Compliance with the proposed water quality objectives will occur through compliance with the Mercury TMDL. The environmental analyses presented in the Environmental Checklist and this Staff Report and the 2004 Mercury TMDL Amendment Staff Report and its companion Environmental Checklist account for potential environmental impacts associated with complying with the Mercury TMDL, as proposed to be revised. With respect to economics, the costs associated with complying with the proposed Project are evaluated above under the California Water Code §13241 Economic Considerations discussion.

Appendix A to the Staff Report

PROPOSED BASIN PLAN AMENDMENT

Amendments to the following chapters of the San Francisco Bay Basin Water Quality Control Plan

Chapter 3 Water Quality Objectives

Chapter 4 Continuing Planning

Chapter 6 Surveillance and Monitoring

Chapter 7 Water Quality Attainment Strategies, Including Total Maximum Daily Loads

Changes proposed (from the September 2004 adopted Basin Plan amendment) in the April 21, 2006, *Proposed Basin Plan Amendment and Staff Report for Revised Total Maximum Daily Load (TMDL) and Proposed Mercury Water Quality Objectives, Draft for Public Review*, are indicated in single ~~strikeout~~ or underline.

Changes proposed in response to comments (on the April 21, 2006 *Draft for Public Review)* are indicated in double ~~strikeout~~ or underline.

Chapter 3. Water Quality Objectives

The following revisions indicated in underline/strikeout are proposed for Chapter 3, Water Quality Objectives.

OBJECTIVES FOR SPECIFIC CHEMICAL CONSTITUENTS

Surface waters shall not contain concentrations of chemical constituents in amounts that adversely affect any designated beneficial use. Water quality objectives for selected toxic pollutants for surface waters are given in Tables 3-3, 3-3A, 3-3B, and 3-4.

The Water Board intends to work towards the derivation of site-specific objectives for the Bay-Delta estuarine system. Site-specific objectives to be considered by the Water Board shall be developed in accordance with the provisions of the federal Clean Water Act, the State Water Code, State Water Board water quality control plans, and this Plan. These site-specific objectives will take into consideration factors such as all available scientific information and monitoring data and the latest U.S. EPA guidance, and local environmental conditions and impacts caused by bioaccumulation. Pending the adoption of site-specific objectives, the objectives in Tables 3-3 and 3-4 apply throughout the region except as otherwise indicated in the Tables or when site-specific objectives for the pollutant parameter have been adopted. Site-specific objectives for copper and nickel, adopted for South San Francisco Bay south of the Dumbarton Bridge, are listed in Table 3-3A. Objectives for mercury that apply to San Francisco Bay are listed in Table 3-3B.

South San Francisco Bay south of the Dumbarton Bridge is a unique, water-quality-limited, hydrodynamic and biological environment that merits continued special attention by the Water Board. Controlling urban and upland runoff sources is critical to the success of maintaining water quality in this portion of the Bay. Site-specific water quality objectives have been adopted for dissolved copper and nickel in this Bay segment. Site-specific objectives may be appropriate for other pollutants of concern, but this determination will be made on a case-by-case basis, and after it has been demonstrated that all other reasonable treatment, source control and pollution prevention measures have been exhausted. The Water Board will determine whether revised water quality objectives and/or effluent limitations are appropriate based on sound technical information and scientific studies, stakeholder input, and the need for flexibility to address priority problems in the watershed.

Table 3-3: Marine[a] Water Quality Objectives for Toxic Pollutants for Surface Waters (all values in ug/l)			
Compound	**4-day Average**	**1-hr Average**	**24-hr Average**
Arsenic[b, c, d]	36	69	
Cadmium[b, c, d]	9.3	42	
Chromium VI[b, c, d, e]	50	1100	
Copper[c, d, f]			
Cyanide[g]			
Lead[b, c, d]	8.1	210	
Mercury[h]	0.025	2.1	
Nickel[b, c, d]	8.2	74	
Selenium[i]			
Silver[b, c, d]		1.9	
Tributyltin[j]			
Zinc[b, c, d]	81	90	
PAHs[k]			15

Notes:

a. Marine waters are those in which the salinity is equal to or greater than 10 parts per thousand 95% of the time, as set forth in Chapter 4 of the Basin Plan. Unless a site-specific objective has been adopted, these objectives shall apply to all marine waters, except for the South Bay south of Dumbarton Bridge, (where the California Toxics Rule (CTR) applies) or as specified in Note h (below). For waters in which the salinity is between 1 and 10 parts per thousand, the applicable objectives are the more stringent of the freshwater (Table 3-4) or marine objectives.

b. Source: 40 CFR Part 131.38 (California Toxics Rule or CTR), May 18, 2000.

c. These objectives for metals are expressed in terms of the dissolved fraction of the metal in the water column.

d. According to the CTR, these objectives are expressed as a function of the water-effect ratio (WER), which is a measure of the toxicity of a pollutant in site water divided by the same measure of the toxicity of the same pollutant in laboratory dilution water. The 1-hr. and 4-day objectives = table value X WER. The table values assume a WER equal to one.

e. This objective may be met as total chromium.

f. Water quality objectives for copper were promulgated by the CTR and may be updated by U.S. EPA without amending the Basin Plan. Note: at the time of writing, the values are 3.1 ug/l (4-day average)

and 4.8 ug/l (1-hr. average). The most recent version of the CTR should be consulted before applying these values.

g. Cyanide criteria were promulgated in the National Toxics Rule (NTR). The NTR criteria specifically apply to San Francisco Bay upstream to and including Suisun Bay and Sacramento-San Joaquin Delta. Note: at the time of writing, the values are 1.0 ug/l (4-day average) and 1.0 ug/l (1-hr. average).

h. Source: U.S. EPA Ambient Water Quality Criteria for Mercury (1984). The 4-day average value for mercury does not apply to San Francisco Bay; instead, the water quality objectives specified in Table 3-3B apply. The 1-hour average value continues to apply to San Francisco Bay.

i. Selenium criteria were promulgated for all San Francisco Bay/Delta waters in the National Toxics Rule (NTR). The NTR criteria specifically apply to San Francisco Bay upstream to and including Suisun Bay and Sacramento-San Joaquin Delta. Note: at the time of writing, the values are 5.0 ug/l (4-day average) and 20 ug/l (1-hr. average).

j. Tributyltin is a compound used as an antifouling ingredient in marine paints and toxic to aquatic life in low concentrations. U.S. EPA has published draft criteria for protection of aquatic life (Federal Register: December 27, 2002, Vol. 67, No. 249, Page 79090-79091). These criteria are cited for advisory purposes. The draft criteria may be revised.

k. The 24-hour average aquatic life protection objective for total PAHs is retained from the 1995 Basin Plan. Source: U.S. EPA 1980.

Table 3-3B: Marine[a] Water Quality Objectives for Mercury in San Francisco Bay[b]

Protection of Human Health	0.2 mg mercury per kg fish tissue	Average wet weight concentration measured in the edible portion of trophic level 3 and trophic level 4 fish[c]
Protection of Aquatic Organisms and Wildlife	0.03 mg mercury per kg fish	Average wet weight concentration measured in whole fish 3–5 cm in length

Notes:

a. Marine waters are those in which the salinity is equal to or greater than 10 parts per thousand 95% of the time, as set forth in Chapter 4 of the Basin Plan. For waters in which the salinity is between 1 and 10 parts per thousand, the applicable objectives are the more stringent of the freshwater or marine objectives.

b. Objectives apply to all segments of San Francisco Bay, including Sacramento/San Joaquin River Delta (within San Francisco Bay region), Suisun Bay, Carquinez Strait, San Pablo Bay, Richardson Bay, Central San Francisco Bay, Lower San Francisco Bay, and South San Francisco Bay (including the Lower South Bay) ~~all marine and estuarine waters contiguous to San Francisco Bay~~.

c. Compliance shall be determined by analysis of fish tissue as described in Chapter 6, Surveillance and Monitoring.

Chapter 4. Continuing Planning

The following revisions indicated in underline/strikeout are proposed for the section at the end of Chapter 4, Continuing Planning.

WATER BOARD RESOURCE ALLOCATION

The items indicated below have been identified in this review as specific areas for which Water Board planning resources should be allocated. The items are divided into categories and each item is followed by an estimate of the frequency at which the item will be reviewed or the staff time and/or contract dollars needed to complete the item. Resolution of these items may result in future Basin Plan amendments.

TOTAL MAXIMUM DAILY LOAD	
Review the San Francisco Bay ~~M~~mercury TMDL and evaluate new and relevant information from monitoring, special studies, and scientific literature. Determine if modifications to the targets, allocations, or implementation plan are necessary.	Every 5 years

Chapter 6. Surveillance and Monitoring

The following insertion indicated in underline is proposed for Chapter 6, Surveillance and Monitoring, immediately after the "Compliance Monitoring" section, and before the "Complaint Investigation" section.

Compliance Monitoring – San Francisco Bay Mercury Human Health Objective

Compliance with the human health marine water quality objective for mercury in San Francisco Bay (Table 3-3B) will be evaluated in fish at the lengths shown below. The mercury concentration in the edible portion of these five species will be averaged and compared to the human health water quality objective.

Table 6-4. Five Most Commonly Consumed Bay Fish	
Species and Edible Portion	Evaluation Length (cm)
Striped bass, muscle without skin	60
California halibut, muscle without skin	75
Jacksmelt, muscle with skin and skeleton	25
White sturgeon, muscle without skin	135
White croaker, muscle with skin	25

Chapter 7. WATER QUALITY ATTAINMENT STRATEGIES, INCLUDING TOTAL MAXIMUM DAILY LOADS

The following text is proposed for insertion into Chapter 7, Water Quality Attainment Strategies, Including Total Maximum Daily Loads, immediately after the introduction of the section Toxic Pollutant Management in the Larger San Francisco Bay Estuary System. For clarity, revisions to text adopted by the Water Board in September 2004 are indicated below in underline/strikeout.

San Francisco Bay Mercury TMDL

The following sections establish the allowable annual mercury load (Total Maximum Daily Load [TMDL]) to San Francisco Bay, and actions and monitoring necessary to implement the TMDL. The numeric targets, allocations, and associated implementation plan will ensure that all San Francisco Bay segments attain applicable water quality standards, including the mercury water quality objectives set forth in Table 3-3B, established to protect and support beneficial uses.

The TMDL allocations and implementation plan focus on controlling the amount of mercury that reaches the Bay and identifying and implementing actions to minimize mercury bioavailability. The organic form of mercury (methylmercury) is toxic and bioavailable, but information on ways of controlling methylmercury production is limited. However, this is an area of active research and strategies for controlling this process are forthcoming. The effectiveness of implementation actions, monitoring to track progress toward targets, and the scientific understanding pertaining to mercury will be periodically reviewed and the TMDL may be adapted as warranted.

Problem Statement

San Francisco Bay is impaired because mercury contamination is adversely affecting existing beneficial uses, including sport fishing, preservation of rare and endangered species, and wildlife habitat. Mercury concentrations in San Francisco Bay fish are high enough to threaten the health of humans who consume them. In addition, mercury concentrations in some bird eggs harvested from the shores of San Francisco Bay are high enough to account for abnormally high rates of eggs failing to hatch.

In the context of this TMDL, "San Francisco Bay" refers to the following water bodies:

- Sacramento/San Joaquin River Delta (within San Francisco Bay region)
- Suisun Bay
- Carquinez Strait
- San Pablo Bay
- Richardson Bay
- Central San Francisco Bay
- Lower San Francisco Bay
- South San Francisco Bay (including the Lower South Bay)

This TMDL also addresses the following mercury-impaired water bodies that exist within the water bodies listed above:

- Castro Cove (part of San Pablo Bay)
- Oakland Inner Harbor (part of Central San Francisco Bay)
- San Leandro Bay (part of Central San Francisco Bay)

Numeric Targets

TMDL numeric targets interpret narrative and/or numeric water quality standards, including beneficial uses and water quality objectives. To protect ~~sport fishing and human health~~humans who consume Bay fish, the average fish tissue mercury concentration for a ~~typically~~ commonly consumed fish species ~~shall not exceed 0.2 mg mercury per kg fish tissue (wet weight)~~ is specified below as a human health target. To protect wildlife and rare and endangered species, the average fish tissue mercury concentration ~~of mercury~~ in fish consumed by piscivorous birds is specified below as a wildlife target.~~bird eggs shall be less than 0.05 mg mercury per kg wet weight.~~ The goal of this target is that controllable water quality factors not cause detrimental mercury concentrations in San Francisco Bay ~~bird eggs~~wildlife, which is consistent with the bioaccumulation objective in Chapter 3. To achieve the human health and wildlife ~~fish tissue and bird egg~~ targets and to attain water quality standards, the Baywide suspended sediment mercury concentration target is 0.2 mg mercury per kg dry sediment.

The Regional Monitoring Program (RMP) conducts monitoring relevant to evaluating progress toward meeting the sediment and human health and wildlife ~~fish tissue~~ targets~~, and the U.S. Fish and Wildlife Service collects information on bird egg mercury concentrations useful to evaluate progress toward meeting the bird egg target~~. The following passages describe acceptable approaches to evaluate progress toward meeting the targets. Other approaches can be considered during adaptive implementation reviews.

Suspended Sediment Target

The suspended sediment target (0.2 mg mercury per kg dry sediment) shall be compared to the annual median Bay suspended sediment mercury concentration found through RMP monitoring. The suspended sediment mercury concentration shall be computed as the difference between total and dissolved mercury concentration in a water sample (at each location) divided by the suspended sediment concentration for that same sample.

Human Health Target

The human health target is a fish tissue mercury concentration (0.2 mg mercury per kg fish tissue). This target applies to average wet weight fish tissue muscle concentrations in 60 cm long striped bass. The RMP conducts fish tissue sampling and analysis in San Francisco Bay every three years. Progress toward attainment of the human health target shall be evaluated by tracking mercury concentrations in striped bass, a ~~frequently~~ commonly consumed sport fish with relatively high mercury concentrations. Striped bass are routinely caught in three size ranges: 45-59 cm (small), 60-82 cm (medium), and larger than 82 cm (large). To provide sufficient data to evaluate the target, striped bass in the small and medium size ranges should be caught and analyzed. The best functional

relationship between mercury concentration and length shall be established for the fish caught, and the resulting equation of fit shall be evaluated at 60 cm to compute the mercury concentration to compare to the human health target. The RMP tracks mercury concentrations in other San Francisco Bay sportfish, such as halibut and jack-smelt. This information will be used to assess overall trends and human health risks.

Wildlife Target

The wildlife target is ~~expressed as~~ a ~~bird egg~~ fish tissue mercury concentration (~~less than 0.5~~ 0.03 mg mercury per kg fish). This target applies to average wet weight whole fish concentrations in 3–5 cm length fish. ~~The RMP is collaborating with the U.S. Fish and Wildlife Service on long-term monitoring and analysis of bird eggs. Eggs will be collected at several locations throughout San Francisco Bay. The wildlife target will be compared to the computed 99th percentile mercury concentration in eggs.~~

~~In addition to measuring mercury concentrations in bird eggs directly, it is also useful to measure the amount of mercury in bird prey. The Water Board will work with t~~The RMP ~~to~~ is developing a long term monitoring program to evaluate mercury concentrations in ~~prey~~ small fish typically consumed by birds, including by the California least tern. Progress toward attainment of the wildlife target will be evaluated by tracking mercury concentrations in 3–5 cm long Bay fish. The RMP is also collaborating with the U.S. Fish and Wildlife Service on long-term monitoring and analysis of bird egg mercury concentrations. ~~Prey species should include benthic invertebrates and small fish that are typically consumed by piscivorous birds. According to the U.S. Fish and Wildlife Service, the sensitive and endangered California least tern will be protected if the average mercury concentration in the fish it consumes does not exceed 0.03 mg per kg fish tissue (wet weight). Achieving this prey fish concentration is an alternative method of demonstrating attainment of the wildlife target.~~

Sources and Losses

During the California Gold Rush, cinnabar mines in the Central Coast Ranges produced the mercury used to extract gold from the Sierra Nevada foothills. Mercury was later mined and used to produce munitions, electronics, and health care and commercial products.

The year 2003 estimate of total mercury inputs to the San Francisco Bay is about 1220 kg/yr. The sources of mercury in San Francisco Bay include bed erosion (about 460 kg/yr), the Central Valley watershed (about 440 kg/yr), urban stormwater runoff (about 160 kg/yr), the Guadalupe River watershed (about 92 kg/yr), direct atmospheric deposition (about 27 kg/yr), non-urban stormwater runoff (about 25 kg/yr), and wastewater discharges (about ~~20~~18 kg/yr). There is a potential that mercury may enter the Bay from Bay margin contaminated sites and abandoned mercury mines outside the Guadalupe watershed. An evaluation of these potential sources is addressed below under Mercury TMDL Implementation.

Using box models for sediment and mercury inputs and outputs to and from San Francisco Bay, the 2003 estimate for San Francisco Bay mercury losses is approximately 1700 kg/yr. Mercury leaves the Bay by transport to the Pacific Ocean via the Golden Gate, the net result of dredging and disposal (in-Bay and upland), and other losses.

Allocations

Tables 4-v through 4-z present load and wasteload allocations for San Francisco Bay mercury sources. Table 4-v presents load and wasteload allocations by source category and the 2003 estimated annual loads. Tables 4-w through 4-z contain wasteload allocations for individual wastewater and urban stormwater discharges to San Francisco Bay. When summed, the individual allocations equal the category totals for urban stormwater and wastewater shown in Table 4-v.

TABLE 4-v: Mercury Load and Wasteload Allocations By Source Category

Source	2003 Mercury Load (kg/yr)	Allocation (kg/yr)
Bed Erosion[a]	460	220
Central Valley Watershed	440	330
Urban Stormwater Runoff	160	82
Guadalupe River Watershed (mining legacy)	92 [b]	2
Atmospheric Deposition	27	27
Non-Urban Stormwater Runoff	25	25
Wastewater (municipal and industrial)	~~20~~18	~~20~~12
Sediment Dredging and Disposal[c]	net loss	0 ≤ ambient concentration

Notes:

a. Bed erosion occurs as mercury buried in Bay sediment becomes available for biological uptake when overlying sediment erodes.

b. This load does not account for mercury captured in ongoing sediment removal programs conducted in the watershed.

c. Sediment dredging and disposal often moves mercury-containing sediment from one part of the Bay to another. The dredged sediment mercury concentration generally reflects ambient conditions in San Francisco Bay sediment. This allocation is both mass-based and concentration-based. The allocation will be implemented by confirming both that the combined effect of dredging and disposal continues to be a net loss and that the mercury concentration of dredged material disposed in the Bay must be at or below the Baywide ambient mercury concentration. This allocation ensures that this source category continues to represent a net loss of mercury.

TABLE 4-w: Individual Wasteload Allocations for Urban Stormwater Discharges			
Entity	**NPDES Permit**	**Allocation (kg/yr)[a]**	**Load Reduction (kg/yr)[b]**
Santa Clara Valley Urban Runoff Pollution Prevention Program	CAS029718	23	21
Alameda Countywide Clean Water Program	CAS029831	20	19
Contra Costa Clean Water Program	CAS029912	11	11
San Mateo County Stormwater Pollution Prevention Program	CAS029921	8.4	8.0
Vallejo Sanitation and Flood Control District	CAS612006	1.6	1.6
Fairfield-Suisun Urban Runoff Management Program	CAS612005	1.6	1.5
American Canyon	CAS612007	0.14	0.13

Napa County area [c]	CAS000004	1.6	1.5
Marin County area [c]	CAS000004	3.3	3.2
Solano County area [c]	CAS000004	0.81	0.77
San Francisco County area [c,d]	CAS000004	8.8	8.4
Total		*82*[e]	*78*[e]

Notes:

[a] Allocations implicitly include all current and future permitted discharges within the geographic boundaries of municipalities and unincorporated areas including, but not limited to, California Department of Transportation (Caltrans) roadways and non-roadway facilities and rights-of-way, atmospheric deposition, public facilities, properties proximate to stream banks, industrial facilities, and construction sites.

[b] This column contains calculated load reductions relative to the estimated 2003 urban stormwater runoff annual load that are consistent with attaining the wasteload allocation. Demonstration of such load reductions is an alternative manner of showing compliance with the allocations.

[c] Includes unincorporated areas and all municipalities in the county that are in the Region and drain to the Bay. The statewide municipal stormwater general permit issued by the State Water Resources Control Board covers these municipalities.

[d] This urban stormwater runoff load estimate does not account for treatment provided by San Francisco's combined sewer system. The treatment provided by the Bayside facilities (NPDES permit CA0037664) will be credited toward meeting the allocation and load reduction.

[e] These totals differ slightly from the column sum due to rounding.

TABLE 4-x: Individual Wasteload Allocations for Municipal Wastewater Discharges

Permitted Entity	NPDES Permit	~~Allocation~~ 2000–2003 Load (kg/yr)	Interim Allocation (kg/yr)	Final Allocation (kg/yr)

Notes:

[a] Data quality concerns pertaining to this discharger will need to be addressed during the next review.

[b] Total differs slightly from the column sum due to rounding.

[c] Wasteload allocations for industrial wastewater discharges do not include mass from once-through cooling water. The Water Board will apply intake credits to once-through cooling water as allowed by law.

Total Maximum Daily Load

The mercury TMDL for San Francisco Bay is the sum of the load and wasteload allocations, ~~706~~ 700 kg/yr. The Bay will attain applicable water quality standards for mercury when the overall mercury load is reduced to the TMDL and mercury methylation control measures are implemented.

A TMDL must include a margin of safety to account for any lack of knowledge concerning the relationship between load and wasteload allocations and water quality. This TMDL's targets and allocations rely on conservative assumptions, which thereby provide an implicit margin of safety. The adaptive approach to implementation provides an additional margin of safety.

There is no evidence that mercury contamination in San Francisco Bay is worse at any particular time of year. Therefore, the TMDL and allocation scheme do not have a seasonal component.

Mercury TMDL Implementation

The San Francisco Bay mercury TMDL implementation plan has four objectives: (1) reduce mercury loads to achieve load and wasteload allocations, (2) reduce methylmercury production and consequent risk to humans and wildlife exposed to methylmercury, (3) conduct monitoring and focused studies to track progress and improve the scientific understanding of the system, and (4) encourage actions that address multiple pollutants. The plan establishes requirements for dischargers to reduce or control mercury loads and identifies actions necessary to better understand and control methylmercury production. In addition, it addresses potential mercury sources and describes actions necessary to manage risks to Bay fish consumers. The adaptive implementation section describes the method and schedule for evaluating and adapting the TMDL and implementation plan as needed to assure water quality standards are attained.

Mercury Source Control Actions

This section, organized by mercury source categories, specifies actions required to achieve allocations and implement the TMDL.

Central Valley Watershed

The Central Valley Regional Water Quality Control Board (Central Valley Water Board) is developing mercury TMDLs for several mercury-impaired water bodies in its region that drain to San Francisco Bay. The Central Valley Water Board staff is currently developing a mercury TMDL for portions of the Delta within the Central Valley region designed to meet the Central Valley watershed's load allocation. This Delta mercury TMDL is scheduled for consideration as a Basin Plan Amendment by the Central Valley Water Board by December ~~2005~~2006.

Attainment of the load allocation shall be assessed as a five-year average annual mercury load by one of two methods. First, attainment may be demonstrated by documentation provided by the Central Valley Water Board that shows a net 110 kg/yr decrease in total mercury entering the Delta from within the Central Valley region. Alternatively, attainment of the load allocation may be demonstrated by multiplying the flow-weighted suspended sediment mercury concentration by the sediment load measured at the RMP Mallard Island monitoring station. If sediment load estimates are unavailable, the load shall be assumed to be 1,600 million kg of sediment per year. The mercury load fluxing past Mallard Island will be less than or equal to 330 kg/yr after attainment of the allocation.

The allocation for the Central Valley watershed should be achieved within 20 years after the Central Valley Water Board begins implementing its TMDL load reduction program. Studies need to be conducted to evaluate the time lag between the remediation of mercury sources and resulting load reductions from the Delta. An interim loading milestone of 385 kg/yr of mercury, halfway between the current load and the allocation, should be

attained ten years after implementation of the Central Valley Delta TMDL begins. This schedule will be reevaluated as the load reduction plans are implemented.

Urban Stormwater Runoff

The wasteload allocations shown in Table 4-w shall be implemented through the NPDES stormwater permits issued to urban runoff management agencies and the California Department of Transportation (Caltrans). The urban stormwater runoff allocations implicitly include all current and future permitted discharges, not otherwise addressed by another allocation, and unpermitted discharges within the geographic boundaries of urban runoff management agencies (collectively, "source category") including, but not limited to, Caltrans roadway and non-roadway facilities and rights-of-way, atmospheric deposition, public facilities, properties proximate to stream banks, industrial facilities, and construction sites.

The allocations for this source category should be achieved within 20 years, and, as a way to measure progress, an interim loading milestone of 120 kg/yr, halfway between the current load and the allocation, should be achieved within ten years. If the interim loading milestone is not achieved, NPDES-permitted entities shall demonstrate reasonable and measurable progress toward achieving the 10-year loading milestone.

The NPDES permits for urban runoff management agencies shall require the implementation of best management practices and control measures designed to achieve the allocations or accomplish the load reductions derived from the allocations. In addition to controlling mercury loads, best management practices or control measures shall include actions to reduce mercury-related risks to humans and wildlife. Requirements in each permit issued or reissued and applicable for the term of the permit shall be based on an updated assessment of control measures intended to reduce pollutants in stormwater runoff to the maximum extent practicable and remain consistent with the section of this chapter titled "Surface Water Protection and Management—Point Source Control—Stormwater Discharges". The following additional requirements are or shall be incorporated into NPDES permits issued or reissued by the Water Board for urban runoff management agencies.

i) Evaluate and report on the spatial extent, magnitude, and cause of contamination for locations where elevated mercury concentrations exist;

ii) Develop and implement a mercury source control program;

iii) Develop and implement a monitoring system to quantify either mercury loads or loads reduced through treatment, source control, and other management efforts;

iv) Monitor levels of methylmercury in discharges;

~~iv~~v) Conduct or cause to be conducted studies aimed at better understanding mercury fate, transport, and biological uptake in San Francisco Bay and tidal areas;

~~vv~~i) Develop an equitable allocation-sharing scheme in consultation with Caltrans (see below) to address Caltrans roadway and non-roadway facilities in the program area, and report the details to the Water Board;

vii) Prepare an annual report that documents compliance with the above requirements and documents either mercury loads discharged, or loads reduced through ongoing pollution prevention and control activities; and

viii) Demonstrate progress toward (a) the interim loading milestone, or (b) attainment of the allocations shown in Table 4-w, by using one of the following methods:

1) Quantify the annual average mercury load reduced by implementing (a) pollution prevention activities, and (b) source and treatment controls. The benefit of efforts to reduce mercury-related risk to wildlife and humans should also be quantified. The Water Board will recognize such efforts as progress toward achieving the interim milestone and the mercury-related water quality standards upon which the allocations and corresponding load reductions are based. Loads reduced as a result of actions implemented after 2001 (or earlier if actions taken are not reflected in the 2001 load estimate) may be used to estimate load reductions.

2) Quantify the mercury load as a rolling five-year annual average using data on flow and water column mercury concentrations.

3) Quantitatively demonstrate that the mercury concentration of suspended sediment that best represents sediment discharged with urban runoff is below the suspended sediment target.

~~An urban runoff management agency that complies with these permit requirements shall be deemed to be in compliance with receiving water limitations relative to mercury.~~ Once the Water Board accepts that a requirement has been completed by an urban runoff management agency, it need not be included in subsequent permits for that agency. These requirements apply to municipalities covered by the statewide municipal stormwater general permit (issued by the State Water Resources Control Board) five years after the effective date of th~~e~~is San Francisco Bay ~~M~~mercury TMDL.

Urban runoff management agencies have a responsibility to oversee various discharges within the agencies' geographic boundaries. However, if it is determined that a source is substantially contributing to mercury loads to the Bay or is outside the jurisdiction or authority of an agency the Water Board will consider a request from an urban runoff management agency which may include an allocation, load reduction, and/or other regulatory requirements for the source in question.

Within the jurisdiction of each urban runoff management agency, Caltrans is responsible for discharges associated with roadways and non-roadway facilities. Consequently, Caltrans shall be required to implement the following actions:

i) Develop and implement a system to quantify mercury loads or loads reduced through control actions;

ii) Prepare an annual report that documents mercury loads or loads reduced through control actions; and

iii) Develop an equitable allocation-sharing scheme that reflects Caltrans load reduction responsibility in consultation with the urban runoff management agencies, and report the details to the Water Board. Alternatively, Caltrans may choose to implement load

reduction actions on a watershed or regionwide basis in lieu of sharing a portion of an urban runoff management agency's allocation. In such a case, the Water Board will consider a separate allocation for Caltrans for which they may demonstrate progress toward attaining an allocation or load reduction in the same manner mentioned previously for municipal programs.

Guadalupe River Watershed (Mining Legacy)

In the near term, the effort underway to develop the Guadalupe River Watershed Mercury TMDL will be the mechanism used to implement and track progress toward achieving the load allocation. Ultimately, the Water Board expects the implementation plan for the Guadalupe River Watershed Mercury TMDL to integrate implementation efforts relative to that TMDL with those implementation efforts for the San Francisco Bay ~~M~~mercury TMDL.

The Guadalupe River Watershed Mercury TMDL will provide a watershed-wide mercury management strategy. Efforts are already underway in the watershed to take early actions to reduce mercury loads, and more are planned. A high priority for the watershed-based strategy is to control upper watershed sources associated with the mining legacy to avoid compromising actions taken in the lower watershed. The strategy will include measures that prevent mercury-laden sediment from reaching the Bay, either by removal or by preventing their transport to the Bay. The strategy will also feature measures intended to reduce methylmercury production and risks to human health and wildlife. An essential component of the strategy will also involve testing and evaluation of new techniques and control measures, the benefits of that may apply throughout the Bay. As the mercury load, methylation, and reductions resulting from these efforts are quantified by the dischargers identified through the Guadalupe River Watershed Mercury TMDL process, the Water Board will consider how the reductions achieved will be counted toward fulfillment of the load reductions required to meet the Guadalupe River watershed load allocation.

The Guadalupe River watershed mining legacy mercury load allocation is expected to be attained within 20 years after the Water Board begins implementing the Guadalupe River Watershed Mercury TMDL. As a way to measure progress, an interim-loading milestone of 47 kg/yr of mercury, halfway between the current load and the allocation, should be achieved within ten years. If the interim loading milestone is not achieved, dischargers shall make reasonable and measurable progress toward achieving the ten-year load reduction through implementation of the watershed-wide strategy.

Progress toward (a) the interim loading milestone, or (b) attainment of the allocation, shall be demonstrated by the dischargers identified through the Guadalupe River Watershed TMDL using one of the methods listed below:

1. Quantify the annual average mercury load reduced by implementing (a) pollution prevention activities, (b) source and treatment controls, and (c) if applicable, other efforts to reduce methylation or mercury-related risks to humans and wildlife consistent with the watershed-based strategy. The Water Board will recognize loads reduced resulting from activities implemented after 1996 (or earlier if actions taken are not reflected in the 2001 load estimate) to estimate load reductions.

2. Quantify the mercury load as a rolling five-year annual average using data on flow and water column mercury concentrations.
3. Quantitatively demonstrate that the mercury concentration of suspended sediment that best represents sediment discharged from the watershed to San Francisco Bay is below the suspended sediment target.

Municipal Wastewater

The individual municipal wastewater wasteload allocations shown in Table 4-x shall be implemented via individual mass limits and an aggregate mass limit that is the sum of the individual allocations, 11 kg/yr. ~~as a group mass limit.~~ The Water Board will issue a San Francisco Bay watershed mercury NPDES permit to all dischargers listed in Table 4-x to implement the individual and aggregate mass limits. ~~. The group mass limit is the sum of the individual allocations for these facilities, 17 kg/yr. If the group mass limit is exceeded, the Water Board will pursue enforcement actions against those individual dischargers whose mass emissions exceed their individual wasteload allocations.~~

The wasteload allocations for this source category shall be achieved within 20 years, and, as a way to measure progress, interim individual allocations equal to a 20 percent reduction from 2000-2003 annual mass discharge levels shall be achieved within 10 years. These interim allocations, shown in Table 4-x, shall be implemented via individual mass limits and an aggregate mass limit that is the sum of the individual interim allocations, 14 kg/yr. During the initial ten years, individual mass limits shall be the 2000-2003 annual mass discharge levels shown in Table 4-x, and the aggregate mass limit is the sum of these individual mass discharge levels.

If ~~the group mass limit is~~ any aggregate mass limit is exceeded, the Water Board will pursue enforcement actions against those individual dischargers whose mass ~~emissions~~ discharges exceed their individual ~~wasteload allocations~~ mass limits.

The ~~group~~ mass limits and the following requirements shall be incorporated into the watershed NPDES permit for municipal wastewater dischargers:

- Develop and implement effective programs that include but are not limited to pollution prevention to control mercury sources and loading, a plan and schedule of actions and effectiveness measures ~~and reduce mercury-related risks to humans and wildlife~~ applicable for the term of the permit, based on identification of the largest and most controllable sources and an updated assessment of source control measures and wastewater treatment technologies (the level of effort shall be commensurate with the mercury load and performance of the facility) and quantify the mercury load avoided or reduced ~~and risk reductions resulting from these activities~~;
- Develop and implement effective programs to reduce mercury-related risks to humans and wildlife and quantify risk reductions resulting from these activities;

- Comply with water quality-based effluent limitations, to be elaborated through the permit, that are consistent with the assumptions and requirements of the mercury wasteload allocation;
- Track individual facility and aggregate wastewater loads and the status of source control and pollution prevention activities;
- Monitor levels of methylmercury in discharges;
- Conduct or cause to be conducted studies aimed at better understanding mercury fate, transport, the conditions under which mercury methylation occurs, and biological uptake in San Francisco Bay and tidal areas;
- Conduct or cause to be conducted studies to evaluate the presence or potential for local effects on fish, wildlife, and rare and endangered species in the vicinity of wastewater discharges; and
- Prepare an annual report that documents mercury loads from each facility, mercury and methylmercury effluent concentrations, and ongoing source control activities, including mercury loads avoided through control actions.

The watershed NPDES permit shall also specify conditions that apply to each individual facility. These conditions are intended to minimize the potential for adverse effects in the immediate vicinity of discharges and to ensure that municipal wastewater facilities maintain proper operation, maintenance, and performance. If a facility exceeds its individual mercury load allocation as a 12-month rolling average ~~and~~ or an effluent mercury trigger concentration, it shall be required to report the exceedance in its individual Self-Monitoring Report, implement a corrective action plan, and ~~to~~ submit a report within 60 days that:

- Evaluates the cause of the trigger or mass exceedances;
- Evaluates the effectiveness of existing pollution prevention or pretreatment programs and methods for preventing future exceedances;
- Evaluates the feasibility and effectiveness of technology enhancements to improve plant performance;~~.~~
- Evaluates other measures for preventing future exceedances, depending on the cause of an exceedance; and
- Includes an action plan and time schedule to correct and prevent trigger exceedances.

Effluent mercury trigger concentrations for secondary treatment facilities are a daily maximum of 0.065 µg/l total mercury and monthly average of 0.041 µg/l total mercury. For advanced treatment facilities, effluent mercury trigger concentrations are a daily maximum of 0.021 µg/l total mercury and a monthly average of 0.011 µg/l total mercury.

The Water Board will pursue enforcement action against dischargers that do not respond to exceedances of triggers or do not implement reasonable actions to correct and prevent trigger exceedances. Determination of reasonable actions will be based on an updated

assessment of source control measures and wastewater treatment technologies applicable for the term of each issued or reissued permit.

Industrial Wastewater

The individual wasteload allocations for the industrial wastewater discharges from the five Bay Area petroleum refineries (Chevron, ConocoPhillips, ~~Shell~~Martinez Refining Co., Ultramar Golden Eagle, and Valero) ~~are shown~~listed in Table 4-y, and the ~~.The~~ individual wasteload allocations for all other industrial wastewater facilities ~~are~~ listed in Table 4-z shall be implemented via individual mass limits and an aggregate mass limit that is the sum of the individual allocations, 1.3 kg/yr. ~~. The total group allocation for industrial and refinery wastewater facilities is 3 kg/yr and shall be implemented as a group mass limit.~~ If the ~~group~~ aggregate mass limit is exceeded, the Water Board will pursue enforcement actions against those individual dischargers whose mass ~~emissions~~ discharges exceed their individual mass limits~~wasteload allocations~~.

The ~~group~~ mass limits and the following requirements shall be incorporated into NPDES permits for all industrial wastewater dischargers:

- Develop and implement effective programs to control mercury sources and loading including demonstration that discharge levels represent good performance based on an updated assessment of source control measures and wastewater treatment technologies ~~and reduce mercury-related risks to humans and wildlife~~ (the level of effort will be commensurate with the mercury load and performance of the facility) and quantify the mercury load avoided or reduced ~~and risk reductions resulting from these activities~~;
- Develop and implement effective programs to reduce mercury-related risks to humans and wildlife and quantify the risk reductions resulting from these activities;
- Comply with water quality-based effluent limitations, to be elaborated through the permit, that are consistent with the assumptions and requirements of the mercury wasteload allocation;
- Monitor levels of methylmercury in discharges;
- Conduct or cause to be conducted studies aimed at better understanding mercury fate, transport, the conditions under which mercury methylation occurs, and biological uptake in San Francisco Bay and tidal areas;
- Conduct or cause to be conducted studies to evaluate the presence or potential for local effects on fish, wildlife, and rare and endangered species in the vicinity of wastewater discharges; and
- Prepare an annual report that documents mercury loads from each facility, mercury and methylmercury effluent concentrations, and ongoing source control activities, including mercury loads avoided through control actions.

The NPDES permits for industrial facilities shall also specify conditions that apply to each individual facility. These conditions are intended to minimize the potential for adverse effects in the immediate vicinity of discharges and to ensure that industrial wastewater facilities maintain proper operation, maintenance, and performance. If a facility exceeds its individual mercury load allocation as a 12-month rolling average ~~and~~ or an effluent mercury trigger concentration, it shall be required to report the exceedance

in its individual Self-Monitoring Report, implement a corrective action plan, and ~~to~~ submit a report within 60 days that:

- Evaluates the cause of the trigger or mass exceedances;
- Evaluates the effectiveness of existing pollution prevention or pretreatment programs and methods for preventing future exceedances;
- Evaluates the feasibility and effectiveness of technology enhancements to improve plant performance;~~.~~
- Evaluates other measures for preventing future exceedances, depending on the cause of an exceedance; and
- Includes an action plan and time schedule to correct and prevent trigger exceedances.

Effluent mercury trigger concentrations are a daily maximum of 0.062 µg/l total mercury and monthly average of 0.037 µg/l total mercury.

The Water Board will pursue enforcement action against dischargers that do not respond to exceedances of triggers or do not implement reasonable actions to correct and prevent trigger exceedances. Determination of reasonable actions will be based on an updated assessment of source control measures and wastewater treatment technologies applicable for the term of each issued or reissued permit.

Bay Area petroleum refineries shall be required to work collaboratively with the Water Board to investigate the environmental fate of mercury in crude oil and report findings to the Water Board within five years of the effective date of the~~is~~ San Francisco Bay ~~M~~mercury TMDL implementation plan. These requirements may be implemented via the Water Board's authority under Section 13267 of the California Water Code or petroleum refinery wastewater NPDES permits. The report shall address two key questions:

1. What are the potential pathways by which crude oil mercury could be discharged to the Bay from Bay Area petroleum refining facilities?
2. What are the annual mercury loads associated with these discharge pathways?

Sediment Dredging and Disposal

The allocation for sediment dredging and disposal is both mass-based and concentration-based. The mercury concentration in dredged material disposed of in the Bay shall not exceed the 99th percentile mercury concentration of the previous 10 years of Bay sediment samples collected through RMP (excluding stations outside the Bay like the Sacramento River, San Joaquin River, Guadalupe River and Standish Dam stations). Prior to disposal, the material shall be sampled and analyzed according to the procedures outlined in the 2001 U.S. Army Corps of Engineers document "Guidelines for Implementing the Inland Testing Manual in the San Francisco Bay Region." All in-Bay disposal of dredged material shall comply with the Dredging and Disposal of Dredged Sediment program described in Chapter 4 and the Long-Term Management Strategy for the Placement~~Disposal~~ of Dredged Material in the San Francisco Bay Region.

The process of dredging and disposing of dredged material in the Bay may enhance biological uptake and methylmercury exposure. To address this concern, permitted dredging and disposal operations shall demonstrate that their activities are accomplished in a manner that does not increase bioavailability of mercury. As part of this demonstration, the Waste Discharge Requirements for such operations shall include requirements to conduct or cause to be conducted studies to better understand how their operations affect mercury fate, transport, and biological uptake.

Atmospheric Deposition

Mercury that deposits directly on the Bay surface and the surrounding watershed is attributed to both remote and local sources. The extent to which these sources can be controlled is unknown and the Water Board's authority to control such sources is limited. The load allocation does not allow an increase of current loads, and does not require a reduction from this source category at this time. Recent scientific studies suggest that mercury newly deposited from the atmosphere may be more available for biological uptake than mercury already present in an aquatic system. As such, the following implementation efforts need to be undertaken to evaluate the significance of atmospheric deposition and the feasibility of load reductions:

- The U.S. Environmental Protection Agency should investigate the significance of atmospheric deposition and actively pursue national and international efforts to reduce the amount of mercury released through combustion of fossil fuels; and
- The Bay Area Air Quality Management District should conduct a local mercury emissions inventory, investigate the significance of local mercury air emissions, evaluate the effectiveness of existing control measures and the feasibility of additional controls.

If local air sources are found to contribute substantially to atmospheric deposition loading to the Bay and its surrounding watershed, the Water Board will consider assigning allocations and load reductions to individual air sources and work with the Bay Area Air Quality Management District to ensure allocations are achieved.

New Mercury Sources

As the TMDL is implemented, new sources of mercury may emerge either as the result of a new facility applying for a discharge permit or as a result of a new source being discovered. The Water Board will consider establishing a load or wasteload allocation for a new mercury source under any of the following circumstances:

- The allocation from one or more existing sources of the same category (e.g., municipal wastewater) will be reduced by an amount equal to the new allocation; or
- The Water Board finds that the magnitude of the new allocation is negligible compared to load reductions from all sources that will have been realized prior to establishing the new allocation; or
- The allocation is for a previously unquantified discharge of mercury from a source category that does not already have an allocation.

This section specifies actions required for sources that are potentially either discharging mercury or enhancing methylmercury production in the Bay.

Mercury Mines

Local inactive mercury mines shall be addressed through continued implementation of the Mines and Mineral Producers Discharge Control Program (Mines Program) described ~~later~~ in ~~this c~~Chapter 4. The key regulatory component of this established program is that property owners of inactive and active mine sites that discharge stormwater contaminated by contact with any overburden, raw material, intermediate products, finished products, byproducts, or waste products are required to comply with NPDES industrial stormwater regulations. Under the Mines Program, the Water Board has the authority to issue individual industrial permits or allow the discharger to obtain coverage under the industrial stormwater general permit issued by the State Water Resources Control Board. For those mines that are not currently meeting the conditions set forth in the Mines Program, responsible parties shall attain compliance within five years of the effective date of the~~is~~ San Francisco Bay ~~M~~mercury TMDL implementation plan.

Bay Margin Contaminated Sites

A number of former industrial and military sites that contain mercury-enriched sediment surround the Bay. Available data are insufficient at this time to determine whether these sites may be discharging to the Bay. While the load these sites contribute to the Bay may be small relative to known sources, these sites may pose local threats. As such, cleanup of these sites is a Water Board priority and many cleanups are underway. The Water Board will require parties responsible for Bay margin contaminated sites to:

1. Quantify mercury mass on site such that the upper 95% confidence limit of the mean value is no more than 20% higher than the estimated mean;
2. Determine seasonal and spatial patterns of total mercury and methylmercury in sediments on site;
3. Estimate future mercury mass on site and patterns of contamination after planned remediation efforts are complete;
4. Determine seasonal patterns of total mercury and methylmercury in the water column at the site;
5. Collect prey items for local fish and birds and assess mercury concentrations; and
6. Quantify rate of sediment accretion or erosion at the site.

These requirements shall be incorporated into relevant site cleanup plans within five years of the effective date of the~~is~~ San Francisco Bay mercury TMDL, and the actions shall be fully implemented within ten years of the effective date of this TMDL.

Wetlands

Wetlands may contribute substantially to methylmercury production and biological exposure to mercury within the Bay. Plans for extensive wetland restoration in the San Francisco Bay region raise the concern that mercury methylation may increase, thereby increasing the amount of mercury entering the food web. Implementation tasks related to

wetlands focus on managing existing wetlands and ensuring that new constructed wetlands are designed to minimize methylmercury production and subsequent transfer to the food web.

The Water Board issues Waste Discharge Requirements and Clean Water Act Section 401 certifications that set forth conditions related to Bay filling and the construction and management of wetlands. To implement the San Francisco Bay mercury TMDL, the Waste Discharge Requirements and Section 401 certifications for wetland projects shall include provisions that the restored wetland region be designed and operated to minimize methylmercury production and biological uptake, and result in no net increase in mercury or methylmercury loads to the Bay. Additionally, projects must include pre- and post-restoration monitoring to demonstrate compliance. There is much active research on mercury cycling in wetlands. Information about how to manage wetlands to suppress or minimize mercury methylation will be adaptively incorporated into this implementation plan as it becomes available.

Risk Management

The mercury problem in San Francisco Bay may take decades to solve. However, there are activities that should be undertaken immediately to help manage the risk to consumers of mercury-contaminated fish. In this effort, the Water Board will work with the California Office of Environmental Health Hazard Assessment, the California Department of Health Services, and dischargers that pursue risk management as part of their mercury-related programs. The risk management activities will include the following:

- Providing multilingual fish-consumption advice to the public to help reduce methylmercury exposure through community outreach, broadcast and print media, and signs posted at popular fishing locations;
- Regularly informing the public about monitoring data and findings regarding hazards of eating mercury-contaminated fish; and
- Performing special studies needed to support health risk assessment and risk communication.
- Investigate ways to address public health impacts of mercury in San Francisco Bay/Delta fish, including activities that reduce actual and potential exposure of and mitigate health impacts to those people and communities most likely to be affected by mercury in San Francisco Bay caught fish, such as subsistence fishers and their families.

Adaptive Implementation

The Water Board will adapt the TMDL to incorporate new and relevant scientific information such that effective and efficient actions can be taken to achieve TMDL goals. Approximately every five years, the Water Board will review the San Francisco Bay ~~M~~mercury TMDL and evaluate new and relevant information from monitoring, special studies, and scientific literature. The reviews will be coordinated through the Water

Board's continuing planning program and will provide opportunities for stakeholder participation. Any necessary modifications to the targets, allocations, or implementation plan will be incorporated into the Basin Plan. At a minimum, the following focusing questions will be used to conduct the reviews. Additional focusing questions will be developed in collaboration with stakeholders during each review.

1. Is the Bay progressing toward TMDL targets as expected? If it is unclear whether there is progress, how should monitoring efforts be modified to detect trends? If there has not been adequate progress, how might the implementation actions or allocations be modified?
2. What are the loads for the various source categories, how have these loads changed over time, and how might source control measures be modified to improve load reduction?
3. Is there new, reliable, and widely accepted scientific information that suggests modifications to targets, allocations, or implementation actions? In particular, is there new evidence regarding methylmercury that might justify a methylmercury TMDL or allocation, either in addition to or instead of the total mercury TMDL and allocations? If so, how should the TMDL be modified?
4. Are effective risk management activities in place to reduce human and wildlife exposure to methylmercury? If not, how should these activities be modified or enhanced?
5. Do prey fish monitoring data confirm that TMDL load allocations are adequate to attain the wildlife target?
6. Are mercury mine and Bay margin contaminated site cleanups proceeding as expected? Are any additional actions needed to protect water quality?

Using available data, the load and wasteload allocations were determined on the basis of their sufficiency to achieve water quality standards. As part of the adaptive implementation process, the Water Board will review the TMDL as a whole and determine whether new evidence suggests revisions of specific load and wasteload allocations that will result in more strategic, efficient, and cost effective achievement of water quality standards. For example, as reliable information becomes available regarding methylation control or the relative bioavailability of sources, the Water Board will consider adjusting allocations to implement the TMDL more effectively. The Water Board may also consider revising implementation requirements and/or resulting permit requirements if such changes are consistent with the assumptions and requirements of the allocations and the cumulative effect of such changes will ensure attainment of water quality standards.

Achievement of the allocations for three of the largest source categories (Central Valley Watershed, Urban Stormwater Runoff, Guadalupe River Watershed) is projected to take 20 years, with an interim 10-year milestone of fifty percent achievement. Approximately 10 years after the effective date of the TMDL or any time thereafter, the Water Board will consider modifying the schedule for achievement of the load allocations for a source category or individual discharger provided that they have complied with all applicable permit requirements and all of the following have been accomplished relative to that source category or discharger:

- A diligent effort has been made to quantify mercury loads and the sources of mercury and potential bioavailability of mercury in the discharge;
- Documentation has been prepared that demonstrates that all technically and economically feasible and cost effective control measures recognized by the Water Board as applicable for that source category or discharger have been fully implemented, and evaluates and quantifies the comprehensive water quality benefit of such measures;
- A demonstration has been made that achievement of the allocation will require more than the remaining 10 years originally envisioned; and
- A plan has been prepared that includes a schedule for evaluating the effectiveness and feasibility of additional control measures and implementing additional controls as appropriate.

Achievement of the wasteload allocations for municipal wastewater dischargers is required within 20 years, and interim allocations within 10 years. The interim allocations are expected to be attained though aggressive pollution prevention and other cost-effective mercury reduction methods. The final wasteload allocations are expected to be attained through wastewater treatment system improvements and/or implementation of a pollutant offset program. Approximately 10 years after the effective date of the TMDL or any time thereafter, the Water Board will consider modifying the schedule for achievement of the wasteload allocations or revisions to wasteload allocations if:

- ~~t~~The State Board has not established a pollutant offset program that can be implemented within the 20 years required to achieve final wasteload allocations;.
- It can be demonstrated that all reasonable and feasible efforts have been taken to reduce mercury loads; and
- It can be demonstrated that no adverse local effects will result.

At approximately 20 years after the start of implementation and after taking the steps regarding schedule modification listed above, if a source category or individual discharger cannot demonstrate achievement of its allocation, despite implementation of all technically and economically feasible and cost effective control measures recognized by the Water Board as applicable for that source category or discharger, the Water Board will consider revising the allocation scheme provided that any resulting revisions ensure water quality standards are attained.

Load and wasteload allocations have been assigned to individual entities. However, assigning loads by watersheds could be a useful approach for managing pollutant loads, particularly if net environmental benefits can be realized. A watershed-based allocation program would only involve watersheds in the San Francisco Bay region that drain to the Bay. Such an approach could involve urban runoff management programs, wastewater facilities, and other dischargers in a watershed accepting joint responsibility for load reductions. An acceptable watershed allocation program may include incentives for agencies to implement load reduction activities and account for avoided mercury loads as well as incentives for strategic removal or sequestration of mercury already in the system. Credits could be used to offset annual loads and attain allocations for multiple sources.

In addition, the Water Board will encourage and consider a pilot mercury mass offset program if it is demonstrated that such a program is a more cost effective and efficient means of achieving water quality standards, and the relative potential for mercury from different sources to enter the food web and the potential for adverse local impacts have been evaluated. These programs should recognize and reward ongoing efforts that are above and beyond those required by this TMDL. Until such programs are established, the Water Board will consider mercury source control and risk reduction activities on a case-by-case basis to determine how they contribute toward achievement of TMDL goals. The Water Board will also include in any new or modified NPDES permit a reopener to implement a pollutant offset program when it is established.

Appendix B to the Staff Report

ENVIRONMENTAL CHECKLIST

APPENDIX B: Environmental Checklist

1. **Project Title:** Revisions to the San Francisco Bay Mercury Total Maximum Daily Load (TMDL) and proposed New Water Quality Objectives for Mercury.

2. **Lead Agency Name and Address:** California Regional Water Quality Control Board, San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, California 94612

3. **Contact Person and Phone Number:** Dyan Whyte (510) 622-2441 Thomas Mumley (510) 622-2395

4. **Project Location:** San Francisco Bay and San Francisco Bay Region

5. **Project Sponsor's Name and Address:** California Regional Water Quality Control Board, San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, California 94612

6. **General Plan Designation:** Not Applicable

7. **Zoning:** Not Applicable

8. **Description of Project:**

   The project consists of: 1) proposed revisions to the mercury TMDL Basin Plan Amendment, and 2) proposed water quality objectives for mercury in fish tissue to protect human health and wildlife. Additional details are provided in the explanation attached.

9. **Surrounding Land Uses and Setting:**

   The proposed water quality objectives and revisions to the Mercury TMDL Amendment would affect all segments of San Francisco Bay. Implementation would involve specific actions throughout the Bay Area.

10. **Other public agencies whose approval is required** (e.g., permits, financing approval, or participation agreement.)

    The California State Water Resources Control Board, the California Office of Administrative Law, and the U.S. Environmental Protection Agency must approve the proposed project.

ENVIRONMENTAL IMPACTS:

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
I. AESTHETICS -- Would the project:				
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☒
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	☐	☐	☐	☒
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☐	☒
II. AGRICULTURE RESOURCES -- In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. **Would the project:**				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?	☐	☐	☐	☒
III. AIR QUALITY -- Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. **Would the project:**				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☐	☒

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
III. AIR QUALITY -- (cont.):				
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	☐	☐	☐	☒
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	☐	☐	☐	☒
d) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☐	☒
e) Create objectionable odors affecting a substantial number of people?	☐	☐	☐	☒
IV. BIOLOGICAL RESOURCES -- Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☐	☒

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
IV. BIOLOGICAL RESOURCES -- (cont.):				
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☒
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☒
V. CULTURAL RESOURCES -- Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	☐	☐	☐	☒
b) Cause a substantial adverse change in the significance of a unique archaeological resource pursuant to §15064.5?	☐	☐	☐	☒
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☐	☐	☒
d) Disturb any human remains, including those interred outside of formal cemeteries?	☐	☐	☐	☒
VI. GEOLOGY AND SOILS -- Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☐	☒
ii) Strong seismic ground shaking?	☐	☐	☐	☒
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☐	☒
iv) Landslides?	☐	☐	☐	☒
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
VI. GEOLOGY AND SOILS -- (cont.):				
c) Be located on geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	☐	☐	☐	☒
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	☐	☐	☐	☒
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☐	☒
VII. HAZARDS AND HAZARDOUS MATERIALS -- Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☐	☒
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☐	☒
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	☒
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☐	☒
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
VII. HAZARDS AND HAZARDOUS MATERIALS -- (cont.):				
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	☐	☐	☐	☒
VIII. HYDROLOGY AND WATER QUALITY -- Would the project:				
a) Violate any water quality standards or waste discharge requirements?	☐	☐	☐	☒
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	☐	☐	☐	☒
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion of siltation on- or off-site?	☐	☐	☐	☒
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	☐	☐	☐	☒
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	☐	☐	☐	☒

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
VIII. HYDROLOGY AND WATER QUALITY -- (cont.):				
f) Otherwise substantially degrade water quality?	☐	☐	☐	☒
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	☐	☐	☐	☒
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	☐	☐	☐	☒
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	☐	☐	☐	☒
j) Inundation of seiche, tsunami, or mudflow?	☐	☐	☐	☒
IX. LAND USE AND PLANNING -- Would the project:				
a) Physically divide an established community?	☐	☐	☐	☒
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☐	☒
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	☐	☐	☐	☒
X. MINERAL RESOURCES -- Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
XI. NOISE -- Would the project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☐	☒
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☐	☒
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☐	☐	☒
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☐	☐	☒
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒
XII. POPULATION AND HOUSING -- Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☐	☒
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒
c) Displace substantial numbers of people necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
XIII. PUBLIC SERVICES --				
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
Fire protection?	☐	☐	☐	☒
Police protection?	☐	☐	☐	☒
Schools?	☐	☐	☐	☒
Parks?	☐	☐	☐	☒
Other public facilities?	☐	☐	☐	☒
XIV. RECREATION --				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒
XV. TRANSPORTATION / TRAFFIC -- Would the project:				
a) Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume-to-capacity ratio on roads, or congestion at intersections)?	☐	☐	☐	☒
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	☐	☐	☐	☒
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☐	☐	☐	☒

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
XV. TRANSPORTATION / TRAFFIC – (cont.):				
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☐	☒
e) Result in inadequate emergency access?	☐	☐	☐	☒
f) Result in inadequate parking capacity?	☐	☐	☐	☒
g) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	☐	☐	☐	☒
XVI. UTILITIES AND SERVICE SYSTEMS -- Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	☐	☐	☐	☒
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☐	☐	☐	☒
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☐	☐	☐	☒
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	☐	☐	☐	☒
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☐	☒
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	☐	☐	☐	☒
g) Comply with federal, state, and local statutes and regulations related to solid waste?	☐	☐	☐	☒

Issues:	*Potentially Significant Impact*	*Less Than Significant With Mitigation Incorporation*	*Less Than Significant Impact*	*No Impact*
XVII. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☐	☐	☐	☒
b) Does the project have impacts that are individually limited, but cumulative considerable? ("Cumulative considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☐	☐	☐	☒
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☐	☐	☒

EXPLANATION

Project Description

The proposed project (the Project) consists of the following changes to the Mercury TMDL Amendment (for reader ease, the Project description is repeated here from part I. Introduction):

1) Establish two numeric mercury water quality objectives for all segments of San Francisco Bay
   - To protect people who consume Bay fish (applies to larger fish consumed by humans): 0.2 mg mercury per kg fish tissue (average wet weight concentration, measured in edible portions (muscle tissue) of trophic level 3 and trophic level 4 fish)
   - To protect aquatic organisms and wildlife (applies to small fish consumed by birds): 0.03 mg mercury per kg fish (average wet weight concentration measured in whole fish 3–5 cm in length)
2) Vacate (i.e. remove) the water column four-day average mercury water quality objective for San Francisco Bay
3) Clarify TMDL targets as follows, in line with objectives stated above:
   - "To protect sport fishing and human health, the average mercury concentration in 60-cm striped bass muscle tissue shall not exceed 0.2 mg mercury per kg fish tissue (wet weight)."
   - "To protect aquatic organisms and wildlife, the concentration of mercury shall not exceed 0.03 ppm, wet weight average, in whole fish 3–5 cm in length."
   - The bird-egg target is a monitoring target.
4) Revise wasteload allocations and the implementation plan for wastewater sources, including:
   - Clarify the pollution prevention requirements for municipal wastewater
   - Establish more stringent wasteload allocations for municipal wastewater dischargers, to be implemented via individual mass limits and aggregate mass limits and incorporating ten-year interim and twenty-year final implementation schedules
   - Correct the wasteload allocations for industrial wastewater
   - Impose more stringent application of compliance triggers for both industrial and municipal wastewater
   - Require municipal and industrial wastewater and urban stormwater to conduct methylmercury monitoring
5) Add a statement to the dredging section of the Mercury TMDL Amendment clarifying the Water Board's intent that all dredging activities in the Bay comply with the Long Term Management Strategy.

6) Expand risk management activities to include investigation of ways to address public health impacts of mercury on people and communities most likely to be affected by mercury in San Francisco Bay-Delta caught fish, such as subsistence fishers and their families

In September 2004 the San Francisco Bay Regional Water Quality Control Board adopted a Basin Plan Amendment to incorporate a TMDL for mercury in the San Francisco Bay (Mercury TMDL Amendment). An Environmental Checklist was prepared for that project and published in April 2004, in compliance with CEQA and the Water Board guidelines of a certified CEQA program. Implementation of pollution reduction measures, public education, and water and sediment monitoring are described and analyzed in the Environmental Checklist for Mercury in San Francisco Bay Total maximum Daily Load and Basin Plan Amendment (Looker & Johnson 2004a).

In September 2005, the State Water Resources Control Board directed the Regional Board to consider revisions to the Basin Plan Amendment as specified in Resolution No. 2005-0060. This Environmental Checklist only evaluates potential environmental impacts of proposed revisions to the Mercury TMDL Amendment and the proposed new water quality objectives.

As mentioned above, the Project includes new proposed mercury water quality objectives to protect human health and wildlife and vacating the 4-day average marine water column water quality objective. Additions and deletion of water quality objectives and targets are presented in Table 1, below.

Table 1. Summary of Proposed Action as it Relates to Water Quality Objectives and TMDL Targets for Mercury in San Francisco Bay

Media	Limit	Proposed Action
Water	0.25 ug/l (4-day average for marine waters)	Vacate from Basin Plan as it applies to San Francisco Bay only
Fish tissue	0.03 mg mercury per kg fish (average wet weight concentration measured in whole fish 3–5 cm in length)	Add to Basin Plan as a new WQO and TMDL target
Fish tissue	0.2 mg mercury per kg fish tissue (average wet weight concentration measured in the edible portion of trophic level 3 and trophic level 4 fish)	Add to Basin Plan as a new WQO

Environmental Analysis

An environmental analysis of the Mercury TMDL was prepared and adopted by the Board in September 2004 on a programmatic Tier 1 level. The proposed Project consists of the above-referenced amendments to the 2004 Mercury TMDL and two new mercury water quality objectives. This environmental analysis only considers the environmental impacts of the proposed revisions and new water quality objectives. Like the 2004 Mercury TMDL, the Project does not define the specific actions local agencies must take to comply with requirements and the environmental analysis set forth herein is also on a

Tier 1 programmatic level. Project-specific environmental impacts will be evaluated as necessary when the projects are known.

The proposed Project will not have significant adverse impacts on the environment. Impacts of each of the above-referenced amendments and the new water quality objectives are discussed below and evaluated in the checklist.

New Water Quality Objectives

The proposed new water quality objectives are the same as the targets adopted or referred to in the Mercury TMDL Amendment adopted by the Water Board in 2004 and implementation of the new water quality objectives is to be achieved through implementation of the Mercury TMDL, as proposed to be revised through the Project. In other words, any physical environmental impacts associated with the proposed new water quality objectives stem from implementation of the Mercury TMDL, as revised. The new water quality objectives themselves are protective of human health, aquatic organisms and wildlife and are environmentally beneficial. With respect to impacts associated with implementation of these new objectives through the Mercury TMDL, the 2004 environmental analysis concluded there would be no significant environmental impacts. The current proposed revisions to the Mercury TMDL do not implicate new significant impacts, as set forth in more detail below.

Vacating the Existing 4-day Average Mercury Water Quality Objective

Vacating the existing 4-day average marine water quality objective for San Francisco Bay will not result in any significant impacts because the two new proposed water quality objectives for mercury in fish tissue are more stringent than the existing Basin Plan objective of 0.025 µg/l.

Clarifying the Mercury TMDL Targets

The human health target of 0.2 mg mercury per kg fish is not being revised; however, text is being added on the method to track progress toward attainment of the target using striped bass 60 cm long. The wildlife target is being re-expressed from a bird egg target (0.5 mg per kg wet weight) to the fish tissue target referenced in the 2004 Mercury TMDL (0.03 mg per kg fish tissue). These two targets reflect the same mercury concentration, with the differing numeric values attributable to how the same concentration of mercury manifests in fish tissue and bird eggs. These clarifications of the 2004 Mercury TMDL do not implicate any new impacts to the environment.

Revisions to Wasteload Allocations for Municipal Wastewater

The final total wasteload allocation for municipal wastewater is being revised from 17 kg/yr to 11 kg/yr—in effect, a 6 kg/yr total reduction to be achieved in 20 years (for context, Staff notes that the final TMDL for all sources is 700 kg/yr). This reduction entails the following reductions in individual wasteload allocations: (1) municipalities without advanced treatment: 40 percent reduction in the final wasteload allocation, with an interim reduction of 20 percent; (2) municipalities with advanced treatment: 20

percent interim and final reduction; (3) facilities whose allocation is 0.1 kg/yr or less or small municipal dischargers: no reduction. Interim reductions must be met in 10 years; final reductions must be met in 20 years.

The potential environmental impacts relate to the reasonably foreseeable methods of compliance with the reduced total wasteload allocation, although the required final reduction is only 6 kg/yr.

Municipalities will comply with the 20 percent reduction by intensifying their existing pollution prevention efforts. As set forth in the 2004 Mercury TMDL Environmental Checklist, physical environmental changes associated with these efforts relate to waste generation, handling and disposal. Pollution prevention activities would encourage proper disposal of mercury-containing wastes, which could slightly increase hazardous waste generation in the Bay Area. The 2004 Environmental Checklist concluded impacts of such slight increase would not be significant, and that to the extent such efforts divert mercury-containing wastes from inappropriate waste streams, it would be a benefit to the environment. The intensified pollution prevention efforts necessary to meet the 20 percent reduction would not significantly add to the generation of hazardous waste, either individually or cumulatively. Increased pollution prevention efforts such mercury amalgam collection from dental offices and mercury thermometer collection programs would add to the generation of mercury, but it would not be substantial and such mercury would be properly handled and disposed of instead of improperly ending up in sewers and non-hazardous waste landfills.

The 40 percent reduction is expected through a combination of aggressive pollution prevention and other mercury reduction methods, water re-use, pollutant trading, offsets and/or system improvements. The conceivable combinations municipalities could invoke to prevent 6 kg/yr of entering San Francisco Bay within the 20-year timeframe require speculation and cannot be evaluated at this point since the specific attributes of such projects and implementation actions are unknown. The Water Board is not dictating any particular method or combination of methods to comply with the 40 percent reduction. Rather, municipalities subject to the 40 percent reduction will be responsible for formulating their own project-specific strategies and they will undertake a Tier 2 project-specific environmental analysis to the extent required when the specific projects are proposed.

With respect to treatment plant upgrades as a method to comply with the 40 percent reduction, based on the public comments by municipal wastewater, treatment plant upgrades to advanced waste treatment/filtration, which has the potential for construction impacts, are not expected. Municipal wastewater sources have indicated through BACWA that upgrading to advanced waste treatment to comply with the 40 percent reduction is not reasonable, and is cost-prohibitive, and that they will investigate reasonable and feasible methods to comply. Their conclusion that upgrading is not reasonable appears to represent the rational calculus on the tens of millions of dollars it would take to chase a small amount of mercury. Thus, advanced waste treatment does not appear to be a reasonably foreseeable method of compliance with the 40 percent reduction requirement. In contrast, municipalities have expressed the need for the

mercury offset policy that State Water Board staff is tasked to develop under the Remand Resolution to comply with the final wasteload allocation. The environmental impacts of the yet-to-be-formulated offset policy is similarly difficult to forecast, much less analyze. When it is formulated, the State Water Board will undertake the appropriate CEQA review.

Revisions to Wasteload Allocation for Industrial Wastewater

The wasteload allocation for industrial wastewater is being revised to correct a calculation error. Specifically, the total load is being changed from 3 kg/yr to 1.3 kg/yr. The proposed load reflects current performance, and thus there is no change from the existing baseline condition, and thus no impacts.

Revisions to Implementation Plan

The Implementation Plan of the 2004 Mercury TMDL is proposed to be revised to 1) require methylmercury monitoring; 2) clarify requirements to better track the effectiveness of programs to control mercury sources and loadings; 3) require more risk management activities; 4) lower the bar for municipal and industrial wastewater to evaluate and correct exceedances of either the individual wasteload allocations or the mercury concentration triggers; and 5) include clarifying language that dredging comply with the existing Long Term Management Strategy. Revisions 2 and 5 do not involve physical changes to the environment. Methylmercury monitoring activities would not be continuous, occurring most frequently on a quarterly basis and would be conducted in an environmentally sensitive manner. The impacts, if any, would be less than significant. The specific increased risk management activities that will take place are unknown and therefore speculative to evaluate. Lowering the bar for municipalities and industrial wastewater to investigate and correct any exceedances would not have a significant adverse impact on the environment.

An explanation for each box checked on the environmental checklist is provided below:

I. Aesthetics

a-d) The new water quality objectives and revisions of the mercury TMDL would not substantially affect any scenic resource or vista, or degrade the existing visual character or quality of any site or its surroundings. It would not create any new source of light or glare.

II. Agriculture Resources

a-c) The Project would not involve the conversion of farmland to non-agricultural use. It would not affect agricultural zoning or any Williamson Act contract.

III. Air Quality

a) Because the Project would not cause any change in population or employment, it would not generate ongoing traffic-related emissions. It would also not involve the construction of any permanent emissions sources. For these reasons, no permanent

change in air emissions would occur, and the Basin Plan Amendment would not conflict with applicable air quality plans.

b) The Project objectives would not involve the construction of any permanent emissions sources or generate ongoing traffic-related emissions. The revised Basin Plan Amendment and new water quality objectives would not violate any air quality standard or contribute substantially to any air quality violation and no impacts would occur.

c) Because the Project would not generate ongoing traffic-related emissions or involve the construction of any permanent emissions sources, it would not contribute considerably to cumulative emissions.

d-e) Because the Project would not involve the construction of any permanent emissions sources, it would not expose sensitive receptors to ongoing pollutant emissions posing health risks or creating objectionable odors.

IV. Biological Resources

a-b) The Project is designed to benefit biological resources, including wildlife and rare and endangered species and would not substantially affect habitats, special-status species, or sensitive communities, and no adverse impacts would result.

c) The Project would require water and sediment sampling in wetlands to monitor methyl mercury production. Water quality monitoring would not be continuous (occurring most frequently on a quarterly basis) and would be conducted in an environmentally sensitive manner. Therefore, the project would and not result in significant adverse impacts to wetlands.

d-f) While no specific projects are required as part of the Project, any actions or specific projects would be developed in accordance with their local agency policies and ordinances, including any applicable habitat conservation plans, natural community conservation plans, or other plans intended to protect biological resources. Therefore, this Project would not conflict with local policies, ordinances, or adopted plans.

V. Cultural Resources

a-d) The Project would not include any substantial construction activities not previously considered in the Environment Checklist for the San Francisco Bay mercury TMDL and would not adversely affect any cultural resource, and no impacts would occur.

VI. Geology and Soils

a) The Project would not involve the construction of habitable structures; therefore, it would not involve any human safety risks related to fault rupture, seismic ground-shaking, ground failure, or landslides.

b) The Project itself would not involve any substantial construction beyond what was analyzed in the Environmental Checklist for the San Francisco Bay Mercury TMDL

(Looker & Johnson 2004a). Compliance with the more stringent wasteload allocations will likely be realized over time not through new treatment plant facilities, but through a combination of aggressive pollution prevention and other cost-effective mercury reduction methods, wastewater treatment system improvements, and the implementation of a State-developed program that establishes pollutant offsets and credits. Therefore, it would not result in substantial soil erosion and no impacts would occur.

c-d) The Project would not involve the construction of habitable structures. Therefore, the Basin Plan Amendment would not create safety or property risks due to unstable or expansive soil.

e) The Project would not require wastewater disposal systems; therefore, affected soils need not be capable of supporting the use of septic tanks or alternative wastewater disposal systems.

VII. Hazards and Hazardous Materials

a-f) Impacts related to mercury load reduction and remediation actions were evaluated in the Environmental Checklist for the San Francisco Bay Mercury TMDL (April 2004). No additional adverse impacts related to hazardous waste and the environment would result from the Project.

g) Hazardous waste management activities resulting from the Project would not interfere with any emergency response plans or emergency evacuation plans.

h) The Project would not affect the potential for wildland fires.

VIII. Hydrology and Water Quality

a) The Project would amend the Basin Plan, which articulates applicable water quality standards; therefore, it would not violate standards or waste discharge requirements.

b) The Project would not decrease groundwater supplies or interfere with groundwater recharge.

c-i) The Project would not include construction activities not previously considered in the Environment Checklist for the Mercury TMDL Amendment (Looker & Johnson 2004a) that would not result in substantial soil erosion, increase the rate or amount of runoff or result in flooding or increased flood hazards. Because the proposed Project is intended to reduce mercury-laden runoff, it would not be a source of new polluted runoff, or degrade water quality.

j) Any Project-related construction would not be subject to substantial risks due to inundation by seiche, tsunami, or mudflow.

IX. Land Use and Planning

a) The Project does not include planned construction that would divide any established community.

b-c) The Project would not conflict with any land use plan, policy, or regulation, and would not conflict with any habitat conservation plan or natural community conservation plan.

X. Mineral Resources

a-b) The Project would not result in the loss of availability of any known mineral resources.

XI. Noise

a-d) The Project does not include construction activities or other actions that would generate noise significant temporary or permanent noises sources beyond what was analyzed in the Environmental Checklist for the Mercury TMDL Amendment (Looker & Johnson 2004a). Sampling for methylmercury would occur at or near the ground or water surface and would not require drilling. No noise or vibration impacts would result from the Project and the Project would not result in violation of local agencies' noise standards.

e-f) The Project would not cause any permanent increase in ambient noise levels, including aircraft noise. Therefore, it would not expose people living within an area subject to an airport land use plan or in the vicinity of a private airstrip to excessive noise.

XII. Population and Housing

a-c) The Project would not affect the population of the Bay Area or California. It would not induce growth through such means as constructing new housing or businesses, or by extending roads or infrastructure. The Project would also not displace any existing housing or any people that would need replacement housing.

XIII. Public Services

a) The Project would not affect populations or involve construction of substantial new government facilities. The Project would not affect service ratios, response times, or other performance objectives for any public services, including fire protection, police protection, schools, or parks.

XIV. Recreation

a-b) Because the Project would not affect population levels, it would not affect the use of existing parks or recreational facilities. No recreational facilities would need to be constructed or expanded.

XV. Transportation / Traffic

a-b) Because the Project would not increase population or provide employment, it would not generate any ongoing motor vehicle trips. Therefore, the Project would not substantially increase traffic in relation to existing conditions. Levels of service would be unchanged.

c) The Project would not affect air traffic.

d) Because the Project would not affect any roads or the uses of any roads, it would not result in hazardous design features or incompatible uses.

e) Because the Project would not affect traffic or roadways, it would not restrict emergency access.

f) Because the Project would not increase population or provide employment, it would not affect parking demand or supply.

g) Because the Project would not generate ongoing motor vehicle trips, it would not conflict with adopted policies, plans, or programs supporting alternative transportation.

XVI. Utilities and Service Systems

a) The Project would amend the Basin Plan, which is the basis for wastewater treatment requirements in the Bay Area; therefore, the Project would be consistent with such requirements.

b) The Project does not mandate the construction of new or expanded water or wastewater treatment facilities. Upgrading of existing wastewater treatment facilities to advanced treatment/filtration, which has the potential for air, construction and traffic impacts, is not a reasonably foreseeable method of compliance for the reasons given above. System improvements may occur to comply with the 40 percent reduction, which may involve minor construction activities. But it would be speculative to evaluate such changes without knowing the specifics of the improvements. If and when they are proposed, they would be evaluated in a project-specific Tier 2 environmental analysis.

c) Because the Project does not revise the stormwater wasteload allocations, the Project would not cause local agencies to construct some new or expanded urban storm water runoff management facilities beyond what was evaluated in the 2004 Environmental Checklist and analysis and no impacts would occur.

d-e) Because the Project would not increase population or provide employment, it would not require an ongoing water supply. It would also not require ongoing wastewater treatment services.

f-g) The project would not generate substantial additional hazardous waste beyond what was analyzed in the 2004 Environmental Checklist. The potential for the Mercury TMDL and Basin Plan Amendment to generate mercury-containing waste was evaluated in the Environmental Checklist for that project San Francisco Bay Regional Water Quality Control Board (Looker & Johnson 2004a). The Project would not substantially affect municipal solid waste generation or landfill capacities.

XVII. Mandatory Findings of Significance

a) The Project would not degrade the quality of the environment. The proposed Project is intended to benefit wildlife and rare and endangered species by decreasing mercury concentrations in San Francisco Bay aquatic organisms to levels where wildlife that consume aquatic organisms do not experience any harm.

b) The Project would not result in significant adverse impacts. There are no potential adverse impacts that would interact in such a way as to further degrade the environment and no cumulative effects would occur. Adopting the new water quality objectives and revisions of the Mercury TMDL Amendment would require no mandatory findings of significance.

c) The Project would not cause any substantial adverse effects to human beings, either directly or indirectly. The Project is intended to benefit human beings (particularly sport and subsistence fishers) by decreasing San Francisco Bay fish tissue mercury concentrations to levels where humans can consume as much fish as they desire without experiencing adverse health effects.

Appendix C to the Staff Report

RESOLUTION NO. 2005–0060

STATE WATER BOARD

RESOLUTION NO. 2005–0060

REMANDING AN AMENDMENT TO THE WATER QUALITY CONTROL PLAN

FOR THE SAN FRANCISCO BAY REGION TO INCORPORATE A TOTAL MAXIMUM DAILY LOAD (TMDL) FOR MERCURY IN SAN FRANCISCO BAY

STATE WATER BOARD
RESOLUTION NO. 2005–0060

REMANDING AN AMENDMENT TO THE WATER QUALITY CONTROL PLAN FOR THE SAN FRANCISCO BAY REGION TO INCORPORATE A TOTAL MAXIMUM DAILY LOAD (TMDL) FOR MERCURY IN SAN FRANCISCO BAY

WHEREAS:

1. The San Francisco Bay Regional Water Quality Control Board (San Francisco Bay Water Board) adopted a revised Water Quality Control Plan for the San Francisco Bay Region (Basin Plan) on June 21, 1995, which was approved by the State Water Resources Control Board (State Water Board) on July 20, 1995 and by the Office of Administrative Law (OAL) on November 13, 1995.

2. On September 15, 2004, the San Francisco Bay Water Board adopted Resolution No. R2–2004–0082 (Attachment 1) amending the Basin Plan to incorporate a TMDL for mercury in the San Francisco Bay.

3. San Francisco Bay Water Board Resolution No. R2–2004–0082 delegated to the San Francisco Bay Water Board Executive Officer authority to make minor, non-substantive corrections to the adopted amendment, if needed, for clarity or consistency. By memorandum dated March 7, 2005, the San Francisco Bay Water Board Executive Officer made such a correction to the amendment (Attachment 2).

4. At the March 16, 2005 Meeting the State Water Board adopted Resolution No. 2005–0026 "Regarding an amendment to the Water Quality Control Plan for the San Francisco Bay region to incorporate a total maximum daily load (TMDL) for mercury in San Francisco Bay." That resolution stipulates that the TMDLs for the control of mercury in the Sacramento-San Joaquin Rivers Delta (Delta), Guadalupe River, and the San Francisco Bay be integrated and that specified issues be addressed.

5. At the June 16, 2005 Meeting, the State Water Board instructed staff to bring the San Francisco Bay mercury TMDL back for a potential vote at the July 2005 meeting and to obtain the following information:
   a. Do the wasteload allocations require the municipal and industrial dischargers to perform at the most appropriate level considering available pollution prevention programs and existing technology?
   b. What is the feasibility and cost of not disposing in the Bay dredged spoils containing mercury concentrations in excess of the sediment target?
   c. What are other federal, state, and local agencies doing to control and remediate mercury in the environment, and how can we all coordinate our efforts to achieve greater reduction?
   d. Consider the feasibility and cost of the suggestions titled, "Option 1.5", made by Baykeeper, Natural Resources Defense Council, and Clean Water Action, in their comment letter dated June 6, 2005.

6. California Water Code (CWC) section 13240 specifies that Regional Water Boards may revise Basin Plans. CWC 13242 requires a program of implementation of water quality objectives.

7. The State Water Board finds that the proposed TMDL for mercury does not adequately address the following issues. The Regional Water Board should:

    a. Modify the wasteload allocations to ensure that they are set at a level that would require municipal and industrial point source dischargers to incorporate the most effective treatment methods and pollution prevention practices practicable for their discharges.
    b. Specify monitoring requirements for methylmercury, the form in which mercury bioaccumulates.
    c. Ensure that wasteload allocations do not result in National Pollutant Discharge Elimination System (NPDES) permits that allow dischargers to discharge concentrations of mercury that contribute to excursions above the mercury narrative water quality objective.
    d. Ensure wasteload allocations take into account the significant variation in effluent quality among the various dischargers and that dischargers of high quality effluent should be recognized for their efforts, while dischargers of lower quality effluent should be required to perform better.
    e. Ensure in-Bay disposal of dredged material containing mercury complies with the requirements of the Long Term Management Strategy for the Placement of Dredged Material in the San Francisco Bay Region, Management Plan 2001(LTMS).
    f. Ensure that all sources of mercury that may affect San Francisco Bay have been adequately identified, such as Bay margin sites and mines within the San Francisco Bay watershed.
    g. Clarify that the proposed bird egg target, as adopted and corrected is either a monitoring target or adopt an acceptable numerical target for the protection of wildlife.

8. The State Water Board supports the TMDL's requirement that the San Francisco Bay area refineries be required to investigate the environmental fate of mercury in crude oil and report findings to the San Francisco Bay Water Board, including the potential pathways by which crude oil mercury could be discharged to the Bay from Bay Area petroleum refining facilities, and the annual mercury loads associated with these discharge pathways.

9. The State Water Board should take an active role in coordinating the efforts to reduce cross-media and cross regional mercury pollution.

10. The United States Environmental Protection Agency (USEPA) has objected to the TMDL in that it is not clear whether the TMDL will result in attainment of the numeric water quality objective of 0.025 micrograms per liter (µg/L) calculated as a four-day average, which is an objective that is applicable to those portions of the San Francisco Bay that are north of the Dumbarton Bridge. The State Water Board finds that the numeric water quality objective is redundant with the existing narrative bioaccumulation objective, in that the purpose of the numeric water column objective was to prevent bioaccumulation in fish tissue.

11. The State Water Board is in the process of developing a statewide numerical fish-tissue objective for mercury.

12. The State Water Board finds that a significant portion of the abandoned mines and mining areas contaminated by mercury in the State of California are situated on federal lands, and therefore the federal government is responsible for remediating these areas to attain water quality standards. The USEPA should actively use its Superfund and other authorities to promptly initiate such investigation and remediation, and cause the other relevant federal agencies to assume their responsibilities for cleaning up their lands.

13. Consistent with finding 12, above, the State Water Board finds that neither the CWA nor the CWC should be used as a means to leverage existing point source discharges as a means of forcing dischargers to bear more than their fair share of responsibility for causing or contributing to any violation of water quality standards. In this context "fair share" shall refer to the dischargers' proportional contribution to the impairment.

14. A Basin Plan amendment does not become effective until approved by State Water Board and until the regulatory provisions are approved by OAL. Additionally, the TMDL must be approved by USEPA.

THEREFORE BE IT RESOLVED THAT:

The State Water Board:

1. Remands the amendment to the Basin Plan to incorporate a TMDL for mercury in San Francisco Bay adopted under San Francisco Bay Water Board Resolution No. R2-2004-0082 as corrected by the Executive Officer (Attachment 2) for further consideration consistent with this resolution.

2. Directs the San Francisco Bay Water Board to evaluate effective pollution prevention practices used in other states and the pollution prevention or other appropriate programs of each San Francisco Bay discharger, and their potential effectiveness in reducing mercury in their discharges. The San Francisco Bay Water Board shall revise the TMDL to incorporate requirements for appropriate programs and practices into the TMDL, and require all dischargers to aggressively implement appropriate pollution avoidance practices that are most effective at eliminating or reducing mercury concentrations in their effluent.

3. Directs the San Francisco Bay Water Board to evaluate and consider the effectiveness of any existing wastewater treatment technology that enhances the removal of mercury. The San Francisco Bay Water Board shall revise the TMDL to establish individual wasteload allocations, after reconsidering the appropriateness of the policy assumptions used by the Regional Water Board to derive the original wasteload allocations. In establishing such wasteload allocations, the San Francisco Bay Water Board shall incorporate provisions that acknowledge the efforts of those point sources whose effluent quality demonstrates good performance, and require improvement by other dischargers.

4. In carrying out the requirements of this resolution, the Regional Water Board shall comply with the requirements of CWC section 13360 regarding specifying the manner of compliance with Regional Water Board orders.

5. Directs the San Francisco Bay Water Board to revise the TMDL to require inclusion in the next round of NPDES permits or in the watershed NPDES permits monitoring for, and determination of the relative proportion of, methylmercury in effluent discharges.

6. Directs the San Francisco Bay Water Board to ensure that in-Bay disposal of dredged material containing mercury complies with the requirements of the Long Term Management Strategy Plan (LTMS).

7. Directs the San Francisco Bay and Central Valley Water Boards to create a watershed legacy mercury inventory and establish a priority list for addressing these sources. The Water Boards shall also propose potential methods or strategies to remediate priority sources.

8. Directs State Water Board staff to develop a State policy for water quality control that establishes alternative methods to allow dischargers to meet mercury effluent limitations that are directed to preventing contributions to excursions above water quality standards. The policy shall allow dischargers to perform other activities aside from eliminating more mercury from their discharges than they would be required to remove by applicable technology-based effluent limitations. This policy shall require more rigorous activities for: (a) dischargers not in compliance with their wasteload allocations and/or other applicable criteria or objectives; and (b) dischargers seeking to increase their mercury load. The policy shall include provisions that recognize the efforts of those dischargers who are meeting or outperforming their wasteload allocations, and that recognize the expenditures made by dischargers who are employing higher treatment levels. The policy shall not include requirements that would leverage existing point source discharges as a means of forcing dischargers to bear more than their fair share of responsibility for causing or contributing to any violation of water quality standards. In this context "fair share" shall refer to the dischargers' proportional contribution to the impairment. The policy shall also include provisions that prevent localized disparate impacts.

9. The San Francisco Bay Water Board shall include requirements in the TMDL that any new or modified NPDES permit for dischargers shall contain a reopener to implement Resolved No. 7, above.

10. Directs the San Francisco Bay and Central Valley Water Boards to investigate ways, consistent with their regulatory authority, to address public health impacts of mercury in San Francisco Bay/Delta fish, including activities that reduce actual and potential exposure of and mitigate health impacts to those people and communities most likely to be affected by mercury in San Francisco Bay-Delta caught fish, such as subsistence fishers and their families.

11. Directs the San Francisco Bay Water Board to either develop an appropriate and allocable numerical target that is protective of wildlife, or clarify that the existing bird-egg target is a monitoring target, and that the TMDL will be revised if results of such monitoring reveal that the beneficial uses are not being protected.

12. Directs the San Francisco Bay Water Board to revise, withdraw, or take other appropriate action to address the marine waters mercury four-day average water quality objective. In so doing the Regional Water Board shall comply the provisions of Clean Water Act section 303,

including but not limited to subparagraph (c)(2)(B), which require the adoption of numerical criteria for toxic pollutants.

13. Directs the San Francisco Bay Water Board to bring a revised TMDL, consistent with this resolution, back to the State Water Board within nine months of the date of this resolution. The San Francisco Bay Water Board shall report its progress in complying with this resolution to the State Water Board within six months of the date of this resolution.

BE IT FURTHER RESOLVED THAT:

The State Water Board:

14. Shall dedicate funds to the Regional Water Board(s) to assist in compliance with this resolution, including for contracting with the United States Geological Survey or other appropriate agencies, to examine the mines and areas impacted by mining from a water quality perspective.

15. Shall commence efforts to coordinate with the Air Resources Board and other relevant agencies to address air deposition of mercury to areas that could affect the quality of Waters of the State.

16. Shall, pursuant to their offers, convene a meeting with the USEPA, Western States Petroleum Association, the Bay Area Clean Water Agencies, and with the San Francisco Bay and Central Valley Water Boards and other interested stakeholders, to investigate methods of addressing and financing the redress of mercury from the mining legacy.

CERTIFICATION

The undersigned, Clerk to the Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on September 7, 2005.

Total Maximum Daily Load for PCBs in San Francisco Bay

Final Staff Report
for Proposed Basin Plan Amendment

California Regional Water Quality Control Board

San Francisco Bay Region

February 13, 2008

San Francisco Bay Regional Water Quality Control Board

1. Introduction

This Staff Report presents the supporting documentation for a proposed Basin Plan amendment that will be considered by the California Regional Water Quality Control Board, San Francisco Bay Region (Water Board) that establishes a Total Maximum Daily Load (TMDL) and implementation plan for Polychlorinated Biphenyls (PCBs), including PCBs with dioxin-like properties, for all of San Francisco Bay. The TMDL is based on attainment of a fish tissue target PCBs concentration protective of human health, wildlife, and aquatic life. This report contains the results of analyses of PCBs impairment assessments, sources and loadings, linkage analyses, load reductions, and implementation actions.

The Clean Water Act requires California to adopt and enforce water quality standards to protect San Francisco Bay. The Water Quality Control Plan for the San Francisco Bay Region (Basin Plan) delineates these standards, which include beneficial uses of waters in the Region, numeric and narrative water quality objectives to protect those uses, and provisions to enhance and protect existing water quality (antidegradation). The California Toxics Rule (CTR) is the basis for the numeric water quality criteria for PCBs in San Francisco Bay. Section 303(d) of the Clean Water Act requires states to compile a list of “impaired” water bodies that do not meet water quality standards and to establish a TMDL for the pollutant that causes impairment. The proposed TMDL and implementation plan are designed to resolve PCBs impairment in all segments of San Francisco Bay.

For the purpose of the report, all segments of San Francisco Bay include the portion of the Sacramento and San Joaquin Delta in the San Francisco Bay Region, and all portions and contiguous tidal zones of Suisun Bay, Carquinez Strait, San Pablo Bay, Richardson Bay, Central Bay, Lower Bay and South Bay. Throughout this report, the terms San Francisco Bay and Bay are inclusive of all these segments.

This report provides the rationale and the technical basis for the required TMDL elements and associated implementation plan. This report meets the requirements of the California Environmental Quality Act (CEQA), including the preparation of a checklist (Appendix A) for adopting Basin Plan amendments and serves in its entirety as a substitute CEQA environmental document. It builds on earlier reports on sources and loadings (June, 2000), impairment assessment (June, 2001) and a Project Report (January 2004). It also builds on the Draft Staff Report (June 23, 2007 version) that was circulated for a 60-day public review period and testimony hearing that was held on September 12, 2007, and the Revised Draft Staff Report (December 3,, 2007 version) that was circulated for a 45-day public review. This report was developed with consideration of stakeholder input, including incorporation of comments received on the Project Report and comments received on the Draft Staff Report and Revised Draft Staff Report, and has been updated with new information.

The process for establishing a TMDL includes compiling and considering available data and information, conducting appropriate analyses relevant to defining the impairment problem, identifying sources, and allocating responsibility for actions to resolve the impairment. This report is organized into sections that reflect background information, the key elements of the TMDL process, and regulatory analyses required to adopt the amendment.

In addition, the scientific basis of the Basin Plan amendment was subjected to external scientific peer review. This step is required under §57004 of the Health and Safety Code, which specifies that an external review is required for work products that serve as the basis for a rule,

"…establishing a regulatory level, standard, or other requirements for the protection of public health or the environment." The scientific basis of the PCBs TMDL, as presented in the Staff Report, was evaluated by two peer reviewers, Prof. David O. Carpenter, M.D., and Prof. Kevin J. Farley, who concluded that the scientific basis of the proposed Basin Plan amendment is based on sound scientific knowledge, methods, and practices.

Section 2 presents the problem statement that the project is based on and defines the project, why it is necessary and its objectives. Section 3 presents information about the physical setting of San Francisco Bay, including climate, hydrology, geology and biology. Section 4 discusses the chemistry and historical use of PCBs. Section 5 provides a discussion of the water quality standards that are applicable to San Francisco Bay. Section 6 presents the results of the impairment assessment that identified adverse impacts to beneficial uses in the Bay.

Section 7 presents our understanding of the sources of loading of PCBs to the Bay. Sources and loading are identified as internal or external to the Bay. Internal sources reflect the current reservoir of PCBs found in sediments or the water column. External sources reflect loads coming into the Bay, for example, from urban runoff or wastewater treatment plants.

Section 8 presents the derivation of the numeric target. Section 9 presents the linkage analysis which describes the relationship between PCBs sources and the proposed target, and estimates the bay's capacity to assimilate PCBs while still meeting the numeric fish tissue targets. Section 10 presents the proposed TMDL and the allocations of the TMDL to external sources.

Section 11 presents the Implementation Plan which includes actions and requirements deemed necessary to implement the external source allocations and actions to manage internal sources of PCBs. It specifies monitoring activities to demonstrate attainment of allocations and the numeric target. It also presents an adaptive implementation strategy to review implementation progress and to evaluate any new information generated, which may lead to improved implementation actions, and refinement of the TMDL, the numeric target or the allocations in the future.

Section 12 presents the results of CEQA analyses including an environmental impact assessment and an evaluation of alternatives to the proposed Basin Plan amendment. Section 13, References, lists all the information sources cited and relied upon in preparation of this report.

2. Project Definition

This section presents the problem statement upon which the proposed Basin Plan amendment project is based. It also presents the project definition and objectives which form the basis of the assessment required by the CEQA.

2.1 Problem Statement

All San Francisco Bay segments were initially placed on the California 303(d) list in 1998 for total PCBs and dioxin-like PCBs due to an interim health advisory for fish consumption. The 1998 listing applies to the following Bay segments: Sacramento and San Joaquin Delta, Suisun Bay, Carquinez Strait, San Pablo Bay, Richardson Bay, Central Bay, Lower Bay and South Bay. The 303(d) list was revised in 2002 to include specific locations in the Lower Bay segment. These listing were sustained on the 2006 303(d) list version (Table 1; Figure 1). This TMDL applies to all Bay segments.

As further discussed in the Impairment Assessment in Section 6, water quality objectives that are not attained include the narrative water quality objective which states that controllable water quality factors shall not cause a detrimental increase in toxic substances found in bottom sediments or aquatic life and the numeric water quality criterion of 0.00017 ug/L total PCBs in water. The existing beneficial use that is not fully supported due to elevated PCBs levels in fish is commercial and sport fishing. However, this TMDL is designed to ensure protection of all beneficial uses of the Bay including but not limited to preservation of rare and endangered species, estuarine habitat, and wildlife habitat.

Table 1-San Francisco Bay Water Segments on 2006 303(d) List for PCBs

Water Body Names	Hydrologic Unit	Total Water Body Size (acres)
Sacramento/San Joaquin Delta	207.100	41,736

(2006 CWA Section 303(d) list)

2.2 Project Definition

The project is the adoption of a proposed Basin Plan Amendment to establish a TMDL and a phased implementation plan to attain PCBs water quality standards in all segments of San Francisco Bay. The Water Board is obligated under Section 303(d) of the Clean Water Act to

develop a TMDL for San Francisco Bay to address PCBs impairment. The following components form the basis of the proposed regulatory provisions and define the project:

1. Numeric target for PCBs concentrations in fish tissue of 10 ug/kg.
2. Total maximum average yearly PCBs loads to San Francisco Bay of 10 kg/year.
3. Allocation of the total maximum average yearly PCBs load among the various external PCBs sources to San Francisco Bay.
4. Plan to implement the TMDL that includes actions to reduce PCBs loads to achieve external load allocations and actions to manage internal sources of PCBs in San Francisco Bay.
5. Monitoring program to evaluate progress in meeting the numeric target and load allocations.
6. Plan and schedule for studies to improve technical understanding relevant to the PCBs TMDL and implementation plan, and for reviewing progress toward meeting targets, implementing actions and evaluating continued appropriateness and effectiveness of actions.

Figure 1-San Francisco Bay Embayments

2.3 Project Objectives

The proposed Basin Plan Amendment is intended to reduce existing and future PCBs discharges to San Francisco Bay associated with controllable water quality factors. Controllable water quality factors are those resulting from human activities that can influence water quality and be reasonably controlled through prevention, mitigation, or restoration. Specific objectives of the project are as follows:

1. Attain numeric PCB water quality criteria and the narrative bioaccumulative water quality objective established for the Bay in as short a time frame as feasible.
2. Protect beneficial uses of San Francisco Bay including but not limited to sport fishing and wildlife habitat.
3. Set target(s) to attain relevant water quality standards in all parts of the Bay.
4. Reduce loading of PCBs to the Bay from external sources and reduce uptake from sediments.
5. Continue to make use of the experience and expertise of the Water Board and its stakeholder community regarding local watersheds and PCBs sources.
6. Initiate actions to reduce PCBs discharges, while continuing to accommodate new information on PCBs fate in the environment.
7. Establish a decision-making framework where management actions evolve to adapt to future knowledge or conditions.
8. Favor actions that have a multi-contaminant benefit and promote efficiencies in water quality regulation and resource management.
9. Avoid actions that will have unreasonable costs relative to their environmental benefits.
10. Comply with the antidegradation requirements of State Board Resolution No. 68-16 and federal antidegradation regulations (40 CRF 131.12).
11. Base decisions on readily available information on ambient conditions, PCBs loads, fish consumption patterns, and PCBs fate and effects.
12. Consider site-specific factors relating to PCBs sources, ambient conditions, watershed characteristics, and response to management actions.
13. Avoid arbitrary decisions and speculation when computing loads, setting targets, setting allocations, determining implementation actions, and defining a margin of safety.
14. When selecting from a range of options, select an environmentally protective option as a means of building an implicit margin of safety into the TMDL.
15. Consider natural, seasonal, and inter-annual variability in determining the manner of implementing the load allocations.
16. Avoid imposing regulatory requirements more stringent than necessary to meet the targets designed to attain water quality standards.
17. Provide details of an implementation plan that includes: a description of the nature of actions necessary to meet allocations and targets and thereby achieve water quality standards; a schedule for actions to be taken; and a description of monitoring to be

undertaken to determine progress toward meeting allocations, targets and water quality objectives.

18. Provide interim risk management programs to protect recreational sport fishing anglers
19. Comply with the Clean Water Act requirement to adopt a TMDL for a 303 (d) listed impaired water body.

3. Setting

San Francisco Bay is located on the Central Coast of California and marks a natural topographic separation between the northern and southern coastal mountain ranges. The Bay functions as the only drainage outlet for waters of the Central Valley.

Because of its highly dynamic and complex environmental conditions, the Bay system supports an extraordinarily diverse and productive ecosystem. The basin's deepwater channels, tidelands, and marshlands provide a wide variety of habitats that have become increasingly vital to the survival of several plant and animal species. The basin sustains communities of crabs, clams, fish, birds and other aquatic life and serves as an important wintering site for migrating waterfowl.

3.1 Physical Setting

San Francisco Bay is a large coastal embayment receiving fresh water from Central Valley rivers via the Delta and from local small tributaries (Figure 2). The Bay is relatively shallow with an average depth of around 6 meters and a median depth of about 2 meters at mean lower low water (Conomos, 1979). Narrow channels 10 to 20 meters deep incise broad expanses of the Bay floor. Deeper sections of channels such as the Golden Gate (110 meters) and Carquinez Strait (27 meters) are topographic constrictions where depths are maintained by scouring from tidal currents. Due to the extent of shallow areas, seasonal winds cause significant sediment resuspension and movement in the Bay.

The Bay is subdivided in segments: Sacramento and San Joaquin Delta, Suisun Bay, Carquinez Strait, San Pablo Bay, Richardson Bay, Central Bay, Lower Bay and South Bay. The northern reach of the San Francisco Bay (Suisun Bay, Carquinez Strait, and San Pablo Bay) is partially to well-mixed while the South Bay (Lower and South Bay) is a tidally oscillating lagoon. The Central Bay is most influenced by water exchange with the ocean.

3.2 Climate

The climate of San Francisco Bay plays an important role in determining the environmental conditions found in the Bay. The Bay has a Xeric (Mediterranean) moisture regime characterized by cool, dry summers and mild, wet winters. The amount and timing of precipitation, air temperature, and wind patterns influence the Bay's freshwater inflow, salinity, currents, and suspended sediment concentrations.

The sun affects the Bay by promoting photosynthesis and warming the shallow areas, which in turn influences carbon dynamics in the water column and sediments. Carbon dynamics and the formation of humic substances (natural organic matter) influence the partitioning of PCBs in aquatic environments between sediments, water, and biota.

The Bay is subjected to strong southwest summer winds. These strong winds exert stress on the water surface, which generates waves. Wind-generated waves resuspend sediments creating turbid conditions and dispersing sediments throughout the Bay, thereby affecting movement of PCBs in the Bay. Waves also tend to mix and aerate the water, which also influences carbon fluxes in the Bay.

PCBs mainly partition into the organic carbon phase such as the organic matter in sediments, or into the lipid fraction of biota. A better understanding of sediment movement and organic carbon fluxes is essential to understanding distribution and long-term fate of PCBs in the Bay. Our

ability to predict the fate of PCBs on a fine scale will require improved understanding of sediment movement and carbon flux throughout the Bay.

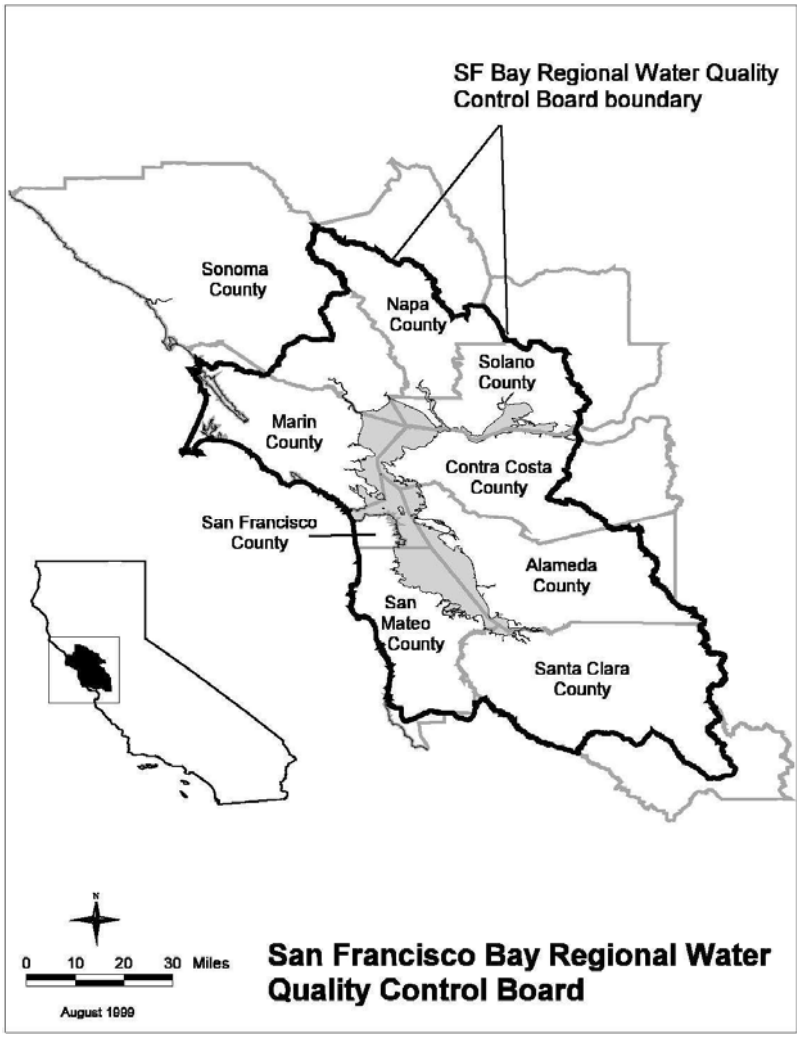

Figure 2-San Francisco Bay Region

3.3 Hydrology

Freshwater inflows, tidal mixing, and their interactions largely determine variations in the hydrology of the Bay. Hydrology has profound effects on biota that live in the Bay because it determines the salinity in different portions of the Bay.

The Bay receives 90 percent of its fresh water inflows from streams and rivers draining the Central Valley watershed and about 10 percent from local tributaries surrounding the Bay (SFEP, 1992a). The Sacramento and San Joaquin Rivers carry about 60 percent of the state runoff draining around 152,500 square kilometers (km^2) or 40 percent of California's surface area (Conomos et al., 1985). Of the fresh water flows entering the Bay from the Central Valley watershed, the Sacramento River typically accounts for 80 percent, the San Joaquin River 15 percent, and smaller rivers and streams the remainder.

The northern reach of the Bay (comprised of Suisun Bay, Carquinez Strait, and San Pablo Bay) is geographically and hydrologically distinct from the Central and South Bays. The northern reach is a partially to well-mixed waterbody (depending on the season) that is dominated by seasonally varying delta inflow. The South Bay is a tidally oscillating, lagoon-type Bay, where variations are determined by water exchange with the northern reach and the ocean. Water residence times are much longer in the South Bay than in the North Bay.

Response time of the Bay to PCBs source control will depend on the sediment hydrodynamics of the Bay, such as its rate of flushing, sediment dynamics, and the variability in inflow. The effect of these parameters over a long time scale needs to be accounted for in determining the long-term fate of PCBs in the Bay.

3.4 Geology

San Francisco Bay is located within the Coast Ranges of California. The Coast Ranges are characterized by northwest trending longitudinal mountain ranges and valleys formed by faulting and folding (Howard, 1979).

In aquatic environments, PCBs are mainly associated with sediments. Therefore, understanding past, current, and future sedimentation and sediment movement is essential for predicting the fate and transport of PCBs in the Bay.

Delta inflow from the Central Valley watershed is the major source of new sediment input into the Bay. Most new sediment (approximately 80 percent) originates in the Sacramento-San Joaquin River drainage and enters primarily as suspended load during the high winter inflows. Much of the winter sediment load from the Sacramento and San Joaquin rivers initially settles out in San Pablo Bay. During the low flow summer months, wind-generated waves and tidal currents resuspend the previously deposited sediment and redistribute it over a wider area.

The Bay's sediment mass balance was greatly altered by the advent of hydraulic mining in the Sierras in the late 1800's. The resulting large increase in sediment loads to the Bay due to hydraulic gold mining affected both the mudflat and sub-tidal areas (SFEP, 1992a). Deposition of fine sediments originally raised mud elevations several meters in Suisun Bay, and the elevation of mud migrated as a "mud wave" to San Pablo Bay and the Central Bay over the past century. During the time of highest PCBs production and use, the continual deposition of sediment buried PCBs being released into the Bay from land and maritime-based activities. Therefore, a large reservoir of PCBs was created in the Bay sediments.

Recent studies indicate that, in portions of the Bay, sediments are eroding (Jaffe et al., 1998). Sediments deposited during the period of Bay Area industrialization are now being uncovered due to a decrease of sediments entering the Bay from the Sacramento and San Joaquin rivers. This erosion could uncover contaminated sediments, resulting in increased availability of PCBs to the food web. Even if all current PCBs sources to the Bay are eliminated, exposure of historically contaminated sediment may turn out to be a significant PCBs source to organisms.

Sediment dynamics influence the distribution, transport and fate of PCBs in the Bay. Bathymetry is a factor affecting sediment dynamics. Broad shallows incised by narrow channels characterize San Pablo Bay, Suisun Bay, and the South Bay. These shallower areas are more prone to wind-generated currents and sediment resuspension and deposition than deeper areas, such as the Central Bay. Near-shore shallow areas are likely repositories of larger reservoirs of PCBs, due to their proximity to historical land-based industrial activities.

Currents created by tides, freshwater inflows, and winds cause erosion and transport of sediments in the Bay. Tidal currents are usually the dominant observed currents in the Bay. Generally, tides appear to have a significant influence on sediment resuspension during the more energetic spring tide when water column sediment concentrations naturally increase.

Strong seasonal winds create circulation and mixing patterns and add to tide- and river-induced current forces. It has been estimated that about 160 million cubic yards (mcy) of sediments are resuspended annually from shallow areas of the Bay by wind-generated waves (U.S. ACE, 1998), while 8 to 10 mcy enter the Bay from the Central Valley watershed and 4 to 8 mcy leave the Bay through the Golden Gate (Table 2). These estimates of sediment inputs have been updated (Schoellhamer et al., 2005), but these relative estimates are used to illustrate the substantial degree of sediment resuspension compared to gains and losses. These are the only estimates of sediment resuspension volumes. By comparison, between 2001 and 2005, an average of 1.8 mcy of dredged sediments was disposed in the Bay as a result of maintenance dredging activities between 2001 and 2005 (DMMO, 2006). The current estimate of the sediment budgets indicates a net loss of 2.4 mcy of sediments from the Bay (Schoellhamer et al., 2005).

Table 2-Sediment Movement in San Francisco Bay

Pathway	Sediment Volume (10^6 cu yd)
Inflow from Central Valley	6.9-8.1
Inflow from other tributaries	1.1-2.4
Outflow through the Golden Gate	4.2-8.1
Resuspension	160

(U.S. ACE, 1998)

Our understanding of sediment dynamics is based on general Bay-wide models. These models are based on Bay-wide averages and do not consider site-specific PCB-Contaminated sites in the near-shore environment.

3.5 Biology

Many species of birds, fish, and mammals regularly reside in the Bay, including a number of endangered, threatened, and rare wildlife species. The Bay supports a diversity of habitat types resulting in a diversity of wildlife species. High food productivity in different habitats types allow some species to achieve substantial numbers. Tidal salt marshes and open waters sustain aquatic plants and phytoplankton that feeds the Bay food web.

Open Waters

Open waters include various habitat types, such as subtidal waters and sloughs. Open waters support benthic and pelagic invertebrates, fish, waterbirds, and seals. Invertebrates serve as prey for large fish populations representing several different trophic levels, including Pacific herring, northern anchovy, Pacific sardine, staghorn sculpin, several species of perch, English sole, and California halibut. Many of these fish species in turn serve as prey to piscivorous birds such as the Forster's tern, California least tern, American white pelican, brown pelican, and double-crested cormorant. Waterfowl such as greater scaup, lesser scaup, canvasbacks, and

surf scoters dive for bivalves, crustaceans, and other invertebrates in shallower open waters. Bird diversity in the open Bay waters is fairly low, as the species of birds that can exploit the subtidal areas are limited to those that can forage from the air (*e.g.*, terns) or under water (*e.g.,* scoters) and those that can swim.

Sloughs and channels provide important habitat for large numbers of benthic and pelagic invertebrates and fish. These organic-rich channels serve as important nurseries and feeding areas for estuarine fish. Diving ducks generally avoid the smaller tidal channels but are found in abundance, particularly during their non-breeding season, near the mouths of the larger sloughs, and in open waters. Terns often forage in the larger channels, and several species of herons and egrets forage in the shallower channels for fish. Many shorebirds feed along the exposed flats along tidal channels at low tide, as do rails and other tidal marsh birds.

The Bay's open water provides shallow and deep-water habitat throughout San Francisco Bay. Sediments in these areas range from clays to sand. The dominant plants are phytoplankton, green algae and blue green algae (SFEP, 1992b). Extensive phytoplankton growth in the water column occurs in Suisun, San Pablo and South Bays. Open waters also provide habitat for benthic (bottom dwelling) organisms, fish, and birds. Other important habitats include mudflats, tidal and brackish marsh, and wetlands. Large numbers of benthic organisms, such as clams, worms, mussels, shrimps, and crabs, reside in these habitats. Bay-dwelling fish, such as shiner surfperch, white croaker, and jacksmelt, are known to feed on these benthic organisms (Goals Project, 2000).

The makeup of benthic communities varies highly both spatially and over time (SFEP, 1992b; Thompson et al., 2000). A better understanding of the factors controlling benthic community composition and dynamics would further our understanding of the food web in general, and the uptake and transfer of PCBs in the food web. Benthic organisms are a large part of the diet for the Bay fish species with the highest PCBs concentration (Roberts et al., 2002). Modeling of PCBs in the food web of in the Bay has been performed providing a linkage between PCBs concentrations in sediment, water and biota (Gobas and Wilcockson, 2003; Gobas and Arnot, 2005).

Mudflats

Intertidal mudflats are expanses of minimally vegetated to unvegetated mud in the lower marsh zone. Most of this habitat occurs just beyond the edge of fully vegetated wetlands, and between channels and edges of wetlands within sloughs. Shallow waters generally cover mudflats during high tide, but they are uncovered at low tide. Narrow mudflats occur along the edges of the tidal sloughs and channels, while larger mudflats occur at the mouths of sloughs and along the edge of the Bay.

Mudflats support a large community of diatoms, worms, shellfish, and algae. Organic debris from tidal marshes, phytoplankton, algae, and diatoms are responsible for the large numbers of benthic invertebrates on mudflats. Crustaceans, polychaete worms, gastropod and bivalve mollusks, and other invertebrates live on or just below the surface of the mud. During high tides, mudflats provide foraging habitat for many species of fishes and wading birds. During low tides, large numbers of shorebirds feed in the mudflats. These mudflats are a key reason for the importance of the San Francisco Bay Area to West Coast shorebird populations.

Smaller channels in brackish and salt marshes are the favored feeding areas for the state and federally endangered California clapper rail. Shorebirds, gulls, terns, American white pelicans,

and ducks often use exposed mudflats as roosting or loafing areas when available, as do Pacific harbor seals. When the tides rise, most of these birds return to roosting areas in salt ponds or other alternate habitats; the seals move to open waters.

The state and federally endangered salt marsh harvest mouse, the salt marsh wandering shrew, and the California vole reside where pickleweed is present. California clapper rails nest in cordgrass, denser stands of pickleweed, and marsh gumplant, in both salt and brackish tidal marshes.

Tidal marshes are important to the aquatic components of the Bay' overall ecosystem, not just to the species that reside and/or feed there. Organic debris from tidal marshes forms much of the foundation of the Bay food web.

Brackish Marsh
Brackish marshes occur in the low-to-mid intertidal reaches of sloughs and creeks draining into the Bay. Their vegetation is subject to tidal inundation diluted by freshwater flows.

The vegetation in brackish marsh habitat is dominated by plant species adapted to intermediate (brackish) salinities, including short bulrushes such as alkali bulrush and saltmarsh bulrush. Other plants found in brackish marshes include alkali heath, cattails, spearscale, and pickleweed. Large patches of the invasive pepperweed also occur within the terraced areas in these middle reaches.

Brackish marshes support many of the wildlife species that use salt marsh and freshwater marsh habitats. Brackish marshes are particularly important for anadromous fish (migrating from saline to fresh water to spawn) and catadromous fish (migrating from fresh to saline water to spawn) and invertebrates such as shrimp.

Most terrestrial and wetland wildlife species are tolerant of a range of salinities, and are affected more by habitat structure and food availability than by salinity. Brackish marshes support most of the bird species occurring in both salt and freshwater marshes. California clapper rails occur in brackish marshes, and likely breed in these marshes. The often taller, denser vegetation in brackish marshes supports large densities of breeding song sparrows, saltmarsh common yellowthroats, and marsh wrens, and large numbers of Virginia rails and soras during migration and winter.

4. Polychlorinated Biphenyls

PCBs are a class of organic compounds produced as complex mixtures for a variety of uses, including dielectric fluids in capacitors and transformers. PCBs were manufactured commercially by the Swann Chemical Company beginning in 1929. Monsanto acquired the process in 1935 and continued PCBs production until 1977 (Erickson, 1997).

In the United States, discovery of PCBs as ubiquitous environmental contaminants led to their initial regulation under the Toxic Substances Control Act (TSCA) in 1976. In 1978, Congress banned the manufacture, processing, and distribution in commerce of PCBs. Use of PCBs was restricted to totally enclosed applications, and non-totally enclosed applications were only allowed with the United States Environmental Protection Agency (U.S. EPA) exemptions. In 1979, U.S. EPA passed regulations that defined totally enclosed applications as intact, non-leaking electrical equipment. U.S. EPA banned the manufacture and distribution in commerce of materials containing any detectable PCBs in 1984 (Erickson, 1997).

Although PCBs uses have been phased out since the ban, large quantities have remained in use, and some PCBs are still in use today (Table 3). Therefore, the potential for continued PCBs release to the environment remains. It is not known how much unreported PCBs are still being used today nor how much were used in the past in a manner such that they could be currently released to the environment.

Table 3-Self Reporting of PCBs Uses in the Bay Area (1999)

4.1 Chemical Structure

PCBs are a family of chlorinated organic compounds formed by two benzene rings linked by a single carbon-carbon bond (Figure 3). Various degrees of substitution of chlorine atoms for hydrogen are possible on the remaining 10 benzene carbons. There are 209 possible arrangements of chlorine atoms on the biphenyl group. Each individual arrangement or compound is called a congener. Groups of congeners with the same number of chlorine atoms are called homologs. Thirteen of the 209 congeners are known to show toxic responses similar to those caused by 2,3,7,8 tetrachlorodibenzo-p-dioxin (TCDD), the most toxic dioxin compound (Van den Berg et al, 1998).

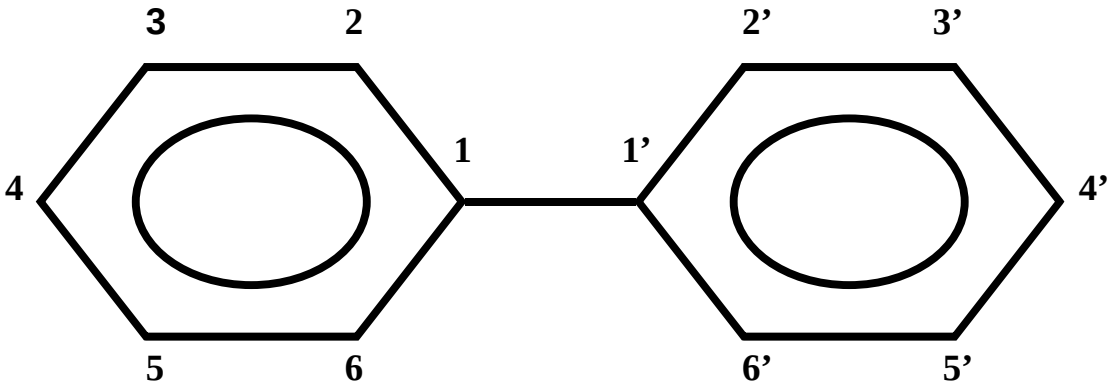

Figure 3-Structure of PCB Molecule

PCBs were mainly marketed as Aroclors in the United States. Aroclors are mixtures of congeners with varying numbers of chlorine atoms (Table 4). Aroclors were the most abundant PCBs mixtures manufactured and used in the United States. The numbering scheme for Aroclors is based on their structure and mixture: the first two digits represent the number of carbon atoms (12) while the second two numbers denote the percent chlorine by weight. Aroclor 1016 is an exception and has a chlorine weight content of 40 to 42 percent (ATSDR, 2000).

Table 4-Percentage of PCB Homolog in Aroclors

Homolog	Aroclor						
	1016	1221	1232	1242	1248	1254	1260
Biphenyl		10					
Mono-CBs	2	50	26	1	--	--	--
Di-CBs	19	35	29	13	1	--	--

Nona-CBs	--	--	--	--	--	--	1
Deca-CBs	--	--	--	--	--	--	--

(ATSDR, 2000)

Although the congener compositions of manufactured Aroclors are known, the fate of the various congeners in the environment is not as well understood. Fate and stability of congeners vary with the degree and location of chlorination, making source identification of environmental PCBs difficult.

4.2 Chemical and Physical Properties

PCB congeners vary markedly in their chemical and physical properties depending on the degree and position of chlorination. Important properties such as non-flammability, low electrical conductivity, high thermal stability, and high boiling point, make PCBs highly stable and persistent in the environment. PCBs are also soluble in non-polar organic solvents and biological lipids, hence their tendency to bioaccumulate in living organisms.

PCBs are generally resistant to degradation, and are strongly resistant to acids and alkalis. PCBs have a low solubility, low volatility (small Henry's Law constant), and increasing affinity for organic matter (increasing log K_{ow}) with increasing chlorination (Table 5). Note that organic compounds with a log K_{ow} greater than 3.5 are considered to have a large potential to bioaccumulate (U.S. EPA, 1985). Biodegradation rates of PCBs also vary greatly depending on the degree and location of chlorination, and redox conditions (ATSDR, 2000).

PCB congeners exhibit of range of properties, which affect their fate and residence time in the environment. Solubility of PCBs in water generally decreases with increased chlorination (Table 5). PCBs adsorption to sediment, denoted by increasing K_{ow}, generally increases with increasing degree of chlorination (Table 6) or increasing sediment organic carbon concentration (ATDSR, 2000). PCBs in aquatic systems are therefore usually found in much greater mass in the sediments than in the water column. Increasing log K_{ow} is accompanied by an increase in the tendency to bioaccumulate in aquatic organisms. Bioconcentration factor (BCF) increases a thousand-fold when going from monochlorobiphenyl to decachlorobiphenyl. Evaporation rates decrease with increasing degree of chlorination (Table 6). In general, the lower chlorinated PCB congeners are removed faster from the aquatic environment than the more chlorinated PCBs as the lower chlorinated congeners are not sorbed as strongly to sediments and are more readily volatilized.

Table 5-Selected Properties of PCBs as Aroclors

Aroclor	Density (g/cm^3)	Solubility (mg/L)	Log K_{ow}	Henry's Law Constant ($atm\text{-}m^3/mole$)
1016	1.37	0.42	5.6	2.9×10^{-4}

(Erickson, 1997)

The biggest reservoir of PCBs in aquatic systems is sediments rather than the water column. As the tendency of PCBs to adsorb to sediments increases with increasing log K_{ow}, their persistence in surface waters increases. This property enhances the importance of bottom-dwelling organisms in the food-web transfer of PCBs. This is also the case for decreasing water solubility and decreasing volatility (decreasing vapor pressure). Many physical and chemical factors affect this persistence and transfer, ultimately limiting our ability to predict the fate and transport of PCBs in aquatic environments.

4.3 Production and Uses

PCBs were produced in very large quantities both within and outside the United States. Although their uses in capacitors and transformers are well known, PCBs were used in a wide variety of applications including some involving direct contact with the environment.

Production

In the United States, commercial PCBs production started in 1929 and continued until 1977 (ATSDR, 2000). The estimated total commercial production of PCBs in the United States ranged from 610 million to 635 million kilograms (kg). Most of domestic uses of PCBs were Aroclors produced in the U.S. with only 1.4 million kg of PCBs imported. U.S. production peaked in 1970 at 39 million kg.

PCBs mixtures were manufactured in other countries under many different trade names; these include Clophen (Germany), Fenclor (Italy), Kaneclor (Japan), Sovol (former USSR) and Phenoclor (France). Fenchlor DK is a product of interest as it is comprised solely of decachlorinated biphenyl (Congener #209) and was used in investment casting (Erickson, 1997).

The Monsanto Chemical Company produced approximately 99 percent of PCBs used by U.S. industry. Prior to ceasing production, up to 200,000 kgs of PCBs products per year were imported into the U.S. (ATSDR, 2000). Importation of PCBs continued after U.S. production was banned until January 1, 1979. However, U.S. EPA permitted 16 companies that filed exemption petitions to continue to import and use PCBs after the ban on importation.

Between 1957 and 1977, 52 percent of the Aroclors produced consisted of Aroclor 1242 and 13 percent were its replacement, Aroclor 1016 (Table 7). Aroclor 1016 production was started in 1970, as it was believed to be less harmful to the environment than Aroclor 1242 (Erickson, 1997). Although frequently reported in environmental samples, the more chlorinated Aroclors 1248, 1254 and 1260 comprised only 7, 16 and 11 percent of the PCBs mixtures produced. This high frequency of detection of more chlorinated PCBs may be due to the preferential loss of lower chlorinated PCB congeners from the environment.

Table 7-Relative Production of Aroclors in the United States (1957-1977)

PCBs Mixture	Percent of Production
Aroclor 1016	13
Aroclor 1221	1
Aroclor 1232	<1
Aroclor 1242	52
Aroclor 1248	7
Aroclor 1254	16
Aroclor 1260	11
Aroclor 1262	1
Aroclor 1268	<1

(U.S. EPA, 1996)

Use

PCBs mixtures were most commonly used as dielectric fluid in electrical equipment such as transformers and capacitors (EIP, 1997). PCBs uses can be divided into three different categories: completely closed systems (electrical equipment such as capacitors and transformers), nominally closed systems (e.g., vacuum pumps and hydraulic transfer systems), and open-ended applications (e.g., paints, adhesives, pesticide extenders, inks, and plasticizers). In addition, PCBs had a vast number of other uses, through their inclusion as components in products such as building materials (paints, caulks and sealants), greases, oils, carbonless copy paper, and as ballast in fluorescent lights (Table 8). For example, PCB-containing paints and building sealants were used extensively at Department of Defense (DOD) and Department of Energy (DOE) facilities (U.S. Navy, 2006a; Poland et al., 2001). PCBs have also been detected in up to half the paints and sealants of buildings constructed between 1950 and 1980 in Switzerland (Kohler et al., 2005), Sweden (Astebro et al., 2000), and Australia (CFEMU no date). Based on the results of these studies, PCBs removal programs from building materials have been implemented in these countries. PCBs have been used and are still in use in non-liquid forms in building materials (U.S. EPA, 1999a), including as aquatic paints in fish hatcheries (WDEC, 2006; Cornwall, 2005). However, the extent of PCB-containing materials use in Bay area buildings, as well as the potential of these materials to be released and transported to the Bay, has not been determined.

Prior to 1974, PCBs were used in both closed and open-ended applications. After 1974, open-ended uses of PCBs mixtures were discontinued. One exception was the use of PCBs 209 (decachlorobiphenyl) as filler for investment casting waxes. About 200 tons of PCBs were imported from France and Italy for this use in 1974. The production of PCBs-containing capacitors and transformers ended in January 1979. The life expectancy of transformers and

capacitors is decades. In-place capacitors and transformers may still remain significant potential sources of PCBs to the environment. U.S. EPA maintains a database of current volumes of PCBs used in the United States. The database only contains uses that have been reported voluntarily. A query of this U.S. EPA database showed significant ongoing use, almost 200,000 kg, in the San Francisco Bay Area (Table 3).

PCBs industrial use and manufacture has created on-land and in-Bay contaminated area in the San Francisco region. Remediation and control of PCBs releases from these sites may be necessary to restore the Bay's beneficial uses. In addition, the role of widespread open-ended PCBs uses needs to be addressed to ensure that the implementation actions are successful.

Table 8-Selected List of PCBs Uses

Category	Use
Electrical Uses	Transformers and Capacitors
	Voltage Regulator (power lines)
	Starting Aid (single phase motors)
	Power Factor Correction (rectifier, AC induction motor, furnaces)
	Consumer Electrical Items (refrigerators, televisions, washing machines)
	Water Well Pumps
	Lamp Ballast (fluorescent, high intensity discharge)
	Switch Gear
	Manufacturing Machinery (capacitors, transformers, associated switchgear)
	PCB Contaminated Mineral Oils (transformer changeout)
Non-Electrical Uses	Printing Inks and Pastes
	Carbonless Copy Paper
	Pumps
	Hydraulic Fluids
	Heat Transfer Fluids
	Flame Retardant
	Air Compressor Lubricants
	Plasticizer in paints, resins, synthetic rubber, surface coatings, wax, sealants, waterproofing compound, glues and adhesives
	Pesticides (as extenders)
	Cutting Oil (microscope slide oil)
PCB Contaminated Solids	Wiping Rags
	Safety Equipment
	Machinery
	Soil, Gravel, Asphalt, Sediment

(EIP, 1997)

Disposal

U.S. EPA first promulgated rules in 1978 specifying that liquids containing >0.05 percent (500 mg/kg) PCBs could only be disposed of by incineration in specially permitted facilities, and all non-liquid PCBs mixtures >0.05 percent could only be disposed in specially permitted landfills. In 1979, the regulated PCBs content was lowered to 0.005 percent, or 50 mg/kg. Regulations did not apply to disposal of PCBs dielectric fluid in small capacitors (<3 lbs.) commonly found in fluorescent light ballasts due to the impracticality of regulating the one billion ballasts installed in

fluorescent light fixtures throughout the U.S. Disposal and management of PCBs is further regulated under the Resource Conservation and Recovery Act (RCRA). The Clean Water Act (CWA) regulates the discharge of PCBs-laden wastewater into U.S. waters.

4.4 Quantitation

Historically, PCBs have been quantified as Aroclor mixtures by comparing environmental samples to pure unweathered Aroclor standards. This method's ability to correctly quantify PCBs has been questioned (U.S. EPA, 1996), due to the changes (weathering) Aroclor mixtures undergo in the environment. Analytical methods are now being used to quantify individual PCB congeners (Erickson, 1997). These new methods for quantifying PCB congeners in soils and tissue matrices are performed on a relatively routine basis. Low-level analysis of PCB congeners in water at detection limits that allow comparison to U.S. EPA criterion are still non-routine, can have poor precision, and are relatively expensive.

U.S. EPA established the PCBs water quality criterion for the protection of aquatic life based on the sum of Aroclors, and for the protection of human health based on total PCBs, e.g., the sum of all congeners, or isomers or homologs or Aroclor analyses (U.S. EPA, 2000b). In order to utilize all readily available data, in this report we define total PCBs as any of the following:

- Sum of Aroclors;
- Sum of the individual congeners routinely quantified by the Regional Monitoring Program (RMP) or a similar congener sum; or
- Sum of the National Oceanic and Atmospheric Administration (NOAA) 18 congeners converted to total Aroclors (NOAA, 1993). A comparison of the sum of 18 NOAA congeners converted to Aroclor with quantified sums of Aroclors shows relatively good correlation (Figure 4) in one study.

This is a broad designation of total PCBs that can introduce data comparability issues. However, for the purpose of estimating PCBs loads, sources and reservoirs, the introduced error will likely be small compared to the range of PCBs concentrations found in the Bay. PCBs concentrations in Bay sediments commonly vary by three to four orders of magnitude: Bay ambient sediments have about 4.6 micrograms per kilogram (µg/kg) PCBs, while areas considered contaminated can have PCBs concentrations ranging from 1,000-10,000 µg/kg and up. In addition, PCBs concentrations in sources, reservoirs and biota vary by several orders of magnitude in the Bay. Therefore, the use of data, obtained by different methodologies, is justifiable for the purpose of this report. Where possible, water PCBs concentrations were quantified using similar analytical methods, permitting better data comparability.

All data collected for the development of this TMDL are congener based. We recommend that ongoing PCBs data collection activities in the Bay analyze for a suite of congeners. Specifically, Regional Board staff promotes the analysis of a congener list comparable to that quantified by the RMP to facilitate data comparability for long-term trend analysis. Typically, PCBs are measured as Aroclors using U.S. EPA method 8082 or U.S. EPA method 608 for wastewater. These are routine, relatively inexpensive, methods employed by most laboratories. However, the reporting limits for sediments (about 20 µg/kg) and water (about 0.5 µg/L) with these methods are significantly greater than current ambient concentrations in the Bay and discharged wastewater. In the last few years, more laboratories have started using U.S. EPA method 1668 for the analysis of PCBs in sediment and water. Using this method, reporting limits achieved for

sediment (50 ng/kg) and water (100 pg/L) have environmental significance. Therefore we use method 1668 for the monitoring of ambient conditions in San Francisco Bay.

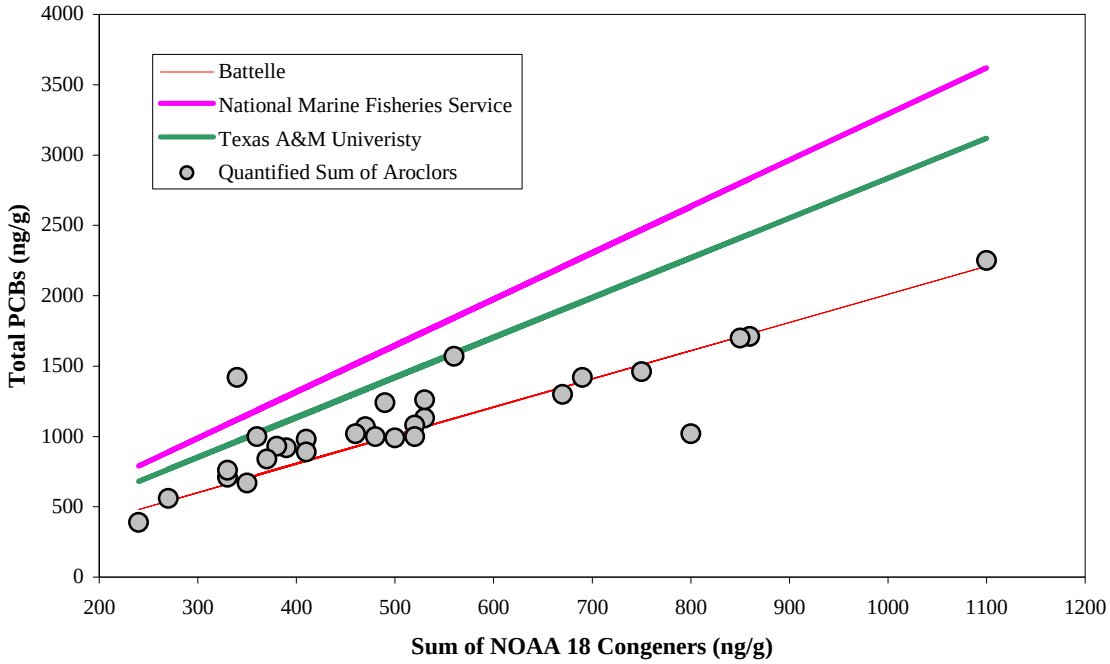

Figure 4-Correlation of PCBs Quantified as Aroclors and Aroclors Calculated from Congener Data (data from SFPUC, 2002)
Regression Line Represents each Organizations Respective Methodology for Quantifying Total Aroclors from Congener Data.

5. Applicable Water Quality Standards

Section 303(d) of the Clean Water Act requires the State of California to identify waters not meeting water quality standards. Water quality standards consist of three parts: beneficial uses, water quality objectives, and antidegradation.

> **Designated or Beneficial Use** - A specific desired use appropriate to the waterbody, termed a *designated use* (beneficial use in California). A beneficial use describes the goal of the water quality standard. It is stated in a written, qualitative form, but the description is as specific as possible.
>
> **Water Quality Criterion or Objective** - A *criterion* that can be measured to establish whether the designated use is being achieved (objective in California). A water quality criterion or objective represents the condition of the waterbody that supports a designated use. The designated or beneficial use is a description of a desired endpoint for the waterbody, and the criterion or objective is a measurable or narrative indicator that is a surrogate for determining attainment of the beneficial use.
>
> **Antidegradation Policy** - An antidegradation policy (under both Federal and California regulations) ensuring that water quality will be maintained at a level protecting beneficial uses.

The beneficial use impaired by PCBs in the Bay is described as follows:

> **Ocean, commercial, and sport fishing (COMM)**
> *Uses of water for commercial or recreational collection of fish, shellfish, or other organisms in oceans, bays, and estuaries, including, but not limited to, uses involving organisms intended for human consumption or bait purposes.*

The applicable water quality objectives include the narrative objective for bioaccumulative substances in San Francisco Bay. This narrative objective states: “Many pollutants can accumulate on particles, in sediment, or bioaccumulate in fish and other aquatic organisms. Controllable water quality factors shall not cause a detrimental increase in toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered.” This narrative water quality objective is applicable to both total PCBs and dioxin-like PCBs.

Two applicable numeric water quality standards for total PCBs are promulgated at 40 Code of Federal Regulation Section 131.38, also known as the California Toxics Rule (CTR). These standards include the saltwater criterion continuous concentration (CCC) of 30 nanograms per liter (ng/L) for the protection of aquatic life and its uses from chronic toxicity, and the human health criterion of 170 picograms per liter (pg/L) for the protection from consumption of aquatic organisms. These criteria apply to total PCBs, defined as the sum of all Aroclors, or all congeners or homologs or isomers, and were derived to protect against adverse effects due to PCBs in water. PCBs concentration in the Bay waters are generally below the CCC water quality standard, indicating that current conditions are protective of aquatic life from chronic toxicity. We therefore propose to use the more protective human health criterion as the applicable water quality standard for the PCBs TMDL. This criterion was derived to protect the general population from an increased risk of no more than one in a million. This criterion was

developed using a bioconcentration factor (BCF) approach with an upper bound potency factor reflective of high risk and persistence. However, in the development of this criterion it is explicitly recognized that it is not as protective of sub-populations that consume greater quantities of fish than the general population, and that subsistence fish consumers may only be protected from an increased risk of one in ten thousand. The CTR does not promulgate a separate numeric water quality criterion for dioxin-like PCBs.

Both the narrative and numeric water quality objectives are intended to protect beneficial uses related to human health (COMM). The narrative water quality objective is also intended to protect wildlife beneficial uses of the Bay, including:

Estuarine habitat (EST)
Uses of water that support estuarine ecosystems, including, but not limited to, preservation or enhancement of estuarine habitats, vegetation, fish, shellfish, or wildlife (e.g., estuarine mammals, waterfowl, shorebirds), and the propagation, sustenance, and migration of estuarine organisms.

Preservation of rare and endangered species (RARE)
Uses of waters that support habitats necessary for the survival and successful maintenance of plant and animal species established under state and federal law as rare, threatened or endangered.

Wildlife habitat (WILD)
Uses of water that support wildlife habitats, including, but not limited to, the preservation and enhancement of vegetation and prey species used by wildlife, such as waterfowl.

6. Impairment Assessment

All segments of San Francisco Bay were placed on the 303(d) list for PCBs due to an interim health advisory for fish consumption. The advisory was based on elevated PCBs concentrations in fish tissue collected in 1994 that may cause a detrimental human health effect for people consuming fish caught in the Bay. Follow-up studies in 1997 and 2000 confirmed the presence of PCBs in Bay fish tissue at concentrations that may be harmful to fish consumers. As such, the narrative water quality objective for bioaccumulative substances that is protective of these beneficial uses is not attained. This is also deemed impairment of COMM beneficial uses with regards to commercial and sport fishing in the Bay, and of EST, RARE and WILD with regards to bioaccumulation.

Consumption of PCBs-contaminated fish is considered a primary source of human exposure in locations where fish consumption (i.e. sports and subsistence fishing) and PCBs contamination are significant. A related probable exposed population is breast-fed children whose mothers consume PCBs-contaminated fish. The evaluation of the health effects of PCBs mixtures is complicated by their complex congener composition (ATSDR, 2000). There is evidence that PCB-health risks increase with increased chlorination because more highly chlorinated PCBs are retained more efficiently in fatty tissues (U.S. EPA, 1997a). Observed effects in humans have ranged from mild reactions to serious health consequences. However, individual PCB congeners have widely varying potencies for producing a variety of adverse biological effects including hepatotoxicity, developmental toxicity, immunotoxicity, neurotoxicity, and carcinogenicity.

PCBs mixtures have been classified as probable human carcinogens (U.S. EPA, 1997a). This is based on studies that have found liver tumors in rats exposed to Aroclors 1260, 1254, 1242, and 1016. Evaluation of the animal data indicates that PCBs with 54 percent chlorine content induces a higher yield of liver tumors in rats than other PCBs mixtures (ATSDR, 2000).

The CTR numerical criterion was derived for the protection of human health from the consumption of aquatic organisms, and as such exceedances of this criterion result in the impairment of the COMM beneficial uses. However, evidence that wildlife may be affected by PCBs exists as bird egg PCBs concentrations that have been measured at levels near the effects threshold (Schwarzbach et al., 2001).

The following sections present the data used to evaluate PCBs impairment of beneficial uses of the Bay. A review of readily available PCBs concentration data for benthic organisms and fish tissue is included, as well as water column PCBs concentrations.

6.1 Benthic Organisms

Several agencies use bivalves to measure the presence of bioaccumulative substances in the water column (NOAA, 1993; Stephenson et al., 1995). Because bivalves integrate water column concentrations of bioaccumulative substances over time, they are useful in identifying geographical areas needing further investigation.

The California Department of Fish and Game (CDFG) initiated the California Mussel Watch Program to measure bioaccumulation in bivalves placed at specific locations throughout the Bay. The long-term bivalve data shows a significant decrease of PCBs concentration in mussels deployed off Point Pinole and Treasure Island between 1977 and 1992 (Stephenson et al., 1995). The bivalve deployment program was continued and expanded by the RMP. RMP data

indicate a continued decrease in PCBs concentration in bivalves placed near Yerba Buena Island from 1980 to 1996 (Gunther et al., 1999).

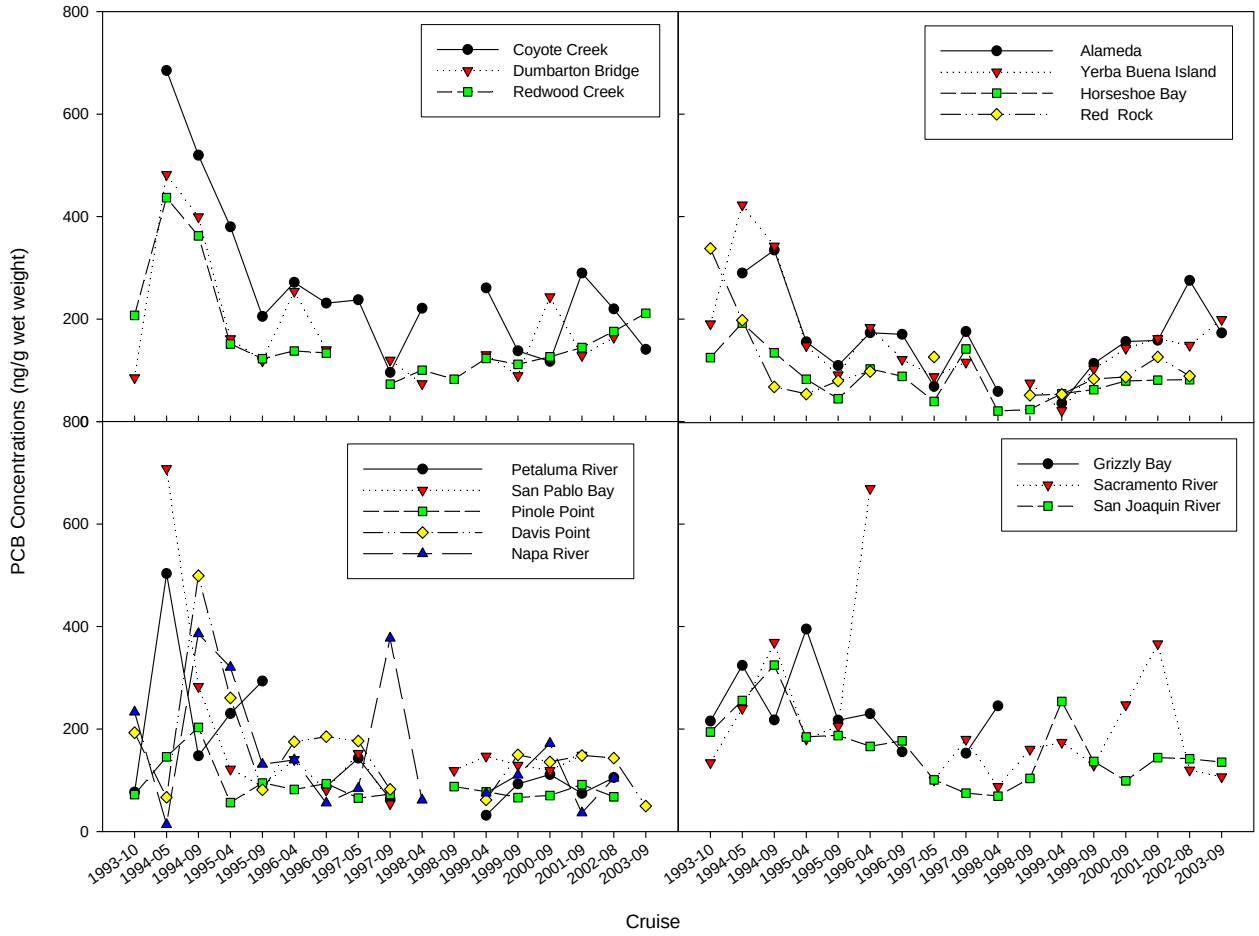

Figure 5-PCBs in Bivalves Deployed in San Francisco Bay (1993-2003)

(http://www.swrcb.ca.gov/programs/smw/index.html and http://www.sfei.org)

Over time, the frequency of deployed bivalves with tissue PCBs concentration less than the screening level of 70 nanograms per gram (ng/g) dry-weight (SFEI, 2000a) has increased (Figure 5), indicating potential improvement of the Bay relative to PCBs. Interpretation of bivalve data is limited, however, due to changing analytical procedures over time.

PCBs tissue concentrations of intertidal benthic organisms have been measured at concentrations up to 700 ng/g wet weight (PRC, 1996) near Hunter's Point Shipyard. Unfortunately, this study combined all species collected within an area and did not measure PCBs concentrations in collocated sediments. Note, however, that the maximum tissue concentration is much greater than the currently used level of concerns for fish tissue and for deployed bivalves. In a subsequent investigation at Hunter's Point Shipyard, PCBs concentrations up to 13,000 ng/g dry weight were measured in polychaete worm tissue collected in the South Basin (U.S. Navy, 2005). The biota were collected at a known PCBs-

contaminated sites in the Bay where sediment PCBs concentrations are several orders of magnitude greater than those in ambient sediments.

PCBs concentrations seem to be declining over time in deployed bivalves, but are still measured at concentrations causing concern. Other benthic organisms, collected at contaminated sites, are often orders of magnitude greater than the screening level, and could be significant sources of PCBs to fish in the Bay.

6.2 Fish Tissue Studies

In 1994, fish were collected throughout the Bay and analyzed for a suite of contaminants including PCBs (SF RWQCB, 1995). All fish species collected in the 1994 study had tissue PCBs concentrations exceeding the calculated screening level of 3 ng/g wet weight (SF RWQCB, 1995). Based on these PCBs concentrations, as well as elevated concentrations of other contaminants, measured in this fish study, the Office of Environmental Health Hazard Assessment (OEHHA) issued an interim fish consumption advisory for all of San Francisco Bay (OEHHA, 1994). The OEHHA advisory is listed as interim because more information is needed about PCBs (and other contaminants) concentrations in fish in San Francisco Bay and fish PCBs concentrations that are protective of human health. Note that nationwide, there are 873 advisory listings for PCBs in surface water (U.S. EPA, 2005). OEHHA is currently reviewing this interim health advisory (OEHHA, 1999). This review includes consideration of newly collected Bay fish PCBs concentration data (SFEI, 1999a; Greenfield et al., 2003; Davis et al., 2006). OEHHA will also be considering survey results of San Francisco Bay sport fish consumers and their level of fish consumption (SFEI, 2000a).

In 1997 and 2000, the RMP collected and analyzed Bay fish for contaminant concentrations (Greenfield et al., 2003; SFEI, 1999b, Davis et al., 2006). As part of these studies, the screening level for fish tissue PCBs concentration was recalculated based on an updated cancer slope factor of 2 (U.S. EPA, 1997a); the resulting screening level was 23 ng/g wet-weight (SF RWQCB, 1995). We recalculated this screening level using local fish consumption habits (SFEI, 2000a). We used a 95th percentile upper bound estimate of the local consumption rate for fish-consuming anglers of 32 grams fish per day rather than a consumption rate for the general population of the Bay area which would be smaller. This conservative estimate constitutes, in effect, a margin of safety for the TMDL, implicitly recognizing the long-term goal of increasing the viability of fish consumption and commercial harvest from the Bay. The screening level is calculated as follows:

$$SVc = \left[\left(RL / CSF\right) * BW\right] / CR \qquad \textit{(Equation 1)}$$

where,

SVc = Screening value for a carcinogen in mg/kg
RL = Maximum acceptable risk level, 10^{-5} or one in 100,000
CSF = Oral cancer slope factor, upper bound estimate is 2 $(mg/kg\text{-}day)^{-1}$
BW = Mean body weight of the population (70 kg)
CR = Fish consumption rate by all consumers based on a four-week recall, 32 g/day

The calculated screening level is 10 ng/g wet-weight. This screening level applies directly to the attainment of the COMM beneficial uses. As will be discussed in Section 9.1, this screening level is equivalent to a sediment PCBs concentration of 1 ng/g. The screening level is therefore

also be protective of the EST, RARE, and WILD beneficial uses as U.S. EPA (1997b) calculated a screening level for the protection of wildlife of 160 ng/g PCBs in sediment. Using the same method and assumptions, a dioxin toxic equivalent (TEQ) screening level of 0.14 pg/g dioxin is calculated for PCBs with dioxin-like properties.

Fish tissue PCBs concentrations in all white croaker and shiner perch exceeded the screening level by an order of magnitude in the four years for which data were collected (Figure 6). Three other fish species had a high frequency of screening level exceedances: sturgeon, jacksmelt and striped bass. Two other species' contaminant concentrations had a low frequency of screening level exceedances: halibut and leopard shark. In shiner surfperch and white croaker, PCBs tissue concentrations are noticeably more elevated than in the other fish species, in large part due to the higher lipid content of these fish (SFEI, 1999b).

Regional differences in fish tissue PCBs concentrations are noticeable, especially in the 1997 data. In the 1997 data, elevated fish tissue PCBs concentrations are noticeable in the Oakland inner harbor for the three fish species shown in Figure 7: jacksmelt, surfperch and white croaker. This is not unexpected as several contaminated sites are located in the Oakland inner harbor (Batelle, 1988; BPTCP, 1998). In 2000, elevated PCBs concentrations are also noticeable for surfperch in the Oakland inner harbor as well as in San Leandro Bay, another area known to have elevated sediment PCBs concentrations (Daum et al., 2000). Elevated fish tissue concentrations in certain locations may reflect a localized diet of benthic organisms residing in contaminated sediments.

PCBs concentrations in white croaker tissue collected in the Oakland Inner Harbor showed a seasonal trend (Figure 8) with higher concentrations in summer and fall and lower concentrations in winter and spring (Greenfield et al., 2003). The trend was correlated with lipid content of the white croaker, and a relation of PCBs concentrations with reproductive activity has been hypothesized (Greenfield et al., 2003). Based on these results, we consider that relying on white croaker PCBs data collected in summer is adequate for long-term trend monitoring as it reflects the season with the higher PCBs concentrations in fish. This seasonal trend will need to be verified for other fish species of concern.

Long-term trends indicate that PCBs tissue concentrations have decreased in shiner surfperch since 1965 (Risebrough, 1995). Unfortunately, data limitations make it difficult to resolve more recent trends of fish tissue PCBs concentrations. For white sturgeon, there does not appear to be a decrease in PCBs concentrations over the last 20 years (Greenfield et al., 2003).

A possible approach for estimating the risk from environmental exposure to PCBs is to use the toxic equivalency factor (TEF) method (ATSDR, 2000). This approach looks at the potency of PCBs mixtures by comparing the toxicity of a individual dioxin-like PCB congener relative to that of 2,3,7,8-tetrachlorodibenzop-dioxin (2,3,7,8-TCDD), the most toxic and studied of the dioxins. Toxicity is calculated as the ratio of the individual PCB congener to that of 2,3,7,8 TCDD that is given a toxicity of 1 (Ahlborg et al., 1994). The contribution of each congener to dioxin-like toxicity (Table 9) is calculated by multiplying their environmental concentrations by its toxic equivalent factor (TEF) and summing to get a dioxin toxic equivalent (TEQ).

A fish tissue screening value for TEQ of 0.14 pg/g was calculated using the same methodology as that for total PCBs. That is, we used the same equation with the same values for risk level, body weight, and fish consumption rates. However, we used a cancer slope factor of 156,000, specific to dioxin-like PCBs (U.S. EPA, 2000d). In some cases, the TEQ was calculated using

only three PCB congeners, numbers 77, 126 and 169. However the TEQ from these three congeners usually comprises more than 80 percent of the TEQ from all PCB congeners with dioxin like toxicity. The screening value is exceeded in shiner surfperch, striped bass and white croaker (Figure 9).

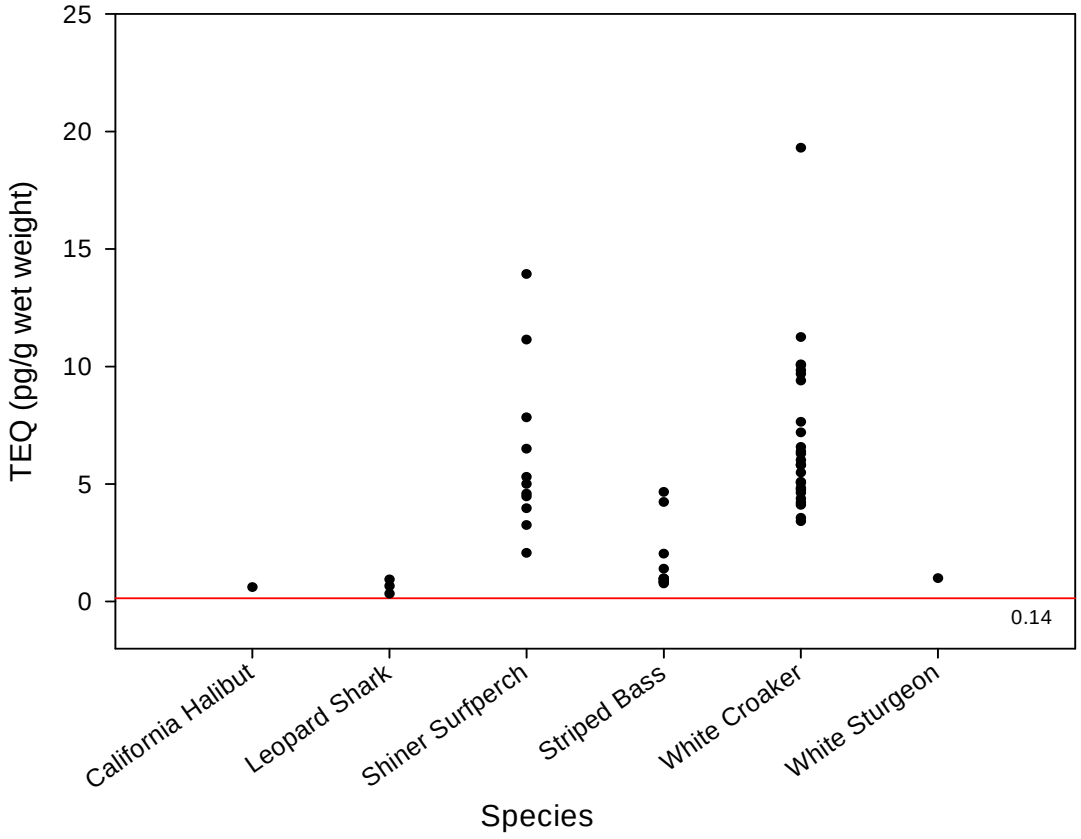

Figure 9- PCB Dioxin Toxic Equivalent (pg/g) in Selected San Francisco Bay Fish (1994, 1997, 2000) (source www.sfei.org)

6.3 Aqueous PCBs concentrations

As previously discussed, U.S. EPA has promulgated a water quality criterion for total PCBs of 170 pg/L (U.S. EPA, 2000b). Over a nine-year period of monitoring at San Francisco Bay monitoring stations (Figure 10), the PCBs water quality criterion was almost always exceeded (Figure 11; Figure 12). In the South Bay and the mouth of the Petaluma River, the water quality criterion was exceeded in 100 percent of the samples. Samples from all other in-Bay RMP sampling locations exceeded the criterion nearly 100 percent of the time. There are no apparent increasing or decreasing trends in water column PCBs concentrations over this time period, so the Bay can be considered at steady state with respect to PCBs concentrations.

