of a method or instrument to respond to the target analyte in the presence of other substances or things.

Semivolatile compound (SVOC): An organic compound which has a boiling point higher than water and which may vaporize when exposed to temperatures above room temperature.

Sensitivity: The capability of a method or instrument to discriminate between measurement responses representing different levels of a target analyte.

Soil vapor (also referred to as "soil gas"): Vapor-phase volatile compounds that migrate or evaporate from contaminated soil.

Soil vapor extraction (SVE): A physical treatment process for in situ remediation of volatile contaminants in vadose zone (unsaturated) soils.

Standard Operating Procedure (SOP): A written document that details the steps of an operation, analysis, or action, the techniques and procedures for which are thoroughly prescribed and accepted as the procedure for performing certain routine or repetitive tasks.

Surrogate: A substance unlikely to be found in the environment that has properties which mimic the target analyte and that is added to a sample to check for analytical efficiency.

Target analyte: The analyte that a test is designed to detect or quantify.

Technical employee: A designated individual who performs the analytical method and associated techniques.

TIC: Tentatively Identified Compound

TNMOC: Total non-methane organic compounds

TPH: Total petroleum hydrocarbons

TRH: Total recoverable hydrocarbons, which are differentiated from total petroleum hydrocarbons (TPH) in that non-fuel-related peaks are subtracted from the TPH result but are included in TRH.

Trip Blank: A sample known not to contain the target analyte, which is carried to the sampling site and transported to the laboratory for analysis without having been exposed to the sampling procedures.

TVH: Total volatile hydrocarbons

Vapor intrusion (VI): The process by which vapors originating from contaminated soil or groundwater migrate through the subsurface into nearby buildings, potentially impacting indoor air quality.

VPH: Volatile Petroleum Hydrocarbons

CHAMBERS
TERMS AND DEFINITIONS

Air change rate: The flow rate of clean air into the chamber divided by the chamber volume. Also, the ratio of volume of clean, conditioned air brought into the emission test chamber or building space per unit time to the chamber or building space volume.

Air flow rate: Air volume entering the emission test chamber per unit time.

Air velocity: Air speed over the surface of the test specimen.

Aldehydes: Formaldehyde, acetaldehyde, and other carbonyl compounds detectable by derivatization with DNPH and analysis by HPLC.

Area specific flow rate: Ratio of the inlet air flow rate to the nominal surface area of the product or the product test specimen.

Background concentration: VOC concentrations in emission test chamber in the absence of a product test specimen.

CREL: Non-cancer chronic reference exposure level developed by Cal/EPA OEHHA. These are inhalation concentrations to which the general population, including sensitive individuals, may be exposed for long periods (10 years or more) without the likelihood of serious adverse systemic effects other than cancer.

Emission factor: Mass of VOC emitted per unit time from a specific unit area of product surface. Other unit measures such as product mass or length may be used as appropriate.

Emission rate: Mass of VOC emitted by an entire product or test specimen per unit time.

Emission test chamber: Non-contaminating, inert enclosure of defined volume with controlled environmental conditions for inlet air flow rate, temperature, and humidity used for determination of VOC emissions from product test specimens.

Loading factor: Ratio of the exposed surface area of the product or the test specimen to the volume of the building space or the emission test chamber.

Manufacturer's identification number: Unique product identifier from which a manufacturer is able to determine the product name, product category or subcategory, manufacturing location, date of manufacture, production line, and/or other pertinent identifying information for the product.

Product category: General group of similar products intended for a particular application and performance, such as VCT, laminated wood flooring, broadloom carpet, sheet vinyl flooring, plywood, OSB, interior paint, etc.

Product subcategory: Group of products within a product category having similar chemistry, construction, weight, formulation, and manufacturing process and which may have a similar VOC emissions profile.

Representative product sample: A product sample that is representative of the product manufactured and produced under typical operating conditions.

Sampling interval: Time over which a single air sample is collected.

Sampling period: Established time for collection of air sample from emission test chamber.

Specific emission rate: Emission rate normalized to the area, mass, or length of a product (i.e., equivalent to emission factor).

Test specimen: Portion of representative sample prepared for emission testing in an emission test chamber following a defined procedure.

TVOC: Sum of the concentrations of all identified and unidentified VOCs between and including n-hexane through n-hexadecane (i.e., C_6 – C_{16}) as measured by the GC/MS TIC method and expressed as a toluene equivalent value.

Ventilation rate: Same as air change rate.

Volatile organic compounds (VOCs): Carbon-containing compounds (excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides and carbonates, and ammonium carbonate) with vapor pressures at standard conditions approximately ranging between those for n-pentane through n-heptadecane. For the purposes of this method, formaldehyde and acetaldehyde are considered to be VOCs.

Zero time: Time establishing the beginning of an emission test.

ANALYTICAL METHODS

Section 1.0

Method: Modified EPA TO-17 VOCs and SVOCs – General Applications

Eurofins Air Toxics SOP #5 Revision 15 Effective Date: December 23, 2013 Methods Manual Summary

Description: This method is an alternative to the canister-based sampling and analysis methods that are presented in EPA Compendium Methods TO-14A and TO-15. Sorbent sampling is also amenable to efficient collection and measurement of semi-volatile compounds that are prone to condensing on the surface of the canister. Thermal desorption gas chromatograph/mass spectrometer (GC/MS) can be applied to matrices beyond ambient air such as soil gas and materials emissions by carefully selecting the appropriate sorbent and sampling parameters. Single bed sorbents such as Tenax TA and Carbopack B can be utilized to collect a specific volatility range while multi-bed sorbent tubes are effective in collecting a wide volatility range. (See Air Toxics' TO-17 VI method for the multi-bed tube application.)

Samples are collected by drawing a measured volume of air through the sorbent tubes. Collection is performed using a low flow vacuum pump or a volumetric syringe attached to the outlet side of the tube. Analysis is accomplished by heating the sorbent tube and sweeping the desorbed compounds onto a secondary "cold" trap for water management and analyte refocusing. The secondary trap is heated for efficient transfer of compounds onto the gas chromatograph (GC) for separation followed by detection using mass spectrometry (MS).

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, the laboratory reports these non-standard compounds with partial validation. Validation includes a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification is analyzed, and no method detection limit study is performed unless previous arrangements have been made. In addition, stability of the non-standard compound during sample storage, safe sampling volume, and desorption efficiency are not validated. Full validation may be available upon request.

The TO-17 method offers significant flexibility in its scope and application depending on the sorbent selected. The most commonly requested sorbent tubes and associated analytes are summarized in the QC tables below.

Table 1. Summary of Sorbent Applications

Sorbent	Typical Analyte Range	Water Management
Tenax TA	C7 – C26	Hydrophobic
Tenax GR	C7 – C30	Hydrophobic
Multi-bed "VI tube" (See TO-17 VI application)	C3 – C26	Largely Hydrophobic

Table 2. Method TO-17 VOCs (Tenax GR/TA) Reporting Limits and QC Limits

Analytes	Reporting Limit (ng)	QC Acceptance Criteria		
		ICAL (%RSD)	LCS (% R)	CCV (%D)
1,1,1-Trichloroethane	5.0	30	70 – 130	30
1,1,1,2-Tetrachloroethane	5.0	30	70 – 130	30
1,1,2,2-Tetrachloroethane	5.0	30	70 – 130	30
1,1,2-Trichloroethane	5.0	30	70 – 130	30
1,1-Dichloropropene	5.0	30	70 – 130	30
1,2,3-Trichlorobenzene	5.0	30	70 – 130	30
1,2,3-Trichloropropane	5.0	30	70 – 130	30
1,2,4-Trichlorobenzene	5.0	30	70 – 130	30
1,2,4-Trimethylbenzene	5.0	30	70 – 130	30
1,2-Dibromo-3-chloropropane	5.0	30	70 – 130	30
1,2-Dichlorobenzene	5.0	30	70 – 130	30
1,2-Dichloroethane	5.0	30	70 – 130	30
1,2-Dichloropropane	5.0	30	70 – 130	30
1,3,5-Trimethylbenzene	5.0	30	70 – 130	30
1,3-Dichlorobenzene	5.0	30	70 – 130	30
1,3-Dichloropropane	5.0	30	70 – 130	30
1,4-Dichlorobenzene	5.0	30	70 – 130	30
2-Chlorotoluene	5.0	30	70 – 130	30
4-Chlorotoluene	5.0	30	70 – 130	30
Benzene	10	30	70 – 130	30
Bromobenzene	5.0	30	70 – 130	30
Bromodichloromethane	5.0	30	70 – 130	30
Bromoform	5.0	30	70 – 130	30
Butylbenzene	5.0	30	70 – 130	30
Carbon Tetrachloride	5.0	30	70 – 130	30
Chlorobenzene	5.0	30	70 – 130	30
Chloroform	5.0	30	70 – 130	30
cis-1,3-Dichloropropene	5.0	30	70 – 130	30
cis-1,4-Dichloro-2-butene	5.0	30	70 – 130	30
Cumene	5.0	30	70 – 130	30

Dibromochloromethane	5.0	30	70 – 130	30
Dibromomethane	5.0	30	70 – 130	30
Ethylbenzene	5.0	30	70 – 130	30
Ethylene Dibromide	5.0	30	70 – 130	30
Hexachlorobutadiene	5.0	30	70 – 130	30
Naphthalene	5.0	30	70 – 130	30
m,p-Xylene	10	30	70 – 130	30
o-Xylene	5.0	30	70 – 130	30
p-Cymene	5.0	30	70 – 130	30
Propylbenzene	5.0	30	70 – 130	30
sec-Butylbenzene	5.0	30	70 – 130	30
Styrene	5.0	30	70 – 130	30
tert-Butylbenzene	5.0	30	70 – 130	30
Tetrachloroethene	5.0	30	70 – 130	30
Toluene	5.0	30	70 – 130	30
trans-1,3-Dichloropropene	5.0	30	70 – 130	30
trans-1,4-Dichloro-2-butene	5.0	30	70 – 130	30
Trichloroethene	5.0	30	70 – 130	30

Note: Full list may not be appropriate, depending on sample volume requirements.

Table 3. Commonly requested TPH parameters (Tenax GR/TA)

TPH	Reporting Limit (ng)	ICAL (%RSD)	ICV (% R)	CCV (%D)	LCS (%R)
GRO (Gasoline Range)	1000	30	70 – 130	30	70 – 130
DRO (C10-C24 Diesel Range)	1000	30	70 – 130	30	70 – 130
Kerosene	1000	30	70 – 130	30	70 – 130
Mineral Spirits (C9-C12 range)	1000	30	70 – 130	30	70 – 130

Table 4. Internal Standard and Field Surrogate Recoveries

Internal Standards		
Analyte	**CCV IS % Recovery**	**Sample IS % Recovery**
Bromochloromethane	60 – 140	60 – 140
1,4-Difluorobenzene	60 – 140	60 – 140
Chlorobenzene-d5	60 – 140	60 – 140
Field Surrogates		
Analyte	**% Recovery**	
1,2-Dichloroethane-d4	50 – 150	
Toluene-d8	50 – 150	
Naphthalene-d8	50 – 150	

Table 5. TO-17 SVOCs (Tenax GR/TA)

Analytes	Reporting Limit (ng)	Acceptance Criteria		
		ICAL (%RSD)	LCS (% R)	CCV (%D)
Naphthalene	5.0	30	70 – 130	30
2-Methylnaphthalene	5.0	30	70 – 130	30
Acenaphthylene	5.0	30	70 – 130	30
Acenaphthene	5.0	30	70 – 130	30
Fluorene	5.0	30	70 – 130	30
Phenanthrene	5.0	30	70 – 130	30

Field Surrogates				
Analyte	**% Recovery**			
Naphthalene-d8	50 – 150			

Table 5. Summary of Calibration and QC Procedures for TO-17 General Application

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
BFB Tune Check	Every 24 hours	TO-15 tune criteria	Correct problem then repeat tune.
5-Point Calibration	Prior to sample analysis	%RSD ≤ 30%, 2 allowed out up to 40%	Correct problem then repeat Initial Calibration Curve.
LCS	After each initial Calibration Curve and daily prior to analysis	Recovery 70 – 130%	If more than 5% target compounds exceed criteria, evaluate system and reanalyze the standard. Re-prepare the standard if necessary. Re-calibrate the instrument if the criteria cannot be met.
LCSD	Each analytical batch	Recovery 70 – 130%; %RPD ≤ 25%	If more than 5% target compounds exceed criteria, evaluate system and recollection process. Correct problem and reanalyze.
Continuing Calibration Verification (CCV)	At the start of each analytical clock	70 – 130 %	If project-specified risk drivers exceed these criteria, more than 5% of the compounds exceed these criteria, or any VOC exceeds 50–150% recovery, maintenance is performed and the CCV test repeated. If the system still fails the CCV, perform a new 5-point Calibration Curve.
Laboratory Blank	After the CCV and at the end of the analytical batch	Results less than the laboratory RL	Inspect the system and re-analyze the Blank. No corrective action for Lab Blank at end of batch.
Internal Standard (IS)	As each standard, Blank, and sample is being loaded	**CCVs:** area counts 60–140%, RT w/in 20 sec of mid-point in ICAL **Blanks and samples**: Retention time (RT) must be within ±0.33 minutes of the RT in the CCV. The IS area must be within ±40% of the CCV's IS area for the Blanks and samples.	**CCV:** Inspect and correct system prior to sample analysis. **Blanks:** Inspect the system and re-analyze the Blank. **Samples:** Samples cannot be re-analyzed due to the nature of the sorbent cartridges. However investigate the problem by reviewing the data. If necessary, run a Lab Blank to check the instrument performance. Report the data and narrate.

Field Surrogates	Each clean sample tube used for pumped sample collection and lab blank and QC samples	50 – 150%	**For blanks:** Inspect the system and re-analyze the Blank. **For samples:** If no obvious reason can be ascertained after evaluation of the data and sample collection parameters, the sample should be reanalyzed to verify out of control recovery. If recovery is out of acceptance criteria in both the primary and recollected sample, the primary sample is reported with the surrogate flagged.

ANALYTICAL METHODS

Section 2.0

Method: EPA Method TO-14A/TO-15 Volatile Organic Compounds (Standard/Quad)

Eurofins Air Toxics SOP #6 Revision 30 Effective Date: April 30, 2013 Methods Manual Summary

Description: This method involves full scan gas chromatograph/mass spectrometer (GC/MS) analysis of whole air samples collected in evacuated stainless steel canisters. Samples are analyzed for volatile organic compounds (VOCs) using EPA Method TO-14A/TO-15 protocols. An aliquot of up to 0.5 liters of air is withdrawn from the canister utilizing a volumetric syringe, volumetric loop, or mass flow controller. This volume is loaded onto a hydrophobic multibed sorbent trap to remove water and carbon dioxide and to concentrate the vapor sample. The focused sample is then flash-heated to sweep adsorbed VOCs onto a secondary trap for further concentration and/or directly onto a GC/MS for separation and detection.

Eurofins Air Toxics maintains a suite of TO-14A/TO-15 methods, each optimized to efficiently meet the data objectives for a wide range of targeted concentration ranges. The methods, their reporting limits, and typical applications are summarized in the table below. This method summary describes TO-14A/TO-15 (Standard or Quad).

Eurofins Air Toxics Method	Base Reporting Limits	Typical Application
TO-14A/TO-15 (5&20)	5 – 20 ppbv	Soil gas and ppmv range vapor matrices
TO-14A/TO-15 (Standard or Quad)	0.5 – 5.0 ppbv	Ambient air, soil gas, and ppbv level vapor matrices
TO-14A/TO-15 (Low-level)	0.1 – 0.5 ppbv	Indoor and outdoor air
TO-14A/TO-15 SIM	0.003 – 0.5 ppbv	Indoor and outdoor air

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, Eurofins Air Toxics reports these non-routine compounds with partial validation. Validation may include a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification analyzed, and no method detection limit study performed unless previous arrangements have been made. In addition, stability of the non-standard compound during sample storage is not validated. Full validation may be available upon request.

Eurofins Air Toxics takes no modifications of technical significance to Method TO-15 for the "Quad" configurations. Since Eurofins Air Toxics applies TO-15 methodology to all Summa canisters regardless of whether TO-14A or TO-15 is specified by the project, the laboratory performs a modified version of method TO-14A as detailed in Table 1. Please note that Methods TO-14A and TO-15 were validated for specially treated canisters. As such, the use of Tedlar bags for sample collection is outside the scope of the method and not recommended for ambient or indoor air samples. It is the responsibility of the data user to determine the usability of TO-14A and TO-15 results generated from Tedlar bags.

Table 1. Summary of TO-14A Method Modifications

Requirement	TO-14A	Eurofins Air Toxics Modifications
Sample Drying System	Nafion Drier	Multibed hydrophobic sorbent
Blank acceptance criteria	≤ 0.2 ppbv	≤ RL
BFB ion abundance criteria	Ion abundance criteria listed in Table 4 of TO-14A	Follow abundance criteria listed in TO-15.
BFB absolute abundance criteria	Within 10% when comparing to the previous daily BFB	CCV internal standard area counts are compared to ICAL; corrective action when recovery is less than 60%.
Initial Calibration	≤ 30% RSD for listed 39 VOCs	≤ 30% RSD with 2 of Eurofins Air Toxics' 62 standard compounds allowed out to ≤ 40% RSD

The standard target analyte list, reporting limit (RL) also referred to as Limit of Quantitation, QC criteria, and QC summary can be found in Tables 2 through 5.

Table 2. Method TO-14A/TO-15 Analyte List (Quad)

Analyte	RL/LOQ (ppbv)	QC Acceptance Criteria			
		ICAL (%RSD)	CCV (%R)	ICV/LCS (%R)	Precision Limits (Max. RPD)
1,1,2,2-Tetrachloroethane	0.5	≤ 30%	70 – 130	70 – 130	± 25
1,1,2-Trichloroethane	0.5	≤ 30%	70 – 130	70 – 130	± 25

2,2,4-Trimethylpentane	0.5	≤ 30%	70 – 130	70 – 130	± 25
Cumene	0.5	≤ 30%	70 – 130	70 – 130	± 25
Propylbenzene	0.5	≤ 30%	70 – 130	70 – 130	± 25
3-Chloroprene	2.0	≤ 30%	70 – 130	70 – 130	± 25
Naphthalene**	2.0	≤40%	60 – 140	60 – 140	± 25
TPH (Gasoline) ***	25	1-Point Calibration	N/A	ICV only; 60 – 140	± 25
NMOC (Hexane/Heptane)***	10	1-Point Calibration	N/A	NA	± 25

*Bromomethane recovery can be variable due to moisture/sorbent interactions specifically on the 2-trap concentration system. Data may require qualifier flags.

**Due to its low vapor pressure, Naphthalene may exceed TO-15 performance requirements. The wider QC limits reflect typical performance. Although Naphthalene is not on Eurofins Air Toxics "standard" TO-15 list, it is commonly requested and included in Table 2.

***TPH and NMOC are not on Eurofins Air Toxics' "standard" TO-15 list, but are included in Table 2 due to common requests.

Table 3. Internal Standards

Analyte	Accuracy (% R)
Bromochloromethane	60 – 140
1,4-Difluorobenzene	60 – 140
Chlorobenzene-d_5	60 – 140

Table 4. Surrogates

Analyte	Accuracy (% R)
1,2-Dichloroethane-d_4	70 – 130
Toluene-d_8	70 – 130
4-Bromofluorobenzene	70 – 130

Table 5. Summary of Calibration and QC Procedures for Methods TO-14A/TO-15

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Tuning Criteria	Every 24 hours	TO-15 ion abundance criteria	Correct problem then repeat tune.
Minimum 5-Point Initial Calibration (ICAL)	Prior to sample analysis	% RSD ≤ 30 with 2 compounds allowed out to ≤ 40% RSD	Correct problem then repeat Initial Calibration curve.
Initial Calibration Verification and Laboratory Control Spike (ICV and LCS)	After each Initial Calibration curve, and daily prior to sample analysis	Recoveries for 85% of "Standard" compounds must be 70–130%. No recovery may be < 50%. If specified by the client, in-house generated control limits may be used.	Check the system and reanalyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.
Initial Calibration Verification and Laboratory Control Spike (ICV and LCS) for Non-standard compounds	Per client request or specific project requirements only	Recoveries of compounds must be 60–140%. No recovery may be <50%.	Check the system and reanalyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.
Continuing Calibration Verification (CCV) for Standard compounds	At the start of each analytical clock after the tune check	70–130%	Compounds exceeding this criterion and associated data will be flagged and narrated with the exception of high bias associated with non-detects. If more than two compounds from the standard list recover outside of 70–130%, corrective action will be taken. If any compound exceeds 60–140%, samples are not analyzed unless data meets project needs. Check the system and reanalyze the standard. Re-prepare the standard if necessary. Re-calibrate the instrument if the criteria cannot be met.
Continuing Calibration Verification (CCV) for Non-standard Compounds	Per client request or specific project requirements only.	Recoveries of compounds must be 60–140%. No recovery may be <50%.	Check the system and reanalyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.
Laboratory Blank	After analysis of standards and prior to sample analysis, or when contamination is present.	Results less than the laboratory reporting limit	Inspect the system and re-analyze the blank. "B"-flag data for common contaminants.

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Internal Standard (IS)	As each standard, blank, and sample is being loaded	Retention time (RT) for blanks and samples must be within ±0.33 min of the RT in the CCV and within ±40% of the area counts of the daily CCV internal standards.	**For blanks:** Inspect the system and reanalyze the blank. **For samples:** Re-analyze the sample. If the ISs are within limits in the re-analysis, report the second analysis. If ISs are out-of-limits a second time, dilute the sample until ISs are within acceptance limits and narrate.
Surrogates	As each standard, blank, and sample is being loaded	70–130% If specified by the client, in-house generated control limits may be used.	**For blanks:** Inspect the system and reanalyze the blank. **For samples:** Re-analyze the sample unless obvious matrix interference is documented. If the %Rs are within limits in the re-analysis, report the second analysis. If %Rs are out-of-limits a second time, report data from first analysis and narrate.
Laboratory Duplicates – Laboratory Control Spike Duplicates (LCSD)	One per analytical batch	RPD ≤25%	Narrate exceedances. If more than 5% of compound list is outside criteria or if compound has >40%RPD, investigate the cause and perform maintenance as required. If instrument maintenance is required, calibrate as needed.

ANALYTICAL METHODS

Section 3.0

Method: ASTM D1946 – Atmospheric Gases

Eurofins Air Toxics SOP #8 Revision 22 Effective Date: December 24, 2013 Methods Manual Summary

Description: This method involves gas chromatograph (GC) analysis of soil gas, landfill gas, ambient air, or stack gas collected in Summa™ canisters, Tedlar bags, or any vessel that has been demonstrated to be clean and leak free. Samples are analyzed for Methane, fixed gases, and Non-Methane Organic Carbon (NMOC) using modified ASTM D1946 protocols. Because the sample is withdrawn from the vessel by positive pressure, rigid containers are first filled to positive pressure using UHP Helium or Nitrogen. Samples are then analyzed using a GC equipped with a FID and a TCD.

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, the laboratory reports these non-standard compounds with partial validation. Validation includes a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification is analyzed, and no method detection limit study is performed unless previous arrangements have been made. In addition, stability of the non-standard compound during sample storage is not validated. Full validation may be available upon request.

Since the protocols in the ASTM D1946 standard were designed for the analysis of reformed gas, the laboratory has taken modifications to apply the method to environmental samples covering a wide concentration range and to implement standard NELAP and EPA calibration criteria. The method modifications, standard target analyte list, reporting limits (RL), Quality Control (QC) criteria, and QC summary can be found in the following tables.

Table 1. Summary of Method Modifications for ASTM D1946

Requirement	ASTM D1946	Eurofins Air Toxics Modifications
Calibration	A single-point calibration is performed using a reference standard closely matching the composition of the unknown.	A minimum 3-point calibration curve is performed. Quantitation is based on a daily calibration standard, which may or may not resemble the composition of the associated samples.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by Eurofins Air Toxics are blended to a ≥ 95% accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5% should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL. Linear range is defined by the calibration curve. Bags may be loaded by vacuum or by positive pressure.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.

Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections >5X the RL.

Table 2. ASTM D1946 Method Compound List and QC Limits

Compound	Reporting Limit (%)	ICAL Criteria (%RSD)	ICV/LCS Criteria (%R)	CCV Criteria (%D)	Precision Limits (RPD)**
Carbon Dioxide	0.010	≤ 15%	85 – 115	± 15%	± 25%
Carbon Monoxide	0.010	≤ 15%	85 – 115	± 15%	± 25%
Methane	0.00010	≤ 15%	85 – 115	± 15%	± 25%
Ethene	0.0010	≤ 15%	85 – 115	± 15%	± 25%
Ethane	0.0010	≤ 15%	85 – 115	± 15%	± 25%
Nitrogen	0.10	≤ 15%	85 – 115	± 15%	± 25%
NMOC	0.010	≤ 15%	85 – 115	± 15%	± 25%
Oxygen	0.10	≤ 15%	85 – 115	± 15%	± 25%
Helium	0.050	≤ 15%	85 – 115	± 15%	± 25%
Hydrogen	0.010*	≤ 15%	85 – 115	± 15%	± 25%

*Reporting limit is 1.0% when sample is pressurized with Helium.
**For detections greater than 5 times the reporting limit.

Note: Results are reported in units of mol %. If required to report volume % or ppmV, a compressibility factor of 1 for all gases will be assumed. As a result, mol % is assumed to be equivalent to volume %. This assumption may result in a bias for highly compressible gases at high concentrations and pressures.

Table 3. Summary of Calibration and QC Procedures for Mod. ASTM Method D1946

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Initial Calibration Curve (ICAL)	Prior to sample analysis	RSD ≤ 15%	Correct problem then repeat Initial Calibration.
Second Source Verification (LCS)	All analytes: once per Initial Calibration, and with each analytical batch.	%R between 85–115%	Check the system and re-analyze the standard. Re-calibrate the instrument if the criteria cannot be met.
Continuing Calibration Verification (CCV)	Daily prior to sample analysis and after every 20 reportable samples.	%D ±15%	Check the system and re-analyze the standard. Re-calibrate the instrument if the criteria cannot be met.
Laboratory Blank (He) (N_2 for He and H_2 analysis)	After each daily check standard and prior to sample analysis, or when contamination is present.	Results below the RL	Inspect the system and re-analyze the Blank.
End Check	At the end of analytical sequence. It can be primary (CCV) or Independent Source (LCS).	%R between 85–115%	Check system and re-analyze the standard. If the 2nd analysis fails, identify and correct the problem. Samples analyzed after the last acceptable CCV are re-analyzed.
Sample Duplicates - Laboratory Control Spike Duplicate (LCSD)	One per analytical batch	RPD ≤ 25%	Narrate exceedances. Investigate the cause and perform maintenance as required and re-calibrate as needed.

ANALYTICAL METHODS

Section 4.0

Method: EPA Method TO-13A PAHs (Full Scan and SIM)

Eurofins Air Toxics SOP #10 Revision 18 Effective Date: April 26, 2013 Methods Manual Summary

Eurofins Air Toxics SOP #74 Revision 10 Effective Date: January 14, 2013 Methods Manual Summary

Description: This method involves drawing a measured volume of air through a filter and sorbent cartridge to collect Polychlorinated Biphenyls (PAHs) in the vapor and particulate phases. The cartridge can be PUF/XAD2 or XAD2 only. While TO-13A describes the use of a high-volume sampling pump, which allows for up to 300 cubic meters (m^3) of air to be collected over a 24-hour period, the method can also be applied to low-volume sample applications suitable for indoor air or soil gas. The sample media is extracted in the laboratory using Soxhlet extraction or pressurized fluid extraction (PFE). The concentrated extracts are analyzed for PAHs using a quadrupole gas chromatograph/mass spectrometer (GC/MS) in full scan or SIM mode by TO-13A protocol. Eurofins Air Toxics performs a modified version of this method. The method modifications, standard target analyte list, Limit of Quantitation (LOQ), QC criteria, and QC summary can be found in the following tables.

In relation to the prescribed media, sampling and collection efficiencies for compounds not listed in TO-13A have not been evaluated. However, if non-standard compounds are required for a project, the laboratory reports these compounds with partial validation. Validation includes a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification is analyzed, and no method detection limit study is performed unless previous arrangements have been made. In addition, stability of the non-standard compound during sample storage is not validated. Full validation may be available upon request.

Required Field QC: EPA Method TO-13 requires at least one field blank per sampling episode. Matrix spikes are referenced, but not definitively required in the routine QA specifications.

Table 1. Summary of Method Modifications for TO-13A

Requirements	EPA Method TO-13A	Eurofins Air Toxics Modifications
Extraction Solvent	10% ether in hexane for PUF; DCM for XAD sorbent. Final extract in hexane.	DCM for PUF/XAD cartridge and XAD sorbent. Final extract in DCM.
Glassware Cleaning	Muffle furnace is utilized.	Solvent cleaning procedure is used.
Extraction Technique	Soxhlet extraction	Soxhlet extraction or pressurized fluid extraction (PFE)
Reporting List	19 PAHs	See Table 2
Calibration range	0.1–2.5 µg/mL in hexane	1.0–160 µg/mL in methylene chloride for standard (quad) or 0.1–40 µg/mL for SIM
Method Blank	< MDL	< Reporting Limit

Table 2. Modified Method TO-13A Analyte List and Reporting Limits

Analyte	SIM RL (µg)	RL (µg)	Minimum ICAL RRF	ICAL (%RSD)	ICV (%R)	CCV (%R)	Precision (%RPD)
2-Chloronaphthalene*	0.1	1.0	NA	≤ 30	± 30	± 30	≤ 25%

Benzo(g,h,i)perylene	60 – 120
2-Methylnaphthalene	60 - 120
2-Chloronaphthalene	60 – 120

*The LCS and Surrogate limits are derived from Compendium Method TO-13A, Sections 13.3.7.4 and 13.4.6.3 (January 1999). These limits only apply to samples that are extracted by Eurofins Air Toxics. When sample extracts are sent to the lab for analysis only, limits of 50-150 % are applied.

Table 6. Summary of Calibration and QC Procedures for EPA Method TO-13A

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Tuning Criteria	Prior to calibration and at start of every 12 hours	TO-13A tuning criteria	Correct problem then repeat tune.
Initial 5-Point Calibration	Prior to sample analysis	ICAL criteria in Table 2	Correct problem then repeat initial calibration.
ICAL ICV	All analytes: Once per initial calibration	All target compound recoveries must be between 70 – 130%	Determine the source of discrepancy between standards. Re-calibrate if needed.
Continuing Calibration Verification (CCV)	At the start of every clock immediately after the DFTPP tune check	PAHs list: Meet Table 2 Min. RRF requirement; %D ≤ 30%	Investigate and correct the problem, up to and including re-calibration if necessary. High bias associated with non-detects in samples will not result in re-analysis.
Internal Standards (IS)	Injected into each standard, blank, and sample extract prior to analysis	**For CCV:** Area count within 50% to 200% of the midpoint of ICAL. **For blanks, samples, and non-CCV QC checks:** retention times within ± 0.33 minutes (20 seconds) and area counts within 50% to 200% of the CCV.	**For CCVs:** Investigate and correct the problem before proceeding with sample analysis. **For blanks:** Inspect the system and re-analyze the blank. **For samples and non-CCV QC:** Unless there is obvious matrix effect, re-analyze the samples and dilute the sample until the ISs meet the criteria; narrate the data to indicate interference.
Surrogates	Field Surrogates: Blank cartridges prior to transport to field for sampling and lab QC prior to extraction. Extraction Surrogates: All samples and lab QC prior to extraction.	See Table 3.	A new aliquot of the extract is analyzed. If Surrogate recoveries are out-of-control a second time, data is flagged and narrated. Re-analysis is not necessary for obvious matrix effects (data is flagged for out-of-control surrogate recoveries). Air samples cannot be re-extracted.
Extracted Laboratory Control Samples (LCS)	With each set of up to 20 extracted samples	See LCS criteria in Table 5.	Re-aliquot and re-analyze the extract. If within limits, report the re-analysis. Otherwise, narrate.

Laboratory Blank	With each set of up to 20 extracted samples	Results less than laboratory reporting limit (Table 2).	Re-aliquot and re-analyze the extract. If less than reporting limit, report the re-analysis. Otherwise, narrate and flag the data.
Solvent Blank	When samples that are extracted together are analyzed on different analytical shifts	All target compounds below the reporting limit (Table 2).	Re-aliquot and re-analyze the solvent. If less than reporting limit, report the re-analysis. Identify the source of contamination, and perform maintenance as needed. If maintenance required, restart the analytical clock.
Laboratory Duplicates – Laboratory Control Spike Duplicates	One per analytical batch	RPD ≤ 25%	Re-analyze duplicate. Investigate the cause, perform maintenance as required, and re-calibrate as needed.

ANALYTICAL METHODS

Section 5.0

Method: Modified EPA Method TO-11A Aldehydes/Ketones

Eurofins Air Toxics SOP #11 Revision 17 Effective Date: March 4, 2014 Methods Manual Summary

Description: This method involves high-pressure liquid chromatography (HPLC) analysis of aldehydes and ketones in ambient air samples. The sampling media is a 2,4-Dinitrophenylhydrazine (DNPH)-coated (silica) cartridge. Aldehydes and ketones are readily converted to a stable hydrazone derivative. The DNPH cartridges are eluted with acetonitrile using gravity-feed technique. Analysis is performed by reverse phase HPLC with UV detection at 360 nm.

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, Eurofins Air Toxics reports these non-standard compounds with partial validation. Validation includes a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification is analyzed, and no method detection limit study is performed unless previous arrangements have been made. For the extraction process, the non-standard compound recovery is evaluated in the extracted laboratory control spike. In addition, stability of the non-standard compound during sample storage is not validated. Full validation may be available upon request.

Eurofins Air Toxics performs modified versions of this method. The method modifications, standard target analyte list, Limits of Quantitation (LOQs), reporting limits (RLs), Quality Control (QC) criteria, and QC summary can be found in the following tables.

Table 1. Summary of Method TO-11A Modifications

Requirement	TO-11A	Eurofins Air Toxics Modifications
Initial Calibration Curve (ICAL)	Multi-point using linear regression performed every 6 months	Multi-point using average Response Factor; re-calibration if daily calibration fails, major maintenance, or column change. Linear regression is performed when requested. Initial Calibration (ICAL) is performed at least once per year.
ICAL Criteria	R^2 for curve ≥ 0.999	%RSD ≤ 10% unless linear regression is required, with R^2 for curve ≥ 0.999
Blank Subtraction	Average blank concentrations calculated. Blank value subtracted from sample result.	One Lab Blank is analyzed per batch; no automatic blank subtraction performed on samples.
Retention Times	Precision of Retention Times ±7%	Retention Time window study is performed, but RT windows are determined by bracketing standards.

Table 2. Method TO-11A Analyte List and QC Criteria (Environmental Field Samples)

Analyte	TO-11A LOQ/RL[a] (µg)	ICAL (%RSD)	ISCV (%R)	CCV (%R)
Acetaldehyde	0.10	≤ 10	± 15	± 10
Acrolein[b]	0.25[d]	≤ 10	± 15	± 10
Benzaldehyde	0.25	≤ 10	± 15	± 10
Crotonaldehyde	0.25	≤ 10	± 15	± 10
Formaldehyde	0.05	≤ 10	± 15	± 10
Hexanal	0.25	≤ 10	± 15	± 10
Isopentanal	0.25	≤ 10	± 15	± 10
MEK/Butyraldehydes[c]	0.25	≤ 10	± 15	± 10
m,p-Tolualdehyde	0.25	≤ 10	± 15	± 10
o-Tolualdehyde	0.25	≤ 10	± 15	± 10
Pentanal	0.25	≤ 10	± 15	± 10
Propanal	0.25	≤ 10	± 15	± 10
Acetone	0.25	≤ 10	± 15	± 10
Acetophenone*	N/A	≤ 10	± 15	± 10
Isophorone*	N/A	≤ 10	± 15	± 10
Heptaldehyde*	0.25	≤ 10	± 15	± 10
2,5-Dimethylbenzaldehyde*	0.25	≤ 10	± 15	± 10

[a] Noted reporting limits are subject to change based on most current MDL study.

[b] Because its derivative is not stable, when the target analyte list includes Acrolein the sample will need to be extracted in field. A special order should be placed with the laboratory during the project set-up stage.

[c] Methyl Ethyl Ketone and the Butyraldehydes co-elute.

[d] Not recommended.

* Special compounds upon request only.

Table 3. Summary of Calibration and QC Procedures for Method TO-11A

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
5-Point Initial Calibration Curve (ICAL)	Analyzed in triplicate prior to sample analysis	%RSD ≤ 10	Repeat calibration.
Instrument LCS	With each ICAL	%R = 85–115%	Check the system and re-analyze the standard. Re-calibrate the instrument if the criteria cannot be met.
Continuing Calibration Verification (CCV)	Daily prior to sample analysis, after a maximum of every 10 injections, and at the end of the analytical batch	Within ±10% of the expected value	Check the system and re-analyze the standard. If the criteria cannot be met, re-calibrate the instrument. If the standard is biased low, re-analyze all samples since last acceptable CCV. If biased high and samples are "ND", re-analysis is not required. "Q"-flag high recoveries.
Instrument (Solvent) Blank Analysis	Following analysis of Standards	Results less than the laboratory RL	Inspect the system and re-analyze the blank.
Laboratory Duplicates - Laboratory Control Spike Duplicate	One per analytical batch	RPD ≤ 25%	Re-analyze the sample a third time. If the limit is exceeded again, investigate the cause and bring the system back to working order. If no problem is found with the system, narrate the data.

ANALYTICAL METHODS

Section 6.0

Method: ASTM D5504 – Sulfur Compounds

Eurofins Air Toxics SOP #13 Revision 17 Effective Date: December 27, 2013 Methods Manual Summary

Description: This method involves gas chromatograph (GC) analysis of whole air samples for sulfur compounds collected in Tedlar bags. Detection of volatile sulfur compounds is accomplished using a Sulfur Chemiluminescence Detector (SCD) following method ASTM D5504.

Care should be taken to ensure samples to be analyzed for reduced sulfur compounds do not come into contact with any metal surfaces. In addition, because of the reactivity of Hydrogen Sulfide (H_2S), and mercaptans, samples collected in Tedlar bags should be analyzed within 24 hours of collection. Samples collected in Tedlar bags should also be protected from heat and light.

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, the laboratory reports these non-standard compounds with partial validation. Validation includes a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification is analyzed, and no method detection limit study is performed unless previous arrangements have been made. In addition, stability of the non-standard compound during sample storage is not validated. Full validation may be available upon request.

The laboratory is not equipped to handle >100 ppmv levels of sulfur compounds. Please notify the laboratory if ppmv levels of sulfur compounds are anticipated.

Method Modifications: The Quality Control (QC) elements listed in the latest ASTM Method D5504-01 are suggested, *not required*. In general, calibration protocols followed by the laboratory are designed to meet standard NELAP and EPA environmental data acceptance criteria. Several method suggestions of note are not included in the laboratory QC procedures unless requested by the client. The deviations from the method recommendations are as follows:

- All field samples are not analyzed in duplicate.
- Daily spiked field samples are not analyzed.

Additionally, upon special request, Eurofins Air Toxics provides passivated canisters for sulfur collection. *Air Toxics does not examine passivated canisters for continued sulfur stability as required by the method, and previous studies have demonstrated that recoveries of the glass-lined canisters indicate a potential loss of inertness which can vary from canister to canister.* Sample analysis results derived from passivated canister media are reported with the appropriate narration. Per the ASTM D5504 method, the storage time when using a passivated/lined canister is not to exceed 7 days.

The standard target analyte list, reporting limits (RL), QC criteria, and QC summary can be found in the following tables.

Table 1. ASTM Method D5504 Compound List and QC Limits

Analyte	RL (ppbv)	QC Acceptance Criteria		
		ICAL (% RSD)	LCS/ CCV* (% R)	Precision (% RPD)
2,5-Dimethylthiophene	4.0	≤ 30	70 – 130	≤ 25
2-Ethylthiophene	4.0	≤ 30	70 –130	≤ 25
3-Methylthiophene	4.0	≤ 30	70 – 130	≤ 25
Carbon Disulfide	5.0	≤ 30	70 – 130	≤ 25
Carbonyl Sulfide	4.0	≤ 30	70 – 130	≤ 25
Diethyl Disulfide	4.0	≤ 30	70 – 130	≤ 25
Diethyl Sulfide	4.0	≤ 30	70 – 130	≤ 25
Dimethyl Disulfide	4.0	≤ 30	70 – 130	≤ 25
Dimethyl Sulfide	4.0	≤ 30	70 – 130	≤ 25
Ethyl Mercaptan	4.0	≤ 30	70 – 130	≤ 25
Ethyl Methyl Sulfide	4.0	≤ 30	70 – 130	≤ 25
Hydrogen Sulfide	4.0	≤ 30	70 – 130	≤ 25
Isobutyl Mercaptan	4.0	≤ 30	70 – 130	≤ 25
Isopropyl Mercaptan	4.0	≤ 30	70 – 130	≤ 25
Methyl Mercaptan	4.0	≤ 30	70 – 130	≤ 25
n-Butyl Mercaptan	4.0	≤ 30	70 – 130	≤ 25
n-Propyl Mercaptan	4.0	≤ 30	70 – 130	≤ 25
tert-Butyl Mercaptan	4.0	≤ 30	70 – 130	≤ 25
Tetrahydrothiophene	4.0	≤ 30	70 – 130	≤ 25
Thiophene	4.0	≤ 30	70 – 130	≤ 25

*The recovery for all analytes should be 70-130%; end check recoveries are 70-130% with 2 allowed out up to 60-140%. The recovery for Hydrogen Sulfide, Carbonyl Sulfide and Carbon Disulfide must be 70-130%.

Table 2. Summary of Calibration and QC Procedures for ASTM Method D 5504

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Initial Calibration (ICAL)	Prior to sample analysis	A minimum of 5 points (3 points may be accepted to meet sample hold times.) % RSD ≤ 30	Evaluate system. Re-prepare and/or re-analyze calibration points.
Second Source Verification (LCS)	With each Initial Calibration; with each analytical batch.	70–130% of the expected values for all the compounds	Check the system, re-prepare and/or re-analyze standard. Re-calibrate instrument if CCV shows similar recoveries. If recoveries are high and no detections are expected, sample analysis may proceed. If hold-time is at risk, flagging and narration of non-compliant compounds may be appropriate.
Continuing Calibration Verification (CCV)	Daily prior to sample analysis	%Recovery = 70–130%	Check the system, re-prepare and re-analyze standard. Re-calibrate instrument if re-analysis shows similar recoveries. If recoveries are high and no detections are expected, sample analysis may proceed. If hold-time is at risk, flagging and narration of non-compliant may be appropriate.
Laboratory Blank	After daily LCS and after high level samples and mid-check standards as needed	Results less than the laboratory reporting limit.	Inspect the system and re-prepare the lab blank bag. Flag associated detections with a “B” flag.
End Check	At the end of the analytical sequence	Recoveries within 70–130% with 2 target analytes not exceeding 60–140%. The recovery for Hydrogen Sulfide, Carbonyl Sulfur and Carbon Disulfide must be 70–130%.	Re-analyze the standard to confirm loading procedure. If the 2nd analysis fails, identify and correct the problem. If possible re-analyze all or a subset samples after the last compliant QC check. If re-analysis within hold-time is not possible, flag data affected data. No flags are required if recovery is high and no associated compounds are detected.

Laboratory Duplicates – LCS/LCSD	One per analytical batch	RPD $\leq$ 25%	Verify that the sample or LCS is securely attached to the sample introduction line. If a problem is identified, document in the run log and re-analyze the duplicate pair. If no loading problem is identified, narrate exceedances. If LCSD is analyzed immediately after LCS and precision is not met, notify manager or technical support team before proceeding with sample analysis.

ANALYTICAL METHODS

Section 7.0

Method: Modified EPA Methods TO-4A/TO-10A Pesticides and PCBs

Eurofins Air Toxics SOP #26 Revision 18 Effective Date: December 27, 2013 Methods Manual Summary

Description: These methods involve drawing a measured volume of air through a filter and PUF cartridge to collect pesticides and Aroclors in the vapor and particulate phases. EPA Method TO-4A describes the use of a high-volume sampling pump which allows for up to 300 cubic meters (m^3) of air to be collected over a 24-hour period, while the TO-10A method describes a low-volume sample application suitable for indoor air. Filters are not required for TO-10A sample collection. The sample media is extracted in the laboratory using Soxhlet extraction or Pressurized Fluid Extraction (PFE). The extracts are solvent-exchanged to hexane, concentrated to a final volume, and analyzed for chlorinated pesticides and PCBs using a gas chromatograph (GC) equipped with a dual Electron Capture Detector (ECD) for detection and confirmation.

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, the laboratory reports these non-standard compounds with partial validation. Validation includes a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification is analyzed, and no method detection limit study is performed unless previous arrangements have been made. For the extraction process, the non-standard compound recovery is evaluated in the extracted laboratory control spike. In addition, stability of the non-standard compound during sample storage is not validated. Full validation may be available upon request.

Eurofins Air Toxics performs modified versions of these methods. The method modifications, standard target analyte list, reporting limit (RL) Quality Control (QC) criteria, and QC summary can be found in the following tables.

Table 1. Summary of Method Modifications for TO-4A/TO-10A

Requirement	EPA Methods TO-4A/TO-10A	Eurofins Air Toxics Modifications
Extraction Solvent	10% (5% for TO-10A) Diethyl Ether in Hexane	Dichloromethane (DCM) exchanging to Hexane during the concentration step
Reagent Blank	Set up extraction system without filter/PUF; reflux with solvent.	No Reagent Blank is extracted. Reagent lots are certified as acceptable prior to use.
Media certification (TO-10A only)	< 0.01 µg for single peak analytes; < 0.1 µg for PCBs	< Reporting Limit for all analytes
Frequency of Continuing Calibration Verification (CCV)	Every 10 samples	Every 20 samples with internal standard
PCB Quantitation	Requires a minimum of 5 peaks.	Use 4 peaks for quantitation.

Field Spike	Requires one PUF cartridge from each batch of 20 to be spiked with standard and not be used during the sampling period. The spiked PUF plug is placed in a sealed container, then extracted along with samples.	A spike is prepared at the time of sample extraction only.
Sampling Efficiency Determination	Prior to implementation of method and then periodically determine sampling efficiency by spiking PUF and sampling ambient air to determine recoveries.	No sampling efficiencies have been determined by the laboratory.

Table 2. Methods TO-4A/TO-10A Reporting and QC Limits

Analyte	RL (µg)	Low Point of the Curve (µg)	QC Acceptance Criteria			
			ICAL (%RSD)	ICV (%R)	CCV (%D)	LCS (%R)
4,4'-DDD	0.10	0.10	≤ 20	± 15	± 15	65 – 125
4,4'-DDE	0.10	0.10	≤ 20	± 15	± 15	65 – 125

Heptachlor	0.10	0.10	≤ 20	± 15	± 15	65 – 125
Heptachlor Epoxide	0.10	0.10	≤ 20	± 15	± 15	65 – 125
Technical Chlordane[①④]	1.0	NA	≤ 20	± 15	± 15	
Toxaphene[①]	1.0	NA	≤ 20	± 15	± 15	

Mirex is not included in the standard pesticides list but can be performed upon request.

*Internal studies have shown poor recoveries of Endrin Aldehyde from PUF cartridge. In-house generated control limits are used to evaluate recovery of this compound.

Surrogates③

Analyte	%R
2,4,5,6-Tetrachloro-m-xylene (TCMX)	60 – 120②
Decachlorobiphenyl (DCB)	60 – 120②

① *The noted multi-component compounds use a one-point calibration.*
② *Recovery limits are derived from Compendium Method TO-10A January 1999.*
③ *Recovery limits are for extracted samples only. Non-extracted samples use limits of 85–115 %R.*
④ *Not routinely reported but available at client request.*

Table 3. Summary of Calibration and QC Procedures for Methods TO-4A/TO-10A

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
5-Point Initial Calibration Curve (ICAL)*	Prior to sample analysis	%RSD ≤ 20 for each compound or average %RSD ≤ 20.	Use linear regression per SW-846 or re-calibrate.
Independent Calibration Verification (ICV)	After each Initial Calibration	Recovery of an individual component or the average of all the target components for a list of 5 or more target components within 85–115% recovery. Not to exceed 75–125% for any individual compounds.	Investigate the source of discrepancy, including re-preparation and re-analysis of standard. Re-calibrate if needed.
Breakdown Check (Endrin and p,p'-DDT)	Daily, prior to Initial Curve; CCV for pesticide analysis only.	Degradation ≤ 15%	Perform maintenance. Repeat breakdown check.
Continuing Calibration Verification (CCV)	Daily, prior to sample analysis, every 20 samples, and at the end of the analysis sequence, at a minimum of every 24 hours.	Recovery of an individual component or the average of all the pesticide target components for a list of 5 or more target components, within 15% of the expected values. Not to exceed 75–125% for any individual compounds.	Analyze new ICAL and/or prepare fresh standards. If the standard analyzed is recovering high and associated samples are ND, "Q" flag the high recoveries. If the standard analyzed is recovering low, re-analyze all samples.
Laboratory Control Spike (LCS) for compounds noted in Table 2.	Extracted with each set of up to 20 samples	As mentioned in Table 2	Analyze another aliquot. If it still fails, "Q" flag the compounds that are outside the control limits.

Surrogates	All samples, QC, and blanks prior to extraction	As mentioned in Table 2	Analyze another aliquot. If it still fails, "Q" flag the compounds outside the control limits.
Internal Standard	With all analyses	CCV 50–200% compared to midpoint of ICAL; samples 50–200% compared to first CCV of the daily analytical batch.	Analyze another aliquot. If a CCV fails, correct problem before proceeding. If a sample fails, analyze a second time. If it still fails, dilute the sample until IS meets the criteria. Narrate the matrix interference.
Laboratory Blanks	With each set of up to 20 samples extracted	Results less than the Laboratory reporting limit.	Analyze another aliquot. If it still fails, "B" flag the compounds that do not meet the acceptance criteria.
Laboratory Duplicates Laboratory Control Spike Duplicate	One per analytical batch	RPD ≤ 25%	Narrate exceedances. Investigate the cause and perform maintenance as required and re-calibrate as needed.
Second-Column Confirmation	100% for all positive results, for both pesticide and PCB analyses	Same as for initial or primary column analysis	Same as for initial or primary column analysis

* A single-point calibration is performed for Technical Chlordane, Toxaphene, and certain Aroclors.

ANALYTICAL METHODS

Section 8.0

Method: EPA Method TO-12 (Non-methane Organic Compounds)

Eurofins Air Toxics SOP #36 Revision 16 Effective Date: April 03, 2013 Methods Manual Summary

Description: This method involves gas chromatograph analysis of whole air samples collected in Summa™ canisters or Tedlar bags. Samples are analyzed for Non-Methane Organic Compounds (NMOC) using EPA Method TO-12 protocols. After concentration on a sorbent bed, samples are analyzed using a Flame Ionization Detector (FID). This method is used when speciation is not required.

NMOC concentrations are quantified using the response factor of heptane. As required by the project, NMOC results referenced to heptane can be converted to units of ppmC (parts per million of Carbon). Additionally, hydrocarbon ranges can be provided based on the elution time of the normal alkanes on the GC column.

Eurofins Air Toxics performs a modified version for each of these methods. The method modifications, standard target analyte list, RL, QC criteria, and QC summary can be found in the following tables.

Table 1. Summary of Method Modifications for TO-12

Requirement	EPA Method TO-12	Eurofins Air Toxics Modifications
Reporting Limit	0.02 ppmC	0.010 ppmv
Initial Calibration	Five levels: Each level three runs with %RSD < 3%; linearity criterion not specified	Minimum of three single levels; %RSD ≤ 30%.
Sample Analysis Frequency	Duplicate analysis with RPD<5%; report average results of two analyses.	Single analysis. Duplicate 10% of samples with RPD ≤ 25% for detections > 5X the RL.
Column*	GC column not used.	GC column used for analysis.
Sample concentration	Cyrogenic concentration	Multibed sorbent concentration

* The column modification implemented for sample analysis allows for additional characterization based on carbon ranges.