The San Joaquin and Sacramento River monitoring stations did not exceed the criterion as often than those in-Bay locations. The criterion was exceeded fewer than 50 percent of the time at only one monitoring station: the Golden Gate located outside the Bay. Elevated in-Bay water column PCBs concentrations can therefore be attributed to Bay Area sources, whether from ongoing discharge of PCBs to the Bay or remobilization of PCBs already in Bay sediments.

There is a high frequency of water column exceedances of the PCBs water quality criterion. Yet, as was discussed in sections 6.1 and 6.2, benthic organisms and fish have elevated PCBs in

areas where sediments also have elevated PCBs concentrations. In order to lower the fish tissue PCBs concentrations to the screening level, the TMDL focuses on PCBs in sediments.

7. Reservoirs, Sources and Loads, and Movement of PCBs

Since the onset of production in 1929, PCBs have been introduced to the environment through land disposal (legal and illegal), accidental spills and leaks, incineration of PCBs or other organic materials in the presence of chlorine, pesticide applications, surface coatings such as paints and caulks, and wastewater discharge. Diffusion of PCBs from localized areas with high PCBs concentrations has resulted in widespread low-level background concentrations across the globe (Erickson, 1997).

In the following sections, we present our understanding of PCBs distribution in the Bay, along with estimates of sources and loads. We have assessed current PCBs mass in the water column and sediments, as well as the loads from direct atmospheric deposition, Central Valley watershed inputs, municipal and industrial wastewaters, and stormwater runoff to the Bay. We also present our understanding of in-Bay PCB-contaminated sites, but can not estimate their role as sources to the water column and biota.

7.1 Environmental Reservoirs

Due to potentially large historical releases of PCBs to the Bay, an estimate of PCBs reservoirs is needed to put current PCBs loads in perspective. Two environmental reservoirs of PCBs exist in the Bay: the water column and the sediments. As discussed below, the mass of PCBs in sediments is much greater than in the water column. However, it is important to note that a numeric criterion exists for water but not for sediments. This is important since the potential for sediments to be resuspended and supply PCBs to the water column is significant, as well as the ability for sediment to supply PCBs directly to biota.

Water Column

SFEI (2007) calculated a Bay-wide PCBs concentration of 430 pg/L from RMP data collected between 2002 and 2006. Based on this water column concentration and a water volume of 5,500 million m^3 for the Bay, they estimate a PCBs mass of 2.4 kg in the water column (SFEI, 2007).

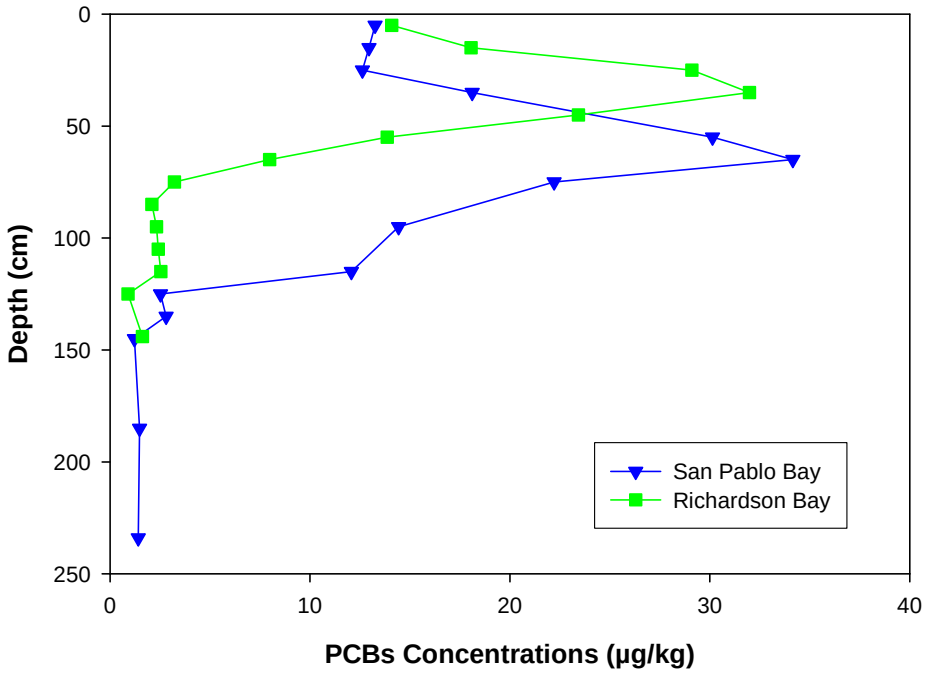

Figure 13-PCBs Concentrations with Depth in Sediments from Two North Bay Locations (USGS, 1999)

Sediments

For the purposes of this report, we separated Bay sediments into two categories: ambient and contaminated. Sediments considered ambient are from locations distant from known sources of contamination and have PCBs concentrations that cannot be statistically differentiated from other sediments collected in similar environments. Sediments considered representative of contamination are usually located near-shore, close to potential sources of contamination and have concentrations often several orders of magnitude greater than ambient sediments.

In 1992, the United States Geological Survey (USGS) collected ambient sediment cores in Richardson Bay and San Pablo Bay (Fuller et al., 1999). Radioisotopes were used to determine deposition chronologies of the sediments, which were compared to the chemical concentrations as a function of depth. PCBs concentrations were relatively constant to a depth of 25 to 50 centimeters (cm), corresponding to deposition since the early 1980s. A sharp increase in PCBs concentrations was observed below those depths, with maximum concentrations corresponding to deposition in the 1970s (Figure 13).

Total masses of PCBs per unit area for the entire depth of the cores were calculated to be 1,400 nanograms per square centimeter (ng/cm^2) and 4,100 ng/cm^2 for Richardson Bay and San Pablo Bay respectively (Venkatesan et al., 1999). Extrapolating the core results to the entire Bay, we estimate based on an estimated surface area of 1,285 km^2 that the total PCBs mass in ambient sediments ranges from 18,000 to 52,000 kg (Table 10). This range is based on the results from sediment cores collected far from known on-land PCBs use areas, and may under-represent total PCBs in the Bay. Yet, sediments represent a PCBs reservoir four to five orders of magnitude larger than the 2.4 kg in the water column.

Table 10-Estimated Total PCBs Mass in Bay Sediments Based on USGS Core Data

Location	Depth (m)	Total PCBs (ng/cm2)	Total PCBs in Estuary (kg)
Richardson Bay	0.75	1,391	18,000
San Pablo Bay	1.25	4,069	52,000

Alternatively, the total mass of PCBs in ambient sediments can be estimated using the mean concentration of PCBs in sediments of 4.6 μg/kg (SFEI, 2007). Again using an area of 1,285 km^2 for the Bay and a depth of 1 meter to cover the depth to which PCBs are usually found. Assuming that Bay sediments are 55 percent solid by weight (range from 40 to 80%), we can estimate total PCBs in sediments. Sediment volumes are converted to sediment dry mass as follows:

$$M_s = \frac{(x\rho_w)}{\left[1 + x\left(\rho_w / \rho_s - 1\right)\right]} V_t \qquad \textit{(Equation 2)}$$

where,

M_s = the dry mass of sediments in kg,
x = the percent solid per unit mass sediment,
ρ_w = the density of water (1kg/L),
ρ_s = the particle density of sediments (2.65 kg/L for aluminosilicates),
and V_t = the volume of sediments.

The dry mass of sediment is then converted to PCBs mass for a range of sediment PCBs concentrations. This gives an estimate of 4,300 kg of total PCBs in ambient sediments of the Bay (Table 11), which is lower than the results based on the USGS cores (Table 10).

There are specific in-Bay locations where sediment PCBs concentrations are much higher than in the rest of the Bay (BPTCP, 1998) that we refer to as PCBs-contaminated sites. Data were collected at these sites (Table 12, Figure 14) to satisfy different regulatory requirements, and are therefore not readily comparable. For example, sampling densities and methods often vary between regulatory programs. Several of the sites (e.g. Cerrito Creek) were identified under the Bay Protection and Toxic Clean-up Program (BPTCP) and the sampling consists of one or a few surface grab samples. The Vallejo Ferry terminal site was identified during sampling and analysis for a dredging project and corresponds to one composite sample collected from several deep cores. Hunters Point Shipyard and Seaplane Lagoon at the Alameda Naval Air Station are Superfund sites regulated under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). They have a much higher sampling density than most other sediment sites in the Bay. Other sites were investigated as part of scientific studies, such as in San Leandro Bay, or remedial investigations of on-land contaminated sites, such as the Emeryville crescent. At the Oyster Point site, remedial actions have already been undertaken. Regardless of the differences in methodology used for collecting these data, the listed sites

have sediment PCBs concentrations several orders of magnitude greater than those considered ambient. These highly elevated PCBs concentrations could be contributing significant PCBs mass to the Bay's biota. PCBs concentrations in sediment dwelling biota can be correlated to PCBs concentrations in sediments (Figure 15). Potential contribution of PCBs to biota from these contaminated sediments needs to be further evaluated, and likely needs to be reduced to lower the fish tissue PCBs concentrations.

Table 11-Estimated Total PCBs Mass in Bay Sediments Based on Ambient PCBs Concentrations

Sediment PCB Concentrations (µg/kg)	SurfaceArea (km^2)	Depth (m)	Total PCBs (kg)
4.6	1,285	1	4,300
11	1,285	1	12,000
22	1,285	1	24,000
35	1,285	1	38,000

7.2 External Sources

As previously discussed, sediments are the largest PCBs reservoir in the Bay and may contribute significant PCBs mass to biota. However, these sediments correspond to only one pathway of PCBs loadings to the Bay. As part of developing this TMDL, all known and potential sources and loads of PCBs to the Bay must be considered. In this section, we present our current understanding of sources and estimates of the loads from the following sources:

- Direct atmospheric deposition
- Central Valley watershed (Sacramento and San Joaquin Rivers)
- Municipal and industrial wastewater discharges
- Runoff and local tributaries

Direct Atmospheric Deposition

PCBs have been detected in remote regions of the world, far from known areas of PCBs use, indicating that atmospheric movement and deposition of PCBs can be significant sources of PCBs to surface waters (Erickson, 1997). Conversely, PCBs can also be lost from surface waters to the atmosphere by volatilization. In some instances, loss of PCBs to the atmosphere can account for the largest removal of PCBs from surface water (Jeremiason et al., 1994).

Deposition of PCBs from the atmosphere occurs either directly to surface waters, or indirectly in the watershed. PCBs deposited in the watershed may then be transported to the Bay via stormwater runoff discharges. The San Francisco Estuary Institute (SFEI) has completed a study of the direct deposition of PCBs to the Bay from the atmosphere (SFEI, 2005; Tsai et al., 2002). Indirect contributions of PCBs to the Bay from the atmosphere were not quantified, but are included in the loadings estimates for urban and non-urban stormwater runoff. Direct PCBs loads to the Bay are estimated to be 0.5 kg/yr (SFEI, 2007), but loss to the atmosphere is estimated at 7.4 kg/yr resulting in a net loss (Table 13). However, PCBs loss from the Bay to the atmosphere is accounted for in the mass budget model and is quantified in the prediction of attainment of the target.

Table 13-Estimated PCBs Mass Associated with Dredge Material Disposal (2001-2005)

Disposal Site	Total Volume 2001-2005 (cu yd)	Average Volume (cu yd/yr)	Average Annual Estimated PCB Mass (kg/yr)
In-Bay Disposal	8,900,000	1,800,000	4.6
Ocean (SF-DODS) Disposal	3,800,000	760,000	-2.0
Upland/Wetland Reuse	8,100,000	1,600,000	-4.1
Net Loss			-6.1

These load estimates are small compared to load estimates for water bodies elsewhere in the United States and may need to be revised. However, it is very likely that loads to the Bay currently are, and have always been, much lower than loads to eastern United States water bodies due to regional wind patterns that typically come from the ocean pushing locally generated airborne PCBs inland and the fact that there have been historically lower uses of PCBs in the Bay area. Finally, it is recognized that water-atmosphere transfers have greatly declined over the last three decades.

Central Valley Watershed

PCBs concentrations in the Sacramento and San Joaquin rivers have been monitored by the RMP for over ten years. Based on the concentrations measured by the RMP, we had previously estimated that about 40 kg of PCBs entered the Bay each year from the Central Valley. More recently, PCBs loads entering the Bay from the Central Valley have been estimated for the years 2002 and 2003 (Leatherbarrow et al., 2005). Annual loads of PCBs were estimated at 6.0 ± 2.0 and 23 ± 18 kg for years 2002 and 2003, respectively. The load estimates are based on measured flow-weighted mean PCBs concentrations ranging from 200 to 6,700 pg/L with a median concentration of 600 pg/L. SFEI calculated annual PCBs mass loadings using Central Valley water discharge data at Mallard Island from the Department of Water Resources (Interagency Ecological Program) using a mass balance approach and the DAYFLOW model (SFEI, 2007). These annual load estimates may be at the lower end of the range of annual loads as these years were drier years with lower sediment inflow from the Central Valley (Leatherbarrow et al., 2005). For the TMDL, we are using the SFEI derived average load of 11 kg/yr, derived from five years of data, as the loading to the Bay from the Central Valley (SFEI, 2007).

Municipal and Industrial Wastewater Dischargers

There are a number of municipal and industrial wastewater discharges into San Francisco Bay (Figure 16 and Figure 17). Municipal wastewater discharges are located throughout the Bay (Figure 16), while the major industrial wastewater discharges take place in the north Bay segments (Figure 17) where ambient PCBs water concentrations are some of lowest in the Bay.

Municipal and industrial wastewater discharges to surface waters are controlled through waste discharge requirements issued as federal National Pollutant Discharge Elimination System (NPDES) permits. Selected municipal wastewater dischargers (Publicly Owned Treatment Works or POTWs) and petroleum refineries have quantified PCBs in their wastewaters using U.S. EPA method 1668 to achieve lower detection limits (SFEI, 2001b; 2002a; 2002b). Wastewaters from the POTWs with secondary treatment have an average PCBs concentration of 3,600 pg/L (Table 14), while wastewaters from POTWs with advanced treatment have an average PCBs concentration of 210 pg/L (Table 15). Wastewaters from petroleum refineries in the North Bay had an average PCBs concentration of 270 pg/L (Table 16), similar to that in the POTWs with advanced treatment, while other industrial wastewater dischargers had an average concentration of 1900 pg/L.

Using average daily flows from the POTWs and industries, including refineries, and the average PCBs concentrations in wastewaters from each category, we estimate that municipal and industrial wastewater discharges annually contribute 2.3 kg and 0.035 kg of PCBs to the Bay respectively.

Urban and non-Urban Stormwater Runoff

Municipal urban stormwater runoff management agencies measured sediment PCBs concentrations within their urban and non-urban stormwater runoff conveyance systems in the summers of 2000 and 2001 (ACCWP, 2001; ACCWP 2002a, ACCWP 2002b; KLI, 2001; KLI, 2002). The purpose of these studies was to determine whether PCBs are evenly distributed and discharged from stormwater conveyance systems or whether PCBs-contaminated sites exist within watersheds. These studies also attempted to evaluate whether runoff conveyances are sources of PCBs in themselves. The studies also examined whether specific locations within watersheds are contributing to ongoing PCBs discharge to the Bay via stormwater conveyance

systems due to historical or current activities at those locations. Finally, loads of PCBs from runoff to the Bay were estimated based on the sediment PCBs concentrations and estimated loadings of sediments to the Bay.

(SFEI, 2002b)

The urban and non-urban stormwater runoff study found sediment PCBs concentrations ranging from the low µg/kg level to the tens of thousands of µg/kg level. Sediment sampling locations were selected to reflect a variety of land use categories (Figure 18 and Figure 19). Sediment PCBs concentrations were statistically greater in areas of industrial, commercial and residential land use than in open space, clearly showing that PCBs were not evenly distributed across watersheds. Eleven of 209 locations had PCBs concentrations greater than 1,000 µg/kg (Figure 20), while 125 locations had PCBs concentrations greater than in-Bay ambient sediments which have PCBs concentrations of 4.6 µg/kg. Pilot studies of these urban stormwater runoff conveyance systems contaminated sites indicate that only in some cases can the PCBs be traced back to current or historical on-land activities (ACCWP, 2002a, ACCWP, 2002b; CCCWP, 2002; San Jose and EOA, 2002; SMCSTPPP, 2002). Elevated PCBs concentrations in the urban and industrial landscapes were expected due to the widespread use of PCBs both in closed and open applications (Table 8), such as transformers or capacitors that may have leaked hydraulic fluids, lubricants, and plasticizers, as well as its uses in building materials. PCBs in open space land use area were also expected due to the known role of atmospheric transport and deposition of PCBs around the world, as well as the direct application of PCBs to the environment in various processes (Section 4.3), such as pesticide extenders.

At several locations with elevated sediment PCBs concentrations, follow-up case studies were conducted to attempt to locate the source of PCBs to the stormwater conveyance system (CCCWP, 2002; San Jose and EOA, 2002; SMCSPPP, 2003; SMCSPPP, 2004). These case studies were successful on only some occasions to identify a potential source of PCBs to the stormwater conveyance system. In another study (Kleinfelder, 2006), targeted sampling for

PCBs in soils and sediments the public right-of-way was performed within an industrial watershed with elevated PCBs in storm drain sediments. Sampling locations were based on an analysis of current and past business, followed by inspections for compliance with the industrial general NPDES permit under which the business operate. This investigation was able to detect a number of potential sources of PCBs within the watershed at a larger frequency than in a randomly determined sampling scheme performed alongside. This study showed a need to target PCBs source and treatment controls to current and historical industrial watersheds.

PCBs loads for the Guadalupe River have been estimated to be from 0.7 to 1.2 kg/yr between 2003 and 2005 (McKee et al., 2005). SFEI extrapolated these loads to small urban tributaries and estimated a total load of 20 kg/yr (SFEI, 2007). We use this total load estimate for combined urban and non-urban stormwater runoff. The contribution to the total load from non-urban runoff is much smaller than that from urban runoff since the mean sediment concentration in open spaces is about 2 μg/kg, whereas it is about 500 μg/kg in urban spaces (KLI, 2002).

7.3 Internal Sources

As discussed in Section 7.1, bottom sediments are the largest environmental reservoir of PCBs in the Bay. In general, the water column PCBs mass is mostly associated with suspended sediments. Deposition of suspended sediments and re-suspension of bottom sediments are therefore important processes controlling the mass of PCBs in Bay water. Continual mixing of bottom sediments from wave action or other disturbances, such as mixing by organisms (bioturbation) or erosion of bedded sediments, can provide an ongoing supply of PCBs to the water column and biota. The large mass of PCBs in sediment denotes the importance of sediment dynamics in predicting the fate and distribution of PCBs throughout the Bay. In this section, we look at two processes affecting the bioavailability of sediment-bound PCBs. First, PCBs in the "active" sediment layer are considered because of their potential to be resuspended along with sediment and their potential for uptake by bottom dwelling aquatic organisms (bioavailability). Second, dredging activities are also considered because they can potentially cause previously buried PCBs to become bioavailable.

Active Sediment Layer

A sediment active layer can be defined many different ways based on the biophysical mechanism and reference timeframe of interest. In this report, the active layer is defined as the Bay sediments that are in contact with biota or that can be resuspended into the water column.

In one study, radioisotope dating indicated a mixing depth of about 10 cm on a timeframe of several months in Richardson Bay (Fuller et al., 1999). Biological and physical mixing within the sediment column was further substantiated by burrow worms found to a depth of 12 to 15 cm. In San Pablo Bay, the depth of the active layer was difficult to measure, as sediments at this site are believed to have undergone episodes of rapid deposition and scouring. Worms have also been observed to a depth of one to two feet in the area offshore of Hunter's Point Shipyard (U.S. Navy, 2005).

In this report, we define the active layer as the top 15 cm of sediments in the Bay, in order to be consistent with modeling performed on the long-term fate of PCBs in the Bay. Although there is uncertainty as to the exact depth of the active layer (Davis, 2003), using 15 cm is appropriate to get an order of magnitude estimate of PCBs mass in the active layer because we are interested in the relative masses of PCBs in the various reservoirs and load categories. Using this depth and a mean sediment PCBs concentration of 4.6 µg/kg, we estimate that a PCBs mass of 650 kg resides in the active sediment layer of the Bay, with potentially a maximum between 3,100 and 4,900 kg. This mass is an order of magnitude greater than PCBs sources and loads discussed in Section 7. The large mass of PCBs in the active layer, as compared to the annual loads, is likely to affect recovery of the Bay even after load reductions have been implemented.

Navigational Dredging

Maintenance dredging of Bay sediments is an ongoing activity where sediment is removed from navigation channels and is disposed of at either designated in-Bay locations (Figure 21) or out of the Bay. Between 2001 and 2005, an annual average of 1.8 million cubic yards per year of dredged sediments were disposed of at in-Bay disposal sites (DMMO, 2006) while an average of about 2.4 million cubic yards of dredged sediments were removed annually from the Bay. Using five year annual averages, we can estimate the mass of PCBs disposed of in and out of the Bay. We converted sediment volumes to dry mass using the equation given in Section 7.1. Using mean ambient PCBs concentrations commonly found in the Bay (4.6 µg/kg), we estimate that, each year about 4.6 kg of PCBs are disposed of in the Bay at dredged sediment disposal sites. During the same period, placement of dredged sediment at either upland sites or the deep ocean disposal site removes about 6.1 kg of PCBs per year from the Bay, resulting in a net loss of about 6.1 kg of PCBs each year. However, the large volume of sediment placed upland originates from the 50-foot deepening project by the Port of Oakland. This is a one-time deepening project that does not qualify as maintenance dredging. It is unlikely that this high volume will be maintained after completion of this dredging project. Future upland beneficial reuse and deep ocean disposal will need to obtain sediments from maintenance dredging projects represented mainly by in-Bay disposal volumes. This will result in much smaller volumes taken out of Bay. These are small PCBs masses compared to that in the surface layer (650 kg), but are on the same scale as the loads discussed in Section 7. Furthermore, note that natural processes are believed to annually re-suspend much larger volumes of sediments (Table 2) and could potentially be mobilizing a significantly larger mass of PCBs.

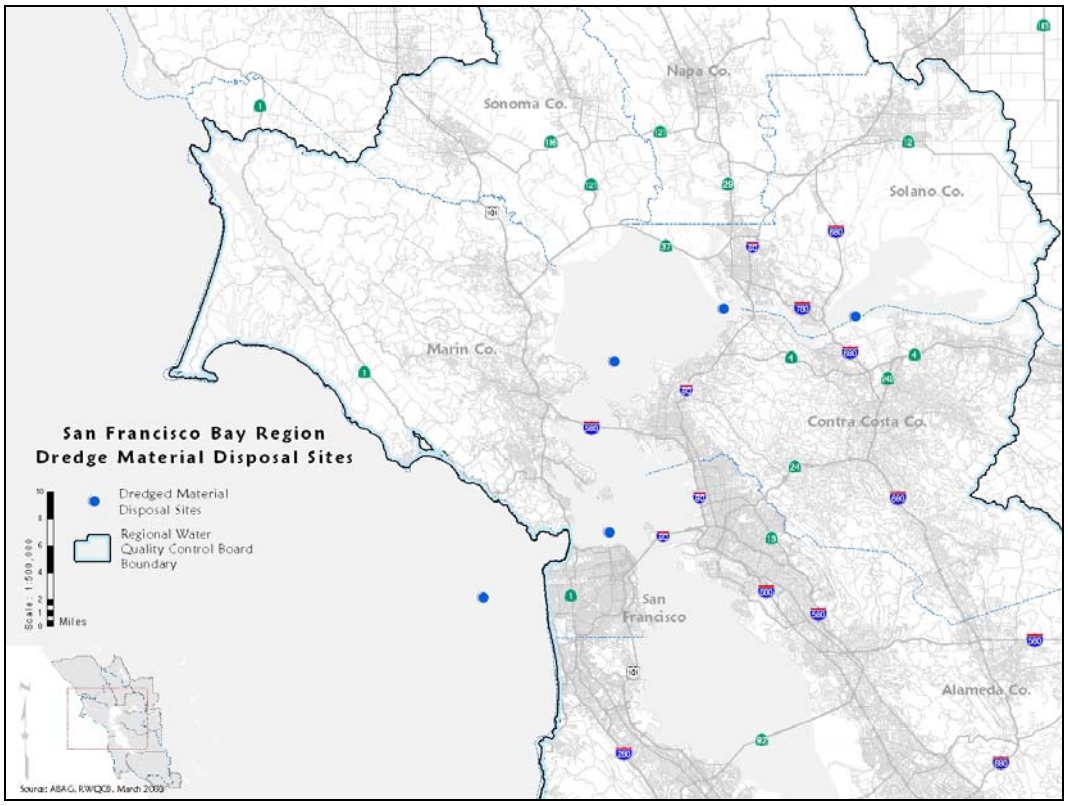

Figure 21-Dredged Sediment Disposal Sites for San Francisco Bay Region

7.4 Summary of PCBs Sources and Loads

Comparing the various load categories, excluding in-Bay sediments, the two major sources of PCBs mass to the Bay come from the Delta and urban stormwater runoff (Figure 22; Table 17) As discussed in Section 7.2, sediments from the Central Valley watershed carry a large mass of PCBs but are lower in concentrations than in-Bay sediments, potentially helping to reduce the current impact of PCBs on the Bay by burying more contaminated sediments. Therefore, implementation of the TMDL should focus primarily on reducing sediment PCBs concentrations by controlling sources in urban stormwater runoff as well as controlling the release of PCBs from contaminated sediments in the Bay.

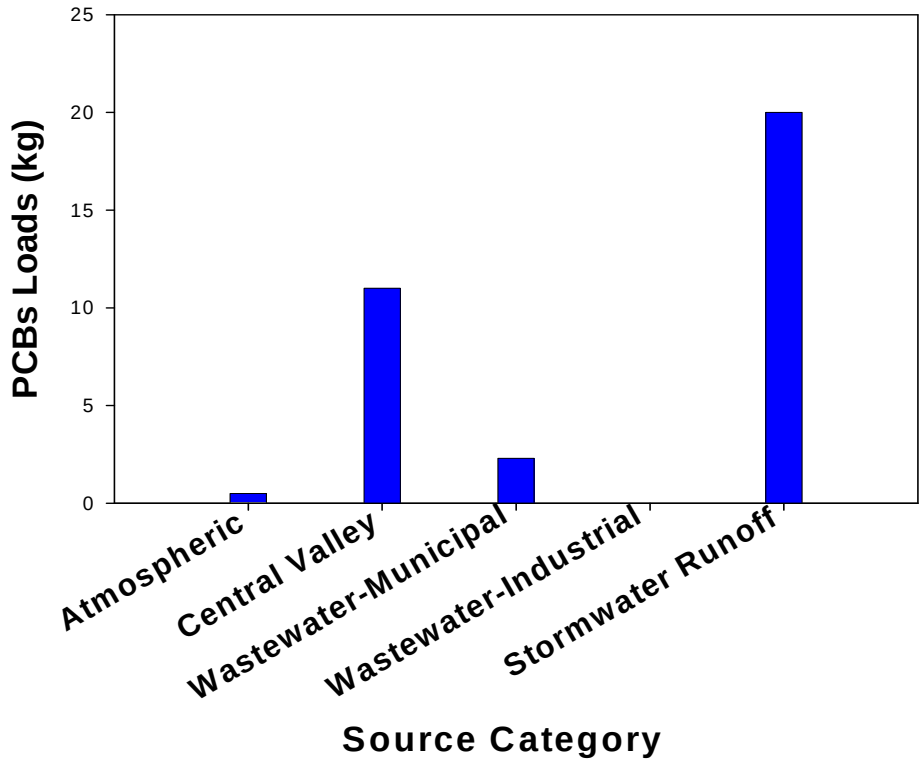

Figure 22-Sources and Loads of PCBs to San Francisco Bay

In summary, PCBs are found mostly in the central and southern portion of the Bay (Figure 23) generally in or near areas associated with historical industrial activities. Therefore, we should focus implementation to these on land areas and the remediation of the nearby in-Bay areas most impacted by PCBs discharges.

Table 17 - Synopsis of PCBs Loads to San Francisco Bay

Source Category	Current PCBs Loads (kg/yr)
Atmospheric	Net Loss
Central Valley Watershed	11
Municipal Wastewater Dischargers	2.3
Industrial Wastewater Dischargers	0.035
Urban and Non-Urban Stormwater Runoff	20

8. Numeric Target

A numeric target is a measurable condition that demonstrates attainment of water quality standards. A numeric target can be a numeric water quality objective, a numeric interpretation of a narrative objective, or a numeric measure of some other factor necessary to meet water quality standards. In this report, we propose a fish tissue PCBs numeric target.

The fish tissue numeric target provides for the attainment of the desired conditions that support the beneficial uses currently impaired. Fish tissue PCBs concentrations are the direct cause of impairment of beneficial uses. The CTR water quality criterion for PCBs is a surrogate measure of impairment as it is derived for the protection of human health based on the risk from eating fish caught in the Bay. This PCBs TMDL focuses on fish tissue PCBs concentrations, as this is the direct measurement of impairment of commercial (COMM) beneficial uses. We expect lower bioaccumulation will also protect estuarine (EST) and wildlife (RARE, WILD) beneficial uses. Fish tissue PCBs concentrations are currently being monitored as part of the RMP, and therefore progress towards attaining the fish tissue numeric target is directly monitored.

8.1 Fish Tissue Target

As noted above, fish tissue PCBs concentrations are the direct cause of impairment of beneficial uses. Therefore, the proposed numeric target for the PCBs TMDL is a fish tissue PCBs concentration. The proposed fish tissue numeric target for PCBs is based on a calculated screening level developed using standard protocol (U.S. EPA, 2000c). The screening level is defined as concentrations of PCBs in fish above which there are potential health concerns. The screening level for PCBs is calculated using Equation 1 (Section 7.1).

We calculated the screening level for a risk of one extra cancer case for an exposed population of 100,000 over a 70-year lifetime, using a mean body weight of 70 kg, a slope factor of 2 $(mg/kg\text{-}day)^{-1}$, and a mean daily consumption rate of 0.032 kg/day. The consumption rate is the 95^{th} percentile upper bound estimate of fish intake reported by all Bay fish-consuming anglers (SFEI, 2000a). The fish tissue screening level calculated based on these numbers is 10 ng/g. This represents about a ten-fold reduction in fish tissue PCBs concentrations from current levels. This numeric fish tissue target is applicable to fish collected in summer and fall seasons, when fish tissue concentrations are most elevated (Figure 8), in consideration of seasonality.

The screening value protective of Bay sport fish consumer is calculated using the upper 95^{th} percentile consumption rate of all consumers, 32 g/day. All consumers reflect a subpopulation of Bay area residents that catch and consume sport fish which is a subset of the fisher category. The general population includes all Bay area residents, including those that do not catch or consume sport fish. As was discussed earlier about the derivation of the CTR criterion for PCBs, the water column criterion was not derived to protect subpopulations at the same risk level as the general population. We have therefore used a 10^{-5} risk level to derive the fish tissue numeric target of 0.010 mg/kg. This numeric target is also more protective than the 10^{-5} risk level since an upper bound consumption rate, rather than the mean, was used for this subpopulation. The numeric target is protective of those consuming ten times more fish, 320 g/day, at a 10^{-4} risk. This is a greater consumption rate than the maximum reported in the fish consumption study, based on a four-week recall. Finally, it is reasonable to assume that this numeric target is protective, at a 10^{-5} risk level, of the general population as only a small fraction of the overall population catch and consume fish in the Bay. Therefore, this fish tissue numeric target is protective of the general population and the most exposed population of the Bay area and is consistent with the CTR criterion. Attainment of the fish tissue target is consistent with the

narrative bioaccumulation water quality objective in the Basin Plan in that it results in removal of the detrimental effects of elevated PCBs in fish.

Attainment of the fish tissue numeric target is also consistent with the CTR criterion. Bioaccumulation factors (BAFs) are the ratios of a substance's concentration in tissue of an aquatic organism to its concentration in the ambient water ($BAF_{water}=C_{tissue}/C_{water}$), where both the organism and its food are exposed and the ratio does not change substantially over time, which seems applicable to the Bay. Once developed, BAFs can be used to either predict future fish tissue concentrations based on water concentrations or inversely water column concentrations using fish tissue concentrations. We have calculated BAFs for PCBs in the entire Bay as well as individual segments of the Bay using RMP fish tissue data collected in 1994, 1997, and 2000, and RMP water column data collected from 1993 through 2001 (Table 18). Using these BAF values, we calculated an expected concentration of PCBs in the water column when the fish tissue numeric target is met. The model calculations predict that the CTR water quality standard will be attained upon attainment of the fish tissue numeric target for PCBs.

The CTR numeric criterion is only a surrogate measure of conditions affecting fish tissue concentration. Site-specific conditions, such as water depth and magnitude of PCBs contamination of sediments, may affect fish tissue PCBs concentrations to a larger extent than water column PCBs concentrations. Measures to attain the PCBs fish tissue numeric target will focus on reductions of pollutant mass loads and contaminated site cleanups, rather than on avoidance of exceedances of concentration-based water quality standards. A decreased input of PCBs into the Bay will result in the reduction of PCBs concentrations in sediments and a decrease in PCBs available for uptake by biota.

Attainment of the fish tissue target for PCBs in San Francisco Bay will be evaluated using white croaker (size class, 20 to 30 centimeters in length) and shiner surfperch (size class, 10 to 15 centimeters in length). These two fish species are selected as the measure of attainment of the target for three reasons. First, these two fish species have the highest PCBs concentrations of all fish monitored in the Bay (Figure 6), which is expected as they are both benthic feeders. Second, they live near shore for at least part of the year and are caught from piers and jetties where recreational fishing is most likely to happen. Finally, the food model predicts that attainment of the fish tissue target for white croaker and shiner surfperch will result in attainment of the target for all other fish species currently monitored in the Bay. Comparison of the numeric target to these fish species constitutes an implicit margin of safety as sport fishers do not limit their fish consumption to these species (SFEI, 2000a) Rather, sport fishers consume a variety of fish species including many with lower PCB concentrations. Attainment of the fish tissue target in these two species ensures attainment of the fish tissue target for all Bay species sport fishers consume, and provides a implicit margin of safety as these other species consumed will have lower PCBs concentration than the fish tissue target.

The Water Board will continue to evaluate attainment of the fish tissue target and require the collection of additional information concerning Bay sport fish patterns of consumption and evaluate if fish species other than white croaker and shiner surfperch should be considered to evaluate attainment of the target. The average PCBs concentrations in the edible portion of these species will be used to determine attainment of the PCBs target following the methods currently in use by the RMP to ensure consistency and data comparability. The number of fish samples collected to determine compliance with the target will be based on guidance described in U.S. EPA's Guidance for Assessing Chemical Contaminant Data for Use in Fish Advisories

(EPA 823-B-00-007) and will be based on the desired statistical power needed to demonstrate differences over time.

Attainment of the PCBs fish tissue numeric target is also expected to result in removal of impairment of the Bay by dioxin-like PCBs. In Figure 24 we show the regression of calculated TEQ from dioxin-like PCBs to that of total PCBs in fish tissue caught in the Bay. The regression shows that a decrease of fish tissue PCBs concentrations to the fish tissue numeric target of 10 ng/g will result in a decrease of TEQ to the TEQ screening level of 0.14 pg/g.

Table 18- Bioaccumulation Factors and Estimated Water Column PCBs Concentrations upon Attainment of the Fish Tissue Target for White Croaker

Waterbody	White Croaker		Shiner Surfperch	
	BAF[a]	Water PCBs Concentration (pg/L)	BAF[a]	Water PCBs Concentration (pg/L)
Entire Bay	0.224	49	0.160	69
Central Bay	0.572	19	0.424	26
North Bay	0.259	43	0.089	123
South Bay	0.498	22	0.090	122

a)BAFs were calculated from pg/L in water and ng/g wet weight in fish

8.2 Antidegradation

A numeric target must be consistent with antidegradation policies as described in 40 CFR 131.12 and SWRCB Resolution 68-16. Antidegradation policies are intended to protect beneficial uses by ensuring that water quality will be maintained at the highest levels.

The fish tissue numeric target is designed to implement the narrative water quality objective for bioaccumulation. This numeric target is intended to achieve beneficial uses of the Bay, specifically relating to the consumption of sport fish by humans. As such, it is consistent with the established numeric water quality criterion for total PCBs. Since PCBs concentrations in sediment and fish tissue currently exceed the narrative bioaccumulation objective, attaining the numeric target will improve current water quality conditions. Therefore, the numeric target is consistent with the antidegradation policies.

9. Linkage Analysis

The TMDL linkage analysis is used to connect PCBs loads to the numeric target protective of beneficial uses in the Bay. This linkage analysis can be accomplished in a variety of ways. One common approach has been to use numerical models. Water quality models for TMDL development are typically classified as either watershed (pollutant load) models or as waterbody (pollutant response) models (NRC, 2001). A watershed model relates pollutant loads to a waterbody as a function of land use and helps allocate the TMDL among sources. A waterbody model is used to predict pollutant concentrations and other responses in the waterbody as a function of the pollutant load. Other models are used to set numerical targets such as food-web models that link sources to biological receptors.

PCBs uptake by biota from sediment is well documented in the scientific literature. In a shallow bay with a large sediment PCBs reservoir, such as San Francisco Bay, this is the most important pathway for PCBs bioaccumulation in fish. Therefore, reducing PCBs concentrations in Bay sediments is the most effective means of reducing fish tissue PCBs concentrations. In this TMDL, we use a food web model to translate the fish tissue numeric target to a corresponding sediment concentration. We then use a waterbody (mass budget) model to predict the long-term fate of PCBs in the Bay and determine the external load of PCBs that will attain the sediment concentration goal resulting in attainment of the fish tissue numeric target.

The mass budget model and food web model represent the linkage between load reductions and attainment of the fish tissue numeric target, as well as between the cause of impairment and the sources of PCBs. Based on the insights provided by these two models, we first present a conceptual model of our understanding of PCBs fate and movement between environmental reservoirs (Figure 25). Figure 25 depicts the conceptual linkage between sources, reservoirs (compartments) and receptors. In this figure, we have used larger arrows and bold text to highlight the sources and processes that we consider important. The left side of Figure 25 represents the mass budget model providing the linkage between the sources, reservoirs and processes. The right side of the conceptual model highlights the food-web model providing the linkage between PCBs reservoirs and aquatic receptors. We consider urban stormwater runoff and releases from current or historical activities as the most significant sources of PCBs to the Bay. PCBs in Bay sediments are likely to function as the major source of PCBs to biota. We consider the major mechanism of PCBs uptake by fish to result from foraging on bottom dwelling organisms (benthic organisms) living in sediment.

9.1 Food Web Bioaccumulation Modeling

PCBs impairment of the Bay is related to PCBs fish tissue concentrations. In order to implement the most effective load reductions, it is critical to understand the important factors and sources causing PCBs bioaccumulation in fish. There are two general approaches for developing a linkage between PCBs concentrations in water, sediment and biota (U.S. EPA, 2000c; U.S. EPA, 2000d). First, there is an empirical approach where one generates data to calculate bioaccumulation factors (BAFs) and biota-sediment accumulation factors (BSAFs). BAFs are the ratios of a substance's concentration in aquatic organisms to ambient water concentrations, taking the organism's trophic level into consideration. BSAFs are the ratios of concentrations in aquatic organisms compared to sediment concentrations. The second approach is to develop an equilibrium or kinetic biological food web model that considers mechanistic aspects of bioaccumulation and describes the chemical reactions and physicochemical processes taking place. These two modeling approaches are complimentary as the empirical data can be used to verify, or calibrate, the food web model results.

SFEI has developed a food web model based on Gobas (1993) and Morrison et al. (1997). Bay-specific data have shown that the fish species of concern have a diet consisting mainly of benthic organisms (Roberts et al., 2002), suggesting the importance of sediment PCBs as a source of PCBs to fish. This model predicts that the most sensitive endpoint is the protection of human health from the consumption of white croaker, and that attainment of conditions that result the fish tissue numeric target will be protective of wildlife. The model mathematically links the concentrations of PCBs in aquatic organisms and their prey to water and sediment PCBs concentrations via the food web as depicted in Figure 26 (Gobas and Arnot, 2005). Using this model, we can associate a specific PCBs concentration in fish to that in sediment, the main compartment of PCBs in aquatic environments, and water. Starting with the numeric fish tissue target of 10 ng/g, the model yields a corresponding concentration of 1 µg/kg PCBs in sediment. This sediment PCBs concentration goal is lower than the sediment concentration deemed protective of wildlife of 160 µg/kg total PCBs (U.S. EPA, 1997b), and is therefore considered to result in attainment of all beneficial uses currently impaired by PCBs. Model results validate the sediment PCBs concentration goal as protective of wildlife in San Francisco Bay. The food web model specifically predicts that this sediment goal will also be protective of wildlife, such as harbor seals, and birds such as cormorants and terns.

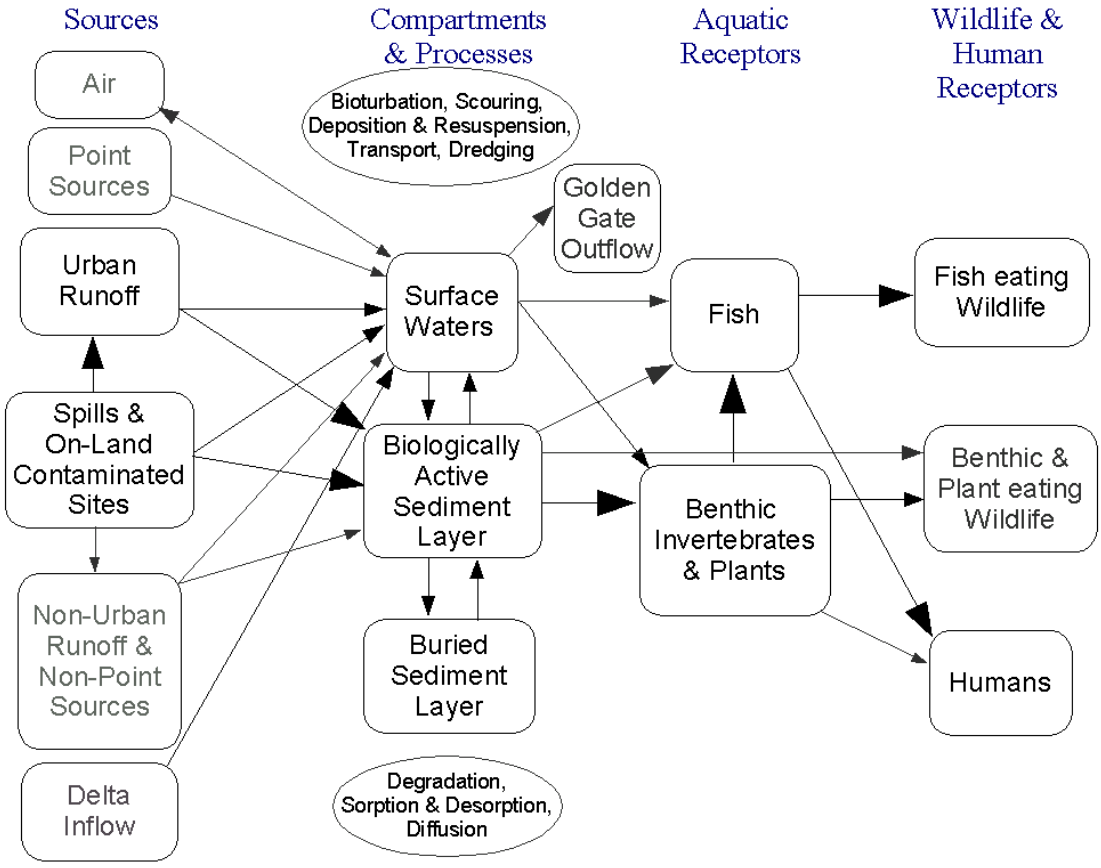

Figure 25-Conceptual Model of PCBs Movement and Fate in San Francisco Bay

This sediment goal is equivalent to reducing the total mass of PCBs in the active layer (of 0.15 m) of the entire Bay to about 160 kg. This represents a ten-fold decrease of PCBs concentrations in ambient sediments and fish tissue. The need to reduce ambient sediment PCBs concentrations by an order of magnitude to attain the 1 µg/kg sediment concentration goal is not unexpected. Empirical models such as biota-sediment accumulation factor (BSAF) are based on a one to one relationship between sediment and fish tissue PCBs concentrations. As discussed in Section 6.2, fish tissue concentrations are also an order of magnitude greater than the fish tissue numeric target for certain species. Hence the need for a ten-fold reduction in sediment to attain the fish tissue numeric target is not surprising. However, this sediment goal should not be interpreted as a clean-up goal, rather it is the long-term sediment PCBs concentration that will be attained after reduction of external loads, some targeted action on internal reservoirs of PCBs, and degradation or burial of PCBs in Bay sediments.

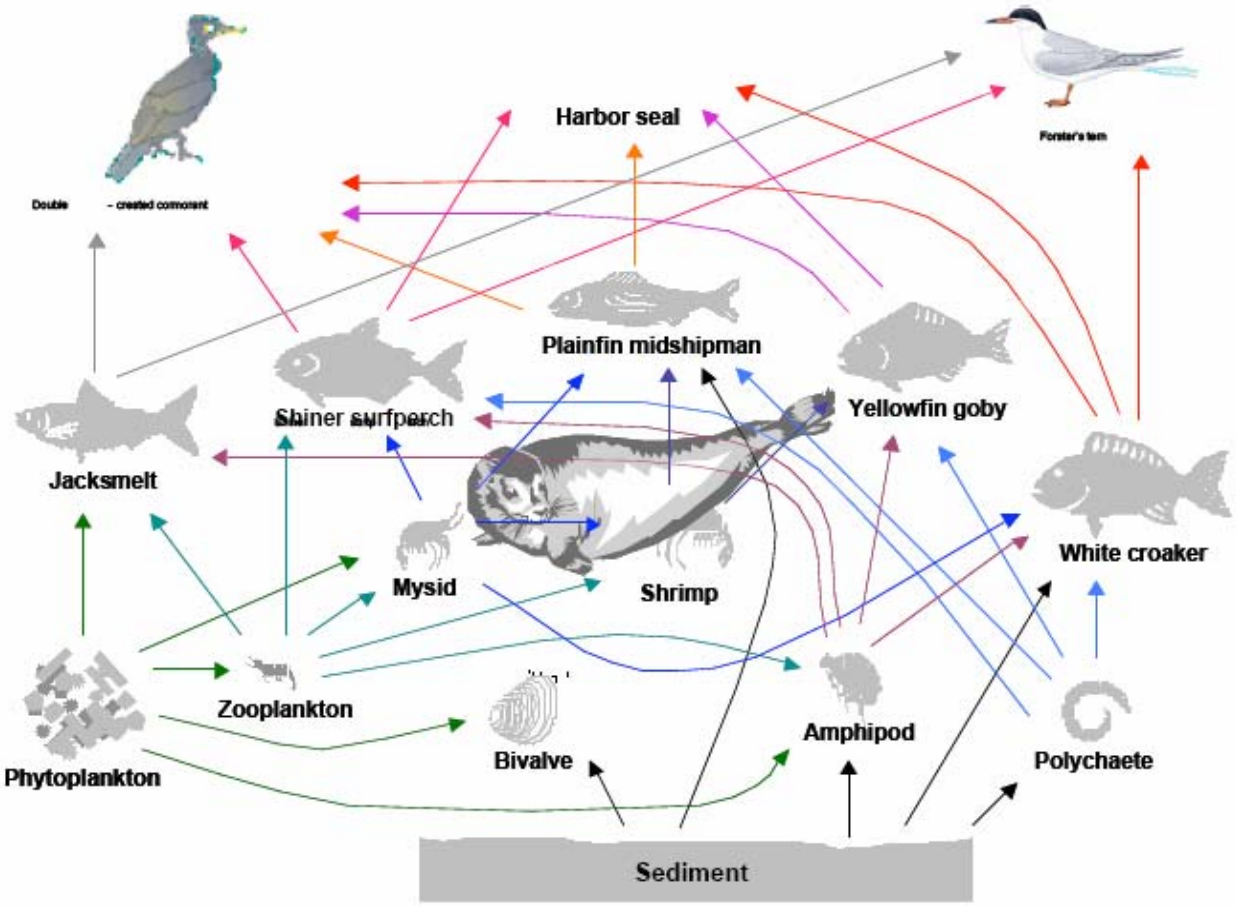

Figure 26-Food Web Model for San Francisco Bay (Gobas and Arnot, 2005)

9.2 Mass Budget Model

A mass budget model allows the exploration of different PCBs load reduction scenarios on the long-term fate of PCBs. SFEI developed a simple mass budget model for PCBs (Davis, 2003) that treats the Bay as a single box with two environmental reservoirs: water and sediment (Figure 27). This model includes eight processes of PCBs input and loss: burial in deep sediment, degradation,

external loadings, outflow to the ocean, tidal mixing, exchange with the atmosphere, natural attenuation, and transfer between sediments and water.

Reduction of the external load to10 kg/year is needed to attain a PCBs mass in the Bay of 160 kg which is equivalent to the PCBs sediment goal of 1 µg/kg. The mass budget model predicts that current external PCBs loads to the Bay of about 34 kg/year will delay the attainment of the 160 kg goal for 100 years (Figure 28). Reduction of current external loads to 20 kg/yr results in a more rapid reduction of PCBs in the active layer, attaining the goal in about 70 years. An external load of 10 kg/yr attains the 160 kg mass in about 30 years. The mass budget model predictions highlight the importance of reducing current external loads of PCBs to the Bay. Achieving these load reductions, along with cleanup of in-Bay sediment PCB-contaminated sites, will form the core of the TMDL implementation strategy.

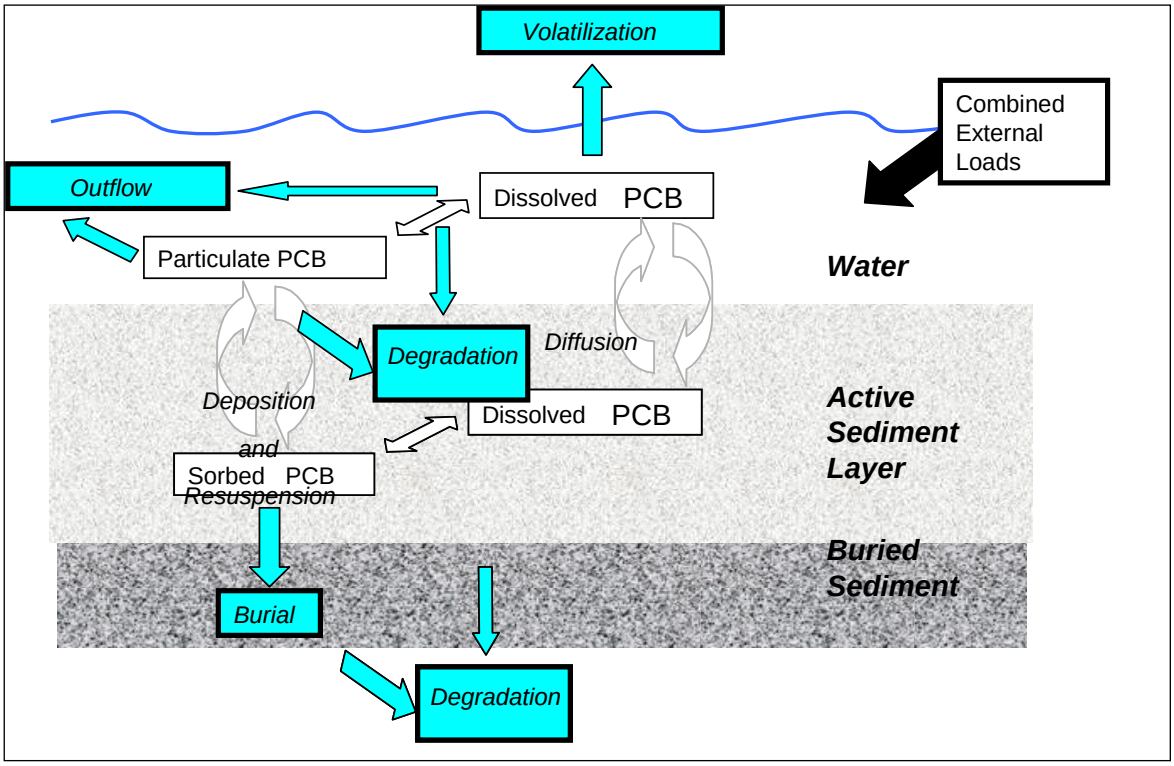

Figure 27-Mass Balance Model for PCBs in San Francisco Bay (Davis, 2003)

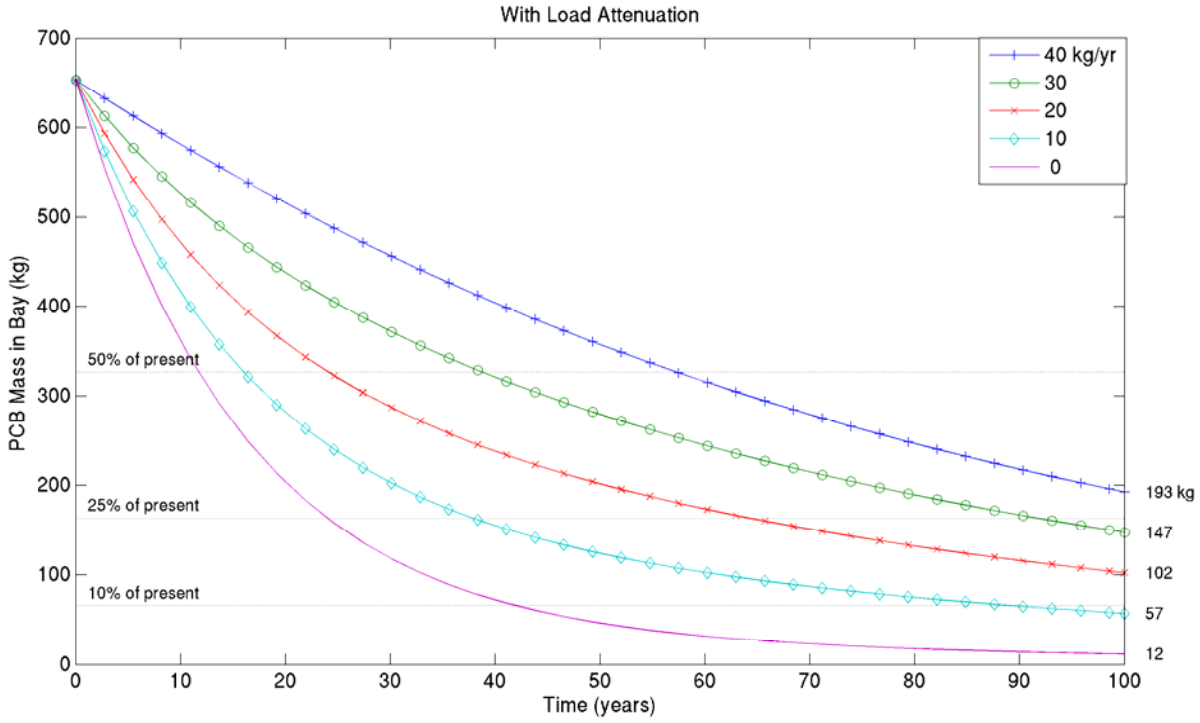

Figure 28-Predicted Long-Term Mass of PCBs in Active Sediment Layer under Different Loading Conditions (SFEI, 2007)

10. Total Maximum Daily Load and Allocations

The total maximum daily load (TMDL) is the maximum quantity of a pollutant that can enter a waterbody and attain water quality standards. The TMDL is allocated amongst the various sources of the pollutant.

10.1 Total Maximum Daily Load

The PCBs TMDL is 10 kg/yr and represents the assimilative capacity of the Bay. This TMDL necessitates achieving a load reduction of about 24 kg/yr to reduce total PCBs in the Bay active layer to 160 kg in about 30 years (Figure 28). This is equivalent to achieving the sediment PCBs concentration goal of 1 µg/kg, which will result in attainment of the fish tissue target of 10 µg/kg.

The TMDL is expressed as an average annual rather than as a daily load for several related reasons. First, the TMDL is derived from a mass budget model that depicts the long term (decadal) fate of PCBs. This model uses daily time steps derived by averaging annual load estimates, as the loadings data are not refined enough to provide discrete daily loads and therefore do not reflect variability in the data. Future data collection to verify attainment of the TMDL will also be collected on an annual timeframe, due to the large cost associated with these types of data. Therefore a TMDL is needed based on annual loads for comparison purposes. Also, the response of fish tissue PCBs concentrations to PCBs load reductions is not instantaneous. Even with immediate or rapid attainment of the sediment goal, there would be delay in attainment of the numeric fish tissue target, due to the time required for depuration (shedding from body) of PCBs by biota to occur. Finally, the TMDL is expressed as an average annual load because the natural variability in quantifying PCBs loads is much greater than the expected rate of load reductions. Long-term averaging of the loads is necessary to dampen out the variability in the data.

10.2 Categorical Load and Wasteload Allocations

We propose to allocate the TMDL (Figure 29, Table 19) among the existing external sources: direct atmospheric deposition, Central Valley watershed, wastewater dischargers, and urban and non-urban stormwater runoff. A portion of the TMDL is also allocated to potential future stormwater treatment by municipal wastewater dischargers. The linkage analysis shows that the fish tissue target can be achieved with reduction of external loads to the TMDL of 10 kg/yr. As such, internal sources are not assigned load allocations. However, reduction of internal loads will lead to an increased rate of recovery of beneficial uses. Sediment dredging and disposal, which results in an on-going net loss of PCBs from the Bay is expected to continue to decrease in-Bay disposal volumes and increase out-of-Bay disposal based on goals established in the "Long Term Management Strategy for the Placement of Dredged Material in The San Francisco Bay Region" (U.S. ACE, 1998). Therefore, sediment dredging is expected to continue to remove PCBs from the Bay. In addition, remediation of in-Bay contaminated sediment is expected to decrease potential loadings from this other internal source.

The following sections present the basis of the allocation for each source category.

10.3 Wasteload Allocations

Wasteload allocations apply to all NPDES permitted discharges to the Bay, including municipal and industrial wastewater dischargers, and municipal stormwater (urban and non-urban stormwater runoff) discharges.

Table 19-PCBs Load and Wasteload Allocations to San Francisco Bay

Source Category	Allocations
	Kilograms per year

Total	***10[b]***

[a] Zero allocation reflects overall net loss to the atmosphere
[b.] Total differs from column sum due to rounding.

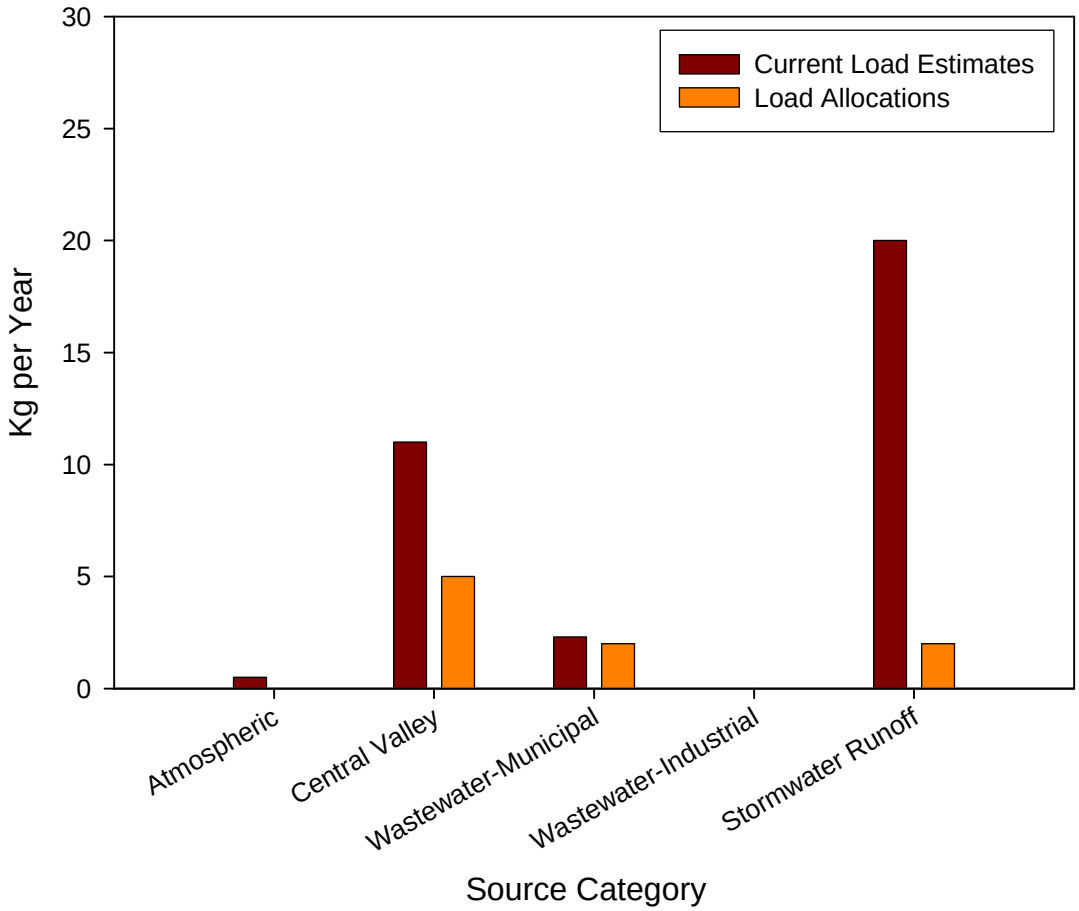

Figure 29-Loads and Allocations of PCBs to San Francisco Bay

Municipal and Industrial Wastewater Dischargers

Municipal and industrial wastewater NPDES permitted facilities discharge a small fraction of the total PCBs load to the Bay. In general, municipal and industrial wastewater dischargers operate at a high level of performance and remove PCBs via solids reduction treatment processes. The wasteload allocations for municipal wastewater dischargers total 2 kg/yr, which reflects the current estimated aggregate load to the nearest kg/yr. Although this is lower than our actual estimate of 2.3 kg/yr, it reflects the anticipated decreases in current loadings expected from implementation actions and degradation of PCBs in sources to wastewater systems. The wasteload allocations for industrial facilities total 0.035 kg/yr, which reflects estimated current loads.

Individual wasteload allocations are specified for each municipal and industrial wastewater dischargers in Table 20 and Table 21, respectively. We have insufficient or no data to calculate wasteload allocations for individual facilities based on individual facility performance at this time. Therefore, individual load allocations are based on each facility's fraction of the total yearly wastewater discharged from this source category using average annual flow data from 1999 through 2002. The resulting individual wasteload allocations do not represent individual facility actual discharge performance and do not account for variability in discharge performance. As part of the adaptive implementation plan of this TMDL, we will use data generated through implementation of the TMDL to review and revise individual allocations for Water Board consideration that account for actual performance.

Stormwater Runoff

Existing PCBs loads from stormwater runoff are estimated at 20 kg/yr. The proposed total wasteload allocation for stormwater runoff is 2 kg/yr. It reflects the resulting PCBs load when all sediment in stormwater runoff has a concentration of 1 µg/kg, the sediment PCBs concentration goal, assuming the sediment loads used to calculate the current PCBs load do not change. Sediment load estimates vary from 870,000 tons (SFEI, 2007), 930,000 tons (Krone, 1979), to 1,500,000 tons (Schoellhamer et al., 2005). Due to the uncertainty in these estimates and until they are refined, we will use 2,000,000 tons as an upper bound estimate of maximum sediment yields from local tributaries to calculate the stormwater wasteload allocations, resulting in 2 kg/yr.

Individual county-based watershed wasteload allocations for stormwater runoff are presented in Table 22. This total wasteload allocation is based on the aggregate allocation of 2 kg/yr and the fraction of the Bay-side year 2000 population residing in each permitted entity (USCB, 2000). Wasteload allocations for stormwater runoff apply to all NPDES permitted municipal stormwater discharges (Table 22). These allocations apply to unincorporated areas and all municipalities in the county that drain to the Bay and are part of the San Francisco Bay Region. They implicitly include all current and future permitted discharges within the geographic boundaries of municipalities and unincorporated areas within each county. Examples of discharges include but are not limited to California Department of Transportation (Caltrans) roadways and non-roadway facilities and rights-of-way, atmospheric deposition, public facilities, properties proximate to stream banks, industrial facilities, and construction sites. The San Francisco allocation does not account for treatment provided by San Francisco's combined sewer system. The wet weather treatment provided by the City and County of San Francisco's Southeast Plant (NPDES permit CA0037664) and the Northpoint Wet Weather Facility will be credited toward meeting the allocation.

Urban Stormwater Runoff Treatment by Municipal Wastewater Dischargers

A potential means to reduce urban stormwater runoff PCBs loads will be to strategically intercept and route runoff to municipal wastewater treatment systems. We propose a separate wasteload allocation for discharges associated with urban stormwater runoff treatment via municipal wastewater treatment systems, since such actions will result in increased PCBs loads from municipal wastewater dischargers, and the proposed individual wasteload allocations for municipal wastewater dischargers reflect current performance levels. We propose a wasteload allocation of 0.9 kg/yr, which is the difference between the TMDL of 10 kg/yr and the sum of the other proposed wasteload and load allocations.

10.4 Load Allocations

In this section, we present the load allocations for nonpoint source discharges of PCBs including direct atmospheric deposition and the Central Valley watershed. Allocations focus on controllable loads of PCBs. Assessment of PCBs load reductions from sources considered uncontrollable will continue as part of the implementation of the TMDL.

Direct Atmospheric Deposition

PCBs freely exchange between the Bay and the atmosphere through both deposition and volatilization. Currently, PCBs escape to the atmosphere from the Bay at a greater rate than they are deposited from the atmosphere, resulting in a net loss of PCBs. As such, the proposed allocation to direct atmospheric deposition is zero. This load allocation is limited to PCBs that deposit directly into the Bay. Atmospheric PCBs deposited in the watershed, and indirectly washed into the Bay with runoff are not included in this source category. However, the PCBs concentrations in non-urban stormwater conveyances from open space areas are low and include indirect loads from atmospheric deposition onto the landscape (KLI, 2002). Therefore, the indirect load from atmospheric deposition in commercial and industrial areas is also estimated to be small, contributing minimally to stormwater runoff discharges.

Table 22 - County-Based Watershed Wasteload Allocations for Stormwater Runoff

County	Population	Allocations
		(kilograms / year)
Alameda	1,440,000	0.5

Santa Clara	1,600,000	0.5
Solano	290,000	0.1
Sonoma	110,000	0.05
Total		***2***

Central Valley Watershed

PCBs loads from the Sacramento and San Joaquin Rivers are significant. However, this load results from the large volume of sediments carried into the Bay at low sediment PCBs concentrations, although the sediment PCBs concentrations are generally greater than the sediment PCBs goal. Current estimates of sediment loads to the Bay are around 1.2 millions tons (Leatherbarrow et al., 2005; Schoellhamer et al., 2005). If all of this sediment from the Central Valley had a concentration equal to the sediment goal, the resulting PCBs loads from the Central Valley would be 1.2 kg/y. However, based on natural attenuation with a half life of 56 years (Davis, 2003), loads will not be reduced to this level in the next 100 years (Figure 30). However, natural attenuation will lower the Central Valley load to 5 kg/yr in about 40 years. As this load reduction will result in attainment of the TMDL, we propose using 5 kg/yr as the load allocation to the Central Valley watershed.

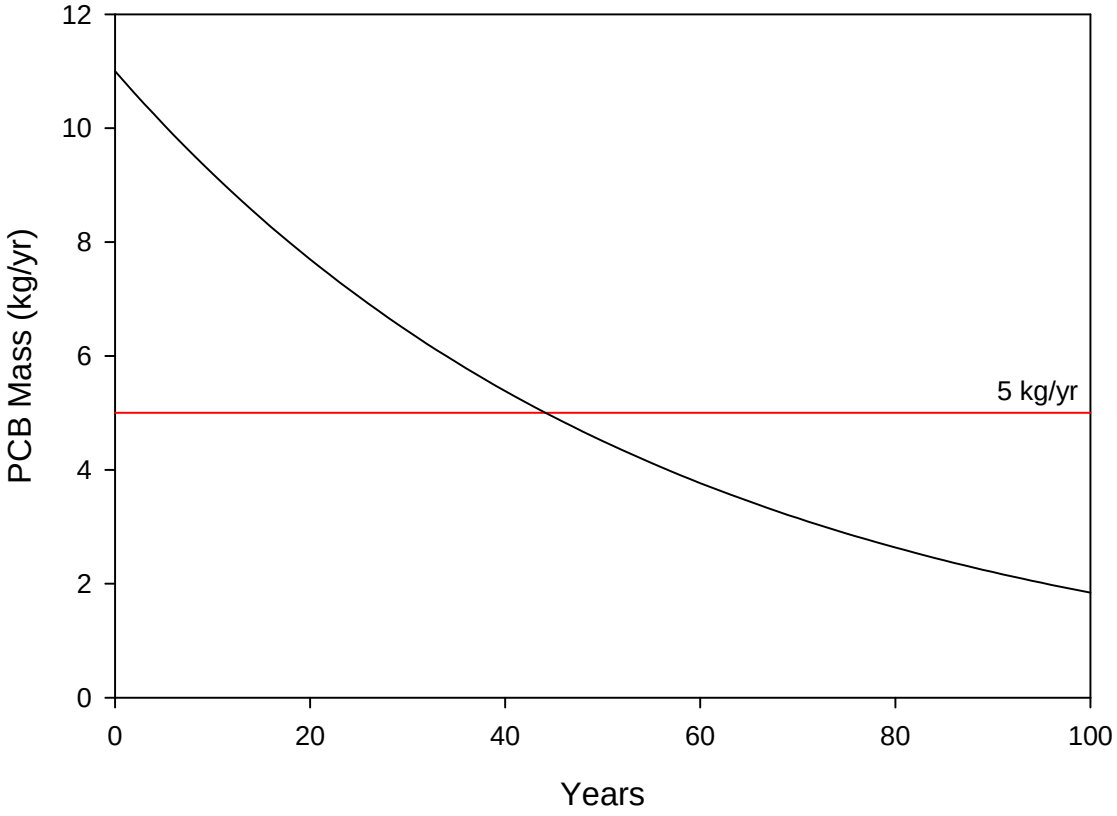

Figure 30-Natural Attenuation of Central Valley PCB Loads

10.5 Margin of Safety and Seasonality

A margin of safety needs to be incorporated into the TMDL to account for uncertainty in understanding the relationship between pollutant discharges and water quality impacts (U.S. EPA, 1991). The margin of safety can be incorporated in the TMDL either explicitly or implicitly (U.S. EPA, 2000a). Making and documenting conservative assumptions used in the TMDL analysis provides an implicit margin of safety. The purpose of the margin of safety is to ensure, given the uncertainties in developing the TMDL, that the beneficial uses currently impaired are restored.

For the PCBs TMDL, we are incorporating an implicit margin of safety. We have used a conservative approach to derive the fish tissue numeric target. We used a high-end value, the 95th percentile consumption rate, rather than the average consumption rate allowed by U.S. EPA (2000c). Therefore, the fish tissue numeric target proposed in this TMDL is as protective as possible following U.S. EPA methodology and should provide additional protection to human health from fish consumption. In addition, the wasteload allocation reserved for urban stormwater runoff treatment via municipal wastewater treatment systems is not expected to be fully utilized for several years. In the meantime, we intend to regularly review the effectiveness of implementation actions in meeting the numeric target and revise, as necessary, the proposed load and wasteload allocations. We also propose to monitor attainment of the numeric target and to reevaluate the appropriateness of the currently proposed fish tissue numeric target and associated total PCBs sediment concentration goal.

Seasonal variation also needs to be considered when developing a TMDL. As was discussed in Section 6.2, PCBs concentrations in white croaker tissue collected in the Oakland Inner Harbor showed a seasonal trend with higher concentrations in summer and fall, and lower concentrations in winter and spring. This trend does not correlate with the expected higher total loading of PCBs to the Bay during the winter associated with stormwater and Central Valley runoff. We account for this seasonal trend by applying the fish tissue target to fish collected in the summer. In this manner, attainment of the fish tissue numeric target in the season when fish are most impacted will also be protective at other times of the year.

11. Implementation

Success of the PCBs TMDL requires an adaptive management approach to implementation actions. Adaptive implementation is a cyclical process in which TMDL plans and actions are regularly assessed for their achievement of water quality standards (NRC, 2001). Adaptive implementation simultaneously makes progress toward achieving water quality standards through implementing actions while relying on monitoring and experimentation to reduce uncertainty and refine future implementation actions.

The adaptive implementation process consists of the development of a plan that includes early implementation actions based on existing knowledge that have a reasonable probability of success and an overview of options for future actions. For PCBs in the Bay, the immediate or early implementation actions are not expected to completely eliminate the Bay impairment. Therefore, future actions must be evaluated based on continued monitoring and response to the early implementation actions, as well as based on well-designed studies used for model refinement.

This implementation plan includes three general implementation categories: control of external loadings of PCBs to the Bay, control of internal sources of PCBs within the Bay, and actions to manage risks to Bay fish consumers. In addition, the monitoring section describes monitoring required to measure attainment of the numeric target, water quality objectives and to measure implementation progress towards attainment of the load and wasteload allocations. The adaptive implementation section describes the method and schedule for evaluating and adapting the TMDL and implementation plan as needed to assure water quality standards are attained based on new information, studies to fill information gaps, and tracking and evaluation of actions.

11.1. External Sources

The following sections outline the proposed approach to adaptive implementation for mass reductions of PCBs loads from external sources.

Direct Atmospheric Deposition

There is a net removal of PCBs from the Bay through the atmosphere and consequent air-borne transport. No foreseeable actions can be taken to accelerate this loss of PCBs from the Bay. In the long-term, this loss will diminish as PCBs mass in the Bay is reduced and the numeric target is attained. A reevaluation of PCBs input and loss from the atmosphere may be needed in the future as part of reevaluation of the long term fate and transport of PCBs in the Bay, or if current implementation actions do not cause a rapid enough trend towards attainment of the target.

Central Valley Watershed

Sediments entering the Bay from the Central Valley have lower PCBs concentrations than in-Bay sediment, and major PCBs mass loading events that occur during episodic high flow events mostly flow directly out of the Bay through the Golden Gate. There are very limited locations with PCBs impairment of waters within the Central Valley watershed. The allocation will be attained through anticipated natural attenuation of PCBs in the Central Valley watershed. Verification of ongoing loads and load reductions will be a regular component of the Regional Monitoring Program.

Municipal and Industrial Wastewater Dischargers

Wasteload allocations for municipal and industrial wastewater discharges reflect current PCBs loads. Loads are expected to diminish as sources of PCBs to wastewater treatment systems diminish over time. Wasteload allocations will be implemented through NPDES permits that require implementation of best management practices (BMPs) to maintain optimum treatment performance for solids removal and to identify and manage controllable sources. Developing effluent limits for PCBs that accurately reflect treatment system performance require a substantial data set that accounts for system variability of a difficult to measure pollutant that is present at very low levels (See Section 5.2). The primary PCBs treatment mechanism is solids removal, and as such, ongoing attainment of suspended solids effluent limits provides a surrogate indicator of PCBs control. In addition to maintaining optimum solids removal performance, wastewater dischargers should evaluate whether there are any controllable sources of PCBs to their systems (e.g., industrial uses of equipment that contain PCBs).

Effluent limits in NPDES permits will be based on current performance; however, it's not feasible to calculate such limits as this time. The wasteload allocations were derived from a limited data set used to estimate the total PCBs annual load to San Francisco Bay from all wastewater discharges. The data set was limited due to the technical difficulty and associated costs of measuring very low concentrations of PCBs in wastewater. Furthermore, the individual allocations, which were based on each facility's fraction of the total yearly wastewater discharged to the Bay, do not represent actual performance of individual dischargers. Consequently, implementation of the individual wasteload allocations as effluent limits is not feasible at this time. NPDES permits will require individual facilities to collect data in order to calculate daily or monthly average effluent limits that are consistent with the annual load allocations, and possibly recalculation of individual wasteload allocations based on these data. However, calculation of these limits is not feasible at this time. Implementation of the wasteload allocations is further complicated by the lack of a low-detection level analytical method that can be used for compliance determinations. The level of quantification achievable with the regulatory analytical methods promulgated under 40 CFR 136 (US EPA Method 608) is 0.5 µg/L. Accordingly, compliance with effluent limits in NPDES permits will be determined using this approved method.

NPDES permits will require quantification of PCBs loads using a lower detection level method such as Method 1668A. This method was used to derive the loading estimates that are the basis of the allocations. However, as noted above, there are technical difficulties and high analytical costs ($1,000 to $1,200 per sample) associated with measuring very low concentrations of PCBs in wastewater. Another complication is that the daily, monthly, and even annual variability of PCBs in wastewater is unknown. Consequently, calculation of limits that account for variability may require several years of data. Also, if individual performance data result in effluent limits that are not consistent with individual wasteload allocations established with this TMDL, then the Water Board will take action to revise the individual allocations as part of the adaptive implementation plan.

We also propose a separate wasteload allocation for discharges associated with urban stormwater runoff treatment via municipal wastewater treatment systems. This allocation will be implemented through a permit that will allow municipal wastewater dischargers to apply for a portion of this reserved allocation. Although we recognize that the capacity and opportunity for existing systems to receive stormwater runoff may be limited, we expect that there will be strategic opportunities to do so.

In addition to controlling PCBs sources and discharges, municipal and industrial wastewater dischargers will be required to support actions to manage the health risks associated with the consumption of PCBs-contaminated Bay fish by people that recreationally fish, and to conduct or cause to be conducted monitoring, and studies to fill critical data needs identified in the Adaptive Implementation section.

Stormwater Runoff

The stormwater runoff wasteload allocations shown in Table 22 will be implemented through NPDES stormwater permits issued to urban runoff management agencies. The stormwater runoff allocations implicitly include all current and future permitted discharges, not otherwise addressed by another allocation, and unpermitted discharges within the geographic boundaries of urban runoff management agencies including, but not limited to, California Department of Transportation (Caltrans) roadway and non-roadway facilities and rights-of-way, atmospheric deposition, public facilities, properties proximate to stream banks, industrial facilities, and construction sites.

Substantial load reductions are required to attain wasteload allocations. In addition to reductions due to natural attenuation, urban runoff management agencies can reduce PCBs loads by preventing PCBs sources from contaminating sediment or by reducing the amount of contaminated sediment discharged to the bay. Urban runoff management agencies can prevent contamination through various source control and pollution prevention activities, including remediation of on-land PCBs contaminated soils and control of releases of PCBs from electrical or other equipment, building materials and waste during demolition/remodeling, or other sources. In addition, urban stormwater PCBs loads can be reduced through capture, detention, and removal of highly contaminated sediment, and possibly by urban storm water treatment, including routing of PCBs contaminated runoff to wastewater treatment systems. Substantial infrastructure improvements are expected to result from implementation of construction and new development runoff permit requirements. These requirements, which promote controls such as planting vegetative buffers around impervious surfaces, may effectively control urban sediment discharges. Many of these actions also have the potential benefit of reducing other particle-associated pollutant loads in addition to PCBs.

Remediation of on-land PCBs-contaminated soils and effective PCBs prevention or removal infrastructure improvements will take several years to pilot test, evaluate, and then plan, design and implement on a scale sufficient to substantially reduce PCBs loads. As such, we propose a 20-year schedule for attaining the wasteload allocations. Requirements in each NPDES permit issued or reissued and applicable for the five-year term of the permit will be based on an updated assessment of best management practices, and control measures intended to reduce PCBs in urban runoff to the maximum extent practicable. This is consistent with the Water Board's phased approach towards attainment of water quality objectives in waters that receive stormwater discharges from urban areas described in Section 4.8 of the Basin Plan.

There are already efforts underway to gain insights regarding opportunities for load reductions. NPDES permit requirements will call for progressive implementation of PCBs control measures. Specific best management practices (BMPs) and control measures to be considered include:

- Abatement of PCBs in runoff from areas with elevated PCBs in soils/sediments
    - Investigate on-land PCBs contaminated soils and/or sediments – PCBs are a known historical contaminant in soils and sediments throughout the region, both in private and public properties, and public rights-of-ways. Although many contaminated sites have undergone remediation, it is likely that PCBs contaminated sites remain and continue to

contribute PCBs to stormwater. Stormwater runoff management agencies are expected to conduct, or cause to be conducted by other agencies or responsible parties, identification of on-land sites with PCBs contamination, such as private properties, public rights-of-ways, and stormwater conveyances. Stormwater runoff management agencies would be expected to report investigation results, including identifying potentially contaminated properties and/or responsible parties to the Water Board and/or DTSC, and/or in some instances to local agencies with authority to conduct oversight of hazardous materials. The Water Board, DTSC, or local agency would be expected to follow up on further investigation and oversee any necessary abatement.

- Improve system design, operation, and maintenance to increase fine sediment—PCBs are mainly transported within the stormwater conveyances attached to sediments. Many routine maintenance BMPs exist and are currently in use to control the discharge of sediments to the Bay from urban stormwater runoff, such as storm drain inlets, detention basins and street sweeping. Urban runoff management agencies are expected to implement increased routine sediment control measures within the stormwater conveyances in locations that will result in increased reduction of PCBs loads.
- Strategic runoff treatment retrofits – There are many sediment control BMPs, such as sand (or other media) filtration devices or multi-chamber treatment trains, that have not been evaluated or implemented for their ability to reduce PCBs loads in urban environments. As such, urban runoff management agencies are expected to investigate and implement as necessary new sediment treatment control measures within stormwater conveyances.
- Urban stormwater runoff treatment via municipal wastewater treatment systems—Opportunities to route dry weather and/or wet weather flows from storm drain systems to wastewater systems should be investigated, pilot tested, and implemented where feasible. This includes consideration of dry weather flows, including possible street washing flows, and wet weather flows, particularly first flush flows.

- Abatement of PCBs in runoff from all areas
  - Control/oversee removal and disposal of PCBs-containing equipment—PCBs-containing equipment remains in use with varying degrees of regulatory oversight depending on equipment type and PCBs concentration. Containment of the PCBs varies depending on equipment uses and regulatory oversight. These materials may therefore be released to the environment and enter stormwater conveyances. As such, urban runoff management agencies are expected to conduct industrial inspections to identify and cause replacement of PCBs-containing equipment remaining in the urban environment.
  - Control/manage removal and disposal of PCBs from building materials and waste during demolition/remodeling – PCBs-containing building materials remain in use with little regulatory oversight. With aging, or construction or demolition activities, these materials may be released to the environment and enter stormwater conveyances. As such, urban runoff management agencies are expected to conduct or cause to be conducted a program to manage PCBs in building materials through their inspection programs.

These BMPs and control measures are expected to be implemented in phases as NPDES permits are issued and reissued. In the first five-year permit term, stormwater permittees will be required to implement control measures on a pilot scale to determine their effectiveness and technical feasibility. Permit requirements will include the following:

- Ensure that industrial inspectors can identify PCBs or PCB-containing equipment during inspections.
- Conduct pilot studies to evaluate the presence of PCBs in building materials (e.g. caulks and adhesives) and develop BMPs to prevent PCBs from being released into the environment during building demolition and renovation.
- Conduct pilot studies to develop and implement best management practices (BMPs) and control measures where areas where elevated PCBs are detected in storm drain sediments, e.g., street cleaning, on-site treatment, investigate on land PCBs-contaminated soils and/or sediments and diversion of stormwater for treatment by wastewater treatment facilities.
- Evaluate the effectiveness of the BMPs and control measures and any environmental impacts associated with their implementation as part of the pilot studies.

The second five-year term permit requirements will be based on the knowledge gained during the first permit term and will call for strategic implementation of the BMPs and control measures identified as effective and that will not cause significant adverse environmental impacts based on the pilot studies conducted during the first permit term. The second term permit will also require development of a plan to fully implement control measures that will result in attainment of allocations, including an analysis of costs, efficiency of control measures and an identification of any significant environmental impacts.

Subsequent permits will include requirements and a schedule to implement technically feasible, effective and cost efficient control measures to attain allocations. If as a consequence, allocations cannot be attained, the Water Board will take action to review and revise the allocations and these implementation requirements as part of adaptive implementation.

In addition to controlling PCBs sources and discharges, urban stormwater management agencies will be required to develop and implement a monitoring system to quantify PCBs loads and the loads reduced through treatment, source control and other actions. The current limited monitoring of PCBs loads from local tributaries by the RMP is not sufficient to quantify PCBs loads from urban stormwater runoff and the loads reduced from urban stormwater runoff control actions. The Water Board will encourage and accept a region-wide design via augmentation of the current RMP as a means of developing and implementing the required PCBs loads monitoring.

Urban stormwater management agencies will also be required to support actions to manage the health risks of consuming PCBs-contaminated Bay fish; and conduct or cause to be conducted monitoring, and studies to fill critical data needs identified in the Adaptive Implementation section.

Urban runoff management agencies have a responsibility to oversee various discharges within the agencies' geographic boundaries. However, if it is determined that a source is substantially contributing to PCBs loads to the Bay or is outside the jurisdiction or authority of an agency the Water Board will consider a request from an urban runoff management agency which may include an allocation, load reduction, and/or other regulatory requirements for the source in question.

Urban Stormwater Runoff Treatment by Municipal Wastewater Dischargers

Routing of urban stormwater runoff through municipal wastewater treatment facilities is a means of reducing PCBs, and other particle-associated pollutant loads to the Bay. The wasteload allocation for stormwater runoff treatment via municipal wastewater treatment systems provides

an incentive to implement this control measure. As described previously, proposed implementation requirements for municipal wastewater and urban stormwater runoff discharges include investigating the feasibility and PCB-removal efficiency of intercepting and routing and treating urban stormwater runoff via wastewater treatment systems, and implementing this control measure where feasible.

A wastewater discharger that accepts urban stormwater runoff will be provided an augmentation of its individual wasteload allocation that accounts for the resulting load increase. The Water Board will consider either amending individual NPDES permits or adopting a separate NPDES permit as an implementing mechanism for this wasteload allocation that would allow wastewater dischargers opportunity to apply for a portion of this wasteload allocation to account for an increase in load associated with treating urban stormwater runoff.

11.2. Internal Sources

Internal sources of PCBs have not been allocated a load. However, we expect reductions in the mass of PCBs from these source categories based on sediment removal activities or other treatment controls. Reduction of the in-Bay PCBs mass will help accelerate the recovery of the Bay from its current impairment, by driving the overall sediment PCBs concentration towards the sediment concentration goal of 1 µg/kg.

The following sections outline the proposed adaptive implementation approach to control internal sources of PCBs.

In-Bay PCB-Contaminated Sites

A number of former and current on-shore industrial and military facilities, and associated PCBs-contaminated in-Bay sediments, exist throughout the Bay. Data are not available for every site to determine whether it is currently discharging to the Bay or contributing significantly to the impairment of the Bay. The State Board adopted a statewide Consolidated Cleanup Plan (Water Code Section 13394) in 2004. Some of the sites listed in Table 12 of this report are identified in the Statewide Consolidated Cleanup Plan. While past and/or current loads of PCBs from these sites to the Bay are difficult to quantify, potentially bioavailable PCBs in off-shore sediments pose a threat to human health and the environment. As such, cleanup of these sites is a Water Board priority and many cleanups are underway. The Water Board will maintain an inventory of contaminated sites (see Table 12) and continue to set priorities for investigating and remediating the sites. Prioritization of contaminated sites may result in identifying sites where additional information is needed to determine future actions, as well as sites where sufficient information is available to determine the need for no further actions. Our initial screening focused on identification of in-Bay sites where sediment PCBs concentrations exceeded 180 ug/kg (Table 23). The Water Board will coordinate clean-up actions with U.S. EPA and the Department of Toxic Substances Control, and issue clean-up orders as necessary. Table 23 provides the status of cleanup at these sites.

The proposed approach to cleanup PCBs contaminated sites is consistent with existing efforts. This TMDL will not result in new requirements for selecting site clean-up levels and remedial options. Rather, setting of clean-up levels at contaminated sites will continue to follow current guidance (e.g. DTSC, 1996; U.S. EPA, 1997c; U.S. EPA, 1998) and continue to be derived on a site- specific basis. The sediment goal derived in this TMDL is not a de facto clean-up level for contaminated sites not should it be interpreted as an applicable or relevant and appropriate requirement (ARAR), or a to be determined (tbd) ARAR, rather it represents the desired

conditions that when achieved throughout the Bay will result in attainment of beneficial uses of the Bay.

Table 23- In-Bay PCBs Contaminated Sites

In-Bay contaminated site remediation	Lead Agency	Status
Work Completed		
Emeryville Crescent	Water Board	Completed
Oyster Point/Shearwater (20,100 cyds removed)	Water Board	Completed
Peyton Slough	Water Board	Completed
Redwood City Harbor	U.S. ACE	Completed
Former Hamilton Army Airbase – Coastal Salt Marsh	Water Board	Completed
Moffett Field/NASA Ames-Northern Channel	U.S. EPA	Completed
Work In Progress		
Yosemite Slough Channel	Water Board	Site Investigation
Alameda Naval Air Station Seaplane Lagoon	U.S. EPA	Record of Decision
Hunter's Point Shipyard	U.S. EPA	Feasibility Study in preparation
Moffett Field/NASA Ames-Site 25	U.S. EPA	Feasibility Study in review
Oakland Army Base	DTSC	
Richmond Harbor/Potrero Point	DTSC	
Stege Marsh	DTSC	PCBs Interim Removal Action completed under Water Board lead
Work Not Started		
Cerrito Creek		
Cordonices Creek		
Guadalupe Slough		
Mission Creek		
Oakland Harbor		
Richardson Bay		
San Francisco Airport		
San Leandro Bay		
Vallejo Ferry Terminal		

Contaminated site investigations and evaluation of remedial activities will occur due to existing regulations whether or not called for in this TMDL. Parties responsible for PCBs contaminated sediment sites will continue to be required to gather the following information:

1. Estimate the pre-cleanup and post-cleanup vertical and lateral extent of PCBs in Bay sediments;
2. Estimate the pre-cleanup and post-cleanup mass of PCBs in Bay sediments;
3. Quantify rate(s) of sediment accretion, erosion or natural attenuation;
4. Implement on-land source control measures, if necessary, to ensure that on-land sources of PCBs do not further contaminate in-Bay sediments;
5. Evaluate, post-cleanup, the residual risks to humans and wildlife;

6. Support actions to reduce the health risks of people who consume PCBs-contaminated San Francisco Bay fish;
7. Conduct or cause to be conducted studies to fill critical data needs identified in the Adaptive Implementation section.

If not already completed, these requirements will be incorporated into individual site cleanup plans within five years of the effective date of this TMDL, with full implementation of the actions within ten years of the effective date of this TMDL or as agreed to in the individual site cleanup plan.

Navigational Dredging

Maintenance dredging involves the removal of sediments from navigation channels and the disposal of this sediment at different permitted sites. Dredged sediment from the Bay can be disposed of at upland sites, at in-Bay disposal sites, or at a deep-ocean disposal site (U.S. EPA and U.S. ACE, 1999a; U.S. EPA and U.S. ACE, 1999b). The Long Term Management Strategy for the Disposal of Dredged Material in the San Francisco Bay Region (LTMS) seeks to reduce the total volume of in-Bay disposal from about 2,000,000 cubic yards per year (yd^3/yr) to approximately 1,000,000 yd^3/yr within about 10 years (U.S. ACE, 2001). The lower in-Bay dredge material disposal will result in a net removal of PCBs from the Bay.

In order to ensure that buried PCBs are not being spread out through the Bay via dredge material disposal at dispersive sites, sediments disposed of in Bay should have total PCBs concentrations no greater than that in ambient surface sediments in the Bay. To provide this assurance, we propose that the PCBs concentration in dredged material disposed of in the Bay not exceed the 99th percentile total PCBs concentration of the previous 10 years of Bay surface sediment samples collected through the RMP (excluding stations outside the Bay like the Sacramento River, San Joaquin River, Guadalupe River and Standish Dam stations). Prior to disposal, the material should be sampled and analyzed according to the procedures outlined in the 2001 U.S. Army Corps of Engineers document "Guidelines for Implementing the Inland Testing Manual in the San Francisco Bay Region." All in-Bay disposal of dredged material shall comply with the Dredging and Disposal of Dredged Sediment program described in Section 4.20 of the Basin Plan and the Long Term Management Strategy for the Disposal of Dredge Material in San Francisco Bay.

In addition to controlling PCBs sources and discharges, dredged material dischargers will be required to support actions to reduce the health risks of people consuming PCBs-contaminated Bay fish, and to conduct or cause to be conducted studies to fill critical data needs identified in the Adaptive Implementation section.

11.3. Risk Management

Load reductions and consequent attainment of the numeric target to support fishing in the Bay as a beneficial use will take time to achieve. However, there are actions that should be undertaken immediately to help manage the risk to consumers of PCBs-contaminated fish. The Water Board will work with the California Office of Environmental Health Hazard Assessment, the California Department of Toxic Substances Control, the California Department of Health Services, and dischargers to pursue risk management strategies. The risk management activities will include the following:

- Investigate and implement actions to address public health impacts of PCBs in San Francisco Bay/Delta fish, including activities that reduce actual and potential exposure of

and mitigate health impacts to those people and communities most likely to be affected by PCBs in San Francisco Bay caught fish, such as sport and subsistence fishers and their families;

- Provide multilingual fish-consumption advice to the public to help reduce PCBs exposure through community outreach, broadcast and print media, and signs posted at popular fishing locations;
- Regularly inform the public about monitoring data and findings regarding hazards of eating PCBs-contaminated fish; and
- Perform special studies needed to support health risk assessment and risk communication.

11.4. Critical Data Needs

Data and other information are needed to assess both the progress toward attainment of the numeric fish tissue target and to inform the adaptive implementation of the TMDL. Dischargers will therefore be required to support the following studies to fill critical data needs.

- PCBs mass budget modeling and food web model improvements – Model refinements are needed to improve our ability to predict recovery rates of the Bay from impairment by PCBs, and to help focus implementation actions on those with the most potential for success. Better models could lead to a recalculation of the TMDL, and revised load and wasteload allocations. The TMDL will be revised if improved models predict that the current TMDL will not result in attainment of the fish tissue target. Improved models will also help evaluate whether implemented actions are effective and sufficient, and could direct the need for different or expanded implementation action. Models are also needed to improve our understanding of the role in-Bay PCBs-contaminated sites play in the Bay's recovery.

- Rate of natural attenuation of PCBs in the Bay environments – Natural attenuation is a component of the implementation of the TMDL. Attenuation rates greatly affect model prediction of recovery of the Bay from PCBs impairment. A better understanding of local rates of natural attenuation is needed in order to predict with more certainty the recovery time of the Bay, and to inform whether more, less or different implementation actions are needed. A refined understanding of the PCBs natural attenuation rate in water and sediment could lead to revised load and wasteload allocations. Specifically, load allocations to the Central Valley and navigational dredging currently rely on natural reduction of PCBs and new findings could result in load reduction actions implementation.

11.5. Monitoring

Monitoring is needed to demonstrate progress toward attainment of allocations and the numeric target. The discharger-funded RMP currently monitors PCBs in San Francisco Bay fish, sediments, and water. The Water Board will call on dischargers to support the RMP to monitor PCBs in fish (as specified in the numeric target), in sediments and water, at a spatial scale and frequency to track trends in the decline of PCBs and to demonstrate attainment of the numeric fish tissue target and sediment concentration goal. Monitoring will provide information on the progress in attaining the TMDL target, and therefore the success of actions implemented. Long term data are needed to verify the recovery rate of the Bay, and compare this with a model predicted recovery rate. These efforts will also inform whether the actions implemented are effective in reducing PCBs to the TMDL target or whether further actions are required. A refined

understanding of long term PCBs concentration trend data in water, sediment and biota could lead to a recalculation of the TMDL, and revised load and wasteload allocations.

Monitoring of load allocations to demonstrate progress towards attainment shall be conducted by municipal and industrial wastewater dischargers and by urban runoff stormwater agencies. The RMP also conducts regular monitoring of PCBs loads from the Central Valley and some limited monitoring of PCBs loads from local tributaries. The current limited monitoring of PCBs loads from local tributaries by the RMP is not sufficient to quantify PCBs loads from ~~urban~~ stormwater runoff or the loads reduced from urban stormwater management control actions. As described in the discussion of implementation of Central Valley allocations, the Water Board will also call on dischargers, via the RMP, to verify ongoing loads and load reductions to allow evaluation of trends in the loads of PCBs from the Central Valley watershed and to confirm that loads are being reduced due to natural attenuation.

11.6. Adaptive Implementation

Adaptive implementation entails taking immediate actions commensurate with available information, reviewing new information as it becomes available, and modifying actions as necessary based on the new information. Taking immediate action allows progress to occur while more and better information is collected, and the effectiveness of current actions is evaluated (NRC, 2001). In this manner, this TMDL will be implemented in phases starting with actions described in each source category, risk management, monitoring, and critical data needs section above with subsequent modifications and phases based on improved knowledge of PCBs sources, control measures, and fate in the environment. In particular, there are four principal ongoing activities that may necessitate TMDL adaptation.

First, the ongoing monitoring being conducted through the Regional Monitoring Program will allow us to improve our understanding of the rate of natural attenuation and recovery and our understanding of patterns of PCB concentrations in tissue and sediment. Interpretation of these data may result in improved ways of expressing TMDL targets or of evaluating them using monitoring data.

Second, there are ongoing efforts to improve understanding of the fate and transport of PCBs in the Bay and to model the relevant biological, physical and chemical processes. Improved modeling capabilities combined with bathymetric and sediment core data allow us to better predict how the Bay will respond to management actions and changing conditions. This will, in turn, inform the need to adapt implementation schedules.

Third, we will continue to pursue clean-up of in-Bay contaminated sites. By evaluating the degree to which in-Bay contaminated sites can be remediated and evaluating the resultant impact on PCB levels in the Bay and its biota, we will gain valuable insights relevant to determining the pace at which the beneficial uses of the Bay will be restored.

Last, the success of the TMDL depends in large part on concerted efforts to locate and evaluate opportunities to control on-land PCB sources and the PCB load conveyed to the Bay via urban stormwater runoff. The progressive approach for addressing this challenge is described in the stormwater runoff implementation section above in more detail.

We will be assessing progress in each of these four areas on a continuing basis to determine if the quantity and quality of emerging information are sufficient to warrant adaptation of the TMDL.

The Water Board will adapt the TMDL and implementation plan to incorporate new and relevant scientific information such that effective and efficient measures can be taken to achieve the TMDL allocations and numeric fish tissue target. The Water Board, via an annual report by Water Board staff on TMDL implementation progress, will evaluate new and relevant information from implementation actions, monitoring, special studies, and scientific literature. Within ten years of the effective date of the TMDL, any necessary modifications to the targets, allocations, or implementation plan will be incorporated into the Basin Plan. The Water Board will make new information available to the public and will allow opportunities for public participation regarding the results of the periodic review of the TMDL, attainment of load allocations, attenuation of PCBs, or revised TMDL derivations.

The Water Board will adapt the TMDL and implementation plan to incorporate new and relevant scientific information such that effective and efficient measures can be taken to achieve the allocations and numeric fish tissue target. The Water Board staff will present an annual progress report to the Water Board on implementation of the TMDL that includes evaluation of new and relevant information that becomes available through implementation actions, monitoring, special studies, and the scientific literature, and within ten years of the effective date of the TMDL, the Water Board will consider amending the PCBs TMDL and implementation plan as necessary to ensure attainment of water quality standards in a timely manner while considering the financial and environmental consequences of new control measures.

In particular, achievement of the allocations for stormwater runoff, which is projected to take 20 years, will be challenging. Consequently, the Water Board will consider modifying the schedule for achievement of the load allocations for stormwater runoff provided that dischargers have complied with all applicable permit requirements and all of the following have been accomplished relative to that source category or discharger:

- A diligent effort has been made to quantify PCBs loads and the sources of PCBs in the discharge;
- Documentation has been prepared that demonstrates that all technically and economically feasible and cost effective control measures recognized by the Water Board as applicable for that source category or discharger have been fully implemented, and evaluates and quantifies the comprehensive water quality benefit of such measures;
- A demonstration has been made that achievement of the allocation will require more than the remaining ten years originally envisioned; and
- A plan has been prepared that includes a schedule for evaluating the effectiveness and feasibility of additional control measures and implementing additional controls as appropriate.

12. Regulatory Analyses

This section provides the regulatory analyses required to adopt the Basin Plan amendment to establish the PCBs TMDL. It includes a discussion of the results of an environmental impact analysis and a discussion of economic considerations. The environmental impact analysis is required under the California Environmental Quality Act (CEQA) when the Water Board adopts a Basin Plan amendment under the Water Board's certified regulatory program (California Public Resources Code § 15251 [g]). The environmental analysis also satisfies Public Resources Code § 21159 which applies when adopting rules or regulations requiring installation of pollution control equipment, compliance with a performance standard, or treatment requirement. It evaluates the reasonably foreseeable environmental impacts of the methods of compliance with the implementation plan in Section 11, and describes the reasonably foreseeable and feasible mitigation measures that could be used to reduce significant environmental impacts. The discussion of economic considerations is provided in accordance with Public Resources Code § 21159 [a] [3] [c] which requires an analysis of economic factors related to costs of implementation of the new rules or regulations. This Staff Report, including the CEQA checklist and these analyses, constitute a substitute environmental document.

The results of the assessment of environmental impacts and economic considerations show that the Basin Plan amendment is not likely to result in long-term, significant impacts and will not cause immediate, large scale expenditures by the entities required to implement the PCBs TMDL. Many of the actions identified in the Basin Plan amendment to implement the PCBs TMDL are built on existing efforts to improve management of urban runoff, treatment of wastewater, and to remediate upland and in-Bay PCBs-contaminated sites. Many of the actions will be implemented in a phased manner after pilot studies are conducted to evaluate those specific BMPs or control measures that are effective both from a load reduction perspective and from a cost perspective. This section analyzes environmental impacts for many of the potential individual projects that may be developed to implement the PCBs TMDL to the extent such impacts can be identified at this time. At such time as individual projects are proposed, the impacts of those individual projects will be evaluated as to location, specific technologies, size, quantity, feasibility and any mitigation necessary to address the identified environmental impacts. These project-specific impacts are too speculative to evaluate at this time. We anticipate that these projects would be required to mitigate any potential environmental impacts. Mitigation measures that are both feasible and already in common use as standard industry practice, are discussed in this analysis of environmental impacts and are expected to reduce all potentially significant impacts to less than significant levels.

12.1. Environmental Impact Analysis: CEQA Compliance

The Water Board is the lead agency responsible for evaluating the potential environmental impacts of the proposed Basin Plan amendment to establish the PCBs TMDL and implementation plan for San Francisco Bay. To accomplish this evaluation, a standard CEQA checklist was prepared (Appendix A) along with an explanation of the results of the analysis. It includes a discussion of the potential environmental impacts as well as mitigation measures that would be used to eliminate or reduce the impacts. Because the Water Board cannot mandate adoption of any specific compliance method, the analysis provided here should be viewed as comparable to a Tier 1 environmental impact review. It does not and cannot present detailed analysis of project-specific

impacts at specific locations in the San Francisco Bay watershed, since such projects have yet to be defined, and thus, any analysis would be speculative at this time. Our assessment evaluates likely impacts of reasonably foreseeable means of compliance and the reasonably foreseeable mitigation measures that would reduce any potentially significant impacts.

12.2. Project Description

Sections 2.2 and 3 of this Staff Report present the project definition, objectives and environmental setting that provide the basis for the CEQA evaluation. The project is composed of a Basin Plan Amendment that includes a TMDL of 10 kg/yr for San Francisco Bay based on a numeric target for fish tissue (10 ug/kg) protective of human health and wildlife beneficial uses and allocates the TMDL among the various external sources. This target is based on evaluating the lifetime incremental cancer risk of one in a 100,000 for an adult recreational sport fisher. It is derived from assuming a 70 kilogram person, consuming on average 32 grams of fish caught in San Francisco Bay per day, over a lifetime of 70 years. The fish consumption rate of 32 g/day is based on a San Francisco Bay survey (SFEI 2000a). This consumption rate represents the 95th percentile upper bound estimate of consumption for local sport fish consumers based on their four-week recall of eating Bay-caught fish.

The Basin Plan amendment includes: a plan to implement the TMDL using a phased approach; a monitoring program to evaluate progress towards achievement of the target; and a plan and schedule for additional studies to improve our technical understanding relevant to the PCBs TMDL and implementation plan. It also requires reviewing progress toward meeting targets, implementing actions, and evaluating continued appropriateness and effectiveness of actions. The phasing of the implementation plan involves conducting pilot studies and/or feasibility studies for some actions, prior to requiring those actions to be undertaken. The proposed implementation schedule also provides a realistic timeframe in which to complete the tasks required by the TMDL and a timeframe to evaluate the need for modifications to the TMDL and the implementation plan.

12.3. Project Objectives

The primary objective of the project is to achieve the PCBs fish tissue target specified by the TMDL in order to restore the currently impaired beneficial uses of commercial and sport fishing in the Bay.

The objectives of the project with respect to PCBs, which are most relevant to the analyses of environmental impacts and alternatives, are listed below (the entire list is found in Section 2.2):

- Attain numeric PCBs water quality criteria and the bioaccumulative narrative water quality objective established for the Bay in as short a time frame as feasible.
- Protect beneficial uses of the Bay related to sport fishing and wildlife
- Provide interim risk management programs to protect recreational sport fishing anglers.
- Set target(s) to attain relevant water quality objectives in all parts of the Bay.
- Avoid imposing regulatory requirements more stringent than necessary to meet the targets designed to attain water quality standards.

- Reduce loading of PCBs to the Bay from external sources.
- Comply with the Clean Water Act requirement to adopt a TMDL for a 303 (d) listed impaired water body.
- Initiate actions to reduce PCBs discharges, while continuing to accommodate new information on PCBs fate in the environment.

12.4. Reasonably Foreseeable Methods of Compliance

Implementation Plan requirements not evaluated in this CEQA analysis
Some of the TMDL implementation plan requirements of the Basin Plan amendment are not evaluated in this Section of the Report because they are requirements that do not cause a direct physical change in the environment or a reasonably foreseeable indirect physical change in the environment. Those requirements include evaluations of potential actions, monitoring, participation in additional research to fill critical data needs, and development of public outreach and human health risk management programs.

Implementation Plan requirements evaluated in this CEQA analysis
Implementation measures that are reasonably foreseeable methods of compliance that result in a physical change in the environment are reviewed in this analysis. An explanation of what is evaluated in this analysis is provided below and organized by source category.

External Sources

Wastewater and Stormwater Implementation

The implementation plan for the TMDL is considered a phased plan because many of the actions necessary to achieve the TMDL allocations will require an evaluation as part of a pilot study or feasibility study prior to implementation. Many of the actions that are required to achieve reductions in PCBs loading to the Bay will be required as part of an NPDES permit for municipal and industrial wastewater dischargers or stormwater runoff management agencies.

The NPDES permit requirements for urban stormwater runoff would be implemented in a phased approach. The first five years of TMDL implementation are anticipated to include pilot studies that will test a variety of control measures in order to implement measures that will achieve load allocations in the most effective and cost-efficient manner. The second five-year permitting period will feature strategic implementation of those measures found to be effective through pilot testing conducted in the first permit term. In 10 years, it is expected that the permit would require a schedule for full implementation of the technically practicable, effective and cost efficient BMPs and control measures to the maximum extent practicable. It is speculative at this time to identify specific individual projects that will be implemented based on the results of the pilot studies. Instead we have has compiled a general list of reasonably foreseeable compliance measures that may be considered as part of a pilot study or may eventually be implemented to attain the load allocations identified in the Basin Plan amendment for the external sources of municipal and industrial wastewater, and urban stormwater runoff.

The general list of reasonably foreseeable means of compliance evaluated in this environmental impact analysis for these source categories includes the following:

- Removal and disposal of PCBs-containing equipment
- Removal and disposal of PCBs from building materials
- Removal and disposal of PCBs residuals in sewer lines
- Survey and remediation of contaminated soil or sediment in public rights-of-way, wastewater conveyances, and private properties
- Increased street cleaning (includes sweeping or washing)
- Storm drain and inlet maintenance (above and beyond normal practices)
- Construction, operation, and maintainance of facilities/units to intercept, divert and treat storm water (e.g., on-site system retrofits including detention basins, infiltration basins, sand filters, bioretention drainage areas etc.)
- Strategically routing/diverting stormwater to POTWs (i.e., municipal wastewater treatment plants) for treatment

These measures are evaluated in this environmental analysis without much detail as to location, size or number, or location-specific feasibility, since they will be evaluated in the future as part of the pilot projects undertaken by the dischargers. BMPs and control measures to be evaluated as part of a pilot study include both potentially new activities as well as augmentation of existing actions. For example, the number and extent of projects to remove and dispose of PCBs-containing equipment and building materials containing PCBs is currently unknown. Storm drain maintenance and street cleaning are all conducted as part of normal municipal stormwater programs. They are included in this analysis because adoption of the PCBs TMDL may increase their frequency.

Pilot studies will be required under a future NPDES stormwater permit to evaluate the feasibility of the construction, operation, and maintenance of new facilities to intercept, divert, and treat stormwater. Therefore, the number and locations of these projects are uncertain. No specific type of project is required; rather this is an implementation measure that could be selected if strategically feasible in some locations. The pilot studies are intended to analyze the environmental impacts of implementing these types of measures.

No specific project to route stormwater to a wastewater treatment plant is currently required. Studies are underway by the San Francisco Estuary Institute under funding from the State Water Resources Control Board to investigate opportunities, i.e., locations of PCB-contaminated stormwater runoff occurring in the vicinity of pump stations. Based on the results of these studies, pilot projects could be pursued by the stormwater management agencies or municipal wastewater treatment facilities.

Central Valley

No actions for the Central Valley watershed load allocations are required other than monitoring, and thus, there are no reasonably foreseeable compliance measures to evaluate here.

Internal Sources

In-Bay Contaminated Hot Spots

There are no load allocations to internal sources, therefore no new actions are explicitly required of any regulated party by this TMDL for in-Bay PCB-contaminated hot spots.

Projects to remediate in-Bay PCB-contaminated sediments have been completed in some locations, are in-progress at others, and may occur in the future for sites identified in Table 23 of this Report.

The environmental impacts of cleanup activities at some of the sites that were identified as part of the Bay Protection Toxic Cleanup Program were analyzed in a programmatic level environmental evaluation by the State Water Resources Control Board during development of the Consolidated Toxic Hot Spots Clean Up Plan (SWRCB, 2003). The environmental evaluation concluded that the action of adoption of the Consolidated Cleanup Plan by the SWRCB will not result in significant adverse impacts. Any adverse environmental effects that may occur due to remediation under the proposed Plan would be substantially the same as environmental effects of remediation if the Plan is not adopted. This is because the regulatory framework requiring remediation and the regulatory framework protecting the environment against adverse affects of remediation, are unchanged by the adoption of the proposed Plan. In other words, the Plan will neither affect the requirements for remediation nor the way in which the environment is protected against adverse effects through permitting, CEQA, Waste Discharge Requirements, Cleanup Orders, etc. This is also true in the case of this PCBs TMDL.

Remediation of PCBs-contaminated hot spots may support attainment of the fish tissue target and TMDL, based on decreases in the mass of PCBs in localized in-Bay surface sediments. Despite the fact that these actions are not required by this Basin Plan amendment, there may be a fair argument that such actions may occur due to the project or may receive greater attention and resources from state, federal or local agencies and thus the number of projects in an active stage at any given time may be accelerated, thus the environmental impacts of selected potential remedial alternatives that involve a potential physical change in the environment are evaluated in this section. This analysis is a general evaluation of environmental impacts that could occur due to remediation of PCBs contaminated sediment. A feasibility study is anticipated to be required prior to implementing any remedial alternative. Some potential remedial alternatives, such as monitored natural recovery, are not evaluated here because they do not involve a physical change in the environment. The fact that they are not evaluated in this report has no bearing on their potential effectiveness as a remedial alternative.

Detailed clean-up plans would also require an assessment of environmental impacts that would be conducted by the lead agency at time of review and approval. These projects could be carried out under the authority of the Water Board, DTSC, US EPA, or in some cases local agencies. In each case, the lead agency is responsible for ensuring environmental impacts are avoided, minimized, and mitigated.

The reasonably foreseeable means of compliance evaluated in this environmental impact analysis for this source category include the following:

- Remediation of contaminated sediment with dredging and appropriate disposal

- Remediation of contaminated sediment with dredging, appropriate disposal, and capping of residual contamination in-situ

Navigational Dredging

There is no load allocated to navigational dredging, instead the TMDL implementation plan establishes a methodology to determine whether sediments dredged to support navigation could be disposed of in-Bay. Application of the methodology to navigational dredging project could result in less material being allowed to be disposed of in-Bay over time if the ambient concentration of PCBs in sediments decreases. A Basin Plan amendment adopted by the Water Board, and approved by State Board on November 6, 2007, sets a long-term overall goal for in-Bay disposal of dredged material at designated in-Bay disposal sites at one mcy (or less) per year to be attained step-wise over a 12-year period. This goal requires a reduction of in-Bay disposal. The environmental impacts of reductions in-Bay disposal were evaluated in the Long Term Management Strategy for Dredged Material Environmental Impact Statement/Programmatic Environmental Impact Report (US EPA 1996) and was identified as being more environmentally beneficial than allowing in-Bay disposal. Navigation dredged material not disposed of in-Bay is likely to be taken to the deep ocean disposal site. The environmental impacts of the implementation plan actions for navigational dredging are therefore not further evaluated in this analysis.

12.5. Regulatory Framework

Agencies with permit review or approval authority over the implementation of reasonably foreseeable means of compliance include the following:

San Francisco Bay Water Board

Issues Clean Water Act Section 401 Water Quality Certifications required to conduct dredging or filling of waters of the U.S., including San Francisco Bay; NPDES permits, WDRs and Cleanup and Abatement Orders for discharges that pollute or threaten to pollute surface or groundwater, and other orders as necessary to enforce the Porter Cologne Water Quality Control Act of 1969.

Bay Conservation and Development Commission

Permits actions subject to the San Francisco Bay Plan; issues consistency determinations with the Coastal Zone Act Reauthorization Amendments of 1990.

The Department of Toxic Substances Control

Issues orders in accordance with Chapter 6.8 of Division 20 of the California Health and Safety Code.

U.S. Army Corps of Engineers

Issues Clean Water Act section 404 permits for dredging and fill projects in navigable waters.

U.S. Fish and Wildlife Service

Conducts section 7 consultation for effects to listed federal species.

National Oceanic Atmospheric Administration/National Marine Fisheries Service (NOAA/NMFS)
Conducts section 7 consultation for effects to migratory and endangered fish species

California Department of Fish and Game
Provides section 2081 consultation for effects to listed species.

Municipalities/Counties
Issue building and/or grading permits; enforce of noise ordinances

12.6 Environmental Checklist

A significant impact is defined by CEQA as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by a project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance" (14 CCR Title 14, Chapter 3, Article 20, Section 15382. Our analysis, prepared using the CEQA checklist (Appendix A), identified some potentially significant environmental impacts in the areas of air quality, biological resources, hydrology and water quality, noise, and utilities and service systems.

Mitigation Measures
Although some potentially significant impacts have been identified, recommended mitigation measures, many of which are mandatory conditions of local, state, and federal regulations and permits, (see Section 12.5, e.g., mitigation requirements of the Water Board's 401 Water Quality permits) will eliminate entirely or reduce these impacts to a "Less than Significant with Mitigation Incorporated" level. As used in this analysis and as defined by CEQA (Article 20, Section 15370), mitigation can be divided into four types:

1. Avoiding the impact altogether by not taking a certain action or part of an action.
2. Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
3. Rectifying or eliminating the impact over time by preservation and maintenance operations during the life of the action.
4. Compensating for the impact by replacing or providing substitute resources or environments.

It is likely that all of these mitigation strategies will be used alone or in a variety of combinations to address specific impacts associated with individual projects developed as means of compliance with the Basin Plan amendment.

It should be noted that the Water Board will not require any actions or projects to implement the PCBs TMDL that would lead to significant, permanent, negative impacts on the environment. Furthermore, we anticipate that all potentially significant environmental impacts will be mitigated to less than significant levels either through the Water Board's regulatory and permitting authorities or under those of other agencies with jurisdiction in relevant areas, such as U.S. Environmental Protection Agency (U.S. EPA), U.S. Fish and Wildlife Service (USFWS), NOAA/NMFS, Occupational Health and Safety Administration (OSHA), U.S. Army Corps of Engineers (U.S. ACE), California Department of Fish and Game (CDFG), California Department of Toxic Substances

Control (DTSC), and San Francisco Bay Conservation and Development Commission (BCDC).

Results of the Environmental Analysis

The CEQA checklist (Appendix A) summarizes the results of the analysis of potential environmental impacts associated with the reasonably foreseeable means of compliance with the PCBs TMDL as proposed in the Basin Plan amendment. The standard CEQA rating system, which was used here, includes four designations of the level of significance. They are: Potentially Significant (PS), Less than Significant (LTS), Less than Significant with Mitigation Incorporated (LTSM), and No Impact (NI). Table 24 presents those environmental impacts determined to be potentially significant before mitigation and the associated mitigation measures. A discussion of the environmental impact categories on the checklist, level of significance, and recommended mitigation measures follows the summary table.

Table 24-Summary of Potentially Significant Environmental Impacts and Mitigation Measures

Reasonably Foreseeable Compliance Measures Evaluated	Environmental Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance With Mitigation
3. AIR QUALITY 3-B Contribute to Air Quality Violation				
<u>On-Land</u> • Construct, operate, and maintain facilities/units to intercept, divert, and treat stormwater • Remediation of PCBs-contaminated soil or sediment from public rights-of-way, storm water conveyances, and private property • Increased street Cleaning (washing and/or sweeping) • Storm drain and inlet maintenance • Strategically route stormwater to POTWs for treatment	Impacts: • Short-term increase in particulates (PM-10) from vehicle exhaust • Short-term increase in photo-chemical smog constituents from vehicle exhaust • Construction-related dust • Diesel exhaust (nuisance odors)	PS	<u>On-Land</u> Implementation of established BMPs and site-control measures to control and minimize dust include, but not limited to: • Spray down construction sites with water or soil stabilizers • Cover all hauling trucks • Maintain adequate freeboard on haul trucks • Limit vehicle speed in unpaved work areas • Suspend work during periods of high wind or air quality restrictions • Install temporary windbreaks • Use of low sulfur or emulsified diesel fuel to reduce constituents of photo-chemical smog • Use of soot traps on diesel equipment to reduce particulates Additional BMPs for removal of PCBs-containing equipment/building materials: • Use covered dust chutes for removal of material • Create a Soil Management Plan • Test and monitor on-site air quality	LTSM

Reasonably Foreseeable Compliance Measures Evaluated	Environmental Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance With Mitigation
In-Bay • Dredge contaminated sediment with offsite disposal (all methods)	Impacts: • Short-term increase in airborne particulates (PM-10) from barge and equipment exhaust • Short-term increase in photo-chemical smog constituents from barge and equipment exhaust	PS	In-Bay • Use of electric-powered excavating equipment and barges in place of diesel-fueled equipment and barges • Use of low sulfur or emulsified diesel fuel to reduce constituents of photo-chemical smog • Use of soot traps on diesel equipment to reduce particulates	LTSM
4. BIOLOGICAL RESOURCES 4-A, C and D Substantial adverse effect on special status species, federally protected wetlands and substantially interfere with migratory fish				
In Bay • Dredge contaminated sediment (all methods)	Impacts: • Disturbance of near-shore tidal wetlands • Short-term habitat disturbances such as vegetation removal, noise, presence of humans	PS	In-Bay Mitigation measures include: • Use of electric dredging equipment (noise reduction) • Use of clamshell buckets and silt screens to minimize re-suspension of sediment • Vibration dampening material on equipment • Adherence to established state and federal policies for "No Net Loss" of wetlands • Adherence to policy to avoid, minimize, mitigate for projects involving wetlands • Adherence to Water Board permit requirements, USFWS, NOAA/NMFS, CDFG consultation requirements • BMPs to minimize project footprint • Pre-construction survey for endangered or sensitive species • Presence of trained on-site biological monitors • Training for construction personnel to	LTSM

Reasonably Foreseeable Compliance Measures Evaluated	Environmental Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance With Mitigation
			recognize and avoid sensitive species	
8. HYDROLOGY AND WATER QUALITY 8-A Violate any water quality standards or waste discharge requirements				
In-Bay • Dredge PCBs-contaminated sediment with off-site disposal • Dredge (partial) and cap remainder in situ	Impacts: • Short term violations of water quality objectives due to sediment resuspension or creation of decant water	PS	In-Bay Mitigation measures include: • Comply with requirements of water quality certification or waste discharge requirements • Installation of temporary sheet pile enclosure or silt curtains • Treatment or proper disposal of decant water	LTSM
11. NOISE 11-A and B Expose people to noise or groundborne vibration in excess of local ordinances or other standards				
On Land • Removal and disposal of PCBs-containing equipment • Removal and disposal of PCBs-containing building materials • Removal and disposal of PCBs residuals in sewer lines • Remediation of contaminated soil or sediment from public rights-of-way, storm water conveyances, and private property • Construct, operate, and maintain facilities/units	Impacts: • Short-term noise related to construction activities and use of heavy equipment for all projects involving construction and removal and hauling of equipment/material from buildings	PS	On Land Mitigation measures include: • Compliance with local noise ordinances (typical standards include blackouts prohibiting use of heavy equipment on Sundays, early morning hours and evenings all week, and on holidays) • Use of noise dampening material or barriers around equipment • Engine and pneumatic exhaust controls • Locating equipment as far as practical from noise-sensitive areas • Selecting haul routes that affect the lowest number of people	LTSM

Reasonably Foreseeable Compliance Measures Evaluated	Environmental Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance With Mitigation
to intercept, divert, and treat stormwater • Strategically route stormwater to POTWs <u>In-Bay</u> • Dredge PCBs-contaminated sediment with off-site disposal • Dredge (partial) and cap remainder in situ	<u>Impacts:</u> • Use of heavy equipment during dredging and hauling activities could cause short-term, localized noise	PS	<u>In-Bay</u> Mitigation measures include: • Compliance with local noise ordinances (typical standards include blackouts prohibiting use of heavy equipment on Sundays, early morning hours and evenings all week, and on holidays) • Use of noise dampening material or barriers around equipment • Engine and pneumatic exhaust controls • Locating equipment as far as practical from noise-sensitive areas • Selecting haul routes that affect the lowest number of people	LTSM
11. NOISE 11-D Substantial temporary or periodic increase in ambient noise in vicinity of project

sediment from public rights-of-way, storm water conveyances, and private property • Construct, operate, and maintain facilities/units to intercept, divert, and treat storm water • Strategically Route Stormwater to POTWs <u>In-Bay</u> • Dredge contaminated sediment (all methods)			• Selecting haul routes that affect the lowest number of people • Compliance with work window restrictions <u>In-Bay</u> Mitigation measures include: • Compliance with local noise ordinances (typical standards include blackouts prohibiting use of heavy equipment on Sundays, early morning hours and evenings all week, and on holidays) • Use of noise dampening material or barriers around equipment • Engine and pneumatic exhaust controls • Locating equipment as far as practical from noise-sensitive areas	
16. UTILITIES AND SERVICE SYSTEMS 16-B Require or result in construction of new water or wastewater treatment facilities or expansion of facilities, construction of which could cause significant environmental effects				
<u>On-Land</u> • Removal and disposal of PCBs residuals in sewer lines • Construct facilities/units to intercept, divert, and treat stormwater	<u>Impacts:</u> • Projects to remove PCBs residuals from sewer lines may, in a limited number of cases, include replacement	PS	<u>On Land</u> Mitigation measures include: • Compliance with existing, applicable zoning, land-use, permitting requirements of all agencies (local, state, and federal) • Use of standard construction BMPs to avoid and minimize environmental impacts	LTSM

Reasonably Foreseeable Compliance Measures Evaluated	Environmental Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance With Mitigation
• Strategically route stormwater to POTWs	of some sections of the line • Some dischargers may strategically select sites where feasible to intercept and divert storm water to POTWs. Construction is likely to be limited to interception devices and pipelines			
16. Utilities and Service Systems 16-C Require or result in construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects				
<u>On Land</u> • Construction of facilities to intercept and divert urban stormwater runoff • Strategically route stormwater to POTWs	<u>Impacts:</u> • Impacts related to construction activities as described above	PS	<u>On Land</u> Mitigation measures include: • Compliance with existing, applicable zoning, land-use, permitting requirements of all agencies (local, state, and federal) • Use of standard construction BMPs to avoid and minimize environmental impacts	LTSM

Discussion of Environmental Impacts and Mitigation by Checklist Category
In this section, we present the rationale for the ratings of environmental impacts listed in the CEQA checklist (Appendix A) and Table 24-Summary of Potentially Significant Environmental Impacts and Mitigation Measures
. The following sections are numbered to match the checklist.

1. Aesthetics

There are no known or reasonably foreseeable impacts to aesthetic values as a result of compliance with the proposed Basin Plan amendment. Significant impacts to aesthetics would involve introduction of new elements that are substantially out of character with existing land uses or would obscure or alter scenic vistas or occur within a designated scenic area. There are no impacts of this type associated with the reasonably foreseeable means of compliance with the Basin Plan amendment as projects will be implemented in urban industrial areas. Some projects may occur adjacent to the San Francisco Bay. Construction impacts associated with activities along the shoreline may include sheet pile installation, removal of vegetation, sediment stabilization or pipeline installation; these impacts are all short-term activities with no long-term impacts to aesthetic resources.

2. Agricultural Resources

There are no known or reasonably foreseeable impacts to agricultural resources as a result of compliance with the proposed Basin Plan amendment. Significant impacts would occur if a project substantially affected agricultural lands or production processes. The reasonably foreseeable methods of compliance with Basin Plan amendment will be implemented in urban, industrial areas where there are essentially no agricultural land uses.

3. Air Quality

The impacts of a project to air quality in the Bay Area are assessed in relation to guidelines set by the Bay Area Air Quality Management District (BAAQMD 1999) as well as in relation to federal standards established by the Clean Air Act. The air pollutants of greatest concern in the Bay area include ozone and inhalable particulate matter less than 10 microns in diameter (PM_{10}) The San Francisco Bay Area Air Basin is currently classified as a nonattainment area for both the state and federal ozone standards, and for state PM_{10} standards.

In the case of implementation activities related to the PCBs TMDL, emissions of air pollutants are primarily associated with construction activities. Given the temporal aspect of such projects, all reasonably foreseeable impacts would be short-term. Construction activities emissions are included in the emission inventory that is the basis for regional air quality plans and are not expected to impede attainment or maintenance of ozone or carbon monoxide standards in the Bay Area (BAAQMD 1999). Even if emissions are greater than anticipated they would be mitigated as discussed below.

The other pollutant of greatest concern related to construction and possible remediation work is fine particulate matter (<PM_{10}), which is related to activities such as excavation, grading, vehicle travel on paved and unpaved surfaces, and vehicle and equipment emissions. Construction-related emissions of PM_{10} vary depending on a variety of factors including the level of activity, specific operations taking placing, equipment being used, and local soil and weather conditions. Although particulate matter is closely associated with diesel exhaust, it is also formed from tire wear and road dust. However, despite the variability of these influences, the BAAQMD has identified numerous BMPs that are feasible control measures to significantly reduce emissions

of PM_{10} from construction projects. In addition, as of mid-2006, California law requires that all highway diesel fuel sold in the state be Ultra Low Sulfur Diesel (ULSD), which is compatible with existing, in-use vehicles. This formulation also contributes to significant reductions in particulate matter emissions. We anticipate use of this fuel and implementation of BMPs would be required as necessary for projects associated with implementation of the PCBs TMDL. Specific areas of impact and mitigation are described below.

Implementation measures for the PCBs TMDL could lead to projects or other activities with impacts to air quality in the following area as listed on the CEQA checklist:

Would the project:

Impact 3-B: Violate any air quality standard or contribute substantially to an existing or projected air quality violation.

These impacts are rated as potentially significant, but less than significant with mitigation incorporated.

<u>On Land</u>

Impacts: Implementation measures for the PCBs TMDL may include removal of PCB-containing equipment from buildings or other industrial facilities and disposal at appropriate offsite locations. Remediation projects may also be implemented to remove contaminated soils or sediments from public rights-of-way, private property, and sewer lines. Such projects would involve the use of heavy equipment during remediation or hauling and disposal of materials.

Some dischargers responsible for urban runoff/stormwater may decide to conduct additional street cleaning, including street sweeping and washing, or installation of new filtration systems for storm drains. Activities of this type could require more frequent operation of street cleaning machinery than under current maintenance schedules. This increase in maintenance could impact air quality on a short-term, periodic basis. Impacts from construction of other possible control measures, e.g., facilities/units to intercept, divert and treat stormwater may also occur but are expected to be short term in nature and the number and locations of such projects would be speculative, as the feasibility and specific nature of these projects will be evaluated by dischargers through pilot studies.

In addition, in a limited number of instances, dischargers may opt to construct facilities to divert stormwater to municipal wastewater treatment facilities. This is only likely to be undertaken where strategically feasible, such as in locations where municipal wastewater treatment facilities are proximate to areas with significant amounts of PCBs in urban runoff. These efforts would involve construction of pipelines connecting the storm collection system to municipal wastewater treatment facilities.

The implementation measures for the PCBs TMDL described above could contribute to two main types of air quality impacts: increased input of PM_{10} (as described above) from dust (in construction areas) and diesel exhaust emissions as well as an increase in vehicle exhaust emissions that contain air pollutants known to contribute to photo-chemical smog, i.e., ozone, cause annoyance odors, and potentially irritate respiratory systems (particularly in sensitive individuals). The impacts would result from use of heavy equipment during construction and construction activities and from increases in street cleaning, as well. Construction-related impacts would be short-term; impacts associated with increases in street cleaning would also be short-term and minimal, but would occur on a regular basis.

Mitigation: Use of standard BMPs should reduce these impacts to less than significant levels. For particulate matter, the BMPs include, but are not limited to: spraying of construction and staging areas to control dust; covering all hauling trucks and maintaining adequate freeboard; using electric equipment when possible; ceasing construction activities during periods of high wind or episodes of poor air quality as identified by BAAQMD; using covered dust chutes for removal of building materials or equipment; developing and implementing soil management plans at all construction sites, and ongoing testing and monitoring to detect and eliminate airborne release of PCBs during remediation activities. Measures to mitigate vehicle exhaust emissions include use of construction and maintenance equipment with lower emission engines, use of soot traps or diesel particulate filters, and use of emulsified or low sulfur diesel fuel. Over time, vacuum-assisted street sweepers could be incorporated into municipal maintenance vehicle fleets, which generate less dust during operation than conventional street sweeping equipment.

In-Bay

Impacts: Remediation of PCBs-contaminated hot spots located along the margins of the Bay may result in short term impacts to air quality. These activities may involve the use of diesel-powered dredging equipment and barges to transport the dredged material. On a localized, short-term basis, this equipment could contribute particulate matter as well as some of the ozone precursors. In addition, disposal of material from remediation of in-Bay contaminated hot spots would most likely be disposed of at upland facilities. Upland disposal could also result in increased use of diesel-fueled trucks, which would increase the release of exhaust emissions with particulates (including PM_{10}) and the constituents of photo-chemical smog.

Mitigation: It is anticipated that standard BMPs would reduce these impacts to less than significant levels. Measures to mitigate vehicle exhaust and equipment emissions include use of construction and maintenance equipment with lower emission engines, use of soot traps or diesel particulate filters, and use of emulsified or low sulfur diesel fuel. For large-scale dredging project near-shore, use of electric-powered excavating equipment and barges would significantly reduce equipment and vehicle emissions of both particulates and pollutants without a consequent loss of performance.

4. Biological Resources

Impacts to biological resources would be considered significant if the project caused substantial adverse effects directly or indirectly on a special status species (e.g., listed threatened or endangered) or candidate species. Similarly, substantial adverse impacts to sensitive natural communities, including wetlands, are considered significant impacts due to the potential presence of endangered species. Conflicts with various resource policies and plans, such as Natural Community Conservation Plans, Habitat Conservation Plans, or local tree protection ordinances, if substantial, could also be considered significant impacts.

Implementation of the TMDL for PCBs could lead to projects or activities with impacts to biological resources in three areas as listed on the CEQA checklist:

Would the project:

Impact 4-A Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local, regional

plans, policies, regulations or by California Department of Fish and Game or U.S. Fish and Wildlife Service.

Impact 4-B Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or the U.S. Fish and Wildlife Service.

Impact 4-C Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including. but not limited to, marsh, vernal pool, coastal, etc) through direct removal, filling, hydrological interruption, or other means.

These impacts are rated potentially significant for in-Bay projects as explained below. There are no known reasonably foreseeable impacts to biological resources from on-land projects; this rating is also explained below.

On Land

There are no reasonably foreseeable impacts to biological resources from implementation of the PCBs TMDL at on-land sites. Although removal of soil and sediment could occur as part of land-based implementation activities, PCBs are normally found in highly urbanized, industrial areas where the presence of sensitive native species and habitats such as wetlands is improbable. As a result, removal of soil and sediment, PCBs-contaminated equipment and building materials, or other remediation activities at on-land sites are unlikely to disturb any rare or sensitive species or habitats. Implementation measures developed to intercept, and treat stormwater or to divert, urban stormwater runoff to municipal wastewater treatment systems are only likely to occur at strategic locations in highly urbanized areas where urban runoff is identified as a source of PCBs or wastewater treatment facilities are in close proximity, which is most likely to be in urban industrial areas. Given these factors, on-land projects have no reasonably foreseeable impacts to biological resources.

In-Bay

Impacts: Implementation of the PCBs TMDL at in-Bay locations could include remediation of sites with PCBs-contaminated sediments. One approach to site remediation dredging is to remove contaminated sediment with offsite disposal or partial dredging combined with capping the remainder in-situ. In-Bay projects to remove PCBs-contaminated sediment would occur in near-shore areas, in sub-tidal or intertidal habitats or in some cases may include sensitive tidal marsh habitat. The size of these projects varies but is generally limited to less than 10 acres. Benthic macroinvertebrate community impacts in sub-tidal or intertidal habitats are generally short-lived. These communities are not considered to be a sensitive natural community. In marine environments, recolonization of stable benthic communities occurs in 3-5 years. In the San Francisco Bay, benthic communities are subject to perturbations due to the effects of salinity changes, wind-wave action and other Bay phenomenon. Changes in community structure occur naturally and therefore remedial dredging small areas of the Bay is not considered a significant environmental impact on biological resources. In addition, one of the reasons some of these sites are on the list of contaminated hot spots, other than because of PCBs, is because toxicity was identified as a concern for the benthic community.

Dredging for remediation of in-Bay contaminated sediment could cause potential impacts to sensitive anadromous fish species such as sturgeon and coho salmon. Impacts are also possible from removal of tidal marsh vegetation and disrupting waterfowl and other wildlife,

including endangered species that inhabit such ecosystems through short-term noise and disturbance caused by the presence of humans.

Mitigation: Use of BMPs, and compliance with resource agency requirements, including USFWS, NOAA/NMFS and CDFG, as part of formal or informal consultations required prior to issuance of Clean Water Act 401 water quality certifications by the Water Board and 404 dredging and filling permits should mitigate potentially significant impacts related to dredging of sediment contaminated by PCBs to less than significant levels. Specific mitigation measures include adherence to established work windows to time of dredging activities to avoid key seasonal activity of anadromous fish and bird species that inhabit near shore areas either seasonally or year round; use of electric dredge equipment; use of environmental (closed) clamshell buckets on dredges; and noise dampening material on equipment. Electric-powered dredging equipment has been used for San Francisco Bay dredging projects, such as in the Oakland Harbor. However, this technology is only feasible if the amount of material to be removed is very large and the site is close to shore. Projects that disrupt tidal marshes would be required to mitigate for the temporal and any long-term potential losses.

Any or all of these mitigation measures could be imposed on projects through the regulatory authority of the Water Board, under the Clean Water Act 401 water quality certification requirements. Therefore impacts to biological resources from in-Bay dredging projects would be mitigated to less than significant levels with mitigation incorporated.

5. Cultural Resources

Cultural resources encompass archeological, traditional, and built environment resources including, buildings, other structures, objects, districts, and sites. Significant impacts to cultural resources would occur if a project caused substantial adverse changes or destroyed cultural, historical, or archeological resources or disturbed human remains.

Implementation of the PCBs TMDL could lead to projects or activities with impacts to cultural resources in two areas as listed on the CEQA checklist:

Would the project:

Impact 5-B Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5.

Impact 5-D Disturb any human remains, including those interred outside of formal cemeteries.

These impacts are rated as less than significant as explained below.

<u>On Land</u>

Impacts: Implementation measures for the PCBs TMDL could include construction of facilities/units to intercept, divert and treat urban stormwater runoff; strategic routing of stormwater to POTWs, and removal of soil and sediment from PCBs-contaminated sites. Grading and excavation would affect near-surface soils in previously disturbed soils or artificial fill. Activities would not affect native soil or areas of high archeological sensitivity. Therefore these impacts are rated as less than significant.

<u>In Bay</u>

Impacts: Implementation of the PCBs TMDL could include dredging with offsite disposal and dredging combined with capping the remainder in-situ at sites identified as contaminated by PCBs. Such activities are most likely to be located in Bay-margin or near-shore areas adjacent to former industrial areas. It is possible, though unlikely, that dredging activities to remove PCBs-contaminated sediment in near-shore locations could uncover previously unmapped cultural resources, such as archeological sites.

6. Geology and Soils

Significant impacts to geology and soils would occur if a project exposed people or structures to potential, substantial adverse effects related to rupture of a known earthquake fault, other seismic events, or landslides. Significant impacts would also occur is a project caused substantial erosion or was located in areas with unsuitable soils or landslide-prone conditions. There are no known or reasonably foreseeable impacts to geology and soils as a result of reasonably feasible compliance measures to implement the PCBs TMDL. It is unlikely that agencies or other entities responsible for implementing this TMDL would select projects or project locations that would place people or structures at risk from seismic hazards or landslides or would develop projects requiring construction at sites with unsuitable soils.

7. Hazards and Hazardous Materials

This category refers to chemicals that have been discharged to the environment that may adversely impact the environment or human health and safety. Soil and groundwater impacted by such chemicals are also included classification. Significant impacts would occur if a project led to increased hazards to the public or environment from transport, handling, or emissions of such materials or if projects are located near airports and listed hazardous materials sites.

Implementation of the TMDL for PCBs could lead to projects or activities with impacts related to hazards and hazardous materials in the following three areas as listed on the CEQA checklist:

Would the project:

Impact 7-B Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Impact 7-C Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Impact 7-D Be located on a site with is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.

These impacts are rated as less than significant as explained below.

<u>On Land</u>

Impacts: Actions to implement the PCBs TMDL would include handling and transport of equipment, building materials, soil and sediment containing PCBs or other potentially hazardous material. To protect people and the environment from potential impacts from PCBs-containing material they would be handled, transported, and stored in accordance with applicable laws and regulations.

Project workers and supervisors are required to comply with applicable Occupational of Health and Safety Administration (OSHA) training requirements for site clean-up personnel. In addition, site-specific health and safety plans would be prepared in accordance with Title 8, California Code of Regulations, §5L92 and Title 29, § 1910.120 of the Federal Code of Regulations, which govern site clean-up.

In-Bay

Impacts: There are also potential remediation projects at numerous sites within the Bay that have been identified as 'hot-spots' containing PCBs-contaminated sediment. These are also under the regulatory oversight of the Water Board, ACOE, U.S. EPA, DTSC, and BCDC. These sites were listed as toxic hot spots; the sediments are contaminated, but the available data indicate they are not at hazardous levels. Most of the available data for PCBs contaminant levels in bay sediments indicate levels below the hazardous waste designation level of >50 ppm. Many of these sites have other contaminants identified as co-occurring in the sediment; these other contaminants are also generally at levels that are not considered hazardous. Additional site investigation activities are necessary to better understand some of these sites, and feasibility studies would also be required, thus analyzing for the potential that some hazardous materials may be associated with these sites is speculative at this time.

To protect people and the environment from potential impacts from PCBs-contaminated sediment, the sediment would be handled, transported, and stored in accordance with applicable laws and regulations.

Project workers and supervisors are required to comply with applicable Occupational of Health and Safety Administration (OSHA) training requirements for site clean-up personnel. In addition, site-specific health and safety plans would be prepared in accordance with Title 8, California Code of Regulations, §5L92 and Title 29, § 1910.120 of the Federal Code of Regulations, which govern site clean-up.

8. Hydrology and Water Quality

Significant impacts to hydrology and water quality would occur if a project substantially alters existing drainage patterns, alters the course of a river or steam, violates water quality standards, or creates or contributes to runoff that would exceed local stormwater drainage systems. Significant impacts would also occur if a project placed housing or other structures within the 100-year flood plain, or exposed people or structures to significant risks from flooding, seiches, or tsunamis. There are no known, reasonably foreseeable impacts to hydrology and water quality from the PCBs TMDL as explained below.

Would the project:

Impact 8 – B Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted?

On Land

Implementation of the PCBs TMDL may include remediation projects involving removal of PCBs-contaminated soil and sediment. These projects could include activities such as excavation and backfill. They would not result in permanent changes to drainage patterns. In

addition, because PCBs-contamination is most closely associated with their use in equipment such as transformers and building materials in older, highly urbanized, industrial areas, they are unlikely to occur in areas where hydrological changes or proximity to streams is of concern. Furthermore, the purpose of the PCBs TMDL and implementation plan is to attain water quality standards.

In-Bay

Remediation projects to remove PCBs-contaminated sediment through dredging are on-going in a number of locations along the Bay margin; some sites are the subject of feasibility studies and others are at different stages of remediation. These projects are being undertaken under regulatory programs other than the PCBs TMDL and are not required by this TMDL. To the extent that the existing pace of cleanup is affected by this TMDL, it is anticipated that any new remediation activities for sites not currently being worked on could result in potentially significant impacts to water quality due to resuspension of contaminated sediments in the water column.

Mitigation: Projects to remediate PCBs-contaminated sediment in hot spot sites through dredging or partial dredging and capping, would require a water quality certification under Section 401 of the Clean Water Act, or waste discharge requirements issued by the Water Board and permit conditions to ensure that there are no violations of water quality. Examples of mitigation measures include the use of temporary sheet pile enclosures to prevent tidal action or deployment of silt curtains to protect water quality. In addition decant water resulting from hydraulic dredging activities would need to be treated prior to discharge into the environment or properly disposed of. Potentially localized short term impacts would be mitigated by these actions. In addition, these types of remediation activities are expected to result in improved water quality in the long-term. Therefore, impacts to hydrology and water quality from in-Bay dredging projects would be mitigated to less than significant levels with mitigation incorporated.

9. Land Use and Planning

Significant impacts to land use and planning would occur if a project physically divided a community, conflicted with a land use plan, policy or regulation, or caused conflict with a habitat conservation plan. There are no projects related to the PCBs TMDL that would be of a type or scale to cause any impacts in this category. Projects anticipated by the PCBs TMDL implementation plan would occur in urban or industrial areas or on the Bay margin and are not expected to result in substantial changes to established communities or land use patterns. Impacts to land use and planning are expected to be less than significant. Pilot studies to evaluate stormwater control measures, such as use of detention basins, will be conducted by land use agencies, i.e., municipalities and counties, and compatibility with land use will be evaluated as part of those pilot/feasibility studies. It is not reasonably foreseeable that large scale implementation of stormwater detention basins will occur as a result of this TMDL as it not feasible in a densely populated urban areas. The locations of such control measures are not specifically required by this project, and therefore, analyzing the impacts would be speculative at this time.

10. Mineral Resources

Significant impacts to mineral resources would occur if a project resulted in the loss of a mineral resource of value locally, regionally, or statewide. There are no projects related to the PCBs TMDL that would be of a type or scale to cause any impacts in this category. None of the PCBs-contaminated sites are known to occur on land identified as a mineral resource of local,

regional, or statewide significance. There are no known or reasonably foreseeable impacts to mineral resources as a result of compliance with the PCBs TMDL.

11. Noise

Significant impacts from noise would occur if a project exposed people to noise or groundborne vibration in excess of excess of established standards in a local general plan or noise ordinance or resulted in substantial permanent increase to ambient noise levels. Significant impacts can also occur if a project causes substantial temporary or periodic increases in noise or if a project is located in the vicinity of an airport and would expose people residing or working in the project area to excessive noise levels.

Reasonably foreseeable means of compliance with the PCBs TMDL at on land locations include projects for removal and disposal of PCBs-containing equipment and building materials; remediation of PCBs-contaminated soil or sediment in public rights-of-way; storm water conveyances; and private property; increased street cleaning (sweeping and washing); storm drain and inlet maintenance above what is currently done. Other possible means of compliance include projects to construct, operate, and maintain facilities/units to intercept, divert, and treat stormwater (e.g., pipelines, detention basins, underground sand filters). For in-Bay control of sources of PCBs, potential means of compliance include projects to dredge PCBs-contaminated sediment. These projects could employ a variety of methods including dredging combined with capping. A small percentage of material removed by these projects may require disposal at approve facilities at upland sites. Noise impacts related to the TMDL are primarily short-term and related to construction activities.

According to the Federal Transit Administration's guidelines for evaluation of noise and groundborne vibration associated with construction activities, assessments of noise and vibration during construction are dependent upon a number of factors. These include proximity to sensitive receptors (schools, museums, some types of parks), characteristics of the soil and rock substrate to transmit vibration, sound-proofing characteristics of buildings, and the degree of noise already present in an area. It is difficult to determine the extent of noise impacts since site-specific factors are not currently known. In addition, impacts also vary based on the type of equipment used and the number of pieces of equipment operated simultaneously. The discussion below is, therefore, general in nature. However, with implementation of industry standard mitigation, we anticipate that all noise impacts could be mitigated to less than significant levels.

Implementation of the PCBs TMDL could lead to projects or activities with impacts related to noise in three areas as listed on the CEQA checklist:

Would the project result in:

Impact 11-A Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Impact 11-B Exposure of persons to or generation of excessive groundborne vibration or groundborne noise?

Impact 11-D A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Impacts 11-A and 11-D are rated as potentially significant, but less than significant with mitigation incorporated as explained below. Impact 11-B is less than significant and is also explained below.

On Land:

Impacts: Projects involving remediation of PCBs-contaminated sites, including removal of equipment or building materials; construction of facilities to treat or intercept and divert stormwater; and clean PCBs-contaminated sewer lines could cause short-term, localized noise impacts.

Mitigation: Individual projects with noise impacts would be subject to applicable local permitting requirements and noise ordinances. Local agencies require implementation of standard construction BMPs to reduce noise impacts, and include, but are not limited to practices such as restrictions on operating hours and use buffer materials around/on machinery. In some cases, use of hydraulic or electric equipment could be substituted for noisier diesel equipment. Newer equipment, which emits less noise, could also be used. For particularly loud or lengthy activities, temporary noise buffers could be installed.

In-Bay:

Impacts: Dredging activities to remove PCBs-contaminated sediment from near shore or Bay margin locations could produce potentially significant noise-related impacts because they may involve the use of sheet pile to dewater work areas. Installation of sheet pile may produce short-term, potentially significant noise impacts.

Mitigation: Individual projects with noise impacts would be subject to applicable local permitting requirements and noise ordinances. Local agencies require implementation of standard construction BMPs to reduce noise impacts, such as restrictions on operating hours, for example, typical standards include blackouts prohibiting use of heavy equipment on Sundays, early mornings and evenings all week, and on holidays). Buffer materials around/on machinery and engine and pneumatic exhaust controls could be used to control noise. In some cases, use of electric powered dredging equipment may be possible as a substitute for noisier diesel machinery.

12. Population and Housing

Significant impacts to population and housing would occur if a project substantially encouraged population growth, displaced substantial numbers of people from existing housing necessitating construction of replacement housing elsewhere. There are no projects related to the PCBs TMDL that would involve construction or removal of housing or bring large numbers of people to the Bay Area. There are no known or reasonably foreseeable impacts to population and housing as a result of compliance with the PCBs TMDL.

13. Public Services

Significant impacts to public services would occur if a project resulted in substantial physical impacts as a result of requirements for increased public services such as police, fire protection, schools, or other public facilities. There are no projects related to the PCBs TMDL of a type that would increase the need for police or fire services. There are no known impacts to public services as a result of the PCBs TMDL.

14. Recreation

Significant impacts to recreation would occur if a project increased the use of existing park facilities such that physical impacts occurred of if a project included construction or expansion of park facilities leading to physical impacts. Actions to implement the PCBs TMDL would not affect use of parks or other recreational facilities or lead to physical impacts to them. There are no known impacts to recreation as a result of the PCBs TMDL.

15. Transportation and Traffic

Significant impacts to transportation and traffic would occur if a project caused a substantial increase in traffic in relation to existing traffic load/capacity of the existing street system, exceeded established level of service standards, resulted in change in air traffic patterns, lead to increases in road-related hazards, resulted in inadequate emergency access or parking.

Assessment of transportation and traffic impacts normally requires extensive study of the project area, existing traffic patterns, loads, and level of service standards. In this programmatic review, such detailed analyses are not possible, since specific projects have not yet been developed. However, Water Board staff anticipates that some reasonably foreseeable means of compliance with the PCBs TMDL could result in impacts to as identified below.

Implementation of the PCBs TMDL could lead to projects or activities with impacts to transportation and traffic in two areas as listed on the CEQA checklist:

Impact 15-A Cause an increase in traffic substantial in relation to the existing traffic load and capacity of the street system.

Impact 15-B Exceed either individually or cumulatively a level of service standard established by county congestion management agency for designated roads and highways.

These impacts are rated as less than significant as explained below.

<u>On Land</u>

Impacts: Projects to implement the TMDL could include construction of facilities to treat stormwater or to strategically divert stormwater to municipal wastewater treatment facilities for treatment. It could also result in projects for remediation or removal of PCBs-containing equipment and building materials. Remediation projects could be developed to remove soils and sediments from public rights of way, wastewater conveyances (in some limited locations), and private property. Finally, some dischargers may increase the frequency of maintenance of storm drain inlets and filtration systems as well as street cleaning (sweeping and washing).

Movement of personnel to and from work sites and hauling of equipment and materials to or from such construction or remediation sites as well as hauling of contaminated in-Bay sediments to upland disposal facilities, could potentially result in short-term impacts to traffic. Increases in the frequency of street cleaning and maintenance activities at storm drain inlets or filters could result in a minor increase in traffic.

The location, routes, and scale of such projects and activities are currently unknown and thus the impacts of any individual project would be speculative. However, standard industry practices require a traffic management plan, which includes measures such as strategic route selection and carefully planned timing for haul-truck traffic, traffic impacts would be minimized. Other

traffic, such as from street cleaning, would add only very small volumes of traffic that would not affect levels of service, roadway networks, or parking capacity. We anticipate that impacts to traffic and transportation would be less than significant levels.

In-Bay

As described above, site remediation at in-Bay locations may produce some material that does not meet new standards for in-Bay disposal. In that case, this material is most likely to be transported to appropriate on-land sites, possibly increasing traffic. However, given the small percentage of material likely to be involved and the ability to control timing and route to minimize effects, this is impacts is considered less than significant.

16. Utilities and Service Systems

Significant impacts to utilities and service systems would occur if a project exceeded wastewater treatment standards, required construction of new water or wastewater treatment facilities, new or expanded storm water drainage facilities, or a project's water needs exceeded existing resources or entitlements. Significant impacts would also occur if a project was not served by a landfill with sufficient capacity or the project failed to comply with federal, state, or local regulations for solid waste.

Implementation of the PCBs TMDL could lead to projects or activities with impacts to utilities and service systems in three areas as listed on the CEQA checklist:

Would the project:

Impact 16-B Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

Impact 16-C Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

These impacts are rated as potentially significant, but less than significant with mitigation incorporated as explained below.

On Land

Impacts: Projects to implement the PCBs TMDL could include construction of new facilities to intercept or treat stormwater or to divert stormwater runoff to municipal wastewater facilities for treatment. While it is not anticipated that retrofits to stormwater drainage systems, construction of new stormwater treatment control measures, or diversion to POTWs, would be significant, construction of any of these facilities could be viewed as potentially significant. The number and location of projects of this type is currently unknown. Pilot studies to evaluate stormwater control measures will be conducted by stormwater management agencies. In addition, the implementation plan calls for pilot studies to evaluate the feasibility of routing stormwater to POTWs, and this would be conducted by individual stormwater agencies or municipal wastewater districts.

Mitigation: Mitigation for these projects is linked to careful site selection. The implementation plan notes that interception and diversion of stormwater is an option that could be employed

where strategically feasible, such as areas where stormwater systems and municipal treatment facilities or conveyances are close together. The benefits of this are lowered cost and lowered potential environmental impacts.

The specific mitigation measures could include, but are not limited to, pre-construction BMPS, such as appropriate site selection and environmentally-friendly design; during construction, the use of standard construction BMPs appropriate to the conditions at a site; and for the project as a whole, measures appropriate to offset impacts, such as habitat restoration or enhancement, contributions to mitigation banks, etc.

In-Bay

This category is not applicable to in-Bay projects.

12.7. Mandatory Findings of Significance

The results of this analysis demonstrate that the means of compliance with TMDL for PCBs in San Francisco Bay and its Implementation Plan will not have any reasonably foreseeable potentially significant impacts on the environment that cannot be mitigated to less than significant levels.

With implementation of mitigation measures identified in the environmental checklist and required by federal, state, and local laws and regulations, impacts having a potential to degrade the environment would be reduced to less than significant levels.

Pursuant to Section 13360 of the Water Code, the Water Board cannot mandate which compliance measures responsible agencies may choose to adopt or which mitigation measures they would employ for projects to implement the PCBs TMDL that do have potentially significant impacts. However, the Water Board anticipates that appropriate mitigation measures, which are already widely in use and considered consistent with industry standards, be applied as necessary, in order to avoid and reduce as well as mitigate potential environmental impacts. These measures should ensure that impacts are reduced to less than significant levels. Since the decision to perform these measures is strictly within the responsibility and jurisdiction of the individual implementing agencies, such measures can and should be adopted by these agencies (Title 14, California Code of Regulations, Section 15091 (a) (2)).

12.8. Cumulative Impacts and Other Analyses

Cumulative Impact Analysis

This section provides an analysis of the significant cumulative impacts of the proposed Basin Plan amendment (CEQA Guidelines Section 15130). Cumulative impacts refers to “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.”

The cumulative impact that results from several closely related projects is the change in the environment that results from the incremental impact of the project when added to other closely related past, present and reasonably foreseeable probable future projects. In this case, these are the impacts from non-TMDL required municipal and private projects to reduce PCBs that would occur in the watershed during the period of implementation of the TMDL.

Approach to Cumulative Impact Analysis

The areas of cumulative impacts analyzed in this section include: 1) the program level cumulative impacts and 2) the project level cumulative impacts. On the program level, the PCBs TMDL is one of several TMDLs planned or already adopted to address impairment in the San Francisco Bay. Other adopted or planned future TMDLs for San Francisco are considered in this program cumulative analysis. On the project level, the full environmental analysis of individual projects is the purview of the implementing counties/municipalities, POTWs or other agencies with approval authority. The cumulative impact analysis included here entails consideration of other stormwater control measures implemented in the past and present, planned future upgrades of wastewater treatment plants, and past, present and future cleanup actions for in-Bay contaminated hot spots.

Adoption of the Basin Plan amendment is intended to facilitate implementation of the TMDL. However the requirements identified in the TMDL implementation plan are generally implemented through NPDES permits, waste discharge requirements or other regulatory tools. Agencies other than the Water Board will likely use regulatory and non-regulatory tools in implementing the PCBs TMDL. The Basin Plan amendment would be cumulatively beneficial to the environment in terms of some resource areas. Conceptually, the impacts associated with improving water quality through the TMDL, if occurring with other construction projects, could contribute to temporary cumulative effects to air quality, noise or traffic impacts that would not occur with only one project.

Overall the cumulative effect is to provide an environmental benefit to the San Francisco Bay and achieve compliance with existing adopted water quality standards established by the U.S. EPA and this Water Board.

Program Cumulative Impacts

The Water Board has adopted one TMDL for San Francisco Bay. The Mercury TMDL for San Francisco Bay (adopted by the Water Board on August 9, 2006 and by the State Board on July 17, 2007) was developed due to impairments from mercury. Many of the reasonably foreseeable methods of compliance for one TMDL are the same as or similar to those that will be used to address other pollutants through the implementation of other TMDLs. In terms of stormwater, best management practices and control measures that are applicable to PCBs are likely to be similar measures to those being implemented for mercury in the urban watershed. On-land control measures for mercury also target mine sites in the watershed and would therefore be conducted in addition to on-land control measures for PCBs. The potential implementation strategies discussed in this document for the PCBs TMDL are likely relevant to the implementation of other TMDLs for the San Francisco Bay.

In addition, TMDLs for selenium, legacy pesticides, and dioxins other than dioxin-like PCBs, are in development for the San Francisco Bay and a TMDL for pathogens is in development for Richardson Bay.

Project Cumulative Impacts

Specific TMDL projects must be environmentally evaluated and cumulative impacts considered as the implementing municipality or agency designs and sites the project. However, as examples, TMDL projects and other construction activities may result in cumulative effects.

With regards to cleanup of PCB-contaminated hot spots, the TMDL requires only the collection of information about in-Bay contaminated hot spots; it does not require other actions at these sites and does not set cleanup standards to be achieved at these sites. Investigation and cleanup of contaminated in-Bay hot spots are already underway at many sites in the Bay without the adoption of the TMDL. The one part per billion sediment goal is not a cleanup goal or regulatory standard. Thus, the one part per billion sediment goal will not require a large-scale, bay-wide mass removal of contaminated sediments from in-Bay hot spots. Table 23 lists the sites where cleanup of contaminated in-Bay sediments sites have occurred in the past, those that are in the process of being addressed, and sites where some studies may have been completed but no plans currently exist for any actions to be taken. Since the TMDL does not call for specific actions to be taken, and it is unclear whether actions will be taken in the future at sites where work has yet to be started, an evaluation of the cumulative environmental impacts is speculative. However, to the degree enough information may be available to provide a general response, they are provide below by subject category.

Air Quality

Implementation of the PCB TMDL Program may cause additional emissions of ozone precursors, $PM_{10,}$ and slightly elevated levels of carbon monoxide during construction activities. Emissions of PM_{10} resulting from implementation of TMDL compliance measures may exceed the thresholds established by the Bay Area Air Quality Management District (BAAQMD), and therefore the TMDL, in conjunction with all other construction activity, may contribute to the region's nonattainment status. However, the BAAQMD CEQA guidelines (BAAQMD 1999) state that cumulative impacts should be determined based on an individual project's consistency with applicable local General Plans and whether it would affect conformance of the General Plan with the regional air quality plan. The majority of the implementation measures under consideration as reasonably foreseeable means of compliance with the TMDL do not result in operational activities that would increase emissions in the areas due to an increase in population or vehicular traffic that would be sustained over time.

The control measure that might increase vehicular traffic is street sweeping/cleaning and storm drain maintenance. Past and current stormwater control measures focus on street sweeping and litter/debris removal, which results in vehicular traffic. This TMDL would increase the amount of vehicular traffic in an incidental fashion as the areas that would be subject to increased street sweeping are geographically small and limited to industrial, former industrial or small adjacent residential areas of municipalities and the cumulative impacts due to the individual impacts from this project when considered with the impacts from existing street sweeping activities are not anticipated to be significant.

The cumulative impacts to emissions of criteria pollutants and greenhouse gases are not anticipated to be significant. Cleanup actions taken at in-Bay contaminated hot spots in the past, present, or planned for the future involve dredging for PCB contaminated sediments in sites smaller than 10 acres and the list of contaminated hot spots has only 21 sites listed (Table 23). Removal actions conducted or planned at contaminated hot spots in the bay to-date range from a few thousand cubic yards to less than 100,000 cubic yards (Battelle 2005, U.S. Navy 2006b, U.S. Navy, 2007 and URS, 2002a). Construction activities at these sites may create short-term impacts. However, these activities do not occur simultaneously and are located in different parts of San Francisco Bay. It takes a number of years to evaluate and select a remedial alternative and thus it is unlikely that multiple projects will be occurring simultaneously. Therefore, the cumulative impact of these projects are not anticipated to be significant. In addition, these types

of construction activities are accounted for in the BAAQMD's emissions inventory in the regional air quality plan.

Biological Resources

Many of the compliance measures required under the TMDL are located in urban, industrial areas, do not impact sensitive habitats or biological resources. Where in-Bay contaminated hot spot cleanups conducted in the past have had the potential to impact biological resources, they have been required to mitigate by waste discharge requirements or 401 water quality certifications for the temporary impacts to sensitive wetlands and to monitor to ensure site vegetation and habitat restoration. In addition, mitigation measures for the protection of listed or endangered species are required where applicable. For example, construction is required to operate outside of nesting seasons and during migratory fish passage windows. These mitigation measures are required by any agency with approval authority for the cleanup actions.

The cumulative impacts to biological resources, i.e., destruction or damage to healthy benthic communities due to the excavation of PCBs-contaminated sediment from in-Bay PCB contaminated hot spots are not anticipated to be significant. Cleanup actions taken at in-Bay contaminated hot spots in the past have involved dredging for PCB contaminated sediments in sites smaller than 10 acres and the list of contaminated hot spots has only 21 sites listed (Table 23). Benthic macroinvertebrate community impacts in sub-tidal or intertidal habitats are generally short-lived; these communities have the ability to recolonize in a few years and are not considered to be a sensitive natural community. In San Francisco Bay, changes in benthic community structure occur naturally and therefore remedial dredging of small areas of the Bay is not considered a significant environmental impact on biological resources.

Cultural Resources

Implementation of the PCBs TMDL is not expected to contribute to a cumulative loss of cultural resources in the San Francisco Bay area. The activities related to past, present or future contol of external loading of PCBs to San Francisco Bay or remediation of In-Bay PCB-contaminated hot spots are not known, or likely, to contain cultural resources that would be lost or contribute to a cumulative loss or to impact historic districts in the Bay area.

Hazards and Hazardous Materials

Projects to cleanup on-land contamination and in-Bay contamination from PCBs in soils and sediment have been on-going in the San Francisco Bay area since the ban was enacted on PCBs. The greatest concern is in the safe transport and treatment, storage and disposal of hazardous materials. The implementation of the PCBs TMDL and all other cumulative projects must comply with the applicable laws and regulation pertaining to public safety in the transport, treatment, storage and disposal of hazardous materials. Thus, cumulative impacts would be less than significant. In addition, addressing sources of these contaminants in the environment has a cumulatively positive impact on the environment.

Hydrology and Water Quality

Implementation of the PCBs TMDL is expected to result in long-term improvement in water quality by reducing the potential for introduction of PCBs into San Francisco Bay. Other TMDLs are addressing other pollutants responsible for impairing water quality in San Francisco Bay, and thus, the cumulative impact of other program, as well as specific, projects constructed to meet Clean Water Act requirements, have resulted in long-term improvements in water quality and are expected to continue this improvement.

Land Use and Planning

The cumulative impacts to land use and planning and landfill capacity are not anticipated to be significant. Cleanup actions taken at in-Bay contaminated hot spots in the past have involved dredging for PCBs-contaminated sediments in sites smaller than 10 acres, and the list of contaminated hot spots has only 21 sites listed (Table 23). Cleanups conducted in the past or planned for the future for remediation of contaminated hot spots have occurred in the vicinity of industrial sites, brownfields, redevelopment sites and former military bases. There has been sufficient land available to process hydraulically dredged sediments prior to off-site disposal at landfills. There has also been adequate landfill capacity in the past, and in some cases, the dried sediment was clean enough to be used as alternate daily cover at landfills. In some cases, material was allowed to be managed upland at industrial sites or remain in-Bay, if properly managed, i.e., capped and isolated in place.

The TMDL does not envision the use of multiple, large detention basins capable of treating all Bay area stormwater. Much of the available land in the Bay Area has been developed for housing, industrial or commercial purposed. Stormwater management agencies are required to conduct pilot studies to evaluate the effectiveness of such control measures prior to strategically implementing them. Therefore, there is no basis to conclude that the proposed project would result in cumulative impacts to land use.

Noise

Construction activities associated with the implementation of the PCBs TMDL in combination with other noise-generating sources may exacerbate noise conditions in some locations, however, these impacts are short term in nature. Most noise is associated with traffic. Noise levels from construction activities, once completed, would return to current levels. Other activities, such as street sweeping, are expected to occur intermittently, over small geographical areas and be of short term duration. Overall, with mitigation, the activities resulting from the PCBs TMDL would not be expected to contribute considerably to a cumulative noise impact.

Transportation and Circulation

Implementation of control measures will create additional short terms increases during construction and maintenance. Implementation, after successful completion of the initial pilot studies, will likely be staggered over time and will occur in a few locations throughout the watershed. This decreases the likelihood that these projects cumulatively will cause significant impacts. The PCBs TMDL would require implementation of control measures and best management practices in locations within the watershed where existing land use indicates a historical use of PCBs. Most of the implementation measures, for example, additional street sweeping, are unlikely to create significant cumulative impacts.

Existing stormwater runoff permits currently require the installation of control measures at new developments or redevelopment projects. Some cities in the Bay area are actively requiring construction of stormwater control measures as part of new development projects. These control measures are generally smaller elements of much larger construction projects, residential subdivisions, commercial high rises, and these larger projects require a consideration of the permanent impacts to traffic and transportation. The stormwater control measures are thus inconsequential to these projects.

Overall, it is anticipated that implementation of the TMDL is unlikely to create cumulatively permanent, significant additions to traffic or transportation.

Utilities and Service Systems
Implementation of the PCBs TMDL would not increase water use. There is the possibility that strategically routing of stormwater to wastewater treatment plants would increase the amount of wastewater processed by these plants. However, the requirement of the TMDL is to evaluate the feasibility of this type of approach with an emphasis on using currently available existing capacity at municipal treatment plants. Therefore no significant additions to wastewater treatment plants are expected. The addition to the plant facilities would be limited to construction of pipelines or pumping capacity to route the stormwater. A few wastewater treatment plants in the Bay Area are planning upgrades to their facilities, improving their capacity or collection system rehabilitation. Some of these facilities have analyzed the environmental impacts of these activities and others are still in the planning stages. All these projects are anticipated to conform with their General Plans. It is not anticipated that construction to support routing of stormwater will create a significant impact on available services.

Growth Inducement
Approval and implementation of the proposed Basin Plan amendment would have no direct effect on growth inducement. Implementation of the PCBs TMDL would not directly or indirectly foster economic or population growth or the construction of additional housing. The project does not require the construction of additional capacity at wastewater treatment plants that might be considered to indirectly foster growth.

Significant Irreversible Changes in the Environment
Approval and implementation of the proposed Basin Plan amendment would result in the irretrievable commitment of petroleum products to fuel vehicles and equipment and the creation of some greenhouse gases that might be viewed as contributing to significant irreversible environmental changes already occurring globally.

12.9. Alternatives Analysis

The discussion that follows evaluates four alternatives to the proposed Basin Plan amendment establishing the PCBs TMDL. It presents a brief evaluation of each alternative. None of the alternatives evaluated significantly lessen the environmental impacts of the proposed project. The proposed project is not expected to result in significant impacts that cannot be mitigated and thus it is not reasonable to look to other alternatives to lessen significant impacts. Some of the alternatives do meet some of project's objectives. However, they generally result in attainment of water quality objectives in a longer period of time and thus do not meet one of the primary objectives which is attainment of water quality objectives in the shortest time frame possible. In addition, there would be a longer period of time during which the environmental impact of exposure to Bay fish contaminated with PCBs would continue. The proposed project is thus the preferred alternative.

No-Project Alternative
The "No-Project" alternative means that the Water Board would not adopt the Basin Plan amendment that establishes the numeric fish tissue target and associated PCBs TMDL, allocations, implementation plan, monitoring requirements, or special studies. A "No-Project" alternative would not set targets, nor would monitoring be required to demonstrate achievement

of those targets or protection of beneficial uses. The Regional Monitoring Program (RMP) may continue to collect and evaluate data on the status and trends of PCBs in San Francisco Bay.

The "No-Project" alternative is anticipated to achieve some of the objectives of the proposed project, including protection of the beneficial uses for sport fishing and wildlife habitat. As seen in Figure 28, the Bay is projected to recover without the project due to natural attenuation of PCBs in the environment. However, it would take nearly 100 years to attain the desired condition, about 60 years more than if the proposed project alternative is implemented. The "No-Project" alternative would delay recovery of the Bay and attainment of beneficial uses by about 60 years, and unduly prolong the associated impacts to Bay sports fish consumers. This alternative would unnecessarily maintain human health risk to Bay sport fish consumers for a longer time than under the proposed project. Thus, it would not meet the objective of attaining water quality objectives in as short a time frame as feasible.

Finally, the "No-Project" alternative would not lessen the environmental impacts over the proposed project because 1) other regulatory programs already require many of the actions and the associated environmental impacts of the proposed project, and 2) the environmental impacts of exposure to PCBs contaminated Bay fish would continue for a longer period of time than with the proposed project and there would be no measures to address risk management of the potential health impacts of consuming PCB-contaminated Bay fish.

Alternative TMDL of 20 kg/yr

We considered doubling the TMDL to 20 kg/yr, using the same long-term mass balance model used to set the proposed TMDL. A higher TMDL of 20 kg/yr would result in higher load and wasteload allocations for each source category. This alternative will result in attainment of the TMDL target in about 70 years. This alternative would delay recovery of the Bay and attainment of beneficial uses by about 30 years, and unduly prolong the associated impacts to Bay sports fish consumers. This alternative would unnecessarily maintain human health risk to Bay sport fish consumers for a longer time than under the proposed project. Under this alternative, we could assign a higher load allocation to the Central Valley, resulting in earlier attainment of the allocations. However, wasteload allocations for industrial and municipal wastewater would remain the same, as they are set at current performance. Therefore, the proposed implementation actions for industrial and municipal wastewater dischargers would remain the same and the associated environmental impacts would remain the same. The stormwater wasteload allocations would likely increase under this alternative. However, there would still be a need for load reductions from stormwater discharges, maintaining the requirements for stormwater agencies to evaluate and implement PCBs source and treatment control BMPs through pilot studies as in the proposed project. Requirements for in-bay contaminated sites, special studies, monitoring, dredgers, and risk management would remain the same as in the proposed project under this alternative. This alternative would not significantly change environmental impacts compared to the proposed project. As the implementation actions would remain the same under this alternative, i.e., implementation requirements for wastewater, stormwater, Central Valley, in-bay contaminated sites, special studies, monitoring, navigational dredging, and risk management in the first phase of implementation would remain the same.

Alternative Based on Equal Percentage Load Reductions

Under this alternative, we could propose load and wasteload allocations based on an equal percentage reduction from each source category to achieve the TMDL of 10kg/yr. This alternative would result in a higher wasteload allocation to stormwater, and lower allocations to

all other source categories. Figure 31 below presents the proposed equal percentage load reductions.

This alternative is not acceptable for several reasons. First, this alternative allows stormwater, the highest controllable source of PCBs in the watershed, to continue to discharge PCBs in sediment at concentrations above the sediment goal. This is anticipated to delay recovery of the Bay from impairment and attainment of beneficial uses. The environmental impacts of exposure to PCBs contaminated Bay fish would continue for a longer period of time than with the proposed project. Increased stormwater load allocations would not relieve the need for implementation of source and treatment control BMPs for PCBs to the maximum extent practicable. As such, it would be speculative to contend that there would be either increased or reduced environmental impacts associated with increased stormwater load allocations. Third, this alternative would place a large financial burden on industrial and municipal wastewater treatment plants. Most treatment plants would need to upgrade to advanced treatment technology to lower PCBs loads to meet the wasteload allocations under this alternative. This would require a large capital investment for wastewater treatment plants upgrades to achieve small load reductions and potential increased environmental impacts to air quality and noise due to the facility upgrades. Requirements for in-bay contaminated sites, special studies, status and trend monitoring, navigational dredging, and risk management would remain the same as in the proposed project under this alternative and thus any relevant environmental impacts would be the same.

This alternative would not significantly change environmental impacts compared to the proposed project. Increased stormwater wasteload allocations would still require load reductions from stormwater discharges, maintaining the requirements for stormwater agencies to evaluate and implement PCBs source and treatment control BMPs through pilot studies as in the proposed project. It would be speculative to contend that there would be either increased or reduced environmental impacts associated with increased stormwater load allocations.

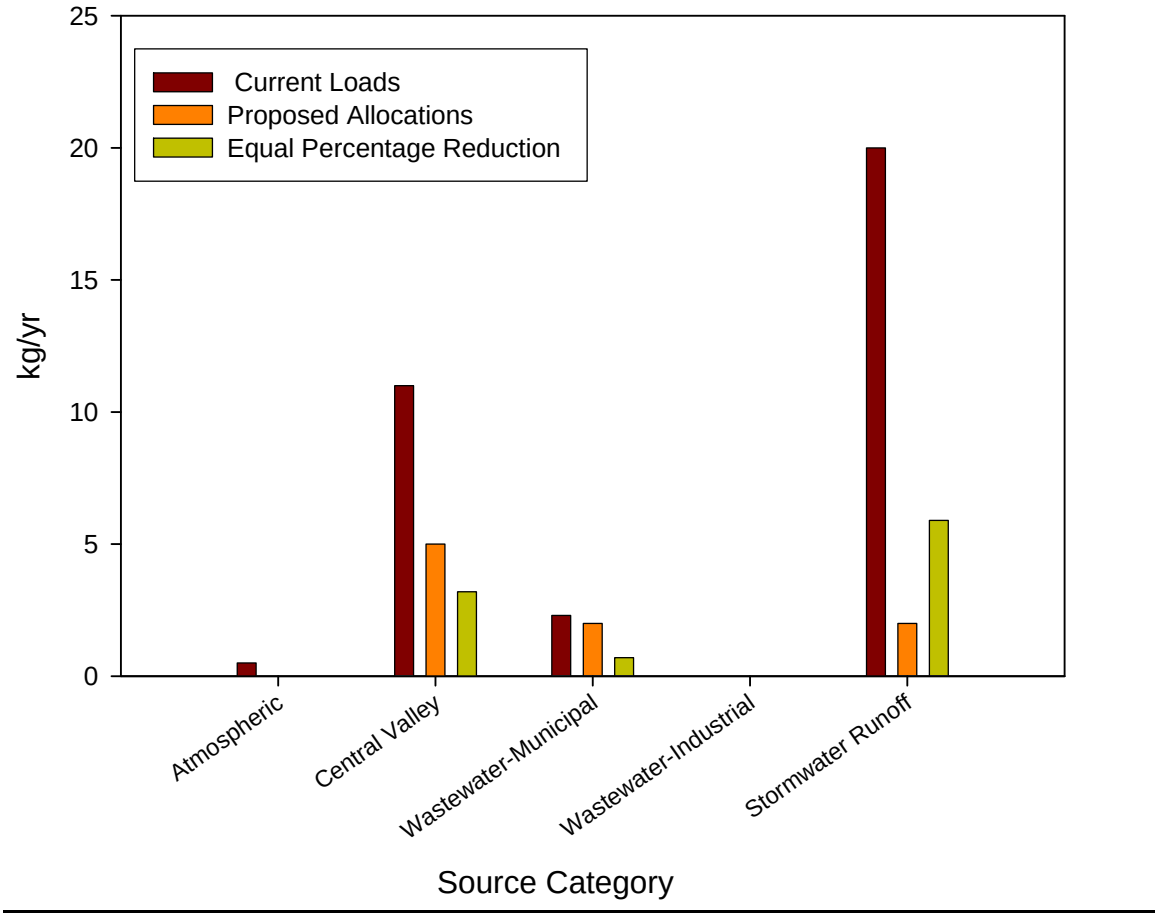

Figure 31-Current Loads, Proposed Allocations and Equal Percentage Reduction Alternative Allocation

Lowest Possible Cost Alternative

Under this alternative, we would propose a TMDL that would attain the project objectives at the lowest possible costs. This alternative would establish a TMDL and set a fish tissue target but would limit implementation to existing on-going implementation actions and monitoring requirements. No new implementation actions, special studies, or pilot studies to evaluate stormwater control measures would be required under this alternative.

As with the “No Project” alternative, the lowest possible cost alternative would achieve some of the objectives of the proposed project, including protection of the beneficial uses for sport fishing and wildlife habitat. As seen in Figure 28, the Bay is projected to recover without the project due to natural attenuation of PCBs in the environment. However, it would take nearly 100 years to attain the desired condition, about 60 years more than if the proposed project alternative is implemented. The “No-Project” alternative would delay recovery of the Bay and attainment of beneficial uses by about 60 years, and unduly prolong the associated impacts to Bay sports fish consumers. This alternative would unnecessarily maintain human health risk to Bay sport fish consumers for a longer time than under the proposed project. Thus, it would not meet the objective of attaining water quality objectives in as short a time frame as possible.

Finally, the lowest possible cost alternative would not lessen the environmental impacts over the proposed project because: 1) other regulatory programs already require many of the actions and the associated environmental impacts of the proposed project, and 2) the environmental impacts of exposure to PCBs contaminated Bay fish would continue for a longer period of time than with the proposed project and there would be no measures to address risk management of the potential health impacts of consuming PCB-contaminated Bay fish.

12.10. Economic Considerations Related to Potential Implementation Plan Actions

The California Environmental Quality act requires that whenever a Water Board adopts a rule that requires the installation of pollution control equipment or establishes a performance standard or treatment requirement, it must conduct an environmental analysis of reasonably foreseeable means of compliance. This analysis must take into account a reasonable range of factors, including economics. This proposed Basin Plan Amendment for the PCBs TMDL includes performance standards (e.g., targets and allocations). This part of the Staff Report discusses the reasonably anticipated costs associated with implementation methods and monitoring that might result from the proposed Basin Plan amendment.

Discussion of Costs

The costs of implementation actions are difficult to estimate because the PCBs TMDL implementation plan applies to the entire nine-county, Bay-wide region and applies to numerous public agencies as well as individual dischargers all of which have a variety of ways to comply with the plan and will be guided in selecting those implementation measures by their technical needs and budgetary constraints. Thus it is difficult to anticipate which implementation measures are most likely to be adopted. Furthermore, phased pilot or feasibility studies will be used to identify and evaluate the feasibility (which includes relative costs and effectiveness) of most compliance measures. These assessments need to be completed before the dischargers select which action or combination of actions will be most effective and appropriate to their allocations. Also, as mentioned previously, many of the implementation measures are part of ongoing programs, and will only result in incremental increases to costs of existing programs.

These factors result in the likelihood that short-term costs will be modest. In the longer term, achieving the proposed allocations set by the TMDL may be more substantial for some dischargers. However, the implementation plan and schedule provide an opportunity to analyze alternative means of compliance and time to identify and secure adequate funding. Furthermore, because PCBs adhere to soil as do numerous other pollutants such as PBDEs, PAHs, chlorinated legacy pesticides, and heavy metals, efforts to reduce PCBs loads to the Bay will produce multi-pollutant reduction benefits. Thus, some of the costs to comply with this TMDL will also result in compliance with other TMDLs and regulatory requirements for those other pollutants.

This discussion provides an overview of the relative costs for each of the source categories that are required to implement new actions, or increased actions to attain allocations or implementation requirements. Cost information is based on similar work performed elsewhere and the best professional judgment of Water Board staff. All costs discussed below are rough estimates and only provide an order-of-magnitude characterization of costs. The main focus of the implementation plan is on control of PCBs in stormwater. Thus, the largest implementation costs are anticipated to result from implementation of the stormwater runoff allocation portion of the TMDL.

The following provides an overview:

Municipal and Industrial Wastewater Dischargers

Wastewater dischargers are required to maintain optimum treatment performance for solids removal and identify and manage controllable sources, i.e., maintain their existing performance. Existing overall annual wastewater management costs exceed $500 million to control all pollutants in wastewater, including PCBs.

The costs of implementing the TMDL are considered to be incidental increases associated with identifying and managing controllable sources. For municipalities, we expect this effort would be part of existing pollution prevention and source control programs and new costs would be minimal. Industrial facilities are already required to manage their use of PCBs. Use of PCBs is allowed in enclosed containers such as in transformers and capacitors. However, as this equipment ages, it must be removed and replaced with PCBs-free products. There will be some new costs associated with conducting or causing to conduct monitoring and special studies to fill critical data gaps and to participate in risk management activities (see discussion below).

Stormwater Runoff Dischargers

The costs of attaining load reductions above and beyond natural attenuation may be substantial. Five California municipalities and one metropolitan area with stormwater programs that were demonstrating meaningful progress toward maximum extent practicable compliance were surveyed for their stormwater compliance costs in the 2002/2003 time frame (SWRCB, 2005). Annual cost per household for the six stormwater programs surveyed ranged from $18 to $46. The City of Fremont, included in this cost survey, has costs estimated at $46 per household. The majority of these program costs were for street sweeping and litter/debris removal. We estimate Bay Area municipalities currently spend approximately $100 million per year to manage urban stormwater runoff (assuming 2.5 million households and average fees of $40 per year per household). An upper bound estimate of the cost of complying with stormwater control requirements for all pollutants, including PCBs, can be thought of in terms of the costs of treating wastewater in the Bay area. The load allocations in the TMDL for stormwater and wastewater are equal. The current cost of treating wastewater, $500 million annually, results in wastewater loads that are equal to what the Basin Plan amendment allocates for stormwater. We consider $500 million to be the reasonable cost estimate to the stormwater runoff management agencies annually. The $500 million would translate into average fees of $200 per year per household.

The TMDL implementation plan calls for dischargers to conduct pilot studies of best management practices and control measures. Based on these studies the effective, cost-efficient control measures will be implemented through NPDES permits. It is anticipated that the overall costs are likely to be less than $500 million per year.

These include:

- Removal and disposal of PCBs from building materials
- Remediation of contaminated soil or sediment in public rights-of-way, wastewater conveyances, and private property
- Street cleaning (includes sweeping or washing)
- Storm drain and inlet maintenance (above and beyond normal practices)

- Construction, operation, and maintenance of facilities/units to intercept, divert, and treat urban stormwater runoff (e.g., detention basins, wetlands, underground sand filters, swales)
- Diversion of urban storm water runoff to wastewater treatment

To provide further perspective on costs, we expect that facilities which treat urban stormwater runoff will have the highest costs of these options. As discussed in the Implementation Plan section of this report, we anticipate dischargers' pilot studies will include consideration of strategic runoff treatment in areas with elevated PCBs in soils/sediments, such as older industrial urban areas. Underground sand filters, such as the Austin sand filter, are likely retrofit treatment unit candidates in these areas. Typically the Austin sand filter system is designed to handle runoff from drainage areas up to 50 acres (U.S. EPA, 1999b), and Caltrans has considered these filters for treatment of highway runoff and has estimated the cost of installing the Austin sand filter unit at around $240,000 (Caltrans, 2004). The Ettie Street pump station drainage area in Oakland, CA, which encompasses 100 acres, is one of the industrial urban areas that drain to the Bay that have high levels of PCBs in storm drain sediments. In the case of Ettie Street watershed, installing Austin sand filters to treat the entire drain area would cost less than $5 million, based on the above figures. Assuming there are about 20 Ettie Street-like watersheds that have high levels of PCBs in storm drain sediments that drain to the Bay, the cost of installing these sand filters would be around $100 million. Annual costs for maintaining sand filter systems
average about 5 percent of the initial construction (U.S. EPA, 1999b). These are rough estimates, but they likely represent the order of magnitude of costs of retrofit treatment units.

The proposed implementation plan and schedule provides opportunity to analyze alternative means of compliance and allows time for urban stormwater runoff agencies to secure reasonable funding. There will be some new costs associated with conducting or causing to conduct monitoring and special studies to fill critical data gaps and to participate in risk management activities (see discussion below.)

Navigational Dredging and Disposal

The proposed sediment dredging and disposal implementation actions are based on the Long Term Management Strategy for the Placement of Dredged Material in the San Francisco Bay Region (U.S. ACE 1998) that is already being implemented. We estimate the current annual costs of dredging and dredged sediment disposal exceeds $50 million per year. Although the LTMS is expected to result in substantial costs over time as less dredged material is disposed of in the bay and more is disposed of in the ocean or at upland sites, little or no new costs should be incurred as a result of this PCBs TMDL and implementation plan, because the overall goal of the LTMS is to limit in-Bay disposal and to the degree the TMDL requires less in-Bay disposal it is furthering the LTMS program's overall goals. There will be some new costs associated with conducting or causing to conduct monitoring and special studies to fill critical data gaps and to participate in risk management activities (see discussion below).

In-Bay Contaminated Sediment

A number of sites within the Bay have already been cleaned up or are currently undergoing remediation or feasibility studies to determine the type and level of clean-up required. The costs per site vary significantly; a few past and planned projects are discussed below.

In 2001, remedial actions, including dredging three feet of PCB and metal contaminated sediment and placement of an underwater isolation cap were completed for the offshore portion

of the former U.S. Steel property in South San Francisco (URS, 2002b). A total of 20,100 cubic yards of sediment were removed from San Francisco Bay at this site. 14,100 cubic yards were dredged from the subtidal area and 6,000 cubic yards were removed using land-based equipment from the intertidal area. The majority of the sediments were taken to a landfill for disposal. The cost of this cleanup was estimated to be about $12 million for three acres.

A Draft Final Feasibility Study for Parcel F (offshore PCB-contaminated sediments) completed for Hunters Point Shipyard (U.S. Navy, 2007) evaluated a range of alternatives from no action, to complete removal and off-site disposal and included a number of alternatives and a mix of remedial actions, including focused removal, off-site disposal and monitored natural recovery. Other than no action, the costs of conducting some level of active remediation were from $13,060,000 to $42,630,000. The costs included base costs, including costs for remedial design and construction, as well as future costs for 30 years of operation and maintenance. The costs of monitored natural recovery, an element of multiple remedial alternatives, were considered to include the costs of deed restrictions, (documentation, posting and enforcement) baseline monitoring, (bathymetric survey and sediment core sampling using a vibracore sampler (30 samples) and annual monitoring over a 30 year period.

A Final Feasibility Study for Seaplane Lagoon at Alameda Point (Battelle 2005) to address PCBs and cadmium and other contaminants in subtidal sediments evaluated a range of remedial alternatives, including but not limited to, no action, monitored natural recovery with institutional controls, isolation capping, dredging/dewatering and off-site disposal and focused dredging/upland confinement. Other than no action, the costs of conducting some level of active remediation were from $2,280,106 to $40,947,000. The costs included base costs, including costs for remedial design and construction, as well as future costs for 30 years of operation and maintenance. The Water Board and other regulatory agencies signed a Record of Decision in 2005 (U.S. Navy 2006b) with the U.S. Navy, agreeing to the selected remedial alternative of dredging, dewatering, and off-site disposal at a 30-year net present value of $24,600,000. The remedy calls for dredging 63,000 cubic yards of contaminated sediment over approximately a 6-acre area. Even though there are and will be substantial costs associated with completing existing and new clean-ups, these sites will be subject to clean-up with or without this TMDL and therefore little or no new costs are anticipated as a result of this TMDL as the costs of cleanup would be driven by other regulatory programs.

Monitoring and Special Studies

The Regional Monitoring Program (RMP) conducted by the San Francisco Estuary Institute collects much of the data that are required as part of the ongoing assessment of the health of the Bay. The RMP is jointly funded by municipal and industrial wastewater dischargers.The current budget for the program is $3.4 million, which includes monitoring of PCBs and other pollutants in water, sediment, and fish throughout the Bay. Maintaining this effort should be sufficient to track attainment of the TMDL target and recovery of the Bay. In addition, the RMP also conducts regular monitoring of PCBs loads from the Central Valley and limited monitoring of PCBs loads from local tributaries. Additional monitoring will be necessary to sufficiently quantify loads from urban stormwater runoff and the loads reduced from urban stormwater runoff control actions. As with the control measures, this loads monitoring would also address other pollutants of concern such as heavy metals, pesticides, and petroleum hydrocarbons. This additional monitoring could cost $500 thousand to $1 million per year.

There are critical data needs to improve our understanding of PCBs fate and transport, particularly PCBs in Bay sediments. Also, a better understanding of the rate of natural

attenuation of PCBs in Bay environments is needed to predict with more certainty the recovery time of the Bay, and to inform on the need for more, less or different implementation actions. We estimate these costs, which would be shared by all source category dischargers, urban stormwater dischargers, and dredgers, would total approximately $1 to 3 million, some of which would be accounted for within the existing RMP. These costs include the costs of collecting information regarding pollutants other than PCBs that are the subject of study by the RMP.

Risk Management

The risk management activities range from conducting studies to support health risk assessment and risk communication associated with eating Bay fish, providing outreach and advice to the general public and regular consumers of Bay fish, and investigating and implementing direct actions that reduce the actual and potential exposure of, and mitigate health impacts to, people and communities most likely to be consuming PCBs-contaminated fish from San Francisco Bay. Responsibility and costs associated with these activities will be shared among the California Office of Environmental Health Hazard Assessment, the California Department of Toxic Substances Control, the California Department of Health Services, dischargers, community-based organizations, and the Water Board. Although the direct risk reduction, studies, outreach efforts and mitigation actions have yet to be determined, they will likely cost in the range of $100 thousand to $1 million dollars per year. Some of these costs are likely to be incurred without this TMDL as the San Francisco Bay mercury TMDL and mercury watershed NPDES permit require similar risk management activities.

ORDER NO. R2-2007- 0032
NPDES PERMIT NO. CA0005240

WASTE DISCHARGE REQUIREMENTS FOR THE C&H SUGAR COMPANY, INC. AND CROCKETT COMMUNITY SERVICES DISTRICT DISCHARGING TO CARQUINEZ STRAIT THROUGH DISCHARGE POINTS 001 AND 002

The following Discharger is authorized to discharge in accordance with the conditions set forth in this Order.

Table 1. Discharger Information

Discharger	C&H Sugar Company, Inc. and Crockett Community Services District (CSD)
Name of Facility	C&H Sugar Refinery, Joint C&H-CSD Philip F. Meads Water Treatment Plant, and CSD's collection system
Facility Address	830 Loring Avenue
	Crockett, California 94525
	Contra Costa County

The Discharger is authorized to discharge from the following discharge points as set forth below.

Table 2. Discharge Locations

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
001	Approximately 22.5 million gallons per day (MGD) of once-through barometric condenser cooling waters, condensed vapors from vacuum pans, once-through cooling water from evaporators and a steam turbine, and roof drains.	38° 03' 27"	122° 13' 06"	Carquinez Strait
002	Approximately 0.93 MGD of secondary treated effluent (process wastewater from the Refinery plus pretreated wastewater from CSD)	38° 03' 30"	122° 13' 28"	Carquinez Strait
003	Storm water: estimated flow rate is less than 1,000 gallons per day (GPD).	38°03'27"	122°13'03"	Carquinez Strait
005	Storm water: estimated flow is 15,000 GPD.	38°03'27"	122°13'11"	Carquinez Strait
006	Storm water: estimated flow is 1,000 GPD.	38°03'27"	122°13'31"	Carquinez Strait
007	Storm water: estimated flow is less than 100 GPD.	38°03'27"	122°13'18"	Carquinez Strait

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
008	Storm water: estimated flow is 3,000 GPD.	38°03'27"	122°13'11"	Carquinez Strait
009	Storm water: estimated flow is less than 100 GPD.	38°03'26"	122°12'46"	Carquinez Strait
011	Storm water: estimated flow is 15,000 GPD.	38°03'27"	122°13'11"	Carquinez Strait
012	Storm water: estimated flow is less than 500 GPD.	38°03'27"	122°13'11"	Carquinez Strait
013	Storm water: estimated flow is 4,500 GPD.	38°03'27"	122°13'15"	Carquinez Strait
014	Storm water: estimated flow is 15,000 GPD.	38°03'22"	122°13'15"	Carquinez Strait
016	Storm water: estimated flow is 25,000 GPD.	38°03'19"	122°13'36"	Carquinez Strait

Table 3. Administrative Information

This Order was adopted by the Regional Water Board on:	April 11, 2007
This Order shall become effective on:	June 1, 2007
This Order shall expire on:	May 31, 2012
The U.S. Environmental Protection Agency (USEPA) and the Regional Water Board have classified this discharge as a major discharge.	
The Discharger shall file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of the Order expiration date as application for issuance of new waste discharge requirements.	

IT IS HEREBY ORDERED, that Order No. 00-025 is rescinded upon the effective date of this Order except for enforcement purposes, and, in order to meet the provisions contained in Division 7 of the California Water Code (CWC) and regulations adopted therein, and the provisions of the federal Clean Water Act (CWA), and regulations and guidelines adopted therein, the Discharger shall comply with the requirements in this Order.

I, Bruce H. Wolfe, Executive Officer, do hereby certify the following is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on April 11, 2007.

Bruce H. Wolfe, Executive Officer

I. FACILITY INFORMATION

The following Discharger is authorized to discharge in accordance with the conditions set forth in this Order.

Table 4. Facility Information

Discharger	C&H Sugar Company, Inc. and Crockett Community Services District (CSD)
Name of Facility	C&H Sugar Refinery, Joint C&H-CSD Philip F. Meads Water Treatment Plant, and CSD's collection system
Facility Address	830 Loring Avenue
	Crockett, CA 94525
	Contra Costa County
Facility Contact, Title, and Phone	Elizabeth M. Crowley, Environmental Compliance Manager, C&H Sugar Company, 510-787-4352 Kent Peterson, General Manager, Crockett Community Services District, 510-787-2992
Mailing Address	C&H - 830 Loring Avenue, Crockett, CA 94525 CSD - P.O. Box 578, Crockett, California 94525
Type of Facility	Cane Sugar Refining / privately owned wastewater treatment plant
Facility Design Flow	35 MGD for once-through cooling water discharge through 001 1.78 MGD secondary treated wastewater for discharge through 002

II. FINDINGS

The California Regional Water Quality Control Board, San Francisco Bay Region (hereinafter Regional Water Board), finds:

A. Background. C&H Sugar Company, Inc. (hereinafter C&H), and the Crockett Community Services District (hereinafter CSD), collectively the Discharger or Dischargers, submitted a Report of Waste Discharge, dated October 15, 2004, and applied for an NPDES permit reissuance to discharge once-through cooling water and treated wastewater from C&H facilities located at 830 Loring Avenue in Crockett, Contra Costa County.

Both C&H and CSD signed a Joint-Use Agreement on November 9, 1976, such that the C&H Refinery wastewater and municipal sewage from the Crockett area are treated at the Joint C&H-CSD Philip F. Meads Water Treatment Plant (hereinafter the Joint Treatment Plant, or JTP). The Dischargers jointly own the JTP, and C&H is the operator.

B. Facility Description.

1. C&H owns and operates a sugar refinery for refining raw cane sugar (hereinafter the Refinery) at 830 Loring Avenue, Crockett, Contra Costa County. The Refinery processes raw cane sugar at an average melt rate of 3,300 tons per day over approximately 260 operating days per year. Crystalline and liquid refined sugars are delivered to clients by both trucks and rail cars. The Refinery currently operates on a 7-day cycle with 5 days on and 2 days down. The Refinery discharges once-through cooling water and condensed vapor, untreated, through Discharge Point 001 to

Carquinez Strait within Northern San Francisco Bay, a water of the United States. The annual average discharge flow rates though Discharge Point 001 during 2002 to 2005 ranged from 13.7 to 22.5 MGD. Sugar refining process wastewater (e.g., char washings, scum filter aid slurries, refinery equipment wash water, railcar washings, truck washings, and contaminated storm water runoff from process areas) with an annual average flow rate of approximately 0.45 MGD is processed through the primary wastewater treatment plant (PWTP) at the Refinery. Solids removed from PTWP are dewatered on a belt filter and loaded on a truck for off-site disposal as soil amendment.

2. Municipal sewage from the community of Crockett is collected, comminuted, and degritted by CSD. Crockett is a small community with few industrial activities. Municipal sewage from CSD mainly consists of wastewater from residential and commercial sources, and inflow/infiltration. After preliminary treatment, the sewage is pumped to the JTP for secondary treatment and disinfection prior to discharge. The annual average flow from the CSD to the JTP is approximately 0.33 MGD. All the grit removed by the District is hauled to a permitted Class III disposal site.

3. The JTP is an activated sludge wastewater treatment facility that treats primary treated sugar refining wastewater and pretreated (comminuted and de-gritted) domestic wastewater from CSD. The Refinery's sanitary wastes and tank truck washings, which account for less than 0.01 MGD, are combined with the pretreated sewage from CSD. The average dry weather design flow (ADWF) from CSD to the JTP is 0.3 MGD. During wet weather, the peak wet weather flow may increase to 3.3 MGD. Excess sewage, which is due to storm water inflow/infiltration, is temporarily stored in CSD's storm water surge tanks prior to returning it to the JTP for treatment. During wet weather, peak flows are stored in the JTP storm water surge tank prior to introduction into the initial surge tank at the beginning of the treatment process for equalization. The treated wastewater is discharged through Discharge Point 002 to the Carquinez Strait.

   Both discharges 001 and 002 discharge through deep water outfalls to Carquinez Strait.

4. **Biosolids Treatment.** Waste biosolids from the dissolved air clarifiers at the JTP are dewatered by belt presses, mixed with lime if stabilization is necessary, and discharged to a truck for off-site disposal. Liquor removed from belt-presses is combined with washings, waste samples, drips, storm water, and other process waters in a plant sump, and returned to the initial surge tank at the beginning of the treatment process.

5. As described in Table 2 and the attached Fact Sheet (**Attachment F**), C&H has several storm water discharge outfalls to discharge the storm water collected at the Refinery, which are regulated by this Order. This Order includes a provision requiring C&H to submit an updated Storm Water Pollution Prevention Plan (SWPPP) and Best Management Practices Plan (BMPP) to reflect the up-to-date storm water pollution prevention and best management practices in place at the Refinery.

Attachment B to this Order is a Location Map showing the location of the C&H facility within the region; **Attachment C** is a flow schematic of the treatment plant.

C. **Legal Authorities.** This Order is issued pursuant to CWA Section 402 and implementing regulations adopted by the USEPA and CWC Chapter 5.5, Division 7. It shall serve as an NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to CWC Article 4, Chapter 4 for discharges that are not subject to regulation under CWA Section 402.

D. **Background and Rationale for Requirements**. The Regional Water Board developed the requirements in this Order based on information submitted as part of the application, through monitoring and reporting programs, and through special studies. **Attachments A** through **G**, which contain background information and rationale for requirements of the Order, are hereby incorporated into this Order and, thus, constitute part of the Findings for this Order.

E. **California Environmental Quality Act (CEQA).** This action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act (Public Resources Code Section 21100, et seq.) in accordance with CWC Section 13389.

F. **Technology-Based Effluent Limitations.** NPDES regulations at 40 CFR 122.44 (a) require permits to include applicable technology-based limitations and standards. This Order includes technology-based effluent limitations, which are based on:

- San Francisco Bay Region Basin Plan, Table 4-2, effluent limits for all treatment facilities,
- Effluent Limitations Guidelines for the Sugar Processing Point Source Category, established at 40 CFR 409 Subpart B (Crystalline Cane Sugar Refining Subcategory), and
- Best professional judgment (BPJ) pursuant to CWA Section 402 (a) (1) (B) and NPDES regulations at 40 CFR 125.3.

A detailed discussion of the technology-based effluent limitations is included in the Fact Sheet (**Attachment F**).

G. **Water Quality-Based Effluent Limitations.** Section 122.44(d) requires that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) may be established: (1) using USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) on an indicator parameter for the pollutant of concern; or (3) using a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

H. **Water Quality Control Plans.** The Water Quality Control Plan for the San Francisco Bay Basin (hereinafter Basin Plan) is the Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the

State, including surface waters and groundwater. It also includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Water Board and approved by the State Water Resources Control Board, Office of Administrative Law and the U.S. EPA, where required. Beneficial uses applicable to Carquinez Strait within the Suisun Basin are as follows.

Table 5. Basin Plan Beneficial Uses of Carquinez Strait

Discharge Point	Receiving Water Name	Beneficial Use(s)
001 and 002	Carquinez Strait	• Industrial Service Supply (IND) • Ocean, Commercial, and Sport Fishing (COMM) • Estuarine Habitat (EST) • Fish Migration (MIGR) • Preservation of Rare and Endangered Species (RARE) • Water Contact Recreation (REC-1) • Noncontact Water Recreation (REC-2) • Fish Spawning (SPWN) • Wildlife Habitat (WILD) • Navigation (NAV).

Requirements of this Order implement the Basin Plan.

I. **Thermal Plan.** The State Water Board adopted a *Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California* (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters. Requirements of this Order implement the Thermal Plan.

J. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the CTR. The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants.

K. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Boards in their basin plans, with the exception of the provision on alternate test procedures for individual discharges that have been approved by USEPA Regional Administrator. The alternate test procedures provision was effective on May 22, 2000. The SIP became effective on May 18, 2000. The State Water Board subsequently amended the SIP on February 24, 2005, and the amendments became effective on July 31, 2005. The SIP includes procedures for determining the need for and calculating WQBELs and requires dischargers to submit data sufficient to do so. Requirements of this Order implement the SIP.

L. Compliance Schedules and Interim Requirements. Section 2.1 of the SIP provides that, based on a discharger's request and demonstration that it is infeasible for an existing discharger to achieve immediate compliance with an effluent limitation derived from a CTR criterion, compliance schedules may be allowed in an NPDES permit. Unless an exception has been granted under Section 5.3 of the SIP, a compliance schedule may not exceed 5 years from the date that the permit is issued or reissued, nor may it extend beyond 10 years from the effective date of the SIP (or May 18, 2010) to establish and comply with CTR criterion-based effluent limitations. Where a compliance schedule for a final effluent limitation exceeds one year, the Order must include interim numeric limitations for that constituent or parameter. Where allowed by the Basin Plan, compliance schedules and interim effluent limitations or discharge specifications may also be granted to allow time to implement new or revised WQOs. This Order includes compliance schedules and interim effluent limitations. A detailed discussion of the basis for the compliance schedules and interim effluent limitations is included in the Fact Sheet (Attachment F).

M. Alaska Rule. On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes (40 C.F.R. § 131.21; 65 Fed. Reg. 24641; (April 27, 2000).) Under the revised regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000 must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.

N. Stringency of Requirements for Individual Pollutants. This Order contains restrictions on individual pollutants that are no more stringent than required by the federal CWA. Individual pollutant restrictions consist of technology-based restrictions and water quality-based effluent limitations. The technology-based effluent limitations consist of restrictions on biochemical oxygen demand (BOD), total suspended solids (TSS), and pH. Restrictions on these pollutants are specified in federal regulations and are no more stringent than required by the CWA. Water quality-based effluent limitations have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant water quality-based effluent limitations were derived from the CTR, the CTR is the applicable standard pursuant to 40 CFR 131.38. The scientific procedures for calculating the individual water quality-based effluent limitations are based on the CTR-SIP, which was approved by USEPA on May 18, 2000. Most beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to 40 CFR 131.21 (c) (1). The remaining water quality objectives and beneficial uses implemented by this Order [those for arsenic, cadmium, chromium (VI), copper (fresh water), lead, nickel, silver (1-hour), and zinc] were approved by USEPA on January 5, 2005, and are applicable water quality standards pursuant to 40 CFR 131.21 (c) (2). Collectively, this Order's restrictions on individual pollutants are no more

stringent than required to implement the technology-based requirements of the CWA and the applicable water quality standards for purposes of the CWA.

O. **Antidegradation Policy.** Section 131.12 requires that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the state and federal antidegradation policies. As discussed in detail in the Fact Sheet the permitted discharge is consistent with the antidegradation provision of section 131.12 and State Water Board Resolution No. 68-16.

P. **Anti-Backsliding Requirements.** CWA Sections 402 (o) (2) and 303 (d) (4) and NPDES regulations at 40 CFR 122.44 (l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. As discussed in detail in the Fact Sheet (**Attachment F**), the prohibitions, limitations, and conditions of this Order are consistent with applicable federal and State anti-backsliding requirements.

Q. **Monitoring and Reporting.** Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP) establishes monitoring and reporting requirements to implement federal and State requirements. This MRP is provided in **Attachment E**. The MRP may be amended by the Executive Officer pursuant to USEPA regulation 40 CFR 122.62, 122.63, and 124.5.

R. **Standard and Special Provisions.** Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in **Attachment D**. The discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42. The Regional Water Board has also included in this Order special provisions applicable to the Discharger (**Attachment G**). A rationale for the special provisions contained in this Order is provided in the attached Fact Sheet.

S. **Provisions and Requirements Implementing State Law.** The provisions/requirements in subsections IV.C, IV.D, V.B, and VI.C of this Order are included to implement state law only. These provisions/requirements are not required or authorized under the federal CWA; consequently, violations of these provisions/requirements are not subject to the enforcement remedies that are available for NPDES violations.

T. **Notification of Interested Parties.** The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and has provided them with an opportunity to submit their written comments and

recommendations. Details of notification are provided in the Fact Sheet (**Attachment F**) of this Order.

U. **Consideration of Public Comment.** The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet (**Attachment F**) of this Order.

III. DISCHARGE PROHIBITIONS

A. The discharge of any wastewater at a location or in a manner different from that described in this Order is prohibited.

B. The discharge of once-through cooling water from Discharge Point 001 and treated wastewater from Discharge Point 002 to Carquinez Strait at any point at which the wastewater does not receive a minimum initial dilution of at least 10:1 is prohibited.

C. The use of algaecides or anti-fouling additives in the barometric condenser cooling water system, discharged at Discharge Point 001, is prohibited.

D. The bypass of untreated or partially treated wastewater to waters of the United States is prohibited, except as provided for in the conditions stated in 40 CFR 122.41(m)(4) and in A.13 of the Standard Provisions and Reporting Requirements for NPDES Surface Water Discharge Permits, August 1993 (**Attachment G**).

E. Any sanitary sewer overflow that results in a discharge of untreated or partially treated wastewater to waters of the United States is prohibited. Sanitary sewer overflows, if any, are the responsibility of CSD.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent Limitations for Discharge Point 001

Compliance with the effluent limitations shall be demonstrated at Discharge Point 001, with compliance measured at Monitoring Location M-001 as described in the attached MRP (**Attachment E**).

1. **Biochemical Oxygen Demand (BOD).** The BOD_5 of the discharge shall not exceed the following limits:

Constituent	Units	Maximum Daily	Monthly Average
BOD_5	lbs/day	6,700	2,200

[1] This effluent limitation is based on a sugar melt rate of 3,300 tons/day and the effluent limits as defined at 40 CFR 409 Subpart B. The resulting mass loading limits are rounded to two significant figures.

[2] Compliance with the maximum daily effluent limitation for BOD_5 shall be determined by evaluating the mass (lbs/day) of BOD_5 discharged at Discharge Point 001 during the calendar day that sampling occurs. The mass (lbs/day) of BOD_5 discharged shall be determined in accordance with the following equation:

lbs/day BOD_5 = [BOD_5 effluent concentration (mg/L) at Discharge Point 001] x effluent flow (MGD) at Discharge Point 001 x 8.34

where: Conversion factor (8.34) in [(L•lb)/(gallon•kg)] = 3.7854 L/gallon x 2.2 lbs/kg

[3] Compliance with the monthly average effluent limitation for BOD_5 shall be determined by averaging all daily values (lbs/day) as determined above in each calendar month.

2. **pH.** The pH of the discharge at Discharge Point 001 shall not be less than 6.0 nor greater than 9.0.

The Discharger may elect to use a continuous on-line monitoring system(s) for measuring pH. If the Discharger employs continuous monitoring, then the Discharger shall be in compliance with the pH limitation specified herein, provided that both of the following conditions are satisfied:

(i) The total time during which the pH values are outside the required range of pH values shall not exceed 7 hours and 26 minutes in any calendar month; and

(ii) No individual excursion from the range of pH values shall exceed 60 minutes.

3. **Final Effluent Limitations for Toxics Substances (Discharge Point 001).**

a. The discharge of effluent at Discharge Point 001 shall not exceed the following limitations.

Table 6. Final Effluent Limitations for Discharge Point 001 - Toxic Pollutants

Constituent	Units	Final Effluent Limitations[1][2]	
		AMEL	MDEL
Arsenic	µg/L	290	510
Copper [3]	µg/L	96	150
Lead	µg/L	3.7	8.3
Mercury [4][5]	µg/L	0.018	0.046
Nickel	µg/L	200	480
Selenium [4]	µg/L	3.9	8.7
Zinc	µg/L	250	590
Cyanide [4][6][7]	µg/L	3.2	6.4
TCDD TEQ [8]	µg/L	1.4×10^{-8}	2.8×10^{-8}
Bis (2-ethylhexly) phthalate	µg/L	54	110

Footnotes for Table 6:

[1] a. All analyses shall be performed using current USEPA methods, or equivalent methods approved in writing by the Executive Officer.

c. Limitations apply to the average concentration of all samples collected during the averaging period (daily = 24-hour period; monthly = calendar month).

d. All metal limitations are total recoverable.

[2] A daily maximum or average monthly value for a given constituent shall be considered noncompliant with the effluent limitations only if it exceeds the effluent limitation and the

Reporting Level for that constituent. As outlined in Section 2.4.5 of the SIP, the table below indicates the Minimum Level (ML) upon which the Reporting Level is based for compliance determination purposes. An ML is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Constituent	ML (µg/L)
Arsenic	1
Copper	2
Lead	0.5
Mercury	0.0005
Nickel	1
Selenium	1
Zinc	1
Cyanide	5
Bis(2-ethylhexyl) phthalate	5

[3] Alternate Effluent Limits for Copper:

a. If a copper SSO for the receiving water becomes legally effective, resulting in adjusted saltwater chronic objective of 2.5 µg/L and acute objective of 3.9 µg/L as documented in the *Copper Site-Specific Objectives in San Francisco Bay, Proposed Basin Plan Amendment and Draft Staff Report, dated March 2, 2007*, upon its effective date, the following limitations shall supersede those copper limitations listed in Table 6 (the rationale for these effluent limitations can be found in the Fact Sheet **[Attachment F]**).

MDEL of 120 µg/L and AMEL of 76 µg/L.

b. If a different copper SSO for the receiving water is adopted, the alternate WQBELs based on the SSO will be determined after the SSO effective date.

[4] Final effluent limitations for mercury, selenium, and cyanide shall become effective on April 28, 2010. The Regional Water Board may amend these final effluent limitations prior to this date in accordance with TMDLs or SSOs that become effective subsequent to the effective date of this Order.

[5] Effluent mercury monitoring shall be performed using ultra-clean sampling and analysis techniques, with a method detection limit of 0.0002 µg/L or lower, or a ML of 0.0005 µg/L or lower.

[6] Compliance may be demonstrated by measurement of weak acid dissociable cyanide.

[7] Alternate Effluent Limits for Cyanide:

a. If a cyanide SSO for the receiving water becomes legally effective, resulting in adjusted saltwater chronic objective of 2.9 µg/L and acute objective of 9. 4 µg/L (based on Regional Water Board Resolution R2-2006-0086), upon its effective date, the following limitations shall supersede those cyanide limitations, above (the rationale for these effluent limitations can be found in the Fact Sheet **[Attachment F]**).

MDEL of 42 µg/L and AMEL of 21 µg/L.

b. If a different cyanide SSO for the receiving water is adopted, the alternate WQBELs based on the SSO will be determined after the SSO effective date.

[8] Final effluent limitations TCDD TEQ shall become effective on June 1, 2017. The Regional Water Board may amend these final effluent limitations prior to this date in accordance with TMDLs that become effective subsequent to the effective date of this Order.

b. **Intake Water Credit.** The Discharger has met the conditions specified in Section 1.4.4, Intake Water Credits, of the SIP as discussed in detail in the Fact Sheet (**Attachment F**). The Discharger qualifies to receive intake water credits for arsenic, copper, lead, mercury, nickel, selenium, zinc, cyanide, and bis(2-ethylhexyl)phthalate applicable toward the concentration-based effluent limitations specified in IV.A.3.a of this Order. These credits are to offset any concentrations of the pollutant found in the intake water, and are only allowed on a pollutant-by-pollutant and discharge-by-discharge basis. Furthermore, these credits are only applicable upon each specific discharge event, and compliance with the concentration-based limitations specified in IV.A.3.a of this Order shall be assessed as follows:

(1) **Monitoring Requirements.** The Discharger shall monitor the pollutant concentrations in the intake and in the effluent (at Monitoring Locations M-INF-001 and M-001, respectively) during the same day.

(2) **Compliance Evaluation.** If an effluent concentration exceeds the effluent limits specified in IV.A.3.a, IV.A.4.a., and IV.C.1 this Order, the Discharger may use intake water credits when determining compliance. In this case, (a) if the intake water concentration sampled during the same day is higher than the effluent concentration, or (b) if it can be statistically demonstrated that the effluent concentration is not significantly higher than the intake water concentrations (see attached Fact Sheet [**Attachment F**] for an statistical analysis example for this purpose), then the concentration and mass-based effluent limitations specified in IV.A.3.a, IV.A.4.a., and IV.C.1 of this Order are not applicable, and therefore, the discharge is in compliance. Otherwise, the effluent must comply with the effluent limitations specified in IV.A.3.a, IV.A.4.a., and IV.C.1 of this Order.

4. Interim Effluent Limitations for Toxic Pollutants

a. The following interim effluent limitations shall become effective upon the effective date of this Order and shall remain effective for the time periods indicated in the table below:

Table 7. Interim Effluent Limitations for Discharge Point 001 -Toxic Pollutants

Constituent	Units	Interim Effluent Limitations	
		MDEL	Effective Period
Mercury	µg/L	0.16	Permit effective date through April 27, 2010
Selenium	µg/L	26	Permit effective date through April 27, 2010
Cyanide	µg/L	5	Permit effective date through April 27, 2010

b. **Intake water credit.** The intake credit provision in IV.A.3.b above also applies to mercury and selenium interim limitations in this section.

B. Effluent Limitations for Discharge Point 002

Compliance with the effluent limitations shall be demonstrated at Discharge Point 002, with compliance measured at Monitoring Location M-002 as described in the attached MRP (**Attachment E**).

1. Effluent Limitations for Conventional and Non-Conventional Pollutants

Discharge of conventional and non-conventional pollutants at Discharge Point 002 shall be limited as follows:

Table 8. Effluent Limitations – Conventional and Non-Conventional Pollutants (Discharge Point 002)

Constituent	Units	Effluent Limitations			
		Maximum Daily	Monthly Average	Instantaneous Minimum	Instantaneous Maximum
BOD_5[1]	lbs/day	2,000 [2]	730 [3]	---	---
TSS[1]	lbs/day	2,600 [2]	730 [3]	---	---
pH[4]	s.u.	---	---	6.0	9.0
Oil and Grease	mg/L	20	10	---	---
Total Chlorine Residual[5]	mg/L	---	---	---	0.0
Settleable Matter					
Before April 18, 2010	mL/L/hr	2.0	1.0	---	---
After April 18, 2010	mL/L/hr	0.2	0.1	---	---

Footnotes for Table 8:

[1] These effluent limitations are based on a raw sugar melt rate of 3,300 tons/day at the Refinery, and a maximum daily average flow rate of 1.67 MGD and a maximum monthly average flow rate of 0.54 MGD of municipal wastewater flow from CSD during 2002 through 2005 for maximum daily and monthly average effluent limitation calculation, respectively. The resulting mass loading limits are rounded to two significant figures.

[2] Compliance with the maximum daily effluent limitations for BOD_5 and TSS shall be determined by evaluating the mass (lbs/day) of BOD_5 and TSS discharged at Discharger Point 002 (as monitored at M-002 as described in the attached Monitoring and Reporting Program or MRP, **Attachment E**). The mass (lbs/day) of BOD_5 and TSS discharged shall be determined in accordance with the following equations:

- lbs/day BOD_5 = BOD_5 concentration (mg/L) at Discharge Point 002 x effluent flow (MGD) at Discharge Point 002 x 8.34
- lbs/day TSS = TSS concentration (mg/L) at Discharge Point 002 x effluent flow (MGD) at Discharge Point 002 x 8.34

where: Conversion factor (8.34) in [(L•lb)/(gallon•kg)] = 3.7854 L/gallon x 2.2 lbs/kg

[3] Compliance with the monthly average effluent limitations for BOD_5 and TSS shall be determined by averaging all daily values (lbs/day) determined as above.

[4] If the Discharger employs continuous monitoring, pursuant to 40 CFR § 401.17, the Discharger shall be in compliance with the pH limitation specified herein, provided that both of the following conditions are satisfied: (i)The total time during which the pH values are outside the required range of pH values shall not exceed 7 hours and 26 minutes in any calendar month; and (ii) No individual excursion from the range of pH values shall exceed 60 minutes.

[5] The chlorine residual requirement is defined as below the limit of detection by standard methods of analysis, as defined in *Standard Methods for the Examination of Water and Wastewater*. The Discharger may elect to use a continuous on-line monitoring system(s) for measuring flows, chlorine and sodium bisulfite dosage (which could be interpolated), and chlorine concentration to prove that chlorine residual exceedances are false positives. If convincing evidence is provided, Regional Water Board staff may conclude that these false positive chlorine residual exceedances are not violations of this permit limitation.

2. **Total Coliform Bacteria.** The median concentration of total coliform bacteria in 5 consecutive effluent samples of the discharge at Discharge Point 002 shall not exceed 240 MPN/100 mL. No single sample shall exceed 10,000 MPN/100mL.

3. **Final Effluent Limitations for Toxic Pollutants.** The discharge of effluent at Discharge Point 002, as monitored at M-002, shall not exceed the following limitations.

Table 9. Final Effluent Limitations for Discharge Point 002 - Toxic Pollutants

Constituent	Units	Final Effluent Limitations[1][2]	
		AMEL	MDEL
Copper [3]	µg/L	88	150
Lead	µg/L	3.6	9.7
Mercury [4][5]	µg/L	0.012	0.038
Cyanide [4][6][7]	µg/L	2.9	6.4
TCDD TEQ [8]	µg/L	1.4×10^{-8}	2.8×10^{-8}
Bis (2-ethylhexyl) phthalate	µg/L	54	110

Footnotes for Table 9:

[1] a. All analyses shall be performed using current USEPA methods, or equivalent methods approved in writing by the Executive Officer.

c. Limitations apply to the average concentration of all samples collected during the averaging period (daily = 24-hour period; monthly = calendar month).

d. All metal limitations are total recoverable.

[2] A daily maximum or average monthly value for a given constituent shall be considered noncompliant with the effluent limitations only if it exceeds the effluent limitation and the Reporting Level for that constituent. As outlined in Section 2.4.5 of the SIP, the table below indicates the Minimum Level (ML) upon which the Reporting Level is based for compliance determination purposes. An ML is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Constituent	ML (µg/L)
Copper	2
Lead	0.5
Mercury	0.0005
Cyanide	5
Bis(2-ethylhexyl) phthalate	5

[3] Alternate Effluent Limits for Copper:

a. If a copper SSO for the receiving water becomes legally effective, resulting in adjusted saltwater chronic objective of 2.5 µg/L and acute objective of 3.9 µg/L as documented in the *Copper Site-Specific Objectives in San Francisco Bay, Proposed Basin Plan Amendment and Draft Staff Report, dated March 2, 2007,* upon its effective date, the following limitations shall supersede those copper limitations listed in Table 9 (the rationale for these effluent limitations can be found in the Fact Sheet [**Attachment F**]).

MDEL of 120 µg/L and AMEL of 70 µg/L.

b. If a different copper SSO for the receiving water is adopted, the alternate WQBELs based on the SSO will be determined after the SSO effective date.

[4] Final effluent limitations for mercury and cyanide shall become effective on April 28, 2010. The Regional Water Board may amend these final effluent limitations prior to this date in accordance with TMDLs or SSOs that become effective subsequent to the effective date of this Order.

[5] Effluent mercury monitoring shall be performed using ultra-clean sampling and analysis techniques, with a method detection limit of 0.0002 µg/L or lower (or a ML of 0.0005 µg/L or lower).

[6] Compliance may be demonstrated by measurement of weak acid dissociable cyanide.

[7] Alternate Effluent Limits for Cyanide:

a. If a cyanide SSO for the receiving water becomes legally effective, resulting in adjusted saltwater chronic objective of 2.9 µg/L and acute objective of 9.4 µg/L (based Regional Water Board Resolution R2-2006-0086), upon its effective date, the following limitations shall supersede those cyanide limitations, above (the rationale for these effluent limitations can be found in the Fact Sheet [**Attachment F**]).

MDEL of 44 µg/L and AMEL of 20 µg/L.

b. If a different cyanide SSO for the receiving water is adopted, the alternate WQBELs based on the SSO will be determined after the SSO effective date.

[8] Final effluent limitations TCDD TEQ shall become effective on June 1, 2017. The Regional Water Board may amend these final effluent limitations prior to this date in accordance with any TMDLs that become effective subsequent to the effective date of this Order.

4. Interim Effluent Limitations for Toxic Pollutants at Discharge Point 002

The following interim effluent limitations shall become effective upon the effective date of this Order and shall remain effective for the time periods indicated in the table below:

Table 10. Interim Effluent Limitations for Discharge Point 002 – Toxic Pollutants

Constituent	Units	Interim Effluent Limitations		
		MDEL	AMEL	Effective Period
Mercury	µg/L	1.0	0.21	Permit effective date through April 27, 2010
Cyanide	µg/L	22.8	---	Permit effective date through April 27, 2010

5. Whole Effluent Acute Toxicity. Representative samples of the discharge at Discharge Point 002 shall meet the following limits for acute toxicity. Compliance with these limits shall be achieved in accordance with Section V.A of the attached MRP (**Attachment E**).

a. The survival of bioassay test organisms in 96-hour flow-through bioassays of undiluted effluent shall be:

(1) An eleven (11)-sample median value of not less than 90 percent survival; and

(2) An eleven (11)-sample 90th percentile value of not less than 70 percent survival.

b. These acute toxicity limits are further defined as follows:

(1) 11-sample median limit:

Any bioassay test showing survival of 90 percent or greater is not a violation of this limit. A bioassay test showing survival of less than 90 percent represents a violation of this effluent limit if five or more of the past ten or fewer bioassay tests also show less than 90 percent survival.

(2) 90th percentile limit:

Any bioassay test showing survival of 70 percent or greater is not a violation of this limit. A bioassay test showing survival of less than 70 percent represents a violation of this effluent limit if one or more of the past ten or fewer bioassay tests also show less than 70 percent survival.

c. Bioassays shall be performed using the most up-to-date USEPA protocol and the most sensitive species as specified in writing by the Executive Officer based on the most recent screening test results. Bioassays shall be conducted in compliance with "Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms," currently 5th Edition (EPA-821-R-02-012), with exceptions granted to the Discharger by the Executive

Officer and the Environmental Laboratory Accreditation Program (ELAP) upon the Discharger's request with justification.

d. If the Discharger can demonstrate to the satisfaction of the Executive Officer that toxicity exceeding the levels cited above is caused by ammonia and that the ammonia in the discharge is not adversely impacting receiving water quality or beneficial uses, then such toxicity does not constitute a violation of this effluent limitation.

6. Whole Effluent Chronic Toxicity.

a. Compliance with the Basin Plan narrative toxicity objective shall be demonstrated according to the following tiered requirements based on results from representative samples of the treated effluent at Discharge Point 002 meeting test acceptability criteria and Section V.B of the MRP (**Attachment E**):

(1) Conduct routine monitoring;

(2) Accelerate monitoring after exceeding a single sample maximum value of 10 TUc[1].

(3) Return to routine monitoring if accelerated monitoring does not exceed the "trigger" in (2) above;

(4) If accelerated monitoring confirms consistent toxicity above the "trigger" in (2), above, initiate toxicity identification evaluation/toxicity reduction evaluation (TIE/TRE) in accordance with a workplan submitted in accordance with Section V.B of the MRP (**Attachment E**), and that incorporates any and all comments from the Executive Officer;

(5) Return to routine monitoring after appropriate elements of TRE workplan are implemented and either the toxicity drops below "trigger" level in (2), above or, based on the results of the TRE, the Executive Officer authorizes a return to routine monitoring.

b. *Test Species and Methods*: The Discharger shall conduct routine monitoring with the most sensitive species determined during the chronic toxicity screening study performed by the Discharger and approved by the Executive Officer. Chronic Toxicity Monitoring Screening Phase Requirements, Critical Life Stage Toxicity Tests and definitions of terms used in the chronic toxicity monitoring are identified in **Appendix E** of the MRP (**Attachments E-1** and **E-2**). In addition, bioassays shall be conducted in compliance with the most recently promulgated test methods, "Short-term Methods for Estimating the Chronic Toxicity of

[1] A TUc equals 100 divided by the no observable effect level (NOEL). The NOEL is determined from IC, EC, or NOEC values. These terms, their usage, and other chronic toxicity monitoring program requirements are defined in more detail in the MRP (**Attachment E**). Monitoring and TRE requirements may be modified by the Executive Officer in response to the degree of toxicity detected in the effluent or in ambient waters related to the discharge.

Effluents and Receiving Waters to Freshwater Organisms," currently 4th Edition (EPA-821-R-02-013), with exceptions granted by the Executive Officer and the Environmental Laboratory Accreditation Program (ELAP).

C. Interim Mercury Mass Emission Effluent Limitations:

Until TMDL and WLA efforts for mercury provide enough information to establish a different WQBEL, the Discharger shall demonstrate that the current mercury mass loading to the receiving water does not increase by complying with the following:

1. **Mass limit for 001.** The 12-month moving average annual load for mercury shall not exceed 0.080 kilograms per month (kg/mo). Compliance shall be calculated using 12-month moving average loadings from Discharge 001 to the receiving water for the entire year. However, if it is determined that a specific monthly sample qualifies for intake water credit, the mass limit will not apply to that specific month.

2. **Mass limit for 002.** The 12-month moving average annual load for mercury shall not exceed 0.026 kg/mo. Compliance shall be calculated using 12-month moving average loadings to the receiving water from Discharge 002 for the entire year.

3. **Compliance determination method.** Compliance for each month will be determined based on the 12-month moving averages over the previous 12 months of monitoring calculated using the method described below:

   Monthly mass emission loading, in kg/mo = Flow, in mgd x Concentration, in µg/L x 0.1151

   12-month moving average Hg mass loading = Running average of last 12 monthly mercury mass loadings, in kg/mo

   Where:
   0.1151—conversion factor

   If more than one mercury measurement is obtained in a calendar month, the average of the calculated mass loadings for the sampling days is used as the monthly value for that month. If the results are less than the method detection limit used, the concentrations are assumed to be equal to the method detection limit.

4. **Mercury Final Limits.** The Regional Water Board intends to amend this Order in accordance with the mercury TMDL and WLAs. The Clean Water Act's anti-backsliding rule, Section 402(o), indicates that this Order may be modified to include a less stringent requirement following adoption of the TMDL and WLA, if the requirements for an exception to the rule are met.

D. Land Discharge Specifications

N/A

E. Reclamation Specifications

N/A

F. Storm Water Limitations

The discharge of storm water runoff Wastes 003 through and including 016 outside the pH range or containing constituents in excess of the following limits is prohibited:

Constituent	Units	Limitation
pH	standard units	6.5 to 8.5
Visible oil	---	none observed
Visible color	---	none observed

V. RECEIVING WATER LIMITATIONS

A. Surface Water Limitations

Discharge to Carquinez Strait shall be limited as follows:

1. Temperature shall be limited as follows:

   a. Discharges, either individually or combined with other discharges, shall not create a zone, defined by water temperatures of more than 1°F above natural receiving water temperature, that exceeds 25 percent of the cross sectional area of Carquinez Strait at any point.

   b. Discharges shall not cause a surface temperature rise greater than 4°F above the natural temperature of the receiving water at any time or place.

2. The discharge shall not cause the following conditions to exist at any place:

   a. Floating, suspended, or deposited macroscopic particulate matter or foam in concentrations that cause nuisance or adversely affect beneficial uses;

   b. Bottom deposits or aquatic growths to the extent that such deposits or growths cause nuisance or adversely affect beneficial uses;

   c. Alterations of temperature, turbidity, or apparent color beyond present natural background levels;

   d. Visible, floating, suspended, or deposited oil or other products of petroleum origin; and

   e. Toxic or other deleterious substances to be present in concentrations or quantities, which will cause deleterious effects on wildlife, waterfowl, or other aquatic biota, or which render any of these unfit for human consumption, either at levels created in the receiving waters or as a result of biological concentration.

3. The discharge shall not cause nuisance, or adversely affect the beneficial uses of the receiving water.

4. The discharge shall not cause the following limits to be exceeded in waters of the State at any one place within one foot of the water surface:

   a. Dissolved Oxygen: 5.0 mg/L, minimum

      The median dissolved oxygen concentration for any three consecutive months shall not be less than 80% of the dissolved oxygen content at saturation. When natural factors cause concentrations less than that specified above, then the discharges shall not cause further reduction in ambient dissolved oxygen concentrations.

   b. Dissolved Sulfide: 0.1 mg/L, maximum

   c. pH: The pH shall not be depressed below 6.5 nor raised above 8.5, nor caused to vary from normal ambient pH by more than 0.5 Standard Units.

   d. Un-ionized Ammonia: 0.025 mg/L as N, annual median; and 0.16 mg/L as N, maximum.

   e. Nutrients: Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.

5. The discharge shall not cause a violation of any particular water quality standard for receiving waters adopted by the Regional Water Board or the State Water Board as required by the Clean Water Act and regulations adopted thereunder. If more stringent applicable water quality standards are promulgated or approved pursuant to CWA Section 303, or amendments thereto, the Regional Water Board will revise and modify this Order in accordance with such more stringent standards.

B. Groundwater Limitations

N/A

VI. PROVISIONS

A. Standard Provisions

1. **Federal Standard Provisions.** The Discharger shall comply with all Standard Provisions included in **Attachment D** of this Order.

2. **Regional Water Board Standard Provisions.** The Discharger shall comply with all applicable items of the attached *Standard Provisions and Reporting Requirements for NPDES Surface Water Discharge Permits, August 1993* (the Standard Provisions, **Attachment G**), and any amendment thereto. Where provisions or reporting requirements specified in this Order are different from equivalent or related provisions or reporting requirements given in the Standard Provisions (**Attachment G**), the specifications of this Order shall apply. Duplicative requirements in the federal Standard Provisions in VI.A.1.2, above (**Attachment D**) and the regional Standard Provisions (**Attachment G**) are not separate requirements. A violation of a duplicative requirement does not constitute two separate violations.

B. Monitoring and Reporting Program Requirements

The Discharger shall comply with the Monitoring and Reporting Program, and future revisions thereto, in **Attachment E**. The Discharger shall also comply with the requirements contained in *Self-Monitoring Program, Part A, August 1993* (**Attachment G**).

C. Special Provisions

1. Reopener Provisions

The Regional Water Board may modify or reopen this Order prior to its expiration date in any of the following circumstances as allowed by law:

a. If present or future investigations demonstrate that the discharge(s) governed by this Order will or have a reasonable potential to cause or contribute to, or will cease to, have adverse impacts on water quality and/or beneficial uses of the receiving waters.

b. If new or revised WQOs, or TMDLs come into effect for the San Francisco Bay estuary and contiguous water bodies (whether statewide, regional, or site-specific). In such cases, effluent limitations in this Order will be modified as necessary to reflect updated WQOs and waste load allocations in TMDLs. Adoption of effluent limitations contained in this Order is not intended to restrict in any way future modifications based on legally adopted WQOs, TMDLs, or as otherwise permitted under Federal regulations governing NPDES permit modifications.

c. If translator or other water quality studies provide a basis for determining that a permit condition(s) should be modified.

d. If administrative or judicial decision on a separate NPDES permit or WDR that addresses requirements similar to this discharge.

e. Or as otherwise authorized by law.

The Dischargers may request permit modification based on the above. The Dischargers shall include in any such request an antidegradation and antibacksliding analysis.

2. Special Studies, Technical Reports and Additional Monitoring Requirements

a. Effluent Monitoring.

The Discharger shall continue to monitor and evaluate the discharge from Outfalls 001 and 002 (measured at M-001 and M-002) for the constituents listed in Enclosure A of the Regional Water Board's August 6, 2001 Letter, according to the sampling frequency specified in the attached MRP **(Attachment E)**. Compliance with this requirement shall be achieved in accordance with the specifications stated in the Regional Water Board's August 6, 2001 Letter under Effluent Monitoring for Minor Discharger.

The Discharger shall evaluate on an annual basis if concentrations of any constituent increase over past performance. The Discharger shall investigate the cause of the increase. The investigation may include, but need not be limited to, an increase in the effluent monitoring frequency, monitoring of internal process streams, and monitoring of influent sources. This may be satisfied through identification of these constituents as "Pollutants of Concern" in the Discharger's Pollutant Minimization Program described in Provision VI.C.3.a, below. A summary of the annual evaluation of data and source investigation activities shall also be reported in the annual self-monitoring report.

A final report that presents all the data shall be submitted to the Regional Water Board no later than 180 days prior to the Order expiration date. This final report shall be submitted with the application for permit reissuance.

b. Ambient Background Receiving Water Monitoring.

The Discharger shall collect or participate in collecting background ambient receiving water monitoring for priority pollutants that is required to perform a reasonable potential analysis (RPA) and to calculate effluent limitations. The data on the conventional water quality parameters (pH, salinity, and hardness) shall also be sufficient to characterize these parameters in the receiving water at a point after the discharge has mixed with the receiving waters. This provision may be met through monitoring through a collaborative ambient monitoring program for San Francisco Bay, such as the Regional Monitoring Program (RMP). This permit may be reopened, as appropriate, to incorporate effluent limits or other requirements based on Regional Water Board review of these data.

The Discharger shall submit a final report that presents all the data to the Regional Water Board 180 days prior to Order expiration. This final report shall be submitted with the application for permit reissuance.

c. Cooling Water Intake Impingement and Entrainment Study.

Before January 1, 2010, the Discharger shall submit to the Regional Water Board a *Cooling Water Intake Report and Sampling Plan*, which shall include the following components.

(1) A list and summary of historical studies characterizing baseline biological conditions in area of influence of the Refinery's cooling water intake structure(s); impingement and entrainment mortality attributed to the Refinery's cooling water intake structure(s); and the physical conditions of Carquinez Strait in the vicinity of the facility's cooling water intake structure(s). The Discharger shall describe the extent to which historical data are representative of current conditions and address whether the data were collected using appropriate quality assurance/quality control procedures.

(2) A summary of source water physical data and cooling water intake structure data that includes the following information:

i. A location map showing the location of the Refinery's cooling water intake structure;

ii. A narrative description and drawings showing the physical configuration of the source water body where the Refinery's cooling water intake structure(s) is located, including aerial dimensions, depths, salinity and temperature regimes;

iii. Characterization of the source water body's hydrological and geomorphological features that define the cooling water intake structure(s) area of influence within the water body;

iv. A description of where the Refinery's cooling water intake structure(s) is located within the water body and in the water column, including latitude and longitude;

v. A description of the operation of each cooling water intake structure, including design and actual (average and maximum) intake flows (volume, rate, velocity), daily hours of operation, number of days per year of operation and seasonal changes; and

vi. Engineering schematics of the cooling water intake structure(s).

(3) A summary of past and on-going consultations with federal, state, and local fish and wildlife agencies regarding environmental impacts of the facility's cooling water intake structure(s).

(4) A sampling plan for field studies to develop or update scientifically valid estimates of impingement and entrainment mortality attributed to the Refinery's cooling water intake structure(s). As necessary, the sampling plan shall provide for source water, baseline biological characterization in the vicinity of the cooling water intake structure(s), in addition to identifying/describing methods to estimate impingement mortality and entrainment.

Baseline biological characterization of the source water body shall (whether through a historic or proposed study), at a minimum, include the following information:

i. A list of species (or relevant taxa) for all life stages and their relative abundance in the vicinity of the cooling water intake structure(s).

ii. Identification of the species and life stages that would be most susceptible to impingement and entrainment. Species evaluated should include the forage base as well as those most significant to commercial and recreational fisheries.

iii. Identification and evaluation of the primary period of reproduction, larval recruitment, and periods of peak abundance for relevant taxa.

iv. Data representative of seasonal and daily activity (e.g., feeding and migration within the water column) of biological organisms within the vicinity of the cooling water intake structure(s).

v. Identification of all threatened, endangered, or protected species that might be susceptible to impingement and entrainment at the facility's cooling water intake structure(s).

Information provided by the Discharger in this study, and information resulting from subsequent studies, will be used by the Regional Water Board in its on-going determination of specific requirements for inclusion into the facility's NPDES permit and to establish the best technology available to minimize adverse environmental impacts associated with the facility's cooling water intake structure(s).

d. Optional Mass Offset.

If the Discharger can demonstrate that further net reductions of the total mass loadings of 303(d)-listed pollutants to the receiving water cannot be achieved through economically feasible measures, such as aggressive source control, wastewater reuse, and treatment plant optimization, but only through a mass offset program, the Discharger may submit to the Regional Water Board for approval a mass offset plan to reduce 303(d)-listed pollutants to the same watershed or drainage basin. The Regional Water Board may modify this Order to allow an approved mass offset program.

3. Best Management Practices and Pollution Minimization Program

a. Both C&H and CSD, acting as the Discharger, shall continue to improve, in a manner acceptable to the Executive Officer, the Discharger's existing Pollutant Minimization Program to reduce pollutant loadings to the treatment plant, and therefore, to the receiving waters.

b. The Discharger shall submit an annual report, acceptable to the Executive Officer, no later than February 28th of each calendar year. The annual report shall cover January through December of the preceding year. Each annual report shall include at least the following information:

(1) A brief description of its treatment facilities and treatment processes.

(2) A discussion of the current pollutants of concern. Periodically, the Discharger shall analyze its own situation to determine which pollutants are currently a problem and/or which pollutants may be potential future problems. This discussion shall include the reasons why the pollutants were chosen.

(3) Identification of sources for the pollutants of concern. This discussion shall include how the Discharger intends to estimate and identify sources of the pollutants. The Discharger shall also identify sources or potential sources not directly within the ability or authority of the Discharger to control, such as pollutants in the potable water supply and air deposition.

(4) Identification of tasks to reduce the sources of the pollutants of concern. This discussion shall identify and prioritize tasks to address the Discharger's pollutants of concern. The Discharger may implement tasks itself or participate in group, regional, or national tasks that will address its pollutants of concern. The Discharger is strongly encouraged to participate in group, regional, or national tasks that will address its pollutants of concern whenever it is efficient and appropriate to do so. A time-line shall be included for the implementation of each task.

(5) Outreach to employees and CSD rate payers. The Discharger (both C&H and CSD) shall inform employees and rate payers, respectively, about the pollutants of concern, potential sources, and how they might be able to help reduce the discharge of these pollutants of concern into the treatment facilities. The Discharger may provide a forum for employees to provide input to the Program.

(6) Discussion of criteria used to measure the Program's and tasks' effectiveness. The Discharger shall establish criteria to evaluate the effectiveness of its Pollution Minimization Program. This shall also include a discussion of the specific criteria used to measure the effectiveness of each of the tasks in item (b) (3, 4, and 5), above.

(7) Documentation of efforts and progress. This discussion shall detail all the Discharger's activities in the Pollution Minimization Program during the reporting year.

(8) Evaluation of Program's and tasks' effectiveness. The Discharger shall use the criteria established in (b) (6) to evaluate the Program's and tasks' effectiveness.

(9) Identification of Specific Tasks and Time Schedules for Future Efforts. Based on the evaluation, the Discharger shall detail how it intends to continue or change its tasks to more effectively reduce the amount of pollutants to the treatment plant, and subsequently in its effluent.

c. Pollutant Minimization Program for Pollutants with Effluent Limitations.

The Discharger shall develop and conduct a Pollutant Minimization Program (PMP) as further described below when there is evidence (e.g., sample results reported as DNQ when the effluent limitation is less than the MDL, sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, results of benthic or aquatic organism tissue sampling) that a priority pollutant is present in the effluent above an effluent limitation and either:

(1) A sample result is reported as DNQ and the effluent limitation is less than the RL; or

(2) A sample result is reported as ND and the effluent limitation is less than the MDL, using definitions described in the SIP.

d. If triggered by the reasons in c. above, the Discharger's PMP shall include, but not be limited to, the following actions and submittals acceptable to the Regional Water Board:

(1) An annual review and semi-annual monitoring of potential sources of the reportable priority pollutant(s), which may include fish tissue monitoring and other bio-uptake sampling, or alternative measures approved by the Executive Officer when it is demonstrated that source monitoring is unlikely to produce useful analytical data;

(2) Quarterly monitoring for the reportable priority pollutant(s) in the influent to the wastewater treatment system, or alternative measures approved by the Executive Officer, when it is demonstrated that influent monitoring is unlikely to produce useful analytical data;

(3) Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable priority pollutant(s) in the effluent at or below the effluent limitation;

(4) Implementation of appropriate cost-effective control measures for the reportable priority pollutant(s), consistent with the control strategy; and

(5) The annual report required by 3.b. above, shall specifically address the following items:

i. All PMP monitoring results for the previous year;

ii. A list of potential sources of the reportable priority pollutant(s);

iii. A summary of all actions undertaken pursuant to the control strategy; and

iv. A description of actions to be taken in the following year.

4. Action Plan for Cyanide.

If and when the cyanide alternate limits in IV become effective, the Discharger shall implement an action plan for cyanide in accordance with the Basin Plan Amendment to adopt cyanide SSOs.

5. Action Plan for Copper

If and when the copper alternate limits in IV become effective, the Discharger shall initiate implementation of an action plan for copper in accordance with the Basin Plan Amendment to adopt copper SSOs.

6. Storm Water Pollution Prevention Plan and Best Management Practices Plan

a. C&H shall submit an updated Storm Water Pollution Prevention Plan (SWPPP) and Best Management Practices Plan (BMPP) either annually or sooner if there is a change in the operation of the Refinery, which may substantially affect the quality of the storm water discharged. Annual updates shall be submitted by July 1 of each year. If there is no change to either of these plans, then the annual updates shall be a letter indicating that the plan is unchanged. The Discharger shall implement the SWPPP and BMPP, and the SWPPP shall comply with the requirements contained in the attached Standard provisions (**Attachment G.**)

In any update of the SWPPP and BMPP, the Discharger shall (1) include at least an up-to-date drainage map for the facility; (2) identify on a map of appropriate scale the areas which contribute runoff to the permitted discharge points; (3) describe the activities in each area and the potential for contamination of storm water runoff and discharge of hazardous waste/material; and, (4) address the feasibility for containment and/or treatment of the storm water.

(1) The SWPPP shall describe site-specific management practices for minimizing storm water runoff from being contaminated, and for preventing contaminated storm water runoff from being discharged directly to waters of the State. It shall also include pollution prevention measures which are above and beyond

the current practices to further reduce and control sources of total organic carbon (TOC) and total suspended solids (TSS).

(2) The BMPP shall entail site-specific plans and procedures implemented and/or to be implemented to prevent hazardous waste/material from being discharged to waters of the State. The updated BMPP shall be consistent with the requirements of 40 CFR 125, Subpart K, and the general guidance contained in the "NPDES Best Management Guidance Document", USEPA Report No. 600/9-79-045, December 1979 (revised June 1981). In particular, a risk assessment of each area identified by C&H shall be performed to determine the potential of hazardous waste/material discharge to surface waters.

The SWPPP and BMPP may include time schedules for the completion of management practices and procedures. C&H shall begin implementing the SWPPP and BMPP within 10 calendar days of approval by the Executive Officer, unless otherwise directed.

b. C&H shall also submit an annual storm water report by July 1 of each year, covering data for the previous wet weather season for E-003 through E-016. The annual storm water report shall, at a minimum, include: (a) a tabulated summary of all sampling results and a summary of visual observations taken during the inspections; (b) a comprehensive discussion of the compliance record and any corrective actions taken or planned to ensure compliance with waste discharge requirements; and (c) a comprehensive discussion of source identification and control programs for constituents that do not have effluent limitations (e.g., total suspended solids.)

7. Construction, Operation and Maintenance Specifications

a. Wastewater Facilities, Review and Evaluation, and Status Reports.

(1) The Discharger shall operate and maintain its wastewater collection, treatment, and disposal facilities in a manner to ensure that all facilities are adequately staffed, supervised, financed, operated, maintained, repaired, and upgraded as necessary, in order to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

(2) The Discharger shall regularly review and evaluate its wastewater facilities and operation practices in accordance with section a.1 above. Reviews and evaluations shall be conducted as an ongoing component of the Discharger's administration of its wastewater facilities.

(3) The Discharger shall provide the Executive Officer, upon request, a report describing the current status of its wastewater facilities and operation practices, including any recommended or planned actions and an estimated time schedule for these actions. The Discharger shall also include, in each annual self-monitoring report, a description or summary of review and

evaluation procedures, and applicable wastewater facility programs or capital improvement projects.

b. Operations and Maintenance Manual (O&M), Review and Status Reports.

(1) The Discharger shall maintain an O&M Manual as described in the findings of this Order for the Discharger's wastewater facilities. The O&M Manual shall be maintained in usable condition and be available for reference and use by all applicable personnel.

(2) The Discharger shall regularly review, revise, or update, as necessary, the O&M Manual(s) so that the document(s) may remain useful and relevant to current equipment and operation practices. Reviews shall be conducted annually, and revisions or updates shall be completed as necessary. For any significant changes in treatment facility equipment or operation practices, applicable revisions shall be completed within 90 days of completion of such changes.

(3) The Discharger shall provide the Executive Officer, upon request, a report describing the current status of its O&M manual, including any recommended or planned actions and an estimated time schedule for these actions. The Discharger shall also include, in each annual self-monitoring report, a description or summary of review and evaluation procedures and applicable changes to its operations and maintenance manual.

c. Contingency Plan, Review and Status Reports.

(1) The Discharger shall maintain a Contingency Plan as required by Regional Water Board Resolution 74-10 (**Attachment G**) and as prudent in accordance with current municipal facility emergency planning. The discharge of pollutants in violation of this Order where the Discharger has failed to develop and/or adequately implement a Contingency Plan will be the basis for considering such discharge a willful and negligent violation of this Order pursuant to Section 13387 of the California Water Code.

(2) The Discharger shall regularly review and update, as necessary, the Contingency Plan so that the plan may remain useful and relevant to current equipment and operation practices. Reviews shall be conducted annually, and updates shall be completed as necessary.

(3) The Discharger shall provide the Executive Officer, upon request, a report describing the current status of its Contingency Plan review and update. The Discharger shall also include, in each annual self-monitoring report, a description or summary of review and evaluation procedures and applicable changes to its Contingency Plan.

8. Special Provisions

a. Sludge Management Practices Requirements.

(1) Permanent biosolids disposal activities at the JTP are not authorized by this Order.

(2) The treatment, disposal, storage, or processing of biosolids shall not cause waste material to be in any position where it is, or can be, carried from the biosolids treatment, disposal, storage, or processing site and deposited in waters of the State.

(3) The biosolids treatment, storage and handling site shall have facilities adequate to divert surface runoff from adjacent areas, to protect boundaries of the site from erosion, and to prevent any conditions that would cause drainage from the materials in the temporary storage site. Adequate protection is defined as protection from at least 100-year storm and protection from the highest possible tidal stage that may occur.

b. Sanitary Sewer Management Plan.

The CSD's collection system, excluding any satellite collection system, is part of CSD that is subject to this Order. As such, CSD shall properly operate and maintain its collection system as required by **Attachment D**, Standard Provisions – Permit Compliance, subsection I.D. This Order does not authorize discharges from CSD's collection system to waters of the United States. In the event there is a discharge from CSD's collection system to waters of the United States, CSD shall report the discharge as required by **Attachment D**, Standard Provisions – Reporting, subsections V.E.1 and V.E.2 of this Order. If there is such a discharge, it shall be CSD's duty to mitigate the discharge as required by **Attachment D**, Standard Provisions – Permit Compliance, subsection I.C. The General Waste Discharge Requirements for Collection System Agencies (Order No. 2006-0003 DWQ) also have requirements for operation and maintenance of collection systems and for reporting and mitigating sanitary sewer overflows. While CSD must comply with both the General Waste Discharge Requirements for Collection System Agencies (General Collection System WDR) and this Order, the General Collection System WDR more clearly and specifically stipulates requirements for operation and maintenance and for reporting and mitigating sanitary sewer overflows. Implementation of the General Collection System WDR requirements for proper operation and maintenance and mitigation of spills will satisfy the corresponding federal NPDES requirements specified in this Order. Following reporting requirements in the General Collection System WDR will satisfy NPDES reporting requirements for sewage spills. Furthermore, CSD has agreed to, and shall, comply with the schedule for development of sewer system management plans (SSMPs) as indicated in the letter issued by the Regional Water Board on July 7, 2005, pursuant to Water Code Section 13267. Until the statewide on-line reporting system becomes operational, the

Discharger shall report sanitary sewer overflows electronically according to the Regional Water Board's SSO reporting program.

c. Settleable Matter Reduction.

CSD shall submit progress reports at two-year intervals to describe the status of measures designed to reduce inflow and infiltration to CSD's collection system and to improve grit removal performed by CSD prior to conveying wastewater to the JTP. Each progress report shall be submitted to the Executive Officer by June 30 of each other year, with the first report due on June 30, 2008.

9. Compliance Schedule and Compliance with Final Effluent Limits.

The Discharger shall comply with the following:

Task	Deadline
a. Implement source control measures identified in the Discharger's Infeasibility Report to reduce concentrations of mercury, cyanide, and TCDD TEQ to the treatment plant, and therefore to receiving waters. For the once-through cooling water discharge, the Discharger shall investigate the sources of mercury, selenium, and cyanide in the discharge, or investigate whether the analytical results represent the true pollutant concentrations in the discharge, but not due to matrix interference.	Upon the effective date of this Order.
b. The Discharger shall evaluate and report on the effectiveness of its source control measures in reducing concentrations of mercury and cyanide to the plant. If previous measures have not been successful in enabling the Discharger to comply with final limits for mercury, selenium, cyanide, the Discharger shall also identify and implement additional source control measures to further reduce concentrations of these pollutants. If the copper and cyanide SSO becomes effective and an alternate limit takes effect, the Discharger shall implement any applicable additional pollutant minimization measures described in Basin Plan implementation requirements associated with the copper and cyanide SSO.	Annually in the Annual Best Management Practices and Pollutant Minimization Report required by Provision VI.C.3

Task	Deadline
c. In the event that source control measures are insufficient for meeting final water quality based effluent limits specified in Effluent Limitations and Discharge Specifications IV.A.3 and IV.B.3 for mercury, selenium, and cyanide, the Discharger shall submit a schedule for implementation of additional actions to reduce the concentrations of these pollutants.	July 1, 2009
d. The Discharger shall commence implementation of the identified additional actions in accordance with the schedule submitted in task c, above.	August 15, 2009.
e. Full Compliance with IV. Effluent Limitations and Discharger Specifications A.3.a and B.3.a for mercury, selenium, and cyanide.	April 28, 2010.
f. Full Compliance with IV. Effluent Limitations and Discharger Specifications A.3.a and B.3.a for dioxin-TEQ. Alternatively, the Discharger may comply with the limit in IV through implementation of a mass offset strategy for dioxin-TEQ in accordance with policies in effect at that time.	June 1, 2017.

VII. COMPLIANCE DETERMINATION

Compliance with the effluent limitations contained in Section IV of this Order will be determined as specified below:

A. General.

Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined in the MRP (Attachment E of this Order). For purposes of reporting and administrative enforcement by the Regional and State Water Boards, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL).

B. Multiple Sample Data.

When determining compliance with an AMEL or MDEL for priority pollutants and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of "Detected, but Not Quantified" (DNQ) or "Not Detected" (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

1. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

ATTACHMENT A – DEFINITIONS

Arithmetic Mean (μ), also called the average, is the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean = $\mu = \Sigma x / n$ where: Σx is the sum of the measured ambient water concentrations, and n is the number of samples.

Average Monthly Effluent Limitation (AMEL): the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL): the highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Bioaccumulative pollutants are those substances taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Carcinogenic pollutants are substances that are known to cause cancer in living organisms.

Coefficient of Variation (*CV*) is a measure of the data variability and is calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

Daily Discharge: Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

Detected, but Not Quantified (DNQ) are those sample results less than the RL, but greater than or equal to the laboratory's MDL.

Dilution Credit is the amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is

calculated from the dilution ratio or determined through conducting a mixing zone study or modeling of the discharge and receiving water.

Effluent Concentration Allowance (ECA) is a value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the coefficient of variation for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in U.S. EPA guidance (Technical Support Document For Water Quality-based Toxics Control, March 1991, second printing, EPA/505/2-90-001).

Enclosed Bays means indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

Estimated Chemical Concentration is the estimated chemical concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

Estuaries means waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater. Estuarine waters included, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

Inland Surface Waters are all surface waters of the State that do not include the ocean, enclosed bays, or estuaries.

Instantaneous Maximum Effluent Limitation: the highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation: the lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Maximum Daily Effluent Limitation (MDEL) means the highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median is the middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order).

If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between the $n/2$ and $n/2+1$).

Method Detection Limit (MDL) is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in title 40 of the Code of Federal Regulations, Part 136, Attachment B, revised as of July 3, 1999.

Minimum Level (ML) is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Mixing Zone is a limited volume of receiving water that is allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

Not Detected (ND) are those sample results less than the laboratory's MDL.

Ocean Waters are the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Water Board's California Ocean Plan.

Persistent pollutants are substances for which degradation or decomposition in the environment is nonexistent or very slow.

Pollutant Minimization Program (PMP) means waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the PMP shall be to reduce all potential sources of a priority pollutant(s) through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board may consider cost effectiveness when establishing the requirements of a PMP. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), shall be considered to fulfill the PMP requirements.

Pollution Prevention means any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State or Regional Water Board.

Reporting Level (RL) is the ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from Appendix 4 of the SIP in accordance with section 2.4.2 of the SIP or established in accordance with section 2.4.3 of the SIP. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Satellite Collection System is the portion, if any, of a sanitary sewer system owned or operated by a different public agency than the agency that owns and operates the wastewater treatment facility that a sanitary sewer system is tributary to.

Source of Drinking Water is any water designated as municipal or domestic supply (MUN) in a Regional Water Board Basin Plan.

Standard Deviation (σ) is a measure of variability that is calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;

μ is the arithmetic mean of the observed values; and

n is the number of samples.

Toxicity Reduction Evaluation (TRE) is a study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.)

ATTACHMENT D – FEDERAL STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code (CWC) and is grounds for enforcement action, for permit termination, revocation and reissuance, or denial of a permit renewal application [*40 CFR §122.41(a)*].

2. The Discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the Clean Water Act for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not been modified to incorporate the requirement [*40 CFR §122.41(a)(1)*].

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order [*40 CFR §122.41I*].

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment [*40 CFR §122.41(d)*].

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order [*40 CFR §122.41(e)*].

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges [*40 CFR §122.41(g)*].

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of State or local law or regulations [*40 CFR §122.5I*].

F. Inspection and Entry

The Discharger shall allow the Regional Water Quality Control Board (Regional Water Board), State Water Resources Control Board (SWRCB), United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to [*40 CFR §122.41(i)*] [*CWC 13383*]:

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order [*40 CFR §122.41(i)(1)*];

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order [*40 CFR §122.41(i)(2)*];

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order [*40 CFR §122.41(i)(3)*];

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the CWC, any substances or parameters at any location [*40 CFR §122.41(i)(4)*].

G. Bypass

1. Definitions

   a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility [*40 CFR §122.41(m)(1)(i)*].

   b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production [*40 CFR §122.41(m)(1)(ii)*].

2. Bypass not exceeding limitations – The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3 and I.G.5 below [*40 CFR §122.41(m)(2)*].

3. Prohibition of bypass – Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless [*40 CFR §122.41(m)(4)(i)*]:

   a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage [*40 CFR §122.41(m)(4)(A)*];

b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance [*40 CFR §122.41(m)(4)(B)*]; and

c. The Discharger submitted notice to the Regional Water Board as required under Standard Provision – Permit Compliance I.G.5 below [*40 CFR §122.41(m)(4)I*].

4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above [*40 CFR §122.41(m)(4)(ii)*].

5. Notice

a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass [*40 CFR §122.41(m)(3)(i)*].

b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions – Reporting V.E below [*40 CFR §122.41(m)(3)(ii)*].

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation [*40 CFR §122.41(n)(1)*].

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of paragraph H.2 of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review [*40 CFR §122.41(n)(2)*].

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that [*40 CFR §122.41(n)(3)*]:

a. An upset occurred and that the Discharger can identify the cause(s) of the upset [*40 CFR §122.41(n)(3)(i)*];

b. The permitted facility was, at the time, being properly operated [*40 CFR §122.41(n)(3)(i)*];

c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b [*40 CFR §122.41(n)(3)(iii)*]; and

d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above [*40 CFR §122.41(n)(3)(iv)*].

3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof [*40 CFR §122.41(n)(4)*].

II. STANDARD PROVISIONS – PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition [*40 CFR §122.41(f)*].

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit [*40 CFR §122.41(b)*].

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the CWC [*40 CFR §122.41(l)(3)*] [*40 CFR §122.61*].

III. STANDARD PROVISIONS – MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity [*40 CFR §122.41(j)(1)*].

B. Monitoring results must be conducted according to test procedures under 40 CFR Part 136 or, in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503 unless other test procedures have been specified in this Order [*40 CFR §122.41(j)(4)*] [*40 CFR §122.44(i)(1)(iv)*].

IV. STANDARD PROVISIONS – RECORDS

A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 CFR Part 503), the Discharger

shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time [*40 CFR §122.41(j)(2)*].

B. Records of monitoring information shall include:

1. The date, exact place, and time of sampling or measurements [*40 CFR §122.41(j)(3)(i)*];
2. The individual(s) who performed the sampling or measurements [*40 CFR §122.41(j)(3)(ii)*];
3. The date(s) analyses were performed [*40 CFR §122.41(j)(3)(iii)*];
4. The individual(s) who performed the analyses [*40 CFR §122.41(j)(3)(iv)*];
5. The analytical techniques or methods used [*40 CFR §122.41(j)(3)(v)*]; and
6. The results of such analyses [*40 CFR §122.41(j)(3)(vi)*].

C. Claims of confidentiality for the following information will be denied [*40 CFR §122.7(b)*]:

1. The name and address of any permit applicant or Discharger [*40 CFR §122.7(b)(1)*]; and
2. Permit applications and attachments, permits and effluent data [*40 CFR §122.7(b)(2)*].

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, SWRCB, or USEPA within a reasonable time, any information which the Regional Water Board, SWRCB, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, SWRCB, or USEPA copies of records required to be kept by this Order [*40 CFR §122.41(h)*] [*CWC 13267*].

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, SWRCB, and/or USEPA shall be signed and certified in accordance with paragraph (2.) and (3.) of this provision [*40 CFR §122.41(k)*].
2. All permit applications shall be signed as follows:

a. For a corporation: By a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures [*40 CFR §122.22(a)(1)*];

b. For a partnership or sole proprietorship: by a general partner or the proprietor, respectively [*40 CFR §122.22(a)(2)*]; or

c. For a municipality, State, federal, or other public agency: by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA) [*40 CFR §122.22(a)(3)*].

3. All reports required by this Order and other information requested by the Regional Water Board, SWRCB, or USEPA shall be signed by a person described in paragraph (b) of this provision, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

   a. The authorization is made in writing by a person described in paragraph (2.) of this provision [*40 CFR §122.22(b)(1)*];

   b. The authorization specified either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company (a duly authorized representative may thus be either a named individual or any individual occupying a named position) [*40 CFR §122.22(b)(2)*]; and

   c. The written authorization is submitted to the Regional Water Board, SWRCB, or USEPA [*40 CFR §122.22(b)(3)*].

4. If an authorization under paragraph (3.) of this provision is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (3.) of this provision must be submitted to the Regional Water Board, SWRCB or USEPA

prior to or together with any reports, information, or applications, to be signed by an authorized representative [40 CFR §122.22I].

5. Any person signing a document under paragraph (2.) or (3.) of this provision shall make the following certification:

   "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations" [*40 CFR §122.22(d)*].

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program in this Order [*40 CFR §122.41(l)(4)*].

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or SWRCB for reporting results of monitoring of sludge use or disposal practices [*40 CFR §122.41(l)(4)(i)*].

3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 CFR Part 136 or, in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board [*40 CFR §122.41(l)(4)(ii)*].

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order [*40 CFR §122.41(l)(4)(iii)*].

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date [*40 CFR §122.41(l)(5)*].

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates

and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance [*40 CFR §122.41(l)(6)(i)*].

2. The following shall be included as information that must be reported within 24 hours under this paragraph [*40 CFR §122.41(l)(6)(ii)*]:

   a. Any unanticipated bypass that exceeds any effluent limitation in this Order [*40 CFR §122.41(l)(6)(ii)(A)*].

   b. Any upset that exceeds any effluent limitation in this Order [*40 CFR §122.41(l)(6)(ii)(B)*].

   c. Violation of a maximum daily discharge limitation for any of the pollutants listed in this Order to be reported within 24 hours [*40 CFR §122.41(l)(6)(ii)I*].

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours [*40 CFR §122.41(l)(6)(iii)*].

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when [*40 CFR §122.41(l)(1)*]:

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR §122.29(b) [*40 CFR §122.41(l)(1)(i)*]; or

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in this Order nor to notification requirements under 40 CFR Part 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1) [*40 CFR §122.41(l)(1)(ii)*].

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan [*40 CFR §122.41(l)(1)(iii)*].

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or SWRCB of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements [*40 CFR §122.41(l)(2)].*

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting E.3, E.4, and E.5 at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E [*40 CFR §122.41(l)(7)*].

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, SWRCB, or USEPA, the Discharger shall promptly submit such facts or information [*40 CFR §122.41(l)(8)*].

VI. STANDARD PROVISIONS – ENFORCEMENT

A. The CWA provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any such sections in a permit issued under section 402, or any requirement imposed in a pretreatment program approved under sections 402(a)(3) or 402(b)(8) of the Act, is subject to a civil penalty not to exceed $25,000 per day for each violation. The CWA provides that any person who negligently violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, or any requirement imposed in a pretreatment program approved under section 402(a)(3) or 402(b)(8) of the Act, is subject to criminal penalties of $2,500 to $25,000 per day of violation, or imprisonment of not more than one (1) year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than $50,000 per day of violation, or by imprisonment of not more than two (2) years, or both. Any person who knowingly violates such sections, or such conditions or limitations is subject to criminal penalties of $5,000 to $50,000 per day of violation, or imprisonment for not more than three (3) years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than $100,000 per day of violation, or imprisonment of not more than six (6) years, or both. Any person who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than $250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than $500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in section 309(c)(3)(B)(iii) of the Clean Water Act, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than $1,000,000 and can be fined up to $2,000,000 for second or subsequent convictions [*40 CFR §122.41(a)(2)*] [*CWC 13385 and 13387*].

B. Any person may be assessed an administrative penalty by the Regional Water Board for violating section 301, 302, 306, 307, 308, 318 or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this

Act. Administrative penalties for Class I violations are not to exceed $10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed $25,000. Penalties for Class II violations are not to exceed $10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed $125,000 [*40 CFR §122.41(a)(3)*].

C. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or both [*40 CFR §122.41(j)(5)*].

D. The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this Order, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than six months per violation, or by both [*40 CFR §122.41(k)(2)*].

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural dischargers shall notify the Regional Water Board as soon as they know or have reason to believe [*40 CFR §122.42(a)*]:

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" [*40 CFR §122.42(a)(1)*]:

   a. 100 micrograms per liter (µg/L) [*40 CFR §122.42(a)(1)(i)*];

   b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony [*40 CFR §122.42(a)(1)(ii)*];

   c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [*40 CFR §122.42(a)(1)(iii)*]; or

   d. The level established by the Regional Water Board in accordance with 40 CFR §122.44(f) [*40 CFR §122.42(a)(1)(iv)*].

2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order,

if that discharge will exceed the highest of the following "notification levels" [*40 CFR §122.42(a)(2)*]:

a. 500 micrograms per liter (µg/L) [*40 CFR §122.42(a)(2)(i)*];

b. 1 milligram per liter (mg/L) for antimony [*40 CFR §122.42(a)(2)(ii)*];

c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [*40 CFR §122.42(a)(2)(iii)*]; or

d. The level established by the Regional Water Board in accordance with 40 CFR §122.44(f) [*40 CFR §122.42(a)(2)(iv)*].

B. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following [*40 CFR §122.42(b)*]:

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to Sections 301 or 306 of the CWA if it were directly discharging those pollutants [*40 CFR §122.42(b)(1)*]; and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order [*40 CFR §122.42(b)(2)*].

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW [*40 CFR §122.42(b)(3)*].

ATTACHMENT E – MONITORING AND REPORTING PROGRAM

Table of Contents

List of Tables

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

The Code of Federal Regulations (CFR) at 40 CFR §122.48 requires that all NPDES permits specify monitoring and reporting requirements. CWC sections 13267 and 13383 also authorize the Regional Water Board to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements which implement the Federal and California regulations.

I. GENERAL MONITORING PROVISIONS

A. The Discharger shall comply with the MRP for this Order as adopted by the Regional Water Board, and with all of the requirements contained in Self-Monitoring Program, Part A, adopted August 1993 (SMP, **Attachment G**). If any discrepancies exist between the MRP and SMP, the MRP prevails.

B. Sampling is required during the entire year when discharging. All analyses shall be conducted using current USEPA methods, or that have been approved by the USEPA Regional Administrator pursuant to 40 CFR 136.4 and 40 CFR 136.5, or equivalent methods that are commercially and reasonably available, and that provide quantification of sampling parameters and constituents sufficient to evaluate compliance with applicable effluent limits and to perform reasonable potential analysis. Equivalent methods must be more sensitive than those specified in 40 CFR 136, must be specified in the permit, and must be approved for use by the Executive Officer, following consultation with the State Water Resources Control Board's Quality Assurance Program.

C. Sampling and analysis of additional constituents is required pursuant to Table 1 of the Regional Water Board's August 6, 2001 Letter titled Requirement for Monitoring of Pollutants in Effluent and Receiving Water to Implement New Statewide Regulations and Policy (**Attachment G**).

D. **Minimum Levels**. For compliance and reasonable potential monitoring, analyses shall be conducted using the commercially available and reasonably achievable detection levels that are lower than the WQOs/WQC or the effluent limitations, whichever is lower. The objective is to provide quantification of constituents sufficient to allow evaluation of observed concentrations with respect to the Minimum Levels given below. All Minimum Levels are expressed as µg/L approximately equal to parts per billion (ppb).

Table E-1. Test Methods and Minimum Levels for Pollutants with Effluent Limits

CTR #	Constituent	Types of Analytical Methods [a] Minimum Levels (µg/L)											
		GC	GCMS	LC	Color	FAA	GFAA	ICP	ICP MS	SPGF AA	HYD-RIDE	CVAA	DCP
2	Arsenic						2.0		2.0	2.0	1.0		
6	Copper								0.5	2			
7	Lead								0.5	2			
8	Mercury [b]								0.0005			0.0002	
9	Nickel						5.0		1.0	5.0			
10	Selenium								2.0		1.0		
13	Zinc								1.0	10			
14	Cyanide				5								
	Dioxin-TEQ [c]												
68	Bis(2-ethylhexyl)phthalate		5.0										

[a] Analytical Methods / Laboratory techniques are defined as follows:
GC - Gas Chromatography
GCMS - Gas Chromatography/Mass Spectrometry
HRGCMS - High Resolution Gas Chromatography/Mass Spectrometry (i.e., EPA 1613, 1624, or 1625)
LC - High Pressure Liquid Chromatography
FAA - Flame Atomic Absorption
GFAA - Graphite Furnace Atomic Absorption
HYDRIDE - Gaseous Hydride Atomic Absorption
CVAA - Cold Vapor Atomic Absorption
ICP - Inductively Coupled Plasma
ICPMS - Inductively Coupled Plasma/Mass Spectrometry
SPGFAA - Stabilized Platform Graphite Furnace Atomic Absorption (i.e., EPA 200.9)
DCP - Direct Current Plasma
COLOR – Colorimetric

[b] Use ultra-clean sampling (USEPA 1669) to the maximum extent practicable, and ultra-clean analytical methods (USEPA 1631) for mercury monitoring.

[c] The minimum levels for 2,3,7,8-TCDD and all other 16 congeners using U.S. EPA 1613 range from 5 – 50 pg/L. These MLs were developed in collaboration with BACWA as levels that were achievable by BACWA participants (BACWA letter dated April 23, 2003).

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order.

Table E-2. Monitoring Station Locations

Discharge Point Name	Monitoring Location Name	Monitoring Location Description
Influent and Intake Water	M-INF-001 (I-1)	At any point in the bay water intake system that delivers water from Carquinez Strait to the Refinery, prior to any treatment or used for cooling or processing.
	M-INF-002 (I-2)	At any point in the wastewater conveyance system from CSD to the JTP where flow measurements are representative of the flow rates of wastewater delivered by CSD.
	M-INF-003 (P-1)	At any point in the wastewater treatment system beyond the primary waste treatment plant at the Refinery and before the surge tank at the JTP.
Effluent	M-001	At any point leading to Discharge Point 001 between the point of discharge and the point where all wastes tributary thereto are present such that the sample is representative of the effluent.
	M-002	At any point leading to Discharge Point 002 between the point of discharge and a point at which all wastes tributary to the point of discharge are present.
	M-002-D	At a point in the disinfection facilities at which adequate contact with the disinfectant has been achieved.
Storm Waters	M-003	At any point in the outfall for Waste 003 between the point of discharge and the point at which all waste tributary to that discharge is present.
	M-005	At any point in the outfall for Waste 005 between the point of discharge and the point at which all storm water tributary to that discharge is present.
	M-008	At any point in the outfall for Waste 008 between the point of discharge and the point at which all storm water tributary to that discharge is present.
	M-009	At any point in the outfall for Waste 009 between the point of discharge and the point at which all storm water tributary to that discharge is present.
	M-011	At any point in the outfall for Waste 011 between the point of discharge and the point at which all storm water tributary to that discharge is present.
	M-012	At any point in the outfall for Waste 012 between the point of discharge and the point at which all storm water tributary to that discharge is present.
	M-013	At any point in the outfall for Waste 013 between the point of discharge and the point at which all waste tributary to that discharge is present.
	M-014	At any point in the outfall for Waste 014 between the point of discharge and the point at which all storm water tributary to that discharge is present.
	M-016	At any point in the outfall for Waste 016 between the point of discharge and the point at which all storm water tributary to that discharge is present.
Receiving Waters	R-001 (C-1)	At a point in Carquinez Strait, located in the boil caused by effluent from Discharge Point 001.
	R-002 (C-2)	At a point in Carquinez Strait, located in the vicinity of the diffusers for Discharge Point 002.
	R-003 (C-RE)	At a point in Carquinez Strait, located at the edge of the wharf at its easterly end.
	R-004 (C-RW)	At a point in Carquinez Strait, located at the edge of the wharf at its westerly end.

III. INFLUENT / INTAKE WATER MONITORING REQUIREMENTS

(Monitoring Location M-INF-001, M-INF-002, and M-INF-003)

The Discharger shall monitor influent / intake water as follows:

Table E-3. Influent/Intake Water Monitoring

Parameter	Monitoring Location	Units[1]	Sample Type	Minimum Sampling Frequency	Analytical Method
Flow [2]	M-INF-001 M-INF-002	MGD/MG	Continuous	Daily	meter
COD [3]	M-INF-003	mg/L and lbs/day	24-hour composite (C-24)	Daily	---

[1] Unit Abbreviations
MGD = million gallons per day
MG = million gallons
mg/L = milligrams per liter
lbs/day = pounds per day

[2] Flows shall be monitored continuously and the following shall be reported in monthly self-monitoring reports:
a. Daily average flow rate (MGD).
b. Daily total flow volume (MG).
c. Monthly average flow rate (MGD).
d. Monthly total flow volume (MG).
e. Average daily maximum and average daily minimum flow rates (MGD) in a month.
f. Intake duration for M-INF-001: in days and hours.

[3] Chemical oxygen demand (COD) monitoring shall be performed daily on wastewater influent to the surge tank. The Discharger may report in-house COD data instead of using a State-certified laboratory or USEPA approved method, as these data are not used for compliance monitoring.

IV. EFFLUENT MONITORING REQUIREMENTS

A. Monitoring Location M-001

The Discharger shall monitor effluent at Monitoring Location M-001 as follows:

Table E-4. Effluent Monitoring (M-001)

Parameter	Units[1]	Sample Type [2]	Minimum Sampling Frequency	Required Analytical Test Methods [3]
Flow[4]	MGD/MG	Continuous	daily	
BOD_5	mg/L and lb/day	C-24	1/week	
pH[5]	Std Units	Grab	5/week	
Temperature	°C	Continuous	5/week	
Conductivity	µmhos/cm	C-24	1/month	
Arsenic	µg/L	C-24	1/month	
Copper	µg/L	C-24	1/ month	
Lead	µg/L	C-24	1/month	

Parameter	Units[1]	Sample Type [2]	Minimum Sampling Frequency	Required Analytical Test Methods [3]
Mercury [6]	µg/L	C-24/Grab	1/month	
Nickel	µg/L	C-24	1/month	
Selenium	µg/L	C-24	1/month	
Zinc	µg/L	C-24	1/month	
Cyanide [7]	µg/L	Grab	1/month	
Dioxin-TEQ [8]	µg/L	Grab	2/year	
Bis (2-ethylhexyl) phthalate	µg/L	C-24	2/year	
All other priority inorganic pollutants [9]	µg/L	[11]	2/year	
All other priority organic pollutants [10]	µg/L	[11]	1/year	
All Applicable Standard Observations	---	Visual observation	1/week	

[1] Unit Abbreviations
MGD = million gallons per day
MG = million gallons
°C = degrees Celsius
mg/L = milligrams per liter

[2] Sample Type Abbreviations
Continuous = measured continuously, and recorded and reported daily
C-24 = 24-hour composite

[3] The Discharger has the option of substituting another method for those listed in this table, but only if that method has a level of quantification below the applicable criterion or below the lowest ML listed in Appendix 4 of the SIP. This alternate method must also be USEPA approved.

[4] Flow Monitoring.
Flows shall be monitored continuously and the following shall be reported in monthly self-monitoring reports:
a. Daily average flow rate (MGD).
b. Daily total flow volume (MG).
c. Monthly average flow rate (MGD).
d. Monthly total flow volume (MG).
e. Average daily maximum and average daily minimum flow rates (MGD) in a month.
f. Discharge duration, in days and hours.

[5] pH. The Discharger may use continuous monitoring for pH. If pH is monitored continuously; the minimum and maximum pH values for each day shall be reported in monthly self-monitoring reports.

[6] Mercury. The Discharger shall use ultra-clean sampling methods (USEPA 1669) to the maximum extent practicable, and ultra-clean analytical methods (USEPA 1631) for mercury monitoring. The Discharger may use alternative methods of analysis (such as USEPA 245), if that alternate method has a method detection limit (MDL)of 2 ng/L (0.0002 µg/L) or less.

[7] Cyanide. Compliance may be demonstrated by measurement of weak acid dissociable cyanide.

[8] Dioxin-TEQ. Chlorinated Dibenzodioxins and Chlorinated Dibenzofurans shall be analyzed using the latest version of USEPA Method 1613; the analysis shall be capable of achieving one half the USEPA method 1613 Minimum Levels. Alternative methods of analysis must be approved by the Executive Officer. In addition to reporting results for each of the 17 congeners, the Dioxin-TEQ shall be calculated and reported using 1998 USEPA Toxicity Equivalent Factors for dioxin and furan congeners.

[9] Priority inorganic pollutants are those pollutants identified as Compound Nos. 1 – 15 by the California Toxics Rule at 40 CFR 131.38.

[10] Priority organic pollutants are those pollutants identified as Compound Nos. 16 – 126 by the California Toxics Rule at 40 CFR 131.38.

[11] The sample type and analytical method should be as described in the August 6, 2001 letter.

B. Monitoring Location M-002 (M-002D)

The Discharger shall monitor effluent at Monitoring Location M-002 (M-002-D) as follows:

Table E-5. Effluent Monitoring (M-002 or M-002-D)

Parameter	Units[1]	Sample Type[2]	Min. Sampling Frequency	Required Analytical Test Methods[3]
Flow[4]	MGD	Continuous	---	
BOD_5[5]	mg/L and lbs/day	C-24	1/week	
TSS[5]	mg/L and lbs/day	C-24	1/week	
Settleable Matter[6]	mL/L/hr	Grab	1/2 weeks	
Oil and Grease[7]	mg/L	Grab	1/week	
pH[8]	Standard Units	Grab	1/day	
Dissolved Oxygen	mg/L	Grab	1/month	
Sulfides (total and dissolved, when DO<5 mg/L)	mg/L	Grab	1/ month	
Hydrogen Peroxide Dosage[9]	mg/L and lbs/day	---	---	
Total Residual Chlorine[10]	mg/L	Continuous	Continuous/H	
Total Coliform Bacteria[11]	MPN/100 mL	Grab	3/week	
Temperature	°C	Continuous	Continuous	
Copper	µg/L	C-24	1/month	
Lead	µg/L	C-24	1/month	
Mercury [12]	µg/L	C-24/ grab	1/ month	
Cyanide [13]	µg/L	Grab	1/month	
Dioxin-TEQ [14]	µg/L	Grab	2/year	
Bis (2-ethylhexyl) phthalate	µg/L	C-24	2/year	
Chronic Toxicity [15]	TUc	C-24	[16]	
Acute Toxicity[17]	% survival	Continuous	1/2 weeks	
All other priority inorganic pollutants [18]	µg/L	[20]	2/year	
All other priority organic pollutants [19]	µg/L	[20]	1/year	
All Applicable Standard Observations	---	Visual observation	5/week	

[1] Unit Abbreviations

MGD	=	million gallons per day
°C	=	degrees Celsius
mg/L	=	milligrams per liter
µg/L	=	micrograms per liter
MPN/100 mL	=	most probable number per 100 milliliters
kg/d	=	kilograms per day
mls/L/hr	=	milliliters per liter per hour

[2] Sample Type Abbreviations

Continuous	=	measured continuously, and recorded and reported daily
C-24	=	24-hour composite

[3] The Discharger has the option of substituting another method for those listed in this table, but only if that method has a level of quantification below the applicable criterion or below the lowest ML listed in Appendix 4 of the SIP. This alternate method must also be USEPA approved.

[4] Flow Monitoring.
Flows shall be monitored continuously and the following shall be reported in monthly self-monitoring reports:

a. Daily average flow rate (MGD).
b. Daily total flow volume (MG).
c. Monthly average flow rate (MGD).
d. Monthly total flow volume (MG).
e. Average daily maximum and average daily minimum flow rates (MGD) in a month.

[5] BOD and TSS. Sampling of BOD_5 and TSS is required once every week when there is Refinery process wastewater discharging into the JTP..

[6] Settable Matter. Monitoring is required when there is process wastewater discharging into the JTP.

[7] Oil & Grease Monitoring: Monitoring of oil and grease is required once every two weeks when there is process wastewater discharging into the JTP.. Each Oil & Grease sample event shall consist of a composite sample comprised of three grab samples taken at equal intervals during the plant operating hours of the sampling date, with each grab sample being collected in a glass container. Each glass container used for sample collection or mixing shall be thoroughly rinsed with solvent rinsing as soon as possible after use, and the solvent rinsing shall be added to the composite sample for extraction and analysis.

[8] pH. The Discharger may use continuous monitoring for pH. If pH is monitored continuously; the minimum and maximum pH values for each day shall be reported in monthly self-monitoring reports.

[9] Hydrogen Peroxide. Hydrogen peroxide dosage shall be reported in mg/L and lbs/day on every occurrence when it is manually added to the surge tank as a result of organic overload. For each occurrence lasting more than one calendar day, the daily dosage (lbs) of hydrogen peroxide shall be reported in that months self monitoring report.

[10] Chlorine residual. The Discharger may record discrete readings from the continuous monitoring every hour on the hour, and report, on a daily basis, the maximum concentration observed following dechlorination. Total chlorine dosage (kg/day) shall be recorded on a daily basis.

[11] The total coliform bacteria sampling location used for monitoring compliance with the coliform limit is M-002-D.

[12] Mercury. The Discharger shall use ultra-clean sampling methods (USEPA 1669) to the maximum extent practicable, and ultra-clean analytical methods (USEPA 1631) for mercury monitoring. The Discharger may use alternative methods of analysis (such as USEPA 245), if that alternate method has a method detection limit (MDL) of 2 ng/L (0.002 µg/L) or less.

[13] Cyanide. Compliance may be demonstrated by measurement of weak acid dissociable cyanide.

[14] Dioxin-TEQ. Chlorinated Dibenzodioxins and Chlorinated Dibenzofurans shall be analyzed using the latest version of USEPA Method 1613; the analysis shall be capable of achieving one half the USEPA method 1613 Minimum Levels. Alternative methods of analysis must be approved by the Executive Officer. In addition to reporting results for each of the 17 congeners, the Dioxin-TEQ shall be calculated and reported using 1998 USEPA Toxicity Equivalent Factors for dioxin and furan congeners.

[15] Chronic Toxicity Monitoring. Test shall be performed and reported in accordance with the Chronic Toxicity Requirements specified in Sections V.B of this MRP.

[16] Chronic Toxicity Monitoring Frequency. The Discharger shall perform a screening phase study to identify a most sensitive species. If no chronic toxicity is observed in the screening phase study, the Discharger is no longer required to perform routine monitoring during the permit term. If chronic toxicity is observed during the screening phase study, in addition to accelerated monitoring on a monthly basis, the routine monitoring frequency shall be once per year.

[17] Acute Toxicity Bioassay. Monitoring of the bioassay water shall include, on a daily basis during the test, the parameters specified in the U.S. EPA-approved method, such as pH, dissolved oxygen, ammonia nitrogen, conductivity, and temperature. These results shall be reported. If the fish survival rate in the effluent is less than 70 percent or if the control fish survival rate is less than 90 percent, the bioassay test shall be restarted with new batches of fish and shall continue back to back until compliance is demonstrated.

[18] Priority inorganic pollutants are those pollutants identified as Compound Nos. 1 – 15 by the California Toxics Rule at 40 CFR 131.38.

[19] Priority organic pollutants are those pollutants identified as Compound Nos. 16 – 126 by the California Toxics Rule at 40 CFR 131.38.

[20] The sample type and analytical method should be as described in the August 6, 2001 letter.

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

A. Whole Effluent Acute Toxicity

Compliance with whole acute toxicity requirements of this Order shall be achieved in accordance with the following:

1. Acute toxicity of effluent limits shall be evaluated by measuring survival of test organisms exposed to 96-hour flow through bioassays.

2. One of the following test species must be used: fathead minnow (*Pimephales promelas*) or rainbow trout (*Oncorhynchus mykiss*).

3. All bioassays shall be performed according to 40 CFR 136, currently the "Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and

Marine Organisms," 5th Edition. Exceptions may be granted to the Discharger by the Executive Officer and the Environmental Laboratory Accreditation Program (ELAP.)

4. If specific identifiable substances in the discharge can be demonstrated by the Discharger as being rapidly rendered harmless upon discharge to the receiving water, compliance with the acute toxicity limit may be determined after the test samples are adjusted to remove the influence of those substances. Written approval from the Executive Officer must be obtained to authorize such an adjustment.

5. Effluent used for fish bioassays must be dechlorinated prior to testing. Monitoring of the bioassay water shall include, on a daily basis, the following parameters: pH, dissolved oxygen, ammonia (if toxicity is observed), temperature, hardness, and alkalinity. These results shall be reported. If the fish survival rate in the effluent is less than 70 percent or if the control fish survival rate is less than 90 percent, the bioassay test shall be restarted with new batches of fish and shall continue back to back until compliance is demonstrated.

B. Whole Effluent Chronic Toxicity

1. Chronic Toxicity Monitoring Requirements

a. **Screening Phase Study.** The Discharger shall submit a screening phase study plan according to **Attachment E-1** of the MRP to the Executive Officer within 120 days from the permit effective date. The Discharger shall initiate the study within 30 days of Executive Officer approval or the Discharger may proceed with the study if the Executive Officer has not commented on the plan after 45 days, and complete the screening phase study within one year from permit effective date.

b. **Sample Collection.** The Discharger shall collect 24-hour composite samples of the treatment facility's effluent at the compliance point specified in Table E-5 of this MRP, for critical life stage toxicity testing as indicated below. For toxicity tests requiring renewals, 24-hour composite samples collected on consecutive days are required.

c. **Routine Monitoring.** Chronic toxicity shall be monitored by using critical life stage test(s) and the most sensitive test species identified by the screening phase testing. The Discharger shall conduct routine monitoring with the species approved by the Executive Officer.

If the Discharger uses two or more species, after at least twelve test rounds, the Discharger may request the Executive Officer to decrease the required frequency of testing, and/or to reduce the number of compliance species to one. Such a request may be made only if toxicity exceeding the TUc values specified in the effluent limitations was never observed using that test species.

d. **Conditions for Accelerated Monitoring.** The Discharger shall accelerate the frequency of monitoring to monthly, or as otherwise specified by the Executive Officer, after exceeding a single sample maximum of 10 TUc.

e. **Methodology.** Sample collection, handling and preservation shall be in accordance with USEPA protocols. The test methodology used shall be in accordance with the references cited in the Permit, or as approved by the Executive Officer. A concurrent reference toxicant test shall be performed for each test.

f. **Dilution Series.** The Discharger shall conduct tests at 100%, 50%, 25%, 10%, and 5%, and 2.5%. The "%" represents percent effluent as discharged.

2. Chronic Toxicity Reporting Requirements

a. **Routine Reporting.** Toxicity test results for the current reporting period shall include the following, at a minimum, for each test.

(1) Sample date(s)

(2) Test initiation date

(3) Test species

(4) End point values for each dilution (e.g., number of young, growth rate, percent survival)

(5) NOEC value(s) in percent effluent

(6) IC15, IC25, IC40, and IC50 values (or EC15, EC25 ... etc.) in percent effluent

(7) TUc values (100/NOEC, 100/IC25, and 100/EC25)

(8) Mean percent mortality (+ s.d.) after 96 hours in 100% effluent

(9) NOEC and LOEC values for reference toxicant test(s)

(10) IC50 or EC50 value(s) for reference toxicant test(s)

(11) Available water quality measurements for each test (i.e., pH, D.O., temperature, conductivity, hardness, salinity, ammonia)

b. **Compliance Summary.** The results of the chronic toxicity testing shall be provided in the most recent self monitoring report and shall include a summary table of chronic toxicity data from at least three of the most recent samples. The information in the table shall include the items listed under V.B.2.a above.

3. Chronic Toxicity Reduction Evaluation (TRE)

a. **Generic TRE Work Plan.** To be prepared for responding to toxicity events, the Discharger shall prepare a generic TRE work plan within 90 days of the effective date of this Order. The Discharger shall review and update the work plan as necessary to remain current and applicable to the discharge and discharge facilities.

b. **Specific TRE Work Plan.** Within 30 days of exceeding either trigger for accelerated monitoring, the Discharge shall submit to the Regional Water Board a TRE work plan, which should be the generic work plan revised as appropriate for this toxicity event after consideration of available discharge data.

c. **Initiate TRE.** Within 30 days of the date of completion of the accelerated monitoring tests observed to exceed the trigger, the Discharger shall initiate a TRE in accordance with a TRE work plan that incorporates any and all comments from the Executive Officer.

d. The TRE shall be specific to the discharge and be in accordance with current technical guidance and reference materials, including USEPA guidance materials. The TRE shall be conducted as a tiered evaluation process, such as summarized below:

   i. Tier 1 consists of basic data collection (routine and accelerated monitoring).
   ii. Tier 2 consists of evaluation of optimization of the treatment process, including operation practices and in-plant process chemicals.
   iii. Tier 3 consists of a toxicity identification evaluation (TIE).
   iv. Tier 4 consists of evaluation of options for additional effluent treatment processes.
   v. Tier 5 consists of evaluation of options for modifications of in-plant treatment processes.
   vi. Tier 6 consists of implementation of selected toxicity control measures, and follow-up monitoring and confirmation of implementation success.

e. The TRE may be ended at any stage if monitoring finds there is no longer consistent toxicity (complying with Effluent Limitations Section IV.6.a).

f. The objective of the TIE shall be to identify the substance or combination of substances causing the observed toxicity. All reasonable efforts using currently available TIE methodologies shall be employed.

g. As toxic substances are identified or characterized, the Discharger shall continue the TRE by determining the source(s) and evaluating alternative strategies for reducing or eliminating the substances from the discharge. All reasonable steps shall be taken to reduce toxicity to levels consistent with chronic toxicity evaluation parameters.

h. Many recommended TRE elements parallel required or recommended efforts of source control, pollution prevention and storm water control programs. TRE efforts should be coordinated with such efforts. To prevent duplication of efforts, evidence of complying with requirements or recommended efforts of such programs may be acceptable to comply with TRE requirements.

i. The Regional Water Board recognizes that chronic toxicity may be episodic and identification of causes of and reduction of sources of chronic toxicity may not be

successful in all cases. Consideration of enforcement action by the Regional Water Board will be based in part on the Discharger's actions and efforts to identify and control or reduce sources of consistent toxicity.

VI. LAND DISCHARGE MONITORING REQUIREMENTS

Not applicable.

VII. RECLAMATION MONITORING REQUIREMENTS

Not applicable.

VIII. STORM WATER MONITORING REQUIREMENTS

The Discharger shall monitor storm water at Monitoring Locations M-003 through M-016 as follows.

Table E-6. Storm Water Monitoring (M-003 through M-016)

Sampling Stations	E-003, E-005, E-008, E-009, E-011, E-013, E-014, and E-016
Type of Samples [1]	Grab
Flow Rate (MGD) [2]	2/year
pH (Standard unit)	2/year
Total suspended solids (mg/L)	2/year
Total organic carbon (mg/L)	2/year
Conductivity (mhos/cm)	2/year
All applicable standard observations [3]	1/month

[1] Storm water discharges shall be sampled during the first 30 minutes of the first daylight storm event which occurs during scheduled operating periods and which is preceded by at least 3 days of dry weather. If sampling during the first 30 minutes if impractical, samples can be taken during the first one hour of discharge, and the discharger shall explain in the monitoring report why the grab sample(s) could not be taken in the first 30 minutes.

A storm event is defined as a continuous or semi-continuous period of rainfall which produces significant storm water discharge. Significant storm water discharge is a continuous discharge of storm water for approximately one hour or more.

The Discharger may apply to the Executive Officer for reduced number of storm water monitoring locations if the discharger can establish and document that storm water discharges from different locations are substantially identical.

[2] Measure or estimate the total volume of storm water discharge from each station for the storm event sampled. Estimates shall be determined from the amount of rainfall and the area of drainage multiplied by a drainage factor satisfactory to the Executive Officer. The areas and drainage factors shall be proposed by the Discharger in the SWPPP.

[3] See Part A Section C.3.a. Also, storm water observations during the dry period (May 1 through September 30) may be reduced to twice during this five month period.

IX. RECEIVING WATER MONITORING REQUIREMENTS – SURFACE WATER AND GROUNDWATER

A. Surface Water Monitoring.

1. The Discharger shall continue to participate in the Regional Monitoring Program, which involves collection of data on pollutants and toxicity in water, sediment and biota of the Estuary. The Discharger's participation and support of the RMP is used in consideration of the level of receiving water monitoring (including sediment) required by this Order.

2. With each annual self-monitoring report, the Discharger shall document how it complies with Receiving Water Limitations V.A. This may include using discharge characteristics (e.g., mass balance with effluent data and closest RMP station), receiving water data, or a combination of both.

B. Ground Water Monitoring.

Not applicable.

X. LEGENDS FOR TABLES

Sampling Frequency		Legend
1/day	=	Daily
5/week	=	Five days per week
2/week	=	Two days per week
3/week	=	Three days per week
1/week	=	One day per week
1/2 weeks	=	Once every two weeks
1/month	=	Once per month
1/quarter	=	Once per quarter
1/5 years	=	Once every five years
2/year	=	Two times per year
1/year	=	Once every year

XI. MODIFICATIONS TO PART A OF SELF-MONITORING PROGRAM (ATTACHMENT G)

The following modifications to Part A of the Self-Monitoring Program (**Attachment G**) supersede the requirements of Part A of the Self-Monitoring Program.
Add to the end of Section C.5 as follows:

5. Bottom Sediment Samples and Sampling and Reporting Guidelines

   b. Sediment sampling and reporting requirement is satisfied through participation in the Regional Monitoring Program.

Modify Section F.4 as follows:

Self-Monitoring Reports

[Add the following to the beginning of the first paragraph]

For each calendar month, a self-monitoring report (SMR) shall be submitted to the Regional Water Board in accordance with the requirements listed in Self-Monitoring Program, Part A. The purpose of the report is to document treatment performance, effluent quality and compliance with waste discharge requirements prescribed by this Order, as demonstrated by the monitoring program data and the Discharger's operation practices.

[And add at the end of Section F.4 the following:]

g. If the Discharger wishes to invalidate any measurement, the letter of transmittal will include a formal request to invalidate the measurement; the original measurement in question, the reason for invalidating the measurement, all relevant documentation that supports the invalidation (e.g., laboratory sheet, log entry, test results, etc.), and discussion of the corrective actions taken or planned (with a time schedule for completion), to prevent recurrence of the sampling or measurement problem. The invalidation of a measurement requires the approval of Water Board staff and will be based solely on the documentation submitted at that time.

h. Reporting Data in Electronic Format

The Discharger has the option to submit all monitoring results in an electronic reporting format approved by the Executive Officer. If the Discharger chooses to submit SMRs electronically, the following shall apply:

1) Reporting Method: The Discharger shall submit SMRs electronically via the process approved by the Executive Officer in a letter dated December 17, 1999, Official Implementation of Electronic Reporting System (ERS) and in the Progress Report letter dated December 17, 2000, or in a subsequently approved format that the Permit has been modified to include.

2) Monthly or Quarterly Reporting Requirements: For each reporting period (monthly or quarterly as specified in this MRP), an electronic SMR shall be submitted to the Regional Water Board in accordance with Section F.4.a-g. above. However, until USEPA approves the electronic signature or other signature technologies, Dischargers that are using the ERS must submit a hard copy of the original transmittal letter, an ERS printout of the data sheet, a violation report, and a receipt of the electronic transmittal.

3) Annual Reporting Requirements: Dischargers who have submitted data using the ERS for at least one calendar year are exempt from submitting an annual

report electronically, but a hard copy of the annual report shall be submitted according to Section XIII.

XII. OTHER MONITORING REQUIREMENTS

Regional Monitoring Program

The Discharger has agreed to continue to participate in the Regional Monitoring Program, which involves collection of data on pollutants and toxicity in water, sediment and biota of the Estuary. The Discharger's participation and support of the RMP is used in consideration of the level of receiving water monitoring required by this Order.

XIII. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

1. The Discharger shall comply with all Standard Provisions (**Attachment D and G**) related to monitoring, reporting, and recordkeeping.

B. Self Monitoring Reports (SMRs)

1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit self-monitoring reports. Until such notification is given, the Discharger shall submit self-monitoring reports in accordance with the requirements described below.

2. The Discharger shall submit monthly Self Monitoring Reports including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order. Monthly reports shall be due 30 days after the end of each calendar month.

C. Monitoring periods and reporting for all required monitoring shall be completed according to the following schedule:

Table E-7. Monitoring Periods and Reporting Schedule

Sampling Frequency	Monitoring Period Begins On...	Monitoring Period	SMR Due Date
Continuous	Effective date of permit	All	First day of second calendar month following month of sampling
1/day	Effective date of permit	Daily	First day of second calendar month following month of sampling
5/week	Effective date of permit	Any five days during a week at a time when the Refinery process wastewater is being treated at the JTP	First day of second calendar month following month of sampling
3/week	Effective date of permit	Any three days during a week at a time when the Refinery process wastewater is being treated at the JTP	First day of second calendar month following month of sampling

Sampling Frequency	Monitoring Period Begins On...	Monitoring Period	SMR Due Date
2/week	Effective date of permit	Any two days during a week at a time when the Refinery process wastewater is being treated at the JTP	First day of second calendar month following month of sampling
1/week	Effective date of permit	Once per week at a time when the Refinery process wastewater is being treated at the JTP	First day of second calendar month following month of sampling
1/2 weeks	Effective date of permit	Once during a two-week period at a time when the Refinery process wastewater is being treated at the JTP	First day of second calendar month following month of sampling
1/month	Effective date of permit	Any day in a calendar month at a time when the Refinery process wastewater is being treated at the JTP	First day of second calendar month following month of sampling
1/quarter	Effective date of permit	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31 (Any one day at a time when the Refinery process wastewater is being treated at the JTP)	May 1 August 1 November 1 February 1
2/year (once-through cooling water and wastewater discharge)	Effective date of permit	Once during wet season (typically November 1 through April 30), once during dry season (typically May 1 through October 31)	June 1 December 1
2/year (storm water)	Effective date of permit	Two times during the wet season when rains, with the first sampling on the first storm event of the season.	Annually by July 1
1/year	Effective date of permit	January 1 through December 31 For priority pollutant monitoring: Alternate between one year during wet season and the following year during dry season (typically May 1 through October 31).	February 1
1/5 years	Effective date of permit	Once during permit term	First day of second calendar month following month of sampling

4. The Discharger shall report with each sample result the applicable Minimum Level (ML) and the current Method Detection Limit (MDL), as determined by the procedure in 40 CFR Part 136.

   The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

   For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words "Estimated Concentration" (may be shortened to "Est. Conc."). The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (+ a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

c. Sample results less than the laboratory's MDL shall be reported as "Not Detected," or ND.

d. The Dischargers shall instruct laboratories to establish calibration standards so that the RL value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. The Discharger shall not use analytical data derived from *extrapolation* beyond the lowest point of the calibration curve.

5. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations.

6. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.

7. SMRs must be submitted to the Regional Water Board, signed and certified as required by the standard provisions (**Attachment D** and **G**), to the address listed below:

   Executive Officer
   California Regional Water Quality Control Board
   San Francisco Bay Region
   1515 Clay Street, Suite 1400
   Oakland, CA 94612
   ATTN: NPDES Permit Division

8. The Discharger has the option to submit all monitoring results in an electronic reporting format approved by the Executive Officer. The Electronic Reporting System (ERS) format includes, but is not limited to, a transmittal letter, summary of violation details and corrective actions, and transmittal receipt. If there are any

discrepancies between the ERS requirements and the "hard copy" requirements listed in the MRP, then the approved ERS requirements supercede.

C. Discharge Monitoring Reports (DMRs)

1. As described in Section XIII.B.1 above, at any time during the term of this permit, the State or Regional Water Board may notify the discharger to electronically submit self-monitoring reports. Until such notification is given, the Discharger shall submit discharge monitoring reports (DMRs) in accordance with the requirements described below.

2. DMRs must be signed and certified as required by the standard provisions (**Attachment D**). The Discharge shall submit the original DMR and one copy of the DMR to the address listed below:

   State Water Resources Control Board
   Discharge Monitoring Report Processing Center
   Post Office Box 671
   Sacramento, CA 95812

3. All discharge monitoring results must be reported on the official USEPA pre-printed DMR forms (EPA Form 3320-1). Forms that are self-generated or modified cannot be accepted.

D. Other Reports

Annual Reports. By February 1st of each year, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the items described in Standard Provisions and Reporting Requirements, and SMP Part A, August 1993 (**Attachment G**).

ATTACHMENT E-1 – CHRONIC TOXICITY – DEFINITIONS OF TERMS AND SCREENING PHASE REQUIREMENTS

CHRONIC TOXICITY

DEFINITION OF TERMS & SCREENING PHASE REQUIREMENTS

I. DEFINITION OF TERMS

A. **No observed effect level** (NOEL) for compliance determination is equal to IC_{25} or EC_{25}. If the IC_{25} or EC_{25} cannot be statistically determined, the NOEL shall be equal to the NOEC derived using hypothesis testing.

B. **Effective concentration** (EC) is a point estimate of the toxicant concentration that would cause an adverse effect on a quantal, "all or nothing," response (such as death, immobilization, or serious incapacitation) in a given percent of the test organisms. If the effect is death or immobility, the term lethal concentration (LC) may be used. EC values may be calculated using point estimation techniques such as probit, logit, and Spearman-Karber. EC_{25} is the concentration of toxicant (in percent effluent) that causes a response in 25% of the test organisms.

C. **Inhibition Concentration** (IC) is a point estimate of the toxicant concentration that would cause a given percent reduction in a non-lethal, non-quantal biological measurement, such as growth. For example, an IC_{25} is the estimated concentration of toxicant that would cause a 25% reduction in average young per female or growth. IC values may be calculated using a linear interpolation method such as USEPA's Bootstrap Procedure.

D. **No observed effect concentration** (NOEC) is the highest tested concentration of an effluent or a toxicant at which no adverse effects are observed on the aquatic test organisms at a specific time of observation. It is determined using hypothesis testing.

II. CHRONIC TOXICITY SCREENING PHASE REQUIREMENTS

A. The Discharger shall perform screening phase monitoring:

1. Subsequent to any significant change in the nature of the effluent discharged through changes in sources or treatment, except those changes resulting from reductions in pollutant concentrations attributable to source control efforts, or

2. Prior to Permit reissuance. Screening phase monitoring data shall be included in the NPDES Permit application for reissuance. The information shall be as recent as possible, but may be based on screening phase monitoring conducted within 5 years before the permit expiration date.

B. Design of the screening phase shall, at a minimum, consist of the following elements:

1. Use of test species specified in Tables 1 and 2 (attached), and use of the protocols referenced in those tables, or as approved by the Executive Officer;

2. Two stages:

a. **Stage 1** shall consist of a minimum of one battery of tests conducted concurrently. Selection of the type of test species and minimum number of tests shall be based on Table 3 (attached); and

b. **Stage 2** shall consist of a minimum of two test batteries conducted at a monthly frequency using the three most sensitive species based on the Stage 1 test results and as approved by the Executive Officer.

3. Appropriate controls; and

4. Concurrent reference toxicant tests.

A. The Discharger shall submit a screening phase proposal to the Executive Officer for approval. The proposal shall address each of the elements listed above.

Table E-1. Critical Life Stage Toxicity Tests for Estuarine Waters

Test Species	Scientific Name	Effect	Duration	Reference
alga	*(Skeletonema costatum) (Thalassiosira pseudonana)*	growth rate	4 days	1
red alga	*(Champia parvula)*	number of cystocarps	7-9 days	3
Giant kelp	*(Macrocystis pyrifera)*	percent germination; germ tube length	48 hours	2
abalone	*(Haliotis rufescens)*	abnormal shell development	48 hours	2
Oyster mussel	*(Crassostrea gigas) (Mytilus edulis)*	{abnormal shell development; {percent survival	48 hours	2
Echinoderms (urchins (sand dollar - Dendraster excentricus	*Strongylocentrotus purpuratus, S. franciscanus);*	percent fertilization	1 hour	2
shrimp	*(Americamysis bahia)*	percent survival; growth	7 days	3
shrimp	*(holmesimysis costata)*	percent survival; growth	7 days	2
topsmel	*(Atherinops affinis)*	percent survival; growth	7 days	2
silversides	*(Menidia beryllina)*	larval growth rate; percent survival	7 days	3

3. Short-term Methods for Estimating the Chronic Toxicity of Effluent and Receiving Waters to Marine and Estuarine Organisms as specified in 40CFR 136. Currently, this is USEPA/600/4-90/003, July 1994. Later editions may replace this version.

Table E-2. Critical Life Stage Toxicity Tests For Fresh Waters

Species	Scientific Name	Effect	Test Duration	References
fathead minnow	*(Pimephales promelas)*	survival growth rate	7 days	4
water flea	*(Ceriodaphnia dubia)*	survival; number of young	7 days	4
alga	*(Selenastrum capricornutum)*	cell division rate	4 days	4

Toxicity Test Reference:

Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms as specified in 40CFR 136. Currently, this is the third edition, USEPA/600/4-91/002, July 1994. Later editions may replace this version.

Table E-3. Toxicity Test Requirements for Stage One Screening Phase

Requirements	Receiving Water Characteristics		
	Discharges to Coast	Discharges to San Francisco Bay ‡	
	Ocean	Marine/Estuarine	Freshwater
Taxonomic Diversity:	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish
Number of tests of each salinity type: Freshwater (†):	0	1 or 2	3
Marine/Estuarine:	4	3 or 4	0
Total number of tests:	4	5	3

† The fresh water species may be substituted with marine species if:

1) The salinity of the effluent is above 1 parts per thousand (ppt) greater than 95% of the time, or

2) The ionic strength (TDS or conductivity) of the effluent at the test concentration used to determine compliance is documented to be toxic to the test species.

‡ Marine/Estuarine refers to receiving water salinities greater than 1 ppt at least 95% of the time during a normal water year.

Fresh refers to receiving water with salinities less than 1 ppt at least 95% of the time during a normal water year.

ATTACHMENT F – FACT SHEET

Table of Contents

List of Tables

ATTACHMENT F – FACT SHEET

As described in Section II of this Order, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility.

Table F-1. Facility Information

WDID	2 071006001
Dischargers	C&H Sugar Company, Inc. (C&H) Crockett Community Services District (CSD)
Name of Facility	C&H Sugar Refinery, Joint C&H-CSD Philip F. Meads Water Treatment Plant (JTP) and its collection system
Facility Address	830 Loring Avenue
	Crockett, CA 94525
	Contra Costa County
Facility Contact, Title and Phone	Elizabeth M. Crowley, Environmental Compliance Manager, C&H Sugar Company, 510-787-4352 Kent Peterson, General Manager, Crockett Community Services District, 510-787-2992
Authorized Person to Sign and Submit Reports	Elizabeth M. Crowley, Environmental Compliance Manager, C&H Sugar Company, 510-787-4352 Kent Peterson, General Manager, Crockett Community Services District, 510-787-2992
Mailing Address	C&H - 830 Loring Avenue, Crockett, CA 94525 CSD - P.O. Box 578, Crockett, California 94525
Billing Address	830 Loring Avenue, Crockett, CA 94525
Type of Facility	Sugar Processing / Privately owned wastewater treatment plant
Major or Minor Facility	Major
Threat to Water Quality	2
Complexity	A
Pretreatment Program	No
Reclamation Requirements	No
Facility Permitted Flow	35 MGD for once-through cooling water discharge through 001; 1.78 MGD for treated wastewater discharge through 002
Facility Design Flow *	35 MGD for once-through cooling water discharge through 001; 1.78 MGD for treated wastewater discharge through 002
Watershed	Suisun Basin
Receiving Water	Carquinez Strait within Northern San Francisco Bay
Receiving Water Type	Surface Water

* The basis for 35 MGD is from James Montgomery, 1973; 1.78 MGD is based on Operation and Maintenance Manual, Engineering Science.

A. C&H Sugar Company, Inc. (C&H) is currently discharging under Order No. 00-025 (NPDES Permit No. CA0005240) from several locations within the C&H Sugar Company, Inc. Refinery. The Refinery discharges once-through cooling waters and condensed

vapors, untreated, at Discharge Point 001, as well as treated wastewater [sugar refining wastes and domestic wastewater from the Crockett Community Services District (CSD)] at Discharge Point 002, and storm waters from Discharge Points 003 through 016, into Carquinez Strait. The Dischargers (collectively C&H and CSD) are subject to a Joint Use Agreement, which allows the CSD to discharge to and make use of the wastewater treatment facility located on the grounds of the Refinery. The wastewater treatment facility, which discharges through Discharge Point 002, is owned jointly by C&H and the CSD; and it is operated by C&H.

B. The Refinery and CSD discharge wastewater to Carquinez Strait, a water of the United States located in North San Francisco Bay.

C. The Discharger filed a Report of Waste Discharge and submitted an application for reissuance of its Waste Discharge Requirements (WDRs) and NPDES permit on October 15, 2004. Order No. 00-025 (previous permit or previous Order), which was adopted on April 19, 2000, automatically continued in effect after its expiration date on April 19, 2005.

II. FACILITY DESCRIPTION

C&H owns and operates a sugar refinery that processes raw cane sugar at an average melt rate of 3,300 tons per day over 260 operating days per year. The Refinery has an average melt rate capacity of 3,600 tons per day. The Refinery typically operates on a 7-day operating cycle, with 5 days of operation followed by 2 days of down time, and it delivers both crystalline and liquid refined sugars from the Refinery by truck and rail. The Refinery may go back to its old practice which ran on a 14-day cycle, with 10 days on and 4 days down.

The Refinery is located on land owned by the California State Lands Commission. The Refinery, including the wastewater treatment systems, is operated by C&H. The wastewater treatment plant is known as the Philip F. Meads Water Treatment Plant or Joint Treatment Plant (JTP), as it is co-owned by and subject to a joint use agreement between C&H Sugar and the CSD.

A. Description of Wastewater Treatment

This Order regulates discharges from Discharge Points 001 and 002. Wastewater discharged at Discharge Point 001 is untreated once-through cooling water from barometric condensers on vacuum pans, evaporators, and turbine generators. Wastewater discharged at Discharge Point 002 is treated effluent from the JTP, a biological treatment plant that receives refinery process wastewaters as well as pretreated domestic wastewater conveyed from the CSD. Refinery process wastewater (char washings, scum and filter aid slurries, refinery equipment washdowns, rail car washings, and contaminated storm water runoff from process areas), with the exception of char filter wash water, is pH adjusted and clarified, before being combined with char process wash water and pumped to the JTP.

Process wastewaters combine with flow from the CSD at the JTP in a surge basin that precedes three one-million-gallon capacity aeration basins. As process wastes typically have high carbohydrate and low nutrient content, phosphoric acid and urea are added to

enhance biological treatment. Wastewater from the aeration basins is clarified by two dissolved air flotation units. Clarified wastewater is disinfected using sodium hypochlorite and dechlorinated with sodium bisulfite before being discharged to Carquinez Strait. Solids removed during wastewater treatment, are dewatered on a belt filter and trucked off-site for disposal as soil amendment.