Table 2. Method Compound List and QC Limits

Analyte	RL (ppmv)	Acceptance Criteria		
		ICAL (%RSD)	LCS/CCV (%R)	Precision (%RPD)
Total NMOC ref. to Heptane	0.010	≤ 30	75-125%	≤ 25

Table 3. Summary of Calibration and QC Procedures for TO-12 (NMOC)

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Initial Calibration Curve (ICAL)	Prior to sample analysis and/or annually	% RSD ≤ 30	Repeat the calibration.
Laboratory Control Sample (LCS)	With each initial calibration and analytical batch	75–125% of the expected value	Check the system and re-analyze the standard. Re-calibrate the instrument if the criteria cannot be met.
Continuing Calibration Verification (CCV)	Daily prior to sample analysis and after every 20 samples or at the end of the analytical sequence	% Difference ± 25 of expected value	Check the system and re-analyze the standard. Re-calibrate the instrument if the criteria cannot be met. Re-analyze all samples since the last acceptable CCV.
Laboratory Blank	In between analysis of standards and project samples	Results less than laboratory reporting limit	Repeat the Laboratory Blank. If the re-analysis of the Lab Blank contains above but at less than 5X the reporting limit, sample analysis may proceed and the associated sample results will be reported with a B flag.
Laboratory Duplicates/ Laboratory Control Spike Duplicate (LCSD)	One per analytical batch	RPD ≤ 25%	Narrate exceedances. Investigate the cause and perform maintenance as required and re-calibrate as needed.

ANALYTICAL METHODS

Section 9.0

Method: EPA Method TO-14A/TO-15 Volatile Organic Compounds by SIM

Eurofins Air Toxics SOP #38 Revision 17 Effective Date: December 27, 2013 Methods Manual Summary

Description: This method involves Selective Ion Monitoring (SIM) gas chromatograph/mass spectrometer (GC/MS) analysis of whole air samples collected in evacuated stainless steel canisters. Samples are analyzed for volatile organic compounds (VOCs) using EPA Method TO-14A/TO-15 protocols. An aliquot of the sample is withdrawn from the canister through a mass flow controller and concentrated onto a hydrophobic drying system that removes water from the sample stream. The sample is then focused onto a cryogenic-cooled column prior to analysis by GC/MS in the SIM mode.

Mass spectrometer detectors can be set to acquire both SIM and full scan data simultaneously. This generates two separate data files in the analytical software. One file contains full scan data and the other contains SIM data for selected compounds. The results for each sample in a report will be from two separate data files originating from the same analytical run. The two data files have the same base file name and are differentiated with a "sim" extension on the SIM data file.

Eurofins Air Toxics maintains a suite of TO-14A/TO-15 methods, each optimized to efficiently meet the data objectives for a wide range of targeted concentration ranges. The methods, their reporting limits, and typical applications are summarized in the table below. This method summary describes TO-14A/TO-15 SIM.

Eurofins Air Toxics Method	Base Reporting Limits	Typical Application
TO-14A/TO-15 (5&20)	5 – 20 ppbv	Soil gas and ppmv range vapor matrices
TO-14A/TO-15 (Standard or Quad)	0.5 – 5.0 ppbv	Ambient air, soil gas, and ppbv level vapor matrices
TO-14A/TO-15 (Low-level)	0.1 – 0.5 ppbv	Indoor and outdoor air
TO-14A/TO-15 SIM	0.003 – 0.5 ppbv	Indoor and outdoor air

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. If full validation of the required compound(s) is not available, the laboratory will present Quality Control (QC) options to the client based on the project objectives.

Please note that Methods TO-14A and TO-15 were validated for specially treated canisters. As such, the use of Tedlar bags for sample collection is outside the scope of the method and not recommended for ambient or indoor air samples. It is the responsibility of the data user to determine the usability of TO-14A and TO-15 results generated from Tedlar bags.

All samples submitted for TO-15 SIM are screened prior to analysis. If samples contain high concentrations of target and/or non-target VOCs, samples may be analyzed by an alternative TO-15 method (i.e. Standard or 5&20) with a higher dynamic calibration range.

Eurofins Air Toxics performs a modified version of TO-15 SIM as detailed in Table 1. Additionally, since Eurofins Air Toxics applies TO-15 methodology to all Summa™ canisters regardless of whether TO-14A or TO-15 is specified by the project, Eurofins Air Toxics performs a modified version of method TO-14A as described in Table 2. The default SIM target list, reporting limits (RL), QC criteria and QC summary may be found in tables 3 and 4.

Table 1. Summary of TO-15 SIM Method Modifications

Requirement	TO-15	Eurofins Air Toxics Modifications
Blank and standards	Zero Air	Nitrogen

Table 2. Summary of TO-14A SIM Method Modifications

Requirement	TO-14A	Eurofins Air Toxics Modifications
Sample Drying System	Nafion Dryer	Multibed hydrophobic sorbent
ICAL %RSD acceptance criteria	≤ 30% RSD for listed 39 VOCs	Follow TO-15 requirements of ≤ 30%RSD with 2 of standard compound list allowed out to ≤ 40%RSD
Blank and standards	Zero air	Nitrogen
BFB ion abundance criteria	Ion abundance criteria listed in Table 4 of TO-14A	Follow abundance criteria listed in TO-15.
BFB absolute abundance criteria	Within 10% when comparing to the previous daily BFB	CCV internal standard area counts are compared to ICAL; corrective action when recovery is less than 60%

Table 3. Method TO-14A/TO-15 Standard Analyte List (SIM) and QC Limits

Analyte	RL/LOQ (ppbv)	QC Acceptance Criteria			
		ICAL (%RSD)	CCV (%R)	ICV/LCS (%R)	Precision Limits (Max. RPD)
Dichlorodifluoromethane (Fr12)	0.020	≤ 30%	70 – 130	70 – 130	± 25
Freon 114	0.020	≤ 30%	70 – 130	70 – 130	± 25
Chloromethane	0.050	≤ 30%	70 – 130	70 – 130	± 25
Vinyl Chloride	0.010	≤ 30%	70 – 130	70 – 130	± 25
Chloroethane	0.050	≤ 30%	70 – 130	70 – 130	± 25
1,1-Dichloroethene	0.010	≤ 30%	70 – 130	70 – 130	± 25
Trans-1,2-Dichloroethene	0.100	≤ 30%	70 – 130	70 – 130	± 25
Methyl tert-Butyl Ether	0.100	≤ 30%	70 – 130	70 – 130	± 25
1,1-Dichloroethane	0.020	≤ 30%	70 – 130	70 – 130	± 25
cis-1,2-Dichloroethene	0.020	≤ 30%	70 – 130	70 – 130	± 25
Chloroform	0.020	≤ 30%	70 – 130	70 – 130	± 25
1,1,1-Trichloroethane	0.020	≤ 30%	70 – 130	70 – 130	± 25
Carbon Tetrachloride	0.020	≤ 40%	60 - 140	60 - 140	± 25
Benzene	0.050	≤ 30%	70 – 130	70 – 130	± 25
1,2-Dichloroethane	0.020	≤ 30%	70 – 130	70 – 130	± 25
Trichloroethene	0.020	≤ 30%	70 – 130	70 – 130	± 25
Toluene	0.020	≤ 30%	70 – 130	70 – 130	± 25
1,1,2-Trichloroethane	0.020	≤ 30%	70 – 130	70 – 130	± 25
Tetrachloroethene	0.020	≤ 30%	70 – 130	70 – 130	± 25
1,2-Dibromoethane	0.020	≤ 30%	70 – 130	70 – 130	± 25
Ethyl Benzene	0.020	≤ 30%	70 – 130	70 – 130	± 25
m,p-Xylene	0.040	≤ 30%	70 – 130	70 – 130	± 25
o-Xylene	0.020	≤ 30%	70 – 130	70 – 130	± 25
1,1,2,2-Tetrachloroethane	0.020	≤ 30%	70 – 130	70 – 130	± 25
1,4-Dichlorobenzene	0.020	≤ 30%	70 – 130	70 – 130	± 25
Naphthalene	0.050	≤ 40%	60 – 140	60 – 140	± 25

Table 3 is the list of Standard compounds, reporting limits and QC acceptance criteria. Each project may be customized as needed. Additional compounds and different reporting limits may be obtainable and/or achieved upon request.

Table 4. Summary of Calibration and QC Procedures for Methods TO-14A/TO-15 by SIM

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Tuning Criteria	Every 24 hours	TO-15 Ion Abundance criteria	Correct problem then repeat tune.
Multi-point Calibration (Minimum of 5 points)	Prior to sample analysis	≤ 30% for standard compounds with 2 compounds allowed out to ≤ 40% RSD	Correct problem then repeat Initial Calibration Curve.
Initial Calibration Verification and Laboratory Control Spike (ICV and LCS)	After each initial calibration curve, and daily prior to sample analysis	Recoveries for 85% of standard compounds must be 70–130% (≤ 40% for Methyl tert-Butyl Ether and trans-1,2-Dichloroethene). No recovery may be ≤ 50%. If specified by the client, in-house generated control limits may be used.	Check the system and re-analyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.
Initial Calibration Verification and Laboratory Control Spike (ICV and LCS) for <u>Non-Standard</u> Compounds	Per client request or specific project requirements only	Recoveries of compounds must be 60–140%. No recovery may be ≤ 50%.	Check the system and re-analyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.
Continuing Calibration Verification (CCV)	At the start of each day after the BFB tune check	70–130%	Compounds exceeding this criterion and associated data will be flagged and narrated with the exception of high bias associated with non-detects. If more than two compounds from the standard list recover outside of 70–130%, corrective action will be taken. If any compound exceeds 60–140%, samples are not analyzed unless data meets project needs. Check the system and re-analyze the standard. Re-prepare the standard if necessary. Re-calibrate the instrument if the criteria cannot be met.
Continuing Calibration Verification (CCV) for <u>Non-Standard</u> Compounds	Per client request or specific project requirements only	Recoveries of compounds must be 60–140%. No recovery may be ≤ 50%.	Check the system and re-analyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.

Laboratory Blank	After analysis of standards and prior to sample analysis, or when contamination is present.	Results less than the laboratory reporting limit (Table 4) or project required reporting limit.	Inspect the system and re-analyze the blank. "B" flag data for common contaminants.
Internal Standard (IS)	As each standard, blank, and sample is being loaded	Retention time (RT) for blanks and samples must be within ±0.33 min of the RT in the CCV and within ±40% of the area counts of the daily CCV internal standards.	**For blanks:** Inspect the system and re-analyze the blank. **For samples:** Re-analyze the sample. If the ISs are within limits in the re-analysis, report the second analysis. If ISs are out-of-limits a second time, dilute the sample until ISs are within acceptance limits and narrate.
Surrogates	As each standard, blank, and sample is being loaded	70–130% If specified by the client, in-house generated control limits may be used.	**For blanks:** Inspect the system and re-analyze the blank. **For samples:** Re-analyze the sample unless obvious matrix interference is documented. If the %Rs are within limits in the re-analysis, report the second analysis. If %Rs are out-of-limits a second time, report data from first analysis and narrate.
Laboratory Duplicates - Laboratory Control Spike Duplicate (LCSD)	One per analytical batch	RPD ≤ 25%	Narrate exceedances. If more than 5% of compound list outside criteria or if compound is > 40%RPD, investigate the cause and perform maintenance as required. If instrument maintenance is required, calibrate as needed.

ANALYTICAL METHODS

Section 10.0

Method: EPA Methods TO-3 and TO-14A (BTEX/TPH)

Eurofins Air Toxics SOP #43 Revision 20 Effective Date: April 02, 2013 Methods Manual Summary

Description: This method involves GC analysis of whole air samples collected in Summa canisters or Tedlar bags. Samples are analyzed for Benzene, Toluene, Ethylbenzene, Xylenes, (BTEX) and Total Petroleum Hydrocarbons (TPH). Either modified EPA Method TO-3 or Method TO-14A or can be used to reference laboratory protocols. BTEX is measured using a Photo Ionization Detector (PID), and TPH is measured using a Flame Ionization Detector (FID). Depending on the client's request, TPH is analyzed and referenced to either gasoline or jet fuel.

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, the laboratory reports these non-standard compounds with partial validation. Validation includes a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification is analyzed, and no method detection limit study is performed unless previous arrangements have been made. In addition, stability of the non-standard compound during sample storage is not validated. Full validation may be available upon request.

Eurofins Air Toxics performs a modified version for these methods. The method modifications, standard target analyte list, reporting limit (RL), QC criteria, and QC summary can be found in the following tables.

Table 1. Summary of Method Modifications for TO-14A

Requirement	EPA Method TO-14A	Eurofins Air Toxics Modifications
Sample Drying System*	Nafion Dryer	Multi-bed sorbent
Sample collection containers	Specially treated stainless steel canisters	Method TO-14A is validated for samples collected in specially treated canisters. As such, the use of Tedlar bags for sample collection is outside the scope of the method and not recommended for ambient or indoor air samples. Associated results are considered qualified.

* The pre-concentrator modification implemented for sample analysis allows for superior performance over the water management and concentration procedures outlined in Method TO-14A. This multi-bed sorbent approach used in EPA Method TO-15 allows for the inclusion of polar compounds such as MTBE, and demonstrates superior performance by minimizing carryover issues that can be problematic using the Nafion dryer scenario described in Method TO-14A.

Table 2. Summary of Method Modifications for TO-3

Requirement	EPA Method TO-3	Eurofins Air Toxics Modifications
Sample Collection	In-line field method	Collection of sample in specially treated canisters or alternative containers for transport to and analysis by an off-site laboratory.
Preparation of Standards	Levels achieved through dilution of gas mixture	Levels achieved through loading various volumes of the gas mixture.
Initial Calibration Calculation	4-point calibration using a linear regression model	5-point calibration using average Response Factor
Initial Calibration Frequency	Weekly	When daily calibration standard recovery is outside 75–125%, or upon significant changes to the procedure or instrumentation.
Daily Calibration Standard Frequency	Prior to sample analysis and every 4-6 hrs	Prior to sample analysis
Minimum Detection Limit (MDL)	Calculated using the equation DL = A+3.3S, where A is intercept of calibration line and S is the standard deviation of at least 3 reps of low level standard.	40 CFR Part 136, App. B
Sample pre-concentration and moisture management	Cyrogenic pre-concentrator with a Nafion dryer	Multi-bed sorbent system

Table 3. Method Compound List and QC Limits

Analyte	RL (ppmv)	Acceptance Criteria		
		ICAL (%RSD)	LCS/CCV (%R)	Precision (%RPD)
Benzene	0.001	≤ 30	± 25	≤ 25
Toluene	0.001	≤ 30	± 25	≤ 25
Ethyl Benzene	0.001	≤ 30	± 25	≤ 25
m,p-Xylenes	0.001	≤ 30	± 25	≤ 25
o-Xylene	0.001	≤ 30	± 25	≤ 25
MTBE	0.001	≤ 30	± 25	≤ 25
TPH (Gasoline Range) MW = 100	0.025	≤ 30	± 25	≤ 25
TPH (JP-4 Range) MW = 156	0.025	≤ 30	± 25	≤ 25

Table 4. Surrogate QC Limits

Surrogate	PID Accuracy (%R)	FID Accuracy (%R)
Fluorobenzene	75–125%	75–150%

Table 5. Summary of Calibration and QC Procedures for TO-3/TO-14A (BTEX & TPH)

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
5-Point Initial Calibration (ICAL)	Prior to sample analysis and annually	%RSD ≤ 30	Correct problem, then repeat the calibration.
Initial Calibration Verification and Laboratory Control Sample (ICV/LCS)	With each initial calibration, and with each analytical batch.	±25% of the expected value	Check the system and re-analyze the standard. Re-prepare the standard or re-calibrate the instrument if the criteria cannot be met.
Continuing Calibration Verification (CCV)	Daily prior to sample analysis and can be used as an End Check	±25% of the expected value	**For initial CCV:** Check the system and re-analyze the standard. Re-calibrate the instrument if the criteria cannot be met. **For Mid- and End Checks:** Check system and re-analyze the standard. If the second analysis fails, identify and correct the problem, then re-analyze all samples since the last acceptable CCV.
Laboratory Blank	In between analysis of standards and project samples	Results less than the laboratory Reporting Limit	Inspect the system and re-analyze the Laboratory Blank.
Surrogate	As each standard, blank, and sample is being loaded	75–125% recovery on the PID; 75–150% on the FID	Low surrogate recovery results in re-analysis (at a higher dilution if high levels of moisture are present). If recovery is out and still low, report the analysis with the better recovery and flag. Because of TPH interference, high surrogate recoveries do not result in re-analysis. Data is flagged to note high recovery.
Laboratory Duplicate - Laboratory Control Spike Duplicate (LCSD)	One per analytical batch	RPD ≤ 25%	Narrate exceedances. Investigate the cause, perform maintenance as required, and re-calibrate as needed.

ANALYTICAL METHODS

Section 11.0

Method: ASTM D1945 – Fixed Gases & C1-C6

Eurofins Air Toxics SOP #54 Revision 18 Effective Date: December 27, 2013 Methods Manual Summary

Description: This method involves gas chromatograph (GC) analysis of soil gas, landfill gas, ambient air, or stack gas collected in Summa^{TM} canisters, Tedlar bags, or any vessel that has been demonstrated to be clean and leak free. Samples are analyzed for Methane and fixed gases and can be used to speciate individual light hydrocarbons up to C6. This method is also used to provide an estimation of the heating value of the gas by method ASTM D3588. Because the sample is withdrawn from the vessel by positive pressure, rigid containers are first filled to positive pressure using UHP Helium or Nitrogen. Samples are then analyzed using a GC equipped with a Flame Ionization Detector (FID) and a Thermal Conductivity Detector (TCD).

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, the laboratory reports these non-standard compounds with partial validation. Validation includes a 3-point calibration with the lowest concentration defining the reporting limit (RL), no second source verification is analyzed, and no method detection limit study is performed unless previous arrangements have been made. In addition, stability of the non-standard compounds during sample storage is not validated. Full validation may be available upon request.

Since the protocols in the ASTM D1945 standard were designed for the analysis of natural gas, the laboratory has made modifications in order to apply the method to environmental samples covering a wide concentration range and to implement standard NELAP and EPA calibration criteria. The method modifications, standard target analyte list, RL, Quality Control (QC) criteria, and QC summary can be found in the following tables.

Table 1. Summary of Method Modifications for ASTM D1945

Requirement	ASTM D1945	Eurofins Air Toxics Modifications
Sample Injection Volume	0.50 mL to achieve Methane linearity.	1.0 mL
Reference Standard	Concentration should not be < half of nor differ by more than 2X the concentration of the sample. Run 2 consecutive checks; must agree within 1%.	A minimum 3-point linear calibration. The acceptance criterion is RSD ≤ 15%. All target analytes must be within the linear range of calibration (with the exception of O_2, N_2, and C6+ hydrocarbons).
Sample Analysis	Equilibrate samples to 20-50° F above source temperature at field sampling.	No heating of samples is performed.
Sample Calculation	Response factor is calculated using peak height for C5 and lighter compounds.	Peak areas are used for all target analytes to quantitate concentrations.

Normalization	Sum of original values should not differ from 100.0% by more than 1.0%.	Sum of original values may range between 85–115%; normalization of data not performed unless client requested.

Table 2. ASTM Method D1945 Compound List and QC Limits

Analyte	Reporting Limit (%)	QC Acceptance Criteria		
		ICAL (%RSD)	CCV/LCS/ICV (%R)	Precision* (%RPD)
Carbon Dioxide	0.01	≤ 15%	± 15%	≤ 25%
Carbon Monoxide	0.01	≤ 15%	± 15%	≤ 25%
Ethene	0.001	≤ 15%	± 15%	≤ 25%
Ethane	0.001	≤ 15%	± 15%	≤ 25%
Acetylene	0.001	≤ 15%	± 15%	≤ 25%
Isobutane	0.001	≤ 15%	± 15%	≤ 25%
Isopentane	0.001	≤ 15%	± 15%	≤ 25%
Methane	0.0001	≤ 15%	± 15%	≤ 25%
n-Butane	0.001	≤ 15%	± 15%	≤ 25%
Neopentane	0.001	≤ 15%	± 15%	≤ 25%
n-Pentane	0.001	≤ 15%	± 15%	≤ 25%
Nitrogen**	0.10	≤ 15%	± 15%	≤ 25%
NMOC (C6+)	0.01	≤ 15%	± 15%	≤ 25%
Oxygen	0.10	≤ 15%	± 15%	≤ 25%
Propane	0.001	≤ 15%	± 15%	≤ 25%
Hydrogen***	0.01	≤ 15%	± 15%	≤ 25%
Helium****	0.05	≤ 15%	± 15%	≤ 25%

* For detections at > 5X the Reporting Limit.
**For canisters that have been pressurized with Nitrogen, the amount of Nitrogen in the sample is determined by subtraction.
***For canisters that have been pressurized with Helium, the Reporting Limit is 1.0%.
****Included by special request only.

Note: Results are reported in units of mol %. If required to report volume % or ppmV, a compressibility factor of 1 for all gases will be assumed. As a result, mol % is assumed to be equivalent to volume %. This assumption may result in a bias for highly compressible gases at high concentrations and pressures.

Table 3. Summary of Calibration and QC Procedures for Mod. ASTM Method D1945

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Initial Calibration (ICAL)	Prior to sample analysis and annually	≤ 15% RSD	Correct problem, then repeat Initial Calibration.
Initial Calibration Verification and Laboratory Control Spike (ICV and LCS)	After each Initial Calibration and once per analytical batch.	85–115% Recovery If specified by the client, in-house generated control limits may be used.	Check the system and re-analyze the standard. Re-prepare the standard if necessary. If the primary standard is found to be in error, re-prepare the primary and calibrate the instrument.
Continuing Calibration Verification (CCV)	Daily prior to sample analysis, and can be used as an End Check.	± 15% Difference	Check the system and re-analyze the standard. Re-prepare the standard if necessary. Re-calibrate the instrument if the criteria cannot be met. If the closing CCV fails, the system is checked and the standard is re-analyzed. Re-prepare the standard if necessary. If the second analysis fails, identify and correct the problem, then re-analyze all samples since the last acceptable CCV.
Laboratory Blank	After analysis of standards and prior to sample analysis, or when contamination is present.	Results less than the laboratory Reporting Limit	Inspect the system and re-analyze the Laboratory Blank.
Laboratory Duplicates-Laboratory Control Spike Duplicate (LCSD)	One per analytical batch	RPD ≤ 25%	Narrate exceedances. Investigate the cause and perform maintenance as required and re-calibrate as needed.

ANALYTICAL METHODS

Section 12.0

Method: PM10/TSP – Particulate Matter

Eurofins Air Toxics SOP #66 Revision 13 Effective Date: December 30, 2013 Methods Manual Summary

Description: This method involves equilibrating quartz filters in a conditioning environment of a specified temperature and humidity range and weighing the filters before and after field sampling. Samples are analyzed for method PM_{10} using 40 CFR Part 50 Appendix J or for Total Suspended Particulate (TSP) using 40 CFR Part 50 Appendix B. An analytical balance with 0.1 mg resolution is used to measure the filter weights. The corresponding change in mass represents the TSP or PM_{10} result, expressed in µg or µg/m^3. The reporting limit is typically 1000 µg. Sampling volumes are required to calculate results in units of µg/m^3.

Table 1. Conditioning Environment Criteria for Methods PM10 and TSP

Method	Conditioning Environment Temperature (˚F)	Conditioning Environment Relative Humidity (%)
PM10	59°F – 86°F ± 5°F	20% – 45% ± 5%
TSP	59°F – 86°F ± 5°F	≤ 50% ± 5%

Table 2. Summary of Calibration and QC Procedures for Methods PM10 and TSP

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Calibration	Calibration checks of 3.00 grams (g) and 5.00 g are weighed to bracket the expected filter weight of ~4.5 g prior to sample analysis and at the end of the analytical batch.	Accuracy limits of 3.00 g weight: 2.997 g – 3.003 g Accuracy limits of 5.00 g weight: 4.995 g - 5.005 g	Correct problem then repeat calibration.
Laboratory Duplicates	Unexposed filters: One per analytical batch Exposed filters: One duplicate per work order	Unexposed filters: Weights of the clean filters should be within ±0.0028 g of the original value. Exposed filters: ≤ 25% RPD and weights must be within ±0.005 g	Re-condition the filter and re-weigh.
Laboratory Blanks	Immediately after the calibration checks	Post-weight of Lab Blank is less than pre-weight and the difference is < 0.0028 g.	Confirm the weight difference and narrate.

ANALYTICAL METHODS

Section 13.0

Method: EPA Method TO-14A/TO-15 Volatile Organic Compounds (Low-Level)

Eurofins Air Toxics SOP #83 Revision 12 Effective Date: February 13, 2014 Methods Manual Summary

Description: This method involves full scan gas chromatograph/mass spectrometer (GC/MS) analysis of whole air samples collected in evacuated stainless steel canisters. Samples are analyzed for volatile organic compounds (VOCs) using EPA Method TO-14A/TO-15 protocols. An aliquot of up to 250 mL of air is withdrawn from the canister utilizing a volumetric syringe, volumetric loop, or mass flow controller. This volume is loaded onto a hydrophobic multibed sorbent trap to remove water and carbon dioxide and to concentrate the vapor sample. The focused sample is then flash-heated to sweep adsorbed VOCs onto a GC/MS for separation and detection. Compounds are detected using a MS operating in full scan mode.

Eurofins Air Toxics maintains a suite of TO-14A/TO-15 methods, each optimized to efficiently meet the data objectives for a wide range of targeted concentration ranges. The methods, their reporting limits, and typical applications are summarized in the table below. This method summary describes TO-14A/TO-15 (Low-Level).

Eurofins Air Toxics Method	Base Reporting Limits	Typical Application
TO-14A/TO-15 (5&20)	5 – 20 ppbv	Soil gas and ppmv range vapor matrices
TO-14A/TO-15 (Standard or Quad)	0.5 – 5.0 ppbv	Ambient air, soil gas, and ppbv level vapor matrices
TO-14A/TO-15 (Low-Level)	0.1 – 0.5 ppbv	Indoor and outdoor air
TO-14A/TO-15 SIM	0.003 – 0.5 ppbv	Indoor and outdoor air

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, Eurofins Air Toxics reports these non-routine compounds with partial validation. Validation may include a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification analyzed, and no method detection limit study performed unless previous arrangements have been made. In addition, stability of the non-standard compound during sample storage is not validated. Full validation may be available upon request.

Since Eurofins Air Toxics applies TO-15 methodology to all Summa™ canisters regardless of whether TO-14A or TO-15 is specified by the project, Eurofins Air Toxics performs a modified version of method TO-14A as detailed in Table 1. Please note that Methods TO-14A and TO-15 were validated for specially treated canisters. As such, the use of Tedlar bags for sample collection is outside the scope of the method and is not recommended for ambient or indoor air samples. It is the responsibility of the data user to determine the usability of TO-14A and TO-15 results generated from Tedlar bags.

All samples submitted for TO-15 Low-Level are screened prior to analysis. If samples contain high concentrations of target and/or non-target VOCs, samples may be analyzed by an alternative TO-15 method (i.e., Standard or 5&20) with a higher dynamic calibration range.

Table 1. Summary of TO-14A Method Modifications

Requirement	TO-14A	Eurofins Air Toxics Modifications
Sample Drying System	Nafion Dryer	Multibed hydrophobic sorbent
Blank acceptance criteria	< 0.2 ppbv	< RL
BFB ion abundance criteria	Ion abundance criteria listed in Table 4 of TO-14A	Follow abundance criteria listed in TO-15.
BFB absolute abundance criteria	Within 10% when comparing to the previous daily BFB	CCV internal standard area counts are compared to ICAL; corrective action taken when recovery is less than 60%.
Blanks and standards	Zero Air	UHP Nitrogen provides a higher purity gas matrix than zero air.
Initial Calibration	≤ 30% RSD for listed 39 VOCs	≤ 30% RSD with 4 compounds allowed out to ≤ 40%

Table 2. Summary of Method TO-15 Modifications

Requirement	TO-15	Eurofins Air Toxics Modifications
Initial Calibration	≤ 30% RSD with 2 compounds allowed out to < 40% RSD	≤ 30% RSD with 4 compounds allowed out to ≤ 40%
Blanks and standards	Zero Air	UHP Nitrogen provides a higher purity gas matrix than zero air.

The standard target analyte list, reporting limits (RL), also referred to as Limit of Quantitation (LOQ), Quality Control (QC) criteria, and QC summary can be found in tables 3 through 6.

Table 3. Method TO-14A/TO-15 Analyte List (Low-Level) and QC Limits

Analyte	RL/LOQ (ppbv)	QC Acceptance Criteria			
		ICAL (%RSD)	CCV (%R)	ICV/LCS* (%R)	Precision Limits (Max. RPD)
1,1,2,2-Tetrachloroethane	0.1	≤ 30%	70 – 130	70 – 130	± 25
1,1,2-Trichloroethane	0.1	≤ 30%	70 – 130	70 – 130	± 25

2,2,4-Trimethylpentane	0.5	≤ 30%	70 – 130	70 – 130	± 25
3-Chloroprene	0.5	≤ 30%	70 – 130	70 – 130	± 25

Non-Standard Compounds

Analyte	RL/LOQ (ppbv)	QC Acceptance Criteria			
		ICAL (%RSD)	CCV (%R)	ICV/LCS (%R)	Precision Limits (Max. RPD)
Acrolein	0.5	≤ 40%	60 – 140	60 – 140	± 25
Butane	0.5	≤ 40%	60 – 140	60 – 140	± 25
Ethyl tert-Butyl Ether	0.5	≤ 40%	60 – 140	60 – 140	± 25
Isopentane	0.5	≤ 40%	60 – 140	60 – 140	± 25
Isopropyl Ether	0.5	≤ 40%	60 – 140	60 – 140	± 25
Methylcyclohexane	0.5	≤ 40%	60 – 140	60 – 140	± 25
Naphthalene**	0.5	≤ 40%	60 – 140	60 – 140	± 25
Propylene	0.5	≤ 40%	60 – 140	60 – 140	± 25
tert-Amyl Methyl Ether	0.5	≤ 40%	60 – 140	60 – 140	± 25
Vinyl Acetate	0.5	≤ 40%	60 – 140	60 – 140	± 25
tert-Butyl Alcohol	0.5	≤ 40%	60 – 140	60 – 140	± 25
TPH (Gasoline)***	10	1- Point Calibration	N/A	ICV only: 60 – 140	± 25
NMOC (Hexane/Heptane)***	2.0	1- Point Calibration	N/A	N/A	± 25

*See Table 6.

**Due to its low vapor pressure, Naphthalene does not meet TO-15 performance requirements. The wider QC limits reflect typical performance. Although Naphthalene is not on Eurofins Air Toxics "standard" TO-15 list, it is commonly requested and therefore included in Table 3.

***TPH and NMOC are not on Eurofins Air Toxics' standard TO-15 list, but are included in Table 3 due to common requests.

Table 4. Internal Standards

Analyte	Accuracy (% R)
Bromochloromethane	60 – 140
1,4-Difluorobenzene	60 – 140
Chlorobenzene-d_5	60 – 140

Table 5. Surrogates

Analyte	Accuracy (% R)
1,2-Dichloroethane-d_4	70 – 130
Toluene-d_8	70 – 130
4-Bromofluorobenzene	70 – 130

Table 6. Summary of Calibration and QC Procedures for Methods TO-14A/TO-15 Low-Level

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Tuning Criteria	Every 24 hours	TO-15 ion abundance criteria	Correct problem then repeat tune.
Minimum 5-Point Initial Calibration (ICAL)	Prior to sample analysis	% RSD ≤ 30 with 4 compounds allowed out to ≤ 40% RSD	Correct problem then repeat Initial Calibration curve.
Initial Calibration Verification and Laboratory Control Spike (ICV and LCS)	After each Initial Calibration curve, and daily prior to sample analysis	Recoveries for 85% of Standard compounds must be 70–130%. No recovery may be < 50%. If specified by the client, in-house generated control limits may be used.	Check the system and re-analyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.
Initial Calibration Verification and Laboratory Control Spike (ICV and LCS) for Non-standard Compounds	Per client request or specific project requirements only	Recoveries of compounds must be 60–140%. No recovery may be <50%.	Check the system and re-analyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.
Continuing Calibration Verification (CCV) for Standard compounds	At the start of each analytical clock after the tune check	70–130%	Compounds exceeding this criterion and associated data will be flagged and narrated with the exception of high bias associated with non-detects. If more than 4 compounds from the standard list recover outside of 70–130%, corrective action will be taken. If any compound exceeds 60–140%, samples are not analyzed unless data meets project needs. Check the system and re-analyze the standard. Re-prepare the standard if necessary. Re-calibrate the instrument if the criteria cannot be met.
Continuing Calibration Verification (CCV) for Non-Standard compounds	Per client request or specific project requirements only	Recoveries of compounds must be 60–140%. No recovery may be <50%.	Check the system and re-analyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.

Laboratory Blank	After analysis of standards and prior to sample analysis, or when contamination is present	Results less than the laboratory reporting limit	Inspect the system and re-analyze the blank. "B"-flag data for common contaminants.
Internal Standard (IS)	As each standard, blank, and sample is being loaded	Retention time (RT) for blanks and samples must be within ±0.33 min of the RT in the CCV and within ± 40% of the area counts of the daily CCV internal standards.	**For blanks:** Inspect the system and reanalyze the blank. **For samples:** Re-analyze the sample unless obvious matrix interference is documented. If the ISs are within limits in the re-analysis, report the second analysis. If ISs are out-of-limits a second time, report data from first analysis and narrate.
Surrogates	As each standard, blank, and sample is being loaded	70–130% R If specified by the client, in-house generated control limits may be used.	**For blanks:** Inspect the system and re-analyze the blank **For samples:** Re-analyze the sample unless obvious matrix interference is documented. If the %Rs are within limits in the re-analysis, report the second analysis. If %Rs are out-of-limits a second time, report data from first analysis and narrate.
Laboratory Duplicates - Laboratory Control Spike Duplicate (LCSD)	One per analytical batch	RPD ≤25%	Narrate exceedances. If more than 5% of compound list is outside criteria or if compound is >40% RPD, investigate the cause and perform maintenance as required. If instrument maintenance is required, calibrate as needed.

ANALYTICAL METHODS

Section 14.0

Method: EPA Method TO-14A/TO-15 Volatile Organic Compounds (5&20)

Eurofins Air Toxics SOP #91 Revision 5 Effective Date: January 14, 2013 Methods Manual Summary

Description: This method involves full scan gas chromatograph/mass spectrometer (GC/MS) analysis of whole air samples collected in evacuated stainless steel canisters. Samples are analyzed for volatile organic compounds (VOCs) using EPA Method TO-14A/TO-15 protocols. An aliquot of up to 0.05 liters of air is withdrawn from the canister utilizing a volumetric syringe or mass flow controller. This volume is loaded onto a hydrophobic multibed sorbent trap to remove water and carbon dioxide and to concentrate the vapor sample. The focused sample is then flash-heated to sweep adsorbed VOCs onto a secondary trap for further concentration and/or onto a GC/MS for separation and detection.

Eurofins Air Toxics maintains a suite of TO-14A/TO-15 methods, each optimized to efficiently meet the data objectives for a wide range of targeted concentration ranges. The methods, their reporting limits, and typical applications are summarized in the table below. This method summary describes TO-14A/TO-15 (5&20). The 5&20 analytical configuration is designed to directly measure ppmv concentrations with minimal offline dilutions due to its wide dynamic calibration range.

Eurofins Air Toxics Method	Base Reporting Limits	Typical Application
TO-14A/TO-15 (5&20)	5 – 20 ppbv	Soil gas and ppmv range vapor matrices
TO-14A/TO-15 (Standard or Quad)	0.5 – 5.0 ppbv	Ambient air, soil gas, and ppbv level vapor matrices
TO-14A/TO-15 (Low-level)	0.1 – 0.5 ppbv	Indoor and outdoor air
TO-14A/TO-15 SIM	0.003 – 0.5 ppbv	Indoor and outdoor air

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, Eurofins Air Toxics reports these non-routine compounds with partial validation. Validation may include a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification analyzed, and no method detection limit study performed unless previous arrangements have been made. In addition, stability of the non-standard compound during sample storage is not validated. Full validation may be available upon request.

Eurofins Air Toxics takes no modifications of technical significance to Method TO-15 for the "5&20" configuration. Since Eurofins Air Toxics applies TO-15 methodology to all Summa canisters regardless of whether TO-14A or TO-15 is specified by the project, the laboratory performs a modified version of method TO-14A as detailed in Table 1. Please note that Methods TO-14A and TO-15 were validated for specially treated canisters. As such, the use of Tedlar bags for sample collection is outside the scope of the method and not recommended for ambient air samples. It is the responsibility of the data user to determine the usability of TO-14A and TO-15 results generated from Tedlar bags.

Table 1. Summary of TO-14A Method Modifications

Requirement	TO-14A	ATL Modifications
Sample Drying System	Nafion Drier	Multibed hydrophobic sorbent
Blank acceptance criteria	< 0.2 ppbv	< RL
BFB ion abundance criteria	Ion abundance criteria listed in Table 4 of TO-14A	Follow abundance criteria listed in TO-15
BFB absolute abundance criteria	Within 10% when comparing to the previous daily BFB	CCV internal standard area counts are compared to ICAL; corrective action when recovery is less than 60%.
Initial Calibration	≤ 30% RSD for listed 39 VOCs	≤ 30% RSD with 2 of Eurofins Air Toxics' 62 standard compounds allowed out to ≤ 40%

The standard target analyte list, reporting limit (RL), also referred to as Limit of Quantitation (LOQ), QC criteria, and QC summary can be found in Tables 2 through 5.

3-Chloroprene	20	≤ 30%	70 – 130	70 – 130	± 25
Naphthalene**	20	≤ 40%	60 – 140	60 – 140	± 25
TPH (Gasoline) ***	100	1- Point Calibration	NA	ICV only: 60 – 140	± 25
NMOC (Hexane/Heptane)***	100	1- Point Calibration	NA	NA	± 25

*Bromomethane recovery can be variable due to moisture/sorbent interactions specifically on the 2-trap concentration system. Data may require qualifier flags.

**Due to its low vapor pressure, Naphthalene may exceed TO-15 performance requirements. The wider QC limits reflect typical performance. Although Naphthalene is not on Eurofins Air Toxics "standard" TO-15 list, it is commonly requested and included in Table 2.

***TPH and NMOC are not on Eurofins Air Toxics' "standard" TO-15 list, but are included in Table 2 due to common requests.

Table 3. Internal Standards **Table 4. Surrogates**

Analyte	Accuracy (% R)	Analyte	Accuracy (% R)
Bromochloromethane	60 – 140	1,2-Dichloroethane-d_4	70 – 130
1,4-Difluorobenzene	60 – 140	Toluene-d_8	70 – 130
Chlorobenzene-d_5	60 – 140	4-Bromofluorobenzene	70 – 130

Table 5. Summary of Calibration and QC Procedures for Methods TO-14A/TO-15 (5&20)

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Tuning Criteria	Every 24 hours.	TO-15 ion abundance criteria	Correct problem then repeat tune.
Minimum 5-Point Initial Calibration (ICAL)	Prior to sample analysis.	% RSD ≤ 30 with 2 compounds allowed out to ≤ 40% RSD	Correct problem then repeat Initial Calibration Curve.
Initial Calibration Verification and Laboratory Control Spike (ICV and LCS)	After each Initial Calibration curve, and daily prior to sample analysis	Recoveries for 85% of "Standard" compounds must be 70-130%. No recovery may be <50%. If specified by the client, in-house generated control limits may be used.	Check the system and reanalyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.
Initial Calibration Verification and Laboratory Control Spike (ICV and LCS) for Non-standard compounds	Per client request or specific project requirements only.	Recoveries of compounds must be 60–140%. No recovery may be <50%.	Check the system and reanalyze the standard. Re-prepare the standard if necessary to determine the source of error. Re-calibrate the instrument if the primary standard is found to be in error.
Continuing Calibration Verification (CCV)	At the start of each analytical clock after the tune check.	70–130%	Compounds exceeding this criterion and associated data will be flagged and narrated with the exception of high bias associated with non-detects. If more than two compounds from the standard list recover outside of 70-130%, corrective action will be taken. If any compound exceeds 60-140%, samples are not analyzed unless data meets project needs. Check the system and reanalyze the standard. Re-prepare the standard if necessary. Re-calibrate the instrument if the criteria cannot be met.
Laboratory Blank	After analysis of standards and prior to sample analysis, or when contamination is present.	Results less than the laboratory reporting limit	Inspect the system and re-analyze the blank. "B"-flag data for common contaminants.
Internal Standard (IS)	As each standard, blank, and sample is being loaded	Retention time (RT) for blanks and samples must be within ±0.33 min of the RT in the CCV and within ±40% of the area counts of the daily CCV internal standards.	**For blanks:** Inspect the system and reanalyze the blank. **For samples:** Re-analyze the sample. If the ISs are within limits in the re-analysis, report the second analysis. If ISs are out-of-limits a second time, dilute the sample until ISs are within acceptance limits and narrate.

Surrogates	As each standard, blank, and sample is being loaded.	70–130% If specified by the client, in-house generated control limits may be used.	**For blanks:** Inspect the system and reanalyze the blank. **For samples:** re-analyze the sample unless obvious matrix interference is documented. If the %Rs are within limits in the re-analysis, report the second analysis. If %Rs are out-of-limits a second time, report data from first analysis and narrate.
Laboratory Duplicates – Laboratory Control Spike Duplicates (LCSD)	One per analytical batch	RPD ≤25%	Narrate exceedances. If more than 5% of compound list is outside criteria or if compound has >40%RPD, investigate the cause and perform maintenance as required. If instrument maintenance is required, calibrate as needed.

ANALYTICAL METHODS

Section 15.0

Method: TO-15 Aliphatic and Aromatic Volatile Petroleum Hydrocarbons (VPH) Fractions by GC/MS

Eurofins Air Toxics SOP #103   Revision 5   Effective Date: January 29, 2014   Methods Manual Summary

Description: The TO-15 VPH method outlines procedures to estimate the concentrations of gaseous phase Aliphatic and Aromatic ranges in ambient air and soil gas collected in stainless steel Summa canisters. The volatile Aliphatic hydrocarbons are collectively quantified within the C5 to C6 range, C6 to C8 range, C8 to C10 range, and the C10 to C12 range. Additionally, the volatile Aromatic hydrocarbons are collectively quantified within the C8 to C10 range and the C10 to C12 range. The Aromatic ranges refer to the equivalent carbon (EC) ranges.

Data is acquired using standard TO-15 GC/MS instrumentation. Procedures are largely based on the hydrocarbon ranges and calibration reference compounds defined by the Washington State Department of Ecology (WSDE) Method for the Determination of Volatile Petroleum Hydrocarbons (VPH) Fractions, dated June 1997. Additionally, the WSDE VPH calibration and quantitation procedures for the Aromatic fraction have been enhanced to more effectively isolate the compounds of interest. The Aromatic fraction measurement is based on a modification of the Massachusetts Department of Environmental Protection (MADEP) Air Phase Hydrocarbon Method (2009).

Eurofins Air Toxics performs a modified version of this method. The method modifications, standard target analyte list, reporting limit (RL) or Limit of Quantitation (LOQ), QC criteria, and QC summary can be found in the following tables.

Table 1. Summary of Method Modifications for TO-15 VPH

Requirement	VPH	Eurofins Air Toxics Modifications
Detector	Tandem GC/FID/PID	GC/MS
Matrix	Soil, water, and sediments	Whole air samples
C6-C8 Reference Compound	Octane	Heptane
Surrogate	2,5-Dibromotoluene	Bromochloromethane, 1,2-Dichloroethane-d4, Toluene-d8, Chlorobenzene-d5, and 4-Bromofluorobenzene
%RSD for Reference Compounds	≤ 20% RSD	≤ 30% RSD with the exception of Decane, Dodecane, 1,2,4,5-Tetramethylbenzene, and Naphthalene at ≤ 40% RSD
%D for the CCV	±20%D	±30%D with the exception of Decane, Dodecane, 1,2,4,5-Tetramethylbenzene, and Naphthalene at ±40%D

Laboratory Control Spike	Matrix Spiking Solution	Independently prepared source performed after initial calibration, 70–130% recovery, with the exception of Decane, Dodecane,1,2,4,5-Tetramethylbenzene, and Naphthalene at 60–140%
CCV Frequency	Before and after every 10 samples	Daily before sample analysis
IDOC	4 Replicates of a CCV at ±20%D; %RSD ≤ 20%	Not performed for this method; TO-15 IDOC performed on the same instrument

Table 2. VPH Standard Target Analyte List (Note: TO-15 analytes can also be included.)

Analyte	Standard RL (ppbv)	5&20 RL (ppbv)	Acceptance Criteria		
			ICAL %RSD	ICV (%R)	CCV (%D)
Pentane	NA	NA	≤ 30%	70-130	≤ 30%
Hexane	NA	NA	≤ 30%	70-130	≤ 30%
C_5-C_6 Aliphatics Pentane + Hexane	**10**	**50**	**≤ 30%**	**70-130**	**≤ 30%**
C_6-C_8 Aliphatics ref. to Heptane	**10**	**50**	**≤ 30%**	**70-130**	**≤ 30%**
C_8-C_{10} Aliphatics ref. to Decane	**10**	**50**	**≤ 40%**	**60-140**	**≤ 40%**
C_{10}-C_{12} Aliphatics ref. to Dodecane	**10**	**50**	**≤ 40%**	**60-140**	**≤ 40%**
Ethyl benzene	2	10	≤ 30%	70-130	≤ 30%
m/p-Xylene	2	10	≤ 30%	70-130	≤ 30%
o-Xylene	2	10	≤ 30%	70-130	≤ 30%
1,2,3-Trimethylbenzene	NA	NA	≤ 30%	70-130	≤ 30%
C_8-C_{10} Aromatics	**10**	**50**	**≤ 30%**	**70-130**	**≤ 30%**
Naphthalene	2	10	≤ 40%	60-140	≤ 40%
1,2,4,5-Tetramethylbenzene	NA	NA	≤ 40%	60-140	≤ 40%
C_{10}-C_{12} Aromatics	**10**	**50**	**≤ 40%**	**60-140**	**≤ 40%**

Table 3. Internal Standard Acceptance Criterion – Aliphatic Fraction

Analyte	Recovery Limits (%R)
1,4-Difluorobenzene	50 – 200%

Table 4. Internal Standard Acceptance Criterion – Aromatic Fraction

Analyte	Recovery Limits (%R)
Chlorobenzene-d_5	60 – 140%

Table 4. Summary of Calibration and QC Procedures

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Tuning Criteria	Every 24 hours	Compendium of Methods for Toxic Organic Air Pollutants, Method TO-15, January 1999	Correct problem then repeat tune.
6-Point Initial Calibration (ICAL)	Prior to sample analysis	%RSD ≤ 30% for VPH Target Analyte List with exceptions for 1,2,4,5-Tetramethylbenzene and Naphthalene, which are ≤40%	Correct problem then repeat initial calibration curve.
Initial Calibration Verification (ICV)	After each initial calibration curve	Recoveries for VPH target compounds 70–130%, or 60–140% for 1,2,4,5-Tetramethylbenzene and Naphthalene. If recovery of any compound is above 130%, analyze samples as long as compound is not detected.	Check the system and re-analyze the standard. Re-prepare the standard if necessary. Re-calibrate the instrument if the criteria cannot be met.
Continuing Calibration Verification (CCV)	At the start of each analytical clock after the tune check	%D ≤ 30% for VPH target compounds with exceptions for 1,2,4,5-Tetramethylbenzene and Naphthalene, which are <40%. One compound is allowed to be out as long as it is ≤ 50%D. If recovery of any compound is above 150% the instrument must be re-calibrated.	Perform maintenance and repeat test. If the CCV still fails, perform maintenance and a new 6-point calibration curve.
Laboratory Blank	After the CCV	Results less than the laboratory RL	Inspect the system and re-analyze the blank.
Internal Standard (IS)	As each standard, blank, and sample is being loaded.	Retention time (RT) for the blanks and samples must be within ±0.33 min of the RT in the CCV. For the aliphatic fraction using the total ion area, the IS area must be within -50% to 200% of the CCV's IS area for the blanks and samples. For the aromatic fraction using extracted ion areas, the IS area must be within -40% to +40% of the CCV's extracted ion IS area.	**For blanks:** Inspect the system and re-analyze the blank **For samples:** If there is not obvious interference with the internal standard, re-analyze the sample. If the ISs are within limits in the re-analysis, report the second analysis. Dilution of the sample to get IS areas within limits may be used if the RL is being obtained.
Laboratory Duplicates	One per analytical batch; since VPH analysis occurs with TO-15 analysis, the Duplicate is reported from the daily TO-15 LCS/LCSD pair. The result is not reported with the VPH fraction.	RPD ≤ 25% for detections >5X the RL	Re-analyze the sample a third time. If the limit is exceeded again, investigate the cause and bring the system back to working order. If no problem is found with the system, narrate.

ANALYTICAL METHODS

Section 16.0

Method: Modified EPA TO-17 VOCs and SVOCs (Vapor Intrusion Application) by GC/MS (Full Scan)

Eurofins Air Toxics SOP #109 Revision 4 Effective Date: December 24, 2013 Methods Manual Summary

Description: The TO-17 "Vapor Intrusion" method utilizes a multi-bed thermal desorption tube for the measurement of air-phase Volatile Organic Compounds (VOCs) and Polycyclic Aromatic Hydrocarbons (PAHs). These tubes are marketed by Eurofins Air Toxics as "TO-17 VI" tubes. The TO-17 VI tubes are applicable to a wide variety of vapor matrices including soil gas, indoor air, and outdoor air. Parameters are optimized to effectively manage high humidity conditions. The TO-17 VI method is an alternative to the canister-based sampling and analysis methods that are presented in EPA Compendium Methods TO-14A and TO-15 as well as an alternative to PUF/XAD sampling for semi-volatile compounds as described by EPA Compendium TO-13A. The VI tube provides sufficient retention of light VOCs such as 1,3-Butadiene while providing an efficient desorption of semi-volatile compounds such as Pyrene.

Samples are collected by drawing a measured volume of air through the VI sorbent tubes. Collection is performed using a low-flow vacuum pump or a volumetric syringe attached to the outlet side of the tube. Analysis is accomplished by heating the sorbent tube and sweeping the desorbed compounds onto a secondary "cold" trap for water management and analyte refocusing. The secondary trap is heated for efficient transfer of compounds onto the gas chromatograph (GC) for separation followed by detection using mass spectrometry (MS).

Certain compounds are not included in Eurofins Air Toxics' standard target analyte list. These compounds are communicated at the time of client proposal request. Unless otherwise directed, the laboratory reports these non-standard compounds with partial validation. Validation includes a 3-point calibration with the lowest concentration defining the reporting limit, no second source verification is analyzed, and no method detection limit study is performed unless previous arrangements have been made. In addition, stability of the non-standard compounds during sample storage, safe sampling volume, and desorption efficiency are not validated. Full validation may be available upon request.

Since the TO-17 VI application significantly extends the scope of target compounds addressed in EPA Method TO-15 and TO-17, the laboratory has implemented several method modifications as outlined in Table 1.