The annual average chemical oxygen demand (COD) concentration in the primary-treated refinery wastewater is approximately 3,930 mg/l. If conditions of high COD loading and low oxygen supply occur, they will result in unsatisfactory bioprocess performance. At times, floating floc has been observed at the sampling location in the chlorination basin. It is a possibility that these are the result of poor clarifier performance at times of heavy COD loads.

B. Description of Intake Water Structure

Water withdrawn from the Carquinez Strait enters the cooling water intake structure through a 10-foot wide opening with 0.5 inch vertical steel bars spaced 4 inches apart and extending from the bottom to above the water line. Water is filtered through a single traveling screen with 0.38 inch square mesh opening and effective area at Mean Low Low Water (MLLW) of 111 feet. The screen, manufactured by Envirex (model 62430) was replaced in 1993. Water passes through the intake screen before reaching the 48 inch diameter pipe leading to the pump room. Previous 316(b) studies indicate that the C&H cooling water intake structure reflects the best available technology for minimizing adverse environmental impacts.

C. Discharge Points and Receiving Waters

This Order regulates discharge from the Refinery through Discharge Point 001 and discharge from the wastewater treatment plant through Discharge Point 002, as well as storm water discharges through Discharge Points 003 through 016 as briefly described below.

Table F-2. Discharge Points

C&H Sugar Company Discharge Points			
No.	**Latitude**	**Longitude**	**Description**
001	38° 03′ 27″	122° 13′ 06″	Discharge consists of approximately 22.5 MGD of non-contact, once-through cooling water from the Refinery's barometric condenser, condensed vapors from vacuum pans, cooling waters from evaporators and steam turbine heat exchangers. The point of discharge is a deep-water diffuser that extends approximately 200 feet offshore into Carquinez Strait to a depth of 47 feet.
002	38° 03′ 30″	122° 13′ 28″	Discharge consists of approximately 0.93 MGD of treated wastewaters from the treatment plant. Refinery process wastewaters, which account for approximately 60 percent of the total discharge, include bone char washings, scum and filter aid slurries, refinery equipment wash down, rail car washings, and storm water runoff from process areas. The CSD's contribution averages 0.33 MGD but can range as high as 3.3 MGD during wet weather periods. The point of discharge is a deep-water multi-port diffuser located directly below the Carquinez Bridge, 637 feet west of the refinery plant.

C&H Sugar Company Discharge Points			
No.	**Latitude**	**Longitude**	**Description**
003	38°03'27"	122°13'03"	Discharge consists of storm water runoff from an area between the boiler house and Bankers Warehouse No. 3, as well as from boiler house roof drains.
005	38°03'27"	122°13'11"	Discharge consists of storm water runoff from an area of approximately 216,500 square feet located centrally in the Refinery yard and from an area south of the railroad tracks on both sides of the extension of Rolph Avenue. Runoff from the refinery combines with street runoff from Crockett and discharges to Carquinez Strait via a shallow collection point.
006	38°03'27"	122°13'31"	Discharge consists of storm water runoff from a large plant area south of the railroad tracks used for product staging prior to loading. Discharge occurs to Carquinez Strait via a pipe under the railroad tracks to a drainage on the south side of the warehouse yard.
007	38°03'27"	122°13'18"	Discharge consists of storm water runoff from community areas and hills as well as from a small area on the fringe of the truck staging area and occurs to Edwards Creek at a point before the creek enters the culverts extending under the railroad tracks to Carquinez Strait.
008	38°03'27"	122°13'11"	Discharge consists of storm water runoff from an area of approximately 19,000 square feet located at the western portion of the Refinery yard.
009	38°03'26"	122°12'46"	Discharge consists of storm water runoff from the refinery's raw sugar loading dock, an area of approximately 30,625 square feet. Discharge occurs to Carquinez Strait via an oil water separator located at the eastern end of the dock.
011	38°03'27"	122°13'11"	Discharge consists of storm water runoff from an area of approximately 2,500 square feet north of the Herreshoff Kiln.
012	38°03'27"	122°13'11"	Discharge consists of storm water runoff from an area of approximately 1,550 square feet located to the east of the canopied product and material storage area in the Refinery yard.
013	38°03'27"	122°13'15"	Discharge consists of storm water runoff from an area of approximately 15,690 square feet south of Warehouse No. 1 at the western side of refinery.
014	38°03'22"	122°13'15"	Discharge consists of storm water runoff from a refinery yard area of approximately 74,320 square feet adjacent to the primary waste treatment plant and a hazardous waste storage area.
016	38°03'19"	122°13'36"	Discharge consists of storm water runoff from undeveloped areas near the wastewater treatment plant as well as community streets and hills adjacent to the JTP.

D. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data

1. Effluent Limitations.

Discharge Points 001 and 002

- Total BOD_5 (lbs/day) discharged at Discharge Points 001 and 002 shall not exceed the following limitations, determined by summing contributions (lbs) from the sugar Refinery and the CSD.

Table F-3. Limitations of Order No. 00-025

BOD_5 Limitation		C&H Sugar		CSD
Monthly Average (lbs/day)	=	2,417	+	[30 mg/L x flow (MGD) x 8.34 (lbs/gal)]
Daily Maximum (lbs/day)	=	6,688	+	[60 mg/L x flow (MGD) x 8.34 (lbs/gal)]

- Discharges from Discharge Points 001 and 002 shall not have a pH value less than 6.0 nor greater than 9.0.

Discharge Point 002

- Total TSS (lbs/day) discharged at Discharge Points 002 shall not exceed the following limitations, determined by summing contributions (lbs) from the sugar refinery and the CSD.

Table F-4. Limitations of Order No. 00-025

TSS Limitation		C&H Sugar		CSD
Monthly Average (lbs/day)	=	506	+	[30 mg/L x flow (MGD) x 8.34 (lbs/gal)]
Daily Maximum (lbs/day)	=	1,517	+	[60 mg/L x flow (MGD) x 8.34 (lbs/gal)]

- The median of 5 consecutive samples of effluent collected at Discharge Point 002 shall not exceed 240 MPN (total coliform bacteria)/100 mL; and no single sample shall exceed 10,000 MPN/100 mL.

- Discharges from Discharge Point 002 shall not have a total residual chlorine concentration greater than 0.0 mg/L.

- Discharges from Discharge Point 002 shall not exceed the following effluent limitations for settleable matter.

Table F-5. Limitations of Order No. 00-025

Effective Dates	Monthly Average	Daily Maximum
4/19/2000 – 4/18/2005	10 mL/L/hr	20 mL/L/hr
4/19/2005 – 4/18/2010	1.0 mL/L/hr	2.0 mL/L/hr

- Discharges from Discharge Point 002 shall not exceed the following effluent limitation for acute toxicity.

  The survival of test fishes in 96-hour flow through bioassays of Waste 002, as discharged, shall be an eleven sample median value of not less than 90 percent survival; and an eleven sample 90^{th} percentile value of not less than 70 percent survival.

- Discharges from Discharge Point 002 shall not exceed the following final limitations for lead and PAHs.

Table F-6. Limitations of Order No. 00-025

Pollutant	Monthly Average	Daily Maximum
Lead	---	50.3 µg/L
PAHs	0.49 µg/L	150 µg/L

- Discharges from Discharge Point 002 shall not exceed the following interim limitations for copper, mercury, and nickel.

Table F-7. Limitations of Order No. 00-025

Pollutant	Monthly Average	Daily Maximum	Running Annual Average	Monthly Average Mass Loading
Copper	---	37 µg/L	1.84 lbs/month	---
Mercury	0.21 µg/L	1.0 µg/L	0.04 lbs/month	---
Nickel	---	53 µg/L	---	1.5 lbs/month

2. Effluent Characterization.

Effluent discharged at Discharge Points 001 and 002 is characterized by the Discharger in its ROWD as follows.

Table F-8. Effluent Characterization

Parameter	Units	Max Daily Value	Max 30 Day Average Value	Long Term Average Value
Discharge Point 001				
Flow	MGD	40.2	24.4	21.7
BOD	mg/L	140	51	14.6
	lbs/day	39,100	13,700	3,600
pH	SU	6.3 – 8.0	7.4 – 7.7	--
Discharge Point 002				
Flow	MGD	1.65	0.77	0.69
BOD	mg/L	16	7	6
	lbs/day	108	92	39
TSS	mg/L	24	17	11
	lbs/day	180	101	70
pH	SU	6.8/8.4 (low/high)	7.4/7.6 (low/high)	--

E. Compliance Summary

The following table summarizes incidents of non-compliance with effluent limitations for Discharge Points 001 and 002 during the previous permit term. If parameters/pollutants do not appear in the table, then no incidents of non-compliance were reported during the permit term.

Table F-9. Compliance Summary

Parameter	Number of Incidents of Non-Compliance				
	2001	2002	2003	2004	2005
Discharge Point 001 and 2 (combined)					
BOD_5 [1]	4	4	3	8	4
Discharge Point 002					
Total Residual Chlorine		2	1		
Total Coliform Bacteria		5			6
Mercury				2	
Nickel		1	2		

[1] BOD5 limitation of Order No. 00-025 was a single limitation that limited the total (combined) mass (lbs) of BOD_5 discharged from Discharge points 001 and 002.

F. Planned Changes

N/A

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in this Order are based on the requirements and authorities described in this section.

A. Legal Authorities

1. This Order is issued pursuant to CWA Section 402 and implementing regulations adopted by the USEPA and CWC Chapter 5.5, Division 7. It shall serve as an NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to CWC Article 4, Chapter 4 for discharges that are not subject to regulation under CWA Section 402.

2. NPDES Permit/USEPA concurrence are based on 40 CFR 123.

3. Order expiration and reapplication are based on 40 CFR 122.46 (a).

B. California Environmental Quality Act (CEQA)

This action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act (Public Resources Code Section 21100, et seq.) in accordance with CWC Section 13389.

C. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plans.** The Regional Water Board adopted a *Water Quality Control Plan for the San Francisco Basin* (Region 2) (hereinafter the Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. The Regional Water Board amended the Basin Plan

(Resolution No. R2-2004-0003) on January 21, 2004. The State Water Board and the Office of Administrative Law approved these amendments on July 22, 2004, and October 4, 2004, respectively. The USEPA gave final approval to the amendment on January, 5, 2005.

2. **Thermal Plan.** The State Water Board adopted a Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for inland surface waters and establishes specific limitations for thermal wastes (cooling water and industrial process water used for the purpose of transporting waste heat) and elevated temperature wastes (liquid, solid, or gaseous material including thermal waste discharged at a temperature higher than the natural temperature of receiving water), which are applicable to the C&H Sugar Company facility.

   The Thermal Plan establishes the following limitations for existing discharges of elevated temperature waste and thermal waste to estuarine environments.

Table F-10. Thermal Plan Requirements

Thermal Plan Section No.	Limitation
5. A. (1)	Elevated temperature waste shall comply with the following:
a	The maximum temperature shall not exceed the natural receiving water temperature by more than 20°F.
b	Elevated temperature waste discharges, either individually or combined with other discharges, shall not create a zone, defined by water temperatures of more than 1°F above natural receiving water temperatures, which exceeds 25 percent of the cross-sectional area of a main river channel at any point.
c	No discharge shall cause a surface water temperature rise greater than 4°F above the natural temperature of the receiving waters at any time or place.
d	Additional limitations shall be imposed when necessary to assure protection of beneficial uses.
5. A. (2)	Thermal waste discharges shall comply with the provisions of 5. A. (1), above, and in addition, the maximum temperature of thermal waste discharges shall not exceed 86°F.

   Based on State Board Resolution No. 75-72, issued on July 17, 1975 and approved by USEPA on September 2, 1975, discharges from Discharge Points 001 and 002 are exempt from Section Nos. 5.A.(1). a. and 5.(A).(2) above.

3. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, amending it on May 4, 1995 and November 9, 1999, and adopted the CTR on May 18, 2000, amending it on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to discharges from this facility

4. **State Implementation Policy.** On March 2, 2000, State Water Board adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP). The SIP

became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Boards in their basin plans, with the exception of the provision on alternate test procedures for individual discharges that have been approved by USEPA Regional Administrator. The alternate test procedures provision was effective on May 22, 2000. The SIP became effective on May 18, 2000. The State Water Board amended the SIP on February 24, 2005, and the amendments became effective on May 31, 2005. The SIP includes procedures for determining the need for and calculating water quality-based effluent limitations (WQBELs), and requires dischargers to submit data sufficient to do so.

5. **Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes. [40 C.F.R 131.21; 65 Fed. Reg. 24641 (April 27, 2000)] Under the revised regulation (also known as the Alaska Rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000 may be used for CWA purposes, whether or not approved by USEPA.

6. **Stringency of Requirements for Individual Pollutants.** This Order contains restrictions on individual pollutants that are no more stringent than required by the federal CWA. Individual pollutant restrictions consist of technology-based restrictions and water quality-based effluent limitations. The technology-based effluent limitations consist of restrictions on biochemical oxygen demand (BOD), total suspended solids (TSS), and pH. Restrictions on these pollutants are specified in federal regulations and are no more stringent than required by the CWA. Water quality-based effluent limitations have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant water quality-based effluent limitations were derived from the CTR, the CTR is the applicable standard pursuant to 40 CFR 131.38. The scientific procedures for calculating the individual water quality-based effluent limitations are based on the CTR-SIP, which was approved by USEPA on May 18, 2000. Most beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to 40 CFR 131.21 (c) (1). The remaining water quality objectives and beneficial uses implemented by this Order [arsenic, cadmium, chromium (VI), copper (fresh water), lead, nickel, silver (1-hour), and zinc] were approved by USEPA on January 5, 2005, and are applicable water quality standards pursuant to 40 CFR 131.21 (c) (2). Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement the technology-based requirements of the CWA and the applicable water quality standards for purposes of the CWA.

7. **Antidegradation Policy.** NPDES regulations at 40 CFR 131.12 require that State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution 68-16, incorporating the requirements of the federal antidegradation policy and requiring that existing quality of waters be maintained unless degradation is justified based on specific findings. As discussed in detail in Section IV.G of this Fact Sheet the permitted discharge is consistent with the antidegradation provision of 40 CFR 131.12 and State Water Board Resolution 68-16.

8. **Anti-Backsliding Requirements.** CWA Sections 402 (o) (2) and 303 (d) (4) and NPDES regulations at 40 CFR 122.44 (l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. As discussed in detail in the Fact Sheet (Attachment F), the prohibitions, limitations, and conditions of this Order are consistent with applicable federal and State anti-backsliding requirements.

9. **Monitoring and Reporting Requirements.** 40 CFR 122.48 requires that all NPDES permits specify requirements for recording and reporting monitoring results. CWC Sections 13267 and 13383 authorize the Regional Water Boards to require technical and monitoring reports. The MRP, included as Attachment E to this Order, establishes monitoring and reporting requirements to implement federal and State requirements. The MRP may be amended by the Executive Officer pursuant to USEPA regulation 40 CFR 122.62, 122.63, and 124.5.

D. Impaired Water Bodies on CWA 303 (d) List

On June 6, 2003, the USEPA approved a revised list of impaired water bodies prepared by the State pursuant to CWA section 303(d) - specific water bodies where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. The pollutants impairing Carquinez Strait include chlordane, DDT, diazinon, dieldrin, dioxin compounds, exotic species, furan compounds, mercury, PCBs, dioxin-like PCBs, and selenium. The SIP requires final effluent limitations for all 303 (d)-listed pollutants to be based on total maximum daily loads (TMDLs) and associated waste load allocations (WLAs).

1. **Total Maximum Daily Loads.** The Regional Water Board plans to adopt TMDLs for pollutants on the 303 (d) list in the San Francisco Bay within the next ten years. Future review of the 303 (d)-list for the Bay may result in revision of the schedules, provide schedules for other pollutants, or both.

2. **Waste Load Allocations.** TMDLs will establish waste load allocations (WLAs) for point sources and load allocations (LAs) for non-point sources, and will result in achieving applicable water quality standards for the impaired waterbodies. Final effluent limitations for impairing pollutants for this Discharger will ultimately be based on WLAs that are derived from the TMDLs.

3. **Implementation Strategy.** The Regional Water Board's strategy to collect water quality data and to develop TMDLs is summarized below.

a. **Data Collection.** The Regional Water Board has provided dischargers to the Bay an option to, collectively, assist in developing and implementing analytical techniques capable of detecting 303 (d)-listed pollutants to, at least, their respective levels of concern or to levels of the applicable WQOs/WQC. This collective effort may include development of sample concentration techniques for approval by the USEPA. The Regional Water Board will require dischargers to characterize pollutant loads from their facilities into water-quality limited receiving waters. Results will be used in the development of TMDLs and may be used to update or revise the 303 (d) list or to change WQOs/WQC for the impaired waterbodies, including Carquinez Strait within San Francisco Bay.

b. **Funding Mechanism.** The Regional Water Board has received, and anticipates continuing to receive, resources from federal and State agencies for TMDL development. To ensure timely development of TMDLs, the Regional Water Board intends to supplement these resources by allocating development costs among dischargers through the RMP or other appropriate funding mechanisms.

E. Other Plans, Polices and Regulations

N/A

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source discharges to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations; and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 CFR 122.44 (a) requires that permits include applicable technology-based limitations and standards; and 40 CFR 122.44 (d) requires that permits include water quality-based effluent limitations (WQBELs) to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where numeric water quality objectives have not been established, three options exist to protect water quality: 1) 40 CFR 122.44 (d) specifies that WQBELs may be established using USEPA criteria guidance under CWA section 304 (a); 2) proposed State criteria or a State policy interpreting narrative criteria supplemented with other relevant information may be used; or 3) an indicator parameter may be established.

Several specific factors affecting the development of limitations and requirements in this Order are discussed as follows:

A. Discharge Prohibitions

1. **Prohibition III. A (No discharge other than as described in this Order).** This prohibition is the same as in the previous permit. This prohibition is based on California Water Code section 13260, which requires filing a Report of Waste Discharge before discharges can occur. Discharges not described in the ROWD, and subsequently in the Order, are prohibited.

2. **Prohibition III. B (No discharge except where a minimum initial dilution of 10 to 1 is provided).** This prohibition is the same as the previous permit and is based on Discharge Prohibition No. 1 from Table 4-1 of the Basin Plan, which prohibits discharges that do not receive a minimum 10:1 initial dilution. Furthermore, this Order allows a 10:1 dilution credit in the calculation of some water quality based effluent limitations, and these limits would not be protective of water quality, if the discharge did not actually achieve a 10:1 minimum initial dilution.

3. **Prohibition III. C (No discharge containing algaecides or anti-fouling additives at Discharge Point 001).** This prohibition is retained from Order No. 00-025.

4. **Prohibition III. D (No bypasses except under the conditions at 40 CFR 122.41(m)(4)(i)(A), (B) and (C)):** This prohibition is based on 40 CFR 122.41(m)(4).

5. **Discharge Prohibition III.E. (No sanitary sewer overflows (SSO) to waters of the United States)**: The Discharge Prohibition No. 15 from Table 4-1 of the Basin Plan, and the Clean Water Act prohibits the discharge of wastewater to surface waters except as authorize under an NPDES permit. POTWs must achieve secondary treatment, at a minimum, and any more stringent limitations that are necessary to achieve water quality standards. (33U.S.C. §1311(b)(1)(B) and (C).) Thus, an SSO that results in the discharge of raw sewage, or sewage not meeting secondary treatment, to surface waters is prohibited under the Clean Water Act and the Basin Plan.

B. Technology-Based Effluent Limitations for Discharge Point 001 and Discharge Point 002

1. Scope and Authority

The CWA requires that technology-based effluent limitations be established based on several levels of controls:

- Best practicable treatment control technology (BPT) represents the average of the best performance by plants within an industrial category or subcategory. BPT standards apply to toxic, conventional, and non-conventional pollutants.

- Best available technology economically achievable (BAT) represents the best existing performance of treatment technologies that are economically achievable within an industrial point source category. BAT standards apply to toxic and non-conventional pollutants.

- Best conventional pollutant control technology (BCT) represents the control from existing industrial point sources of conventional pollutants including BOD, TSS, fecal coliform, pH, and oil and grease. The BCT standard is established after considering the "cost reasonableness" of the relationship between the cost of attaining a reduction in effluent discharge and the benefits that would result, and also the cost effectiveness of additional industrial treatment beyond BPT.

- New source performance standards (NSPS) represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA requires USEPA to develop effluent limitations, guidelines and standards (ELGs) representing application of BPT, BAT, BCT, and NSPS. Section 402(a)(1) of the CWA and section 125.3 of the Code of Federal Regulations authorize the use of best professional judgment (BPJ) to derive technology-based effluent limitations on a case-by-case basis where ELGs are not available for certain industrial categories and/or pollutants of concern. Where BPJ is used, the permit writer must consider specific factors outlined in section 125.3.

Pursuant to Section 306 (b) (1) (B) of the CWA, U.S. EPA has established standards of performance (technology-based limitations and standards) for the crystalline cane sugar refining industry at 40 CFR 409 Subpart B. These regulations apply to the Discharger's facility and were used to develop limitations and requirements of Order No. 00-025. (See Finding 25 of Order No. 00-025.)

2. Applicable Technology-Based Effluent Limitations

a. Effluent Guidelines for Crystalline Cane Sugar Refinery.

The following specific standards of performance for existing facilities, representing the best practicable control technology currently available and the best conventional pollutant control technology, as established at 40 CFR 409 Subpart B, are applicable to the C&H Sugar Company facility.

40 CFR 409.22 (a). Any crystalline cane sugar refinery discharging both barometric condenser cooling water and other process waters shall meet the following limitations. The BOD_5 limitation is determined by the addition of the net BOD_5 attributed to the barometric condenser cooling water to that amount of BOD_5 attributed to the process water. The TSS limitation is that amount of TSS attributed to the treated process water. Where the barometric condenser cooling water and process water streams are mixed and impossible to measure separately prior to discharge, the values should be considered net.

Table F-11. Technology-Based Requirements in 40 CFR 409.22(a)

Effluent Characteristic	Effluent Limitation	
	Daily Maximum	30-Day Average
BOD_5 (lbs/ton [a])	2.38	0.86
TSS (lbs/ton [a])	0.54	0.18
pH	6.0 – 9.0	

[a] lbs BOD_5 or TSS per ton of melt (raw sugar contained within aqueous solution at the beginning of the process for production of refined cane sugar).

40 CFR 409.22 (b). Any crystalline cane sugar refinery discharging barometric condenser cooling water only should be required to achieve the following net limitations.

Table F-12. Technology-Based Requirements in 40 CFR 409.22(b)

Effluent Characteristic	Effluent Limitation	
	Daily Maximum	30-Day Average
BOD_5 (lbs/ton [a])	2.04	0.68

[a] lbs BOD_5 or TSS per ton of melt (raw sugar contained within aqueous solution at the beginning of the process for production of refined cane sugar).

Effluent standards for process wastewater only. The technology-based standards specified in 40 CFR 409 (a) and (b) as described above are interpreted for discharging process wastewater only, as shown in Table F-14. These technology-based standards are the difference between those specified in 40 CFR 409.22(a) and (b).

Table F-13. Technology-Based Requirements for Process Wastewater

Effluent Characteristic	Effluent Limitation	
	Daily Maximum	30-day Average
BOD_5 (lbs/ton) [a]	0.34	0.18
TSS (lbs/ton)	0.54	0.18
pH	6.0 – 9.0	

b. Technology-Based Effluent Limitations for Discharge Points 001 and 002

(1) Discharge Point 001

The technology-based standards described above are interpreted to require the following effluent limitations for Discharge Point 001 (as a discharge of barometric cooling water only).

Table F-14. Technology-Based Limitations (001)

Constituent	Units	Effluent Limitations	
		Maximum Daily	Monthly Average
BOD_5	lbs/day	6,700	2,200
pH	pH units	6.0 – 9.0 at all times	

The BOD_5 effluent limitations are based on an average melt rate of raw cane sugar of 3,300 tons per day:

BOD_5 maximum daily limit (lbs/day) = 2.04 lbs/ton * 3,300 tons/day
= 6,732 (lbs/day)

BOD_5 monthly average limit (lbs/day) = 0.68 lbs/ton * 3,300 tons/day
= 2,244 (lbs/day)

The final mass loading limits were rounded to two significant figures, as shown in Table F-15.

(2) Discharge Point 002

Discharge Point 002 contains both process wastewater from the Refinery and municipal wastewater from CSD. The technology-based standards specified in 40 CFR 409 (a) and (b) are interpreted to require BOD_5 and TSS mass-loading effluent limitations for Discharge Point 002 (discharging process wastewater only). In addition, Basin Plan provides technology-based effluent limits for all wastewater treatment plants, including pH, oil and grease, settleable matter, total chlorine residual, and total coliform bacteria.

Table F-15. Summary of Technology-Based Limitations (002)

Constituent	Units	Effluent Limitations			
		Maximum Daily	Monthly Average	Instantaneous Minimum	Instantaneous Maximum
BOD_5[1]	lbs/day	2,000	730	---	---
TSS	lbs/day	2,600	730	---	---
pH	s.u.	---	---	6.0	9.0
Oil and Grease	mg/L	20	10	---	---
Total Chlorine Residual	mg/L	---	---	---	0.0
Settleable Matter					
Before April 18, 2010	mL/L/hr	2.0	1.0	---	---
After April 18, 2010	mL/L/hr	0.2	0.1	---	---

i) **BOD_5 and TSS mass loading effluent limits.** For this permit reissuance, Regional Board staff applied a new approach, which is based on 40 CFR 125.3(c)(2) and (3) and relies on Best Professional Judgment. The BOD_5 and TSS effluent limitations are the sum of those for the process wastewater and those for the municipal wastewater. The technology-based standards specified in 40 CFR 409(a) and (b) are interpreted for process wastewater as shown in Table F-13 above; the limits are calculated based on an average melt rate of raw cane sugar of 3,300 tons per day. The BOD_5 and TSS daily maximum limits for secondary treatment of sewage wastewater are from 40 CFR 133.102. The use of BOD_5 and TSS daily maximum effluent limits of 60 mg/L in mass loading limit calculation is retained from previous permit. Municipal wastewater maximum daily flow rate of 1.67 MGD and maximum monthly average flow rate of 0.54 MGD from CSD, observed during 2002 to 2005, were used in calculating loadings from CSD.

BOD_5 maximum daily limit (lbs/day) = 0.34 lbs/ton * 3,300 tons/day + 1.67 MGD*60 mg/L*8.34 =1,958 (lbs/day)

BOD_5 monthly average limit (lbs/day) = 0.18 lbs/ton * 3,300 tons/day + 0.54 MGD*30 mg/L*8.34 = 729 (lbs/day)

TSS maximum daily limit (lbs/day) = 0.54 lbs/ton * 3,300 tons/day + 1.67 MGD*60 mg/L*8.34 = 2,618 (lbs/day)

TSS monthly average limit (lbs/day) = 0.18 lbs/ton * 3,300 tons/day + 0.54 MGD*30 mg/L*8.34 = 729 (lbs/day)

where: Conversion factor (8.34) in [(L•lb)/(gallon•kg)] = 3.7854 L/gallon x 2.2 lbs/kg

The final mass loading limits were rounded to two significant figures, as shown in Table F-15.

Regional Water Board staff evaluated the Discharger's performance data and found that the Discharger would have had no problem complying with the proposed new technology-based limits from 2001 through 2005. Board staff concluded that immediate compliance with these limits is feasible. It is also concluded that the proposed limits represent Best Practicable Control Technology (BPT) and Best Conventional Pollutant Control Technology (BCT). In setting these limits, the factors specified in 40 CFR 125.3(d), as shown in the table below were considered.

Table F-16. Factors Considered Pursuant to 40 CFR 125.3(d)

Factors	Considerations
Cost relative to benefits	The cost of imposing these limits is reasonable given that the Discharger can comply without modifying its existing process.
Comparison of cost and pollutant reductions from publicly owned treatment works to cost and pollutant reductions from sugar refineries	The facility provides secondary treatment of CSD wastewater; therefore, the cost of continuing its operations is comparable to the costs for comparable publicly owned treatment works.
Age of equipment and facilities	The limits can be met with existing equipment and facilities, which must be also maintained to comply with secondary treatment standards for municipal wastewater.
Process employed	The limits can be met with the existing process.
Engineering aspects of various controls	The existing controls are practicable and capable of meeting the limits.
Process changes	No process changes are necessary to meet the limits.
Non-water quality environmental impacts	Because no process changes are necessary, no non-water quality impacts are foreseeable.

ii) **pH.** The effluent limitation for pH (6.0 – 9.0) for Outfalls 001 and 002 are retained from the previous permit and reflect requirements established by Table 4-2 of the Basin Plan for deep water discharges of conventional pollutants.

Pursuant to 40 CFR 401.17, "pH Effluent Limitations Under Continuous Monitoring," if the Discharger opts to use continuous pH monitoring, the Discharger will be in compliance with the pH limitation specified herein, provided that both of the following conditions are satisfied: (i) The total time during which the pH values are outside the required range of pH values shall not exceed 7 hours and 26 minutes in any calendar month; and (ii) No individual excursion from the range of pH values shall exceed 60 minutes.

iii) **Oil and grease.** This Order includes oil and grease technology-based effluent limitations . Technology-based effluent limitations are put in place to ensure that full secondary treatment is achieved by the wastewater treatment facility, as required under 40 CFR §133.102. Basin Plan Table 4-2 contains effluent limits for oil and grease of 20 mg/L as a daily maximum, and 10 mg/L as a monthly average for all treatment facilities. Therefore, these limits apply to JTP. The previous permit does not include an oil and grease effluent limit.

iv) **Chlorine Residual.** The instantaneous maximum limitation for chlorine of 0.0 mg/L for Outfall 002 is being retained by this Order and is based on the Basin Plan (Chapter 4, Table 4-2).

v) **Settleable Matter.** The interim and final effluent limitations for settleable matter are retained from the previous permit. The interim limits are established using BPJ. The CSD is required to continue its settleable matter special study to address the high settleable matter from excessive I/I. Final limitations for settleable matter, which become effective on April 18, 2010, reflect a level of effluent quality attainable by properly maintained and operated clarifiers.

vi) **Total Coliform Bacteria.** The purpose of these effluent limitations is to ensure adequate disinfection of the discharges in order to protect beneficial uses of the receiving waters. These effluent limits are retained from the previous permit, which are based on Basin Plan Table 4-2, total coliform limits for deepwater dischargers.

C. Water Quality-Based Effluent Limitations (WQBELs)

WQBELs have been derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law. The scientific procedures for calculating individual WQBELs are based on the CTR-SIP, which was approved by USEPA prior to May 1, 2001, or Basin Plan provisions approved by USEPA on May 29, 2000. Most beneficial uses and water quality objectives contained in the Basin Plan were approved under State law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless "applicable water quality standards for purposes of the [Clean Water] Act" pursuant to 40 CFR 131.21 (c) (1). Other water quality objectives and beneficial uses implemented by this Order (specifically arsenic, copper, lead, mercury, nickel, and zinc) were approved by USEPA

on January 5, 2005, and are applicable water quality standards pursuant to 40 CFR 131.21 (c) (2). Collectively, this Order's restrictions on individual pollutants are no more stringent than the applicable water quality standards for purposes of the Clean Water Act.

1. Scope and Authority

a. As specified in 40 CFR 122.44 (d) (1) (i), permits are required to include WQBELs for all pollutants "which the Director determines are or may be discharged at a level which will cause, have the reasonable potential to cause, or contribute to an excursion above any State water quality standard." The process for determining "Reasonable Potential" and calculating WQBELs, when necessary, is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in other State plans and policies, the CTR, and NTR.

b. NPDES regulations and the SIP provide the basis to establish Maximum Daily Effluent Limitations (MDELs).

(1) NPDES Regulations. NPDES regulations at 40 CFR Part 122.45 (d) state:

"For continuous discharges all permit effluent limitations, standards, and prohibitions, including those necessary to achieve water quality standards, shall *unless impracticable* be stated as maximum daily and average monthly discharge limitations for all discharges other than publicly owned treatment works."

(2) SIP. The SIP (page 8, Section 1.4) requires WQBELs be expressed as MDELs and average monthly effluent limitations (AMELs).

c. MDELs are used in this Order to protect against acute water quality effects. The MDELs are necessary for preventing fish kills or mortality to aquatic organisms.

2. Applicable Beneficial Uses and Water Quality Criteria and Objectives

a. **Applicable Beneficial Uses.** Beneficial uses applicable to Carquinez Strait are from the Basin Plan and are as follows:

Table F-17. Basin Plan Beneficial Uses of Carquinez Strait

Discharge Point	Receiving Water Name	Beneficial Use(s)
001 and 002	Carquinez Strait	• Industrial Service Supply (IND) • Ocean, Commercial, and Sport Fishing (COMM) • Estuarine Habitat (EST) • Fish Migration (MIGR) • Preservation of Rare and Endangered Species (RARE) • Water Contact Recreation (REC-1) • Noncontact Water Recreation (REC-2) • Fish Spawning (SPWN) • Wildlife Habitat (WILD) • Navigation (NAV).

b. The WQC and WQOs applicable to the receiving waters for this discharge are from the Basin Plan, the CTR, and the NTR.

(1) **Basin Plan.** The Basin Plan specifies numeric WQOs for 10 priority toxic pollutants, as well as narrative WQOs for toxicity and bioaccumulation in order to protect beneficial uses. The pollutants for which the Basin Plan specifies numeric objectives are arsenic, cadmium, chromium (VI), copper in freshwater, lead, mercury, nickel, silver, zinc, and cyanide (see also c., below). The narrative toxicity objective states in part "[a]ll waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce other detrimental responses in aquatic organisms." The bioaccumulation objective states in part "[c]ontrollable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered." Effluent limitations and provisions contained in this Order are designed to implement these objectives, based on available information.

(2) **CTR.** The CTR specifies numeric aquatic life criteria for 23 priority toxic pollutants and numeric human health criteria for 57 priority toxic pollutants. These criteria apply to inland surface waters and enclosed bays and estuaries such as here, except that where the Basin Plan's Tables 3-3 and 3-4 specify numeric objectives for certain of these priority toxic pollutants, the Basin Plan's numeric objectives apply over the CTR (except in the South Bay south of the Dumbarton Bridge).

(3) **NTR.** The NTR established numeric aquatic life criteria for selenium, numeric aquatic life and human health criteria for cyanide, and numeric human health criteria for 34 toxic organic pollutants for waters of San Francisco Bay upstream to, and including, Suisun Bay and the Sacramento-San Joaquin Delta. This includes the receiving water for this Discharger.

c. Technical Support Document for Water Quality-Based Toxics Controls.

Where numeric objectives have not been established or updated in the Basin Plan, NPDES regulations at 40 CFR Part 122.44 (d) require that WQBELs be established based on USEPA criteria, supplemented where necessary by other relevant information, to attain and maintain narrative WQOs to fully protect designated beneficial uses.

To determine the need for and establish WQBELs, when necessary, the Regional Water Board staff has followed the requirements of applicable NPDES regulations, including 40 CFR Parts 122 and 131, as well as guidance and requirements established by the Basin Plan; USEPA's *Technical Support Document for Water Quality-Based Toxics Control* (the TSD, EPA/505/2-90-001, 1991); and the State Water Resources Control Board's *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (the SIP, 2005).

d. Basin Plan and CTR Receiving Water Salinity Policy. The Basin Plan and CTR state that the salinity characteristics (i.e., freshwater versus saltwater) of the receiving water shall be considered in determining the applicable WQOs/WQC. Freshwater criteria shall apply to discharges to waters with salinities equal to or less than 1 ppt at least 95 percent of the time. Saltwater criteria shall apply to discharges to waters with salinities equal to or greater than 10 ppt at least 95 percent of the time in a normal water year. For discharges to waters with salinities in between these two categories, or tidally influenced fresh waters that support estuarine beneficial uses, the criteria shall be the lower of the salt- or freshwater criteria (the freshwater criteria for some metals are calculated based on ambient hardness) for each substance.

Salinity. The receiving water for discharges from the C&H Sugar Company is Carquinez Strait within northern San Francisco Bay - a tidally influenced waterbody with fresh water inflows. Regional Water Board staff evaluated salinity data for the period of March 1993 through August 2001 for the two nearest receiving water stations within the San Francisco Estuary Institutes's Regional Monitoring Program (RMP) – BD40 (Davis Point) and BD50 (Napa River). During this time period, salinity was greater than ten ppt in 30 of 57 samples; therefore, the receiving water is viewed as an estuarine environment for purposes of determining the need for and establishing water quality based effluent limitations. In these circumstances, the more stringent of the marine and fresh water WQOs/WQC from the Basin Plan, the CTR, and the NTR are applicable to discharges from the C&H Sugar Company facility.

e. Receiving Water Hardness.

Some fresh water WQOs/WQC for metals are hardness dependent; i.e., as hardness increases in the receiving water, the toxicity of certain metals decreases. To determine applicable water quality criteria for hardness dependent metals for purposes off this reasonable potential analysis, Regional Water Board staff used a hardness value of 48 mg/L $CaCO_3$, which is the

minimum hardness value observed in 26 samples collected at the Davis Point and the Napa River RMP monitoring stations between March 1993 and August 2001. When there are sufficient receiving water data for hardness, Regional Water Board staff typically perform a statistical analysis to determine an adjusted geometric mean – the value greater than 30 percent of the data points. When there is insufficient data to perform a statistical analysis, as in these circumstances, Regional Water Board staff use the minimum observed hardness in the receiving water. The Discharger has the option to sample for receiving hardness at the vicinity of the intake structure during the next 5-year permit term. The Regional Water Board may consider a new hardness value based on any new data for water quality objective/criteria calculation for the next permit reissuance.

3. Determining the Need for WQBELs

Assessing whether a pollutant has Reasonable Potential is the fundamental step in determining whether or not a WQBEL is required.

a. Reasonable Potential Analysis Methodology.

The RPA identifies the observed MEC in the effluent for each pollutant, based on effluent concentration data. There are three triggers in determining Reasonable Potential according to Section 1.3 of the SIP.

- The first trigger is activated if the MEC is greater than or equal to the lowest applicable WQO (MEC≥ WQO), which has been adjusted, if appropriate, for pH, hardness, and translator data. If the MEC is greater than the adjusted WQO, then that pollutant has reasonable potential, and a WQBEL is required.

- The second trigger is activated if the observed maximum ambient background concentration (B) is greater than the adjusted WQO (B>WQO) and the pollutant was detected in any of the effluent samples.

- The third trigger is activated if a review of other information determines that a WQBEL is required to protect beneficial uses, even though both MEC and B are less than the WQO/WQC. A limitation may be required under certain circumstances to protect beneficial uses.

b. Effluent data.

The Regional Water Board's August 6, 2001 letter titled Requirement for Monitoring of Pollutants in Effluent and Receiving Water to Implement New Statewide Regulations and Policy (hereinafter referred to as the August 6, 2001 Letter) to all permittees, formally required the Discharger (pursuant to Section 13267 of the CWC) to initiate or continue to monitor for the priority pollutants using analytical methods that provide the best detection limits reasonably feasible. Regional Water Board staff analyzed this effluent data and the nature of upper San Francisco Bay to determine if the discharge has Reasonable Potential. The RPA was based on the effluent monitoring data from January

2002 through December 2005 for metals, inorganic priority pollutants, and organic priority pollutants.

c. Ambient Background Data.

(1) Ambient background values are used in the reasonable potential analysis (RPA) and in the calculation of effluent limitations. For the RPA, ambient background concentrations are the observed maximum detected water column concentrations. The SIP allows background to be determined on a discharge-by-discharge or water body-by-water body basis (SIP section 1.4.3). Consistent with the SIP, Regional Water Board staff has chosen to use a water body-by-water body basis because of the uncertainties inherent in accurately characterizing ambient background in a complex estuarine system on a discharge-by-discharge basis. The SIP states that for calculating WQBELs, ambient background concentrations are either the observed maximum ambient water column concentrations or, for criteria/objectives intended to protect human health from carcinogenic effects, the arithmetic mean of observed ambient water concentrations.

(2) The RMP station at Yerba Buena Island, located in the Central Bay, has been monitored for most of the inorganic (CTR constituent numbers 1–15) and some of the organic (CTR constituent numbers 16–126) toxic pollutants, and these data from the RMP, for the period March 1993 – August 2003, were used as background data in performing the RPA for this Discharger. Not all the constituents listed in the CTR were analyzed by the RMP during this time.

(3) These data gaps are addressed by the August 6, 2001 Letter. This letter formally requires the Dischargers (pursuant to Section 13267 of the California Water Code) to conduct ambient background monitoring and effluent monitoring for those constituents not currently sampled by the RMP and to provide this technical information to the Regional Water Board.

On May 15, 2003 and June 15, 2004 , a group of several San Francisco Bay Region Dischargers (known as the Bay Area Clean Water Agencies, or BACWA) submitted a collaborative receiving water study, entitled the San Francisco Bay Ambient Water Monitoring Interim Report, and Final CTR Sampling Update. These studies include monitoring results from sampling events in 2002 and 2003 for the remaining priority pollutants not monitored by the RMP.

The RPA was conducted and the WQBELs were calculated using RMP data from 1993 through 2003 for inorganics and organics at the Yerba Buena Island RMP station, and additional data from the BACWA Ambient Water Monitoring: Final CTR Sampling Update Report for the Yerba Buena Island RMP station. The Dischargers may utilize the receiving water study provided by BACWA to fulfill all requirements of the August 6, 2001 letter for receiving water monitoring in this Order.

d. RPA Determination.

Using the method prescribed in Section 1.3 of the SIP, Regional Water Board staff compared the effluent data and ambient background data with numeric and narrative WQOs in the Basin Plan and numeric WQC from USEPA, the NTR, and the CTR. The Basin Plan objectives and CTR criteria are shown in **Attachment F-2** of this Fact Sheet. The MECs, WQOs/WQC, bases for the WQOs/WQC, background concentrations used, and Reasonable Potential conclusions from the RPAs for Discharge Points 001 and 002 are listed in the following tables for all constituents analyzed. Some of the constituents in the CTR were not determined because of the lack of an objective/criteria or effluent data. Based on the RPA methodology in the SIP, some constituents did not demonstrate Reasonable Potential. The RPA results are shown below and **Attachment F-2** of this Fact Sheet. The pollutants that exhibit Reasonable Potential in discharges from Discharge Point 001 are arsenic, copper, lead, mercury, nickel, selenium, zinc, cyanide, dioxin-TEQ, and bis (2-ethylhexyl) phthalate, and in discharges at Discharge Point 002, are copper, lead, mercury, cyanide, dioxin-TEQ, and bis(2-ethylhexyl)phthalate.

Table F-18. RPA Summary (001)

CTR #	Priority Pollutants (µg/L)	Governing WQO/WQC	MEC or Minimum DL	Maximum Background or Minimum DL[1, 2]	RPA Results[3]
1	Antimony	4300	**0.6**	**1.8**	No
2	Arsenic	36	**45**	**2.46**	**Yes**
3	Beryllium	No Criteria	0.06	**0.215**	Undetermined
4	Cadmium	0.64	**0.6**	**0.1268**	No
5a	Chromium (III or Total)	110	**40**	Not Available	No
5b	Chromium (VI)	11.0	0.9	**4.4**	No
6	Copper	7.2	**20**	**2.55**	**Yes**
7	Lead	1.3	**2.6**	**0.804**	**Yes**
8	Mercury	0.025	**0.082**	**0.0086**	**Yes**
9	Nickel	30	**160**	**3.73**	**Yes**
10	Selenium	5.0	**26**	**0.39**	**Yes**

[1] Concentration in bold is the actual detected maximum concentration, otherwise the concentration shown is the maximum detection level.
[2] Maximum Background = Not Available, if there is not monitoring data for this constituent.
[3] RPA Results = Yes, if MEC > WQO/WQC,
= No, if MEC or all effluent concentration non-detect < WQO/WQC,
= Undetermined, if no objective promulgated, and
= Cannot be determined due to lack of data.

e. **Constituents with limited data.** The Discharger has performed sampling and analysis for the constituents listed in the CTR. This data set was used to perform the RPA. In some cases, Reasonable Potential cannot be determined because effluent data are limited, or ambient background concentrations are not available. The Discharger will continue to monitor for these constituents in the effluent using analytical methods that provide the best feasible detection limits. When additional data become available, further RPA will be conducted to determine whether to add numeric effluent limitations to this Order or to continue monitoring.

f. **Pollutants with no Reasonable Potential.** WQBELs are not included in this Order for constituents that do not demonstrate Reasonable Potential; however, monitoring for those pollutants is still required. If concentrations of these constituents are found to have increased significantly, the Discharger will be required to investigate the source(s) of the increase(s). Remedial measures are required if the increases pose a threat to water quality in the receiving water.

4. WQBEL Calculations.

a. Applicable WQC/WQOs for Pollutants with Reasonable Potential.

WQBELs were developed for the toxic and priority pollutants that were determined to have reasonable potential to cause or contribute to exceedances of the WQOs or WQC. The WQOs or WQC used for each pollutant with Reasonable Potential and the basis for the WQOs/WQC is indicated in the following table.

Table F-20. Water Quality Criteria/Objectives for Toxics

Pollutant	Water Quality Criterion or Objective (µg/L)			Basis
	Aquatic Life Chronic	Aquatic Life Acute	Human Health	
Arsenic	36	69	---	Basin Plan (salt water aquatic life)
Copper	8.2	7.2	---	CTR (salt water aquatic life) converted to total with site-specific translators for the Bay) – for RPA purpose
Copper	20	17	---	CTR (salt water aquatic life) converted to total with site-specific translators and a WER for the Bay) – for WQBEL calculation
Copper	16	14	---	Proposed site-specific objectives and a WER for the Bay – for alternate WQBEL calculation
Lead	1.2	32	---	Basin Plan (fresh water aquatic life)
Mercury	0.025	2.1	0.051	Basin Plan (salt water aquatic life)
Nickel	30	130	4600	Basin Plan (salt water aquatic life)
Selenium	5.0	20	---	NTR criteria for the Bay
Zinc	64	64	---	Basin Plan (fresh water aquatic life)
Cyanide	1.0	1.0	220000	NTR criteria for the Bay
Cyanide	2.9	9.4	---	Proposed site-specific objectives for the Bay
Dioxin-TEQ	---	---	1.4×10^{-8}	Basin Plan narrative
Bis (2-ethylhexyl) phthalate	---	---	5.9	CTR Human Health

b. Dilution Credit

The SIP provides the basis for the dilution credit granted. The C&H Sugar Company Outfalls 001 and 002 are designed to achieve a minimum of 10:1 dilution. Review of RMP data (local and North Bay stations) reveals variability in the receiving water, and the hydrology of the receiving water is very complex. Therefore, there is uncertainty associated with the representative nature of the appropriate ambient background data for effluent limit calculations. Pursuant to Section 1.4.2.1 of the SIP, "dilution credit may be limited or denied on a pollutant-by-pollutant basis...." The Regional Water Board finds that a conservative 10:1 dilution credit for non-bioaccumulative priority pollutants and a zero dilution credit for bioaccumulative priority pollutants are necessary for protection of beneficial uses. The detailed basis for each are explained below.

(1) For certain bioaccumulative pollutants, based on BPJ, dilution credit is not included in calculating the final WQBELs. This determination is based on available data on concentrations of these pollutants in aquatic organisms, sediment, and the water column. The Regional Water Board placed selenium, mercury, and polychlorinated biphenyls (PCBs) on the CWA Section 303(d) list. U.S. EPA added dioxin and furan compounds, chlordane, dieldrin, and 4,4'-DDT to the CWA Section 303(d) list. Dilution credit is not included for mercury. The following factors suggest that there is no more assimilative capacity in the Bay for these pollutants.

San Francisco Bay fish tissue data show that these pollutants exceed screening levels. The fish tissue data are contained in *Contaminant Concentrations in Fish from San Francisco Bay 1997* (May 1997). Denial of dilution credits for these pollutants is further justified by fish advisories for San Francisco Bay. The Office of Environmental Health and Hazard Assessment (OEHHA) performed a preliminary review of the data from the 1994 San Francisco Bay pilot study, *Contaminated Levels in Fish Tissue from San Francisco Bay*. The results of the study showed elevated levels of chemical contaminants in the fish tissues. Based on these results, OEHHA issued an interim consumption advisory covering certain fish species from the Bay in December 1994. This interim consumption advice was issued and is still in effect owing to health concerns based on exposure to sport fish from the Bay contaminated with mercury, dioxins, and pesticides (e.g., DDT).

For selenium, the denial of dilution credits is based on Bay waterfowl tissue data presented in the California Department of Fish and Game's Selenium Verification Study (1986-1990). These data show elevated levels of selenium in the livers of waterfowl that feed on bottom dwelling organisms such as clams. Additionally, in 1987 the Office of Environmental Health Hazard Assessment issued an advisory for the consumption of two species of diving ducks in the North Bay found to have high tissue levels of selenium. This advisory is still in effect.

(2) Furthermore, Section 2.1.1 of the SIP states that for bioaccumulative compounds on the 303(d) list, the Regional Water Board should consider whether mass-loading limits should be limited to current levels. The Regional Water Board finds that mass-loading limits are warranted for mercury for the receiving waters of this Discharger. This is to ensure that this Discharger does not contribute further to impairment of the narrative objective for bioaccumulation.

(3) For non-bioaccumulative constituents, a conservative allowance of 10:1 dilution for discharges to the Bay has been assigned for protection of beneficial uses. The basis for using 10:1 is that it was granted in the previous permit. This 10:1 is also based on the Basin Plan's prohibition number 1, which prohibits discharges with less than 10:1 dilution. Limiting the dilution

credit is based on SIP provisions in Section 1.4.2. The following outlines the basis for derivation of the dilution credit.

i. A far-field background station is appropriate because the receiving water body (the Bay) is a very complex estuarine system with highly variable and seasonal upstream freshwater inflows and diurnal tidal saltwater inputs. The SIP allows background to be determined on a discharge-by-discharge or water body-by-water body basis (SIP 1.4.3). Consistent with the SIP, Regional Water Board staff has chosen to use a water body-by-water body basis because of the uncertainties inherent in accurately characterizing ambient background in a complex estuarine system on a discharge-by-discharge basis.

   The Yerba Buena Island Station fits the guidance for ambient background in the SIP compared to other stations in the RMP. The SIP states that background data are applicable if they are "representative of the ambient receiving water column that will mix with the discharge." Regional Water Board staff believes that data from this station are representative of water that will mix with the discharge from 001 and 002. Although this station is located near the Golden Gate, it would represent the typical water flushing in and out of the Bay each tidal cycle. For most of the Bay, the waters represented by this station make up a large part of the receiving water the will mix with the discharge.

ii. Because of the complex hydrology of the San Pablo Bay, a mixing zone has not been established. There are uncertainties in accurately determining the mixing zones for each discharge. The models that have been used to predict dilution have not considered the three-dimensional nature of the currents in the estuary resulting from the interaction of tidal flushes and seasonal fresh water outflows. Salt water is heavier than fresh water, colder saltwater from the ocean flushes in twice a day generally under the warmer fresh river waters that flow out annually. When these waters mix and interact, complex circulation patterns occur due to the different densities of these waters. These complex patterns occur throughout the estuary but are most prevalent in the San Pablo, Carquinez Strait, and Suisun Bay areas. The locations change depending on the strength of each tide and the variable rate of delta outflow. Additionally, sediment loads to the bay from the Central Valley also change on a longer-term basis. These changes can result in changes to the depths of different parts of the Bay making some areas more shallow and/or other areas more deep. These changes affect flow patterns that in turn can affect the initial dilution achieved by a diffuser.

iii. The SIP allows limiting a mixing zone and dilution credit for persistent pollutants (e.g., copper, silver, nickel, and lead). Discharges to the bay are defined in the SIP as incompletely mixed discharges. Thus, dilution credit should be determined using site-specific information. The SIP 1.4.2.2 specifies that the Regional Water Board "significantly limit a mixing zone

and dilution credit as necessary... For example, in determining the extent of a mixing zone or dilution credit, the RWQCB shall consider the presence os pollutants in the discharge that are ...persistent." The SIP defines persistent pollutants to be "substances for which degradation or decomposition in the environment is nonexistent or very slow." The pollutants at issue here are persistent pollutants (e.g. copper). The dilution studies that estimate actual dilution do not address the effects of these persistent pollutants in the Bay environment, such as their long-term effects on sediment concentrations.

c. Final Effluent Limitation Calculations.

The following tables summarize the WQBELs calculated for each toxic and priority pollutants that were determined to have reasonable potential to cause or contribute to exceedances of the WQOs or WQC. The WQBELs were calculated based on appropriate WQOs/WQC and the appropriate procedures specified in Section 1.4 of the SIP, as shown in **Attachment F-3** of this Fact Sheet.

Table F-21. Final WQBELs for Toxics (Discharge Point 001)

Pollutants	Units	AMEL	MDEL
Arsenic	µg/L	290	510
Copper	µg/L	96	150
Copper (alternate Limits)	µg/L	76	120
Lead	µg/L	3.7	8.3
Mercury	µg/L	0.018	0.046
Nickel	µg/L	200	480
Selenium	µg/L	3.9	8.7
Zinc	µg/L	250	590
Cyanide	µg/L	3.2	6.4
Cyanide (alternate limits)	µg/L	21	42
Dioxin - TEQ	µg/L	1.4×10^{-8}	2.8×10^{-8}
Bis (2-ethylhexy) phthalate	µg/L	54	110

Table F-22. Final WQBELs for Toxics (Discharge Point 002)

Pollutants	Units	AMEL	MDEL
Copper	µg/L	88	150
Copper (alternate Limits)	µg/L	70	120
Lead	µg/L	3.6	9.7
Mercury	µg/L	0.012	0.038
Cyanide	µg/L	2.9	6.4
Cyanide (alternate limits)	µg/L	20	44
Dioxin – TEQ	µg/L	1.4×10^{-8}	2.8×10^{-8}
Bis (2-ethylhexy) phthalate	µg/L	54	110

d. Development of Effluent Limitations for Specific Pollutants – Outfalls 001 and 002

(1) **Arsenic.**

i. **Arsenic WQOs.** The most stringent water quality objectives/criteria for arsenic, applicable to discharges from the C&H Sugar Company facility, are 36 and 69 µg/L – chronic and acute, respectively, from the Basin Plan and CTR for the protection of saltwater aquatic life.

ii. **RPA Results.** From January 2002 – July 2004, the maximum observed effluent concentration (MEC) of arsenic was 45 µg/L at Discharge Point 001. Because the MEC at Discharge Point 001 exceeds the most stringent applicable objective/criterion of 36 µg/L, there is reasonable potential for discharges from Discharge Point 001 to cause or contribute to exceedances of applicable WQOs/WQC (trigger 1), and this Order establishes effluent limitations for arsenic for that outfall.

iii. **Arsenic WQBELs.** The arsenic WQBELs calculated according to SIP procedures are 510 µg/L as the maximum daily effluent limit (MDEL) and 290 µg/L as the average monthly effluent limit (AMEL) for Discharge Point 001. A dilution credit of 10:1 was incorporated into the calculation of WQBELs.

iv. **Plant Performance and Attainability.** During the period January 2002 through July 2004, the Discharger's effluent concentrations were in the range of 6 µg/L to 45 µg/L (32 samples). A statistical analysis shows that the Discharger can comply with these final effluent limitations.

v. **Antibacksliding.** The previous permit did not include effluent limitations for arsenic; therefore, the new limits are more stringent than the previous ones, which is consistent with antibacksliding requirements.

(2) **Copper.**

i. **Copper WQC.** The marine chronic and acute criteria for dissolved copper adopted in the CTR and Basin Plan are defined as 3.1 and 4.8 µg/L multiplied by a water effects ratio or WER (40 CFR 131.38 (b) and (c)(4)(i) and (iii)). The default value for the WER is 1.0 unless a WER has been developed as set forth in USEPA's WER guidance (Interim Guidance on Determination and Use of Water Effect Ratios, USEPA Office of Water, EPA-823-B-94-001, February 1994). WERs have been developed for San Francisco Bay in accordance with this USEPA guidance as documented in *North of Dumbarton Bridge Copper and Nickel Site-Specific Objective (SSO) Derivation (Clean Estuary Partnership December 2004.* The most recent document is *Copper Site-Specific Objectives in San Francisco Bay, Proposed Basin Plan Amendment and Draft Staff Report, dated March 2,*

2007). Based on the data in these reports, a WER of 2.4 is appropriate for this discharge. In addition, Regional Water Board developed copper site-specific translators along with the study using RMP data for San Pablo Bay. The translators are 0.38 and 0.67 for converting chronic and acute dissolved WQC into total WQC, respectively. The resulting adjusted WQC for this discharge are 20 µg/L for chronic protection and 17 µg/L for acute protection, and are used in WQBELs calculation. However, when determining reasonable potential, a WER value of 1.0 is still used, the resulting WQC as 8.2 µg/L for chronic protection and 7.2 µg/L for acute protection are used in RPA.

ii. **RPA Results.** From January 2002 through December 2005, maximum observed effluent concentrations (MECs) of copper were 20 and 13 µg/L at Discharge Points 001 and 002, respectively. Because the MECs at Discharge Points 001 and 002 both exceed the most stringent applicable criterion of 7.2 µg/L, there is reasonable potential for discharges from both outfalls to cause or contribute to exceedances of applicable WQC (trigger 1); and this Order, therefore, establishes effluent limitations for copper for Discharge Points 001 and 002.

iii. **Copper WQBELs.** The copper WQBELs calculated according to SIP procedures are: for Discharge Point 001 – 150 µg/L as the maximum daily effluent limit (MDEL) and 96 µg/L as the average monthly effluent limit (AMEL); for Discharge Point 002 – 150 µg/L as MDEL and 88 µg/L as AMEL. A dilution credit of 10:1 was incorporated into the calculation of WQBELs.

iv. **Plant Performance and Attainability.** During the period January 2002 through December 2005, the Discharger's effluent concentrations were in the range of 6 µg/L to 20 µg/L for 001 (32 samples), and 2.3 µg/L to 13 µg/L for 002 (50 samples). A statistical analysis shows that the Discharger can comply with these final effluent limitations.

v. **Copper SSO and Alternate WQBELs**. During the permit term, the Regional Water Board may amend the copper WQBELs based on the SSO being developed for the San Francisco Bay as depicted in the documents cited in subsection a. above. The site specific objectives proposed are 6.0 µg/L as a four-day average and 9.4 µg/L as a one-hour average, expressed as dissolved metal. Using the site-specific translators, 0.38 and 0.67 for converting chronic and acute dissolved WQC into total WQC, respectively, the resulting WQOs are 16 µg/L for chronic protection and 14 µg/L for acute protection. Based on the Discharger's current copper data (coefficient of variation of 0.32 and 0.40 for Discharges 001 and 002, respectively), the alternate WQBELs for copper will be 120 µg/L as an MDEL and 76 µg/L as an AMEL for Discharge 001; and 120 µg/L as an MDEL and 70 µg/L as an AMEL for Discharge 002. These alternative limits will become effective only if the

site-specific objective adopted contains the same assumptions in the report cited in subsection a. above.

vi. **Antibacksliding.** The previous permit included an interim effluent limit of 37 µg/L as a daily maximum for Discharge 002. Antibacksliding does not apply to interim limits and since there were no final WQBELs in the previous permit to which to compare the new final WQBELs, there is no backsliding. There was no effluent limit in the previous permit for Discharge 001; therefore, the new limits are more stringent than the previous ones, which is consistent with antibacksliding requirements.

(3) **Lead.**

i. **Lead WQOs/WQC.** The most stringent applicable water quality objectives/criteria for lead, applicable to discharges from the C&H Sugar Company facility, are 1.3 and 32 µg/L – chronic and acute, respectively, from the Basin Plan and the CTR for the protection of fresh water aquatic life. As fresh water aquatic life objectives/criteria from the Basin Plan and the CTR are hardness dependent (i.e., toxicity of lead in fresh water increases with decreasing hardness), these specific objectives/criteria are based on a receiving water hardness of 48 mg/L $CaCO_3$, which is the lowest hardness concentration observed at the RMP Davis Point and Napa River Monitoring Stations. The Regional Water Board typically uses hardness data from the closest RMP monitoring station and/or site-specific data, if it is available. When sufficient data exist to do statistical analyses, Regional Water Board staff use a background receiving water hardness figure that is an adjusted geometric mean - the value that is greater than 30 percent of the data points. When hardness data are limited, as in these circumstances, Regional Water Board staff use the minimum hardness value to determine fresh water objectives/criteria for lead.

ii. **RPA Results.** From January 2002 through December 2005, maximum observed effluent concentrations (MECs) of lead were 2.6 and 2.8 µg/L at Discharge Points 001 and 002, respectively. Because the MECs at both outfalls exceed the most stringent applicable objective/criterion of 1.3 µg/L, there is reasonable potential for discharges from Discharge Points 001 and 002 to cause or contribute to exceedances of applicable WQOs/WQC (trigger 1), and this Order establishes effluent limitations for lead for Discharge Points 001 and 002.

iii. **Lead WQBELs.** The lead WQBELs calculated according to SIP procedures are: for Discharge Point 001 – 8.3 µg/L as the maximum daily effluent limit (MDEL) and 3.7 µg/L as the average monthly effluent limit (AMEL); for Discharge Point 002 – 9.7 µg/L as MDEL and 3.6 µg/L as AMEL. A dilution credit of 10:1 was incorporated into the calculation of WQBELs.

iv. **Plant Performance and Attainability.** During the period January 2002 through December 2005, the Discharger's effluent concentrations were in the range of <0.02 µg/L to 2.6 µg/L for Discharge 001 (32 samples), and 0.13 µg/L to 2.8 µg/L (50 samples) for Discharge 002. A statistical analysis shows that the Discharger can comply with these final effluent limitations.

v. **Antibacksliding.** The previous permit included a final MDEL of 50.3 µg/L for Discharge 002. The new limits are more stringent than this previous permit limit. Therefore, antibacksliding requirements are satisfied. There was no effluent limit in the previous permit for Discharge 001; therefore, the new limits are more stringent than the previous ones, which is consistent with antibacksliding requirements.

(4) **Mercury.**

i. **Mercury WQOs/WQC.** Both the Basin Plan and the CTR include objectives and criteria that govern mercury in the receiving water. The Basin Plan specifies objectives for the protection of saltwater aquatic life of 0.025 µg/L as a 4-day average and 2.1 µg/L as a 1-hour average. The CTR specifies a long-term average criterion for protection of human health of 0.051 µg/L.

ii. **RPA Results.** From January 2002 through December 2005, maximum observed effluent concentrations (MECs) of mercury were 0.082 and 0.98 µg/L at Discharge Points 001 and 002, respectively. Because the MECs at both outfalls exceed the most stringent applicable objective of 0.025 µg/L, there is reasonable potential for discharges from Discharge Points 001 and 002 to cause or contribute to exceedances of applicable WQOs (trigger 1), and this Order establishes effluent limitations for mercury for both outfalls.

iii. **Mercury WQBELs.** The mercury WQBELs calculated according to SIP procedures are: for Discharge Point 001 – 0.046 µg/L as the maximum daily effluent limit (MDEL) and 0.018 µg/L as the average monthly effluent limit (AMEL); for Discharge Point 002 – 0.038 µg/L as MDEL and 0.012 µg/L as AMEL. Although discharges from Discharge Points 001 and 002 are viewed as deep water discharges pursuant to the Basin Plan, these final effluent limitations are not based on a minimum initial dilution of 10 to 1, as typically provided to deep water discharges. Mercury is a bioaccumulative pollutant, and therefore credit for dilution cannot be justified in developing effluent limitations.

iv. **Plant Performance and Attainability.** During the period January 2002 through December 2005, the Discharger's effluent concentrations were in the range of 0.0031 µg/L to 0.082 µg/L for Discharge 001 (32 samples), and 0.0009 µg/L to 0.98 µg/L (50 samples) for Discharge 002. Both the MECs exceed the AMELs, respectively. As detailed in a section below, it

is infeasible for the Discharger to comply with the final WQBELs; therefore, interim effluent limitations are established.

v. **Mercury Control Strategy.** The Regional Water Board is developing a TMDL to control mercury levels in San Francisco Bay. The Regional Water Board, together with other stakeholders, will cooperatively develop source control strategies as part of the TMDL development. Municipal discharge point sources do not represent a significant mercury loading to San Francisco Bay. Therefore, the currently preferred strategy is to apply interim mass loading limits to point source discharges while focusing mass reduction efforts on other more significant and controllable sources. While the TMDL is being developed, the Discharger will cooperate in maintaining ambient receiving water conditions by complying with performance-based mercury mass emission limits. Therefore, this Order includes interim mass loading effluent limitations for mercury, as described in the fact sheet below. The Discharger is required to implement source control measures and cooperatively participate in special studies as described below.

vi. **Mercury TMDL.** The current 303(d) list includes the San Francisco Bay as impaired by mercury due to high mercury concentrations in the tissues of fish from the Bay. Methylmercury, a highly toxic for of mercury, is a persistent bioaccumulative pollutant. There is no evidence to show that mercury discharged by the Discharger is taken out of the hydrologic system by processes such as evaporation before reaching San Francisco Bay. The Regional Water Board intends to establish a TMDL that will lead toward overall reduction of mercury mass loadings into San Francisco Bay. The final mercury effluent limitations will be based on the Discharger's WLA in the TMDL. While the TMDL is being developed, the Discharger will comply with performance-based mercury concentration and mass-based limitations to cooperate with maintaining current ambient receiving water conditions.

vii. **Antibacksliding.** The previous permit did not specify final WQBELs for mercury and only contained interim effluent limitations for Discharge 002, which were 1 µg/L as a daily maximum, and 0.21 µg/L as a monthly average limit. Antibacksliding does not apply to interim limits and since there were no final WQBELs in the previous permit to which to compare the new WQBELs, there is no backsliding. Nevertheless, the new limits for Discharge 002 are more stringent than the previous interim limits, which is consistent with antibacksliding requirements.

(5) **Nickel.**

i. **Nickel WQOs/WQC.** The most stringent applicable WQOs/WQC for nickel, applicable to discharges from the C&H Sugar Company facility, are 30 and 130 µg/L - chronic and acute, respectively, from the Basin Plan and the CTR for the protection of saltwater aquatic life. Because the

Basin Plan and CTR express the saltwater aquatic life objectives/criteria for nickel as dissolved metal, these specific objectives/criteria (30 and 130 µg/L), which are expressed as total recoverable metal, were derived using site specific translators of 0.27 (chronic) and 0.57 (acute), as recommended by the Clean Estuary Partnership's *North of Dumbarton Bridge Copper and Nickel Development and Selection of Final Translators* (2005).

ii. **RPA Results.** From January 2002 – December 2005, maximum observed effluent concentrations (MECs) of nickel were 160 and 13 µg/L at Discharge Points 001 and 002, respectively. Because the MEC at Discharge Point 001 exceeds the most stringent applicable WQO of 30 µg/L, there is reasonable potential for discharges from Discharge Point 001 to cause or contribute to exceedances of applicable WQOs/WQC (trigger 1), and this Order, therefore, establishes effluent limitations for nickel for Discharge Point 001.

iii. **Nickel WQBELs.** The nickel WQBELs calculated according to SIP procedures are 480 µg/L as the maximum daily effluent limit (MDEL) and 200 µg/L as the average monthly effluent limit (AMEL) for Discharge Point 001. A dilution credit of 10:1 was incorporated into the calculation of WQBELs.

iv. **Plant Performance and Attainability.** During the period January 2002 through July 2004, the Discharger's effluent concentrations were in the range of 10 µg/L to 160 µg/L for Discharge 001 (32 samples). A statistical analysis shows that the Discharger can comply with these final effluent limitations.

v. **Antibacksliding.** Although the previous permit included an interim daily maximum effluent limitation for nickel at Discharge Point 002 of 53 µg/L, there is no WQBEL for Discharge Point 002 because there is no reasonable potential from this discharge. Therefore, antibacksliding requirements are satisfied. There was no effluent limit in the previous permit for Discharge 001; therefore, the new limits are more stringent than the previous ones, which is consistent with antibacksliding requirements.

(6) **Selenium.**

i. **Selenium WQC.** The most stringent applicable water quality criteria for selenium, applicable to discharges from the C&H Sugar Company facility, are 5 and 20 µg/L, from the NTR for the protection of chronic and acute aquatic life in San Francisco Bay.

ii. **RPA Results.** From January 2002 – December 2005, maximum observed effluent concentrations (MECs) of selenium were 26 and 2.0 µg/L at Discharge Points 001 and 002, respectively. Because the MEC at Discharge Point 001 exceeds the most stringent applicable criterion of

5.0 µg/L, there is reasonable potential for discharges from Discharge Point 001 to cause or contribute to exceedances of applicable WQC (trigger 1), and this Order, therefore, establishes effluent limitations for selenium for Discharge Point 001.

iii. **Selenium WQBELs.** The selenium WQBELs calculated according to SIP procedures are 8.7 µg/L as the maximum daily effluent limit (MDEL) and 3.9 µg/L as the average monthly effluent limit (AMEL) for Discharge Point 001. Selenium is a bioaccumulative pollutant, and therefore credit for dilution cannot be justified in developing effluent limitations.

iv. **Plant Performance and Attainability.** During the period January 2002 through July 2005, the Discharger's effluent concentrations were in the range of <0.5 µg/L to 26 µg/L for Discharge 001 (32 samples). The Discharger's Infeasibility Analysis asserts the Discharger cannot immediately comply with these WQBELs for selenium. A statistical analysis was conducted on the Discharger's effluent data from January 2002 through December 2005. Based on the analysis, the Regional Water Board concurs with the Discharger's assertion of infeasibility to comply with final selenium WQBELs.

v. **Antibacksliding.** The previous permit did not include an effluent limitation for selenium at either discharge; therefore, the new limits are more stringent than the previous ones, which is consistent with antibacksliding requirements.

(7) **Zinc.**

i. **Zinc WQOs/WQC.** The most stringent applicable WQOs/WQC for zinc applicable to discharges from the C&H Sugar Company facility is 64 µg/L, which is both a chronic and an acute objective/criterion from the Basin Plan and the CTR for the protection of fresh water aquatic life. This WQO/WQC is calculated based on a hardness value of 48 mg/L as $CaCO_3$, which is the lowest hardness concentration observed at the RMP Davis Point and Napa River Monitoring Stations.

ii. **RPA Results.** From January 2002 through December 2005, maximum observed effluent concentrations (MECs) of zinc were 220 and 30 µg/L at Discharge Points 001 and 002, respectively. Because the MEC at Discharge Point 001 exceeds the most stringent applicable objective/criterion of 64 µg/L, there is reasonable potential for discharges from Discharge Point 001 to cause or contribute to exceedances of applicable WQOs/WQC (trigger 1), and this Order establishes effluent limitations for zinc for Discharge Point 001.

iii. **Zinc WQBELs.** The zinc WQBELs calculated according to SIP procedures are 590 µg/L as the maximum daily effluent limit (MDEL) and 250 µg/L as the average monthly effluent limit (AMEL) for Discharge Point

001. A dilution credit of 10:1 was incorporated into the calculation of WQBELs.

iv. **Plant Performance and Attainability.** During the period January 2002 through July 2004, the Discharger's effluent concentrations were in the range of 4 µg/L to 220 µg/L for Discharge 001 (32 samples). Due to lack of appropriate distribution fit to the effluent data, a statistical analysis cannot be performed, however, the MEC does not exceed the AMEL; therefore, it is expected that the Discharger can comply with these final effluent limitations.

v. **Antibacksliding.** The previous permit did not include an effluent limit for either discharge; therefore, the new limits are more stringent than the previous ones, which is consistent with antibacksliding requirements.

(8) **Cyanide.**

i. **Cyanide WQC.** The most stringent applicable water quality criterion for cyanide applicable to discharges from the C&H Sugar Company facility is 1.0 µg/L, which is both a chronic and an acute criterion from the NTR for the protection of aquatic life in San Francisco Bay.

ii. **Cyanide RPA Results.** From January 2002 through December 2005, maximum observed effluent concentrations (MECs) of cyanide were 4.0 and 19 µg/L at Discharge Points 001 and 002, respectively. Because the MECs at both outfalls exceed the most stringent applicable criterion of 1.0 µg/L, there is reasonable potential for discharges from Discharge Points 001 and 002 to cause or contribute to exceedances of applicable WQC (trigger 1), and this Order establishes effluent limitations for cyanide for Discharge Points 001 and 002.

iii. **Cyanide WQBELs.** The cyanide WQBELs calculated according to SIP procedures are: for Discharge Point 001 – 6.4 µg/L as the maximum daily effluent limit (MDEL) and 3.2 µg/L as the average monthly effluent limit (AMEL); for Discharge Point 002 – 6.4 µg/L as MDEL and 2.9 µg/L as AMEL. A dilution credit of 10:1 was incorporated into the calculation of WQBELs.

iv. **Plant Performance and Attainability.** During the period January 2002 through December 2005, the Discharger's effluent concentrations were in the range of <0.6 µg/L to 4 µg/L (32 samples) for Discharge 001, and <9 µg/L to 19 µg/L for Discharge 002 (30 samples). The Discharger's Infeasibility Analysis asserts the Discharger cannot immediately comply with these WQBELs for cyanide. A direct comparison between the MEC and the AMEL for Discharge 001 and a statistical analysis of the effluent data from 002 were conducted, and the Regional Water Board concurs with the Discharger's assertion of infeasibility to comply with these final cyanide WQBELs.

v. **Alternate Effluent Limits for Cyanide.** The Regional Water Board adopted Resolution No. R2-2006-0086 in December 2006, to amend Basin Plan to adopt site-specific objectives for cyanide for San Francisco Bay. In this resolution, the cyanide site-specific criteria for marine waters are 2.9 µg/L as a four-day average, and 9.4 µg/L as a one-hour average. Based on the Discharger's current cyanide data (coefficient of variation of 0.60 for Discharge Point 001 and 0.71 for Discharge Point 002), final water quality based effluent limits for cyanide for 001 will be 42 µg/L as an MDEL and 21 µg/L as an AMEL; and for 002, 44 µg/L as MDEL and 20 µg/L as AMEL. These alternative limits will become effective after this Basin Plan amendment is approved by State Water Board, USEPA, and Office of Administrative Law.

vi. **Antibacksliding.** The previous permit did not include a cyanide effluent limit for either discharge; therefore, the new limits are more stringent than the previous ones, which is consistent with antibacksliding requirements.

(9) **Dioxin-TEQ.**

i. The Basin Plan contains a narrative WQO for bioaccumulative substances:

"Many pollutants can accumulate on particulates, in sediments, or bioaccumulate in fish and other aquatic organisms. Controllable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered."

This narrative WQO applies to dioxin and furan compounds, based in part on the consensus of the scientific community that these compounds associate with particulates, accumulate in sediments, and bioaccumulate in the fatty tissue of fish and other organisms.

ii. The CTR establishes a numeric human health WQC of 0.014 picogram per liter (pg/L) for 2,3,7,8-tetrachlorinated dibenzo-p-dioxin (2,3,7,8-TCDD) based on consumption of aquatic organisms. The preamble of the CTR states that California NPDES permits should use toxicity equivalents (TEQs) where dioxin-like compounds have a reasonable potential with respect to narrative criteria. In USEPA's National Recommended WQOs, December 2002, USEPA published the 1998 World Health Organization Toxicity Equivalence Factor (TEF)[1] scheme. In addition, the CTR preamble states USEPA's intent to adopt revised WQC guidance subsequent to their health reassessment for dioxin-like compounds. The

[1] The 1998 WHO scheme includes TEFs for dioxin-like PCBs. Since dioxin-like PCBs are already included within "Total PCBs," for which the CTR has established a specific standard, dioxin-like PCBs are not included in this Order's version of the TEF scheme.

SIP applies to all toxic pollutants, including dioxins and furans. Staff used TEQs and the CTR criteria for 2,3,7,8-TCDD to translate the Basin Plan narrative WQOs for bioaccumulation to numeric WQOs for the other 16 congeners.

iii. USEPA's 303(d) listing determined that the narrative objective for bioaccumulative pollutants was not met because of the levels of dioxins and furans in the fish tissue.

iv **RPA Results.** From January 2002 through December 2005, maximum observed effluent concentrations (MECs) of dioxin-TEQ were 5.61×10^{-8} and 8.17×10^{-10} µg/L at Discharge Points 001 and 002, respectively. Because the MEC at Discharge 001 exceeds the numeric translation of the narrative objective (1.4×10^{-8} µg/L,) and the maximum ambient background concentration of 7.1×10^{-8} exceeds the most stringent applicable WQO, there is reasonable potential for discharges from Discharge Points 001 and 002 to cause or contribute to exceedances of applicable water quality criteria (trigger 1 and trigger 2, respectively), and this Order establishes effluent limitations for dioxin-TEQ for Discharge Points 001 and 002.

v. **Dioxin-TEQ Final Effluent Limits.** Final WQBELs for dioxin-TEQ, calculated according to methods presented in Section 1.4 of the SIP, are 2.8×10^{-8} and 1.4×10^{-8} µg/L as MDEL and AMEL, respectively, for both discharges. Dioxin-TEQ is a bioaccumulative pollutant, and therefore credit for dilution cannot be justified in developing effluent limitations for this pollutant. These final effluent limitations for dioxin-TEQ are not included in the Order, as the compliance schedule established for dioxin-TEQ exceeds the expected term of the Order. The Discharger shall comply with the final effluent limits starting June 1, 2017.

vi. **Plant Performance and Attainability.** During January 2002 through December 2005, the Discharger's effluent concentrations were in the range of 0 pg/L to 0.0561 pg/L (6 samples) for Discharge 001, and 0 pg/L to 0.000817 pg/L for Discharge 002 (5 samples). The Discharger's Infeasibility Analysis asserts the Discharger cannot immediately comply with these WQBELs for dioxin-TEQ. This Order includes a compliance schedule until May 31, 2017. Since there is insufficient data to either perform a meaningful statistical analysis or to calculate an interim effluent limit, this Order does not contain an interim effluent limitation for dioxins. Effluent limits may be imposed if more information is available or until a TMDL is developed for the Bay.

vii. **Antibacksliding.** The previous permit did not include a dioxins effluent limit for either discharge; therefore, the new limits are more stringent than the previous ones, which is consistent with antibacksliding requirements.

(10) **Bis (2-ethylhexyl) phthalate (BEHP).**

i. **BEHP WQC.** The most stringent applicable water quality criterion for bis (2-ethylhexyl) phthalate or BEHP, applicable to discharges from the C&H Sugar Company facility is 5.9 µg/L, which is a criterion from the CTR for the protection of human health when organisms only (not water) are consumed from the receiving water.

ii. **RPA Results.** From January 2002 through December 2005, maximum observed effluent concentrations (MECs) of BEHP were 21 and 17 µg/L at Discharge Points 001 and 002, respectively. Because the MECs at both outfalls exceed the most stringent applicable criterion of 5.9 µg/L, there is reasonable potential for discharges from Discharge Points 001 and 002 to cause or contribute to exceedances of applicable water quality criteria (trigger 1), and this Order establishes effluent limitations for BEHP for Discharge Points 001 and 002.

iii. **BEHP WQBELs.** The final WQBELs for BEHP calculated according to SIP procedures are 110 µg/L as the maximum daily effluent limit (MDEL) and 54 µg/L as the average monthly effluent limit (AMEL) for both discharge points. A dilution credit of 10:1 was incorporated into the calculation of WQBELs.

iv. **Plant Performance and Attainability.** During the period January 2002 through December 2005, the Discharger's BEHP effluent concentrations were in the range of <0.3 µg/L to 21 µg/L for Discharge 001 (8 samples), and <0.3 µg/L to 17 µg/L for Discharge 002 (6 samples). Since there is limited data to perform a meaningful statistical analysis to determine compliance attainability, a direct comparison between the MECs and AMELs was conducted. Since both MECs do not exceed the AMEL, it is expected that the Discharger can comply with these final effluent limitations.

v. **Antibacksliding/Antidegradation.** The previous permit did not include a BEHP effluent limit for either discharge; therefore, the new limits are more stringent than the previous ones, which is consistent with antibacksliding and antidegradation requirements.

D. Interim Effluent Limitations

1. SIP and Basin Plan Compliance Schedule Requirements.

The SIP and the Basin Plan authorize compliance schedules in a permit if an existing discharger cannot immediately comply with a new and more stringent effluent limitation. Compliance schedules for limitations derived from CTR or the NTR WQC are based on Section 2.2 of the SIP, and compliance schedules for

limitations derived from Basin Plan WQOs are based on the Basin Plan. Both the SIP and the Basin Plan require the discharger to demonstrate the infeasibility of achieving immediate compliance with the new limitation to qualify for a compliance schedule. The SIP and Basin Plan require the following documentation to be submitted to the Regional Water Board to support a finding of infeasibility:

- Descriptions of diligent efforts the Discharger has made to quantify pollutant levels in the discharge, sources of the pollutant in the waste stream, and the results of those efforts.
- Descriptions of source control and/or pollutant minimization efforts currently under way or completed.
- A proposed schedule for additional or future source control measures, pollutant minimization, or waste treatment.
- A demonstration that the proposed schedule is as short as practicable.

The Basin Plan provides for a 10-year compliance schedule to implement measures to comply with new standards as of the effective date of those standards. This provision applies to the objectives adopted in the 2004 Basin Plan Amendment. Additionally, the provision authorizes compliance schedules for new interpretations of other existing standards if the new interpretation results in more stringent limitations. The basis for compliance schedules is given in **Appendix F-4** of this Fact Sheet.

2. Feasibility Evaluation

On January 10, 2007, the Discharger submitted an infeasibility analysis (infeasibility analysis), asserting it is infeasible to immediately comply with the WQBELs, calculated according to SIP Section 1.4, for mercury and selenium at Discharger Point 001, and for mercury, selenium, and cyanide at Discharge Point 002. Regional Water Board staff performed statistical analysis using self-monitoring data from January 2002 through December 2005 to compare the mean, 95th percentile, and 99th percentile with the long-term average (LTA), AMEL, and MDEL, respectively, to confirm if it is feasible for the Discharger to comply with the WQBELs. If any LTA, AMEL, or MDEL exceed the mean, 95th percentile, or 99th percentile, respectively, the infeasibility for the Discharger to comply with WQBELs is confirmed statistically. When the statistical analysis is not meaningful duo to lack of data, or due to lack of appropriate distribution fit to the effluent data, a direct comparison between MEC and AMEL is made; infeasibility is confirmed when the MEC is greater than the AMEL. If infeasibility is confirmed, interim effluent limitations are established. The table below shows these comparisons in µg/L:

Table F-23. Summary of Feasibility Analysis and Interim Limitations (unit: µg/L)

	Mean / LTA	95th vs. AMEL	99th vs. MDEL	Feasible to Comply
Mercury (001)	0.018>0.01	0.05>0.018	0.089>0.046	No
Mercury (002)	0.019>0.0035	0.13>0.012	0.4>0.038	No
Selenium (001)	8.4>2.3	18>3.9	22>8.7	No
Cyanide (001)	0.66<2.0	MEC=4>AMEL=3.2		No
Cyanide (002)	4.8>0.3	15>2.9	19>6.4	No

For dioxin-TEQ compounds for both discharge points, due to limited effluent data, there is uncertainty in determining compliance or establishing an interim limitation. In addition, the Minimum Levels (MLs) developed for 2,3,7,8-TCDD and 16 congeners (referred to as dioxins) by the Regional Water Board and BACWA range from 5 pg/L to 50 pg/L, which are higher than the WQBELs. Because Order No. 00-025 did not include an effluent limitation for dioxin-TEQ, and data is insufficient to statistically determine an interim limitation for this pollutant, an interim limitation is not established by the Order; however, the Order includes a 10-year schedule for compliance with final limitations and requires additional monitoring. An interim limitation may be calculated and established as a discharge limitation, when sufficient data for dioxin-TEQ are available. As a result, this permit does not contain an interim limitation for dioxin-TEQ.

3. Compliance Schedule and Interim Effluent Limitations

This Order establishes a compliance schedule until April 27, 2010 for mercury, cyanide, and selenium. The final WQBELs for the above pollutants shall become effective on April 28, 2010, or until the Regional Water Board adopts the TMDLs for mercury and selenium or SSOs for cyanide. This Order includes cyanide WQBELs based on the draft SSOs. Since the compliance schedules extend beyond 1 year, pursuant to the SIP and 40 CFR §122.47, the Regional Water Board shall establish interim numeric limitations and interim requirements to control the pollutants. To maintain existing water quality, this Order establishes interim limits for mercury (001 and 002), selenium (001), and cyanide (001 and 002) based on the previous permit limits or existing plant performance, whichever is more stringent, unless antibacksliding and antidegradation requirements are satisfied. **Attachment F-4** of the Fact Sheet details the general basis for final compliance dates. The Regional Water Board may take appropriate enforcement actions if interim limitations and requirements are not met. Specific bases for these interim limits are described in the following findings for these pollutants.

Discharge Point 001

1) Mercury – There is no effluent limitation for mercury in the previous permit. Therefore, an interim limit of 0.16 µg/L based on recent performance (99.87th percentile or mean plus 3 standard deviations) is established as the interim limit, expressed as a daily maximum. The establishment of a performance-based effluent limit is allowed by CWA Section 404(o)(2)(C) and (E). This interim limit

will remain in effect until April 27, 2010, or until the Regional Water Board amends the limitation based on TMDL or additional data. A maximum compliance schedule is allowed for mercury because of the considerable uncertainty in determining an effective measure (e.g., pollution prevention, treatment upgrades) that should be implemented to ensure compliance with final limits.

2) Selenium – There is no effluent limitation for selenium in the previous permit. Therefore, an interim limit of 26 µg/L based on recent performance (99.87^{th} percentile or mean plus 3 standard deviations) is established as the interim limit, expressed as a daily maximum. The establishment of a performance-based effluent limit is allowed by CWA Section 404(o)(2)(C) and (E). This interim limit will remain in effect until April 27, 2010, or until the Regional Water Board amends the limitation based on TMDL or additional data. A maximum compliance schedule is allowed for selenium because of the considerable uncertainty in determining an effective measure (e.g., pollution prevention, treatment upgrades) that should be implemented to ensure compliance with final limits.

3) Cyanide – There is no effluent limit for cyanide in the previous permit. Due to high censoring of the effluent data set, it is not feasible to calculate a 99.87^{th} percentile; therefore, the SIP minimum level of 5 µg/L is set as the interim limitation, expressed as a daily maximum, and will remain in effect until April 27, 2010, or until the Regional Water Board amends the limitation based on an SSO or additional data. A maximum compliance schedule is allowed for cyanide because of the considerable uncertainty in determining an effective measure (e.g., pollution prevention, treatment upgrades) that should be implemented to ensure compliance with final limits.

Discharge Point 002

1) Mercury - The previous permit established the following interim, concentration-based and mass-based effluent limitations for mercury at Discharge Point 002.

Concentration-Based	Mass-Based
0.21 µg/L – average monthly	0.04 lbs/month – running annual average
1.0 µg/L – maximum daily	

The 99.87^{th} percentile of the mercury effluent data is calculated to be 1.24 µg/L, the previous permit limits are more stringent. Therefore, the previous permit limits are retained as the interim effluent limits and will remain in effect until April 27, 2010, or until the Regional Water Board amends the limitation based on TMDL or additional data. The establishment of a performance-based effluent limit is allowed by CWA Section 404(o)(2)(C) and (E). A maximum compliance schedule is allowed for mercury because of the considerable uncertainty in determining an effective measure (e.g., pollution prevention, treatment upgrades) that should be implemented to ensure compliance with final limits.

2) Cyanide – There is no effluent limit for cyanide in the previous permit. Therefore, an interim limit of 22.8 µg/L based on recent performance (99.87th percentile or mean plus 3 standard deviations) is established as the interim limit, expressed as a daily maximum, and will remain in effect until April 27, 2010, or until the Regional Water Board amends the limitation based on an SSO or additional data. The establishment of a performance-based effluent limit is allowed by CWA Section 404(o)(2)(C) and (E). A maximum compliance schedule is allowed for cyanide because of the considerable uncertainty in determining an effective measure (e.g., pollution prevention, treatment upgrades) that should be implemented to ensure compliance with final limits.

4. Mercury Interim Mass Emission Limitation

This Order includes an interim performance-based mercury mass effluent limitations of 0.080 and 0.026 kg/month for Discharge Points 001 and 002, respectively. These performance-based mass effluent limitations are intended to maintain the discharges at current loadings. The mass limitations are calculated using the ultra-clean data collected from January 2002 through December 2005 as they better reflect the Discharger's performance. The recalculated mass limit is a reflection of better mercury effluent data (sampling and analytical techniques have improved). (See **Appendix F-5** for the mercury mass limitation calculation.) The mass limits will maintain current loadings until a TMDL is established for San Francisco Bay. The final mercury effluent limitations will be based on the Discharger's WLA in the TMDL.

The inclusion of interim performance-based mass limits for bioaccumulative pollutants is consistent with the guidance described in section 2.1.1 of the SIP. Because of their bioaccumulative nature, an uncontrolled increase in the total mass load of these pollutants in the receiving water will have significant adverse impacts on the aquatic ecosystem.

5. This Order also establishes interim requirements in a provision for development and/or improvement of a Pollution Prevention and Minimization Program to reduce pollutant loadings to the facilities and for submittal of annual reports on this Program.

E. Whole Effluent Toxicity

1. Whole Effluent Acute Toxicity.

a. **Discharge Point 001.** This Order does not include whole effluent acute toxicity effluent limits for Discharge Point 001. Discharge from 001 is primarily once-through cooling water, taken from the bay; 100 percent of this discharge is from the bay. Therefore, it is unlikely that this discharge will cause toxicity in Carquinez Strait, particularly given the dilution that occurs at the deep water outfall diffuser.

b. **Discharge Point 002.** This Order includes effluent limits for Discharge Point 002 for whole effluent acute toxicity that are unchanged from the previous Order. No acute toxicity was ever observed. All bioassays shall be performed according to

the U.S. EPA approved method in 40 CFR 136, currently "Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms, 5th Edition." The Discharger is required to use the 5th Edition method for compliance determination upon the effective date of this Order.

2. Whole Effluent Chronic Toxicity

a. **Basin Paln ETCP.** The Basin Plan adopted an Effluent Toxicity Characterization Program (ETCP), with the goal of developing and implementing toxicity limits for each discharger based on actual characteristics of both receiving waters and waste streams. Dischargers were required, including this Discharger, to monitor their effluent using critical life stage toxicity tests to generate information on toxicity test species sensitivity and effluent variability to allow development of appropriate chronic toxicity effluent limitations. In 1988 and 1991, selected dischargers conducted two rounds of effluent characterization. A third round was completed in 1995. Regional Water Board guidelines for conducting toxicity tests and analyzing results were published in 1988 and last updated in 1991. The Regional Water Board implements water quality objectives for toxicity through the ETCP.

b. **Discharge Point 001.** This permit does not include whole effluent chronic toxicity requirements for Discharge 001. The Discharger conducted a variability phase test as required by ETCP. The results of the test using red abalone, purple sea urchin and marine diatom show that Discharge 001 does not contribute additional chronic toxicity to the influent bay water. Thus this Order continues the existing condition that no chronic toxicity test is required for Discharge 001.

c. **Discharge Point 002.**

(1) **Permit Requirements.** The nature and flow volume of Discharge 002 suggests that there is a low potential for the treated effluent to cause chronic toxicity in Carquinez Strait. There were no chronic toxicity requirements in the previous permit. However, in order to characterize this effluent and provide data for future permit reissuance, this permit includes new requirements for chronic toxicity monitoring based on the Basin Plan narrative toxicity objective, U.S. EPA and State Water Board Task Force guidance, and BPJ. This permit includes the Basin Plan narrative toxicity objective as the applicable effluent limit, implemented via monitoring with numeric values as "trigger" to initiate accelerated monitoring and to initiate a chronic toxicity reduction evaluation (TRE) as necessary. The permit requirements for chronic toxicity are consistent with the CTR and SIP requirements. If monitoring shows no chronic toxicity, this requirement may be removed for next permit reissuance.

(2) **Chronic Toxicity Trigger.** This Order includes a chronic toxicity trigger, which is a single sample maximum of 10 TUc. A single sample trigger is included based on the monitoring frequency and Basin Plan Table 4-5.

(3) **Permit Reopener.** The Regional Water Board will consider amending this permit to include numeric toxicity limits if the Discharger fails to aggressively implement all reasonable control measures included in its approved TRE workplan, following detection of consistent significant non-artifactual toxicity.

F. Intake Water Credits for Discharge 001

1. 40 CFR §122.45(g) and Section 1.4.4 of the SIP allows intake water credits where specified conditions are met.

   a. **40 CFR §122.45(g).** 40 CFR §122.45(g) allows credit for pollutants in intake water, in some cases where the facility is faced with situations in which limits are difficult or impossible to meet with BAT/BCT technology. Net credits are authorized only up to the extent necessary to meet the applicable limitation or standard, and if the intake water is taken from the same body of water into which the discharge is made.

   As previously described in this Order, Discharge 001 only contains once-through cooling water taken from the Bay; the Refinery does not add any pollutants into the discharge, nor does it treat the cooling water before discharge. Due to the characteristics of the discharge, BAT/BCT technologies may not result in any net environmental benefit, Based on this, Regional Water Board staff determined that the Discharger meets the conditions specified in 40 CFR §122.45(g).

   b. **Section 1.4.4 of the SIP.** The SIP allows intake water credits provided the Discharger meets the following conditions to the satisfaction of the Regional Water Board:

      1) The observed maximum ambient background concentration and the intake water concentration of the pollutant exceed the most stringent applicable WQO/WQC for that pollutant;

      2) The intake water credits are consistent with any TMDL applicable to the discharge;
      3) The intake water is from the same water body as the receiving water body;
      4) The facility does not alter the intake water pollutant chemically or physically in a manner that adversely affects water quality and beneficial uses; and
      5) The timing and location of the discharge does not cause adverse effects on water quality and beneficial uses that would not occur if the intake water pollutant had been left in the receiving water body.

      The Discharger submitted an intake water credit request and additional information on August 7, 2006 and January 5, 2007, respectively (see **Attachment F-7**), justifying that it qualifies for intake water credit based on the SIP requirements at Discharge Point 001.

The Discharger sampled for arsenic, copper, lead, mercury, nickel, selenium, zinc, cyanide, and bis(2-ethylhexyl)phthalate at both intake water and discharge from February 2002 through July 2004. As discussed above, all pollutants in the discharge were detected above the applicable WQO/WQC.

The Discharger indicated in its August 7 request, "The discharge point is hydrologically connected to the intake source. All of the non-contact cooling intake water is from the Carquinez Strait and the intake structure is located approximately 500 feet upstream of Discharge Point 001. As 100 percent of the water discharged at 001 is from the same receiving water body, the intake water pollutants would have reached the vicinity of the discharge point in the receiving water within a reasonable time and with the same effect had it not been diverted by its use for cooling."

The Discharger performed statistical analysis on intake and effluent water quality data. The analysis shows that either intake concentrations are higher than those in the effluent or there is no significant difference between the intake and effluent quality for the above pollutants, except for nickel, where the higher intake water concentrations might be due to analytical variability.

Based on the Discharger's justifications, the Regional Water Board determines that C&H is qualified to receive intake water credit for its discharge of once-through cooling water through Discharge Point 001.

2. **Application of Intake Water Credit.**

Intake water credits are to offset any concentrations of the pollutant found in the intake water, and are only allowed on a pollutant-by-pollutant and discharge-by-discharge basis. Whenever an effluent concentration exceeds the effluent limits specified in this Order, the discharge may receive intake water credit (a) if the intake water concentration sampled during the same day is higher than the effluent concentration, or (b) if it can be statistically demonstrated that the effluent concentration is not significantly higher than the intake water concentrations. For the statistical analysis, the Discharger may establish a 90% confidence interval, based on the most recent intake water monitoring data (if intake water concentrations do not show a trend, then the analysis shall include as many historical data as possible - this may require a separate statistical analysis to determine the range of historical data that can be used in establishing a background condition); if the effluent data is higher than the upper confidence limit of the intake water confidence interval, then it is a violation. The Discharger will need to update the background condition with newly collected data whenever an analysis is needed.

G. Antidegradation Analysis

1. Changes in Flow and Pollutant Loads and Concentrations

The total flow from the facility is the combined C&H Sugar process wastewater flow and CSD municipal wastewater flow. The process flow could increase with the

foreseeable sugar production increase. The previous permit was based on a raw sugar melt rate of 2,810 tons per day, whereas this Order is based on 3,300 tons per day, an increase of about 17%. However, the municipal discharge is unlikely to increase much, if at all. The community of Crockett is relatively small and its potential for growth is limited due to geographic constraints. No significant development is proposed in the Crockett service area; therefore, CSD's dry weather flow is likely to remain close to existing levels. During high flow periods, CSD's flow is dominated by infiltration and inflow of storm water, which will not increase as a result of this Order. Furthermore, the municipal flow is limited by the fact that CSD fully uses its capacity allotment under its treatment contract with C&H.

All concentration-based effluent limits in this Order are either new, the same as those of the previous permit, or lower than those of the previous permit. The only exception is copper due to the incorporation of the newly developed water effect ratio (WER). The BOD_5 and TSS limits in this Order are expressed in terms of loads. To the extent that these limits are based on the new raw sugar melt rate, they are higher in this than the previous permit. However, the underlying BOD_5 and TSS concentration assumptions are the same as those used for the previous permit.

2. Potential for Water Quality Degradation

The concentration of copper discharges is unlikely to change because the Discharger proposes no changes to its treatment process. The Discharger will maintain its current treatment performance because it cannot manipulate its processes to adjust effluent copper levels independently of other treatment parameters. To maintain compliance with other effluent limits, the Discharger will maintain its current performance with respect to copper. Moreover, pollution minimization requirements are designed to maintain current performance.

Any possible small changes in Carquinez Strait copper concentrations would not be measurable, and no observable water quality degradation would occur. Ambient San Francisco Bay copper concentrations are very consistent from year to year at least partly due to the dominant role of sediments in determining dissolved copper concentrations. Sediments are a large repository of copper, and when sediments are suspended, copper may desorb and become dissolved, accounting for a large fraction of the dissolved ambient concentration. For this reason, the amount copper in Carquinez Strait is unlikely to change much, if at all, due to any changes resulting from this Order.

The foreseeable increase in TSS will be small and incremental, particularly when compared to other TSS sources to Carquinez Strait, through which all Central Valley discharges flow. Because the Discharger uses a deep water outfall equipped with a diffuser that provides greater than 10:1 dilution, the small change in TSS load will not be measurable in Carquinez Strait, and no observable water quality degradation will occur.

Likewise, the foreseeable increase in BOD_5 will also be small and incremental, particularly when compared to other BOD_5 sources to Carquinez Strait. Because the

Discharger uses a deep water outfall equipped with a diffuser, the small change in BOD_5 load will not be measurable in Carquinez Strait, and no observable water quality degradation will occur. Moreover, BOD_5 degrades relatively quickly, making increases in BOD_5 less observable.

3. Consistency with Antidegradation Policies

Carquinez Strait meets water quality standards for copper, TSS, and BOD_5. It is not listed as impaired by any of these pollutants. Therefore, the quality of Carquinez Strait waters exceeds levels necessary to support propagation of fish and wildlife, and recreation. In this case, some degradation is allowed pursuant to antidegradation policies, provided that the Water Board finds that (1) the lowering of water quality is necessary to accommodate important economic or social development in the area; (2) the reduced water quality fully protects existing beneficial uses; and (3) the highest statutory and regulatory requirements are imposed. No measurable or observable degradation is anticipated with respect to copper, TSS, or BOD_5.

Any degradation associated with this Order would accommodate commensurate economic and social development in the area. Increased TSS and BOD_5 loads will result from increased sugar production. In the unlikely event that copper concentrations were to rise, the increase would result from increased sugar production or possibly increased housing in Crockett. New housing provides a place for people to live, and increasing sugar production increases employment and tax revenues. Increased housing, employment, and tax revenues serve the economic and social development interests of the people of California.

The copper, TSS, and BOD_5 limits fully protect beneficial uses. Available data demonstrate that the new copper WER better reflects the water chemistry characteristics of Carquinez Strait than the default WER, which is more conservative than necessary to protect beneficial uses. Increased TSS and BOD_5 discharges will not cause a nuisance or depress oxygen concentrations such that beneficial uses are adversely affected because they will occur through a deep water outfall equipped with a diffuser to provide rapid mixing.

The copper, TSS, and BOD_5 limits are consistent with all applicable statutes and regulations. The copper limits are derived from applicable water quality standards in accordance with the SIP. The TSS and BOD_5 limits are derived from effluent guidelines for sugar refining and publicly owned treatment works. The limits are based on 40 CFR 125.3(c)(2) and (3) and rely on Best Professional Judgment. They represent Best Practicable Control Technology (BPT) and Best Conventional Pollutant Control Technology (BCT). Therefore, they represent the best practicable treatment or control available.

H. Storm Water Limitations

The storm water discharge shall not be outside the pH range of 6.5 to 8.5, and shall not have visible color or oil: These limitations are from the previous permit, and are based retained from the previous permit.

I. Land Discharge Specifications

N/A

J. Reclamation Specifications

N/A

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

A. Surface Water

1. Temperature Limitations. These limitations are retained from the previous permit and are based on the Thermal Plan.

2. Receiving Water Limitations V.A.2 through V.A.4 (conditions to be avoided). These limitations are in the previous permit and are based on the narrative/numerical objectives contained in Chapter 3 of the Basin Plan.

3. Receiving Water Limitations V.A.5 (compliance with State Law). This requirement is in the previous permit, requires compliance with Federal and State law, and is self-explanatory.

B. Groundwater

N/A

VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

The principal purposes of a monitoring program by a discharger are to:

1. Document compliance with waste discharge requirements and prohibitions established by the Regional Water Board,

2. Facilitate self-policing by the discharger in the prevention and abatement of pollution arising from waste discharge,

3. Develop or assist in the development of limitations, discharge prohibitions, national standards of performance, pretreatment and toxicity standards, and other standards, and to

4. Prepare water and wastewater quality inventories.

Section 122.48 of 40 CFR requires all NPDES permits to specify recording and reporting of monitoring results. Sections 13267 and 13383 of the California Water Code authorize the Regional Water Boards to require technical and monitoring reports. The Monitoring and Reporting Program, Attachment E of this Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this facility.

The MRP is a standard requirement in almost all NPDES permits issued by the Regional Water Board, including this Order. It contains definitions of terms, specifies general sampling and analytical protocols, and sets out requirements for reporting of spills, violations, and routine monitoring data in accordance with NPDES regulations, the California Water Code, and Regional Water Board's policies. The MRP also contains a sampling program specific for this Facility. It defines the sampling stations and frequency, the pollutants to be monitored, and additional reporting requirements. Pollutants to be monitored include all parameters for which effluent limitations are specified. Monitoring for additional constituents, for which no effluent limitations are established, is also required to provide data for future completion of RPAs for them.

A. Influent Monitoring

Flow monitoring requirements at Monitoring Locations I-1 (salt water intake) and I-2 (CSD), and COD monitoring requirements at P-1 (surge tank influent) are retained from the previous permit.

B. Effluent Monitoring

Discharge Point 001.

- Monitoring requirements for flow, BOD_5, pH, temperature, and conductivity are retained from the previous permit.
- The MRP establishes routine monitoring for toxics with effluent limitations established by this Order [As, Cu, Pb, Hg, Ni, Se, Zn, CN, dioxin-TEQ, and bis (2-ethylhexyl) phthalate].
- The MRP requires the Discharger to continue to sample for priority pollutants om accordance to the August 6, 2001 letter. The results will be used for RPA and effluent limit calculation for next permit reissuance.

Discharge Point 002.

- Monitoring requirements for the following parameters are retained from the previous permit: flow, dissolved oxygen, dissolved sulfides, pH, temperature, total coliform bacteria, total residual chlorine, hydrogen peroxide usage, settleable matter, and oil and grease.
- The MRP establishes monitoring requirements for acute toxicity at a frequency of one time every two weeks and chronic toxicity at once during the permit term or annually if toxicity is ever observed; whereas Order No. 00-025 had required only acute (not chronic) toxicity monitoring.
- The MRP establishes routine monitoring for toxics with effluent limitations established by this Order [Cu, Pb, Hg, CN, dioxin-TEQ, and bis (2-ethylhexyl) phthalate].
- Specific monitoring requirements for several toxics or families of toxic pollutants (total phenolic compounds, extractable hydrocarbons, purgeable hydrocarbons,

PAHs, organochlorine pesticides and PCBs, nitrogen and phosphorous containing pesticides, and chlorinated herbicides and acids, and tributyltin) are no longer required, because the MRP requires routine monitoring for toxics with effluent limitations, as well as monitoring for all CTR pollutants.

Discharge Points 003 – 016

- This order retains the same monitoring requirements for storm water discharges.

C. Whole Effluent Chronic Toxicity Screening

The screening phase monitoring is important to help determine which test species is most sensitive to the toxicity of the effluent for compliance monitoring as part of the compliance requirements. This requirement is based on the Basin Plan and BPJ.

D. Receiving Water Monitoring

1. Surface Water

The MRP retains all receiving water monitoring requirements from Order No. 00-025. Hardness monitoring is new and optional, if the Discharger wishes to use site-specific hardness for WQOs/WQC calculation for next permit reissuance.

2. Groundwater

N/A

E. Other Monitoring Requirements

N/A

VII. RATIONALE FOR PROVISIONS

A. Standard Provisions

Standard Provisions, which, in accordance with 40 CFR 122.41 - 122.42, apply to all NPDES discharges and must be included in every NPDES permit, are provided in **Attachments D** and **G** of this Order.

B. Monitoring and Reporting Requirements

The Discharger is required to conduct monitoring of the permitted discharges in order to evaluate compliance with permit conditions. Monitoring requirements are contained in the MRP (**Attachment E**), Standard Provisions and SMP, Part A (**Attachment G)** of the Permit. This provision requires compliance with these documents, and is based on 40 CFR 122.63. The Standard Provisions and SMP, Part A are standard requirements in almost all NPDES permits issued by the Regional Water Board, including this Order. They contain definitions of terms, specify general sampling and analytical protocols, and set out requirements for reporting of spills, violations, and routine monitoring data in accordance with NPDES regulations, the California Water Code, and Regional Water Board's policies. The MRP contains a sampling program specific for the facility. It

defines the sampling stations and frequency, the pollutants to be monitored, and additional reporting requirements. Pollutants to be monitored include all parameters for which effluent limitations are specified. Monitoring for additional constituents, for which no effluent limitations are established, is also required to provide data for future completion of RPAs for them.

C. Special Provisions

1. Reopener Provisions

These provisions are based on 40 CFR 123 and allow future modification of this Order and its effluent limitations as necessary in response to updated WQOs that may be established in the future.

2. Special Studies and Additional Monitoring Requirements

a. **Effluent Characterization for Selected Constituents.** This Order includes effluent limitations and routine monitoring requirements for toxic pollutants which are present in effluent at levels which will cause, have the reasonable potential to cause, or contribute to an excursion above any State water quality standard. Monitoring for other toxic pollutants is required to provide on-going characterization of the discharges from the facility so that effluent limitations can be established, if necessary. The Discharger is required to monitor effluent in accordance with its Sampling Plan, which was prepared pursuant to August 6, 2001 sent by the Regional Water Board to all dischargers.

b. **Ambient Background Monitoring.** This provision, to continue to conduct receiving water monitoring, will provide on-going characterization of the receiving water and is based on the previous Order and the Basin Plan.

c. **CWA Section 316 (b) Requirements.**

CWA Section 316 (b) addresses adverse environmental impacts caused by the intake of once-through cooling water. Such impacts are most commonly described to include impingement of aquatic life on cooling water intake structures and entrainment of aquatic life within cooling water flows where it is subject to thermal and physical stresses. CWA Section 316 (b) requires that NPDES permits include requirements for the best technology available in the location, design, construction, and capacity of cooling water intake structures to minimize adverse environmental impacts. The Regional Water Board, like other permitting authorities, has been implementing Section 316 (b), using best professional judgment, on a case-by-case basis for more than 25 years; however, in 2001, USEPA began to promulgate rules to implement Section 316 (b).

On November 9, 2001 and December 26, 2002, USEPA finalized Phase I 316 (b) rules, applicable to new facilities that withdraw more than 2 MGD of water and use at least 25 percent of that water solely for cooling purposes. On February 16, 2004, USEPA finalized Phase II rules, applicable to existing power

generation facilities with cooling water intake structures designed for intake flows of 50 MGD or greater and using at least 25 percent of that water solely for cooling purposes. Phase III rules, which were intended to address existing facilities not covered by the Phase II rules, were proposed on November 1, 2004, and became effective on July 17, 2006. By adopting Phase III rules in a substantially simpler form than the proposed rules, USEPA concluded that NPDES permitting authorities should continue to implement Section 316 (b) for existing facilities not covered by the Phase II rule (except for certain offshore oil and gas facilities) on a case-by-case basis, using best professional judgment.

Provision VI. C. 2. d of this Order, therefore, reflects the best professional judgment of the Regional Water Board in implementing CWA Section 316 (b) - to establish the best technology available to minimize adverse environmental impacts associated with the facility's cooling water intake structure(s).

Provision VI. C. 2. d requires the Discharger to provide the following information to the Regional Water Board.

- A list and summary of historical studies characterizing: baseline biological conditions in area of influence of the facility's cooling water intake structure(s); impingement mortality and entrainment attributed to the facility's cooling water intake structure(s); and the physical conditions of Carquinez Strait in the vicinity of the facility's cooling water intake structure(s). The Discharger must describe the extent to which historical data are representative of current conditions and document that the data were collected using appropriate quality assurance/quality control procedures.

- A summary of source water physical data and cooling water intake structure data.

- A summary of past and on-going consultations with federal, state, and local fish and wildlife agencies regarding environmental impacts of the facility's cooling water intake structure(s).

- A sampling plan for field studies to develop or update scientifically valid estimates of impingement mortality and entrainment attributed to the facility's cooling water intake structure(s). As necessary, the sampling plan shall provide for source water, baseline biological characterization in the vicinity of the cooling water intake structure(s), in addition to identifying/describing methods to estimate impingement mortality and entrainment.

In large part, the 316 (b) requirements established by this Order for the C&H Sugar Company facility are based on the following requirements (for inclusion into NPDES permits) of the Phase II rule, which is codified at 40 CFR Part 125, Subpart J.

- Proposal for Information Collection [40 CFR 125.95 (b) (1)]

- Source water physical data, cooling water intake structure data, and cooling water system data [40 CFR 122.21 (r) (2, 3, and 5)]
- Comprehensive Demonstration Study, to include:
  - Source Waterbody Flow Information [40 CFR 125.95 (b) (2)]
  - Impingement Mortality and/or Entrainment Characterization Study [40 CFR 125.95 (b) (3)]
  - Design and Construction Technology Plan and a Technology Installation and Operation Plan [40 CFR 125.95 (b) (4)]
  - Restoration Plan [40 CFR 125.95 (b) (5)]
  - Information to Support Site-Specific Determination of BAT [40 CFR 125.95 (b) (6)]
  - Verification Monitoring Plan [40 CFR 125.95 (b) (6)]

d. **Mass offset.** This option is provided to encourage the Discharger to implement aggressive reduction of mass loads to the receiving water.

3. Pollution Minimization

This provision is based on Chapter 4 of the Basin Plan and Section 2.4.5 of the SIP.

Additionally, on October 15, 2003, the Regional Water Board adopted Resolution R2-2003-0096 in support of a collaborative working approach between the Regional Water Board and the Bay Area Clean Water Agencies to promote Pollution Minimization Program development and excellence. Specifically, the Resolution embodies a set of eleven guiding principles that will be used to develop tools such as "P2 menus" for specific pollutants, as well as provide guidance in improving P2 program efficiency and accountability. Key principles in the Resolution include promoting watershed, cross-program and cross-media approaches to pollution prevention, and jointly developing tools to assess program performance that may include peer reviews, self-audits or other formats.

4. Action Plan for Cyanide

This provision is based on the proposed Basin Plan Amendment that will adopt the site-specific objectives for cyanide for San Francisco Bay (Regional Water Board Resolution R2-2006-0086).

5. Action Plan for Copper

This provision is based on the proposed Basin Plan Amendment that will adopt the site-specific objectives for copper for San Francisco Bay (most recent document dated March 2, 2007).

6. Storm Water Pollution Prevention Plan and Best Management Practices Plan

This provision is retained from the previous Order. This provision requires ongoing implementation of the Storm Water Pollution Prevention Plan and Best Management Practices Plan, to ensure compliance with Federal storm water pollution controls. The SWPPP is based on the Standard Provisions (**Attachment G**), and BMPP on 40 CFR 125, Subpart K.

7. Construction, Operation, and Maintenance Specifications

a. **Wastewater Facilities, Review and Evaluation, Status Reports**. This provision is based on the previous permit and the Basin Plan.

b. **Operations and Maintenance Manual, Review and Status Reports.** This provision is based on the Basin Plan, the requirements of 40 CFR §122, and the previous permit.

c. **Contingency Plan, Review and Status Reports.** This provision is based on the Basin Plan, the requirements of 40 CFR §122, and the previous permit.

8. Special Provisions for Municipal Facilities

a. **Sludge Management Practices Requirements.** This provision is retained from the previous Order.

b. **Sanitary Sewer Overflows and Sewer System Management Plan.** This provision is to explain the Order's requirements as they relate to CSD's collection system, and to promote consistency with the State Water Resources Control Board adopted Statewide General Waste Discharge Requirements for Sanitary Sewer Overflow (SSO WDRs) and a related Monitoring and Reporting Program (Order No. 2006-0003-DWQ). The bases for these requirements are described elsewhere in this Fact Sheet for those requirements.

c. **Settleable Matter Reduction.** This provision is retained from the previous Order. Due to significant amount of inflow and infiltration into CSD's collection system, the wet weather sewage flow from the CSD typically carries a high levels of settable matters. CSD has previously submitted a facilities plan for sewer system improvements. One of the purposes of the project is to reduce inflow and infiltration, and to improve the grit removal facilities to reduce the present operation and maintenance problems related to grit carryover to the JTP. This permit requires CSD to continue this effort as condition for interim effluent limits for settleable matter.

9. Compliance Schedules and Compliance with Final Effluent Limitations.

Mercury, Selenium, Dioxin-TEQ, and Cyanide Compliance Schedules: This provision is based on Basin Plan at p. 4-14 (Compliance Schedules), 40 CFR 122.47(a)(3), SIP 2.2.1. Maximum compliance schedules are allowed because of the considerable uncertainty in determining effective measures (e.g., pollution

prevention, treatment upgrades) that should be implemented to ensure compliance with final limits. In our view, it is appropriate to allow the Discharger sufficient time to first explore source control measures before requiring it to propose further actions, such as treatment plant upgrades, that are likely to be much more costly. This approach is supported by the Basin Plan (page 4-25), which states, "In general, it is often more economical to reduce overall pollutant loading into treatment systems than to install complex and expensive technology plant.

VIII. PUBLIC PARTICIPATION

The San Francisco Bay Regional Water Board is considering the issuance of waste discharge requirements (WDRs) that will serve as a National Pollutant Discharge Elimination System (NPDES) permit for C&H Sugar Company. As a step in the WDR adoption process, the Regional Water Board staff has developed tentative WDRs. The Regional Water Board encourages public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Notification was provided through the Contra Costa Times on February 10, 2007.

B. Written Comments

The staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments should be submitted either in person or by mail to the Executive Office at the Regional Water Board at the address above on the cover page of this Order, Attention Tong Yin.

To be fully responded to by staff and considered by the Regional Water Board, written comments must be received at the Regional Water Board offices by 5:00 p.m. on February 15, 2007.

C. Public Hearing

The Regional Water Board will hold a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date:	April 11, 2007
Time:	9:00 a.m.
Location:	Elihu Harris State Office Building 1515 Clay Street Oakland, CA 1st floor Auditorium
Contact:	Ms. Tong Yin, Phone: (510)622-2418; email: TYin@waterboards.ca.gov

Interested persons are invited to attend. At the public hearing, the Regional Water Board will hear testimony, if any, pertinent to the discharge, WDRs, and permit. Oral testimony will be heard; however, for accuracy of the record, important testimony should be in writing.

Please be aware that dates and venues may change. Our web address is www.waterboards.ca.gov /sanfranciscobay where you can access the current agenda for changes in dates and locations.

D. Waste Discharge Requirements Petitions

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Water Board regarding the final WDRs. The petition must be submitted within 30 days of the Regional Water Board's action to the following address:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

E. Information and Copying

The Report of Waste Discharge (RWD), related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Copying of documents may be arranged through the Regional Water Board by calling (510) 622-2300.

F. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this facility, and provide a name, address, and phone number.

G. Additional Information

Requests for additional information or questions regarding this order should be directed to Ms. Tong Yin at (510) 622-2418, or by e-mail at TYin@waterboards.ca.gov .

Reasonable Potential Analysis Results for Discharge Point 001

Fact Sheet Attachment F-2(1)
C and H Sugar Company, Inc. - Discharge Point 001
Reasonable Potential Analysis Results

Beginning			Step 2	Step 3					Step 4		Step 2	Step 3		Step 4	Step 6	Step 6	Step 7 & 9		
	Constituent name	C (ug/L) Lowest (most stringent) Criteria [a] (Enter "No Criteria" for no criteria)	Effluent Data Available?	Are all data points non-detects?	Minimum MDL (ug/L) if all data ND.	Enter the pollutant effluent detected max conc (ug/L)	If all data points are ND and MinDL>C, interim monitoring is required	Maximum Pollutant Concentration (MEC) (ug/L) (MEC= detected max value; If all ND & MDL<C than MEC = MDL)	MEC vs. C Y if MEC >= C, effluent limitation is required; 2. If MEC<C, go to Step 5		Background Data Available?	Are all background data points non-detects?	If all background data points ND Enter the min. detection limit (MDL) (ug/L)	Enter the pollutant background detected max conc (ug/L)	If all B is ND, is MDL>C? (If Y, Go To Step 7)	B vs. C If B>C, effluent limitation is required	f) Review other information in the SIP page 4. If other information indicates limits are required If information is unavailable or insufficient: 8) the RWQCB shall establish interim monitoring requirements.	RPA Result	Reason

a. The most stringent of salt and fresh water criteria were selected for this analysis.

b. According to Table 1 of Section (b)(1) of CTR (40CFR 131.38), those criteria should use Basin Plan objectives; criteria for Se and CN are specified by the NTR.

c. Acronyms in the "Final Result" column:

Ud: Cannot determine reasonable potential due to the absence of data, or because Minimum DL is greater than water quality objective or CTR criteria

Ue: No criteria available

IM: Interim monitoring is required

a. The most stringent of salt and fresh water criteria were selected for this analysis.

b. According to Table 1 of Section (b)(1) of CTR (40CFR 131.38), those criteria should use Basin Plan objectives; criteria for Se and CN are specified by the NTR.

c. Acronyms in the "Final Result" column:

Ud: Cannot determine reasonable potential due to the absence of data, or because Minimum DL is greater than water quality objective or CTR criteria

Uo: No criteria available

IM: Interim monitoring is required

Appendix F-4
General Basis for Final Compliance Dates [1]
for Discharges North of the Dumbarton Bridge
Revised March 23, 2006

Constituent	Reference for applicable standard	Maximum compliance schedule allowed	Compliance date and Basis
Cyanide Selenium	NTR	10 years	**10-yr, but no later than April 28, 2010** (10 years from effective date of SIP). Basis is the Basin Plan, see note [2].
Copper (salt)	CTR	5 years	**5-yr, but no later than May 18, 2010.** Bases are CTR and SIP. See note [4]
Mercury PAH EPA 610	Numeric Basin Plan (BP)	10 years	**10-yr, but no later than April 28, 2010,** which is 10 years from effective date of SIP (April 28, 2000). Basis is the Basin Plan, See note [2a].
Arsenic Cadmium Chromium (VI) Copper (fresh) Lead Nickel Silver (CMC) Zinc	Numeric BP	10 years	**10-yr, but no later than January 1, 2015.** This is 10 years (using full months) from effective date of 2004 BP amendment (January 5, 2005). Basis is the Basin Plan section 4.3.5.6. See note [2b]. Also, see note [3] for permits issued prior to effective date of 2004 BP amendment.
Dioxins/Furans Tributyltin Other toxic pollutants not in CTR	Narrative BP using SIP methodology	10 years	**10-yr from effective date of permit** (which is when new standard is adopted; no sunset date). Basis is the Basin Plan, see note [2c].
Other priority pollutants on CTR and not listed above	CTR	5 years	**5-yr, but no later than May 18, 2010** (this is 10 years from effective date of CTR/SIP). Basis is the CTR and SIP. See note [4]

[1] These dates are maximum allowable compliance dates applicable. As required by the Basin Plan, CTR, SIP, and 40CFR122.47, compliance should be as short as possible. These are only applicable for discharges north of the Dumbarton Bridge because applicable criteria for the south bay are different than those cited above.

a. For pollutants where there are planned TMDLs or SSOs, and final WQBELs may be affected by those TMDLs and SSOs, maximum timeframes may be appropriate due the uncertain length of time it takes to develop the TMDL/SSO.

b. However, for pollutants without planned TMDLs or SSOs, the State Board in the EBMUD remand order (WQO 2002-0012), directs the Regional Board to establish schedules that are as short as feasible in accordance with requirements.

[2] The Basin Plan provides for a 10-year compliance schedule for implementation of measures to comply with new standards as of the effective date of those standards. This provision has been construed to authorize compliance schedules for new interpretations of existing standards, such as the numeric and narrative water quality objectives specified in the Basin Plan, if the new interpretations result in more stringent limits than in the previous permit.

c. For the numeric standards and objectives in place prior to the SIP (these include the 1995 Basin Plan objectives, and NTR criteria that were implemented in accordance with the Basin Plan), due to the adoption of the SIP, the Water Board has newly interpreted these objectives and standards. The effective date of this new interpretation is the effective date of the SIP (April 28, 2000) for implementation of these numeric Basin Plan objectives.

d. For numeric objectives for the seven pollutants adopted in the 2004 Basin Plan (amendments), the Water Board has newly adopted these objectives. The effective date of these new objectives is the approval date of the 2004 Basin Plan by U.S. EPA (January 5, 2005) for implementation of these numeric Basin Plan objectives. December is the last full month directly preceding the sunset date. Compliance should be set on the first day of the month to ease determination of monthly average limits. Therefore, compliance must begin on January 1, 2015.

e. For narrative objectives, the Board must newly interpreted these objectives using best professional judgment as defined in the Basin Plan for each permit. Therefore, the effective date of this new interpretation will be the effective date of the permit.

[3] The schedules established in permits effective prior to the 2004 Basin Plan (amendments) should be continued into subsequent permits reissued after the 2004 Basin Plan. For example, Permit XX, adopted Nov 2004 became effective Feb 1, 2005. Permit XX establishes a compliance schedule for copper to end April 1, 2010. When next reissued in 2010, the compliance deadline for the same copper limit should remain April 1, 2010. However, if in applying the 2004 BP objective results in a more stringent limit for copper, then a new compliance schedule may extend to the new date in 2015, provided discharger XX justifies the need for the longer compliance schedule.

[4] Permits effective after SIP/CTR that specified 5-yr compliance schedules pursuant to SIP §2.1for CTR pollutants do not qualify for another compliance schedule for those same CTR pollutants during reissuance.

a. An exception to this would be if new data collected during the term of the permit results in more stringent limitations, then a compliance schedule may be allowable for the more stringent limits up to May 18, 2010.

b. Another exception applies to pollutants granted a compliance schedule pursuant to the 2000 SIP §2.2.2, Interim Requirements for Providing Data (note 2005 SIP amendment deleted this section as it is not applicable to permits effective after May 18, 2003). Because SIP §2.1 provides for a maximum 5-year compliance schedule, and permittees granted §2.2.2 schedules have not been previously granted such a schedule under §2.1, those permittees who can demonstrate infeasibility to achieve immediate compliance with limits calculated using the data collected, qualify for a §2.1 schedule up to the maximum statutory date (April 28, 2010).

Cyanide was one pollutant for which the Water Board granted a §2.2.2 compliance schedules to collect better ambient data for cyanide, because the Regional Monitoring Program data were not complete primarily due to inadequate detection limits. BACWA and WSPA funded an effort to collect these data as part of the collaborative receiving water monitoring for other CTR pollutants. The Regional Water Board has received these data, which form the basis for current permits. However, upon further consideration, the SIP §2.2.2 compliance schedule was granted in error, because cyanide is an NTR criterion and not a CTR criterion, and the SIP compliance schedule provisions apply to "...CTR criterion and/or effluent limitations." Thus, it is more appropriate to apply the Basin Plan's compliance schedule provision, which was the implementation tool for NTR criteria prior to the SIP superceding the provisions in the Basin Plan related to calculation of water quality based effluent limitations. As such, the compliance schedule for cyanide should follow note [2a], above.

Note: If mercury effluent concentration is non-detect, the detection limit is used in the calculation.
If there are more than one Hg effluent data in a month, the average Hg concentration for that month is used.

Appendix F-6
Discharger's Infeasibility Analysis

C&H SUGAR COMPANY, INC.
Elizabeth M. Crowley
Environmental Compliance Manager

January 10, 2007

Ms. Tong Yin
California Regional Water Quality Control Board -
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, California 94612

Subject: Infeasibility Analysis – C&H Sugar Company, Inc. and Crockett Services District, Crockett, California, File #2119.1006 – C&H Sugar Company, Inc.

Dear Ms. Yin

Pursuant to the requirements of the State Implementation Policy (SIP), C&H has prepared an Infeasibility Analysis to address with the draft TO's Water Quality Based Effluent Limits (WQBELs) for selenium cyanide and mercury from the C&H Sugar Company, Inc., Crockett Sanitary Department (CSD) and Philip F. Meads Water Treatment Plant ("the JTP"). Based on our analysis, it is infeasible for the JTP to achieve compliance with the proposed WQBELs for selenium, cyanide and mercury prior to issuance of the permit. Therefore, interim limits will be required for these constituents. Details of our analysis are presented below.

Background

The Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays and Estuaries of California, known as the State Implementation Policy (SIP), establishes statewide policy for National Pollutant Discharge Elimination System (NPDES) permitting. The SIP provides for the situation where it is not feasible or reasonable to impose a WQBEL derived from the California Toxics Rule (CTR) or Basin Plan objective on an existing NPDES discharger without sufficient time to evaluate and implement compliance options. The SIP allows for the adoption of interim limits and a schedule to come into compliance with final WQBELs in such cases. To qualify for interim limits and a compliance schedule, the SIP provides dischargers with the ability to demonstrate that it is infeasible to achieve immediate compliance with the WQBELs.

Pursuant to Section 2.1 of the SIP the following information is provided to support a finding of infeasibility for the JTP:

(a) Documentation that diligent efforts have been made to quantify pollutant levels in the discharge and the sources of the pollutant in the waste stream, and the results of those efforts;

830 Loring Ave
Crockett, CA 94525
Tel 510 787 4352
Fax 510 787 4443
elizabeth.crowley@chsugar.com

(b) Documentation of source control and/or pollution minimization efforts currently underway or completed;
(c) A proposed schedule for additional or future source control measures, pollutant minimization actions, or waste treatment (i.e., JTP upgrades); and
(d) A demonstration that the proposed schedule is as short as practicable.

An additional consideration, while WQBELs have been presented in the draft Tentative Order No. R2-2006-XXX (draft TO), Site Specific Objectives (SSOs) for cyanide and total maximum daily loads (TMDLs) for mercury are likely to lead to different final WQBELs for these chemicals. Nevertheless, the SSO and TMDL may not be completed in timeframe that would obviate the need for compliance with the final WQBELs in the draft TO. Therefore, interim limits are necessary for these constituents.

Infeasibility Analysis

Pollutants to be Evaluated

An Infeasibility Analysis has been performed to ascertain whether is it infeasible to comply with the WQBELS provided in the draft TO by the California Regional Water Quality Control Board - San Francisco Bay Region (Regional Board). The pollutants for which C&H has found it infeasible to achieve WQBELs prior to issuance of the permit are:

- Selenium;
- Mercury; and
- Cyanide.

Effluent Limitation Attainability

Statistical analysis of self-monitoring data collected from January 2002 thru December 2005 was conducted to evaluate whether is it feasible to comply with the WQBELs for selenium, cyanide and mercury. Statistical confirmation of the infeasibility to comply with the WQBELs is attained if the mean, 95th percentile or 99th percentile exceeds the long-term average (LTA), average monthly effluent limitation (AMEL) or maximum daily effluent limitation (MDEL), respectively. Table 1, shown below, summarizes the statistical analysis and shows that it is infeasible to immediately comply with the WQBELs for selenium, cyanide and mercury.

Table 1: Summary of Feasibility Analysis

Constituent (Discharge Location)	Mean vs. LTA (µg/l)	95th vs. AMEL (µg/l)	99th vs. MDEL (µg/l)	Feasible to Comply
Mercury (001)	0.018>0.01	0.05>0.018	0.089>0.046	No
Mercury (002)	0.019>0.0035	0.13>0.012	0.4>0.038	No
Selenium (001)	8.4>2.3	18>3.9	22>8.7	No
Cyanide (001)	0.66<2.0	MEC=4>AMEL=3.2		No
Cyanide (002)	4.8>0.3	15>2.9	19>6.4	No

A. <u>Documentation that diligent efforts have been made to quantify pollutant levels in the discharge and the sources of the pollutant in the waste stream, and the results of those efforts.</u>

<u>Pollutant Source Identification</u>

An investigation into potential sources of selenium, cyanide and mercury has been conducted for the non-contact cooling water effluent (E-001). An investigation into potential sources of cyanide and mercury has also been conducted for effluent from the JTP (E-002). Effluent from Discharge Point 002 (E-002) consists of treated wastewater from the C&H plant and treated sewage from CSD (treated wastewater).

i. Selenium, cyanide and mercury in non-contact cooling water effluent (E-001)

A *Water Intake Study* (C&H, 2006) was conducted to identify potential sources of selenium, cyanide and mercury in the non-contact cooling water effluent (E-001). The paired t-test statistical method was selected to evaluate the one to one relationship between the corresponding influent and effluent data collected between February 16, 2002 and July 16, 2004. Statistical analysis of influent (I-1) and effluent (E-001) data revealed: no statistically significant difference (at 95 percent confidence) between the influent and effluent data. In some instances the influent data was significantly higher than effluent data. Hence, the investigative efforts have concluded that the source of selenium, cyanide and mercury in effluent from E-001 is the influent water.

ii. Cyanide in treated wastewater (E-002)

- Wastewater Treatment

Cyanide is formed in wastewater treatment plants as a by-product of disinfection processes, such as chlorination.

- Matrix Interferences

Detection of cyanide has been associated with matrix inferences from salts. Cyanide measurements in effluent may be an artifact of the analytical method. This question is being explored in a national research study sponsored by the Water Environmental Research Foundation.

iii. Mercury in treated wastewater (E-002)

Source investigation efforts have revealed that mercury is not used in any process at the C&H plant. However, potential sources have been identified for mercury in effluent:

- Atmospheric sources of mercury

As stated in the *Waste Minimization Plan Annual Report* submitted on June 28, 2002 mercury is present in the ambient air and is a potential source to storm water and the open treatment basins at the JTP. In addition, mercury is a potential contaminant introduced during low-level mercury sample collection (C&H and CVSD, Waste Minimization Plan, Quarterly Report #13: June-August, 2004) and subsequent analysis using EPA Method 1631.

California Air Resources Board conducted an investigation into the concentration of mercury in ambient air at the John Swett High School in the Crockett community. Analytical data collected at the John Swett High School revealed ambient air mercury concentrations at 1.5 nanograms per cubic meter (ng/m^3), which could contribute mercury to the wastewater samples.

- Mercury in East Bay Municipal Utility District Water

The East Bay Municipal Utilities District (EBMUD) regularly conducts analyses of mercury in the water supply. EBMUD data has previously shown that there are pollutants present in the water supply to the C&H plant (C&H Waste Minimization Plan Quarterly Report, August 2001). However, EBMUD data for mercury has a reporting limit of 2 micrograms per liter (µg/l), which is above the 0.038 µg/l MDEL presented in the draft TO.

- Mercury in domestic wastewater

Domestic wastewater has also been identified as a potential source of mercury for the JTP. The average residential source has been estimated to discharge 0.24 µg/l of mercury from: human waste; laundry graywater; thermometers; contact lens solution; household products; food wastes; and other identified sources.

B. Documentation of source control and/or pollution minimization efforts currently underway or completed.

The existing pollution prevention activities have been designed to reduce discharge of pollutants, including mercury. However, the efforts have not achieved a level of control or minimization that would meet the Draft TO's WQBELs. An analysis of the existing and ongoing potential pollution prevention measures is presented below. Cyanide had not previously been anticipated to be a pollutant of concern in effluent from E-002; therefore source control actions targeting cyanide have not been implemented.

Intake Water Study

The Intake Water Study concluded that the source of selenium, cyanide and mercury in effluent from E-001 is the influent water. Therefore, source control and/or pollution minimization efforts were not necessary for E-001.

Wet Weather Preparedness Program

A yearly checklist for inspection of pump station facilities and removal of grit from the collection system, including contributions of mercury, is prepared prior to each wet-weather season (CVSD Waste Minimization Plan Annual Report, 2003).

Tank and Force Main Cleaning

Mud, sand and other solids with potential for contribution of mercury was removed from the CSD equalization tank and 3,130 lineal feet of force main during 2003 (CVSD Waste Minimization Plan Annual Report, 2003). Additional surge tank solids were removed from the JTP in 2004 by C&H contractors.

Community Outreach Program

CSD has been implementing a community outreach program to inform the local community regarding the development and implementation of its pretreatment program. The outreach program is designed to educate the community regarding actions that they can take to help reduce pollutant loads and the cost for addressing the pollutants. The outreach program includes:

- a thermometer exchange program offering digital fever thermometers in trade for any devices containing mercury (CVSD Waste Minimization Plan, December – February 2004); and

- a web site to emphasize the importance of source control in the home and business, including the thermometer exchange program (CVSD Waste Minimization Plan, March - May 2004).

Outreach and Training

The C&H plant provides outreach and training to employees and contractors handling, using and disposing of materials that may contain mercury (C&H Waste Minimization Plan Annual Submittals, 2002).

Additional efforts were made by the C&H Environmental Department to contact and alert the John Swett High School Science Department Chairperson and the local dental office. In once instance the Dental office had just had their mercury trap serviced, but it had not been properly reinstalled. The correction was made after C&H issued the alert.

Mercury Source Investigation

A mercury source investigation was conducted by the C&H plant and revealed that mercury is present in equipment switches, laboratory thermometers, and fluorescent light bulbs. The equipment, thermometers and fluorescent light bulbs containing mercury are completely enclosed and do not expose the mercury under usual circumstances. Mercury-containing items that are removed are handled and manifested as hazardous waste for proper disposal (C&H Waste Minimization Plan Quarterly Report, August 2001).

Atmospheric Mercury

Field blanks were collected for mercury analysis during self-monitoring from January 2002 through December 2005. The maximum concentration of mercury in the field blank samples was reported at 0.021 micrograms per liter (µg/l).

C. A proposed schedule for additional or future source control measures, pollutant minimization actions, or waste treatment (e.g., JTP upgrades).

Investigative studies have concluded that the source of selenium, cyanide and mercury in effluent from E-001 is the intake water. Therefore, additional source control measures are not feasible.

Additional source control measures to address cyanide and mercury in effluent from E-002 will be evaluated during the next three years, i.e., prior to 2010. A discussion of the proposed activities is presented below.

i. Data Validation (Second Quarter 2007 to Third Quarter 2007)

Before additional efforts are taken to implement studies or control measures for cyanide and mercury, studies regarding the anticipated effluent concentrations will be conducted.

- Mercury in Field Blanks

Mercury field blanks will be used to identify false positives from ambient air contamination to assess data reliability, pursuant to USEPA Method 1631 Revision D. Consistent with Section 12.5.2 of USEPA Method 1631 Revision D the concentration of mercury in the method blanks or field blanks associated with the sample may be subtracted from the results for that sample, or must be subtracted if requested or required by a regulatory authority or in a permit.

- Cyanide Matrix Interference

As cyanide is reported to be an artifact of matrix inferences associated with the analytical protocol, matrix interferences studies will be conducted to quantify the contribution of cyanide from interference.

ii. Source Characterization (Fourth Quarter 2007 to First Quarter 2008)

Additional source characterization will be conducted if the results of the data validation reveal that the cyanide or mercury is above the final WQBELs. A survey will be conducted of potential dischargers of high concentrations of detergents, e.g., nursing homes, hospitals, car washes, pet grooming facilities. Sampling will be conducted to characterize contributions from selected businesses.

iii. Source Control (Second Quarter 2008 to Fourth Quarter 2008)

If the comprehensive source identification confirms that source control measures are required, appropriate source control measures will be identified. Alternative treatment methods for cyanide and mercury will be evaluated if source control does not reduce E-002 concentrations to meet the final WQBELs.

iv. Treatment Evaluation (First Quarter 2009 to Second Quarter 2009)

The JTP will evaluate end-of-pipe treatment options is source characterization does not meet final WQBELs for cyanide and mercury. Preliminary results of the source identification study will be used to screen potential treatment technologies and select candidate processes for further engineering development.

v. Construct Treatment System (Second Quarter 2009 to Second Quarter 2010)

Based on the treatment evaluation, appropriate treatment technology(s) will be pilot-tested. Following pilot-testing, design of a full-scale treatment system will be conducted. Subsequently, equipment would be procured and installed.

D. A demonstration that the proposed schedule is as short as practicable.

The Intake Water Study demonstrated that the source of selenium, cyanide and mercury in effluent from E-001 is the intake water. Final effluent limits for mercury will be derived from the waste load allocation established under the TMDL. The final WQBEL for mercury is projected to be changed based on the results of the TMDL and waste load allocation. Similarly, the SSO for cyanide has been approved by the Regional Board. Adoption of the SSO for cyanide is anticipated to result in higher final WQBELs. As treatment for the intake water is infeasible, the three year schedule, i.e., March 2007 to April 2010, is the shortest practicable to allow either the Regional Board to adopt the SSO for cyanide and the TMDL for mercury or develop appropriate final WQBELs based on intake water quality.

The discharge monitoring data show that the calculated 95th percentile values for mercury and the maximum estimated concentration (MEC) for cyanide from E-002 exceed the AMELs developed for these constituents. Therefore, additional work must be undertaken to comply with the final WQBELs presented in the draft TO.

It is likely that mercury in E-002 originates from ambient air and domestic wastewater. Data validation and source investigation are to be conducted to confirm and quantify matrix inference contributions of cyanide. Given the limited information on the source(s) of these pollutants it is unknown what additional actions and measures may be necessary to meet the final WQBELs. Furthermore, if the JTP cannot achieve compliance though pollution prevention alone, then the treatment involving yet-to-be defined innovative technology will be needed. Given the complexity and unknown variables, the three year schedule to conduct investigations, identify, pilot test, design, construct and commission facilities to comply with the final WQBELs is the shortest practicable and is consistent with the California Toxics Rule (CTR), SIP and Water Quality Control Plan – San Francisco Bay Region (Basin Plan). As noted above the three-year schedule should allow the Regional Board to adopt the SSO for cyanide and the TMDL for mercury, which are anticipated to result in higher WQBELs for E-002.

Summary

This evaluation indicates that immediate compliance with projected final WQBELs for selenium, cyanide and mercury is not feasible. Based on the infeasibility of immediate compliance, the draft TO should include interim performance-based limits. Compliance schedules are needed to allow time for completion of activities that include TMDL/waste load allocation (WLA) development, approval of site-specific water quality objectives (WQOs) (where applicable), adjustments of WQBELs to confirm the WLAs and revised site-specific WQOs (as necessary), source characterization and evaluation of source control measures, engineering, installation and commissioning of end-of-pipe wastewater treatment facilities. The JTP will implement the actions listed above for the constituents receiving interim limits.

Please contact me or Peter M. Krasnoff, P.E., of WEST, if you have any questions or wish to discuss the findings.

Sincerely,

Elizabeth M. Crowley

Subject: Intake Water Credit, C&H Sugar Company, Inc. and Crockett Services District
Crockett, California, File #2119.1006 – C&H Sugar Company, Inc.

Pursuant to your request of January 3, 2007 and our ongoing discussions regarding the renewal of the National Pollution Discharge Elimination System (NPDES) permit for C&H and the joint CSD/C&H Sugar discharge, C&H Sugar is submitting the attached supplemental monitoring data, and formally requesting an intake water credit for: arsenic; 2,3,7,8-TCDD-TEQ (TCDD-TEQ); and bis(2-ehtylhexyl)phthalate at the C&H Sugar discharge location E-001. In addition, we are providing an updated statistical analysis for cyanide at M-INF-001 (I-1) using revised method detection limits.

Background

As part of the permit renewal process, the California Regional Water Quality Control Board - San Francisco Bay Region (Regional Board) undertook a Reasonable Potential Analysis (RPA) that identified certain chemicals with the potential to be present in the non-contact cooling water effluent (E-001) above water quality based effluent limits (WQBELs). These chemicals included: arsenic, copper; lead; mercury; nickel; selenium; zinc; cyanide; TCDD-TEQ; and bis(2-ehtylhexyl)phthalate.

Based on statistical analysis of influent (I-1) and effluent (E-001) data collected at C&H between February 16 2002 and July 16, 2004, C&H formally requested an intake water credit on August 6, 2006. Water intake credits were requested for: copper, lead, mercury, selenium, zinc and cyanide. The Regional Board approved water intake credits for: copper; lead; mercury, selenium and zinc. In addition, the Regional Board requested supplemental statistical evaluations for arsenic; TCDD-TEQ; and bis(2-ehtylhexyl)phthalate.

Data Analysis

Effluent monitoring data from E-001 indicated that arsenic, TCDD-TEQ; and bis(2-ehtylhexyl)phthalate were detected up to 45 micrograms per liter (µg/l), 0.056 picograms per liter (pg/l) and 4 µg/l respectively in the non-contact cooling water. TCDD was not reported above a maximum method detection limit of 0.847 pg/l.

830 Loring Ave
Crockett, CA 94525
Tel 510 787 4352
Fax 510 787 4443
elizabeth.crowley@chsugar.com

Influent monitoring data from I-1 indicated that arsenic, TCDD-TEQ; and bis(2-ehtylhexyl)phthalate were detected up to 55 micrograms per liter (µg/l), 0.039 picograms per liter (pg/l) and 0.8 µg/l, respectively. TCDD was not reported above a maximum method detection limit of 0.847 pg/l. Based on this monitoring data, the intake water quality exceeds WQBELs for arsenic and TCDD-TEQ. In fact, given the levels of these chemicals in the intake water, it would be difficult to meet final WQBELs for arsenic at 36 µg/l, and TCDD-TEQ at $1.4X10^{-8}$ µg/l with BAT/BCT technology applied to just the intake water. More importantly, it is not possible for C&H to address source reduction associated with these constituents because these chemicals are not used in any of the C&H's processes, and elevated concentrations appear to be solely an artifact of intake water.

Analysis of the monitoring data demonstrates that there is no statistically significant difference between the I-1 and E-001 analytical data. Intake and discharge samples were collected contemporaneously between February 2002 and July 2004 for arsenic; TCDD-TEQ; and bis(2-ehtylhexyl)phthalate. Statistical analysis was performed with paired t-tests using the I-1 and E-001 monitoring data to assess whether influent non-contact cooling water quality (I-1) was statistically different from non-contact cooling water discharge from E-001. The paired t-test statistical method was selected to evaluate the one to one relationship between the corresponding influent and effluent values.

Statistical analysis of the monitoring data using the paired t-test did not reveal a significant difference at 95 percent confidence between I-1 and E-001 data for arsenic ($p=0.305$); TCDD-TEQ ($p=0.219$); and bis(2-ehtylhexyl)phthalate ($p=0.147$).

Cyanide Method Detection Limit at I-1

A review of I-I cyanide analytical data and consultation with Caltest Laboratory revealed that the method detection limit for the inflow was of 0.9 µg/l and that the method-reporting limit for the inflow was 3 µg/l. A revised statistical analysis of the E-001 and I-1 analytical data was conducted using the updated information. Statistical analysis for cyanide revealed no significant difference at the 95 percent confidence between I-1 and E-001 data ($p=0.360$).

We appreciate the opportunity to provide input at this time. Please contact me if you have questions or wish to discuss our comments.

Sincerely,

Elizabeth M. Crowley

Re: Intake Water Credit
C&H Sugar and Crockett Services District
Crockett, California
File #2119.1006 – C&H Sugar Company, Inc.

Dear Ms. Yin:

Pursuant to your request of August 2, 2006 and our ongoing discussions regarding the renewal of the National Pollution Discharge Elimination System (NPDES) permit for C&H and the joint CSD/C&H Sugar discharge, C&H Sugar is submitting the attached supplemental monitoring data, and formally requesting an intake water credit for the C&H Sugar discharge location E-001 based on the information contained in this letter and the attached data. It is our understanding that the California Regional Water Quality Control Board – San Francisco Bay Region ("Regional Board") will evaluate this request and data prior to the issuance of an updated draft NDPES permit.

As part of the permit renewal process, the Regional Board undertook a Reasonable Potential Analysis (RPA) that identified certain chemicals with the potential to be present in the non-contact cooling water effluent (E-001) above water quality based effluent limits (WQBELs). These chemicals included: arsenic, copper, lead, mercury, nickel, selenium and 2,3,7,8-TEQ. The RPA appropriately narrowed the list to mercury, selenium and cyanide as the chemicals with potential to be present in the discharge above WQBELs.

As you know, C&H's existing NPDES permit regulates the discharge at E-001 based on the net increase of Biochemical Oxygen Demand (BOD) above influent. C&H supports a continuation of this approach, as it is consistent with the analysis of the monitoring data from 2002 to 2004 that reflects no statistical difference between the intake and the effluent

Fax 510 787 4443
elizabeth.crowley@chsugar.com

non-contact cooling water discharged at E-001. Details of the analysis and justification for the intake water credit are provided below.

Intake Water Allowance

The Regional Board has developed preliminary effluent limits for mercury, selenium and cyanide for the discharge E-001, i.e., the non-contact cooling water discharge. As presented in our July 10, 2006 comments on the Regional Board's Reasonable Potential Analysis (RPA), this is a discharge of non-contact cooling water and C&H's process are not a suspected source of the identified chemicals. C&H should not have to address pollutants present in the intake from the receiving water body. As provided in the State Implementation Policy, Section 1.4.4, the Regional Board may consider intake water quality when establishing WQBELs, where:

"(1) The observed maximum ambient background concentration, as determined in section 1.4.3.1, and the intake water concentration of the pollutant exceeds the most stringent applicable criterion/objective for that pollutant;

(2) The intake water credits provided are consistent with any TMDL applicable to the discharge that has been approved by the RWQCB, SWRCB, and U.S. EPA [TMDL; not applicable];

(3) The intake water is from the same water body as the receiving water body. The discharger may demonstrate this condition by showing that:

(a) the ambient background concentration of the pollutant in the receiving water, excluding any amount of the pollutant in the facility's discharge, is similar to that of the intake water;
(b) there is a direct hydrological connection between the intake and discharge points;
(c) the water quality characteristics are similar in the intake and receiving waters; and
(d) the intake water pollutant would have reached the vicinity of the discharge point in the receiving water within a reasonable period of time and with the same effect had it not been diverted by the discharger.

The RWQCB may also consider other factors when determining whether the intake water is from the same water body as the receiving water body;

(4) The facility does not alter the intake water pollutant chemically or physically in a manner that adversely affects water quality and beneficial uses; and

(5) The timing and location of the discharge does not cause adverse effects on water quality and beneficial uses that would not occur if the intake water pollutant had been left in the receiving water body."
As you know, TMDLs are not applicable in this instance.

As the analysis presented below demonstrates, these conditions have been met[1]. Therefore, we request the Regional Board establish effluent limitations for the non-contact cooling water discharge from E-001 to allow discharge of the mass and concentrations equivalent to the influent water. Due to the inherent variability in laboratory analysis, and consistent with the SIP, we also request that the allowance be based on the arithmetic mean of the influent and effluent water quality.

The monitoring data indicated that mercury, selenium and cyanide were detected up to 0.05 micrograms per liter (µg/l), 20 µg/l, 2.1 µg/l, respectively in the influent non-contact cooling water. The WQBEL for mercury, selenium and cyanide have been identified by the Regional Board as 0.025 µg/l, 5 µg/l and 1 µg/l, respectively. Based on this monitoring data, the intake water quality exceeds WQBELs. In fact, given the levels of these chemicals in the intake water, it would be difficult to meet final WQBELs for mercury, selenium and cyanide with BAT/BCT technology applied to just the intake water. More importantly, it is not possible for C&H to address source reduction associated with these constituents because these chemicals are not used in any of the C&H's processes, and elevated concentrations appear to be the result of concentrations in the intake water.

On the second applicable criteria, the discharge point is hydrologically connected to the intake source. All of the non-contact cooling intake water is from the Carquinez Strait and the intake structure is located approximately 500 feet upstream of discharge point E-001. As 100 percent of the water discharged at E-001 is from the same receiving water body, the intake water pollutants would have reached the vicinity of the discharge point in the receiving water within a reasonable time and with the same effect had it not been diverted by its use for cooling.

This latter conclusion is supported by a statistical analysis of the monitoring data that demonstrates that there is no change in water quality from its use as non-contact cooling water. Intake and discharge samples were collected contemporaneously 32 times between February 2002 and July 2004. Statistical analysis was performed with paired t-tests using the I-1 and E-001 monitoring data to assess whether influent non-contact cooling water quality (I-1) was statistically different from non-contact cooling water discharge from E-001. The paired t-test statistical method was selected to evaluate the one to one relationship between the corresponding influent and effluent values.

Statistical analysis of the monitoring data using the paired t-test did not reveal a significant difference at the 95 percent confidence between I-1 and E-001 data for selenium as well as copper, chromium, and zinc. The statistical analysis, however, revealed that influent water quality (I-1) was significantly higher at the 95 percent confidence level than the discharge from E-001 for mercury, as well as cadmium, lead, and silver. The only chemical that analysis suggested might appear to be present at a statistically higher concentration in the

[1]The U.S. EPA NPDES permit program also allows credit for pollutants in intake water in cases where the facility is faced with situations in which limits are difficult or impossible to meet with Best Available Technology Economically Achievable (BAT) or Best Conventional Pollutant Control Technology (BCT). 40 Code of Federal Regulations §122.45(g)

effluent than in the influent was cyanide. However, there are no sources of cyanide in the system of non-contact cooling water that discharges at E-001. Thus, the analytical data appears to be reflecting something other than a contribution from C&H. The statistically significant difference for cyanide appears attributable to inherent variability in laboratory analytical recoveries and bias from varying laboratory-reporting limits, i.e., the laboratory-reporting limit for cyanide at I-1 was 0.003 µg/l compared to 0.9 µg/l at E-001. As the statistical analysis shows, without an intake credit for the non-contact cooling water intake, the discharge would be inappropriately regulated for pollutants.

We appreciate your consideration of our request and for the opportunity to provide input at this time. Please contact me if you have questions or wish to discuss our comments.

Sincerely,

Elizabeth M. Crowley

ORDER No. R2-2007-0077
NPDES No. CA0038849

WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL AND INDUSTRIAL WASTEWATER DISCHARGES OF MERCURY TO SAN FRANCISCO BAY

The following Dischargers are subject to waste discharge requirements as set forth in this Order, for the purpose of implementing the San Francisco Bay Mercury Total Maximum Daily Load (TMDL) wasteload allocations for municipal and industrial wastewater discharges to San Francisco Bay and its contiguous bay segments:

Table 1. Discharger Information

Discharger **Name of Facility** **Facility Address**	See attached Tables 1A and 1B for Discharger Information.
The U.S. Environmental Protection Agency (USEPA) and the Regional Water Quality Control Board have classified these discharges as either major or minor discharges as indicated in Tables 1A and 1B.	

Discharges from the discharge points identified below are subject to waste discharge requirements as set forth in this Order:

Table 2. Discharge Locations

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
See attached Tables 2A and 2B for Discharge Locations.				

Table 3. Administrative Information

This Order was adopted by the Regional Water Quality Control Board on:	**November 1, 2007**
This Order shall become effective on:	**January 1, 2008**[1]
This Order shall expire on:	**December 31, 2012**

[1] This Order becomes effective on the latter of this date or on the 1st (first) of the month after the TMDL for Mercury in San Francisco Bay becomes effective, except that if the San Francisco Bay Mercury TMDL is not approved by U.S. EPA or is approved in a form that is substantially different than was approved by the State Water Board on July 17, 2007, and implemented herein, this Order shall not become effective.

I, Bruce H. Wolfe, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on the date indicated above.

_____

Bruce H. Wolfe, Executive Officer

(a) This Order applies to the mercury discharges from internal waste streams discharged through these discharge points, and not to the once through cooling water discharges of these discharge points.

(b) This Discharger shares the North Bayside System Unit outfall with the Dischargers indicated in footnote (b) of Table 2A. This outfall serves as the combined discharge point E-002 into San Francisco Bay for these Dischargers. However, compliance with the requirements of this Order are by each Discharger at its individual compliance station specified in the Monitoring and Reporting Program, Attachment E, of this Order.

(c) The Regional Water Board adopted Order R2-2007-0065 on August 8, 2007, terminating the individual discharge permit for General Chemical West LLC effective April 1, 2008. This Discharger will cease discharge from this outfall no later than this date. The requirements of this Order do not apply to this Discharger if the effective date of this Order falls after the Discharger ceases to discharge.

II. FINDINGS

The California Regional Water Quality Control Board, San Francisco Bay Region (hereinafter Regional Water Board), finds:

A. Background. The dischargers listed in this Order in Tables 1A and 1B (collectively, Dischargers; individually, Discharger) are currently discharging pursuant to the Order Nos. and National Pollutant Discharge Elimination System (NPDES) Permit Nos. as shown in Attachment B. This Order is the mercury watershed permit and implements the wasteload allocations and implementation requirements of the mercury TMDL and implementation plan adopted by the Regional Water Board on August 9, 2006, and supersedes mercury requirements in those permits.

For the purposes of this Order, references to the "dischargers" or "permittees" in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Dischargers herein.

B. Facility Description. The Dischargers listed in Table 1A (Municipal Dischargers) own and operate secondary and advanced secondary wastewater treatment facilities as described in their respective Orders. The Dischargers listed in Table 1B (Industrial Dischargers) own and operate wastewater treatment facilities as described in their respective Orders. Wastewater is discharged from the Discharge points indicated in Tables 2A and 2B to San Francisco Bay and its tributaries, which are waters of the United States within the San Francisco Bay watershed. Attachment C shows a map of the Dischargers subject to this Order.

C. Legal Authorities. This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. Environmental Protection Agency (USEPA) and chapter 5.5, division 7 of the California Water Code (commencing with section 13370). It shall serve as an NPDES permit for point source discharges of mercury from Dischargers' facilities to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the Water Code (commencing with section 13260).

D. Background and Rationale for Requirements. The Regional Water Board developed the requirements in this Order based on detailed technical analyses which provide the foundation for the mercury TMDL. The Fact Sheet (Attachment F), which contains background information and rationale for Order requirements, is hereby incorporated into this Order and constitutes part of the Findings for this Order. Attachments A through G are also incorporated into this Order.

E. California Environmental Quality Act (CEQA). Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code sections 21100-21177.

G. Water Quality-Based Effluent Limitations. Section 301(b) of the CWA and section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards. This Order sets forth water quality-based effluent limitations for mercury,

which implement and are consistent with the assumptions and requirements of the mercurty TMDL wasteload allocations.

H. Water Quality Control Plans. The Regional Water Board adopted a Water Quality Control Plan for the San Francisco Bay Basin, *Water Quality Control Basin (Region 2)* (hereinafter Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, the Basin Plan implements State Water Resources Control Board (State Water Board) Resolution No. 88-63, which established state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply. Beneficial uses applicable to the San Francisco Bay are as follows:

Table 5. Basin Plan Beneficial Uses

Receiving Water Name	Beneficial Use(s)
San Francisco Bay and Applicable Tributaries – See individual Order Nos. (Attachment B) for specific Beneficial Uses that apply.	Agricultural Supply (AGR), Cold Freshwater Habitat (COLD), Ocean, Commercial, and Sport Fishing (COMM), Estuarine habitat (EST), Industrial Service Supply (IND), Marine Habitat (MAR), Fish Migration (MIGR), Municipal and domestic Supply (MUN), Navigation (NAV), Industrial Process Supply (PROC), Preservation of Rare and Endangered Species (RARE), Water Contact Recreation (REC1), Noncontact Water Recreation (REC2), Shellfish Harvesting (SHELL), Fish Spawning (SPWN), Warm Freshwater Habitat (WARM) Wildlife Habitat (WILD)

Requirements of this Order implement the Basin Plan.

The Regional Water Board adopted a Basin Plan Amendment on August 9, 2006, that establishes new water quality objectives for mercury, and that establishes the San Francisco Bay Mercury TMDL to attain the new mercury objectives in San Francisco Bay and contiguous bay segments. The Regional Water Board's Executive Officer made corrections on May 23, 2007, and the State Water Board approved the Basin Plan Amendment (as corrected), and new water quality objectives on July 17, 2007. The new objectives and TMDL become effective after approval by the USEPA. Elevated mercury concentrations currently exist in the tissues of fish, and methylmercury, a highly toxic form of mercury, is a persistent bioaccumulative pollutant. The mercury TMDL calls for reduction of mercury mass loadings to San Francisco Bay. Additional details regarding mercury sources to San Francisco Bay, and technical information related to the San Francisco Bay Mercury TMDL, are provided in the Fact Sheet. The purpose of this Order is to implement the San Francisco Bay Mercury TMDL wasteload allocations for Dischargers listed in Tables 1A and 1B.

I. State Implementation Policy. On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the California Toxics Rule and National Toxics Rule, and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The State Water Board adopted amendments to the

SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this Order implement the SIP.

J. Antidegradation Policy. Section 131.12 requires that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the state and federal antidegradation policies. As discussed in detail in the Fact Sheet, the permitted discharges are consistent with the antidegradation provision of 40 C.F.R. section 131.12 and State Water Board Resolution No. 68-16.

K. Anti-Backsliding Requirements. Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations at title 40, Code of Federal Regulations section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. Because the water quality-based effluent limitations in this Order are based on a TMDL, there is no backsliding.

L. Monitoring and Reporting. Section 122.48 requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program establishes monitoring and reporting requirements to implement federal and State requirements. This Monitoring and Reporting Program is provided in Attachment E.

M. Standard and Special Provisions. Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in Attachment D. The Dischargers must comply with all standard provisions and with those additional conditions that are applicable under section 122.42. The Regional Water Board has also included in this Order special provisions applicable to the Dischargers. A rationale for the special provisions contained in this Order is provided in the attached Fact Sheet (Attachment F).

N. Provisions and Requirements Implementing State Law. Not applicable.

O. Notification of Interested Parties. The Regional Water Board has notified the Dischargers and interested agencies and persons of its intent to prescribe Waste Discharge Requirements for the discharges and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet of this Order.

P. Consideration of Public Comment. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharges. Details of the Public Hearing are provided in the Fact Sheet of this Order.

IT IS HEREBY ORDERED, that this Order supersedes all mercury requirements for Discharge Points listed in Table 2A and 2B that are regulated by the Order Nos. listed in Attachment B, except for applicable enforcement purposes, and, in order to meet the provisions contained in division 7 of the Water Code (commencing with section 13000) and regulations adopted thereunder, and the provisions of the federal Clean Water Act (CWA) and regulations and guidelines adopted thereunder, the Dischargers shall comply with the requirements in this Order.

III. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Municipal Discharger Effluent Limits

The mass and concentration of mercury in the effluent at the Discharge Points indicated in Table 4A, with compliance measured at the Monitoring Location as described in the MRP (Attachment E) for each Discharger shall not exceed the limitations in Table 6.

Table 6. Municipal -- Individual Mercury Effluent Limitations

Aggregate Mass Emission Limit[1,4,5](kg/yr)	**17**	**14**	**11**	**Not applicable**	**Not applicable**

Footnotes:

(1) Compliance with the Average Annual Effluent Limitations is determined annually for each Municipal Discharger each calendar year, and is attained if the sum of all individual Municipal Dischargers' mercury mass emissions, calculated as described below, is not greater than the Aggregate Mass Emission Limit of 17 kg/yr (or 14 kg/yr in 10 years, or 11 kg/yr in 20 years). If the sum of all individual Municipal Dischargers' mercury mass emission(s) is greater than 17 kg/yr (or 14 kg/yr in 10 years, or 11 kg/yr in 20 years), the Municipal Discharger(s) whose mercury mass emission(s) exceed(s) its (their) individual limitation(s) in Table 6, shall be deemed to be in violation of its (their) mercury mass limitation(s). For compliance determination, mass emissions shall be determined as defined below:

a. The total annual aggregate mass emission shall be the sum of the individual annual mass emissions from each Municipal Discharger. The sum shall be rounded to the nearest kilogram for comparison with the 17 kg/yr.

b. The annual average mass emission for each Discharger shall be computed for the period January 1 through December 31, annually. If this Order becomes effective on or after April 1st, no annual average mass emission calculation shall be necessary on this first partial calendar year. In this case, annual average mass emission calculation and compliance determination shall commence on the following full calendar year and all subsequent years.

c. The annual average mass emission for each Discharger listed in Table 6 above shall be the sum of monthly emissions on a calendar year basis and computed as follows:

$$Annual\ Mass\ Emission, kg/year = \sum \left(Monthly\ Mass\ Emission\ Rates, kg/month \right)$$

or, for Dischargers with less frequent mercury monitoring than monthly, or if this Order becomes effective after January 1st and prior to March 1st, the Annual Mass Emission shall be computed using the arithmetic average of available monthly mass emissions as follows:

$$Annual\ Mass\ Emission, kg/year = \left(\frac{\sum MonthlyMassEmission, kg/mo}{NumberofMonthlyMassEmissionsCalculated} \right) * 12 mo/year$$

where

$$Monthly\ Mass\ Emission, kg/mo = \left(\frac{0.003785}{N}\right) * \left(\sum_{i=1}^{N} Q_i C_i\right) * 30.5 = \frac{0.1154425}{N} * \left(\sum_{i=1}^{N} Q_i C_i\right)$$

and where

C_i = mercury concentration of each individual sample, µg/l
Q_i = Discharger flow rate on date of sample, millions of gallons per day (mgd)
N = number of samples collected during the month
0.003785 = conversion factor to convert (µg/l)*(mgd) into kg/day
30.5 = number of days in a standard month
0.1154425= product of (conversion factor)·(number of standard days per month)

and where Q_i for intermittent Dischargers [Dischargers who do not discharge every day in a calendar month, or have no discharge for an entire month (Q_i = 0)] shall be computed as follows:

$$Q_i = \left(\frac{\sum_{d=1}^{D} Q_d}{30.5}\right)$$

where

Q_d = is the total flow for the day when discharge occurred, million gallons
D = total number of days where discharge occurred in a month
30.5 = number of days in a standard month

d. The Monthly Mass Emission for a Discharger who provides recycled wastewater for industrial supply, shall include the effluent discharge adjustment granted to the industrial Discharger for its recycled wastewater use as described in III.B and Provision V.C.5 of this Order. The monthly effluent discharge adjustment mass shall be reported in each Self-Monitoring Report and in the Annual Mercury Information Reporting Form Part 2 of 3 under "Comments on Data."

(2) For compliance determination as defined in Section VI and Attachment A of this Order, the Discharger shall achieve the following, Minimum Level (ML).

Table 7. Minimum Levels

Constituent	Minimum Level	Units
Mercury	0.0005	µg/L

(3) This Discharger serves domestic customers but is not a municipal government agency. For the purpose of this Order, this Discharger is a "Municipal Discharger."

(4) Total differs slightly from the column sum due to rounding to the nearest kilogram.

(5) The first Annual Average Effluent Limits represent the San Francisco Bay Mercury TMDL's initial mass limits for Municipal Dischargers. In accordance with the TMDL and the compliance schedule provision that the Regional Water Board will submit to USEPA for approval, the Municipal Dischargers listed in this table have up to 10 years from the effective date of this Order to achieve the "Effective in 10 Years Annual Average Effluent Limits" and its respective Aggregate Annual Mass Emission Limit, and up to 20 years to achieve the "Effective in 20 Years Annual Average Effluent Limits" and its respective Aggregate Annual Mass Emission Limit listed in Table 6.

B. Industrial Discharger Effluent Limits

The mass and concentration of mercury in the effluent at the Discharge Points indicated in Table 4B for each Discharger shall not exceed the limitations in Table 8. Monitoring locations are described in Attachment E of this Order.

Table 8. Industrial -- Individual Mercury Effluent Limitations

Permitted Entity	Average Annual Effluent Limit[1,2] (kg/yr)	Average Monthly Effluent Limit[2] (µg/L)	Maximum Daily Effluent Limit[2]
Industrial Wastewater Discharger (Non-Petroleum Refinery):

Shell Oil Products US and Equilon Enterprises LLC	0.22	0.079	0.12
Tesoro Refining & Marketing Co.	0.11	0.079	0.12
Valero Refining Company	0.08	0.079	0.12
Aggregate Mass Emission Limit[4](kg/yr)	**1.3[4]**	**Not applicable**	**Not applicable**

Footnotes:

(1) Compliance with the Average Annual Effluent Limitations is determined annually for each Industrial Discharger each calendar year, and is attained if the sum of the individual Industrial Dischargers' mercury mass emissions, calculated as described below, is not greater than the Aggregate Mass Emission Limit of 1.3 kg/yr. If the sum of all individual Industrial Dischargers' mercury mass emission(s) is greater than 1.3 kg/yr, the Industrial Discharger(s) whose mercury mass emission(s) exceed(s) its (their) individual limitation, above, shall be deemed to be in violation of its (their) mercury mass limitation(s). For compliance determination, mass emissions shall be determined as defined below:

a. The total annual aggregate mass emission shall be the sum of the individual annual mass emissions from each Industrial Discharger. The sum shall be rounded to the nearest kilogram for comparison with the 1.3 kg/yr.

b. The annual average mass emission for each Industrial Discharger shall be computed for the period January 1 through December 31, annually. If this Order becomes effective on or after April 1st, no annual average mass emission calculation shall be necessary on this first partial calendar year. In this case, annual average mass emission calculation and compliance determination shall commence on the following full calendar year and all subsequent years.

c. The annual average mass emission for each Discharger listed in Table 8 above shall be the sum of monthly emissions on a calendar year basis and computed as follows:

$$Annual\ Mass\ Emission, kg/year = \sum \left(Monthly\ Mass\ Emission\ Rates, kg/month \right)$$

Or, for Dischargers with less than monthly mercury monitoring, the Annual Mass Emission shall be computed using the arithmetic average of available monthly mass emissions as follows:

$$Annual\ Mass\ Emission, kg/year = \left(\frac{\sum MonthlyMassEmission, kg/mo}{NumberofMonthlyMassEmissionsCalculated} \right) * 12 mo/year$$

where

$$Monthly\ Mass\ Emission, kg/mo = \left(\frac{0.003785}{N} \right) * \left(\sum_{i=1}^{N} Q_i C_i \right) * 30.5 = \frac{0.1154425}{N} * \left(\sum_{i=1}^{N} Q_i C_i \right)$$

and where

C_i = mercury concentration of each individual sample, µg/l
Q_i = Discharger flow rate on date of sample, millions of gallons per day (mgd)
N = number of samples collected during the month
0.003785 = conversion factor to convert (µg/l)*(mgd) into kg/day
30.5 = number of days in a standard month
0.1154425= product of (conversion factor)·(number of standard days per month)

and where Q_i for intermittent Dischargers [Dischargers who do not discharge every day in a calendar month, or have no discharge for an entire month (Q_i = 0)] shall be computed as follows:

$$Q_i = \left(\frac{\sum_{d=1}^{D} Q_d}{30.5} \right)$$

where

Q_d = is the total flow for the day when discharge occurred, million gallons
D = total number of days where discharge occurred in a month
30.5 = number of days in a standard month

d. For an Industrial Discharger who uses treated recycled wastewater for industrial supply from a Municipal Discharger named in this Order, the Industrial Discharger shall subtract from its Monthly Mass Emission in c., above, an adjustment for the recycled water used and discharged through its discharge point as provided in Provision V.C.5 of this Order. The Industrial Discharger shall report this effluent discharge adjustment mass to the Municipal Discharger that provided the recycled wastewater within 15 days following the end of the calendar month for which an adjustment is applied, and shall report the adjustment in each Self-Monitoring Report and in the Annual Mercury Information Reporting Form Part 2 of 3 under “Comments on Data.”

(2) For compliance determination as defined in Section VI and Attachment A of this Order, the Discharger shall achieve the following, Minimum Level (ML).

Table 9. Minimum Levels

Constituent	Minimum Level	Units
Mercury	0.0005	µg/L

(3) N/A means that a concentration-based limit is not applicable at this time.

(4) Total differs slightly from the column sum due to rounding to two significant digits.

IV. RECEIVING WATER LIMITATIONS – Receiving water limitations are provided in each Discharger's individual NPDES Permits (see Attachment B).

V. PROVISIONS

A. Standard Provisions

The Dischargers shall comply with all Standard Provisions included in Attachment D of this Order, except for Standard Provisions V.D related to compliance schedules.

B. Monitoring and Reporting Program Requirements. The Dischargers shall comply with the Monitoring and Reporting Program (MRP), and future revisions thereto, in Attachment E of this Order. The Dischargers shall also comply with the requirements contained in Self-Monitoring Program, Part A (August 1993) (Attachment G), including any amendments thereto.

C. Special Provisions

1. Triggers for Additional Mercury Control

a. Each individual Discharger shall comply with C.1.c. of this Order if its discharge exceeds any of the applicable triggers described in Tables 10 and 11.

Table 10. Triggers for Municipal Dischargers

Type of Trigger	Average Monthly	Maximum Daily
Concentration for Secondary Treatment Plants	0.041 µg/L	0.065 µg/L
Concentration for Advanced Secondary Treatment Plants	0.011 µg/L	0.021 µg/L
Mass Emission	Individual annual mass emission limit, as depicted in Table 6, above, and computed as a 12-month running average, as shown in C.1.b., below.	

Table 11. Triggers for Industrial Dischargers

Type of Trigger	Average Monthly	Maximum Daily
Concentration	0.037 μg/L	0.062 μg/L
Mass Emission	Individual annual mass emission limit, as depicted in Table 8, above, and computed as a 12-month running average, as shown in C.1.b., below.	

b. The running 12-month average mass emission shall be computed monthly for each calendar month as follows:

$$(12-month\ Running\ Average, kg) = (Current\ Mass\ Emission, kg) + \sum (Previous\ 11\ months'\ mass\ emissions, kg)$$

where the current mass emission is the emission for the current calendar month computed as shown in III.A. above.

c. Each Discharger who exceeds any of the applicable triggers listed in Table 10 or 11, above, shall comply with the following action requirements:

Table 12. Action Plan for Trigger Exceedance

Task	Deadline
i. *Accelerated Sampling.* As soon as the Discharger becomes aware of the exceedance, resample within 48 hours and commence weekly sampling (or more frequent than weekly) for a total of at least 6 new samples. If all 6 new samples show mercury levels below the triggers, return to routine sampling. If during the accelerated sampling, (1) any of the new samples are above the maximum daily trigger, or (2) the monthly average of the new samples is above the monthly trigger, or (3) the 12-month running average mass is above the mass trigger, then proceed with action plan for mercury reduction and continue sampling monthly until the observed mercury discharge is below the trigger levels for 3 consecutive months, at which point the Discharger shall complete the reporting of this exceedance as required by Tasks ii. and ix, and return to routine monitoring, and discontinue efforts under Task iii, below.	See deadlines in task description.
ii. *Report Trigger Exceedance.* The Discharger shall report to the Regional Water Board any exceedance of trigger levels in the cover letter of its Self-Monitoring Report, and the status of its plans and actions to accelerate monitoring and/or develop and implement an action plan for mercury reduction.	In the Self-Monitoring Report due 30 days after the end of the monitoring period.
iii. *Action Plan for Mercury Reduction*. Develop, submit, and implement an Action Plan that (1) evaluates the cause[1] of the trigger exceedance(s); (2) evaluates the effectiveness of existing pollution prevention or pretreatment programs and methods for preventing future exceedances; (3) evaluates the feasibility and effectiveness of technology enhancements to improve treatment plant performance; and (4) evaluates other measures for preventing future exceedances. In addition, the Discharger shall identify in the Action Plan mercury reduction measures it will take along with an implementation schedule for those measures to correct current and prevent future trigger exceedances.	Within 130 days of the initial trigger exceedance

[1] *Possible causes of exceedances include (but are not limited to) changes in reclamation, increases in the number of sewer connections, increases in infiltration and inflow (I/I), changes in the type or number of industrial, commercial, or residential sources, changes in the raw material used in manufacturing processes, changes in treatment system operation, or factors beyond the Discharger's control, such as a natural disaster, vandalism, illegal dumping, or extreme flood event.*	
iv. *Annual Reporting*. The Discharger shall provide a status of its mercury reduction efforts in the annual Self-Monitoring Report. Additionally, as causes and corrective actions are identified, the Discharger shall amend or supplement its Action Plan as appropriate. Such changes shall be reported to the Regional Water Board in the Discharger's Annual Self-Monitoring Report.	Annually due February 1st of each year until the Discharger demonstrates compliance with trigger levels for a continuous 3-month period of sampling.

2. Mercury Source Control Program for Municipal Dischargers

The Dischargers in Table 1A shall develop, implement, and document cost-effective pretreatment/pollution prevention reduction strategies for dental offices to manage and reduce the amount of mercury amalgam that is discharged from dental offices into the public wastewater collection systems in accordance with the following:

a. The target for this program is that 85% of dental offices that generate mercury amalgam waste in the region will be participating in an amalgam program within 5 years after the effective date of this Order. Within 2 years of the effective date of this Order, the municipal wastewater Dischargers (Table 1A) shall develop and begin to implement a dental amalgam program with the goal of achieving the target within five years.

b. The municipal wastewater Dischargers in Table 1A shall estimate the dental amalgam collected (and describe the basis for its estimation) and describe any other mercury pollution prevention programs that are implemented and maintained by individual municipal wastewater dischargers. The municipal wastewater Dischargers shall provide this information to the Regional Water Board no later than June 30, 2012. The municipal wastewater Dischargers may collaborate to provide this information in a single report to satisfy this requirement for the entire group.

3. Additional Special Studies for Adaptive Management

The Dischargers in Tables 1A and 1B, or their agent(s), shall submit a work plan within one year of the effective date of this Order, to include an implementation schedule for the following activities:

a. Conduct or cause to be conducted studies aimed at better understanding mercury fate, transport, the conditions under which mercury methylation occurs, and biological uptake in San Francisco Bay, its contiguous segments, and tidal areas; and

b. Conduct or cause to be conducted studies to evaluate the presence of, or potential for, local effects on fish, wildlife, and rare and endangered species in the vicinity of wastewater discharges.

The work plan shall include annual progress reports, due April 1st to the Regional Water Board. This progress report shall be combined with any group compliance reporting required by IV.C. of the Monitoring and Reporting Program, Attachment E of this Order.

4. Risk Reduction Programs

The Dischargers shall develop and implement or participate in effective programs to reduce mercury-related risks to humans and quantify the resulting risk reductions from these activities. The activities may be performed by a third party if the Dischargers wish to provide funding for this purpose. This requirement may be satisfied by a combination of related efforts through the Regional Monitoring Program or other similar collaborative efforts.

The risk reduction activities shall include investigating ways to address public health impacts of mercury in San Francisco Bay/Delta fish, including activities that reduce actual and potential exposure of health impacts to those people and communities most likely to be affected by mercury in San Francisco Bay-caught fish, such as subsistence fishers and their families. Such strategies should include public participation in developing effective programs in order to ensure their effectiveness. The Dischargers may include studies needed to establish effective exposure reduction activities and risk communication messages as part of their planning.

Within 1 year of the effective date of this Order, the Dischargers shall submit, or cause to be submitted, a progress report describing their efforts in developing risk management and reduction programs, with community participation and input.

Within 2 years of the effective date of this Order, the Dischargers shall submit, or cause to be submitted, a report describing the details of their risk management and reduction programs, the community participation process that was involved in developing such programs, any third parties involved in implementing the programs, and a plan for evaluating the programs' effectiveness. The report shall include an implementation schedule with implementation beginning within 3 years of the effective date of this Order. The Dischargers shall describe the progress of their efforts in the Annual Self-Monitoring Report required by IV.B.2.b. (or IV.C, Optional Group Compliance Reporting) in Attachment E of this Order.

5. Mercury Discharge Adjustment for Recycled Wastewater Use by Industrial Dischargers

When an industrial Discharger named on Table 1B of this Order uses recycled wastewater from a municipal Discharger named on Table 1A of this Order, the industrial Discharger may, at its option, apply an adjustment (hereinafter Adjustment) to its mercury mass emission or discharge concentration when determining compliance with its concentration and mass limits specified in III.B. of this Order.

The Adjustment shall be based on measured influent mercury levels from the recycled wastewater in accordance with the following:

a. The Industrial Discharger shall sample and analyze the influent recycled wastewater and the effluent discharge at least monthly. Influent sampling shall include measurement of daily flow volume for the entire duration that Adjustments are applied. Influent sampling shall occur at an appropriate influent sampling station as identified in the Discharger's individual permit.

b. The Industrial Discharger shall determine the time interval between introduction of a given constituent of concern in the influent recycled water and the first appearance of the constituent in the final effluent. The basis for this determination must be included in any calculation of Adjustment.

c. Calculation of Mercury Discharge Adjustment.

<u>Concentration Adjustment</u>
Influent concentration multiplied by total influent recycled water flow volume for that monitoring interval will yield an influent mass, which is valid for that monitoring interval. This influent mass is then divided by the total effluent flow volume for the time interval following the appropriate time lag described in 5.b. above, for that monitoring period to give a concentration Adjustment that will apply for the monitoring interval. The monitoring interval is the time between sampling days. For example, monthly sampling yields a one month monitoring interval. An example follows:

ex. Mercury is monitored monthly. The lag time is Y days.

Step 1: {(Influent concentration of mercury in Recycled Wastewater) – (Influent concentration of mercury in potable water)} x (Total Influent Volume of Recycled Wastewater for the month) = (Influent mass of mercury from Recycled Wastewater)

Step 2: (Influent mass) ÷ (Total effluent discharge volume for the 30-day period, Y days after influent sampled) = (Concentration Adjustment to be subtracted from concentration of mercury in the discharge, valid for that month)

<u>Mass Adjustment</u>
Influent concentration multiplied by total influent recycled water flow volume for that monitoring interval will yield an influent mass, which is valid for that monitoring interval. This influent mass is divided by the number of days in that monitoring period to give a mass Adjustment that will apply for the monitoring interval. The monitoring interval is the time between sampling days. For example, monthly sampling yields a one month monitoring interval. A schematic example follows:

ex. Constituent B is monitored monthly. The lag time is Y days.

Step 1: {(Influent concentration of mercury in Recycled Wastewater) – (Influent concentration of mercury in potable water)} x (Total Influent Volume of Recycled Wastewater for the month) = (Influent mass of mercury in Recycled Wastewater)

Step 2: (Influent mass) ÷ (30.5, the number of days in a standard month) = (Mass Emission Adjustment to be subtracted from monthly mass emission for that month)

d. If an Industrial Discharger opts to apply a Mass Emission Adjustment, the Regional Water Board shall transfer that Adjustment to the mass emission for the corresponding discharge interval from the Municipal Discharger who is the producer and source of the recycled wastewater. If this reverse Adjustment results in an adjusted mass discharge level above both of the following criteria, then, that Municipal Discharger is in violation of its Annual Average Effluent Limit and is subject to enforcement action by the Regional Water Board:

   i. The sum of the adjusted mass discharge levels from the Industrial Discharger and the Municipal Discharger exceeds the sum of the individual Average Annual Effluent Limits for these two Dischargers; and

   ii. The adjusted mass discharge levels from the Municipal Discharger results in an aggregate mass emission from all Municipal Dischargers that exceeds the Aggregate Mass Emission Limit for Municipal Dischargers.

6. Reopener Provision

This Order may be reopened for modification, or revocation and reissuance, as a result of the following:

a. if the State Water Board has not established a pollutant offset program that can be implemented within 20 years of the effective date of this Order; or

b. if there is modification of the San Francisco Bay Mercury TMDL implementation provisions.

VI. COMPLIANCE DETERMINATION

Compliance with the effluent limitations contained in section IV of this Order will be determined as specified below:

A. General.

Compliance with effluent limitations for mercury shall be determined using sample reporting protocols defined in the MRP and Attachment A of this Order. For purposes of reporting and administrative enforcement by the Regional and State Water Boards, a Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL).

B. Multiple Sample Data.

When determining compliance with an average monthly effluent limit (AMEL) for priority pollutants and more than one sample result is available, the Dischargers shall compute the arithmetic mean unless the data set contains one or more reported determinations of "Detected, but Not Quantified" (DNQ) or "Not Detected" (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

1. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

ATTACHMENT A – DEFINITIONS

Arithmetic Mean (μ)
Also called the average, is the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean = $\mu = \Sigma x / n$ where: Σx is the sum of the measured ambient water concentrations, and n is the number of samples.

Average Monthly Effluent Limitation (AMEL)
The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)
The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week

Detected, but Not Quantified (DNQ) are those sample results less than the RL, but greater than or equal to the laboratory's MDL.

Maximum Daily Effluent Limitation (MDEL)
The highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median
The middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (*n*) is odd, then the median = $X_{(n+1)/2}$. If *n* is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between the *n*/2 and *n*/2+1).

Method Detection Limit (MDL) is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in title 40 of the Code of Federal Regulations, Part 136, Attachment B, revised as of July 3, 1999.

Minimum Level (ML) is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Not Detected (ND) are those sample results less than the laboratory's MDL.
Pollutant Minimization Program (PMP)

PMP means waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the PMP shall be to reduce all potential sources of a priority pollutant(s) through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board may consider cost effectiveness when establishing the requirements of a PMP. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), shall be considered to fulfill the PMP requirements.

Pollution Prevention
Pollution Prevention means any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State or Regional Water Board.

Reporting Level (RL) is the ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from Appendix 4 of the SIP in accordance with section 2.4.2 of the SIP or established in accordance with section 2.4.3 of the SIP. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Total Maximum Daily Load (TMDL) is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards, and an allocation of that amount to the pollutant's sources.

ATTACHMENT B – EXISTING ORDER NOS. AND NPDES PERMIT NOS.

Municipal Dischargers:

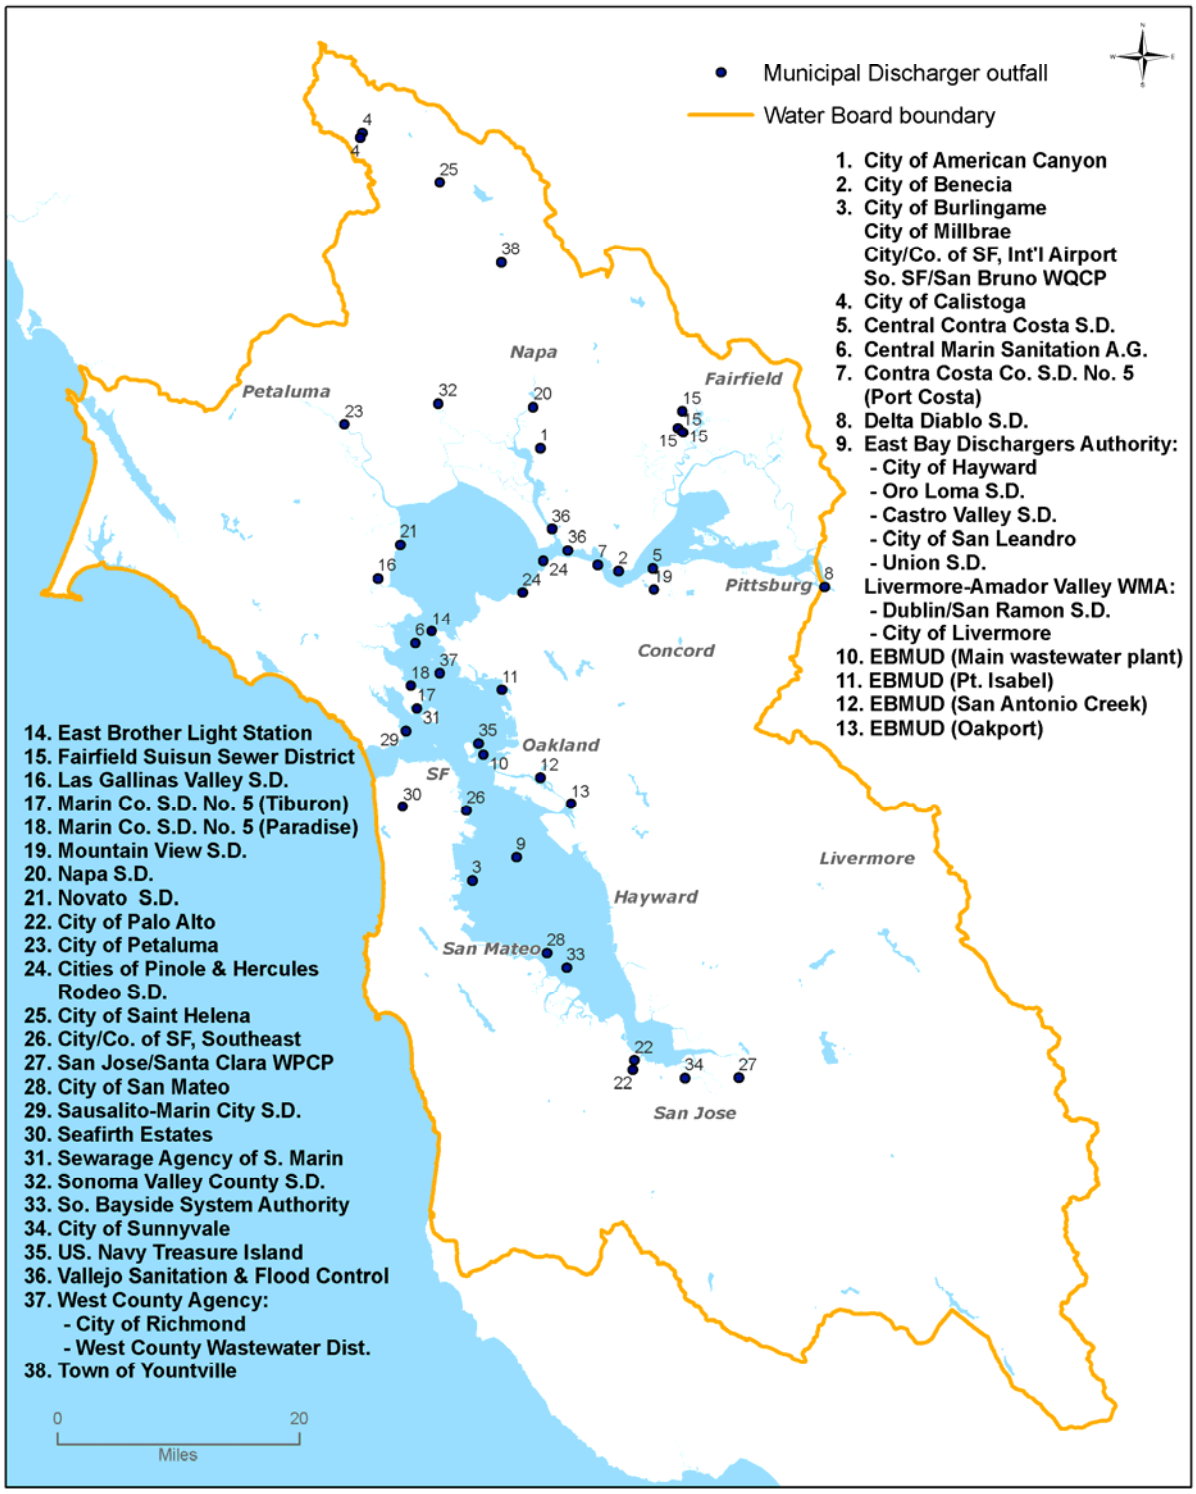
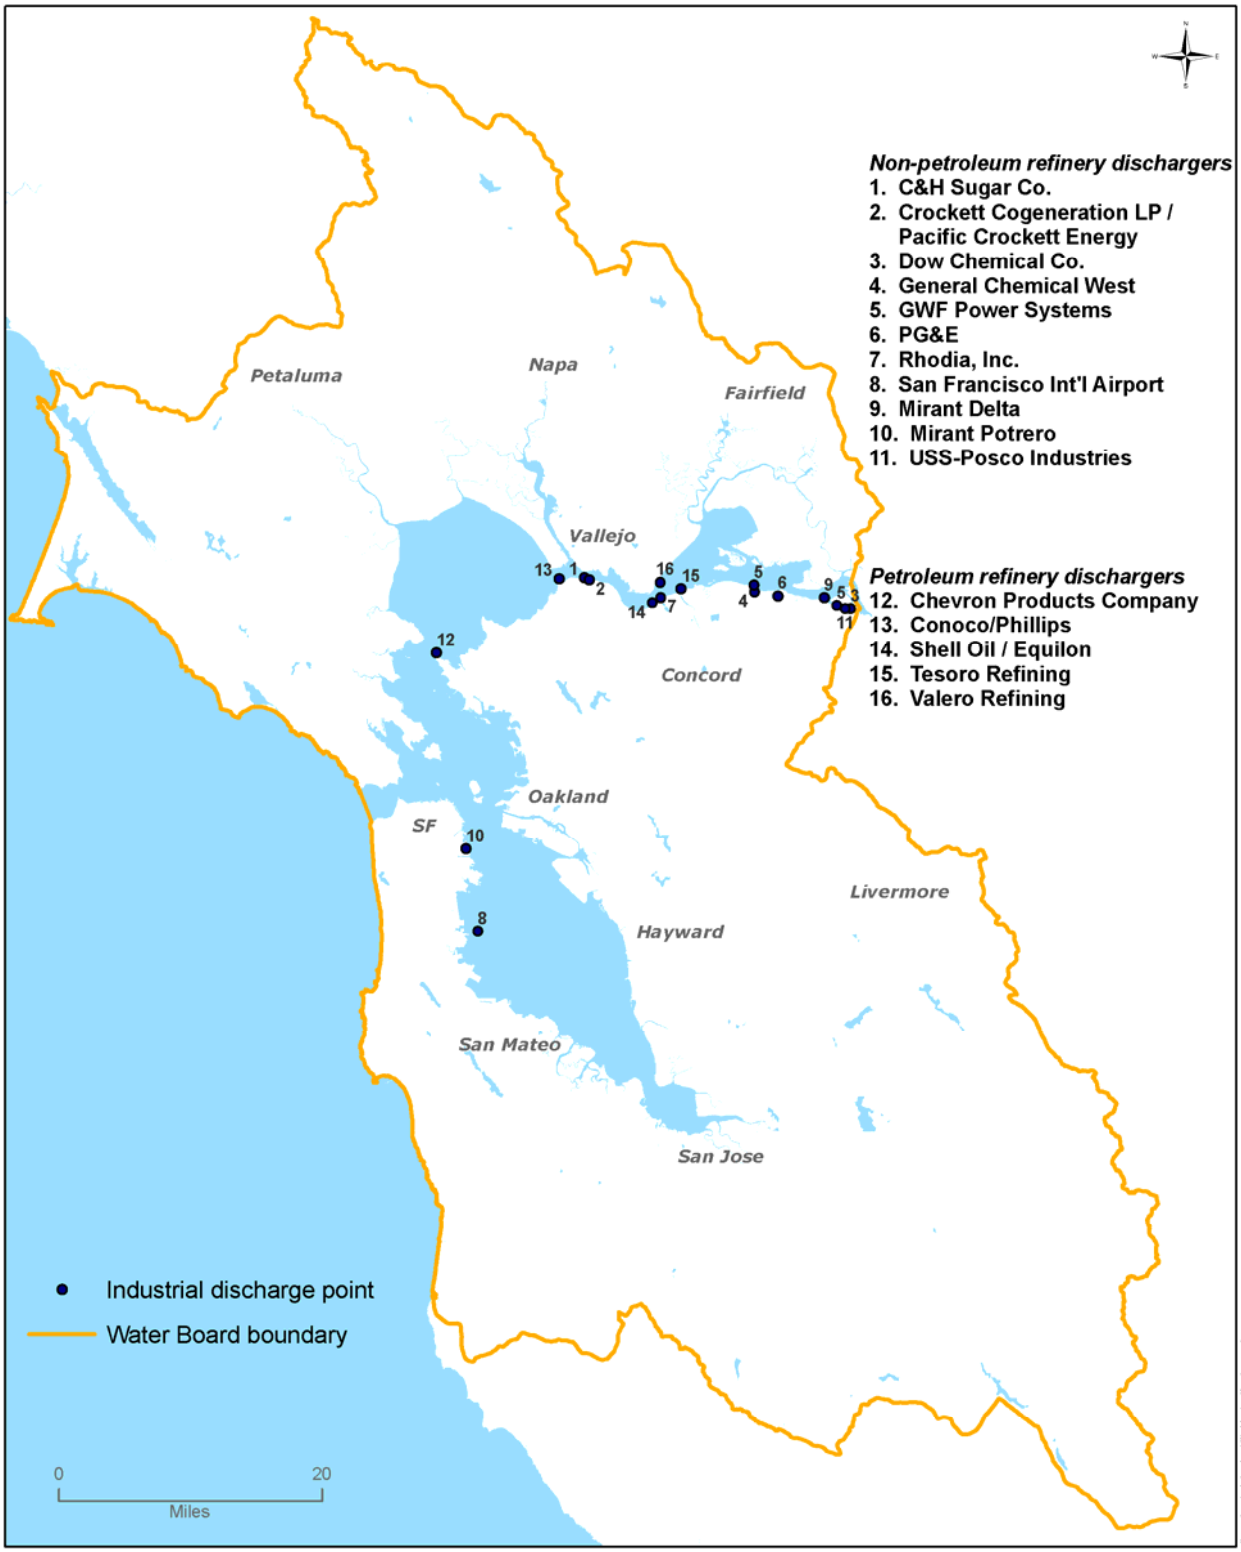
ATTACHMENT C – MAP OF MUNICIPAL AND INDUSTRIAL DISCHARGERS

Municipal Discharger outfall locations



Industrial Discharge Outfalls



ATTACHMENT D – STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Dischargers must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 C.F.R. § 122.41(a).)

2. The Dischargers shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Dischargers shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Dischargers shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Dischargers to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Dischargers shall allow the Regional Water Board, State Water Board, United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 C.F.R. § 122.41(i); Wat. Code, § 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (40 C.F.R. § 122.41(i)(1));

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (40 C.F.R. § 122.41(i)(2));

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (40 C.F.R. § 122.41(i)(3)); and

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 C.F.R. § 122.41(i)(4).)

G. Bypass

1. Definitions

   a. “Bypass” means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)

   b. “Severe property damage” means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)

2. Bypass not exceeding limitations. The Dischargers may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)

3. Prohibition of bypass. Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):

   a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));

   b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and

   c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)

4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)

5. Notice

   a. Anticipated bypass. If a Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass. (40 C.F.R. § 122.41(m)(3)(i).)

   b. Unanticipated bypass. A Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). (40 C.F.R. § 122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).).

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):

   a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));

   b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));

   c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and

   d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)

3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS – PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by a Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Dischargers wish to continue an activity regulated by this Order after the expiration date of this Order, the Dischargers must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of a Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. § 122.41(l)(3); § 122.61.)

III. STANDARD PROVISIONS – MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)

B. Monitoring results must be conducted according to test procedures under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503 unless other test procedures have been specified in this Order. (40 C.F.R. § 122.41(j)(4); § 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS – RECORDS

A. Except for records of monitoring information required by this Order related to a Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by Part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

B. Records of monitoring information shall include:

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));

2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));

3. The date(s) analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));

4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and

6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and

2. Permit applications and attachments, permits and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information

The Dischargers shall furnish to the Regional Water Board, State Water Board, or USEPA within a reasonable time, any information which the Regional Water Board, State Water Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Dischargers shall also furnish to the Regional Water Board, State Water Board, or USEPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, § 13267.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 C.F.R. § 122.41(k).)

PLUS

For Industrial Dischargers that are corporations:

2. All permit applications shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures. (40 C.F.R. § 122.22(a)(1).)

For Industrial Dischargers that are partnerships or sole proprietorships:

2. All permit applications shall be signed by a general partner or the proprietor, respectively. (40 C.F.R. § 122.22(a)(2).)

For a municipality, State, federal, or other public agency:

2. All permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA). (40 C.F.R. § 122.22(a)(3).).

PLUS, for all Dischargers:

3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or USEPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

   a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));

   b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

   c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)

4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)

5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:

   "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." (40 C.F.R. § 122.22(d).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order. (40 C.F.R. § 122.22(l)(4).)

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 C.F.R. § 122.41(l)(4)(i).)

3. If a Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Dischargers shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Dischargers become aware of the circumstances. A written submission shall also be provided within five (5) days of the time a Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 C.F.R. § 122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 C.F.R. § 122.41(l)(6)(ii)):

   a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)

   b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

F. Planned Changes

The Dischargers shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or

For Municipal Dischargers:

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (40 C.F.R. § 122.41(l)(1)(ii).)

For Industries:

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are subject neither to effluent limitations in this Order nor to notification requirements under section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1). (40 C.F.R. § 122.41(l)(1)(ii).)

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 C.F.R.§ 122.41(l)(1)(iii).)

G. Anticipated Noncompliance

The Dischargers shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Dischargers shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When a Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or USEPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

VI. STANDARD PROVISIONS – ENFORCEMENT

A. The Regional Water Board is authorized to enforce the terms of this permit under several provisions of the Water Code, including, but not limited to, sections 13385, 13386, and 13387.

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural Dischargers shall notify the Regional Water Board as soon as they know or have reason to believe (40 C.F.R. § 122.42(a)):

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(1)):

   a. 100 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(1)(i));

   b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(1)(ii));

   c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(1)(iii)); or

   d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(1)(iv).)

2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following “notification levels" (40 C.F.R. § 122.42(a)(2)):

a. 500 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(2)(i));

b. 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(2)(ii));

c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(2)(iii)); or

d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(2)(iv).)

B. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 C.F.R. § 122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to sections 301 or 306 of the CWA if it were directly discharging those pollutants (40 C.F.R. § 122.42(b)(1)); and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order. (40 C.F.R. § 122.42(b)(2).)

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 C.F.R. § 122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM

Table of Contents

List of Tables

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

The Code of Federal Regulations section 122.48 requires that all NPDES permits specify monitoring and reporting requirements. Water Code Sections 13267 and 13383 also authorize the Regional Water Quality Control Board (Regional Water Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements which implement the federal and California regulations.

I. GENERAL MONITORING PROVISIONS

A. The Dischargers shall comply with the MRP for this Order as adopted by the Regional Water Board, and with all of the Self-Monitoring Program, Part A, adopted August 1993 (SMP, Attachment G of this Order). The MRP and SMP may be amended by the Executive Officer pursuant to US EPA regulations 40 CFR122.62, 122.63, and 124.5. If any discrepancies exist between the MRP and SMP, the MRP prevails.

B. Sampling is required during the entire year when discharging. All analyses shall be conducted using current US EPA methods, or that have been approved by the US EPA Regional Administrator pursuant to 40 CFR 136.4 and 40 CFR 136.5, or equivalent methods that are commercially and reasonably available, and that provide quantification of sampling parameters and constituents sufficient to evaluate compliance with applicable effluent limits. Equivalent methods must be more sensitive than those specified in 40 CFR 136, must be specified in the permit, and must be approved for use by the Executive Officer, following consultation with the State Water Board's Quality Assurance Program. The Regional Water Board will find a Discharger in violation of the limitation if the discharge concentration exceeds the effluent limitation and the Reporting Level for the analysis for that constituent.

C. Minimum Levels. For compliance monitoring, analyses shall be conducted using the lowest commercially available and reasonably achievable detection levels. The objective is to provide quantification of constituents sufficient to allow evaluation of observed concentrations with respect to the Minimum Levels given below. All Minimum Levels are expressed as µg/L approximately equal to parts per billion (ppb).

According to the SIP, method-specific factors can be applied. In such cases, this additional factor must be applied in the computation of the Reporting Level. Application of such factors will alter the Reporting Level from the Minimum Level for the analysis. Dischargers are to instruct laboratories to establish calibration standards so that the Minimum Level value is the lowest calibration standard. At no time is a Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve. The table below indicates the highest minimum level that the Discharger's laboratory must achieve for calibration purposes.

Constituent	Minimum Level	Units
Mercury	0.0005	µg/L

II. MONITORING LOCATIONS

The Dischargers shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Station Locations

Discharge Point Name	Monitoring Location Name	Monitoring Location Description
Discharge point indicated in individual NPDES permits for discharge from the Discharger's wastewater treatment plant (often but not always E-001)	Location as indicated in individual NPDES permits for mercury or other toxic pollutants For C&H Sugar Company, location is M-002. For Mirant Delta, LLC, locations are E-001B through to and including E-001I. For Mirant Potrero, LLC, location is E-001C. For San Francisco International Airport, location is EFF-001A for both its Sanitary and Industrial Plants (or at the Discharger's option, the locations are at EFF-001-Ind for the Industrial Plant and EFF-001-San for the Sanitary Plant for monitoring compliance with the different concentration based limits for each facilitiy). Discharge flow rates shall be at location EFF-001-Ind for the Industrial Plant, and EFF-001-San for the Sanitary Plant.	As described in individual NPDES permits for mercury or other toxic pollutants

III. EFFLUENT MONITORING REQUIREMENTS

The Dischargers shall monitor mercury in effluent as shown in Table E-2 below and reported on the form included in the next section:

Table E-2. Mercury Monitoring Requirements

Parameter	Units[1]	Sample Type[2]	Minimum Sampling Frequency[3,4]
Total mercury[5]	µg/L	C-24 or Grab[6]	Monthly for Major Dischargers (see Table 1A and 1B)
			Quarterly for Minor Dischargers (see Table 1A and 1B), except as otherwise indicated below
			Annually for East Brothers Light Station Inc. Marin County Sanitary District No. 5, Paradise Cove Seafirth Estates Company and Property Owners
Methylmercury[7]	µg/L	C-24 or Grab	Quarterly for Dischargers with Average Annual Mass Limits greater than or equal to 0.08 kg/yr
			Semi-annually for Dischargers with Average Annual Mass Limits between 0.08 and 0.04 kg/yr
			Annually for Dischargers with Average Annual Mass Limits less than or equal to 0.04 kg/yr

(1) Unit Abbreviation: µg/L = micrograms per liter

(2) Sample Type: C-24 = 24-hour composite. 24-hour composites may be made up of discrete grab samples collected over a 24-hour period, or may be collected using automatic compositing equipment.

If using compositing equipment, the Discharger shall implement all feasible ultra clean techniques to reduce sample contamination (such as use of ultra clean Teflon tubing).

(3) Intermittent or seasonal dischargers shall collect samples during those months for which a discharge occurs.

(4) Monitoring frequency: Monitoring frequency may be increased subsequent to reissuance of this Order.

(5) Total mercury: The Dischargers shall use ultra-clean sampling (USEPA 1669), and ultra-clean analytical methods (USEPA 1631) for total mercury monitoring.

(6) Grab Samples shall be collected coincident with composite samples collected for the analysis of other regulated parameters.

(7) Methylmercury: These Dischargers shall use ultra-clean sampling (USEPA 1669) to collect unfiltered methylmercury samples, and ultraclean analytical methods (USEPA 1630/1631, Revision E) with a method detection limit of 0.02 ng/L.

IV. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

The Dischargers shall comply with all Standard Provisions (Attachments D and G) related to monitoring, reporting, and recordkeeping.

B. Individual Reporting in Self Monitoring Reports (SMRs)

1. Compliance with CIWQS

At any time during the term of this permit, the State or Regional Water Board may notify the Dischargers to electronically submit Self-Monitoring Reports (SMRs) using the State Water Board's California Integrated Water Quality System (CIWQS) Program Web site (http://www.waterboards.ca.gov/ciwqs/index.html). Until such notification is given, the Dischargers shall submit hard copy SMRs. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.

2. Due Dates and Information Required for SMRs

a. Report Data with Routine SMR

The Dischargers shall submit mercury data collected as part of this Order in the regular monthly or quarterly Self Monitoring Reports (SMR) required in each Discharger's individual permit. As required in each Discharger's individual permit, for those Dischargers required to report monthly, monthly reports shall be due no later than 30 days after the end of each calendar month. For those Dischargers required to report quarterly in its individual permit, quarterly reports are due 30 days after the end of each calendar quarter.

(i) For Industrial Dischargers claiming an effluent credit for recvcled water use pursuant to Provision V.C.5, the amount of credit claimed for that month shall be reported monthly to the Municipal Discharger that supplied the recycled water. The reporting from the Industrial Discharger to the Municipal Discharger shall be completed no later than 15 days following the end of the

calendar month. The municipal and industrial Dischargers shall then include this information in their respective monthly (or quarterly) and annual SMRs.

(ii) If a Discharger monitors mercury more frequently than required by this Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.

b. **Annual SMR and Required Forms**
Annual SMRs are due February 1 following each calendar year. Each Discharger shall provide its mercury information on the forms shown at the end of this section (pages E-9 through E-13) as an attachment to the cover letter for the Discharger's annual SMR required by its individual permit. Furthermore, by February 1, each Discharger shall send an additional copy of its completed forms to the Regional Water Board by email (in PDF), mail, or fax. This duplicate reporting is necessary to facilitate the Regional Water Board's compilation of the data for compliance determination with the group annual average limitation from all affected Dischargers. Dischargers not required by their individual permits to submit annual SMRs shall still submit annual SMRs for mercury as described in this subsection. The reporting required in this subsection "b." is waived only if the Discharge participates in the Group Compliance Reporting described in IV.C, below.

3. **Monitoring Periods**
Monitoring periods for all required monitoring shall be completed according to the following schedule:

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
Monthly	Effective date of permit	1st day of calendar month through last day of calendar month
Quarterly	Effective date of permit	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31
Semiannually	Effective date of permit	January 1 through June 30 July 1 through December 31
Annually	Effective date of permit	January 1 through December 31

4. **Reporting of ML or RL, DNQ, and ND, and Establishing Calibration Standards**
The Dischargers shall report with each sample result the applicable Minimum Level (ML) or Reporting Level (RL) and the current Method Detection Limit (MDL), as determined by the procedure in 40 CFR Part 136.

The Dischargers shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

   For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words "Estimated Concentration" (may be shortened to "Est. Conc."). The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (± a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

c. Sample results less than the laboratory's MDL shall be reported as "Not Detected," or ND.

d. Dischargers are to instruct laboratories to establish calibration standards so that the ML value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is a Discharger to use analytical data derived from *extrapolation* beyond the lowest point of the calibration curve.

5. **Reporting Data in Tabular Format**
   The Dischargers shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with effluent limitations. The Dischargers are not required to duplicate the submittal of data that is entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Dischargers shall electronically submit the data in a tabular format as an attachment.

6. **Cover Letter for SMR**
   Each Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the WDRs and any exceedances of trigger levels; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation or trigger level exceedance.

7. **Signatory and Certification of SMR**
   SMRs must be submitted to the Regional Water Board, signed and certified as required by the Standard Provisions (Attachment D), to the address listed below:

   Executive Officer
   California Regional Water Quality Control Board
   San Francisco Bay Region
   1515 Clay Street, Suite 1400
   Oakland, CA 94612
   ATTN: NPDES Wastewater Division

8. **Optional Electronic Reporting System**
The Dischargers have the option to submit all monitoring results in an electronic reporting format approved by the Executive Officer. The Electronic Reporting System (ERS) format includes, but is not limited to, a transmittal letter, summary of violation details and corrective actions, and transmittal receipt.

C. Optional Group Compliance Reporting

As an alternative to IV.B.2.b. above, each Discharger at its option, may submit its annual mercury discharge forms to a regional entity, such as the

- Bay Area Clean Water Agencies (BACWA) for Dischargers listed in Table 4A, and non-petroleum refinery Industrial Dischargers listed in Table 4B (provided these Industrial Dischargers have made prior arrangement with BACWA to report on their behalf), of the Order, at
  BACWA
  P.O. Box 24055, MS 702
  Oakland, CA 94623
  ATTN: SF Bay Mercury Watershed Wastewater Permit Compliance Reporting

or

- Western State Petroleum Association (WSPA) for Petroleum Refinery Industrial Dischargers listed in Table 4B of the Order, at
  WSPA
  1415 L Street, Suite 600
  Sacramento, CA 95814
  ATTN: SF Bay Mercury Watershed Wastewater Permit Compliance Reporting

If the Discharger chooses this alternative, it shall indicate in the cover letter of its annual report due to the Regional Water Board on February 1st of its intent and commitment to report with a group by February 15th. **Each Discharger shall provide its mercury information on the form shown at the end of this section** by February 15th so as to allow the respective regional entity to provide compiled information to the Regional Water Board as indicated below. If the Discharger fails to meet its commitment, it will be subject to enforcement action by the Regional Water Board for failure to meet the February 1st reporting deadline and requirement.

1. Compliance Report of Mercury Discharge Levels

By April 1st of each year, the Dischargers' group will submit a report describing the group's mercury discharges for the preceding calendar year. The report will contain the following:

- Summary tables depicting each Discharger's annual and monthly flows, mercury concentrations, and mercury mass loads, calculated as described

in Effluent Limitations III.A. and B. of the Order, and the sum of all the individual Dischargers' annual mass loads (if the Dischargers' group did not receive completed forms from the each group member, the sum should be left blank along with blank rows or columns left in the summary tables those group members);

- An analysis of the effluent data, including discussion of all statistical methods used;
- A discussion of apparent trends in mercury loading of each Discharger; and
- An electronic file containing all the data, in a format compatible with the Regional Water Board's Electronic Reporting System or California Integrated Water Quality System.
- Copies of the completed forms from each Discharger who provided forms.

2. Report on Mercury Reduction Efforts

By April 1st of each year, the Dischargers' group will submit a report describing their mercury reduction efforts. This report will contain the following:

a. A discussion of events that may have affected mercury loading for the preceding calendar year; and

b. A description of mercury source control projects, planned or under way, including where applicable, but not limited to:

   i. descriptions of project activities; and

   ii. implementation schedules for planned source control projects; and

   iii. estimates of mercury mass loads that can be avoided through program activities unrelated to normal treatment, including recycled water delivered, summarized by activity if appropriate.

San Francisco Bay Regional Water Quality Control Board

Annual Mercury Information Reporting Form
Part 1 of 3 – Basic Information

Complete and return all 3 parts of this form to the Regional Water Board no later than February 1st in your Annual Self Monitoring Report, to report on the previous calendar year. You must also mail, fax, or email PDF file of a second copy of this completed form to the address below. In lieu of this dual reporting to the Regional Water Board, you may complete one set of these forms and report through a group in accordance with MRP Section IV.C. (see page E-6).

Comments on data (if any):

For Dischargers claiming an effluent credit for recycled wastewater use pursuant to Provision V.C.5 of the Order, please indicate the credit(s) that will be applied to the mass loads listed above, and show on the back of this sheet the credit calculation and basis (use additional sheets if necessary). For Dischargers who provide or use recycled wastewater tor industrial supply pursuant to Provision V.C.5 of the Order, please indicate any adjustments that have been applied to the mass loads listed above.

San Francisco Bay Regional Water Quality Control Board

Annual Mercury Information Reporting Form
Part 3 of 3 – Source Control Information

Discharger: _____

Calendar Year Reporting: _____

1. Discussion of any events that affected mercury loading for the calendar year:

2. Description of mercury source control projects underway or planned. Each project shall include: (1) description of project activities; (2) implementation schedule(s); and (3) estimates of mercury mass loads that can be avoided through program activities unrelated to normal treatment, summarized by activity if appropriate.

    a. Projects completed or underway during the reporting year:

    b. Projects planned for the near future (include information about expected schedule):

D. Discharge Monitoring Reports (DMRs)

1. As described in Section X.B.1 above, at any time during the term of this permit, the State or Regional Water Board may notify the Dischargers to electronically submit self-monitoring reports. Until such notification is given, major Dischargers (See Tables 1A and 1B in cover section of permit) shall submit mercury results as part of their discharge monitoring reports (DMRs) in accordance with the requirements described below.

2. DMRs must be signed and certified as required by the standard provisions (Attachment D). Each Discharger shall submit the original DMR and one copy of the DMR to the address listed below:

Standard Mail	**FedEx/UPS/ Other Private Carriers**
State Water Resources Control Board Division of Water Quality c/o DMR Processing Center PO Box 100 Sacramento, CA 95812-1000	State Water Resources Control Board Division of Water Quality c/o DMR Processing Center 1001 I Street, 15th Floor Sacramento, CA 95814

3. All discharge monitoring results must be reported on the official US EPA pre-printed DMR forms (EPA Form 3320-1). Forms that are self-generated will not be accepted unless they follow the exact same format of EPA Form 3320-1.

ATTACHMENT F – FACT SHEET

A. The Dischargers listed in this Order are currently discharging pursuant to the Order Nos. and National Pollutant Discharge Elimination System (NPDES) Permit Nos. as shown in Attachment B. This Mercury Watershed Permit implements the San Francisco Bay mercury Total Maximum Daily Load (TMDL) adopted by the Regional Water Board on December 13, 2006. The TMDL will be effective once USEPA approves it. Upon this Order's effective date, it will supersede mercury requirements in the Orders listed in Attachment B, or in the Orders that will be adopted by the Regional Water Board in reissuing the expired or expiring NPDES permits prior to the effective date of this Order.

For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Dischargers herein.

B. The Dischargers listed in Table 1A of the Order own and operate secondary and advanced secondary wastewater treatment facilities as described in their respective Orders. The Dischargers listed in Table 1B of the Order own and operate wastewater treatment facilities as described in their respective Orders. Wastewater is discharged to San Francisco Bay and its tributaries, which are waters of the United States within the San Francisco Bay watershed. Attachment C shows a map of the dischargers subject to this Order.

II. FACILITIES DESCRIPTION

A. Description of Wastewater Treatment

Municipal wastewater treatment plants provide secondary treatment, which includes settling, filtration, and biological treatment. Some plants also provide advanced treatment, which removes additional solids. Removing additional solids removes additional pollutants, like mercury, that adhere to particles. Municipal wastewater treatment plants generally remove over 90% of the mercury in their influent. While the removed mercury is not directly discharged to water, some is returned to the environment through landfills, incinerators, or soil amendments. The primary sources of mercury in municipal wastewater are expected to be human waste and medical and dental facilities.

Industrial Dischargers include petroleum refineries, chemical plants, and other large industrial facilities. The mercury loads depend on the types of activities in which these Dischargers engage. The wastewater treatment facilities also vary depending on the activities. Individual permits, listed in Attachment B, provide further descriptions of treatment processes.

B. Discharge Points and Receiving Waters

The locations of discharge points are shown in Tables 4A and 4B of the Order, above. Treated wastewater is discharged to San Francisco Bay and its tributaries as indicated on Tables 2A and 2B of the Order.

C. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data

Effective effluent limitations contained in current individual permits for the Dischargers subject to this Order are shown in the table below. Information for each Discharger is available in the individual permit and monitoring reports for that Discharger. All limits are specified in ug/l.

Table F-2. Current Individual Permit Mercury Effluent Limits for Municipal Dischargers

Discharger	Average Monthly	Maximum Daily
American Canyon, City of	0.021	0.039

D. Compliance Summary

There have been no serious exceedances of mercury effluent limitations for the Dischargers in recent years.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in the proposed Order are based on the requirements and authorities described in this section.

A. Legal Authorities

This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. Environmental Protection Agency (USEPA) and chapter 5.5, division 7 of the California Water Code (commencing with section 13370). It shall serve as a NPDES permit for point source discharges or mercury from the facilities listed in this Order to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the Water Code (commencing with section 13260).

B. California Environmental Quality Act (CEQA)

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code sections 21100 through 21177.

C. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plans.** The Regional Water Quality Control Board (Regional Water Board) adopted a Water Quality Control Plan for the San Francisco Bay Basin (Region 2) (hereinafter Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, the Basin Plan implements State Water Resources Control Board (State Water Board) Resolution No. 88-63, which established state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply. Beneficial uses applicable to San Francisco Bay Water are as follows:

Table F-4. Basin Plan Beneficial Uses

Receiving Water Name	Beneficial Use(s)
San Francisco Bay and Applicable Tributaries – See individual Order Nos. (Attachment B) for specific Beneficial Uses that apply.	Agricultural Supply (AGR), Cold Freshwater Habitat (COLD), Ocean, Commercial, and Sport Fishing (COMM), Estuarine habitat (EST), Industrial Service Supply (IND), Marine Habitat (MAR), Fish Migration (MIGR), Municipal and domestic Supply (MUN), Navigation (NAV), Industrial Process Supply (PROC), Preservation of Rare and Endangered Species (RARE), Water Contact Recreation (REC1), Noncontact Water Recreation (REC2), Shellfish Harvesting (SHELL), Fish Spawning (SPWN), Warm Freshwater Habitat (WARM) Wildlife Habitat (WILD)

Requirements of this Order implement the Basin Plan.

The Regional Water Board adopted a Basin Plan Amendment on December 13, 2006, that establishes new water quality objectives for mercury, and that establishes the San Francisco Bay Mercury TMDL to attain the new mercury objectives in San Francisco Bay and contiguous bay segments. The new objectives and TMDL become effective after approval by the State Water Board and USEPA. Elevated mercury concentrations currently exist in the tissues of fish, and methylmercury, a highly toxic form of mercury, is a persistent bioaccumulative pollutant. The mercury TMDL calls for reduction of mercury mass loadings to San Francisco Bay. Additional details regarding mercury sources to San Francisco Bay, and technical information related to the San Francisco Bay Mercury TMDL, are provided in the Fact Sheet. The purpose of this Order is to implement the San Francisco Bay Mercury TMDL wasteload allocations for Dischargers listed in Tables 1A and 1B.

2. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000 with respect to the priority pollutant criteria promulgated for California by the USEPA through the California Toxics Rule and National Toxics Rule and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000 with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005 that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this Order implement the SIP.

3. **Antidegradation Policy.** Section 131.12 requires that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the State and federal

antidegradation policies. The permitted discharges must be consistent with the antidegradation provision of section 131.12 and State Water Board Resolution No. 68-16.

4. **Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations at title 40, Code of Federal Regulations[1] section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.

D. Impaired Water Bodies on CWA 303(d) List

On June 6, 2003, the USEPA approved a revised list of impaired water bodies prepared by the State (hereinafter referred to as the 303(d) list), prepared pursuant to provisions of Section 303(d) of the Federal CWA requiring identification of specific water bodies where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. San Francisco Bay is listed as an impaired waterbody for mercury. The SIP requires final effluent limitations for all 303(d)-listed pollutants to be based on total maximum daily loads and associated wasteload allocations.

San Francisco Bay is impaired for mercury because mercury contamination is adversely affecting existing beneficial uses, including sport fishing, preservation of rare and endangered species, and wildlife habitat. Mercury concentrations in San Francisco Bay fish are high enough to threaten the health of humans who consume them. In addition, mercury concentrations in some bird eggs harvested from the shores of San Francisco Bay are high enough to account for abnormally high rates of eggs failing to hatch.

The San Francisco Bay mercury TMDL was adopted by the Regional Water Board on August 9, 2006. The numeric targets, allocations, and associated implementation plan will ensure that all San Francisco Bay segments attain applicable water quality standards, including new mercury water quality objectives indicated in section IV.A.2. to protect and support beneficial uses.

The TMDL allocations and implementation plan focus on controlling the amount of mercury that reaches the Bay and identifying and implementing actions to minimize mercury bioavailability. The organic form of mercury (methylmercury) is toxic and bioavailable, but information on ways of controlling methylmercury production is limited. However, this is an area of active research and strategies for controlling this process are forthcoming. The effectiveness of implementation actions, monitoring to track progress toward targets, and the scientific understanding pertaining to mercury will be periodically reviewed and the TMDL may be adapted as warranted.

The mercury TMDL implementation plan has four objectives: (1) reduce mercury loads to achieve load and wasteload allocations, (2) reduce methylmercury production and consequent risk to humans and wildlife exposed to methylmercury, (3) conduct monitoring and focused studies to track progress and improve the scientific

[1] All further statutory references are to title 40 of the Code of Federal Regulations unless otherwise indicated.

understanding of the system, and (4) encourage actions that address multiple pollutants. The plan establishes requirements for Dischargers to reduce or control mercury loads and identifies actions necessary to better understand and control methylmercury production. In addition, it addresses potential mercury sources and describes actions necessary to manage risks to Bay fish consumers. The adaptive implementation section describes the method and schedule for evaluating and adapting the TMDL and implementation plan as needed to assure water quality standards are attained.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. Section 122.44(d) of the Code of Federal Regulations requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

A. Water Quality-Based Effluent Limitations (WQBELs)

1. Scope and Authority

Section 301(b) of the CWA and section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards. Water quality-based effluent limitations are included in this permit to implement wasteload allocations which are part of the San Francisco Bay mercury TMDL.

2. Applicable Beneficial Uses and Water Quality Criteria and Objectives

The WQC and WQOs applicable to the receiving waters for this discharge are from the Basin Plan. A Basin Plan amendment, adopted by the Regional Water Board on August 9, 2006, and corrected by the Regional Water Board Executive Officer on May 23, 2007 (for the WLA for C&H Sugar Co.), was approved by the State Water Board on July 17, 2007. This Basin Plan amendment added two new mercury water quality objectives and vacated an outdated objective. The new objectives apply to all segments of San Francisco Bay, including all marine and estuarine waters contiguous to San Francisco Bay. The new objective to protect people who consume Bay fish applies to fish large enough to be consumed by humans. The objective is 0.2 mg mercury per kg fish tissue (average wet weight concentration measured in the muscle tissue of fish large enough to be consumed by humans). The proposed objective to protect aquatic organisms and wildlife applies to small fish (3–5 cm in length) commonly consumed by the California least tern, an endangered species. This objective is 0.03 mg mercury per kg fish (average wet weight concentration).

These two new objectives replace the water column four-day average marine mercury objective of 0.025 µg/L, which no longer applies to San Francisco Bay waters. Effluent limitations, and provisions contained in this Order are designed to

implement the new objectives in accordance with the implementation provisions of the San Francisco Bay Mercury TMDL, based on available information.

3. Determining the Need for WQBELs

This Order contains WQBELs for mercury. As required by section 122.44(d)(1)(vii), the Regional Water Board is including WQBELs for mercury in this Order that are consistent with the assumptions and requirements of the San Francisco Bay Mercury TMDL wasteload allocation. Based on the water quality monitoring done at the time of the TMDL adoption, which set the wasteload allocation at the level necessary to attain water quality standards, the Regional Water Board has determined that the WQBEL is consistent with the assumptions of the TMDL. Similarly, compliance with the effluent limitations will satisfy the requirements of the TMDL.

The Regional Water Board has developed water quality-based effluent limitations for mercury pursuant to section 122.44(d)(1)(vii), which does not require or contemplate a reasonable potential analysis. Similarly, the SIP at Section 1.3 recognizes that reasonable potential analysis is not appropriate if a TMDL has been developed.

4. WQBEL Calculations

There are two sets of WQBELs in this Order: mass-based and concentration-based.

Mass-based WQBELs

The mass-based WQBEL's are based on the established aggregate wasteload allocations for municipal Dischargers and industrial Dischargers which comprise a portion of the San Francisco Bay mercury TMDL. For the San Francisco Bay mercury TMDL, loads are expressed in terms of annual mercury loads in kilograms per year (kg/yr) because the adverse effects of mercury occur through long-term bioaccumulation. The loads are intended to represent long-term averages and account for long-term variability, including seasonal variability.

The San Francisco Bay mercury TMDL's initial aggregate load limit of 17 kg/yr and associated individual load limits for Municipal Dischargers are shown in Table F-5 below. Also shown are the interim aggregate load limit and associated individual load limits applicable in 10 years, and final wasteloads allocations that apply in 20 years.

The Order implements the 10 and 20 year timeframe for compliance with the interim and final aggregate load limits of the TMDL's wasteload allocations. These timeframes are appropriate to allow Municipal Dischargers time to implement additional measures to reduce their contribution of mercury discharge to San Francisco Bay. The timeframes are as soon as possible because of the high level of uncertainty in pollution prevention methods and other measures envisioned in the TMDL for reducing mercury discharge concentrations from municipalities. As indicated in the TMDL, the other measures that would be necessary include wastewater re-use, pollutant trading, offsets and/or system improvements. The

uncertainties inherent in developing a pollutant trading and offset program warrant this long timeframe as state policies for these programs are still in their initial stages. The development and design of plans for the infrastructure and funding required for significantly increasing wastewater re-use, and system improvements by public agencies also warrant such a timeframe.

Table F-5. TMDL Mass Limits and Wasteload Allocations for Municipal Wastewater Dischargers

Notes to Tables F-6 and F-7:

[a] Total differs slightly from the column sum due to rounding.

[b] Wasteload allocations for industrial wastewater discharges do not include mass from once-through cooling water. The Regional Water Board will apply intake credits to once-through cooling water as allowed by law.

Because wastewater Dischargers regularly monitor and report their discharges, their combined loads can be estimated more precisely than any of the other loads estimated for the San Francisco Bay mercury TMDL. Available data are sufficient to allow statistical analyses that quantitatively characterize variations from year to year. The initial waste load allocations were based on current load estimates computed using available data on effluent mercury concentrations and effluent discharge volumes from 2000 through 2003.

In order to account for the inter-annual variability of discharge given the relatively short data period, current loading for the two wastewater discharge groups (municipal and industrial) was estimated as the upper 99% confidence intervals about the mean. The combined mercury load for all municipal wastewater discharges to San Francisco Bay and its tributaries is about 17 kg/yr. The combined load of the industrial Dischargers and petroleum refineries is about 1.3 kg/yr. Together, these wastewater discharges account for a load of about 18.3 kg/yr, or about 2% of the bay's total mercury load. As stated in the TMDL implementation plan, "if any aggregate mass limit is exceeded, the Regional Water Board will pursue enforcement actions against those individual dischargers whose mass discharges exceed their individual mass limits. "

This Order does not contain requirements for the California Department of Parks and Recreation, Angel Island State Park, the PG&E Hunters Point facility, or the US Navy Point Molate facility, because the wastewater discharges from these facilties have ceased and the Regional Water Board has rescinded their NPDES permits. This Order also does not contain requirements for the three Hanson Aggregates facilities which currently are covered or will soon be covered in general NPDES permits. These facilities comprise a very small portion of the total wastewater mercury load to San Francisco Bay, although mercury TMDL wasteload allocations may be implemented for these facilities in the future through separate actions.

Concentration-based WQBELs

In addition to the mass limits, which are based directly on the TMDL's wasteload allocations, this Order requires Dischargers to meet concentration effluent limitations. This is consistent with the assumptions and requirements of the TMDL, as well as the State Water Board's understanding in Resolution No. 2007-0045 approving the TMDL whcih states in part "that any NPDES permit or permits that implement the San Francisco Bay mercury TMDL will include individual numeric effluent limitations consistent with the assumptions and requirements of waste load allocations for each wastewater discharger, that will be individually enforceable." A primary assumption and requirement of the TMDL is that wastewater dischargers maintain current treatment performance. This is stated in the TMDL and its supporting documents as follows:

- "The watershed NPDES permit for municipal facilities will put in place a set of triggered actions … intended … to ensure that municipal wastewater facilities maintain their ongoing operation, maintenance, and performance." (p. 75, Staff Report for the TMDL, September 2, 2004)
- The TMDL's "conditions are intended … to ensure that industrial wastewater facilities maintain proper operation, maintenance, and performance." (BPA-20, Basin Plan Amendment, August 9, 2006)

Moreover, the TMDL's initial wasteload allocations were calculated from actual discharge data from 2000 to 2003.

To set individual numeric limits consistent with this and the performance levels determined in the TMDL as necessary to attain water quality standards, Regional Water Board staff derived performance based concentration limits for three separate categories of performance using discharge data from the same time period (2000 through 2003) from representative sets of wastewater dischargers. These data were obtained from data reported by the Dischargers to the Regional Water Board's Electronic Reporting System (ERS), or entered into ERS by Regional Water Board staff from the Dischargers' self-monitoring reports. The calculations are described in Appendix F-2 of this Fact Sheet. The three categories of performance are municipal secondary treatment, municipal advanced secondary treatment, and industrial treatment based on petroleum refineries' performance.

The concentration limits for non-petroleum refinery Dischargers were determined using performance data from petroleum refineries (2000-2003). Though the manufacturing and treatment processes at those facilities differ from those at petroleum refineries, using petroleum refinery performance data is consistent with the way the performance based trigger levels were set for all industrial dischargers in the TMDL.

As required by 40 CFR 122.45(d), average monthly and average weekly effluent limits are set for "publically owned treatment plants"; these include the Municipal Dischargers. For Industrial Dischargers, this regulation requires average monthly and maximum daily effluent limits.

Individual mercury mass and concentration effluent limitations are shown in Tables F-8 and F-9 below. These limitations are intended to minimize the potential for adverse effects in the immediate vicinity of discharges and to ensure that wastewater facilities maintain proper operation, maintenance, and performance.

Aggregate Mass Emission Limit (kg/yr)	17[4]	**14**	**11**	Not Applicable	Not Applicable

Footnotes:

(1) Compliance with the Average Annual Effluent Limitations is determined annually for each Municipal Discharger each calendar year, and is attained if the sum of the individual Municipal Dischargers' mercury mass emissions, calculated as described below, is not greater than the Aggregate Mass

Emission Limit of 17 kg/yr (or 14 kg/yr in 10 year, or 11 kg/yr in 20 years). If the sum of all individual Municipal Dischargers' mercury mass emission(s) is greater than 17 kg/yr (or 14 kg/yr in 10 year, or 11 kg/yr in 20 years), the Municipal Discharger(s) whose mercury mass emission(s) exceed(s) its (their) individual limitation(s) in Table 6, shall be deemed to be in violation of its (their) mercury mass limitation(s). For compliance determination, mass emissions shall be determined as defined below:

a. The total annual aggregate mass emission shall be the sum of the individual annual mass emissions from each Municipal Discharger. The sum shall be rounded to the nearest kilogram for comparison with the Aggregate Mass Emission Limit.

b. The annual average mass emission for each Discharger shall be computed for the period January 1 through December 31, annually. Calendar timeframes for discharge limitations are consistent with federal regulations and USEPA guidance. If there are delays in USEPA's approval of the TMDL such that this Order does not become effective until well into a calendar year, say one calendar quarter, it is appropriate to delay compliance determination with the annual limit until the next full calendar year so as to not bias the annual mass emission calculation with data from just the remainder of the calendar year.

c. The annual average mass emission for each Discharger listed in Table F-8 above shall be the sum of monthly emissions on a calendar year basis and computed as follows:

$$Annual\ Mass\ Emission, kg/year = \sum \left(Monthly\ Mass\ Emission\ Rates, kg/month \right)$$

where

$$Monthly\ Mass\ Emission, kg = \left(\frac{0.003785}{N} \right) * \left(\sum_{i=1}^{N} Q_i C_i \right) * 30.5 = \frac{0.1154425}{N} * \left(\sum_{i=1}^{N} Q_i C_i \right)$$

and where

C_i = mercury concentration of each individual sample, µg/l
Q_i = Discharger flow rate on date of sample, millions of gallons per day (mgd)
N = number of samples collected during the month
0.003785 = conversion factor to convert (µg/l)*(mgd) into kg/day
30.5 = number of days in a standard month
0.1154425= product of (conversion factor)·(number of standard days per month)

(2) This Order requires the Dischargers to achieve an analytical minimum level based on that specified in USEPA Method 1613.

Minimum Levels

Constituent	Minimum Level	Units
Mercury	0.0005	µg/L

(3) This Discharger serves domestic customers but is not a municipal government agency.

(4) Total differs slightly from the column sum due to rounding to the nearest kilogram.

(5) The first Annual Average Effluent Limits represent the San Francisco Bay Mercury TMDL's initial mass limits for Municipal Dischargers. In accordance with the TMDL and the compliance schedule provision that the Regional Water Board will submit to USEPA for approval, the Municipal Dischargers listed in this table have up to 10 years from the effective date of this Order to achieve the "Effective in 10 Years Annual Average Effluent Limits" and its respective Aggregate Annual Mass Emission Limit, and up to 20 years to achieve the "Effective in 20 Years Annual Average Effluent Limits" and its respective Aggregate Annual Mass Emission Limit listed in Table 6.

Table F-9. Industrial -- Individual Mercury Effluent Limitations

Permitted Entity	Annual Average Effluent Limit[1,2] (kg/yr)	Monthly Average Effluent Limit[2] (µg/L)	Daily Maximum Effluent Limit[2] (µg/L)
Industrial Wastewater Discharger (Non-Petroleum Refinery):			
C&H Sugar and Crockett Community Services District	0.045	0.079	0.12
Crockett Cogeneration, LP and Pacific Crockett Energy, Inc.	0.0047	0.079	0.12
The Dow Chemical Company	0.041	0.079	0.12
General Chemical West, LLC	0.21	0.079	0.12
GWF Power Systems L. P., Site I	0.0016	0.079	0.12
GWF Power Systems L. P., Site V	0.0025	0.079	0.12
Pacific Gas and Electric Company	0.00063	0.079	0.12
Rhodia, Inc.	0.011	0.079	0.12
San Francisco, City and County of, SF International Airport, Industrial	0.051	0.079	0.12
Mirant Delta, LLC	0.0078	0.079	0.12
Mirant Potrero LLC	0.0031	0.079	0.12
USS-Posco Industries	0.045	0.079	0.12
Industrial Wastewater Discharger (Petroleum Refinery):			
Chevron Products Company	0.34	0.079	0.12
ConocoPhillips	0.13	0.079	0.12
Shell Oil Products US and Equilon Enterprises LLC	0.22	0.079	0.12
Tesoro Refining & Marketing Co.	0.11	0.079	0.12
Valero Refining Company	0.08	0.079	0.12
Aggregate Mass Emission Limit[3] (kg/yr)	**1.3**	Not Applicable	Not Applicable

Footnotes:

(1) Compliance with the Average Annual Effluent Limitations is determined annually for each Industrial Discharger each calendar year, and is attained if the sum of the individual Industrial Dischargers' mercury mass emissions, calculated as described below, is not greater than the Aggregate Mass Emission Limit of 1.3 kg/yr. If the sum of the individual Industrial Dischargers' mercury mass emission(s) is greater than 1.3 kg/yr, the Industrial Discharger(s) whose mercury mass emission(s) exceed(s) its (their) individual limitation(s) in Table 6, shall be deemed to be in violation of its (their) mercury mass limitation(s). For compliance determination, mass emissions shall be determined as defined below:

a. The total annual aggregate mass emission shall be the sum of the individual annual mass emissions from each Industrial Discharger. The sum shall be rounded to the nearest kilogram for comparison with the 1.3 kg/yr.

b. The annual average mass emission for each Discharger shall be computed for the period January 1 through December 31, annually. Calendar timeframes for discharge limitations are consistent with federal regulations and USEPA guidance. If there are delays in USEPA's approval of the TMDL such that this Order does not become effective until well into a calendar year, say one calendar quarter, it is appropriate to delay compliance determination with the annual limit until the next full calendar year so as to not bias the annual mass emission calculation with data from just the remainder of the calendar year.

c. The annual average mass emission for each Discharger listed in Table F-9 above shall be the sum of monthly emissions on a calendar year basis and computed as follows:

$$Annual\ Mass\ Emission, kg/year = \sum (Monthly\ Mass\ Emission\ Rates, kg/month)$$

where

$$Monthly\ Mass\ Emission, kg = \left(\frac{0.003785}{N}\right) * \left(\sum_{i=1}^{N} Q_i C_i\right) * 30.5 = \frac{0.1154425}{N} * \left(\sum_{i=1}^{N} Q_i C_i\right)$$

and where

C_i = mercury concentration of each individual sample, µg/l
Q_i = Discharger flow rate on date of sample, millions of gallons per day (mgd)
N = number of samples collected during the month
0.003785 = conversion factor to convert (µg/l)*(mgd) into kg/day
30.5 = number of days in a standard month
0.1154425= product of (conversion factor)·(number of standard days per month)

(2) This Order requires the Dischargers to achieve an analytical minimum level based on that specified in USEPA Method 1613.

Minimum Levels

Constituent	Minimum Level	Units
Mercury	0.0005	µg/L

(3) Total differs slightly from the column sum due to rounding, and from several industrial dischargers discontinuing their discharges.

5. Satisfaction of Anti-Backsliding Requirements

Effluent limits based on a TMDL are afforded certain latitude in terms of anti-backsliding. As outlined in the State Water Board's Office of Chief Counsel memorandum pertaining to offsets, pollutant trading, and market programs, dated November 22, 2006, when a TMDL is in place, the Clean Water Act and the Porter-Cologne Water Quality Control Act give latitude to develop means of achieving compliance with water quality standards, subject to certain limitations. Water quality based objectives may be adjusted upwards or downwards to be consistent with the TMDL. While the Clean Water Act's anti-backsliding provisions generally prohibit allowing less stringent effluent limitations, section 402(o) contains an express exception applicable when a TMDL is in place. It allows relaxation consistent with the TMDL if "the cumulative effect of all such revised effluent limitations based on such total maximum daily load or waste load allocation will assure attainment of such water quality standards. . . ." 33 U.S.C. § 1313(d)(4)(A)(i). Federal regulations bolster this and require WQBELs to be "consistent with the assumptions and requirements of any available wasteload allocations." 40 CFR 122.44(d)(1)(vii)(B). As set forth in the above-mentioned memorandum, "…as long as the cumulative effect of all WQBELs for NPDES-permitted discharges to a water is consistent with the assumptions and requirements of an applicable TMDL, the regional water board may adjust WQBELs using a variety of mechanisms that are designed to achieve the attainment of water quality standards."

Additionally, under the State Board Order WQ 2001-06 (Tosco Order[2]), the State Water Board held that a "limit that implements or is consistent with the wasteload allocations in a TMDL complies with the exception in Section 303(d)(4)."

It is important to keep the above principles in mind when implementing a TMDL. In any event, in this specific case, anti-backsliding is not even applicable. Anti-backsliding prevents backsliding from comparable limits (Tosco Order). All of the proposed limits in the proposed permit are either equal to or consistent with the assumption and requirements of the TMDL. The previous limits were not. Therefore, they are not comparable.

Even if anti-backsliding did apply here, for the current individual permits that specify water quality based mass effluent limits for mercury, Section 303(d)(4) allows relaxation of those limits because the annual average mass limits in this Order are based on the wasteload allocations in the San Francisco Bay mercury TMDL, and the implementation of this TMDL will assure attainment of the water quality standard for mercury.

Similarly, section 303(d)(4) also allows backsliding for the ten Municipal Dischargers and eight Industrial Dischargers whose monthly concentration limits are less stringent than their current (water quality based) individual permits. The newly calculated concentration limits are based on the dataset used to derive the wasteload allocations of the TMDL. They also reflect the levels that, as determined by the TMDL, will attain the water quality objective for mercury. Therefore, they are consistent with the assumptions and requirements of the mercury TMDL and will assure attainment of water quality standards, consistent with section 303(d)(4) and 40 CFR 122.44(d)(1)(vii)(B).

Section 402(o)(2)(B)(i) further provides justification for relaxing the ten Municipal and two Industrial (PG&E and Tesoro) Dischargers' concentration limits. This section allows backsliding if new information (other than revised regulations, guidance, or test methods) is available that justifies less stringent limits. The new information is that the basis for these previous limits is not a scientifically reliable indicator for protecting water quality and beneficial uses from mercury. Specifically, the previous permit limits were based directly, or carried over from limits based directly, on the scientifically outdated mercury objective of 0.025 μg/L (or the equally outdated and illegal footnoted criterion of 0.012 μg/L) of the Basin Plan. Further, as a policy matter, anti-backsliding requirements should not canonize bad science or illegally derived limits. Limits based on a TMDL reflect the latest science and will assure attainment of water quality objectives in a coherent and consistent manner that takes into account all loading inputs to a waterbody and which does not penalize good performing dischargers.

[2] The Tosco Order has been upheld in two Court of Appeal decisions, *CBE et al. v. State Water Resources Control Board et al*., 109 Cal.App.4th 1089 (2003) and 132 Cal.App.4th 1313 (2005).

6. Satisfaction of Antidegradation Policy

The Order's mercury effluent limitations, which implement wasteload allocations, have been computed to satisfy the total maximum daily load that will allow the San Francisco Bay to come into attainment with water quality objectives. This Order includes requirements that are part of an overall comprehensive plan to restore mercury levels in San Francisco Bay. Because the TMDL is consistent with protecting existing instream water uses and the level of water quality necessary to protect the existing uses, antidegradation requirements are satisfied. Furthermore, this Order specifies performance based effluent limits that will assure compliance with antidegredation.

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

No additional receiving water limits beyond those already specified in the Dischargers' individual permits are necessary in this Order.

VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

Section 122.48 requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP), Attachment E of this Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this facility.

The mercury TMDL contains a requirement to "prepare an annual report that documents mercury loads from each facility, mercury and methylmercury effluent concentrations, and ongoing source control activities, including mercury loads avoided through control actions." Dischargers are therefore required by this Order to report mercury discharge levels and trends, and mercury reduction measurements in Self-Monitoring Reports to facilitate the adaptive management process for implementation of the San Francisco Bay mercury TMDL. A special form is provided for use in compiling information for determining compliance with the group mass limit. Duplicate reporting using the form is required which the Regional Water Board believes is not burdensome for the Dischargers, but will facilitate the Regional Water Board's timely determination of compliance with the group mass limit. Incentive is provided for the optional group reporting by eliminating the duplicative reporting requirement, and allowing the Dischargers a little more time to provide the data. This optional group reporting facilitates adaptive management, and also consolidates the information in one place for ease of access by the public.

The monitoring frequencies specified in the MRP are dependent on each Discharger's contribution of mercury, and its resources to conduct the monitoring. For example, those with higher mercury limits and/or are major dischargers are required to monitor more frequently.

Also, pursuant to USEPA guidance (Technical Support Document, March 1991) the following factors were considered in selecting the frequencies. (The data referenced below are summarized in Appendix F-3.):

- Effluent variability – The individual discharge concentrations are generally not highly variable with the coefficient of variation for a representative set of Dischargers at a median of 0.5 (full range is from about 0.3 up to 2).

- Type of treatment process including retention times – the majority of the treatment processes involves biological processes with a few of the smaller industrial facilities relying upon physical/chemical treatment. For the most part, these systems have long retention times on the order of days up to a week for some systems.

- Compliance history – All Dischargers have complied with their applicable effluent limits for mercury in the past 5 years with very few exceptions. Pursuant to USEPA "Interim Guidance for Performance-Based Reductions of NPDES Permit Monitoring Frequencies," dated April 19, 1996, lower frequencies than those proposed in this Order may be appropriate. However, in consideration of the other factors listed here, those Dischargers are required by this Order to monitor at least once per month.

- Cost of monitoring relative to the Discharger's capabilities – Mercury and methylmercury sampling requires use of ultra-clean low detection techniques requiring at least two personnel to properly perform. The analysis is also specialized and costs more for this reason. As indicated in the paragraph above, the monitoring frequency was staggered based on each Discharger's resources to conduct the monitoring.

- Number of monthly samples used in developing the permit limit – previous individual permits have for the most part required monthly monitoring with a few permits requiring weekly or biweekly monitoring and others at quarterly or annual frequencies. Some Dischargers monitored more frequently than required. All these data were used in calculating the wasteload allocations that formed the effluent limits in this Order.

- Environmental significance and nature of the pollutant – Mercury is a pollutant of great concern in San Francisco Bay because it is bioaccumulative and is an impairment to beneficial uses. The Dischargers covered by this Order make up close to 2 percent of the total mercury load to the Bay.

The Regional Water Board finds that these monitoring and reporting requirements bear a reasonable relationship to the Regional Water Board's need for and the benefits obtained from the reports.

VII. RATIONALE FOR PROVISIONS

A. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in

accordance with section 122.42, are provided in Attachment D. The Dischargers must comply with all standard provisions and with those additional conditions that are applicable under section 122.42. Standard Provisions section V.D does not apply in this Order because it pertains to compliance schedule which is not required in this Order.

Section 122.41(a)(1) and (b) through (n) establish conditions that apply to all State-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in the Order. Section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with section 123.25, this Order omits federal conditions that address enforcement authority specified in sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

B. Special Provisions

1. Triggers for Additional Mercury Control

Mass and concentration triggers were developed to allow for early required actions in the event an increasing trend in mercury discharge is observed by individual Dischargers. The purpose of the triggers is to evaluate the source of new mercury and identify a method for reduction before levels become elevated.

Consistent with the TMDL, mass triggers for municipal and industrial Dischargers are equivalent to the individual mass limits stated in the Order, but determined monthly, instead of annually, using a rolling 12-month average. This is necessary in order to capture any increases in a more timely fashion to allow development and implementation of reduction measures that may avoid an actual effluent limit violation.

For concentration triggers, there are two broad categories of municipal facilities—those that provide secondary treatment, and those that provide advanced treatment. Facilities providing advanced treatment have better performance, hence lower effluent concentrations than those providing secondary treatment, so the trigger concentrations for advanced facilities are lower than those for secondary treatment facilities.

Consistent with the TMDL implementation plan, the proposed effluent mercury concentration trigger values for municipal secondary treatment facilities are a daily maximum of 0.065 µg/l total mercury (derived from the 99th percentile concentration of effluent data collected from January 2000 to September 2002) and a monthly average of 0.041 µg/l total mercury (derived from the 95th percentile concentration of effluent data collected from January 2000 to September 2002). For facilities providing advanced treatment, the proposed concentration triggers are a daily maximum of 0.021 µg/l total mercury (the 99th percentile concentration) and a monthly average of 0.011 µg/l total mercury (the 95th percentile concentration).

Consistent with the TMDL implementation plan, the proposed effluent trigger concentrations for industrial Dischargers are a daily maximum of 0.062 µg/l total mercury (derived from the 99th percentile concentration of effluent data collected from January 2000 to September 2002) and a monthly average of 0.037 µg/l total mercury (derived from the 95th percentile concentration of effluent data collected from January 2000 to September 2002).

Consistent with the TMDL if a Discharger exceeds either the mass or concentration trigger, the Order requires the Discharger to report the exceedance in its individual Self-Monitoring Report, and to submit a report that:

- Evaluates the cause of the trigger exceedances;
- Evaluates the effectiveness of existing pollution prevention or pretreatment programs and methods for preventing future exceedances;
- Evaluates the feasibility and effectiveness of technology enhancements to improve plant performance.

The Order provides for 130 days to provide this report, which allows for 30 days for standard laboratory turnaround on ultra clean samples, plus 40 days for accelerated monitoring to verify and better characterize trigger exceedances, and finally the 60-day timeframe from the TMDL implementation plan to submit the report. The Regional Water Board will pursue enforcement action against Dischargers that do not respond to exceedances of triggers or do not implement actions to correct and prevent trigger exceedances. Determination of appropriate actions will be based on an updated assessment of source control measures and wastewater treatment technologies applicable for the term of each issued or reissued permit.

The TMDL implementation plan requires the permit to specify that an exceedance of a trigger level would trigger the discharger to take corrective actions. The TMDL implementation plan explains that one of the concepts behind requiring triggered actions is to ensure that wastewater dischargers maintain ongoing operation, maintenance, and performance of their treatment facilities. Therefore, it is consistent with this concept for this Order to allow further characterization through accelerated monitoring to determine if ongoing performance was maintained before corrective measures must be taken. Accelerated weekly monitoring for at least six events that would span over two months would provide reasonable and convincing weight of evidence that the first initial trigger was either an anomaly or a spurious source and could be disregarded. These additional samples would also help to characterize the duration and magnitude of the exceedance and help with development of the action plan should one be necessary.

See Appendix F-1 for an example of actions required in response to initial trigger exceedances:

2. Mercury Source Control Program for Municipal Dischargers

The mercury TMDL includes a requirement to “develop and implement effective programs that include but are not limited to pollution prevention to control mercury sources and loading, a plan and schedule of actions and effectiveness measures

applicable for the term of the permit, based on identification of the largest and most controllable sources and an updated assessment of source control measures and wastewater treatment technologies (the level of effort shall be commensurate with the mercury load and performance of the facility) and quantify the mercury load avoided or reduced…" Therefore, this Order contains requirements for source control. Dischargers are responsible for investigating the sources and strategies for controlling those sources. However, a major source of mercury to wastewater treatment plants is from dental offices, and efforts are already underway by municipal wastewater facilities to manage and reduce the amount of mercury amalgam that is discharged from dental offices into the public collection systems. The target for this program is that 85 percent of dental offices in the region will be participating in an amalgam program five years after full adoption of the TMDL.

3. Additional Special Studies for Adaptive Management

The potential availability of wastewater mercury for methylation and biological uptake, and possible local effects of such discharges, is not well understood. Consistent with the TMDL, this Order requires Dischargers to undertake or otherwise support studies to evaluate local impacts and bioavailability. If evidence of local effects from wastewater effluent is discovered, or if municipal wastewater facilities significantly contribute to mercury concentrations in the food web, the Regional Water Board may impose discharge restrictions aimed at minimizing or avoiding adverse impacts.

Due to the uncertainties in assessing the nature of sources and impacts of mercury, the TMDL was designed with an adaptive management approach. In particular, the TMDL implementation plan specifies requirements for Dischargers to:

- Conduct or cause to be conducted studies aimed at better understanding mercury fate, transport, the conditions under which mercury methylation occurs, and biological uptake in San Francisco Bay and tidal areas, and
- Conduct or cause to be conducted studies to evaluate the presence or potential for local effects on fish, wildlife, and rare and endangered species in the vicinity of wastewater discharges

Consistent with the adaptive management approach, after the activities in the initial years of the permit for evaluating group mercury discharges, collecting methylmercury data of wastewater effluent, conducting source control programs, and engaging in risk management, this Order requires the development of a work plan by Dischargers within the permit term to conduct or participate in management studies. It is intended that information gathered to date will be used to begin the process of evaluating sources and impacts of mercury to identify next steps to control mercury in San Francisco Bay.

These studies may be undertaken by BACWA or WSPA on the Dischargers' behalf, or by such other agents (e.g., CEP, Regional Monitoring Program) as may exist or come into existence for this purpose. The Dischargers are collectively and individually responsible for undertaking such studies. It is the intent of the Regional

Water Board to maximize the use of existing programs and resources for monitoring and research efforts.

4. Risk Reduction Programs

The TMDL requires municipal and industrial wastewater Dischargers to "develop and implement effective programs to reduce mercury-related risks to humans and wildlife and quantify risk reductions resulting from these activities." This provision is based on this requirement. We envision a multi-phase process to develop a regional risk management strategy. The Order requires Dischargers to include public participation in the development process as this could make the programs more effective. The first phase should focus on identifying specific risk-management needs, the appropriate measures to address those needs, and the associated costs and mechanisms to implement the measures. This could reasonably take one to two years to develop. Another year is a reasonable timeframe for municipal entities to secure resources and identify the appropriate mechanisms to start implementing the risk reduction programs.

As indicated in the TMDL, in this effort, the Regional Water Board will work with the California Office of Environmental Health Hazard Assessment, the California Department of Public Health, and other organizations including Dischargers that pursue risk management as part of their mercury-related programs. For an effective and efficient regional program, the Order allows that the activities may be performed by a third party if the Dischargers wish to provide funding for this purpose. The Regional Monitoring Program is one such vehicle because it has an equitable and accepted cost allocation system already in place along with an established stakeholder overview and participation process.

5. Effluent Discharge Adjustment for Recycled Wastewater Use by Industrial Dischargers

As dictated by California Water Code sections 13510 through 13512, the Regional Water Board should support and encourage water recycling facilities. The use of recycled wastewater preserves fresh potable water supply sources. The effluent discharge adjustment (or Adjustment) provided in this Order is to avoid penalizing Dischargers who produce recycled wastewater and Dischargers who use recycled wastewater in industrial processes, and is based on the principles outlined in the Basin Plan at 4.6.1.1. It is also similar to an existing provision in the individual permits for the petroleum refineries.

The Adjustment is only applicable if the mercury in the recycled wastewater is ultimately discharged through an industrial discharger's outfall. The Adjustments are calculated based on mass balance principles and will thus not result in any net increase in mercury loadings to the Bay. The mass Adjustment subtracted from one industrial discharger, is then added to the municipal discharger who supplied the recycled wastewater and who would have otherwise discharged that mercury through its municipal treatment plant discharge outfall. Local impacts from this shifting in load will be minimal because the discharge locations for the two will be to the same receiving water body. This is because the cost of water transport between

facilities that are very far apart would make the reuse project infeasible. Furthermore, this Order's Provision V.C.3 requires Additional Special Studies that will look for the "presence of, or potential for, local effects in the vicinity of wastewater discharges." If any local impacts are determined, the Regional Water Board will require appropriate corrective measures.

A concentration Adjustment is also provided because a typical reuse project involves use of the recycled wastewater in cooling towers or boilers where the concentration of mercury increases through evaporative losses. The blowdown would go to the industrial discharger's sewer and potentially elevate its discharge concentration. Since the concentration limit is established based on past performance, future recycled wastewater use could impact the industrial discharger's compliance with the performance limit. Therefore, a concentration Adjustment is provided. Unlike the mass Adjustment, it is inappropriate to apply the concentration Adjustment in reverse to the municipal discharger because the reason for the Adjustment is to account for evaporative losses. These losses occur at the industrial facility and do not affect the municipal discharger's performance.

However, it may be appropriate some time in the future to provide a concentration Adjustment when a municipal discharger installs advanced recycled wastewater treatment facilities at its treatment plant site (e.g. reverse osmosis) and blends the concentrated waste stream with its effluent prior to discharge. The mass discharged through the municipal discharger's outfall would not increase but the concentration would. No such projects currently exists in this region.

Currently, the only reuse project where an Adjustment would be applied is between Chevron Products Company (Chevron) and the West County Wastewater District. Chevron currently uses about 4 million gallons per day of recycled wastewater. A new reuse project is scheduled to go on line in 2009 that will bring the amount to approximately 7-8 million gallons per day. West County Wastewater District (WCWD) discharges through a joint outfall with the City of Richmond under the West County Agency NPDES permit. Based on this provision, any mass Adjustment subtracted from Chevron would be added to the mass emission reported by the West County Agency prior to determining compliance with the average annual mass limit.

Under this two way Adjustment, for projects like the WCWD and Chevron recycled water project, the allowable mass discharge to the Bay under this Order would be the sum of the WCWD and Chevron individual mass limits that were based on the wasteload allocations in the TMDL. Only if the sum of WCWD's and Chevron's mass discharge exceed the sum of their individual mass limits would there be a real mass discharge greater than that allowed in the TMDL from these two dischargers. Therefore, this Order allows that a violation would only occur from an Adjustment if the sum of the mass discharge from both exceeds the sum of the individual mass limits, and the adjusted mass discharge from Municipal Dischargers as a group exceeds the aggregate mass limit for the Municipal Dischargers.

6. Reopener Provision

Two reopener conditions are provided in the Order. These are based on the TMDL's adaptive implementation provisions as they relate to the final waste load allocations for municipal dischargers. The TMDL implementation plan states at page BPA 26,

> "the final wasteload allocations are expected to be attained through wastewater treatment system improvements and/or implementation of a pollutant offset program. Approximately 10 years after the effective date of the TMDL or any time thereafter, the [Regional] Water Board will consider modifying the schedule for achievement of the wasteload allocations or revisions to wasteload allocations if:
>
> - The State [Water] Board has not established a pollutant offset program that can be implemented within the 20 years required to achieve final wasteload allocations…"

VIII. PUBLIC PARTICIPATION

The California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board) is considering the issuance of waste discharge requirements (WDRs) that will supersede mercury requirements in existing National Pollutant Discharge Elimination System (NPDES) permits. As a step in the WDR adoption process, the Regional Water Board staff has developed this tentative WDR. The Regional Water Board encourages public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Water Board has notified the Dischargers and interested agencies and persons of its intent to prescribe waste discharge requirements for the discharges and has provided them with an opportunity to submit their written comments and recommendations. Notification was provided through the following: (a) paper copies of this Order were relayed to the Dischargers and other interested parties, and (b) the San Francisco Chronicle published a notice that this item would appear before the Regional Water Board in March 2007.

The Regional Water Board received comments on the March 2007 draft requirements. On July 17, 2007, the State Water Board adopted a resolution approving the San Francisco Bay Mercury TMDL (as corrected). This resolution called on the Regional Water Board to include specific limits in the waste discharge requirements implementing the TMDL. The Regional Water Board revised the draft waste discharge requirements in response to the resolution and comments received on the March 2007, draft.

The Regional Water Board has notified the Dischargers and interested agencies and persons of its intent to prescribe the requirements as revised and has provided them with an opportunity to submit their written comments and recommendations on the revisions. This Notification was provided through the following: (a) Dischargers received

paper copies of this Order, (b) interested agencies and persons received notification by email, and (c) the San Francisco Chronicle published a notice in August 2007 that this item would appear before the Regional Water Board.

B. Written Comments

The staff determinations are tentative. Interested persons are invited to submit written comments concerning the revisions of this Tentative Order. Comments must be submitted either in person or by mail to the attention of **Lila Tang** at the Regional Water Board at the address above on the cover page of this Order.

To be fully responded to by staff and considered by the Regional Water Board, written comments should be received at the Regional Water Board offices by **5:00 p.m. on Monday, September 13, 2007.**

C. Public Hearing

The Regional Water Board held a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date: **November 1, 2007**
Time: 9:00 am
Location: Elihu Harris State Office Building
1515 Clay Street, 1st Floor Auditorium
Oakland, CA 94612
Contact: Lila Tang, (510)622-2425, ltang@waterboards.ca.gov

Interested persons were invited to attend. At the public hearing, the Regional Water Board heard testimony pertinent to the discharges and Tentative Order. Oral testimony was heard; however, for accuracy of the record, important testimony was presented in writing.

Please be aware that dates and venues may change. Our Web address is www.waterboards.ca.gov/sanfranciscobay where you can access the current agenda for changes in dates and locations. Regional Water Board agenda material including staff's responses to written comments, and revisions to the Tentative Order was posted at this website one week prior to the hearing date, and Dischargers and interested parties were notified by email of their availability.

D. Waste Discharge Requirements Petitions

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Water Board regarding the final Order. The petition must be submitted within 30 days of the Regional Water Board's action to the following address:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

E. Information and Copying

The San Francisco Bay Mercury TMDL, Tentative Order, related documents, any comments received, and other information are available at www.waterboards.ca.gov/sanfranciscobay. These documents are also on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., except from noon to 1:00 p.m., Monday through Friday. Copying of documents may be arranged through the Regional Water Board by calling (510) 622-2300.

F. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this permit, and provide a name, address, and phone number.

G. Additional Information

Requests for additional information or questions regarding this order should be directed to **Lila Tang** at **(510)622-2425, or by email at ltang@waterboards.ca.gov.**

APPENDIX F-1 -- EXAMPLE OF WHEN REQUIRED ACTIONS ARE TRIGGERED

Facility X is subject to the following triggers:

Average Monthly Trigger = 0.041 μg/L
Maximum Daily Trigger = 0.065 μg/L
12-month Mass Emission Trigger = 0.91 kg/yr

A sample collected on May 4th is 0.046 μg/L, with the results received on May 30th by discharger X from its contract laboratory.

Discharger Action: Initiate accelerated monitoring (weekly or more frequent) as soon as practical (within 48 hours) after receipt of sample result above trigger level (0.046 μg/L is above the monthly trigger of 0.041 μg/L).

Discharger Action: Report this exceedance in its cover sheet for the May self-monitoring report (due June 30th), and continue to report mercury data on the cover sheet until successful completion.

Discharger Action: Continue accelerated monitoring until not less than a total of 6 new samples have been collected.

Discharger X's accelerated samples reveal the following results:

Sample Date	Sample Result, μg/L	12-month mass, kg/yr
(May 4)	**(0.046)**	0.80
June 1	0.031	0.79
June 5	0.059	0.82
June 14	0.023	0.81
June 18	0.055	0.82
June 30	0.040	0.82
July 5	0.029	0.81

Discharger Action: Initiate, no later than July 5, development of Action Plan for Mercury Reduction..

Note: Despite the fact that the one sample for July are below all three triggers, the average of the samples in June is above the monthly average trigger.

Discharger Action: Discharger may shift to monthly monitoring after collection of the 6th accelerated sample.

Additional monitoring results:

Sample Date	Sample Result, μg/L	12-month mass, kg/yr
August 11	**0.027**	0.80
September 14	0.042	0.78
October 5	0.042	0.075
October 7	ND (<0.0005)	
November 5	0.035	**0.81**
December 10	0.022	**0.93**
January 5	0.018	**0.94**
February 14	0.028	0.85
March 25	0.010	0.81
April 7	0.023	0.75

Discharger Action: Submit and implement Action Plan for Mercury Reduction (due 130 days after May 30).

Note: Despite the July and August samples being below both concentration triggers, three consecutive months below **all** triggers are necessary before the Action Plan activities are no longer required. The May sample is still above the monthly trigger.

Note: In September, though that sample is above the monthly concentration trigger, accelerated monitoring is not required again because discharger X has already been triggered into Action Plan mode.

Note: In December, though the concentrations have been below concentration triggers for 3 consecutive months, discharger X must continue with the Action Plan because its 12-month running average mass discharge exceeds the mass trigger.

Discharger Action: Report on current mercury reduction efforts in its Annual Self-Monitoring Report due February 1st.

In April, three consecutive months show successful completion of this effort. Discharger X is no longer required to further implement its Action Plan, and may thus return to routine monitoring. Discharger X reports its mercury reduction efforts in its Annual Self-Monitoring Report due next February 1st.

APPENDIX F-2 -- CALCULATION OF CONCENTRATION BASED EFFLUENT LIMITS

Introduction

To calculate concentration based mercury limits that are consistent with the assumptions and requirements of the Mercury TMDL, the Regional Water Board analyzed mercury data from 2000 to 2003. We grouped data into three categories (municipal secondary treatment, municipal advanced secondary treatment involving filtration, and industrial treatment). The statistical analysis used data from 17 secondary treatment plants, 7 advanced secondary treatment plants, and 5 petroleum refineries.

The purpose of pooling mercury data to calculate limits based on category of treatment and/or process that are similar to reduce the likelihood of penalizing plants that have implemented effective control measures and are already performing well, and rewarding other plants that may not have implemented similar measures.

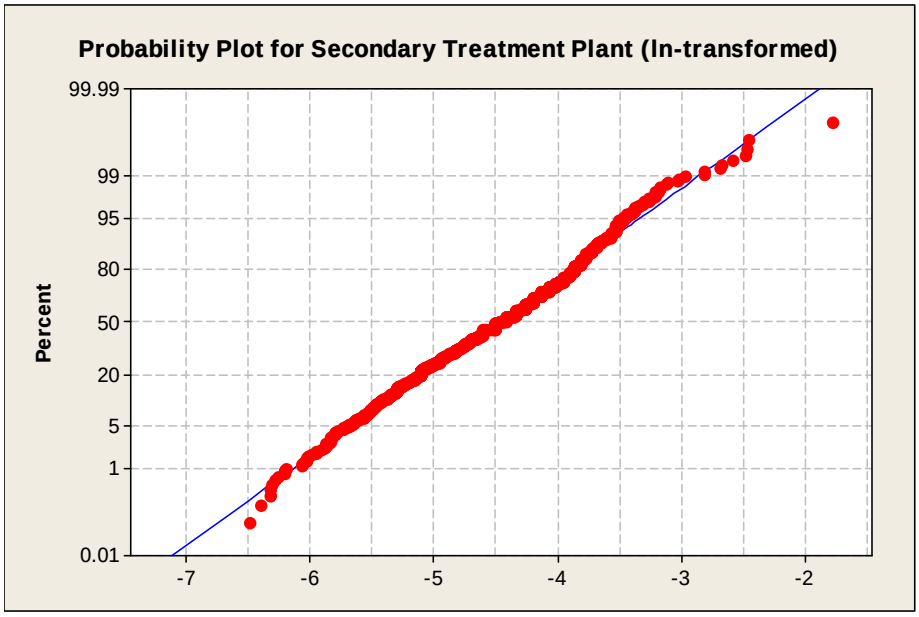
Data Analysis of Municipal Treatment Facilties

We analyzed mercury data from all POTWs that are using the Regional Water Board's electronic reporting system (ERS). Mercury data that did not appear to result from ultra-clean sampling because of high detection limits were removed (i.e., EBMUD data from January 2000 through May 2001, and San Francisco City and County Southeast from October 21, 2003). Additionally, when detection limits were very low (practical quantification limit (PQL) equaled 0.5 ng/L and method detection limit equaled 0.24 ng/L, we censored data at the PQL). Finally, we did not use data from the South Bayside System Authority because this treatment plant does not always filter treated wastewater, which makes it difficult to categorize this system as secondary or advanced secondary treatment.

Secondary Treatment Plants

Our analysis of secondary treatment plants indicates that mercury data fit a log-normal distribution since the data closely follow the line of normality, as shown in Figure 1 below:

Figure 1: Probability Plot of Mercury Data for Secondary Treatment Plants



Because natural log transformed mercury data for secondary treatment plants fits a normal distribution, it is possible to calculate performance-based limits based on select percentiles. For secondary treatment plants (sample size of 984), the mean and standard deviation in the natural log phase are -4.5212 and 0.7188, respectively. We calculated daily, weekly, and monthly mercury limits based on the 99.87th percentile (3 standard deviations above the mean), the 99.57th percentile (2.625 standard deviations above the mean), and the 99.38th percentile (2.5 standard deviations above the mean).

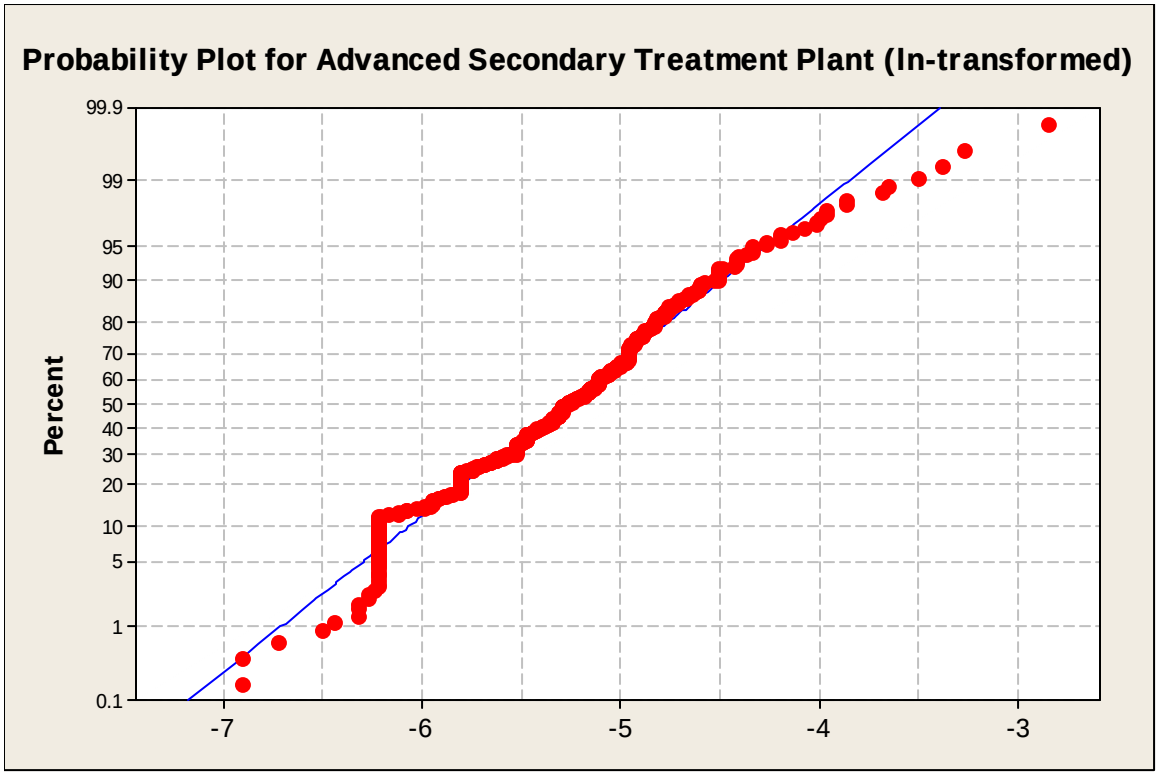
Table 1: Mercury Limits for Secondary Treatment Plants

Percentile	Averaging Period	Mercury Limit (ng/L)
99.87th	Daily	94
99.57th	Weekly	72
99.38th	Monthly	66

Advanced Secondary Treatment Plants

Our analysis of advanced secondary treatment plants indicates those data also fit a log-normal distribution since the data follow the line of normality, as shown in Figure 2 below.

Figure 2: Probability Plot of Mercury Data for Advanced Secondary Treatment Plants



Because natural log transformed mercury data for advanced secondary treatment plants fits a normal distribution, it is again possible to calculate performance-based limits based on select percentiles. For advanced secondary treatment plants (sample size of 434), the mean and standard deviation in the natural log phase are -5.3457 and 0.6664, respectively. We

calculated daily, weekly, and monthly mercury limits based on the 99.87th percentile, the 99.57th percentile, and the 99.38th percentile.

Table 2: Mercury Limits for Advanced Secondary Treatment Plants

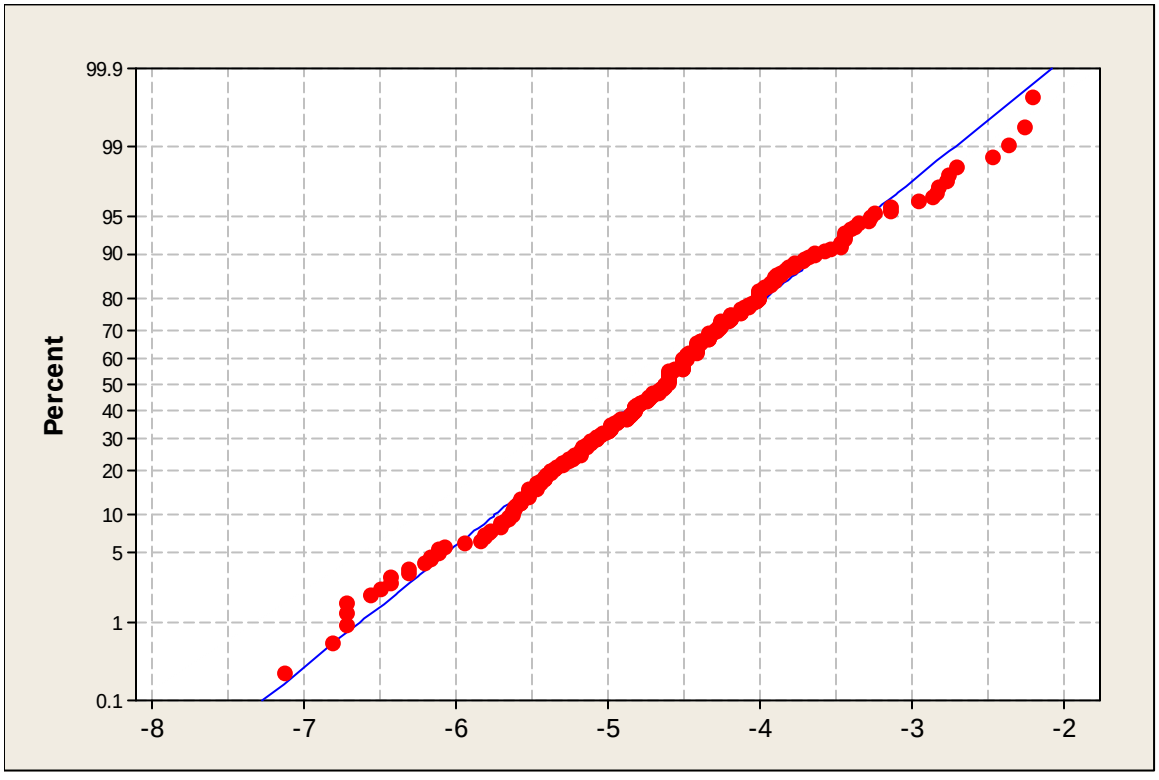
Percentile	Averaging Period	Mercury Limit (ng/L)
99.87th	Daily	35
99.57th	Weekly	27
99.38th	Monthly	25

Data Analysis of Industrial Treatment

We analyzed mercury data from five refineries that report data to the Water Board's electronic reporting system (ERS). As explained in the data tables, Regional Water Board staff determined that a number of data points from three of the refineries (i.e., Chevron, ConocoPhillips, and Shell) were not indicative of treatment plant performance, and therefore, should be removed. Additionally, when detection limits were very low (practical quantification limit (PQL) of 0.5 ng/L, we censored data at the PQL).

Our analysis of five Bay Area refineries indicates that mercury data fit a log-normal distribution since the data closely follow the line of normality, as shown in Figure 1 below:

Figure 3: Probability Plot of Mercury Data for Bay Area Refineries



Because natural log transformed mercury data fits a normal distribution, it is possible to calculate performance-based limits based on select percentiles. For refineries (sample size of 296), the mean and standard deviation in the natural log phase are -4.7000 and 0.8654,

respectively. We calculated daily, weekly, and monthly mercury limits based on the 99.87th percentile (3 standard deviations above the mean), the 99.57th percentile (2.625 standard deviations above the mean), and the 99.38th percentile (2.5 standard deviations above the mean).

Table 3: Mercury Limits for Industries Using Petroleum Refinery Performance

Percentile	Averaging Period	Mercury Limit (ng/L)
99.87th	Daily	122
99.57th	Weekly	88
99.38th	Monthly	79

APPENDIX F-3 -- SUMMARY OF DISCHARGE CHARACTERISTICS IN CONSIDERATION OF MONITORING FREQUENCIES

Discharger	Coefficient of Variation	Baseline Hg Sampling Frequency	2000-2003 Long Term Average (LTA), ug/l	Proposed AMEL (ug/l)	Ratio of LTA to AMEL	USEPA Performance-Based Frequency(1)
Mt. View Sanitary District	0.78	1/month	0.0092	0.025	0.37	1/Q
Petaluma Permit	0.50	1/month	0.0066	0.025	0.26	1/Q

(1) Interim Guidance for Performance-Based Reductions of NPDES Permit Monitoring Frequencies, USEPA, April 19, 1996.

ATTACHMENT 27

ORDER No. R2-2013-0029
NPDES No. CA0037664

The following discharger is subject to waste discharge requirements (WDRs) set forth in this Order.

Table 1. Discharger Information

Discharger	City and County of San Francisco
Facility Name	Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System
Facility Address	San Francisco Public Utilities Commission / Wastewater Enterprise 750 Phelps Street San Francisco, CA 94124
CIWQS Place Number	256499

Table 2. Discharge Locations

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
Treatment Plant Discharge Points				
001 (Pier 80 Outfall)	Secondary-treated effluent (dry weather); Primary-treated and secondary-treated effluent (wet weathter)	37.749444	-122.372778	Lower San Francisco Bay
002 (Quint Street Outfall)	Secondary-treated effluent (wet weathter)	37.747222	-122.386944	Islais Creek
003 and 004 (Pier 33 Outfall)	Primary-treated effluent (wet weathter)	37.806944	-122.403056	Central San Francisco Bay
005 and 006 (Pier 35 Outfall)	Primary-treated effluent (wet weathter)	37.810000	-122.405556	Central San Francisco Bay
Combined Sewer Discharge Points				
009 (Baker Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.808056	-122.446667	Marina Beach North Shore Drainage Basin
010 (Pierce Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.806944	-122.440000	Marina Beach North Shore Drainage Basin
011 (Laguna Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.811667	-122.43189	Yacht Harbor #2 North Shore Drainage Basin

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
013 (Beach Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.808333	-122.406667	Pier 39 North Shore Drainage Basin
015 (Sansome Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.806667	-122.403056	Pier 31 North Shore Drainage Basin
017 (Jackson Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.798333	-122.39472	Pier 3 North Shore Drainage Basin
018 (Howard Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.793056	-122.390000	Pier 14 Central Drainage Basin
019 (Brannan Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.785278	-122.373333	Pier 32 Central Drainage Basin
022 (Third Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.777222	-122.389444	Mission Creek Central Drainage Basin
023 (Fourth Street North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.775556	-122.391389	Mission Creek Central Drainage Basin
024 (Fifth Street North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.773889	-122.393889	Mission Creek Central Drainage Basin
025 (Sixth Street North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.771944	-122.396111	Mission Creek Central Drainage Basin
026 (Division Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.770278	-122.397500	Mission Creek Central Drainage Basin
027 (Sixth Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.771389	-122.395000	Mission Creek Central Drainage Basin
028 (Fourth Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.775000	-122.391111	Mission Creek Central Drainage Basin
029 (Mariposa Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37764722	-122.385278	Central Basin Central Drainage Basin
030 (20th Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.761111	-122.380000	Central Basin Central Drainage Basin
030A (22nd Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.757778	-122.380278	Central Basin Central Drainage Basin
031 (Third Street North	Equivalent-to-primary-treated effluent (wet weathter)	37.747778	-122.386111	Islais Creek Central Drainage Basin

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
031A (Islais Creek North Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747778	-122.387500	Islais Creek Central Drainage Basin
032 (Marin Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.748611	-122.390833	Islais Creek Central Drainage Basin
033 (Selby Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747778	-122.390833	Islais Creek Central Drainage Basin
035 Third Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747222	-122.386111	Islais Creek Central Drainage Basin
037 (Evans Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.735833	-122.373889	India Basin Southeast Drainage Basin
038 (Hudson Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.733333	-122.373839	India Basin Southeast Drainage Basin
040 (Griffith Street South Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.723056	-122.382222	Yosemite Creek Southeast Drainage Basin
041 (Yosemite Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.723889	-122.385556	Yosemite Creek Southeast Drainage Basin
042 (Fitch Street Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.722222	-122.381944	South Basin Southeast Drainage Basin
043 (Sunnydale Avenue Outfall)	Equivalent-to-primary-treated effluent (wet weathter)	37.747222	-122.386944	Candlestick Cove Southeast Drainage Basin

Table 3. Administrative Information

This Order was adopted on:	August 14, 2013
This Order shall become effective on:	October 1, 2013
This Order shall expire on:	September 30, 2018
The Discharger shall file a Report of Waste Discharge as an application for reissuance of WDRs in accordance with California Code of Regulations, title 23, and an application for reissuance of a National Pollutant Discharge Elimination System (NPDES) permit no later than:	March 30, 2018
The U.S. Environmental Protection Agency (U.S. EPA) and the California Regional Water Quality Control Board, San Francisco Bay Region, have classified this discharge as follows:	Major

I, Bruce H. Wolfe, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of the Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on the date indicated above.

_____

Bruce H. Wolfe**,** Executive Officer

I. FACILITY INFORMATION

Information describing the Southeast Water Pollution Control Plant (Southeast Plant), North Point Wet Weather Facility (North Point Facility), Bayside Wet Weather Facilities, and Wastewater Collection System (collectively, the Facility) is summarized in Table 1 and in Fact Sheet (Attachment F) sections I and II.

II. FINDINGS

The California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board), finds:

A. Legal Authorities. This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA, and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as an NPDES permit for point source discharges from the Facility to surface waters.

B. Background and Rationale for Requirements. The Regional Water Board developed the requirements in this Order based on information the Discharger submitted as part of its application, information obtained through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F) contains background information and rationale for the requirements in this Order and is hereby incorporated into and constitutes findings for this Order. Attachments A through E, G, and H are also incorporated into this Order.

C. Provisions and Requirements Implementing State Law. No provisions and requirements in this Order are included to implement State law only.

D. Notification of Interested Parties. The Regional Water Board notified the Discharger and interested agencies and persons of its intent to prescribe these WDRs and provided an opportunity to submit written comments and recommendations. The Fact Sheet provides details regarding the notification.

E. Consideration of Public Comment. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. The Fact Sheet provides details regarding the public hearing.

THEREFORE, IT IS HEREBY ORDERED that Order No. R2-2008-0007 (previous order) is rescinded upon the effective date of this Order except for enforcement purposes, and, in order to meet the provisions of Water Code division 7 (commencing with § 13000) and regulations adopted thereunder, and the provisions of the CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order. This action in no way prevents the Regional Water Board from taking enforcement action for past violations of the previous order.

III. DISCHARGE PROHIBITIONS

A. Discharge of treated wastewater at a location or in a manner different from that described in this Order is prohibited.

B. Discharge at Discharge Point No. 001 is prohibited when treated wastewater does not receive a dilution of at least 231:1, as modeled. Compliance shall be achieved by proper operation and maintenance of the discharge outfall to ensure that it (or its replacement, in whole or part) is in good working order and is consistent with or can achieve better mixing than that described in Fact Sheet section IV.C.4.a. The Discharger shall address measures taken to ensure this in its application for permit reissuance.

C. The bypass of untreated or partially-treated wastewater to waters of the United States is prohibited, except during wet weather (as defined in Attachment A) and as provided for in the conditions stated in Attachment D section I.G.

D. Except during wet weather, discharges from Discharge Point Nos. 002 through 043 are prohibited.

E. Average dry weather effluent flow in excess of 85.4 MGD is prohibited at Discharge Point No. 001. Average dry weather effluent flow shall be determined from three consecutive dry weather months each year, with compliance measured at Monitoring Location EFF-001A as described in the Monitoring and Reporting Program (MRP).

F. Any sanitary or combined sewer discharge of untreated or partially-treated wastewater to waters of the United States not expressely authorized by this Order is prohibited.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent Limitations—Dry Weather

1. During dry weather, the Discharger shall comply with the following effluent limitations at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001A as described in the MRP.

Table 4. Effluent Limitations—Dry Weather

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Biochemical Oxygen Demand, 5-day @ 20°C (BOD_5)	mg/L	30	45	---	---	---
Total Suspended Solids (TSS)	mg/L	30	45	---	---	---
Oil and Grease	mg/L	10	---	20	---	---
pH [1]	s.u.	---	---	---	6.0	9.0
Total Residual Chlorine	mg/L	---	---	---	---	0.0 [2]
Copper, Total Recoverable	µg/L	53	---	76	---	---
Cyanide, Total	µg/L	20	---	43	---	---
Dioxin-TEQ	µg/L	1.4×10^{-8}	---	2.8×10^{-8}	---	---
1,2-Diphenylhydrazine	µg/L	5.4	---	11	---	---

Parameter	Units	Effluent Limitations				
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Total Ammonia, as N	mg/L	190	---	290	---	---

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter
s.u. = standard units
% = percent

Footnotes:

[1] If the Discharger monitors pH continuously, pursuant to 40 C.F.R. section 401.17 the Discharger shall be in compliance with this pH limitation provided that both of the following conditions are satisfied: (i) the total time during which the pH is outside the required range shall not exceed 7 hours and 26 minutes in any calendar month; and (ii) no individual excursion from the required pH range shall exceed 60 minutes.

[2] Effluent residual chlorine concentrations shall be monitored continuously or, at a minimum, every hour. The Discharger shall report for each day the maximum residual chlorine concentration observed following dechlorination using all values measured during that day. However, if monitoring continuously, for the purpose of mandatory minimum penalties required by Water Code section 13385(i), compliance shall be based only on discrete readings from the continuous monitoring every hour on the hour. The Discharger shall retain continuous monitoring readings for at least three years. The Regional Water Board reserves the right to use all continuous monitoring data for discretionary enforcement.

The Discharger may elect to use a continuous on-line monitoring system for measuring or determining that residual dechlorinating agent is present. This monitoring system may be used to prove that anomalous residual chlorine exceedances measured by on-line chlorine analyzers are false positives and are not violations of this total residual chlorine limit because it is chemically improbable to have chlorine present in the presence of sodium bisulfite.

2. **Percent Removal.** During dry weather, the average monthly percent removal of biochemical oxygen demand (BOD_5) and total suspended solids (TSS) at Discharge Point No. 001 shall not be less than 85 percent (i.e., in each calendar month, the arithmetic mean of BOD_5 and TSS, by concentration, for effluent samples collected at Monitoring Location EFF-001A as described in the MRP shall not exceed 15 percent of the arithmetic mean of the BOD_5 and TSS, by concentration, for influent samples collected at Monitoring Location INF-001 as described in the MRP at approximately the same times during the same period).

3. **Bacteria.** Dry weather discharges at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001A as described in the MRP, shall meet the following limitations:

   a. **Enterococcus.** The geometric mean enterococcus bacteria concentration of all samples in a calendar month shall not exceed 35 most probable number per 100 milliliters (MPN/100 mL).

   b. **Fecal Coliform.** The median fecal coliform density of all samples in any calendar month shall not exceed 500 MPN/100 mL, and no more than 10 percent of the samples in any calendar month shall contain a fecal coliform density equal to or greater than 1,100 MPN/100 mL.

4. **Whole Effluent Acute Toxicity.** During dry weather, discharges at Discharge Point No. 001 shall comply with the following limitations, with compliance measured at Monitoring Location EFF-001A as described in the MRP:

a. An 11-sample median value of not less than 90 percent survival; and

b. An 11-sample 90th percentile value of not less than 70 percent survival.

These acute toxicity limitations are defined as follows:

- **11-sample median.** A bioassay test showing survival of less than 90 percent represents a violation of this effluent limit if five or more of the past ten or fewer bioassay tests also show less than 90 percent survival.

- **11-sample 90th percentile.** A bioassay test showing survival of less than 70 percent represents a violation of this effluent limit if one or more of the past ten or fewer bioassay tests also show less than 70 percent survival.

Bioassays shall be performed using the most up-to-date U.S. EPA protocols and species as specified in the MRP. If these protocols prove unworkable, the Executive Officer and the Environmental Laboratory Accreditation Program may grant exceptions in writing upon the Discharger's request with justification.

If the Discharger can demonstrate that toxicity exceeding the levels cited above is caused by ammonia and that the ammonia in the discharge complies with the ammonia effluent limits in Section IV.A.1 of this Order, then such toxicity does not constitute a violation of this effluent limitation.

5. **Whole Effluent Chronic Toxicity.** During dry weather, discharges at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001A as described in the MRP, shall not contain chronic toxicity at a level that would cause or contribute to toxicity in the receiving water. Chronic toxicity is a detrimental biological effect on growth rate, reproduction, fertilization success, larval development, or any other relevant measure of the health of an organism population or community. Compliance with this limit shall be determined by analysis of indicator organisms and toxicity tests as described in the MRP.

B. Effluent Limitations—Wet Weather

During wet weather, the Discharger shall comply with the following effluent limitations at Discharge Point Nos. 001 through 006, with compliance measured at Monitoring Locations EFF-001B, EFF-002, and EFF-003 as described in the MRP. Provision VI.C.5 of this Order imposes additional technology-based and water quality-based wet weather requirements.

Table 5. Effluent Limitations—Wet Weather

		Effluent Limitations	
Parameter	**Units**	**Monthly Geometric Mean**	**Instantaneous Maximum**
Total Residual Chlorine	mg/L	---	0.0 [1]
Enterococcus	MPN/100 mL	35 [2]	---

Unit Abbreviation:

mg/L = milligrams per liter

Footnote:

[1] Effluent residual chlorine concentrations shall be monitored continuously or, at a minimum, every hour. The Discharger shall report for each day the maximum residual chlorine concentration observed following dechlorination using all values measured during that day. However, if monitoring continuously, for the purpose of mandatory minimum penalties required by Water Code section 13385(i),

compliance shall be based only on discrete readings from the continuous monitoring every hour on the hour. The Discharger shall retain continuous monitoring readings for at least three years. The Regional Water Board reserves the right to use all continuous monitoring data for discretionary enforcement.

The Discharger may elect to use a continuous on-line monitoring system for measuring or determining that residual dechlorinating agent is present. This monitoring system may be used to prove that anomalous residual chlorine exceedances measured by on-line chlorine analyzers are false positives and are not violations of this total residual chlorine limit because it is chemically improbable to have chlorine present in the presence of sodium bisulfite.

[2] Data from both wet and dry weather shall be included when calculating the geometric mean for compliance with this monthly wet weather limitation. For days with discharge but no sampling, the enterococcus densities shall be assumed to be the same as the densities of the most recent discharge samples. For days with no discharge, enterococcus densities shall be assumed to be 1 MPN/100 mL for calculational purposes.

V. RECEIVING WATER LIMITATIONS

A. The discharge shall not cause the following conditions to exist in receiving waters at any place outside the near-field mixing zone (i.e., where mixing is not controlled by effluent discharge momentum and buoyancy):

1. Floating, suspended, or deposited macroscopic particulate matter or foams;

2. Bottom deposits or aquatic growths to the extent that such deposits or growths cause nuisance or adversely affect beneficial uses;

3. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;

4. Visible, floating, suspended, or deposited oil or other products of petroleum origin; or

5. Toxic or other deleterious substances in concentrations or quantities that cause deleterious effects on wildlife, waterfowl, or other aquatic biota, or render any of these unfit for human consumption, either at levels created in the receiving waters or as a result of biological concentration.

B. The discharge shall not cause the following limits to be exceeded in receiving waters at any place within one foot of the water surface outside the near-field mixing zone (i.e., where mixing is not controlled by effluent discharge momentum and buoyancy):

1. Dissolved Oxygen — 5.0 mg/L, minimum

The median dissolved oxygen concentration for any three consecutive months shall not be less than 80% of the dissolved oxygen content at saturation. When natural factors cause concentrations less than that specified above, the discharge shall not cause further reduction in ambient dissolved oxygen concentrations.

2. Dissolved Sulfide — Natural background levels

3. pH — The pH shall not be depressed below 6.5 or raised above 8.5. The discharge shall not cause changes greater than 0.5 pH units in normal ambient pH levels.

4. Nutrients — Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.

C. The discharge shall not cause a violation of any water quality standard for receiving waters adopted by the Regional Water Board or State Water Board as required by the CWA and regulations adopted thereunder (including the *Combined Sewer Overflow (CSO) Control Policy*) outside near-field mixing zones (i.e., where mixing is not controlled by effluent discharge momentum and buoyancy). If more stringent water quality standards are promulgated or approved pursuant to CWA section 303, or amendments thereto, the Regional Water Board may revise or modify this Order in accordance with the more stringent standards.

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all "Standard Provisions" in Attachment D.

2. The Discharger shall comply with all applicable provisions of the "Regional Standard Provisions, and Monitoring and Reporting Requirements for NPDES Wastewater Discharge Permits" (Attachment G). Attachment G provisions I.J (Storm Water) and III.A.3.c (Storm Water Monitoring) do not apply.

B. Monitoring and Reporting

The Discharger shall comply with the MRP (Attachment E), and future revisions thereto, and applicable sampling and reporting requirements in Attachments D and G.

C. Special Provisions

1. Reopener Provisions

The Regional Water Board may modify or reopen this Order prior to its expiration date in any of the following circumstances as allowed by law:

a. If present or future investigations demonstrate that the discharges governed by this Order have or will have a reasonable potential to cause or contribute to, or will cease to have, adverse impacts on water quality or beneficial uses of the receiving waters.

b. If new or revised water quality objectives or total maximum daily loads (TMDLs) come into effect for San Francisco Bay and contiguous water bodies (whether statewide, regional, or site-specific). In such cases, effluent limitations in this Order may be modified as necessary to reflect the updated water quality objectives and wasteload allocations in the TMDLs. Adoption of the effluent limitations in this Order is not intended to restrict in any way future modifications based on legally-adopted water quality objectives or TMDLs, or as otherwise permitted under federal regulations governing NPDES permit modifications.

c. If translator, dilution, or other water quality studies provide a basis for determining that a permit condition should be modified.

d. If State Water Board precedential decisions, new policies, new laws, or new regulations are adopted.

e. If an administrative or judicial decision on a separate NPDES permit or waste discharge requirements addresses requirements similar to this discharge.

f. Or as otherwise authorized by law.

The Discharger may request a permit modification based on any of the circumstances above. With any such request, the Discharger shall include antidegradation and anti-backsliding analyses.

With the consent of the Discharger, the Executive Officer may make minor modifications to this Order for the purposes set forth in 40 C.F.R. section 122.63.

2. Effluent Characterization Study and Report

a. Study Elements. The Discharger shall continue to characterize and evaluate the dry weather discharge from the following discharge point to verify that the "no" or "cannot determine" reasonable potential analysis conclusions of this Order remain valid and to inform the next permit reissuance. The Discharger shall collect representative samples at the monitoring stations set forth below, as defined in the MRP, at no less than the frequency specified below:

Discharge Point	Monitoring Station	Minimum Frequency
001	EFF-001A	Once per calendar year

The samples shall be analyzed for the priority pollutants listed in Attachment G, Table C, except for those priority pollutants with effluent limitations where the MRP already requires more frequent monitoring. Compliance with this requirement shall be achieved in accordance with the specifications of Attachment G, sections III.A.1 and III.A.2.

The Discharger shall evaluate on an annual basis if concentrations of any of these priority pollutants significantly increase over past performance. The Discharger shall investigate the cause of any such increase. The investigation may include, but need not be limited to, an increase in monitoring frequency, monitoring of internal process streams, and monitoring of influent sources. The Discharger shall establish remedial measures addressing any increase resulting in reasonable potential to cause or contribute to an exceedance of applicable water quality objectives during dry weather. This requirement may be satisfied through identification of the constituent as a "pollutant of concern" in the Discharger's Pollutant Minimization Program, described in Provision VI.C.3.

b. Reporting Requirements

i. Routine Reporting. The Discharger shall, within 30 days of receipt of analytical results, report the following in the transmittal letter for the appropriate self-monitoring report:

(a) Indication that a sample for this characterization study was collected; and

(b) Identity of priority pollutants detected at or above applicable water quality criteria (see Fact Sheet Table F-9 for the criteria), and the detected concentrations of those pollutants.

ii. Annual Reporting. The Discharger shall summarize the annual data evaluation and source investigation in the annual self-monitoring report.

iii. Final Report. The Discharger shall submit a final report that presents all these data with the application for permit reissuance.

3. Pollutant Minimization Program

a. The Discharger shall continue to improve its existing Pollutant Minimization Program to promote minimization of pollutant loadings to the treatment plant and therefore to the receiving waters.

b. The Discharger shall submit an annual report no later than February 28 each year. Each annual report shall include at least the following information:

i. Brief description of treatment plant. The description shall include the service area and treatment plant processes.

ii. Discussion of current pollutants of concern. Periodically, the Discharger shall analyze its circumstances to determine which pollutants are currently a problem and which pollutants may be potential future problems. This discussion shall include the reasons for choosing the pollutants.

iii. Identification of sources for pollutants of concern. This discussion shall include how the Discharger intends to estimate and identify pollutant sources. The Discharger shall include sources or potential sources not directly within the ability or authority of the Discharger to control, such as pollutants in the potable water supply and air deposition.

iv. Identification of tasks to reduce the sources of pollutants of concern. This discussion shall identify and prioritize tasks to address the Discharger's pollutants of concern. The Discharger may implement the tasks by itself or participate in group, regional, or national tasks that address its pollutants of concern. The Discharger is strongly encouraged to participate in group, regional, or national tasks that address its pollutants of concern whenever it is efficient and appropriate to do so. An implementation timeline shall be included for each task.

v. Outreach to employees. The Discharger shall inform employees about the pollutants of concern, potential sources, and how they might be able to help reduce the discharge of these pollutants of concern into the Facility. The Discharger may provide a forum for employees to provide input.

vi. Continuation of Public Outreach Program. The Discharger shall prepare a pollution prevention public outreach program for its service area. Outreach may

include participation in existing community events, such as county fairs; initiating new community events, such as displays and contests during Pollution Prevention Week; conducting school outreach programs; conducting plant tours; and providing public information in newspaper articles or advertisements, radio or television stories or spots, newsletters, utility bill inserts, or web sites. Information shall be specific to target audiences. The Discharger shall coordinate with other agencies as appropriate.

vii. Discussion of criteria used to measure Pollutant Minimization Program and task effectiveness. The Discharger shall establish criteria to evaluate the effectiveness of its Pollutant Minimization Program. This discussion shall idenify the specific criteria used to measure the effectiveness of each task in Provisions VI.C.3.b.iii, iv, v, and vi.

viii. Documentation of efforts and progress. This discussion shall detail all of the Discharger's Pollutant Minimization Program activities during the reporting year.

ix. Evaluation of Pollutant Minimization Program and task effectiveness. This Discharger shall use the criteria established in Provision VI.C.3.b.vii to evaluate the program and task effectiveness.

x. Identification of specific tasks and timelines for future efforts. Based on the evaluation, the Discharger shall explain how it intends to continue or change its tasks to more effectively reduce the amount of pollutants flowing to the Facility, and subsequently in its effluent.

c. The Discharger shall develop and conduct a Pollutant Minimization Program as further described below when there is evidence that a priority pollutant is present in the effluent above an effluent limitation (e.g., sample results reported as detected but not quantified [DNQ] when the effluent limitation is less than the method detection limit [MDL], sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, or results of benthic or aquatic organism tissue sampling) and either:

i. A sample result is reported as DNQ and the effluent limitation is less than the Reporting Level (RL); or

ii. A sample result is reported as not detected (ND) and the effluent limitation is less than the MDL using definitions in Attachment A and reporting protocols described in the MRP.

d. If triggered by the reasons set forth in Provision VI.C.3.c, above, the Discharger's Pollutant Minimization Program shall include, but not be limited to, the following actions and submittals:

i. Annual review and semi-annual monitoring of potential sources of the reportable priority pollutants, which may include fish tissue monitoring and other bio-uptake sampling, or alternative measures when source monitoring is unlikely to produce useful analytical data;

ii. Quarterly monitoring for the reportable priority pollutants in the influent to the Facility. The Executive Officer may approve alternative measures when influent monitoring is unlikely to produce useful analytical data;

iii. Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable priority pollutants in the effluent at or below the effluent limitation;

iv. Implementation of appropriate cost-effective control measures for the reportable priority pollutants, consistent with the control strategy; and

v. Inclusion of the following specific items within the annual report required by Provision VI.C.3.b above:

(a) All Pollutant Minimization Program monitoring results for the previous year;
(b) List of potential sources of the reportable priority pollutants;
(c) Summary of all actions undertaken pursuant to the control strategy; and
(d) Description of actions to be taken in the following year.

4. Special Provisions for Municipal Facilities

a. Pretreatment Program. The Discharger shall implement and enforce its approved pretreatment program in accordance with federal pretreatment regulations (40 C.F.R. part 403); pretreatment standards promulgated under CWA sections 307(b), 307(c), and 307(d); pretreatment requirements specified under 40 C.F.R. section 122.44(j); and the requirements in Attachment H, "Pretreatment Requirements." The Discharger's responsibilities include, but are not limited to, the following:

i. Enforcement of the National Pretreatment Standards of 40 C.F.R. sections 403.5 and 403.6;

ii. Implementation of its pretreatment program in accordance with legal authorities, policies, procedures, and financial provisions described in the National Pretreatment Program (40 C.F.R. part 403).

iii. Submission of reports to the State Water Board and the Regional Water Board as described in Attachment H.

iv. Evaluation of the need to revise local limits under 40 C.F.R. section 403.5(c)(1) and, within 180 days following the effective date of this Order, submission of a report describing the changes, with a plan and schedule for implementation. To ensure no significant increase in copper discharges, and thus compliance with antidegradation requirements, the Discharger shall not consider eliminating or relaxing local limits for copper.

b. Sludge and Biosolids Management

i. All sludge and biosolids shall be disposed of, managed, or used in a municipal solid waste landfill; through land application; as a Class A compost; through a waste-to-

energy facility or another recognized and approved technology; in a sludge-only landfill; or in a sewage sludge incinerator in accordance with 40 C.F.R. part 503.

ii. Sludge and biosolids treatment, storage, and disposal, or use, shall not create a nuisance, such as objectionable odors or flies, or result in groundwater contamination.

iii. The sludge and biosolids treatment and storage site shall have facilities adequate to divert surface runoff from adjacent areas, to protect site boundaries from erosion and rising sea levels, and to prevent any conditions that would cause drainage from the materials in the storage site. Adequate protection is defined as protection from at least a 100-year storm and the highest possible tidal stage that may occur.

iv. Sludge or biosolids disposed in a municipal solid waste landfill shall meet the requirements of 40 C.F.R. part 258. In the annual self-monitoring report, the Discharger shall provide the amount of sludge or biosolids disposed and indicate the landfill to which it was sent.

v. This Order does not authorize permanent onsite sludge or biosolids storage or disposal. A Report of Waste Discharge shall be filed and the site brought into compliance with all applicable regulations prior to commencement of any such activity.

c. Collection System Management. The Discharger shall properly operate and maintain its entire collection system (see Provision VI.C.5 and Attachment D, section I.D). The Discharger shall report any noncompliance (see Attachment D, sections V.E.1 and V.E.2) and mitigate any discharge from its collection system that violates this Order (see Attachment D, section I.C).

i. Separate Sanitary Sewer System. The *General Waste Discharge Requirements for Wastewater Collection Agencies* (General Collection System WDRs), State Water Board Order 2006-0003 DWQ as amended by State Water Board Order WQ 2008-0002-EXEC, has requirements for operation and maintenance of separate sanitary sewer collection systems and for reporting and mitigating sanitary sewer overflows from the separate sanitary sewer portion of the Discharger's collection system. While the Discharger must comply with both the General Collection System WDRs and this Order, the General Collection System WDRs more clearly and specifically stipulate requirements for operation and maintenance and for reporting and mitigating sanitary sewer overflows. Implementation of the General Collection System WDRs for proper operation and maintenance and mitigation of sanitary sewer overflows will satisfy the corresponding federal NPDES requirements specified in Attachment D (as supplemented by Attachment G). Following the notification and reporting requirements in the General Collection System WDRs will satisfy NPDES the corresponding reporting requirements specified in Attachment D (as supplemented by Attachment G) for sanitary sewer overflows from the separate sanitary sewer portion of the collection system.

ii. Combined Sewer System. For purposes of this Order, a combined sewer system "excursion" is a release or diversion of untreated or partially-treated wastewater from

the combined sewer system that exits the system temporarily and then re-enters it. Excursions are caused by blockages or flow conditions within the publicly-owned portion of the combined sewer system and can occur in public rights of way or on private property. Excursions do not include releases from privately-owned sewer laterals or authorized combined sewer discharges from Discharge Point Nos. 009 through 043.

(a) Excursion Database. By January 1, 2014, the Discharger shall develop and maintain a database containing information about each excursion that occurs within the Southeast Plant's service area. The Discharger may limit these data to excursions occurring within the City and County of San Francisco. The Discharger may, at its option, include information concerning releases from private sewer laterals. The database shall contain the following information for each excursion:

(1) Location, including latitude and longitude, street address (if available), zip code, cross street, and asset number;

(2) Destination (if known), including whether the excursion was fully captured and returned to the combined sewer system and whether any portion of it entered a drainage channel or surface water;

(3) Estimated volume, in gallons, including volume that reached a surface water or drainage channel and volume recovered (all spills to drainage channels or surface waters are subject to MRP section IX.B, which modifies Attachment G section V.E.2);

(4) Date and time excursion was reported to the San Francisco Public Utilities Commission;

(5) Operator arrival date and time;

(6) End date and time of excursion, if known;

(7) Source (e.g., manhole, catch basin, vent trap);

(8) Cause (e.g., mainline blockage, roots, broken pipe);

(9) Corrective actions taken, including steps taken or planned to reduce, eliminate, and prevent reoccurrence;

(10) Parameters for which samples were analyzed and results (if applicable);

(11) Whether the County Health Officer was notified and health warnings were posted (if known);

(12) Whether a beach was affected and, if so, which one (if applicable);

(13) California Emergency Management Agency (CalEMA) control number, and date and time CalEMA was called (if applicable);

(14) Date and time County Health Officer was notified (if applicable).

If the Discharger chooses to include information regarding releases from private sewer laterals, it should also record responsible party contact information, if known.

(b) Routine Reporting. The Discharger shall report any excursion greater than 1,000 gallons, regardless of whether it enters a drainage channel or surface water, to the Regional Water Board and the San Francisco Department of Public Health not later than two hours after becoming aware of the discharge. The Discharger shall make this report as soon as (1) it has knowledge of the excursion, (2) reporting is possible, and (3) a report can be provided without impeding cleanup or other emergency measures. The Discharger shall report excursions by calling the Regional Water Board's spill hotline (currently 510-622-2369) and following standard procedures developed by the San Francisco Public Utilities Commission and the San Francisco Department of Public Health. (Spill to drainage channels or surface waters are subject to MRP section IX.B, which modifies Attachment G section V.E.2.)

(c) Annual Report. The Discharger shall submit a report no later than August 15 each year that compiles and summarizes information from the excursion database for the preceding 12 months ending June 30. Within the report, the Discharger shall review collection system performance, evaluate excursion trends in terms of time and location, summarize actions taken within the preceding year to minimize excursions, and identify specific tasks for the coming year to further minimize excursions.

(d) Record Keeping. The Discharger shall maintain documentation supporting the database records for at least three years following each excursion. The Executive Officer may extend this period if necessary. Documentation shall include, but need not be limited to, work orders and other maintenance records associated with responses and investigations. The Discharger shall make all excursion records available for review upon Regional Water Board staff request.

If the Discharger collects water quality samples for analysis, it shall maintain the following information:

- Date, exact place, and time of sampling or measurement;
- Individual who performed sampling or measurement;
- Date of analysis;
- Individual who performed analysis;
- Analytical technique or method used; and
- Analysis results.

5. Combined Sewer Sytem Controls

The Discharger shall maximize flows to the Southeast Plant and pollutant removal during wet weather in accordance with the Nine Minimum Controls and the Discharger's Long-Term Control Plan.

a. Combined Sewer Operations and Maintenance Plan. The Discharger shall revise and update its *Combined Sewer Operations and Maintenance Plan* as necessary to ensure compliance with the Nine Minimum Controls and the Long-Term Control Plan requirements of the *Combined Sewer Overflow Control Policy*. The Discharger shall submit the updated plan by August 15, 2015, and following any subsequent revision.

b. Nine Minimum Controls. The Discharger shall continue implementing the following controls:

i. Conduct Proper Operations and Maintenance Programs. The Discharger shall implement its *Combined Sewer Operations and Maintenance Plan*, which shall include the elements described below. The Discharger shall operate and maintain the system according to the plan and in accordance with Provision VI.C.4.c.ii of this Order. The Discharger shall maintain records to document plan implementation.

(a) Designate Manager for Combined Sewer Discharges and Overflows. The Discharger shall designate a person to be responsible for the wastewater collection system and serve as the contact person regarding the operation of the combined sewer system. The Discharger shall notify the Regional Water Board within 90 days of the designation of a new contact person.

(b) Inspect and Maintain Combined Sewer System. The Discharger shall properly operate and maintain the collection system and the combined sewer discharge outfalls to reduce the magnitude, frequency, and duration of combined sewer discharges. The Discharger shall perform the following:

- Regularly clean sewers and catch basins, and repair or replace, as necessary, sewers and related equipment;
- Disconnect any illegal connections;
- Inspect and maintain discharge structures, regulators, pumping stations, and tide gates to ensure that they are in good working condition and adjusted to minimize combined sewer discharges, prevent combined sewer overflows, and prevent tidal inflow;
- Inspect each combined sewer discharge outfall at least once per year. The inspection shall include, but not be limited to, entering the regulator structure, if accessible; determining the extent of any structural defect or debris and grit buildup; and removing any debris that may constrict flow, cause blockage, or result in a dry weather combined sewer overflow. For outfalls that are inaccessible, the Discharger may perform a visual check of the discharge pipe to determine whether combined sewer overflows have occurred or could potentially occur during dry weather; and

- Record all inspection results in a maintenance log.

(c) Provide Trained Staff. The Discharger shall provide adequate staff to carry out the operation, maintenance, repair, and testing required to ensure compliance with the terms and conditions of this Order. The Discharger shall provide appropriate training for each staff member.

(d) Allocate Funds for Operation and Maintenance. The Discharger shall allocate adequate funds for operation and maintenance activities.

ii. Maximize Use of Collection System for Storage. The Discharger shall continue to maximize the use of the collection system (i.e., collection system piping, not only the storage/transports) for in-line storage to reduce the magnitude, frequency, and duration of combined sewer discharges.

iii. Review and Modify Pretreatment Program. The Discharger shall continue to implement controls to minimize the impact of non-domestic discharges to its collection system. At three-year intervals, the Discharger shall re-evaluate whether additional modifications to its pretreatment program are feasible or practical. The Discharger shall maintain records to document this evaluation and implementation of controls.

iv. Maximize Flow to Southeast Plant and North Point Facility. The Discharger shall operate the Southeast Plant at maximum treatable flow during wet weather. The Discharger shall ensure that the *Combined Sewer Operation and Maintenance Plan* is implemented to maximize the volume of wastewater treated at the Southeast Plant and the North Point Facility and discharged via deep water outfalls, consistent with the hydraulic capacities of the storage, transport, treatment, and disposal facilities. The Discharger shall report rainfall with the self-monitoring reports the MRP requires.

v. Prohibit Dry Weather Combined Sewer Overflows. Dry weather combined sewer overflows from Discharge Point Nos. 002 through 043 are prohibited. The Discharger shall respond to dry weather combined sewer overflows in accordance with MRP section IX.B, which modifies Attachment G section V.E.2. During any dry weather combined sewer overflow, the Discharger shall inspect the overflow point each day until the overflow stops. The Discharger shall document in the inspection log each combined sewer overflow event, its duration, its cause, and the corrective measures taken.

vi. Control Solid and Floatable Materials in Combined Sewer Discharges. The Discharger shall continue to implement measures to control solid and floatable materials in combined sewer discharges, including the following:

(a) Ensuring that overflow structures are baffled or using other means to reduce the volume of floatable materials in combined sewer discharges, and

(b) Removing solid or floatable materials captured in the storage/transports prior to discharge.

vii. Develop and Implement Pollution Prevention Program. The Discharger shall continue to implement a Pollution Prevention Program focused on reducing the impact of combined sewer discharges and overflows on receiving waters. It shall develop and implement this program in accordance with Provision VI.C.3.