Table 1. EPA TO-17 Method Modifications – VI Application

Requirement	TO-17	Eurofins Air Toxics Modifications
Initial Calibration	%RSD ≤ 30% with 2 allowed out up to 40%	For the VOC list: %RSD ≤ 30% with 2 allowed out up to 40% For the PAH list: %RSD ≤ 30% with 2 allowed out up to 40%
Daily Calibration	%D for each target compound within ±30%.	Fluorene, Phenanthrene, Anthracene, Fluoranthene, and Pyrene within ±40%D
Audit Accuracy	70 – 130%	Second source recovery limits for Fluorene, Phenanthrene, Anthracene, Fluoranthene, and Pyrene = 60 – 140%
Distributed Volume Pairs	Collection of distributed volume pairs required for monitoring ambient air to ensure high quality.	If the client is sampling well-characterized air or has verified performance through previous sampling or distributed pairs, single tube sampling may be appropriate. Distributed volume pairs may not be practical or useful for soil vapor collection due to required configuration and volume constraints.

Table 2. Method TO-17 VI Standard Analyte List and QC Limits

Volatile Organic Compounds	Reporting Limit (ng)	QC Acceptance Criteria			
		ICAL (%RSD)	ICV (%R)	CCV (%D)	LCS (%R)
Freon 114	14	30	70 – 130	30	70 – 130

Naphthalene-d8	50 – 150	

Table 5. Summary of Calibration and QC Procedures for Modified Method TO-17 VI

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
BFB Tune Check	Before initial and daily calibration. Check is valid for 24 hours.	TO-15 tune criteria	Correct problem then repeat tune.
5-Point Calibration	Prior to sample analysis	%RSD ≤ 30% with 2 VOCs exceeding up to 40% RSD and 2 PAHS exceeding criteria up to 40%RSD.	Correct problem then repeat Initial Calibration Curve.
Initial Calibration Verification (ICV)	After each initial Calibration Curve	See Table 2; 20% of the compounds are allowed to exceed criterion.	Determine if the exceedance is due to an inaccurate calibration standard or inaccurate ICV standard. Recalibrate with an accurate standard or re-prepare the ICV as necessary. If any VOC exceeds 50–150% recovery, system is checked and the ICV is reanalyzed. For compounds with recoveries greater than 150% and no positive detections in the samples, approval to proceed will be granted on a case-by-case basis.
Continuing Calibration Verification (CCV)	At the start of each 24-hour clock after the Tune Check	70 – 130% 60–140% for Fluorene, Phenanthrene, Anthracene, Fluoranthene and Pyrene	If project-specified risk drivers exceed these criteria, more than 5% of the compounds exceed these criteria, or any VOC exceeds 50–150% recovery, maintenance is performed and the CCV test repeated. If the system still fails the CCV, perform a new 5-point Calibration Curve.
Laboratory Blank	After the CCV and before the samples and at end of sequence	Results less than the laboratory RL for Lab Blank analyzed prior to samples	Inspect the system and re-analyze the Blank. Flag associated data as appropriate.
Laboratory Control Spike (LCS)	Once per analytical batch	70 – 130% 60–140% for Fluorene, Phenanthrene, Anthracene, Fluoranthene and Pyrene; 20% of compound list may exceed criteria before corrective action is required.	Verify accuracy of standard. Re-prepare LCS if necessary. If calibration curve and/or system is found to be out of control, perform maintenance and re-calibrate. If any VOC exceeds 50–150% recovery, maintenance is performed and the ICV test is repeated. For compounds with recoveries greater than 150% and no positive detections in the samples, approval to proceed will be granted on a case-by-case basis.

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Laboratory Control Spike Duplicate (LCSD)	Once per analytical batch (reanalysis of LCS)	≤ 20% RPD	Verify accuracy of standard. Re-prepare LCS if necessary. If calibration curve and/or system is found to be out of control, perform maintenance and re-calibrate. If any VOC exceeds 50–150% recovery, maintenance is performed and the ICV test is repeated. For compounds with recoveries greater than 150% and no positive detections in the samples, approval to proceed will be granted on a case-by-case basis.
Internal Standard (IS)	As each QC sample and sample are being loaded	**CCVs:** Area counts > 60% recovery; Retention Time (RT) within 20 seconds of mid-point in ICAL. **Blanks and samples**: Retention time (RT) must be within ±0.33 minutes of the RT in the CCV. The IS area must be within ±40% of the CCV's IS area for the Blanks and samples.	**CCV:** Inspect and correct system prior to sample analysis. **Blanks:** Inspect the system and re-analyze the Blank. **Samples:** Investigate the problem by verifying the instrument is in control by running a Lab Blank. Re-analyze recollected samples to verify recovery. Report the run with acceptable IS recovery. If both runs are unacceptable, narrate and flag associated data.
Field Surrogates	Added to each tube prior to shipment to field. Added to QC samples prior to analysis.	50–150%	**For blanks:** Inspect the system and re-analyze the Blank. **For samples:** Review data to determine whether sample collection parameters or matrix interference resulted in the exceedances. If so, narrate and flag recovery. If no cause is evident, verify the instrument is in control by running a Lab Blank. Re-analyze recollected sample to verify recovery.
Field Blank	Project-dependent	Artifact levels should be less than the reporting limit or less than 10% of the mass measured on the sampled tubes, whichever is less.	Flag associated results and evaluate tube conditioning and storage procedures.
Distributed Pairs	Project-dependent	%RPD ≤ 25%	Narrate discrepancy.

ANALYTICAL METHODS

Section 17.0

Method: ANALYSIS OF VOCS BY GC/MS COLLECTED ON CHARCOAL-BASED PASSIVE SAMPLERS

Eurofins Air Toxics SOP #100 Revision 4 Effective Date: January 10, 2014 Methods Manual Summary

Description: This method involves gas chromatograph/mass spectrometer (GC/MS) analysis of volatile organic compounds (VOCs) collected using charcoal-based passive samplers. These passive samplers include the Radiello® 130, SKC badges (575 and Ultra series), 3M™ OVM badges, and the WMS™ permeation sampler. Passive samplers are used to measure vapor-phase VOCs in a variety of gaseous matrices including indoor air, outdoor air, extracted soil gas, and emissions from materials. VOCs in the sampling environment pass through the diffusive barrier or permeable membrane of the sampler at a known, controlled rate (defined as the sampling rate) and adsorb to the charcoal-based sorbent pad of the sampler. The sorbent is extracted using a volume of carbon disulfide, and the extract is directly injected into a GC equipped with an MS. The retention time and spectral pattern of a compound are compared with that of known standard. Concentrations of the analytes are calculated from the average relative response factors of calibration curves obtained from analysis of standard solutions. The results are reported in units of µg/sample or µg/m^3 if the sampling rate and duration is known. Results for subsurface soil gas measurements are typically reported in units of µg/sample since there may be a low bias in the calculated µg/m^3 concentration due to starvation effects. Starvation effects occur when the uptake rate of the sampler exceeds the delivery rate of vapors from the surrounding soil.

There are no regulatory methods for the preparation and analysis of the Radiello and WMS samplers, while OSHA methods are available for workplace exposure measurements for several of the VOCs using 3M OVM 3500 and SKC 575 series samplers. The OSHA methods and recommended procedures published by Radiello (FSM) and 3M serve as the basis for this standard operating procedure for the analysis of environmental samples. Additionally, QC elements outlined in EPA SW-846 8260 and 8270 are incorporated as applicable. One variance of note that Eurofins Air Toxics has taken to the OSHA, Radiello, and the OVM 3500 methods is the use of GC/MS instead of GC/FID, thus providing more definitive compound identification and quantification for trace level environmental measurements.

Table 1 lists the target analytes routinely calibrated, along with the extract reporting limits and QC acceptance criteria. Tables 4 through 6 list the reporting limit for each sampler type in units of mass and the sampling rate. The sampling rates for the WMS sampler are maintained as proprietary and are not published as part of this document. To calculate the sample reporting limit in terms of µg/m^3, the compound sampling rate and the sample duration are required. Please consult with the laboratory to determine the appropriate sampler to meet project objectives.

Table1. Target Analytes, (Extract) Reporting Limits, and QC Criteria

Analytes	Reporting Limit (µg/mL)	Acceptance Criteria			
		ICAL (%RSD)	ICV (% R)	LCS (%R)	CCV (%D)
Chloromethane	0.2	30	70 – 130	50 – 140	%D ≤ 40%
Vinyl Chloride	0.2	30	50 – 140	50 – 140	%D ≤ 40%

Table 7. Summary of Calibration and QC Procedures

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action
Tuning Criteria	Prior to calibration and at the start of every 12-hour clock	Method 8260B tuning criteria	Correct problem then repeat tune.
Initial 5-Point Calibration (ICAL)	Prior to sample analysis	Compound criteria in Table 1	Correct problem then repeat initial calibration. Analysis may proceed if no more than 2 VOCs exceed criteria or 5% of VOCs if short list is used. Narrate exceedances.
Initial Calibration Verification (ICV)	Once per initial calibration	See Table 1	Verify concentrations and standard preparation. Analysis may proceed if no more than 2 VOCs exceed criteria or 5% of VOCs if short list is used. Narrate exceedances.
Continuing Calibration Verification (CCV)	At the start of every shift immediately after the BFB tune check	See "CCV criteria" column in Table 1	Investigate and correct the problem, up to and including recalibration if necessary. Analysis may proceed if no more than 2 VOCs exceed criteria or 5% of VOCs if short list is used. Associated results are flagged.
Internal Standards (IS)	IS is added at the time of extraction to all samples and QC samples.	**For CCVs:** Area counts 50 –200%; RT w/in 30 seconds of midpoint in ICAL **For blanks, samples and non-CCV QC checks:** Area counts 50 – 200%; RT within 20 seconds of RT in CCV	**CCV:** Inspect and correct system prior to sample analysis. **For blanks:** Inspect the system and re-analyze the blank. **For samples:** Re-analyze; if out again, flag data.
Surrogate	Surrogate is added at the time of extraction to all samples and QC samples.	70–130%	Same as for Internal Standards.
Solvent Blanks	Immediately after the calibration standard or after samples with high concentrations	Results less than laboratory reporting limit (see Table 1)	Re-aliquot and re-analyze solvent blank. If detections remain, flag concentrations in associated samples.

Extracted Laboratory Blank	Each set of up to 20 samples	Results less than the reporting limit	Flag sample concentrations in associated extraction batch.
Extracted Laboratory Control Spike (LCS)	Each set of up to 20 samples	See Table 1.	Re-aliquot and re-analyze the extract. If within limits, report the re-analysis. Otherwise, narrate.
Extracted Laboratory Control Spike Duplicate (LCSD)	Each set of up to 20 samples	%RPD ≤ 25%	Analysis may proceed if no more than 2 VOCs exceed criteria (or 5% for short list exceed criteria). Run a 3rd time; perform corrective action or narrate as appropriate.

1.0 INTRODUCTION

This Health and Safety Plan (HASP) addresses health and safety concerns related to the fieldwork associated with the Los Peñasquitos Lagoon TMDL Sediment Monitoring Program. All Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler) field team members and subcontractor's field teams must become familiar with the contents of this HASP and site-specific safety concerns.

The project Health and Safety Officer (HSO) will be responsible for assuring that all members of the field team are familiar with the requirements of the HASP and appropriate training is receive for their specific roles. The Field Sampling Manager is responsible for enforcing site-specific health and safety protocols (SSHS), including emergency response/contingency plans. The Project Manager and individual employees have the authority to suspend work, if necessary, due to health and safety concerns.

1.1 Field Activities

Amec Foster Wheeler is responsible for field activities associated with the Los Peñasquitos Lagoon TMDL Sediment Monitoring. The following sub-sections discuss these field activities in detail.

1.1.1 Site Selection of Monitoring Sites

Site selection for this project will include physical exertion (walking, standing, and bending) in extreme weather conditions (heat and cold) for moderate periods over uneven surfaces. This will also include moderate lifting (manhole covers, sample, and equipment handling).

1.1.2 Equipment Installation and Maintenance

Equipment installation and maintenance may include working with power tools in wet or damp environments and the operation of heavy equipment. Confined space entry may be required for equipment installation and occasional maintenance activities.

1.1.3 Travel

Travel to and from the selected monitoring sites will occur for equipment installation, maintenance activities, and pre- and post-storm event monitoring. Although automated equipment lessens required travel during storm events, some access is typically necessary during storm events and often at night to: document observations, collect samples, take field measurements, replace composite sample containers, and repair any malfunctioning equipment.

Establishment of Work Zones and Traffic Control

Field crew will make efforts to locate equipment in safe work zones, far from high-traffic and high-use areas. If equipment location is adjacent to high-traffic and high-use zone, field crew will implement appropriate traffic control measures, as needed.

Removal and Replacement of Sample Containers

Composite sample containers will need to be removed and replaced immediately after each storm event and, perhaps, during storm events.

1.2 Traffic Safety

Working near roadways presents inherent risks dominated by the possibility of errant vehicles. The motoring public is largely made of conscientious drivers operating well-maintained equipment. However, some percentage of vehicles on the road at any given time may be marginally under control due to driving factors like distractions, fatigue, confusion, or inadequate training, as well as mechanical factors like vehicle age and condition. Any or all of these factors may contribute to a vehicle leaving the traveled lanes and entering the work site.

Traffic load, posted speed limits, and proximity to travel lanes all have a direct relation to the probability of worker exposure to errant vehicles. Work site selection can reduce the exposure potential relating to these factors. In all cases, the Field Sampling Manager will make the final evaluation of the appropriateness for performing work based on present site conditions.

Field teams will use signs, cones, and flashing amber lights when necessary based on traffic control permitting requirements for sites within the roadway in order to inform motorists of activities that may influence roadway travel conditions. To avoid shoulder and lane closures, field crew will attempt to pull vehicles off the road and perform work as far away from the edge of pavement as possible.

Field members will work in teams and utilize high-visibility, reflective (Class 2 ANSI/ISEA minimum) vests and/or clothing. Steel-toed boots and hard hats are required for the entrant during confined space entry, if overhead hazards exist, and/or if operating heavy equipment when working along roadsides.

When working on or near the shoulder, physical barriers will be employed whenever possible to protect workers from errant vehicles. Physical barriers include barrier vehicles, guardrails, fences, and other fabricated or natural objects capable of slowing, stopping, or diverting an errant vehicle. Barrier vehicles are to be unoccupied, positioned upstream of the work zone, and parked to prevent the vehicle from rolling into the work area or active travel lanes if struck by an errant vehicle. Workers not protected by a physical barrier should employ the use of a lookout.

1.3 Confined Space Entry

There are no known instances where a permitted confined space entry will be necessary during the course of site selection or monitoring. However, non-permitted confined space entry may occur for installation of automated equipment. The Project Manager, the Site Health and Safety Officer, and the Health and Safety Director must be notified and proper procedures will be followed should a situation arise that requires a non-permitted confined space entry;

The Occupational Safety and Health Administration (OSHA) requires that all individuals entering a permitted or non-permitted confined space be trained in confined space entry, instructed in the nature of the hazards involved, the necessary precautions to be taken, and the use of protective and emergency equipment required for the job. Amec Foster Wheeler employees will be trained in confined space entry procedures prior to entry.

1.4 General Safety

In addition to traffic hazards, field teams may face a variety of potential dangers while maintaining the facilities, installing equipment, and performing environmental monitoring. Some of these dangers include:

- Slippery and wet pavements
- Unstable earth and surfaces
- Poor visibility, especially at night and during rain storms
- Back injuries
- Swift moving water
- Falling into water/drowning
- Trip and fall
- Pinching and/or crushing of hands and fingers
- Dermal/eye contact with storm contaminants
- Walking on uneven/unstable surfaces
- Ergonomic injury/repetitive motions
- Heat illness
- Prolonged weather exposure (heat and cold)
- Power tools and heavy equipment
- Lifting heavy objects
- Electrical hazards posed by field equipment malfunctions
- Light to moderate carrying of field equipment and supplies

- Transients, muggers, and criminals
- Sharp edges and broken glass
- Animals and other biological hazards

Field crews are trained to take the following safety while working in the field:

- Stay away from the edges of fast moving water and avoid areas of pooled water by roadways. These areas are usually slippery during rainy conditions.
- If sampling is required within the riparian zone, use a lifeline and a personal flotation device. Always have one crewmember serve as a lookout on shore.
- Watch your step while walking in and around rocks in the riparian zones. Wet rocks are usually sharp and slippery during rainy conditions.
- Never work alone at night or during the day. Two people are required during each site visit. Stay within shouting distance of your partner at all times.
- Avoid leaving materials, tools, and equipment lying around where someone can trip over them.
- Maximize lighting at all times, especially at night.
- Always keep a charged cellular phone or other means of communication nearby.
- Do not use your back to lift heavy objects. When lifting objects weighing 50 lbs or more, two or more employees are required to excuse the lift.
- Never use drugs or alcohol while working.
- Always wear an orange reflective vest during site visits, when necessary and a hard hat when overhead dangers exist.
- Always wear appropriate footwear, including steel-toed boots and/or rain boots.
- Use a buddy system if working over water. Stay clear from edges of swift water.
- Do not use power tools and equipment unless trained in the proper use and care of the specific tools.
- Always wear eye protection when working with tools or chemicals.
- Wear nitrile gloves when collecting samples.
- Respond appropriately to protect workers from the elements, including but not limited to sun, rain and wind.
- Avoid excessive sun or hat exposure. Wear a hat, sunglasses, and sunscreen.
- Be knowledgeable of heat illness symptoms and know how to respond to them.
- If lightning is observed while working in the field, seek shelter.

- Be aware of your surroundings. Watch for plants, animals, people, and tripping hazards. Clean up the work area before leaving.
- Always carry sufficient amounts of drinking water. Employees should drink at a minimum one quart of water per hour for the entire shift.
- Be aware of the nearest toilet and hand washing facilities.

Field crew will complete the following personal hygiene procedures:

- Toilet and hand washing facilities will not be located on-site. An alternate sanitary facility and its specific location will be identified prior to beginning work activities.
- Personal protective equipment (PPE) shall be kept clean, in good repair, and on-site. Safety devices, including protective clothing worn by the employee, shall not be interchanged among the employees until properly cleaned.
- All equipment will be free of gross hazardous and non-hazardous waste (i.e., mud and/or soil) upon leaving the work site.

2.0 SITE-SPECIFIC HASP

This section provides information on unique hazards and necessary precautions for the types of sites included in this program. Emergency response phone numbers and routes to the nearest medical emergency facilities can be found at the end of this appendix. Field personnel will be responsible for adhering to the requirements of this HASP and the task-specific Activity Hazard Assessments (AHAs) for installation, maintenance, and wet/dry weather monitoring. If additional measures are required due to unforeseen or temporary changes to the work environment, the on-site team leader will make the final judgment for any safety procedure changes.

2.1 Errant Vehicles

There is a minimum to moderate exposure hazard from errant vehicles while accessing most sites. While personnel are station along the shoulder of the roadway, they should be located far away from the roadway lanes and face the approaching traffic. Field crew should always remain on the side of the vehicle furthest from the travel lane and employ the use of flashing amber lights. A lookout person is required if two or more field crew are engaged in exposed activity within 30 feet of the travel lane. Exposed activities may occur before, during, and after storm events.

2.2 Chemical Hazards

Chemical hazards may collect within pipes and/or collection channels. Chemicals can be corrosive and can burn exposed flesh, and/or they can cause severe illness if they are absorbed through the skin or ingested. When encountering a suspected liquid hazard exercise caution. Use a pH meter or pH test paper to test for corrosives, but always assume that a hazardous chemical is present and wear personal protective clothing. Chemical hazards other than those described above could be hazardous chemicals that have precipitated or accumulated on the sides of the pipes and channels. Table 2-1 lists potential chemicals in gaseous form that may be on-site along with each chemical's Permissible Exposure Limit (PEL), Immediately Dangerous to Life and Health (IDHL), odor thresholds, and routes of entry. Personnel will use proper PPE to guard against chemical hazards.

Table 2-1: Toxic Gases

Name	Source/Use	IDLH[a] Ceiling PPM	STEL[b] PPM/Exposure Time (min)	TWA[c] 8-Hr PEL[d] PPM	Odor Threshold
Acetone	Solvent	2,500	1,000/15	750	100
Carbon Dioxide	Comb./Sludge	40,000	30,000/15	5,000	–
Carbon Monoxide	Comb./Exhaust	1,200	–	25	–
Chlorine	–	10	1/15	0.5	–
Gasoline	Fuel	–	500/15	300	0.005-10
Hydrogen Sulfide	Sewer/Sludge Coal Gas/Petrol	100	15/15	10	Impairs smell
Nitrogen Oxides	–	20	1/15	–	–
Ozone	Electric Arcing	5	0.3/15	0.1	0.015

[a] IDLH = Immediately Dangerous to Life and Health
[b] STEL = Short Term Exposure Limit
[c] TWA = Time Weighted Average
[d] PEL = Permissible Exposure Limit

2.3 Physical Hazards

Always be alert and use adequate protection to safeguard against the physical hazards associated with working at these sites. The most common hazard encountered is falling or tripping, potentially causing mechanical injury. The following are some other common hazards:

- Sharp objects
- "Flash" flooding
- High water
- Strong currents
- Electrical risk
- Moving vehicles
- Travel risk
- Uneven walking surfaces
- Heat and cold
- Plant and structures

2.4 Biological Hazards

Beware of poison ivy, poison oak, and other plants that cause allergic reactions. Also, use protection against bacteria and other micro biota that could be present in the water and sediment. Be aware that mosquitoes are a common vector for human diseases. Use caution when unlocking or opening equipment that has been stored on-site as black widows, snakes, and other venomous or stinging insects/animals may be present.

2.5 Drowning Hazards

Working in or near the rivers may expose field crews to potential drowning hazards. The chance of drowning can occur along the riverbed or in the water. However, drowning hazards are more common when wading or standing in the river. Do not enter the water if the field team leader determines the conditions to be unsafe or if posted advisories are along the sampling site. Field crew should equip personal floatation devices, lifelines, and all necessary PPE.

2.6 Heat Stress

Heat stress is a major hazard, especially for workers wearing protective clothing. The same protective materials that shield the body from chemical exposure also limit the dissipation of body heat and moisture causing dangerous rises in body temperature. In its early stages, heat stress can cause rashes, cramps, discomfort, and drowsiness, resulting in impaired functional ability that threatens the safety of both the individual and coworkers. Untreated heat stress can lead to heat stroke and even death. Careful training and frequent monitoring of personnel who wear protective clothing, sensible scheduling of work and rest periods, and frequent replacement of fluids can protect against this hazard.

There is a possibility that heat stress may occur on this project during the dry weather season. Workers will be instructed to take breaks in a shaded area in order to mitigate any symptoms or signs of heat stress, should they exist. Symptoms of heat stress include excessive sweating, muscle spasms, thirst, dizziness, rapid/weak pulse, flushed skin, loss of consciousness, or convulsions. Breaks will last until symptoms are relieved and/or the pulse of the worker is less than 110 beats per minute. As a preventive measure, workers will be instructed to drink fluids to keep hydrated. For severe heat stress, workers will be examined by a health-care professional as soon as possible.

Additionally, during periods of hot weather or other potential heat stress conditions the following safe work practices must apply:

- Be knowledgeable of heat illness symptoms during periods of abnormally high heat.
- Watch for symptoms of heat illness which include excessive sweating, headache, poor concentration, muscle pain, headache, cramping, dizziness, and irritability, loss of coordination, vomiting, blurry vision, confusion, and lack of sweating, fainting, or seizures.
- Drink plenty of water throughout the day. Employees working in the heat need to drink (4) eight ounce glasses of water per hour, including at the start of the shift to replace the water lost due to sweat. This is the minimum amount per person that should be brought into the field.
- Dress appropriately for weather conditions. Wear lightweight, light-colored, loose clothing. Wear a wide brimmed hat if possible.
- Wear sunscreen and sunglasses.

- Use cool compresses to stay cool. Placing cool compresses on the back of the neck lowers the body's core temperature.
- Take scheduled rest periods and spend them in the shade.
- Tell your supervisor immediately if you feel you may be getting sick from the heat.
- Know the locations of the closest drinking water supplies.
- Keep track of your coworkers. You all need to look out for each other.
- Know how to contact emergency services in the event of heat illness, how to effectively report the work location to 911, and the location of the nearest hospital and the quickest route for arrival.

2.7 Cold Exposure

Storms can bring unusual cold weather to the area. Low temperatures and wet conditions are potential dangers that can cause cold injury (frostbite and hypothermia) and impair the ability to work. Wear appropriate clothing, have warm shelter readily available (vehicle), carefully schedule work and rest periods, and monitor workers' physical conditions to safeguard against these types of hazards. Should an employee begin to feel the effects of cold injury they should be removed from cold exposure in a manner that will not cause their condition to worsen or cause their body to go into shock.

2.8 Dehydration

Dehydration can occur during wet or dry weather, and in heat or in cold. High altitudes, limited shade, extreme temperatures, and physical exertion increase the rate of dehydration. Drink plenty of water throughout the day. Ensure sufficient amounts of water are brought to the site for each employee. Take water and rest breaks in shaded areas where possible and safe to do so.

2.9 Worker Safety

Only personnel trained in the use of the proper safety equipment will be allowed to complete the required tasks.

2.9.1 Personal Protective Equipment (PPE)

Recommended PPE includes hard hats, safety vests, work boots, gloves, and sturdy clothing. This equipment will not only help protect against numerous potential hazards but will also allow others to identify you as belonging to the work site. Additionally, Nitrile, latex, or other plastic-based PPE will be used by any personnel who is likely to come in contact with storm water runoff as the contents of the water are unknown and potentially dangerous.

The safety officer will select the PPE ensemble based on the potential hazards. **Each worker will be responsible for maintaining his or her own PPE**.

In general the following in Table 2-2 applies:

Table 2-2: Standard PPE for Non-Hazardous Work Zones

Activity	Head/Face/Ear	Foot	Hands	Respirator	Clothing
General Site Labor	Hard hat (Class B or E)[c] Safety glasses Hearing protection[b]	Steel-toed boots w/ puncture resistant insoles.[d]	Leather/Nitrile gloves as needed	None[a]	Shirt w/sleeves. Long pants. High-visibility reflective vest Personal Floatation Device
Supervision of Work	Hard hat (Class B or E) [c] Safety glasses Hearing protection[b]	Steel-toed boots w/ puncture resistant insoles. [d]	Leather/Nitrile gloves as needed	None[a]	Shirt w/sleeves. Long pants. High-visibility reflective vest Personal Floatation Device
Site Visitors	Hard hat (Class B or E) [c] Safety glasses Hearing protection[b]	Steel-toed boots w/ puncture resistant insoles. [d]	None	None[a]	Shirt w/sleeves. Long pants. High-visibility reflective vest Personal Floatation Device

[a] Voluntary use of respirators is authorized for nuisance dusts and exposures known to be below PEL levels. For nuisance dust use disposable N, R, or P95 or better (dispose of N or R types daily and P type weekly). For odors use half mask with OV or OV/P95 or better (change at start of week).
[b] Hearing protection with adequate noise reduction rating (if consistently exposed to greater than 85 decibels steady-state or 140 decibels impulse). Workers should use clean hands to insert earplugs. Ample supplies of disposable earplugs will be available onsite.
[c] Hard hats are required only when overhead dangers exist.
[d] Steel-toed boots are required at sites when site conditions pose a risk to foot injury from falling objects.

2.9.2 Special Circumstances

Extreme caution will be used when maintaining pole-mounted equipment. Qualified individuals will perform this task with proper equipment due to the danger of potential slips and falls.

2.10 Traffic Safety

A shoulder or lane closure will be considered for all work near the shoulder that is expected to last more than 30 minutes.

2.11 Sample Collection Safety

The following precautions will be taken while collecting samples at the monitoring stations:

- Use plenty of light during the evening hours and use reflective ANSI/ISEA class II or III vests (23 CFR Part 634) if working near the roadway.

- Always wear protective gloves, a reflective vest, and a hard hat when overhead dangers exist.
- Wear boots and foul weather gear during rainy weather.
- Keep a safe distance from the water body if deep water, rapid flow or flash flood conditions are present or imminent. Employees should avoid unstable banks, employ the use of a grab pole, and use a lifeline and a personal flotation device. If the Field Team Leader determines the site is unsafe to collect samples even with proper precautions in place, do not collect samples.
- Do not eat or smoke while on the job site.
- Use proper lifting techniques and get assistance when moving coolers and large sample containers or other equipment.
- Handle glass sample containers with care. If a glass container breaks, employees should wear proper PPE and use appropriate cleanup equipment.

2.12 Installation Safety

The following precautions will be taken while installing the storm water monitoring stations:

- Use plenty of light during the evening hours and use reflective ANSI/ISEA class II or III vests (23 CFR Part 634) if working near the roadway.
- Always wear protective gloves, a reflective vest, and a hard hat when overhead dangers exist.
- Wear boots and foul weather gear during rainy weather.
- Do not eat or smoke while on the job site.
- Use proper lifting techniques and get assistance when moving coolers and large sample composite containers or other equipment.

2.13 Medical Emergency Procedures

Even with full safety awareness and compliance by field teams, medical emergencies can and do occur. To handle minor injuries, field teams will have a basic first aid kit on-site at all times. Table 2-3 is a list of site-specific emergency contacts.

Table 2-3: Emergency Contacts

Name	Phone	Comments
San Diego Police Department	911	From cell phone
Jeremy Burns, Project Manager	858-342-8828	From cell phone

Document all information related to the accident or incident that resulted in injury or damage and report it to the Consultant Safety Manager.

The nearest hospital is located at:

> Scripps Memorial Hospital
> 9888 Genesee Avenue
> La Jolla, CA 92037

Maps showing driving routes are presented in Figures 2-1 – 2-3 show the location and driving route to the nearest hospital. Driving directions to the hospital from each monitoring location are also provided in Tables 2-4 through 2-6.

2.14 Hazardous Spills

Hazardous substances may be used for various purposes at and around the site. When working with hazardous substances, leaks and spills are always a concern. At sites within close proximity to the roadway, the potential also exists of hazardous spills originating from traveling vehicles.

A spill may present a number of hazards. The specific hazards depend on the substance(s) involved. Among the possibilities are:

- Fire
- Explosion
- Contamination of individuals who come in contact with the spilled substance
- Hazardous substances entering the water supply

Spill response procedures are designed to minimize the risk of any of these things occurring as a result of a spill or, at the very least, reducing the degree of hazard. The primary concern of spill contamination is to stop or retard the spill before it becomes serious. Field teams working with potentially hazardous materials will be trained in the use of proper PPE, the safe usage or handling of the substances, and contingency plans for spills and leaks.

2.15 Tailgate Safety Training

The Health and Safety Officer or another designated Safety Officer will conduct tailgate safety training sessions regularly. These meetings will be held on-site prior to work operations. New personnel working on-site will be required to attend a tailgate meeting prior to work operations. The purpose of the safety-training meeting is to ensure that field team members understand and will abide by all safety and potential emergency response measures that may be necessary for the wellbeing of the field team.

The following items will be discussed at each safety meeting:

- Traffic safety
- Safe entering and exiting of the highway or roadway
- Use of personal protective clothing and equipment
- Potential chemical and physical hazards and how to deal with them
- Nearest hospital information
- Emergency response procedures
- Any other site-specific safety issues

Field team members must sign the tailgate safety training meeting form in acknowledgment of understanding all issues discussed. An example of a tailgate meeting form is included Figure 2-4.

Figure 2-4: Tailgate Safety Meeting Form

Amec Foster Wheeler SITE VISIT TAILGATE SAFETY MEETING

PROJECT: Los Peñasquitos Lagoon TMDL Sediment Monitoring

Safety Topics Discussed
1. Protective clothing and equipment: PPE – Use the PPE that has been provided to prevent injury, exposure to the cold and wet weather conditions, and exposure to storm water runoff containing diluted levels of chemical contaminates. Typical PPE may consist of a hard hat, rain gear, rubber rain boots, nitrile gloves, pants, long sleeved shirts, and layered clothing. Use and wear a PFD if working over water, on piers or quay walls. Equipment and tool use - Use proper equipment for the task in the prescribed manner to prevent injury.
2. Chemical hazards: Dermal/eye contact with water contaminants - Do not overfill containers. Fill bottles only to the neck or as otherwise instructed by the site manager. Food, drinks, or cigarettes will not be consumed while observing or sampling. Prior to handling food, drinks, or cigarettes, personnel will wash hands and face.
3. Physical hazards: Lifting - Use proper equipment and lifting and motion technique. Do not twist back, stay balanced and use your legs. Vehicle Hazards - Be aware of vehicle operations in your area. Make eye contact with vehicle operators on approaching equipment. Driving - Drive vehicle in accordance with company policy. Drive in right lane, use 3-second rule or extended distance from vehicle in front of you. Drive speed limit or slower depending on road conditions and visibility. Working over water - Exercise care and alertness when working around water. Use the buddy system and wear a PFD if working over water, on piers or quay walls.
4. Vehicle Hazards: - Wear seat belt while vehicle is in motion. - Do not exceed the posted speed limit. - Reduce speed in adverse weather conditions. - Always drive with headlights on. Drive vehicle in accordance with Amec Foster Wheeler policy. Drive in the right lane and maintain an extended distance (3-second rule) from the vehicle in front of you. - Drive defensively and follow traffic regulations. - Do not make sudden lane changes, weave through traffic, or cut off other drivers. - Do not use handheld or hands-free cell phones while driving. - Stop at intersections and give the right-of-way to other vehicles and pedestrians. - Check tires for proper inflation.
5. Traffic Hazards: - Be aware of vehicles in your area. Make eye contact with approaching vehicle operators. - In dry weather, a reflective vest should be worn for maximum visibility in high-traffic areas. - Use traffic cones around the work zone in high-traffic areas. - At least two persons must be present to perform any work in high-traffic areas. One of these persons must monitor approaching traffic for any potential hazards. Watch out for moving vehicles and equipment and equipment.

Safety Topics Discussed (continued)

6. Environmental and biohazards: Dangerous animals and insect bites and stings – Be aware of your surroundings and watch for dangerous animals and insects such as spiders and snakes. Wear appropriate clothing such as pants, long sleeved shirts, and steel toe boots. Watch for Poison oak, Poison ivy, and other biological hazards.
7. Equipment hazards: Pinch Points – Use proper equipment in the prescribed manner in conjunction with proper lifting techniques to avoid pinch points. Wear leather or canvas gloves - to protect the hands when performing manual labor, such as moving manhole covers.
8. Decontamination procedures: If an exposure or eye contact occurs, respond with appropriate first aid and immediately notify the supervisor.
9. Other: The supervisor will review any other significant safety matters specific to sampling and observation activities at this site.
10. Review of emergency procedures: In case of emergency, immediately dial 911.

The results in this report apply to the samples analyzed in accordance with the Chain of Custody document. Weck Laboratories, Inc. certifies that the test results meet all NELAC requirements unless noted in the case narrative. This analytical report is confidential and is only intended for the use of Weck Laboratories, Inc. and its client. This report contains the Chain of Custody document, which is an integral part of it, and can only be reproduced in full with the authorization of Weck Laboratories, Inc.

Dear Jeremy Burns :

Enclosed are the results of analyses for samples received 01/08/16 12:15 with the Chain of Custody document. The samples were received in good condition, at 5.1 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

Notes and Definitions

ND	NOT DETECTED at or above the Reporting Limit. If J-value reported, then NOT DETECTED at or above the Method Detection Limit (MDL)
NR	Not Reportable
Dil	Dilution
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
% Rec	Percent Recovery
Sub	Subcontracted analysis, original report available upon request
MDL	Method Detection Limit
MDA	Minimum Detectable Activity
MRL	Method Reporting Limit

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California Department of Health Services.

The Reporting Limit (RL) is referenced as the Laboratory's Practical Quantitation Limit (PQL) or the Detection Limit for Reporting Purposes (DLR).

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Dear Jeremy Burns :

Enclosed are the results of analyses for samples received 01/12/16 08:00 with the Chain of Custody document. The samples were received in good condition, at 3.1 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

Notes and Definitions

ND	NOT DETECTED at or above the Reporting Limit. If J-value reported, then NOT DETECTED at or above the Method Detection Limit (MDL)
NR	Not Reportable
Dil	Dilution
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
% Rec	Percent Recovery
Sub	Subcontracted analysis, original report available upon request
MDL	Method Detection Limit
MDA	Minimum Detectable Activity
MRL	Method Reporting Limit

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California Department of Health Services.

The Reporting Limit (RL) is referenced as the Laboratory's Practical Quantitation Limit (PQL) or the Detection Limit for Reporting Purposes (DLR).

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

The results in this report apply to the samples analyzed in accordance with the Chain of Custody document. Weck Laboratories, Inc. certifies that the test results meet all NELAC requirements unless noted in the case narrative. This analytical report is confidential and is only intended for the use of Weck Laboratories, Inc. and its client. This report contains the Chain of Custody document, which is an integral part of it, and can only be reproduced in full with the authorization of Weck Laboratories, Inc.

Dear Jeremy Burns :

Enclosed are the results of analyses for samples received 03/10/16 16:30 with the Chain of Custody document. The samples were received in good condition, at 5.8 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

MRL	Method Reporting Limit

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California Department of Health Services.

The Reporting Limit (RL) is referenced as the Laboratory's Practical Quantitation Limit (PQL) or the Detection Limit for Reporting Purposes (DLR).

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

The results in this report apply to the samples analyzed in accordance with the Chain of Custody document. Weck Laboratories, Inc. certifies that the test results meet all NELAC requirements unless noted in the case narrative. This analytical report is confidential and is only intended for the use of Weck Laboratories, Inc. and its client. This report contains the Chain of Custody document, which is an integral part of it, and can only be reproduced in full with the authorization of Weck Laboratories, Inc.

Dear Jeremy Burns :

Enclosed are the results of analyses for samples received 03/15/ 16 11:40 with the Chain of Custody document. The samples were received in good condition, at 1.3 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

Case Narrative:
This is a Supplement to the Certificate of Analysis previously issued 4/1/16 for the above referenced project to correct sample ID to reflect COC and to split report to separate projects.

APPENDIX D
PEBBLE COUNT PARTICLE-SIZE DISTRIBUTION ANALYSIS

This page is intentionally blank.

APPENDIX D: POST-STORM PEBBLE COUNT PARTICLE SIZE DISTRIBUTION ANALYSIS

This appendix presents the particle size distribution analysis results conducted for Carroll Canyon, Carmel Valley, and Los Peñasquitos Creek using the post-storm pebble count data collected throughout the wet weather season.

The graphs for Carroll Canyon and Carmel Valley Creeks are relatively consistent, but show a trend toward larger pebble sizes after the largest series of rainfall events of the monitoring season, January 4 to January 7, 2016. This series of events had intense periods of rain resulting in high flow rates, known to transport particles (particularly smaller particles) at higher rates based on supply limits, leaving behind a higher proportion of larger pebbles. The results for Los Peñasquitos Creek did not show a consistent pattern until after the large rainfall event in January, where the grain size distribution shifted to larger percentages of sand accumulating compared to the beginning of the monitoring season. This may be to the very high flow during the January 4 to January 7 storm scouring the bottom of fine material and depositing larger particles (e.g., sand), with subsequent storms (with low flows) depositing fine particles again. The survey at this site on October 6, 2015 seems to be the outlier in terms of having the lowest percentage of sand. If that survey is removed, the lowest percentage of sand observed in the streambed occurred after the largest storm in January 2016. While large events may mobilize particles and transport them downstream, results from past years in addition to this season suggest that low flow conditions do not alter the streambed composition at Los Peñasquitos Creek by transporting material downstream, rather the composition is most affected by deposition over time.

Complete pebble count results and particle-size distribution plots are provided below.

CROSS-SECTION SURVEYS AND HEAD-VERSUS-FLOW TABLE CALCULATIONS

This page is intentionally blank.

Revised Head versus Flow Estimates

During the 2015–2016 monitoring season, cross-sectional areas of streambeds at the three monitored locations were updated and used to revise the head-versus-flow tables. Refined cross-sectional areas were captured using a laser-level scope. Cross-sectional survey results are provided in the following tables and graphs:

50	5.25	94	5.57		

Multiple field flow measurements using wading rods and StreamPro ADCPs were used to verify and calibrate the revised head-versus-flow table. Flow estimates were estimated using the Manning's equation, which is used to calculate cross-sectional average velocity in open channels:

$$v = k_n / n \, R^{2/3} \, S^{1/2} \quad (1)$$

Where,

v = cross-sectional mean velocity (ft/s)
k_n = 1.486
n = Manning coefficient of roughness
R = hydraulic radius (ft)
S = slope of pipe (ft/ft)

Hydraulic radius can be expressed as:

$$R = A / P \qquad (2)$$

Where,

A = cross sectional area of flow (ft^2)
P = wetted perimeter (ft)

The following figures show the revised and previous head versus flow estimates and field flow measurements for Carroll Canyon, Carmel Valley and Los Peñasquitos Creeks:

APPENDIX G
ALTERNATIVE LOAD ESTIMATION ANALYSIS

This page is intentionally blank.

FY16 Update

Rainfall intensities were estimated for both FY15 and FY16 based on data recorded from Los Peñasquitos Creek rain gauge and relationships between maximum 1-hour rainfall intensity and estimated daily load using data collected during FY14 and FY15. When incorporating data collected during FY16, the relationships were much weaker and deemed unreliable. This is likely due to the intense nature of storms monitoring in FY16. Therefore, the best fit line developed in FY15 was used to calculate non-monitored load estimates for FY15 and FY16. Although this analysis is preliminary, the equations from FY15 were used for comparison purposes between the FY16 load estimations using the “average estimation method” described in the Monitoring Report, and for comparison of the effectiveness of the current form of the “rainfall intensity estimation method” described in this appendix between two hydrologically different years. The procedures described below are those used in FY15 (as reported in the FY15 Monitoring Report). Estimation results for FY16 were added to Table G-1.

Estimates of Rainfall Intensities

Estimates of maximum rainfall intensity and maximum 1-hour moving rainfall intensity were calculated using the following method:

- Cumulative event rainfall depths are estimated throughout the storm event using rainfall detection values (when the rain gauge bucket tips and a known depth of rain is recorded) and specific dates and times;
- Rainfall Intensities (in/hr) are estimated based on the slope or measured of depth per time ($\Delta D/\Delta t$) divided by 24, where ΔD is the depth associated with each bucket tip;
- Estimates of rainfall intensities assume the intensity starts at zero and increases to the intensity between the first two recorded bucket tips, and the time of the unrecorded start of the rainfall is equal to the time when rainfall was detected for the first time Δt_1 minus Δt;
- Maximum rainfall intensity (in/hr) is observed as the maximum of all estimated rainfall intensities; and lastly,
- The maximum 1-hour rainfall intensity (in/hr) is estimated as the depth of recorded rainfall that occurs within an hour.

The following table summarizes rainfall intensities calculated for the 2013-2014 and 2014-2015 storm events:

Table G-1.

Los Peñasquitos Creek 2015–2016 Annual Load (tons/year)	128	14,100
Total Estimated Annual Load 2015–2016 (tons/year)	**688**	**23,500**

a. For the 2014–2015 year, monitoring occurred on December 2–4, 2014, December 12–13, 2014, and February 22, 2015; For the 2015–2016 year, monitoring occurred on January 4–5, 2016, January 31, 2016, and March 5–7, 2016; daily loads are calculated using SSC data and flow duration (see Sections 3.1 and 3.4).
b. Represents calculated value for monitored event.
c. Calculated value for monitored event covers all days of the monitored storm, not just the listed day. For example, for Carroll Canyon Creek, the value of 1,283 represents the calculated value for January 4 and 5, 2016, and 25.8 represents the calculated value for March 5–7, 2016.

Comparative Graphs: Rainfall Intensities versus EMC and Sediment Loads

Estimates of flow-weighted event mean concentrations (EMCs) and sediment loads, which are estimates based analytical SSCs and flow data, were compared with the maximum rainfall intensities. Six pair of estimated values was plotted for each monitoring location: Carroll Canyon, Carmel Valley and Los Peñasquitos Creek. Preliminary graphs using all data indicating a stronger relationship between the maximum 1-hour rainfall intensity and sediment load than maximum rainfall intensity and sediment load. For example, Los Peñasquitos Creek trend curve had a coefficient of determination (R^2) higher (0.51) using the maximum 1-hour rainfall intensity than using the maximum rainfall for the limited set of data (0.31).

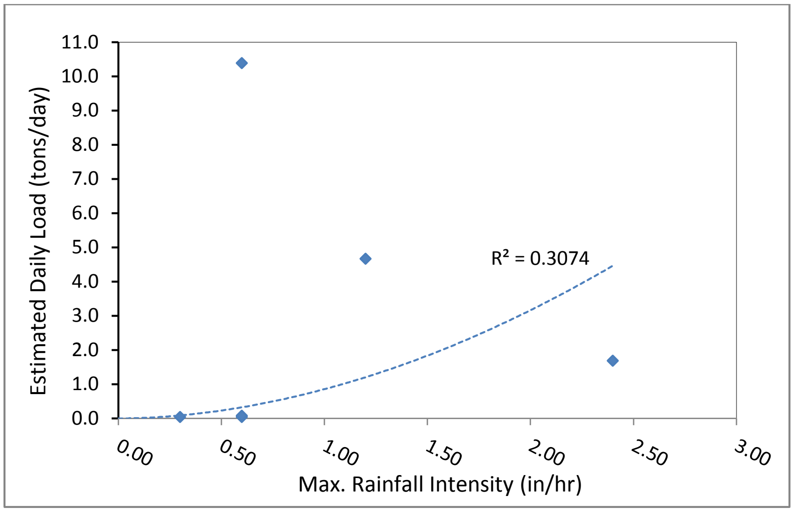

Figure G-1.
Los Peñasquitos Creek, Maximum Rainfall Intensity vs. Daily Sediment Load

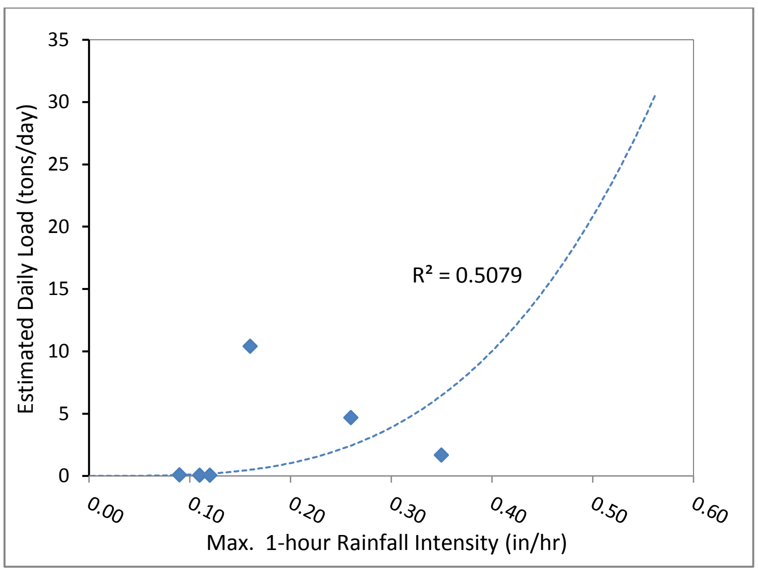

Figure G-2.
Los Peñasquitos Creek, Maximum 1-hour Rainfall Intensity vs. Daily Sediment Load

To further refine trend lines and as part of this evaluation, outliers in this set of data pairs were identified using a statistical regression analysis. For example, if the estimated standardized residual for a data pair was above 2 (standard deviations) and was not consistent with its neighbor points, the data pair was identified as an outlier. See example below.

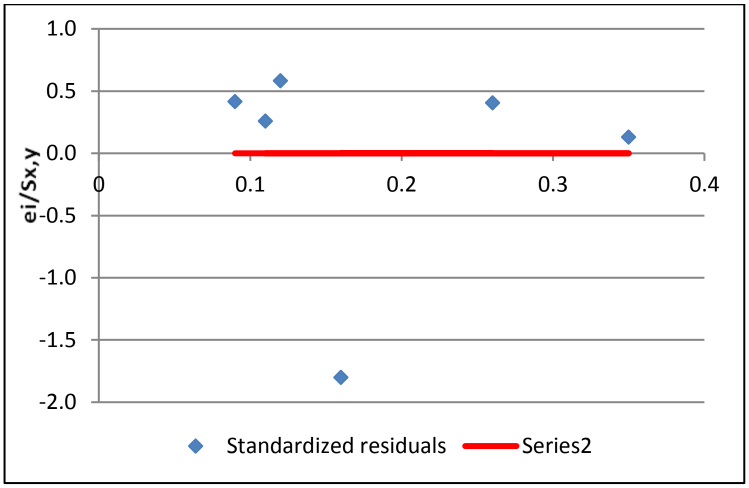

Figure G-3.
Los Peñasquitos Creek, 1-hour Maximum Rainfall Intensity versus Standardized Residual

Data from the December 2-4, 2014 monitoring storm event was identified as outlier for Carroll Canyon and Los Peñasquitos Creeks and from the November 21, 2013 monitoring storm event for Carmel Valley Creek.

Based on final set of limited data, revised graphs were prepared and provided in Figures 3-10 through 3-12 (see Section 3.5).

<u>Estimated Sediment Loads during Monitored and Non-monitored Storm Events</u>

Best-fitting equations from the refined set of data for Carroll Canyon, Carmel Valley and Los Peñasquitos Creeks were used to estimate EMC and sediment load values for the 2014-2015 monitored and non-monitored storm events (See Section 3.5). Equations used to predict sediment loads are as follow:

Table G-2.
Best-fitting Equations

Site	EMC	Daily Sediment Load
Carroll Canyon Creek	$Y= 648.2*X^{0.7434}$	$Y= 301.34*X^{2.0499}$
Carmel Valley Creek	$Y= -10.011*X + 11.67$	$Y= 2.3091*X^{1.4476}$
Los Peñasquitos Creek	$Y= 33.86*X^{1.1806}$	$Y= 112.81*X^{3.294}$

Note: X as Maximum 1-hour Rainfall Intensity, and Y as EMC and Sediment Load Values

Estimated EMC and daily sediment loads for monitored and non-monitoring storm events are provided in Table 3-5 (See section 3.5).

Refinement of sediment load estimates will be conducted during future monitoring activities at these locations. A statistical regression analysis will be rerun and trend lines will be re-estimated as more data become available (wider range of rainfall intensity values and storm patterns). It is expected that equations from this analysis will be refined to provide a better relationship between rainfall intensity and estimated EMC and sediment load values for each monitoring location.

Additional parameters (such as total rainfall volume, storm duration, etc) may be evaluated in addition to the maximum 1-hour rainfall intensity to conduct a multiple regression analysis using more than one independent variable. Although this would add more complexity, it can also provide a more robust and realistic approach since the sediment loads is dependent on a variety of factors.

EXECUTIVE SUMMARY

This report presents the 2015–2016 compliance monitoring data required by the Bacteria Total Maximum Daily Load (TMDL)[1] for the Los Peñasquitos Watershed Management Area (WMA) as incorporated into the Municipal Separate Storm Sewer System (MS4) Permit[2] (San Diego Regional Water Quality Control Board [Regional Board], 2010 and 2013, respectively).

The Bacteria TMDL Compliance Monitoring Program is designed to assess the conditions of the receiving waters and has the following objectives:

- Characterize levels of bacteria concentrations at compliance monitoring locations.
- Track progress toward meeting the Bacteria TMDL numeric targets.

Fecal indicator bacteria[3] (FIB) sampling for the compliance monitoring period (October 2015 through September 2016) was conducted at one beach compliance monitoring location:

- **Los Peñasquitos River Outlet/Beach–FM-100:** An ocean receiving water of the Los Peñasquitos River that receives discharges from the Los Peñasquitos Lagoon and upstream creeks.

Wet weather samples were collected between October 1, 2015, and April 30, 2016, within the first 72 hours after the end of rainfall for three wet weather events. Dry weather samples were collected at least weekly in October 2015 and from April 2016 through September 2016, and at least monthly on dry weather days from November 1, 2015, through March 31, 2016. Weekly monitoring was scheduled so that a minimum of five samples were collected in each calendar month. Samples were analyzed for the FIB compliance constituents: total coliform, fecal coliform, and *Enterococcus*.