The Discharger shall also continue to implement a street sweeping program and clean catch basins at a frequency sufficient to prevent large accumulations of pollutants and debris.

viii. Notify Public of Combined Sewer Discharges. The Discharger shall continue to implement a public notification plan to inform citizens of when and where combined sewer discharges occur. The plan shall include the following:

(a) A mechanism to alert persons using receiving waters affected by combined sewer discharges for recreation; and

(b) A system to determine the nature and duration of conditions resulting from combined sewer discharges potentially harmful to receiving water users.

Warning signs shall be posted at beach locations where water contact recreation occurs whenever a combined sewer discharge occurs that could affect recreational users at that location. Warning signs shall be posted on the same day as the combined sewer discharge event unless the combined sewer discharge occurs after 4:00 p.m., in which case, signs shall be posted by 8:00 a.m. the next day. The Discharger shall maintain records documenting public notification.

ix. Monitor to Characterize Wet Weather Discharge Impacts and Efficacy of Controls. The Discharger shall continue monitoring wet weather discharges to characterize their impacts and the efficacy of wet weather discharge controls. The monitoring shall build upon the efforts and results the Discharger described in *Special Study: Overflow Impacts and Efficacy of Combined Sewer Overflow Controls for the San Francisco Bayside System, Southeast Water Pollution Control Plant, North Point Wet Weather Facility and Bayside Wet Weather Facilities* (June 29, 2012).

(a) Monitoring Requirements. Compliance with the following monitoring requirements shall be achieved in accordance with the specifications of Attachment D, section III, and Attachment G, sections III.A.1 and III.A.2. Samples shall be composites comprised of individual grab samples collected at equal intervals of no more than one hour for the duration of each discharge event, but not exceeding 24 hours. If an event does not last at least 24-hours, the Discharger shall sample for as long as possible and report the duration.

(1) Southeast Plant and North Point Facility Discharges. When Southeast Plant or North Point Facility discharges occur during wet weather, the Discharger shall collect effluent samples representing Discharge Point Nos. 001 through 006 at Monitoring Locations EFF-001B, EFF-002, and

EFF-003, as defined in the MRP. In addition to the monitoring required in MRP Table E-4, the Discharger shall monitor for the priority pollutants listed in Attachment G, Table C, at least once per year.

(2) Combined Sewer Discharges. The Discharger shall collect effluent samples representing Discharge Point Nos. 009 through 043 at Monitoring Locations CSD-010 through CSD-043, as defined in the MRP. The Discharger shall collect samples at a monitoring location whenever a combined sewer discharge event of at least one hour in duration occurs at that location (and may also collect samples representing shorter events). In addition to the monitoring required in MRP Table E-5, the Discharger shall monitor each sample for the following:

- total suspended solids
- settleable matter
- pH
- metals (arsenic, cadmium, copper, lead, nickel, selenium, silver, and zinc)
- cyanide
- ammonia (total)

The Discharger shall also monitor a combined sewer discharge at Monitoring Location CSD-41 for the remaining priority pollutants listed in Attachment G, Table C, at least once per year.

(3) Shoreline Monitoring. The Discharger shall collect shoreline receiving water grab samples at Monitoring Locations S-202.4, S-202.5, S-210, S-211, S-300.1, S-301.1, and S-301.2, as defined in the MRP. In addition to the monitoring required in MRP Table E-6, the Discharger shall monitor enterococcus and fecal coliform at a frequency sufficient to characterize ambient conditions (e.g., weekly).

(b) Reporting Requirements

(1) Routine Reporting. The Discharger shall, within 60 days of receipt of analytical results, indicate in the transmittal letter for the appropriate self-monitoring report that a sample for this study was collected.

(2) Final Report. The Discharger shall report its findings by September 30, 2017. The report shall include the following:

- All wet weather discharge monitoring data collected, including acute toxicity data (the Discharger shall include data that do not necessarily conform to the test procedures in 40 C.F.R. part 136 and explain these circumstances to provide context for data interpretation);

- All shoreline monitoring data collected and any discharge-related beach closures;

- Updated water contact recreational use surveys, focusing particularly on recreational use following combined sewer discharge events;

- Evaluation of combined sewer discharge control efficacy (e.g., using TSS as a proxy for pollutant removal efficiency); and

- Evaluation of combined sewer discharge impacts (e.g., comparing average and maximum discharge and receiving water monitoring data with water quality objectives, translated as appropriate using available metals translators and water effects ratios).

c. Long-Term Control Plan. The Discharger shall comply with the following provisions, consistent with implementation of its Long-Term Control Plan.

i. The Discharger shall optimize sytem operations to minimize combined sewer discharges and maximize pollutant removal during wet weather.

ii. The Discharger shall capture for treatment, or storage and subsequent treatment, 100 percent of the combined sewage flow collected in the combined sewage system during precipitation events. Captured combined sewage shall be directed to either the Southeast Plant, the North Point Facility, or the storage/transports. All combined sewage captured shall receive a minimum of the following treatment:

(a) Secondary treatment,
(b) Primary treatment, or
(c) Equivalent-to-primary treatment (in storage/transports).

iii. The Discharger shall operate the wet weather facilities as set forth below. If the Discharger can demonstrate (e.g., through modeling conducted as part of its Sewer System Improvement Program) that changes to these operating parameters will result in additional storage or treatment, it may implement such changes. Written acknowledgement that the Executive Officer concurs with the Discharger's demonstration must be obtained prior to implementation.

(a) North Shore Drainage Basin. Activation and operation of the North Point Facility shall depend on rainfall, forecasts, and storage conditions in the North Shore Drainage Basin and the Central Drainage Basin.

- The North Point Facility shall be activated when the level of combined sewage and stormwater in the North Shore Storage/Transport Box is at 200 inches.

- The North Point Facility shall be activated to treat 135 to 145 MGD of combined in-flow within 60 minutes of any combined sewer discharge through Discharge Point Nos. 013 to 017.

- The North Point Facility shall remain operational as long as necessary to minimize the likelihood of storage/transport combined sewer discharges in the Central or Southeast Drainage Basins.

(b) Central Drainage Basin. Activation and operation of the Channel Pump Station shall depend on rainfall, forecasts, and storage conditions in the Central Drainage Basin and the Southeast Drainage Basin.

- The Channel Pump Station shall pump 80 MGD to the Southeast Plant or Southeast Plant influent shall be at 250 MGD (from the Channel and Flynn Pump Stations and the Southeast Plant Lift Station) before there is any storage/transport combined sewer discharge to Mission Creek (Discharge Point Nos. 022 to 027).

- Flow from the Channel Pump Station to the Southeast Plant may be reduced to prevent a combined sewer discharge from the Southeast Drainage Basin storage/transport structures if the flows between the Central Drainage Basin structures and the Southeast Drainage Basin structures (Griffith Pump Station and/or Flynn Pump Station) become unbalanced, e.g., Griffith and/or Flynn storage levels continue to rise while the Southeast Plant is at maximum flow.

- The Mariposa Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point No. 029.

- The 20th St. Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point 030 or 030A.

(c) Southeast Drainage Basin. Southeast Plant operation shall depend on rainfall, forecasts, and storage conditions in the Central Drainage Basin and the Southeast Drainage Basin. The Southeast Plant shall have an influent flow of 240 to 250 MGD prior to any combined sewer discharge into Islais Creek from Discharge Point Nos. 031 through 035.

- The Griffith Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point Nos. 040 through 042. Flows from the Griffith Pump Station to the Southeast Plant may be reduced to maximize storage in the Southeast Drainage Basin if flows between the Central Drainage Basin and the Southeast Drainage Basin become unbalanced (e.g., if unused storage capacity exists in the Southeast Drainage Basin while the Southeast Plant is at maximum flow).

- The Sunnydale Pump Station shall be operated at design capacity prior to any combined sewer discharge through Discharge Point No. 043. Flows from the Sunnydale Pump Station to the Griffith Pump Station may be reduced to maximize storage in the Southeast Drainage Basin if flows between the Central Drainage Basin and the Southeast Drainage Basin become unbalanced (e.g., if unused storage capacity exists in the Southeast Drainage Basin while the Southeast Plant is at maximum flow).

iv. The Discharger shall comply with the following after rains subside:

(a) Treatment at the Southeast Plant and North Point Facility shall continue until North Shore, Central, and Southeast Drainage Basin storage/transports are essentially empty of stormwater flows.

(b) If the National Weather Service predicts a 30 percent or greater chance of rain within the next 24 hours, the following provisions shall apply:

- Pumping shall occur until the wastewater level in the Channel Pump Station Box is between 100 to 150 inches,
- Pumping shall occur until the wastewater level in the North Shore Box is at 100 inches, and
- Pumping shall occur until the Islais Creek storage is essentially empty.

(c) If the National Weather Service predicts a less than 30 percent chance of rain within the next 24 hours, the following provisions shall apply:

- Pumping shall occur until the wastewater level in the Channel Pump Station Box is below 150 inches,
- Pumping shall occur until the wastewater level in the North Shore Box is below 150 inches, and
- Pumping shall occur until the Islais Creek storage is essentially empty.

v. By March 30, 2018, the Discharger shall synthesize and update its Long-Term Control Plan into one document that reflects current circumstances. The synthesis and update shall include the following elements.

(a) The Long-Term Control Plan shall continue to reflect the historical long-term average annual design goals for combined sewer discharges:

- Four combined sewer discharge events along the North Shore (Discharge Point Nos. 009 through 017);
- Ten combined sewer discharge events within the Central Basin (Discharge Point Nos. 018 through 036); and
- One combined sewer discharge event along the Southeast Sector (Discharge Point Nos. 037 through 043).

(b) The Discharger shall set forth operational requirements similar to those listed in Provisions VI.C.5.c.iii and VI.C.5.c.iv, above, to optimize system operations so as to maximize pollutant removal during wet weather and minimize combined sewer discharges.

(c) The Discharger shall set forth additional measures, to the extent technically and economically feasible, to maximize pollutant removal and minimize combined sewer discharges (e.g., implementing and promoting green infrastructure and low impact development that enhances stormwater detention and percolation).

(d) The Discharger shall develop and propose a metric to evaluate the performance of its wet weather disinfection systems for Discharge Point Nos. 001 through 006.

(e) The Discharger shall propose a plan for post-construction compliance monitoring of all wet weather discharges consistent with the *Combined Sewer Overflow Control Policy*.

vi. The Discharger shall submit a report implementing *Combined Sewer Overflow Control Policy* section II.C.3, "Consideration of Sensitive Areas." At a minimum, the Discharger shall explore how it could eliminate or relocate combined sewer discharges that discharge to sensitive areas. The Discharger shall base its assessment on any new or improved techniques (including but not limited to green infrastructure and low impact development) that can reduce, eliminate, or relocate combined sewer discharges from sensitive areas. The Discharger shall submit the report with its application for permit reissuance.

d. If the Executive Officer determines that the Discharger has caused a violation of any water quality standard for receiving waters, the Discharger shall evaluate its Long-Term Control Plan and its Combined Sewer Operations and Maintenance Plan, and submit a report identifying additional measures, considering its financial capabilities, to address the violation. The report shall include information on the technical and economic feasibility of the additional measures. The Discharger shall submit this report within 180 days after the Executive Officer provides notification of the violation, and the Discharger shall begin implementing the additional measures described in the report, as may be modified by the Executive Officer, within 60 days after report submittal.

6. Other Special Provisions

a. Copper Action Plan. The Discharger shall implement pretreatment, source control, and pollution prevention for copper in accordance with the following tasks and time schedule.

Table 6. Copper Action Plan

Task	Compliance Date
1. Review Potential Copper Sources The Discharger shall submit an inventory of potential copper sources to the treatment plant.	*Completed June 2009*
2. Implement Copper Control Program The Discharger shall submit a plan for and begin implementation of a program to reduce copper sources identified in Task 1. The plan shall consists, at a minimum, of the following elements: a. Provide education and outreach to the public (e.g., focus on proper pool and spa maintenance and plumbers' roles in reducing corrosion); b. If corrosion is determined to be a significant copper source, work cooperatively with local water purveyors to reduce and control water	*Completed February 2011*

Task	Compliance Date
corrosivity, as appropriate, and ensure that local plumbing contractors implement best management practices to reduce corrosion in pipes; and c. Educate plumbers, designers, and maintenance contractors for pools and spas to encourage best management practices that minimize copper discharges.	
3. Implement Additional Measures If the Regional Water Board notifies the Discharger that the three-year rolling mean copper concentration in Central or Lower San Francisco Bay exceeds 2.2 µg/L, then within 90 days of the notification, the Discharger shall evaluate the effluent copper concentration trend and, if it is increasing, develop and begin implementation of additional measures to control copper discharges. The Discharger shall report on the progress and effectiveness of actions taken, and provide a schedule for actions to be taken in the next 12 months.	With annual pollution prevention report due February 28 following 90 days after notification
4. Undertake Studies to Reduce Copper Pollutant Impact Uncertainties. The Discharger shall submit an updated study plan and schedule to conduct or cause to be conducted technical studies to investigate possible copper sediment toxicity and to investigate sub-lethal effects on salmonids. Specifically, the Discharger shall include the manner in which the above will be accomplished and describe the studies to be performed with an implementation schedule. To satisfy this requirement, the Discharger may collaborate and conduct these studies as a group.	*Completed January 2011*
5. Report Status of Copper Control Program. The Discharger shall submit an annual report documenting copper control program implementation and addressing the effectiveness of the actions taken, including any additional copper controls required by Task 3 above, and provide a schedule for actions to be taken in the next 12 months. Additionally, the Discharger shall report the findings and results of the studies completed, planned, or in progress under Task 4. Regarding Task 4 studies, dischargers may collaborate and provide this information in a single report to satisfy this requirement for an entire group.	With annual pollution prevention report due February 28 each year

b. Cyanide Action Plan. The Discharger shall implement monitoring and surveillance, pretreatment, source control and pollution prevention for cyanide in accordance with the following tasks and time schedule.

Table 7. Cyanide Action Plan

Task	Compliance Date
1. Review Potential Cyanide Sources The Discharger shall submit an inventory of potential cyanide sources to the treatment plant. If no cyanide sources are identified, Tasks 2 and 3 are not required, unless the Discharger receives a request to discharge detectable levels of cyanide to the sewer. If so, the Discharger shall notify the Executive Officer and implement Tasks 2 and 3.	*Completed June 2008*
2. Implement Cyanide Control Program The Discharger shall submit a plan and begin implementation of a program to minimize cyanide discharges to its treatment plant consisting, at a minimum, of the following elements: a. Inspect each potential source to assess the need to include that source in the control program. b. Inspect contributing sources included in the control program annually.	*Completed February 2011*

Task	Compliance Date
Inspection elements may be based on U.S. EPA guidance, such as Industrial User Inspection and Sampling Manual for POTWs (EPA 831-B-94-01). c. Develop and distribute educational materials to sources and potential sources regarding the need to prevent cyanide discharges. d. Prepare an emergency monitoring and response plan to be implemented if a significant cyanide discharge occurs. For purposes of this Order, a "significant cyanide discharge" is occurring if cyanide is found in the Southeast Plant's influent above 21 µg/L.	
3. Implement Additional Cyanide Control Measures If the Regional Water Board notifies the Discharger that ambient monitoring shows cyanide concentrations are 1.0 µg/L or higher in the main body of San Francisco Bay, then within 90 days of the notification, the Discharger shall commence actions to identify and abate cyanide sources responsible for the elevated ambient concentrations, and shall report on the progress and effectiveness of actions taken, and provide a schedule for actions to be taken in the next 12 months.	With next annual pollution prevention report due February 28 (at least 90 days following notification)
4. Report Status of Cyanide Control Program The Discharger shall submit an annual report documenting cyanide control program implementation and addressing the effectiveness of actions taken, including any additional cyanide controls required by Task 3, above, and provide a schedule for actions to be taken in the next 12 months.	With annual pollution prevention report due February 28 each year

c. Standard Operating Procedures for Resource Recovery. If the Discharger receives hauled-in anaerobically-digestible material for injection into an anaerobic digester, the Discharger shall notify the Regional Water Board and develop and implement Standard Operating Procedures for this activity. The Standard Operating Procedures shall be developed by February 1, 2014, or prior to initiation of hauling. The Standard Operating Procedures shall address material handling, including unloading, screening or other processing prior to anaerobic digestion, and transportation; spill prevention; spill response; avoidance of the introduction of materials that could cause interference, pass through, or upset of the treatment processes; avoidance of prohibited material; vector control; odor control; operation and maintenance; and the disposition of any solid waste segregated from introduction to the digester. The Discharger shall provide training to its staff on the Standard Operating Procedures and shall maintain records for a minimum of three years for each load received, describing the hauler, waste type, and quantity received. In addition, the Discharger shall maintain records for a minimum of three years for the disposition location and quantity of cumulative pre-digestion segregated solid waste hauled offsite.

ATTACHMENT A – DEFINITIONS

Arithmetic Mean (μ)
Also called the average, the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean = $\mu = \Sigma x / n$ where: Σx is the sum of the measured ambient water concentrations, and n is the number of samples.

Average Monthly Effluent Limitation (AMEL)
The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)
The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Bioaccumulative
Taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Carcinogenic
Known to cause cancer in living organisms.

Coefficient of Variation
Measure of data variability calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

Combined Sewer Discharge
Authorized discharge during a wet weather day from an approved combined sewer discharge point. Refer to Table 2 of the Order for a list of approved combined sewer discharge points.

Combined Sewer Discharge Event
Wet weather event that results in an authorized discharge from one or more approved combined sewer discharge points. A discrete combined sewer discharge event is separated by at least six hours from any other combined sewer discharge event. Refer to Table 2 of the Order for a list of approved combined sewer discharge points.

Combined Sewer System Excursion
Release or diversion of untreated or partially treated wastewater from the combined sewer system that exits the system temporarily and then re-enters it. Excursions do not include releases from privately owned sewer laterals, or authorized combined sewer discharges.

Daily Discharge
Either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit) for a constituent with limitations expressed in units of mass; or (2) the

unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period is considered the result for the calendar day in which the 24-hour period ends.

Detected, but Not Quantified (DNQ)
Sample result less than the RL, but greater than or equal to the laboratory's MDL. Sample results reported as DNQ are estimated concentrations.

Dilution Credit
Amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio or determined by conducting a mixing zone study or modeling the discharge and receiving water.

Dry Weather
Any weather not defined as wet weather (determined on a day-by-day basis).

Effluent Concentration Allowance (ECA)
Value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the CV for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in U.S. EPA guidance (*Technical Support Document For Water Quality-based Toxics Control*, March 1991, second printing, EPA/505/2-90-001).

Enclosed Bay
Indentation along the coast that encloses an area of oceanic water within a distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

Estimated Chemical Concentration
Concentration that results from the confirmed detection of the substance below the ML value by the analytical method.

Estuaries
Waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars are considered estuaries. Estuarine waters are considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater.

Estuarine waters include, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

Inland Surface Waters
All surface waters of the state that do not include the ocean, enclosed bays, or estuaries.

Instantaneous Maximum Effluent Limitation
Highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation
Lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Maximum Daily Effluent Limitation (MDEL)
Highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median
Middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between n/2 and n/2+1).

Method Detection Limit (MDL)
Minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in in 40 C.F.R. part 136, Attachment B, revised as of July 3, 1999.

Minimum Level (ML)
Concentration at which the entire analytical system gives a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Mixing Zone
Limited volume of receiving water allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

Not Detected (ND)
Sample results less than the laboratory's MDL.

Persistent Pollutants
Substances for which degradation or decomposition in the environment is nonexistent or very slow.

Pollutant Minimization Program
Program of waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the Pollutant Minimization Program is to reduce all potential sources of a priority pollutant through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. Cost effectiveness may be considered when establishing the requirements of a Pollutant Minimization Program. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), is considered to fulfill Pollutant Minimization Program requirements.

Pollution Prevention
Any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State Water Board or Regional Water Board.

Reporting Level (RL)
ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order, including an additional factor if applicable as discussed herein. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from SIP Appendix 4 in accordance with SIP section 2.4.2 or established in accordance with SIP section 2.4.3. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Source of Drinking Water
Any water designated as having a municipal or domestic supply (MUN) beneficial use.

Standard Deviation (σ)
Measure of variability calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;
μ is the arithmetic mean of the observed values; and
n is the number of samples.

Toxicity Reduction Evaluation (TRE)
Study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to

the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. A TIE is a set of procedures to identify the specific chemicals responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

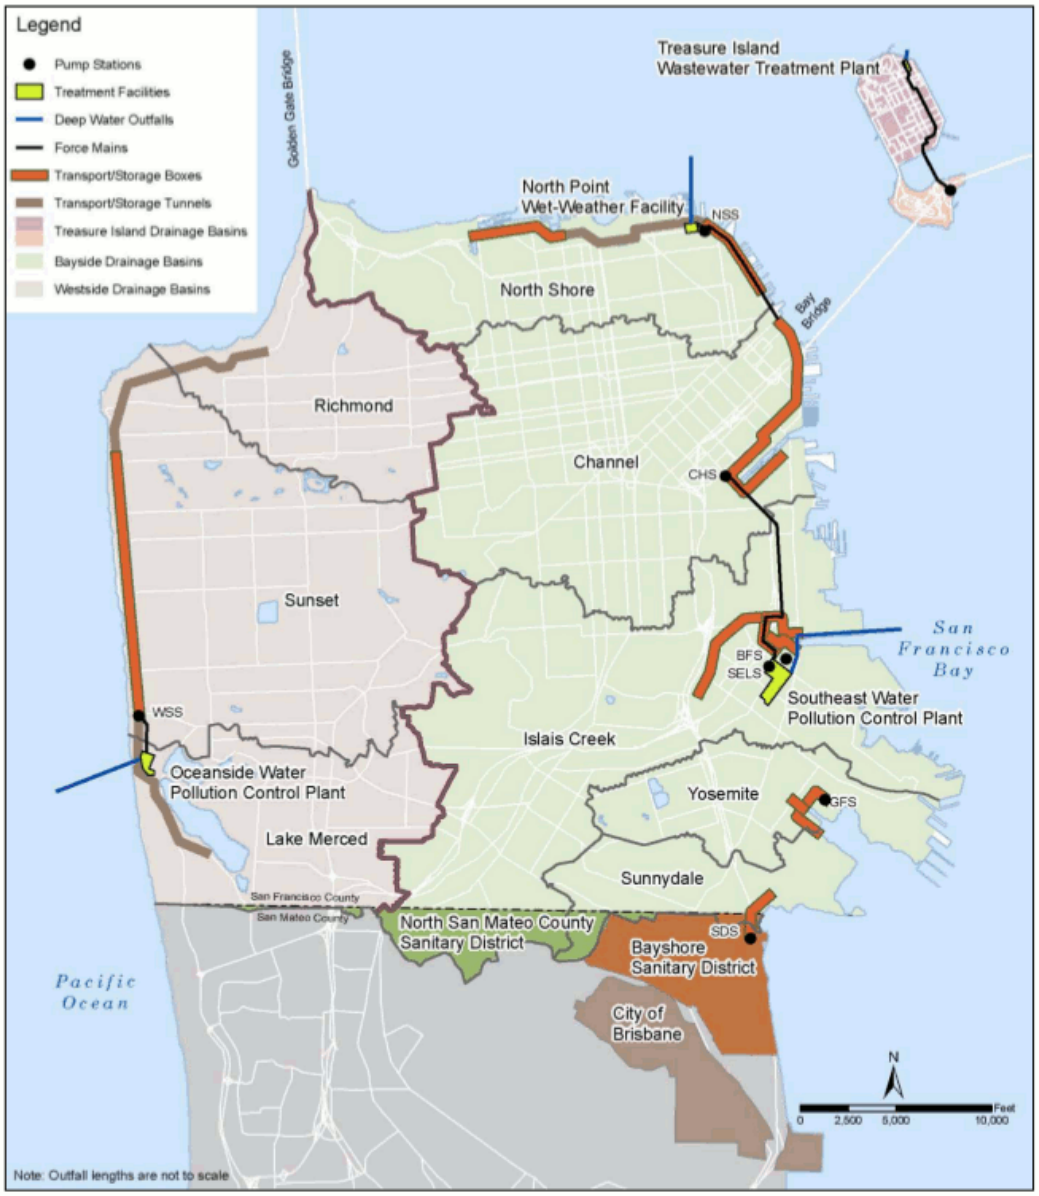
Wet Weather
Weather in which any one of the following conditions exists as a result of rain (determined on a day-by-day basis):

1. Instantaneous influent flow to the Southeast Plant (at Monitoring Location INF-001 as defined in the Monitoring and Reporting Program) exceeds 110 MGD and discharge occurs at Discharge Point No. 002;

2. Average influent biochemical oxygen demand (BOD_5) or total suspended solids (TSS) concentration at the Southeast Plant is less than 100 mg/L; or

3. North Shore storage/transport wastewater elevation exceeds 100 inches.

ATTACHMENT B – FACILITY MAP



The Facility subject to this Order is shown in the light green (eastern) area of the map and includes the Southeast Water Pollution Control Plant, the North Point Wet Weather Facility, and the Bayside Wet Weather Facilities. The remaining collection system subject to this Order is not shown. The Oceanside Water Pollution Control Plant, Westside Wet Weather Facilities, and Treasure Island Wastewater Treatment Plant are shown only for reference.

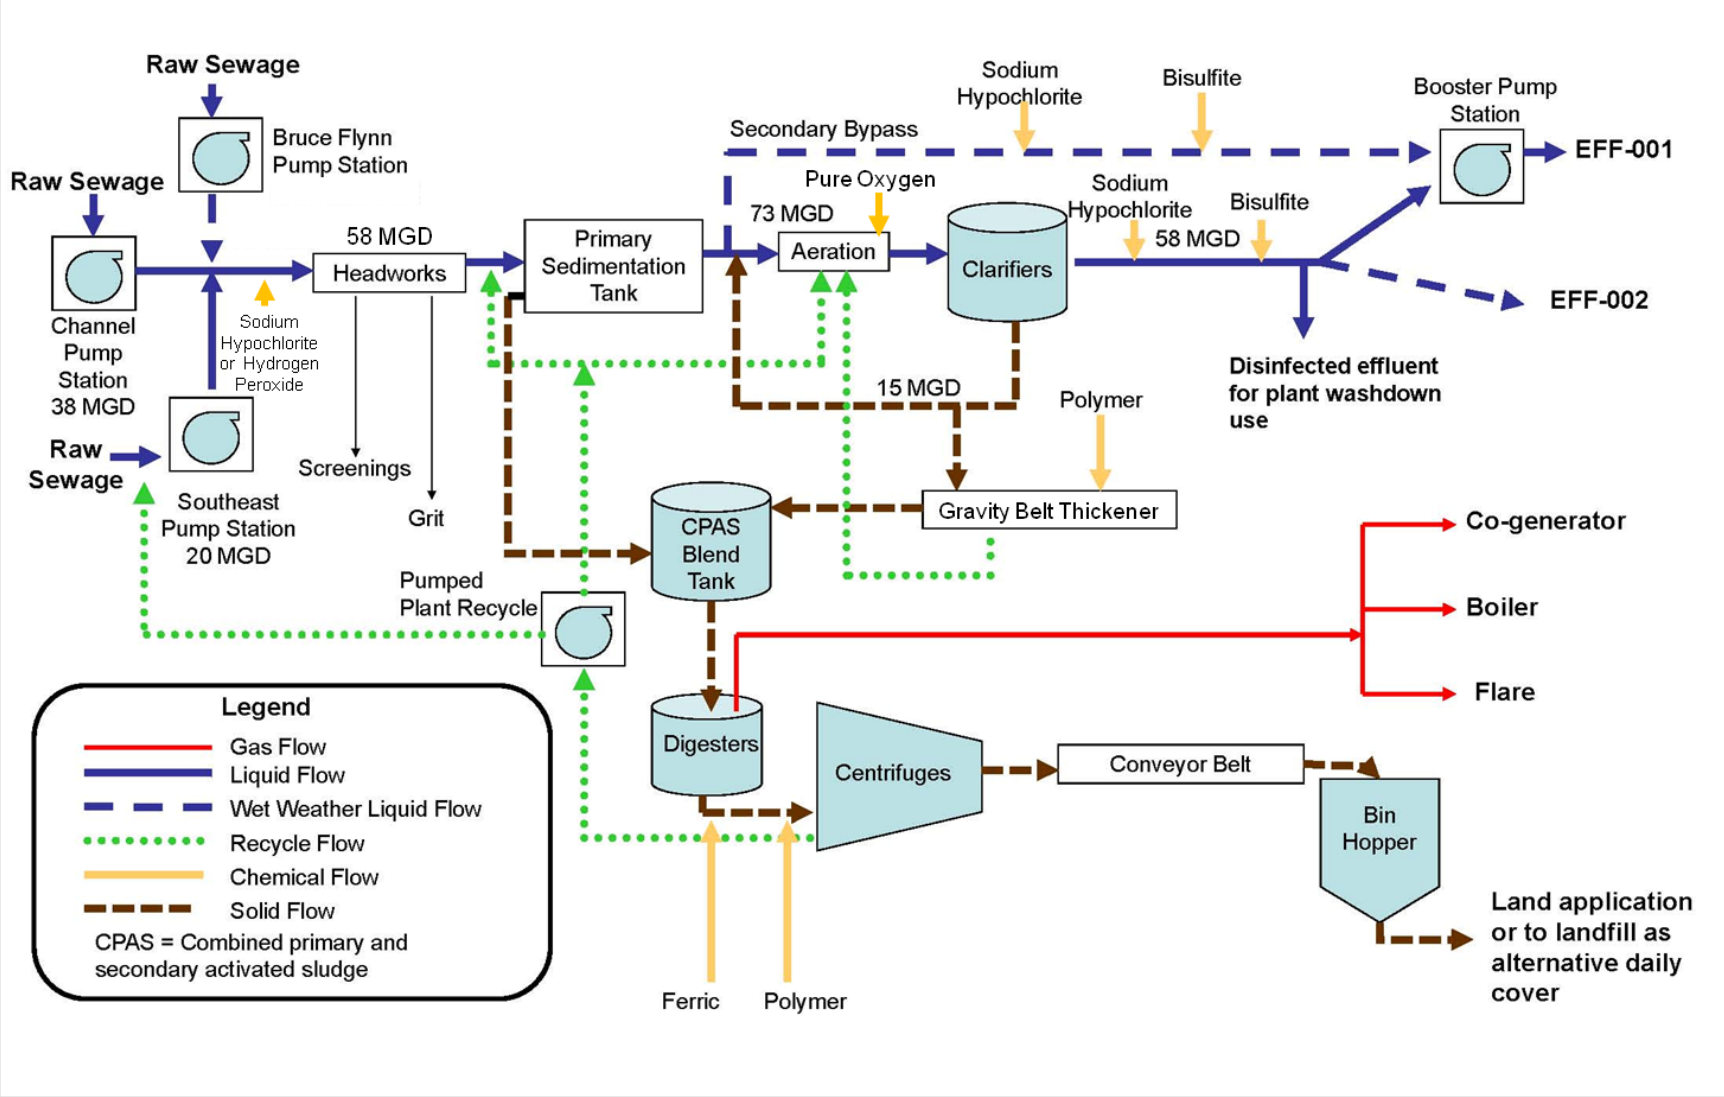
ATTACHMENT C – PROCESS FLOW DIAGRAM



ATTACHMENT D –STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 C.F.R. § 122.41(a).)

2. The Discharger shall comply with effluent standards or prohibitions established under CWA section 307(a) for toxic pollutants and with standards for sewage sludge use or disposal established under CWA section 405(d) within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 C.F.R. § 122.41(i); Wat. Code, § 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (40 C.F.R. § 122.41(i)(1));

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (40 C.F.R. § 122.41(i)(2));

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (40 C.F.R. § 122.41(i)(3)); and

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 C.F.R. § 122.41(i)(4).)

G. Bypass

1. Definitions

a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)

b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)

2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)

3. Prohibition of bypass. Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):

a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));

b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of

equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and

c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)

4. Approval. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions—Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)

5. Notice

a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass. (40 C.F.R. § 122.41(m)(3)(i).)

b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). (40 C.F.R. § 122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).)

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):

a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));

b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));

c. The Discharger submitted notice of the upset as required in Standard Provisions—Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and

d. The Discharger complied with any remedial measures required under Standard Provisions—Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)

3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS—PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. § 122.41(l)(3); § 122.61.)

III. STANDARD PROVISIONS – MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)

B. Monitoring results must be conducted according to test procedures under 40 C.F.R. part 136 or, in the case of sludge use or disposal, approved under 40 C.F.R. part 136 unless otherwise specified in 40 C.F.R. part 503 unless other test procedures have been specified in this Order. (40 C.F.R. § 122.41(j)(4); § 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS—RECORDS

A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 C.F.R. part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years

from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

B. Records of monitoring information shall include the following:

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));

2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));

3. The date(s) the analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));

4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and

6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and

2. Permit applications and attachments, permits, and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS—REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or U.S. EPA within a reasonable time, any information which the Regional Water Board, State Water Board, or U.S. EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or U.S. EPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, § 13267.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Standard Provisions—Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 C.F.R. § 122.41(k).)

2. For a corporation, all permit applications shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and

regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures. (40 C.F.R. § 122.22(a)(1).)

For a partnership or sole proprietorship, all permit applications shall be signed by a general partner or the proprietor, respectively. (40 C.F.R. § 122.22(a)(2).)

For a municipality, state, federal, or other public agency, all permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA). (40 C.F.R. § 122.22(a)(3).).

3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or U.S. EPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

a. The authorization is made in writing by a person described in Standard Provisions—Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));

b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)

4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions—Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)

5. Any person signing a document under Standard Provisions—Reporting V.B.2 or V.B.3 above shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly

responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." (40 C.F.R. § 122.22(d).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program in this Order. (40 C.F.R. § 122.22(l)(4).)

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 C.F.R. § 122.41(l)(4)(i).)

3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 C.F.R. part 136, or another method required for an industry-specific waste stream under 40 C.F.R. subchapters N or O, the results of such monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 C.F.R. § 122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 C.F.R. § 122.41(l)(6)(ii)):

a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)

b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 C.F.R. section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (Alternatively, for an existing manufacturing, commercial, mining, or silvicultural discharge as referenced in 40 C.F.R. section 122.42(a), this notification applies to pollutants that are subject neither to effluent limitations in this Order nor to notification requirements under 40 C.F.R. section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1).) (40 C.F.R. § 122.41(l)(1)(ii).)

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 C.F.R. § 122.41(l)(1)(iii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order's requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions—Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision—Reporting V.E above. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the

Regional Water Board, State Water Board, or U.S. EPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

VI. STANDARD PROVISIONS – ENFORCEMENT

A. The Regional Water Board is authorized to enforce the terms of this Order under several provisions of the Water Code, including, but not limited to, sections 13385, 13386, and 13387.

VII. ADDITIONAL PROVISIONS—NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural Dischargers shall notify the Regional Water Board as soon as they know or have reason to believe (40 C.F.R. § 122.42(a)):

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(1)):

a. 100 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(1)(i));

b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(1)(ii));

c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(1)(iii)); or

d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(1)(iv).)

2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(2)):

a. 500 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(2)(i));

b. 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(2)(ii));

c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(2)(iii)); or

d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(2)(iv).)

B. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 C.F.R. § 122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to CWA sections 301 or 306 if it were directly discharging those pollutants (40 C.F.R. § 122.42(b)(1)); and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of this Order. (40 C.F.R. § 122.42(b)(2).)

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 C.F.R. § 122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

Contents

Tables

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

The Code of Federal Regulations (40 C.F.R. § 122.48) requires that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements that implement federal and State regulations.

I. GENERAL MONITORING PROVISIONS

A. The Discharger shall comply with this MRP. The Executive Officer may amend this MRP pursuant to 40 C.F.R. sections 122.62, 122.63, and 124.5. If any discrepancies exist between this MRP and the "Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits" (Attachment G), this MRP shall prevail.

B. The Discharger shall conduct all monitoring in accordance with Attachment D, section III, as supplemented by Attachment G. Equivalent test methods must be more sensitive than those specified in 40 C.F.R. section 136 and must be specified in this permit.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Locations

Type of Sampling Location	Monitoring Location Name	Monitoring Location Description [1]
Influent	INF-001	Any point at the Southeast Plant upstream of the primary sedimentation basins at which all waste tributary to the treatment system is present, and preceding any phase of treatment. *Latitude 37.744611 Longitude -122.392111*
Influent	INF-002	Any point at the North Point Facility upstream of the primary sedimentation basins at which all waste tributary to the treatment system is present, and preceding any phase of treatment. *Latitude 37.806333 Longitude -122.409389*
Effluent	EFF-001A	During dry weather, any point at the Southeast Plant between the point at which all wastes have gone through complete secondary treatment, including disinfection, and Discharge Point No. 001 (deep water outfall). *Latitude 37.743611 Longitude -122.390000*
Effluent	EFF-001B	During wet weather, any point at the Southeast Plant at which adequate disinfection is assured and Discharge Point No. 001 (deep water outfall) (may be the same as Monitoring Location EFF-001A). *Latitude 37.743611 Longitude -122.390000*
Effluent	EFF-002	During wet weather, any point at the Southeast Plant between the point at which all wastes have gone through complete secondary treatment, including disinfection, and Discharge Point No. 002 (Islais Creek outfall). *Latitude 37.746944 Longitude -122.388056*

Type of Sampling Location	Monitoring Location Name	Monitoring Location Description [1]
Effluent	EFF-003	During wet weather, any point at the North Point Facility between Discharge Point Nos. 003 and 004 (Pier 33 outfalls) and 005 and 006 (Pier 35 outfalls) and the point at which all waste tributary to those outfalls is present and adequate disinfection is assured. *Latitude 37.806667 Longitude -122.407500*
Combined Sewer Discharge	CSD-010	During wet weather, any point between Discharge Point No. 010 (Pierce Street outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.806944 Longitude -122.440000*
Combined Sewer Discharge	CSD-025	During wet weather, any point between Discharge Point No. 025 (Sixth Street North outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.071944 Longitude -122.396111*
Combined Sewer Discharge	CSD-029	During wet weather, any point between Discharge Point No. 029 (Mariposa Street outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.764722 Longitude -122.385278*
Combined Sewer Discharge	CSD-031A	During wet weather, any point between Discharge Point No. 031A (North Islais North outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.747778 Longitude -122.387500*
Combined Sewer Discharge	CSD-041	During wet weather, any point between Discharge Point Nos. 041 or 042 (Yosemite Avenue or Fitch Street outfalls) and the point at which all waste tributary to the outfalls is present. *Latitude 37.723889 Longitude -122.381389* or *Latitude 37.722222 Longitude -122.381389*
Combined Sewer Discharge	CSD-043	During wet weather, any point between Discharge Point No. 043 (Sunnydale Avenue outfall) and the point at which all waste tributary to the outfall is present. *Latitude 37.747222 Longitude -122.386944*
Shoreline	S-202.5	Crissy Field West *Latitude 37.811667 Longitude -122.490000*
Shoreline	S-202.4	Crissy Field (east of Lagoon) *Latitude 37.810278 Longitude -122.452778*
Shoreline	S-210.1	Aquatic Park (Hyde St. Pier) *Latitude 37.8150DW00 Longitude -122.425833*
Shoreline	S-211	Aquatic Park Beach East End *Latitude 37.814722 Longitude -122.424167*
Shoreline	S-300.1	Candlestick Point SRA (Sunnydale Cove Beach) *Latitude 37.715833 Longitude -122.394167*
Shoreline	S-301.1	Candlestick Point SRA (Windsurfer Circle) *Latitude 37.715278 Longitude -122.366607*
Shoreline	S-301.2	Candlestick Point SRA (Jack Rabbit Beach) *Latitude 37.718611 Longitude -122.366667*
Biosolids	BIO-001	Biosolids (treated sludge)

Footnote:

[1] Latitude and longitude information is approximate for administrative purposes.

III. INFLUENT MONITORING REQUIREMENTS

The Discharger shall monitor Southeast Plant influent at Monitoring Location INF-001 as follows. Only flow monitoring is required during wet weather.

Table E-2. Influent Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MGD	Continuous	Continuous/D [3]
Biochemical Oxygen Demand (5-day @ 20°C)(BOD_5)	mg/L	C-24	1/Week [3]
Total Suspended Solids (TSS)	mg/L	C-24	5/Week [3]
Cyanide, Total [2]	µg/L	Grab	1/Month [3]

Unit Abbreviations:

MGD = million gallons per day
MG = million gallons
mg/L = milligrams per liter
µg/L = micrograms per liter

Sample Type:

Continuous = measured continuously
C-24 = 24-hour composite sample
Grab = Grab sample

Sampling Frequency:

Continuous/D = measured continuously, and recorded and reported daily
1/Week = once per week
5/Week = five times per week
1/Month = once per month

Footnotes:

[1] Flow shall be monitored continuously and the following information shall be reported in monthly self-monitoring reports:
- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

[2] Influent cyanide monitoring may be used to satisfy the pretreatment monitoring requirements in Table E-7.

[3] BOD_5, TSS, and total cyanide monitoring is required only during dry weather.

IV. EFFLUENT MONITORING REQUIREMENTS

A. Dry Weather

During dry weather, the Discharger shall monitor Southeast Plant effluent at Monitoring Location EFF-001A as follows:

Table E-3. Effluent Monitoring — Dry Weather

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MGD	Continuous	Continuous/D
BOD_5	mg/L	C-24	1/Week [2]
TSS	mg/L	C-24	5/Week
Chemical Oxygen Demand (COD)	mg/L	C-24	5/Week [2]
Oil and Grease [3]	mg/L	Grab	1/Month

Parameter	Units	Sample Type	Minimum Sampling Frequency
pH [4]	standard units	Continuous or Grab	Continuous or 5/Week
Enterococcus [9]	MPN/100 mL	Grab	4/Year [8]
Fecal Coliform [9]	MPN/100 mL	Grab	1/Week
Total Residual Chlorine [5]	mg/L	Continuous or Grab	Continuous/H or 1/Hour
Acute Toxicity [6]	% Survival	Flow through	1/Month
Chronic Toxicity [7]	TUc	C-24	2/Year
Ammonia, Total	mg/L as N	Grab or C-24	1/Month
Copper, Total Recoverable	µg/L	C-24	1/Month
Cyanide, Total	µg/L	Grab	1/Month
Dioxin-TEQ	µg/L	Grab	2/Year
1,2-Diphenylhydrazine	µg/L	Grab	1/Month

Unit Abbreviations:

MGD = million gallons per day
mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
MPN/100 mL = most probable number per 100 milliliters
TUc = chronic toxicity units, equal to 100/NOEL, where NOEL = IC_{25}, EC_{25}, or NOEC
µg/L = micrograms per liter

Sample Type:

Continuous = measured continuously
C-24 = 24-hour composite sample
Grab = grab sample

Sampling Frequency:

Continuous/H = measured continuously, and recorded and reported hourly
Continuous/D = measured continuously, and recorded and reported daily
1/Hour = once per hour
1/Week = once per week
3/Week = three times per week
5/Week = five times per week
1/Month = once per month
5/Month = five times per month
2/Year = twice per year
4/Year = four times per year

Footnotes:

[1] Flow shall be monitored continuously and the following information shall be reported in monthly self-monitoring reports:
- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

[2] If the COD concentration exceeds 75 mg/L on two consecutive days, the Discharger shall increase the BOD_5 sampling frequency to daily until it demonstreates that the BOD_5 concentration is below 30 mg/L.

[3] Each oil and grease sampling and analysis event shall be conducted in accordance with U.S. EPA Method 1664.

[4] If pH is monitored continuously, the minimum and maximum pH values for each day shall be reported in self-monitoring reports.

[5] Effluent residual chlorine concentrations shall be monitored continuously or, at a minimum, every hour. The Discharger shall report for each day the maximum residual chlorine concentration observed following dechlorination. However, if monitoring continuously, the Discharger shall report for each day the maximum residual chlorine concentration based only on discrete readings from the continuous monitoring taken every hour on the hour. The Discharger shall retain continuous monitoring readings for at least three years. The Regional Water Board reserves the right to use all other continuous monitoring data for discretionary enforcement.

[6] Acute bioassay tests shall be performed in accordance with MRP section V.A.

[7] Critical life stage toxicity tests shall be performed in accordance with MRP section V.B.

[8] The four samples shall be collected in different calendar months during the higher recreational water contact season (June through October). If the enterococcus effluent limitation is exceeded, the Discharger shall conduct 5/Month accelerated sampling for at least three consecutive months. If full compliance is demonstrated after the three months, the Discharger may return to the 4/Year sampling.

[9] Results may be reported as Colony Forming Units/100 milliliters (CFU/100 mL) if the laboratory method used provides results in CFU/100 mL.

B. Wet Weather

1. **Southeast Plant and North Point Facility Outfalls.** During wet weather, when wet weather facilities are operating, the Discharger shall monitor Southeast Plant effluent at Monitoring Locations EFF-001B and EFF-002, and North Point Facility effluent at Monitoring Location EFF-003, as follows:

Table E-4. Effluent Monitoring — Wet Weather

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	MGD	Continuous	Continuous/D
TSS	mg/L	C-X	1/Month
COD	mg/L	C-X	1/Month
Oil and Grease	mg/L	Grab	1/Month
pH	standard units	Continuous or Grab	Continuous or 1/Month
Enterococcus [5]	MPN/100 mL [2]	Grab	1/Day [4]
Fecal Coliform	MPN/100 mL [2]	Grab	1/Day [4]
Total Residual Chlorine	mg/L	Continuous or Grab	Continuous/H or 1/Hour
Acute Toxicity [3]	% Survival	Grab	1/Month
Copper, Total Recoverable	µg/L	C-X	1/Month
Cyanide, Total	µg/L	C-X	1/Month
Ammonia, Total	mg/L as N	Grab	1/Month

Unit Abbreviations:

MGD = million gallons per day
mg/L = milligrams per liter
mg/L as N = milligrams per liter as nitrogen
µg/L = micrograms per liter
MPN/100 mL = most probable number per 100 milliliters

Sample Type:

Continuous = measured continuously
C-X = composite sample comprised of individual grab samples collected at equal intervals of no more than one hour for the duration of the discharge event but not exceeding 24 hours. If an event does not last at least 24-hours, the Discharger shall sample for as long as possible and note the duration in its self-monitoring report.
Grab = grab sample

Sampling Frequency:

Continuous/H = measured continuously, and recorded and reported hourly
Continuous/D = measured continuously, and recorded and reported daily
1/Hour = once per hour
1/Month = once per month
1/Day = once per wet weather day

Footnotes:

[1] Flow shall be monitored continuously and the following information shall be reported in monthly self-monitoring reports:
- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

[2] Results may be reported as colony forming units (CFU)/100 mL if the laboratory method used provides results in CFU/100 mL.

[3] Acute bioassay tests shall be performed only at Monitoring Location EFF-001B and EFF-003 in accordance with MRP section V.A.

[4] Wet weather effluent samples shall be collected within 4 hours after discharges start (when discharges start between 4:00 a.m. and 2:00 p.m.). If the wet weather facility begins operation after 2:00 p.m., samples shall be collected first thing the next morning during business hours (by 9:00 a.m.), provided that the discharge is still occurring.

[5] Data from both wet and dry weather shall be included when calculating the geometric mean for compliance with this monthly wet weather limitation. For days with discharge but no sampling, the enterococcus densities shall be assumed to be the same as the densities of the most recent discharge samples. For days with no discharge, enterococcus densities shall be assumed to be 1 MPN/100 mL for calculational purposes.

2. Combined Sewer Discharge Outfalls. During wet weather, when combined sewer discharges are occurring, the Discharger shall monitor combined sewer discharges at Monitoring Locations CSD-010 through CSD-043 as follows:

Table E-5. Combined Sewer Discharge Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Event Duration	minutes	---	1/Event
Flow Volume [1]	MG	Continuous	1/Event

Unit Abbreviations:

MG = million gallons

Sample Type:

Continuous = measured continuously

Sampling Frequency:

1/Event = once per combined sewer discharge event

Footnote:

[1] Flow volume may be estimated using models.

The Discharger shall also record and report in its self-monitoring reports the following information for each combined sewer discharge event at Monitoring Locations CSD-010 through CSD-043:

a. Date and time that combined sewer discharge started;

b. Rainfall intensity and amount (aggregated hourly data); and

c. Information supporting discharge volume estimate (if estimated).

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

The Discharger shall monitor whole effluent acute and chronic toxicity as follows.

A. Whole Effluent Acute Toxicity

1. During dry weather, acute toxicity at Discharge Point No. 001 (Monitoring Location EFF-001A) shall be evaluated by measuring survival of test organisms exposed to 96-hour continuous flow-through bioassays. The Discharger may stop a bioassay if wet weather occurs during a 96-hour test. If so, the Discharger shall initiate another test as soon as possible (i.e., as soon as approximately 96 hours of dry weather is forecasted). The Discharger may choose to continue a test during wet weather unless the instantaneous influent flow to the Southeast Plant (at Monitoring Location INF-001 as defined in the MRP) exceeds 110 MGD and discharge occurs at Discharge Point No. 002.

During wet weather, acute toxicity at Discharge Point Nos. 001 and 003 through 006 (Monitoring Locations EFF-001B and EFF-003) shall be evaluated by measuring survival of test organisms exposed to 96-hour static bioassays.

2. Test organisms shall be rainbow trout (*Oncorhynchus mykiss*) or fathead minnow (*Pimphales promelas*). The Executive Officer may specify a more sensitive organism or, if testing a particular organism proves unworkable, the most sensitive organism available.

3. All bioassays shall be performed according to the most up-to-date protocols in 40 C.F.R. part 136, currently *Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms,* 5th Edition (EPA-821-R-02-012).

4. If the Discharger demonstrates that specific identifiable substances in the discharge are rapidly rendered harmless upon discharge to the receiving water, compliance with the acute toxicity limit may be determined after test samples are adjusted to remove the influence of those substances. Written acknowledgement that the Executive Officer concurs with the Discharger's demonstration and that the adjustment will not remove the influence of other substances must be obtained prior to any such adjustment. The Discharger may manually adjust the pH of whole effluent acute toxicity samples prior to performing bioassays to minimize ammonia toxicity interference.

5. Bioassay water monitoring shall include, on a daily basis, pH, dissolved oxygen, ammonia (if toxicity is observed), temperature, hardness, and alkalinity. These results shall be reported. If a violation of an acute toxicity limit occurs, the bioassay test shall be repeated with new fish as soon as practical and shall be repeated until a test fish survival rate of 90 percent or greater is observed. If the control fish survival rate is less than 90 percent, the bioassay test shall be restarted with new fish and shall continue as soon as practical until an acceptable test is completed (i.e., control fish survival rate is 90 percent or greater).

B. Whole Effluent Chronic Toxicity

1. Monitoring Requirements

a. Sampling. During dry weather, the Discharger shall collect 24-hour composite effluent samples at Monitoring Location EFF-001A for critical life stage toxicity testing as indicated below. For toxicity tests requiring renewals, the Discharger shall collect 24-hour composite samples on consecutive days.

b. Test Species. The test species shall be purple sea urchin (*Strongylocentroltus purpuratus*) or, if gravid purple sea urchin are unavailable, sand dollar (*Dendraster excentricus*), unless a more sensitive species is identified.

The Discharger shall conduct a screening chronic toxicity test as described in Appendix E-1 following any significant change in the nature of the effluent. If there is no significant change in the nature of the effluent, the Discharger shall conduct a screening test and submit the results with its application for permit reissuance.

c. Frequency. Chronic toxicity monitoring shall be as specified below:

i. The Discharger shall monitor routinely twice per year.

ii. The Discharger shall accelerate monitoring to monthly after either exceeding a three-sample median of 10 TUC or a single-sample maximum of 20 TU_c. Based on the TUc results, the Executive Officer may specify a different frequency for accelerated monitoring to ensure that accelerated monitoring provides useful information.

iii. The Discharger shall return to routine monitoring if accelerated monitoring does not exceed either trigger in ii, above.

iv. If accelerated monitoring confirms consistent toxicity in excess of either trigger in ii, above, the Discharger shall continue accelerated monitoring and initiate toxicity reduction evaluation (TRE) procedures in accordance with section V.B.3, below.

v. The Discharger shall return to routine monitoring after implementing appropriate elements of the TRE, and either the toxicity drops below both triggers in ii, above, or, based on the TRE results, the Executive Officer determines that accelerated monitoring would no longer provide useful information.

Monitoring conducted pursuant to a TRE shall satisfy the requirements for routine and accelerated monitoring while the TRE is underway.

d. Methodology. Sample collection, handling, and preservation shall be in accordance with U.S. EPA protocols. In addition, bioassays shall be conducted in compliance with the most recently promulgated test methods, as shown in Appendix E-1. These are *Short-Term Methods for Estimating the Chronic Toxcicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms*, currently first edition (EPA/600/R-95-136). If these protocols prove unworkable, the Executive Officer and the Environmental Laboratory Accreditation Program may grant exceptions in writing upon the Discharger's request with justification. If the Discharger demonstrates that specific identifiable substances in the discharge are rapidly rendered harmless upon discharge to the receiving water, compliance with the chronic toxicity limit may be determined after test samples are adjusted to remove the influence of those substances. Written acknowledgement that the Executive Officer concurs with the Discharger's demonstration and that the adjustment will not remove the influence of other substances must be obtained prior to any such adjustment.

e. Dilution Series. The Discharger shall conduct tests at 20%, 15%, 10%, 5%, and 2.5%. The "%" represents percent effluent as discharged. Test sample pH may be controlled to the level of the effluent sample as received prior to being salted up.

2. Reporting Requirements

a. The Discharger shall provide toxicity test results for the current reporting period in the self-monitoring report and shall include the following, at a minimum, for each test.

i. Sample date

ii. Test initiation date

iii. Test species

iv. End point values for each dilution (e.g., number of young, growth rate, percent survival)

v. No Observable Effect Level (NOEL) values in percent effluent. The NOEL shall equal the IC_{25} or EC_{25} (see MRP Appendix E-1). If the IC_{25} or EC_{25} cannot be statistically determined, the NOEL shall equal to the No Observable Effect Concentration (NOEC) derived using hypothesis testing. The NOEC is the maximum percent effluent concentration that causes no observable effect on test organisms based on a critical life stage toxicity test.

vi. IC_{15}, IC_{25}, IC_{40}, and IC_{50} values (or EC_{15}, EC_{25}, EC_{40}, and EC_{50}) as percent effluent

vii. TUc values (100/NOEL, where NOEL = IC_{25}, EC_{25}, or NOEC

viii. Mean percent mortality (±s.d.) after 96 hours in 100% effluent (if applicable)

ix. IC_{50} or EC_{50} values for reference toxicant tests

x. Available water quality measurements for each test (e.g., pH, dissolved oxygen, temperature, conductivity, hardness, salinity, and ammonia)

b. The Discharger shall provide the results of the most recent three chronic toxicity tests and the 3-sample median in the self-monitoring report as TUc's.

3. Toxicity Reduction Evaluation (TRE)

a. The Discharger shall prepare a generic TRE work plan within 90 days of the effective date of this Order to be ready to respond to toxicity events. The Discharger shall review and update the work plan as necessary so that it remains current and applicable to the discharge and discharge facilities.

b. Within 30 days of exceeding either chronic toxicity trigger in section V.B.1.c.ii, above, the Discharger shall submit a TRE work plan, which shall be the generic work plan revised as appropriate for this toxicity event after consideration of available discharge data.

c. Within 30 days of completing an accelerated monitoring test observed to exceed either trigger in section V.B.1.c.ii, above, the Discharger shall initiate a TRE in accordance with a TRE work plan that incorporates any and all comments from the Executive Officer.

d. The TRE shall be specific to the discharge and be in accordance with current technical guidance and reference materials, including U.S. EPA guidance materials. The Discharger shall conduct the TRE as a tiered evaluation as summarized below.

i. Tier 1 shall consist of basic data collection (routine and accelerated monitoring).

ii. Tier 2 shall consist of evaluation of treatment process optimization, including operational practices and in-plant process chemicals.

iii. Tier 3 shall consist of a toxicity identification evaluation (TIE).

iv. Tier 4 shall consist of evaluation of options for additional effluent treatment processes.

v. Tier 5 shall consist of evaluation of options for modifications of in-plant treatment processes.

vi. Tier 6 shall consist of implementation of selected toxicity control measures, and followup monitoring and confirmation of implementation success.

e. The Discharger may end the TRE at any stage if monitoring finds there is no longer consistent toxicity (i.e., compliance with Provision IV.A.5 of the Order).

f. The objective of the TIE shall be to identify the substance or combination of substances causing the observed toxicity. The Discharger shall employ all reasonable efforts using currently available TIE methodologies.

g. As toxic substances are identified or characterized, the Discharger shall continue the TRE by determining the sources and evaluating alternative strategies for reducing or eliminating the toxic substances from the discharge. The Discharger shall take all reasonable steps to reduce toxicity to levels below the chronic toxicity limit.

h. Many recommended TRE elements parallel required or recommended efforts related to source control, pollution prevention, and stormwater control programs. TRE efforts should be coordinated with such efforts. To prevent duplication of efforts, evidence of complying with requirements or recommended efforts of such programs may be acceptable to demonstrate compliance with TRE requirements.

i. Chronic toxicity may be episodic and identification of causes of and reduction of sources of chronic toxicity may not be successful. Regional Water Board enforcement considerations will be based in part on the Discharger's actions and efforts to identify and control or reduce sources of consistent toxicity.

VI. RECEIVING WATER MONITORING REQUIREMENTS

A. Regional Monitoring. The Discharger shall continue to participate in the Regional Monitoring Program, which collects data on pollutants and toxicity in San Francisco Bay water, sediment, and biota.

B. Shoreline Monitoring. Following any combined sewer discharge event at Discharge Point Nos. 009, 010, 011, 013, or 015, the Discharger shall monitor shoreline receiving waters at Monitoring Locations S-202.4, S-202.5, S-210, and S-211. Following any combined sewer discharge event at Discharge Point Nos. 040, 041, or 042, the Discharger shall monitor at Monitoring Location S-301.2. Following any combined sewer discharge event at Discharge Point No. 043, the Discharger shall monitor at Monitoring Locations S-300.1 and S-301.1. Monitoring shall be conducted at each location as follows for up to seven days or until the single-sample bacteriological standards of Cal. Code of Regs. tit. 17, section 7958(a)(1), are met at that location (i.e., the enterococcus density is less than 104 most probable number (MPN)/100 mL and the fecal coliform density is less than 400 MPN/100 mL). Samples shall be collected between 8:00 a.m. and 4:00 p.m.

Table E-6. Shoreline Monitoring

Parameter	Units	Sample Type	Minimum Sampling Frequency
Enterococcus [1]	MPN/100 mL [3]	Grab	1/Day
Fecal Coliform [2]	MPN/100 mL [3]	Grab	1/Day

Unit Abbreviations:

MPN/100 mL = most probable number per 100 milliliters

Sample Type:

Grab = Grab sample

Sampling Frequency:

1/Day = once per day

Footnotes:

[1] The Discharger shall monitor for enterococcus using U.S. EPA-approved methods, such as the IDEXX Enterolert method. When replicate analyses are made, the reported result shall be the geometric mean of the replicate results.

[2] Alternatively, the Discharger may measure *E. coli* as recommended for the U.S. EPA Beach Monitoring Program. *E. coli* may be measured using the IDEXX Colilert method.

[3] Results may be reported as CFU/100 mL if the test method used provides results in CFU/100 mL.

VII. PRETREATMENT AND BIOSOLIDS MONITORING REQUIREMENTS

The Discharger shall comply with the following pretreatment monitoring requirements for influent (at Monitoring Location INF-001), effluent (at Monitoring Location EFF-001A), and biosolids (at Monitoring Location BIO-001). The Discharger shall report summaries of analytical results in annual and semi-annual pretreatment reports in accordance with Attachment H. At its option, the Discharger may also report biosolids analytical results in its electronic self-monitoring reports by manual entry, by EDF/CDF, or as an attached file.

Table E-7. Pretreatment and Biosolids Monitoring

Constituents	Sampling Frequency			Sample Type	
	Influent INF-001 [1]	Effluent EFF-001A [1]	Biosolids BIO-001	Influent and Effluent	Biosolids
VOC [2]	2/Year	2/Year	2/Year	Grab	Grabs [6c]
BNA [3]	2/Year	2/Year	2/Year	Grab	Grabs [6c]
Metals [4]	1/Month	1/Month	2/Year	C-24 [6a]	Grabs [6c]
Hexavalent Chromium [5]	1/Month	1/Month	2/Year	Grab	Grabs [6c]
Mercury	1/Month	1/Month	2/Year	Grab or C-24 [6a][6b]	Grabs [6c]
Cyanide, Total	1/Month	1/Month	---	Grab	Grabs [6c]

Sample Type:

C-24 = 24-hour composite sample
Grab = Grab sample

Sampling Frequency:

1/Month = once per month
2/Year = twice per year

Footnotes:

[1] Influent and effluent monitoring conducted in accordance with Tables E-2 and E-3 may be used to satisfy these pretreatment monitoring requirements.

[2] VOC: volatile organic compounds

[3] BNA: base/neutrals and acids extractable organic compounds

[4] The metals are arsenic, cadmium, copper, lead, nickel, silver, zinc, and selenium.

[5] The Discharger may elect to report total chromium instead of hexavalent chromium. Samples collected for total chromium measurements shall be 24-hour composites.

[6] Sample types:

a. If an automatic compositor is used, the Discharger shall obtain 24-hour composite samples through flow-proportioned composite sampling. Alternatively, 24-hour composite samples may consist of discrete grab samples combined (volumetrically flow-weighted) prior to analysis or mathematically flow-weighted.

b. The Discharger may use automatic compositors for mercury if either (1) the compositing equipment (hoses and containers) complies with ultra-clean specifications, or (2) equipment blank samples demonstrate that the compositing equipment has not contaminated the sample.

c. The biosolids sample shall be a composite of the biosolids to be disposed. Biosolids collection and monitoring shall comply with the requirements specified in Attachment H, Appendix H-4. The Discharger shall also comply with the biosolids monitoring requirements of 40 C.F.R. part 503.

VIII. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

The Discharger shall comply with all Standard Provisions (Attachments D and G) related to monitoring, reporting, and recordkeeping, with modifications shown in section IX, below.

B. Self-Monitoring Reports (SMRs)

1. **SMR Format.** The Discharger shall electronically submit SMRs using the State Water Board's California Integrated Water Quality System (CIWQS) Web site (http://www.waterboards.ca.gov/ciwqs/index.html). The CIWQS website will provide additional information for SMR submittal in the event of a planned service interruption for electronic submittal.

2. **SMR Due Dates and Contents.** The Discharger shall submit SMRs by the due dates, and with the contents, specified below:

   a. **Monthly SMRs —** Monthly SMRs shall be due 30 days after the end of each calendar month, covering that calendar month. The monthly SMR shall contain the applicable items described in sections V.B and V.C of both Attachments D and G of this Order. See Provision VI.C.2 (Effluent Characterization Study and Report) of this Order for information that must also be reported with monthly SMRs.

      Monthly SMRs shall include all new monitoring results obtained since the last SMR was submitted. If the Discharger monitors any pollutant more frequently than required by this Order, the Discharger shall include the results of such monitoring in the calculations and reporting for the SMR.

   b. **Annual SMR —** Annual SMRs shall be due February 1 each year, covering the previous calendar year. The annual SMR shall contain the items described in sections V.C.1.f of Attachment G. See also Provisions VI.C.2 (Effluent Characterization Study and Report) and VI.C.5.b.ix (Monitor to Characterize Wet Weather Discharge Impacts and Efficacy of Controls) of the Order for requirements to submit reports with the annual SMR.

   c. **Specifications for Submitting SMRs to CIWQS —** The Discharger shall submit analytical results and other information using one of the following methods.

Table E-8. CIWQS Reporting

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	**Attached File**
All parameters identified in influent, effluent, and receiving water monitoring tables (except Dissolved Oxygen and Temperature)	Required for all results	
Dissolved Oxygen Temperature	Required for monthly maximum and minimum results only [1]	Discharger may use this method for all results or keep records
Cyanide Arsenic Cadmium Chromium Copper Lead Mercury Nickel Selenium Silver Zinc Dioxins and Furans (by U.S. EPA Method 1613)	Required for all results [2]	
Antimony Beryllium Thallium Other Pollutants (by U.S. EPA Methods 601, 602, 608, 610, 614, 624, and 625)	Not required (unless identified in influent, effluent, or receiving water monitoring tables), but encouraged [1]	Discharger may use this method and submit results with application for permit reissuance, unless data are submitted by CDF/EDF upload
Volume and Duration of Blended Discharge [3]	Required for all blended effluent discharges	

Parameter	Method of Reporting	
	EDF/CDF data upload or manual entry	Attached File
Analytical Method	Not required (Discharger may select "data unavailable") [1]	
Collection Time Analysis Time	Not required (Discharger may select "0:00") [1]	

Footnotes:

[1] The Discharger shall continue to monitor at the minimum frequency specified in this MRP, keep records of the measurements, and make the records available upon request.

[2] These parameters require EDF/CDF data upload or manual entry regardless of whether monitoring is required by this MRP or other provisions of this Order (except for biosolids, sludge, or ash provisions).

[3] The requirement for volume and duration of blended discharge applies only if this Order authorizes the Discharger to discharge blended effluent.

The Discharger shall arrange all reported data in a tabular format and summarize data to clearly illustrate whether the Facility is operating in compliance with effluent limitations. The Discharger is not required to duplicate the submittal of data entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format, the Discharger shall electronically submit the data in a tabular format as an attachment.

3. **Monitoring Periods.** Monitoring periods for all required monitoring shall be as set forth below unless otherwise specified:

Table E-9. Monitoring Periods

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
Continuous	Permit effective date	All
1/Hour	Permit effective date	Hourly
1/Day	Permit effective date	Midnight through 11:59 p.m. or any 24-hour period that reasonably represents a calendar day for purposes of sampling.
1/Week or 2/Week or 5/Week	Sunday following permit effective date or on permit effective date if on Sunday	Sunday through Saturday
1/Month	First day of calendar month following permit effective date or on permit effective date if on first day of month	First day of calendar month through last day of calendar month
1/2 Months	First day of calendar month following permit effective date or on permit effective date if that date is first day of month	First day of calendar month through last day of next calendar month
1/Year	January 1	January 1 through December 31
2/Year	Closest January 1 or July 1 following (or on) permit effective date	November 1 through April 30 May 1 through October 31
4/Year	Closest January 1, April 1, July 1, or October 1 following (or on) permit effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
1/5 Years	Permit effective date	Once during the Order term no more than 12 months prior to applying for permit reissuance.

4. **RL and MDL Reporting.** The Discharger shall report with each sample result the Reporting Level (RL) and Method Detection Limit (MDL) as determined by the procedure in 40 C.F.R. part 136. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

   a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

   b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported. The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (+/- a percentage of the reported value), numerical ranges (low to high), or any other means the laboratory considers appropriate.

   c. Sample results less than the laboratory's MDL shall be reported as "Not Detected" or ND.

   d. The Discharger shall instruct laboratories to establish calibration standards so that the minimum level (ML) value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.

5. **Compliance Determination.** Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined above and in the Fact Sheet and Attachments A, D, and G. For purposes of reporting and administrative enforcement by the Regional Water Board and State Water Board, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL).

C. Discharge Monitoring Reports (DMRs)

1. At any time during the term of this Order, the State Water Board or Regional Water Board may notify the Discharger to electronically submit DMRs. Until such notification is given, the Discharger shall submit DMRs in accordance with the requirements described below.

2. Once notified by the State Water Board or Regional Water Board, the Discharger shall submit hard copy DMRs. The Discharger shall sign and certify DMRs as Attachment D requires. The Discharger shall submit original DMRs to one of the addresses listed below:

Standard Mail	FedEx/UPS/Other Private Carriers
State Water Resources Control Board Division of Water Quality c/o DMR Processing Center PO Box 100 Sacramento, CA 95812-1000	State Water Resources Control Board Division of Water Quality c/o DMR Processing Center 1001 I Street, 15th Floor Sacramento, CA 95814

3. All discharge monitoring results shall be reported on official U.S. EPA pre-printed DMR forms (EPA Form 3320-1) or self-generated forms that follow the exact same format as EPA Form 3320-1.

IX. MODIFICATIONS TO ATTACHMENT G

This MRP modifies Attachment G as indicated below:

A. Attachment G sections V.C.1.f and V.C.1.g are revised as follows, and section V.C.1.h (Reporting data in electronic format) is deleted.

f. Annual self-monitoring report requirements

By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

1) Annual compliance summary table of treatment plant performance (this summary table is not required if the Discharger has submitted the year's monitoring results to CIWQS in electronic reporting format by EDF/CDF upload or manual entry);

2) Comprehensive discussion of treatment plant performance and compliance with the permit (this discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater (this item is not required if the Discharger has submitted the year's monitoring results to CIWQS in electronic reporting format by EDF/CDF upload or manual entry);

4) List of approved analyses, including the following:

(i) List of analyses for which the Discharger is certified;

(ii) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory shall not be submitted but be retained onsite); and

(iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all stormwater to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs addressed as follows, unless the Discharger submits SMRs electronically to CIWQS:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format – *Deleted*

B. Attachment G sections V.E.2, V.E.2.a, and V.E.2.c are revised as follows, and sections V.E.2.b (24-hour Certification) and V.E.2.d (Communication Protocol) are deleted.

2. Unauthorized Discharges from Municipal Wastewater Treatment Plants[1]

The following requirements apply to municipal wastewater treatment plants that experience an unauthorized discharge at their treatment facilities and

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

supersede requirements imposed on the Discharger by the Executive Officer by letter of May 1, 2008.

a. Two (2)-Hour Notification

For any unauthorized discharges that enter a drainage channel or a surface water, the Discharger shall, as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the California Emergency Management Agency (CalEMA, currently 800-852-7550), the local health officers or directors of environmental health with jurisdiction over the affected water bodies, and the Regional Water Board. Timely notification by the Discharger to CalEMA also satisfies notification to the Regional Water Board. Notification shall include the following:

1) Incident description and cause;

2) Location of threatened or involved waterway(s) or storm drains;

3) Date and time the unauthorized discharge started;

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on); and

6) Identity of the person reporting the unauthorized discharge.

b. 24-hour Certification – *Deleted*

c. 5-day Written Report

Within five business days, the Discharger shall submit a written report that includes, in addition to the information required above, the following:

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

2) Efforts implemented to minimize public exposure to the unauthorized discharge;

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;

4) Corrective measures taken to minimize the impact of the unauthorized discharge;

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges; and

7) Quantity and duration of the unauthorized discharge, and the amount recovered.

d. Communication Protocol – *Deleted*

X. MODIFICATIONS TO ATTACHMENT H

This MRP modifies Attachment H as indicated below.

A. Attachment H, Appendix H-3, Signature Requirements for Pretreatment Annual and Semiannual Reports, is revised as follows.

The pretreatment annual and semiannual reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Discharger (POTW - 40 C.F.R. section 403.12[m]). Signed copies of the reports shall be submitted to the State Water Board and the Regional Water Board through the electronic self-monitoring report (eSMR) module of the California Integrated Water Quality System (CIWQS).

APPENDIX E-1
CHRONIC TOXICITY
DEFINITION OF TERMS AND SCREENING PHASE REQUIREMENTS

I. Definition of Terms

A. No observed effect level (NOEL) for compliance determination is equal to IC_{25} or EC_{25}. If the IC_{25} or EC_{25} cannot be statistically determined, the NOEL shall be equal to the NOEC derived using hypothesis testing.

B. Effective concentration (EC) is a point estimate of the toxicant concentration that would cause an adverse effect on a quantal, "all or nothing," response (such as death, immobilization, or serious incapacitation) in a given percent of the test organisms. If the effect is death or immobility, the term lethal concentration (LC) may be used. EC values may be calculated using point estimation techniques such as probit, logit, and Spearman-Karber. EC_{25} is the concentration of toxicant (in percent effluent) that causes a response in 25 percent of the test organisms.

C. Inhibition concentration (IC) is a point estimate of the toxicant concentration that would cause a given percent reduction in a nonlethal, nonquantal biological measurement, such as growth. For example, an IC_{25} is the estimated concentration of toxicant that would cause a 25 percent reduction in average young per female or growth. IC values may be calculated using a linear interpolation method such as U.S. EPA's Bootstrap Procedure.

D. No observed effect concentration (NOEC) is the highest tested concentration of an effluent or a toxicant at which no adverse effects are observed on the aquatic test organisms at a specific time of observation. It is determined using hypothesis testing.

II. Chronic Toxicity Screening Phase Requirements

A. The Discharger shall perform screening phase monitoring:

1. Subsequent to any significant change in the nature of the effluent discharged through changes in sources or treatment, except those changes resulting from reductions in pollutant concentrations attributable to source control efforts, or

2. Prior to permit reissuance. Screening phase monitoring data shall be included in the NPDES permit application for reissuance. The information shall be as recent as possible, but may be based on screening phase monitoring conducted within 5 years before the permit expiration date.

B. Design of the screening phase shall, at a minimum, consist of the following elements:

1. Use of test species specified in Appendix E-2, attached, and use of the protocols referenced in those tables.

2. Two stages:

a. Stage 1 shall consist of a minimum of one battery of tests conducted concurrently. Selection of the type of test species and minimum number of tests shall be based on Appendix E-2 (attached).

b. Stage 2 shall consist of a minimum of two test batteries conducted at a monthly frequency using the three most sensitive species based on the Stage 1 test results.

3. Appropriate controls.

4. Concurrent reference toxicant tests.

5. Dilution series of 100%, 50%, 25%, 12.5%, 6.25%, and 0%, where "%" is percent effluent as discharged, or as otherwise approved by the Executive Officer if different dilution ratios are needed to reflect discharge conditions.

C. The Discharger shall submit a screening phase proposal. The proposal shall address each of the elements listed above. If within 30 days, the Executive Officer does not comment, the Discharger shall commence with screening phase monitoring.

APPENDIX E-2
SUMMARY OF TOXICITY TEST SPECIES REQUIREMENTS

Table AE-1. Critical Life Stage Toxicity Tests for Estuarine Waters

Species	(Scientific Name)	Effect	Test Duration	Reference
Alga	*(Skeletonema costatum)* *(Thalassiosira pseudonana)*	Growth rate	4 days	1
Red alga	*(Champia parvula)*	Number of cystocarps	7–9 days	3
Giant kelp	*(Macrocystis pyrifera)*	Percent germination; germ tube length	48 hours	2
Abalone	*(Haliotis rufescens)*	Abnormal shell development	48 hours	2
Oyster Mussel	*(Crassostrea gigas)* *(Mytilus edulis)*	Abnormal shell development; percent survival	48 hours	2
Echinoderms - Urchins Sand dollar	*(Strongylocentrotus purpuratus, S. franciscanus)* *(Dendraster excentricus)*	Percent fertilization or larval development	1 hour (fertilization) or 72 hours (development)	2
Shrimp	*(Americamysis bahia)*	Percent survival; growth	7 days	3
Shrimp	*(Holmesimysis costata)*	Percent survival; growth	7 days	2
Topsmelt	*(Atherinops affinis)*	Percent survival; growth	7 days	2
Silversides	*(Menidia beryllina)*	Larval growth rate; percent survival	7 days	3

Table AE-3. Toxicity Test Requirements for Stage One Screening Phase

Requirements	Receiving Water Characteristics		
	Discharges to Coast	Discharges to San Francisco Bay [1]	
	Ocean	Marine/Estuarine	Freshwater
Taxonomic diversity	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish	1 plant 1 invertebrate 1 fish
Number of tests of each salinity type: Freshwater [2] Marine/Estuarine	0 4	1 or 2 3 or 4	3 0
Total number of tests	4	5	3

[1] (a) Marine refers to receiving water salinities greater than 1 part per thousand (ppt) at least 95 percent of the time during a normal water year.

(b) Freshwater refers to receiving water with salinities less than 1 ppt at least 95 percent of the time during a normal water year.

(c) Estuarine refers to receiving water salinities that fall between those of marine and freshwater, as described above.

[2] The freshwater species may be substituted with marine species if:

(a) The salinity of the effluent is above 1 ppt greater than 95 percent of the time, or

(b) The ionic strength (TDS or conductivity) of the effluent at the test concentration used to determine compliance is documented to be toxic to the test species.

ATTACHMENT F - FACT SHEET

Contents

Tables

ATTACHMENT F – FACT SHEET

This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order. As described in section II.B of the Order, the Regional Water Board incorporates this Fact Sheet as its findings supporting the issuance of the Order.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility.

Table F-1. Facility Information

WDID	2 386010001
CIWQS Place ID	256499
Discharger	City and County of San Francisco
Facility Name	Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities, and Wastewater Collection System
Facility Address	San Francisco Public Utilities Commission / Wastewater Enterprise 750 Phelps Street San Francisco, CA 94124
	San Francisco County
Facility Contact, Title, Phone	Tommy Moala, Assistant General Manager, Wastewater Enterprise, (415) 554-2465
Authorized Person to Sign and Submit Reports	Same as Facility Contact
Mailing Address	San Francisco Public Utilities Commission 525 Golden Gate Ave., 13th Floor San Francisco, CA 94102
Billing Address	Same as Mailing Address
Facility Type	Publicly Owned Treatment Works
Major or Minor Facility	Major
Threat to Water Quality	1
Complexity	A
Pretreatment Program	Yes
Reclamation Requirements	Not Applicable
Mercury and PCBs Requirements	NPDES Permit No. CA0038849
Permitted Flow	85.4 million gallons per day (MGD)
Design Flow	Southeast Water Pollution Control Plant: 85.4 MGD – Average dry weather design flow capacity; 250 MGD – Wet weather design flow capacity: 150 MGD receives primary and secondary treatment, and additional 100 MGD receives only primary treatment. North Point Wet Weather Facility: 150 MGD – Wet weather design flow capacity (only primary treatment).
Watershed	San Francisco Bay
Receiving Water	San Francisco Bay
Receiving Water Type	Marine

A. The City and County of San Francisco (Discharger) is the owner and operator of the Southeast Water Pollution Control Plant (Southeast Plant), North Point Wet Weather Facility (North Point Facility), Bayside Wet Weather Facilities, and wastewater collection system (collectively Facility).

For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. The Discharger is regulated pursuant to National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037664. It was previously subject to Order No. R2-2008-0007 (previous order), which was adopted on January 30, 2008, and expired on March 31, 2013. The Facility discharges wastewater to Central and Lower San Francisco Bay, waters of the United States within the San Francisco Bay watershed. Attachment B provides a map of the area around the Facility. Attachment C provides a Facility flow schematic.

The Discharger must file a petition with the State Water Resources Control Board (State Water Board), Division of Water Rights, and receive approval for any change in the point of discharge, place of use, or purpose of use of treated wastewater that decreases the flow in any portion of a watercourse. The State Water Board retains the jurisdictional authority to enforce such requirements under Water Code section 1211.

C. The Discharger filed a Report of Waste Discharge and submitted an application for reissuance of its WDRs and NPDES permit on October 2, 2012.

D. The discharge is also regulated under NPDES Permit No. CA0038849, which establishes requirements on mercury and polychlorinated biphenyls (PCBs) from wastewater discharges to San Francisco Bay. This Order does not affect the mercury and PCBs permit.

II. FACILITY DESCRIPTION

A. Wastewater and Biosolids Treatment and Controls

1. **Location and Service Area.** The Facility serves eastern San Francisco and portions of Brisbane and Daly City (served by the City of Brisbane, the Bayshore Sanitary District, and the North San Mateo County Sanitation District). The service area population is approximately 580,000.

   The Southeast Plant is located on Phelps Street at Jarrold Avenue near the Islais Creek Channel. It provides primary and secondary treatment of combined wastewater and stormwater. The North Point Facility is located on Bay Street near The Embarcadero. It provides primary treatment of combined wastewater and stormwater during wet weather. The Bayside Wet Weather Facilities are located throughout the eastern side of San Francisco, primarily near the shore. They provide equivalent-to-primary treatment during wet weather.

2. **Collection System.** The collection system is primarily a combined sewer system that conveys wastewater and stormwater to the Southeast Plant, North Point Facility, and Bayside Wet Weather Facilities. It consists of approximately 600 miles of pipe, and 7 major and 11 minor pump stations. Separate sanitary and storm drains serve isolated areas, including parts of Candlestick Point and Mission Bay. The Facility also receives wastewater from three satellite wastewater collection systems: the Bayshore Sanitary District (portions of Brisbane and Daly City), the City of Brisbane (residential sector), and the North San Mateo County Sanitation District (portions of Daly City). For the purposes of this Order, the Facility does not include the satellite collection systems.

3. **Wastewater Treatment.** The Discharger operates the Southeast Plant, North Point Facility, and Bayside Wet Weather Facilities to maximize treatment.

   a. **Southeast Plant.** During dry weather, the Southeast Plant provides secondary wastewater treatment. The treatment processes include a headworks (with coarse and fine bar screens, and grit removal), primary sedimentation tanks, pure oxygen aeration basins, secondary clarifiers, and chlorine contact basins (for chlorination using sodium hypochlorite and dechlorination using sodium bisulfite). These processes are shown in the diagram in Attachment C. The Southeast Plant has a dry weather design capacity of 85.4 MGD. From June 2010 through August 2012, its average dry weather flow was 58 MGD.

      During wet weather, the Southeast Plant processes up to 250 MGD of combined wastewater (i.e., sewage, industrial wastewater, and stormwater). Up to 150 MGD receives both primary and secondary treatment; the remaining flow (up to 100 MGD) receives only primary treatment. The entire volume is disinfected prior to discharge.

   b. **North Point Facility.** The North Point Facility discharges only during wet weather and provides primary treatment of combined wastewater. The treatment consists of bar screens, sedimentation tanks equipped with skimmers (clarification, removal of floatables), sodium hypochlorite injection, and dechlorination using sodium bisulfite addition. The North Point Facility can provide primary treatment for up to 150 MGD of combined wastewater. The entire volume of treated wastewater is disinfected and dechlorinated prior to discharge. Solids are directed to the Southeast Plant for digestion.

      The North Point Facility discharges under the following circumstances:

      - the North Shore Storage/Transport Box is at 200 inches;
      - within 60 minutes of any combined sewer discharge through Discharge Point Nos. 013 through 017; or
      - as necessary to minimize the likelihood of combined sewer discharges in the Central and Southeast Drainage Basins.

   c. **Bayside Wet Weather Facilities.** During dry weather, storage/transport structures transport wastewater to the Southeast Plant. During wet weather, these structures transfer combined wastewater to the Southeast Plant and, if necessary, the North Point Facility. They also provide storage for more than 120 million gallons of combined wastewater. In the event that the capacities of the Southeast Plant, North Point Facility, and storage/transport structures are exceeded, the combined wastewater receives the equivalent of primary treatment in the storage/transport structures and is discharged to San Francisco Bay through any one of 29 shoreline combined sewer discharge structures. The treatment in the storage/transport structures consists of settling solids with a series of baffles and weirs that also remove floatable materials prior to discharge. This process equates to the minimum treatment specified in U.S. EPA's *Combined Sewer Overflow Control Policy* (see Fact Sheet section III.C.8). After the wet weather is over, wastewater and accumulated solids remaining in the storage/transport structures are sent to the Southeast Plant for secondary treatment.

4. **Sludge and Biosolids Management.** Sludge from the primary and secondary clarification operations is processed using anaerobic digestion. The process consists of gravity belt thickeners for waste activated sludge thickening, mesophilic anaerobic digesters, and horizontal bowl centrifuges for dewatering. After digestion, the sludge is conditioned with ferric chloride and polymer, dewatered, and stored in cake hoppers for hauling. The digested and dewatered biosolids are beneficially used at a permitted landfill or land-applied at a permitted site. A portion of the biosolids is blended with green waste to create Class A compost. Class B biosolids are land-applied on farms in Solano and Sonoma counties or used at a landfill.

B. Discharge Points and Receiving Waters

1. **Dry Weather Discharges.** During dry weather, all flow receives secondary treatment and is discharged to Lower San Francisco Bay (a tidally-influenced, marine waterbody) through a deep water outfall (Discharge Point No. 001) at Pier 80, which is immediately north of the Islais Creek Channel. The outfall is approximately 810 feet east of Pier 80 at a depth of approximately 43 feet below mean lower low water. A diffuser at the outfall consists of 18 ports placed 15.9 feet apart on center along the terminal end of the outfall. The length of the diffuser is oriented approximately 90 degrees off north, perpendicular to the predominant current direction. The diffuser port openings are 8 inches in diameter, located at an elevation 42 inches above the sediment bed, and set at 0 degrees from horizontal.

   Following a September 2010 inspection that discovered that some fittings on the diffuser risers had broken off, the Discharger began replacing the discharge ports on the diffuser. The number of ports will remain the same, but the new ports will be equipped with duckbill valves to prevent rocks and debris from entering. The duckbill valves will likely increase dilution at the outfall.

2. **Wet Weather Discharges.** During wet weather, when secondary treatment capacity at the Southeast Plant has been exceeded, a portion of the primary-treated effluent bypasses aeration and secondary clarification. The bypassed primary effluent is chlorinated and dechlorinated, and then blended with disinfected secondary-treated wastewater and discharged through Discharge Point No. 001. The discharge from the Southeast Plant through Discharge Point No. 001 is maximized up to 110 MGD. Effluent flows in excess of 110 MGD are discharged via the Quint Street shallow water outfall into Islais Creek (Discharge Point No. 002). All effluent discharged through Discharge Point No. 002 receives secondary treatment, and all primary treated effluent is directed to the deep water outfall. Up to 140 MGD of secondary-treated wastewater may be discharged through Discharge Point No. 002. Under the most critical circumstances, up to 100 MGD of disinfected primary-treated effluent may be blended with 10 MGD of disinfected secondary-treated effluent and discharged through Discharge Point No. 001.

   When necessary, treated wastewater from the North Point Facility is discharged into San Francisco Bay through four deepwater outfalls, two of which discharge at the end of Pier 33 (Discharge Point Nos. 003 and 004) and two of which discharge at the end of Pier 35 (Discharge Point Nos. 005 and 006). If the capacities of the Southeast Plant, the North Point Facility, and the storage/transport structures are exceeded, wastewater in the storage/transport structures is discharged to San Francisco Bay through one or more of the 29 combined sewer discharge structures (Discharge Point Nos. 009 through 043).

C. Summary of Existing Requirements and Monitoring Data

Effluent limitations contained in the previous order and representative monitoring data from the previous order term are presented below:

Table F-2. Previous Effluent Limitations and Monitoring Data

Parameter	Units	Effluent Limitations					Monitoring Data (4/08–9/12)
		Monthly Average	Weekly Average	Daily Maximum	Instant-aneous Maximum	Instant-aneous Minimum	Highest Daily Discharge
Dry Weather (Discharge Point No. 001)							
Biochemical Oxygen Demand, 5-day @ 20°C (BOD_5)	mg/L	30	45	---	---	---	47 [6]
Total Suspended Solids (TSS)	mg/L	30	45	---	---	---	62 [6]
Oil and Grease	mg/L	10	---	20	---	---	17
pH	s.u.	---	---	---	9.0	6.0	6.1 – 7.7
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	35 [1]	---	---	---	---	16 [4]
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	270
Copper	µg/L	53 [3]	---	76 [3]	---	---	37
Lead	µg/L	36	---	89	---	---	1.6
Silver	µg/L	7	---	22	---	---	2.6
Zinc	µg/L	490	---	720	---	---	55
Cyanide	µg/L	20 [4]	---	43 [4]	---	---	9.5
Dioxin-TEQ	mg/yr			[5]			0 [5]
Tetrachloroethylene	µg/L	84	---	240	---	---	0.79
Bis (2-ethylhexyl) phthalate	µg/L	55	---	110	---	---	1.7
Ammonia	mg/L as N	190	---	290	---	---	42
Tributyltin	µg/L	0.032	---	0.065	---	---	< 0.0026
Wet Weather (Discharge Point No. 001)							
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	---	---	---	104	---	600
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	450
Wet Weather (Discharge Point No. 002)							
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	---	---	---	104	---	>24,000

Parameter	Units	Effluent Limitations					Monitoring Data (4/08–9/12)
		Monthly Average	Weekly Average	Daily Maximum	Instant-aneous Maximum	Instant-aneous Minimum	Highest Daily Discharge
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	680 [7]
Wet Weather (Discharge Point Nos. 004 through 006)							
Total Residual Chlorine	mg/L	---	---	---	0.0	---	0.0
Enterococcus	MPN/ 100 mL	---	---	---	104	---	5,800
Fecal Coliform	MPN/ 100 mL	500 [2]	---	---	---	---	>16,000 [7]

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter
s.u. = standard units
CFU/100 mL = colony forming units per 100 milliliters
MPN/100 mL = Most Probable Number per 100 milliliters
mg/L as N = milligrams per liter as nitrogen
mg/yr = milligrams per year

Footnotes:

[1] Monthly geometric mean.

[2] The 30-day moving median value was not to exceed 500 MPN/100 mL and no more than 10 percent of the samples in any 30-day period were to equal or exceed 1,100 MPN/100 mL.

[3] Final effluent limitations for copper became effective on the effective date of the copper site-specific objectives (January 6, 2009).

[4] Final effluent limitations for cyanide became effective on the effective date of the cyanide site specific objectives (July 22, 2008).

[5] Final effluent limitations for dioxin-TEQ became effective on June 30, 2012. The dioxin-TEQ limit was 1.6 mg/year. Compliance was to be based on the product of the average concentration in samples collected each year and the annual dry weather flow. No dioxin or furan congener was detected above the ML in Attachment G, Table A; therefore, in accordance with Attachment G section V.C.1.c.3, the 2012 dioxin-TEQ discharge was 0 mg/year.

[6] The monthly and weekly average BOD_5 and TSS concentrations at these times complied with BOD_5 and TSS effluent limitations.

[7] The 30-day median and 10th percentile fecal coliform densities at these times complied with fecal coliform effluent limitations.

Table F-3. Additional Wet Weather Monitoring Data

Parameter	Units	Discharge Point No. 001		Discharge Point No. 002		Discharge Point Nos. 003 through 006	
		Range	Median [1]	Range	Median [1]	Range	Median [1]
Chemical Oxygen Demand (COD)	mg/L	53 – 200	120	25 – 100	52	74 – 360	160
Oil and Grease	mg/L	--	--	--	--	<5 – 43	9.5
Total Residual Chlorine	mg/L	0	0	0	0	0	0
Enterococcus	MPN/ 100 mL	<10 – 600	<10	<10 – >24,000	31	<10 – 5,800	<10
Fecal Coliform	MPN/ 100 mL	<2 – 450	<10	<2 – 680	<10	<2 – >16,000	<10
Copper	µg/L	3 – 64	35	1 – 17	8	5 – 99	45
Lead	µg/L	1 – 43	12	0.1[2] – 2	1	1 – 31	13

Mercury	µg/L	<0.2 – 0.40	<0.2	<0.2	<0.2	<0.2 – 0.30[2]	<0.2
Silver	µg/L	0.04 – 2.6	0.28	0.03[2] – 0.51	0.14	0.04[2] – 0.75	0.32
Zinc	µg/L	12 – 230	100	4 – 64	32	14 – 290	130
Cyanide	µg/L	<3 – 3.3[2]	<3	<3	<3	1.9[2] – 12	<3
Ammonia	mg/L as N	3 – 29	5	7 – 41	32	2 – 14	5

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter
MPN/100 mL = Most Probable Number per 100 milliliters
mg/L as N = milligrams per liter as nitrogen

Footnotes:

[1] Median calculation reflects inclusion of estimated concentrations (i.e., detected but not quantified, DNQs) and nondetects (at the detection limit).

[2] Estimated concentration (i.e., detected but not quantified, DNQ)

D. Summary of Combined Sewer Discharge Events

The following tables summarize combined sewer discharge events over a 14-year period and estimated average combined sewer discharge event durations for wet season 2008-2009 through wet season 2012-2013:

Table F-4. Frequency of Combined Sewer Discharge Events

Year	Rainfall (inches)	Number of Combined Sewer Discharge Events		
		North Shore Basin [2]	Central Basin [3]	Southeast Basin [3]
1998-1999	17.0	1	13	0
1999-2000	20.9	3	12	1
2000-2001	15.8	0	8	0
2001-2002	19.3	2	9	2
2002-2003	21.1	3	14	4
2003-2004	16.9	4	8	2
2004-2005	28.2	4	15	1
2005-2006	28.9	3	16	2
2006-2007	15.1	1	5	1
2007-2008	17.4	3	7	2
2008-2009	15.6	3	4	1
2009-2010	22.4	5	11	3
2010-2011	26.3	6	21	0
2011-2012	15.9	2	8	1
14-Year Median	**18.4**	**3**	**10**	**1**
Design Criterion [1]		**4**	**10**	**1**

Footnotes:

[1] These criteria were based on 70 years of historic rainfall data and used to design the the Bayside Wet Weather Facilities. They are useful in evaluating system performance.

[2] North Shore Basin combined sewer discharges occur from Discharge Point Nos. 009 through 017.

[3] Central Basin combined sewer discharges occur from Discharge Point Nos. 018 through 035.

[4] Southeast Basin combined sewer discharges occur from Discharge Point Nos. 037 through 043.

Table F-5. Durations of Combined Sewer Discharge Events

Northshore Basin		Central Basin		Southeast Basin	
Discharge Point	Estimated Average Duration (Hours)	Discharge Point	Estimated Average Duration (Hours)	Discharge Point	Estimated Average Duration (Hours)
009	2	018	3	037	5
010	2	019	3	038	5

E. Compliance Summary

1. **Effluent Limitation Violations.** The Discharger violated its wet weather enterococcus limit ten times during the previous order term, as listed in the following table:

Table F-6. Wet Weather Enterococcus Effluent Limitation Violations

Violation Date	Monitoring Location	Unit	Effluent Limit	Reported Value
December 16, 2008	EFF-002	MPN/100mL	104	110
January 22, 2009	EFF-002	MPN/100mL	104	8,664 [1]
April 7, 2009	EFF-002	MPN/100mL	104	>24,196 [1]
January 29, 2010	EFF-002	MPN/100mL	104	11,199 [1]
December 5, 2010	EFF-001B	MPN/100mL	104	402
January 30, 2011	EFF-001B	MPN/100mL	104	598
March 19, 2011	EFF-001B	MPN/100mL	104	784 [1]
March 15, 2011	EFF-003	MPN/100mL	104	1,317 [2]
March 24, 2011	EFF-003	MPN/100mL	104	5,794 [2]
November 16, 2012	EFF-003	MPN/100mL	104	108

Footnotes:

[1] The Discharger asserts that these values may be false positives since simultaneous fecal coliform results were relatively low.

[2] These violations may be subject to minimum penalties of $3,000 each pursuant to California Water Code §13385(i).

The Discharger asserts that four reported values may be false positives due to matrix interference because, in each case, simultaneous fecal coliform results were relatively low.

However, the Discharger certified these results and, to date, has presented no corroborating information to invalidate them pursuant to MRP section XI.D.2 or Attachment G section V.C.1.a.5 of the previous order. The Discharger modified its sampling practices in early 2010 to test for interference before completing enterococcus analyses. As for the other violations, the Discharger points to the challenge of adding sufficient chlorine when operating at maximum hydraulic capacity, indicating that sudden stormwater surges make predicting the chlorine dose necessary for compliance difficult. The Discharger is considering options but has not proposed corrective actions.

The March 15 and 24, 2011, violations may be subject to minimum penalties of $3,000 each pursuant to California Water Code section 13385(i) because they are the fourth and fifth effluent limit violations within six months. Regional Water Board staff will evaluate relevant evidence and present the matter for Regional Water Board consideration as a separate action in the near future, as appropriate.

2. **Inspections.** The Facility is subject to annual compliance evaluation inspections. During the previous order term, there were five inspections, four of which focused on treatment plant operations at the Southeast Plant. The treatment plant inspections concluded with satisfactory ratings for compliance. An October 2010 inspection focused on the collection system.

   The collection system inspection addressed two main issues: (1) accumulation of grease and debris in the storage/transports; and (2) Discharger responsiveness to reports of collection system excursions onto sidewalks and streets. The Discharger responded to the inspection report by describing its routine collection system maintenance practices and programs addressing fats and grease and by pointing out that the number of apparent collection system problems reported was very high because all of its emergency hotline calls were included, whether or not they related to actual collection system problems. At the time, the Discharger was developing a new computer-based asset management system to allow it to better track and respond to calls.

   To follow up on the inspection and the Discharger's response, the Executive Officer issued an order requiring additional information pursuant to Water Code section 13267. This 13267 order required information on the extent and causes of excursions onto sidewalks and streets, and progress toward collection system improvements, asset management system development and implementation, and collection system cleaning and maintenance.

   In response, the Discharger submitted several reports, including a special study on combined sewer system excursions during the period from October 1, 2011, through September 30, 2012. Using its computer-based asset management system, it reported how many calls it received and how many of the calls related to collection system issues. Most (98 percent) of the reports related to private sewer laterals for which others were responsible. Nevertheless, the Discharger often resolved these problems on behalf of the other parties. The rest (about 70) related to the Discharger's collection system.

   The Discharger described specific maintenance activities, improvements, and repairs to its collections system; tracked the effectiveness of its fats, oil, and grease control program; and

described program improvements. Grease buildup is the main cause of the Discharger's sewer system blockages.

F. Planned Changes

The Discharger has started several infrastructure projects. In October 2012, the Discharger began the Southeast Plant Northside Facility Reliability Upgrade (Phase 2) project, which is an $11.5-million project to replace aging secondary sludge handlers and aeration-related electrical systems and to modify the secondary clarification process. The project is expected to be completed in August 2014. The Discharger began an Oxygen Generation Plant Replacement project in December 2012 and plans to complete this $12-million project in December 2013. The Discharger began dewatering facility corrosion repairs in August 2012, a $9.1-million project to address corrosion damage to concrete, the sludge piping network, and the electrical system at the sludge dewatering building. This project is expected to be completed in January 2014. The Discharger is also designing a project to begin in August 2013 to replace and relocate the sodium hypochlorite storage tanks for disinfection.

The Discharger's Sewer System Improvement Program is a three-phase, $6.9-billion effort over the next 20 years to address deficiencies, improve operational flexibility, provide seismic reliability, and ensure future compliance with anticipated environmental regulatory requirements. The program will address aging infrastructure and technologies at the treatment plants and increase the ability of the collection system to convey wastewater.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements in this Order are based on the requirements and authorities described below:

A. Legal Authorities

This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA, and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters.

B. California Environmental Quality Act

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act, Public Resources Code division 13, chapter 3 (commencing with § 21100).

C. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plan.** The Regional Water Board adopted the *Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan), which designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. Requirements in this Order implement the Basin Plan. In addition, this Order is consistent with State Water Board Resolution No. 88-63, which established State policy that all waters, with certain exceptions,

should be considered suitable or potentially suitable for municipal or domestic supply. Because of the marine influence on San Francisco Bay, total dissolved solids levels exceed 3,000 mg/L; therefore, San Francisco Bay meets an exception to State Water Board Resolution No. 88-63.

Beneficial uses for the receiving waters of each Facility discharge point are listed below:

Table F-7. Basin Plan Beneficial Uses

Discharge Points	Receiving Water	Beneficial Uses
001, 002, 019, 043	Lower San Francisco Bay	Industrial Service Supply (IND) Ocean, Commercial, and Sport Fishing (COMM) Shellfish Harvesting (SHELL) Estuarine Habitat (EST) Fish Migration (MIGR) Preservation of Rare and Endangered Species (RARE) Fish Spawning (SPWN) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
003, 004, 005, 006, 009, 010, 011, 013, 015, 017, 018	Central San Francisco Bay	Industrial Service Supply (IND) Industrial Process Supply (PROC) Ocean, Commercial, and Sport Fishing (COMM) Shellfish Harvesting (SHELL) Estuarine Habitat (EST) Fish Migration (MIGR) Preservation of Rare and Endangered Species (RARE) Fish Spawning (SPWN) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
022, 023, 024, 025, 026, 027, 028	Mission Creek	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
029, 030, 030A	Central Basin	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
031, 031A, 032, 033, 035	Islais Creek	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)

037, 038	India Basin	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
040, 042	South Basin	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2) Navigation (NAV)
041	Yosemite Creek	Ocean, Commercial, and Sport Fishing (COMM) Estuarine Habitat (EST) Wildlife Habitat (WILD) Water Contact Recreation (REC1) Non-Contact Water Recreation (REC2)

2. **Sediment Quality.** The State Water Board adopted the *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality* on September 16, 2008, and it became effective on August 25, 2009. This plan supersedes other narrative sediment quality objectives, and establishes new sediment quality objectives and related implementation provisions for specifically defined sediments in most bays and estuaries. This Order implements the sediment quality objectives of this plan.

3. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** U.S. EPA adopted the NTR on December 22, 1992, and amended it on May 4, 1995 and November 9, 1999. About 40 criteria in the NTR apply in California. On May 18, 2000, U.S. EPA adopted the CTR. The CTR promulgated new toxics criteria for California and incorporated the previously adopted NTR criteria that applied in the State. U.S. EPA amended the CTR on February 13, 2001. These rules contain water quality criteria for priority pollutants.

4. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated for California through the NTR and the priority pollutant objectives the Regional Water Board established in the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives, and provisions for chronic toxicity control. Requirements of this Order implement the SIP for dry weather discharges.

5. **Antidegradation Policy.** Federal regulations at 40 C.F.R. section 131.12 requires that state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy through State Water Board Resolution 68-16, which is deemed to incorporate the federal antidegradation policy where the federal policy applies under federal law. Resolution 68-16 requires that existing

water quality be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. Permitted discharges must be consistent with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution 68-16.

6. **Anti-Backsliding Requirements.** CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.

7. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code §§ 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. §§ 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the State, including protecting rare, threatened, or endangered species. The Discharger is responsible for meeting all applicable Endangered Species Act requirements.

8. **Combined Sewer Overflow Control Policy.** U.S. EPA's *Combined Sewer Overflow Control Policy* (59 Fed. Reg. 18688-18698, April 19, 1994). The policy establishes a national approach for controlling combined sewer discharges and overflows and calls for a two-phased process. During the first phase, dischargers operating combined sewer systems were required to implement the Nine Minimum Controls, which were to constitute CWA technology-based requirements as applied to combined sewer systems (best conventional pollutant control technology [BCT] and best available control technology economically achievable [BAT]). Dischargers were also required to develop Long-Term Control Plans based on their financial capabilities. During the second phase, dischargers were required to implement the Long-Term Control Plans, thus providing a basis for demonstrating or presuming attainment of water quality objectives protective of beneficial uses. This Order requires the Discharger to continue operating its combined sewer system in accordance with the Nine Minimum Controls and its Long-Term Control Plan.

D. Impaired Waters on CWA 303(d) List

In October 2011, U.S. EPA approved a revised list of impaired waters prepared pursuant to CWA section 303(d), which requires identification of specific water bodies where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. Where it has not done so already, the Regional Water Board plans to adopt Total Maximum Daily Loads (TMDLs) for pollutants on the 303(d) list. TMDLs establish wasteload allocations for point sources and load allocations for non-point sources, and are established to achieve the water quality standards for the impaired waters.

Central and Lower San Francisco Bay are listed as impaired waters. The pollutants impairing Central San Francisco Bay are chlordane, DDT, dieldrin, dioxins and furans, exotic species, mercury, dioxin-like PCBs and PCBs, selenium, and trash. The pollutants impairing Lower San Francisco Bay are chlordane, DDT, dieldrin, exotic species, dioxins and furans, mercury, trash, and dioxin-like PCBs and PCBs. On February 12, 2008, U.S. EPA approved a TMDL for

mercury in San Francisco Bay. On March 29, 2010, U.S. EPA approved a TMDL for PCBs in San Francisco Bay. The TMDLs for mercury and PCBs are incorporated into the Basin Plan and apply to this discharge; however, mercury and PCBs discharges are not covered by this Order. Instead, they are regulated under NPDES Permit No. CA0038849.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants discharged into waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 C.F.R. section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 C.F.R. section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of receiving waters.

A. Discharge Prohibitions

1. Prohibitions in this Order

a. Discharge Prohibition III.A (No discharge other than as described in this Order): This prohibition is based on 40 C.F.R. section 122.21(a) and Water Code section 13260, which require filing an application and Report of Waste Discharge before a discharge can occur. Discharges not described in the application and Report of Waste Discharge, and subsequently in this Order, are prohibited.

b. Discharge Prohibition III.B (Minimum initial dilution of 231:1): This Order is based on a modeled dilution ratio of 231:1 for the calculation of one or more effluent limitations reflecting available information regarding the dilution achieved at Discharge Point No. 001 (see section IV.C.4.a of this Fact Sheet). Therefore, this prohibition is necessary to ensure that the assumptions used to derive the dilution credit remain substantially the same so the limitations remain protective of water quality.

c. Discharge Prohibition III.C (No bypass of secondary treatment): This prohibition is based on 40 C.F.R. section 122.41(m) and U.S. EPA's *Combined Sewer Overflow Control Policy*. Bypass of secondary treatment is prohibited except during wet weather as defined in Attachment A or in accordance with 40 C.F.R. section §122.41(m) (see Attachment D section I.G.)

d. Discharge Prohibition III.D (No dry weather discharges at Discharge Point Nos. 002 through 043): This prohibition reflects the principle objective of U.S. EPA's *Combined Sewer overflow Control Policy* (i.e., to ensure that combined sewer discharges only result from wet weather and that such discharges only occur at specified locations). Dry weather discharges must receive full secondary treatment prior to discharge through Discharge Point No. 001.

e. Discharge Prohibition III.E (Average dry weather effluent flow not to exceed dry weather design capacity): This prohibition is based on the Southeast Plant's design

treatment capacity (i.e., the historic and tested reliability of the treatment plant). Exceeding the average dry weather flow design capacity could result in lowering the reliability of achieving compliance with water quality requirements.

This Order prohibits an average dry weather effluent flow greater than 85.4 MGD. The previous order prohibited an average dry weather flow greater than 84.5 MGD. That value was a typographical error. The prohibitions in earlier orders (e.g., Order No. R2-2002-0073) specified 85.4 MGD. Federal regulations allow correction of this error (40 C.F.R. § 122.63).

f. Discharge Prohibition III.F (No sewer overflows): Basin Plan Table 4-1, Discharge Prohibition 15, and the CWA prohibit the discharge of wastewater to surface waters except as authorized under an NPDES permit. Publicly owned treatment works must achieve secondary treatment at a minimum and any more stringent limitations necessary to meet water quality standards (33 U.S.C. § 1311[b][1][B and C]). A sanitary sewer or combined sewer overflow that results in the discharge of raw sewage or wastewater not meeting this Order's effluent limitations to surface waters is therefore prohibited under the CWA and the Basin Plan. This prohibition does not apply to combined sewer discharges explicitly authorized in this Order pursuant to U.S. EPA's *Combined Sewer Overflow Control Policy*.

2. Exception to Shallow Water and Dead-End Slough Discharge Prohibition

Basin Plan Table 4-1, Discharge Prohibition 1, prohibits discharges not receiving a minimum of 10:1 initial dilution and discharges to dead-end sloughs. Basin Plan section 4.2 provides for exceptions under certain circumstances:

- An inordinate burden would be placed on the Discharger relative to the beneficial uses protected, and an equivalent level of environmental protection can be achieved by alternate means;
- A discharge is approved as part of a reclamation project;
- Net environmental benefits will be derived as a result of the discharge; or
- A discharge is approved as part of a groundwater cleanup project.

Discharges to Discharge Point Nos. 001 and 003 through 006 receive a minimum of at least 10:1 dilution[1]; therefore, they are not subject this discharge prohibition. During wet weather, this Order grants an exception for discharges to Discharge Point Nos. 002 and 009 through 043 for the following reasons:

a. Wet weather discharges to Discharge Point Nos. 002 and 009 through 043 occur as a result of the Discharger's efforts to maximize treatment of sanitary and industrial wastewater *and* stormwater. To eliminate all combined sewer discharges would place an inordinate burden on the Discharger, which has invested heavily in infrastructure that

[1] Dilution at Discharge Point No. 001 is discussed in section IV.C.4.a of this Fact Sheet. Discharge Point Nos. 003 through 006 are located off of Piers 33 and 35 and discharge at a depth of about 10 feet below mean low low water (MLLW). In August 1973, the Discharger completed a study that estimated dilution ratios to be at least 10:1 at each outfall when discharging at a maximum flow of 170 MGD.

captures and treats most combined wastewater and stormwater. Providing additional deepwater discharge capacity is unwarranted for the relatively small portion of the combined wastewater not discharged to deep water. Such a burden would be wholly disproportional relative to the beneficial uses protected because this Order's requirements are sufficient to protect beneficial uses.

b. An equivalent level of environmental protection has been achieved because Provision VI.C.5 specifies controls that ensure the reliability of the Discharger's system in maximizing treatment and minimizing discharges not receiving at least 10:1 initial dilution. Combined sewer discharges at Discharge Point Nos. 009 through 043 receive equivalent-to-primary treatment, but before any combined sewer discharges occur, the Discharger optimizes discharges at Discharge Point Nos. 001 through 006. Discharges to Discharge Point Nos. 001 and 003 through 006 receive at least 10:1 dilution. When Discharge Point No. 001 (the Pier 80 deepwater outfall) is at capacity, the Discharger redirects only its highest quality effluent (secondary-treated wastewater) to Discharge Point No. 002.

Furthermore, in 1999 the Discharger took steps to enhance San Francisco Bay's beneficial uses by contributing $1 million to the Port of San Francisco to restore a 25-acre wetland at Heron's Head Park (Pier 98). Enhancing beneficial uses in this way provides environmental protection equivalent to providing at least 10:1 dilution for additional flows.

c. Net environmental benefits result from the operation of a combined sewer system. The system removes many pollutants in urban runoff, which elsewhere in the Region are discharged through stormwater outfalls with little or no treatment. For example, the system removes almost 2,000 tons, or 84 percent, of suspended sediment from the stormwater component of its influent each year (*Special Study Overflow Impacts and Efficacy of Combined Sewer Overflow Controls for the San Francisco Bayside System, Southeast Water Pollution Control Plant, North Point Wet Weather Facility and Bayside Wet Weather Facilities*, June 29, 2012).

B. Conventional and Non-Conventional Pollutant Effluent Limitations

1. Scope and Authority

a. Dry Weather Discharges. CWA section 301(b) and 40 C.F.R. section 122.44 require that permits include conditions meeting technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet water quality standards. The dry weather discharges authorized by this Order must meet minimum federal technology-based requirements based on Secondary Treatment Standards at 40 C.F.R. section 133 as summarized below. In addition, the 30-day average percent removal for biochemical oxygen demand (BOD_5) (or carbonaceous biochemical oxygen demand, $CBOD_5$) and total suspended solids (TSS), by concentration, is not to be less than 85 percent. The Basin Plan contains additional requirements for certain pollutants.

Table F-8. Secondary Treatment Requirements

Parameter	Monthly Average	Weekly Average
BOD_5	30 mg/L	45 mg/L
$CBOD_5$ [1]	25 mg/L	40 mg/L
TSS	30 mg/L	45 mg/L
pH	6.0 – 9.0 standard units [2]	

Footnotes:

[1] $CBOD_5$ effluent limitations may be substituted for BOD_5 limitations.

[2] The pH is to be between 6.0 and 9.0 unless inorganic chemicals are added during treatment or industrial sources cause the pH to be less than 6.0 or greater than 9.0.

b. Wet Weather Discharges. Discharges from combined sewer systems are point sources subject to NPDES permit requirements; however, such wet weather discharges are not subject to the Secondary Treatment Standards. The *Combined Sewer Overflow Control Policy* establishes technology-based requirements for combined sewer systems based on 40 C.F.R. section 125.3. The Policy requires the Discharger to implement Nine Minimum Controls, which represent the best conventional technology and best available technology economically achievable. Provision VI.C.5.b of this Order contains these requirements. This Order contains total residual chlorine and enterococcus limits for disinfected effluent from Discharge Point Nos. 001 through 006 to ensure proper operations and maintenance consistent with the Nine Minimum Controls.

2. Effluent Limitations

a. Dry Weather Discharges (Discharge Point No. 001)

i. BOD_5 and TSS. The dry weather BOD_5 and TSS effluent limitations, including the 85 percent removal requirements, are based on the Secondary Treatment Standards and Basin Plan Table 4-2.

ii. Oil and Grease. The oil and grease effluent limitations are based on Basin Plan Table 4-2.

iii. pH. The pH effluent limitations are based on the Secondary Treatment Standards and Basin Plan Table 4-2.

iv. Total Residual Chlorine. The total residual chlorine effluent limitation is based on Basin Plan Table 4-2. The allowance for determining false positives when using continuous devices is based on the fact that continuous instruments occasionally have anomalous spikes, and it is chemically improbable to have free chlorine present in the presence of sodium bisulfite.

v. Enterococcus. Basin Plan Table 4-2A requires the enterococcus effluent limitation for discharges to receiving waters with the water contact recreation beneficial use.

vi. Fecal Coliform. Basin Plan Table 4-2A requires total coliform effluent limitations for discharges to receiving waters with the shellfish harvesting beneficial use, but Basin Plan Table 4-2A, footnote c, allows substituting fecal coliform limitations for

total coliform limitations provided that the substitution will not result in unacceptable adverse impacts on beneficial uses. This Order contains the following fecal coliform effluent limits:

- The median fecal coliform density in any calendar month is not to exceed 500 MPN/100 mL); and
- no more than 10 percent of the samples in any calendar month may contain a fecal coliform density equal to or greater than 1,100 MPN/100 mL.

The Fact Sheet for Regional Water Board Order No. 94-149 attributes these limits to "recommendations for the Department of Health Services (Memorandum from Don Womeldorf, Chief Environmental Management Branch to James Baetge SWRCB dated Octover 24, 1990) and the initial dilution achieved at the Pier 80 Outfall."

These limits will not result in unacceptable adverse impacts on beneficial uses, including water contact recreation and shellfish harvesting. The enterococcus limit discussed above adequately protects water contact recreation. As for shellfish harvesting, Southeast Plant effluent is diluted at least 50:1 at the Pier 80 outfall (*Dilution Model for the San Francisco Southeast Treatment Plant Bay Outfall [Pier 80]*, December 6, 2007) and the nearest shellfish beds are near Candlestick Point, more than three miles away (*San Francisco Bay Subtidal Habitat Goals Report*, 2010). Basin Plan Table 3-1 contains a 30-day median fecal coliform objective of 14 MPN/100 mL and a 90th percentile fecal coliform objective of 43 MPN/100 mL to protect shellfish harvesting. Therefore, accounting for mixing and dilution, the fecal coliform limits in this Order will protect shellfish harvesting. Moreover, in April 1993, the Discharger decreased its chlorine residual for a time and observed that total coliform and fecal coliform levels near Candlestick Point remained equal to San Francisco Bay background levels ("NPDES Limits for Bacteria," *Water Environment & Technology*, Vol. 8, August 1996, pp 69-73). Other Lower San Francisco Bay dischargers have conducted similar receiving water impact studies and found no relationship between effluent and shoreline fecal coliform densities (City of San Mateo, November 1997; South Bayside System Authority, January 1998). Apparently, other fecal coliform sources (e.g., birds, wildlife, urban runoff) more directly affect shoreline fecal coliform levels. The studies evaluated a range of effluent discharges that included fecal coliform densities considerably higher than those allowed by this Order.

The Monitoring and Reporting Program requires weekly monitoring, but samples may be collected more frequently. The 10 percent requirement will be interpreted as follows. If up to nine samples are collected in a calendar month, a single sample with a fecal coliform density equal to or greater than 1,100 MPN/100 mL would violate the 10 percent limit; if 10 to 19 samples are collected, two samples at or above 1,100 MPN/100 mL would violate the limit; if 20 to 29 samples are collected, three samples at or above 1,100 MPN/100 mL would violate the limit; and if 30 or 31 samples are collected, four samples at or above 1,100 MPN/100 mL would violate the limit.

b. Wet Weather Discharges (Discharge Point Nos. 001 through 006)

i. Total Residual Chlorine. The total residual chlorine effluent limitation is based on Basin Plan Table 4-2, as guidance, to ensure that Southeast Plant and North Point Facility treatment, including disinfection, is conducted in a manner consistent with proper operations and maintenance as required by the Nine Minimum Controls. The allowance for determining false positives when using continuous devices accounts for the fact that continuous instruments occasionally have anomalous spikes, and it is chemically improbable to have free chlorine present in the presence of sodium bisulfite.

ii. Enterococcus. To ensure that Southeast Plant and North Point Facility disinfection is conducted in a manner consistent with proper operations and maintenance, as required by the Nine Minimum Controls, this Order contains an enterococcus effluent limitation. Disinfection performance is to be evaluated using a monthly geometric mean enterococcus limit of 35 MPN/100 mL, chosen based on the receiving water quality objective for water contact recreation in Basin Plan Table 3-1.

This Order does not retain the previous order's single-sample maximum enterococcus limit because, in the context of using single-sample maxima for enterococcus, U.S. EPA states in part:

> Other than in the beach notification and closure decision context, the geometrice mean is the more relevant value for ensuring that appropriate actions are taken to protect and improve water quality because it is a more reliable measure, being less subject to random variation, and more directly linked to the underlying studies on which the 1986 bacteria criteria were based. (69 Fed. Reg. 67224, November 16, 2004.)

This change is not subject to anti-backsliding requirements because the two limits reflect different averaging periods and both are consistent with Basin Plan Table 3-1 water quality objectives.

This Order also does not retain the previous order's fecal coliform limits. The enterococcus limit is sufficient to evaluate treatment performance. Anti-backsliding requirements do not apply because this Order replaces the fecal coliform limits with a new enterococcus limit; therefore, a direct comparison is impossible.

C. Toxic Pollutant Effluent Limitations

1. Scope and Authority

For toxic pollutants, this Order contains water quality-based effluent limitations (WQBELs) that implement water quality objectives that protect beneficial uses. CWA section 301(b) and 40 C.F.R. section 122.44(d) require that permits include limitations more stringent than federal technology-based requirements where necessary to achieve applicable water quality standards. According to 40 C.F.R. section 122.44(d)(1)(i), permits must include effluent limitations for all pollutants that are or may be discharged at levels that have a reasonable potential to cause or

contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective, WQBELs must be established using (1) U.S. EPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting a narrative criterion, supplemented with relevant information (40 C.F.R. § 122.44[d][1][vi]). The process for determining reasonable potential and calculating WQBELs is intended to achieve applicable water quality objectives and criteria and protect designated uses of receiving waters as specified in the Basin Plan.

During dry weather, this Order imposes numeric effluent limitations at Discharge Point No. 001 for toxic pollutants with reasonable potential to cause or contribute to exceedances of water quality standards. During wet weather, this Order imposes narrative effluent limitations for toxic pollutants, not numeric limitations. In accordance with the *Combined Sewer Overflow Control Policy*, this Order requires the Discharger to implement its Long-Term Control Plan to control combined sewer discharges and overflows. The plan calls for meeting CWA water quality-based requirements by providing a minimum level of treatment. The *Combined Sewer Overflow Control Policy* presumes that CWA water quality-based requirements will be met if the Discharger implements at least primary clarification of at least 85 percent of collected wastewater (unless data indicate otherwise). U.S. EPA describes this "presumption approach" as follows:

> A program that meets any of the criteria listed below would be presumed to provide an adequate level of control to meet the water quality-based requirements of the CWA, provided the permitting authority determines that such presumption is reasonable in light of the data and analysis conducted in the characterization, monitoring, and modeling of the system and the consideration of sensitive areas described above. These criteria are provided because data and modeling of wet weather events often do not give a clear picture of the level of [combined sewer overflow] controls necessary to protect [water quality standards].
>
> i. No more than an average of four overflow events per year, provided that the permitting authority may allow up to two additional overflow events per year. For the purpose of this criterion, an overflow event is one or more overflows from a CSS (Combined Sewer System) as the result of a precipitation event that does not receive the minimum treatment specified below; or
>
> ii. The elimination or the capture for treatment of no less than 85% by volume of the combined sewage collected in the Combined Sewer System during precipitation events on a system-wide annual average basis; or
>
> iii. The elimination or removal of no less than the mass of the pollutants, identified as causing water quality impairment through the sewer system characterization, monitoring, and modeling effort, for the volumes that would be eliminated or captured for treatment under paragraph ii above.

> Combined sewer overflows remaining after implementation of the nine minimum controls and within the criteria specified at [i or ii], should receive a minimum of:
>
> - Primary clarification (Removal of floatables and settleable solids may be achieved by any combination of treatment technologies or methods that are shown to be equivalent to primary clarification.);
>
> - Solids and floatables disposal; and
>
> - Disinfection of effluent, if necessary, to meet [water quality standards], protect designated uses and protect human health, including removal of harmful disinfection chemical residuals, where necessary."

The Discharger's Long-Term Control Plan exceeds the specifications for the presumption approach. The Discharger's system is designed to capture 100 percent of combined wastewater within the storage/transport boxes and to provide treatment consisting of floatables and settleable solids removal. Therefore, no untreated combined sewer overflows occur (combined sewer discharges receive equivalent-to-primary treatment). Provision VI.C.5.c of this Order requires the Discharger to continue implementing its Long-Term Control Plan.

2. Beneficial Uses and Water Quality Criteria and Objectives

Discharge Point No. 001 discharges to Lower San Francisco Bay. Section III.C.1, above, identifies the beneficial uses of Lower San Francisco Bay. Water quality criteria and objectives to protect these beneficial uses are described below:

a. Basin Plan Objectives. The Basin Plan specifies numeric water quality objectives for 10 priority pollutants and narrative water quality objectives for toxicity and bioaccumulation. The narrative toxicity objective states, "All waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce other detrimental responses in aquatic organisms." The narrative bioaccumulation objective states, "Controllable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered."

b. CTR Criteria. The CTR specifies numeric aquatic life and human health criteria for numerous priority pollutants. These criteria apply to inland surface waters and enclosed bays and estuaries. Some human health criteria are for consumption of "water and organisms" and others are for consumption of "organisms only." The criteria applicable to "organisms only" apply to Lower San Francisco Bay because it is not a source of drinking water.

c. NTR Criteria. The NTR establishes numeric aquatic life and human health criteria for a number of toxic pollutants for San Francisco Bay waters upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. The NTR criteria apply to Lower San Francisco Bay.

d. Sediment Quality Objectives. The *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality* contains a narrative water quality objective: "Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities in bays and estuaries of California." This objective is to be implemented by integrating three lines of evidence: sediment toxicity, benthic community condition, and sediment chemistry. The policy requires that if the Regional Water Board determines that a discharge has reasonable potential to cause or contribute to an exceedance of this objective, it is to impose the objective as a receiving water limit.

e. Receiving Water Salinity. Basin Plan section 4.6.2 (like the CTR and NTR) states that the salinity characteristics (i.e., freshwater vs. saltwater) of the receiving water are to be considered in determining the applicable water quality objectives. Freshwater criteria apply to discharges to waters with salinities equal to or less than one part per thousand (ppt) at least 95 percent of the time. Saltwater criteria apply to discharges to waters with salinities equal to or greater than 10 ppt at least 95 percent of the time in a normal water year. For discharges to waters with salinities between these two categories, or tidally-influenced freshwaters that support estuarine beneficial uses, the water quality objectives are the lower of the salt or freshwater objectives (the latter calculated based on ambient hardness) for each substance.

Lower San Francisco Bay is a salt water environment based on salinity data generated through the Regional Monitoring Program (RMP). Salinity data collected at the Alameda (BB70) sampling location between 1993 and 2001 indicate that the salinity was greater than 10 ppt in 100 percent of the samples. Lower San Francisco Bay is therefore classified as saltwater, and the reasonable potential analysis and WQBELs are based on saltwater water quality criteria and objectives.

f. Site-Specific Metals Translators. Effluent limitations for metals must be expressed as total recoverable metal (40 C.F.R. § 122.45[c]). Since the water quality objectives for metals are typically expressed as dissolved metal, translators must be used to convert metals concentrations from dissolved to total recoverable and vice versa. The CTR contains default translators; however, site-specific conditions, such as water temperature, pH, suspended solids, and organic carbon may affect the form of metal (dissolved, non-filterable, or otherwise) present and therefore available to cause toxicity. In general, dissolved metals are more available and more toxic to aquatic life than other forms. Site-specific translators can account for site-specific conditions, thereby preventing overly stringent or under-protective water quality objectives. For copper, Basin Plan Table 7.2.1-2 contains site-specific translators for deep water discharges to Lower San Francisco Bay: 0.73 and 0.87 (monthly and daily). For nickel, this Order uses site-specific translators the Clean Estuary Partnership developed, as set forth in *North of Dumbarton Bridge Copper and Nickel Development and Selection of Final Translators* report (March 2005): 0.65 and 0.85 (monthly and daily). For silver, this Order uses a site-specific translator based on RMP data collected from 1993 through 2001 at the Alameda sampling station (BB70): 0.66.

3. Need for Water Quality-Based Effluent Limitations (Reasonable Potential Analysis)

Assessing whether a pollutant has reasonable potential to exceed a water quality objective is the fundamental step in determining whether a WQBEL is required.

a. Methodology. For dry weather discharges, SIP section 1.3 sets forth the methodogy used for this Order for assessing whether a pollutant has reasonable potential to exceed a water quality objective. The analysis begins with identifying the maximum effluent concentration (MEC) observed for each pollutant based on available effluent concentration data and the ambient background concentration (B). SIP section 1.4.3 states that ambient background concentrations are either the maximum ambient concentration observed or, for water quality objectives intended to protect human health, the arithmetic mean of observed concentrations.There are three triggers in determining reasonable potential:

i. Trigger 1 is activated if the maximum effluent concentration is greater than or equal to the lowest applicable water quality objective (MEC $\geq$ water quality objective).

ii. Trigger 2 is activated if the ambient background concentration observed in the receiving water is greater than the water quality objective (B > water quality objective) *and* the pollutant is detected in any effluent sample.

iii. Trigger 3 is activated if a review of other information indicates that a WQBEL is needed to protect beneficial uses.

b. Effluent Data. The reasonable potential analysis for this Order is based on effluent monitoring data the Discharger collected from April 2008 through September 2012. The copper data were collected from October 2009 through September 2012 because these more recent three years of data better represent current discharge conditions.

c. Ambient Background Data. The reasonable potential analysis for this Order is based on RMP data collected at the Yerba Buena Island station (BC10) from 1993 through 2011, and additional Bay Area Clean Water Agencies data from *San Francisco Bay Ambient Water Monitoring Interim Report* (2003) and *Ambient Water Monitoring: Final CTR Sampling Update* (2004). These reports contain monitoring results from 2002 and 2003 for priority pollutants the RMP did not monitor at the time. For ammonia, the ambient concentration at the RMP station nearest to the discharge point, the Alameda RMP station (BB70), was used because, as described in section IV.C.4.a.iii of this Fact Sheet, this Order grants full dilution credit for ammonia.

d. Reasonable Potential Analysis for Toxic Pollutants. The maximum effluent concentrations, most stringent applicable water quality criteria and objectives, and ambient background concentrations used in the analysis are presented in the following table, along with the reasonable potential analysis results (yes or no) for each pollutant. Reasonable potential was not determined for all pollutants because there are not water quality objectives for all pollutants, and monitoring data are unavailable for others. The pollutants that exhibit reasonable potential are copper, cyanide, dioxin-TEQ, 1,2-diphenylhydrazine, and total ammonia.

Table F-9. Reasonable Potential Analysis

CTR #	Priority Pollutants	Governing criterion or objective (µg/L)	MEC or Minimum DL [1][2] (µg/L)	B or Minimum DL [1][2] (µg/L)	Results [3]

Footnotes:

[1] The maximum effluent concentration and ambient background concentration are the actual detected concentrations unless preceded by a "<" sign, in which case the value shown is the minimum detection level (DL).

[2] The maximum effluent concentration or ambient background concentration is "Unavailable" when there are no monitoring data for the constituent.

[3] RPA Results = Yes, if MEC ≥ WQC, B > WQC and MEC is detected, or Trigger 3
= No, if MEC and B are < WQC or all effluent data are undetected
= Undetermined (Ud), if no criteria have been promulgated or data are insufficient.

[4] SIP section 1.3 excludes from its reasonable potential analysis procedure priority pollutants for which a TMDL has been developed. TMDLs have been developed for mercury and PCBs in San Francisco Bay. Mercury and PCBs from wastewater discharges are regulated by NPDES Permit No. CA0038849, which implements the San Francisco Bay Mercury and PCBs TMDLs.

[5] Units for total ammonia are milligrams per liter as nitrogen.

e. Reasonable Potential Analysis for Sediment Quality. Pollutants in some receiving water sediments may be present in quantities that alone or in combination are toxic to benthic communities. Efforts are underway to identify stressors causing such conditions. However, to date there is no evidence directly linking compromised sediment conditions to the discharges subject to this Order; therefore, the Regional Water Board cannot draw a conclusion about reasonable potential for these discharges to cause or contribute to exceedances of the sediment quality objectives. Nevertheless, the Discharger continues to participate in the RMP, which monitors San Francisco Bay sediment and seeks to identify stressors responsible for degraded sediment quality. Thus far, the monitoring has provided only limited information about potential stressors and sediment transport. The Regional Water Board is exploring options for obtaining additional information that may inform future analyses.

f. Constituents with limited data. In some cases, reasonable potential cannot be determined because effluent data are limited or ambient background concentrations are unavailable. Provision VI.C.2 of the Order requires the Discharger to continue monitoring for these constituents in its effluent using analytical methods that provide the best feasible detection limits. When additional data become available, further analysis will be conducted to determine whether numeric effluent limitations are necessary.

g. Pollutants with No Reasonable Potential. This Order does not contain WQBELs for constituents that do not demonstrate reasonable potential; however, Provision VI.C.2 of the Order still requires monitoring for those pollutants. If concentrations are found to have increased significantly, Provision VI.C.2 of the Order requires the Discharger to investigate the sources of the increases and implement remedial measures if the increases pose a threat to receiving water quality.

4. Water Quality-Based Effluent Limitations

For dry weather discharges, WQBELs were developed for the pollutants determined to have reasonable potential to cause or contribute to exceedances of water quality objectives. The WQBELs are based on the procedures specified in SIP section 1.4.

a. Dilution Credits. SIP section 1.4.2 allows dilution credits under certain circumstances. The Discharger submitted a dilution study titled *Dilution Model for the San Francisco Southeast Treatment Plant Bay Outfall (Pier 80)*, dated December 6, 2007. The study contains estimates of initial dilution based on the UM3 model as implemented with the U.S. EPA-supported Visual PLUMES modeling package. The study used the average dry weather flow, 62 MGD, to estmate the initial dilution representing chronic (long-term average) conditions, and the 95th percentile of dry weather flows, 72 MGD, to calculate the initial dilution representing acute (short-term) conditions. Estimated initial dilution ratios are 231:1 (230 parts ambient water to one part effluent) at 62 MGD and 51:1 at 72 MGD.

i. Bioaccumulative Pollutants. For certain bioaccumulative pollutants, dilution credit is significantly restricted or denied. Specifically, these pollutants include dioxin and furan compounds, which appear on the CWA section 303(d) list for Lower San Francisco Bay because, based on available data on the concentrations of these pollutants in aquatic organisms, sediment, and the water column, they impair San Francisco Bay beneficial uses. The following factors suggest insufficient assimilative capacity in San Francisco Bay for these pollutants.

Tissue samples taken from San Francisco Bay fish show the presence of these pollutants at concentrations greater than screening levels (*Contaminant Concentrations in Fish from San Francisco Bay*, May 1997). The results of a 1994 San Francisco Bay pilot study, presented in *Contaminated Levels in Fish Tissue from San Francisco Bay* (Regional Water Board, 1994) also show elevated levels of chemical contaminants in fish tissues. The Office of Environmental Health and Hazard Assessment (OEHHA) completed a preliminary review of the data in the 1994 report and in December 1994 issued an interim consumption advisory covering certain fish species in San Francisco Bay due to the levels of some of these pollutants.

OEHHA updated this advisory in a May 2011 report, *Health Advisory and Safe Eating Guidelines for San Francisco Bay Fish and Shellfish*, which still suggests insufficient assimilative capacity in San Francisco Bay for 303(d)-listed pollutants. Therefore, dilution credits are denied for bioaccumulative pollutants on the 303(d) list for which data are lacking on sources and significant uncertainty exists about how different sources contribute to bioaccumulation.

ii. Non-Bioaccumulative Pollutants (except ammonia). For non-bioaccumulative pollutants (except ammonia), a conservative dilution credit of 10:1 (D = 9) has been assigned. The 10:1 dilution credit is based, in part, on Basin Plan Prohibition 1 (Table 4-1), which prohibits discharges with less than 10:1 dilution. SIP section 1.4.2 allows for limiting the dilution credit. The dilution credit is limited for the following reasons:

(a) San Francisco Bay is a complex estuarine system with highly variable and seasonal upstream freshwater inflows and diurnal tidal saltwater inputs. SIP section 1.4.3 allows background conditions to be determined on a discharge-by-discharge or water body-by-water body basis. A water body-by-water body approach is taken here due to inherent uncertainties in characterizing ambient background conditions in a complex estuarine system on a discharge-by-discharge basis.

(b) Because of the complex hydrology of San Francisco Bay, there are uncertainties in accurately determining an appropriate mixing zone. The models used to predict dilution do not consider the three dimensional nature of San Francisco Bay currents resulting from the interaction of tidal flushes and seasonal fresh water outflows. Being heavier and colder than fresh water, ocean salt water enters San Francisco Bay on a twice-daily tidal cycle, generally beneath the warmer fresh water that flows seaward. When these waters mix and interact, complex circulation patterns occur due to the varying densities of the fresh and ocean waters. The complex patterns occur throughout San Francisco Bay, but are most prevalent in San Pablo Bay, Carquinez Strait, and Suisun Bay. The locations of this mixing and interaction change, depending on the strength of each tide. Additionally, sediment loads from the Central Valley change on a long-term basis, affecting the depth of different parts of San Francisco Bay, resulting in alteration of flow patterns, mixing, and dilution at the outfall.

For non-bioaccumultive pollutants (except ammonia), the Yerba Buena Island RMP monitoring station (BC10), relative to other RMP stations, fits SIP guidance for establishing background conditions. SIP section 1.4.3 requires that background water quality data be representative of the ambient receiving water that will mix with the discharge. Because the WQBELs for non-bioaccumultive pollutants (except ammonia) are based on a restricted dilution credit, water quality data from the Yerba Buena Island monitoring station best represents the water that will mix with the discharge.

iii. Ammonia. For ammonia, a conservative estimate of actual initial dilution was used to calculate the effluent limitations. This is justified because ammonia, a non-

persistent pollutant, quickly disperses and degrades to a non-toxic state, and cumulative toxicity is unlikely. The 231:1 dilution ratio is appropriate for calculating limits based on the chronic water quality objective because that objective is an annual median; the dilution ratio associtated with the long-term average flow best represents long-term (chronic) conditions. The 51:1 dilution ratio is appropriate for calculating limits based on the acute water quality objective because that objective is an absolute maximum; the dilution associated with the maximum flow best represents short-term (acute) conditions.

For ammonia, the Alameda RMP monitoring station (BB70), relative to other RMP stations, fits SIP guidance for establishing background conditions. SIP section 1.4.3 requires that background water quality data be representative of the ambient receiving water that will mix with the discharge. Because the ammonia WQBELs are based on actual dilution at the edge of the initial mixing zone, data from the Alameda RMP station best represents the water at the edge of the initial mixing zone.

b. WQBEL Development. For those pollutants with reasonable potential, average monthly effluent limitations (AMELs) and maximum daily effluent limitations (MDELs) were developed as explained below:

i. Copper

(a) Water Quality Objectives. Basin Plan Table 3-3A contains chronic and acute marine water quality objectives for copper of 6.0 and 9.4 µg/L (site-specific objectives for San Francisco Bay), expressed as dissolved metal and accounting for a Water Effects Ratio of 2.4. Converting these water quality objectives to total recoverable metal using the site-specific translators of 0.73 (chronic) and 0.87 (acute) results in water quality criteria of 8.2 µg/L (chronic) and 10.8 µg/L (acute).

(b) Reasonable Potential Analysis. This Order establishes copper WQBELs because the maximum effluent concentration (13 µg/L) exceeds the governing water quality objective (8.2 µg/L), demonstrating reasonable potential by Trigger 1, and because Basin Plan section 7.2.1.2 requires that individual NPDES permits for municipal and industrial wastewater treatment facilities include copper WQBELs.

(c) WQBELs. Copper WQBELs, calculated according to SIP procedures with an effluent data coefficient of variation of 0.28 and a dilution credit of D = 9 (dilution ratio = 10:1), are an AMEL of 53 µg/L and an MDEL of 76 µg/L.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because this Order's copper WQBELs are the same as those in the previous order.

ii. Cyanide

(a) Water Quality Objectives. Basin Plan Table 3-3C contains chronic and acute marine water quality objectives for cyanide of 2.9 µg/L and 9.4 µg/L (site-specific objectives for San Francisco Bay).

(b) Reasonable Potential Analysis. This Order establishes cyanide WQBELs because the maximum effluent concentration (9.5 µg/L) exceeds the governing water quality objective (2.9 µg/L), demonstrating reasonable potential by Trigger 1.

(c) WQBELs. Cyanide WQBELs, calculated according to SIP procedures with an effluent data coefficient of variation of 0.80 and a dilution credit of D = 9, are an AMEL of 20 µg/L and an MDEL of 45 µg/L. This MDEL is less stringent than the one in the previous order (43 µg/L); therefore, this Order retains the previous MDEL to avoid backsliding.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because this Order's cyanide WQBELs are at least as stringent as those in the previous order.

iii. Dioxin-TEQ

(a) Water Quality Objective. The Basin Plan narrative water quality objective for bioaccumulative substances states, "Many pollutants can accumulate on particulates, in sediments, or bioaccumulate in fish and other aquatic organisms. Controllable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered."

Because it is the consensus of the scientific community that dioxins and furans associate with particulates, accumulate in sediments, and bioaccumulate in the fatty tissue of fish and other organisms, the Basin Plan's narrative bioaccumulation water quality objective applies to these pollutants. Elevated levels of dioxins and furans in San Francisco Bay fish tissue demonstrate that the narrative bioaccumulation water quality objective is not being met. U.S. EPA has therefore placed Lower San Francisco Bay on its 303(d)-list of receiving waters where water quality objectives are not being met after imposition of applicable technology-based requirements.

When the CTR was promulgated, U.S. EPA stated its support of the regulation of dioxin and dioxin-like compounds through the use of toxicity equivalencies (TEQs). U.S. EPA stated, "For California waters, if the discharge of dioxin or dioxin-like compounds has reasonable potential to cause or contribute to a violation of a narrative criterion, numeric WQBELs for dioxin or dioxin-like compounds should be included in NPDES permits and should be expressed using a TEQ scheme" (65 Fed. Reg. 31695-31696, May 18, 2000). This Order uses a TEQ scheme based on a set of toxicity equivalency factors (TEFs) the World Health Organization developed in 1998, and a set of bioaccumulation equivalency factors (BEFs) U.S. EPA developed for the Great Lakes region (40 C.F.R. part 132, Appendix F) to convert the concentration of any congener of dioxin or furan into an equivalent concentration of 2,3,7,8-tetrachlorinated dibenzo-p-dioxin (2,3,7,8-TCDD). Although the 1998 World Health Organization scheme includes TEFs for dioxin-like PCBs, they are not included in this Order's TEQ scheme.

The CTR has established a specific water quality criterion for PCBs, and dioxin-like PCBs are included in the analysis of total PCBs.

The CTR establishes a numeric water quality objective for 2,3,7,8-TCDD of 1.4×10^{-8} µg/L for the protection of human health when aquatic organisms are consumed. The CTR criterion is used as a criterion for dioxin-TEQ because dioxin-TEQ represents a toxicity weighted concentration equivalent to 2,3,7,8-TCDD, thus translating the narrative bioaccumulation objective into a numeric criterion.

(b) Reasonable Potential Analysis. TEFs and BEFs were used to express measured concentrations of 16 dioxin congeners in effluent and background samples as equivalent 2,3,7,8-TCDD concentrations. For each sample, the sum of these equivalent concentrations is the dioxin-TEQ concentration. This Order establishes dioxin-TEQ WQBELs because the ambient background receiving water dioxin-TEQ concentration (5.3×10^{-8} µg/L) exceeds the CTR numeric criterion for 2,3,7,8-TCDD (1.4×10^{8} µg/L) and dioxin-TEQ was detected in the effluent, demonstrating reasonable potential by Trigger 2.

(c) WQBELs. Dioxin-TEQ WQBELs, calculated according to SIP procedures with a default coefficient of variation of 0.60 and no dilution credit, are an AMEL of 1.4×10^{-8} µg/L and an MDEL of 2.8×10^{-8} µg/L.

(d) Anti-backsliding. The previous order contained an annual mass-based dioxin-TEQ effluent limit based on a dry weather flow of 85.4 MGD and a monthly average effluent concentration of 1.4×10^{-8} µg/L. Anti-backsliding requirements are satisfied because this Order's dioxin-TEQ WQBELs are as stringent as the previous mass-based limitation (the new AMEL is the same as the concentration used to derive the prevous mass-based limit).

iv. 1,2-Diphenylhydrazine

(a) Water Quality Objectives. The CTR contains a human health water quality criterion for 1,2-diphenylhydrazine of 0.54 µg/L when organisms only (not water) are consumed from the receiving water.

(b) Reasonable Potential Analysis. This Order establishes WQBELs for 1,2-diphenylhydrazine because the maximum effluent concentration (1.1 µg/L) exceeds the governing water quality objective (0.54 µg/L), demonstrating reasonable potential by Trigger 1.

(c) WQBELs. WQBELs for 1,2-diphenylhydrazine, calculated according to SIP procedures with a default coefficient of variation of 0.60 and a dilution credit of D = 9, are an AMEL of 5.4 µg/L and an MDEL of 11 µg/L.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because the previous order did not contain 1,2-diphenylhydrazine limitations.

v. Ammonia

(a) Water Quality Objectives. The discharge into Lower San Francisco Bay occurs south of the San Francisco Bay Bridge. For these waters, Basin Plan section 3.3.20 contains water quality objectives for un-ionized ammonia of 0.025 mg/L as an annual median and 0.4 mg/L as a maximum. These objectives were translated from un-ionized ammonia concentrations to equivalent total ammonia concentrations (as nitrogen) since (1) sampling and laboratory methods are unavailable to analyze for un-ionized ammonia, and (2) the fraction of total ammonia that exists in the toxic un-ionized form depends on the pH, salinity, and temperature of the receiving water.

To translate the un-ionized ammonia objectives, pH, salinity, and temperature data were obtained from the RMP station nearest to the outfall (Alameda station, BB70). The un-ionized fraction of total ammonia was calculated as follows:

$$\text{For salinity} > 10 \text{ ppt: fraction of } NH_3 = \frac{1}{1+10^{(pK-pH)}}$$

Where:

$$pK = 9.245 + 0.116(I) + 0.0324\,(298 - T) + \frac{0.0415(P)}{(T)}$$

$$I = \text{Molal ionic strength of saltwater} = \frac{19.9273(S)}{(1{,}000 - 1.005109(S))}$$

S = Salinity (parts per thousand)

T = Temperature (degrees Kelvin)

P = Pressure (one atmosphere)

The median and 90th percentile un-ionized ammonia fractions were then used to express the daily maximum and the annual average un-ionized objectives as chronic and acute total ammonia criteria. This approach is consistent with U.S. EPA guidance on translating dissolved metal water quality objectives to total recoverable metal water quality objectives (U.S. EPA, 1996, *The Metals Translator: Guidance for Calculating a Total Recoverable Limit from a Dissolved Criterion,* EPA Publication 823-B-96-007).

The equivalent total ammonia chronic and acute criteria are 1.1 mg/L and 8.5 mg/L as nitrogen.

(b) Reasonable Potential Analysis. This Order relies on the SIP methodology as guidance to perform the reasonable potential analysis. This Order establishes total ammonia WQBELs because the maximum effluent concentration (42 mg/L as nitrogen) exceeds the governing water quality criterion (1.1 mg/L as nitrogen), demonstrating reasonable potential by Trigger 1.

(c) WQBELs. This Order relies on the SIP methodology as guidance to calculate the total ammonia WQBELs. The WQBELs are the more stringent AMEL and MDEL based on independent calculations using the chronic and acute objectives. To calculate an AMEL and MDEL based on the chronic objective, the median background concentration at the Alameda RMP station (BB70) (0.11 mg/L) and the minimum dilution based on the average flow (231:1) were used. To calculate an AMEL and MDEL based on the acute objective, the maximum background concentration (0.22 mg/L) and the minimum dilution based on the maximum flow (51:1) were used. Because the Basin Plan's chronic un-ionized ammonia objective is an annual median, the median background concentration and long-term average dilution represent ambient conditions better than a daily maximum concentration and minimum dilution.

The total ammonia WQBELs in this Order are based on the chronic objective. Calculated using an effluent data coefficient of variation of 0.15 and a dilution credit of D = 230, they are an AMEL of 220 mg/L and an MDEL of 300 mg/L.

Statistical adjustments were made to the total ammonia WQBEL calculations. The SIP assumes a 4-day average concentration and a monthly sampling frequency of 4 days per month to calculate effluent limitations based on chronic criteria, but the Basin Plan's chronic water quality objective for un-ionized ammonia is based on an annual median instead of the typical 4-day average. Therefore, a 365-day average and a monitoring frequency of 30 days per month (the maximum daily sampling frequency in a month since the averaging period for the chronic criteria is longer than 30 days) were used. These statistical adjustments are supported by U.S. EPA's *Water Quality Criteria; Notice of Availability; 1999 Update of Ambient Water Quality Criteria for Ammonia* (64 Fed. Reg. 71974-71980, December 22, 1999).

The newly calculated AMEL and MDEL are less stringent than those in the previous order (190 µg/L and 290 µg/L); therefore, this Order retains the previous AMEL and MDEL to avoid backsliding.

(d) Anti-backsliding. Anti-backsliding requirements are satisfied because this Order's total ammonia WQBELs are the same as those in the previous order.

(e) Growing Regional Concern with Nutrients. As described above and in section IV.C.4.a.iii of this Fact Sheet, a translated Basin Plan un-ionized ammonia objective and a conservative estimate of actual initial dilution were used to calculate the total ammonia effluent limitations. In the future, the Regional Water Board may grant less dilution credit or change the ammonia limitations in other ways to address growing concerns about nutrients in the receiving water. Currently, a region-wide effort is underway to study and evaluate potential effects. This effort, which is referred to as the San Francisco Bay Nutrient Strategy, includes developing a nutrient assessment framework that can be used to calculate WQBELs for nutrients. The Regional Water Board, through its Executive Officer, has also required wastewater dischargers, including this Discharger, to monitor nutrients, including ammonia, in their influent and

effluent. This information will be used to compare nutrient loads from wastewater discharges to loads from other sources, to support modeling and evaluation of load reduction scenarios, and to determine the need for additional wastewater treatment to address nutrients.

c. Effluent Limit Calculations. The following table shows the WQBEL calculations:

Table F-10. WQBEL Calculations

PRIORITY POLLUTANTS	Copper	Cyanide	Dioxin TEQ	1,2-Diphenyl-hydrazine	Total Ammonia (acute)	Total Ammonia (chronic)

5. Whole Effluent Acute Toxicity

This Order includes dry weather effluent limitations for whole effluent acute toxicity based on Basin Plan Table 4-3. All bioassays are to be performed according to the U.S. EPA approved method in 40 C.F.R. section 136, currently *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, 5th Edition (EPA-821-R-02-012). The approved test species specified in the MRP are rainbow trout (*Oncorhynchus mykiss*) and fathead minnow (*Pimephales promelas*).

Based on Basin Plan section 3.3.20, if the Discharger can demonstrate that ammonia causes acute toxicity in excess of the acute toxicity limitations in this Order, and that the ammonia in the discharge complies with the ammonia effluent limitations in this Order, then such toxicity does not constitute a violation of the effluent limitations for whole effluent acute toxicity.

6. Whole Effluent Chronic Toxicity

a. Water Quality Objective. Basin Plan section 3.3.18 states, "There shall be no chronic toxicity in ambient waters. Chronic toxicity is a detrimental biological effect on growth rate, reproduction, fertilization success, larval development, population abundance, community composition, or any other relevant measure of the health of an organism, population, or community."

b. Reasonable Potential Analysis. The Discharger conducted semiannual chronic toxicity tests during the previous order term using the echinoderm larval development test. The previous order contained chronic toxicity triggers (three-sample median of 10 TUc or single-sample maximum of 20 TUc) for accelerated chronic toxicity testing. The maximum single-sample chronic toxicity result during the previous order term was 10 TUc in July 2009. The relatively low toxicity indicates low reasonable potential for

chronic toxicity so this Order contains only a narrative chronic toxicity limit. A numeric limit is unwarranted.

c. Requirements. The Order contains a narrative chronic toxicity effluent limitation based on the Basin Plan's narrative toxicity water quality objective. The Order also includes requirements for chronic toxicity monitoring to ensure attainment of the narrative toxicity objective and a monitoring "trigger" for initiation of accelerated monitoring requirements when exceeded. The Discharger is required to implement a chronic toxicity reduction evaluation in some circumstances. These requirements are consistent with CTR and SIP requirements.

d. Screening Phase Study and Monitoring Requirement. The MRP requires the Discharger to conduct a chronic toxicity screening phase study, as described in MRP Appendix E-1, prior to permit reissuance. The Discharger's April 2012 chronic toxicity screening study did not indicate the presence of toxicity effects in the effluent for the test species examined. Therefore, the Discharger will continue to using the echinoderm larval development test (i.e., purple sea urchin [*Strongylocentroltus purpuratus*] or sand dollar [*Dendraster excentricus*]. The accelerated monitoring triggers are based on Basin Plan Table 4-5.

D. Effluent Limitation Considerations

1. Anti-backsliding. This Order complies with the anti-backsliding provisions of CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l), which generally require effluent limitations in a reissued permit to be as stringent as those in the previous permit. Most requirements of this Order are at least as stringent as those in the previous order, with some exceptions:

- This Order does not retain silver, lead, zinc, tetrachloroethylene, tributyltin, and bis(2-ethylhexyl)phthalate limits from the previous order because data no longer indicate that these pollutants have reasonable potential to exceed water quality objectives. This is consistent with State Water Board Order WQ 2001-16.

- This Order replaces the previous order's wet weather enterococcus and fecal coliform limits with a new wet weather enterococcus limit. The change from an instantaneous maximum enterococcus limit to a geometric mean is not subject to anti-backsliding requirements because the two limits reflect different averaging periods, both are consistent with Basin Plan Table 3-1 water quality objectives, and a direct comparison between the two types of limits is impossible. Likewise, the change from fecal coliform limits to an enterococcus limit is not subject to anti-backsliding requirements because a direct comparison between these two types of limits is also impossible.

- This Order does not retain mercury limits from the previous order because NPDES Permit No. CA0038849 now covers mercury discharges.

2. Antidegradation. This Order complies with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution No. 68-16. It continues the status quo with respect to the level of discharge authorized in the previous order, which is the baseline by

which to measure whether degradation will occur. This Order does not allow for a reduced level of treatment relative to the previous order.

This Order corrects a typographical error in the previous order. Discharge Prohibition III.E allows the average dry weather flow to increase from 84.5 MGD to 85.4 MGD. Earlier orders (e.g., Order No. R2-2002-0073) allowed this slightly higher flow. This change will not affect water quality, particularly since the effluent limitations and other provisions of this Order require the Discharger to maintain its existing treatment performance. Therefore, discharges subject to this Order will not degrade water quality, and findings authorizing degradation are unnecessary.

This Order replaces the previous order's wet weather enterococcus and fecal coliform limits with a new wet weather enterococcus limit. This change will not degrade receiving water quality because the old and new limits are all consistent with Basin Plan Table 3-1 water quality objectives, and any difference in effects would be temporally limited and would not result in any long-term deleterious effect on water quality (e.g., they would cease after wet weather is over).

3. **Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. This Order's technology-based requirements implement minimum, applicable federal technology-based requirements. In addition, this Order contains more stringent effluent limitations as necessary to meet water quality standards. Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement CWA requirements.

   This Order's WQBELs have been derived to implement water quality objectives that protect beneficial uses. The beneficial uses and water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that WQBELs were derived from the CTR, the CTR is the applicable standard pursuant to 40 C.F.R. section 131.38. The procedures for calculating these WQBELs are based on the CTR, as implemented in accordance with the SIP, which U.S. EPA approved on May 18, 2000. U.S. EPA approved most Basin Plan beneficial uses and water quality objectives prior to May 30, 2000. Beneficial uses and water quality objectives submitted to U.S. EPA prior to May 30, 2000, but not approved by U.S. EPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to 40 C.F.R. section 131.21(c)(1). U.S. EPA approved the remaining beneficial uses and water quality objectives so they are applicable water quality standards pursuant to 40 C.F.R. section 131.21(c)(2).

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

The receiving water limitations in sections V.A.1 and V.A.2 of the Order are based on Basin Plan narrative and numeric water quality objectives. The receiving water limitation in section V.A.3 of the Order requires compliance with federal and State water quality standards in accordance with the CWA and regulations adopted thereunder.

VI. RATIONALE FOR PROVISIONS

A. Standard Provisions

Attachment D contains standard provisions that apply to all NPDES permits in accordance with 40 C.F.R. section 122.41 and additional conditions applicable to specific categories of permits in accordance with 40 C.F.R. section 122.42. The Discharger must comply with these provisions. The conditions set forth in 40 C.F.R. sections 122.41(a)(1) and (b) through (n) apply to all state-issued NPDES permits and must be incorporated into the permits either expressly or by reference.

In accordance with 40 C.F.R. section 123.25(a)(12), states may omit or modify conditions to impose more stringent requirements. Attachment G contains standard provisions that supplement the federal standard provisions in Attachment D.

This Order omits federal conditions that address enforcement authority specified in 40 C.F.R. sections 122.41(j)(5) and (k)(2) because the State's enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates Water Code section 13387(e) by reference.

B. Monitoring and Reporting

Pursuant to 40 C.F.R. section 122.48, NPDES permits must specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383, and 40 C.F.R. sections 122.41(h) and (j), authorize the Regional Water Board to require technical and monitoring reports. This Order establishes monitoring and reporting requirements, contained in the Monitoring and Reporting Program (Attachment E), that implement federal and State requirements. For more background regarding these requirements, see section VII of this Fact Sheet.

C. Special Provisions

1. Reopener Provisions

These provisions are based on 40 C.F.R. sections 122.62 and 122.63 and allow modification of this Order and its effluent limitations as necessary in response to updated water quality objectives, regulations, or other new and relevant information that may become available in the future, and other circumstances as allowed by law.

2. Effluent Characterization Study and Report

This Order does not include effluent limitations for priority pollutants that do not demonstrate reasonable potential, but this provision requires the Discharger to continue monitoring for these pollutants during dry weather as described in the MRP and Attachment G. Dry weather monitoring data are necessary to verify that the "no" and "cannot determine" reasonable potential analysis conclusions of this Order remain valid. This requirement is authorized pursuant to CWC section 13267, and is necessary to inform the

next permit reissuance and to ensure that the Discharger takes timely action in response to any unanticipated change in effluent quality during the term of this Order.

3. Pollutant Minimization Program

This provision is based on Basin Plan section 4.13.2 and SIP section 2.4.5.

4. Special Provisions for Municipal Facilities

a. Pretreatment Program. This provision is based on 40 C.F.R. part 403. The Discharger implements a pretreatment program due to the nature and volume of industrial influent to the Southeast Plant. Two significant industrial users discharge to the Facility and are subject to the Discharger's pretreatment program. This provision lists the Discharger's responsibilities regarding its pretreatment program and requires compliance with the provisions in Attachment H, "Pretreatment Requirements."

b. Sludge and Biosolids Management. "Sludge" refers to the solid, semisolid, and liquid residue removed during primary, secondary, and advanced wastewater treatment processes. "Biosolids" refers to sludge that has been treated and may be beneficially used. This provision is based on Basin Plan section 4.17 and 40 C.F.R. parts 257 and 503.

c. Collection System Management. The Discharger's collection system is predominantly a combined sewer system with some limited separate sanitary sewers. It is part of the Facility regulated through this Order. This provision explains this Order's requirements as they relate to the Discharger's collection system and promotes consistency with the State Water Board's *Statewide General Waste Discharge Requirements for Sanitary Sewer Systems* (General Collection System WDRs), Order 2006-0003-DWQ as amended by WQ 2008-0002-EXEC.

i. Separate Sanitary Sewer System. The General Collection System WDRs require public agencies that own or operate sanitary sewer systems with greater than one mile of pipes or sewer lines to enroll for coverage under the General Collection System WDRs. The General Collection System WDRs contain requirements for collection system operation and maintenance and for reporting and mitigating sanitary sewer overflows. They also require agencies to develop sanitary sewer management plans and report all sanitary sewer overflows. The Discharger must comply with both the General Collection System WDRs and this Order. To the extent that the Discharger's separate sanitary sewer collection system is part of the Facility subject to this Order, certain provisions apply, as specified in Provision VI.C.4.c.i.

ii. Combined Sewer System. For purposes of this Order, an "excursion" is a release or diversion of untreated or partially treated wastewater from the combined sewer system that exits the system temporarily and then re-enters it. The Discharger and U.S. EPA developed the collection system excursion reporting requirement in this Order so the information would be available.

5. Combined Sewer Overflow Controls

The *Combined Sewer Overflow Control Policy* addresses combined sewer system operations. Its requirements are summarized below as they relate to this Order. The Discharger has designed, constructed, and implemented control strategies that address wet weather flows. This provision specifies performance criteria for wet weather combined sewer system operations.

a. Combined Sewer Operations and Maintenance Plan. This provision is necessary to ensure that combined sewer system operations and maintenance comply with the Nine Minimum Controls and the Long-Term Control Plan requirements of the *Combined Sewer Overflow Control Policy*.

b. Nine Minimum Controls. The *Combined Sewer Overflow Control Policy* requires these "Nine Minimum Controls" to satisfy CWA technology-based requirements:

- Conduct proper operations and maintenance programs,
- Maximize use of collection system for storage,
- Review and modify pretreatment program,
- Maximize flow to Southeast Plant and North Point Facility,
- Prohibit dry weather combined sewer overflows,
- Control solid and floatable materials in combined sewer discharges,
- Develop and implement pollution prevention program,
- Notify public of combined sewer discharges, and
- Monitor to characterize wet weather discharge impacts and efficacy of controls.

The *Combined Sewer Overflow Control Policy* requires monitoring to ascertain the effectiveness of controls and to verify compliance with water quality standards and protection of beneficial uses. If implemented controls do not result in attainment of water quality standards, including beneficial uses, a discharger must evaluate its operating practices. If monitoring indicates that water quality standards are not met, the data may be used to identify additional controls necessary to achieve water quality standards.

Over the previous order term, the Discharger monitored combined sewer discharges (*Special Study: Overflow Impacts and Efficacy of Combined Sewer Overflow Controls for the San Francisco Bayside System, Southeast Water Pollution Control Plant, North Point Wet Weather Facility and Bayside Wet Weather Facilities*, June 29, 2012). It found that average combined sewer discharge pollutant concentrations are below acute water quality objectives for metals and other priority pollutants, with the exceptions of copper and zinc. The average dissolved zinc concentration was 91 µg/L (based on the default CTR acute translator), compared to the water quality objective of 90 µg/L. The average dissolved copper concentration was 19 µg/L (based on the Basin Plan Table 7.2.1-2 acute translator), compared to the water quality objective of 10.8 µg/L. Water quality objectives apply in the receiving water, not combined sewer discharges *per se*. Therefore, given the relatively short duration of combined sewer discharges (i.e., just a few hours each time), and accounting for the inevitable dilution within the receiving waters during wet weather, water quality standards appear to be maintained.

The Order requires the Discharger to continue monitoring wet weather discharges to characterize their impacts and evaluate the efficacy of its wet weather controls. The Order also requires receiving water monitoring for enterococcus and fecal coliform at recreational use locations to determine the impacts of wet weather discharges on water contact recreation. The data collected may be used to document current conditions and evaluate whether beneficial uses are protected.

Among other requirements, the Nine Minimum Controls require the Discharger to notify the public when combined sewer discharges occur. The Discharger's current notification process fulfills these requirements. It includes posting permanent signs at San Francisco beaches that inform the public in English, Spanish, and Chinese that international "No Swimming" signs will be posted when it is unsafe to enter the water and to warn users that bacteria concentrations may be elevated during heavy rain. The Discharger posts "No Swimming" signs at beaches whenever a combined sewer discharge occurs in the area. These signs remain posted until water sampling indicates that bacteria concentrations have dropped below levels of concern for water contact recreation (i.e., the single-sample bacteriological standards of Cal. Code of Regs. tit. 17, § 7958[a][1]). Both types of signs provide the Discharger's toll-free water quality hotline (1-877-SFBEACH) that the Discharger updates weekly and whenever new bacteria results are available. The Discharger also provides color-coded indicators (green/open; red/posted) of beach water quality conditions on the Internet (http://beaches.sfwater.org).

The Discharger has designated Lewis Harrison as the contact person responsible for the wastewater collection system. The Order allows the Discharger to designate a different contact person as long as the Discharger notifies the Regional Water Board within 90 days.

c. Long-Term Control Plan. The *Combined Sewer Overflow Control Policy* requires implementation of a Long-Term Control Plan to to satisfy CWA water quality-based requirements (see section IV.C.1 of this Fact Sheet). The Discharger designed and built a combined sewer system that provides for long-term control and treatment. This provision specifies how the combined sewer system is to be operated, consistent with implementation of the Long-Term Control Plan. The Discharger designed the system based on historical rainfall to achieve the following long-term average annual goals:

- Four combined sewer discharge events along the North Shore (Discharge Point Nos. 009 through 017);
- Ten combined sewer discharge events within the Central Basin (Discharge Point Nos. 018 through 036); and
- One combined sewer discharge event along the Southeast Sector (Discharge Point Nos. 037 through 043).

Some years are wetter than others and may contribute more or less flow than anticipated by these design goals; therefore, these goals are not intended for determining compliance.

This provision requires the Discharger to synthesize and update its Long-Term Control Plan into one document that reflects current circumstances. The updated plan is necessary to optimize system operations so as to maximize pollutant removal during wet weather

and minimize combined sewer discharges. This requirement recognizes that circumstances have changed since the plan was first developed and implemented. However, the Order maintains the historical long-term average annual design goals for combined sewer discharges.

In addition to the system design elements of the plan, the Discharger is to describe additional measures, to the extent technically and economically feasible, to minimize combined sewer discharges (e.g., implementing and promoting low-impact development measures that enhance stormwater percolation and slow stormwater runoff to the combined sewer system).

The Discharger is also to develop and propose a mechanism to evaluate the performance of its wet weather disinfection system for Discharge Point Nos. 001 through 006. Based on the proposal, the Regional Water Board may consider replacing the wet weather enterococcus limits in this Order when it next takes up this permit for reissuance.

This provision also requires the Discharger to review its approach to protecting sensitive areas, which include waters with threatened or endangered species and their habitat, waters with primary contact recreation, and waters with shellfish beds, among others. This provision implements *Combined Sewer Overflow Control Policy* section II.C.3, "Consideration of Sensitive Areas," which requires the following with each permit reissuance:

i. Prohibit new or significantly increased combined sewer discharges;

ii. Eliminate and relocate combined sewer discharges that discharge to sensitive areas wherever physically possible and economically achievable, except where elimination or relocation would provide less environmental protection than additional treatment (where elimination or relocation is not physically possible and economically achievable, or would provide less environmental protection than additional treatment, treatment for remaining combined sewer discharges must be sufficient to protect beneficial uses); and

iii. Where elimination or relocation is not physically possible and economically achievable, reassess the situation, based on new or improved techniques to eliminate or relocate the combined sewer discharges, or based on changed circumstances that influence economic achievability, with each subsequent permit term.

d. This provision sets forth steps the Discharger must take if the Executive Offer finds that its discharges cause violations of water quality standards in receiving waters.

6. Other Special Provisions

a. Copper Action Plan. This provision is based on Basin Plan section 7.2.1.2 and is necessary to ensure that use of copper site-specific objectives is consistent with antidegradation policies. Data the San Francisco Estuary Institute compiled for 2008-2010 indicate no degradation of San Francisco Bay water quality with respect to copper (http://www.sfei.org/content/copper-site-specific-objective-3-year-rolling-averages).

b. Cyanide Action Plan. This provision is based on Basin Plan section 4.7.2.2 and is necessary to ensure that use of cyanide site-specific objectives is consistent with antidegradation policies. The threshold for considering influent cyanide concentrations to indicate a possible "significant cyanide discharge" in the Discharger's service area is set at 21 µg/L. This concentration is about 1.5 times the maximum cyanide concentration (14 µg/L) found in the facility's influent during the previous order term. Because the Discharger has not observed influent cyanide concentrations greater than 14 µg/L, if influent concentrations 1.5 times this level were observed, there could be a significant cyanide source.

c. Standard Operating Procedures Requirement for Resource Recovery. Standard Operating Procedures are required for dischargers that accept hauled waste fats, oil, and grease for injection into anaerobic digesters. The development and implementations of Standard Operating Procedures for management of these materials is intended to allow the California Deparment of Resources Recycling and Recovery to exempt operations from separate and redundant permitting programs. If the Discharger does not accept fats, oil, and grease for resource recovery purposes, it is not required to develop and implement Standard Operating Procedures.

VII. RATIONALE FOR MONITORING AND REPORTING PROGRAM (MRP)

Attachment E contains the MRP for this Order. It specifies sampling stations, pollutants to be monitored (including all parameters for which effluent limitations are specified), monitoring frequencies, and reporting requirements. The following provides the rationale for the MRP requirements.

A. MRP Requirements Rationale

1. **Influent Monitoring.** Influent flow monitoring is necessary to identify wet weather as defined in Attachment A and to evaluate implementation of Long-Term Control Plan requirements. BOD_5 and TSS monitoring is necessary to evaluate compliance with this Order's 85 percent removal requirement. Basin Plan section 4.7.2.2 requires cyanide monitoring because this Order is based on site-specific cyanide water quality objectives.

2. **Effluent Monitoring.** Effluent flow monitoring is necessary to evaluate compliance with Prohibition III.E (average dry weather flow) and to understand Facility operations. During dry weather, monitoring for the other parameters in Table E-3 is necessary to evaluate compliance with this Order's effluent limitations applicable to Discharge Point No. 001. During wet weather, enterococcus and total residual chlorine monitoring is necessary to evaluate compliance with this Order's effluent limitations applicable to Discharge Point Nos. 001 through 006. Fecal coliform monitoring will provide additional information regarding the efficacy of controls. During combined sewer discharge events, duration and flow volume monitoring is necessary to characterize combined sewer discharges. Provision VI.C.2 of the Order requires monitoring for additional priority pollutants for which there are no effluent limits to inform the next permit reissuance and to ensure that the Discharger takes timely steps in response to any unanticipated change in effluent quality.

Provision VI.C.5.b.ix(a) of the Order requires monitoring to characterize combined sewer discharge impacts and efficacy of controls.

3. **Whole Effluent Toxicity Testing**. Acute and chronic whole effluent toxicity tests are necessary to evaluate compliance with acute and chronic toxicity effluent limitations during dry weather. Chronic toxicity tests during dry weather are also necessary to evaluate whether chronic toxicity triggers the need for a Toxicity Reduction Evaluation. Acute toxicity tests during wet weather are necessary to evaluate the efficacy of wet weather controls.

4. **Receiving Water Monitoring.** The Discharger is required to continue participating in the RMP, which involves collecting data on pollutants and toxicity in San Francisco Bay water, sediment, and biota. This monitoring is necessary to characterize the receiving water and the effects of the discharges authorized in this Order. The Discharger is also required to monitor shoreline locations where water contact recreation takes place. This monitoring is necessary to assess the possible effects of combined sewer discharges and to comply with Provisions VI.C.5.b.viii, "Notify Public of Combined Sewer Discharges," and VI.C.5.b.ix, "Monitor to Characterize Combined Sewer Discharge Impacts and Efficacy of Controls."

5. **Pretreatment and Biosolids Monitoring.** The pretreatment and biosolids monitoring requirements for influent, effluent, and biosolids are necessary to evaluate compliance with the Discharger's U.S. EPA-approved pretreatment program. Biosolids monitoring is also required pursuant to 40 C.F.R. part 503.

B. Monitoring Requirements Summary. The table below summarizes routine monitoring requirements. This table is for informational purposes only. The actual requirements are specified in the MRP and elsewhere in this Order.

Table F-11. Monitoring Requirements Summary

Parameter	Influent INF-001	Effluent EFF-001A	Effluent EFF-001B, EFF-002, and EFF-003	Effluent CSD-010 through CSD-043	Biosolids BIO-001	Receiving Water
Flow	Continuous[1]	Continuous[1]	Continuous[1]	1/Event[1]		
BOD_5	1/Week[2]	1/Week[3]				
TSS	5/Week[2]	5/Week	1/Month	1/Event		
Chemical Oxygen Demand (COD)		5/Week[3]	1/Month			
Oil and Grease		1/Month	1/Month			
pH		Continuous or 5/Week	Continuous or 1/Month	1/Event		Support RMP
Total Residual Chlorine		Continuous or 1/Hour	Continuous or 1/Hour			
Acute Toxicity		1/Month	1/Month[8]			Support RMP
Chronic Toxicity		2/Year				Support RMP
Enterococcus		4/Year[4]	1/Day			1/Day[6]
Fecal Coliform		1/Week	1/Day			1/Day[6]
Dissolved Oxygen						Support RMP
Sulfides						Support RMP
Temperature						Support RMP
Copper, Total Recoverable		1/Month	1/Month			Support RMP
Cyanide, Total	1/Month[2]	1/Month	1/Month	1/Event		Support RMP

Parameter	Influent INF-001	Effluent EFF-001A	Effluent EFF-001B, EFF-002, and EFF-003	Effluent CSD-010 through CSD-043	Biosolids BIO-001	Receiving Water
Ammonia, Total		1/Month	1/Month	1/Event		Support RMP
Dioxin-TEQ		2/Year				Support RMP
1,2-Diphenylhydrazine		1/Month				Support RMP
Settleable Matter				1/Event		
All other priority pollutants		1/Year	1/Year	1/Year[7]		Support RMP
Volatile Organic Compounds	2/Year	2/Year			2/Year	
Base/Neutrals Acid Extractable Organic Compounds	2/Year	2/Year			2/Year	
Metals[2]	1/Month	1/Month		1/Event	2/Year	Support RMP
Hexavalent Chromium	1/Month	1/Month			2/Year	Support RMP
Mercury	1/Month	1/Month			2/Year	Support RMP
Metric tons/year					See Attach. G, § III.B.1	
Paint filter test					See Attach. G, § III.B.2	

Footnotes:

[1] The following flow information is to be reported:

- Daily average flow (MGD)
- Monthly average flow (MGD)
- Total monthly flow volume (MG)
- Maximum and minimum daily average flow rates (MGD)

For Monitoring Locations CSD-010 through CSD-043, only total flow volume (MG) and event duration are to be reported.

[2] The metals are arsenic, cadmium, copper, lead, nickel, selenium, silver, and zinc.

[3] If the COD_5 concentration exceeds 75 mg/L on two consecutive days, the Discharger is to increase the BOD_5 sampling frequency to daily until it demonstreates that the BOD_5 concentration is below 30 mg/L.

[4] If the enterococcus effluent limitation is exceeded, the Discharger is to conduct 5/Month accelerated sampling for at least three consecutive months. If full compliance is demonstrated after the three months, the Discharger may return to the 4/Year sampling.

[5] Influent monitoring is only required during dry weather.

[6] Monitoring is to be once per day following nearby combined sewer discharges. Otherwise, monitoring is to be sufficient to characterize ambient background conditions (e.g., weekly).

[7] Monitoring is only required at Monitoring Location CSD-041.

[8] Monitoring is only required at Monitoring Locations EFF-001B and EFF-003.

VIII. PUBLIC PARTICIPATION

The Regional Water Board considered the issuance of WDRs that will serve as an NPDES permit for the Facility. As a step in the WDR adoption process, Regional Water Board staff developed tentative WDRs and encouraged public participation in the WDR adoption process.

A. Notification of Interested Parties. The Regional Water Board notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and provided an opportunity to submit written comments and recommendations. Notification was provided through *The Recorder*. The public had access to the agenda and any changes in dates and locations through the Regional Water Board's website at http://www.waterboards.ca.gov/sanfranciscobay.

B. Written Comments. Interested persons were invited to submit written comments concerning the tentative WDRs as explained through the notification process. Comments were due either in person or by mail at the Regional Water Board office at 1515 Clay Street, Suite 1400, Oakland, California 94612, to the attention of Derek Whitworth.

For full staff response and Regional Water Board consideration, the written comments were due at the Regional Water Board office by 5:00 p.m. on July 1, 2013.

C. Public Hearing. The Regional Water Board held a public hearing on the tentative WDRs during its regular meeting at the following date and time, and at the following location:

Date: Wednesday, August 14, 2013
Time: 9:00 a.m.
Location: Elihu Harris State Office Building
1515 Clay Street, 1st Floor Auditorium
Oakland, CA 94612

Contact: Derek Whitworth, (510) 622-2349, DWhitworth@waterboards.ca.gov

Interested persons were invited to attend. At the public hearing, the Regional Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony wasrequested to be in writing.

Dates and venues change. The Regional Water Board web address is http://www.waterboards.ca.gov/sanfranciscobay, where one could access the current agenda for changes in dates and locations.

D. Reconsideration of Waste Discharge Requirements. Any aggrieved person may petition the State Water Board to review the Regional Water Board decision regarding the final WDRs. The State Water Board must receive the petition at the following address within 30 calendar days of the Regional Water Board action:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

For instructions on how to file a petition for review, see http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml.

E. Information and Copying. The Report of Waste Discharge, related supporting documents, and comments received are on file and may be inspected at the address above at any time between 9:00 a.m. and 5:00 p.m., Monday through Friday. Copying of documents may be arranged by calling (510) 622-2300.

F. Register of Interested Persons. Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference the Facility, and provide a name, address, and phone number.

G. Additional Information. Requests for additional information or questions regarding this Order should be directed to Derek Whitworth at (510) 622-2349 or DWhitworth@waterboards.ca.gov.

(SUPPLEMENT TO ATTACHMENT D)

For

NPDES WASTEWATER DISCHARGE PERMITS

March 2010

Contents

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS (SUPPLEMENT TO ATTACHMENT D)

FOR

NPDES WASTEWATER DISCHARGE PERMITS

APPLICABILITY

This document applies to dischargers covered by a National Pollutant Discharge Elimination System (NPDES) permit. This document does not apply to Municipal Separate Storm Sewer System (MS4) NPDES permits.

The purpose of this document is to supplement the requirements of Attachment D, Standard Provisions. The requirements in this supplemental document are designed to ensure permit compliance through preventative planning, monitoring, recordkeeping, and reporting. In addition, this document requires proper characterization of issues as they arise, and timely and full responses to problems encountered. To provide clarity on which sections of Attachment D this document supplements, this document is arranged in the same format as Attachment D.

I. STANDARD PROVISIONS - PERMIT COMPLIANCE

A. Duty to Comply – Not Supplemented

B. Need to Halt or Reduce Activity Not a Defense – Not Supplemented

C. Duty to Mitigate – This supplements I.C. of Standard Provisions (Attachment D)

1. Contingency Plan - The Discharger shall maintain a Contingency Plan as originally required by Regional Water Board Resolution 74-10 and as prudent in accordance with current municipal facility emergency planning. The Contingency Plan shall describe procedures to ensure that existing facilities remain in, or are rapidly returned to, operation in the event of a process failure or emergency incident, such as employee strike, strike by suppliers of chemicals or maintenance services, power outage, vandalism, earthquake, or fire. The Discharger may combine the Contingency Plan and Spill Prevention Plan into one document. Discharge in violation of the permit where the Discharger has failed to develop and implement a Contingency Plan as described below will be the basis for considering the discharge a willful and negligent violation of the permit pursuant to California Water Code Section 13387. The Contingency Plan shall, at a minimum, contain the provisions of a. through g. below.

a. Provision of personnel for continued operation and maintenance of sewerage facilities during employee strikes or strikes against contractors providing services.

b. Maintenance of adequate chemicals or other supplies and spare parts necessary for continued operations of sewerage facilities.

c. Provisions of emergency standby power.

d. Protection against vandalism.

e. Expeditious action to repair failures of, or damage to, equipment and sewer lines.

f. Report of spills and discharges of untreated or inadequately treated wastes, including measures taken to clean up the effects of such discharges.

g. Programs for maintenance, replacement, and surveillance of physical condition of equipment, facilities, and sewer lines.

2. Spill Prevention Plan - The Discharger shall maintain a Spill Prevention Plan to prevent accidental discharges and minimize the effects of such events. The Spill Prevention Plan shall:

a. Identify the possible sources of accidental discharge, untreated or partially treated waste bypass, and polluted drainage;

b. Evaluate the effectiveness of present facilities and procedures, and state when they became operational; and

c. Predict the effectiveness of the proposed facilities and procedures, and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational.

This Regional Water Board, after review of the Contingency and Spill Prevention Plans or their updated revisions, may establish conditions it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of the permit upon notice to the Discharger.

D. Proper Operation & Maintenance – This supplements I.D of Standard Provisions (Attachment D)

1. Operation and Maintenance (O&M) Manual - The Discharger shall maintain an O&M Manual to provide the plant and regulatory personnel with a source of information describing all equipment, recommended operational strategies, process control monitoring, and maintenance activities. To remain a useful and relevant document, the O&M Manual shall be kept updated to reflect significant changes in treatment facility equipment and operational practices. The O&M Manual shall be maintained in usable condition and be available for reference and use by all relevant personnel and Regional Water Board staff.

2. Wastewater Facilities Status Report - The Discharger shall regularly review, revise, or update, as necessary, its Wastewater Facilities Status Report. This report shall document how the Discharger operates and maintains its wastewater collection, treatment, and disposal facilities to ensure that all facilities are adequately staffed, supervised, financed, operated, maintained, repaired, and upgraded as necessary to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

3. Proper Supervision and Operation of Publicly Owned Treatment Works (POTWs) - POTWs shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Division 4, Chapter 14, Title 23 of the California Code of Regulations.

E. Property Rights – Not Supplemented

F. Inspection and Entry – Not Supplemented

G. Bypass – Not Supplemented

H. Upset – Not Supplemented

I. Other – This section is an addition to Standard Provisions (Attachment D)

1. Neither the treatment nor the discharge of pollutants shall create pollution, contamination, or nuisance as defined by California Water Code Section 13050.

2. Collection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater, except in cases where excluding the public is infeasible, such as private property. If public contact with wastewater could reasonably occur on public property, warning signs shall be posted.

3. If the Discharger submits a timely and complete Report of Waste Discharge for permit reissuance, this permit continues in force and effect until a new permit is issued or the Regional Water Board rescinds the permit.

J. Storm Water – This section is an addition to Standard Provisions (Attachment D)

These provisions apply to facilities that do not direct all storm water flows from the facility to the wastewater treatment plant headworks.

1. Storm Water Pollution Prevention Plan (SWPP Plan)

The SWPP Plan shall be designed in accordance with good engineering practices and shall address the following objectives:

a. To identify pollutant sources that may affect the quality of storm water discharges; and

b. To identify, assign, and implement control measures and management practices to reduce pollutants in storm water discharges.

The SWPP Plan may be combined with the existing Spill Prevention Plan as required in accordance with Section C.2. The SWPP Plan shall be retained on-site and made available upon request of a representative of the Regional Water Board.

2. Source Identification

The SWPP Plan shall provide a description of potential sources that may be expected to add significant quantities of pollutants to storm water discharges, or may result in non-storm water discharges from the facility. The SWPP Plan shall include, at a minimum, the following items:

a. A topographical map (or other acceptable map if a topographical map is unavailable), extending one-quarter mile beyond the property boundaries of the facility, showing the wastewater treatment facility process areas, surface water bodies (including springs and wells), and discharge point(s) where the facility's storm water discharges to a municipal storm drain system or other points of discharge to waters of the State. The requirements of this paragraph may be included in the site map required under the following paragraph if appropriate.

b. A site map showing the following:

   1) Storm water conveyance, drainage, and discharge structures;

   2) An outline of the storm water drainage areas for each storm water discharge point;

   3) Paved areas and buildings;

   4) Areas of actual or potential pollutant contact with storm water or release to storm water, including but not limited to outdoor storage and process areas; material loading, unloading, and access areas; and waste treatment, storage, and disposal areas;

   5) Location of existing storm water structural control measures (i.e., berms, coverings, etc.);

   6) Surface water locations, including springs and wetlands; and

   7) Vehicle service areas.

c. A narrative description of the following:

   1) Wastewater treatment process activity areas;

   2) Materials, equipment, and vehicle management practices employed to minimize contact of significant materials of concern with storm water discharges;

   3) Material storage, loading, unloading, and access areas;

   4) Existing structural and non-structural control measures (if any) to reduce pollutants in storm water discharges; and

   5) Methods of on-site storage and disposal of significant materials.

d. A list of pollutants that have a reasonable potential to be present in storm water discharges in significant quantities.

3. Storm Water Management Controls

The SWPP Plan shall describe the storm water management controls appropriate for the facility and a time schedule for fully implementing such controls. The appropriateness and priorities of controls in the SWPP Plan shall reflect identified potential sources of pollutants. The description of storm water management controls to be implemented shall include, as appropriate:

a. Storm water pollution prevention personnel

Identify specific individuals (and job titles) that are responsible for developing, implementing, and reviewing the SWPP Plan.

b. Good housekeeping

Good housekeeping requires the maintenance of clean, orderly facility areas that discharge storm water. Material handling areas shall be inspected and cleaned to reduce the potential for pollutants to enter the storm drain conveyance system.

c. Spill prevention and response

Identify areas where significant materials can spill into or otherwise enter storm water conveyance systems and their accompanying drainage points. Specific material handling procedures, storage requirements, and cleanup equipment and procedures shall be identified, as appropriate. The necessary equipment to implement a cleanup shall be available, and personnel shall be trained in proper response, containment, and cleanup of spills. Internal reporting procedures for spills of significant materials shall be established.

d. Source control

Source controls include, for example, elimination or reduction of the use of toxic pollutants, covering of pollutant source areas, sweeping of paved areas, containment of potential pollutants, labeling of all storm drain inlets with “No Dumping” signs, isolation or separation of industrial and non-industrial pollutant sources so that runoff from these areas does not mix, etc.

e. Storm water management practices

Storm water management practices are practices other than those that control the sources of pollutants. Such practices include treatment or conveyance structures, such as drop inlets, channels, retention and detention basins, treatment vaults, infiltration galleries, filters, oil/water separators, etc. Based on assessment of the potential of various sources to contribute pollutants to storm water discharges in significant quantities, additional storm water management practices to remove pollutants from storm water discharges shall be implemented and design criteria shall be described.

f. Sediment and erosion control

Measures to minimize erosion around the storm water drainage and discharge points, such as riprap, revegetation, slope stabilization, etc., shall be described.

g. Employee training

Employee training programs shall inform all personnel responsible for implementing the SWPP Plan. Training shall address spill response, good housekeeping, and material management practices. New employee and refresher training schedules shall be identified.

h. Inspections

All inspections shall be done by trained personnel. Material handling areas shall be inspected for evidence of, or the potential for, pollutants entering storm water discharges. A tracking or follow up procedure shall be used to ensure appropriate response has been taken in response to an inspection. Inspections and maintenance activities shall be documented and recorded. Inspection records shall be retained for five years.

i. Records

A tracking and follow-up procedure shall be described to ensure that adequate response and corrective actions have been taken in response to inspections.

4. Annual Verification of SWPP Plan

An annual facility inspection shall be conducted to verify that all elements of the SWPP Plan are accurate and up-to-date. The results of this review shall be reported in the Annual Report to the Regional Water Board described in Section V.C.f.

K. Biosolids Management – This section is an addition to Standard Provisions (Attachment D)

Biosolids must meet the following requirements prior to land application. The Discharger must either demonstrate compliance or, if it sends the biosolids to another party for further treatment or distribution, must give the recipient the information necessary to ensure compliance.

1. Exceptional quality biosolids meet the pollutant concentration limits in Table III of 40 CFR Part 503.13, Class A pathogen limits, and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8). Such biosolids do not have to be tracked further for compliance with general requirements (503.12) and management practices (503.14).

2. Biosolids used for agricultural land, forest, or reclamation shall meet the pollutant limits in Table I (ceiling concentrations) and Table II or Table III (cumulative loadings or pollutant concentration limits) of 503.13. They shall also meet the general requirements (503.12) and management practices (503.14) (if not exceptional quality biosolids) for Class A or Class B pathogen levels with associated access restrictions (503.32) and one of the 10 vector attraction reduction requirements in 503.33(b)(1)-(b)(10).

3. Biosolids used for lawn or home gardens must meet exceptional quality biosolids limits.

4. Biosolids sold or given away in a bag or other container must meet the pollutant limits in either Table III or Table IV (pollutant concentration limits or annual pollutant loading rate limits) of 503.13. If Table IV is used, a label or information sheet must be attached to the biosolids packing that explains Table IV (see 503.14). The biosolids must also meet the Class A pathogen limits and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8).

II. STANDARD PROVISIONS – PERMIT ACTION – Not Supplemented

III. STANDARD PROVISIONS – MONITORING

A. Sampling and Analyses – This section is a supplement to III.A and III.B of Standard Provisions (Attachment D)

1. Use of Certified Laboratories

Water and waste analyses shall be performed by a laboratory certified for these analyses in accordance with California Water Code Section 13176.

2. Use of Appropriate Minimum Levels

Table C lists the suggested analytical methods for the 126 priority pollutants and other toxic pollutants that should be used, unless a particular method or minimum level (ML) is required in the MRP.

For priority pollutant monitoring, when there is more than one ML value for a given substance, the Discharger may select any one of the analytical methods cited in Table C for compliance determination, or any other method described in 40 CFR part 136 or approved by U.S. EPA (such as the 1600 series) if authorized by the Regional Water Board. However, the ML must be below the effluent limitation and water quality objective. If no ML value is below the effluent limitation and water quality objective, then the method must achieve an ML no greater than the lowest ML value indicated in Table C. All monitoring instruments and equipment shall be properly calibrated and maintained to ensure accuracy of measurements.

3. Frequency of Monitoring

The minimum schedule of sampling analysis is specified in the MRP portion of the permit.

a. Timing of Sample Collection

1) The Discharger shall collect samples of influent on varying days selected at random and shall not include any plant recirculation or other sidestream wastes, unless otherwise stipulated by the MRP.

2) The Discharger shall collect samples of effluent on days coincident with influent sampling unless otherwise stipulated by the MRP or the Executive Officer. The Executive Officer may approve an alternative sampling plan if it is demonstrated to be representative of plant discharge flow and in compliance with all other permit requirements.

3) The Discharger shall collect grab samples of effluent during periods of day-time maximum peak effluent flows (or peak flows through secondary treatment units for facilities that recycle effluent flows).

4) Effluent sampling for conventional pollutants shall occur on at least one day of any multiple-day bioassay test the MRP requires. During the course of the test, on at least one day, the Discharger shall collect and retain samples of the discharge. In the event a bioassay test does

not comply with permit limits, the Discharger shall analyze these retained samples for pollutants that could be toxic to aquatic life and for which it has effluent limits.

i. The Discharger shall perform bioassay tests on final effluent samples; when chlorine is used for disinfection, bioassay tests shall be performed on effluent after chlorination-dechlorination; and

ii. The Discharger shall analyze for total ammonia nitrogen and calculate the amount of un-ionized ammonia whenever test results fail to meet the percent survival specified in the permit.

b. Conditions Triggering Accelerated Monitoring

1) If the results from two consecutive samples of a constituent monitored in a 30-day period exceed the monthly average limit for any parameter (or if the required sampling frequency is once per month and the monthly sample exceeds the monthly average limit), the Discharger shall, within 24 hours after the results are received, increase its sampling frequency to daily until the results from the additional sampling show that the parameter is in compliance with the monthly average limit.

2) If any maximum daily limit is exceeded, the Discharger shall increase its sampling frequency to daily within 24 hours after the results are received that indicate the exceedance of the maximum daily limit until two samples collected on consecutive days show compliance with the maximum daily limit.

3) If final or intermediate results of an acute bioassay test indicate a violation or threatened violation (e.g., the percentage of surviving test organisms of any single acute bioassay test is less than 70 percent), the Discharger shall initiate a new test as soon as practical, and the Discharger shall investigate the cause of the mortalities and report its findings in the next self monitoring report (SMR).

4) The Discharger shall calibrate chlorine residual analyzers against grab samples as frequently as necessary to maintain accurate control and reliable operation. If an effluent violation is detected, the Discharger shall collect grab samples at least every 30 minutes until compliance with the limit is achieved, unless the Discharger monitors chlorine residual continuously. In such cases, the Discharger shall continue to conduct continuous monitoring as required by its permit.

5) When a bypass occurs (except one subject to provision III.A.3.b.6 below), the Discharger shall monitor flows and collect samples on a daily basis for all constituents at affected discharge points that have effluent limits for the duration of the bypass (including acute toxicity using static renewals), except chronic toxicity, unless otherwise stipulated by the MRP.

6) Unless otherwise stipulated by the MRP, when a bypass approved pursuant to Attachment D, Standard Provisions, Sections I.G.2 or I.G.4, occurs, the Discharger shall monitor flows and, using appropriate procedures as specified in the MRP, collect and retain samples for affected discharge points on a daily basis for the duration of the bypass. The Discharger shall analyze for total suspended solids (TSS) using 24-hour composites (or more frequent increments) and for bacteria indicators with effluent limits using grab samples. If TSS exceeds 45 mg/L in any composite sample, the Discharger shall also analyze the retained samples for that discharge

for all other constituents that have effluent limits, except oil and grease, mercury, dioxin-TEQ, and acute and chronic toxicity. Additionally, at least once each year, the Discharger shall analyze the retained samples for one approved bypass discharge event for all other constituents that have effluent limits, except oil and grease, mercury, dioxin-TEQ, and acute and chronic toxicity. This monitoring shall be in addition to the minimum monitoring specified in the MRP.

c. Storm Water Monitoring

The requirements of this section only apply to facilities that are not covered by an NPDES permit for storm water discharges and where not all site storm drainage from process areas (i.e., areas of the treatment facility where chemicals or wastewater could come in contact with storm water) is directed to the headworks. For storm water not directed to the headworks during the wet season (October 1 to April 30), the Discharger shall:

1) Conduct visual observations of the storm water discharge locations during daylight hours at least once per month during a storm event that produces significant storm water discharge to observe the presence of floating and suspended materials, oil and grease, discoloration, turbidity, and odor, etc.

2) Measure (or estimate) the total volume of storm water discharge, collect grab samples of storm water discharge from at least two storm events that produce significant storm water discharge, and analyze the samples for oil and grease, pH, TSS, and specific conductance.

   The grab samples shall be taken during the first 30 minutes of the discharge. If collection of the grab samples during the first 30 minutes is impracticable, grab samples may be taken during the first hour of the discharge, and the Discharger shall explain in the Annual Report why the grab sample(s) could not be taken in the first 30 minutes.

3) Testing for the presence of non-storm water discharges shall be conducted no less than twice during the dry season (May 1 to September 30) at all storm water discharge locations. Tests may include visual observations of flows, stains, sludges, odors, and other abnormal conditions; dye tests; TV line surveys; or analysis and validation of accurate piping schematics. Records shall be maintained describing the method used, date of testing, locations observed, and test results.

4) Samples shall be collected from all locations where storm water is discharged. Samples shall represent the quality and quantity of storm water discharged from the facility. If a facility discharges storm water at multiple locations, the Discharger may sample a reduced number of locations if it establishes and documents through the monitoring program that storm water discharges from different locations are substantially identical.

5) Records of all storm water monitoring information and copies of all reports required by the permit shall be retained for a period of at least three years from the date of sample, observation, or report.

d. Receiving Water Monitoring

The requirements of this section only apply when the MRP requires receiving water sampling.

1) Receiving water samples shall be collected on days coincident with effluent sampling for conventional pollutants.

2) Receiving water samples shall be collected at each station on each sampling day during the period within one hour following low slack water. Where sampling during lower slack water is impractical, sampling shall be performed during higher slack water. Samples shall be collected within the discharge plume and down current of the discharge point so as to be representative, unless otherwise stipulated in the MRP.

3) Samples shall be collected within one foot of the surface of the receiving water, unless otherwise stipulated in the MRP.

B. Biosolids Monitoring – This section supplements III.B of Standard Provisions (Attachment D)

When biosolids are sent to a landfill, sent to a surface disposal site, or applied to land as a soil amendment, they must be monitored as follows:

1. Biosolids Monitoring Frequency

Biosolids disposal must be monitored at the following frequency:

Metric tons biosolids/365 days	Frequency
0-290	Once per year
290-1500	Quarterly
1500-15,000	Six times per year
Over 15,000	Once per month

(Metric tons are on a dry weight basis)

2. Biosolids Pollutants to Monitor

Biosolids shall be monitored for the following constituents:

- Land Application: Arsenic, cadmium, copper, mercury, molybdenum, nickel, lead, selenium, and zinc
- Municipal Landfill: Paint filter test (pursuant to 40 CFR 258)
- Biosolids-only Landfill or Surface Disposal Site (if no liner and leachate system): arsenic, chromium, and nickel

C. Standard Observations – This section is an addition to III of Standard Provisions (AttachmentD)

1. Receiving Water Observations

The requirements of this section only apply when the MRP requires standard observations of the receiving water. Standard observations shall include the following:

a. *Floating and suspended materials* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence, source, and size of affected area.

b. *Discoloration and turbidity*: description of color, source, and size of affected area.

c. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

d. *Beneficial water use*: presence of water-associated waterfowl or wildlife, fisherpeople, and other recreational activities in the vicinity of each sampling station.

e. *Hydrographic condition*: time and height of corrected high and low tides (corrected to nearest National Oceanic and Atmospheric Administration location for the sampling date and time of sample collection).

f. *Weather conditions*:

1) Air temperature; and

2) Total precipitation during the five days prior to observation.

2. Wastewater Effluent Observations

The requirements of this section only apply when the MRP requires wastewater effluent standard observations. Standard observations shall include the following:

a. *Floating and suspended material of wastewater origin* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence.

b. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

3. Beach and Shoreline Observations

The requirements of this section only apply when the MRP requires beach and shoreline standard observations. Standard observations shall include the following:

a. *Material of wastewater origin*: presence or absence, description of material, estimated size of affected area, and source.

b. *Beneficial use*: estimate number of people participating in recreational water contact, non-water contact, or fishing activities.

4. Land Retention or Disposal Area Observations

The requirements of this section only apply to facilities with on-site surface impoundments or disposal areas that are in use. This section applies to both liquid and solid wastes, whether confined or unconfined. The Discharger shall conduct the following for each impoundment:

a. Determine the amount of freeboard at the lowest point of dikes confining liquid wastes.

b. Report evidence of leaching liquid from area of confinement and estimated size of affected area. Show affected area on a sketch and volume of flow (e.g., gallons per minute [gpm]).

c. Regarding odor, describe presence or absence, characterization, source, distance of travel, and wind direction.

d. Estimate number of waterfowl and other water-associated birds in the disposal area and vicinity.

5. Periphery of Waste Treatment and/or Disposal Facilities Observations

The requirements of this section only apply when the MRP specifies periphery standard observations. Standard observations shall include the following:

a. *Odor*: presence or absence, characterization, source, and distance of travel.

b. *Weather conditions*: wind direction and estimated velocity.

IV. STANDARD PROVISIONS – RECORDS

A. Records to be Maintained – This supplements IV.A of Standard Provisions (Attachment D)

The Discharger shall maintain records in a manner and at a location (e.g., wastewater treatment plant or Discharger offices) such that the records are accessible to Regional Water Board staff. The minimum period of retention specified in Section IV, Records, of the Federal Standard Provisions shall be extended during the course of any unresolved litigation regarding the subject discharge, or when requested by the Regional Water Board or Regional Administrator of U.S. EPA, Region IX.

A copy of the permit shall be maintained at the discharge facility and be available at all times to operating personnel.

B. Records of monitoring information shall include – This supplements IV.B of Standard Provision (Attachment D)

1. Analytical Information

Records shall include analytical method detection limits, minimum levels, reporting levels, and related quantification parameters.

2. Flow Monitoring Data

For all required flow monitoring (e.g., influent and effluent flows), the additional records shall include the following, unless otherwise stipulated by the MRP:

a. Total volume for each day; and

b. Maximum, minimum, and average daily flows for each calendar month.

3. Wastewater Treatment Process Solids

a. For each treatment unit process that involves solids removal from the wastewater stream, records shall include the following:

1) Total volume or mass of solids removed from each collection unit (e.g., grit, skimmings, undigested biosolids, or combination) for each calendar month or other time period as appropriate, but not to exceed annually; and

2) Final disposition of such solids (e.g., landfill, other subsequent treatment unit).

b. For final dewatered biosolids from the treatment plant as a whole, records shall include the following:

1) Total volume or mass of dewatered biosolids for each calendar month;

2) Solids content of the dewatered biosolids; and

3) Final disposition of dewatered biosolids (disposal location and disposal method).

4. Disinfection Process

For the disinfection process, these additional records shall be maintained documenting process operation and performance:

a. For bacteriological analyses:

1) Wastewater flow rate at the time of sample collection; and

2) Required statistical parameters for cumulative bacterial values (e.g., moving median or geometric mean for the number of samples or sampling period identified in this Order).

b. For the chlorination process, when chlorine is used for disinfection, at least daily average values for the following:

1) Chlorine residual of treated wastewater as it enters the contact basin (mg/L);

2) Chlorine dosage (kg/day); and

3) Dechlorination chemical dosage (kg/day).

5. Treatment Process Bypasses

A chronological log of all treatment process bypasses, including wet weather blending, shall include the following:

a. Identification of the treatment process bypassed;

b. Dates and times of bypass beginning and end;

c. Total bypass duration;

d. Estimated total bypass volume; and

e. Description of, or reference to other reports describing, the bypass event, the cause, the corrective actions taken (except for wet weather blending that is in compliance with permit conditions), and any additional monitoring conducted.

6. Treatment Facility Overflows

This section applies to records for overflows at the treatment facility. This includes the headworks and all units and appurtenances downstream. The Discharger shall retain a chronological log of overflows at the treatment facility and records supporting the information provided in section V.E.2.

C. Claims of Confidentiality – Not Supplemented

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information – Not Supplemented

B. Signatory and Certification Requirements – Not Supplemented

C. Monitoring Reports – This section supplements V.C of Standard Provisions (Attachment D)

1. Self Monitoring Reports

For each reporting period established in the MRP, the Discharger shall submit an SMR to the Regional Water Board in accordance with the requirements listed in this document and at the frequency the MRP specifies. The purpose of the SMR is to document treatment performance, effluent quality, and compliance with the waste discharge requirements of this Order.

a. Transmittal letter

Each SMR shall be submitted with a transmittal letter. This letter shall include the following:

1) Identification of all violations of effluent limits or other waste discharge requirements found during the reporting period;

2) Details regarding violations: parameters, magnitude, test results, frequency, and dates;

3) Causes of violations;

4) Discussion of corrective actions taken or planned to resolve violations and prevent recurrences, and dates or time schedule of action implementation (if previous reports have been submitted that address corrective actions, reference to the earlier reports is satisfactory);

5) Data invalidation (Data should not be submitted in an SMR if it does not meet quality assurance/quality control standards. However, if the Discharger wishes to invalidate any measurement after it was submitted in an SMR, a letter shall identify the measurement suspected to be invalid and state the Discharger's intent to submit, within 60 days, a formal request to invalidate the measurement. This request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that

supports invalidation [e.g., laboratory sheet, log entry, test results, etc.], and discussion of the corrective actions taken or planned [with a time schedule for completion] to prevent recurrence of the sampling or measurement problem.);

6) If the Discharger blends, the letter shall describe the duration of blending events and certify whether blended effluent was in compliance with the conditions for blending; and

7) Signature (The transmittal letter shall be signed according to Section V.B of this Order, Attachment D – Standard Provisions.).

b. Compliance evaluation summary

Each report shall include a compliance evaluation summary. This summary shall include each parameter for which the permit specifies effluent limits, the number of samples taken during the monitoring period, and the number of samples that exceed applicable effluent limits.

c. Results of analyses and observations

1) Tabulations of all required analyses and observations, including parameter, date, time, sample station, type of sample, test result, method detection limit, method minimum level, and method reporting level, if applicable, signed by the laboratory director or other responsible official.

2) When determining compliance with an average monthly effluent limitation and more than one sample result is available in a month, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of detected but not quantified (DNQ) or nondetect (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

i. The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

ii. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

If a sample result, or the arithmetic mean or median of multiple sample results, is below the reporting limit, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation and the Discharger conducts a Pollutant Minimization Program, the Discharger shall not be deemed out of compliance.

3) Dioxin-TEQ Reporting: The Discharger shall report for each dioxin and furan congener the analytical results of effluent monitoring, including the quantifiable limit (reporting level), the method detection limit, and the measured concentration. The Discharger shall report all measured values of individual congeners, including data qualifiers. When calculating dioxin-TEQ, the Discharger shall set congener concentrations below the minimum levels (ML) to zero. The Discharger shall calculate and report dioxin-TEQs using the following formula,

where the MLs, toxicity equivalency factors (TEFs), and bioaccumulation equivalency factors (BEFs) are as provided in Table A:

$$\text{Dioxin-TEQ} = \Sigma\ (C_x \times TEF_x \times BEF_x)$$

where: C_x = measured or estimated concentration of congener *x*
TEF_x = toxicity equivalency factor for congener x
BEFx = bioaccumulation equivalency factor for congener *x*

Table A

Minimum Levels, Toxicity Equivalency Factors,
and Bioaccumulation Equivalency Factors

Dioxin or Furan Congener	Minimum Level (pg/L)	1998 Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factor (BEF)
2,3,7,8-TCDD	10	1.0	1.0
1,2,3,7,8-PeCDD	50	1.0	0.9
1,2,3,4,7,8-HxCDD	50	0.1	0.3
1,2,3,6,7,8-HxCDD	50	0.1	0.1
1,2,3,7,8,9-HxCDD	50	0.1	0.1
1,2,3,4,6,7,8-HpCDD	50	0.01	0.05
OCDD	100	0.0001	0.01
2,3,7,8-TCDF	10	0.1	0.8
1,2,3,7,8-PeCDF	50	0.05	0.2
2,3,4,7,8-PeCDF	50	0.5	1.6
1,2,3,4,7,8-HxCDF	50	0.1	0.08
1,2,3,6,7,8-HxCDF	50	0.1	0.2
1,2,3,7,8,9-HxCDF	50	0.1	0.6
2,3,4,6,7,8-HxCDF	50	0.1	0.7
1,2,3,4,6,7,8-HpCDF	50	0.01	0.01
1,2,3,4,7,8,9-HpCDF	50	0.01	0.4
OCDF	100	0.0001	0.02

d. Data reporting for results not yet available

The Discharger shall make all reasonable efforts to obtain analytical data for required parameter sampling in a timely manner. Certain analyses require additional time to complete analytical processes and report results. For cases where required monitoring parameters require additional time to complete analytical processes and reports, and results are not available in time to be included in the SMR for the subject monitoring period, the Discharger shall describe such circumstances in the SMR and include the data for these parameters and relevant discussions of any observed exceedances in the next SMR due after the results are available.

e. Flow data

The Discharger shall provide flow data tabulation pursuant to Section IV.B.2.

f. Annual self monitoring report requirements

By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

1) Annual compliance summary table of treatment plant performance, including documentation of any blending events;

2) Comprehensive discussion of treatment plant performance and compliance with the permit (This discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices.);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater;

4) List of approved analyses, including the following:

(i) List of analyses for which the Discharger is certified;

(ii) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory shall not be submitted but be retained onsite); and

(iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all storm water to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs to:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format

The Discharger has the option to submit all monitoring results in an electronic reporting format approved by the Executive Officer. If the Discharger chooses to submit SMRs electronically, the following shall apply:

1) *Reporting Method*: The Discharger shall submit SMRs electronically via a process approved by the Executive Officer (see, for example, the letter dated December 17, 1999, "Official Implementation of Electronic Reporting System [ERS]" and the progress report letter dated December 17, 2000).

2) *Monthly or Quarterly Reporting Requirements*: For each reporting period (monthly or quarterly as specified in the MRP), the Discharger shall submit an electronic SMR to the Regional Water Board in accordance with the provisions of Section V.C.1.a-e, except for requirements under Section V.C.1.c(1) where ERS does not have fields for dischargers to input certain information (e.g., sample time). However, until U.S. EPA approves the electronic signature or other signature technologies, Dischargers that use ERS shall submit a hard copy of the original transmittal letter, an ERS printout of the data sheet, and a violation report (a receipt of the electronic transmittal shall be retained by the Discharger). This electronic SMR submittal suffices for the signed tabulations specified under Section V.C.1.c(1).

3) *Annual Reporting Requirements*: Dischargers who have submitted data using the ERS for at least one calendar year are exempt from submitting the portion of the annual report required under Section V.C.1.f(1) and (3).

D. Compliance Schedules – Not supplemented

E. Twenty-Four Hour Reporting – This section supplements V.E of Standard Provision (Attachment D)

1. Spill of Oil or Other Hazardous Material Reports

a. Within 24 hours of becoming aware of a spill of oil or other hazardous material that is not contained onsite and completely cleaned up, the Discharger shall report by telephone to the Regional Water Board at (510) 622-2369.

b. The Discharger shall also report such spills to the State Office of Emergency Services [telephone (800) 852-7550] only when the spills are in accordance with applicable reporting quantities for hazardous materials.

c. The Discharger shall submit a written report to the Regional Water Board within five working days following telephone notification unless directed otherwise by Regional Water Board staff. A report submitted electronically is acceptable. The written report shall include the following:

1) Date and time of spill, and duration if known;

2) Location of spill (street address or description of location);

3) Nature of material spilled;

4) Quantity of material involved;

5) Receiving water body affected, if any;

6) Cause of spill;

7) Estimated size of affected area;

8) Observed impacts to receiving waters (e.g., oil sheen, fish kill, water discoloration);

9) Corrective actions taken to contain, minimize, or clean up the spill;

10) Future corrective actions planned to be taken to prevent recurrence, and schedule of implementation; and

11) Persons or agencies notified.

2. Unauthorized Discharges from Municipal Wastewater Treatment Plants[1]

The following requirements apply to municipal wastewater treatment plants that experience an unauthorized discharge at their treatment facilities and are consistent with and supercede requirements imposed on the Discharger by the Executive Officer by letter of May 1, 2008, issued pursuant to California Water Code Section 13383.

a. Two (2)-Hour Notification

For any unauthorized discharges that result in a discharge to a drainage channel or a surface water, the Discharger shall, as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the State Office of Emergency Services (telephone 800-852-7550), the local health officers or directors of environmental health with jurisdiction over the affected water bodies, and the Regional Water Board. The notification to the Regional Water Board shall be via the Regional Water Board's online reporting system at www.wbers.net, and shall include the following:

1) Incident description and cause;

2) Location of threatened or involved waterway(s) or storm drains;

3) Date and time the unauthorized discharge started;

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on); and

6) Identity of the person reporting the unauthorized discharge.

b. 24-hour Certification

Within 24 hours, the Discharger shall certify to the Regional Water Board, at www.wbers.net, that the State Office of Emergency Services and the local health officers or directors of environmental health with jurisdiction over the affected water bodies have been notified of the unauthorized discharge.

c. 5-Day Written Report

Within five business days, the Discharger shall submit a written report, via the Regional Water Board's online reporting system at www.wbers.net, that includes, in addition to the information required above, the following:

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

2) Efforts implemented to minimize public exposure to the unauthorized discharge;

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;

4) Corrective measures taken to minimize the impact of the unauthorized discharge;

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges; and

7) Quantity and duration of the unauthorized discharge, and the amount recovered.

d. Communication Protocol

To clarify the multiple levels of notification, certification, and reporting, the current communication requirements for unauthorized discharges from municipal wastewater treatment plants are summarized in Table B that follows.

Table B

Summary of Communication Requirements for Unauthorized Discharges[1] from Municipal Wastewater Treatment Plants

Discharger is required to:	Agency Receiving Information	Time frame	Method for Contact
1. Notify	California Emergency Management Agency (Cal EMA)	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Telephone – (800) 852-7550 (obtain a control number from Cal EMA)
	Local health department	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Depends on local health department
	Regional Water Board	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Electronic[2] www.wbers.net
2. Certify	Regional Water Board	As soon as possible, but not later than **24 hours** after becoming aware of the unauthorized discharge.	Electronic[3] www.wbers.net
3. Report	Regional Water Board	Within **5 business days** of becoming aware of the unauthorized discharge.	Electronic[4] www.wbers.net

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

[2] In the event that the Discharger is unable to provide online notification within 2 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the notification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the notification information into the Regional Water Board's online system in electronic format.

[3] In most instances, the 2-hour notification will also satisfy 24-hour certification requirements. This is because the notification form includes fields for documenting that OES and the local health department have been contacted. In other words, if the Discharger is able to complete all the fields in the notification form within 2 hours, certification requirements are also satisfied. In the event that the Discharger is unable to provide online certification within 24 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the certification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the certification information into the Regional Water Board's online system in electronic format.

[4] If the Discharger cannot satisfy the 5-day reporting requirements via the Regional Water Board's online reporting system, it shall submit a written report (preferably electronically in pdf) to the appropriate Regional Water Board case manager. In cases where the Discharger cannot satisfy the 5-day reporting requirements via the online reporting system, it must still complete the Regional Water Board's online reporting requirements within 15 calendar days of becoming aware of the unauthorized discharge.

F. Planned Changes – Not supplemented

G. Anticipated Noncompliance – Not supplemented

H. Other Noncompliance – Not supplemented

I. Other Information – Not supplemented

VI. STANDARD PROVISION – ENFORCEMENT – Not Supplemented

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS – Not Supplemented

VIII. DEFINITIONS – This section is an addition to Standard Provisions (Attachment D)

More definitions can be found in Attachment A of this NPDES Permit.

1. Arithmetic Calculations

   a. Geometric mean is the antilog of the log mean or the back-transformed mean of the logarithmically transformed variables, which is equivalent to the multiplication of the antilogarithms. The geometric mean can be calculated with either of the following equations:

   $$\text{Geometric Mean} = Anti\log\left(\frac{1}{N}\sum_{i=1}^{N} Log(C_i)\right)$$

   or

   $$\text{Geometric Mean} = (C_1 * C_2 * \ldots * C_N)^{1/N}$$

   Where "N" is the number of data points for the period analyzed and "C" is the concentration for each of the "N" data points.

   b. Mass emission rate is obtained from the following calculation for any calendar day:

   $$\text{Mass emission rate (lb/day)} = \frac{8.345}{N}\sum_{i=1}^{N} Q_i C_i$$

   $$\text{Mass emission rate (kg/day)} = \frac{3.785}{N}\sum_{i=1}^{N} Q_i C_i$$

   In which "N" is the number of samples analyzed in any calendar day and "Q_i" and "C_i" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" grab samples that may be taken in any calendar day. If a composite sample is taken, "C_i" is the concentration measured in the composite sample and "Q_i" is the average flow rate occurring during the period over which the samples are composited. The daily concentration of a constituent measured over any calendar day shall be determined from the flow-weighted average of the same constituent in the combined waste streams as follows:

Cd = Average daily concentration = $\frac{1}{Q_t}\sum_{i=1}^{N} Q_i C_i$

In which "N" is the number of component waste streams and "Q" and "C" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" waste streams. "Q_t" is the total flow rate of the combined waste streams.

c. Maximum allowable mass emission rate, whether for a 24-hour, weekly 7-day, monthly 30-day, or 6-month period, is a limitation expressed as a daily rate determined with the formulas in the paragraph above, using the effluent concentration limit specified in the permit for the period and the specified allowable flow.

d. POTW removal efficiency is the ratio of pollutants removed by the treatment facilities to pollutants entering the treatment facilities (expressed as a percentage). The Discharger shall determine removal efficiencies using monthly averages (by calendar month unless otherwise specified) of pollutant concentration of influent and effluent samples collected at about the same time and using the following equation (or its equivalent):

Removal Efficiency (%) = 100 × [1-(Effluent Concentration/Influent Concentration)]

2. Biosolids means the solids, semi-liquid suspensions of solids, residues, screenings, grit, scum, and precipitates separated from or created in wastewater by the unit processes of a treatment system. It also includes, but is not limited to, all supernatant, filtrate, centrate, decantate, and thickener overflow and underflow in the solids handling parts of the wastewater treatment system.

3. Blending is the practice of recombining wastewater that has been biologically treated with wastewater that has bypassed around biological treatment units.

4. Bottom sediment sample is (1) a separate grab sample taken at each sampling station for the determination of selected physical-chemical parameters, or (2) four grab samples collected from different locations in the immediate vicinity of a sampling station while the boat is anchored and analyzed separately for macroinvertebrates.

5. Composite sample is a sample composed of individual grab samples collected manually or by an automatic sampling device on the basis of time or flow as specified in the MRP. For flow-based composites, the proportion of each grab sample included in the composite sample shall be within plus or minus five percent (+/-5%) of the representative flow rate of the waste stream being measured at the time of grab sample collection. Alternatively, equal volume grab samples may be individually analyzed with the flow-weighted average calculated by averaging flow-weighted ratios of each grab sample analytical result. Grab samples comprising time-based composite samples shall be collected at intervals not greater than those specified in the MRP. The quantity of each grab sample comprising a time-based composite sample shall be a set of flow proportional volumes as specified in the MRP. If a particular time-based or flow-based composite sampling protocol is not specified in the MRP, the Discharger shall determine and implement the most representative sampling protocol for the given parameter subject to Executive Officer approval.

6. Depth-integrated sample is defined as a water or waste sample collected by allowing a sampling device to fill during a vertical traverse in the waste or receiving water body being sampled. The Discharger shall collect depth-integrated samples in such a manner that the collected sample will be representative of the waste or water body at that sampling point.

7. Flow sample is an accurate measurement of the average daily flow volume using a properly calibrated and maintained flow measuring device.

8. Grab sample is an individual sample collected in a short period of time not exceeding 15 minutes. Grab samples represent only the condition that exists at the time the wastewater is collected.

9. Initial dilution is the process that results in the rapid and irreversible turbulent mixing of wastewater with receiving water around the point of discharge.

10. Overflow is the intentional or unintentional spilling or forcing out of untreated or partially treated wastes from a transport system (e.g., through manholes, at pump stations, and at collection points) upstream from the treatment plant headworks or from any part of a treatment plant facility.

11. Priority pollutants are those constituents referred to in 40 CFR Part 122 as promulgated in the Federal Register, Vol. 65, No. 97, Thursday, May 18, 2000, also known as the California Toxics Rule, the presence or discharge of which could reasonably be expected to interfere with maintaining designated uses.

12. Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.

13. Toxic pollutant means any pollutant listed as toxic under federal Clean Water Act section 307(a)(1) or under 40 CFR 401.15.

14. Untreated waste is raw wastewater.

15. Waste, waste discharge, discharge of waste, and discharge are used interchangeably in the permit. The requirements of the permit apply to the entire volume of water, and the material therein, that is disposed of to surface and ground waters of the State of California.

Table C

List of Monitoring Parameters and Analytical Methods

CTR No.	Pollutant/Parameter	Analytical Method[1]	Minimum Levels[2] (µg/l)											
			GC	GCMS	LC	Color	FAA	GFAA	ICP	ICP MS	SPGFAA	HYD RIDE	CVAA	DCP

14.	Cyanide	SM 4500 CN^- C or I				5								
15.	Asbestos (only required for dischargers to MUN waters)[5]	0100.2 [6]												
16.	2,3,7,8-TCDD and 17 congeners (Dioxin)	1613												
17.	Acrolein	603	2.0	5										
18.	Acrylonitrile	603	2.0	2										
19.	Benzene	602	0.5	2										
33.	Ethylbenzene	602	0.5	2										
39.	Toluene	602	0.5	2										
20.	Bromoform	601	0.5	2										
21.	Carbon Tetrachloride	601	0.5	2										
22.	Chlorobenzene	601	0.5	2										
23.	Chlorodibromomethane	601	0.5	2										
24.	Chloroethane	601	0.5	2										

[1] The suggested method is the U.S. EPA Method unless otherwise specified (SM = Standard Methods). The Discharger may use another U.S. EPA-approved or recognized method if that method has a level of quantification below the applicable water quality objective. Where no method is suggested, the Discharger has the discretion to use any standard method.

[2] Minimum levels are from the *State Implementation Policy*. They are the concentration of the lowest calibration standard for that technique based on a survey of contract laboratories. Laboratory techniques are defined as follows: GC = Gas Chromatography; GCMS = Gas Chromatography/Mass Spectrometry; LC = High Pressure Liquid Chromatography; Color = Colorimetric; FAA = Flame Atomic Absorption; GFAA = Graphite Furnace Atomic Absorption; ICP = Inductively Coupled Plasma; ICPMS = Inductively Coupled Plasma/Mass Spectrometry; SPGFAA = Stabilized Platform Graphite Furnace Atomic Absorption (i.e., U.S. EPA 200.9); Hydride = Gaseous Hydride Atomic Absorption; CVAA = Cold Vapor Atomic Absorption; DCP = Direct Current Plasma.

[3] Analysis for total chromium may be substituted for analysis of chromium (III) and chromium (VI) if the concentration measured is below the lowest hexavalent chromium criterion (11 ug/l).

[4] The Discharger shall use ultra-clean sampling (U.S. EPA Method 1669) and ultra-clean analytical methods (U.S. EPA Method 1631) for mercury monitoring. The minimum level for mercury is 2 ng/l (or 0.002 ug/l).

[5] MUN = Municipal and Domestic Supply. This designation, if applicable, is in the Findings of the permit.

[6] Determination of Asbestos Structures over 10 [micrometers] in Length in Drinking Water Using MCE Filters, U.S. EPA 600/R-94-134, June 1994.

ATTACHMENT H – PRETREATMENT REQUIREMENTS

CALIFORNIA REGIONAL WATER QUALITY CONTROL
BOARD
SAN FRANCISCO BAY REGION

ATTACHMENT H
PRETREATMENT PROGRAM PROVISIONS

For

NPDES POTW WASTEWATER DISCHARGE PERMITS

March 2011
(Corrected May 2011)

TABLE OF CONTENTS Page

Attachment H: Pretreatment Program Provisions

A. The Discharger shall be responsible and liable for the performance of all Control Authority pretreatment requirements contained in 40 CFR 403, including any regulatory revisions to Part 403. Where a Part 403 revision is promulgated after the effective date of the Discharger's permit and places mandatory actions upon the Discharger as Control Authority but does not specify a timetable for completion of the actions, the Discharger shall complete the required actions within six months from the issuance date of this permit or six months from the effective date of the Part 403 revisions, whichever comes later.

(If the Discharger cannot complete the required actions within the above six-month period due to the need to process local adoption of sewer use ordinance modifications or other substantial pretreatment program modifications, the Discharger shall notify the Executive Officer in writing at least 60 days prior to the six-month deadline. The written notification shall include a summary of completed required actions, an explanation for why the six month deadline cannot be met, and a proposed timeframe to complete the rest of the required actions as soon as practical but not later than within twelve months of the issuance date of this permit or twelve months of the effective date of the Part 403 revisions, whichever comes later. The Executive Officer will notify the Discharger in writing within 30 days of receiving the request if the extension is not approved.)

The United States Environmental Protection Agency (U.S. EPA), the State and/or other appropriate parties may initiate enforcement action against a nondomestic user for noncompliance with applicable standards and requirements as provided in the Clean Water Act (Act).

B. The Discharger shall enforce the requirements promulgated under Sections 307(b), 307(c), 307(d) and 402(b) of the Act with timely, appropriate and effective enforcement actions. The Discharger shall cause nondomestic users subject to Federal Categorical Standards to achieve compliance no later than the date specified in those requirements or, in the case of a new nondomestic user, upon commencement of the discharge.

C. The Discharger shall perform the pretreatment functions as required in 40 CFR 403 and amendments or modifications thereto including, but not limited to:

1. Implement the necessary legal authorities to fully implement the pretreatment regulations as provided in 40 CFR 403.8(f)(1);

2. Implement the programmatic functions as provided in 40 CFR 403.8(f)(2);

3. Publish an annual list of nondomestic users in significant noncompliance as provided per 40 CFR 403.8(f)(2)(viii);

4. Provide for the requisite funding and personnel to implement the pretreatment program as provided in 40 CFR 403.8(f)(3); and

5. Enforce the national pretreatment standards for prohibited discharges and categorical standards as provided in 40 CFR 403.5 and 403.6, respectively.

D. The Discharger shall submit annually a report to U.S. EPA Region 9, the State Water Board and the Regional Water Board describing its pretreatment program activities over the previous calendar year. In the event that the Discharger is not in compliance with any conditions or requirements of the Pretreatment Program, the Discharger shall also include the reasons for noncompliance and a plan and schedule for achieving compliance. The report shall contain, but is not limited to, the information specified in Appendix H-1 entitled, "Requirements for Pretreatment Annual Reports." The annual report is due each year on February 28.

E. The Discharger shall submit a pretreatment semiannual report to U.S. EPA Region 9, the State Water Board and the Regional Water Board describing the status of its significant industrial users (SIUs). The report shall contain, but is not limited to, information specified in Appendix H-2 entitled, "Requirements for Pretreatment Semiannual Reports." The semiannual report is due July 31 for the period January through June. The information for the period July through December of each year shall be included in the Annual Report identified in Appendix H-1. The Executive Officer may exempt the Discharger from the semiannual reporting requirements on a case by case basis subject to State Water Board and U.S. EPA's comment and approval.

F. The Discharger shall conduct the monitoring of its treatment plant's influent, effluent, and sludge (biosolids) as described in Appendix H-4 entitled, "Requirements for Influent, Effluent and Sludge (Biosolids) Monitoring." (The term "biosolids," as used in this Attachment, shall have the same meaning as wastewater treatment plant "sludge" and will be used from this point forward.) The Discharger shall evaluate the results of the sampling and analysis during the preparation of the semiannual and annual reports to identify any trends. Signing the certification statement used to transmit the reports shall be deemed to certify the Discharger has completed this data evaluation. A tabulation of the data shall be included in the pretreatment annual report as specified in Appendix H-4. The Executive Officer may require more or less frequent monitoring on a case by case basis.

APPENDIX H-1

REQUIREMENTS FOR PRETREATMENT ANNUAL REPORTS

The Pretreatment Annual Report is due each year on February 28 and shall contain activities conducted during the previous calendar year. The purpose of the Annual Report is to:

- Describe the status of the Discharger's pretreatment program; and
- Report on the effectiveness of the program, as determined by comparing the results of the preceding year's program implementation.

The report shall contain, at a minimum, the following information:

A. Cover Sheet

The cover sheet shall include:

1. The name(s) and National Pollutant Discharge Elimination Discharge System (NPDES) permit number(s) of the Discharger(s) that is part of the Pretreatment Program;

2. The name, address and telephone number of a pretreatment contact person;

3. The period covered in the report;

4. A statement of truthfulness; and

5. The dated signature of a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for overall operation of the Publicly Owned Treatment Works (POTW) (40 CFR 403.12(m)).

B. Introduction

This section shall include:

1. Any pertinent background information related to the Discharger and/or the nondomestic user base of the area;

2. List of applicable interagency agreements used to implement the Discharger's pretreatment program (e.g., Memoranda of Understanding (MOU) with satellite sanitary sewer collection systems); and

3. A status summary of the tasks required by a Pretreatment Compliance Inspection (PCI), Pretreatment Compliance Audit (PCA), Cleanup and Abatement Order (CAO), or other pretreatment-related enforcement actions required by the Regional Water Board or the U.S. EPA. A more detailed discussion can be referenced and included in the section entitled, "Program Changes," if needed.

C. Definitions

This section shall include a list of key terms and their definitions that the Discharger uses to describe or characterize elements of its pretreatment program, or the Discharger may provide a reference to its website if the applicable definitions are available on-line.

D. Discussion of Upset, Interference and Pass Through

This section shall include a discussion of Upset, Interference or Pass Through incidents, if any, at the Discharger's treatment plant(s) that the Discharger knows of or suspects were caused by nondomestic user discharges. Each incident shall be described, at a minimum, consisting of the following information:

1. A description of what occurred;

2. A description of what was done to identify the source;

3. The name and address of the nondomestic user responsible;

4. The reason(s) why the incident occurred;

5. A description of the corrective actions taken; and

6. An examination of the local and federal discharge limits and requirements for the purposes of determining whether any additional limits or changes to existing requirements may be necessary to prevent other Upset, Interference or Pass Through incidents.

E. Influent, Effluent and Biosolids Monitoring Results

The Discharger shall evaluate the influent, effluent and biosolids monitoring results as specified in Appendix H-4 in preparation of this report. The Discharger shall retain the analytical laboratory reports with the Quality Assurance and Quality Control (QA/QC) data validation and make these reports available upon request.

This section shall include:

1. Description of the sampling procedures and an analysis of the results (see Appendix H-4 for specific requirements);
2. Tabular summary of the compounds detected (compounds measured above the detection limit for the analytical method used) for the monitoring data generated during the reporting year as specified in Appendix H-4;
3. Discussion of the investigation findings into any contributing sources of the compounds that exceed NPDES limits; and
4. Graphical representation of the influent and effluent metal monitoring data for the past five years with a discussion of any trends.

F. Inspection, Sampling and Enforcement Programs

This section shall include at a minimum the following information:

1. Inspections: Summary of the inspection program (e.g., criteria for determining the frequency of inspections and inspection procedures);

2. Sampling Events: Summary of the sampling program (e.g., criteria for determining the frequency of sampling and chain of custody procedures); and

3. Enforcement: Summary of Enforcement Response Plan (ERP) implementation including dates for adoption, last revision and submission to the Regional Water Board.

G. Updated List of Regulated SIUs

This section shall contain a list of all of the federal categories that apply to SIUs regulated by the Discharger. The specific categories shall be listed including the applicable 40 CFR subpart and section, and pretreatment standards (both maximum and average limits). Local limits developed by the Discharger shall be presented in a table including the applicability of the local limits to SIUs. If local limits do not apply uniformly to SIUs, specify the applicability in the tables listing the categorical industrial users (CIUs) and non-categorical SIUs. Tables developed in Sections 7A and 7B can be used to present or reference this information.

1. CIUs - Include a table that alphabetically lists the CIUs regulated by the Discharger as of the end of the reporting period. This list shall include:

    a. Name;

    b. Address;

    c. Applicable federal category(ies);

    d. Reference to the location where the applicable Federal Categorical Standards are presented in the report;

    e. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

    f. Information, calculations and data used to determine the limits for those CIUs for which a combined waste stream formula is applied.

2. Non-categorical SIUs - Include a table that alphabetically lists the SIUs not subject to any federal categorical standards that were regulated by the Discharger as of the end of the reporting period. This list shall include:

    a. Name;

b. Address;

c. A brief description of the type of business;

d. Identify all deletions and additions keyed to the list submitted in the previous annual report. All deletions shall be briefly explained (e.g., closure, name change, ownership change, reclassification, declassification); and

e. Indicate the applicable discharge limits (e.g., different from local limits) to which the SIUs are subject and reference to the location where the applicable limits (e.g., local discharge limits) are presented in the report.

H. SIU (categorical and non-categorical) Compliance Activities

The information required in this section may be combined in the table developed in Section 7 above.

1. **Inspection and Sampling Summary:** This section shall contain a summary of all the SIU inspections and sampling activities conducted by the Discharger and sampling activities conducted by the SIU over the reporting year to gather information and data regarding SIU compliance. The summary shall include:

   a. The number of inspections and sampling events conducted for each SIU by the Discharger;

   b. The number of sampling events conducted by the SIU. Identify SIUs that are operating under an approved Total Toxic Organic Management Plan;

   c. The quarters in which the above activities were conducted; and

   d. The compliance status of each SIU, delineated by quarter, and characterized using all applicable descriptions as given below:

      (1) Consistent compliance;

      (2) Inconsistent compliance;

      (3) Significant noncompliance;

      (4) On a compliance schedule to achieve compliance (include the date final compliance is required);

      (5) Not in compliance and not on a compliance schedule; and

      (6) Compliance status unknown, and why not.

2. **Enforcement Summary:** This section shall contain a summary of SIU compliance and enforcement activities during the reporting year. The summary may be included in the summary

table developed in section 8A and shall include the names and addresses of all SIUs affected by the actions identified below. For each notice specified in enforcement action "i" through "iv," indicate whether it was for an infraction of a federal or local standard/limit or requirement.

a. Warning letters or notices of violations regarding SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

b. Administrative Orders regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

c. Civil actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

d. Criminal actions regarding the SIUs' apparent noncompliance with or violation of any federal pretreatment categorical standards and/or requirements, or local limits and/or requirements;

e. Assessment of monetary penalties. Identify the amount of penalty in each case and reason for assessing the penalty;

f. Order to restrict/suspend discharge to the Discharger; and

g. Order to disconnect the discharge from entering the Discharger.

3. July-December Semiannual Data: For SIU violations/noncompliance during the semiannual reporting period from July 1 through December 31, provide the following information:

a. Name and facility address of the SIU;

b. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

c. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

d. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

e. For violations/noncompliance identified in the reporting period, provide:

(1) The date(s) of violation(s);

(2) The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

(3) A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

I. Baseline Monitoring Report Update

This section shall provide a list of CIUs added to the pretreatment program since the last annual report. This list of new CIUs shall summarize the status of the respective Baseline Monitoring Reports (BMR). The BMR must contain the information specified in 40 CFR 403.12(b). For each new CIU, the summary shall indicate when the BMR was due; when the CIU was notified by the Discharger of this requirement; when the CIU submitted the report; and/or when the report is due.

J. Pretreatment Program Changes

This section shall contain a description of any significant changes in the Pretreatment Program during the past year including, but not limited to:

1. Legal authority;
2. Local limits;
3. Monitoring/ inspection program and frequency;
4. Enforcement protocol;
5. Program's administrative structure;
6. Staffing level;
7. Resource requirements;
8. Funding mechanism;
9. If the manager of the Discharger's pretreatment program changed, a revised organizational chart shall be included; and
10. If any element(s) of the program is in the process of being modified, this intention shall also be indicated.

K. Pretreatment Program Budget

This section shall present the budget spent on the Pretreatment Program. The budget, either by the calendar or fiscal year, shall show the total expenses required to implement the pretreatment program. A brief discussion of the source(s) of funding shall be provided. In addition, the Discharger shall make available upon request specific details on its pretreatment program expense amounts such as for personnel, equipment, and chemical analyses.

L. Public Participation Summary

This section shall include a copy of the public notice as required in 40 CFR 403.8(f)(2)(viii). If a notice was not published, the reason shall be stated.

M. Biosolids Storage and Disposal Practice

This section shall describe how treated biosolids are stored and ultimately disposed. If a biosolids storage area is used, it shall be described in detail including its location, containment features and biosolids handling procedures.

N. Other Pollutant Reduction Activities

This section shall include a brief description of any programs the Discharger implements to reduce pollutants from nondomestic users that are not classified as SIUs. If the Discharger submits any of this program information in an Annual Pollution Prevention Report, reference to this other report shall satisfy this reporting requirement.

O. Other Subjects

Other information related to the Pretreatment Program that does not fit into any of the above categories should be included in this section.

P. Permit Compliance System (PCS) Data Entry Form

The annual report shall include the PCS Data Entry Form. This form shall summarize the enforcement actions taken against SIUs in the past year. This form shall include the following information:

1. Discharger's name,

2. NPDES Permit number,

3. Period covered by the report,

4. Number of SIUs in significant noncompliance (SNC) that are on a pretreatment compliance schedule,

5. Number of notices of violation and administrative orders issued against SIUs,

6. Number of civil and criminal judicial actions against SIUs,

7. Number of SIUs that have been published as a result of being in SNC, and

8. Number of SIUs from which penalties have been collected.

APPENDIX H-2

REQUIREMENTS FOR JANUARY-JUNE PRETREATMENT SEMIANNUAL REPORT

The pretreatment semiannual report is due on July 31 for pretreatment program activities conducted from January through June unless an exception has been granted by the Regional Water Board's Executive Officer (e.g., pretreatment programs without any SIUs may qualify for an exception to the pretreatment semiannual report). Pretreatment activities conducted from July through December of each year shall be included in the Pretreatment Annual Report as specified in Appendix H-1. The pretreatment semiannual report shall contain, at a minimum the following information:

A. Influent, Effluent and Biosolids Monitoring

The influent, effluent and biosolids monitoring results shall be evaluated in preparation of this report. The Discharger shall retain analytical laboratory reports with the QA/QC data validation and make these reports available upon request. The Discharger shall also make available upon request a description of its influent, effluent and biosolids sampling procedures. Violations of any parameter that exceed NPDES limits shall be identified and reported. The contributing source(s) of the parameters that exceed NPDES limits shall be investigated and discussed.

B. Significant Industrial User Compliance Status

This section shall contain a list of all SIUs that were not in consistent compliance with all pretreatment standards/limits or requirements for the reporting period. For the reported SIUs, the compliance status for the previous semiannual reporting period shall be included. Once the SIU has determined to be out of compliance, the SIU shall be included in subsequent reports until consistent compliance has been achieved. A brief description detailing the actions that the SIU undertook to come back into compliance shall be provided.

For each SIU on the list, the following information shall be provided:

1. Name and facility address of the SIU;

2. Indicate if the SIU is subject to Federal Categorical Standards; if so, specify the category including the subpart that applies;

3. For SIUs subject to Federal Categorical Standards, indicate if the violation is of a categorical or local standard;

4. Indicate the compliance status of the SIU for the two quarters of the reporting period; and

5. For violations/noncompliance identified in the reporting period, provide:

    a. The date(s) of violation(s);

    b. The parameters and corresponding concentrations exceeding the limits and the discharge limits for these parameters; and

c. A brief summary of the noncompliant event(s) and the steps that are being taken to achieve compliance.

C. Discharger's Compliance with Pretreatment Program Requirements

This section shall contain a discussion of the Discharger's compliance status with the Pretreatment Program Requirements as indicated in the latest Pretreatment Compliance Audit (PCA) Report or Pretreatment Compliance Inspection (PCI) Report. It shall contain a summary of the following information:

1. Date of latest PCA or PCI report;

2. Date of the Discharger's response;

3. List of unresolved issues; and

4. Plan(s) and schedule for resolving the remaining issues.

APPENDIX H-3

SIGNATURE REQUIREMENTS FOR PRETREATMENT ANNUAL AND SEMIANNUAL REPORTS

The pretreatment annual and semiannual reports shall be signed by a principal executive officer, ranking elected official, or other duly authorized employee who is responsible for the overall operation of the Discharger [POTW - 40 CFR 403.12(m)]. Signed copies of the reports shall be submitted to the U.S. EPA, the State Water Board, and the Regional Water Board at the following addresses unless the Discharger is instructed by any of these agencies to submit electronic copies of the required reports:

Pretreatment Program Reports
Clean Water Act Compliance Office (WTR-7)
Water Division
Pacific Southwest Region
U.S. Environmental Protection Agency
75 Hawthorne Street
San Francisco, CA 94105-3901

Submit electronic copies only to State and Regional Water Boards:
Pretreatment Program Manager
Regulatory Unit
State Water Resources Control Board
Division of Water Quality-15th Floor
1001 I Street
Sacramento, CA 95814
DMR@waterboards.ca.gov
NPDES_Wastewater@waterboards.ca.gov

Pretreatment Coordinator
NPDES Wastewater Division
SF Bay Regional Water Quality Control Board
1515 Clay Street, Suite 1400
Oakland, CA 94612
(Submit the report as a single Portable Document Format (PDF) file to the Pretreatment Coordinator's folder in the Regional Water Board's File Transfer Protocol (FTP) site. The instructions for using the FTP site can be found at the following internet address:
http://www.waterboards.ca.gov/sanfranciscobay/publications_forms/documents/FTP_Discharger_Guide-12-2010.pdf.)

APPENDIX H-4

REQUIREMENTS FOR INFLUENT, EFFLUENT AND BIOSOLIDS MONITORING

The Discharger shall conduct sampling of its treatment plant's influent, effluent and biosolids at the frequency shown in **the pretreatment requirements table** of the Monitoring and Reporting Program (MRP, Attachment E). When sampling periods coincide, one set of test results, reported separately, may be used for those parameters that are required to be monitored by both the influent and effluent monitoring requirements of the MRP and the Pretreatment Program. The Pretreatment Program monitoring reports as required in Appendices H-1 and H-2 shall be transmitted to the Pretreatment Program Coordinator.

A. Reduction of Monitoring Frequency

The minimum frequency of Pretreatment Program influent, effluent, and biosolids monitoring shall be dependent on the number of SIUs identified in the Discharger's Pretreatment Program as indicated in Table H-1.

Table H-1: Minimum Frequency of Pretreatment Program Monitoring

Number of SIUs	Minimum Frequency
< 5	Once every five years
> 5 and < 50	Once every year
> 50	Twice per year

If the Discharger's required monitoring frequency is greater than the minimum specified in Table H-1, the Discharger may request a reduced monitoring frequency for that constituent(s) as part of its application for permit reissuance if it meets the following criteria:

The monitoring data for the constituent(s) consistently show non-detect (ND) levels for the effluent monitoring and very low (i.e., near ND) levels for influent and biosolids monitoring for a minimum of eight previous years' worth of data.

The Discharger's request shall include tabular summaries of the data and a description of the trends in the industrial, commercial, and residential customers in the Discharger's service area that demonstrate control over the sources of the constituent(s). The Regional Water Board may grant a reduced monitoring frequency in the reissued permit after considering the information provided by the Discharger and any other relevant information.

B. Influent and Effluent Monitoring

The Discharger shall monitor for the parameters using the required sampling and test methods listed in **the pretreatment table** of the MRP. Any test method substitutions must have received prior written Executive Officer approval. Influent and effluent sampling locations shall be the same as those sites specified in the MRP.

The influent and effluent samples should be taken at staggered times to account for treatment plant detention time. Appropriately staggered sampling is considered consistent with the requirement for

collection of effluent samples coincident with influent samples in Section III.A.3.a(2) of Attachment G. All samples must be representative of daily operations. Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto. For effluent monitoring, the reporting limits for the individual parameters shall be at or below the minimum levels (MLs) as stated in the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (2000) [also known as the State Implementation Policy (SIP)]; any revisions to the MLs shall be adhered to. If a parameter does not have a stated ML, then the Discharger shall conduct the analysis using the lowest commercially available and reasonably achievable detection levels.

The following report elements should be used to submit the influent and effluent monitoring results. A similarly structured format may be used but will be subject to Regional Water Board approval. The monitoring reports shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

1. Sampling Procedures, Sample Dechlorination, Sample Compositing, and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto. The Discharger shall make available upon request its sampling procedures including methods of dechlorination, compositing, and data validation.

2. A tabulation of the test results for the detected parameters shall be provided.

3. Discussion of Results – The report shall include a complete discussion of the test results for the detected parameters. If any pollutants are detected in sufficient concentration to upset, interfere or pass through plant operations, the type of pollutant(s) and potential source(s) shall be noted, along with a plan of action to control, eliminate, and/or monitor the pollutant(s). Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

C. Biosolids Monitoring

Biosolids should be sampled in a manner that will be representative of the biosolids generated from the influent and effluent monitoring events except as noted in (3. below. The same parameters required for influent and effluent analysis shall be included in the biosolids analysis. The biosolids analyzed shall be a composite sample of the biosolids for final disposal consisting of:

1. Biosolids lagoons – 20 grab samples collected at representative equidistant intervals (grid pattern) and composited as a single grab, or

2. Dried stockpile – 20 grab samples collected at various representative locations and depths and composited as a single grab, or

3. Dewatered biosolids - daily composite of 4 representative grab samples each day for 5 days taken at equal intervals during the daily operating shift taken from a) the dewatering units or b) each truckload, and shall be combined into a single 5- day composite.

The U.S. EPA manual, POTW Sludge Sampling and Analysis Guidance Document, August 1989, containing detailed sampling protocols specific to biosolids is recommended as a guidance for sampling procedures. The U.S. EPA manual Analytical Methods of the National Sewage Sludge Survey, September 1990, containing detailed analytical protocols specific to biosolids, is recommended as a guidance for analytical methods.

In determining if the biosolids are a hazardous waste, the Discharger shall adhere to Article 2, "Criteria for Identifying the Characteristics of Hazardous Waste," and Article 3, "Characteristics of Hazardous Waste," of Title 22, California Code of Regulations, sections 66261.10 to 66261.24 and all amendments thereto.

The following report elements should be used to submit the biosolids monitoring results. A similarly structured form may be used but will be subject to Regional Water Board approval. The results shall be submitted with the Pretreatment Annual Report identified in Appendix H-1.

- Sampling Procedures and Data Validation (applicable quality assurance/quality control) shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto. The Discharger shall make available upon request its biosolids sampling procedures and data validation methods.

- Test Results – Tabulate the test results for the detected parameters and include the percent solids.

- Discussion of Results – Include a complete discussion of test results for the detected parameters. If the detected pollutant(s) is reasonably deemed to have an adverse effect on biosolids disposal, a plan of action to control, eliminate, and/or monitor the pollutant(s) and the known or potential source(s) shall be included. Any apparent generation and/or destruction of pollutants attributable to chlorination/dechlorination sampling and analysis practices shall be noted.

The Discharger shall also provide a summary table presenting any influent, effluent or biosolids monitoring data for non-priority pollutants that the Discharger believes may be causing or contributing to interference, pass through or adversely impacting biosolids quality.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

ORDER No. R2-2015-0019

WASTE DISCHARGE REQUIREMENTS for:

TOMALES VILLAGE COMMUNITY SERVICES DISTRICT
TOMALES VILLAGE COMMUNITY SERVICES DISTRICT WASTEWATER TREATMENT PLANT
TOMALES, MARIN COUNTY

The California Regional Water Quality Control Board, San Francisco Bay Region (Water Board or Board), finds that:

1. **Discharger.** Tomales Village Community Services District (the Discharger) is a government agency dedicated to operating and maintaining the Tomales Village Community Services District Wastewater Treatment Plant (Facility) that serves approximately 100 residences in Tomales, less than ten commercial businesses and restaurants within the community, and the Shoreline Unified School District located in Tomales. The Discharger is legally responsible for the wastewater system and the discharges of wastewater to land regulated by this Order and for compliance with this Order. The wastewater system is managed and operated by wastewater treatment operators employed by the Discharger.

2. **Purpose of Order.** The purpose of this Order is to update Waste Discharge Requirements (WDRs) to reflect current conditions at the Facility, including, but not limited to, the following:

   a. Updated regulatory requirements;
   b. Facility improvements, including conversion into a three-stage treatment pond system, installation of a fats, oils, and grease interceptor, and upgrade of the discharge system;
   c. Permitted change from seasonal to conditional discharge to the discharge area (by this Order);
   d. Discontinued discharge of wastewater to the school district irrigation ponds; and
   e. Changes to the self-monitoring program since the WDRs were last updated in 1986.

   This Order also rescinds previous Water Board Order No. 86-086.

3. **History of the Order.** The Discharger previously treated and discharged wastewater pursuant to Order No. 86-086, Water Reclamation Requirements for North Marin County Water District - Tomales Sewage Treatment Plant, Town of Tomales, Marin County, adopted on November 19, 1986. The previous owner and operator of the Facility, the North Marin County Water District, transferred ownership of the Facility to the Discharger on April 20, 1999.

4. **Report of Waste Discharge**. The Discharger submitted a renewed Report of Waste Discharge (ROWD) for the Facility, dated September 28, 2001, to apply for reissuance of the WDRs to reflect the operational changes in the Facility's wastewater system. The Facility operated in compliance with the renewed ROWD under California Water Code (CWC) section 13264. This Order addresses the changes described in the 2001 ROWD and subsequent changes and upgrades to the original system. This Order authorizes WDRs for the system that is in place and operating at the time of this Order.

5. **Waste Discharge Requirements**. This Order prescribes WDRs for the current, upgraded Facility and supersedes Order No. 86-086.

Site Description and Location

6. **Discharge Origin and Facility Location**
   a. **Tomales**. The 0.33 square-mile town of Tomales (Tomales), including the Shoreline Unified School District, is situated in the Coast Range of northwest Marin County, approximately three miles northeast

of Tomales Bay. Tomales is located in between Stemple Creek, approximately 1.5 miles to the north, and Keys Creek immediately to the south.

b. Facility Location. The Facility is located northeast of the intersection of State Route 1 and Tomales-Petaluma Road, in northwestern Marin County, within Tomales.

Attachment A of this Order is a plan view drawing depicting the location and boundaries of the Facility.

Wastewater System Design, Construction, and Operation

7. Wastewater Facility Overview. For purposes of this Order, the wastewater system is comprised of all equipment, control, and monitoring systems located on the Facility that provide collection, conveyance, treatment, storage, and discharge of wastewater entering the Facility. For purposes of this Order, the Facility includes both the parcel where the three-stage treatment pond system is located and the storage ponds and spray irrigation field (discharge area) located approximately 3,600 feet south and across Tomales-Petaluma Road.

Attachment B of this Order is a flow diagram illustrating the current wastewater treatment and discharge processes and flows.

8. Wastewater Sources and Flows. Wastewater is generated from the Tomales residences and the Shoreline Unified School District as sanitary wastewater. The design flow capacity of the three-stage treatment pond system, and average dry weather flow rate authorized by this Order, is 43,000 gallons per day (GPD).

9. Collection System. The collection system consists of approximately 2.6 miles of six- and eight-inch-diameter gravity sewer mains. The collection system includes one lift station equipped with two grinder sewage pumps capable of delivering 22 gallons per minute of influent. One pump acts as a standby unit and is used in the event that the primary pump becomes inoperable. The collection system is permitted under the General Order for Sanitary Sewer Systems (see Finding 36).

Attachment C of this Order is a map of the district boundaries and collection system.

10. Comminutor. Collected wastewater influent flows first into the comminutor for screening of larger solids as primary treatment. The comminutor cuts and shreds particles in the influent, reducing the material to a size that will pass through ¼-inch wide slots. On a weekly basis, operators manually remove the larger solids screened out by the comminutor (see Discharge Specification B.11).

11. Fats, Oils, and Grease Interceptor. Wastewater is conveyed downstream for further primary treatment in a 2000-gallon Selvage three-chamber fats, oils, and grease (FOG) interceptor unit, after the comminutor and in line before the three-stage treatment pond system. The FOG interceptor screens and detains solids and FOG before the influent goes to the first pond of the three-pond system. The FOG interceptor is serviced quarterly: a licensed septic waste hauler removes accumulated solids and takes them offsite for disposal (see Discharge Specification B.11).

12. Three-stage Treatment Pond System

a. Facility Upgrade. In spring 2010, the Discharger completed improvements to the treatment facilities, resulting in three lined and mechanically-aerated ponds. The Discharger converted the original sand filter in existence in 2010 into the first treatment pond. The treatment lagoon in existence in 2010 was divided into two additional treatment ponds, plumbed in series with the first pond. All three ponds were lined with a 30-year Hypalon (chlorosulfonated polyethylene synthetic rubber) liner. The combined capacity of the three ponds is approximately 1.3 million gallons, with two feet of freeboard.

b. Pond Order. The first pond receives the primary influent from the FOG interceptor. The first pond is the first stage of the treatment pond system and provides secondary treatment through aeration and settling. The second pond increases the secondary treatment through further aeration and settling. The third pond, though also equipped with an aerator, is usually not aerated: it passively functions as the settling and polishing pond before conveyance of the secondary effluent to the storage ponds.

c. Backup Aeration System. The three ponds of the new three-stage treatment pond system are each equipped with an aerator. The system incorporates a backup aeration system: in the event that an aerator becomes inoperable, the order of the ponds may be reconfigured such that the remaining functioning aerators in the pond can provide optimal mixing characteristics and oxygen to prevent the pond from becoming anaerobic and causing an odor problem. Further, the stage order of all three ponds may be reconfigured according to Attachment D to accommodate for any temporal dysfunctions or non-operation in any part of the system.

Attachment D of this Order is an illustration of the components and specifications and an overview of the permitted configurations of the three-stage treatment pond system.

13. **Lift Station**. The Facility has one lift station, located at the intersection of State Route 1 and Tomales-Petaluma Road. The lift station pumps secondary effluent from the three-stage treatment pond system to the storage ponds. The Facility uses two Gould 5CLC 15 horsepower pumps, which are set to operate on a rotating basis for equal wear and redundancy, and can be used in tandem if necessary.

14. **Storage Ponds**. The Facility pumps treated secondary effluent from the three-stage treatment pond system to the two storage ponds: West Pond and East Pond. The effluent may be directed into either or both ponds at any time. The two ponds are both clay-lined ponds, with a combined maximum storage capacity of 10.1 million gallons. The storage ponds occupy a 10-acre site south of the Tomales-Petaluma Road, south of Keys Creek and the three-stage treatment pond system, and directly north of the discharge area.

15. **Disinfection.** A diffuser located in the discharge pipe mixes liquid sodium hypochlorite into the secondary effluent, conveyed from the storage pond(s), for disinfection before discharge. The secondary effluent and chlorine solution are mixed in the discharge pipe for a contact period of approximately twenty-seven minutes. The disinfected secondary effluent is then pumped onto the discharge area via spray irrigation.

16. **Discharge Area.** Disinfected secondary effluent is discharged to land via spray irrigation onto a 21-acre vegetated gently sloping hillside field, fenced and gated, located downhill of the storage ponds, and about 3,600 feet south of the wastewater treatment ponds. This irrigation field is also known as the discharge area for the Facility. The irrigation field is occasionally grazed by neighboring steers.

17. **Collection Ditch**. A runoff collection ditch surrounding the irrigation field prevents effluent runoff from discharging offsite and also intercepts the rainfall run-on from adjacent fields. A collection sump at the base of the irrigation field will send an alarm to the programmable logic controller to automatically shut off the irrigation pumps if the water level reaches a level predefined by the operators and specified in the Operation and Maintenance Manual.

18. **Discharge System**. The irrigation system has eight zones fitted with seven large nozzle type guns, with one converted to two lines with an array of 35 Rain Bird sprinklers. Each of the eight zones is rated to deliver 80-100 gallons per minute, spreading the effluent over a large area. Each zone can be programmed to run multiple cycles. The entire irrigation system is integrated into the system-wide Supervisory Control and Data Acquisition (SCADA) system with predefined alarm call-out points and remote access for emergency shutdown or reconfiguration of irrigation time and cycles.

19. Discharge Operations

a. **Past Seasonal Operation**. Order No. 86-086 authorized seasonal operation of the Facility's irrigation field. Under that order, reclaimed water could not be applied during the wet weather season (November 15 through April 15, as defined by that order), when the ground was saturated, or during periods when rainfall or runoff from adjacent land could occur. The irrigation system was operated under Order No. 86-086 via an automatic timer during the dry season and discharged approximately 25,000 GPD on average, for the months when discharge occurred, based on 2012-2013 daily and weekly effluent discharge data.

b. **"1998 Winter Irrigation Plan" for Emergency Discharges.** In 1998, Water Board staff approved the Facility's "1998 Winter Irrigation Plan," which allowed for the release of emergency discharges via spray irrigation from the storage ponds to the irrigation field during the wet weather season (November 15 through April 15). These releases have allowed for the maintenance of safe water levels in the storage ponds from 1998 until the time of this Order.

c. **Change from Seasonal to Conditional Discharge**. This Order rescinds the Winter Irrigation Plan (and Order No. 86-086) and authorizes a change in the discharge system operation from seasonal discharge to conditional discharge to preclude uncontrolled runoff and the need for emergency discharge during rainfall periods and to maintain appropriate holding capacity for the storage ponds. The conditional discharge operation allows the Discharger to manage discharges of treated wastewater in accordance with prevailing environmental conditions and notification requirements instead of the former fixed-calendar basis. This Order includes requirements for control of all discharges, including complete treatment, final effluent quality in compliance with the Order, and assessment of soil, weather, and discharge conditions to prevent ponding or runoff. Discharge from the storage ponds to the irrigation field is not authorized if it is determined that ponding or runoff from the site would occur (see Discharge Specification B.3).

20. Recycled Water Feasibility Study. In 2009, the Discharger conducted a Wastewater Treatment Plant Water Reclamation & Reuse Tertiary Treatment Feasibility Study. The study was initiated to assess the feasibility for a proposed Tertiary Treatment and Recycling Project, a joint plan with the Shoreline Unified School District to construct a filtration and disinfection system to produce tertiary treated water for recycling and reuse to supplement the school's water needs and to help replenish the groundwater in the Tomales Bay watershed. The Discharger concluded, based on the results of the study, that the project is infeasible given the project capital outlay.

Surrounding Environment of the Facility

21. a. Facility Characteristics. The Facility is located on property that is primarily characterized by agricultural or rural land use, consisting of chaparral, oak and bay woodland, and coastal scrub vegetation types. The geology of the 0.33 square-mile Tomales area is referred to as the "Franciscan Complex," which is generally described as an overlying 10- to 15 foot-thick layer of unconsolidated materials and soil with colluvium accumulation in the valleys and hillsides. In the proximity of Tomales, an undifferentiated Pliocene Marine geologic formation, known as "Wilson Grove," overlies the Franciscan Complex. The 135 square-mile Wilson Grove Formation Highlands groundwater basin underlies the Facility.

b. Climate and Surroundings. Tomales lies within the Walker Creek watershed, which receives approximately 35 inches of precipitation per year, consistent with the Mediterranean climate of the central coast of California. The watershed receives higher-intensity rain from November through March, comprising 85 percent of the annual rainfall within the watershed. Walker Creek, a tributary to Tomales Bay, is located 1.5 miles from the southwestern boundary of the Facility. Keys Creek, a

tributary to Walker Creek, lies immediately south of the three-stage treatment pond system. See Finding 33 for further information on surrounding waters of the State.

22. Groundwater Quality Characteristics. A statewide groundwater ambient monitoring and assessment program (GAMA) collects data for local and area-wide groundwater quality characterization. Searching in GAMA for the one-mile radius around the Facility returned 41 sampling events conducted at 10 wells from 1999 to 2014. The values for nitrate as nitrate ranged from 0 to 19 mg/L, with a median value of 2.0 mg/L. The drinking water maximum contaminant level for nitrate as nitrate is 45 mg/L. The underlying Wilson Grove Formation Highlands groundwater basin is listed with existing beneficial uses of municipal and domestic water supply as well as agricultural water supply (see Finding 33). The groundwater basin is listed with potential beneficial uses of industrial process water supply and industrial service water supply.

Discharge Characteristics

23. Discharges. The waste discharges to land addressed by this Order consist of domestic and commercial wastewater from the approximately 100 residences of Tomales and the 500-student Shoreline Unified School District located at 10 John Street in Tomales. As described above, secondary effluent is conveyed from the three-stage treatment pond system to the two storage ponds located to the south. The secondary effluent is then disinfected and discharged from the storage ponds as irrigation for the adjacent 21-acre vegetated field. No effluent is discharged via any other system or process, and there is no discharge to surface water.

24. Discharge Quantity. The current average inflow to the Facility is approximately 16,900 GPD, based on 2012-2013 data. The design inflow capacity of the three-stage treatment pond system as provided in the Discharger's Operation and Maintenance Manual and authorized by this Order is 43,000 GPD on an average dry weather flow basis.

This Order authorizes an annual wastewater flow limit of 15,738,000 gallons per year, based on an average dry weather flow value of 43,000 GPD and 366 days. For reference, wastewater flows (influent and effluent, when applicable) from January 2012 through December 2013 are tabulated below:

Month-Yr	Influent Month Total (gallons)	Influent Average Day (gallons)	Influent Peak Day (gallons)	Effluent Month Total (gallons)
Jan-12	534,000	17,200	46,000	0
Feb-12	417,000	14,900	18,000	0
Mar-12	696,000	23,200	61,000	0
Apr-12	649,400	21,600	35,600	0
May-12	474,000	15,300	20,000	784,000
Jun-12	407,000	13,600	17,000	990,000
Jul-12	436,000	14,000	18,000	1,229,000
Aug-12	389,000	13,000	16,000	751,000
Sep-12	426,000	14,200	18,000	508,000
Oct-12	513,000	16,500	19,000	0
Nov-12	611,000	20,400	76,000	0
Dec-12	1,240,400	40,000	87,000	0
Jan-13	621,000	20,000	30,000	0
Feb-13	380,000	13,600	21,000	0

Mar-13	415,000	13,400	21,000	0
Apr-13	459,000	15,300	25,000	262,000
May-13	424,000	13,700	16,000	761,000
Jun-13	414,000	13,800	19,000	753,000
Jul-13	759,000	24,500	28,000	979,000
Aug-13	426,000	13,700	17,000	1,006,000
Sep-13	411,000	13,700	17,000	428,000
Oct-13	432,000	13,900	17,000	561,000
Nov-13	393,000	13,100	15,000	0
Dec-13	428,000	13,800	15,000	0

"0" indicates no effluent discharge to land occurred during the entire month.

25. Discharge Quality for 2012-2013. Results from routine sampling (per the Self-Monitoring Program of Order No. 86-086) of the final effluent discharged into the irrigation field are summarily presented below:

Month-Yr	**pH range**	**Dissolved Oxygen range (mg/L)**	**Chemical Oxygen Demand range (mg/L)**	**Total Coliforms range (MPN/100ml H_2O)**
Order No. 86-086 limits	*≤ 6*	*≥ 1.0*	*≤ 210*	*≤ 240*
May-12	8.1 - 8.9	2.1 - 3.2	120.0 – 170.0	< 2 – 4
Jun-12	7.9 - 8.5	3.0 - 30.0	130.0 – 220.0	< 2
Jul-12	8.2 - 9.1	2.0 - 3.7	170.0 – 250.0	14 – 240
Aug-12	7.9 - 9.0	3.0 - 3.6	190.0 – 270.0	< 2 – 22
Sep-12	6.0 - 9.7	NA	130.0 – 220.0	4 – 170
Apr-13	8.4 - 8.9	2.2 - 2.3	88	< 2
May-13	8.8 - 9.6	2.3 - 4.8	120.0 – 130.0	< 2 – 240
Jun-13	8.7 - 9.2	2.0 - 4.6	120.0 – 130.0	120 – 130
Jul-13	8.4 - 9.5	1.0 - 4.3	3.5 – 130.0	2 – 50
Aug-13	8.5 - 9.5	2.0 - 2.8	170.0 – 290.0	< 2 – 59

Oct-13	9.7 – 9.9	3.5 – 5.8	230.0 – 510.0	< 2 - 26

NA denotes 'not available' because the information is missing in the monthly Self-Monitoring Report.

Exceedances. These sampling results indicate several instances of exceedances. For the sampling period of January 2012 to December 2013, the Discharger commented on and addressed the exceedance, as a component of the monthly Self-Monitoring Report, citing the sampling date and location, specific non-compliance event, probable cause (if determined by the Discharger), and the corresponding corrective action. Since the upgrade to the entire wastewater system in spring 2010, there has been no evidence of repeating patterns of either violations or violations without corrective actions. Water Board staff reviewed the self-monitoring reports, found the corrective actions taken to be acceptable, and determined that no further regulatory actions are necessary.

Monitoring

26. Remote System Monitoring. The Facility includes a remote wastewater monitoring SCADA system. The SCADA system provides continuous monitoring of three site locations: the three-stage treatment pond system, the lift station, and the irrigation field and storage ponds. The SCADA system monitors and controls the pond levels, the starting and stopping of aerators and lift pumps, the timing of the irrigation, and transmits notification of any pre-set alarms to the operators. SCADA alarms include, but are not limited to, high/low pond levels for each pond, pump fail, aerator fail, lift station high/low level, power fail, low pressure force main and discharge pipes, irrigation station fail, and others. The SCADA dialer will continue phoning the alarm through a series of priority numbers until the alarm is acknowledged. The alarms are called out to the operators that are on-call full time, 24-hours per day, via voice modem, and alarms are addressed immediately by the operators from their remote location. If the situation cannot be addressed immediately, the operators are dispatched immediately to the site.

27. Wastewater Monitoring. Wastewater flows are currently monitored for total daily flow into the stage one treatment pond and daily effluent discharge (when applicable) from the storage ponds into the irrigation field. This Order contains a Self-Monitoring Program (see Attachment E) that requires wastewater quantity and quality monitoring at defined points throughout the wastewater system in order to ensure proper operation and performance of the system and to document compliance with these requirements.

Operation and Maintenance

28. Operation and Maintenance. At the time of this Order, the wastewater system is managed by operators employed by the Discharger. This Order requires the wastewater system to be operated and maintained by certified wastewater treatment plant operators that are experienced in and knowledgeable of the wastewater system design and proper operation. The certified wastewater treatment plant operator may be an employee of the Discharger or a contract employee.

29. Operation and Maintenance Program. An Operation and Maintenance (O&M) Program is needed in order to ensure that all aspects of the wastewater system are properly operated and maintained. The O&M Program must include descriptions of all wastewater system components and equipment, accurately dimensioned site plans identifying the locations of all components and relevant site features (e.g., buildings, wells, drainage ways, roads, etc.), recommended strategies and procedures for system operations in accordance with system designs and discharge requirements, procedures and criteria for process control monitoring, maintenance activities necessary to ensure continuous proper operation of the wastewater system, and identification of persons responsible for operation and maintenance of the wastewater system and how these persons can be contacted. This Order requires development and implementation of an O&M Program acceptable to the Executive Officer and preparation and submittal of an O&M Manual that fully describes the O&M Program for the current system.

Applicable Plans, Policies, and Other Authorities

30. California Water Code. This Order serves as WDRs pursuant to CWC Division 7, Chapter 4, Article 4 (commencing with section 13260).

31. Basin Plan. The Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) is the Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State, including surface waters and groundwater. It also includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Water Board and approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law and the U.S. EPA, where required.

32. Basin Plan Implementation. The Basin Plan contains water quality objectives and beneficial uses for waters of the State within the San Francisco Bay Region and an Implementation Plan. This Order includes prohibitions and discharge requirements to protect existing and potential beneficial uses of waters of the State, in the surrounding area of the Facility and its operations, as well as to protect public health and the environment.

33. Beneficial Uses of Waters of the State. The Discharger discharges the final effluent onto land, not into surface water(s). The final effluent is discharged onto the irrigation field via spray irrigation. The irrigation field is located over the Wilson Grove Formation Highlands groundwater basin. The existing and potential beneficial uses of Wilson Grove Formation Highlands groundwaters, underlying the area of Tomales, as set forth in the Basin Plan include the following:

a. Municipal and domestic water supply,
b. Industrial process water supply,
c. Industrial service water supply, and
d. Agricultural water supply.

At the time of this Order, there are no known domestic water supply wells less than or equal to 100 feet from any point of the discharge area.

34. Shellfish Protection Act. In Water Board Resolution No. 94-018, as a result of the 1993 Shellfish Protection Act, the Board identified Tomales Bay as an area where commercial shellfish growing areas are threatened. This Order is consistent with upholding the Shellfish Protection Act in authorizing WDRs for a facility that is configured for zero discharge to surface waters and to protect water quality for the preservation of shellfish and shellfish habitats.

35. a. Tomales Bay TMDL. Tomales Bay and its tributaries have been identified as impaired and have been placed on the federal Clean Water Act 303(d) list of impaired waters for nutrients, sediment, mercury, and pathogens. The Water Board is required to establish a Total Maximum Daily Load (TMDL) for these pollutants. The U.S. EPA approved the TMDL for pathogens in the Tomales Bay watershed on February 8, 2007. The basis for the pathogen listing includes exceedances of the numeric water quality objectives for fecal and total coliforms for the shellfish and recreational beneficial uses. Tomales Bay supports the third largest shellfish harvesting area in the State. The waste material at this Facility could potentially be a source of nutrients and pathogens to the watershed if an unintended release occurred (e.g., as a result of flooding or a mechanical failure). The Discharger is aware of the TMDL, and the Facility is configured to have zero discharge to surface waters. This Order prohibits discharges of treated wastewater to surface waters to prevent any additional impacts to Tomales Bay.

b. Facility Upgrade Addresses Historical Concern for Surface Water Quality Impacts. The Facility is configured for zero discharge to surface waters. In 2007, in response to concerns about the adjacent Keys Creek, the Discharger contracted an engineer to conduct seepage tests on the treatment lagoon area (converted to two treatment ponds in 2010) to evaluate the present and future effects of the natural migration of Keys Creek. The results of the third-party observation-based assessment indicated no significant level of seepage impact from the natural migration of Keys Creek to the treatment pond system for another 80-100 years if nothing changes. Additionally, in spring 2010, the Facility implemented improvements to the Facility that included conversion to the three-stage treatment pond system and lining all three treatment ponds with a manufactured, impermeable 30-year Hypalon liner. Improvements also included installing a sub-drain below each treatment pond, with plumbing to direct any pond or external water collection into the third pond of the three-stage treatment pond system. The added liner and sub-drain prevent the natural erosion of Keys Creek from impacting the stability of the treatment pond system. These improvements also preclude any unintended discharges from the treatment pond system area into the surface waters of the State.

36. General Order for Sanitary Sewer Systems. Order No. 2006-0003-DWQ, "Statewide General Waste Discharge Requirements for Sanitary Sewer Systems" (General Order), applies to all public agencies that own or operate sanitary sewer systems greater than one mile in length. This finding serves to acknowledge that the Discharger's collection system is enrolled and regulated under the General Order.

Antidegradation Policy Analysis

37. Antidegradation Policy. State Water Board Resolution No. 68-16 (the Antidegradation Policy) requires that the Regional Water Board, in regulating the discharge of waste, maintain the high quality of waters of the State until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial uses, and will not result in water quality less than that described in the Regional Water Board's policies (e.g., quality that exceeds water quality objectives). Resolution No. 68-16 also requires that any activity which produces wastes and discharges waste to existing high quality water(s) be required to meet WDRs that will result in the best practicable treatment or control of the discharge necessary to ensure that pollution or nuisance will not occur and the highest water quality consistent with maximum benefit to the people of the State will be maintained. Resolution No. 68-16 prohibits degradation of water quality as it existed in 1968, or at any time thereafter that water quality was better than in 1968, other than degradation that was previously authorized. An antidegradation analysis is required for regulatory actions that result in a significant increase in pollutant loadings.

38. Antidegradation Analysis. Board staff completed an analysis of the potential for the Facility to degrade surface water and groundwater. The analysis is summarized here and presented in full in a separate technical memorandum that is available at the Board's website. Board staff concluded that the authorized discharge to land will not unreasonably affect present and anticipated beneficial uses of the groundwater or nearby surface waters and will not result in water quality less than that prescribed in the Antidegradation Policy.

The analysis considered permitted treatment plant wastewater flows of 43,000 GPD, soil characteristics, groundwater and effluent water quality data, groundwater level data, and pollutant loading rates. The analysis determined that the effluent may produce localized, minor effects that can be assimilated in the subsurface soils of the discharge area and that the discharges conducted in compliance with this Order will adequately protect water quality and the beneficial uses of the receiving waters.

a. Protection of Surface Waters. This Order prohibits discharges either directly or via subsurface migration to surface waters, so existing and potential beneficial uses of nearby surface waters will not be affected. The Facility's three-stage treatment pond system is fitted with a manufactured, impermeable 30-year Hypalon (chlorosulfonated polyethylene synthetic rubber) lining for all three treatment ponds and a sub-drain system. The sub-drain is plumbed to direct any pond or external water collection into the third pond of the three-stage treatment pond system. The final disinfected effluent is discharged to land via spray irrigation at the irrigation field. Based on the Facility's configuration to prevent any direct discharges to surface waters, there is no reason to believe that existing water quality of nearby surface waters will be reduced due to the implementation of this Order. Therefore, no antidegradation analysis is required for surface waters.

b. Protection of Groundwaters. The only permitted effluent discharge is to land via spray irrigation. The wastewater system treats domestic and commercial flows. There are no industrial sources discharging to the collection system. Treated effluent is discharged to the spray irrigation field where it either infiltrates into the ground, evaporates, or is taken up by plants. The subsurface soils in the discharge area have the assimilative capacity to sufficiently attenuate the wastewater constituents as the effluent travels through the soils, prior to reaching groundwater. Further, the irrigation field is surrounded by a perimeter ditch to prevent any offsite discharges, should runoff occur. The ditch is also equipped with a collection sump with a water level alarm, which will shut down all facility discharge operations if the water reaches a specified level of concern. The prior reported monthly monitoring data for the Facility

demonstrate that the Facility supports existing and potential beneficial uses of the waters of the State adjacent to and underlying the Facility site. This antidegradation analysis, as it relates to the protection of groundwaters, also illustrates that surface waters will be protected, in the event of any indirect subsurface discharges from groundwaters into surface waters. Due to the nature of the discharge (to land via irrigation) and the measures established for pollution prevention, the operations of this Facility under this Order are not expected to reduce existing high quality waters.

Safe Drinking Water Act

39. It is the policy of the State of California that every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. This Order upholds that policy by requiring limits on discharges that will ensure groundwater does not exceed maximum contaminant levels designed to protect human health and that water is safe for domestic use.

California Environmental Quality Act (CEQA)

40. CEQA. The issuance of WDRs for the subject discharges is exempt from the provisions of CEQA pursuant to Title 14, Division 6, Chapter 3, Section 15301 (existing facilities) and Section 15302 (replacement or reconstruction) of the California Code of Regulations.

Notification and Public Meeting

41. Public Notice. The Board has notified the Discharger and interested persons of its intent to prescribe WDRs for the subject wastewater system and discharges and has provided them with an opportunity for a public hearing and to submit written views and recommendations.

42. Public Hearing. The Board, in a properly noticed public hearing, heard and considered all comments pertaining to these WDRs.

IT IS HEREBY ORDERED, that the Discharger, pursuant to the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, shall comply with the following:

A. PROHIBITIONS

1. The treatment, storage, or discharge of wastes shall not create a nuisance or pollution as defined in CWC section 13050.

2. Discharges of waste into or from the wastewater system other than as described in and authorized by this Order are prohibited.

3. There shall be no direct or indirect discharge to surface waters.

4. There shall be no discharge of waste that has not undergone the full treatment process, according to the flow schematic in Attachment B and the permitted treatment pond configurations as described in Attachment D, to groundwaters of the State from the Discharger's Facility.

5. The discharge of waste shall not degrade the quality of any groundwater used for domestic purposes or cause an increase or decrease in any quality parameter that would make groundwater unsuitable for any listed existing or potential beneficial use(s).

6. Wastewater shall not be allowed to flow from the discharge area via surface flow, airborne spray, or surfacing after percolation.

7. Discharge of treated wastewater to any land other than the designated discharge area is prohibited.

8. Migration of pollutants through subsurface transport from the discharge area(s) to waters of the State is prohibited.

9. Discharges of wastewater to the wastewater system in excess of the system operating hydraulic capacity or organic loading treatment capacity are prohibited.

B. DISCHARGE SPECIFICATIONS

1. Source Wastewaters. The only wastewater authorized by this Order to be discharged into the wastewater system consists of wastewater from commercial and residential domestic use in the Tomales area and the Shoreline Unified School District. The Discharger must apply for amended WDRs before accepting any other kind of wastewater.

2. Treatment and Storage Ponds

a. Freeboard. A minimum freeboard of two feet shall be maintained in the ponds at all times.

b. 100-Year Flood. The ponds shall be adequately protected from erosion, washout, and flooding from the maximum flood having a predicted frequency of once in 100 years.

c. Treatment Pond Lining. The treatment ponds shall be lined with a geotextile fabric or other materials with a permeability of no more than 10^{-6} cm/sec.

d. Treatment Pond Aerators. Each of the three aerated ponds (within the three-stage treatment pond system) shall be equipped with one or more aerators in order to provide sufficient aeration capacity to achieve biological stabilization of the wastewater discharged to the ponds, and to prevent the creation of anaerobic or nuisance conditions.

e. Treatment and Storage Ponds. Wastewater at any place about two feet from the water's edge of a treatment or storage pond shall not exceed the following limits in any grab sample:

	Measured parameter	Quality specification
1)	Dissolved Oxygen	2.0 mg/L, minimum
2)	Dissolved Sulfides*	0.1 mg/L, maximum
3)	pH	6.5 minimum

*Dissolved sulfides sampling is required only when dissolved oxygen concentration is below 2 mg/L.

3. Spray Discharge

a. Notification for "Off-season" Discharges. The Discharger shall provide e-mail notification to the Water Board and the California Department of Public Health prior to discharges outside the window of time between April 15 and November 30. These discharges are known as "off-season" discharges.

b. Operating Conditions. Discharges of wastewater to the designated discharge area shall not occur under any of the following conditions:

1) Rainfall within 72 hours before spray discharge,
2) Rainfall forecast within 72 hours of spray discharge,
3) Presence of ponded standing water,

4) Saturated soils, or
5) Increased potential of ponding or runoff.

c. Sprinklers. All sprinklers used in spray discharge shall be of the low trajectory type in order to minimize the potential for transmission of airborne spray beyond the perimeter of the spray field.

4. Authorized Wastewater Flows

a. **Wastewater System**. Collection of wastewater from the Tomales area into the Facility shall not exceed an average dry weather flow of 43,000 gallons per day or a peak wet weather flow of 240,000 gallons per day.

5. Final Effluent Quality. Treated wastewater used for irrigation of the pasture shall meet the following quality limits at all times, in any grab sample:

	Measured Parameter	Quality Specifications
a.	pH	6.5 minimum
b.	Biochemical oxygen demand	65 mg/L, maximum
c.	Biochemical oxygen demand	45 mg/L, monthly average
d.	Total coliform	240 MPN*/100 ml, maximum median from last 5 samples (* MPN means most probable number)

6. Discharge Discontinuation. Discharges of effluent to the discharge area are prohibited during any period when the limits specified in B.5 (Final effluent quality) above are not being met. The discharges shall not resume until all conditions which caused the specified limits to be violated have been corrected.

7. Wastewater System Operation and Maintenance

a. The Discharger shall, at all times, properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with conditions of this Order. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls including appropriate quality assurance procedures. This discharge specification requires the operation of backup or auxiliary facilities or similar systems only when necessary to achieve compliance with the conditions of this Order.

b. The wastewater system shall be operated and maintained in accordance with the procedures identified in the Operations and Maintenance (O&M) Manual required by this Order (Provision C.11.b).

8. Pump Stations

a. All pump stations shall be designed, constructed, operated, and maintained to prevent the occurrence of a sewage spill or spills resulting from mechanical breakdown or power failure.

b. All pump stations shall be equipped with reserve hydraulic capacity sufficient to provide storage of wastewater during a pump failure condition for at least 24 hours, and water level monitoring and alarm system(s) to provide notification of high water level conditions. The alarm system shall include audible and visual alarms sufficient to notify operating personnel of an alarm condition. If operating personnel are not present at the Facility, the alarm system shall include an automated telephone dialer or other telecommunication system capable of notifying on-call operating personnel of the alarm condition.

c. The power supply for alarm systems shall be sustained in the case of a loss of power, in order to ensure notification to the operators.

9. Pipe Separations

a. There shall be no cross-connection between potable domestic water supply pipes and pipes containing treated wastewater.

b. There shall be at least a 10-foot horizontal and a one-foot vertical separation between all pipes transporting wastewater and pipes transporting potable domestic water, with the potable domestic water pipes above the wastewater pipes.

10. Discharge Area Separation from Wells. The discharge area shall be designed, constructed, and maintained such that a horizontal separation distance of at least 100 feet is maintained between any future domestic water supply wells and the nearest point of the discharge area.

11. Wastewater Solids. All solid materials removed from any stage of the liquid waste stream of the wastewater system shall be disposed of at a legal point of disposal, and in accordance with the provisions of Title 27 of the California Code of Regulations. This includes solids accumulated in septic tanks, grease traps or pump tanks. For the purpose of this requirement, a legal point of disposal is defined as a facility for which WDRs have been prescribed or waived by a Regional Water Board and which facility is in full compliance therewith. This Order does not authorize disposal of wastewater solids anywhere on the Facility.

C. PROVISIONS

1. Order Compliance. The Discharger shall comply immediately with all Prohibitions, Specifications, and Provisions of this Order. In the event that the Discharger is unable to comply immediately, the Discharger has 30 days from the time of the adoption of this Order to submit a required time schedule demonstrating that compliance will be reached within 6 months of the adoption of this Order. All required submittals must be acceptable to the Executive Officer. The Discharger must also comply with all conditions of these WDRs. Violations may result in enforcement actions, including Water Board orders or court orders requiring corrective action or imposing civil monetary liability, or in modification or revocation of these WDRs by the Water Board (CWC sections 13261, 13263, 13265, 13268, 13300, 13301, 13304, 13340, and 13350).

2. Self-Monitoring Program. The Discharger shall comply with the Self-Monitoring Program (Attachment E) for this Order as adopted by the Board and as may be amended by the Executive Officer.

3. Order Availability. A copy of these WDRs shall be maintained by the Discharger and shall be made available by the Discharger to all employees or contractors performing work (maintenance, monitoring, repair, construction, etc.) at the Facility.

4. Vested Rights. This Order does not convey any property rights of any sort or any exclusive privileges. The requirements prescribed herein do not authorize the commission of any act causing injury to persons or property, do not protect the Discharger from liability under federal, State, or local laws, nor do they create a vested right for the Discharger to continue the waste discharge.

5. Severability. Provisions of these WDRs are severable. If any provisions of these requirements are found invalid, the remaining requirements shall not be affected.

6. Requirements for Technical Reports. All technical and monitoring reports required by this Order are required pursuant to CWC section 13267. Failure to submit reports in accordance with schedules

established by this Order or failure to submit a report of sufficient technical quality acceptable to the Executive Officer may subject the Discharger to enforcement actions pursuant to CWC section 13268.

7. **Electronic Reporting Format.** In addition to print submittals, all reports submitted pursuant to this Order shall be submitted as electronic files in PDF format. All electronic files shall be submitted via the Water Board's file transfer protocol (FTP) site or the centralized email address: WDR.monitoring@waterboards.ca.gov. Email notification shall be provided to Water Board staff whenever a file is uploaded to the Water Board's FTP site.

8. **As-Built Plans - Current System**
   a. **As-Built Plans.** The Discharger shall submit to the Board a technical report, acceptable to the Executive Officer, no later than 90 calendar days from the date of adoption of this Order, comprised of as-built plan drawings, and narrative descriptions as appropriate, of the completed- to-date wastewater treatment and discharge system.

   b. **Tank Specifications.** For all tanks, the as-built plans shall include complete tank specifications (e.g., location, material, total and operating capacities, dimensions, date of installation, number of compartments, access openings, risers and riser lids), and results of watertight verification tests. All plan drawings shall be of a scale of at least one inch equals 40 feet, properly labeled, and clearly legible.

9. **Future Changes**
   a. **As-Built Plans.** In the event of any changes to wastewater system components in the future, updated as-built plans of the portion of the system affected by such changes shall be submitted to the Board within 90 days of completion of those changes. Depending upon the types and extent of changes, an amendment to this Order may be necessary.

   b. **Water Balance Documentation**. If there are plans to increase the operations to 80% of the Facility capacity or more, the Discharger shall submit a Water Balance Documentation for the discharge system including the two storage ponds and the discharge area. The water balance documentation shall demonstrate adequate capacity for the wastewater treatment and discharge system to treat and discharge according to seasonal weather patterns in the vicinity of the Facility and the authorized wastewater inflow volume discharge specifications in this Order.

10. **Operation and Maintenance Providers**
   a. The wastewater system shall be operated and maintained by persons that are experienced in and knowledgeable of proper wastewater treatment and discharge practices. Such persons shall be wastewater treatment plant operators possessing a current and valid certification from the State of California.

   b. If the Discharger does not have this expertise within its own staff, the Discharger may fulfill this requirement by contracting with a State Water Board-certified wastewater treatment plant contract operator for operation and maintenance of the wastewater system.

   c. The Discharger shall submit to the Board, within ten days of adoption of this Order, copies of signed service contracts with operators for operation and maintenance of the wastewater system.

   d. In the event of any changes in contracted service providers, the Discharger shall notify the Board in writing of such changes prior to the effective date of such changes, and submit copies of the new or revised contracts within ten working days from the effective date of those changes.

11. Operation and Maintenance Program. The Discharger shall develop and implement an Operations and Maintenance (O&M) Program for the wastewater system, in accordance with the following:

a. **O&M Program.** The O&M Program shall include all procedures necessary to properly operate the wastewater system in accordance with design parameters, to achieve compliance with WDRs, and to maintain the system in good working condition.

b. **O&M Manual**. The O&M Program shall include an O&M Manual documenting all aspects of the program and it shall be readily accessible at all times for the system operators. The O&M Manual shall include, but not be limited to, the following:

1) Description of the overall wastewater system;
2) Scaled plan drawings of the wastewater system, including pipes, valves and control equipment;
3) Description of the wastewater flow through the system, from sources to final discharge;
4) Descriptions and specifications of all system components and equipment;
5) Routine procedures for operation of the wastewater system;
6) Routine procedures for management and disposal of wastewater solids removed from the wastewater streams;
7) Procedures for maintenance of all system components;
8) Procedures for operation of the wastewater system during emergency conditions such as power outage, major equipment failure, extreme wet weather conditions, or other emergencies; and
9) Copies of all applicable regulatory permits for the wastewater system, or specific references of those permits and identification of a location at the Facility where those permits are available for review and reference by operating personnel, other service providers, or regulatory agency staff.

c. **O&M Manual Submittal.** The Discharger shall submit to the Board a technical report, acceptable to the Executive Officer, no later than 90 calendar days from the date of adoption of this Order, comprised of a complete copy of the O&M Manual, identification of person(s) responsible for implementation of the O&M Program, and contact information for those persons.

d. **O&M Manual Review and Updates.** The Discharger shall periodically review and update, as necessary, the O&M Manual in order to ensure that the manual remains current and applicable to the wastewater system and its proper operation.

e. **O&M Manual Annual Reports.** Annually, the Discharger shall submit a report to the Board containing any revisions or updates of the O&M Manual that have been made, or a letter stating that the O&M Manual remains adequate and no revisions are necessary. This report shall be submitted as part of the Annual Monitoring Report.

12. Non-Compliance Reporting. In the event the Discharger is unable to comply with any of the conditions of this Order, the Discharger shall notify the Board by telephone as soon as the Discharger or the Discharger's agents have knowledge of the incident. Written confirmation of this notification shall be submitted within five working days of the telephone notification. The written notification shall include the following information:

a. A description of the noncompliance and its cause;
b. The period of noncompliance;
c. Actions that were taken in response to the incident; and
d. The steps taken or planned to prevent recurrence of the noncompliance.

13. Endangerment of Human Health or the Environment. The Discharger shall report any noncompliance that may endanger human health or the environment. Any such information shall be provided orally to the

Executive Officer, or an authorized representative, and the California Department of Public Health (CDPH), Environmental Management Branch, Preharvest Shellfish Unit, within 24 hours from the time the Discharger becomes aware of the circumstances. In addition, the Discharger shall notify the property owners of the adjacent residential properties and commercial facilities by telephone as soon as the Discharger or Discharger's agents have knowledge of the incident. A written submission to the Water Board and CDPH shall be provided within five days of the time the Discharger becomes aware of the circumstances. The written submission shall contain the following:

a. A description of the noncompliance and its cause;
b. The period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected;
c. Actions that were taken in response to the incident;
d. The anticipated time it is expected to continue; and
e. The steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance.

The Executive Officer, or an authorized representative, may waive the written report on a case-by-case basis if the oral report has been received within 24 hours.

14. Entry, Access, and Inspection. The Discharger shall permit the Board or its authorized representatives, in accordance with CWC section 13267(c):

a. Entry upon premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order;
b. Access to and copy of, at reasonable times, any records required by conditions of this Order;
c. Inspection, at reasonable times, of any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; or
d. Photography, sampling, or monitoring, at reasonable times, for the purpose of assuring compliance with this Order.

15. Warning Signs. The Discharger shall clearly identify the wastewater discharge area, and other wastewater system components as necessary, with warning signs to inform the public that wastewater is present, and that this water is unfit for human consumption.

Notification for Modifications to the Order

16. Change in Control or Ownership. In the event of any change in control or ownership of land or wastewater systems presently owned or controlled by the Discharger, the Discharger shall notify the succeeding owner or operator of the existence of this Order by letter, a copy of which shall be forwarded to this Board. The succeeding owner or operator, in order to obtain authorization for discharges regulated by this Order, must apply in writing to the Water Board, requesting transfer of the Order. This request shall include complete identification of the new owner or operator, the reasons for the change, and the effective date of the change. Discharges conducted without submittal of this request will be considered discharges without WDRs and thus violations of the CWC.

17. Report of Waste Discharge for Change in Discharge Characteristics, Facility. The Discharger shall file with the Board a ROWD at least 180 days before making any material change in the character, location, or volume of the discharges or discharge facilities, or any changes to the wastewater system equipment as described in this Order, except for emergency conditions. In the event of implementing changes in response to emergency conditions, the Board shall be notified immediately by telephone, and in writing within five calendar days of such changes.

18. Order Review and Update. The Board will review this Order periodically and may revise the requirements as necessary to comply with changing State and federal laws, regulations, policies, or guidelines; changes in this Board's Basin Plan; or changes in the discharge characteristics.

19. Order Termination. After notice and public meeting, this Order may be terminated or modified by the Board for any reason.

20. Rescission of Previous Order. The WDRs prescribed by this Order supersede those prescribed by Order No. 86-086 for North Marin County Water District. Order No. 86-086 is hereby rescinded, except for enforcement purposes.

I, Bruce H. Wolfe, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region on May 13, 2015.

CALIFORNIA Water Boards

EDMUND G. BROWN JR. GOVERNOR

MATTHEW RODRIQUEZ SECRETARY FOR ENVIRONMENTAL PROTECTION

San Francisco Bay Regional Water Quality Control Board

ORDER No. R2-2016-0045
NPDES No. CA0030228

The following discharger is subject to waste discharge requirements (WDRs) set forth in this Order:

Table 1. Discharger Information

Discharger	Schnitzer Steel Industries, Inc.
Facility Name	Schnitzer Steel Products Company
Facility Address	1101 Embarcadero West Oakland, CA, 94607 Alameda County
CIWQS Place Number	255924

Table 2. Discharge Locations

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
001	Treated process water, cooling water, dust suppression water, wash water, and stormwater	37.7962°	-122.2887°	Oakland Inner Harbor

Table 3. Administrative Information

This Order was adopted on:	November 9, 2016
This Order shall become effective on:	January 1, 2017
This Order shall expire on:	December 31, 2021
The Discharger shall file a Report of Waste Discharge as an application for reissuance of WDRs in accordance with California Code of Regulations, title 23, and an application for reissuance of a National Pollutant Discharge Elimination System (NPDES) permit no later than:	April 5, 2021
The U.S. Environmental Protection Agency (U.S. EPA) and the California Regional Water Quality Control Board, San Francisco Bay Region, have classified this discharge as follows:	Minor

I, Bruce H. Wolfe, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of the Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on the date indicated above.

I. FACILITY INFORMATION

Information describing the Schnitzer Steel Industries, Inc.'s (Discharger's) Schnitzer Steel Products Company (Facility) is summarized in Table 1 and Fact Sheet (Attachment F) sections I and II.

II. FINDINGS

The California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board), finds the following:

A. Legal Authorities. This Order serves as WDRs pursuant to California Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to federal Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as an NPDES permit for point source discharges from the Facility to surface waters.

B. Background and Rationale for Requirements. The Regional Water Board developed the requirements in this Order based on information the Discharger submitted as part of its application and other available information. The Fact Sheet contains background information and rationale for the requirements in this Order and is hereby incorporated into and constitutes findings for this Order. Attachments A through E and G are also incorporated into this Order.

C. Provisions and Requirements Implementing State Law. No provisions and requirements in this Order are included to implement State law only.

D. Notification of Interested Parties. The Regional Water Board notified the Discharger and interested agencies and persons of its intent to prescribe these WDRs and provided an opportunity to submit written comments and recommendations. The Fact Sheet provides details regarding the notification.

E. Consideration of Public Comment. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. The Fact Sheet provides details regarding the public hearing.

THEREFORE, IT IS HEREBY ORDERED that in order to meet the provisions of California Water Code division 7 (commencing with § 13000) and regulations adopted thereunder, and the provisions of the CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order. As of the effective date of this Order, this Order rescinds the Discharger's coverage under State Water Resources Control Board (State Water Board) Order No. 2014-0057-DWQ (*Waste Discharge Requirements for Discharges of Storm Water Associated with Industrial Activities Excluding Construction Activities*, NPDES Permit No. CAS000001), except for enforcement purposes. The requirements of this Order shall supersede the requirements prescribed in that general permit as it applies to this Discharger as of the effective date of this Order. This Order does not affect any other order applicable to the Discharger or Facility, including but not limited to Cleanup and Abatement Order No. R2-2013-1001.

III. DISCHARGE PROHIBITIONS

A. Discharge of treated wastewater at a location or in a manner different from that described in Fact Sheet sections I, II.A, and II.B, Attachments B and C, and elsewhere in this Order is prohibited.

B. Discharge at Discharge Point No. 001 is prohibited whenever the Discharger is allowed to discharge wastewater to the East Bay Municipal Utility District (EBMUD) wastewater treatment plant via the sanitary sewer.

C. Discharge greater than 600 gallons per minute (gpm) is prohibited at Discharge Point No. 001.

D. Bypass of untreated or partially-treated effluent to waters of the United States is prohibited, except as provided for in Attachment D section I.G of this Order.

E. Discharge of untreated stormwater, process wastewater, or waste materials (e.g., dust suppression water, wash water, spilled product, fugitive dust, dirt, rubbish, refuse, or debris), except as authorized by this Order, directly or indirectly to waters of the United States is prohibited. Incidental dust suppression water droplets, incidental spilled product from ship loading activity, fugitive dust or dirt, or wind-blown debris may be discharged provided that the Discharger fully complies with Provisions VI.C.6.d and VI.C.8 of the Order.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. The Discharger shall comply with the following effluent limitations at Discharge Point No. 001, with compliance measured at Monitoring Location EFF-001 as described in the Monitoring and Reporting Program (MRP) (Attachment E):

Table 4. Effluent Limitations

Parameter	Units	Effluent Limitations			
		Average Monthly [2]	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Total Suspended Solids (TSS)	mg/L	30	45	---	---
pH	standard units	---	---	6.5	8.5
Oil and Grease	mg/L	10	20	---	---
Copper	µg/L	6.2	12	---	---
Acute Toxicity [1]	percent survival	---	---	70	---

Unit Abbreviations:

mg/L = milligrams per liter
µg/L = micrograms per liter

Footnotes:

[1] Acute toxicity tests shall measure the survival of test organisms in 96-hour bioassays of undiluted effluent. Bioassay shall be performed using the most up-to-date U.S. EPA protocols and species as specified in the MRP. A bioassay test showing survival of less than 70% shall represent a violation of this effluent limit.

[2] Compliance with average monthly effluent limitations shall be based on at least two monitoring results collected within the same calendar month. If a second sample cannot be collected within a calendar month because no additional discharge event occurs within the month, then the single sample shall only be used to evaluate compliance with the maximum daily effluent limit.

B. In accordance with Provision VI.C.6, the Discharger shall implement Best Management Practices (BMPs) to the extent practicable as part of a Water Pollution Prevention Plan (WPPP) to control its discharges as necessary to meet applicable water quality standards. BMPs shall

reflect best available technology economically achievable (BAT) and best conventional pollutant control technology (BCT) to reduce or prevent discharges of pollutants in a manner that reflects best industry practice considering technological availability and economic practicability and achievability. Likewise, Provision VI.C.4 sets forth additional controls necessary to implement BAT and BCT.

V. RECEIVING WATER LIMITATIONS

A. The discharge shall not cause the following conditions to exist in receiving waters at any place:

1. Floating material, including solids, liquids, foams, and scum, in concentrations that cause nuisance or adversely affect beneficial uses;

2. Alteration of suspended sediment in such a manner as to cause nuisance or adversely affect beneficial uses, or detrimental increase in the concentrations of toxic pollutants in sediments or aquatic life;

3. Suspended material in concentrations that cause nuisance or adversely affect beneficial uses;

4. Bottom deposits or aquatic growths to the extent that such deposits or growths cause nuisance or adversely affect beneficial uses;

5. Alteration of temperature beyond present natural background levels;

6. Changes in turbidity that cause nuisance or adversely affect beneficial uses, or increases from normal background light penetration or turbidity greater than 10 percent in areas where natural turbidity is greater than 50 nephelometric turbidity units;

7. Coloration that causes nuisance or adversely affects beneficial uses;

8. Visible, floating, suspended, or deposited oil or other products of petroleum origin; or

9. Toxic or other deleterious substances in concentrations or quantities that cause deleterious effects on wildlife, waterfowl, or other aquatic biota, or render any of these unfit for human consumption, either at levels created in the receiving waters or as a result of biological concentration.

B. The discharge shall not cause the following limits to be exceeded in receiving waters at any place within one foot of the water surface:

1. Dissolved Oxygen — 5.0 mg/L, minimum

The median dissolved oxygen concentration for any three consecutive months shall not be less than 80% of the dissolved oxygen content at saturation. When natural factors cause concentrations less than that specified above, the discharge shall not cause further reduction in ambient dissolved oxygen concentrations.

2. Dissolved Sulfide — Natural background levels

3.	pH	The pH shall not be depressed below 6.5 or raised above 8.5. The discharge shall not cause changes greater than 0.5 pH units in normal ambient pH levels.
4.	Nutrients	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.

C. The discharge shall not cause a violation of any water quality standard for receiving waters adopted by the Regional Water Board or the State Water Board as required by the CWA and regulations adopted thereunder. If more stringent water quality standards are promulgated or approved pursuant to CWA section 303, or amendments thereto, the Regional Water Board may revise or modify this Order in accordance with the more stringent standards.

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all "Standard Provisions" in Attachment D.

2. The Discharger shall comply with all applicable provisions of the "Regional Standard Provisions, and Monitoring and Reporting Requirements for NPDES Wastewater Discharge Permits" in Attachment G.

B. Monitoring and Reporting

The Discharger shall comply with the MRP (Attachment E), and future revisions thereto, and applicable sampling and reporting requirements in Attachments D and G.

C. Special Provisions

1. Reopener Provisions

The Regional Water Board may modify or reopen this Order prior to its expiration date in any of the following circumstances as allowed by law:

a. If present or future investigations demonstrate that the discharges governed by this Order have or will have a reasonable potential to cause or contribute to, or will cease to have, adverse impacts on water quality or beneficial uses of the receiving waters.

b. If new or revised water quality objectives or total maximum daily loads (TMDLs) come into effect for San Francisco Bay and contiguous water bodies (whether statewide, regional, or site-specific). In such cases, effluent limitations in this Order may be modified as necessary to reflect the updated water quality objectives and wasteload allocations in the TMDLs. Adoption of the effluent limitations in this Order is not intended to restrict in any way future modifications based on legally adopted water quality objectives or TMDLs or as otherwise permitted under federal regulations governing NPDES permit modifications.

c. If translator, dilution, or other water quality studies provide a basis for determining that a permit condition should be modified.

d. If State Water Board adopts precedential decisions, new policies, new laws, or new regulations are adopted.

e. If an administrative or judicial decision on a separate NPDES permit or WDRs addresses requirements similar to this discharge.

f. Or as otherwise authorized by law.

The Discharger may request a permit modification based on any of the circumstances above. With any such request, the Discharger shall include antidegradation and anti-backsliding analyses.

2. Effluent Characterization Study and Report

a. Study Elements. The Discharger shall characterize and evaluate the discharge from the following discharge point to verify that the "no" or "unknown" reasonable potential analysis conclusions of this Order remain valid and to inform the next permit reissuance. The Discharger shall collect representative samples at the monitoring location set forth below, as defined in the MRP, at no less than the frequency specified below:

Discharge Point	Monitoring Location	Minimum Frequency
001	EFF-001	Once

The samples shall be analyzed for the priority pollutants listed in Attachment G, Table C, except for those priority pollutants with effluent limitations where the MRP already requires monitoring. Compliance with this requirement shall be achieved in accordance with the specifications of Attachment G sections III.A.1 and III.A.2.

b. Reporting Requirements

i. The Discharger shall, within 45 days of receipt of analytical results, report the following in the transmittal letter for the appropriate self-monitoring report:

(a) Indication that a sample for this characterization study was collected; and

(b) Identity of priority pollutants detected at or above applicable water quality criteria (see Fact Sheet Table F-5 for the criteria) and the detected concentrations of those pollutants.

ii. The Discharger shall summarize the data evaluation and submit a final report that presents all these data with its application for permit reissuance.

3. Pollutant Minimization Program

a. The Discharger shall develop and conduct a Pollutant Minimization Program as further described below when there is evidence that a priority pollutant is present in the effluent above an effluent limitation (e.g., sample results reported as detected but not quantified [DNQ] when the effluent limitation is less than the method detection limit [MDL], sample results from analytical methods more sensitive than those methods required by this Order in accordance with State Implementation Policy (SIP) sections 2.4.2 or 2.4.3,

presence of whole effluent toxicity, health advisories for fish consumption, or results of benthic or aquatic organism tissue sampling) and either:

i. A sample result is reported as DNQ and the effluent limitation is less than the Reporting Level (RL); or

ii. A sample result is reported as not detected (ND) and the effluent limitation is less than the MDL, using definitions in Attachment A and reporting protocols described in the MRP.

b. If triggered by the reasons set forth in Provision VI.C.3.a, above, the Discharger's Pollutant Minimization Program shall include, but not be limited to, the following actions and submittals:

i. Annual review and semi-annual monitoring of potential sources of the reportable priority pollutants, which may include fish tissue monitoring and other bio-uptake sampling or alternative measures when source monitoring is unlikely to produce useful analytical data;

ii. Quarterly monitoring for the reportable priority pollutants in the influent to the wastewater treatment system. The Executive Officer may approve commensurate alternative measures when influent monitoring is unlikely to produce useful analytical data;

iii. Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable priority pollutants in the effluent at or below the effluent limitation;

iv. Implementation of appropriate cost-effective control measures for the reportable priority pollutants, consistent with the control strategy; and

v. Inclusion of the following specific items in the annual report:

(a) All Pollutant Minimization Program monitoring results for the previous year;
(b) List of potential sources of the reportable priority pollutants;
(c) Summary of all actions undertaken pursuant to the control strategy; and
(d) Description of actions to be taken in the following year.

4. Treatment System Optimization

a. The Discharger shall optimize its treatment system to maximize pollutant removal using inventoried stormwater, inventoried process wastewater, or simulated stormwater consisting of existing process wastewater diluted with potable water, as appropriate. Treated effluent generated from the study shall be discharged to the EBMUD wastewater treatment plant via the sanitary sewer.

By July 1, 2017, the Discharger shall submit a report documenting the steps taken to optimize its system. The report shall, at a minimum, contain the following elements:

i. Process Control Parameters. The report shall identify process control parameters (e.g., detention time or pH) critical to pollutant removal during each treatment phase

(i.e., preliminary clarification, electrocoagulation, clarification and filtration, and carbon polishing).

ii. Optimal Operating Conditions. The report shall identify optimal operating conditions and process monitoring parameters that allow for adjustments to optimize pollutant removal for each treatment phase. The Discharger may conduct treatability studies that vary control parameters to identify conditions that best remove pollutants during each treatment phase. The Discharger shall also optimize the entire treatment system considering all treatment phases, including carbon polishing, to optimize pollutant removal (i.e., the optimal conditions for individual treatment phases may not optimize conditions for the entire treatment system).

b. After July 1, 2017, when discharging at Discharge Point No. 001, the Discharger shall at all times operate the treatment system in the manner that optimizes pollutant removal.

5. Storage and Treatment Standard Operation and Maintenance Procedures

By September 1, 2017, the Discharger shall develop and commence implementation of standard operation and maintenance procedures for the wastewater storage and treatment system as described below (in addition to complying with the operations and maintenance requirements of Attachments D and G, sections I.D). The procedures shall be consistent with the results of treatment optimization required by Provision VI.C.4. The Discharger shall maintain a copy of the standard operation and maintenance procedures at the Facility, update it as necessary, and notify the Regional Water Board of significant revisions.

The standard operation and maintenance procedures shall, at a minimum, contain the following elements:

a. Scrap acceptance criteria to ensure that Discharger operators screen all incoming scrap metal to minimize to the extent reasonably practicable hazardous or radioactive material and other pollutants that can adversely affect treatment system effluent quality;

b. Procedures to ensure that onsite wastewater storage (i.e., storage within the 1.2-million-gallon storage tank and any additional onsite storage structures that may be built in the future) and reuse are optimized so as to minimize discharges to Discharge Point No. 001 and to minimize onsite ponding to the extent practicable (e.g., by preemptively discharging excess wastewater to the sanitary sewer when significant rain is anticipated and by efficiently transferring ponded water to the 1.2-million-gallon storage tank);

c. Operational parameters and settings to ensure that the system is operating optimally when discharge to Discharge Point No. 001 is necessary (e.g., control parameters to maintain when discharging to Discharge Point No. 001 versus the sanitary sewer);

d. Monitoring protocols to ensure compliance with the MRP;

e. Maintenance requirements (e.g., criteria that trigger removal of sludge, backwash of filters, and regeneration of activated carbon; and inspection and replacement frequency of critical equipment); and

f. Operator training (e.g., refresher training before the wet season begins each year).

6. Water Pollution Prevention Plan

This provision supersedes the requirements of Attachment G sections I.C.2 and I.J.

By April 1, 2017, the Discharger shall develop, submit, and commence implementation of a facility-wide Water Pollution Prevention Plan (WPPP) that contains the following elements as described further below: (a) site map, (b) list of industrial materials, (c) potential pollutant sources, (d) best management practices (BMPs), (e) monitoring plan, (f) annual evaluation, and (g) annual report. The WPPP shall set forth BMPs for stormwater, process wastewater, and process-related materials to comply with discharge limitations, including Discharge Prohibition III.E of this Order, and to achieve the following objectives:

- Collect, convey, and retain stormwater and process wastewater onsite for reuse to the extent practicable;

- Reduce or prevent pollutants in stormwater and process wastewater delivered to the onsite wastewater treatment system; and

- To the extent practicable, prevent offsite discharges that could directly or indirectly affect waters of the United States.

The Discharger shall maintain a copy of the WPPP at the Facility, update it as necessary, and notify the Regional Water Board of significant revisions within 30 days of making such revisions.

Prior to submitting the WPPP, the Discharger shall comply with provisions X and XI.A of NPDES Permit No. CAS000001 (State Water Board Order No. 2014-0057-DWQ). After the Discharger submits the WPPP, compliance with provisions X and XI.A of NPDES Permit No. CAS000001 shall no longer be required.

a. Site Map. The WPPP shall contain one or more site maps that illustrate the following:

i. Facility boundary and stormwater and process wastewater drainage areas, including the flow direction of each drainage area, areas of soil erosion (i.e., unpaved soil or soil with compromised pavement), and nearby surface water bodies and municipal storm drain inlets;

ii. Locations of stormwater and process wastewater collection and conveyance systems, associated treatment systems, discharge locations, and direction of flow;

iii. Locations of structural control measures (e.g., storage tanks, catch basins, berms, detention ponds, secondary containment, oil/water separators, and diversion barriers) that affect stormwater and process wastewater flows;

iv. Impervious areas, including paved areas, buildings, covered storage areas, and other roofed structures;

v. Locations where materials are directly exposed to precipitation or wind, and locations where significant spills or leaks have occurred;

vi. Industrial storage areas and storage tanks, shipping and receiving areas, fueling areas, vehicle and equipment storage and maintenance areas, material handling, conveyance, and processing areas, waste treatment and storage areas, dust or particulate generating areas, cleaning and materials reuse areas, and other areas of industrial activity that may have potential pollutant sources.

b. List of Industrial Materials. The WPPP shall include a list of industrial materials or wastes handled at the Facility and the locations where each material is stored, received, shipped, and handled, as well as the typical quantities and handling frequencies.

c. Potential Pollutant Sources. The WPPP shall contain the following elements:

i. Description of Potential Pollutant Sources

(a) Industrial Processes. The WPPP shall describe each industrial process, including shredding, dust suppression, ship loading, equipment washdown, and any other activities that generate water that drains to stormwater or process wastewater conveyance systems. The WPPP shall describe the type, characteristics, and approximate quantity of industrial materials used in or resulting from each process. The WPPP shall identify and describe areas protected by containment structures and the corresponding containment capacity.

(b) Material Handling and Storage Areas. The WPPP shall describe each material handling and storage area, including the type, characteristics, and quantity of industrial materials or wastes handled or stored; the shipping, receiving, and loading procedures; the spill or leak prevention and response procedures; and the areas protected by containment structures and corresponding containment capacity.

(c) Dust, Particulate, Debris, and Refuse Generating Activities. The WPPP shall identify all industrial activities that generate dust, particulate, debris, or refuse that may be deposited within the Facility boundaries or at offsite locations that could directly or indirectly affect waters of the United States. These activities shall include, but not be limited to, onsite material transfer, ship loading and unloading, shredding, and Joint Products Plant operations. The WPPP shall describe such activities, locations where these materials may accumulate, source types, and characteristics.

(d) Significant Spills and Leaks. The WPPP shall identify Facility areas where spills or leaks can likely occur. The WPPP shall list the following for the previous five years:

(1) any industrial materials that have spilled or leaked in significant quantities and have been discharged to (or had the potential to discharge to) waters of the United States; and

(2) any toxic chemicals identified in 40 C.F.R. section 302 that have been reported on U.S. EPA Form R, as well as any oil or hazardous substances in excess of reportable quantities (40 C.F.R. §§ 110, 117, and 302) discharged to waters of the United States.

In each case, the WPPP shall include the location, characteristics, and approximate quantity of the materials spilled or leaked; approximate quantity of the materials discharged; the cleanup or remedial actions that occurred or are planned; the approximate remaining quantity of materials that have the potential to be discharged; and the preventive measures taken to ensure that spills or leaks do not recur.

(e) Erodible Surfaces. The WPPP shall describe Facility locations where soil or other particulate erosion may be caused by industrial activity (e.g., truck traffic) or contact with water or wind. These locations shall, at a minimum, include areas of unpaved soil or soil with compromised pavement.

ii. Assessment of Potential Pollutant Sources

(a) The WPPP shall include a narrative assessment of all areas of industrial activity with potential industrial pollutant sources. At a minimum, the assessment shall include the following:

(1) Facility areas with likely pollutant sources, including but not limited to areas where wastewater or waste materials (e.g., dust suppression water, wash water, spilled product, fugitive dust, dirt, rubbish, refuse, or debris) could directly or indirectly affect waters of the United States;

(2) Pollutants likely to be present;

(3) Approximate quantity, physical characteristics, and location of each industrial material handled, produced, processed, stored, recycled, or disposed;

(4) Degree to which the pollutants associated with those materials may be discharged directly or indirectly (e.g., through contact with water or wind) to waters of the United States;

(5) Direct and indirect pathways (e.g., through contact with water or wind) by which pollutants may be discharged to waters of the United States;

(6) Sampling, visual observation, and inspection records; and

(7) Effectiveness of existing BMPs in meeting the WPPP objectives.

(b) Based on the assessment above, the WPPP shall identify any Facility areas where the minimum BMPs described in Provision VI.C.6.d.i below will not adequately meet the WPPP objectives. The Discharger shall identify and implement, to the extent feasible, advanced BMPs as described in Provision VI.C.6.d.ii below for such areas.

(c) Based on the assessment above, the WPPP shall identify any drainage areas with no exposure to industrial activities and materials.

d. Best Management Practices. The WPPP shall describe BMPs as required below:

i. Minimum BMPs. The Discharger shall implement and maintain each of the following minimum BMPs to the extent practicable. The Discharger shall select, design, install, and implement BMPs in a manner that reflects best industry practice considering technological availability and economic practicability and achievability to meet the WPPP objectives and applicable effluent limits.

(a) Good Housekeeping. The Discharger shall undertake the following:

(1) Observe outdoor areas to determine housekeeping needs. These areas shall include stormwater and process wastewater drainage areas, conveyance systems, areas around ship loading operations, and materials handling and storage areas. They shall also include offsite areas in the vicinity of the Facility, including Embarcadero West and adjacent neighboring properties. If access to neighboring properties cannot be arranged, observations shall be made to the extent possible from reasonably accessible areas. Any dust, debris, waste, spills, leaks, or tracked materials associated with the Discharger's operations shall be cleaned up and disposed of properly;

(2) Minimize or prevent material tracking (e.g., by trucks);

(3) Minimize or control dust, particulate, debris, and refuse generated from industrial materials or activities; and

(4) Sweep paved surfaces to minimize the potential for pollutants to be tracked offsite.

(b) Preventive Maintenance. The Discharger shall undertake the following:

(1) Identify all equipment and systems used outdoors that may spill or leak pollutants;

(2) Observe the identified equipment and systems to detect leaks and identify conditions that may result in the development of leaks;

(3) Establish an appropriate schedule for maintenance of identified equipment and systems; and

(4) Establish procedures for prompt maintenance and repair of equipment and maintenance of systems when conditions exist that may result in the development of spills or leaks.

(c) Spill and Leak Prevention and Response. The Discharger shall undertake the following:

(1) Establish procedures and controls to minimize spills and leaks;

(2) Develop and implement spill and leak response procedures to prevent industrial materials from discharging through the water conveyance systems (spilled or leaked industrial materials shall be cleaned promptly and disposed of properly);

(3) Identify and describe all necessary and appropriate spill and leak response equipment, locations of spill and leak response equipment, and spill or leak response equipment maintenance procedures; and

(4) Identify and train appropriate spill and leak response personnel.