This report summarizes FIB concentrations and key hydrologic data at the compliance monitoring location by season. Compliance was assessed by comparing analytical results for total coliform, fecal coliform, and *Enterococcus* with the applicable receiving water limitations (RWLs), in accordance with the Bacteria TMDL requirements in Attachment E of the MS4 Permit. The RWLs are a combination of numeric targets for bacteria density and allowable exceedance frequencies. The MS4 Permit clarifies the final RWLs (as the most probable number [MPN]) for total coliform, fecal coliform, and *Enterococcus*. The single-sample maximum numeric targets are required to be achieved only during wet weather, with a final allowable exceedance frequency of 22 percent (%). For dry weather days, the 30-day geometric mean numeric targets must be achieved, with a 0% exceedance frequency. Table ES-1 lists the numeric targets for beaches.

---

[1] *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) To Incorporate Revised Total Maximum Daily Loads for Indicator Bacteria Project I—Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek),* Resolution No. R9-2010-0001, Regional Board, February 10, 2010 (Bacteria TMDL).

[2] *National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer System (MS4) Draining the Watersheds Within the San Diego Region,* Order Number R9-2013-0001, May 14, 2013 (MS4 Permit).

[3] Fecal indicator bacteria include total colifom, fecal coliform, and *Enterococcus*.

Table ES-1.
Final Receiving Water Limitations for Beaches

(Maximum Bacteria Densities and Allowable Exceedance Frequencies)

Constituent	Wet Weather Days [a] Single-Sample Maximum		Dry Weather Days [b] 30-Day Geometric Mean	
	Numeric Target [c] (MPN/100mL)	Final Allowable Exceedance Frequency [d]	Numeric Target [e] (MPN/100mL)	Final Allowable Exceedance Frequency
Total Coliform	10,000	22%	1,000	0%
Fecal Coliform	400	22%	200	0%
Enterococcus	104	22%	35	0%

Notes:
% = percent; mL = milliliters; MPN = most probable number
Source (including footnotes): Bacteria TMDL, Regional Board, Order No. R9-2010-0001, 2010.

a. Wet weather days are defined as days with rainfall events of 0.2 inch or greater, plus the following 72 hours.
b. Dry weather days are defined as days with less than 0.2 inch of rainfall observed on each of the previous 3 days.
c. Wet weather numeric objectives are based on the single-sample maximum (or equivalent) water quality objectives in the *California Ocean Plan* (State Water Resources Control Board [SWRCB], 2012). Compliance with the wet weather TMDLs in the receiving water is based on the frequency of the wet weather days in any given year exceeding the wet weather numeric objective, but the 30-day geometric mean must also be met.
d. The wet weather allowable exceedance frequency is set at 22 percent. In the calculation of the wet weather TMDLs, the Regional Board chose to apply the 22% allowable exceedance frequency as determined for Leo Carrillo Beach in Los Angeles County. At the time the wet weather watershed model was developed, this 22% exceedance frequency was the only reference beach exceedance frequency that was available. The 22% allowable exceedance frequency that is used to calculate the wet weather TMDLs is justified because the San Diego region watersheds' exceedance frequencies will likely be close to the value calculated for Leo Carrillo Beach, and are consistent with the exceedance frequency that was applied by the Los Angeles Regional Board.
e. Dry weather numeric objectives are based on the 30-day geometric mean (or equivalent) water quality objectives in the California Ocean Plan (SWRCB, 2012). Compliance with the dry weather TMDLs in the receiving water is based on the frequency of the dry weather geometric mean exceeding the dry weather numeric objective.

Monitoring Results and Compliance Discussion

In accordance with the monitoring and assessment requirements in the MS4 Permit, three separate weather-based evaluations were used to address the program objectives: wet weather, wet season, and dry season. Table ES-2 summarizes the 2015–2016 exceedance frequency results and compares them with interim and final allowable exceedance frequencies.

Table ES-2.
2015–2016 Bacteria TMDL Exceedance Frequency Results for Los Peñasquitos River WMA

Site ID	Bacteria TMDL Constituent	Wet Weather [a] Single-Sample Maximum (CFU/100mL)			Wet Season [a, c] 5-Sample Geometric Mean (CFU/100mL)			Dry Season [b] 30-Day Geometric Mean (CFU/100mL)		
		2015–2016 [d] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency	2015–2016 [e] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency	2015–2016 [e] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency

	Fecal Coliform	0%	26%	22%	0%	2%	0%	0%	2%	0%
	Enterococcus	13%	26%	22%	0%	10%	0%	0%	10%	0%

Notes:
% = percent; CFU = colony-forming unit; FM-100 = Los Peñasquitos River Outlet/Beach
Green shaded cells show the 2015-2016 observed exceedance frequency.

a. October 1, 2015–April 30, 2016
b. May 1, 2016–September 30, 2016
c. In accordance with the MS4 Permit, wet and dry weather FIB data were combined to calculate geometric means for the wet season and compared with dry weather RWLs (numeric targets and allowable exceedance frequencies) as shown in Table ES-1.
d. The exceedance frequency was derived by dividing the total number of wet weather days (days with 0.2 inch of rainfall or greater plus the following 72 hours) that exceeded the single-sample maximum numeric target divided by the total number of wet weather days during the wet season. To determine exceedances for non-sampled wet weather days, the average (interpreted as the geometric mean) of the analytical results from three monitored storm events was applied to the remaining observed wet weather days that were not sampled. The results from the total number of wet weather days, with either assigned averages or analyzed result values, were then compared with single-sample maximum numeric targets.
e. The exceedance frequency was derived by dividing the total number of geometric exceedances by the total number of geometric means calculated during the season.

This page intentionally left blank.

Wet Weather Single-Sample Maximum Exceedance Frequencies

The wet weather exceedance rate applies only to wet weather days (days with 0.2 inch of rainfall or more, plus the following 72 hours) between October 1 and April 30 of each year. Wet weather exceedance rates for total coliform, fecal coliform, and *Enterococcus* were derived by calculating the average result of wet weather samples and applying that average to the remaining (not sampled) observed wet weather days. Sampling results and the assigned averages were compared with single-sample maximum numeric targets, as established in the Bacteria TMDL. A total of three storm events were sampled during the 2015–2016 wet weather season, at the following location:

- **FM-100:** During wet weather, the receiving waters at Los Peñasquitos River Outlet/Beach achieved a 0% single-sample maximum exceedance frequency for compliance constituent fecal coliform. The single-sample maximum exceedance frequency for compliance constituents total coliform and *Enterococcus* was 13%.

Wet Season Geometric Mean Exceedance Frequencies

The wet season is from October 1 through April 30 of each year. Wet season exceedance rates for total coliform, fecal coliform, and *Enterococcus* are derived by calculating a rolling geometric mean using results from the last five sampling results (combined dry weather and wet weather):

- **FM-100:** During the wet season, the receiving waters at Los Peñasquitos River Outlet/Beach achieved 0% exceedance frequencies for compliance constituents total coliform, fecal coliform, and *Enterococcus.*

Dry Season Geometric Means and Exceedance Frequencies

The dry season is May 1 through September 30 of each year. Dry season exceedance rates for total coliform, fecal coliform, and *Enterococcus* are derived by calculating a rolling 30-day geometric mean using the last five sampling results, as described in the *California Ocean Plan,* (Ocean Plan) (SWCRB, 2012), at the compliance monitoring location:

- **FM-100:** During the dry season, the receiving waters at Los Peñasquitos River Outlet/Beach achieved 0% exceedance frequencies for compliance constituents total coliform, fecal coliform, and *Enterococcus.*

Summary

Collectively, these findings suggest that bacteria densities support water contact recreation beneficial use (REC-1) conditions in the Los Peñasquitos WMA year-round.

During the wet season, which evaluates a combination of both wet and dry weather samples, FM-100 achieved a 0% exceedance frequency and is in compliance with the final dry weather geometric mean RWLs.

During the dry season, when recreational activities occur with more regularity, FM-100 achieved a 0% exceedance frequency and is in compliance with the final dry weather geometric mean RWLs.

Ongoing Efforts

Certain studies and activities of the Los Peñasquitos WMA Responsible Agencies (RAs) may provide additional data that could be used in subsequent Bacteria TMDL compliance assessments:

- The City and County of San Diego are participating in data assessments and coordination meetings with the Regional Board and other Copermittees to determine potential modifications to be considered in the Bacteria TMDL Reopener. During the Bacteria TMDL Reopener, the Regional Board will update the TMDL based on current data and United States Environmental Protection Agency (USEPA) policy, which may lead to revised terms of compliance. The Bacteria TMDL Reopener is in progress and is expected to be completed in 2018.
- The RAs have completed the San Diego Regional Reference Stream Study and San Diego Regional Reference Beach Studies. The data are being used in the Bacteria TMDL Reopener to evaluate natural sources of bacteria in reference streams and at beaches and these data are being utilized in the Bacteria TMDL Reopener to update numeric targets (Southern California Coastal Water Research Project [SCCWRP], 2015, 2016).
- Additional information regarding bacteria densities and sources in the Los Peñasquitos WMA may be included in Water Quality Improvement Plan Annual Report.
- RAs will continue to monitor for the Bacteria TMDL Compliance Monitoring Program for fiscal year (FY)17.

1.0 INTRODUCTION

This report presents the 2015–2016 Los Peñasquitos Watershed Management Area (WMA) Bacteria Total Maximum Daily Load (TMDL)[4] (San Diego Regional Water Quality Control Board [Regional Board], 2010) compliance monitoring data, in accordance with Attachment E.6 of the Municipal Separate Storm Sewer System (MS4) Permit.[5] The Los Peñasquitos River WMA Bacteria TMDL Compliance Monitoring Plan (Los Peñasquitos Watershed Management Area Responsible Agencies [Responsible Agencies], 2015) (Compliance Monitoring Plan) was developed to meet the Bacteria TMDL requirements of the MS4 Permit and to generate data to support the Los Peñasquitos WMA Water Quality Improvement Plan (Responsible Agencies, 2016). Supporting information for this compliance monitoring report is in the Compliance Monitoring Plan and Los Peñasquitos WMA Water Quality Improvement Plan located on the Project Clean Water websites (www.projectcleanwater.org).

The Bacteria TMDL Compliance Monitoring Program is designed to assess the conditions of the receiving waters and has the following objectives:

- Characterize levels of bacteria concentrations at compliance monitoring locations.
- Track progress toward meeting the Bacteria TMDL numeric targets.

In accordance with the Compliance Monitoring Plan, the Responsible Agencies (RAs) monitored the Pacific Ocean Shoreline at the Los Peñasquitos River Outlet/Beach (Los Peñasquitos River compliance monitoring location, or FM-100). Table 1-1 provides the location name and coordinates for the compliance monitoring location, and Figure 1-1 presents a map of the compliance monitoring location within the WMA. Indicator bacteria sampling for the 2015–2016 compliance monitoring season was conducted during wet and dry weather at the Los Peñasquitos River Outlet/Beach compliance monitoring location and samples were analyzed for three fecal indicator bacteria (FIB) compliance constituents: total coliform, fecal coliform, and *Enterococcus.*

Table 1-1.
Bacteria TMDL Compliance Monitoring Location

Site ID	Site Name	Site Type	Latitude	Longitude
FM-100 [a]	Los Peñasquitos River Outlet/Beach	Pacific Ocean Shoreline	32.935	–117.261

Notes:

1.1 Document Overview

This report has five sections that contain the following information:

- **Section 1—Introduction:** Information on purpose of report, the Bacteria TMDL, compliance monitoring location, numeric targets, and schedule.
- **Section 2—Monitoring and Analytical Methodology:** Overview of the compliance monitoring conducted during the reporting period, including any changes to monitoring or analytical methods, hydrology summaries, event data and observations, and FIB concentrations in wet and dry weather during 2015—2016, along with an evaluation of seasonal patterns in FIB concentrations.
- **Section 3—Compliance Evaluation:** Evaluation of current receiving water conditions and a comparison with the Bacteria TMDL receiving water limitations (RWLs) based on 2015–2016 data.

- **Section 4—Summary:** Program objectives and ongoing efforts.
- **Section 5—References:** Sources used to prepare this report.

1.2 Compliance Requirements for Bacteria Total Maximum Daily Load

As described in the Los Peñasquitos River WMA Water Quality Improvement Plan, the basis for Bacteria TMDL compliance is demonstrated through interim and final water quality-based effluent limitations (WQBELs). The WQBELs include RWLs for the Los Peñasquitos River Outlet/Beach compliance monitoring location and are provided in Table 1-2.

Table 1-2.
Final Receiving Water Limitations for Beaches

(Maximum Bacteria Densities and Allowable Exceedance Frequencies)

Constituent	Wet Weather Days [a]		Dry Weather Days [b]	
	Single-Sample Maximum (MPN/100mL) [c]	Single-Sample Maximum Allowable Exceedance Frequency [d]	30-Day Geometric Mean (MPN/100mL) [e]	30-Day Geometric Mean Allowable Exceedance Frequency
Total Coliform	10,000	22%	1,000	0%
Fecal Coliform	400	22%	200	0%
Enterococcus	104	22%	35	0%

Notes:
% = percent; mL = milliliters; MPN = most probable number
Source (including footnotes): Bacteria TMDL, Regional Board, Order No. R9-2010-0001, 2010.

a. Wet weather days are defined as days with rainfall events of 0.2 inch or greater, plus the following 72 hours.

b. Dry weather days are defined as days with less than 0.2 inch of rainfall observed on each of the previous 3 days.

c. Wet weather numeric objectives are based on the single-sample maximum (or equivalent) water quality objectives in the *California Ocean Plan* (State Water Resources Control Board [SWRCB], 2012). Compliance with the wet weather TMDLs in the receiving water is based on the frequency of the wet weather days in any given year exceeding the wet weather numeric objective, but the 30-day geometric mean must also be met.

d. The wet weather allowable exceedance frequency is set at 22%. In the calculation of the wet weather TMDLs, the Regional Board chose to apply the 22% allowable exceedance frequency as determined for Leo Carrillo Beach in Los Angeles County. At the time the wet weather watershed model was developed, this 22% exceedance frequency was the only reference beach exceedance frequency that was available. The 22% allowable exceedance frequency that is used to calculate the wet weather TMDLs is justified because the San Diego region watersheds' exceedance frequencies will likely be close to the value calculated for Leo Carrillo Beach, and are consistent with the exceedance frequency that was applied by the Los Angeles Regional Board.

e. Dry weather numeric objectives are based on the 30-day geometric mean (or equivalent) water quality objectives in the *California Ocean Plan* (SWRCB, 2012). Compliance with the dry weather TMDLs in the receiving water is based on the frequency of the dry weather geometric mean exceeding the dry weather numeric objective.

The Los Peñasquitos River WMA Water Quality Improvement Plan provides the compliance timeline for the Bacteria TMDL, which outlines the interim and final reduction milestones for both dry and wet weather. Per Attachment E.6.c(1) of the MS4 Permit, interim compliance dates may be modified by an accepted Water Quality Improvement Plan. Full dry weather compliance requires a 0% exceedance frequency for all dry weather periods by 2021, and full wet weather compliance requires a 22% allowable exceedance frequency during wet weather periods by 2031.

The "existing" or historical exceedance frequency is used to calculate 50% interim milestones for both wet and dry weather. Progress toward achieving dry weather and wet weather milestones is demonstrated through comparison with interim and final allowable exceedance frequencies. Table 1-3 presents dry weather existing, interim, and final allowable exceedance frequencies. Per the Water Quality Improvement Plan, the 50% reduction milestone is to be met in 2019 for the Cities of Del Mar, Poway, and San Diego and in 2020 for the County of San Diego, with a 100% reduction milestone in 2021 for all RAs.

Table 1-3.
Los Peñasquitos WMA Bacteria TMDL Compliance Reduction Milestones—Dry Weather

Constituent	"Existing" Exceedance Rate	Interim Milestone [a]	2021 Final Compliance
Total Coliform	1%	1%	0%
Fecal Coliform	4%	2%	0%
Enterococcus	19%	10%	0%

Notes:
% = percent
a. Interim dry weather goals are a 50% reduction of existing dry weather exceedance frequencies, based on available historical data from the years 1996 to 2002. Source: Los Peñasquitos WMA Bacteria TMDL Compliance Monitoring Plan (Responsible Agencies, 2015). For reporting purposes, values are rounded to the nearest whole percent.

Table 1-4 presents wet weather existing, interim, and final allowable exceedance frequencies. Per the Water Quality Improvement Plan, the 50% reduction milestone is to be met in 2024 for the Cities of Del Mar, Poway, and San Diego and in 2028 for the County of San Diego, with a 100% reduction milestone in 2031 for all RAs.

Table 1-4.
Los Peñasquitos WMA Bacteria TMDL Compliance Reduction Milestones—Wet Weather

Constituent	"Existing" Exceedance Rate [a]	Interim Milestone [b]	2031 Final Compliance [c]
Total Coliform	30%	26%	22%
Fecal Coliform	30%	26%	22%
Enterococcus	30%	26%	22%

Notes:
a. Interim wet weather goals are provided in the Bacteria TMDL (Regional Board, 2010).
b. Interim wet weather goals are provided in Attachment E of the MS4 Permit (Regional Board, 2013).
c. The final milestone is a 100% reduction from the existing exceedance frequency to the allowable exceedance frequency.

1.3 Monitoring and Analytical Methods

The Pacific Ocean Shoreline at Los Peñasquitos River Mouth segment named in the Bacteria TMDL was removed from the Clean Water Act 303(d)-List for REC-1 impairment in 2010 and is considered de-listed. Per Attachment E of the MS4 Permit, because of the de-listed status of their segment, the Los Peñasquitos WMA RAs have the flexibility to propose alternative monitoring procedures (such as reduced monitoring) for Bacteria TMDL compliance monitoring as part of the Water Quality Improvement Plan and its updates. For their first year of implementation, the RAs elected to monitor more frequently than the minimum monitoring requirements described in Attachment E of the MS4 Permit.

The Compliance Monitoring Plan describes the monitoring and analytical methods (Sections 3 and 4) and data management methods (Section 5.1). Compliance monitoring was performed in accordance with the Compliance Monitoring Plan, except as noted in Sections 1.3.1 and 1.3.2.

1.3.1 Dry Weather Monitoring

Per the Compliance Monitoring Plan, weekly dry weather monitoring was scheduled so that five samples were collected in each calendar month. However, in May 2016 and September 2016, only four samples were collected in each of these months because of wet weather interference.

1.3.2 Precipitation Data

Per the MS4 Permit, rainfall precipitation data are not a requirement for Bacteria TMDL compliance monitoring. Per the Compliance Monitoring Plan, precipitation data from the National Weather Service (NWS) Del Mar rain gauge were to be used to track the total number of wet weather days as defined in the MS4 Permit. However, the NWS Del Mar rain gauge was relocated in September 2015, and was also missing data for a portion of the 2015–2016 monitoring year. To provide a more complete dataset, the NWS Miramar Naval Air Station (MNAS) gauge was used in its place. Because MNAS officially became Marine Corps Air Station Miramar (Miramar) in 1999, this gauge is referred to as the Miramar gauge in this report (Shettle, 2001). The Miramar gauge is technically within the Mission Bay WMA; however, it is less than 1 mile from the Los Peñasquitos WMA and is the nearest gauge that is representative of rainfall in the middle of watershed. Historical daily rainfall amounts generated by the NWS will be used to assess the annual rainfall and historical average for San Diego County.

This page intentionally left blank

2.0 MONITORING RESULTS SUMMARY

This section outlines hydrology summaries, event data and observations, and FIB concentrations for both wet and dry weather conditions.

Precipitation data from the NWS Miramar rain gauge were used to track the total number of wet weather days as defined in the Compliance Monitoring Plan. Historical daily rainfall amounts generated by the NWS at the Miramar gauge were used to compare the annual rainfall and historical averages for San Diego County.

A summary of quality assurance and quality control data is provided in Appendix A. Field measurements and analytical results for wet weather are presented in Appendix B. Field measurements and analytical results for dry weather are presented in Appendix C.

2.1 Wet Weather Compliance Monitoring

Wet weather monitoring was conducted at the compliance monitoring location by Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler) for three storm events during the 2015–2016 wet season. The RAs elected to monitor during wet weather at a higher frequency than required by the Compliance Monitoring Plan to provide additional baseline data. Storms resulting in greater than 0.2 inch of precipitation were targeted for analysis. One grab sample was collected per storm event along with *in situ* field measurements within 72 hours after the end of precipitation. Event field data, including atmospheric conditions, sample characteristics, sampling times, field measurements, and other notable observations, were documented. Bacteria grab samples were submitted to the City of San Diego Environmental Monitoring and Technical Services (EM&TS) Laboratory or Weck Laboratories, Inc., for analysis.

2.1.1 Wet Weather Hydrology Summary

Precipitation data from Miramar were used to track the total number of wet weather days. To assess rainfall for the current monitoring year, measured precipitation values at Miramar are compared with the 1893–2016 historical rainfall average for Poway Valley, located approximately 6 miles northeast of Miramar. This comparison will support future evaluations of annual precipitation and potential effects on FIB concentrations or the assessment of exceedances. The historical data were obtained through the Western Regional Climate Center (WRCC) website, which maintains climate data collected by the National Oceanic and Atmospheric Administration (NOAA), the National Climatic Data Center, and the NWS.

Total precipitation recorded at Miramar for the 2015–2016 wet season was 10.74 inches, which was below the historical average of 12.5 inches at Poway Valley (WRCC, 2016). Below-average rainfall was observed in November and December, 2015, and February and March 2016. Above-average rainfall was observed in January 2016 (including an extreme 25-year storm event[6]) and April 2016. The total rainfall observed in January 2016 was largely from one storm event in early January 2016 that produced 5.39 inches of rainfall at the Miramar gauge.

Table 2-1 summarizes wet weather monthly precipitation data for Miramar for the 2015–2016 wet season, along with the historical Poway Valley data for comparison.

Table 2-1.
Wet Weather Monthly Rainfall Summary

Month	Miramar Rainfall (inches)	
	Miramar 2015–2016 Monitoring Season	Poway Valley 1893–2016 Historical Average
October 2015	0.53	0.52
November 2015	0.47	1.36
December 2015	1.30	1.87
January 2016	6.00	2.80
February 2016	0.06	2.70
March 2016	1.29	2.30
April 2016	1.09	0.95
Total Rainfall	**10.74**	**12.50**

Source: National Oceanic and Atmospheric Administration (NOAA); Western Regional Climate Center (WRCC)

Three storm events were successfully captured at the compliance monitoring location. The monitored storms represent three sizes. Wet Weather Event 1 was the smallest storm, with 0.35 inch of rainfall; Wet Weather Event 2 was the largest, with 5.39 inches observed; and Wet Weather Event 3 was moderate in size, with 0.59 inch observed. Wet Weather Events 1 and 3 depict the usual range of events that may occur during a typical wet season, while Wet Weather Event 2 was exceptionally large and was not representative of wet weather events in the region.

The watershed response also varies throughout the wet season, based on factors such as antecedent soil moisture conditions, impervious area, rainfall amount, and rainfall intensity. During larger storms, runoff from previously pervious surfaces can increase after soils are completely saturated. Earlier in the season, soil conditions are drier, increasing infiltration and therefore decreasing runoff. Later in the season, the ground is more saturated, resulting in greater discharge volumes to ocean receiving waters.

Precipitation values for the three storm events as recorded at the Miramar gauge are presented in Table 2-2. Each monitored storm event is described in detail in the following sections.

[6] According to the NWS NOAA ATLAS 14 Point Precipitation Frequency Estimate for Miramar MCAS (http://hdsc.nws.noaa.gov/hdsc/pfds/pfds_map_cont.html?bkmrk=ca). Accessed November 3, 2016.

Table 2-2.
Total Rainfall for 2015–2016 Monitored Events

Event	Event Start Date	Event End Date	Sampling Date	Rainfall Miramar (inches)
Wet Weather Event 1	11/2/2016	11/4/2016	11/6/2015	0.35
Wet Weather Event 2	1/4/2016	1/11/2016	1/9/2016	5.39
Wet Weather Event 3	1/30/2016	2/3/2016	2/3/2016	0.59

2.1.1.1 Wet Weather Event 1 – November 6, 2015

A qualifying wet weather event (greater than or equal to 0.2 inch of rainfall preceded by at least 72 hours of less than 0.1 inch of rainfall) occurred from November 2–4, 2015. A total of 0.07 inch of rainfall was recorded on November 2, 2015, followed by the majority of event rainfall (0.27 inch) on November 3, 2015. A total of 0.01 inch of rainfall was measured on November 4, 2015, for a total of 0.35 inch for Wet Weather Event 1, as recorded by the Miramar gauge.

Wet weather samples were collected at the compliance monitoring location approximately 57 hours after the end of the storm event. Samples were submitted to Weck Laboratories, Inc. for analysis within prescribed holding times. Conductivity in the receiving water at the time of sample collection was the highest of all three monitored wet weather events (44,000 microSiemens per centimeter [µS/cm]), and turbidity was the lowest of all three monitored wet weather events (1.44 nephelometric turbidity units [NTU]). This relationship is expected, considering that Wet Weather Event 1 was the smallest monitored storm and discharge from the lagoon and upper drainage area was likely limited compared with conditions for other storm events.

2.1.1.2 Wet Weather Event 2 – January 9, 2016

The second monitored storm event occurred from January 4–9, 2016. This event was the largest storm event of the 2015–2016 wet season, with a total of 5.39 inches of rainfall. The greatest amount of rainfall occurred on January 6, 2016 (2.03 inches), followed by January 5, 2016 (1.87 inches) and January 7, 2016 (1.26 inches), with lesser amounts recorded on January 4, 8, and 9, 2016 (0.08 inch, 0.14 inch, and 0.01 inch, respectively). The intensity of this event dislodged concrete-lined channels, caused flooding, and mobilized large amounts of sediment and debris (City of San Diego, 2016).

Wet weather samples were collected at the compliance monitoring location approximately 32 hours after the end of the storm event. Samples were submitted to Weck Laboratories, Inc. for analysis within prescribed holding times. Conductivity in the receiving water at the time of sample collection was the lowest of all three monitored wet weather events (20,700 µS/cm), and turbidity was the highest of all three monitored wet weather events (55 NTU), as would be expected, considering the size of the storm and increased discharge from the lagoon and upper drainage area.

2.1.1.3 Wet Weather Event 3 – February 3, 2016

The third and final monitored event for the 2015–2016 wet season occurred from January 30 through February 3, 2016, and generated a total of 0.59 inch of rainfall. On January 30, 2016, 0.02 inch of rainfall was measured, followed by 0.57 inch on January 31, 2016, as recorded at the Miramar gauge.

Wet weather samples were collected at the compliance monitoring location approximately 70 hours after the end of the storm event. Bacteria grab samples were submitted to the City EM&TS Laboratory for analysis within prescribed holding times. Conductivity in the receiving water at time of sample collection was 32,300 µS/cm and turbidity was 15.3 NTU.

2.1.2 Wet Weather FIB Concentrations

Generally, FIB concentrations at FM-100 during wet weather were below single-sample maximum thresholds. Elevated FIB concentrations during wet weather were observed once in 2015–2016, following the exceptionally large wet weather event in early January 2016 that produced over 5 inches of precipitation. *Enterococcus* and total coliform concentrations exceeded single-sample maximum thresholds in samples collected immediately following the exceptionally large wet weather event (Wet Weather Event 2). Note that field measurements for this event reflected increased freshwater discharge from the lagoon and upper drainage area: conductivity values were lower (20,700 µS/cm) and turbidity values were higher (55 NTU) than those observed during any other wet weather event.

Table 2-3 presents 2015–2016 wet weather analytical results for compliance constituents (total coliform, fecal coliform, and *Enterococcus*). Figure 2-1 illustrates 2015–2016 wet weather bacteria densities compared with the single-sample maximum numeric targets. Optional field measurements for 2015–2016 wet weather monitoring are in Appendix B.

Wet weather laboratory reports for the 2015–2016 monitoring year are in Appendix D. Wet weather field data sheets for 2015–2016 are in Appendix E.

Table 2-3.
Wet Weather Analytical Results for Los Peñasquitos WMA

Analyte	Unit	Numeric Target	Method	MDL [a]	RL [a]	Analytical Results – Site ID FM-100		
						Wet Weather Event 1 11/6/15 [b]	Wet Weather Event 2 1/9/16 [b]	Wet Weather Event 3 2/3/16 [b]
Total Coliform	CFU/100mL	10,000	SM 9222B	2	20 [c] 200 [d] 2 [e]	940	**44,000**	1,800

2015–2016 Wet Weather Fecal Indicator Bacteria Concentrations – FM-100

2.2 Dry Weather Compliance Monitoring

Dry weather monitoring was performed during both the wet season (October 1, 2015, through April 30, 2016) and the dry season (May 1 through September 30, 2016) by the City of San Diego. As specified in the Compliance Monitoring Plan, the following sampling was conducted:

- Weekly dry weather monitoring in October 2015 and from April 2016 through September 2016.
  - RAs elected to perform weekly monitoring during October 2015 and from April 2016 through September 2016 to capture potential conditions with more recreational activities, consistent with the recreational monitoring season of the California Assembly Bill 411 (the Beach Safety Act, or AB 411) program. Weekly dry weather sampling is also above and beyond the requirements of Attachment E of the MS4 Permit: only monthly sampling is required.
  - At least five samples were collected in each calendar month, except during May 2016 and September 2016, when only four samples were collected because of wet weather interference.
- Monthly dry weather monitoring from November 2015 through March 2016.

Dry weather events, as defined by the Compliance Monitoring Plan, may occur on dry weather days with an antecedent dry period of 72 hours with less than 0.1 inch of rainfall. All dry weather samples were collected by City Storm Water Department staff. Bacteria samples were submitted to the City of San Diego EM&TS Laboratory for analysis.

2.2.1 Dry Weather Monitoring Summary

Dry weather monitoring was conducted from May 2016 through September 2016. During each successful dry weather event, water grab samples were collected in the receiving waters at the compliance monitoring location. Tables presenting dry weather FIB concentrations and field measurements for the 2015–2016 monitoring year are provided in Appendix C. During the wet season, a total of 15 dry weather events took place at the compliance monitoring location. During the dry season, City of San Diego field scientists were unable to collect a fifth monthly sample in May 2016 and September 2016 because of storm events. Thus, only 23 (of 25 targeted) dry weather events were captured in the dry season.

Visual observations were noted by the City of San Diego field scientists during each dry weather sampling event. In general, field observations such as seaweed, sea grass, and shorebirds were recorded. Table 2-4 presents sampling event information (approximate tidal stage and total antecedent dry weather days before each event), with wet season dry weather sampling dates highlighted in blue.

Table 2-4.
Dry Weather Sampling Summary and Antecedent Dry Days

Date Visited	Tide Height [a] (feet)	Antecedent Dry Days [b]	
		<0.1 inch	<0.2 inch

Notes:
Source: National Oceanographic and Atmospheric Administration (NOAA)
Blue-shading indicates dry weather events during the wet season.
a. Tide height is approximate, as reported by City of San Diego field staff.
b. National Weather Service (NWS) archived rain gauge data for Miramar were used to determine antecedent dry days.
c. 4/13/16 was defined as a wet weather day based on precipitation >0.2 inch on 4/10/16. However, hourly weather observations at the MCAS Miramar KNKX rain gauge place the end of measureable precipitation on 4/10/16 at 04:55 PDT, before the first sampling time. Thus, samples collected on 4/13/16 were collected >72 hours after the end of precipitation and are considered dry weather samples.

Although total measured rainfall during the wet season was below average, above-average rainfall was recorded throughout the 2016 dry season. From May 1, 2016, through September 30, 2016, a total of 0.95 inch of precipitation was measured at the Miramar gauge. Table 3-3 summarizes total monthly rainfall for the 2016 dry season. Above-average rainfall during the dry season was also observed in 2015. These consecutive elevated dry season rainfall totals may because of the influence of a strong El Niño event in late 2015.

Table 2-5.
Dry Season Monthly Rainfall Summary

Month	Rainfall (inches)	
	Miramar 2015–2016 Monitoring Season	Poway Valley 1893–2016 Historical Average
May 2016	0.59	0.37
June 2016	0.00	0.08
July 2016	0.00	0.04
August 2016	0.00	0.07
September 2016	0.36	0.19
Total Rainfall	**0.95**	**0.75**

2.2.2 Dry Weather FIB Concentrations

Dry weather samples were collected during the 2015–2016 wet season and the 2016 dry season. Dry weather samples collected during the 2016 dry season consistently displayed lower bacteria concentrations than dry weather samples collected during the wet season.

FIB concentrations were generally low, with frequent non-detects. No correlation between duration of the antecedent dry period and FIB concentrations was observed. Elevated *Enterococcus* results were found on only one occasion, in June 2016. The source of the elevated *Enterococcus* value is not known; potential sources include land areas draining directly to the Bacterial TMDL-listed segment, upstream sources in the Los Peñasquitos WMA, and natural sources (regrowth and marine life). Note that the lagoon was not flowing into the ocean during this sampling event. Under dry weather conditions, the lagoon occasionally discharges to the ocean receiving water. In the 2015–2016 monitoring year, the lagoon was observed flowing into the ocean during only 8 dry weather events, 5 of which were at the end of the monitoring year (August through September 2016). According to the Southern California Bight 2008 Regional Monitoring Program (Bight '08) Shoreline Microbiology Study conducted by the Southern California Coastal Water Research Project (SCCWRP) at southern California beaches (SCCWRP, 2012), resident bird populations are natural sources of FIB; FIB regrowth on beach wrack and beach sand is a potential source of increased FIB densities.

Figure 2-2 depicts FIB concentrations for each dry weather monitored event between October 1, 2015, and September 30, 2016. The blue-shaded areas indicate dry weather results of sampling during the wet season, when elevated FIB densities are more likely to occur.

3.0 COMPLIANCE EVALUATION

This section presents the results of the compliance evaluation for dry and wet seasons in accordance with the assessment requirements of Attachment E of the MS4 Permit.

3.1 Compliance Evaluation Methods

Separate evaluations were completed using geometric means for dry season dry weather and wet season combined all weather, and single-sample maximums for wet weather results as described in this report. FIB data collected between October 2015 and September 2016 in accordance with the Compliance Monitoring Plan were used in the compliance assessments.

Several inconsistencies were identified in Attachment E.6.6 of the MS4 Permit that may affect the interpretation of compliance; these inconsistencies are explained in detail in Appendix F.

3.1.1 Wet Weather Single-Sample Maximum Exceedance Frequency

Wet weather exceedances are based on a comparison of the rate of exceedances of the single-sample maximum numeric target with the allowable 22% exceedance frequency. Wet weather events include the storm day(s) (0.2 inch of rainfall or more) and the following 72 hours, resulting in a minimum wet weather event duration of 4 days. Per of Attachment E of the MS4 Permit, for monitored storm events, the highest reported result from a storm event is applied to each non-monitored day for the duration of that event. An inferred exceedance rate must also be calculated to account for non-monitored storm events.

For the remaining wet weather days that are not associated with a monitored event, the average (interpreted as geometric mean) of the highest reported results from each of the three monitored wet weather events is assigned to the remaining wet weather days in the wet season:

$$\text{Geometric Mean} = \quad n^{th} \text{ root of } (X_1)(X_2)_{\dots} X_n$$

where: n is the number of monitored storm events
X_n is sample n result (e.g., X_1 = Wet Weather 1 Result)

The wet weather exceedance frequency is then determined by dividing the number of wet weather days that exceeded the single-sample maximum numeric target by the total number of wet weather days observed during the 2015–2016 wet season.

$$\text{Wet Weather Exceedance Frequency (\%)} = 100 * \frac{\Sigma(\text{WWD} > \text{Wet Weather RWL})}{\Sigma\text{WWD}}$$

where: ΣWWD is the sum of wet weather days (0.2 inch of rainfall or more) and the following 72 hours

A list of observed wet weather days for the 2015–2016 wet season, both monitored and observed, is presented in Appendix B.

3.1.2 Wet Season Geometric Mean and Exceedance Frequency

Per of Attachment E of the MS4 Permit, a wet season exceedance frequency was calculated using the combined wet and dry weather results between October 1 and April 30, and was compared with dry weather RWLs. During the wet season, the amount of time summarized by each geometric mean varies. Dry weather sampling was conducted weekly during the wet season in October 2015 and April 2016, and monthly from November 2015 through March 2016. In addition, three wet weather events were monitored during the wet season; one sample was collected for each wet weather event. A rolling geometric mean calculation was calculated from the five most recent wet season samples. With each subsequent sample collected, the first sample from the preceding five-sample geometric mean was dropped. The wet season geometric mean is calculated as follows:

$$\text{5-Sample Geometric Mean} = n\sqrt{(X_1)(X_2)(X_3)(X_4)(X_5)}$$

where: n is the number of individual results used in the calculation
X_n is sample *n* result (e.g., X_1 = November result, X_2 = Wet Weather 1 Result)

A wet season exceedance occurs when a geometric mean exceeds the dry weather numeric target. The first geometric mean was calculated after the fifth sample in October 2015.

To determine the wet season exceedance frequency, the number of wet season geometric means that exceed the dry weather numeric target was divided by the total number of calculated wet season geometric means, expressed as follows:

$$\text{Wet Season Exceedance Frequency (\%)} = 100 * \frac{\text{Wet Season } G_n > \text{DW NT}}{\text{Wet Season } G_n}$$

where: Wet Season G_n is the number of wet season geometric means
DW NT is the dry weather numeric target

3.1.3 Dry Season Geometric Mean and Exceedance Frequency

Attachment E of the MS4 Permit states that the geometric mean calculation should be consistent with the requirements in the Ocean Plan (SWRCB, 2012). A 30-day rolling geometric mean calculation was based on a minimum of five samples for any 30-day period. Geometric means were calculated as follows:

$$\text{30-Day Geometric Mean} = n\sqrt{(X_1)(X_2)(X_3)(X_4)(X_5)}$$

where: n is the number of individual results used in the calculation
X_n is week *n* result (e.g., X_1 = week 1 result)

Dry season dry weather monitoring began in early May 2016; the first geometric mean was calculated after the fifth sample, in early June 2016. With each subsequent sample collected, the first sample from the preceding five-sample geometric mean was dropped outside of a

30-day window. Samples collected between May 1 and September 30, 2016, are used in this calculation.

A dry weather exceedance occurs when the geometric mean exceeds the dry weather numeric target. The first exceedance rate was calculated in early June 2016, after the first geometric mean calculation. The number of geometric means that exceed the dry weather numeric target is divided by the total number of calculated dry season geometric means to determine the dry season exceedance frequency, as follows:

$$\text{Dry Season Exceedance Frequency (\%)} = 100 * \frac{\text{Dry Season } G_n > \text{DW NT}}{\text{Dry Season } G_n}$$

where: Dry Season G_n is the number of dry season geometric means
DW NT is the dry weather numeric target

3.2 Wet Weather Exceedance Rates and Compliance Evaluation

Per MS4 Permit Attachment E assessment requirements, the wet weather exceedance rate is inferred for the wet season, based on the three sampled wet weather events. A wet weather day is defined as any wet weather event with 0.2 inch of rainfall or more, plus the following 72 hours. Using this criterion, 45 wet weather days were observed during the 2015–2016 wet season, as recorded at the Miramar gauge. Results for wet weather days in 2015–2016 are presented in Appendix B. This assessment applies the average (applied as a geometric mean) of the three wet weather sampling results to each day of non-sampled wet weather events. A total of 14 of the 45 wet weather days were associated with sampled storm events (three storm events plus the following 72 hours per event); the geometric mean of the results was assigned to each of the remaining 31 non-sampled wet weather days.

A 0% exceedance frequency for fecal coliform and a 13% exceedance frequency for total coliform and *Enterococcus* were achieved at FM-100 during wet weather. The exceedances observed for total coliform and *Enterococcus* were driven by one sample collected following an exceptionally large rain event in early January 2016: over 5 inches of precipitation were observed on the Miramar gauge. Without this sample, the 2015–2016 exceedance frequency for all compliance constituents would have been 0%. Regardless, based on current monitoring, FM-100 is meeting both interim and final RWLs for all compliance constituents.

Table 3-1 presents wet weather single-sample maximum exceedance frequencies for the compliance monitoring location. The geometric mean is presented in the table to illustrate the average derived from the three sampled events applied to the remaining non-sampled wet weather days, as compared with the numeric target.

Table 3-2 compares 2015–2016 exceedance frequencies with historical exceedance rates, and interim and final RWLs.

Table 3-1.
2015–2016 Wet Weather Single-Sample Maximum Exceedance Rates

a. Existing exceedance rate for wet season is a modeled estimate established in the Bacteria TMDL.

3.3 Wet Season Geometric Mean Exceedance Rates

The overall wet season evaluation combines bacteria results during both dry weather and wet weather events. Higher exceedance rates are expected during the wet season, with the inclusion of storm samples that reflect high-flow conditions. However, for the 2015–2016 wet season, geometric mean exceedance rates were 0% for all compliance constituents. Thus, both interim and final RWLs are being achieved at the compliance monitoring location.

Table 3-3 presents the wet season geometric mean exceedance rates for all compliance constituents, based on the available data, including the number of geometric means calculated from the results, the number of geometric means that exceeded the numeric target, and the maximum geometric mean.

Table 3-4 compares current wet season geometric exceedance frequencies with the existing dry weather exceedance rates and the status of progress compared with interim and final RWLs.

Table 3-3.
2015–2016 Wet Season Geometric Mean Exceedance Rates

a. Existing exceedance rate is based on available 1996–2002 historical data.

3.4 Dry Season Exceedance Rates

The overall dry season evaluation combines bacteria results during dry weather events from May 1, 2016, through September 30, 2016. Lower exceedance rates are typically expected during the dry season, which does not include the influence of wet weather events that reflect high-flow conditions.

Dry season monitoring occurred approximately weekly, and exceedances were based on a 30-day geometric mean composed of the preceding five samples. Of the 23 monitored events during the dry season at the compliance monitoring location, the *Enterococcus* concentration was elevated on one occasion. However, the geometric mean did not exceed dry weather numeric objectives at the compliance monitoring location during the dry season for the FIB compliance constituents.

Table 3-5 presents the dry season geometric mean exceedance rates for all compliance constituents, including the number of geometric means calculated from the results, the number of geometric means that exceeded the numeric target, and the maximum geometric mean.

Table 3-6 compares current dry season geometric exceedance frequencies with the existing dry weather exceedance rates, and provides the status of progress as compared with interim and final RWLs.

Table 3-5.

a. Existing exceedance rate is based on available 1996–2002 historical data.

3.5 Wet and Dry Season Overview

Figure 3-1 presents the 2015–2016 rolling geometric means throughout the wet and dry seasons from October 1, 2015, through September 30, 2016. Wet season geometric means are illustrated with a blue line with blue markers throughout the blue areas (wet season), which reflect the rolling geometric mean using the previous five samples. Wet weather numeric targets are illustrated with a blue dashed line. FIB concentrations in dry and wet weather are indicated with gold circles and blue triangles, respectively. The red line with green markers illustrates the rolling 30-day geometric means throughout the dry season (May through September 2016). Dry weather TMDL numeric targets are illustrated with an orange dashed line.

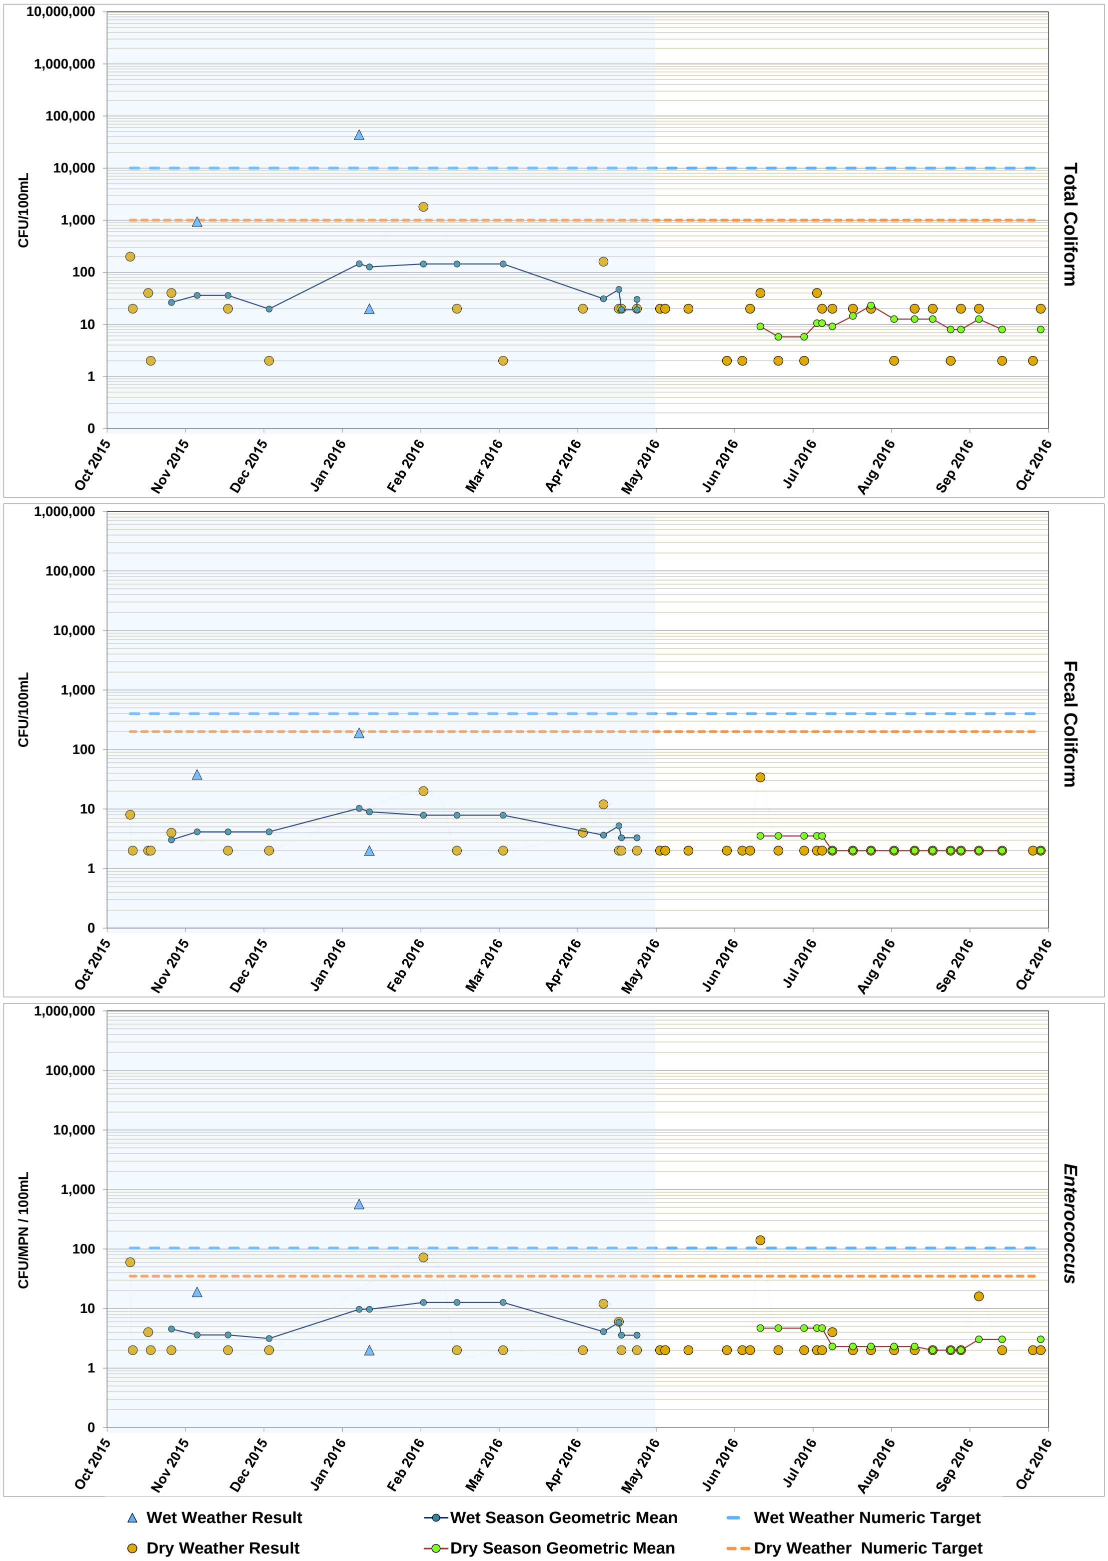

Figure 3-1.
FIB Densities and Geometric Means, 2015–2016 Wet and Dry Season – FM-100

3.6 Progress Toward Attaining Interim and Final Receiving Water Limitations

Table 3-7 depicts the general progress toward meeting interim and final numeric targets by season for the compliance monitoring location in the Los Peñasquitos WMA. This table indicates whether targets for collective FIB have been met (●), have been partially met (**O**), or have not yet been met (**X**). A partially met goal means that at least one of the FIB constituents is meeting the RWL.

**Table 3-7.
General Progress Toward Interim and Final Targets
for Los Peñasquitos Watershed Management Area, 2015–2016**

2015–2016 Wet Weather Single-Sample Maximum		2015–2016 Wet Season Geomeans		2016 Dry Season Geomeans	
Interim	**Final**	**Interim**	**Final**	**Interim**	**Final**
●	●	●	●	●	●

Notes:

● = Currently, interim or final receiving water limitations (RWLs) have been fully achieved.

O = Currently, interim or final RWLs have been partially achieved, but not all compliance constituents have attained the RWL.

X = Currently, no fecal indicator bacteria (FIB) constituents meet Bacteria Total Maximum Daily Load (TMDL) RWL.

4.0 SUMMARY

This section describes current receiving water conditions in the Los Peñasquitos WMA related to the project goals. Dry and wet weather data collected during the 2015–2016 wet season and dry weather data collected during the 2016 dry season were used to evaluate compliance on the basis of current conditions.

4.1 Characterization of Current FIB Concentrations

Overall, full compliance with both interim and final wet weather RWLs was achieved for 2015–2016 wet weather samples. Observed exceedance rates were below the final allowable wet weather exceedance rate of 22% for all compliance constituents.

During the wet season, which evaluates a combination of both wet and dry weather samples using dry weather geometric mean RWLs, 0% exceedance frequencies were achieved for all compliance constituents. Full compliance with both interim and final dry weather RWLs was achieved for the 2015–2016 wet season.

During the dry season, when recreational activities occur with more regularity, 0% exceedance frequencies were achieved for all compliance constituents.

Collectively, these data sets suggest that bacteria densities support water contact recreation beneficial use (REC-1) conditions in the Los Peñasquitos WMA year-round. The 2015–2016 monitoring results are summarized below.

Wet Weather Single-Sample Maximum Comparison

The compliance monitoring location is achieving interim and final wet weather RWLs for all three compliance constituents.

Wet Season Geometric Mean Comparison

The compliance monitoring location is achieving interim and final dry weather RWLs for all three compliance constituents during the wet season.

Dry Season Geometric Mean Comparison

The compliance monitoring location is achieving interim and final dry weather RWLs for all three compliance constituents during the dry season.

Table 4-1 presents the 2015–2016 exceedance rate frequency results by season in the Los Peñasquitos WMA.

This page intentionally left blank

Table 4-1.
2015–2016 Bacteria TMDL Exceedance Frequency Results for Los Peñasquitos River WMA

Site ID	Bacteria TMDL Constituent	Wet Weather [a] Single-Sample Maximum (CFU/100mL)			Wet Season [a, c] 5-Sample Geometric Mean (CFU/100mL)			Dry Season [b] 30-Day Geometric Mean (CFU/100mL)		
		2015–2016 [d] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency	2015–2016 [e] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency	2015–2016 [e] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency
FM-100	Total Coliform	13%	26%	22%	0%	1%	0%	0%	1%	0%
	Fecal Coliform	0%	26%	22%	0%	2%	0%	0%	2%	0%
	Enterococcus	13%	26%	22%	0%	10%	0%	0%	10%	0%

Notes:
% = percent; CFU = colony-forming unit; ID = identification; mL = milliliters; Site ID: FM-100 = Los Peñasquitos River Outlet/Beach; TMDL = total maximum daily load
Green shaded cells show the 2015-2016 observed exceedance frequency.
a. October 1, 2015–April 30, 2016
b. May 1, 2016–September 30, 2016
c. In accordance with the Compliance Monitoring Plan, wet and dry weather FIB data were combined to calculate geometric means for the wet season and compared with dry weather RWLs, as shown in Table ES-1.
d. The exceedance frequency was derived by dividing the total number of wet weather days (days with 0.2 inch of rainfall or greater plus the following 72 hours) that exceeded the single-sample maximum numeric target divided by the total number of wet weather days during the wet season. To determine exceedances for non-sampled wet weather days, the average (interpreted as the geometric mean) of the analytical results from three monitored storm events was applied to the remaining observed wet weather days that were not sampled. The results from the total number of wet weather days, with either assigned averages or analyzed result values, were then compared with single-sample maximum numeric targets.
e. The exceedance frequency was derived by dividing the total number of geometric exceedances by the total number of geometric means calculated during the season.

APPENDIX A

QUALITY ASSURANCE / QUALITY CONTROL SUMMARY

A. QUALITY ASSURANCE/QUALITY CONTROL SUMMARY

This appendix describes the quality assurance/quality control (QA/QC) activities associated with compliance and special study monitoring for the Bacteria TMDL. Some measurement quality objectives (MQOs) and QA/QC activities were fulfilled jointly for the Los Peñasquitos, Scripps, Tecolote Creek, Chollas Creek Compliance, and Chollas Creek Special Study Bacteria TMDL monitoring programs due to the overlapping nature of the five programs. Laboratory QA/QC activities provide information needed to assess laboratory contamination, analytical precision, and analytical accuracy. The QA/QC program includes both field and laboratory components.

A.1 Field Sampling Quality Assurance and Quality Control (QA/QC)

Monitoring and analyses followed Surface Water Ambient Monitoring Program (SWAMP) Quality Assurance (QA) guidelines. SWAMP requires the collection of field blanks in order to evaluate potential contamination and sampling errors, and recommends collection of field duplicates. These samples isolate errors related to grab sampling prior to submittal of the samples to the analytical laboratory. Field sampling protocols can be found in the Bacteria TMDL Project Monitoring Plans and QAPPs[1] for each watershed.

A brief summary of each measurement type is provided below:

Field Blanks

Field blanks verify that field conditions, field sampling activities, and air deposition are not sources of contamination. Field blanks were taken by filling sample bottles with reagent grade, analyte-free deionized water in the field during a sampling event. The samples were then submitted blind to the laboratory for analysis. The project QAPP outlined frequency for field blanks is at least 5 percent of the total sample count. Results of field blank analysis should be below the reporting limit for each analyte.

For the 2015-2016 monitoring year, field blank data for the joint program fulfilled MQOs for accuracy and frequency. All field blank indicator bacteria concentrations were below the reporting limit, which fulfilled the accuracy MQO. Field blank samples were collected at a frequency of 10 percent for *Enterococcus,* fecal coliform, and total coliform and at a frequency of 19 percent for *E. coli*, which fulfilled the frequency MQO. Field blank data are provided in Table A-1.

Table A-1.
Field Blank Results

Analyte	Accuracy MQO	Result	Accuracy MQO Met	Frequency MQO	Frequency Achieved	Frequency MQO Met
Enterococcus	<RL for target analyte	ND	Yes	5% of total project sample count	10%	Yes
Fecal Coliform		ND	Yes		10%	Yes
Total Coliform		ND	Yes		10%	Yes
E. coli		ND	Yes		19%	Yes

[1] Note: The Los Peñasquitos Bacteria TMDL program does not have a standalone QAPP: instead, quality control and quality assurance procedures are defined in the monitoring plan.

Field Duplicates

Field duplicates measure precision and evaluate error introduced by field sampling. Duplicate samples consist of two replicates (an original and a duplicate) of the same matrix collected at the same time and location using the same sampling technique. The project QAPPs outlined frequency for field duplicates is at least 5 percent of the total sample count. The relative percent difference (RPD) was calculated to determine the precision between duplicate samples. This calculation is shown below:

$$RPD = \frac{abs[log(x_1) - log(x_2)]}{0.5 * [log(x_1) + log(x_2)]}$$

Where: abs is the absolute value
x_1 is measurement 1 (primary sample, log-transformed)
x_2 is measurement 2 (e.g., duplicate sample, log-transformed)

Field duplicate samples for the joint program were collected at the following frequencies, all of which satisfied the MQO of 5 percent: 10 percent for *Enterococcus*, fecal coliform, and total coliform*,* and 20 percent for *E. coli*.

For the Los Peñasquitos program, field duplicate RPDs were as follows: average RPD results were 2 percent and 1 percent for *Enterococcus* and fecal coliform, respectively, and average RPD results were 76% for total coliform. *E. coli* was not an analytical constituent for the Los Peñasquitos monitoring location. Though the average RPD for total coliform did not meet the precision MQO of RPD<25%, the duplicate sample pairs responsible for the elevated RPDs were all non-detects, and the elevated RPD was a function of different detection limits between the two duplicate samples, not real results. Thus, the data should not be qualified.

Field duplicate RPD and frequency data are provided in Table A-2 for wet and dry weather samples collected from October 1, 2015 – September 30, 2016.

Table A-2.
Field Duplicate Results

Analyte	Precision MQO	Average RPD Result[a]	Precision MQO Met[a]	Frequency Data Quality Objective	Frequency Achieved	Frequency MQO Met
Enterococcus	RPD<25%[b]	2%	Yes	5% of total project sample count	10%	Yes
Fecal Coliform		1%	Yes		10%	Yes
Total Coliform		76%	No[c]		10%	Yes
E. coli		NA[d]	NA[d]		20%	Yes

Notes:
NA = not analyzed
a. Evaluated using field duplicates collected at the Los Peñasquitos monitoring location only
b. USEPA studies suggest a RPD of less than or equal to 50 percent for field duplicates would be more appropriate for bacteriological methods given the spatial variability of bacteria concentrations in surface waters.
c. The precision MQO was not met because of 3 duplicate pairs where both results in the pair were non-detects, but had different detection limits, which generated an RPD of 125%. Because the sample sets were all in agreement regarding the non-detect, the data are considered valid.
d. *E. coli* is not an analytical constituent for the Los Peñasquitos monitoring location, but was analyzed for some duplcates as part of the joint program.

A.2 Laboratory Quality Assurance and Quality Control (QA/QC)

Laboratory QC samples include laboratory replicates, positive and negative controls as described below. Table A-3 describes the planned frequency and types of quality control samples as outlined in the QAPPs.

Laboratory Replicate – For a laboratory replicate, a sample is prepared and analyzed twice to assess the repeatability (precision). Precision is evaluated by calculating the running mean between the two sets of results for each specific type. A minimum of one laboratory replicate was to be analyzed from each batch per the QAPP.

Per the SWAMP requirements for Indicator Bacteria in Fresh Water published in 2013 and revised in 2015, precision will be measured using the following calculation:

$$R_{log} \leq 3.27 \times \bar{R}$$

To calculate the precision for bacterial analyses, the results from the preceding 15 positive samples of a specific type (matrix) are used to calculate a running mean. The results used to calculate the running mean must all correspond to the same quality control parameter (such as laboratory duplicates). The results of different quality control parameters such as laboratory and field duplicates must not both be used t
o calculate a single running mean.

Step 1:
Record the results from duplicate analyses (these results are here designated as D_1 and D_2).

Step 2:
Calculate the logarithm (here designated as L_1 and L_2) of each duplicate result.
Note: If either of the values D_1 or D_2 are less than 1, add 1 to both values before calculating the logarithms.

$$L_1 = \log D_1$$
$$L_2 = \log D_2$$

Step 3:
Calculate the range of logarithms (R_{log}) for each pair of duplicates. (R_{log}) is equal to the absolute value of the difference between the two numbers.

$$(R_{log}) = |L_1 - L_2|$$

Step 4:
Calculate the mean of R_{log} $(\bar{R})$ for the duplicates analyzed

$$\bar{R} = \frac{\sum R_{log}}{n}$$

where

$\sum R_{log}$ = the sum of the ranges of logarithms calculated for each pair of duplicates *n* = the number of pairs of duplicates (in this case, *n* = 15)

Step 5:
Assess the precision of the duplicate analyses.

In order for the laboratory to demonstrate an acceptable level of precision, the range of logarithms for a particular duplicate must be less than the mean of the range of logarithms multiplied by 3.27.

$$R_{log} \leq 3.27 \times \bar{R}$$

Positive and Negative Controls –A positive control is generated by analyzing a matrix known to contain the target bacteria (such as wastewater influent), which is filtered and incubated the same way as a sample. Target bacteria growth should be observed on the filter after incubation. A positive control is used to detect procedural errors or the presence of contaminants in the laboratory analysis that might inhibit bacteria growth (USEPA, 2012). A negative control is generated by analyzing the buffered rinse water, which is filtered and incubated the same way as a sample. There should be no growth on the negative control plates after incubation. A negative control is used to detect laboratory contamination of the analyses.

Table A-3.
Laboratory QC

Constituent Category	Method Blanks	
	Frequency	Acceptance Limits
Laboratory Replicate	One per 20 samples or analytical batch, whichever is more frequent	$R_{log} \leq 3.27 \times \bar{R}$
Positive and Negative Controls	Per batch of bottles or reagents	Positive Control = Growth on filter; Negative Control = No growth on filter

Laboratory QC–Dry Weather:

Dry weather sample analyses were conducted in full by the City of San Diego Environmental & Technical Services (EM&TS) Laboratory. Dry weather QA/QC data were generated daily for each method used, including laboratory replicates and positive and negative controls (including dilution blanks and media controls), unless otherwise noted. Additional sample volume was collected in the field at the discretion of the City of San Diego field staff and submitted to the EM&TS Laboratory for replicate analyses throughout the monitoring program. Dry weather QA/QC data, sample types and results for the joint program are summarized in Table A-4.

Table A-4.
Dry Weather Quality Control Results

Analyte	Accuracy			
	Positive Control	Negative Control	Dilution Blank	Media Control
Enterococcus[a]	100% Pass	100% Pass	100% Pass	100% Pass
Fecal Coliform[b]	100% Pass	100% Pass	Not Analyzed	100% Pass
Total Coliform[b]	100% Pass	100% Pass	100% Pass	100% Pass
E. coli[c]	100% Pass	98% Pass[d]	Not Analyzed	100% Pass

a. 2 batches not run for EPA 1600 controls
b. 6 batches not run for SM 9222B/D controls
c. 3 batches not run for SM 9223B controls.
d. One lab batch (9/7/16) failed negative control tests. Contaminated tests were re-run and passed.

Laboratory QC–Wet Weather:

Wet weather sample analyses were conducted by Weck Laboratories and the City of San Diego EM&TS Laboratory. Wet weather laboratory QA/QC for the joint program included laboratory replicates, positive and negative controls, and method blanks.

Weck Laboratories analyzed positive controls, negative controls, and filter blanks as method blanks for wet weather events on November 4 and November 6, 2015, and January 9, 2016. The City of San Diego EM&TS Laboratory analyzed media and dilution blanks as method blanks for all other wet weather events. Method blanks were analyzed during each wet weather event (batch) and reported with the analytical results. All method blank QA/QC data for Weck Laboratories and EM&TS Laboratory were reported as below the reporting limit. Wet weather QA/QC data, sample types and results are summarized in Table A-5.

Table A-5.
Wet Weather Quality Control Results

Analyte	Accuracy		
	Positive[a] Control	Negative[a] Control	Method[a] Blank
Enterococcus	100% Pass	100% Pass	100% Pass
Fecal Coliform	100% Pass	100% Pass	100% Pass
Total Coliform	100% Pass	100% Pass	100% Pass
E. coli	100% Pass	100% Pass	100% Pass

Notes:
a. Data is combined from both Weck Laboratories and City of San Diego EM&TS Laboratory.

Laboratory QC–Precision:

Per recent updates to the SWAMP QA guidelines for indicator bacteria in freshwater, and as described above, log-transformation has been incorporated into laboratory precision MQOs for Bacteria TMDL analyses. The precision results for combined dry and wet weather laboratory replicates are presented in Table A-6. The acceptance rates for laboratory precision were 86, 88, 88, and 95 percent for *Enterococcus*, fecal coliform, and total coliform, and *E. coli*, respectively.

The higher precision observed for *E. coli* compared to the other constituents is potentially related to the method type. *Enterococcus,* fecal coliform, and total coliform are all analyzed by membrane filtration methods, where the bacteria are cultured and counted directly: thus, any positive integer result is possible. The *E. coli* method is a most probable number (MPN) method, where the sample is mixed with media and incubated in a multi-celled tray. The tray cells are then counted as positive or negative: an MPN table converts the number of positive cells into a result. Because of the use of the MPN table, the number of possible results is limited and may explain the higher precision. Laboratory replicates that did not meet precision criteria typically had low concentrations near the reporting limit, where variability is higher than normal.

Table A-6.
Lab Replicate Precision Acceptance Results

Analyte	Precision Acceptance Rate
Enterococcus	86%
Fecal Coliform	88%
Total Coliform	88%
E. coli	95%

APPENDIX B

2015–2016 WET WEATHER ANALYTICAL RESULTS

Table B-1.
2015–2016 Wet Weather Field Parameters and Analytical Results for FM-100

Analyte	Units	WQO	Method	MDL/RL[a]	FM-100 WW1 11/6/2015	FM-100 WW2 01/09/2016	FM-100 WW3 02/03/2016

The results in this report apply to the samples analyzed in accordance with the Chain of Custody document. Weck Laboratories, Inc. certifies that the test results meet all NELAC requirements unless noted in the case narrative. This analytical report is confidential and is only intended for the use of Weck Laboratories, Inc. and its client. This report contains the Chain of Custody document, which is an integral part of it, and can only be reproduced in full with the authorization of Weck Laboratories, Inc.

Dear Roshan Christoph :

Enclosed are the results of analyses for samples received 11/06/15 15:55 with the Chain of Custody document. The samples were received in good condition, at 3.8 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

Case Narrative:
Quality Controls ran on 11/6/15 are as follows:
Total and Fecal Coliform ws spiked with E. coli was positive
Enterococcus was spiked with E. faecalis was positive
Blanks were all Non-Detected

This report contains the Chain of Custody document, which is an integral part of it, and can only be reproduced in full with the authorization of Weck Laboratories, Inc.

Dear Roshan Christoph :

Enclosed are the results of analyses for samples received 01/09/16 16:58 with the Chain of Custody document. The samples were received in good condition, at 3.8 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

Case Narrative:
Quality Controls ran on 1/09/16 are as follows:
Total and Fecal Coliform ws spiked with E. coli was positive
Enterococcus was spiked with E. faecalis was positive
Blanks were all Non-Detected

Notes and Definitions

ND	NOT DETECTED at or above the Reporting Limit. If J-value reported, then NOT DETECTED at or above the Method Detection Limit (MDL)
NR	Not Reportable
Dil	Dilution
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
% Rec	Percent Recovery
Sub	Subcontracted analysis, original report available upon request
MDL	Method Detection Limit
MDA	Minimum Detectable Activity
MRL	Method Reporting Limit

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California Department of Health Services.

The Reporting Limit (RL) is referenced as the Laboratory's Practical Quantitation Limit (PQL) or the Detection Limit for Reporting Purposes (DLR).

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

APPENDIX F

BACTERIA TMDL AND MS4 PERMIT DISCREPANCIES

F.1 Inconsistencies in Bacteria Total Maximum Daily Load (TMDL) Requirements (Attachment E.6)

The Bacteria TMDL Compliance Monitoring Program and this compliance monitoring report are designed to address the monitoring and assessment requirements defined in Attachment E.6.6 of the MS4 Permit. A number of inconsistencies were identified that may affect the interpretation of compliance.

<u>MS4 Permit Monitoring and Assessment</u>:

This report includes three compliance evaluations outlined in Sections 2.7 through 2.9, based on the MS4 Permit assessment requirements *(*San Diego Regional Water Quality Control Board [Regional Board], 2013*,* page E-49).

There is discrepancy between Table 6.2b–*Final Receiving Water Limitations Expressed as Bacteria Densities and Allowable Exceedance Frequencies for Creeks (Regional Board, 2013,* page E-32) and Table 6.5–*Interim Wet Weather Receiving Water Limitations Expressed as Interim Wet Weather Allowable Exceedance Frequencies (Regional Board, 2013,* page E-44).

As a clarification to the TMDLs, Table 6.2b in the MS4 Permit clarifies the final receiving water limitations (RWLs) for fecal coliform and *Enterococcus* and removes total coliform as a numeric target for creeks. However, Table 6.5 still includes a 41 percent interim wet weather allowable exceedance frequency for total coliform.

There is discrepancy between the monitoring procedures and assessment requirements. The sampling frequency defined in the monitoring procedures would provide insufficient data to complete the dry season geometric mean assessment requirement. The following are summaries of the MS4 Permit requirements and how the monitoring program addressed the discrepancies:

- The monitoring procedures of MS4 Permit Attachment E.6 require dry weather samples at creeks to be consistent with those of receiving monitoring stations in accordance with Provision D of the MS4 Permit as stated in Provision E.6.d(2)b.(i) (Regional Board, 2013, page E-50). Provision D of the MS4 Permit requires three dry weather monitoring events at receiving water stations.
- The assessment requirements for dry weather geometric mean exceedance frequencies state that the method and number of samples must be consistent with the requirements of the Basin Plan, which requires 5 samples per 30 days (Regional Board, 2010). The wet season geometric mean evaluation requirements do not stipulate that the Basin Plan methodology be applied.
- The Bacteria TMDL Monitoring Program was designed to generate the data needed to complete the assessment requirements. Dry weather monitoring was conducted at a higher frequency than required by the Bacteria TMDL monitoring procedures. Dry weather monitoring was conducted weekly during the dry season and monthly during the wet season to compare results with the dry weather geometric mean numeric targets.

There is an inconsistency between RWLs and assessment requirements that is traced back to inconsistencies between written requirements and tables in the Bacteria TMDL. The assessment section does not require a calculation of single-sample maximum (SSM) exceedances for dry weather. The following are summaries of the MS4 Permit requirements and how the monitoring program addressed the discrepancies:

- The assessment section requires exceedance frequencies to be calculated for dry season geometric means, wet season geometric means, and wet weather SSMs. The assessment requirements of the MS4 Permit are reinforced by the table of RWLs for creeks and the discussion of numeric targets, as presented in the Bacteria TMDL (Regional Board, 2010, pages A52 and A13, respectively).
- The footnotes of Table 6.2b of the MS4 Permit state that for "*dry weather days, the single sample maximum and 30-day geometric mean receiving water limitations are required to be achieved" and "wet weather days, only the single sample maximum receiving water limitations are required to be achieved" (*Regional Board, 2013, page E-32). These are not consistent with the footnotes for the same table presented in the Bacteria TMDL. The footnotes in the MS4 Permit are reinforced by the discussion of compliance with dry weather TMDLs described in the Bacteria TMDL, which states that, "*In addition to geometric means, the bacteria densities must be consistent with the SSM REC-1 WQOs in the Basin Plan for creeks.*"
- The Bacteria TMDL Compliance Monitoring Program was designed to generate the data needed to complete the assessment requirements.

The MS4 Permit assessment section clearly defines an evaluation of wet season geometric means that includes wet weather sampling results and dry weather sampling results. This assessment applies the dry weather numeric target to a data set that includes storm samples.

Notes:
< = Analyte not detected at method detection limit shown; J = Analyte detected above the method detection limit but below the reporting limit; e = CFU/100mL, estimated value, plate count falls outside recommended reporting limits per EPA method guidelines; NA = Not Analyzed; NR = Not Required, * = CFU; ** = Laboratory methods for Chromium (III) and Chromium (VI) require filtering the sample; therefore, the dissolved and total fractions of Chromium (III) and Chromium (VI) are equal; ***NAL analyte not required for Ocean Receiving Waters; **** = Nitrite and nitrate can be analyzed separately or together (Table D-7, MS4 Permit)

Attachment D.2 – Major MS4 Outfall Dry Weather Visual Observation Data

(Electronic Submittal)

Intentionally Left Blank

Major MS4 Outfall Dry Weather Monitoring Data Files

The following dry weather MS4 outfall data files are included in this attachment:

- County of San Diego Non-Major MS4 Outfall Dry Weather Visual Observation Data (County of San Diego has no major MS4 outfalls in Los Peñasquitos WMA)
- City of Del Mar Major MS4 Outfall Dry Weather Visual Observation Data
- City of Poway Major MS4 Outfall Dry Weather Visual Observation Data
- City of San Diego Major MS4 Outfall Dry Weather Visual Observation Data

All data files are referenced in the Monitoring Results and Assessment Appendix C.

Intentionally Left Blank

Attachment D.3 – Dry Weather Assessment Methodology

Intentionally Left Blank

1 Assessment of Dry Weather Outfall Monitoring Results

In 2013 the San Diego Regional Water Quality Control Board (Regional Board) issued *Order No. R9-2013-0001 (amended by Order Nos. R9-2015-0001 and R9-2015-0100), National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region*, herein referred to as the MS4 Permit, regulating MS4 discharges throughout the San Diego Region. The MS4 Permit requires a series of dry weather MS4 outfall assessments be performed annually to assess and report the progress of each Copermittee toward effectively prohibiting non-storm water and illicit discharges into the MS4 within its jurisdiction. This Attachment describes the methodology used to perform these required assessments.

Dry weather monitoring requirements are not discussed here, and can be found in the MS4 outfall monitoring plan for each Watershed Management Area (WMA). MS4 outfall monitoring plans are available through Project Clean Water (www.projectcleanwater.org).

Per MS4 Permit Provision D.4.b(1)(b), Copermittees will annually assess and/or report the following, beginning in the Transitional Monitoring Annual Reports and continuing in the Water Quality Improvement Plan Annual Reports:

(i) The known and suspected controllable sources (e.g. facilities, areas, land uses, pollutant generating activities) of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area;

(ii) Sources of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area that have been reduced or eliminated; and

(iii) Modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges pursuant to Provision D.2.b.

The following additional assessments, listed in Permit Provision D.4.b(1)(c), are required in the Water Quality Improvement Plan Annual Reports:

(i) The assessments listed in Provision D.4.b.(1)(b);

(ii) Based on the data collected and applicable NALs [non-storm water action levels] in the Water Quality Improvement Plan, rank the MS4 outfalls in the Copermittee's jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action to update the Water Quality Improvement Plan, with the goal of eliminating persistent flow non-storm water discharges and/or pollutant loads in order of the ranked priority list through targeted programmatic actions and source investigations;

(iii) For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identify the known and suspected sources within the Copermittee's jurisdiction in the Watershed Management Area that may cause or contribute to the NAL exceedances;

(iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b, and utilize a model or other method, to calculate or estimate the non-storm water

volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually.

[a] Each Copermittee must calculate or estimate the annual non-storm water volumes and pollutant loads collectively discharged from the Copermittee's major MS4 outfalls to receiving waters within the Copermittee's jurisdiction, with an estimate of the percent contribution from each known source for each MS4 outfall; and

[b] Each Copermittee must annually identify and quantify (i.e. volume and pollutant loads) sources of non-storm water not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.

The sections that follow describe the assessments in greater detail. Within each section are references to the data sources used in each assessment; these are suggestions for regional consistency, and additional supporting data may be used as necessary. Data sources are provided [within brackets] and include the following:

- Jurisdictional MS4 outfall inventory;
- Jurisdictional Illicit Discharge Detection and Elimination (IDDE) investigation results and follow-up actions;
- Jurisdictional Runoff Management Program (JRMP) Annual Report Forms; and
- Dry Weather MS4 Data Sharing Template (Data Sharing Template) results.

2 Provision D.4.b.(1)(b) Assessments

2.1 Persistent Flow Classification

As part of the MS4 Outfall Discharge Monitoring Station Inventory required by Permit Provision D.2.a(1), each Copermittee must identify all major outfalls that discharge directly to receiving waters within its jurisdiction in the WMA. Each Copermittee must maintain the following information for each major MS4 outfall:

- Latitude and longitude of MS4 outfall point of discharge;
- Watershed Management Area;
- Hydrologic subarea;
- Outlet size;
- Accessibility (i.e. safety and without disturbance of critical habitat);
- Approximate drainage area; and
- Classification of whether the MS4 outfall is known to have persistent dry weather flows, transient dry weather flows, no dry weather flows, or unknown dry weather flows.

Copermittees regularly update this information and include the geo-located outfalls on an MS4 map as part of their JRMP. The accuracy of the MS4 map must be confirmed during field screening monitoring. The frequency with which each Copermittee must field screen the MS4 outfalls in its inventory varies according to the number of major MS4 outfalls discharging from a Copermittee's jurisdiction to receiving waters within the region and within each WMA. The frequency of required field screening is outlined in MS4 Permit Provision D.2.a.(2)(a).

A summary of the updated persistent flow classification will also be reported in the Water Quality Improvement Plan Annual Report. This information will include the number of persistent, transient, dry, and unknown dry weather flow sites for each jurisdiction [Data Sharing Template, "Station Information" tab, "Current Flow Classification" column]. These flow classifications can be defined as the following:

- Persistent - having flowing, pooled, or ponded water more than 72 hours after a measurable rainfall event of 0.1 inch or greater during the three consecutive most recent monitoring and/or inspection events;
- Transient - having flowing, pooled, or ponded water during at least one but not on all three most recent consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation ≥ 0.1 inch;
- Tidal - persistent or transient flow with ocean tides as the source;
- Dry - having no flowing, pooled, or ponded water during the last three consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation ≥ 0.1 inch; and
- Unknown - site cannot be evaluated, or has not been visited enough times to determine flow status.

2.2 Known and Controllable Source Categorization

As described in Provision E.2 of the MS4 Permit, each Copermittee must seek to identify the source(s) of non-storm water discharge from their MS4, where there is evidence of non-storm water having been discharged into or from the MS4 [i.e., ponding or flow, in the absence of wet weather]. In the Water Quality Improvement Plan Annual Reports, the Copermittees will categorize the known and suspected controllable sources of transient and persistent flows within their jurisdiction in the WMA. As part of this categorization, each Copermittee will report the number of major outfalls within its jurisdiction in the WMA, the number of dry weather visual inspections performed in the monitoring year (October 1 through September 30), and the following additional information:

1) The number of sites with flowing or ponded observations in the monitoring year [Data Sharing Template, “Visual Observation” tab, “Flow Status” column];
2) Whether the sources of flow at the identified flowing and/or ponded sites are known or suspected [Data Sharing Template, “Runoff Sources” tab, “Runoff Sources Suspected or Known?” column];
3) If the source of flow is known or suspected, whether it is:
    a. Authorized by a separate NPDES Permit [Data Sharing Template, “Runoff Sources” tab, “NPDES Allowable Discharge”/ column];
    b. Identified as a category of non-storm water discharge that must be addressed as an illicit discharge, based on Provision E.2.a of the MS4 Permit [Data Sharing Template, “Runoff Sources” tab, “Unpermitted Discharge” column]; or
    c. Identified as a category of non-storm water discharge that is not controllable by the Copermittee (e.g., ground water seepage) [Data Sharing Template, “Runoff Sources” tab, “Unpermitted Discharge” column].

It should be noted that a site with flowing or ponded observations may have multiple known or suspected sources of flow. For example, a site may be impacted by both irrigation runoff and groundwater seepage.

2.3 Dry Weather Flow Elimination Assessment

As described in their Jurisdictional Runoff Management Plans (JRMPs), each Copermittee must initiate the implementation of procedures, in a timely manner, to eliminate all detected and identified illicit discharges and connections within its jurisdiction. If the Copermittee identifies the source of illicit discharge or connection as controllable, the Copermittee must implement its Enforcement Response Plan as described in its JRMP. Copermittees will submit a summary of the non-storm water discharges and illicit discharges and connections eliminated within its jurisdiction in the previous monitoring year as part of the JRMP Annual Report Form (Permit Attachment D, Section IV). Specific investigations initiated through monitoring are compiled [Data Sharing Template, “Runoff Sources” tab, “Was Flow Source Eliminated” column; Jurisdictional IDDE investigation forms (optional)] and summarized in the Water Quality Improvement Plan Annual Report Monitoring and Assessment Appendix.

2.4 Field Screening Modifications

Copermittees will identify modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges pursuant to Provision D.2.b.

Modifications to the field screening monitoring locations will be reported in the Water Quality Improvement Plan Annual Reports [Data Sharing Template, "Station Information" tab, "Modifications to Locations and Frequencies Necessary to Identify and Eliminate Sources of Flow D.4.b.(1).(b).(iii)" column].

Intentionally Left Blank

3 Provision D.4.b.(1)(c) Assessments

3.1 Dry Weather MS4 Outfall Prioritization

Based on the data collected and applicable NALs in the Water Quality Improvement Plan, each Copermittee will rank the MS4 outfalls in the their jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action. The prioritization will be conducted annually by each Copermittee and will include at least five highest priority major MS4 outfalls with non-storm water persistent flows, per WMA, that will be monitored in the subsequent monitoring year. If a Copermittee has fewer than five major MS4 outfalls with non-storm water persistent flows in the WMA, all the Copermittee's persistently flowing sites in the WMA will be monitored. For Copermittee's identified as responsible parties to a TMDL in Attachment E of the MS4 Permit, additional highest priority outfall monitoring locations may be selected if five sites are not sufficient to determine compliance with the TMDL.

Each Copermittee's prioritization methodology may differ. Data that will be used in the prioritization may include but are not limited to:

- Persistent flow status (defined as evidence of flow in each of the 3 most recent visual inspections) [Data Sharing Template, "Station Information" tab, "Current Flow Classification" column];
- Receiving water connectivity [Data Sharing Template, "Visual Observations" tab, "Flow Reaches Receiving Water" column];
- Potential to contribute to Highest Priority Water Quality Condition [Data Sharing Template, "Laboratory Data" tab];
- NAL exceedance [Data Sharing Template, "Laboratory Data" tab];
- Historical data; and
- Data not collected by the Copermittees.

The updated prioritization will be included in the Water Quality Improvement Plan Annual Reports, with explanations for any sites that have been added or removed from the Copermittee's list of highest priority outfalls. Once a site has been identified as highest priority, it may only be removed from the prioritization for one of the following reasons identified in Provision D.2.B.(2).(b).(ii) of the MS4 Permit:

- The non-storm water discharges have been effectively eliminated (i.e. no flowing, pooled, or ponded water) for three consecutive dry weather monitoring events; or
- The source(s) of the persistent flows has been identified as a category of non-storm water discharges that does not require an NPDES permit and does not have to be addressed as an illicit discharge because it was not identified as a source of pollutants (i.e. constituents in non-storm water discharge do not exceed NALs), and the persistent flow can be re-prioritized to a lower priority; or
- The constituents in the persistent flow non-storm water discharge do not exceed NALs, and the persistent flow can be re-prioritized to a lower priority; or

- The source(s) of the persistent flows has been identified as a non-storm water discharge authorized by a separate NPDES permit.

If a site has been removed from the list of five highest priority outfalls, it will be replaced with the Copermittee's next highest priority major MS4 outfall in the WMA, unless there are fewer than five persistently flowing major MS4 outfalls remaining.

3.2 Analysis of NAL Exceedance

Each major MS4 outfall identified as a highest priority persistently flowing outfall will be monitored under dry conditions at least semi-annually. The semi-annual monitoring event includes field observations, field monitoring, and analytical monitoring, including monitoring of NAL constituents. NALs are based on the receiving water type, and different NALs will be applicable to different outfalls in each WMA, depending on whether the outfall discharges to ocean receiving waters, bays, harbors, lagoons, estuaries, or inland streams and rivers. The NALs are presented in tables in the MS4 Permit by receiving water type, as follows:

- Ocean Surf Zone:
  - Table C-1: total coliform, fecal coliform, and *Enterococcus*.
- Bays, Harbors, and Lagoons/Estuaries:
  - Table C-2: turbidity, pH, fecal coliform, *Enterococcus*, and priority pollutants from Table C-3 (cadmium, copper, chromium III, chromium VI, lead, nickel, silver, and zinc).
- Inland Surface Waters:
  - MS4 Permit Table C-4: dissolved oxygen, turbidity, pH, fecal coliform, *Enterococcus*, total nitrogen, total phosphorus, methylene blue active substance (MBAS), iron, manganese, and priority pollutants from Table C-3 (cadmium, copper, chromium III, chromium VI, lead, nickel, silver, and zinc).

The NALs from the MS4 Permit tables are replicated in Tables 3-1 through 3-4. The Water Quality Improvement Plans may include additional WMA-specific NALs related to the highest priority water quality conditions in that WMA, or any applicable TMDLs in Attachment E of the MS4 Permit.

Table C.2-1
Non-Storm Water Action Levels for Discharges from MS4s to Ocean Surf Zone

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100mL	1,000	–	10,000/1,000[1]	OP
Fecal Coliform	MPN/100mL	200[2]	–	400	OP
Enterococcus	MPN/100mL	35	–	104[3]	OP

AMAL = average monthly action level; MDAL = maximum daily action level; OP = Ocean Plan water quality objective; MPN/100mL = most probable number per 100 milliliters

1. Total coliform density NAL is 1,000 MPN/100 mL when the fecal/total coliform ratio exceeds 0.1.
2. Fecal coliform density NAL is 200 MPN/100mL during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas."

Table C.2-2
Non-Storm Water Action Levels for Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Turbidity	NTU	75	–	225	OP
pH	Units	Within limit of 6.0 to 9.0 at all times.			OP
Fecal Coliform	MPN/100mL	200[1]	–	400[2]	BP
Enterococcus	MPN/100mL	35	–	104[3]	BP
Priority Pollutants	µg/L	See Table 3-4			

BP = Basin Plan water quality objective; µg/L = microgram per liter.

1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN/100mL during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas" and is not applicable to water bodies that are not designated with the water contact recreation (REC-1) beneficial use.

Table C.2-3
Non-Storm Water Action Levels for Discharges from MS4s to Inland Surface Waters

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Dissolved Oxygen	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters.			BP
Turbidity	NTU	–	20	See MDAL	BP
pH	Units	Within limit of 6.5 to 8.5 at all times.			BP
Fecal Coliform	MPN/100mL	200[1]	–	400[2]	BP
Enterococcus	MPN/100mL	33	–	61[3]	BP
Total Nitrogen	mg/L	–	1.0	See MDAL	BP
Total Phosphorus	mg/L	–	0.1	See MDAL	BP
MBAS	mg/L	–	0.5	See MDAL	BP
Iron	mg/L	–	0.3	See MDAL	BP
Manganese	mg/L	–	0.05	See MDAL	BP
Priority Pollutants	µg/L	See Table 3-4			

WARM = warm freshwater habitat beneficial use; COLD = cold freshwater habitat beneficial use;

MBAS = Methylene Blue Active Substance

1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN/100mL during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater “designated beach areas” and is not applicable to water bodies that are not designated with the water contact recreation (REC-1) beneficial use.

Table C.2-4
Non-Storm Water Action Levels for Priority Pollutants

Parameter	Units	Freshwater (CTR)		Saltwater (CTR)	
		MDAL	AMAL	MDAL	AMAL
Cadmium	µg/L	**	**	16	8
Copper	µg/L	*	*	5.8	2.9
Chromium III	µg/L	**	**	–	–
Chromium VI	µg/L	16	8.1	83	41
Lead	µg/L	*	*	14	2.9
Nickel	µg/L	**	**	14	6.8
Silver	µg/L	*	*	2.2	1.1
Zinc	µg/L	*	*	95	47

CTR = California Toxics Rule

* Action levels developed on a case-by-case basis (see below).

** Action levels developed on a case-by-case basis (see below), but calculated criteria are not to exceed Maximum Contaminant Levels (MCLs) under the California Code of Regulations, Title 22, Division 4, Chapter 15, Article 4, Section 64431.

The Cadmium, Copper, Chromium (III), Lead, Nickel, Silver, and Zinc NALs for MS4 discharges to freshwater receiving waters will be developed on a case-by-case basis based on site-specific water quality data (receiving water hardness). For these priority pollutants, refer to 40 CFR 131.38(b)(2).

For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, Copermittees will identify the known and suspected sources within the Copermittee's jurisdiction in the WMA that may cause or contribute to the NAL exceedances [Data Sharing Template, "Runoff Sources" tab; Jurisdictional IDDE forms].

3.3 Non-Storm Water Volume and Pollutant Load Assessment

Each Copermittee must analyze the data collected under the Dry Weather MS4 Outfall Discharge Monitoring program, and utilize a model or other method to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually.

3.3.1 Identification of Dry Weather Days

The first step in calculating annual non-storm water volumes and pollutant loads is to determine the number of dry weather days in the monitoring year. The number of dry weather days will be determined using County of San Diego ALERT Station Data (https://sandiego.onerain.com). A single ALERT Station will be selected to represent rainfall conditions in each WMA. This representative ALERT Station will be the same station utilized in Wet Weather MS4 Outfall Discharge Monitoring Assessments, and will be the station that is closest to a majority of wet weather MS4 outfall discharge monitoring stations. This station may vary each year, depending on the wet weather MS4 outfall discharge stations monitored and the availability of ALERT Station data.

A wet weather day is defined as any day with at least 0.1 inches of measurable rainfall within a 24-hour period, and the subsequent 72 hours. A dry weather day will be defined as all other days during the monitoring year (October 1-September 30).

3.3.2 Non-Storm Water Volume Assessment

An annual non-storm water volume will be assigned to each persistently flowing major MS4 outfall station in the Copermittee's jurisdiction in the WMA. This annual non-storm water volume will be calculated by summing a daily flow volume for each persistently flowing major MS4 outfall station across each dry weather day. The following guidelines will be applied:

- ❖ Scenario A: If a major MS4 outfall station was visited once during the monitoring year, and a single discrete flow rate was measured, this flow rate will be applied across all dry weather days within the year. In Scenario A, the following equations will be applied.

$$V_{Daily} = Q \times 86{,}400$$
$$V_{Annual\_Outfall} = V_{Daily} \times (\#Dry\ Days)$$

Where:

V_{Daily} = Daily flow volume from MS4 Outfall (cubic feet)

Q = Monitored outfall flow rate (cfs)

86,400 = Conversion Factor, seconds per day

$V_{Annual\_Outfall}$ = Annual flow volume from MS4 Outfall (cubic feet)

$\#Dry\ Days$ = Number of dry weather days as assessed at the applicable County ALERT Station

- ❖ Scenario B: If a major MS4 outfall station was visited more than once during the monitoring year, and more than one discrete flow rate was measured, monthly dry weather flow volumes will be calculated. The monthly flow volume calculation method will vary based on whether a flow measurement was logged at the outfall during that month. For calendar months in which the outfall was visited one or more times, the mean of the measured flow rates will be applied to all dry weather days within the month. For calendar months in which the outfall was not visited, the mean of all flow rates observed at that site during the calendar year will be applied. In Scenario B, the following equations will be applied.

For each month in the monitoring year with at least one site visit and corresponding instantaneous flow estimate:

$$V_{Month\_Mon} = \frac{\sum Q_{n\_Month}}{n_{Month}} \times 86{,}400 \times (\#Dry\ Days/month)$$

For each month in the monitoring year with no site visits or instantaneous flow estimates:

$$V_{Month\_NonMon} = \frac{\sum Q_{n\_Year}}{n_{Year}} \times 86{,}400 \times (\#Dry\ Days/month)$$

To calculate an annual dry weather flow volume:

$$V_{Annual\_Outfall} = \sum V_{Month\_Mon} + \sum V_{Month\_NonMon}$$

Where:

V_{Month_Mon} = Monthly flow volume from MS4 Outfall during month when outfall was visited one or more times (cubic feet)

Q_{n_Month} = Monitored outfall flow rate during visual observation event "n", during month when outfall was visited one or more times (cfs)

n_{Month} = Number of site visits with instantaneous flow measurements during month when outfall was visited one or more times

86,400 = Conversion Factor, seconds per day

$\#Dry\ Days$ = Number of dry weather days as assessed at the applicable County ALERT Station

V_{Month_NonMon} = Monthly flow volume from MS4 Outfall during month when outfall was not visited (cubic feet)

Q_{n_Year} = Monitored outfall flow rate during visual observation event "n", during monitoring year (cfs)

n_{Year} = Number of site visits with instantaneous flow measurements during monitoring year

$V_{Annual\_Outfall}$ = Annual flow volume from MS4 Outfall (cubic feet)

❖ Scenario C: If a major MS4 outfall station was monitored continuously for a period of time longer than a day, a measured daily flow volume will be calculated for each monitored day. The mean of these daily flow volumes will be applied to all non-monitored dry days. In Scenario C, the following equations will be applied.

$$V_{Daily\_n} = Measured\ Daily\ Flow\ Volume$$

$$V_{Daily\_Mean} = \frac{\sum V_{Daily_n}}{n}$$

$$V_{Annual\_Outfall} = \sum V_{Daily\_n} + V_{Daily\_Mean} \times (\#Dry\ Days - n)$$

Where:

V_{Daily_n} = Daily flow volume from MS4 Outfall during dry weather day with a continuous flow monitoring event (cubic feet)

V_{Daily_Mean} = Mean of measured daily outfall flow volumes (cubic feet)

n = number of dry days of continuous flow data at the outfall

$V_{Annual\_Outfall}$ = Annual flow volume from MS4 Outfall (cubic feet)

$\#Dry\ Days$ = Number of dry weather days as assessed at the applicable County ALERT Station

- Scenario D: If a major MS4 outfall station was not visited during the monitoring year, the mean of annual outfall flow volumes for all monitored stations in the jurisdiction in the WMA will be applied.

When the annual dry weather flow volume has been calculated for each persistently flowing major MS4 outfall within the jurisdiction within the WMA, a Copermittee's annual non-storm water volume will be calculated by summing the annual dry weather flow volume for each persistently flowing outfall.

Within all the above scenarios, observations of ponding (i.e., evidence of non-storm water in the MS4, with no connectivity to the receiving water) will be assigned a flow rate of zero.

The methodology above assumes that a persistently flowing major MS4 outfall is flowing on 100% of dry weather days. This assumption is highly conservative.

3.3.3 Non-Storm Water Pollutant Load Assessment

The Copermittees will estimate the annual non-storm water pollutant loads collectively discharged from their persistently flowing major MS4 outfalls to receiving waters in the MS4. A load will be calculated for each pollutant analyzed at each high priority outfall, based on the arithmetic mean of the analytical results from the two dry weather outfall monitoring events at that outfall during the monitoring year. The following equation will be applied:

$$Pollutant\ Load_{Annual} =$$
$$\left(V_{Annual} \times \frac{Pollutant\ Concentration_{Event1} + Pollutant\ Concentration_{Event2}}{2}\right) \times \mathrm{UC}$$

Where:
$Pollutant\ Load_{Annual}$ = Annual dry weather pollutant load from monitored outfall (lb or MPN)
V_{Annual} = Annual flow volume from MS4 outfall (cubic feet)
$Pollutant\ Concentration_{Event1}$ = Pollutant concentration measured at the outfall during dry weather monitoring event 1 (units vary)
$Pollutant\ Concentration_{Event2}$ = Pollutant concentration measured at the outfall during dry weather monitoring event 2 (units vary)
UC = Unit Conversion. Varies according to units used to express pollutant concentration, but common conversions are:

a. mg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\,g}{1000mg}\right)\left(\frac{1\,lb}{453.592\,g}\right)$
b. µg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\,g}{1{\times}10^6\mu g}\right)\left(\frac{1\,lb}{453.592\,g}\right)$
c. MPN/100mL: $UC = \left(\frac{100mL}{0.1L}\right)\left(\frac{28.317L}{1ft^3}\right)$

For each non-high priority persistently flowing outfall in a Copermittee's jurisdiction in the WMA, the mean of that Copermittee's monitored outfall results for each pollutant will be applied. It should be noted that only analytical data for outfalls that were identified as persistently flowing during the monitoring year will be included in the mean. In this case, the following equation will be applied:

$$Pollutant\ Load_{Annual} = \left(V_{Annual} \times Pollutant\ Concentration_{Mean}\right) \times \mathrm{UC}$$

Where:

$Pollutant\ Load_{Annual}$ = Annual dry weather pollutant load from non-monitored outfall (lb or MPN)

V_{Annual} = Annual flow volume from MS4 outfall (cubic feet)

$Pollutant\ Concentration_{Mean}$ = Mean pollutant concentration measured across high priority persistently flowing outfalls within the Copermittee's jurisdiction in the WMA during the monitoring year (units vary)

UC = Unit Conversion. Varies according to units used to express pollutant concentration, but common conversions are:

a. mg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\ g}{1000mg}\right)\left(\frac{1\ lb}{453.592\ g}\right)$
b. µg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\ g}{1\times10^6 \mu g}\right)\left(\frac{1\ lb}{453.592\ g}\right)$
c. MPN/100mL: $UC = \left(\frac{100mL}{0.1L}\right)\left(\frac{28.317L}{1ft^3}\right)$

For any pollutants not detected at the method detection limit (MDL), a concentration of MDL/2 will be applied in calculating loads.

3.4 Non-Storm Loads Not Subject to Copermittee's Legal Authority

Each Copermittee must annually identify and quantify (i.e. volume and pollutant loads) sources of non-storm water not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters. If a Copermittee has identified a source of non-storm water not subject to their jurisdiction during field screening events or IDDE inspections, the volumes and loads for this source will be quantified according to the methodology outlined in Section 3.3.

Intentionally Left Blank

4 Dry Weather Assessment Methodology Assumptions and Limitations

The calculation of the MS4 Permit required assessments necessitates a number of assumptions be made to translate the monitoring data into conclusions regarding flow volume and load for the entire WMA. This may introduce potential sources of error, while propagating potential errors inherent to the monitoring data. A summary of these assumptions and sources of error follows:

- Monitoring Error—Annual non-storm water volumes and pollutants loads are based on the results from dry weather visual observations and dry weather outfall monitoring events. Error in the monitoring data could have the effect of propagating error in all subsequent calculations. Potential sources of error in the monitoring data include the following:
  - *Monitored Flow Selection*—The pollutant loading estimations rely on monitoring data from one or more non-storm water visual observations per major MS4 outfall per year. The 2015-2016 monitoring year is the first year of dry weather flow volume and load calculation, and this period generally has represented a drought condition. This can affect the type and volume of non-storm water sources such as irrigation and ground water. The potential for inter-annual variability is a source of error in both the flow and chemistry data.
  - *Flow Measurement Method*—The MS4 Outfall Monitoring Plans provides different options to determine the non-storm water volume: (1) field-based estimation methods (e.g., “float method” or “bucket and stopwatch method”) and (2) equipment-based flow measurements. The method chosen varies among outfalls and Copermittees, introducing inter-site variability in volume estimations. The field-based estimation methods introduce various amounts of human error with the use of stopwatches and error in determining volume amounts in non-graduated buckets. Consistent equipment-based flow monitoring approach is more accurate and precise compared to the field-based estimation methods. However, this approach introduces variability through the flow measurement device and sensor type used to account for site-specific conditions, and can also be cost and time prohibitive across the number of outfalls monitored. Each measurement device and sensor type has an inherent accuracy range (e.g., ±2% accuracy for sub-AV probes). Additionally, each flow measurement device and sensor type can produce slightly different values for the same event, adding a layer of inter-site variability.
  - *Rainfall Measurement*—The accuracy of determining the number of dry days relies on the accuracy of the rainfall measurements representing that outfall. Rainfall measurements were based on the County of San Diego ALERT rain gauge closest to the majority of wet weather outfalls in each WMA, and not site specific rain data. Rainfall totals across the San Diego area can vary widely within a given storm.

- *Chemistry Results*—An attempt to maintain regional consistency in reporting limits (RLs) and method detection limits (MDLs) was made. However, differences in lab capabilities can sometimes lead to different RLs and MDLs. This can introduce error if constituent concentrations are near or below the MDL for one monitoring event or Copermittee, and the MDL differs for another monitoring event or Copermittee. An attempt was made to account for this type of error by assigning constituents that were not detected a value of MDL/2 for the purposes of the assessment calculations.

❖ Assessment Methodology Error—The assessments require a series of assumptions and extrapolations be made regarding the determination of annual volumes and pollutant loadings. Each assumption carries the possibility of error, including the following:

- *Annual Volume Estimation Representativeness*—Regardless of the flow measurement method utilized, error is introduced when utilizing the median of more than one field measurement to determine an annual volume estimation. It is assumed these field measurements are representative of "typical" non-storm water conditions since persistently flowing non-storm water flows are relatively consistent through the year. However, this may not be the case, and error could be introduced into these estimations. For example, groundwater base flows can increase during the wet season, increasing dry weather flow rates. Or, alternatively, irrigation and irrigation runoff may increase during the dry season, increasing dry weather flow rates. Unless flow observations are made throughout the year under a variety of conditions, this seasonal variation may not be captured.
- *Annual Volume Estimation Confidence*—Based on availability of data, multiple calculation methods are used to estimate annual flow volume. The confidence associated with each estimate varies because differing amounts of data go into each estimate. That is to say, volumes calculated based on continuous flow data are associated with a higher confidence than volumes based on one or two instantaneous flow measurements.
- *Annual Pollutant Load Estimations*—The annual volume estimation error introduced previously disseminates into the annual pollutant load estimations through calculations discussed in Section 3.3.3. Although persistent non-storm water flows are relatively consistent throughout the year, collecting two grab samples in one year provides a very brief snapshot in time of the pollutant concentration at an outfall, which may not be indicative of typical conditions or pollutant loadings. Additionally, using an arithmetic mean as a "typical" value of pollutant concentrations to estimate pollutant loads can introduce error if the sample size of the mean is too small, as means are sensitive to sample size.

cf = cubic feet; lb = pounds; MPN = most probable number; N = nitrogen; NR = Not Required; P = phosphorus; TDS = total dissolved solids; TKN = total Kjeldahl nitrogen
* = Nitrite and nitrate can be analyzed separately or together (Table D-7, MS4 Permit); ** NAL analyte not required for Ocean Receiving Waters.

Attachment E – Data Quality Objectives and Quality Control

Intentionally Left Blank

1 Data Quality Objectives

This attachment addresses Quality Assurance/Quality Control (QA/QC) activities associated with the Los Peñasquitos Watershed Management Area Monitoring Program for both wet and dry weather monitoring activities and the relevant data quality objectives (DQOs). The QA/QC program included both field and laboratory procedures.

DQOs are quantitative and qualitative statements that define project objectives and specify the acceptable ranges of field sampling and laboratory performance. Results that did not meet data quality objectives were qualified and may be considered estimates. Data quality objectives for this project included the following:

- Precision
- Frequency

Precision describes how well repeated measurements agree. The evaluation of precision described here relates to repeated measurements/samples collected in the field (field duplicates). Precision measurements were determined by comparing results from field duplicates to the precision objectives. Relative percent differences (RPDs) were calculated to determine the precision between duplicate samples. This calculation is shown below:

$$RPD = \frac{abs[x_1 - x_2]}{0.5 * (x_1 + x_2)}$$

Where:

abs is the absolute value.

x1 is measurement 1 (e.g., Sample).

x2 is measurement 2 (e.g., Duplicate).

Frequency is the rate at which a required analysis is performed. The frequency of field QC samples and laboratory QC samples is verified with stated DQOs. The field QC frequency DQOs were five percent. Laboratory frequency DQOs were dependent upon the QC sample type.

DQO results for precision and frequency are presented in the following sections.

2 Field Quality Assurance/Quality Control

This section addresses QA/QC activities associated with field sampling. The field QA/QC samples were used to evaluate potential contamination and sampling errors applicable to field sampling introduced prior to submittal of the samples to the analytical laboratory. Field QA/QC procedures utilized field blanks and field duplicates. A brief summary of each measurement type is described below, followed by a summary of their respective DQOs, and frequencies in Table E-1:

- **Field Blank** – Field blanks were collected to check for cross-contamination. A field blank sample was prepared during a non-storm water monitoring event and for each type of grab sample collected as part of a storm water monitoring event. A field blank was not conducted for composite samples during the storm water monitoring event per the Monitoring Plan. The field blanks were created by pouring laboratory-grade distilled, deionized water into laboratory supplied bottles at one of the monitoring locations.

- **Field Duplicates** – Field duplicates were collected to check the reproducibility of both laboratory procedures and field collection procedures. A field duplicate sample was collected during two non-storm water events and for each type of grab sample collected as part of a storm water monitoring event. A field duplicate was not collected for composite samples during the storm water monitoring event. A field duplicate of in-situ parameters was not performed per the Monitoring Plan.

Table E-1
Field Quality Control Samples

Constituent Category	Measurement Quality Objectives		Frequency of Analysis
	Field Blank	Field Duplicate	
Conventionals	<RL for target analyte	RPD < 25%[(a)]	5% of total project sample count
Indicator Bacteria	<RL for target analyte	RPD < 25%[(b)]	5% of total project sample count
Metals	<RL for target analyte	RPD < 25%[(a)]	5% of total project sample count
Nutrients	<RL for target analyte	RPD < 25%[(a)]	5% of total project sample count
Solid Parameters	<RL for target analyte	RPD < 25%[(a)]	5% of total project sample count
Organics	<RL for target analyte	Per method	5% of total project sample count

Notes: NA= Not applicable; RL = reporting limit; RPD = relative percent difference.
(a) NA if native concentration of either sample <RL.
(b) Field duplicates are not a current SWAMP requirement for indicator bacteria. However, the collection and analysis of a field duplicate is recommended.

Analytical results from the field QA/QC sampling program are summarized below.

2.1 Wet Weather Results

A field blank was collected from MS4-LPC-2 during Wet Weather Event 2 for fecal indicator bacteria analytes. No analytes were detected above their reporting limits. Table E-2 presents the reported results of the field blanks below.

Table E-2
Wet Weather Field Blank Results

Analyte	Units	Reporting Limit	MS4-LPC-2
			3/6/16
Enterococcus	MPN/100 mL	1	< 1
Fecal Coliform	MPN/100 mL	18	< 18
Total Coliform	MPN/100 mL	18	< 18

A precision goal of less than twenty-five percent RPD was assessed using results obtained from a field duplicate sample taken at RW-LPC-3 during Wet Weather Event 2. Because microbiological constituents have an exponential growth curve, their RPDs are typically higher than chemical constituents. To give an accurate representation, their results are log transformed prior to calculating the RPD value. Parameters met this DQO for both the conventional parameters and indicator bacteria. Relative percent difference values calculated from field duplicate data are provided below in Table E-3.

Table E-3
Wet Weather Field Duplicate Results

Relative Percent Difference					
Analyte	Units	MS4-LPC-03-01	MS4-LPC-03-02	3/6/2016	DQO
Conventional Parameters					
Total Calcium	mg/L	77.9	70.6	9.8%	< 25%
Total Magnesium	mg/L	50.3	45.9	9.1%	< 25%
Hardness as CaCO3	mg/L	401	365	9.4%	< 25%
Indicator Bacteria					
Enterococcus	log(MPN/100mL)	3.6	3.3	9.4%	< 25%
Fecal Coliform	log(MPN/100mL)	4.0	3.5	13.8%	< 25%
Total Coliform	log(MPN/100mL)	4.5	4.5	0.0%	< 25%

2.2 Dry Weather Results

Of the 22 dry weather samples taken within 3 jurisdictions, only one field blank was collected, which was from Outfall 282-1749, 3 (DW Site 2) on 8/31/16. No analytes were detected above their reporting limits in this field blank, as shown in Table E-4 below.

Table E-4
Dry Weather Field Blank Results

Analyte	Units	Reporting Limit	282-1749, 3 (DW Site 2)
			8/31/2016
Conventional Parameters			
Chloride	mg/L	0.05	< 0.05

OrthoPhosphate as P	mg/L	0.05	< 0.05
Sulfate	mg/L	5	< 5
Solid Parameters			
Total Dissolved Solids	mg/L	20	< 20
Total Suspended Solids	mg/L	20	< 20
Synthetic Organics			
Pentachlorophenol	ug/L	5	< 5

A precision goal of less than twenty-five percent RPD was assessed using results obtained from field duplicate samples taken at S-12 on 6/30/16, and 282-1749-3 on 8/1/16 during non-storm events. Again, the fecal indicator bacteria was log transformed prior to RPD calculation. Analyzed parameters met this DQO with the exception of iron, manganese, dissolved zinc, TKN, total nitrogen, total phosphorous, orthophosphate, and total suspended solids at S-12, and fecal indicator bacteria, chromium, magnesium, dissolved nickel, and total suspended solids at 282-1749-3. Relative percent difference values calculated from field duplicate data are provided in Table E-5 below.

3 Laboratory Analyses Holding Times

All wet weather samples were analyzed within the required holding time limits. Fecal Indicator Bacteria exceeded the 8-hour hold time for the dry weather samples. Nitrate and Nitrite exceeded the 48-hour hold time for samples taken at SB-12. Total Dissolved Solids analyses exceeded the 7 day hold time for dry weather samples taken. All other samples were analyzed within the required holding time, as shown in Table E-6 below. The results were within the historical range, and thus are considered valid. Details of hold time exceedances are shown in Table E-7. The laboratory reports are included in Appendix C.

Table E-6
Dry Weather Holding Time Results

Analyte	Holding Time Limits	QA/QC Results
Conventional Parameters		
Hardness (Total)	6 months	Samples analyzed within holding time.
MBAS	7 days until extraction; 40 days after extraction	Samples analyzed within holding time.
Indicator Bacteria		
Enterococcus	8 hours	**Dry weather samples exceeded hold time.**
Fecal Coliform	8 hours	**Dry weather samples exceeded hold time.**
Total Coliform	8 hours	**Dry weather samples exceeded hold time.**
Total Metals		
Cadmium	6 months at room temp following acidification	Samples analyzed within holding time.
Chromium	6 months at room temp following acidification	
Chromium (III)	6 months at room temp following acidification	
Chromium (VI)	28 days at 6°C; 24 hours without preservation	
Copper	6 months at room temp following acidification	
Iron	6 months at room temp following acidification	
Lead	6 months at room temp following acidification	
Manganese	6 months at room temp following acidification	
Nickel	6 months at room temp following acidification	
Selenium	6 months at room temp following acidification	
Silver	6 months at room temp following acidification	
Zinc	6 months at room temp following acidification	
Dissolved Metals		
Cadmium	6 months at room temp following acidification	Samples analyzed within holding time.
Chromium	6 months at room temp following acidification	
Chromium (III)	6 months at room temp following acidification	
Chromium (VI)	28 days at 6°C; 24 hours without preservation	
Copper	6 months at room temp following acidification	
Iron	6 months at room temp following acidification

Attachment F.3 – Wet Weather Assessment Methodology

Intentionally Left Blank

1 Assessment of Wet Weather Outfall Results

In 2013 the San Diego Regional Water Quality Control Board (Regional Board) issued *Order No. R9-2013-0001 (amended by Order Nos. R9-2015-0001 and R9-2015-0100), National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region*, herein referred to as the MS4 Permit, regulating MS4 discharges throughout the San Diego Region. The MS4 Permit requires a series of wet weather MS4 outfall assessments be performed annually to assess and report the progress of water quality improvement strategies toward reducing pollutants in storm water discharges from the MS4. This Attachment describes the methodology used to perform these required assessments. The methodology outlined here is largely based on the transitional methodology described in the Transitional Wet Weather MS4 Outfall Discharge Monitoring Work Plan (San Diego Regional Copermitees, 2015). Areas where the methodology differs from the transitional methodology are described in the relevant section, and also summarized in Section 5.0

Per MS4 Permit Provision D.4.b.(2)(b), Copermittees will annually assess and report the following:

- ❖ The average storm water runoff coefficient for each land use type within the Watershed Management Area (WMA);
- ❖ The volume of storm water and pollutant loads discharged from each of the Copermittee's monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch;
- ❖ The total flow volume and pollutant loadings discharged from the Copermittee's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls;
- ❖ The percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea with a major MS4 outfall to receiving waters or within each major MS4 outfall to receiving waters in the Copermittee's jurisdiction within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; and
- ❖ Modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify pollutants in storm water discharges from the MS4s in the Watershed Management Area.

Following acceptance of the Water Quality Improvement Plans and completion of the first year of Water Quality Improvement Plan Wet Weather MS4 Outfall Discharge Monitoring (2015-2016), annual assessments will also include comparison to applicable storm water action levels (SALs) in each Watershed Management Area as required by MS4 Permit Provision D.4.b.(2)(c). Compliance with applicable SALs will be used to evaluate whether the analyses and assumptions used to develop the Water Quality Improvement Plan should be updated as a component of the adaptive management process (MS4 Permit Provision B.5).

Table 1-1 provides the equations used in this methodology and lists the input and output variables for each equation. The sections that follow describe the application of these equations in greater detail.

Table 1-1
MS4 Wet Weather Outfall Assessment Equations

Permit Provision	Equation Reference	Equation	Inputs	Outputs
D.4.b.(2)(b)(1)[a]	A.1	$C_{Outfall\_Actual} = \frac{V_{Outfall\_Event}}{A_{Outfall} \times d_{Outfall\_Event}} \times \frac{12in}{1ft} \times \frac{1acre}{43{,}560\ ft^2}$	$V_{Outfall\_Event}$ (cf) $A_{Outfall}$ (acre) $d_{Outfall\_Event}$ (in)	$C_{Outfall\_Actual}$ (dimensionless)

Notes:

1) For those outfalls monitored for more than one monitoring year, the outfall runoff "C" ($C_{outfall\_Actual}$) will be averaged across all years of monitoring. This average value ($C_{outfall\_His}$) is to be substituted for the calculated outfall runoff "C" ($C_{outfall\_Actual}$) in all subsequent calculations.
2) Historical data are included in this calculation. The WMA land use runoff "C" (C_{WMA_LU}) is calculated based on the area-weighted average of all years of outfall monitoring data.
3) Unit conversion (UC) varies by units used to express pollutant concentration. Common unit conversions include:
   a. mg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\ g}{1000mg}\right)\left(\frac{1\ lb}{453.592\ g}\right)$
   b. µg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\ g}{1\times10^6\mu g}\right)\left(\frac{1\ lb}{453.592\ g}\right)$
   c. MPN/100mL: $UC = \left(\frac{100mL}{0.1L}\right)\left(\frac{28.317L}{1ft^3}\right)$
4) The WMA land use EMC is averaged across all years of monitoring. This average EMC (EMCWMA_LU_HIS) is included in all subsequent calculations.

V=Runoff Volume; A=Area; d=depth; C=Runoff Coefficient
HM=County of San Diego Hydrology Manual; LU=Land Use; CF=Correction Factor; WMA=Watershed Management Area; EMC=Event Mean Concentration; HSA=Hydrologic SubArea; Juris=Jurisdictional; UC=Unit Conversion
in = inches; cf=cubic feet; lb=pounds

2 Land Use Analysis

2.1 Land Use Categorization

The process of calculating average storm water runoff coefficients for land use types first requires defining land use types within the WMA and locating the boundaries of each type. Geographic Information Systems (GIS) can be used to locate the boundaries and measure the area of each land use type. Grouping specific land use types into larger categories simplifies the calculation of average storm water runoff coefficients within the WMA. The categorizations used are based on the updated land use categorizations in the Transitional Monitoring and Assessment Program Report for the San Diego River WMA (2014-2015) (San Diego County MS4 Copermittees, 2016). These categories differ slightly from the categories presented in the Transitional Wet Weather MS4 Outfall Discharge Monitoring Work Plan (San Diego Regional Copermitees, 2015).

Table 2-1 lists each San Diego Geographic Information Source (SanGIS) land use type and the corresponding land use category used in the wet weather MS4 assessments. The latest SanGIS land use GIS data layer can be downloaded from the SanGIS website (www.sangis.org).

Table 2-1
Land Use Types and Categories for Wet Weather MS4 Outfall Assessments

Land Use Category	SanGIS Land Use Type	SanGIS Land Use Code
Agriculture	Golf course	7204

Source: San Diego County MS4 Copermittees, 2016
Notes:
1) Water land uses excluded from MS4 outfall assessments. Water land uses assumed to be a sink for runoff storage.

The Agriculture and Open Space land use categories were further subdivided based on hydrologic soil group (i.e., Soil Group A, B, C, or D). Any Agriculture or Open Space areas with an undefined soil group were classified as belonging to Soil Group D.

Federal, State, and Indian Reservation land uses were excluded from the load calculations. MS4 Permit Copermittees have limited jurisdiction over these land uses. Categorization of these land uses was based on the SanGIS LAND_OWNERSHIP_SG shape file. The following categories were excluded:

- Bureau of Land Management
- California Department of Fish and Game
- Indian Reservations

- Military Reservations
- Other Federal
- State
- State (Caltrans)
- State Parks
- U.S. Fish & Wildlife Service
- U.S. Forest Service

2.2 Expected Runoff Coefficients

Each land use category was assigned an expected runoff coefficient (Runoff "C") based on values listed in the San Diego County Hydrology Manual (County of San Diego, 2003). The Runoff "C" is a unitless coefficient representing fraction of rainfall that runs off a given land area rather than infiltrating. A larger Runoff "C" (approaching one) corresponds to a higher fraction of runoff, and typically corresponds to areas of low permeability (e.g., parking lots). A smaller Runoff "C" is often associated with undeveloped areas or other areas of high permeability.

Table 2-2 lists the expected runoff coefficients for each land use category (San Diego Regional Copermitees, 2015).

Table 2-2
Expected Runoff "C" Values by Land Use Category

Land Use Category	Runoff Coefficient
Agriculture[1]	0.2, 0.25, 0.3, OR 0.35
Commercial	0.82
Educational	0.58
Industrial	0.87
Mixed Use	0.66
Residential: Multi-Family	0.6
Residential: Rural	0.41
Residential: Single-Family	0.49
Open Space[1]	0.2, 0.25, 0.3, OR 0.35
Transportation	0.71

Notes:
1) Runoff coefficient varies by hydrologic soil group. Values presented are for soil groups A, B, C, and D, respectively.
Source: County of San Diego, 2003

2.3 Volumes and Loads of Storm Water Discharges

2.3.1 Land Use Storm Water Runoff Coefficient (D.4.b.(2)(b)(i)[a])

MS4 Permit Provision D.4.b.(2)(b)(i) requires calculation of the average storm water runoff coefficient (Runoff "C") for each land use type within the WMA. This calculation is based on the measured flow and rainfall values for each monitored outfall, along with the outfall drainage area characteristics.

The average Runoff "C" is calculated according to the following steps. The corresponding equation or equations for each step, as listed in Table 1-1, are provided in brackets.

1) Calculate the observed (actual) runoff coefficient for each monitored outfall. The observed runoff coefficient for each outfall ($C_{Outfall\_Actual}$) is calculated based on the observed runoff volume, size of the outfall drainage area, and depth of observed rainfall for the monitored storm. Rainfall data for each event is obtained from the County of San Diego Automatic Local Evaluation in Real Time (ALERT) System rain gauge closest to each monitoring station. [Equation A.1]. This is repeated for each monitored outfall in the WMA. For those outfalls monitored during more than one monitoring year (e.g., during 2014-2015 and 2015-2016), the observed runoff coefficient is averaged across all years of monitoring. This new value ($C_{Outfall\_His}$) is used in place of $C_{Outfall\_Actual}$ in all subsequent calculations [Equation A.1.a].

2) Calculate the expected Runoff "C" for each monitored outfall. The expected Runoff "C" ($C_{Outfall\_HM}$) for each outfall is calculated based on the areas of each land use category in the outfall drainage area and the expected Runoff "C" for each land use category from the San Diego County Hydrology Manual, as listed in Table 1-2. [Equation A.2]. This is repeated for each monitored outfall in the WMA.

3) Calculate a Runoff "C" correction factor ($CF_{Outfall\_C}$) for each monitored outfall. The Runoff "C" Correction Factor is calculated by dividing the observed runoff coefficient ($C_{Outfall\_Actual}$) by the expected runoff coefficient ($C_{Outfall\_HM}$) [Equation A.3]. This is repeated for each monitored outfall in the WMA.

4) Calculate a land use Runoff "C" for each land use represented in the drainage area of each monitored outfall. A unique Runoff "C" ($C_{Outfall\_LU}$) is calculated for each land use category represented in each outfall drainage area [Equation A.4]. This is repeated for each land use category in each monitored outfall drainage area.

5) Calculate a WMA Runoff "C" for each land use category in the WMA. The WMA Runoff "C" (C_{WMA_LU}) is calculated as the area-weighted average of the outfall land use Runoff "C" values calculated in Step 4. In order to improve the accuracy of the resulting WMA Runoff "C" over time, results from each year of MS4 Outfall Monitoring are incorporated into the average [Equation A.5]. This equation is repeated for each land uses category in the WMA.

2.3.2 Monitored MS4 Outfall Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[b])

MS4 Permit Provision D.4.b.(2)(b)(i)[b] requires calculation of the storm water volume and pollutant loads discharged from each of the Responsible Agency's monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area, for each storm event with measurable rainfall greater than 0.1 inch. This calculation is based on the actual Runoff "C" values, the size of each outfall drainage area, ALERT rain data for the rain gauge closest to each outfall, and the observed chemistry data.

The wet season storm water volume and pollutant loads are calculated according to the following steps. The corresponding equation or equations for each step, as listed in Table 1-1, are provided in brackets.

1) Calculate the annual storm water volume from each outfall. The storm water volume ($V_{Outfall\_Annual}$) is calculated using the actual runoff coefficient for each outfall ($C_{Outfall\_Actual}$ from Equation A.1) and the area of each outfall, multiplied by the total rainfall for the wet season. Total rainfall is calculated as the sum of rainfall from qualifying wet season rain events, based on the closest ALERT system gauge for each outfall. A qualifying storm event is defined as a wet season storm event with measureable rainfall greater than 0.1 inch. [Equation B.1]. This equation is repeated for each monitored outfall.

2) Calculate annual pollutant loads for each pollutant at each monitored outfall. The monitored event analytical result for each pollutant at each outfall is used to calculate an annual pollutant load ($PollutantLoad_{Outfall}$). [Equation B.2]. This equation is repeated for each pollutant at each monitored outfall.

2.3.3 Jurisdictional Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[c])

MS4 Permit Provision D.4.b.(2)(b)(i)[c] requires calculation of the total flow volume and pollutant loadings discharged from each Responsible Agency's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls. The WMA Runoff "C" values, calculated as described in Section 3.1, will be used in combination with land use area data and ALERT rainfall data to calculate a total flow volume for each jurisdiction. The annual volumes will be applied to pollutant event mean concentrations (EMCs) to calculate annual jurisdictional pollutant loadings.

The jurisdictional flow volume and pollutant loads are calculated according to the following steps. The corresponding equation or equations for each step, as listed in Table 1-1, are provided in brackets.

1) Calculate the wet season flow volume from each land use area in each jurisdiction in the WMA. An annual flow volume for each land use type in each jurisdiction ($V_{WMA\_Jurisd\_LU}$) is calculated using the land use Runoff "C" (C_{WMA_LU}), calculated as described in Section 3.1, the area of each land use type in each jurisdiction within the WMA, and the total qualifying wet season rainfall. The total qualifying wet season rainfall (sum of rainfall from events with rainfall totals exceeding >0.1inch) is calculated using a representative ALERT station from each WMA. If more than one ALERT station is present in a WMA, the station closest to the majority of monitoring locations will be used. [Equation C-1]. This equation is repeated for each land use type for each Responsible Agency.

2) Calculate the wet season flow volume from each jurisdiction in the WMA. The wet season flow volume from each land use in a jurisdiction will be summed to generate the wet season jurisdictional flow volume (V_{WMA_Juris}). [Equation C.2]. This equation is repeated for each Responsible Agency in the WMA.

3) Define the event mean concentration (EMC) for each monitored event. The event mean concentration (EMC) for each constituent ($EMC_{Outfall\_Actual}$) for each monitored outfall is defined as the measured constituent concentration for the outfall [Equation C.3].

4) Calculate the expected (calculated) EMC for each pollutant at each monitored outfall. An expected (calculated) EMC ($EMC_{Outfall\_Calculated}$) for each constituent at a monitored outfall will be calculated as the area-weighted average of literature EMC values for each land use type represented by the monitored outfall drainage area. The literature EMC values, based on literature EMCs provided in the San Diego River WMA Water Quality Improvement Plan (LWA & Amec Foster Wheeler, 2016) are provided in Table 2-3. [Equation C.4]. This equation is repeated for each pollutant at each monitored outfall.

5) Calculate an EMC correction factor for each pollutant measured from each monitored outfall. A ratio, or correction factor for the Estimated Mean Concentration ($CF_{Outfall\_EMC}$), is calculated using the actual EMC and the expected (calculated) EMC for each constituent at each outfall [Equation C.5]. This equation is repeated for each pollutant at each monitored outfall.

6) Calculate a land use EMC for each land use represented in the drainage area of each monitored outfall. The EMC correction factor is multiplied by the expected EMC (Table 2-3) for each constituent at each monitored outfall [Equation C.6], resulting in a corrected EMC for each constituent for each outfall ($EMC_{Outfall\_LU}$). This equation is repeated for each pollutant and each land use at each outfall.

7) Calculate a WMA EMC for each pollutant and each land use category. An EMC for each monitored constituent in the WMA by each land use type (EMC_{WMA_LU}) is then calculated as the area-weighted average of the outfall land use EMC [Equation C.7]. This equation is repeated for each pollutant and each land use in the WMA.

8) Calculate the historical average WMA EMC for each pollutant and each land use category. Each EMC calculated using Equation C.7 is averaged with the historical EMCs for that constituent and land use, to derive the historical average WMA EMC ($EMC_{WMA\_LU\_HIS}$) [Equation C.8]. This equation is repeated for each pollutant and each land use in the WMA.

9) Calculate the annual pollutant load for each pollutant from each Responsible Agency in the WMA. Wet season jurisdictional pollutant loads ($Pollutant\ Load_{WMA\_Juris}$) are calculated for each constituent by summing the load from each land use in the jurisdiction [Equation C.9]. This equation is repeated for each pollutant and each Responsible Agency.

Notes:
NA=Not applicable. EMCs not provided because annual load not calculated for these constituents.
1. Distribution of constituent EMCs based on values listed for fecal coliform
2. Distribution of constituent EMCs based on values listed for nitrate as N
3. Distribution of constituent EMCs based on values listed for total lead
4. Distribution of constituent EMCs based on values listed for dissolved copper.
5. Distribution of constituent EMCs based on values listed for total suspended solids.
6. Values for Agricultural land use based on average of Agriculture (Row Crop) and Orchard values.
7. Values for Mixed Use land use based on average of Commercial and Residential: Multi-Family values.

2.3.4 Land Use Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[d])

MS4 Permit Provision D.4.b.(2)(b)(i)[d] requires calculating the percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea (HSA) with a major MS4 outfall to receiving waters, or within each major MS4 outfall to receiving waters, in the Responsible Agency's jurisdiction within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch. The methods used to perform these calculations are similar to those used to calculate the WMA jurisdictional storm water volumes and pollutant loads described in Section 2.4.3, except HSAs without a major outfall are excluded.

The HSA flow volume and pollutant loads are calculated according to the following steps. The corresponding equation or equations for each step, as listed in Table 1-1, are provided in brackets.

1) Calculate the wet season flow volume from each land use area in each HSA with a major outfall in the WMA. An annual flow volume for each land use type in each HSA ($V_{HSA\_Juris\_LU}$) is calculated using the land use Runoff "C" (C_{WMA_LU}), calculated as described in Section 2.4.1, the area of each land use type in each HSA in each jurisdiction within the WMA, and the total qualifying wet season rainfall. [Equation D.1]. This equation is repeated for each land use type in each HSA for each jurisdiction in the WMA.
2) Calculate the wet season flow volume from each jurisdiction in each HSA with a major outfall in the WMA. The wet season flow volume from each land use in the HSA (by jurisdiction) is added to calculate the total storm water volume by HSA (V_{HSA_Juris}) for the jurisdiction [Equation D.2]. This equation is repeated for each Responsible Agency.
3) Calculate the percent of storm water volume discharged from each HSA, by jurisdiction. A percent volume for each jurisdiction ($\%V_{HSA\_Juris}$) can be calculated by dividing the wet season flow volume from the HSA by the total jurisdictional runoff volume in the WMA [Equation D.3]. This equation is repeated for each Responsible Agency.
4) Calculate the annual pollutant load for each pollutant from each Responsible Agency in the WMA, by HSA. Pollutant loads by HSA by jurisdiction (Pollutant $Load_{HSA\_Juris}$) are calculated for each constituent by summing the load from each land use area in the HSA [Equation D.4]. This equation is repeated for each pollutant, each Responsible Agency, and each HSA in which that Responsible Agency has a major outfall.
5) Calculate the percent pollutant load contribution for each pollutant from each HSA. The percent contribution of pollutant load for each jurisdiction (%Pollutant $Load_{HSA\_Juris}$) can be calculated by dividing the HSA pollutant load for each jurisdiction by the WMA pollutant load for that jurisdiction [Equation D.5]. This equation is repeated for each pollutant, each Responsible Agency, and each HSA in which that Responsible Agency has a major outfall.

Intentionally Left Blank

3 Storm Water Action Level Comparison

Per MS4 Permit Provision D.4.b.(2)(c), Responsible Agencies must compare pollutant concentrations from monitored wet weather outfalls to applicable Storm Water Action Levels (SALs). The Responsible Agencies will include this comparison in each Water Quality Improvement Plan Annual Report. The SALs listed in Provision C.2 of the MS4 Permit are provided in Table 3-1. Additional SALs may apply, on a WMA-specific basis, for pollutants that cause or contribute to a receiving water condition associated with the highest priority water quality condition. These SALs will be provided in the applicable Water Quality Improvement Plan Annual Report.

Table 3-1
Storm Water Action Levels (SALs) for Discharges from MS4s to Receiving Waters

Parameter	Units	Action Level
Turbidity	NTU	126
Nitrate & Nitrite (Total)	mg/L	2.6
Phosphorus (Total P)	mg/L	1.46
Cadmium (Total Cd)[1]	µg/L	3.0
Copper (Total Cu)[1]	µg/L	127
Lead (Total Pb)[1]	µg/L	250
Zinc (Total Zn)[1]	µg/L	976

Notes:
NTU= Nephelometric Turbidity Units; mg/L = milligrams per liter; µg/L = micrograms per liter
1) If a total metals concentration exceeds the listed action level, the concentration must be compared to the California Toxics Rule criteria and the USEPA 1-hour maximum concentration for the detected level of receiving water hardness associated with that sample. If the sample does not exceed the USEPA 1-hr maximum concentration criterion for the measured level of hardness, the sample results will not be considered above the SAL.

Intentionally Left Blank

4 Summary of Changes from Transitional Methodology

The methodology presented is largely identical to the transitional methodology outlined in the Transitional Wet Weather MS4 Outfall Discharge Monitoring Work Plan (San Diego Regional Copermitees, 2015). Differences from the transitional work plan include the following:

- Land use categorization, presented in Table 2-1, is based on the revised categorization presented in the San Diego River Transitional Monitoring Annual Report.
- For the purposes of calculating land use areas, agricultural and open space land uses of an undefined soil group are classified as soil group D.
- Literature EMCs are based on values listed in the San Diego River WMA Water Quality Improvement Plan (LWA & Amec Foster Wheeler, 2016). Literature EMCs for constituents not described in that document are estimated as described in Table 2-3.
- For outfalls monitored during more than one monitoring season, the outfall runoff coefficient (Runoff “C”) is averaged based on all years of monitoring.
- The WMA land use Runoff “C” is an area-weighted average across all years of monitoring.
- The land use EMC values are based on an average of the land use EMC values for all years of monitoring.
- The assessment excludes State, Federal, and Indian Reservation lands from the WMA and HSA load calculations. The transitional monitoring and assessment program excluded Federal and Indian Reservation lands only. These land uses are often outside the jurisdiction of the Copermittees.

IMPORTANT NOTICE

EXECUTIVE SUMMARY

Los Peñasquitos Lagoon (Lagoon) has been historically impacted by anthropogenic disturbances. These have caused excessive sedimentation leading to the gradual degradation and loss of estuarine habitat. As a result, the Lagoon was placed on the Clean Water Act Section 303(d) List of Water Quality Limited Segments for sedimentation and siltation. To address these water quality impairments, the San Diego Regional Water Quality Control Board (Regional Board) adopted Resolution Number R9-2012-0033: *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) To Incorporate the Total Maximum Daily Load (TMDL) for Sedimentation in Los Peñasquitos Lagoon* (referred to as the Sediment TMDL) (Regional Board, 2012).

More recently, the Sediment TMDL has been adopted into Order Number R9-2013-0001, as Amended by Order No. R9-2015-0001*, NPDES No. CAS010266 National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region* (Regional Board, 2015) (referred to as the MS4 Permit).

Prior to adoption of the Sediment TMDL into the MS4 Permit, the City of San Diego (City) developed a special study to assess source areas of sediment within the subwatersheds of the Los Peñasquitos Watershed Management Area (WMA) (referred to as the Watershed Special Study). Phase I of the Watershed Special Study focused on the Carroll Canyon Creek subwatershed based on previous data identifying Carroll Canyon Creek as the largest contributor of suspended sediment load to the Lagoon. It also included aerial deposition monitoring to determine alternate inputs of sediment to the subwatershed. Phase I was conducted during Fiscal Year 2015 (FY15) (July 1 2014 – June 30, 2015) and is summarized in this report.

The MS4 Permit required development of a Water Quality Improvement Plan (WQIP) for each WMA. The MS4 permit required that WQIP Monitoring and Assessment program include a special study to address the highest priority water quality condition or conditions in that WMA. For the Los Peñasquitos WMA, the highest priority water quality condition is the impairment of the Estuarine and Biological beneficial uses in the Lagoon. During wet weather condition this impairment is caused by hydromodification and siltation/sedimentation. Phase I of the Watershed Special Study was enhanced by including the Carmel Valley Creek and Los Peñasquitos Creek subwatersheds and designated as the special study for the Los Peñasquitos WMA. The second year (Phase II) of the Watershed Special Study was conducted during Fiscal Year 2016 (FY16) (July 1 2015 – June 30, 2016).

Project Objectives. The Watershed Special Study looks to characterize upland sources of sediment that might be transported into the Lagoon. It was conducted concurrently with the Los Peñasquitos WMA Sediment TMDL Compliance Monitoring Program (TMDL Monitoring Program). The TMDL Monitoring Program includes monitoring at the base of the three subwatersheds and focused on assessing sediment load to the Lagoon. By monitoring both the upland portions of the subwatersheds (Watershed Special Study) and what was is being transported into the lagoon (TMDL Monitoring Program), the system can be assessed as a whole. Both monitoring programs were designed to provide data on suspended sediment concentration (SSC) during wet weather conditions, estimated sediment loads, and delivery potential within storm flows.

Monitoring Elements. Monitoring took place prior to and during the wet season

Pre-wet-season (prior to October 1, 2015) monitoring consisted of:

- Volumetric streambed sampling for particle-size distribution;
- Pebble counts;
- Cross-section surveys; and
- Photodocumentation.

Wet season (October 1, 2015 – April 30, 2016) monitoring consisted of:

- Pollutograph sampling for SSC;
- Bedload sampling for particle-size distribution;
- Post-storm pebble counts and photodocumentation;
- Instantaneous flow measurements; and
- Long-term flow monitoring.

FY16 Aerial Deposition during dry weather (September 1, 2015 – April 30, 2016) monitoring consisted of:

- Aerial deposition sampling for particulate matter equal to or less than 10 microns in diameter (PM_{10});
- Monitoring using optical sensors and Federal Reference Method (FRM); and
- Comparison of the two methods.

Load Estimation and Comparison. Data collected during the 2015–2016 wet season showed fluctuations of SSC that generally correlated with changes in water flow; SSC was higher at or just after the times when higher flows were recorded and during the rising limb of the hydrograph, as expected for sediment transport influenced by supply limits. During Phase I, the highest suspended sediment loads were calculated at the Arizona Crossing location (CC-AC) in the Carroll Canyon Creek subwatershed, which is at the downstream end of a stream reach that is dominated by highly erodible features and gravel mining operations. However, during Phase II, the highest sediment loads were calculated at the North City (LP-NC) location in the upper Los Peñasquitos Creek subwatershed, near the border of the Cities of Poway and San Diego.

The storms monitored during the two phases were vastly different in size and intensity, which makes comparisons challenging. Phase I occurred during drought conditions and storms were generally characterized by light to moderate, consistent rainfall. Phase II occurred during an El Niño year. Although rainfall totals were below annual averages, storms were generally intense and brief. There was a series of three particular intense storms that occurred over three days in early January 2016 (the first of which was monitored). Certain stream reaches may warrant further investigation to clarify potential sources and sinks of sediment. This includes a reach of Carroll Canyon Creek running through gravel mine operations (potential source area) and the immediate downstream reach (potential sink area). The sink area stores material that can be mobilized during large, intense storms, which are the types of storms that the data indicate occurred this year. Another area of interest is the reaches near the LP-NC site and downstream through the Los Peñasquitos Creek subwatershed. Load estimates at LP-NC are of magnitude similar to those measured at the base of the creek. This may also be another source reach followed by a large sink. However, there is only one year of data for this subwatershed; therefore, these results and assessments are preliminary.

Aerial Deposition Monitoring. Based on the results of aerial deposition monitoring, the contribution of airborne particles to the sediment loads in the WMA is not significant. PM_{10} analytical results from three monitoring events were generally low, either at or near the reporting limits. There were marginal increases in concentrations around anthropogenic activities, particularly in the Carroll Canyon Creek subwatershed relative to other monitored locations; however, these slight increases were not consistent or significant. Monitoring results from the two types of monitoring equipment (federal reference method and optical sensors) indicated that results were similar in that results from both types of equipment were low or negligible. However, within the low ranges of concentrations, results did not correlate well and showed a mean relative percent difference of 108 percent. Although the RPD is high, this is due to very low concentrations measured that are within 10 times the laboratory reporting limit and standard flow volume. RPD calculations for low concentrations such as those measured during this program mischaracterize what are actually very small differences in concentration.

Visual observations at the Carroll Canyon Creek downwind monitoring location, near the Black Mountain SSC monitoring location, discovered a large amount of dirt and dust deposited on the surface of vehicles, roads, and buildings and other surrounding structures. This observed dust and dirt deposition may be due to the high volume of truck traffic in the mining operations adjacent to the monitoring location, which may trigger turbulent diffusion and transport sediment from the road and vehicles to the proximate surroundings. However, this finding is more likely attributable to track-out from trucks directly to the road surfaces, and contributes only locally to aerial suspension and deposition, rather than as particles becoming airborne and being transported over longer distances throughout the subwatershed. Monitoring equipment placed on the nearby roof of a fire department did not show high concentrations of PM_{10}.

1.0 INTRODUCTION

This report summarizes monitoring and sampling activities conducted during Phase II of the Los Peñasquitos Watershed Management Area (WMA) Sediment Load Special Study (Watershed Special Study) that took place during Fiscal Year 2016 (FY16) (July 1, 2015 – June 30, 2016). Results discussed in this report will incorporate findings from Phase I of this study, which occurred during Fiscal Year 2015 (FY15) (July 1, 2014 – June 30, 2015), to provide an assessment based on the complete dataset. The purpose of this study is to (a) assess the sediment transport characteristics of the WMA that contributes sediment load to the Los Peñasquitos Lagoon (Lagoon), (b) assess potential for load contribution from aerial deposition, and (c) incorporate summarized findings from the concurrent Los Peñasquitos WMA Sediment TMDL Compliance Monitoring Program (TMDL Monitoring Program) (Amec Foster Wheeler, 2016).

1.1 BACKGROUND

The Lagoon is a coastal salt marsh lagoon in west-central San Diego County, in southern California. The WMA is approximately 60,500 acres and contains portions of the cities of Poway and Del Mar, unincorporated areas of San Diego County, and the communities of Mira Mesa, Scripps Ranch, Carmel Valley, and Sorrento Valley within the City of San Diego (City). The WMA is drained by three major creeks, Carroll Canyon Creek, Carmel Valley Creek, and Los Peñasquitos Creek, which ultimately discharge into the Lagoon.

The Lagoon has incurred a number of anthropogenic disturbances that have caused excessive sedimentation and the gradual degradation and loss of estuarine habitat. As a result, the Lagoon was placed on the Clean Water Act Section 303(d) List of Water Quality Limited Segments (303(d) List) for sedimentation and siltation. To address these water quality impairments, the San Diego Regional Water Quality Control Board (Regional Board) adopted Resolution Number R9-2012-0033: *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) To Incorporate the Total Maximum Daily Load (TMDL) for Sedimentation in Los Peñasquitos Lagoon* (referred to as the Sediment TMDL) (Regional Board, 2012).[1] More recently, the Sediment TMDL has been adopted into Order Number R9-2013-0001, as Amended by Order No. R9-2015-0001*, NPDES No. CAS010266, National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region* (Regional Board, 2015) (referred to as the MS4 Permit).

Prior to adoption of the Sediment TMDL into the MS4 Permit and based on previous data identifying Carroll Canyon Creek as the largest contributor of sediment load to the Lagoon, the City developed a special study to assess source areas of sediment within the Carroll Canyon Creek subwatershed (referred to as the Watershed Special Study, Phase I), which took place during the 2014–2015 wet season.

[1] The Sediment TMDL has been approved by the State Water Resources Control Board (SWRCB), the California Office of Administrative Law (OAL), and the United States Environmental Protection Agency (USEPA).

The MS4 Permit required development of a Water Quality Improvement Plan (WQIP) for each WMA. The MS4 permit required that WQIP Monitoring and Assessment program include a special study to address the highest priority water quality condition or conditions in that WMA. For the Los Peñasquitos WMA, the highest priority water quality condition is the impairment of the Estuarine and Biological beneficial uses in the Lagoon. During wet weather condition this impairment is caused by hydromodification and siltation/sedimentation. Phase I of the Watershed Special Study was enhanced by including the Carmel Valley Creek and Los Peñasquitos Creek subwatersheds and designated as the special study for the Los Peñasquitos WMA. The second year (Phase II) of the Watershed Special Study was conducted during Fiscal Year 2016 (FY16) (July 1 2015 – June 30, 2016). The WQIP is being implemented by the Cities of San Diego, Poway, and Del Mar, and the County of San Diego, collectively referred to as the Responsible Agencies (RAs).

1.2 CURRENT STUDY

The City of San Diego initiated Phase I of the Watershed Special Study during FY 15 that comprised sediment sampling and characterization before and throughout the 2014–2015 wet season (October 1 – April 30) in the upper reaches of the Carroll Canyon Creek subwatershed. This Phase I monitoring was coordinated with monitoring at the TMDL Monitoring Program for FY15.

Amec Foster Wheeler conducted monitoring for Phase II of the Watershed Special Study during FY 16 that comprised sediment sampling and characterization before and throughout the 2015–2016 wet season (October 1 – April 30) in the upper reaches of the three subwatersheds. Phase II monitoring was coordinated with monitoring at the TMDL compliance monitoring sites. The goal of the Watershed Special Study is to preliminarily identify source and sink areas within the Watershed, and to provide insight as to which areas may require further investigation and/or management measures by the RAs, in order to address the highest priority water quality condition in the Los Peñasquitos WMA.

1.3 PROJECT OBJECTIVES

The objective of Phase II of the Watershed Special Study was to monitor the upper regions of the Carroll Canyon Creek, Los Peñasquitos Creek, and Carmel Valley Creek subwatersheds, both within the riverine water column during storm events and for aerial deposition during ambient dry conditions. Phase II included air and water monitoring locations in the Carmel Valley and Los Peñasquitos Creeks subwatersheds (Phase I took place in the Carroll Canyon Creek subwatershed only). The purpose of the riverine monitoring was to (a) measure flows, (b) monitor suspended sediment concentration (SSC) during three storm events, (c) assess changes in streambed composition throughout the season, (d) estimate wet weather sediment loads from the various stream reaches, and (e) assess whether aerial deposition of airborne particulates contributes significantly to sediment loading in the subwatershed.

This monitoring program was designed to answer the following questions:

- Wet Season Riverine Monitoring
    - What is the sediment concentration at discrete times throughout a wet weather event hydrograph at points throughout the subwatersheds?
    - What are current sediment load estimates at points throughout the subwatersheds? Is there a greater load from a potential source area?
    - How do the wet weather sediment delivery potentials of each creek compare with each other?
- Dry Weather Aerial Deposition Monitoring
    - What are the aerial contributions of sediment to the subwatersheds within the WMA?
    - Can these airborne particles be associated with specific sources or land uses?
    - What is the contribution of aerial deposition relative to wet weather suspended sediment concentrations observed in the subwatersheds?

These data will allow comparison of the current sediment transport conditions within the WMA and relative to the Sediment TMDL waste load allocation (WLA). It will also help the RAs evaluate potential management measures, such as best management practices (BMPs) and low-impact development (LID).

2.0 MONITORING APPROACH AND ANALYTICAL METHODS

The Watershed Special Study complements the TMDL Monitoring Program described in the final report (Amec Foster Wheeler, 2016), which is a continuation of previous monitoring using the same monitoring approach and analyses.[2] The Watershed Special Study's monitoring elements are:

<u>Before the wet season:</u>

- Volumetric streambed samples for particle-size distribution
- Initial pebble counts and photodocumentation
- Channel cross-sectional surveys

<u>Wet season:</u>

- Continuous flow and rainfall measurements
  - Sampling during three wet weather events
  - SSC pollutograph sampling
- Bedload sampling for particle-size distribution
- Post-storm pebble counts and photodocumentation
  - Field flow measurements to calibrate head-versus-flow table
- Site identification (ID) and descriptions (See Figure 2-1 for locations of sites)
  - Carroll Canyon Creek Subwatershed
    - CC-TC – Carroll Canyon – Trapezoidal Channel
    - CC-BM – Carroll Canyon – Black Mountain
    - CC-ML – Carroll Canyon – Maya Linda
    - CC-AC – Carroll Canyon – Arizona Crossing
    - CC-NR – Carroll Canyon – Nancy Ridge
  - Los Peñasquitos Creek Subwatershed
    - LP-HV – Los Peñasquitos – Hidden Valley
    - LP-NC – Los Peñasquitos – North City
  - Carmel Valley Creek Subwatershed
    - CV-CV – Carmel Valley – Carmel Valley

<u>Aerial deposition:</u>

[2] For brevity, this monitoring report does not include the details of the individual monitoring elements; they are given in the final *Los Peñasquitos Watershed Management Area Sediment Load Special Study Monitoring Plan* (Amec Foster Wheeler, 2015) provided in Appendix A.

- Three sampling events
  - 2015–2016 monitoring events took place in fall and mid-winter because of planned (February 2016) destruction of Del Mar City Hall, where the reference station was located
- Sampling events consist of three 24-hour sample collection periods at each site: two during weekdays and one during the weekend
- Sampling with both USEPA Federal Reference Methodology (FRM) sampling equipment and optical sensor sampling equipment
  - Comparison between the results of both equipment types for future aerial deposition monitoring consideration
- Site IDs and descriptions:
  - CC-CC – Carroll Canyon Optical
  - CC-DM – Reference - Del Mar (Optical and FRM site)
  - CC-DW – Carroll Canyon – Downwind (Optical and FRM site)
  - CC-SR – Carroll Canyon – Scripps Ranch
  - CC-UP – Carroll Canyon – Upwind (Optical and FRM site)
  - CV-CD – Carmel Valley – Camino Del Sur
  - LP-PO – Los Peñasquitos – Poway
  - LP-PR – Los Peñasquitos – Preserve

Figures 2-1 and 2-2 show the project's monitoring locations, and also depicts the Sediment TMDL compliance monitoring sites. These monitoring locations are described in detail in the Los Peñasquitos Watershed Management Area Sediment Load Special Study Monitoring Plan (Monitoring Plan) (Amec Foster Wheeler, 2015) (Appendix A).

Deviations from the Monitoring Plan:

Three additional aerial deposition monitoring locations were added by the City in the Carroll Canyon Creek subwatershed that were monitored in conjunction with the planned locations. Resources for these locations were provided by the City, and not through funding approved by the RAs (see Figure 2-2 for monitoring locations). The additional sites were:

- CC-ER – Carroll Canyon – Eco Rentals
- CC-MP – Carroll Canyon – Maddox Park
- CC-SF – Carroll Canyon – Camino Santa Fe

3.0 RESULTS AND DISCUSSION

This section presents the data collected during Phase II and discusses the results of both Phase I and II of the Watershed Special Study.

3.1 WET WEATHER MONITORING

Wet weather monitoring was conducted for a total of three storm events during Phase II of the Watershed Special Study. Table 3-1 presents the dates and rainfall totals for monitored events. Rainfall totals recorded at the Carmel Valley (CV-CV) monitoring location were used for as the Watershed Special Study project rainfall data. Based on the *San Diego County Hydrology Manual* (County of San Diego, 2003), the 85th percentile, 24-hour storm for the project area is approximately 0.65 to 0.75 inch. The first monitored rainfall event was greater than the 85th percentile threshold, while the second and third were approximately at the 85th percentile threshold.

Table 3-1
Summary of Monitored Wet Weather Events

Event	Date	Rainfall Total[a] (inches)
1	January 4–6, 2016	1.58
2	January 31, 2016	0.65
3	March 6–8, 2016	0.70

a. Rainfall for the upper WMA areas monitored for the Watershed Special Study was measured at the CV-CV monitoring location.

3.1.1 Hydrology

Table 3-2 presents the monthly rainfall totals from the onsite rain gauge at the CV-CV monitoring location. The CC-TC monitoring location was used for rainfall measurement during Phase I; however, equipment failures at CC-TC during Phase II, where data was not reported during known rain events and other periods of non-reported data, did not allow for a reliable continuous data set. The rainfall data presented are representative of the upper WMA rainfall totals, where the majority of the Watershed Special Study sites are located. Lower WMA rainfall data are presented in the Los Peñasquitos Lagoon WMA Sediment TMDL Compliance Monitoring Report (Amec Foster Wheeler, 2016). Rainfall data were also used to determine the number of "wet" days throughout the year. For the purposes of this project, a wet day is defined as a 24-hour period with at least 0.1 inch of rainfall. A total of 22 wet days were recorded during the 2015–2016 wet season at CV-CV, compared to 21 wet days recorded for the TMDL Compliance Program. This is because the upper WMA area received more rainfall overall, primarily due to orographic factors. For load estimates and comparability with the TMDL Compliance Program monitoring locations, a total of 21 wet days (number of wet days in the lower WMA) was used in the annual load estimation.

**Table 3-2.
Monthly Rainfall Totals
2015–2016 Wet Weather Season**

Month	Rainfall Total (inches)
October 2015	0.90
November 2015	0.71
December 2015	1.67
January 2016	4.77
February 2016	0.16
March 2016	1.26
April 2016	0.86
Season Total	10.33

3.1.2 Analytical Results

The final number of pollutograph samples selected for analysis for each monitored wet weather event at each monitoring locations varied. The number selected depended on the characteristics of each storm event. Table 3-3 summarizes the number of pollutograph samples submitted per monitoring location during the monitored wet weather events.

**Table 3-3.
Number of Samples Collected
During Wet Weather Monitoring Events**

Site	Number of Samples Submitted		
	Event 1	Event 2	Event 3
Hidden Valley (LP-HV)	10	12	19
North City (LP-NC)	10	20	24
Upper Carmel Valley (CV-CV)	16	14	15
Black Mountain (CC-BM)	13	16	15
Trap Channel (CC-TC)	18	6	7
Arizona Crossing (CC-AC)	8	15	21
Maya Linda (CC-ML)	15	18	20
Nancy Ridge (CC-NR)	18	13	19

Figures 3-1 through 3-21 present the event hydrographs that show flow and analytical results for SSC analysis at each monitoring location. Data show that peaks in SSC generally correlate with peaks in storm flow. Although peak flow typically is most strongly associated with increased SSC, other factors also affect SSC, such as rainfall intensity and the associated rate of rise in flow, supply limitations, the preceding baseline flow, sample timing, and duration of storm flow.

The flow meter at CC-AC reported valid data for the majority of the 2015-2016 wet season; however, early in the third wet weather monitoring event field crews noticed the flow meter was reporting, erroneous data. The flow meter was replaced at that time with another flow meter. Once installed, the meter was watched for a period of approximately 20 minutes and appeared to be functioning properly. At some point after the field crew had departed, the second flow meter also malfunctioned, reporting flat-lined data (i.e., one single value) for most of the night, followed by erratic data. This was caught be field crews after storm flows had started. A third flow meter was placed on site at this time. By the time the third flow meter was in place, too much of the storm flows had passed to reconstruct a hydrograph. Therefore, total event flow was estimated and a hydrograph could not be graphed for CC-AC for the third wet weather monitoring event.

Summarized SSC analytical results and laboratory reports are provided in Appendix B.

3.1.3 Bedload Sample Collection

Collection of bedload samples was attempted during each monitored event at five of the eight monitoring locations. CC-ML, LP-HV, and CV-CV did not have suitable locations at which to install samplers. Bedload sampling was attempted using both the trap samplers (installed in the streambed), which have been used in previous wet seasons, and manual bedload samplers (where safe access allowed). No samples were successfully collected during the first event. Most samplers were lost or damaged because of the high flows. One sample from CC-TC was collected during the second event and one sample was collected from CC-NR during the third event. However, in each case, samplers were either displaced or partially buried/overfilled upon retrieval, preventing assessment of the amount of material collected and the associated time frame.

Manual bedload sample collection attempts occurred during low flows, when it was safe to enter the stream, and yielded results from CC-AC and CV-CV during the second wet event only. Samples collected and measured from these two sites resulted in load estimates of 0.21 ton per day and 0.015 ton per day, respectively (not significant relative to washload estimated with SSC results). These samples were collected at one point during one storm and may not be representative of a consistent bed movement condition throughout the storm or day, nor of bedload during other non-sampled. This sample collection was an improvement over that of previous monitoring efforts, but further bedload results are required to accurately quantify this factor.

Appendix C provides the bedload particle size analysis for the bedload samples. Appendix C also provides the results from the volumetric bedload particle size analysis performed in the pre-wet-season sample at each monitoring location.

3.1.4 Post-Storm Pebble Count and Photo Documentation

Post-storm pebble counts were conducted on six occasions during the 2015–2016 wet season. Results from the pebble counts show a general increase in the presence of fine material at CC-TC and CC-BM. Results for CC-AC, CC-NR, and LP-NC varied throughout the year, with no apparent trend. No pebble counts were conducted at CC-ML, LP-HV, and CV-CV, as there were no suitable locations at which to conduct sampling.

For a complete summary of the pebble count findings, refer to Appendix D.

Streambed photographs taken throughout the wet season at each monitoring location were compiled into a photograph log, which is in Appendix E.

3.1.5 Event Mean Concentration and Suspended Sediment Load Results

The annual suspended sediment load was estimated by multiplying the average of the three daily load estimates at each monitoring location by the number of wet days from the 2014–2015 (14 days) and the 2015–2016 (21 days) monitoring years.

Load estimation options are often limited to this type of approach (referred to herein as the “average estimation method”) based on the amount of data. This approach can potentially skew overall estimates in either direction. For example, as in the case for the 2015–2016 wet season, the high load estimate resulting from the unusually large January event drives up the average load. This elevated averaged gets applied to all wet days, regardless of storm size or intensity, potentially resulting in an overestimation. In an effort to better represent load estimations for non-monitored storms at the TMDL Monitoring Program sites, alternative approaches were explored in FY15 by assessing the relationships among rainfall intensity, event mean concentration (EMC), and sediment load to determine whether EMC and/or sediment load values can be reasonably estimated based on rainfall intensity.

This type of approach allows for load estimations based on a measured parameter (e.g., rainfall) for a non-monitored storm, rather than simply applying an average of monitored events. When incorporating data collected during the 2015–2016 wet season, the strength of these relationships decreased and they were deemed unreliable for use in estimating loads. This change is most likely due to flow-duration effects and the non-linear nature of high versus low flows on SSC transport. This also resulted in the inability to use this approach for the Watershed Special Study sites, given the limited data points. Therefore, the load estimations in this report are calculated using only the average estimation method described above. Although the results may be skewed high, these values are comparable to those calculated in the same manner for the TMDL Monitoring Program and they allow for relative comparisons and assessments of fluctuating loads within the subwatersheds.

Table 3-4 provides the EMCs and daily and annual sediment load estimates for Phase I and Phase II.

**Table 3-4.

a. Based on the 14 wet days during 2014–2015, and 21 wet days during 2015–2016, as determined during this wet season (Section 3.1.1)
b. The three sites upstream of the confluence to Carroll Canyon Creek were summed to provide a subtotal of the upstream contribution.
mg/L = milligrams per liter

During Phase I, the highest suspended sediment loads were calculated at the Arizona Crossing location (CC-AC), which is at the downstream end of a stream reach that is dominated by highly erodible features. However, during Phase II, the highest sediment loads were calculated at the

North City location (LC-NC) in the upper Los Peñasquitos Creek subwatershed, and were attributable to unusually high flows rather than unusually high EMCs.

There are some challenges when comparing the two phases or years, given the differences in storm characteristics. Phase I occurred during drought conditions and storms were generally characterized by light to moderate consistent rain. Phase II occurred during an El Niño year and, although rainfall totals were slightly below annual averages, storms were generally intense and brief, in particular during storms that occurred over three days in early January 2016, when over half of the total wet season rainfall occurred. Considering these differences in seasons and the data collected through both phases, comparability between years is limited. However, the data collected do provide some preliminary findings.

Stream reaches that may warrant further investigation include the reach of Carroll Canyon Creek running through the gravel mine operations and the immediate reach downstream, the upper portion of Los Peñasquitos Creek, and the upper portions of Carmel Valley Creek. The following provides greater detail regarding each of these stream reaches.

Carroll Canyon Creek. The reach of Carroll Canyon Creek running through the gravel mine operations and the immediate reach downstream appear to be source and sink areas, respectively, with the sink storing material that can be mobilized during large, intense storms, which are the types of storms that the data seem to indicate occurred this year. During Phase I monitoring, the CC-AC site estimated loads were 970 tons per year, while the next downstream site (CC-NR) had an estimated load of 57 tons per year. This result led to a hypothesis last year that the reach between these two locations can serve as a sink, with the sink storing material that can be mobilized during large, intense storms. Monitoring during Phase II indicated that this hypothesis may be true, because much of that material was mobilized and transported downstream based on calculated loads of 1,031 tons per year at CC-AC and 6,343 tons per year at CC-NR (downstream of CC-AC). Input from Flanders Canyon Creek, which is downstream of CC-AC, was not measured this season but may have also contributed unusually high loads.

During sampling, field crews experienced some equipment issues that do not affect the overall assessment of the data. During the first event, there were sample collection failures during a portion of the storm (see dashed lines in Figure 3-4), which may have biased the flow-weighted EMC low, because missed samples were during higher flows. SSC estimates were made for the period of missed samples, based on flow rates and SSC comparisons during that event. When these estimations were incorporated into calculations for this site, the EMC and estimated load increased for this event. Using these estimated SSC values, the estimated load was 1,479 tons per year (compared to 1,031 tons per year calculated without the additional SSC estimated values). This higher estimated load for CC-AC is still less than that for CC-NR.

For the third event, total flow had to be estimated on the basis of previously collected data at CC-AC because of flow monitoring equipment failure (as discussed in Section 3.1.2). Therefore, a flow-weighted EMC could not be calculated for this event at this site. Sample collection was not affected by this failure. The CC-AC load for this storm was estimated using mean SSC and total estimated flow.

Despite the equipment issues encountered at the CC-AC site, preliminary data appear to indicate that this source-sink dynamic does exist in the stream between the upper limit of the gravel mine and CC-NR, and may warrant further investigation for potential management measures to control loads to the Lagoon from Carroll Canyon Creek. Although there were some equipment issues encountered during monitoring, results are representative of the overall conditions within the subwatershed.

Los Peñasquitos Creek. Another area of interest is the upper subwatershed reaches near the LP-HV and LP-NC sites and downstream through the Los Peñasquitos Creek subwatershed. Load estimates are of magnitude similar to those measured at the base of the creek. Table 3-4 provides estimated loads based on submitted samples. Similar to equipment issues during the first event at CC-AC, damaged equipment caused some samples at LP-HV to be missed during peak flows. SSC estimates were made for this period based on samples collected during the monitoring event and associated flows (see dashed lines in Figure 3-6). When these estimates are included in EMC and load calculations, the estimated first event daily load and annual loads at LP-HV are approximately 70 percent of the estimates at LP-NC.

This result may indicate another source reach followed by a large sink, as the load estimates are slightly higher at LP-NC compared to those at the base of the creek. The portion of Los Peñasquitos Creek downstream of the LP-NC location is generally characterized by less developed lands immediately surrounding the creek when compared to portions through Poway. The more natural portion of the creek may be able manage higher flows with less scouring and erosive effects of hydromodification. However, there is only one year of data for this subwatershed; therefore, these results and assessments are preliminary.

Carmel Valley Creek. Similar to Los Peñasquitos Creek, load estimates from the upper portion of Carmel Valley Creek were similar (slightly less) than the estimated load at the base of the creek. However, overall load estimates from Carmel Valley Creek are significantly less than those at Los Peñasquitos and Carroll Canyon Creeks. The proportionally high loads from the upper subwatershed may be attributable to less restricted flows coming from the upper reaches, prior to converging and flowing through the lower reaches, which are generally characterized as lower gradient with heavy vegetation. Also, similar to findings at Los Peñasquitos Creek, this result is based on a limited data set from one year of monitoring. Furthermore, the relatively small loads from this subwatershed make it a low priority for management measures.

Overall WMA Findings Summary. Although these findings are based on limited data, they do provide an initial framework for assessing management measures and focus areas. Of the three subwatersheds, Carroll Canyon Creek is the primary subwatershed on which to focus resources and management measures. In typical years, Carroll Canyon Creek delivers the highest percentage of sediment load to the Lagoon (80 to 90 percent), and despite not contributing the highest percentage this year, its estimated SSC EMCs were the highest of the three subwatersheds. Management measures that address controlling sources of sediment where possible can drive down SSC concentrations, and ultimately loads.

Land use and creek condition through the portion of Carroll Canyon Creek that contributes the highest EMCs and proportion of sediment loads are important factors to consider when assessing methods to control sources. Figure 3-16 presents the land uses surrounding the section of Carroll

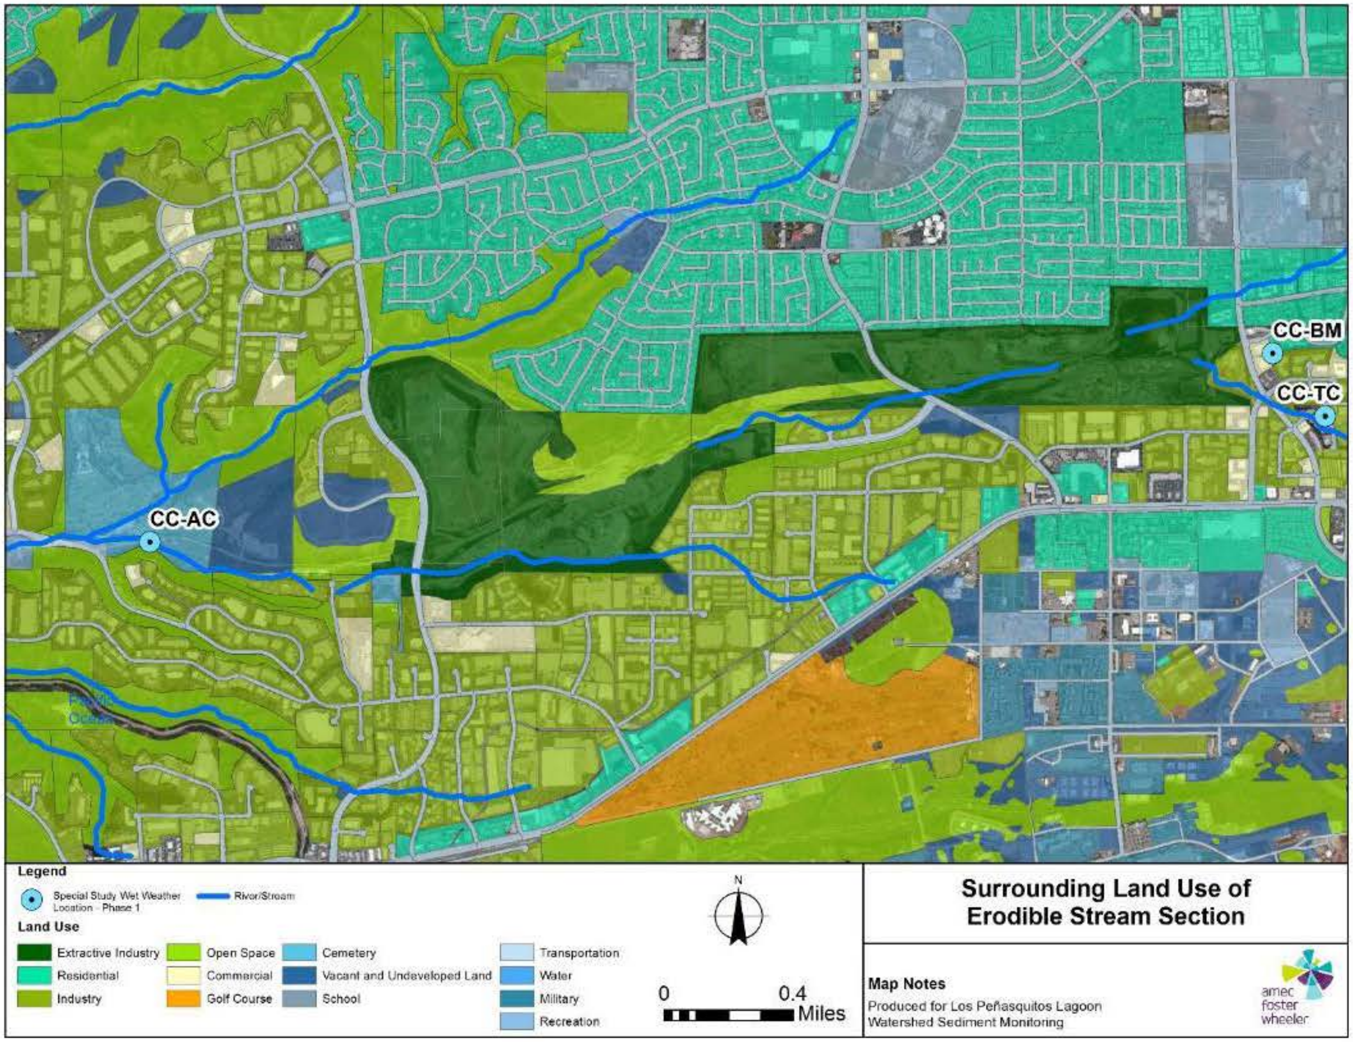

Figure 3-16.
Central Carroll Canyon Creek Land Uses

This page is intentionally blank.

Canyon Creek between the monitoring locations described above. These reaches are characterized by lack of vegetation and erodible and unstable banks. The land uses surrounding the section of creek between the three upper subwatershed monitoring locations and CC-AC include heavily developed residential land uses to the north, active industrial land uses to the south and east, and a mining operation along the northern banks of the creek itself.

Flow presents a much more challenging factor to control or reduce. During the unusually high flows encountered during this wet season, loads were elevated throughout the WMA and this was the driving force for the increase in the relative contribution from Los Peñasquitos Creek and the magnitude of the annual load estimate. Managing such high flow through these systems may not be the most cost-effective strategy and doing so to a significant degree may not be feasible. Flows observed this season were large and strong enough to destroy the upper portion of the concrete lined channel in Carroll Canyon Creek and flood the area between CC-AC and CC-NR and the commercial area near the base of Carroll Canyon Creek. BMPs typically are not designed to be effective for storms and/or flows of this size. However, implementing measures to reduce existing impacts of hydromodification may help drive down flow rates, which will likely help reduce erosion and sediment transport (SSC concentrations).

3.1.6 Analysis of SSC and Flow

A preliminary analysis compared SSC measured during two wet seasons (2014–2016) and the corresponding flow rates for those samples. Results of this analysis are provided in Figures 3-16 through 3-23.

CC-NR and CC-AC had the strongest SSC versus flow relationships, with coefficient of determination (R^2) values of 0.78 and 0.74, respectively. These sites were also shown to have ample sediment supply upstream, as found in a geomorphic assessment conducted during the 2014 monitoring program (AMEC, 2014). The reaches upstream of these monitoring locations were characterized by highly erodible banks, with limited armoring within the channel. Hidden Valley also had a relatively strong SSC versus flow relationship (R^2=0.62) over the study period.

The other five sites showed poor relationships between SSC and flow. CC-BM (R^2=0.39) and CC-ML (R^2=-0.13) are similar in that samples are taken as flow enters a storm drain. These two sites, along with CC-TC (R^2=0.22), have small drainage areas with high proportions of impervious surfaces that contribute to their "flashy" behavior and unreliable sediment supply. The LP-NC (R^2=0.38) sample collection point is near the bank after the creek passes over a small pool, which may cause suspended material to settle out of the water column before it can be measured. The collection point faces a similar obstacle at CV-CV (R^2=-0.28), as it is located in a section of the creek directly downstream of a large pool and is situated among small boulders that can become small rapids during high-flow conditions.

3.2 AERIAL DEPOSITION SAMPLING RESULTS

Aerial deposition monitoring results from both FY15 and FY16 indicated that airborne particulate matter equal to or less than 10 microns in diameter (PM_{10}) are not a significant source of sediment within the WMA. Review of the data from the six dry weather deposition sampling events in the Carroll Canyon Creek subwatershed and three events in the other two subwatersheds show generally low concentrations, either at or near the reporting limits. There were marginal increases in concentrations around anthropogenic activities, particularly in the Carroll Canyon Creek subwatershed relative to other monitored locations; however, these slight increases were not consistent or significant. Monitoring results from the two types of monitoring equipment (FRM and optical sensors) indicated that results were similar, in that results from both types of equipment were low or negligible. However, within the low ranges of concentrations, results did not correlate well and showed a mean relative percent difference of 108 percent. Although the RPD is high, this is due to very low concentrations measured that are within 10 times the laboratory reporting limit and standard flow volume. RPD calculations for low concentrations such as those measured during this program mischaracterize what are actually very small differences in concentration. Appendix F provides detailed results and technical memorandum for aerial deposition monitoring.

Visual observations at the Carroll Canyon Creek downwind monitoring location, near the Black Mountain SSC monitoring location, discovered significant particle matter deposition on the surfaces of vehicles, roads, and buildings and other surrounding structures. The observed deposition may be due to the high volume of truck traffic at the mining operations adjacent to the monitoring location, which may trigger turbulent diffusion and transport sediment from the road and vehicles to the nearby surroundings. Despite these observations, monitoring equipment placed on the roof of a nearby fire department did not show high concentrations of PM_{10}. This result indicates that the observed deposition in the immediate area is not being suspended high into the air column and remains localized to the area just outside the gravel mine driveway.

4.0 CONCLUSIONS AND RECOMMENDATIONS

Data generated during the Watershed Special Study monitoring program provided initial insight into the sediment transport characteristics of three subwatersheds within the Los Peñasquitos WMA. The monitoring program was designed to answer the following questions:

- Wet Season Riverine Monitoring
    - What is the sediment concentration at discrete times throughout a wet weather event hydrograph at points throughout the subwatersheds?
    - What are current sediment load estimates at points throughout the subwatersheds? Is there a greater load from a potential source area?
    - How do the wet weather sediment delivery potentials of each creek compare with each other?
- Dry Weather Aerial Deposition Monitoring
    - What are the aerial contributions of sediment to the subwatersheds within the WMA?
    - Can these entrained particles be associated with specific sources or land uses?
    - What is the contribution of aerial deposition relative to wet weather suspended sediment concentrations observed in the subwatersheds?

4.1 CONCLUSIONS

Based on the Watershed Special Study (both phases), the central portion of Carroll Canyon Creek between the three upper subwatershed monitoring locations and CC-NR appears to be the primary area affecting loads to the Lagoon via Carroll Canyon Creek. During Phase I, relatively high loads were estimated at the CC-AC location, which then seemed to be deposited in the channel, as lower loads were estimated at the CC-NR location. During Phase II, there was a relative shift in load proportion, with CC-NR showing higher loads than CC-AC. This dynamic suggests that during typical seasons the large contribution of sediment load that comes from the reach between the upper monitoring locations and CC-AC is deposited downstream, and can be mobilized during years with larger, more intense storms, as encountered during Phase II. The remobilized material contributed to the elevated SSC EMCs and load estimates for Carroll Canyon Creek. Data from the Los Peñasquitos Creek and Carmel Valley Creek subwatersheds suggest that proportionally high loads are generated in the upper portion of these subwatersheds, and may be deposited and/or pick up relatively low amounts of sediment prior to discharging to the Lagoon.

Although Los Peñasquitos Creek delivered the highest overall load this season, this result was driven by the unusually high flows encountered during Phase II; SSC EMCs were relatively low when compared to those of the other two subwatersheds. Overall contribution from Carmel Valley Creek was approximately 1 percent of the annual load estimate this season, and is consistently a small percentage of the total load, thus making this subwatershed the lowest priority for assessing management measures.

Based on data collected during both phases of the Watershed Special Study, two key monitoring locations within the Carroll Canyon subwatershed, CC-AC and CC-NR, showed relatively strong relationships between flow and SSC results, with R^2 values of 0.74 and 0.78, respectively. The other monitoring locations exhibited weak to no relationship between these two parameters, with R2 values ranging from 0.62 to -0.28. Further assessment of the data collected during this program, along with data collected at the TMDL compliance sites, will allow for a better understanding of these relationships at each site, and ultimately will facilitate better load estimations and key areas for potential management measures. Further assessment that includes factors such as supply limitations, dynamic hydrologic factors, and development of flow-duration and load-durations curves (when sufficient data allow) can assist in assessing shear stress within the creeks, which is a key factor in development of management measures.

Aerial deposition monitoring results from Phase II indicated that the contribution from airborne particles to the suspended sediment loads observed in the WMA is not significant relative to those generated by storm flows. PM_{10} analytical results from three monitoring events were generally low or negligible, as they were at or near the analytical laboratory's reporting limits. There were marginal increases in concentrations around anthropogenic activities, particularly in the Carroll Canyon Creek subwatershed relative to other monitored locations; however, these slight increases were not consistent or significant. Monitoring results from the two types of monitoring equipment (FRM and optical sensors) indicated that results were similarly low or negligible; however, within the low ranges of concentrations, results did not correlate well and showed a mean relative percent difference of 108 percent. The variability observed is primarily due to the low range of concentrations, where RPD calculations can misrepresent very small concentration differences.

4.2 RECOMMENDATIONS

The Watershed Special Study is complete. Monitoring at these locations is not planned to continue. The following are recommendations for potential future assessment efforts:

Perform detailed data analysis of both TMDL compliance site and Watershed Special Study monitoring location data using applicable sediment transport methods by utilizing available hydrologic, hydraulic, and geomorphic data for the study reaches. Calibrate the sediment transport predictions with sediment load collected through previous monitoring efforts. Assessment of data collected during this program over the past three years may be used to develop flow-duration and load-duration curves, assess shear stress within the creeks, and ultimately support sediment transport predictions for more accurate annual load estimations.

Focus assessments of management measures on the central portion of Carroll Canyon Creek. Based on data collected during both phases of this program, this portion of the creek appears to be the primary area within the WMA impacting SSC levels and associated impacts to estimated loads to the Lagoon. Reduction of SSC generated and stored in this area will provide a key reduction in sediment loads to the Lagoon.

Assess existing hydromodification impacts and methods to reduce those impacts. Increased flow rates attributed to land use development and associated hydromodification impacts increase erosion and the sediment transport capability of the creeks. This finding appears to be particularly true within the Carroll Canyon Creek subwatershed, where there is a high level of development and measured flows are "flashy" in response. This also appears to exist in the upper portion of Los Peñasquitos Creek subwatershed, in the Poway area, because flows measured at the LP-NC location showed a rapid response to rainfall and had the highest SSC EMCs within the subwatershed.

Focus potential future monitoring on the central Carroll Canyon Creek reaches. If future monitoring is determined to be needed, the scale of the monitoring program should be reduced to focus on the central Carroll Canyon Creek reaches, similar to Phase I. Data collected during both phases of the Watershed Special Study indicated that this area has the greatest sediment transport dynamics driven by storm flows. Further aerial deposition monitoring for load contribution is not recommended, because the data indicated an insignificant contribution from aerial suspension and deposition. Monitoring may be required for various reasons, including further assessment of concentrations and loads for design purposes or effectiveness assessment of potential future management measures implemented within the subwatershed.

1.0 INTRODUCTION

This special study will complement and provide supporting information for the implementation of Resolution Number R9-2012-0033, *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) to Incorporate the Total Maximum Daily Load (TMDL) for Sedimentation in Los Peñasquitos Lagoon* (Sediment TMDL) (Regional Board, 2012). The study will monitor suspended sediment concentrations (SSCs) and the deposition of airborne particulates at multiple points along the major tributaries within the greater Los Peñasquitos Watershed Management Area (WMA). The purpose of this special study is to better understand sediment loading and transport within the Los Peñasquitos WMA. Data collected during this special study are intended to provide information on potential source areas within the subwatersheds and to determine whether aerial deposition is a contributing factor to sediment loads. Results of this monitoring are aimed at assisting Responsible Agencies to determine the most effective use of resources to manage sediment loading throughout the WMA.

1.1 BACKGROUND

The Los Peñasquitos WMA encompasses an approximate 94-square-mile drainage area in west-central San Diego County. Within the WMA are the City of Poway, a portion of the City of Del Mar, unincorporated areas of San Diego County, and the City of San Diego communities of Mira Mesa, Scripps Ranch, Carmel Valley, and Sorrento Valley.

The WMA drains a highly urbanized region that supports a variety of water supply, economic, recreational, and habitat-related beneficial uses. The WMA includes four subwatersheds: Carmel Valley Creek, Los Peñasquitos Creek, Carroll Canyon Creek, and Los Peñasquitos Lagoon (the area immediately surrounding the lagoon). For the purposes of this monitoring plan, the three major streams (Carmel Valley Creek, Los Peñasquitos Creek, and Carroll Canyon Creek [also known as Soledad Canyon Creek]) will be referred to collectively as the subwatersheds that are included for monitoring purposes, as these are the primary conveyances that ultimately discharge into the Los Peñasquitos Lagoon (Lagoon). The subwatershed of Los Peñasquitos Lagoon is not included in the monitoring under this special study.

The Lagoon has incurred a number of anthropogenic disturbances that have resulted in excessive sedimentation and the gradual degradation and loss of the estuarine habitat. Accordingly, the Lagoon was placed on the 2006 Clean Water Act (CWA) Section 303(d) List of Water Quality Limited Segments (303(d) list) for sedimentation and siltation on June 28, 2007. Under the 303(d) listing, beneficial uses that are most impaired by sedimentation are estuarine habitat and preservation of biological habitats of special significance. Sedimentation in the Lagoon also restricts tidal flows between the Lagoon and the ocean, and degrades critical saltmarsh habitats.

On June 13, 2012, the San Diego Regional Water Quality Control Board (Regional Board) adopted the Sediment TMDL, which is designed to restore the Lagoon to its mid-1970s condition. The Sediment TMDL has been approved by the State Water Resources Control Board (State Board) and was approved by the California Office of Administrative Law (OAL) on July 14, 2014, and the United States Environmental Protection Agency (USEPA) on October 30, 2014. This Monitoring Plan will be adopted to evaluate progress toward meeting TMDL targets and sediment reduction goals.

The Sediment TMDL will be incorporated into the San Diego Regional Municipal Separate Storm Sewer System (MS4) Permit (MS4 Permit) (Order Number R9-2013-0001) (Regional Board, 2013) and will be included in the Water Quality Improvement Plan for the Los Peñasquitos WMA. The requirements of the Sediment TMDL and the MS4 Permit will be addressed in the Los Peñasquitos WMA Water Quality Improvement Plan. This special study assessing sediment transport within the subwatersheds of the Los Peñasquitos WMA fulfills requirements set forth in the Water Quality Improvement Plan. This study is to be conducted in two phases during the current MS4 Permit cycle, as described in Section 1.2. The first phase was initiated solely by the City of San Diego to serve as a pilot study to assess the feasibility of implementation. The second phase is implemented by the Responsible Agencies throughout the entire WMA, per Water Quality Improvement Plan requirements.

The Responsible Agencies that are party to the development of the Water Quality Improvement Plan for this WMA are:

- City of Del Mar
- City of Poway
- City of San Diego
- County of San Diego
- California Department of Transportation (Caltrans)

Caltrans has partial responsibility for the implementation of the Sediment TMDL along with the Comprehensive Load Reduction Plan (CLRP) for the TMDL for indicator bacteria, *Project I—Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)*, Resolution No. R9-2010-0001 (Regional Board, 2010), referred to as the Bacteria TMDL. Caltrans is therefore included as a Responsible Agency, but is not listed in the MS4 Permit as a Copermittee. Caltrans is under a separate storm water permit from the State of California (State) to reduce or eliminate the discharge of pollutants to storm drainage systems and receiving waters (Order No. 2012-0011-DWQ and Amendment Order No. WQ 2014-0077-DWQ) (State Board, 2014 and 2013). Caltrans is voluntarily participating in the development of several Water Quality Improvement Plans across the San Diego region.

1.2 SPECIAL STUDY PLANNING AND OBJECTIVES

This special study will assess sediment transport at multiple points throughout the WMA’s subwatersheds (Carmel Valley Creek, Los Peñasquitos Creek, and Carroll Canyon Creek) in both the riverine water column (during storms) and aerial deposition (during ambient dry conditions). Data collected during this program will provide current sediment loading information for the monitored segments of the creeks. Outcomes from this special study are intended to assist in evaluating and refining the sources of sediment within the study area, which will ultimately assist in addressing potential management measures related to the Sediment TMDL waste load allocation (WLA). This special study is designed to answer the following study questions:

- Wet Season Riverine Monitoring
  - What is the sediment concentration at discrete times throughout a wet weather event hydrograph at points throughout the subwatersheds?

  - What are current sediment load estimates (washload and bedload) at points throughout the subwatersheds? Is there a greater load from a potential source area?
  - How do the sediment delivery potentials of the various creek reaches compare with each other during wet weather events?
- Dry Weather Aerial Deposition Monitoring
  - What are the aerial contributions of sediment to the subwatersheds within the WMA?
  - Can these entrained particles be associated with specific sources or land uses?
  - What is the contribution of aerial deposition relative to wet weather suspended sediment concentrations observed in the sub-watersheds?

This special study is to be executed in two phases as follows:

- Phase 1
  - Initiated by the City of San Diego to assess the feasibility of the study design and provide additional data on Carroll Canyon Creek discharges, as the creek has been identified as the primary contributor of sediment loads to the Lagoon
  - Conducted during Fiscal Year (FY) 2015 (FY15), July 2014 through June 2015. This phase could potentially continue in future fiscal years if Phase 2 is not initiated
  - Includes wet season riverine and dry weather aerial deposition monitoring in the Carroll Canyon Creek subwatershed only
- Phase 2
  - Implemented by the WMA Responsible Agencies throughout the WMA, per the Water Quality Improvement Plan
  - Conducted during one fiscal year, July through June, before the current MS4 Permit Report of Waste Discharge submittal in 2018
  - Includes wet season riverine and dry weather aerial deposition monitoring in the three subwatersheds: Carroll Canyon, Los Peñasquitos, and Carmel Valley Creeks

1.3 SUBWATERSHED STUDY AREAS

There are three monitored subwatersheds within the Los Peñasquitos WMA: Carmel Valley Creek, Los Peñasquitos Creek, and Carroll Canyon Creek. Figure 1-1 shows subwatersheds, boundaries of the creeks' drainage areas, 303(d)-listed segments, and jurisdictional boundaries. Caltrans' jurisdiction occurs in the three subwatershed and consists of the corridors associated with their highways (e.g., Interstate 5, Highway 1/Pacific Coast Highway [PCH]) and are not delineated separately in WMA maps.

Carmel Valley Creek, the northernmost creek, drains the approximate 15.71-square-mile (10,057-acre) sub-basin of Carmel Valley. Carmel Valley Creek flows westward from its headwaters (on Black Mountain) to its drainage point, at the northeastern corner of the Lagoon. The Carmel Valley Creek subwatershed is entirely within City of San Diego boundaries.

Los Peñasquitos Creek is the largest subwatershed in the WMA, draining approximately 59 square miles (37,760 acres) through the middle of the WMA. This creek conjoins with Carroll

Canyon Creek prior to entering the Lagoon. The Los Peñasquitos Creek subwatershed includes portions of the Cities of Poway, Del Mar, and San Diego, and unincorporated areas of San Diego County.

Carroll Canyon Creek, also known as Soledad Canyon Creek, is the southernmost of the three major drainages in the WMA. The creek runs through Carroll Canyon and ultimately drains into the Lagoon at the southwestern end, near its confluence with Los Peñasquitos Creek. Carroll Canyon Creek drains an area of approximately 17.19 square miles (11,004 acres). The Carroll Canyon Creek subwatershed is entirely within City of San Diego boundaries.

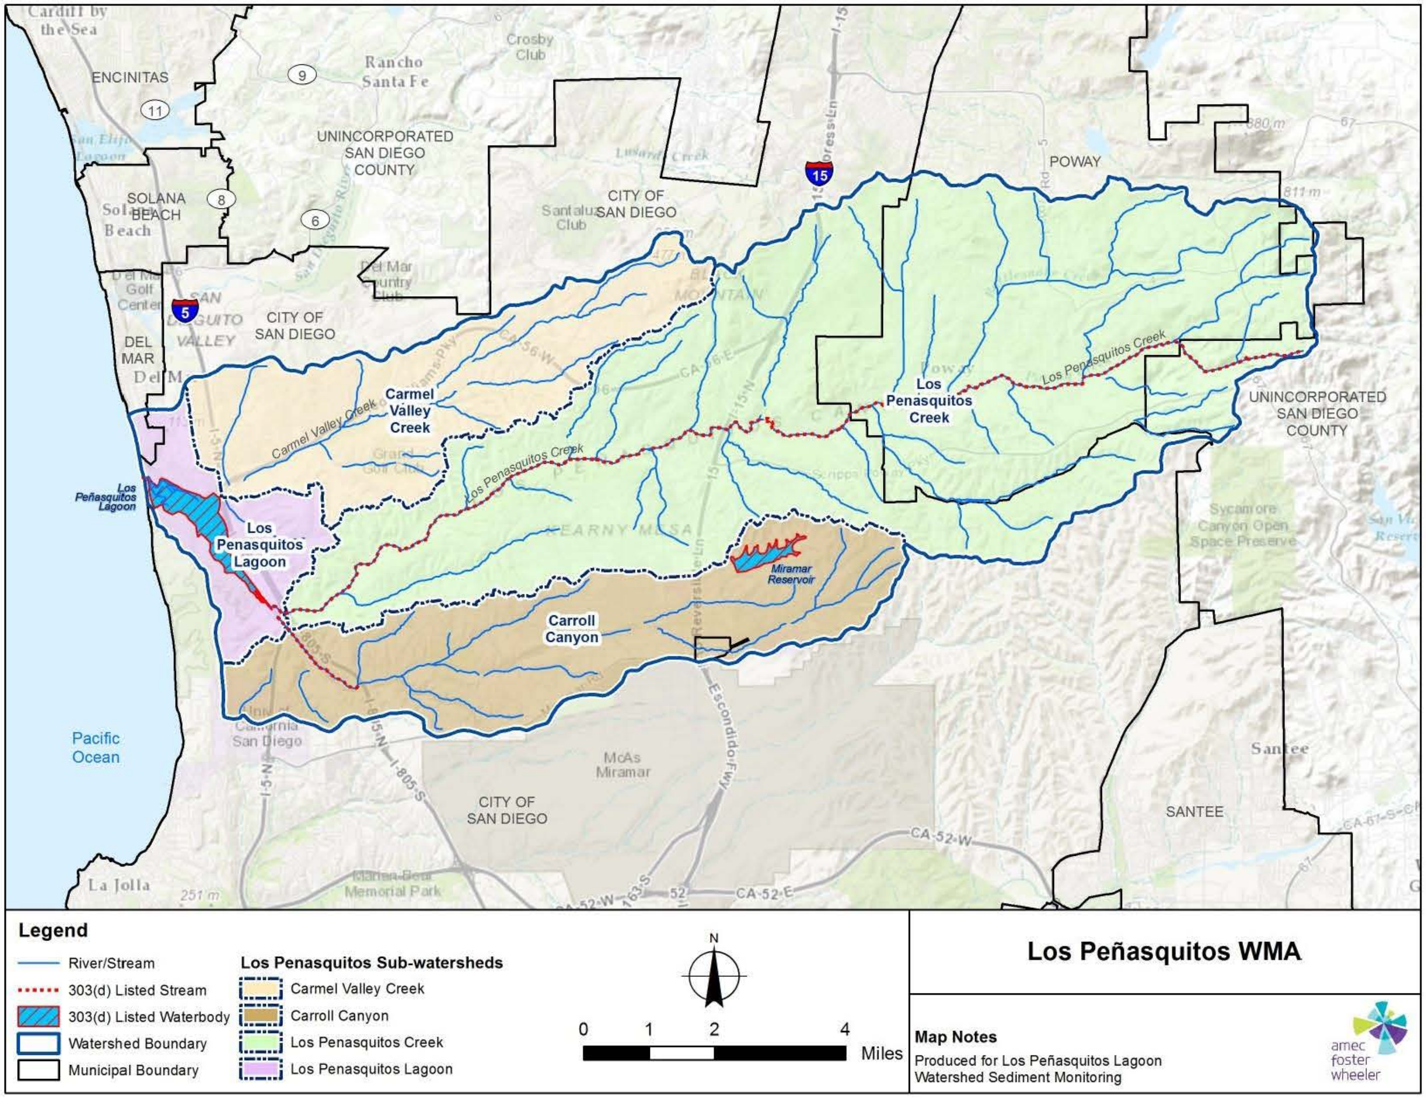

Figure 1-1.

1.4 PROJECT ORGANIZATION

The City of San Diego is the municipal government agency that oversees the project. The other municipalities within the WMA will contribute to the program through a Memorandum of Understanding (MOU). The City of San Diego has assigned two staff members to provide project oversight:

- Andre Sonksen is responsible for storm water compliance-related projects at the City of San Diego and will provide project oversight.

- Karina Danek will provide Water Quality Improvement Plan and MS4 Permit-related support, as needed.

Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler) will coordinate sampling design, sample collection, laboratory analysis, data management, data analysis, and reporting. Amec has assigned project responsibilties to several staff members:

- Jeremy Burns will serve as the Amec Foster Wheeler Project Manager, and will be responsible for project coordination and development, scheduling, budget management, and oversight of all project plans, activities, and reports.
- Kiernan Brtalik, the Amec Foster Wheeler Project Coordinator and Field Sampling Manager, will be responsible for implementing the monitoring activities, coordinating laboratory work, and developing the project report.
- Dr. Theodore VonBitner will be the Amec Foster Wheeler Quality Assurance Officer, with responsibility for the project quality assurance (QA) and quality control (QC) procedures used during sampling, laboratory analysis, data management, and data analysis.
- Jesse Davis, as the Amec Foster Wheeler Health and Safety Officer, will be responsible for implementing the project health and safety plan and related practices.
- Dr. Habib Matin will provide Amec Foster Wheeler senior principal-level oversight and review during development of this monitoring plan, implementation of sampling, data analysis, and reporting.
- Liz Collins is the manager of Amec Foster Wheeler's material testing laboratory, which will conduct particle-size distribution analyses for bedload samples; she will ensure that samples analyzed by Amec Foster Wheeler are analyzed in accordance with the methods and QA requirements outlined in this monitoring plan.

Weck Laboratories, Inc. (Weck), located in City of Industry, California, will be responsible for wet weather SSC analysis:

- Hai Van Nguyen is the Weck Project Manager and will ensure that samples are analyzed in accordance with the methods and QA requirements outlined in this monitoring plan. The Weck laboratory QA/QC manual is in Appendix A.

Eurofins Air Toxics Laboratories, Inc. (Air Toxics), located in Folsom, California, will be responsible for analyzing the aerial deposition samples:

- Kyle Vagadori is the Air Toxics Project Manager and will ensure that aerial deposit samples are analyzed in accordance with the methods and QA requirements outlined in this monitoring plan. The Air Toxics laboratory QA/QC manual is provided in Appendix A.

The project organization is provided in Figure 1-2.

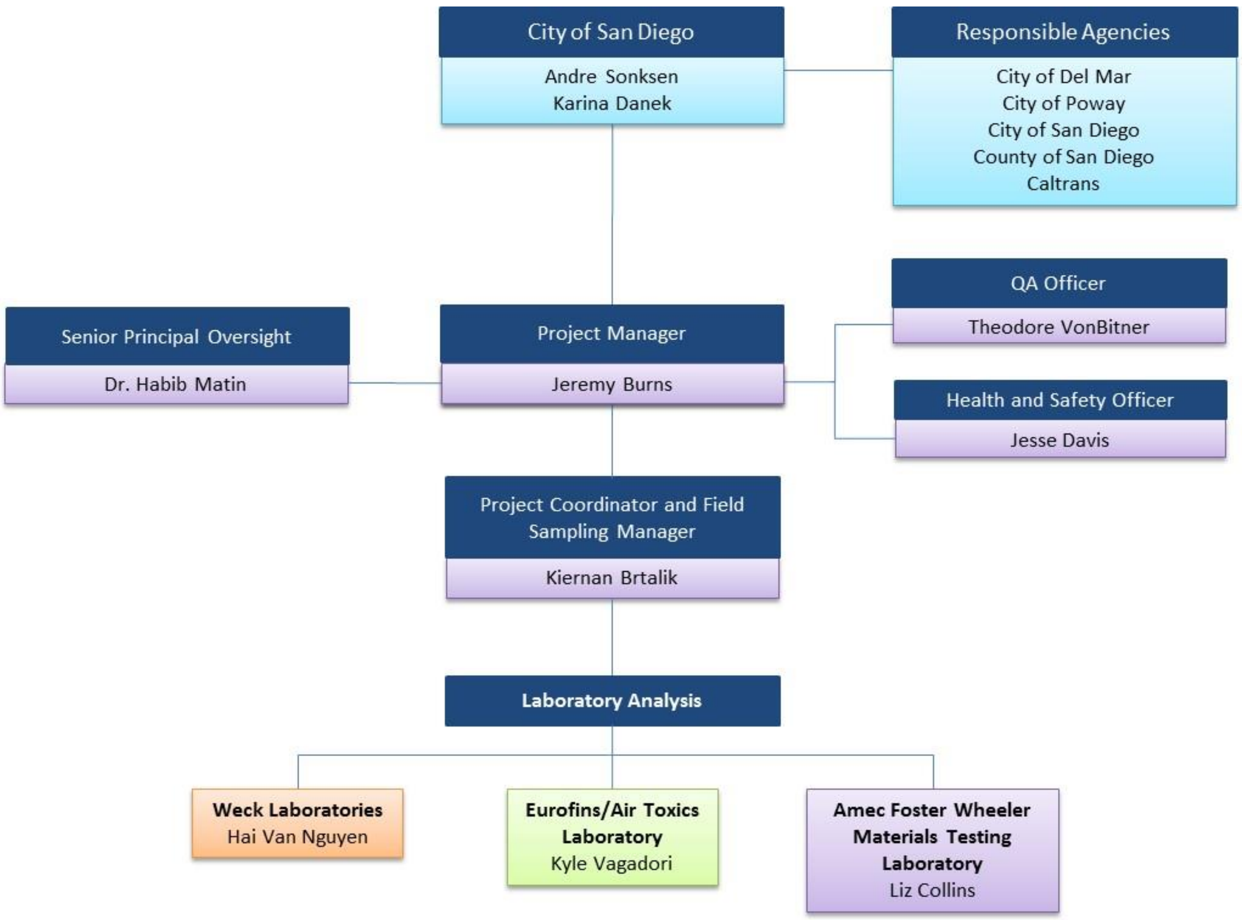

Figure 1-2.
Amec Foster Wheeler Team Organization

1.5 MONITORING PLAN ORGANIZATION

This monitoring plan encompasses wet weather riverine and dry weather aerial depositions monitoring. Given the different media, monitoring locations, and analyses, the structure of the monitoring and analytical procedures in this document is organized on the basis of monitoring type. The Introduction, QA/QC, and Data Analysis and Reporting sections (Sections 1, 5, and 6) are inclusive of both monitoring aspects and describe the overall, collective goals of this special study. For the sake of clarity, the monitoring details (e.g., locations, approach, analyses, etc.) for each monitoring type have been separated in this document.

This page intentionally left blank.

2.0 WET SEASON RIVERINE MONITORING

Wet weather and related sediment sampling will occur at several locations in Carmel Valley Creek, Los Peñasquitos Creek, and Carroll Canyon Creek within the study boundary. This section describes the monitoring locations, sampling procedures, and analytical requirements associated with the wet season riverine sampling.

2.1 WET SEASON SAMPLING LOCATIONS

Approximate wet weather sampling locations were pre-selected along Carroll Canyon Creek, Los Peñasquitos Creek, and Carmel Valley Creek. Locations were targeted on the basis of site accessibility, spacing along each creek, characteristics of creek segments, and/or jurisdictional boundaries.

Site names, identifications (IDs) and the approximate geographic coordinates within each subwatershed are listed in Table 2-1. The locations are also shown in Figure 2-1.

Included in Figure 2-1 are three TMDL compliance monitoring locations that are sampled as part of the Los Peñasquitos WMA compliance monitoring program. The three TMDL compliance sites are at the base of each primary tributary creek and are named after their respective subwatersheds: Carmel Valley Creek, Los Peñasquitos Creek, and Carroll Canyon Creek. These locations are shown in the map for context, but are not included in Table 2-1, because they are not part of this special study. Site locations for Phase 1 of this special study are currently being monitored. Site locations for Phase 2 are approximate and may change on the basis of site reconnaissance and suitability for monitoring, as determined during siting efforts in these subwatersheds during Phase 1.

Table 2-1.
Los Peñasquitos WMA Speical Study
Wet Season Monitoring Locations

Site Name	Subwatershed	Site ID	Site Description	Latitude[1]	Longitude[1]	Monitoring Phase
Nancy Ridge	Carroll Canyon Creek	CC-NR	Approx. 100 feet east of the Carroll Canyon Road and Nancy Ridge Drive intersection	32.89168	-117.19194	1 and 2
Arizona Crossing	Carroll Canyon Creek	CC-AC	Approx. 900 feet east of the Fenton Road and Carroll Canyon Road intersection	32.89249	-117.18221	1 and 2
Maya Linda	Carroll Canyon Creek	CC-ML	Large underground storm drain in the Mira Monte Apartments parking lot – northeastern corner of Building “A”	32.90605	-117.11719	1 and 2
Black Mountain	Carroll Canyon Creek	CC-BM	Creek behind office building, approximately 500 feet southeast of the Black Mountain Road and Maya Linda Road intersection	32.90055	-117.12223	1 and 2
Trap Channel	Carroll Canyon Creek	CC-TC	Lined drainage channel approximately 65 feet east of the Via Pasar and Candida Street intersection	32.89770	-117.11947	1 and 2
North City[1]	Los Peñasquitos Creek	LP-NC	Creek near the Sabre Springs Road and Springbrook Drive intersection near Poway	32.94275	-117.08428	2 only
Hidden Valley[1]	Los Peñasquitos Creek	LP-HV	Creek near the Gate Drive and Fairgate Drive intersection in Poway	32.95502	-117.03386	2 only
Carmel Valley[1]	Carmel Valley Creek	CV-CV	Creek location where it passes under Carmel Valley Road	32.94843	-117.19762	2 only

1. Site locations are subject to change. The number of Phase 2 locations (Los Peñasquitos Creek and Carmel Creek) may be increased or decreased on the basis of site reconnaissance and suitability for monitoring.

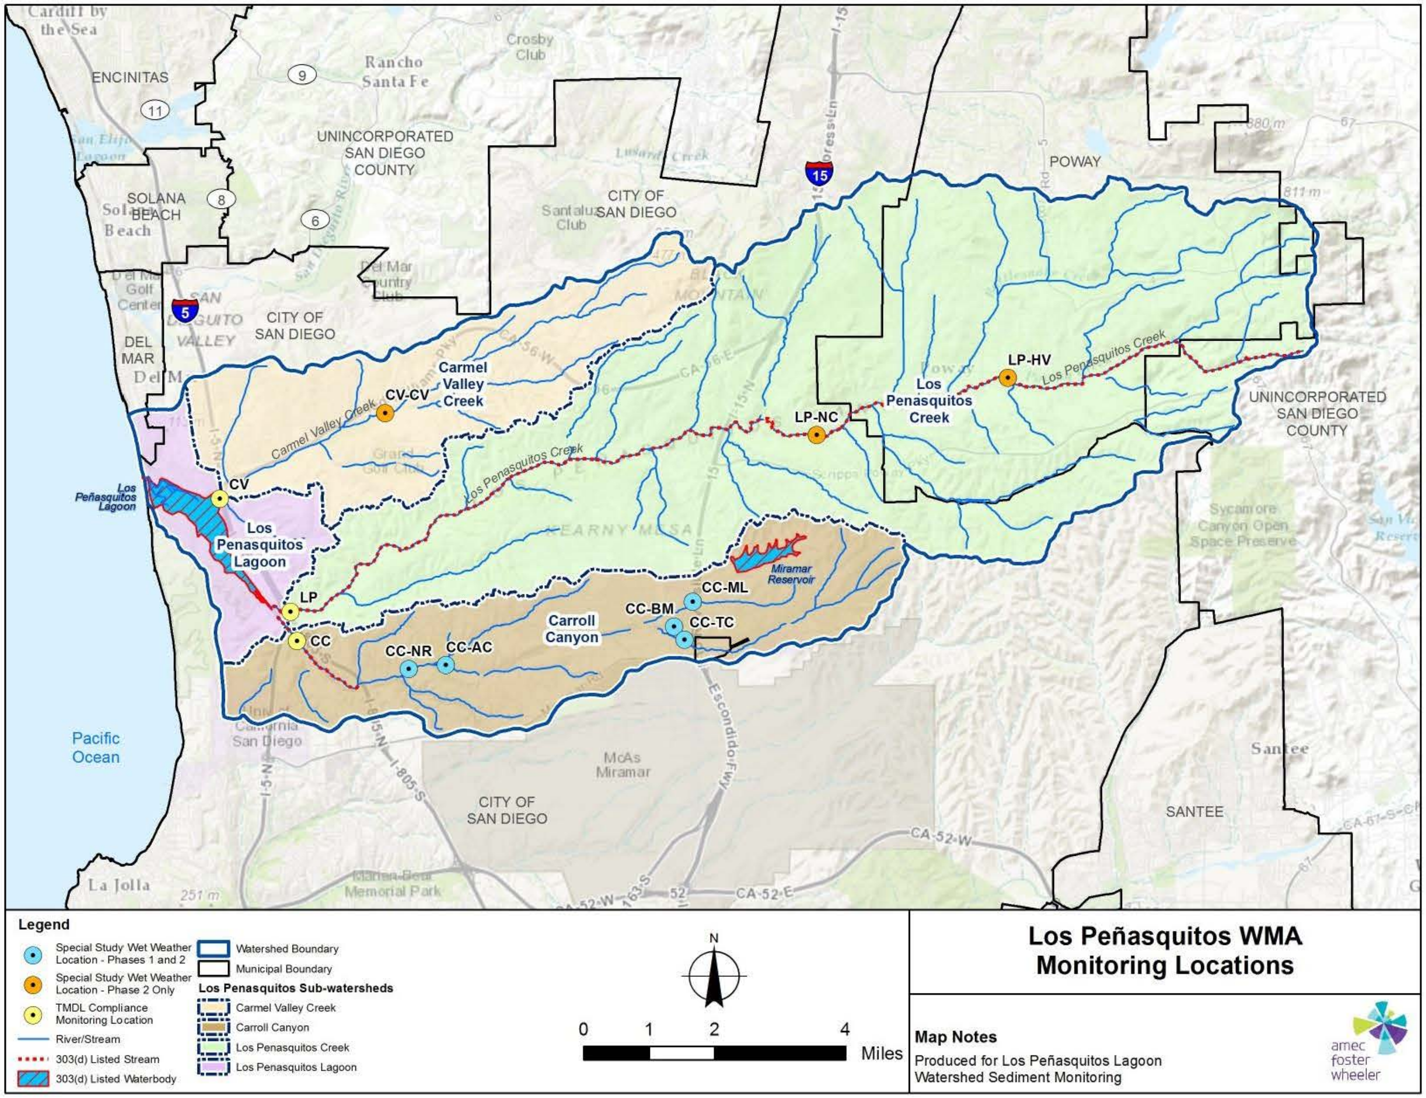

Figure 2-1.
Los Peñasquitos WMA Wet Season Monitoring Locations

This page intentionally left blank

2.2 SAMPLING METHODOLOGY

2.2.1 Pre-Wet Season Sampling

Sections 2.2.1.1 through 2.2.1.4 describe sampling activities for this special study to be performed prior to the wet season.

2.2.1.1 Volumetric Stream Bed Sampling

Volumetric stream bed sampling will be conducted at each monitoring location (except Maya Linda, since it is located in a concrete conveyance) on one occasion prior to the wet weather season. Up to three stream bed material samples will be collected at a representative portion along a cross-sectional transect at each monitoring location. Samples will be collected in an area approximately 12 inches by 12 inches, and by digging down approximately 12 inches, yielding a sample size of approximately 1 cubic foot. If an armor layer of large cobble exists that has a grain size that is distinctly larger than the grain size of the underlying material, the layers will be sampled separately. Samples will be placed in 5-gallon buckets and will be labeled by Site ID. Samples will be transported to Amec Foster Wheeler's materials testing laboratory and analyzed for particle-size distribution (PSD). Data from this sampling provide information on existing grain size and potential susceptibility to erosion. The PSD data provide valuable information on the streambed armoring processes and changes in PSD due to geomorphic changes at the study reach. This PSD monitoring will document the changes in particle size distributions at the beginning of each season in comparison to the size distribution form the previous year.

2.2.1.2 Cross-Sectional Channel Surveys

During the volumetric sampling, field crews will conduct cross-sectional channel surveys at each monitoring location. Surveys will be used to refine flow measurements.

2.2.1.3 Pebble Count Before Wet Season

A pebble count will be conducted at each monitoring location prior to the wet season, except the Maya Linda location. This data point will be used as the baseline for the season and as a comparison point for the subsequent pebble counts that will be conducted after monitored storms and after non-monitored major storms throughout the wet season. It is anticipated that a total of eight pebble counts will occur throughout the project. The method used will be the sampling frame and template method developed by Bunte and Abt (2001a and 2001b), which uses a minimum of 100 particles and half-phi template (gravelometer) to measure particle sizes. A tape measure will be used to space three sampling transects across riffle sections at each location. The pebble count represents the size of material in the area and can be used to assess the representativeness of the volumetric samples. Site locations will be physically marked and recorded using Global Positioning System (GPS) for subsequent pebble counts throughout the wet season. Pebble counts can be used to assess stream power and its ability to move particles downstream. They also provide PSD data after storm events. This information will be used to evaluate the changes in PSD (i.e., D35, D50, and D90) after each storm event compared to the size distribution at the beginning of the wet season. This data will provide information on whether the streambed is coarsening as a result of the storm events.

2.2.1.4 Photodocumentation

The stream bed will be documented with photographs taken during dry weather volumetric sample collection and initial pebble counts. Photos will be taken of the stream bed using a 1-square-foot frame placed in three designated locations within each stream. These same points will be photographed during subsequent pebble counts, based on pebble count site markings. These photographs will provide a time series of stream bed material changes throughout the wet season.

2.2.2 Wet Weather Monitoring

Wet weather monitoring will occur during three qualifying rainfall events (storms forecast to produce greater than 0.20 inch of rainfall) during each wet season. Monitoring will consist of pollutograph and bedload sampling, post-storm pebble counts, photodocumentation, and long-term flow monitoring.

2.2.2.1 Pollutograph Sampling

During each monitored event, water samples will be collected for SSC analysis. A target of 10 pollutograph samples will be collected at each monitoring location (as listed in Table 2-1) during each of the three monitored events. Sampling will be conducted either manually or with automated samplers at each monitoring location. Samples will be collected at equal time intervals or at times adjusted to capture multiple peaks throughout the storm duration. Data from these samples will provide insight on sediment concentrations throughout a storm and will be used to calculate load estimations.

2.2.2.2 Bedload Sampling

Samplers will be installed per United States Department of Agriculture guidelines (Bunte et al., 2007). Attempts will be made to collect bedload samples during monitored events at each monitoring location, with the exception of the Maya Linda site. The Maya Linda site is in a large, underground storm drain that is not considered a feasible location for bedload sampling.

Previous sample collection by Amec Foster Wheeler in other City project locations (Flanders Canyon Creek [2011–2012] and Carroll Canyon Creek [2011–2013]) has been successful on limited occasions; however, based on best professional judgment for these previous monitoring efforts, bedload sample collection may be unsuccessful for a given storm event. For the aforementioned studies, the cause of sample failure is unknown. It is hypothesized that flows may redirect around bedload samplers because of stream hydrology or sample exclusion due to large cobbles.

For these challenged bedload sampling locations, efforts will be made to move the in-stream samplers around in the channel if flows appear to be bypassing the samplers. Bedload samples will be collected using a bedload trap sampler installed at two points across the channel at each site. If a sampler fills with material during the storm and it is safe to access it, attempts will be made to change the mesh bag. These samples will provide data on material that is moving along the stream bed during storms and is not suspended in the water column. If collection is successful, bedload samples will be analyzed for particle size distribution. Bedload data will be used in conjunction with SSC sample data to calculate load estimations. Bedload data will be used in conjunction with SSC sample data to estimate sediment loads. Particle size data for bedload samples will provide insight into stream power and its potential to cause erosion. Bedload data will also provide information on bed shear stress during storm events on the incipient motion of particles for each storm and the effect of bed armoring on particle motion and its transport capacity

2.2.2.3 Post-Storm Pebble Count

A pebble count will be conducted at each monitoring location after each monitored storm and after major storms throughout the wet season, as budget permits. See Section 2.2.1.3 for procedure details.

2.2.2.4 Photodocumentation

The stream bed will be documented with photographs taken during post-storm pebble counts. Photographs will be taken at the same locations that were photographed during the prior to the wet season. These photographs will provide a time series of stream bed material changes throughout the wet season. See Section 2.2.1.4 for procedure details.

2.2.2.5 Long-term Flow Monitoring

In addition to storm event monitoring, flow will be measured continuously at each of the monitoring locations. Flow data will be logged at 1-minute intervals during storm events and at 15-minute intervals during non-storm events. Data will be downloaded, twice per month, to confirm that data are being recorded and that the equipment is functioning properly. Flow data collected at these monitoring locations will be used to calculate load estimations and provide an understanding of the flow regimes at each location, which can affect the sediment transport capabilities at each monitoring location. The continuous flow data can be used in evaluating sediment transport load during storm events. The flow data will be used in evaluating stream transport capacity using particle size distribution and bedload sampling results.

2.3 WET WEATHER MONITORING PREPARATION AND LOGISTICS

2.3.1 Weather Tracking

Weather will be tracked for monitoring purposes throughout the wet season. Throughout the wet season, several sources of weather information will be monitored continuously; however, the National Weather Service (NWS) webpage will be the primary source used to determine whether and when to mobilize monitoring crews.

2.3.2 Storm Selection Criteria

The following criteria will be used to determine whether to mobilize, on the basis of forecast data from the NWS, for an impending storm event:

- Storm forecasts must meet criteria at least 48 hours prior to the onset of rainfall;
- A storm must be forecast to produce at least 0.20 inch of rainfall;
- The probability of precipitation must be greater than 60 percent; and
- A storm event must be preceded by at least 72 hours of dry conditions (less than 0.10 inch of precipitation).

The Field Sampling Manager and/or Project Manager may modify the criteria on a storm-by-storm basis, in consultation with the City of San Diego.

2.3.3 Staffing and Mobilization

Staffing Plan

Monitoring both the flow characteristics and water quality of storm water requires considerable planning before any rain actually falls. Obtaining representative samples and complete storm data is possible only with trained and alert field teams. The uncertainty of weather forecasts coupled with abrupt changes in the weather can greatly alter the expected workload. It is critical to plan and prepare in advance as many aspects of the field work as possible. A staffing plan that designates personnel and specifies the equipment required for each facet of monitoring will be completed as soon as a potential event has been forecast.

Each monitoring team will consist of two field individuals. The staffing plan will specify the following:

- Personnel assigned to each position
- Shift times (e.g., startup and relief) and assigned monitoring location
- Equipment mobilization requirements
- Communication channels

No field teams will be mobilized for a storm event that would require field sampling or laboratory analysis on federal holidays.

Staffing Positions and Personnel

Storm monitoring tasks require a variety of skills. Amec Foster Wheeler personnel will be assigned to the following positions:

- Project Manager
- Field Sampling Manager
- Field Technicians

Project Manager

During storm events, the Project Manager will monitor the status of the storm conditions and communicate with the Field Sampling Manager. The Project Manager must be able to obtain and interpret the most recent weather forecasts to estimate the appropriate timing and duration of the storm. This information will be used to determine the time span between pollutograph sample collections and to make informed decisions regarding the storm status. It is also the responsibility of the Project Manager to notify all personnel of shift start- and end-time changes.

The assigned Project Manager has excellent decision-making and dispatching skills as well as an understanding of the project requirements. If the Project Manager is not available during the storm event, an individual with similar skills will be assigned; however, the Project Manager will be available to answer questions.

Field Sampling Manager

This position requires an understanding of project requirements, sampling procedures, and equipment operations. The Field Sampling Manager must be able to troubleshoot most of the common problems that could be experienced by any of the field teams. The Field Sampling Manager will lead sampling activities, monitor the ability of field teams to safely and effectively complete their shifts, and communicate frequently with the Project Manager to prioritize tasks, request relief teams as needed, and provide onsite weather observations.

The Field Sampling Manager is a technically skilled field supervisor and is the most experienced member of the field team.

Field Technicians

Field technicians are field personnel trained in storm water sample collection and health and safety procedures. They will assist the Field Sampling Manager in storm water sample collection.

Equipment Mobilization

Equipment needed for storm water sampling includes automated sampling equipment, sample containers, safety equipment, personal rain gear, and storm kits. The necessary equipment will be loaded into the appropriate vehicles early in the storm preparation sequence. During the monitoring season, field crews will use safety equipment, personal rain gear, and other monitoring location maintenance equipment.

Table 2-2 lists the contents of a field technician's field kit.

Table 2-2.
Field Equipment for Storm Monitoring and Mobilization

Storm Kit Equipment List	Mobilization List
Flashlights or headlamps	Paper towels
High-quality alkaline batteries for lamps	Cellular phone
Maps of all required areas	Personal rain gear
Pencils and indelible markers	Digital or disposable camera
Desiccant (packages and jar)	Safety gear (see Appendix B, Health and Safety Plan)
Diagonal clipper	Spare sample labels
Electrical tape	Sample control paperwork
Cable ties (assorted sizes)	Spare sets of 1-liter bottle suites for carousel
Utility knife	Automated sampling equipment not existing onsite (including appropriate spare batteries)
Ziploc® plastic bags (assorted sizes)	Spoons, trowels, and shovels
Nitrile gloves	Bedload trap equipment and spare bedload trap nets
Full set of keys (if necessary)	
Field notebook	

Communication Channels

Communication channels must be established for personnel to contact each other before and during the event. The project field notebook will include lists of home, work, and cellular telephone numbers of the Amec Foster Wheeler field team and the work telephone numbers of the primary laboratory contacts and City personnel. Cellular telephone communication links to field teams are essential for efficient storm water monitoring because the Project Manager and Field Sampling Manager will need to track the location and workload of each field team and to prioritize tasks.

Training of Field Personnel

Field personnel will be properly trained in the use of the monitoring equipment and in all appropriate health and safety protocols (see Appendix B). Specifically, the following elements will be included in the training of all field personnel:

- Review of health and safety plan
- Classroom training
- Field training (as necessary)

Each field team member will review the Health and Safety Plan (HASP) and consult with the Field Sampling Manager for any questions before mobilization. Classroom and field training will be provided prior to the first monitored storm event to inform field personnel of the project-specific objectives.

2.3.4 Station Preparation

Field Equipment Installation

Each field installation team will consist of two technicians who are knowledgable on the use of storm water samplers. The technicians will also be familiar with equipment siting requirements. The team will deliver and install the enclosure, monitoring equipment, intake tubing, and flow monitoring sensors prior to the onset of the storm season. Any equipment that is not installed or stored onsite will be mobilized during pre-storm activities.

Determination of Sampling Time Intervals

Water quality monitoring using pollutograph sampling requires an understanding of forecast storm length to determine the proper time intervals between the targeted 10 samples. If automated samplers are used to collect pollutograph samples, the proper time interval must be entered into the automated samplers before the storm starts. Although 10 samples are targeted to be collected throughout the storm, achievement of that target is based on actual storm duration; if the storm ends much earlier than forecast, 10 samples may not be collected.

This project requires individual samples per analysis on the basis of analytical methods. One-liter containers will be used to collect water samples for SSC; one container will be filled at each sample collection interval.

Preparation of Automated Equipment

A maintenance and calibration program will be performed at each automated water sampler before each wet weather event during the monitoring season. Maintenance will include checking the performance of all the equipment, checking power supplies, inspecting and clearing intake structures, checking the status of the instrumentation desiccant, and performing any necessary equipment repairs to keep the monitoring equipment operational.

Field teams will inspect the monitoring equipment at all flow monitoring locations to make sure that it is functional and will verify that the equipment is functional on field forms.

If automated samplers are used for water sample collection, field teams will make sure that the automated sampler has been reset and that it has been programmed to collect samples on the basis of the specified time intervals. The automated sampler will be programmed to collect 10 samples.

Sample Handling

Once samples are collected, the sample bottles will be iced, with sufficient ice maintained around the bottle to ensure that the sample temperature is 6 degrees Celsius or less.

General Inspection of Monitoring Location

The general suitablity for installation of monitoring equipment will be surveyed at each location and assessed to determine whether there is debris or trash that could clog or foul equipment. The equipment will be physically observed for potential problems, such as a damaged cable or a kinked hose. When access allows, intake strainers and flow sensors will be visually checked and cleared of debris, if necessary.

2.3.5 Documentation

Each time a monitoring location is visited (whether during a storm or not), the visit will be recorded in the field log. The field data sheets in Appendix C are a guide to ensure that all the required data are obtained. Occasional checks of equipment parameters, such as date, time, and current water level (when safe access allows), will be conducted to verify that the data being recorded are accurate and that any deviations can be addressed in a timely fashion.

The following information will be entered during monitoring location visits:

- Site identification (alphanumeric)
- Date and time
- Monitoring program
- Field team
- Conveyance type
- Weather conditions
- Runoff characteristics
- Equipment condition
- Sample count
- Miscellaneous comments

Additional data will be recorded on the field data sheet at the end of a monitoring event. The following data will be collected at all stations where applicable:

- Total Flow Volume—Total volume of water that passed the station during the storm.
- Pollutograph Sample Count and Collection Times and Flow Rates—Total number of pollutograph samples collected throughout the storm, the time at which each was collected, and the flow rate at the time of sample collection.
- Total Rainfall—Total accumulated rainfall (in inches) since the start of the storm, measured each time the rain bucket tips.

Flow and rainfall data will be logged by the storm water flow meter and will be downloaded after the storm. However, if any downloaded data are lost, the data recorded on the field data sheet will serve as a secondary data reference.

2.3.6 Field Equipment Installation, Calibration, and Maintenance

Field teams will install the equipment, making sure that all equipment is securely mounted, using stainless-steel hardware. Sampling tubing and wiring will be routed through conduits that will be placed between the monitoring locations and the sampling enclosures. Above-ground instruments will be protected within the monitoring location equipment enclosure. Conduit runs will be buried in short, shallow trenches or secured to other basin features using stainless-steel hardware. Exposed conduit, intakes, and sensors will be securely fastened, using stainless-steel brackets, screws, and anchors.

Bedload trap samplers will be installed prior to a monitored event.

Monitoring equipment will be calibrated upon installation and during maintenance and pre-storm visits. During wet weather events, the field crew will document the equipment status, which will include:

- Checking the performance of all equipment
- Checking power supplies
- Inspecting and clearing intake structures
- Calibrating equipment, as necessary

Field crews will attempt to address maintenance needs that arise while onsite. If issues remain, field crews will note the nature of the problem and return to perform the required maintenance.

2.3.7 Flow Monitoring and Water Quality Monitoring Equipment Specifications

Data-Logging Flow Meter

The Sigma 950 area-velocity-bubbler (AVB) data-logging flow meters measure, calculate, and log flow data, based on a set of continuous measurements and programmed information.

Based on channel type and available historical flow data, water flow at each monitoring location will be measured, using either a head versus flow table or an AVB probe, which measures water stage and velocity. The flow meter allows programming of the geometry of the conveyance and, based on input from the AVB probe, the flow meter calculates instantaneous flow rates. The flow meters also have inputs for a rain gauge and sampler communication.

Flow meters will have data logging capability that allows the flow meter to be connected to an automated sampler. The flow meter provides a method for controlling (pacing or triggering) the sampler and storing the corrresponding sampling data.

The flow meters will measure and log flow levels and rainfall at 1-minute intervals. During rain events, the flow meters convert instantaneous flow into total runoff volume. Storm and hydrological data are electronically stored in the flow meter, with each monitoring event stored separately. The information recorded includes:

- Level, velocity (if applicable), flow, and rainfall data at the programmed logging interval
- Flow rate at the time of each sample
- Time of peak flow rate
- Cumulative rainfall
- Discharge volume totals

Automated Sampler

One of two automated samplers will be used for this project: an American Sigma 900 MAX or a SD900 sampling system. Each system consists of an intake strainer, Teflon-lined intake tubing, flexible silicon pump tubing, a peristaltic pump, a distributor arm, and sample bottles. If manual sample collection is determined to be more practical or successful, the automated samplers will not be used. The decision regarding the method of sample collection will be made on a case-by-case basis by the Field Sampling Manager.

The intake strainers will be securely fastened in a manner that allows sample collection in the estimated middle depth of water column. The intake tubing will be securely fastened to the intake strainer and will be housed in protective conduit to the point where the tubing enters the monitoring equipment enclosure. The intake tubing will be attached to the flexible silicon pump tubing at the sampler. The flexible silicon pump tubing will run through the sampler peristaltic pump into a distributor arm to fill the sample bottles.

Rain Gauges

A tipping bucket rain gauge is configured with a small "bucket" that holds a known amount of rainfall. When the bucket is full, it tips the water out, momentarily closes a switch, and then resets itself and starts the process again. The data logger counts each switch closure and so accumulates rainfall totals. The rain gauges used in this monitoring program are manufactured by American Sigma and will tip after every 0.01 inch of rain.

Rain gauges are installed at the Black Mountain and Trap Channel locations. The other monitoring locations do not allow for rainfall measurement because of site conditions or logistics. The two locations are representative of the upper watershed, while the lower watershed is represented by data collected at the TMDL Compliance Monitoring locations.

Power

The automated sampling equipment (if used) will be powered by 12-volts direct current (VDC) power sources, either 12-VDC deep-cycle marine batteries or 12-VDC gel cell batteries. At each monitoring location, one battery will power each piece of equipment separately; this reduces the chance of batteries running low on power and also gives redundancy in the power system at the monitoring locations. If a battery fails, the other battery can power all of the equipment until a backup battery can be installed by the field crew.

Equipment Security Housing

All monitoring equipment will be housed for the entire monitoriong season in fiberglass or metal equipment enclosures at the monitoring locations, where access allows.

2.4 ANALYTICAL PROCEDURES

Analytical procedures and laboratory information for wet season monitoring are provided in Sections 2.3.1 through 2.3.6. Table 2-3 provides the analytical methods, units, and reporting limits (RLs). Table 2-4 provides the analytical holding times, container types, and preservation requirements.

Alternative laboratory analytical methods may be used as long as appropiate detection limits and quality assurance requirements can be met.

Table 2-3.
Analytical Requirements for Water and Sediment Samples

Analysis	Method	Matrix	Units	Reporting Limit
Particle Size Distribution	ASTM C 136/117	Sediment	Millimeters	NA
Suspended Sediment Concentration	ASTM D 3977	Water	Milligrams per liter	2.0

ASTM = ASTM International; NA = not applicable;

Table 2-4.
Analytical Holding Times, Container Types, and Preservation Requirements

Analysis	Method	Matrix	Holding Time	Container Type	Preservation
Particle Size Distribution	ASTM C 136/117	Sediment	—	Mesh bag or bucket	—
Suspended Sediment Concentration	ASTM D 3977	Water	7 days	1-liter HDPE	≤6 degrees Celsius (°C)

ASTM = ASTM International; HDPE = high-density polyethylene

2.4.1 Volumetric Sample Analysis

Stream bed material samples will be collected at each monitoring location prior to the start of the wet season and analyzed for particle size distribution. If there is a distinct layer of large cobble (i.e., armor layer) above smaller-grain-size material at any sample point, the two layers will be sampled separately. Tables 2-3 and 2-4 provide anayltical and handling requirements.

2.4.2 Wet Weather Sample Analysis

This study aims to sample three wet weather events during each monitoring year. Schedule permitting, wet weather sampling will be conducted during the same three events trageted for the Sediment TMDL Compliance Monitoring program. This will provide paired data and a better overall view of the subwatershed function and the contribution to the Lagoon from the other subwatersheds.

Water samples collected will be analyzed for SSC; bedload sediment samples will be analyzed for particle-size distribution (except for at the Maya Linda monitoring location, because it is an underground storm drain). Table 2-3 provides the analytical methods, units, and RLs. Table 2-4 provides the analytical holding times, container types, and preservation requirements. SSC was selected for water sample analysis over total suspended solids (TSS) because SSC analysis uses the entire sample volume rather than an aliquot, as used in TSS analysis. Based on this anlaytical difference, SSC is considered more representative than TSS of actual sample concentrations, particularly when a sample is composed of larger, heavier particle sizes.

2.4.3 Pebble Count

The pebble count procedure is to measure the size of a random selection of pebbles along a selected stream path to represent the size of material in the area. This does not require collection and/or analysis of samples.

2.4.4 Photodocumentation

The stream bed will be photodocumented initially during the volumetric sample collection before the wet season, as well as after each major storm event, when pebble counts are conducted. This does not require collection and/or analysis of samples.

2.4.5 Laboratory Selection

For volumetric and bedload samples, analyses of particle-size distribution will be conducted by Amec Foster Wheeler's materials testing laboratory at:

- **Amec Foster Wheeler Environment & Infrastructure, Inc.**
  9177 Sky Park Court, San Diego, CA 92123
  (858) 278-3600 (office); (858) 278-5300 (fax)

For water samples, SSC analysis will be performed by:

- **Weck Laboratories, Inc**.
  14859 East Clark Avenue, City of Industry, CA 91745
  (626) 336-2139 (office); (626) 336-2634 (fax)

If necessary, alternative analytical laboratories may be used as long as the required detection limits and project QA/QC objectives can be achieved.

2.4.6 Sample Labeling

Sample bottles and containers will be pre-labeled, to the extent possible, before each monitoring event. Pre-labeling simplifies field activities and leaves only the date, time, and sampling crew's names to be filled out in the field. Each sample container provided will be labeled with the following information:

- Sample identification (ID)
- Project name
- Event number
- Sample collection date (month, day, year)
- Time of collection (in 24-hour [military] time)

- Bottle _N_ of_N__ (for multi-bottle samples)
- Sampler's initials
- Analysis

Field samples will be labeled as described below. These samples will be labeled, recorded on the chain-of-custody (COC) form, and then transported to the appropriate analytical laboratory.

Each sample collected will be assigned a unique alphanumeric code (sample ID) for tracking. The sample ID will be standardized for all samples and will contain information related to the monitoring location, event, and type of sample. The required sample ID components, applicable to all samples, are:

- Site ID:
  - According to Table 2-1
- Event Number:
  - DW = Dry weather
  - 1 = First wet weather event
  - 2 = Second wet weather event
  - 3 = Third wet weather event
- Sample Type:
  - PG1–PG10 = Pollutograph number (for water samples)
  - RB or LB = Right bank or left bank (for bedload samples)

2.4.7 Laboratory Data Package Deliverables

Laboratories will be required to provide analytical results within a three-week turnaround time per event. The deliverable package will include one hard (paper) copy and electronic data files of the results. The hard copy will include standard narratives identifying any analytical problems, QA/QC exceedances, and corrective actions. Individual data sets may be submitted to Amec Foster Wheeler as either Microsoft Excel workbook files or Microsoft Access database files.

3.0 DRY WEATHER AERIAL DEPOSITION MONITORING

3.1 AERIAL DEPOSITION SAMPLING LOCATIONS

Anthropogenic activities throughout the WMA have exposed sediments to wind and water erosion and suspension forces. Storm water flow is the primary transport mechanism of these pollutants, by eroding soils during significant rainfall and transporting sediment particles into streams. Erosion and suspension of particulate matter (PM) by wind or physical suspension may also contribute to sediment loading in the Lagoon.

Preliminary locations for aerial deposition monitoring have been identified and were based on the goal of attaining data that represent upwind and downwind concentrations of sediment from anthropogenic activities, measurement of background concentrations, predominant seasonal wind direction, accessibility of each sampling site, and/or security. Marine Corps Air Station (MCAS) Miramar measurements indicate that typical wind directions in the vicinity of Carroll Canyon are from the west-northwest to east-southeast.

The five current locations that are sampled under Phase 1 are indicated on Figure 3-1. The five current locations include a control site in Del Mar[1] (minimal anthropogenic exposure) and four locations throughout Carroll Canyon. Phase 2 will include these five sites along with two locations in the Los Peñasquitos Creek subwatershed and one location in the Carmel Valley subwatershed. The approximate locations of the three additional sites for Phase 2 are shown in Figure 3-1. Site names, identifications (IDs), brief descriptions, and the geographic coordinates of each aerial deposition monitoring location are listed in Table 3-1. Phase 2 specific site locations are subject to change, based on field reconnaissance efforts and site suitability for sampling determined during Phase 1. Monitoring methodologies will include the USEPA Federal Reference Method (FRM) and optical sensor monitoring. These methods are decribed further in Section 3.2.

[1] The Del Mar control site falls outside of the Los Peñasquitos WMA; however, this location was deemed representative of aerial conditions along the coastline of the Los Peñasquitos WMA, as it is approximately one mile north of the WMA boundary and is minimally impacted by anthropogenic activity.

This page intentionally left blank

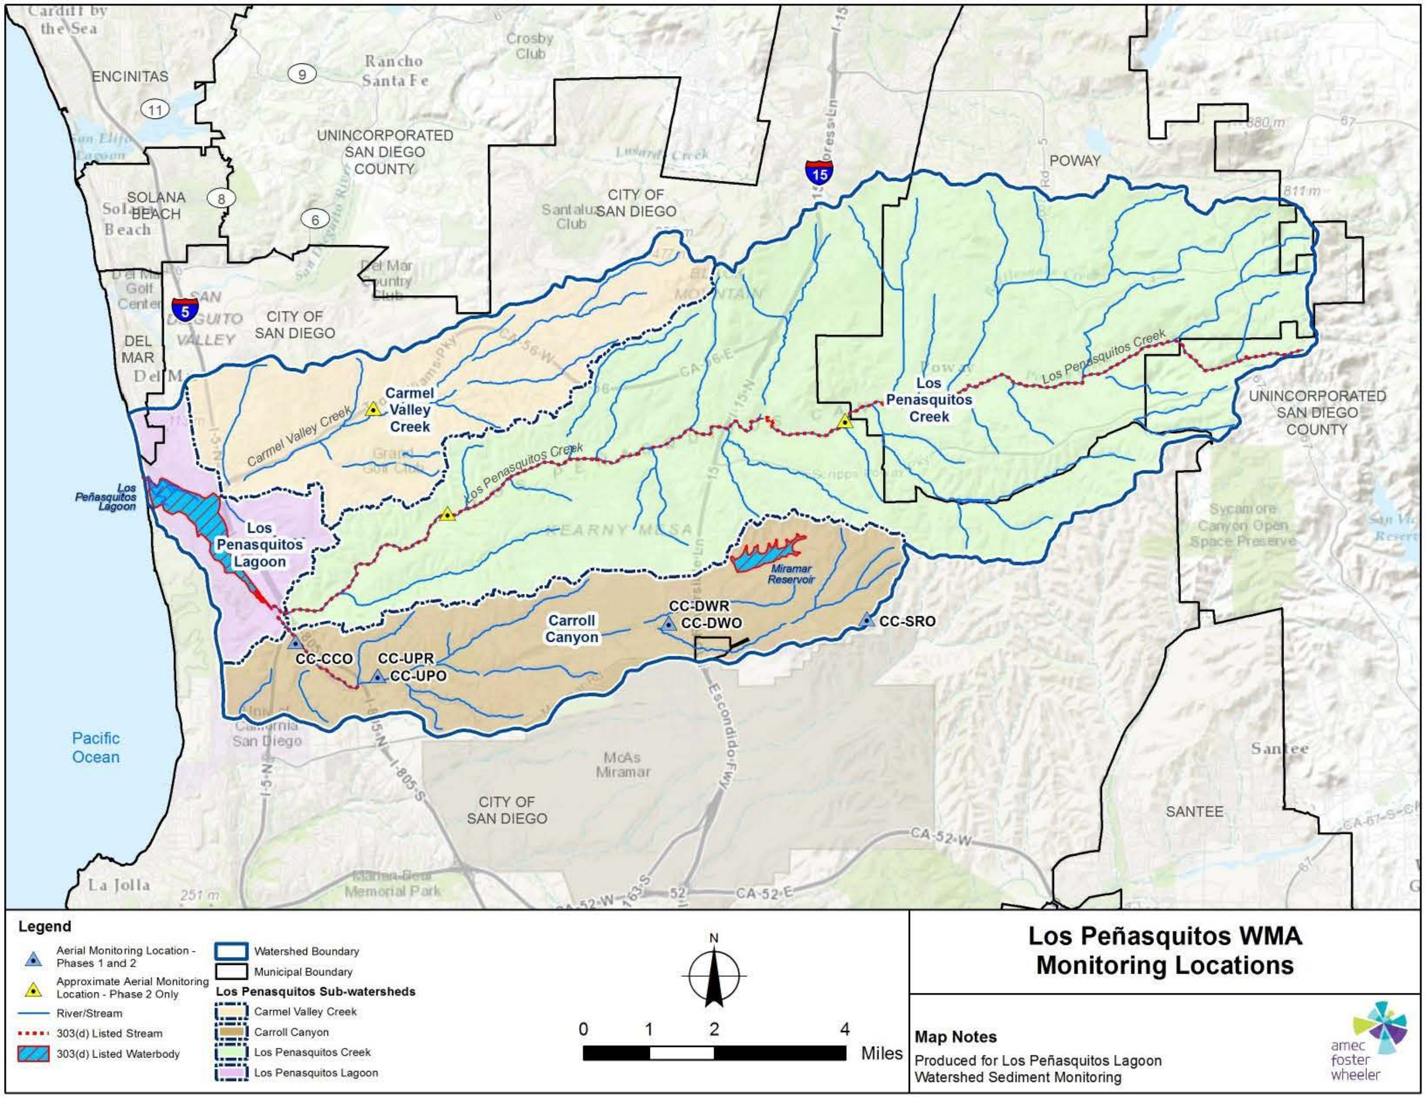

Figure 3-1.
Los Peñasquitos WMA
Aerial Deposition Sampling Locations

This page intentionally left blank

Table 3-1.
Los Peñasquitos WMA
Aerial Deposition Sampling Locations

Site Name	Sub-Watershed	Site ID	Monitoring Method	Site Description	Latitude	Longitude	Monitoring Phase
Del Mar	Lagoon / Control Site	CC-DMR / CC-DMO	FRM and Optical	Elevated location near the corner of 11th Street and Camino Del Mar	32.95497	-117.26404	1 and 2
Carroll Canyon Upwind	Carroll Canyon Creek	CC-UPR / CC-UPO	FRM and Optical	Elevated location near the corner where Scranton Road turns into Carroll Canyon Road	32.89019	-117.20006	1 and 2
Carroll Canyon Downwind	Carroll Canyon Creek	CC-DWR / CC-DWO	FRM and Optical	Elevated location near the Black Mountain Road and Carroll Canyon Road intersection	32.90134	-117.12352	1 and 2
Carroll Canyon Optical	Carroll Canyon Creek	CC-CCO	Optical Only	Elevated location close to the Carroll Canyon TMDL compliance monitoring location	32.89794	-117.22160	1 and 2
Scripps Ranch Optical	Carroll Canyon Creek	CC-SRO	Optical Only	Elevated location in Scripps Ranch	32.90191	-117.07146	1 and 2
TBD	Los Peñasquitos Creek	TBD	Optical Only	TBD	TBD	TBD	2 only
TBD	Los Peñasquitos Creek	TBD	Optical Only	TBD	TBD	TBD	2 only
TBD	Carmel Valley Creek	TBD	Optical Only	TBD	TBD	TBD	2 only

TBD = to be determined. Aerial deposition sampling locations in the Phase 2 subwatersheds will be based on the results and recommendations of Phase 1 monitoring.

Phase 1: Carroll Canyon Creek Aerial Deposition Monitoring

A total of five monitoring locations will be monitored during Phase 1, as listed in Table 3-1. One of the locations is a control site in Del Mar. This location serves as a control site because it is minimally exposed to anthropogenic activities in the small area near the coastline. The remaining four are located throughout the WMA.

Three of the five monitoring locations are coupled stations that include both FRM and optical monitoring. Optical monitoring is cost-effective means of monitoring PM_{10}; however, it is not a method that qualifies as a FRM. The coupled locations allow confirmation and/or calibration of the optical station data with the FRM station data. The cost-effectiveness of the optical stations allows for more monitoring points throughout the entire project area (Phases 1 and 2). This approach is discussed further in Section 3.2.2.

Phase 2: Los Peñasquitos Creek and Carmel Valley Creek Aerial Deposition Monitoring Planned Locations

In addition to the five locations monitored during Phase 1, Phase 2 will include two planned locations within the Los Peñasquitos Creek subwatershed and one in the Carmel Valley Creek subwatershed. Phase 1 includes the Del Mar control site, which will be applicable to the three subwatersheds. The three additional Phase 2 monitoring locations will be optical monitoring stations only.

A higher number of locations were included within the Carroll Canyon sub-watershed compared to the others due to the gravel mining operations being a potentially significant source of dust particles.

3.2 SAMPLING METHODOLOGY

Data from the sampling rounds will be used to estimate direct and indirect deposition in the study area and to determine the relative contributions of sediment input to the Lagoon.

Anthropogenic activities such as construction, automobile traffic, and mining activities can contribute to dust emissions. Aerial deposition sampling for particulate matter will occur at aerial sampling locations during three sampling rounds per year: (1) early fall, prior to the wet season; (2) mid-winter; and (3) late spring, near the end of the wet season. Sampling rounds will not be conducted during rain events or within 72 hours after the end of a rain event. During each sampling round, three 24-hour sample collection periods will occur at each monitoring location: two during weekdays and one during the weekend. This will allow for appropriate representation of varying anthropogenic activity between weekdays and weekends.

Aerial deposition sampling generally falls into two measurement categories: monitoring for PM with an aerodynamic diameter of 10 microns or less (PM_{10}) and monitoring for PM with a diameter of 2.5 microns or less ($PM_{2.5}$). PM_{10} is the particle size most generally associated with construction and land-movement activities, and therefore is the proposed measurement standard for this project.

Two different types of sampling equipment will be used for this study: the FRM and optical sensor sampling. These methods are described further in Sections 3.2.1 and 3.2.2.

3.2.1 USEPA Federal Reference Methodology Sampling

The USEPA specifies sampler design, performance characteristics, and operational requirements applicable to the PM_{10} FRM in Appendix J of 40 Code of Federal Regulations (CFR) Part 50. PM_{10} FRM samplers are intended to acquire deposits over 24-hour periods on Teflon-membrane filters from air drawn at a controlled flow rate through the PM_{10} inlet. The inlet and size separation components, filter types, filter cassettes, and internal configurations of the filter holder assemblies are specified by design, with drawings and manufacturing tolerances published in Appendix O of 40 CFR Part 50. Other sampler components and procedures (such as flow rate control, operator interface controls, exterior housing, and data acquisition) are specified by performance characteristics, with specific test methods to assess that performance.

FRM samplers will be installed with filters specific to PM_{10} to determine the mass concentration. Filters will be analyzed for PM_{10} mass. PM_{10} mass is collected using a high-volume sampler and quartz fiber filters, and then weighed to the nearest microgram by the laboratory using special ultra-sensitive balances under exacting conditions. The laboratory will be required to perform pre-analysis and post-analysis of the filters used to capture the particulate samples.

Inlets for the samplers will be located at least 2 meters above ground level and will be free of interference from nearby buildings, structures, or vegetation. Air is drawn into a sampler and deposited on a filter by the sampler. The sampler records the flow rate and sampling interval for calculating concentrations by volume. The FRM sampling equipment to be used is the BGI PQ100 PM Portable Air Sampler (USEPA Designation No. RFPS-1298-124). This sampler is a low-volume sampler, which can run on direct current (DC) power or on alternating current (AC) power.

3.2.2 Optical Sensor Sampling

Real-time, light-scattering optical PM sensors generally have lower power requirements and offer installation and mounting flexibility that allow a wider range of applications than FRM stations do. The optical sensor equipment to be used is the TSI DustTrak II Aerosol Monitor (model 8530).

Optical sensors are a more cost-effective approach to collecting PM_{10} emissions data. Although these sensors are not an accepted FRM device, using the three co-located stations as calibration points between the FRM and optical sensor data will allow for applying any necessary calibrations or offsets to the independent optical sensors. This procedure provides a higher degree of confidence in the optical sensor data.

3.3 AERIAL DEPOSITION MONITORING PREPARATION AND LOGISTICS

3.3.1 Staffing and Mobilization

Staffing Plan

Installation, maintenance, and operation of the aerial deposition samplers require knowledge of the sampler operation and the ability to troubleshoot issues in the field. Field personnel will be scheduled to run the samplers for each sampling round during a period when no rainfall is forecast.

Each installation and sampling team will consist of two field individuals. The staffing plan will specify the following:

- Personnel assigned to each position
- Shift times (e.g., start-up and relief) and assigned monitoring locations
- Equipment mobilization requirements
- Communication channels

No field sampling or laboratory analysis will be performed on the following holiday black out dates:

- Thanksgiving (November 27–28, 2014)
- Christmas Eve and Day (December 24–25, 2014)

- New Year's Eve Day (December 31, 2014) and New Year’s Day (January 1, 2015)

Staffing Positions and Personnel

Aerial deposition sampling tasks require a variety of skills. Amec Foster Wheeler personnel will be assigned to the following positions:

- Project Manager
- Field Sampling Manager
- Field Technicians

Project Manager: The Project Manager will provide guidance and oversight during each aerial deposition sampling round. If the Project Manager is not available, an individual with similar skills will be assigned; however, the Project Manager will still be available to answer questions.

Field Sampling Manager: The Field Sampling Manager is a technically skilled field supervisor and is the most experienced member of the field team. This position requires an understanding of project requirements, sampling procedures, and equipment operations. The Field Sampling Manager must be able to troubleshoot most of the common problems that could be experienced by any of the field teams. This manager will lead sampling activities.

Field Technicians: Field technicians are field personnel trained in aerial deposition sample collection, equipment operation, and health and safety procedures.

Equipment Mobilization

Equipment needed for activation and operation of the aerial deposition samplers includes filters, power supplies, tools, sample handling and shipping supplies, laptop computers for downloading data, and safety equipment.

Table 3-2 lists the content of a field technician’s field kit for installation and operation of the aerial deposition monitors.

Table 3-2.
Field Equipment for Aerial Deposition Monitoring

Aerial Deposition Monitoring Kit Equipment List	
Maps of all required areas Pencils and indelible markers Field logbook New (unexposed) filter packs Electrical tape Chain-of-custody forms High-visibility safety vest FRM and optical samplers Power supplies and/or cables	Tools (clamps, crimps, polyvinyl chloride pipes (PVC), wires, tubes, nails, screws, hammer, screwdrivers, pliers) Cable ties (assorted sizes) Utility knife Filter pack shipping envelopes Ziploc® plastic bags (assorted sizes) Nitrile gloves Full set of keys (if necessary)

FRM = USEPA Federal Reference Method

Communication Channels

Communication channels must be established so that field personnel can contact each other before and during the sampling event. The project field notebook will include lists of home, work, and cellular telephone numbers of the Amec Foster Wheeler field team and the work telephone numbers of the primary laboratory contacts and City personnel.

Training of Field Personnel

Field personnel will be properly trained in the use of the sampling equipment and in all appropriate health and safety protocols (see Appendix B). Specifically, the following elements will be included in the training of all field personnel:

- Review of health and safety plan
- Classroom training
- Field training (as necessary)

Each field team member will review the project's HASP and consult with the Field Sampling Manager about any issues that arise before mobilization. Classroom and field training will be provided prior to the first aerial deposition sampling round to inform field personnel of the project-specific objectives.

3.3.2 Station Preparation

Field Equipment Installation

Each field installation team will consist of two technicians who are trained in using the aerial deposition samplers and knowledgable about utility installation requirements. The technicians will also be familiar with equipment siting requirements. The team will deliver and install the shelter, towers, support materials, and all monitoring equipment procured and tested in accordance with the equipment procedures manuals. The team will coordinate utility installation, if needed, such as AC power capabilities, site security, shipping of major equipment and support materials, and compliance with local codes.

Determination of Sampling Time Intervals

The aerial deposition samplers will be programmed to collect measurements and/or samples at 5-minute intervals for 24 hours for each sampling period; 24 hours is a standard time frame for aerial deposition sampling.

Preparation of Automated Equipment

Equipment for aerial deposition sampling will be rented from an equipment vendor, and is expected to be calibrated and in good working order upon its arrival. Equipment received will be checked to verify that it is in good working order prior to mobilizing. Maintenance on the sampling equipment will be conducted by the equipment vendor.

FRM and optical sensor sampling equipment will be installed onsite for approximately one week or long enough to allow sampling in the three targeted sampling periods.

Field teams will confirm that the aerial deposition monitor data have been downloaded and that each sampler has been reset and programmed to collect samples, based on specified time intervals.

Sample Filters

Once the PM samples are collected, the filters will be removed from the samplers, and handled and shipped according to the requirements of the manufacturer and the laboratory.

General Inspection of Monitoring Locations

The general functionality of the area surrounding the air sampling locations will be observed and assessed to determine whether there is debris or trash that could clog or foul equipment. The equipment will be physically observed for potential problems, such as damaged components.

3.3.3 Documentation

Each time an aerial deposition monitoring location is visited, the visit will be recorded in the field log. The field data sheets in Appendix C are a guide to ensure that all the required data are obtained. Occasional checks of equipment parameters, such as date and time, will be conducted to verify that the data being recorded are accurate and that any deviations can be addressed in a timely fashion.

The following general information will be entered during aerial deposition monitoring location visits:

- Site identification (alphanumeric)
- Date and time
- Monitoring program
- Field team
- Conveyance type
- Weather conditions
- Visual observations
- Equipment condition
- Sample count
- Miscellaneous comments

Additional data will be recorded on the field data sheet at the end of a sampling round. The following data will be collected at all monitoring locations, where applicable:

- Total Flow Volume—Total volume of air (in gallons) that passed the monitoring location during the sampling round.
- Measurement and Sample Count and Collection Times—Total number of samples collected throughout the sampling and the time at which each sample was collected.

3.3.4 Air Intake and Air Quality Monitoring Equipment

Federal Reference Method Samplers

USEPA-approved FRM samplers will be used to measure, calculate, and log PM_{10} data, on the basis of a set of continuous measurements and programmed information. The approved FRM low-volume sampler to be used is the BGI Incorporated PQ100 PM Portable Air Sampler (USEPA Designation No. RFPS-1298-124).

Optical Sensor

Light-scattering optical sensors will be used both in conjunction with the FRM samplers and independently. TSI Incorporated Dust Trak II monitors (model 8530) will be used in this study.

Power

The aerial deposition sampling equipment will be powered by 12- VDC power sources or 110-volts alternating current (VAC), if available. At each 12-VDC monitoring station, one battery will power each piece of equipment separately.

Equipment Security Housing

All monitoring equipment will be housed in enviromental enclosures at the monitoring locations. The samplers and enclosures will be installed for each sampling round.

3.4 ANALYTICAL PROCEDURES

Analytical procedures and laboratory information are provided in Sections 3.4.1 through 3.4.4. Table 3-3 provides the analytical methods, units, and RLs. Table 3-4 provides the analytical holding times, container types, and preservation requirements.

Alternative laboratory analytical methods may be used as long as appropiate detection limits and quality assurance requirements can be met.

Table 3-3.
Analytical Requirements for Air, Water, and Sediment Samples

Analysis	Method	Matrix	Units	Reporting Limit
PM_{10} Mass	40 CFR Part 50 Appendix J	Air (filter)	Milligrams [a]	1.0

PM_{10} = particulate matter of 10 microns or less
a. PM_{10} analytical results are also expressed in milligrams per cubic meter (mg/m^3)

Table 3-4.
Analytical Holding Times, Container Types, and Preservation Requirements

Analysis	Method	Matrix	Holding Time	Container Type	Preservation
PM_{10} Mass	40 CFR Part 50 Appendix J	Air (filter)	—	Laboratory provided, pre-weighed bag	—

PM_{10} = particulate matter of 10 microns or less

3.4.1 Aerial Deposition Particulate Matter Analysis

Federal Reference Method Analysis

PM_{10} samples will be collected during three sampling rounds per year and analyzed for total PM_{10} mass. Tables 3-3 and 3-4 provide anayltical and handling requirements.

Optical Sensor Analysis

The optical sensor is designed to measure and record the total mass at specified intervals. Optical sensor data will be analyzed in accordance with the manufacturer's specification of the meter used for PM_{10} monitoring.

3.4.2 Laboratory Selection

For aerial deposition samples, PM_{10} analysis will be performed by:

- **Eurofins|Air Toxics, Inc.**
  180 Blue Ravine Road, Ste. B Folsom, CA 95630
  (916) 985-1000 (office)

If necessary, alternative analytical laboratories may be used as long as the required detection limits and project QA/QC objectives can be achieved.

3.4.3 Sample Labeling

Sample filters will be pre-labeled, to the extent possible, before each monitoring event. Pre-labeling simplifies field activities and leaves only the date, time, and sampling crew's names to be filled out in the field. Each sample container provided will be labeled with the following information:

- Sample identification (ID)
- Project name
- Event number
- Sample collection date (month, day, year)
- Time of collection (in 24-hour [military] time)
- Sampler's initials
- Analysis

Field samples will be labeled as described below. These samples will be labeled, recorded on the COC form, and then transported to the appropriate analytical laboratory.

Each sample collected will be assigned a unique alphanumeric code (sample ID) for tracking. The sample ID will be standardized for all samples and will contain information related to the monitoring location, event, and type of sample. The required sample ID components, applicable to all samples, are:

- Site ID:
  - According to Table 2-2
- Event Number:
  For the aerial deposition samples:
  - 1 = First sampling round
  - 2 = Second sampling round
  - 3 = Third sampling round
- Sample Type:
  - PG1–PG10 = Pollutograph number (for water samples)
  - RB or LB = Right bank or left bank (for bedload samples)

3.4.4 Laboratory Data Package Deliverables

Laboratories will be required to provide analytical results within a three-week turnaround time per event. The deliverable package will include one hard (paper) copy and electronic data files of the results. The hard copy will include standard narratives identifying any analytical problems, QA/QC exceedances, and corrective actions. Individual data sets may be submitted to Amec Foster Wheeler as either Microsoft Excel workbook files or Microsoft Access database files.

This page intentionally left blank

4.0 QUALITY ASSURANCE AND QUALITY CONTROL

This section addresses QA/QC activities associated with laboratory analyses.

4.1 LABORATORY QUALITY ASSURANCE AND QUALITY CONTROL

The laboratories will have written standard operating procedures (SOPs) that specify (for each analytical method) instrument operation and maintenance, determination of method detection limits, QC acceptance criteria, blank requirements, and stepwise procedures. At a minimum, SOPs will be written for the following procedures:

- Sample receipt, control, and disposal
- Sample preparation
- Health and safety practices
- Corrective action(s)

The SOPs and all revisions will be available to the analysts in the laboratories. The laboratories will maintain written records of all activities that might affect the quality of the results.

4.1.1 Laboratory QC Samples

The following laboratory QC checks will be required for this project.

Calibration: All instruments will be calibrated and the calibration acceptance criteria will be met before samples are analyzed. For SSC and PM_{10} analyses, the balance used will be calibrated on the day of sample analysis in the range of samples.

Method Blanks: The method blank ensures that the equipment and reagents used in preparing the samples are free of contaminants that could interfere with the analysis. For SSC analysis, one method blank will be analyzed per batch.

4.1.2 Corrective Action

Corrective action is taken when an analysis is deemed suspect for some reason, such as high blank concentrations. The corrective action varies from analysis to analysis, but typically involves:

- Checking the procedure
- Reviewing the documents and calculations to identify any possible error
- Correcting the error
- Re-analyzing the sample, if it is available, to see whether results can be improved
- Completely reprocessing and re-analyzing additional sample material, if it is available

The laboratories have procedures in place to follow when failures occur, will identify the individual(s) responsible for corrective action, and will appropriately document the incident.

4.2 MEASUREMENT QUALITY OBJECTIVES

The measurement quality objectives (MQOs) for SSC and PM_{10} analyses are quantitative and qualitative statements that define project objectives and specify the acceptable ranges of laboratory performance.

Analytical MQOs willl be assessed through application of accuracy and completeness parameters, as discussed in this section. For SSC analyses, no laboratory duplicates are conducted because the entire sample is used for analysis, so precision is not measured. For PM_{10} analyses, accuracy, precision, and completeness are measured by the laboratory. Due to high variability in SSC concentrations, field duplicates are not collected, as they would be collected by the automated sampler in succession and potential for variability is very high. Field duplicates are not collected for PM_{10} analysis, as the samplers are not configured to hold two filiters and, thus, would require setting up a complete second sampling device. MQOs are summarized in Table 4-1.

Accuracy: Accuracy is defined as the nearness of a result, or the mean of a set of results, to the true or accepted value. Because there are no analyte spikes or laboratory control samples (LCSs) available for SSC or PM_{10} analyses, analytical accuracy of SSC and PM_{10} analyses is measured only by analysis of method blanks. For SSC and PM_{10} analyses, one method blank will be analyzed per batch or 20 samples, whichever is more frequent.

Precision: Precision describes how well repeated measurements agree. The evaluation of precision described here relates to repeated measurements and samples analyzed by the laboratory (laboratory replicates). For PM_{10} analysis, one method blank will be analyzed per batch or 20 samples, whichever is more frequent. Laboratory replicates are not conducted for SSC analysis.

Completeness: Completeness is a measure of the percentage of project-specific data that are valid. Valid data are obtained when samples are collected and analyzed in accordance with QC procedures outlined in this monitoring plan, and when none of the QC criteria that affect data usability are exceeded. The number of valid results divided by the number of possible individual analyte results, expressed as a percentage, determines the completeness of the data set. The requirement of completeness is 90 percent for samples and is determined using the following equation:

$$Completeness = \frac{Actual\ number\ of\ samples\ collected}{Project\ required\ total\ samples\ to\ be\ collected} * 100.$$

Table 4-1.
Water Sample Measurement Quality Objectives

Constituent	Accuracy (Laboratory Method Blank)	Precision (Laboratory Duplicate)	Completeness
SSC	MB: <RL	NA[1]	90%
PM_{10}	Post-weight of filter is within 0.0028 grams of pre-weight filter	Unexposed filters: Weights of the clean filters should be within ±0.0028 grams of the original value Exposed filters: ≤ 25% RPD and weights must be within ±0.005 grams	90%

Notes:
MB = Method blank, NA = Not Applicable, RL = Reporting limit, g = grams, RPD = relative percent difference
1. NA due to complete sample being used for primary analysis (i.e., the one-liter sample cannot be split per method).

This page intentionally left blank

5.0 DATA ANALYSIS AND REPORTING

The data collected during the each monitoring season will be compiled and analyzed with the findings presented in the Draft Los Peñasquitos WMA Special Study Report. The draft report will summarize the sample collection methods and events and will present the findings of the wet season and aerial deposition monitoring. It will provide spatial loading information throughout the monitored portions of the creeks used to compare with the loading data calculated from the TMDL Compliance Monitoring program.

Any deviations from protocols listed in the monitoring plan and the implications of those deviations on the interpretation of the data will be included in the report. A data quality assessment and analytical, field, and hydrological data will be provided as appendices on compact discs. Dr. Habib Matin will provide principal-level support for data interpretation and report review during development of the draft monitoring report.

The draft report will be completed prior to the end of each fiscal year and incorporated into the Water Quality Improvement Plan Annual Report as appropriate. Upon completion of the entire special study, a comprehensive draft report will be developed that summarizes the findings from each phase of the study. The final report will incorporate comments from the City and other Responsible Agencies and will be incorporated into the Report of Waste Discharge.

The results in this report apply to the samples analyzed in accordance with the Chain of Custody document. Weck Laboratories, Inc. certifies that the test results meet all NELAC requirements unless noted in the case narrative. This analytical report is confidential and is only intended for the use of Weck Laboratories, Inc. and its client. This report contains the Chain of Custody document, which is an integral part of it, and can only be reproduced in full with the authorization of Weck Laboratories, Inc.

Dear Jeremy Burns :

Enclosed are the results of analyses for samples received 01/08/16 12:15 with the Chain of Custody document. The samples were received in good condition, at 5.1 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

Notes and Definitions

ND	NOT DETECTED at or above the Reporting Limit. If J-value reported, then NOT DETECTED at or above the Method Detection Limit (MDL)
NR	Not Reportable
Dil	Dilution
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
% Rec	Percent Recovery
Sub	Subcontracted analysis, original report available upon request
MDL	Method Detection Limit
MDA	Minimum Detectable Activity
MRL	Method Reporting Limit

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California Department of Health Services.

The Reporting Limit (RL) is referenced as the Laboratory's Practical Quantitation Limit (PQL) or the Detection Limit for Reporting Purposes (DLR).

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Dear Jeremy Burns :

Enclosed are the results of analyses for samples received 02/03/16 16:50 with the Chain of Custody document. The samples were received in good condition, at 4.6 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

Notes and Definitions

ND	NOT DETECTED at or above the Reporting Limit. If J-value reported, then NOT DETECTED at or above the Method Detection Limit (MDL)
NR	Not Reportable
Dil	Dilution
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
% Rec	Percent Recovery
Sub	Subcontracted analysis, original report available upon request
MDL	Method Detection Limit
MDA	Minimum Detectable Activity
MRL	Method Reporting Limit

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California Department of Health Services.

The Reporting Limit (RL) is referenced as the Laboratory's Practical Quantitation Limit (PQL) or the Detection Limit for Reporting Purposes (DLR).

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Dear Jeremy Burns :

Enclosed are the results of analyses for samples received 03/10/16 16:30 with the Chain of Custody document. The samples were received in good condition, at 7.7 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.