(d) Material Handling and Waste Management. The Discharger shall undertake the following:

(1) Screen all incoming scrap to minimize the chance of accepting materials that could be significant sources of pollutants (see Provision VI.C.5.a);

(2) Prevent or minimize handling of industrial materials or wastes that can be readily mobilized by contact with water or wind;

(3) Cover, contain, or otherwise manage all stored industrial materials (including but not limited to non-solid industrial materials or wastes, such as particulates, powders, shredded material, etc.) that can be readily mobilized, transported, or dispersed by contact with water or wind;

(4) Cover or close industrial waste disposal containers and industrial material storage containers when not in use;

(5) Divert stormwater and process wastewater away from stockpiled materials;

(6) Employ measures to reduce ponding of stormwater and process wastewater in the vicinity of stockpiled materials;

(7) Clean up all spills of industrial materials or wastes that occur during handling in accordance with the spill response procedures in Provision VI.C.6.d.i(c) above; and

(8) Observe and clean, as appropriate, any outdoor material or waste handling equipment or containers (e.g., conveyor system, skiff pan) that can be contaminated by contact with industrial materials or wastes.

(e) Erosion and Sediment Controls. For each erodible surface location identified in Provision VI.C.6.c.i(e) above, the Discharger shall undertake the following:

(1) Implement effective wind erosion controls;

(2) Provide effective stabilization for inactive areas, finished slopes, and other erodible areas prior to forecasted storms;

(3) Maintain effective perimeter controls and stabilize all site entrances and exits to sufficiently control erodible materials that could be discharged or tracked offsite (e.g., by using paving, wheel washes, and sweeping); and

(4) Divert stormwater and process wastewater generated from within the Facility away from all erodible materials.

(f) Employee Training Program. The Discharger shall undertake the following:

(1) Ensure that all personnel implementing the various WPPP compliance activities are properly trained to implement WPPP requirements, including but not limited to BMP implementation, BMP effectiveness evaluations, visual observations, and monitoring activities. Appropriate staff shall be trained by a Qualified Industrial Stormwater Practitioner who has completed State Water Board-sponsored or approved training and has registered in the State Water Board's Stormwater Multiple Application and Report Tracking System (SMARTS);

(2) Prepare or acquire appropriate training manuals or training materials;

(3) Identify which personnel need to be trained, their responsibilities, and the type of training they shall receive;

(4) Provide a training schedule; and

(5) Maintain documentation of all completed training classes and the personnel that received training.

(g) Quality Assurance and Record Keeping. The Discharger shall undertake the following:

(1) Develop and implement management procedures to ensure that appropriate staff implements all WPPP elements;

(2) Develop a method of tracking and recording the implementation of the BMPs identified in the WPPP; and

(3) Maintain the BMP implementation records, training records, and records related to any spills and cleanup-related response activities for a minimum of five years.

ii. Advanced BMPs. In addition to implementing the minimum BMPs described above, the Discharger shall, to the extent practicable, implement and maintain additional advanced BMPs necessary to achieve WPPP objectives and to comply with discharge limitations, including Discharge Prohibition III.E of this Order. The Discharger shall do so in a manner that reflects BAT and BCT (i.e., best industry practice considering technological availability and economic practicability and achievability). One example of a possible advanced BMP would be to pressure wash Embarcadero West from the Facility main gate to the non-ferrous customer gate to minimize offsite tracking of pollutants and capture rinse water for return to the Facility.

iii. BMP Descriptions

(a) The WPPP shall describe BMPs being implemented at the Facility, including the following:

(1) The pollutants or waste material that the BMP is designed to reduce or prevent;

(2) The frequency, times of day, or conditions when the BMP is scheduled for implementation;

(3) The locations within each area of industrial activity or industrial pollutant source where the BMP shall be implemented;

(4) The individual or position responsible for implementing the BMP;

(5) The procedures, including maintenance procedures, and instructions to implement the BMP effectively;

(6) The equipment and tools necessary to implement the BMP effectively; and

(7) BMPs that may require more frequent visual observations beyond those described in Provision VI.C.6.e.ii below.

(b) The WPPP shall identify and justify each minimum BMP or applicable advanced BMP not being implemented at the Facility (i.e., because the BMP does not reflect best industry practice considering technological availability and economic practicability and achievability).

(c) The WPPP shall identify any BMPs implemented in lieu of any of the minimum or applicable advanced BMPs.

iv. BMP Summary Table. The WPPP shall include a table summarizing each identified area of industrial activity, the associated industrial pollutant sources, the industrial pollutants, and the BMPs being implemented.

e. Monitoring Plan. The WPPP shall contain a Monitoring Plan describing how the Discharger will evaluate the effectiveness of WPPP implementation and determine what changes to the WPPP may be needed, if any. The Monitoring Plan shall contain the following elements: (i) areas to be monitored, (ii) visual observations, (iii) monitoring team, (iv) records and reporting, and (v) WPPP revisions. Provision VI.C.6.e.vi, below, provides a mechanism for reducing these monitoring requirements if appropriate.

i. Areas to Be Monitored. The Monitoring Plan shall include a list of areas to be monitored considering the potential pollutant sources identified in accordance with Provision VI.C.6.c, above. The list shall include the following:

(a) Onsite drainage areas, including outdoor industrial equipment and storage areas, outdoor industrial activity areas, and other potential industrial pollutant sources;

(b) Areas associated with ship loading operations;

(c) Areas where industrial wheel washes are operating; and

(d) Offsite areas adjacent to the Facility, including Embarcadero West and adjacent neighboring properties. If access to neighboring properties cannot be arranged,

monitoring shall be conducted to the extent possible from reasonably accessible areas.

ii. Visual Observations

(a) At least once each calendar month, the Discharger shall visually observe each area listed pursuant to section VI.C.6.e.i, above, for the presence or indication of prior, current, or potential unauthorized discharges to waters of the United States.

(b) The Discharger shall assess the potential source of any observed prior, current, or potential unauthorized discharge and the effectiveness of related BMPs.

(c) The Discharger shall record visual observations, potential sources of unauthorized discharges, and comments regarding BMP effectiveness on a standard form that the Discharger shall develop for this purpose and include within the Monitoring Plan.

(d) Visual observations shall be conducted during daylight and during Facility operations.

iii. Monitoring Team. The Monitoring Plan shall identify team members assigned to conduct the monitoring, describe their roles, and establish training protocols.

iv. Records and Reporting

(a) The Discharger shall summarize visual observations in quarterly SMRs and the WPPP Annual Report (see Provision VI.C.6.g below).

(b) The Discharger shall maintain all records throughout the life of this Order and for a minimum of five years. Records shall include the date, approximate time, locations observed or recorded, presence and probable source of any observed pollutants, and any response action or additional WPPP revisions necessary in response to the visual observations and enhanced monitoring.

v. Corrective Actions and WPPP Revisions. The Discharger shall take corrective actions, and review and revise the WPPP as necessary, when visual observations indicate that pollutant sources have not been adequately controlled to prevent unauthorized discharges.

vi. Reduced Monitoring. With the written concurrence of the Executive Officer, the Discharger may reduce the frequency of visual observations commensurate with reductions in the potential for pollutants to be directly or indirectly discharged to waters of the United States. For example, monitoring may be reduced if there is documented evidence that BMPs are effective and reliably implemented. Likewise, monitoring may be eliminated to the extent that any site improvements eliminate the potential for discharges to waters of the United States.

f. Annual Evaluation. The WPPP shall commit the Discharger to conduct at least one Annual Evaluation for each reporting year (July 1 through June 30). If the Discharger conducts an Annual Evaluation fewer than 8 months or more than 16 months after it

conducts the previous Annual Evaluation, it shall document its justification for doing so. Based on each Annual Evaluation, the Discharger shall revise the WPPP as appropriate and implement the revisions within 90 days of completing the Annual Evaluation. At a minimum, each Annual Evaluation shall consist of the following:

i. Review of all visual observation, sampling results, and inspection records for the previous reporting year;

ii. Inspection of all areas of industrial activity and associated potential pollutant sources for evidence of, or the potential for, pollutants or waste materials travelling offsite;

iii. Inspection of all drainage areas previously identified as having no exposure to industrial activities and materials;

iv. Inspection of equipment needed to implement BMPs;

v. Inspection of any BMPs; and

vi. Review and effectiveness assessment of all BMPs for each area of industrial activity and associated potential pollutant sources to determine if BMPs are properly designed, implemented, and effective.

g. Annual Report. The WPPP shall commit the Discharger to certify and submit an Annual Report no later than July 30 following each reporting year (July 1 through June 30). The Discharger shall include the following in each Annual Report:

i. Compliance Checklist that indicates whether the Discharger complies with, and has addressed all applicable requirements of, this Order;

ii. Explanation for any non-compliance, as indicated in the Compliance Checklist;

iii. Identification, including page numbers or sections, of all revisions made to the WPPP within the reporting year;

iv. Date of the Annual Evaluation; and

v. Summary of visual observations.

7. Onsite Storage Capacity

a. Onsite Storage Capacity Requirements. The Discharger shall maintain the capacity to store stormwater and wastewater within the 1.2-million-gallon storage tank, and any additional onsite storage structures that may be built in the future, as necessary to achieve WPPP objectives (see Provision VI.C.6) in a manner that reflects BAT and BCT (i.e., best industry practice considering technological availability and economic practicability and achievability).

b. Draft Work Plan. By July 1, 2017, the Discharger shall submit a draft work plan to the Regional Water Board for a study to determine the volume of onsite storage required to meet the onsite storage capacity requirement above. The study shall evaluate a range of storms of varying frequency and duration as determined from local, historical rainfall

records. At a minimum, the study shall consider 25-year, 50-year, and 100-year return frequency storms. The work plan shall describe the analytical approach to be used, including how onsite water movement, tides, sea level rise, and flooding will be assessed. The study shall not include infiltration as available onsite storage. Likewise, the study shall not include onsite ponding (other than within storage structures specifically constructed to store stormwater and wastewater) as available onsite storage. Calculations shall include safety factors. All hydrologic calculations shall be certified by a California-licensed professional engineer.

The study shall identify technologically available implementation alternatives capable of meeting the onsite storage needs for the storms considered and estimate the cost for each alternative. The study shall recommend an alternative that maximizes onsite storage based on best industry practice considering economic practicability and achievability.

c. Final Work Plan. By August 1, 2017, the Discharger shall incorporate Regional Water Board comments, if any; submit a final work plan; and commence work plan implementation.

d. Interim Report. By January 1, 2018, the Discharger shall submit an interim report with its findings, including the recommendation for the volume of onsite storage required to meet the onsite storage capacity requirement above and the costs associated with the various alternatives considered. The report shall identify improvements necessary to implement the recommended alternative (e.g., improved stormwater conveyance), if any. If improvements are necessary, it shall also set forth a schedule for implementation to be completed no later than October 1, 2018. The Executive Officer may extend this deadline up to two years if the Discharger demonstrates that necessary improvements cannot feasibly be completed sooner (e.g., to accommodate any uncertainties associated with remaining Cleanup and Abatement Order No. R2-2013-1001 requirements or with other improvements required by this Order). The Discharger shall implement the recommended alternative in accordance with the schedule.

e. Final Report. By April 1, 2019, the Discharger shall submit a Final Report documenting all work completed to comply with the onsite storage requirements above. The Executive Officer may extend this deadline up to two years if the Discharger demonstrates that necessary improvements cannot feasibly be completed sooner (e.g., to accommodate any remaining Cleanup and Abatement Order No. R2-2013-1001 requirements or other improvements required by this Order). The Final Report may be the same as the Interim Report if no improvements are necessary.

8. Wooden Pier Conveyor System Containment

The Discharger shall fully contain the wooden pier conveyor system such that all industrial stormwater and process wastewater are collected and transferred upland via the stormwater conveyance system, and all spilled product, dust, dirt, rubbish, refuse, and debris are captured for recycling or offsite disposal.

a. Work Plan. By September 1, 2017, the Discharger shall submit a work plan to the Regional Water Board that identifies tasks required to fully contain the wooden pier conveyor system, as described above, and sets forth a schedule for implementation that

achieves full containment no later than October 1, 2019. At a minimum, tasks shall include completion of (1) interim improvements to the conveyor system, wooden pier, and surrounding area; (2) design and engineering studies required to identify all work necessary to implement long-term improvements (e.g., wooden pier bearing capacity study); and (3) long-term improvements.

b. Final Report. By January 1, 2020, the Discharger shall submit a Final Report documenting all work completed to fully contain the wooden pier conveyor system. The Executive Officer may extend this deadline by one-year increments if the Discharger demonstrates that necessary improvements cannot feasibly be completed by October 1, 2019, due to constraints related to project phasing or the structural integrity of the wooden pier, unavoidable delays in obtaining permits or other authorizations, or other circumstances beyond the Discharger's control.

9. Structural Improvements

a. Work Plan. By September 1, 2017, the Discharger shall submit a work plan to the Regional Water Board that identifies tasks required to implement the upgrades described below and sets forth a schedule for complete implementation no later than October 1, 2019. The Executive Officer may extend the deadline for complete implementation by one-year increments if the Discharger demonstrates that necessary improvements cannot feasibly be completed by October 1, 2019, due to constraints related to project phasing, unavoidable delays in obtaining permits or other authorizations, or other circumstances beyond the Discharger's control.

i. Stockpile Management. To the extent practicable, the Discharger shall implement measures (e.g., berms) to divert stormwater and process wastewater away from stockpiled industrial materials to minimize offsite tracking of pollutants and pollutant loads at the treatment system.

ii. Paving. The Discharger shall install paving (or repair, restore, or otherwise maintain existing paving) at the Facility to minimize offsite tracking of pollutants and pollutant loads at the treatment system. At a minimum, the work plan shall: (1) identify areas where degraded pavement will be repaired and restored; (2) identify areas where additional surfaces will paved; (3) document the rationale for each unpaved area not to be paved; (4) include grading and drainage plans with typical cross-sections; (5) include figures showing flow directions and stormwater conveyance system inlets; and (6) describe how the work will be coordinated with any remaining soil and groundwater monitoring activities required by Cleanup and Abatement Order No. R2-2013-1001 and subsequent Regional Water Board orders, if any.

iii. Drainage Upgrades. The Discharger shall install drainage improvements to Embarcadero West immediately adjacent to the Facility (i.e., between the Facility main gate and the non-ferrous "peddler" entrance) to collect and convey stormwater and wash water to the onsite stormwater management system for recycling or treatment.

b. Final Report. By January 1, 2020, the Discharger shall submit a Final Report documenting all work completed to implement the proposed paving and drainage

improvements. The Executive Officer may extend this deadline by one-year increments if the Discharger demonstrates that necessary improvements cannot feasibly be completed by January 1, 2020.

ATTACHMENT A – DEFINITIONS

Arithmetic Mean (μ)
Also called the average, the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean = $\mu = \Sigma x / n$ where: Σx is the sum of the measured ambient water concentrations, and n is the number of samples.

Average Monthly Effluent Limitation (AMEL)
The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)
The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Bioaccumulative
Taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Carcinogenic
Known to cause cancer in living organisms.

Coefficient of Variation
Measure of data variability calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

Daily Discharge
Either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit) for a constituent with limitations expressed in units of mass; or (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period is considered the result for the calendar day in which the 24-hour period ends.

Detected, but Not Quantified (DNQ)
Sample result less than the RL, but greater than or equal to the laboratory's MDL. Sample results reported as DNQ are estimated concentrations.

Dilution Credit
Amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio or determined by conducting a mixing zone study or modeling the discharge and receiving water.

Effluent Concentration Allowance (ECA)
Value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the CV for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in U.S. EPA guidance (*Technical Support Document For Water Quality-based Toxics Control*, March 1991, second printing, EPA/505/2-90-001).

Enclosed Bay
Indentation along the coast that encloses an area of oceanic water within a distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

Estimated Chemical Concentration
Concentration that results from the confirmed detection of the substance below the ML value by the analytical method.

Estuaries
Waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars are considered estuaries. Estuarine waters are considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater. Estuarine waters include, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

Inland Surface Waters
All surface waters of the state that do not include the ocean, enclosed bays, or estuaries.

Instantaneous Maximum Effluent Limitation
Highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation
Lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Maximum Daily Effluent Limitation (MDEL)
Highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median
Middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between n/2 and n/2+1).

Method Detection Limit (MDL)
Minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in in 40 C.F.R. part 136, Attachment B, revised as of July 3, 1999.

Minimum Level (ML)
Concentration at which the entire analytical system gives a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Mixing Zone
Limited volume of receiving water allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

Not Detected (ND)
Sample results less than the laboratory's MDL.

Persistent Pollutants
Substances for which degradation or decomposition in the environment is nonexistent or very slow.

Pollutant Minimization Program
Program of waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the Pollutant Minimization Program is to reduce all potential sources of a priority pollutant through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. Cost effectiveness may be considered when establishing the requirements of a Pollutant Minimization Program. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), is considered to fulfill Pollutant Minimization Program requirements.

Pollution Prevention
Any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State Water Board or Regional Water Board.

Reporting Level (RL)
ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order, including an additional factor if applicable as discussed herein. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from SIP Appendix 4 in accordance with SIP section 2.4.2 or established in accordance with SIP section 2.4.3. The ML is based

on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Source of Drinking Water
Any water designated as having a municipal or domestic supply (MUN) beneficial use.

Standard Deviation (σ)
Measure of variability calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;

μ is the arithmetic mean of the observed values; and

n is the number of samples.

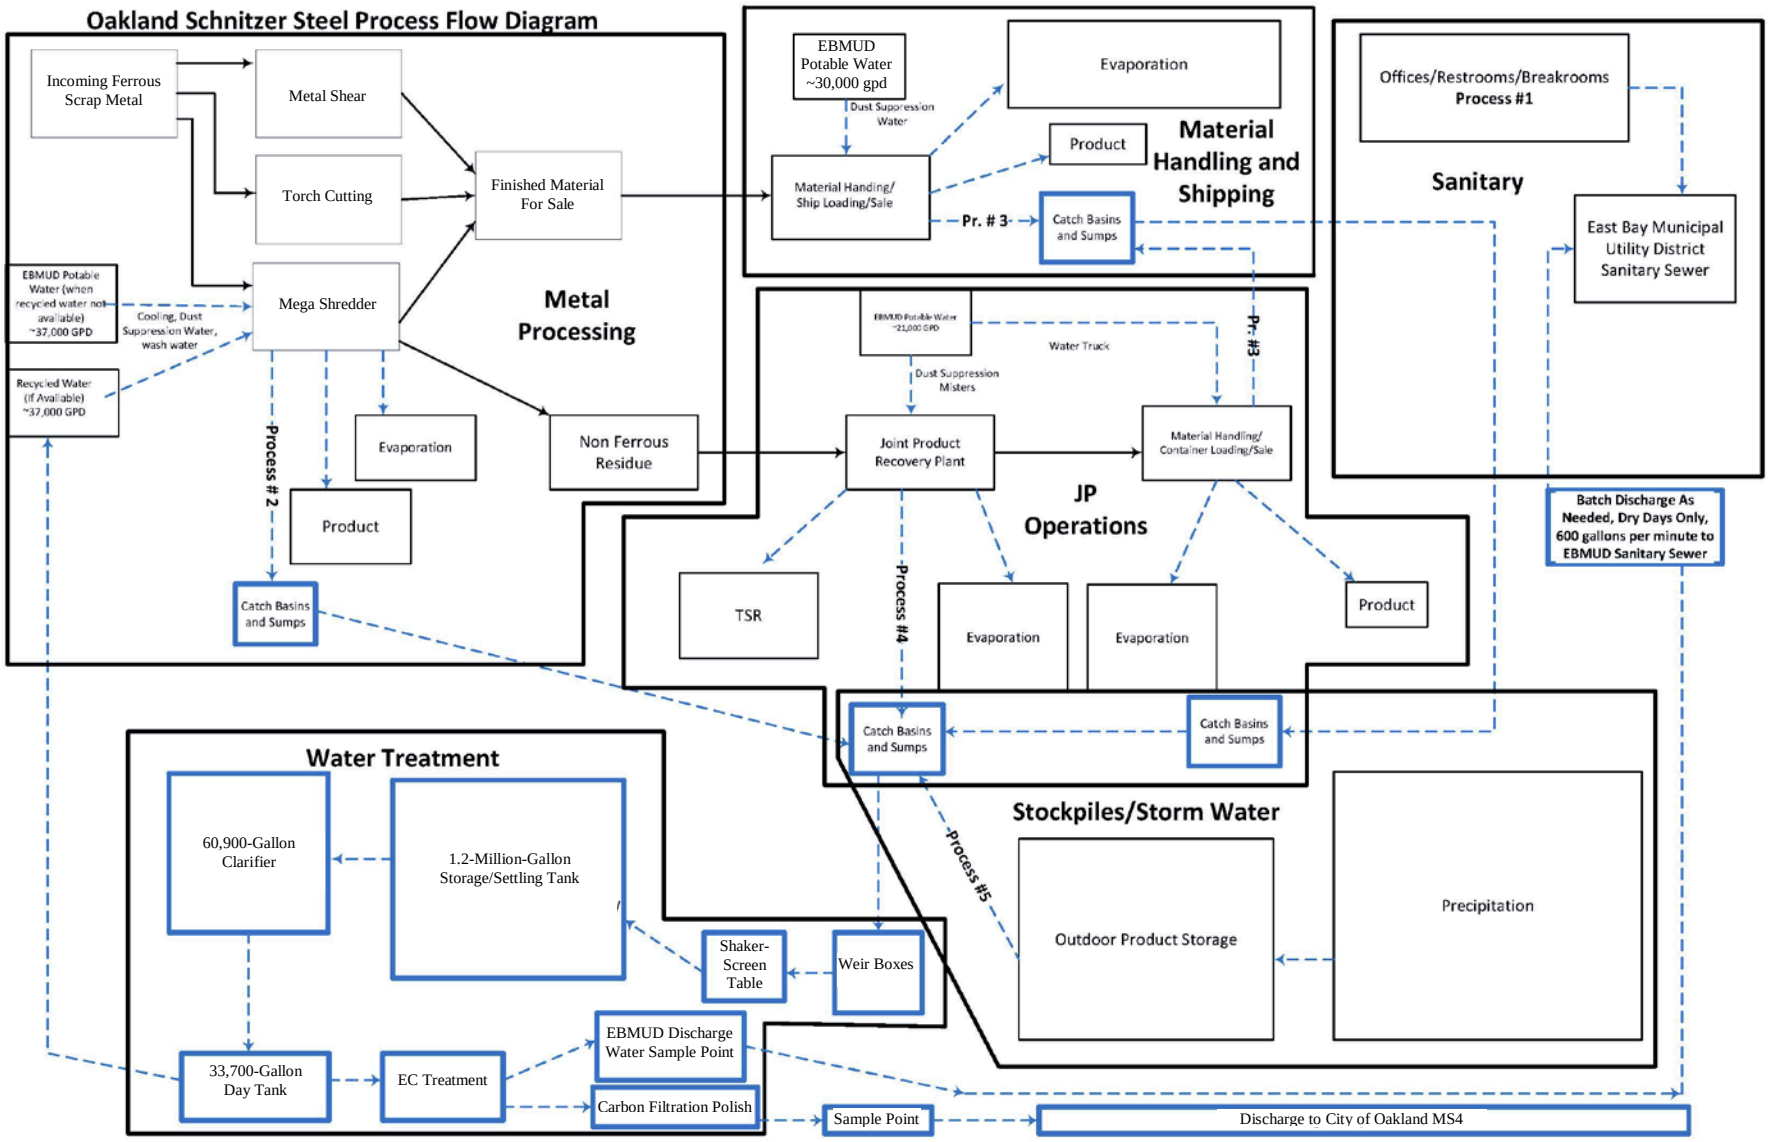
Toxicity Reduction Evaluation (TRE)
Study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. A TIE is a set of procedures to identify the specific chemicals responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

ATTACHMENT B – FACILITY MAP

ATTACHMENT B – FACILITY MAP

Due to the dynamic nature of the Discharger's operations, certain activities (e.g., parking) and material storage locations (e.g., heavy melting steel storage, bonus storage, aggregate storage) are subject to change. Facility locations not subject to change include Discharge Point No. 001, the treatment system and related appurtenances, and the storm sewer connection.

ATTACHMENT C – PROCESS FLOW DIAGRAM



ATTACHMENT D –STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the terms, requirements, and conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application; or a combination thereof. (40 C.F.R. § 122.41(a); Wat. Code §§ 13261, 13263, 13265, 13268, 13000, 13001, 13304, 13350, 13385.)

2. The Discharger shall comply with effluent standards or prohibitions established under CWA section 307(a) for toxic pollutants and with standards for sewage sludge use or disposal established under CWA section 405(d) within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i); Wat. Code, §§ 13267, 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(i); 40 C.F.R. § 122.41(i)(1); Wat. Code, §§ 13267, 13383);

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(2); Wat. Code, §§ 13267, 13383);

3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(3); Wat. Code, §§ 13267, 13383); and

4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i)(4); Wat. Code, 13267, 13383.)

G. Bypass

1. Definitions

a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)

b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)

2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)

3. Prohibition of bypass. Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):

a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));

b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment

should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and

c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)

4. Approval. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions—Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)

5. Notice

a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit prior notice, if possible at least 10 days before the date of the bypass. The notice shall be sent to the Regional Water Board. As of December 21, 2020, a notice shall also be submitted electronically to the initial recipient defined in Standard Provisions – Reporting V.J below. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(i).)

b. Unanticipated bypass. The Discharger shall submit a notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). The notice shall be sent to the Regional Water Board. As of December 21, 2020, a notice shall also be submitted electronically to the initial recipient defined in Standard Provisions – Reporting V.J below. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).)

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):

a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));

b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));

c. The Discharger submitted notice of the upset as required in Standard Provisions—Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and

d. The Discharger complied with any remedial measures required under Standard Provisions—Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)

3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS—PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. §§ 122.41(l)(3), 122.61.)

III. STANDARD PROVISIONS—MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)

B. Monitoring must be conducted according to test procedures approved under 40 C.F.R. part 136 for the analyses of pollutants unless another method is required under 40 C.F.R. chapter 1, subchapters N or O. Monitoring must be conducted according to sufficiently sensitive test methods approved under 40 C.F.R. part 136 for the analysis of pollutants or pollutant parameters or required under 40 C.F.R. chapter 1, subchapter N or O. For the purposes of this paragraph, a method is sufficiently sensitive when:

1. The method minimum level (ML) is at or below the level of the effluent limitation established in the permit for the measured pollutant or pollutant parameter, and either (a) the method ML is at or below the level of the applicable water quality criterion for the measured pollutant or pollutant parameter, or (b) the method ML is above the applicable water quality criterion but the amount of the pollutant or pollutant parameter in a facility's discharge is

high enough that the method detects and quantifies the level of the pollutant or pollutant parameter in the discharge; or

2. The method has the lowest ML of the analytical methods approved under 40 C.F.R. part 136 or required under 40 C.F.R. chapter 1, subchapter N or O, for the measured pollutant or pollutant parameter.

In the case of pollutants or pollutant parameters for which there are no approved methods under 40 C.F.R. part 136 or otherwise required under 40 C.F.R. chapter 1, subchapters N or O, monitoring must be conducted according to a test procedure specified in this Order for such pollutants or pollutant parameters. (40 C.F.R. §§ 122.21(e)(3), 122.41(j)(4), 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS—RECORDS

A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 C.F.R. part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

B. Records of monitoring information shall include the following:

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));

2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));

3. The date(s) the analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));

4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and

6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):

1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and

2. Permit applications and attachments, permits, and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS—REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or U.S. EPA within a reasonable time, any information which the Regional Water Board, State Water Board, or U.S. EPA may request to determine whether cause exists for modifying, revoking and reissuing, or

terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or U.S. EPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, §§ 13267, 13383.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Standard Provisions—Reporting V.B.2, V.B.3, V.B.4, V.B.5, and V.B.6 below. (40 C.F.R. § 122.41(k).)

2. For a corporation, all permit applications shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures. (40 C.F.R. § 122.22(a)(1).)

For a partnership or sole proprietorship, all permit applications shall be signed by a general partner or the proprietor, respectively. (40 C.F.R. § 122.22(a)(2).)

For a municipality, State, federal, or other public agency, all permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA). (40 C.F.R. § 122.22(a)(3).).

3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or U.S. EPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

a. The authorization is made in writing by a person described in Standard Provisions—Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));

b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)

4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions—Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)

5. Any person signing a document under Standard Provisions—Reporting V.B.2 or V.B.3 above shall make the following certification:

> "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." (40 C.F.R. § 122.22(d).)

6. Any person providing the electronic signature for documents described in Standard Provisions – V.B.1, V.B.2, or V.B.3 that are submitted electronically shall meet all relevant requirements of Standard Provisions – Reporting V.B, and shall ensure that all relevant requirements of 40 C.F.R. part 3 (Cross-Media Electronic Reporting) and 40 C.F.R. part 127 (NPDES Electronic Reporting Requirements) are met for that submission. (40 C.F.R § 122.22(e).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program in this Order. (40 C.F.R. § 122.22(l)(4).)

2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting the results of monitoring, sludge use, or disposal practices. As of December 21, 2016, all reports and forms must be submitted electronically to the initial recipient defined in Standard Provisions – Reporting V.J and comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(l)(4)(i).)

3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 C.F.R. part 136, or another method required for an industry-specific waste stream under 40 C.F.R. chapter 1, subchapters N or O, the results of such monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written report shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The report shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

For noncompliance related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports must include the data described above (with the exception of time of discovery) as well as the type of event (i.e., combined sewer overflow, sanitary sewer overflow, or bypass event), type of overflow structure (e.g., manhole, combined sewer overflow outfall), discharge volume untreated by the treatment works treating domestic sewage, types of human health and environmental impacts of the event, and whether the noncompliance was related to wet weather.

As of December 21, 2020, all reports related to combined sewer overflows, sanitary sewer overflows, or bypass events must be submitted to the Regional Water Board and must be submitted electronically to the initial recipient defined in Standard Provisions – Reporting V.J. The reports shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. The Regional Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours:

a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)

b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)

3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 C.F.R. section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or

2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (Alternatively, for an existing manufacturing, commercial, mining, or silvicultural discharge as referenced in 40 C.F.R. section 122.42(a), this notification applies to pollutants that are subject neither to effluent limitations in this Order nor to notification requirements under 40 C.F.R. section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1).) (40 C.F.R. § 122.41(l)(1)(ii).)

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 C.F.R. § 122.41(l)(1)(iii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order's requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions—Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision—Reporting V.E above. For noncompliance related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports shall contain the information described in Standard Provision – Reporting V.E and the applicable required data in appendix A to 40 C.F.R. part 127. The Regional Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or U.S. EPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

J. Initial Recipient for Electronic Reporting Data

The owner, operator, or duly authorized representative is required to electronically submit NPDES information specified in appendix A to 40 C.F.R. part 127 to the initial recipient defined in 40 C.F.R. section 127.2(b). U.S. EPA will identify and publish the list of initial recipients on its website and in the Federal Register, by state and by NPDES data group [see 40 C.F.R. § 127.2(c)]. U.S. EPA will update and maintain this list. (40 C.F.R. § 122.41(l)(9).)

VI. STANDARD PROVISIONS—ENFORCEMENT

A. The Regional Water Board is authorized to enforce the terms of this Order under several provisions of the Water Code, including, but not limited to, sections 13268, 13385, 13386, and 13387.

VII. ADDITIONAL PROVISIONS—NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural Dischargers shall notify the Regional Water Board as soon as they know or have reason to believe (40 C.F.R. § 122.42(a)):

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(1)):

a. 100 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(1)(i));

b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(1)(ii));

c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(1)(iii)); or

d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(1)(iv).)

2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(2)):

a. 500 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(2)(i));

b. 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(2)(ii));

c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(2)(iii)); or

d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(2)(iv).)

B. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following (40 C.F.R. § 122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to CWA sections 301 or 306 if it were directly discharging those pollutants (40 C.F.R. § 122.42(b)(1)); and

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of this Order. (40 C.F.R. § 122.42(b)(2).)

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 C.F.R. § 122.42(b)(3).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

Contents

Tables

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

Clean Water Act section 308 and 40 C.F.R. sections 122.41(h), 122.41(j)-(l), 122.41(i), and 122.48 require that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. This MRP establishes monitoring, reporting, and recordkeeping requirements that implement federal and State laws and regulations.

I. GENERAL MONITORING PROVISIONS

A. The Discharger shall comply with this MRP. The Executive Officer may amend this MRP pursuant to 40 C.F.R. sections 122.62, 122.63, and 124.5. If any discrepancies exist between this MRP and the "Regional Standard Provisions, and Monitoring and Reporting Requirements (Supplement to Attachment D) for NPDES Wastewater Discharge Permits" (Attachment G), this MRP shall prevail.

B. The Discharger shall conduct all monitoring in accordance with Attachment D, section III, as supplemented by Attachment G. Equivalent test methods must be more sensitive than those specified in 40 C.F.R. section 136 and must be specified in this permit.

II. MONITORING LOCATION

The Discharger shall establish the following monitoring location to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Location

Sampling Location Type	Monitoring Location Name	Monitoring Location Description [1]
Effluent	EFF-001	A point following all phases of treatment and prior to discharge to the City of Oakland storm sewer at which all waste tributary is present.

III. EFFLUENT MONITORING REQUIREMENTS

When discharging, the Discharger shall monitor effluent at Monitoring Location EFF-001 as follows:

Table E-2. Effluent Monitoring Requirements

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow [1]	gpm, hours, gallons	Continuous	Continuous
Turbidity	NTU	Grab	1/Day
pH	standard units	Grab	1/Day
Total Suspended Solids	mg/L	Grab	1/Event and at least 2/Year
Total Organic Carbon [2]	mg/L	Grab	1/Event and at least 2/Year
Oil and Grease [3]	mg/L	Grab	1/Event and at least 2/Year
Aluminum	µg/L	Grab	1/Event and at least 2/Year
Iron	µg/L	Grab	1/Event and at least 2/Year
Copper	µg/L	Grab	1/Event and at least 2/Year
Lead	µg/L	Grab	1/Event and at least 2/Year
Zinc	µg/L	Grab	1/Event and at least 2/Year
Acute Toxicity [4]	percent survival	Grab	1/Year

Unit Abbreviations:

gpm = gallons per minute
NTU = nephelometric turbidity units
mg/L = milligrams per liter
µg/L = micrograms per liter

Sample Type:

Continuous = measured continuously
Grab = grab sample

Sampling Frequency:

Continuous = measured continuously
1/Day = once per day (24-hour period)
1/Year = once per year
1/Event and at least 2/Year = once during every discharge of at least 4 hours in duration and at least twice per year regardless of discharge duration

Footnotes:

[1] Flow shall be monitored continuously during discharge and the following information shall be reported in self-monitoring reports:
- Average flow (gpm)
- Duration of discharge event (hours)
- Total flow per discharge event (gallons)

[2] Chemical oxygen demand may be measured in lieu of total organic carbon.

[3] Oil and grease sampling and analysis shall be conducted in accordance with U.S. EPA Method 1664A.

[4] Acute toxicity bioassay tests shall be performed in accordance with MRP section IV.A below.

IV. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

The Discharger shall monitor whole effluent acute toxicity at Monitoring Location EFF-001 as follows:

A. Compliance with the acute toxicity effluent limitation shall be evaluated by measuring survival of test organisms exposed to 96-hour static renewal bioassays.

B. Test organisms shall be rainbow trout and fathead minnow. If one species is consistently less sensitive to the discharge than the other, or if acute toxicity is not observed with one species, the Executive Officer may allow monitoring using only one species (e.g., the more sensitive species).

C. Bioassays shall be performed according to the most up-to-date protocols in 40 C.F.R. part 136, currently *Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms,* 5th Edition (EPA-821-R-02-012).

D. Bioassay water monitoring shall include, on a daily basis, residual chlorine, pH, dissolved oxygen, temperature, hardness, and alkalinity. These results shall be reported. If final or intermediate results of an acute bioassay test indicate a violation or threatened violation (e.g., the percentage of surviving test organisms is less than 70 percent), the Discharger shall initiate a new test as soon as practical, investigate the cause of the mortalities, and report its findings in the next self-monitoring report. The Discharger shall repeat the test until a test fish survival rate of 70 percent or greater is observed. If the control fish survival rate is less than 90 percent, the bioassay test shall be restarted with new fish and shall continue as soon as practical until an acceptable test is completed (i.e., control fish survival rate is 90 percent or greater).

V. RECEIVING WATER MONITORING REQUIREMENTS

The Discharger shall participate in the Regional Monitoring Program (RMP), which involves collection of data on pollutants and toxicity in water, sediment, and biota of San Francisco Bay.

VI. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

The Discharger shall comply with all Standard Provisions (Attachments D and G) related to monitoring, reporting, and recordkeeping, with modifications shown in section VII, below.

B. Self-Monitoring Reports (SMRs)

1. **SMR Format.** The Discharger shall electronically submit SMRs using the State Water Board's California Integrated Water Quality System (CIWQS) website (http://www.waterboards.ca.gov/ciwqs/index.html). The CIWQS website will provide additional information for SMR submittal in the event of a planned service interruption for electronic submittal.

2. **SMR Due Dates and Contents.** The Discharger shall submit SMRs by the due dates, and with the contents, specified below:

   a. **Quarterly SMRs —** Quarterly SMRs shall be due 30 days after the end of each calendar quarter (January 1 – March 31, April 1 – June 30, July 1 – September 30, and October 1 – December 31), covering that quarter. The quarterly SMR shall contain the applicable items described in sections V.B and V.C of both Attachments D and G of this Order. See Provision VI.C.2 (Effluent Characterization Study and Report) and Provision VI.C.6 (Water Pollution Prevention Plan) of this Order for additional information that must be reported with quarterly SMRs.

      Quarterly SMRs shall include all new monitoring results obtained since the last SMR was submitted. If the Discharger monitors any pollutant or waste discharges more frequently than required by this Order, the Discharger shall include the results of such monitoring in the calculations and reporting for the related SMR.

   b. **Annual SMR —** Annual SMRs shall be due July 30 each year, covering the previous four quarters (July 1 through June 30). The annual SMR shall contain the items described in sections V.C.1.f of Attachment G. See also Provision VI.C.2 (Effluent Characterization Study and Report) and Provision VI.C.3 (Pollutant Minimization Program) of the Order for additional information that must be reported with annual SMRs.

   c. **Specifications for Submitting SMRs to CIWQS —** The Discharger shall submit analytical results and other information using one of the following methods:

Table E-3. CIWQS Reporting

Parameter		Method of Reporting	
		EDF/CDF data upload or manual entry	Attached File
All parameters identified in influent, effluent, and receiving water monitoring tables (except Dissolved Oxygen and Temperature)		Required for all results	
Dissolved Oxygen Temperature		Required for monthly maximum and minimum results only [1]	Discharger may use this method for all results or keep records
Antimony Arsenic Beryllium Cadmium Chromium Copper Cyanide Lead Mercury Nickel Selenium	Silver Thallium Zinc Dioxins and Furans (by U.S. EPA Method 1613) Other Pollutants (by U.S. EPA methods 601, 602, 608, 610, 614, 624, and 625)	Required for all results [2]	
Analytical Method		Not required (Discharger may select "data unavailable") [1]	
Collection Time Analysis Time		Not required (Discharger may select "0:00") [1]	

Footnotes:

[1] The Discharger shall continue to monitor at the minimum frequency specified in this MRP, keep records of the measurements, and make the records available upon request.

[2] These parameters require EDF/CDF data upload or manual entry regardless of whether monitoring is required by this MRP or other provisions of this Order (except for biosolids, sludge, or ash provisions).

The Discharger shall arrange all reported data in a tabular format and summarize data to clearly illustrate whether the Facility is operating in compliance with effluent limitations. The Discharger is not required to duplicate the submittal of data entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format, the Discharger shall electronically submit the data in a tabular format as an attachment.

3. **Monitoring Periods.** Monitoring periods for all required monitoring shall be as set forth below unless otherwise specified:

Table E-4. Monitoring Periods

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
Continuous	Permit effective date	All times during discharge
1/Day	Permit effective date	All 24-hour periods during discharge, commencing with start of each discharge
1/Event	Permit effective date	From commencement of each discharge lasting 4 hours or longer until the discharge ceases
1/Week	Sunday following permit effective date or on permit effective date if on Sunday	Sunday through Saturday

Sampling Frequency	Monitoring Period Begins On…	Monitoring Period
1/Month	First day of calendar month following permit effective date or on permit effective date if on first day of month	First day of calendar month through last day of calendar month
2/Year	Nearest July 1 before or after permit effective date	July 1 through June 30
1/Year	Nearest July 1 before or after permit effective date	July 1 through June 30
Once	Permit effective date	Anytime such that results are included with application for permit reissuance

4. **RL and MDL Reporting.** The Discharger shall report with each sample result the Reporting Level (RL) and Method Detection Limit (MDL) as determined by the procedure in 40 C.F.R. part 136. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

   a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

   b. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

   For purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ. The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (+/- a percentage of the reported value), numerical ranges (low to high), or any other means the laboratory considers appropriate.

   c. Sample results less than the laboratory's MDL shall be reported as "Not Detected" or ND.

   d. The Discharger shall instruct laboratories to establish calibration standards so that the minimum level (ML) value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.

5. **Compliance Determination.** Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined above and in the Fact Sheet and Attachments A, D, and G. For purposes of reporting and administrative enforcement by the Regional Water Board and State Water Board, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL).

C. Discharge Monitoring Reports (DMRs)

DMRs are U.S. EPA reporting requirements. The Discharger shall electronically certify and submit DMRs together with SMRs using the Electronic Self-Monitoring Reports module eSMR 2.5 or any upgraded version. Electronic DMR submittal shall be in addition to electronic SMR submittal. Information about electronic DMR submittal is available at the DMR website at http://www.waterboards.ca.gov/water_issues/programs/discharge_monitoring.

VII. MODIFICATIONS TO ATTACHMENT G

This MRP modifies Attachment G as indicated below:

A. Attachment G section V.C.1.c.2 is revised as follows:

2) When determining compliance with an average monthly or maximum daily effluent limitation and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of detected but not quantified (DNQ) or nondetect (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

   i. The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

   ii. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

   If a sample result, or the arithmetic mean or median of multiple sample results, is below the reporting limit, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation and the Discharger conducts a Pollutant Minimization Program, the Discharger shall not be deemed out of compliance.

B. Attachment G sections V.C.1.f and V.C.1.g are revised as follows, and section V.C.1.h (Reporting data in electronic format) is deleted.

f. Annual self monitoring report requirements

   By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

   1) Annual compliance summary table of treatment plant performance, including documentation of any blending events (this summary table is not required if the Discharger has submitted the year's monitoring results to CIWQS in electronic reporting format by EDF/CDF upload or manual entry);

2) Comprehensive discussion of treatment plant performance and compliance with the permit (This discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices.);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater (this item is not required if the Discharger has submitted the year's monitoring results to CIWQS in electronic reporting format by EDF/CDF upload or manual entry);

4) List of approved analyses, including the following:

   (i) List of analyses for which the Discharger is certified;

   (ii) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory shall not be submitted but be retained onsite); and

   (iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all stormwater to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs addressed as follows, unless the Discharger submits SMRs electronically to CIWQS:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format – *Deleted*

ATTACHMENT F - FACT SHEET

Contents

Tables

ATTACHMENT F – FACT SHEET

This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order. As described in section II.B of the Order, the Regional Water Board incorporates this Fact Sheet as its findings supporting the issuance of the Order.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility:

Table F-1. Facility Information

WDID	2 01S0067
CIWQS Place ID	255924
Discharger	Schnitzer Steel Industries, Inc.
Facility Name	Schnitzer Steel Products Company
Facility Address	1101 Embarcadero West Oakland, CA 94607
	Alameda County
Facility Contact, Title, Phone, Email	Rob Ellsworth, Regional Environmental Manager 916-705-2934, rellsworth@schn.com
Authorized Person to Sign and Submit Reports	Same as Facility contact
Mailing Address	P. O. Box 747 Oakland, CA 94604
Billing Address	Same as mailing address
Facility Type	Industrial, SIC Code 5093 (Scrap and Waste Materials)
Major or Minor Facility	Minor
Threat to Water Quality	2
Complexity	B
Pretreatment Program	No
Reclamation Requirements	Not Applicable
Permitted Flow	600 gallons per minute (gpm)
Design Flow	600 gpm (0.86 million gallons per day)
Watershed	South Bay Basin
Receiving Water	Oakland Inner Harbor
Receiving Water Type	Marine

A. Schnitzer Steel Industries, Inc., (Discharger) owns and operates the Schnitzer Steel Products Company (Facility), a 26.5-acre scrap metal recycling facility adjacent to the Oakland Inner Harbor at 1101 Embarcadero West, Oakland. Attachment B includes a map of the Facility and its surroundings. The Facility is surrounded by approximately 5,000 feet of perimeter walls. Operations at this site began in 1965.

For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

B. The Facility intermittently discharges treated stormwater and process wastewater to Oakland Inner Harbor, a water of the United States within the South Bay Basin watershed. Prior to this Order, the

Facility was regulated pursuant to the *Waste Discharge Requirements for Discharges of Storm Water associates with Industrial Activities Excluding Construction Activities*, NPDES Permit No. CAS000001. This Order terminates the Discharger's coverage under the statewide permit because this Order regulates the same discharges.

C. The Discharger filed a report of waste discharge and application for Waste Discharge Requirements (WDRs) and NPDES permit on January 30, 2015, and provided supplemental information on March 31, 2015, and April 20, 2015.

II. FACILITY DESCRIPTION

A. Wastewater Treatment and Controls

1. Facility Operations. Facility operations include shredding light iron products; shearing and torch cutting heavy recyclable steel products; preparing and sorting ferrous and non-ferrous metal recycling feedstock; treating shredder residue; staging of raw scrap metal, recycled metal products, and shredder residue; and shipping finished products and treated shredder residue. Attachment B provides maps indicating the locations of specific activities, including materials storage. Attachment C provides the process flow diagram.

Bulk scrap metal is delivered to the Facility by rail and truck at the main commercial entrance at Embarcadero West, where it is inspected and designated for unloading according to the following segregated material streams:

- "Bonus" heavy melting steel material to be processed by torch cutting into smaller sizes for shipment;
- Standard grade heavy melting steel to be processed by shear cutting into smaller sizes prior to shipment; and
- Light iron products, including automobiles, appliances, and other recyclable light steel materials, to be processed by shredding prior to further processing for removal of ferrous and non-ferrous metals.

At the shredder, light iron products are shredded so that ferrous metals can be magnetically isolated from non-ferrous metals and non-metallic materials, including plastic, glass, fiber, rubber, and other non-metallic materials found in light iron products. The finished isolated ferrous metals are stockpiled and loaded into cargo ships at the Facility's docks. The remaining material, which is a combination of non-ferrous metals and non-metallic materials, known as non-ferrous raw, is further processed at the Joint Products Plant, where non-ferrous metals are separated by metal type from the non-metallic materials and stored in designated bins prior to being placed into shipping containers for transport by truck to a Port of Oakland container loading dock. The residual non-metallic material (referred to as shredder residue) is chemically stabilized using cement and silicate and transported by truck to landfills for use as alternative daily cover.

Non-bulk ferrous and non-ferrous metal scrap is received at the peddler entrance, inspected, and sorted. Larger objects are shredded and processed as described above. Smaller scrap is sorted and segregated by hand into bins. Finished products are baled or stored in cargo containers and transported by truck to a container loading dock at the Port of Oakland.

2. **Wastewater Generation**. Wastewater is generated through multiple Facility operations, including ship loading, shredding, materials handling, wheel washing, oil-water separation, and firefighting. Domestic wastewater is discharged to the local sanitary sewer system.

   a. **Ship Loading**. Ships are loaded either directly from trucks on the concrete pier crane dock with a skiff pan or through a conveyor system that runs along the wooden pier. Approximately 30,000 gallons per day of potable water is sprayed to minimize fugitive dust generated by ship loading operations, which typically occur once or twice per month for an average of three to four days per event. Spilled product, dust, dirt, rubbish, refuse, and debris are removed and disposed of offsite (see "Sludge and Solids Management," below).

      i. **Concrete Pier Crane Dock.** The pier crane dock has concrete curbs, drain inlets, and pipes and pumps that collect and convey runoff for treatment. It also has splash guards to contain water. Periodically, the pier crane dock is power-washed or swept. Runoff from dust suppression and washdown is collected by a containment system, transferred upland, and re-used onsite (see "Onsite Water Recycling," below).

      ii. **Wooden Pier Conveyor System.** The wooden pier has a shrouded conveyor system with a containment tray beneath the conveyor, rubber edge guards, and a telescoping arm that can fully extend into ships to place materials. The portion that extends over open water is enclosed. The pier is partially lined with recycled conveyor belts and surrounded by wooden beams to capture debris. The pier is swept after loading operations. Water that falls into the containment tray either evaporates or is transferred upland for onsite re-use (see "Onsite Water Recycling," below). Conditions at the wooden pier will improve with implementation of Provision VI.C.8.

   b. **Shredding**. Approximately 30,000 to 50,000 gallons per day of onsite recycled water (supplemented by potable water) is injected into the shredder to control heat and abate dust emissions. Residual water not evaporated by the latent heat of the shredding process is captured by a series of pumps and sumps and conveyed to a 1.2-million-gallon tank to be recycled (see "Onsite Water Recycling," below).

   c. **Materials Handling**. Various incoming scrap, processed scrap metal products, and process residues are stored outdoors in large stockpiles. During internal transfer and handling operations, approximately 21,000 gallons per day of potable water is sprayed on internal access roads and the working faces of the stockpiles for dust suppression. The runoff is collected by the stormwater conveyance system and re-used onsite (see "Onsite Water Recycling," below).

   d. **Wheel Washing**. Two large, custom, industrial wheel wash systems are used to clean the wheels and undercarriages of trucks entering the pier crane dock and exiting the Facility. The systems collect, treat, and reuse the wash water in a closed loop system. Periodically, potable water is supplied to the systems and sediment is emptied into a dewatering bin and disposed of offsite (see "Sludge and Solids Management," below).

   e. **Oil-Water Separation**. Three oil-water separators collect water draining from the shear area, the maintenance shop, and the northern part of the outdoor product storage area. Treated effluent from the oil-water separators is pumped to the onsite water recycling system for reuse in the metal shredding process. Free petroleum product is removed from

the oil-water separators by vacuum truck and disposed of offsite (see "Sludge and Solids Management," below).

f. Firefighting. In the event of a fire at the Facility, potable water is used to extinguish the fire. The runoff is captured by the stormwater conveyance system and re-used onsite (see "Onsite Water Recycling," below).

3. Onsite Water Recycling. The Discharger retains stormwater and process wastewater onsite for recycling and reuse. Stormwater and process wastewater are collected by means of sheet flow and a collection system consisting of drain inlets, sumps, and pump stations that collect and convey surface drainage to the center of the Facility near the shredder. Portable pumps are also used to convey ponded water to the collection system.

The comingled stormwater and process wastewater is directed to a weir box adjacent to the shredder, where solids are allowed to settle out. From there, the wastewater is pumped to another weir box for further solids settling before flowing through a screening system to remove more solids prior to storage in a 1.2-million-gallon storage tank. The wastewater in the storage tank is sent to a 60,900-gallon clarifier for additional solids removal before flowing to a 33,700-gallon day tank that serves as the feed tank for the shredder cooling and dust suppression system. The 33,700-gallon day tank also serves as a surge tank feeding the onsite wastewater treatment system. Residual solids and sediment are collected, sampled, and disposed of offsite.

The Discharger maximizes the use of onsite recycled water in the shredding operation and supplements it with potable water only when necessary (typically during the dry season). During the wet season, when the stormwater and process wastewater exceed (or could exceed) the holding capacity of the 1.2-million-gallon storage tank, the Discharger routes the wastewater for treatment before discharge (see "Wastewater Treatment and Discharge," below).

4. Wastewater Treatment and Discharge. The Discharger operates a multistage wastewater treatment system that treats excess wastewater and discharges the effluent to the sanitary sewer under East Bay Municipal Utility District (EBMUD) Wastewater Discharge Permit No. 02300311. When EBMUD allows discharge to the sanitary sewer, the Discharger may discharge an unlimited volume of water to the sanitary sewer at a maximum flow rate of 600 gallons per minute. Under the terms and conditions of the EBMUD permit, the Discharger may not discharge to the sanitary sewer during a rain event (or within 24 hours after a rain event), which is defined as any precipitation greater than a drizzle. Under such conditions, the Discharger stores the runoff and treated wastewater onsite until discharge to the sanitary sewer can resume. If rain persists or if substantial additional rain is forecast, then the Discharger further treats its wastewater by routing it through activated carbon units and discharges the polished effluent to a City of Oakland storm sewer (Discharge Point No. 001) pursuant to this Order. The Discharger actively manages its wastewater through onsite storage and by discharging to the sanitary sewer as much as possible. Discharge to the storm sewer occurs only in the event of significant or extended periods of precipitation.

The treatment system is designed to treat up to 600 gallons of wastewater per minute and includes storage and preliminary clarification, electrocoagulation, clarification and filtration, and carbon polishing. Attachment C provides a schematic process flow diagram.

a. **Storage and Preliminary Clarification**. Wastewater from the 1.2-million gallon storage tank is pumped to a 60,900-gallon preliminary clarifier. From there, the wastewater flows to the 33,700-gallon day tank prior to being sent for electrocoagulation.

b. **Electrocoagulation**. Wastewater from the pre-treatment conditioning tank is distributed through a series of electrocoagulation treatment cells, where highly charged polymeric metal hydroxides are introduced. This neutralizes the surface charges on metal or other pollutant-containing colloidal and suspended solids to facilitate agglomeration, coagulation, and subsequent separation.

c. **Clarification and Filtration**. When the wastewater leaves the electrocoagulation treatment cells, it enters a clarification system where coagulated particles are removed by gravity. The wastewater then undergoes sand filtration to further remove solids. The filtrate is pumped to a sanitary sewer connection located near the Joint Products Plant area and discharged to the sanitary sewer under the terms of the EBMUD permit.

d. **Carbon Polishing**. Any water not discharged to the sanitary sewer is passed through additional granulated activated carbon treatment to remove organics and other trace contaminants prior to discharge to the storm sewer (Discharge Point No. 001).

5. **Other Discharges.** Although this Order generally prohibits discharge of untreated stormwater, process wastewater, and waste materials, it also recognizes the potential for incidental dust suppression water droplets, incidental spilled product from ship loading activity, fugitive dust or dirt, or wind-blown debris to be discharged despite implementation of the BMPs listed in Provision VI.C.6.d of the Order.

6. **Sludge and Solids Management.** Free petroleum products generated from the oil-water separators, and residual solids and sediment generated during ship loading, wheel washing, onsite water recycling, and other housekeeping activities, are periodically removed from their containment systems. The sludge generated by the wastewater treatment system is removed on an as-needed basis (e.g., when the sludge starts to affect the effluent storage capacity). All solids and sludge are profiled and disposed of offsite at permitted landfills.

B. Discharge Point and Receiving Water

Fully-treated effluent not used onsite or discharged to the sanitary sewer is discharged to a 60-inch-diameter storm drain that traverses the eastern side of the Facility (Discharge Point No. 001). The storm drain discharges to the Oakland Inner Harbor, which is part of Lower San Francisco Bay.

C. Compliance Summary

This Order is a new NPDES permit. Prior to adoption of this Order, the Facility was regulated under NPDES Permit No. CAS000001 (industrial stormwater general permit), most recently issued through State Water Board Order No. 2014-0057-DWQ and, prior to that, State Water Board Order No. 97-03-DWQ.

A compliance inspection report dated March 29, 2012, indicates that the Discharger violated Order No. 97-03-DWQ by discharging wastes, including process sediment, industrial wastewater, and

debris from its shredding operation, into surface waters and at places where they were (or could have been) discharged to surface waters. Specifically, the pier crane dock (including the access bridge) and the ship loading conveyor did not fully contain process wastewater, process sediment, and other solids, which could have been discharged to the waters below. The Facility, which is mostly unpaved, is constructed like a large "bowl" that collects water onsite. Pooled water comes into contact with scrap, product, and waste piles and errant debris throughout the site. On March 29, 2012, various sheens were visible on the pooled water, indicating the presence of pollutants. Trucks driving through unpaved muddy areas with pooled water left wet sediment tracks on the access road leading from the site exit to Embarcadero West, which was covered with a layer of sediment and dust. Debris from the shredding operation was visible on neighboring properties adjacent to storm drains susceptible to runoff to the Oakland Inner Harbor.

On January 2, 2013, the Regional Water Board issued Cleanup and Abatement Order No. R2-2013-1001, which, among other things, required the Discharger to propose and implement best management practices (BMPs) to reduce or prevent pollutant discharges into the Oakland Inner Harbor. The Discharger submitted a new Storm Water Pollution Prevention Plan, BMP Plan, and Onsite Water Recycling Plan and Stockpile Management Plan on February 15, 2013, and revised plans on November 4, 2014, that describe the BMPs implemented at the Facility to date, including construction of a new wastewater treatment system (described in Fact Sheet section II.A.4, above) to treat stormwater not reused onsite. In subsequent correspondence dated July 2, 2015, the Regional Water Board acknowledged significant BMPs were implemented that improve water quality but stated that additional improvements are needed.

D. Planned Changes

During the term of this Order, the Discharger is considering a project to design and build enclosures for the shredder and the Joint Products Plant to minimize aerial dispersion of waste materials. This possible change is mentioned here only for informational purposes and is not a requirement of this Order *per se*, except to the extent that it pertains to compliance with this Order's requirements. Mention here does not imply Regional Water Board authorization. The Discharger may need to seek permits or permit modifications to implement this change.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

A. Legal Authorities. This Order serves as WDRs pursuant to Water Code article 4, chapter 4, division 7 (commencing with § 13260). This Order is also issued pursuant to Clean Water Act (CWA) section 402 and implementing regulations adopted by U.S. EPA and Water Code chapter 5.5, division 7 (commencing with § 13370). It shall serve as an NPDES permit for point source discharges from the Facility to surface waters.

B. California Environmental Quality Act. Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act, Public Resources Code division 13, chapter 3 (commencing with § 21100). Compliance with the provisions of CEQA is only required for NPDES permit actions pertaining to new sources as defined by the federal Clean Water Act (i.e., sources constructed after New Source Performance Standards were published). The Facility is not a new source because U.S. EPA has not published New Source Performance Standards for this discharge category.

C. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plan.** The San Francisco Bay Regional Water Board (Regional Water Board) adopted *The Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. Requirements in this Order implement the Basin Plan. In addition, this Order implements State Water Board Resolution 88-63, which established State policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply (MUN). Because of the marine influence on San Francisco Bay, total dissolved solids levels in the receiving water exceed 3,000 mg/L and thereby meet an exception to State Water Board Resolution No. 88-63. The MUN designation therefore does not apply to the receiving water. Beneficial uses applicable to Oakland Inner Harbor are as follows:

Table F-2. Beneficial Uses

Discharge Point	Receiving Water	Beneficial Uses
001	Oakland Inner Harbor	Estuarine habitat (EST) Wildlife habitat (WILD) Contact water recreation (REC-1) Non-contact water recreation (REC-2) Navigation (NAV)

2. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** U.S. EPA adopted the NTR on December 22, 1992, and amended it on May 4, 1995, and November 9, 1999. About 40 criteria in the NTR apply in California. On May 18, 2000, U.S. EPA adopted the CTR. The CTR promulgated new toxics criteria for California and incorporated the previously adopted NTR criteria that applied in the State. U.S. EPA amended the CTR on February 13, 2001. These rules contain water quality criteria for priority pollutants.

3. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated for California through the NTR and the priority pollutant objectives the Regional Water Board established in the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria U.S. EPA promulgated through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives, and provisions for chronic toxicity control. Requirements of this Order implement the SIP.

4. **Antidegradation Policy.** Federal regulations at 40 C.F.R. section 131.12 require that state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy through State Water Board Resolution 68-16, "*Statement of Policy with Respect to Maintaining High Quality of Waters in California*," which is deemed to incorporate the federal antidegradation policy where the federal policy applies under federal law. Resolution 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Basin Plan

implements, and incorporates by reference, both the State and federal antidegradation policies. Permitted discharges must be consistent with the antidegradation provisions of 40 C.F.R. section 131.12 and State Water Board Resolution 68-16.

5. **Anti-Backsliding Requirements.** CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.

6. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code §§ 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. §§ 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the State, including protecting rare, threatened, or endangered species. The Discharger is responsible for meeting all applicable Endangered Species Act requirements.

D. Impaired Waters on CWA 303(d) List. In October 2011, U.S. EPA approved a revised list of impaired waters prepared pursuant to CWA section 303(d), which requires identification of specific water bodies where it is expected that water quality standards will not be met after implementation of technology-based effluent limitations on point sources. Where it has not done so already, the Regional Water Board plans to adopt Total Maximum Daily Loads (TMDLs) for waters on the 303(d) list. TMDLs establish wasteload allocations for point sources and load allocations for non-point sources and are established to achieve the water quality standards for the impaired waters.

Oakland Inner Harbor is listed as impaired by chlordane, DDT, dieldrin, dioxins and furans, invasive species, mercury, PCBs, and selenium. On February 12, 2008, U.S. EPA approved a TMDL for mercury in San Francisco Bay. On March 29, 2010, U.S. EPA approved a TMDL for PCBs in San Francisco Bay. Neither TMDL contains a wasteload allocation for this discharge. Therefore, this Order prohibits mercury and PCBs discharges unless and until a watershed permit (e.g., NPDES Permit No. CA 0038849) allows them. No TMDLs have been completed yet for the other pollutants on the 303(d) list; available data do not indicate that the Facility discharges those pollutants in detectable quantities.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants discharged into waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 C.F.R. section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 C.F.R. section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of receiving waters.

A. Discharge Prohibitions

1. **Discharge Prohibition III.A** (No discharge of treated wastewater at a location or in a manner different from that described in this Order): This prohibition is based on 40 C.F.R. section 122.21(a), duty to apply, and Water Code section 13260, which requires filing an application and Report of Waste Discharge before discharges can occur. Discharges not described in the permit application and Report of Waste Discharge, and subsequently in this Order, are prohibited.

2. **Discharge Prohibition III.B** (No discharge at Discharge Point No. 001 whenever EBMUD accepts wastewater via the sanitary sewer): Basin Plan Table 4-1, Discharge Prohibition 1, prohibits discharges not receiving a minimum of 10:1 initial dilution. This Order grants an exception to this prohibition based, in part, on the fact that the discharge is intermittent and occurs only during significant storms. This prohibition ensures that the Facility is operated as intended.

   Basin Plan section 4.2 provides for exceptions to Basin Plan Discharge Prohibition 1 under certain circumstances:

   - An inordinate burden would be placed on the Discharger relative to the beneficial uses protected, and an equivalent level of environmental protection can be achieved by alternate means;
   - A discharge is approved as part of a reclamation project;
   - Net environmental benefits will be derived as a result of the discharge; or
   - A discharge is approved as part of a groundwater cleanup project.

   The Basin Plan further states:

   > Significant factors to be considered by the Regional Water Board in reviewing requests for exceptions will be the reliability of the discharger's system in preventing inadequately treated wastewater from being discharged to the receiving water and the environmental consequences of such discharges.

   This Order grants an exception for discharges to the Oakland Inner Harbor for the following reasons:

   a. An inordinate burden would be placed on the Discharger relative to the beneficial uses protected if this Order were to require the discharge to achieve 10:1 dilution within the Oakland Inner Harbor. Constructing and operating a deepwater outfall is burdensome since the discharge occurs only during significant storms. Additionally, the municipal storm outfall is not within the control of the Discharger. Moreover, since discharge is allowed only during significant storms, there are high turbulent flows in the municipal storm system to rapidly dilute and diffuse the discharge prior to it entering the Oakland Inner Harbor, which achieves the intended purpose of Basin Plan Prohibition 1.

   b. An equivalent level of environmental protection is provided by various means: (1) the allowance of discharge only when necessary during significant storms (Prohibition III.B) when there will also be high diluting flows in the municipal storm sewer system and

receiving water; (2) the requirement for multistage treatment using electrocoagulation and other technologies including carbon adsorption (Prohibitions III.D and E, and treatment description in Fact Sheet section II.A.4, above); and (3) requirements for treatment system optimization and standard operation and maintenance procedures to ensure the highest quality of discharge (Provisions VI.C.4 and VI.C.5).

3. **Discharge Prohibition III.C** (No discharge greater than 600 gallons per minute at Discharge Point No. 001): This prohibition ensures that wastewater flows do not exceed the design capacity of the wastewater treatment facility. Discharge in excess of the design capacity could compromise treatment performance.

4. **Discharge Prohibition III.D** (No bypass of untreated or partially-treated effluent): This prohibition is based on 40 C.F.R. section 122.41(m). Bypass of treatment is prohibited except in accordance with 40 C.F.R. section 122.41(m) (see Attachment D section I.G).

5. **Discharge Prohibition III.E** (No discharge of untreated stormwater, process wastewater, or waste materials, except as authorized by this permit): This prohibition is based on Basin Plan Discharge Prohibition 7 and ensures that stormwater, process wastewater, and waste materials, such as dust suppression water, wash water, spilled product, fugitive dust, dirt, rubbish, refuse, or debris, are not discharged into the Oakland Inner Harbor or other waters of the United States. This prohibition does not pertain to incidental amounts of waste materials discharged despite implementation of the BMPs listed in Provision VI.C.6.d of the Order.

B. Technology-Based Effluent Limitations

1. Scope and Authority

CWA section 301(b) and 40 C.F.R. section 122.44 require that permits include conditions meeting technology-based requirements at a minimum and any more stringent effluent limitations necessary to meet water quality standards. The CWA requires that technology-based effluent limitations be established based on several levels of control:

- **Best practicable treatment control technology (BPT).** BPT represents the average of the best existing performance by well-operated facilities within an industrial category or subcategory. BPT standards apply to toxic, conventional, and non-conventional pollutants.

- **Best available technology economically achievable (BAT).** BAT represents the best existing performance of treatment technologies that are economically achievable within an industrial point source category. BAT standards apply to toxic and non-conventional pollutants.

- **Best conventional pollutant control technology (BCT).** BCT represents the control from existing industrial point sources of conventional pollutants, including biochemical oxygen demand, total suspended solids, fecal coliform, pH, and oil and grease. The BCT standards are established after considering the relationship between the cost of attaining a reduction in effluent discharge and the benefits that would result and also the cost effectiveness of additional industrial treatment beyond BPT.

- **New source performance standards (NSPS).** NSPS represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA requires U.S. EPA to develop effluent limitations, guidelines, and standards representing application of BPT, BAT, BCT, and NSPS. U.S. EPA has done so for many types of industries but not scrap metal recycling.

Basin Plan Table 4-2 contains technology-based effluent limitations for pH, residual chlorine, settleable matter, and oil and grease that apply to all treatment facilities. It also contains effluent limitations for biochemical oxygen demand (BOD) and total suspended solids (TSS) that the Regional Water Board may, at its option, apply to non-sewage discharges as long as doing so does not preempt any of U.S. EPA's effluent limitations, guidelines, and standards.

CWA section 402(a)(1) and 40 C.F.R. section 125.3 authorize the use of best professional judgment to derive technology-based effluent limitations on a case-by-case basis whenever U.S. EPA has not promulgated effluent limitations, guidelines, and standards. When best professional judgment is used, the Regional Water Board must consider specific factors outlined in 40 C.F.R. section 125.3.

2. Effluent Limitations

For discharges from Discharge Point No. 001, this Order imposes the technology-based pH and oil and grease effluent limitations from Basin Plan Table 4-2 because these limitations apply to all treatment facilities. It does not impose the residual chlorine limitation from Basin Plan Table 4-2 because the Discharger's treatment system does not involve chlorination, and any residual chlorine from potable water used onsite would dissipate before discharge. It does not impose BOD effluent limitations because the discharge does not contain sewage. Finally, it does not impose settleable matter effluent limitations because the treatment system includes sand filtration and carbon filtration in addition to sedimentation, and all but the finest suspended particulates are expected to be removed from the wastewater.

Based on best professional judgment, this Order imposes the TSS effluent limitations from Basin Plan Table 4-2 for Discharge Point No. 001 discharges because the treatment system is designed to remove metal and other pollutant-containing particular matter (electrocoagulation is a key component of the treatment train). TSS removal is a good indicator of treatment system performance. TSS is a conventional pollutant and, therefore, subject to BPT and BCT levels of control. BAT controls do not apply because they only apply to toxic and non-conventional pollutants. NSPS controls do not apply because the Facility is not a "new source" (i.e., a source created after U.S. EPA establishes NSPS effluent limitations, guidelines, and standards, which it has not done for scrap metal recycling). When using best professional judgment to impose technology-based effluent limitations based on BPT and BCT controls, 40 C.F.R. section 125.3(d) requires that the Regional Water Board consider the following factors:

Table F-3. Factors Considered Pursuant to 40 C.F.R. section 125.3(d)

Factors	Considerations
Cost relative to pollutant reduction benefits	The Discharger indicates that the treatment system cost more than $2 million to build. It expects ongoing operations and maintenance to cost approximately $1,900 per million gallons per year (or about $1,600 for each operating day). The treatment system reduces TSS concentrations from as high as 100 mg/L to less than 4 mg/L. As such, it reduces pollutant loads delivered to Discharge Point No. 001 and the sanitary sewer system.
Comparison of cost and pollutant reductions from publicly-owned treatment works to those from this Facility	The treatment system cost and pollutant reduction is comparable to those of a publicly-owned treatment works because this Order imposes the same TSS effluent limits as the Regional Water Board assigns to publicly-owned treatment works (both based on Basin Plan Table 4-2).
Age of equipment and facilities involved	The treatment system is new; construction was completed in August 2015.
Process employed	The treatment system employs electrocoagulation and other processes designed primarily to remove solids (e.g., TSS) from scrap metal recycling wastewater.
Engineering aspects of application or control techniques	Electrocoagulation effectively removes particles ranging from suspended solids to sub-micrometer colloids. It generates less volumes of sludge and the sludge is more shear resistant and more readily dewatered when compared to conventional chemical coagulation. It is a common technique used to treat industrial wastewater containing metals.
Process changes	The treatment system is new; no process changes are necessary.
Non-water quality environmental impacts (including energy requirements)	The Port of Oakland conducted an Initial Study, dated November 14, 2014, pursuant to the California Environmental Quality Act. The study concluded that treatment system construction and other site improvements could not have a significant environmental impact on the environment; therefore, the Port of Oakland certified a Negative Declaration on January 6, 2015.

Due to the intermittent nature of the discharge, this Order specifies that compliance with the average monthly effluent limits for oil and grease and TSS is to be based on at least two monitoring results collected within the same calendar month. For months during which the Discharger cannot collect a second sample due to lack of additional discharge events, compliance is to be evaluated based only on the maximum daily effluent limits.

This Order (section IV.B) cites Provision VI.C.6 as a narrative effluent limitation applicable to Discharge Point No. 001 and any other discharges that comply with Discharge Prohibition III.E of this Order. According to State Water Board Order No. 2014-0057-DWQ, which, for the most part, contains essentially the same requirements, these requirements reflect BAT and BCT to reduce or prevent discharges of pollutants in a manner that reflects best industry practice considering technological availability and economic practicability and achievability. This standard restates the standard U.S. EPA articulated in its 2015 *Multi-Sector General Permit for Stormwater Discharges Associated with Industrial Activity* and its accompanying Fact Sheet. This approach is authorized by 40 C.F.R. section 122.44(k), which allows BMPs to be used in lieu of numeric effluent limitations to control or abate pollutant discharges. Because BAT is more stringent than BPT, additional measures to implement BPT are unnecessary.

Similarly, this Order (section IV.B) cites Provision VI.C.4 as a narrative effluent limitation to ensure that discharges reflect BAT and BCT.

C. Water Quality-Based Effluent Limitations

1. Scope and Authority

This Order contains Water Quality Based Effluent Limitations (WQBELs) that implement water quality objectives that protect beneficial uses. CWA section 301(b) and 40 C.F.R. section 122.44(d) require that permits include limitations more stringent than federal technology-based requirements where necessary to achieve applicable water quality standards. According to 40 C.F.R. section 122.44(d)(1)(i), permits must include effluent limitations for all pollutants that are or may be discharged at levels that have a reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective, WQBELs must be established using (1) U.S. EPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting a narrative criterion, supplemented with relevant information (40 C.F.R. § 122.44[d][1][vi]). The process for determining reasonable potential and calculating WQBELs is intended to achieve applicable water quality objectives and criteria and protect designated uses of receiving waters as specified in the Basin Plan. This Order imposes numeric effluent limitations for pollutants with reasonable potential to cause or contribute to exceedances of water quality standards.

The discussion below focuses on numeric WQBELs for Discharge Point No. 001. To the extent that this Order seeks to control other potential discharges that comply with Discharge Prohibition III.E, it is infeasible to establish numeric effluent limitations; therefore, Provision VI.C.6 of this Order also serves as a narrative WQBEL. Regulations at 40 C.F.R. section 122.44(k)(4) authorize the use of BMPs to control or abate pollutant discharges when numeric effluent limitations are infeasible. Compliance with these conditions is expected to control discharges sufficiently to meet applicable water quality standards.

2. Water Quality Criteria and Objectives

a. Basin Plan Objectives. The Basin Plan specifies numeric water quality objectives for numerous pollutants and narrative water quality objectives for others, including toxicity. The narrative toxicity objective states, “All waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce other detrimental responses in aquatic organisms.”

b. CTR Criteria. The CTR specifies numeric aquatic life and human health criteria for numerous priority pollutants. These criteria apply to inland surface waters and enclosed bays and estuaries. Some human health criteria are for consumption of “water and organisms” and others are for consumption of “organisms only.” The criteria applicable to “organisms only” apply to the Oakland Inner Harbor because it does not support the municipal or domestic supply (MUN) beneficial use (i.e., it is not a drinking water source).

c. NTR. The NTR establishes numeric aquatic life and human health criteria for a number of toxic pollutants for San Francisco Bay waters upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. The NTR criteria apply to the Oakland Inner Harbor.

d. Receiving Water Salinity. Basin Plan section 4.6.2 (like the CTR and NTR) states that the salinity characteristics (i.e., freshwater versus saltwater) of the receiving water are to be considered in determining applicable water quality objectives. Freshwater criteria apply to discharges to waters with salinities equal to or less than one part per thousand (ppt) at least 95 percent of the time. Saltwater criteria apply to discharges to waters with salinities equal to or greater than 10 ppt at least 95 percent of the time in a normal water year. For discharges to waters with salinities between these two categories, or tidally-influenced freshwaters that support estuarine beneficial uses, the water quality objectives are the lower of the salt or freshwater objectives (the latter calculated based on ambient hardness) for each substance.

The Oakland Inner Harbor is a marine water body based on salinity data collected through Regional Monitoring Program (RMP). Salinity data collected from 1993 to 2013 at Yerba Buena Island (station BC 10), the RMP monitoring location nearest the discharge point, indicates that the salinity is less than 1 parts per thousand zero percent of the time and greater than 10 parts per thousand in 100 percent of the time. The Oakland Inner Harbor is therefore a marine water, and the marine water quality criteria and objectives apply.

e. Site-Specific Metals Translators. Effluent limitations for metals must be expressed as total recoverable metal (40 C.F.R. § 122.45[c]). Since the water quality objectives for metals are typically expressed as dissolved metal, translators must be used to convert metals concentrations from dissolved to total recoverable and vice versa. The CTR contains default translators; however, site-specific conditions, such as water temperature, pH, suspended solids, and organic carbon may affect the form of metal (dissolved, non-filterable, or otherwise) present and therefore available to cause toxicity. In general, dissolved metals are more available and more toxic to aquatic life than other forms. Site-specific translators can account for site-specific conditions, thereby preventing overly stringent or under-protective water quality objectives.

As listed in the table below, this Order incorporates site-specific translators for copper from Basin Plan Table 7.2.1-2 and site-specific translators for nickel from *North of Dumbarton Bridge Copper and Nickel Development and Selection of Final Translators* (Clean Estuary Partnership, March 2005). CTR default translators were used for all other metals.

Table F-4. Site-Specific Translators

Pollutant	Acute	Chronic
Copper	0.87	0.73
Nickel	0.85	0.65

f. Sediment Quality Objectives. The *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality* contains a narrative water quality objective: "Pollutants in sediments shall not be present in quantities that, alone or in combination,

are toxic to benthic communities in bays and estuaries of California." This objective is to be implemented by integrating three lines of evidence: sediment toxicity, benthic community condition, and sediment chemistry. The policy requires that if the Regional Water Board determines that a discharge has reasonable potential to cause or contribute to an exceedance of this objective, it is to impose the objective as a receiving water limit.

3. Need for Effluent Limitations (Reasonable Potential Analysis)

a. Available Information. When this Order was drafted, the Facility did not yet provide the full treatment described in Fact Sheet section II.A.4 and no performance data were available. Therefore, the reasonable potential analysis is based on performance data from a similar treatment system located in Surrey, British Columbia. The Surrey system closely resembles the treatment system at the Facility except that it does not contain the final carbon polishing step. Relying on Surrey facility data is, therefore, a conservative approach because the resulting reasonable potential analysis is based on data that could reflect higher pollutant concentrations than those of Facility effluent.

Data are available for three samples collected at the Surrey facility in March 2014, October 2014, and March 2015. The March 2014 data relate to volatile organics and polycyclic aromatic hydrocarbons. The October 2014 and March 2015 data relate to metals.

For ambient background data, this reasonable potential analysis relies on RMP data collected at Yerba Buena Island (station BC10) from 1993 through 2013, and additional Bay Area Clean Water Agencies data from *San Francisco Bay Ambient Water Monitoring Interim Report* (2003) and *Ambient Water Monitoring: Final CTR Sampling Update* (2004). These reports contain monitoring results from 2002 and 2003 for priority pollutants the RMP did not monitor at the time.

In some cases, reasonable potential cannot be determined because effluent data are limited or ambient background concentrations are unavailable. Provision VI.C.2 of the Order requires the Discharger to continue monitoring for these constituents in its effluent using analytical methods that provide the best feasible detection limits. When additional data become available, further analysis will be conducted to determine whether numeric effluent limitations are necessary.

b. Toxic Pollutants

i. Methodology. SIP section 1.3 sets forth the methodology used for this Order to assess whether a toxic pollutant has reasonable potential to exceed a water quality objective. The analysis begins with identifying the maximum effluent concentration (MEC) observed for each pollutant based on available effluent concentration data and the ambient background concentration (B). SIP section 1.4.3 states that ambient background concentrations are either the maximum ambient concentration observed or, for water quality objectives intended to protect human health, the arithmetic mean of observed concentrations. There are three triggers in determining reasonable potential:

- **Trigger 1** is activated if the maximum effluent concentration is greater than or equal to the lowest applicable water quality objective (MEC ≥ water quality objective).

- **Trigger 2** is activated if the ambient background concentration observed in the receiving water is greater than the water quality objective (B > water quality objective) *and* the pollutant is detected in any effluent sample.

- **Trigger 3** is activated if a review of other information indicates that a WQBEL is needed to protect beneficial uses.

ii. Analysis. The maximum effluent concentrations, most stringent applicable water quality criteria and objectives, and ambient background concentrations used in the analysis are presented in the following table, along with the reasonable potential analysis results (yes or no) for each pollutant. Reasonable potential was not determined for all pollutants because there are not water quality objectives for all pollutants. The analysis indicates that no pollutant exhibits reasonable potential to cause or contribute to exceedances of water quality objectives. However, Basin Plan section 7.2.1.2 requires copper WQBELs.

Table F-5. Reasonable Potential Analysis

CTR No.	Priority Pollutant	Governing Water Quality Objective (µg/L)	MEC or Minimum DL [1][2] (µg/L)	Maximum Background or Minimum DL [1][2] (µg/L)	RPA Result [3]

Footnotes:

[1] The maximum effluent concentration and ambient background concentration are the actual detected concentrations unless preceded by a "<" sign, in which case the value shown is the minimum detection level (DL).

[2] The maximum effluent concentration or ambient background concentration is "Unavailable" when there are no monitoring data for the constituent.

[3] RPA Results = Yes, if MEC ≥ WQC, B > WQC and MEC is detected, or Trigger 3
= No, if MEC and B are < WQC or all effluent data are undetected
= Unknown (U), if no criteria have been promulgated or data are insufficient.

[4] Basin Plan section 7.2.1.2 requires copper WQBELs.

[5] SIP section 1.3 excludes from its RPA procedure priority pollutants for which a TMDL has been developed. Basin Plan sections 7.2.2 and 7.2.3 contain mercury and PCBs TMDLs. The urban stormwater runoff wasteload allocations for those TMDLs implicitly include all current and future permitted discharges not otherwise addressed by another allocation and unpermitted discharges within the geographic boundaries of runoff management agencies. Because the Discharger discharges treated effluent to the City of Oakland storm drain, the discharge is covered under the Alameda County Clean Water Program wasteload allocation, which is implemented through NPDES Permit No. CAS612008, *Municipal Regional Stormwater NPDES Permit*. Provisions VI.C.4 through VI.C.6 of this Order further serve to implant these wasteload allocations.

[6] Basin Plan section 4.7.2.2 does not require cyanide WQBELs because the Discharger does not use cyanide in its industrial processes and does not disinfect its effluent.

c. Whole Effluent Acute Toxicity. Basin Plan section 3.3.18 states, "There shall be no acute toxicity in ambient waters" and requires effluent limitations for whole effluent acute toxicity. As such, it is presumed that there is reasonable potential for acute toxicity in the discharge to cause or contribute to exceedance of the toxicity water quality objective in the Oakland Inner Harbor.

d. Whole Effluent Chronic Toxicity. The discharge will be intermittent and temporally limited, occurring only during precipitation when EBMUD does not allow discharge to the sanitary sewer system. As such, discharge durations will be too short to result in chronic exposures, and thus there is no reasonable potential that the discharge could cause chronic toxicity in the Oakland Inner Harbor.

e. Sediment Quality. Pollutants in some receiving water sediments may be present in quantities that alone or in combination are toxic to benthic communities. Efforts are underway to identify stressors causing such conditions. However, to date there is no evidence directly linking compromised sediment conditions to the discharges subject to this Order; therefore, the Regional Water Board cannot draw a conclusion about reasonable potential for these discharges to cause or contribute to exceedances of the

sediment quality objectives. Nevertheless, pursuant to Monitoring and Reporting Program (MRP) section V, the Discharger will participate in the RMP, which monitors San Francisco Bay sediment and seeks to identify stressors responsible for degraded sediment quality. Thus far, the monitoring has provided only limited information about potential stressors and sediment transport. The Regional Water Board is exploring options for obtaining additional information that may inform future analyses.

4. Effluent Limitations

This Order does not contain water quality-based effluent limitations (WQBELs) for constituents that do not demonstrate any reasonable potential to exceed the water quality objectives; however, Provision VI.C.2 of the Order requires monitoring for such pollutants. If concentrations are found to have increased significantly, Provision VI.C.2 requires the Discharger to investigate the sources of the increases and implement remedial measures if the increases pose a threat to receiving water quality.

a. **Copper**. Basin Plan section 7.2.1.2 requires copper WQBELs for all wastewater discharges. The copper WQBELs are based on the procedures in SIP section 1.4. Average monthly effluent limitations (AMELs) and maximum daily effluent limitations (MDELs) were calculated as shown in the table below:

Table F-6. WQBEL Calculations

Pollutant	**Copper**
Units	**µg/L**
Basis and Criteria type	Basin Plan Aquatic Life
Criteria -Acute	11
Criteria -Chronic	8.2
SSO Criteria -Acute	-----
SSO Criteria -Chronic	-----
Water Effects ratio (WER)	1
Lowest WQO	8.2
Site Specific Translator - MDEL	0.87
Site Specific Translator - AMEL	0.73
Dilution Factor (D) (if applicable)	0
No. of samples per month	4
Aquatic life criteria analysis required? (Y/N)	Y
HH criteria analysis required? (Y/N)	N
Applicable Acute WQO	12.4
Applicable Chronic WQO	11.2
HH criteria	
Background (Maximum Conc for Aquatic Life calc)	2.5
Background (Average Conc for Human Health calc)	-----
Is the pollutant on the 303d list (Y/N)?	N
ECA acute	12.4
ECA chronic	11.2
ECA HH	

Pollutant	Copper
Units	**µg/L**
Number of data points <10 or at least 80% of data reported non detect? (Y/N)	Y
Avg of effluent data points	
Std Dev of effluent data points	
CV calculated	N/A
CV (Selected) - Final	0.60
ECA acute mult99	0.32
ECA chronic mult99	0.53
LTA acute	4.0
LTA chronic	5.9
minimum of LTAs	4.0

MDEL mult99	3.1
AMEL (aq life)	6.2
MDEL(aq life)	12.4
MDEL/AMEL Multiplier	2.0
AMEL (human hlth)	
MDEL (human hlth)	
minimum of AMEL for Aq. life vs HH	6.2
minimum of MDEL for Aq. Life vs HH	12
Previous permit limit (AMEL)	-----
Previous permit limit (MDEL)	-----
Final limit - AMEL	6.2
Final limit - MDEL	12

Due to the intermittent nature of the discharge, this Order specifies that compliance with the average monthly effluent limit for copper is to be based on at least two monitoring results collected within the same calendar month. For months during which the Discharger cannot collect a second sample due to lack of additional discharge events, compliance is to be evaluated based only on the maximum daily effluent limit.

b. Whole Effluent Acute Toxicity. The acute toxicity effluent limit is based on Basin Plan Table 4-3. The test species specified in the MRP are rainbow trout and fathead minnow. If one species is consistently less sensitive to the discharge than the other, the Discharger may discontinue monitoring using the less sensitive species. The Executive Officer must first concur in writing that monitoring with only one species is appropriate.

D. Discharge Requirement Considerations

1. Anti-backsliding. CWA sections 402(o) and 303(d)(4) and 40 C.F.R. section 122.44(l) require effluent limitations in a reissued permit to be as stringent as those in the previous

permit. This is the first individual NPDES permit for the Facility (the *Waste Discharge Requirements for Discharges of Storm Water associates with Industrial Activities Excluding Construction Activities*, NPDES Permit No. CAS000001, State Water Board Order No. 97-03-DWQ, did not impose numeric limits); therefore, there is no backsliding.

2. **Antidegradation.** Antidegradation policies require that existing water quality be maintained unless degradation is justified based on specific findings. State Water Board Resolution No. 68-16 sets forth California's Antidegradation policy. Consistent with 40 C.F.R section 131.12, Resolution No. 68-16 incorporates the federal antidegradation policy. The Basin Plan implements, and incorporates by reference, the State and federal antidegradation policies. Permitted discharges must be consistent with these policies.

   In accordance with State Water Board Administrative Procedures Update No. 90-004, the potential for degradation is evaluated by comparing the receiving water quality likely to result from the new permit to the water quality baseline. The water quality baseline is the best receiving water quality that has existed since 1968 when considering Resolution No. 68-16 or since 1975 under the federal policy, unless subsequent lowering was due to regulatory action consistent with State and federal antidegradation policies. If poorer water quality was permitted, the most recent water quality resulting from permitted action is the baseline water quality. For purposes of this analysis, existing water quality is assumed to be the best that has existed since 1968 and 1975. No poorer water quality has been permitted. (Water quality in 1968 and 1975 was worse than it is now because most CWA controls, such as the secondary treatment standards for municipal wastewater treatment, were not yet in place.)

   This Order authorizes the discharges to the Oakland Inner Harbor. Based on best professional judgment and pertinent available information, the discharge will not be adverse to the intent and purpose of the antidegradation policies. For the following reasons, these discharges will not degrade existing Oakland Inner Harbor water quality:

   i. Discharges from the Facility were previously regulated pursuant to NPDES Permit No. CAS000001. Authorized discharges occur intermittently and are temporally limited. They only occur during precipitation when the Discharger cannot discharge to the sanitary sewer.

   ii. The discharge is small relative to other wet weather discharges in the area, such as those from the storm drain system into which Facility effluent flows prior to discharge, and relative to the Oakland Inner Harbor and San Francisco Bay. The treatment system design capacity is only 600 gallons per minute. The storm drain can discharge up to 27,000 gallons per minute.

   iii. The intermittent and short-term discharges to the Oakland Inner Harbor will be dispersed throughout San Francisco Bay by currents and tides and will not result in observable water quality differences, particularly after each short-term discharge ceases.

   Based on these findings, a more comprehensive antidegradation analysis is not required.

3. **Stringency of Requirements for Individual Pollutants.** This Order contains technology-based effluent limitations for certain pollutant parameters and implements minimum, applicable federal technology-based requirements. Except for copper, this Order does not

contain WQBELs for individual pollutants because no individual pollutant exhibits reasonable potential to cause or contribute to exceedances of water quality objectives.

This Order's effluent limitations have been established to protect beneficial uses of the receiving water. The beneficial uses and associated water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that WQBELs were derived from the CTR, the CTR is the applicable standard pursuant to 40 C.F.R. section 131.38. U.S. EPA approved most Basin Plan beneficial uses and water quality objectives prior to May 30, 2000. Beneficial uses and water quality objectives submitted to U.S. EPA prior to May 30, 2000, but not approved by U.S. EPA before that date, are nonetheless "applicable water quality standards for purposes of the Clean Water Act" pursuant to 40 C.F.R. section 131.21(c)(1). U.S. EPA approved the remaining beneficial uses and water quality objectives so they are applicable water quality standards pursuant to 40 C.F.R. section 131.21(c)(2).

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

The receiving water limitations in sections V.A and V.B of the Order are based on Basin Plan narrative and numeric water quality objectives. The receiving water limitation in section V.C of the Order requires compliance with federal and State water quality standards.

VI. RATIONALE FOR PROVISIONS

A. Standard Provisions

Attachment D contains standard provisions that apply to all NPDES permits in accordance with 40 C.F.R. section 122.41 and additional conditions applicable to specific categories of permits in accordance with 40 C.F.R. section 122.42. The Discharger must comply with these provisions. The conditions set forth in 40 C.F.R. sections 122.41(a)(1) and (b) through (n) apply to all state-issued NPDES permits and must be incorporated into the permits either expressly or by reference.

In accordance with 40 C.F.R. section 123.25(a)(12), states may omit or modify conditions to impose more stringent requirements. Attachment G contains standard provisions that supplement the federal standard provisions in Attachment D.

This Order omits federal conditions that address enforcement authority specified in 40 C.F.R. sections 122.41(j)(5) and (k)(2) because the State's enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates Water Code section 13387(e) by reference.

B. Monitoring and Reporting

CWA section 308 and 40 C.F.R. sections 122.41(h), 122.41(j)-(l), 122.44(i), and 122.48 require that NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. The MRP (Attachment E) of this Order establishes monitoring, reporting, and recordkeeping requirements that implement federal and State requirements. For more background regarding these requirements, see Fact Sheet section VII.

C. Special Provisions

1. Reopener Provisions

These provisions are based on 40 C.F.R. sections 122.62 and 122.63 and allow modification of this Order and its effluent limitations as necessary in response to updated water quality objectives, regulations, or other new and relevant information that may become available in the future and other circumstances as allowed by law.

2. Effluent Characterization Study and Report

This Order does not include effluent limitations for priority pollutants that do not demonstrate reasonable potential, but this provision requires the Discharger to monitor for these pollutants as described in the MRP and Attachment G. Monitoring data are necessary to verify that the "no" and "unknown" reasonable potential analysis conclusions of this Order remain valid. This requirement is authorized pursuant to Water Code section 13267 and is necessary to inform the next permit reissuance.

3. Pollutant Minimization Program

This provision is based on SIP section 2.4.5.

4. Treatment System Optimization

This provision requires the Discharger to identify critical process control parameters and to optimize pollutant removal by July 1, 2017. This requirement is necessary to justify the equivalent protection exception from Basin Plan Prohibition 1. Furthermore, it ensures that the treatment system is operated in a manner reflective of BAT and BCT (i.e., best industry practice considering technological availability and economic practicability and achievability). The treated effluent resulting from the study must be discharged to the sanitary sewer because it may contain chlorine from the potable water used to simulate the influent wastewater to be treated.

5. Storage and Treatment Standard Operation and Maintenance Procedures

This provision requires the Discharger to develop standard procedures to ensure that the Facility personnel operate and maintain the treatment system appropriately and consistently. This requirement is necessary to justify the equivalent protection exception from Basin Plan Prohibition 1.

6. Water Pollution Prevention Plan

The requirements of this provision serve as narrative effluent limitations and facilitate compliance with Discharge Prohibition III.E of this Order. In conjunction with the numeric effluent limitations listed in Table 4 of the Order, they constitute technology-based pollutant discharge controls based on best professional judgment (see Fact Sheet section IV.B). These requirements reflect best industry practice considering technological availability and economic practicability and achievability.

The WPPP, including the Best Management Practices (BMPs) requirements, closely follow the corresponding requirements of NPDES Permit No. CAS000001 (State Water Board Order No. 2014-0057-DWQ, *General Permit for Storm Water Discharges Associated with Industrial Activities*), which, in turn, closely follows U.S. EPA's *Multi-Sector General NPDES Permit for Stormwater Discharges Associated with Industrial Activity.* However, the requirements in this Order more specifically address the nature of the Facility and the potential for pollutants associated with its scrap metal processing operations to directly or indirectly reach waters of the United States (e.g., through vehicle tracking, wind transport, or ship loading or unloading).

Prior to submitting the WPPP, this provision requires the Discharger to continue complying with provisions X and XI.A of NPDES Permit No. CAS000001. The Discharger has filed a Notice of Intent and received an Authorization to Discharge pursuant to that general permit. With adoption of this Order, coverage under that permit is no longer necessary. After submitting the WPPP, continued compliance with provisions X and XI.A of NPDES Permit No. CAS000001 will also be unnecessary.

7. Onsite Storage Capacity

This provision requires the Discharger to maintain the capacity to store stormwater and wastewater within the 1.2 million-gallon storage tank and determine the volume of onsite storage necessary to achieve WPPP objectives in a manner that reflects BAT and BCT (i.e., best industry practice considering technological availability and economic practicability and achievability). This provision requires the Discharger to implement storage improvements if necessary to reflect BAT and BCT.

8. Wooden Pier Conveyor System Containment

This provision requires containment of spilled product, dust, dirt, rubbish, refuse, and debris at the wooden pier. It also requires that stormwater and process wastewater be collected and transferred upland via the stormwater conveyance system. It reflects BAT and BCT, and reduces or prevents discharges in a manner that reflects best industry practice considering technological availability and economic practicability and achievability. This standard is already achieved at the concrete pier dock.

9. Structural Improvements

This provision requires the Discharger to implement structural improvements at the Facility. It reflects BAT and BCT and reduces or prevents discharges in a manner that reflects best industry practice considering technological availability and economic practicability and achievability.

VII. MONITORING AND REPORTING PROGRAM (MRP)

Attachment E contains the MRP for this Order. It specifies sampling stations, pollutants to be monitored (including all parameters for which effluent limitations are specified), monitoring frequencies, and reporting requirements. The following provides the rationale for the MRP requirements:

A. MRP Requirements Rationale

1. **Effluent Monitoring.** Effluent flow monitoring is necessary to evaluate compliance with Discharge Prohibition III.C and to understand Facility operations. Other effluent monitoring is necessary to evaluate compliance with this Order's effluent limitations and to support future reasonable potential analyses and possible development of WQBELs during the next permit reissuance.

   Additional monitoring is necessary to evaluate treatment system performance and support possible development of technology-based effluent limits during the next permit reissuance. Turbidity monitoring assesses colloidal matter removal. Total organic carbon monitoring assesses organic pollutant removal. Monitoring of certain metals assesses metals removal. The metals to be monitored include aluminum, iron, copper, lead, and zinc. These metals are associated with the scrap metal recycling industry (*Multi-sector General Permit for Stormwater Discharges Associated with Industrial Activity*, U.S. EPA, May 27, 2009).

2. **Receiving Water Monitoring.** The Discharger is required to participate in the RMP, which involves collecting data on pollutants and toxicity in San Francisco Bay water, sediment, and biota. This monitoring is necessary to characterize the receiving water and the effects of the discharge this Order authorizes.

B. Monitoring Requirements Summary

The table below summarizes routine monitoring requirements. This table is for informational purposes only. The actual requirements are specified in the MRP and elsewhere in this Order.

Table F-7. Monitoring Requirements Summary

Parameter	Effluent	Receiving Water	Site
Flow	Continuous	---	---
Turbidity	1/Day	---	---
pH	1/Day	Support RMP	---
Total Suspended Solids	1/Event and at least 2/Year	---	---
Total Organic Carbon	1/Event and at least 2/Year	---	---
Oil and Grease	1/Event and at least 2/Year	---	---
Aluminum	1/Event and at least 2/Year	Support RMP	---
Iron	1/Event and at least 2/Year	Support RMP	---
Copper	1/Event and at least 2/Year	Support RMP	---
Lead	1/Event and at least 2/Year	Support RMP	---
Zinc	1/Event and at least 2/Year	Support RMP	---
Acute Toxicity	1/Year	--	---
Other Priority Pollutants	Once	Support RMP	---
Visual Observations	---	---	1/Month

VIII. PUBLIC PARTICIPATION

The Regional Water Board considered the issuance of this Order that will serve as an NPDES permit for the Facility. As a step in the order adoption process, Regional Water Board staff developed a tentative order and encouraged public participation in the order adoption process.

A. Notification of Interested Parties. The Regional Water Board notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and provided an opportunity to submit written comments and recommendations. Notification was provided through the *Oakland Tribune.* The public had access to the agenda and any changes in dates and locations through the Regional Water Board's website at http://www.waterboards.ca.gov/sanfranciscobay.

B. Written Comments. Interested persons were invited to submit written comments concerning the tentative WDRs as explained through the notification process. Comments were due either in person or by mail at the Regional Water Board office at 1515 Clay Street, Suite 1400, Oakland, California 94612, to the attention of Jessica Watkins.

For full staff response and Regional Water Board consideration, the written comments were due at the Regional Water Board office by **5:00 p.m. on September 19, 2016.**

C. Public Hearing. The Regional Water Board held a public hearing on the tentative WDRs during its regular meeting at the following date and time and at the following location:

Date: Wednesday, November 9, 2016
Time: 9:00 a.m.
Location: Elihu Harris State Office Building
1515 Clay Street, 1st Floor Auditorium
Oakland, CA 94612

Contact: Jessica Watkins, (510) 622-2349, jessica.watkins@waterboards.ca.gov

Interested persons were invited to attend. At the public hearing, the Regional Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony was requested to be in writing.

Dates and venues change. The Regional Water Board web address is http://www.waterboards.ca.gov/sanfranciscobay, where one could access the current agenda for changes in dates and locations.

D. Reconsideration of Waste Discharge Requirements. Any aggrieved person may petition the State Water Board to review the Regional Water Board's decision regarding the final WDRs. The State Water Board must receive the petition at the following address within 30 calendar days of the Regional Water Board action:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

For instructions on how to file a petition for review, see http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml.

E. Information and Copying. The Report of Waste Discharge, related supporting documents, and comments received are on file and may be inspected at the address above at any time between

8:00 a.m. and 5:00 p.m. (except noon to 1:00 p.m.), Monday through Friday. Copying of documents may be arranged by calling (510) 622-2300.

F. Register of Interested Persons. Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference the Facility, and provide a name, address, and phone number.

G. Additional Information. Requests for additional information or questions regarding this Order should be directed to Jessica Watkins, (510) 622-2349, jessica.watkins@waterboards.ca.gov.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

REGIONAL STANDARD PROVISIONS, AND MONITORING AND REPORTING REQUIREMENTS (SUPPLEMENT TO ATTACHMENT D)

FOR

NPDES WASTEWATER DISCHARGE PERMITS

APPLICABILITY

This document applies to dischargers covered by a National Pollutant Discharge Elimination System (NPDES) permit. This document does not apply to Municipal Separate Storm Sewer System (MS4) NPDES permits.

The purpose of this document is to supplement the requirements of Attachment D, Standard Provisions. The requirements in this supplemental document are designed to ensure permit compliance through preventative planning, monitoring, recordkeeping, and reporting. In addition, this document requires proper characterization of issues as they arise, and timely and full responses to problems encountered. To provide clarity on which sections of Attachment D this document supplements, this document is arranged in the same format as Attachment D.

I. STANDARD PROVISIONS - PERMIT COMPLIANCE

A. Duty to Comply – Not Supplemented

B. Need to Halt or Reduce Activity Not a Defense – Not Supplemented

C. Duty to Mitigate – This supplements I.C. of Standard Provisions (Attachment D)

1. Contingency Plan - The Discharger shall maintain a Contingency Plan as originally required by Regional Water Board Resolution 74-10 and as prudent in accordance with current municipal facility emergency planning. The Contingency Plan shall describe procedures to ensure that existing facilities remain in, or are rapidly returned to, operation in the event of a process failure or emergency incident, such as employee strike, strike by suppliers of chemicals or maintenance services, power outage, vandalism, earthquake, or fire. The Discharger may combine the Contingency Plan and Spill Prevention Plan into one document. Discharge in violation of the permit where the Discharger has failed to develop and implement a Contingency Plan as described below will be the basis for considering the discharge a willful and negligent violation of the permit pursuant to California Water Code Section 13387. The Contingency Plan shall, at a minimum, contain the provisions of a. through g. below.

a. Provision of personnel for continued operation and maintenance of sewerage facilities during employee strikes or strikes against contractors providing services.

b. Maintenance of adequate chemicals or other supplies and spare parts necessary for continued operations of sewerage facilities.

c. Provisions of emergency standby power.

d. Protection against vandalism.

e. Expeditious action to repair failures of, or damage to, equipment and sewer lines.

f. Report of spills and discharges of untreated or inadequately treated wastes, including measures taken to clean up the effects of such discharges.

g. Programs for maintenance, replacement, and surveillance of physical condition of equipment, facilities, and sewer lines.

2. Spill Prevention Plan - The Discharger shall maintain a Spill Prevention Plan to prevent accidental discharges and minimize the effects of such events. The Spill Prevention Plan shall:

a. Identify the possible sources of accidental discharge, untreated or partially treated waste bypass, and polluted drainage;

b. Evaluate the effectiveness of present facilities and procedures, and state when they became operational; and

c. Predict the effectiveness of the proposed facilities and procedures, and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational.

This Regional Water Board, after review of the Contingency and Spill Prevention Plans or their updated revisions, may establish conditions it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of the permit upon notice to the Discharger.

D. Proper Operation & Maintenance – This supplements I.D of Standard Provisions (Attachment D)

1. Operation and Maintenance (O&M) Manual - The Discharger shall maintain an O&M Manual to provide the plant and regulatory personnel with a source of information describing all equipment, recommended operational strategies, process control monitoring, and maintenance activities. To remain a useful and relevant document, the O&M Manual shall be kept updated to reflect significant changes in treatment facility equipment and operational practices. The O&M Manual shall be maintained in usable condition and be available for reference and use by all relevant personnel and Regional Water Board staff.

2. Wastewater Facilities Status Report - The Discharger shall regularly review, revise, or update, as necessary, its Wastewater Facilities Status Report. This report shall document how the Discharger operates and maintains its wastewater collection, treatment, and disposal facilities to ensure that all facilities are adequately staffed, supervised, financed, operated, maintained, repaired, and upgraded as necessary to provide adequate and reliable transport, treatment, and disposal of all wastewater from both existing and planned future wastewater sources under the Discharger's service responsibilities.

3. Proper Supervision and Operation of Publicly Owned Treatment Works (POTWs) - POTWs shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Division 4, Chapter 14, Title 23 of the California Code of Regulations.

E. Property Rights – Not Supplemented

F. Inspection and Entry – Not Supplemented

G. Bypass – Not Supplemented

H. Upset – Not Supplemented

I. Other – This section is an addition to Standard Provisions (Attachment D)

1. Neither the treatment nor the discharge of pollutants shall create pollution, contamination, or nuisance as defined by California Water Code Section 13050.

2. Collection, treatment, storage, and disposal systems shall be operated in a manner that precludes public contact with wastewater, except in cases where excluding the public is infeasible, such as private property. If public contact with wastewater could reasonably occur on public property, warning signs shall be posted.

3. If the Discharger submits a timely and complete Report of Waste Discharge for permit reissuance, this permit continues in force and effect until a new permit is issued or the Regional Water Board rescinds the permit.

J. Stormwater – This section is an addition to Standard Provisions (Attachment D)

These provisions apply to facilities that do not direct all stormwater flows from the facility to the wastewater treatment plant headworks.

1. Stormwater Pollution Prevention Plan (SWPP Plan)

The SWPP Plan shall be designed in accordance with good engineering practices and shall address the following objectives:

a. To identify pollutant sources that may affect the quality of stormwater discharges; and

b. To identify, assign, and implement control measures and management practices to reduce pollutants in stormwater discharges.

The SWPP Plan may be combined with the existing Spill Prevention Plan as required in accordance with Section C.2. The SWPP Plan shall be retained on-site and made available upon request of a representative of the Regional Water Board.

2. Source Identification

The SWPP Plan shall provide a description of potential sources that may be expected to add significant quantities of pollutants to stormwater discharges, or may result in non-stormwater discharges from the facility. The SWPP Plan shall include, at a minimum, the following items:

a. A topographical map (or other acceptable map if a topographical map is unavailable), extending one-quarter mile beyond the property boundaries of the facility, showing the wastewater treatment facility process areas, surface water bodies (including springs and wells), and discharge point(s) where the facility's stormwater discharges to a municipal storm drain system or other points of discharge to waters of the State. The requirements of this paragraph may be included in the site map required under the following paragraph if appropriate.

b. A site map showing the following:

   1) Stormwater conveyance, drainage, and discharge structures;

   2) An outline of the stormwater drainage areas for each stormwater discharge point;

   3) Paved areas and buildings;

   4) Areas of actual or potential pollutant contact with stormwater or release to stormwater, including but not limited to outdoor storage and process areas; material loading, unloading, and access areas; and waste treatment, storage, and disposal areas;

   5) Location of existing stormwater structural control measures (i.e., berms, coverings, etc.);

   6) Surface water locations, including springs and wetlands; and

   7) Vehicle service areas.

c. A narrative description of the following:

   1) Wastewater treatment process activity areas;

   2) Materials, equipment, and vehicle management practices employed to minimize contact of significant materials of concern with stormwater discharges;

   3) Material storage, loading, unloading, and access areas;

   4) Existing structural and non-structural control measures (if any) to reduce pollutants in stormwater discharges; and

   5) Methods of on-site storage and disposal of significant materials.

d. A list of pollutants that have a reasonable potential to be present in stormwater discharges in significant quantities.

3. Stormwater Management Controls

The SWPP Plan shall describe the stormwater management controls appropriate for the facility and a time schedule for fully implementing such controls. The appropriateness and priorities of controls in the SWPP Plan shall reflect identified potential sources of pollutants. The description of stormwater management controls to be implemented shall include, as appropriate:

a. Stormwater pollution prevention personnel

Identify specific individuals (and job titles) that are responsible for developing, implementing, and reviewing the SWPP Plan.

b. Good housekeeping

Good housekeeping requires the maintenance of clean, orderly facility areas that discharge stormwater. Material handling areas shall be inspected and cleaned to reduce the potential for pollutants to enter the storm drain conveyance system.

c. Spill prevention and response

Identify areas where significant materials can spill into or otherwise enter stormwater conveyance systems and their accompanying drainage points. Specific material handling procedures, storage requirements, and cleanup equipment and procedures shall be identified, as appropriate. The necessary equipment to implement a cleanup shall be available, and personnel shall be trained in proper response, containment, and cleanup of spills. Internal reporting procedures for spills of significant materials shall be established.

d. Source control

Source controls include, for example, elimination or reduction of the use of toxic pollutants, covering of pollutant source areas, sweeping of paved areas, containment of potential pollutants, labeling of all storm drain inlets with “No Dumping” signs, isolation or separation of industrial and non-industrial pollutant sources so that runoff from these areas does not mix, etc.

e. Stormwater management practices

Stormwater management practices are practices other than those that control the sources of pollutants. Such practices include treatment or conveyance structures, such as drop inlets, channels, retention and detention basins, treatment vaults, infiltration galleries, filters, oil/water separators, etc. Based on assessment of the potential of various sources to contribute pollutants to stormwater discharges in significant quantities, additional stormwater management practices to remove pollutants from stormwater discharges shall be implemented and design criteria shall be described.

f. Sediment and erosion control

Measures to minimize erosion around the stormwater drainage and discharge points, such as riprap, revegetation, slope stabilization, etc., shall be described.

g. Employee training

Employee training programs shall inform all personnel responsible for implementing the SWPP Plan. Training shall address spill response, good housekeeping, and material management practices. New employee and refresher training schedules shall be identified.

h. Inspections

All inspections shall be done by trained personnel. Material handling areas shall be inspected for evidence of, or the potential for, pollutants entering stormwater discharges. A tracking or follow up procedure shall be used to ensure appropriate response has been taken in response to an inspection. Inspections and maintenance activities shall be documented and recorded. Inspection records shall be retained for five years.

i. Records

A tracking and follow-up procedure shall be described to ensure that adequate response and corrective actions have been taken in response to inspections.

4. Annual Verification of SWPP Plan

An annual facility inspection shall be conducted to verify that all elements of the SWPP Plan are accurate and up-to-date. The results of this review shall be reported in the Annual Report to the Regional Water Board described in Section V.C.f.

K. Biosolids Management – This section is an addition to Standard Provisions (Attachment D)

Biosolids must meet the following requirements prior to land application. The Discharger must either demonstrate compliance or, if it sends the biosolids to another party for further treatment or distribution, must give the recipient the information necessary to ensure compliance.

1. Exceptional quality biosolids meet the pollutant concentration limits in Table III of 40 CFR Part 503.13, Class A pathogen limits, and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8). Such biosolids do not have to be tracked further for compliance with general requirements (503.12) and management practices (503.14).

2. Biosolids used for agricultural land, forest, or reclamation shall meet the pollutant limits in Table I (ceiling concentrations) and Table II or Table III (cumulative loadings or pollutant concentration limits) of 503.13. They shall also meet the general requirements (503.12) and management practices (503.14) (if not exceptional quality biosolids) for Class A or Class B pathogen levels with associated access restrictions (503.32) and one of the 10 vector attraction reduction requirements in 503.33(b)(1)-(b)(10).

3. Biosolids used for lawn or home gardens must meet exceptional quality biosolids limits.

4. Biosolids sold or given away in a bag or other container must meet the pollutant limits in either Table III or Table IV (pollutant concentration limits or annual pollutant loading rate limits) of 503.13. If Table IV is used, a label or information sheet must be attached to the biosolids packing that explains Table IV (see 503.14). The biosolids must also meet the Class A pathogen limits and one of the vector attraction reduction requirements in 503.33(b)(1)-(b)(8).

II. STANDARD PROVISIONS – PERMIT ACTION – Not Supplemented

III. STANDARD PROVISIONS – MONITORING

A. Sampling and Analyses – This section is a supplement to III.A and III.B of Standard Provisions (Attachment D)

1. Use of Certified Laboratories

Water and waste analyses shall be performed by a laboratory certified for these analyses in accordance with California Water Code Section 13176.

2. Use of Appropriate Minimum Levels

Table C lists the suggested analytical methods for the 126 priority pollutants and other toxic pollutants that should be used, unless a particular method or minimum level (ML) is required in the MRP.

For priority pollutant monitoring, when there is more than one ML value for a given substance, the Discharger may select any one of the analytical methods cited in Table C for compliance determination, or any other method described in 40 CFR part 136 or approved by U.S. EPA (such as the 1600 series) if authorized by the Regional Water Board. However, the ML must be below the effluent limitation and water quality objective. If no ML value is below the effluent limitation and water quality objective, then the method must achieve an ML no greater than the lowest ML value indicated in Table C. All monitoring instruments and equipment shall be properly calibrated and maintained to ensure accuracy of measurements.

3. Frequency of Monitoring

The minimum schedule of sampling analysis is specified in the MRP portion of the permit.

a. Timing of Sample Collection

1) The Discharger shall collect samples of influent on varying days selected at random and shall not include any plant recirculation or other sidestream wastes, unless otherwise stipulated by the MRP.

2) The Discharger shall collect samples of effluent on days coincident with influent sampling unless otherwise stipulated by the MRP or the Executive Officer. The Executive Officer may approve an alternative sampling plan if it is demonstrated to be representative of plant discharge flow and in compliance with all other permit requirements.

3) The Discharger shall collect grab samples of effluent during periods of day-time maximum peak effluent flows (or peak flows through secondary treatment units for facilities that recycle effluent flows).

4) Effluent sampling for conventional pollutants shall occur on at least one day of any multiple-day bioassay test the MRP requires. During the course of the test, on at least one day, the Discharger shall collect and retain samples of the discharge. In the event a bioassay test does

not comply with permit limits, the Discharger shall analyze these retained samples for pollutants that could be toxic to aquatic life and for which it has effluent limits.

i. The Discharger shall perform bioassay tests on final effluent samples; when chlorine is used for disinfection, bioassay tests shall be performed on effluent after chlorination-dechlorination; and

ii. The Discharger shall analyze for total ammonia nitrogen and calculate the amount of un-ionized ammonia whenever test results fail to meet the percent survival specified in the permit.

b. Conditions Triggering Accelerated Monitoring

1) If the results from two consecutive samples of a constituent monitored in a 30-day period exceed the monthly average limit for any parameter (or if the required sampling frequency is once per month and the monthly sample exceeds the monthly average limit), the Discharger shall, within 24 hours after the results are received, increase its sampling frequency to daily until the results from the additional sampling show that the parameter is in compliance with the monthly average limit.

2) If any maximum daily limit is exceeded, the Discharger shall increase its sampling frequency to daily within 24 hours after the results are received that indicate the exceedance of the maximum daily limit until two samples collected on consecutive days show compliance with the maximum daily limit.

3) If final or intermediate results of an acute bioassay test indicate a violation or threatened violation (e.g., the percentage of surviving test organisms of any single acute bioassay test is less than 70 percent), the Discharger shall initiate a new test as soon as practical, and the Discharger shall investigate the cause of the mortalities and report its findings in the next self monitoring report (SMR).

4) The Discharger shall calibrate chlorine residual analyzers against grab samples as frequently as necessary to maintain accurate control and reliable operation. If an effluent violation is detected, the Discharger shall collect grab samples at least every 30 minutes until compliance with the limit is achieved, unless the Discharger monitors chlorine residual continuously. In such cases, the Discharger shall continue to conduct continuous monitoring as required by its permit.

5) When a bypass occurs (except one subject to provision III.A.3.b.6 below), the Discharger shall monitor flows and collect samples on a daily basis for all constituents at affected discharge points that have effluent limits for the duration of the bypass (including acute toxicity using static renewals), except chronic toxicity, unless otherwise stipulated by the MRP.

6) Unless otherwise stipulated by the MRP, when a bypass approved pursuant to Attachment D, Standard Provisions, Sections I.G.2 or I.G.4, occurs, the Discharger shall monitor flows and, using appropriate procedures as specified in the MRP, collect and retain samples for affected discharge points on a daily basis for the duration of the bypass. The Discharger shall analyze for total suspended solids (TSS) using 24-hour composites (or more frequent increments) and for bacteria indicators with effluent limits using grab samples. If TSS exceeds 45 mg/L in any composite sample, the Discharger shall also analyze the retained samples for that discharge for all other constituents that have effluent limits, except oil and grease, mercury, dioxin-TEQ, and acute and chronic toxicity. Additionally, at least once each year, the Discharger

shall analyze the retained samples for one approved bypass discharge event for all other constituents that have effluent limits, except oil and grease, mercury, dioxin-TEQ, and acute and chronic toxicity. This monitoring shall be in addition to the minimum monitoring specified in the MRP.

c. Stormwater Monitoring

The requirements of this section only apply to facilities that are not covered by an NPDES permit for stormwater discharges and where not all site storm drainage from process areas (i.e., areas of the treatment facility where chemicals or wastewater could come in contact with stormwater) is directed to the headworks. For stormwater not directed to the headworks during the wet season (October 1 to April 30), the Discharger shall:

1) Conduct visual observations of the stormwater discharge locations during daylight hours at least once per month during a storm event that produces significant stormwater discharge to observe the presence of floating and suspended materials, oil and grease, discoloration, turbidity, and odor, etc.

2) Measure (or estimate) the total volume of stormwater discharge, collect grab samples of stormwater discharge from at least two storm events that produce significant stormwater discharge, and analyze the samples for oil and grease, pH, TSS, and specific conductance.

   The grab samples shall be taken during the first 30 minutes of the discharge. If collection of the grab samples during the first 30 minutes is impracticable, grab samples may be taken during the first hour of the discharge, and the Discharger shall explain in the Annual Report why the grab sample(s) could not be taken in the first 30 minutes.

3) Testing for the presence of non-stormwater discharges shall be conducted no less than twice during the dry season (May 1 to September 30) at all stormwater discharge locations. Tests may include visual observations of flows, stains, sludges, odors, and other abnormal conditions; dye tests; TV line surveys; or analysis and validation of accurate piping schematics. Records shall be maintained describing the method used, date of testing, locations observed, and test results.

4) Samples shall be collected from all locations where stormwater is discharged. Samples shall represent the quality and quantity of stormwater discharged from the facility. If a facility discharges stormwater at multiple locations, the Discharger may sample a reduced number of locations if it establishes and documents through the monitoring program that stormwater discharges from different locations are substantially identical.

5) Records of all stormwater monitoring information and copies of all reports required by the permit shall be retained for a period of at least three years from the date of sample, observation, or report.

d. Receiving Water Monitoring

The requirements of this section only apply when the MRP requires receiving water sampling.

1) Receiving water samples shall be collected on days coincident with effluent sampling for conventional pollutants.

2) Receiving water samples shall be collected at each station on each sampling day during the period within one hour following low slack water. Where sampling during lower slack water is impractical, sampling shall be performed during higher slack water. Samples shall be collected within the discharge plume and down current of the discharge point so as to be representative, unless otherwise stipulated in the MRP.

3) Samples shall be collected within one foot of the surface of the receiving water, unless otherwise stipulated in the MRP.

B. Biosolids Monitoring – This section supplements III.B of Standard Provisions (Attachment D)

When biosolids are sent to a landfill, sent to a surface disposal site, or applied to land as a soil amendment, they must be monitored as follows:

1. Biosolids Monitoring Frequency

Biosolids disposal must be monitored at the following frequency:

Metric tons biosolids/365 days	Frequency
0-290	Once per year
290-1500	Quarterly
1500-15,000	Six times per year
Over 15,000	Once per month

(Metric tons are on a dry weight basis)

2. Biosolids Pollutants to Monitor

Biosolids shall be monitored for the following constituents:

- Land Application: Arsenic, cadmium, copper, mercury, molybdenum, nickel, lead, selenium, and zinc
- Municipal Landfill: Paint filter test (pursuant to 40 CFR 258)
- Biosolids-only Landfill or Surface Disposal Site (if no liner and leachate system): arsenic, chromium, and nickel

C. Standard Observations – This section is an addition to III of Standard Provisions (Attachment D)

1. Receiving Water Observations

The requirements of this section only apply when the MRP requires standard observations of the receiving water. Standard observations shall include the following:

a. *Floating and suspended materials* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence, source, and size of affected area.

b. *Discoloration and turbidity*: description of color, source, and size of affected area.

c. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

d. *Beneficial water use*: presence of water-associated waterfowl or wildlife, fisherpeople, and other recreational activities in the vicinity of each sampling station.

e. *Hydrographic condition*: time and height of corrected high and low tides (corrected to nearest National Oceanic and Atmospheric Administration location for the sampling date and time of sample collection).

f. *Weather conditions*:

1) Air temperature; and

2) Total precipitation during the five days prior to observation.

2. Wastewater Effluent Observations

The requirements of this section only apply when the MRP requires wastewater effluent standard observations. Standard observations shall include the following:

a. *Floating and suspended material of wastewater origin* (e.g., oil, grease, algae, and other macroscopic particulate matter): presence or absence.

b. *Odor*: presence or absence, characterization, source, distance of travel, and wind direction.

3. Beach and Shoreline Observations

The requirements of this section only apply when the MRP requires beach and shoreline standard observations. Standard observations shall include the following:

a. *Material of wastewater origin*: presence or absence, description of material, estimated size of affected area, and source.

b. *Beneficial use*: estimate number of people participating in recreational water contact, non-water contact, or fishing activities.

4. Land Retention or Disposal Area Observations

The requirements of this section only apply to facilities with on-site surface impoundments or disposal areas that are in use. This section applies to both liquid and solid wastes, whether confined or unconfined. The Discharger shall conduct the following for each impoundment:

a. Determine the amount of freeboard at the lowest point of dikes confining liquid wastes.

b. Report evidence of leaching liquid from area of confinement and estimated size of affected area. Show affected area on a sketch and volume of flow (e.g., gallons per minute [gpm]).

c. Regarding odor, describe presence or absence, characterization, source, distance of travel, and wind direction.

d. Estimate number of waterfowl and other water-associated birds in the disposal area and vicinity.

5. Periphery of Waste Treatment and/or Disposal Facilities Observations

The requirements of this section only apply when the MRP specifies periphery standard observations. Standard observations shall include the following:

a. *Odor*: presence or absence, characterization, source, and distance of travel.

b. *Weather conditions*: wind direction and estimated velocity.

IV. STANDARD PROVISIONS – RECORDS

A. Records to be Maintained – This supplements IV.A of Standard Provisions (Attachment D)

The Discharger shall maintain records in a manner and at a location (e.g., wastewater treatment plant or Discharger offices) such that the records are accessible to Regional Water Board staff. The minimum period of retention specified in Section IV, Records, of the Federal Standard Provisions shall be extended during the course of any unresolved litigation regarding the subject discharge, or when requested by the Regional Water Board or Regional Administrator of U.S. EPA, Region IX.

A copy of the permit shall be maintained at the discharge facility and be available at all times to operating personnel.

B. Records of monitoring information shall include – This supplements IV.B of Standard Provision (Attachment D)

1. Analytical Information

Records shall include analytical method detection limits, minimum levels, reporting levels, and related quantification parameters.

2. Flow Monitoring Data

For all required flow monitoring (e.g., influent and effluent flows), the additional records shall include the following, unless otherwise stipulated by the MRP:

a. Total volume for each day; and

b. Maximum, minimum, and average daily flows for each calendar month.

3. Wastewater Treatment Process Solids

a. For each treatment unit process that involves solids removal from the wastewater stream, records shall include the following:

1) Total volume or mass of solids removed from each collection unit (e.g., grit, skimmings, undigested biosolids, or combination) for each calendar month or other time period as appropriate, but not to exceed annually; and

2) Final disposition of such solids (e.g., landfill, other subsequent treatment unit).

b. For final dewatered biosolids from the treatment plant as a whole, records shall include the following:

1) Total volume or mass of dewatered biosolids for each calendar month;

2) Solids content of the dewatered biosolids; and

3) Final disposition of dewatered biosolids (disposal location and disposal method).

4. Disinfection Process

For the disinfection process, these additional records shall be maintained documenting process operation and performance:

a. For bacteriological analyses:

1) Wastewater flow rate at the time of sample collection; and

2) Required statistical parameters for cumulative bacterial values (e.g., moving median or geometric mean for the number of samples or sampling period identified in this Order).

b. For the chlorination process, when chlorine is used for disinfection, at least daily average values for the following:

1) Chlorine residual of treated wastewater as it enters the contact basin (mg/L);

2) Chlorine dosage (kg/day); and

3) Dechlorination chemical dosage (kg/day).

5. Treatment Process Bypasses

A chronological log of all treatment process bypasses, including wet weather blending, shall include the following:

a. Identification of the treatment process bypassed;

b. Dates and times of bypass beginning and end;

c. Total bypass duration;

d. Estimated total bypass volume; and

e. Description of, or reference to other reports describing, the bypass event, the cause, the corrective actions taken (except for wet weather blending that is in compliance with permit conditions), and any additional monitoring conducted.

6. Treatment Facility Overflows

This section applies to records for overflows at the treatment facility. This includes the headworks and all units and appurtenances downstream. The Discharger shall retain a chronological log of overflows at the treatment facility and records supporting the information provided in section V.E.2.

C. Claims of Confidentiality – Not Supplemented

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information – Not Supplemented

B. Signatory and Certification Requirements – Not Supplemented

C. Monitoring Reports – This section supplements V.C of Standard Provisions (Attachment D)

1. Self Monitoring Reports

For each reporting period established in the MRP, the Discharger shall submit an SMR to the Regional Water Board in accordance with the requirements listed in this document and at the frequency the MRP specifies. The purpose of the SMR is to document treatment performance, effluent quality, and compliance with the waste discharge requirements of this Order.

a. Transmittal letter

Each SMR shall be submitted with a transmittal letter. This letter shall include the following:

1) Identification of all violations of effluent limits or other waste discharge requirements found during the reporting period;

2) Details regarding violations: parameters, magnitude, test results, frequency, and dates;

3) Causes of violations;

4) Discussion of corrective actions taken or planned to resolve violations and prevent recurrences, and dates or time schedule of action implementation (if previous reports have been submitted that address corrective actions, reference to the earlier reports is satisfactory);

5) Data invalidation (Data should not be submitted in an SMR if it does not meet quality assurance/quality control standards. However, if the Discharger wishes to invalidate any measurement after it was submitted in an SMR, a letter shall identify the measurement suspected to be invalid and state the Discharger's intent to submit, within 60 days, a formal request to invalidate the measurement. This request shall include the original measurement in question, the reason for invalidating the measurement, all relevant documentation that supports invalidation [e.g., laboratory sheet, log entry, test results, etc.], and discussion of the

corrective actions taken or planned [with a time schedule for completion] to prevent recurrence of the sampling or measurement problem.);

6) If the Discharger blends, the letter shall describe the duration of blending events and certify whether blended effluent was in compliance with the conditions for blending; and

7) Signature (The transmittal letter shall be signed according to Section V.B of this Order, Attachment D – Standard Provisions.).

b. Compliance evaluation summary

Each report shall include a compliance evaluation summary. This summary shall include each parameter for which the permit specifies effluent limits, the number of samples taken during the monitoring period, and the number of samples that exceed applicable effluent limits.

c. Results of analyses and observations

1) Tabulations of all required analyses and observations, including parameter, date, time, sample station, type of sample, test result, method detection limit, method minimum level, and method reporting level, if applicable, signed by the laboratory director or other responsible official.

2) When determining compliance with an average monthly effluent limitation and more than one sample result is available in a month, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of detected but not quantified (DNQ) or nondetect (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

i. The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.

ii. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

If a sample result, or the arithmetic mean or median of multiple sample results, is below the reporting limit, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation and the Discharger conducts a Pollutant Minimization Program, the Discharger shall not be deemed out of compliance.

3) Dioxin-TEQ Reporting: The Discharger shall report for each dioxin and furan congener the analytical results of effluent monitoring, including the quantifiable limit (reporting level), the method detection limit, and the measured concentration. The Discharger shall report all measured values of individual congeners, including data qualifiers. When calculating dioxin-TEQ, the Discharger shall set congener concentrations below the minimum levels (ML) to zero. The Discharger shall calculate and report dioxin-TEQs using the following formula, where the MLs, toxicity equivalency factors (TEFs), and bioaccumulation equivalency factors (BEFs) are as provided in Table A:

$$\text{Dioxin-TEQ} = \Sigma\ (C_x \times TEF_x \times BEF_x)$$

where: C_x = measured or estimated concentration of congener *x*
TEF_x = toxicity equivalency factor for congener x
BEFx = bioaccumulation equivalency factor for congener *x*

Table A

Minimum Levels, Toxicity Equivalency Factors,
and Bioaccumulation Equivalency Factors

Dioxin or Furan Congener	Minimum Level (pg/L)	1998 Toxicity Equivalency Factor (TEF)	Bioaccumulation Equivalency Factor (BEF)
2,3,7,8-TCDD	10	1.0	1.0
1,2,3,7,8-PeCDD	50	1.0	0.9
1,2,3,4,7,8-HxCDD	50	0.1	0.3
1,2,3,6,7,8-HxCDD	50	0.1	0.1
1,2,3,7,8,9-HxCDD	50	0.1	0.1
1,2,3,4,6,7,8-HpCDD	50	0.01	0.05
OCDD	100	0.0001	0.01
2,3,7,8-TCDF	10	0.1	0.8
1,2,3,7,8-PeCDF	50	0.05	0.2
2,3,4,7,8-PeCDF	50	0.5	1.6
1,2,3,4,7,8-HxCDF	50	0.1	0.08
1,2,3,6,7,8-HxCDF	50	0.1	0.2
1,2,3,7,8,9-HxCDF	50	0.1	0.6
2,3,4,6,7,8-HxCDF	50	0.1	0.7
1,2,3,4,6,7,8-HpCDF	50	0.01	0.01
1,2,3,4,7,8,9-HpCDF	50	0.01	0.4
OCDF	100	0.0001	0.02

d. Data reporting for results not yet available

The Discharger shall make all reasonable efforts to obtain analytical data for required parameter sampling in a timely manner. Certain analyses require additional time to complete analytical processes and report results. For cases where required monitoring parameters require additional time to complete analytical processes and reports, and results are not available in time to be included in the SMR for the subject monitoring period, the Discharger shall describe such circumstances in the SMR and include the data for these parameters and relevant discussions of any observed exceedances in the next SMR due after the results are available.

e. Flow data

The Discharger shall provide flow data tabulation pursuant to Section IV.B.2.

f. Annual self monitoring report requirements

By the date specified in the MRP, the Discharger shall submit an annual report to the Regional Water Board covering the previous calendar year. The report shall contain the following:

1) Annual compliance summary table of treatment plant performance, including documentation of any blending events;

2) Comprehensive discussion of treatment plant performance and compliance with the permit (This discussion shall include any corrective actions taken or planned, such as changes to facility equipment or operation practices that may be needed to achieve compliance, and any other actions taken or planned that are intended to improve performance and reliability of the Discharger's wastewater collection, treatment, or disposal practices.);

3) Both tabular and graphical summaries of the monitoring data for the previous year if parameters are monitored at a frequency of monthly or greater;

4) List of approved analyses, including the following:

(i) List of analyses for which the Discharger is certified;

(ii) List of analyses performed for the Discharger by a separate certified laboratory (copies of reports signed by the laboratory director of that laboratory shall not be submitted but be retained onsite); and

(iii) List of "waived" analyses, as approved;

5) Plan view drawing or map showing the Discharger's facility, flow routing, and sampling and observation station locations;

6) Results of annual facility inspection to verify that all elements of the SWPP Plan are accurate and up to date (only required if the Discharger does not route all stormwater to the headworks of its wastewater treatment plant); and

7) Results of facility report reviews (The Discharger shall regularly review, revise, and update, as necessary, the O&M Manual, the Contingency Plan, the Spill Prevention Plan, and Wastewater Facilities Status Report so that these documents remain useful and relevant to current practices. At a minimum, reviews shall be conducted annually. The Discharger shall include, in each Annual Report, a description or summary of review and evaluation procedures, recommended or planned actions, and an estimated time schedule for implementing these actions. The Discharger shall complete changes to these documents to ensure they are up-to-date.).

g. Report submittal

The Discharger shall submit SMRs to:

California Regional Water Quality Control Board
San Francisco Bay Region
1515 Clay Street, Suite 1400
Oakland, CA 94612
Attn: NPDES Wastewater Division

h. Reporting data in electronic format

The Discharger has the option to submit all monitoring results in an electronic reporting format approved by the Executive Officer. If the Discharger chooses to submit SMRs electronically, the following shall apply:

1) *Reporting Method*: The Discharger shall submit SMRs electronically via a process approved by the Executive Officer (see, for example, the letter dated December 17, 1999, "Official Implementation of Electronic Reporting System [ERS]" and the progress report letter dated December 17, 2000).

2) *Monthly or Quarterly Reporting Requirements*: For each reporting period (monthly or quarterly as specified in the MRP), the Discharger shall submit an electronic SMR to the Regional Water Board in accordance with the provisions of Section V.C.1.a-e, except for requirements under Section V.C.1.c(1) where ERS does not have fields for dischargers to input certain information (e.g., sample time). However, until U.S. EPA approves the electronic signature or other signature technologies, Dischargers that use ERS shall submit a hard copy of the original transmittal letter, an ERS printout of the data sheet, and a violation report (a receipt of the electronic transmittal shall be retained by the Discharger). This electronic SMR submittal suffices for the signed tabulations specified under Section V.C.1.c(1).

3) *Annual Reporting Requirements*: Dischargers who have submitted data using the ERS for at least one calendar year are exempt from submitting the portion of the annual report required under Section V.C.1.f(1) and (3).

D. Compliance Schedules – Not supplemented

E. Twenty-Four Hour Reporting – This section supplements V.E of Standard Provision (Attachment D)

1. Spill of Oil or Other Hazardous Material Reports

a. Within 24 hours of becoming aware of a spill of oil or other hazardous material that is not contained onsite and completely cleaned up, the Discharger shall report by telephone to the Regional Water Board at (510) 622-2369.

b. The Discharger shall also report such spills to the State Office of Emergency Services [telephone (800) 852-7550] only when the spills are in accordance with applicable reporting quantities for hazardous materials.

c. The Discharger shall submit a written report to the Regional Water Board within five working days following telephone notification unless directed otherwise by Regional Water Board staff. A report submitted electronically is acceptable. The written report shall include the following:

1) Date and time of spill, and duration if known;

2) Location of spill (street address or description of location);

3) Nature of material spilled;

4) Quantity of material involved;

5) Receiving water body affected, if any;

6) Cause of spill;

7) Estimated size of affected area;

8) Observed impacts to receiving waters (e.g., oil sheen, fish kill, water discoloration);

9) Corrective actions taken to contain, minimize, or clean up the spill;

10) Future corrective actions planned to be taken to prevent recurrence, and schedule of implementation; and

11) Persons or agencies notified.

2. Unauthorized Discharges from Municipal Wastewater Treatment Plants[1]

The following requirements apply to municipal wastewater treatment plants that experience an unauthorized discharge at their treatment facilities and are consistent with and supercede requirements imposed on the Discharger by the Executive Officer by letter of May 1, 2008, issued pursuant to California Water Code Section 13383.

a. Two (2)-Hour Notification

For any unauthorized discharges that result in a discharge to a drainage channel or a surface water, the Discharger shall, as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the State Office of Emergency Services (telephone 800-852-7550), the local health officers or directors of environmental health with jurisdiction over the affected water bodies, and the Regional Water Board. The notification to the Regional Water Board shall be via the Regional Water Board's online reporting system at www.wbers.net, and shall include the following:

1) Incident description and cause;

2) Location of threatened or involved waterway(s) or storm drains;

3) Date and time the unauthorized discharge started;

4) Estimated quantity and duration of the unauthorized discharge (to the extent known), and the estimated amount recovered;

5) Level of treatment prior to discharge (e.g., raw wastewater, primary treated, undisinfected secondary treated, and so on); and

6) Identity of the person reporting the unauthorized discharge.

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

b. 24-hour Certification

Within 24 hours, the Discharger shall certify to the Regional Water Board, at www.wbers.net, that the State Office of Emergency Services and the local health officers or directors of environmental health with jurisdiction over the affected water bodies have been notified of the unauthorized discharge.

c. 5-Day Written Report

Within five business days, the Discharger shall submit a written report, via the Regional Water Board's online reporting system at www.wbers.net, that includes, in addition to the information required above, the following:

1) Methods used to delineate the geographical extent of the unauthorized discharge within receiving waters;

2) Efforts implemented to minimize public exposure to the unauthorized discharge;

3) Visual observations of the impacts (if any) noted in the receiving waters (e.g., fish kill, discoloration of water) and the extent of sampling if conducted;

4) Corrective measures taken to minimize the impact of the unauthorized discharge;

5) Measures to be taken to minimize the chances of a similar unauthorized discharge occurring in the future;

6) Summary of Spill Prevention Plan or O&M Manual modifications to be made, if necessary, to minimize the chances of future unauthorized discharges; and

7) Quantity and duration of the unauthorized discharge, and the amount recovered.

d. Communication Protocol

To clarify the multiple levels of notification, certification, and reporting, the current communication requirements for unauthorized discharges from municipal wastewater treatment plants are summarized in Table B that follows.

Table B

Summary of Communication Requirements for Unauthorized Discharges[1] from Municipal Wastewater Treatment Plants

Discharger is required to:	Agency Receiving Information	Time frame	Method for Contact
1. Notify	California Emergency Management Agency (Cal EMA)	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Telephone – (800) 852-7550 (obtain a control number from Cal EMA)
	Local health department	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Depends on local health department
	Regional Water Board	As soon as possible, but not later than **2 hours** after becoming aware of the unauthorized discharge.	Electronic[2] www.wbers.net
2. Certify	Regional Water Board	As soon as possible, but not later than **24 hours** after becoming aware of the unauthorized discharge.	Electronic[3] www.wbers.net
3. Report	Regional Water Board	Within **5 business days** of becoming aware of the unauthorized discharge.	Electronic[4] www.wbers.net

[1] California Code of Regulations, Title 23, Section 2250(b), defines an unauthorized discharge to be a discharge, not regulated by waste discharge requirements, of treated, partially treated, or untreated wastewater resulting from the intentional or unintentional diversion of wastewater from a collection, treatment or disposal system.

[2] In the event that the Discharger is unable to provide online notification within 2 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the notification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the notification information into the Regional Water Board's online system in electronic format.

[3] In most instances, the 2-hour notification will also satisfy 24-hour certification requirements. This is because the notification form includes fields for documenting that OES and the local health department have been contacted. In other words, if the Discharger is able to complete all the fields in the notification form within 2 hours, certification requirements are also satisfied. In the event that the Discharger is unable to provide online certification within 24 hours of becoming aware of an unauthorized discharge, it shall phone the Regional Water Board's spill hotline at (510) 622-2369 and convey the same information contained in the certification form. In addition, within 3 business days of becoming aware of the unauthorized discharge, the Discharger shall enter the certification information into the Regional Water Board's online system in electronic format.

[4] If the Discharger cannot satisfy the 5-day reporting requirements via the Regional Water Board's online reporting system, it shall submit a written report (preferably electronically in pdf) to the appropriate Regional Water Board case manager. In cases where the Discharger cannot satisfy the 5-day reporting requirements via the online reporting system, it must still complete the Regional Water Board's online reporting requirements within 15 calendar days of becoming aware of the unauthorized discharge.

F. Planned Changes – Not supplemented

G. Anticipated Noncompliance – Not supplemented

H. Other Noncompliance – Not supplemented

I. Other Information – Not supplemented

VI. STANDARD PROVISION – ENFORCEMENT – Not Supplemented

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS – Not Supplemented

VIII. DEFINITIONS – This section is an addition to Standard Provisions (Attachment D)

More definitions can be found in Attachment A of this NPDES Permit.

1. Arithmetic Calculations

   a. Geometric mean is the antilog of the log mean or the back-transformed mean of the logarithmically transformed variables, which is equivalent to the multiplication of the antilogarithms. The geometric mean can be calculated with either of the following equations:

   $$\text{Geometric Mean} = Anti\log\left(\frac{1}{N}\sum_{i=1}^{N} Log(C_i)\right)$$

   or

   $$\text{Geometric Mean} = (C_1 * C_2 * \ldots * C_N)^{1/N}$$

   Where "N" is the number of data points for the period analyzed and "C" is the concentration for each of the "N" data points.

   b. Mass emission rate is obtained from the following calculation for any calendar day:

   $$\text{Mass emission rate (lb/day)} = \frac{8.345}{N}\sum_{i=1}^{N} Q_i C_i$$

   $$\text{Mass emission rate (kg/day)} = \frac{3.785}{N}\sum_{i=1}^{N} Q_i C_i$$

   In which "N" is the number of samples analyzed in any calendar day and "Q_i" and "C_i" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" grab samples that may be taken in any calendar day. If a composite sample is taken, "C_i" is the concentration measured in the composite sample and "Q_i" is the average flow rate occurring during the period over which the samples are composited. The daily concentration of a constituent measured over any calendar day shall be determined from the flow-weighted average of the same constituent in the combined waste streams as follows:

Cd = Average daily concentration = $\frac{1}{Q_t}\sum_{i=1}^{N} Q_i C_i$

In which "N" is the number of component waste streams and "Q" and "C" are the flow rate (MGD) and the constituent concentration (mg/L) associated with each of the "N" waste streams. "Q_t" is the total flow rate of the combined waste streams.

c. Maximum allowable mass emission rate, whether for a 24-hour, weekly 7-day, monthly 30-day, or 6-month period, is a limitation expressed as a daily rate determined with the formulas in the paragraph above, using the effluent concentration limit specified in the permit for the period and the specified allowable flow.

d. POTW removal efficiency is the ratio of pollutants removed by the treatment facilities to pollutants entering the treatment facilities (expressed as a percentage). The Discharger shall determine removal efficiencies using monthly averages (by calendar month unless otherwise specified) of pollutant concentration of influent and effluent samples collected at about the same time and using the following equation (or its equivalent):

Removal Efficiency (%) = 100 × [1-(Effluent Concentration/Influent Concentration)]

2. Biosolids means the solids, semi-liquid suspensions of solids, residues, screenings, grit, scum, and precipitates separated from or created in wastewater by the unit processes of a treatment system. It also includes, but is not limited to, all supernatant, filtrate, centrate, decantate, and thickener overflow and underflow in the solids handling parts of the wastewater treatment system.

3. Blending is the practice of recombining wastewater that has been biologically treated with wastewater that has bypassed around biological treatment units.

4. Bottom sediment sample is (1) a separate grab sample taken at each sampling station for the determination of selected physical-chemical parameters, or (2) four grab samples collected from different locations in the immediate vicinity of a sampling station while the boat is anchored and analyzed separately for macroinvertebrates.

5. Composite sample is a sample composed of individual grab samples collected manually or by an automatic sampling device on the basis of time or flow as specified in the MRP. For flow-based composites, the proportion of each grab sample included in the composite sample shall be within plus or minus five percent (+/-5%) of the representative flow rate of the waste stream being measured at the time of grab sample collection. Alternatively, equal volume grab samples may be individually analyzed with the flow-weighted average calculated by averaging flow-weighted ratios of each grab sample analytical result. Grab samples comprising time-based composite samples shall be collected at intervals not greater than those specified in the MRP. The quantity of each grab sample comprising a time-based composite sample shall be a set of flow proportional volumes as specified in the MRP. If a particular time-based or flow-based composite sampling protocol is not specified in the MRP, the Discharger shall determine and implement the most representative sampling protocol for the given parameter subject to Executive Officer approval.

6. Depth-integrated sample is defined as a water or waste sample collected by allowing a sampling device to fill during a vertical traverse in the waste or receiving water body being sampled. The Discharger shall collect depth-integrated samples in such a manner that the collected sample will be representative of the waste or water body at that sampling point.

7. Flow sample is an accurate measurement of the average daily flow volume using a properly calibrated and maintained flow measuring device.

8. Grab sample is an individual sample collected in a short period of time not exceeding 15 minutes. Grab samples represent only the condition that exists at the time the wastewater is collected.

9. Initial dilution is the process that results in the rapid and irreversible turbulent mixing of wastewater with receiving water around the point of discharge.

10. Overflow is the intentional or unintentional spilling or forcing out of untreated or partially treated wastes from a transport system (e.g., through manholes, at pump stations, and at collection points) upstream from the treatment plant headworks or from any part of a treatment plant facility.

11. Priority pollutants are those constituents referred to in 40 CFR Part 122 as promulgated in the Federal Register, Vol. 65, No. 97, Thursday, May 18, 2000, also known as the California Toxics Rule, the presence or discharge of which could reasonably be expected to interfere with maintaining designated uses.

12. Stormwater means stormwater runoff, snow melt runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.

13. Toxic pollutant means any pollutant listed as toxic under federal Clean Water Act section 307(a)(1) or under 40 CFR 401.15.

14. Untreated waste is raw wastewater.

15. Waste, waste discharge, discharge of waste, and discharge are used interchangeably in the permit. The requirements of the permit apply to the entire volume of water, and the material therein, that is disposed of to surface and ground waters of the State of California.

Table C

List of Monitoring Parameters and Analytical Methods

CTR No.	Pollutant/Parameter	Analytical Method[5]	Minimum Levels[6] (µg/l)											
			GC	GCMS	LC	Color	FAA	GFAA	ICP	ICP MS	SPGFAA	HYD RIDE	CVAA	DCP

13.	Zinc	200 or 289					20		20	1	10			
14.	Cyanide	SM 4500 CN^- C or I				5								
15.	Asbestos (only required for dischargers to MUN waters)[9]	0100.2 [10]												
16.	2,3,7,8-TCDD and 17 congeners (Dioxin)	1613												
17.	Acrolein	603	2.0	5										
18.	Acrylonitrile	603	2.0	2										
19.	Benzene	602	0.5	2										
33.	Ethylbenzene	602	0.5	2										
39.	Toluene	602	0.5	2										
20.	Bromoform	601	0.5	2										
21.	Carbon Tetrachloride	601	0.5	2										
22.	Chlorobenzene	601	0.5	2										
23.	Chlorodibromomethane	601	0.5	2										

[5] The suggested method is the U.S. EPA Method unless otherwise specified (SM = Standard Methods). The Discharger may use another U.S. EPA-approved or recognized method if that method has a level of quantification below the applicable water quality objective. Where no method is suggested, the Discharger has the discretion to use any standard method.

[6] Minimum levels are from the *State Implementation Policy*. They are the concentration of the lowest calibration standard for that technique based on a survey of contract laboratories. Laboratory techniques are defined as follows: GC = Gas Chromatography; GCMS = Gas Chromatography/Mass Spectrometry; LC = High Pressure Liquid Chromatography; Color = Colorimetric; FAA = Flame Atomic Absorption; GFAA = Graphite Furnace Atomic Absorption; ICP = Inductively Coupled Plasma; ICPMS = Inductively Coupled Plasma/Mass Spectrometry; SPGFAA = Stabilized Platform Graphite Furnace Atomic Absorption (i.e., U.S. EPA 200.9); Hydride = Gaseous Hydride Atomic Absorption; CVAA = Cold Vapor Atomic Absorption; DCP = Direct Current Plasma.

[7] Analysis for total chromium may be substituted for analysis of chromium (III) and chromium (VI) if the concentration measured is below the lowest chromium (VI) criterion (11 ug/l).

[8] The Discharger shall use ultra-clean sampling (U.S. EPA Method 1669) and ultra-clean analytical methods (U.S. EPA Method 1631) for mercury monitoring. The minimum level for mercury is 2 ng/l (or 0.002 ug/l).

[9] MUN = Municipal and Domestic Supply. This designation, if applicable, is in the Findings of the permit.

[10] Determination of Asbestos Structures over 10 [micrometers] in Length in Drinking Water Using MCE Filters, U.S. EPA 600/R-94-134, June 1994.

SECTION 1 INTRODUCTION AND BACKGROUND

INTRODUCTION

The Alameda Countywide Clean Water Program (Program) is a consortium of agencies within Alameda County that discharge stormwater to the San Francisco Bay. This Stormwater Quality Management Plan (Plan) describes the Program's approach to reducing stormwater pollution.

There are five major sections to the Plan. The Background provides a brief history of water quality regulations. The Program Description describes the structure, accomplishments, and recent developments of the Program. The Component Work Plans describe the objectives and tasks of each Program component. The Pollution Reduction Plans describe the actions the Program and the member agencies will take to address specific pollutants that are impairing water quality. Lastly, the Performance Standards list specific tasks that the member agencies are required to perform.

The Plan for FY 2001/02 through 2007/08 is the Program's third stormwater quality management plan and will serve as the basis of the Program's third stormwater discharge permit from the California Regional Water Quality Control Board, San Francisco Bay Region (Regional Board). The Plan was submitted to the Regional Board 180 days prior to the expiration of the Program's second permit on February 19, 2002. The federal Clean Water Act (1972) requires stormwater dischargers to reduce pollutants to the maximum extent practicable. The Plan, in conjunction with the permit adopted by the Regional Board, is designed to enable the consortium to meet that requirement.

BACKGROUND

HISTORY OF THE CLEAN WATER ACT

By the late 1960s, urbanization and industrialization had taken a toll on the nation's waters: many rivers and bays were visibly polluted. In response to growing public concern over water pollution, Congress passed the Clean Water Act (1972). The goals of the Clean Water Act are to restore the biological, physical, and chemical integrity of our nation's waters and to make all of our waters fishable and swimable.

Section 402 of the Clean Water Act (CWA) established the National Pollutant Discharge Elimination System (NPDES) permit program. The NPDES permit program set nationwide permitting requirements for discharging pollutants into waterways. The limits varied by category of industry and were based on a level of treatment that was achievable using the best available technology. The 1987 amendments to the CWA required that municipal stormwater discharges obtain NPDES permit coverage. These amendments required municipalities to effectively prohibit non-stormwater discharges to their storm drain systems and to implement controls to reduce pollutants in stormwater to the maximum extent practicable.

PORTER-COLOGNE WATER QUALITY CONTROL ACT

In California, the State Water Resources Control Board (State Board) along with the nine Regional Boards has primary responsibility for regulating water quality. The State Board has overall responsibility for water quality regulation under division 7 of the Porter-Cologne Water Quality Control Act (Act). This Act also divides the state into nine hydrological basins, for local administration of the Act by the semiautonomous Regional Boards with coordination and oversight from the State Board. The Regional Boards have authority to regulate point source discharges, such as municipal stormwater discharges, through the adoption of waste discharge requirements under chapter 5.5 of the Act. In addition, the responsibility for implementing the NPDES permit program has been delegated to the State Board and its local Region Boards.

RECENT DEVELOPMENTS

The implementation of the CWA has been very effective in cleaning up our nation's waters. The reduction of pollution has been particularly dramatic for industrial and sanitary treatment plant discharges. For example, the amount of metals being discharged from these sources decreased by about 60 percent between 1986 and 1999 (T. Wu, personal communication, February 2001). However, many of our nation's waters still do not meet the goals set forth in the CWA. Two approaches to address this problem are being implemented, namely, the total maximum daily load (TMDL) program, and the watershed management approach.

TMDL Program

A TMDL is an estimate of the maximum quantity of a pollutant that could be discharged to a body of water while still ensuring the attainment of water quality standards. The TMDL program was established by Section 303 of the CWA. Congress correctly presumed that even after the implementation of technology based controls, some water bodies would not meet water quality standards. For each water body that does not meet applicable standards (referred to as "impaired"), a TMDL must be established. After the TMDL is established, additional requirements are placed on sources of the pollutant so that the total quantity of the pollutant discharged to the water body from all sources is no greater than the established TMDL.

In response to lawsuits, the U.S. Environmental Protection Agency (U. S. EPA) has recently initiated an intensive effort to develop TMDLs for all impaired waters. In the San Francisco Bay region, TMDLs are scheduled to be developed for mercury, PCBs, chlorinated pesticides, diazinon, sediment, and several other pollutants.

Watershed Management Approach

A watershed is the area of land that drains to a specific body of water. USEPA defines the watershed management approach as having the following components: problem identification, stakeholder involvement, and integrated actions. The watershed management approach is similar to the TMDL approach in that both address

water quality problems in a comprehensive manner. The difference between the two is that the TMDL approach is primarily a command and control approach, whereas the watershed management approach focuses on developing cooperative solutions. Under the watershed management approach, people that live and work in a watershed (stakeholders) develop a consensus regarding the best solutions to watershed problems. The watershed management approach can also encompass issues such as flood control, habitat restoration, and water supply, which are not specifically regulated by the CWA. This Plan describes the Program's involvement in both the TMDL program and the watershed management approach.

SUSMPs

SUSMPs (Standard Urban Stormwater Mitigation Plans) represent a new initiative by the State Board and Regional Boards to control the detrimental effects on water quality caused by new development and redevelopment. The Los Angeles Regional Water Quality Control Board initiated the use of SUSMPs, and under appeal to the State Board, its use was upheld in October 2000 as the statewide standard for what constitutes maximum extent practicable stormwater controls. In the Bay area SUSMPs will need to be tailored to fit local hydrologic and development conditions.

The Alameda Countywide Clean Water Program has long implemented the portion of the SUSMPs requiring the use of BMPs. One of the new parts is the requirement specifying that about 85 percent of the volume of runoff typical of an average wet season must be treated. Another new part will be the requirement to minimize the rate of runoff that flows from a project site in order to prevent increased erosion of creek channels.

It is expected that SUSMPs will be increasingly used to impose requirements on new development and redevelopment that will be more specific and numeric.

SECTION 2 PROGRAM DESCRIPTION

MISSION, VISION, AND STRATEGIC OBJECTIVES

Mission

The mission of the Alameda Countywide Clean Water Program is to help local residents, businesses and municipalities meet the stormwater quality goals of the Clean Water Act.

Vision

We, the member agencies, see the Alameda Countywide Clean Water Program as an innovative, nationally recognized leader in efficient and effective stormwater management, protecting and preserving our natural water resources and the San Francisco Bay.

Strategic Objectives: To accomplish its mission and vision, the Program has developed the following strategic objectives:

- Continue our self-directed, proactive approach fostering trust and respect from regulators and business and environmental groups;
- Produce tangible water quality improvements through expanded collaborations with other organizations;
- Communicate a clear vision of the Program's goals and objectives to the public, and to member agencies' staff, management, and elected officials; and,
- Improve communication links and working relationships among departments within member agencies and between the Program and Regional Board staff.

PROGRAM STRUCTURE

The following agencies are members of the Program: the cities of Alameda, Albany, Berkeley, Dublin, Emeryville, Fremont, Hayward, Livermore, Newark, Oakland, Piedmont, Pleasanton, San Leandro, and Union City; the County of Alameda; the Alameda County Flood Control and Water Conservation District (District); and Zone 7 of the District. The Program was established in 1991 through a Memorandum of Agreement (MOA). The MOA established a General Program and individual programs. The General Program carries out activities in common on behalf of the member agencies. The individual programs are implemented by each member agency. A copy of the MOA is included in Appendix A.

As part of its individual program, each of the member agencies is responsible for complying with the NPDES permit requirements for discharges from its municipally owned storm drain system. The NPDES permit finds that enforcement actions will, wherever possible, be pursued only against the individual agency responsible for the violation. As an area wide activity, the General Program will inform any of the member agencies about potential significant permit compliance problems that it becomes aware of and will offer suggested solutions.

There are eight components to the Program: Planning and Regulatory

Compliance, Watershed Assessment, Monitoring and Special Studies, Public Information and Participation, Municipal Maintenance Activities, New Development and Construction Controls, Illicit Discharge Controls, and Industrial/Commercial Discharge Controls. Component objectives and tasks are described in Section 4. Individual Program activities are described in the Performance Standards (Section 5). Each component is coordinated through a subcommittee that is composed of representatives of the member agencies. All subcommittees report to the Management Committee which is the official decision making body for the Program.

General Program activities are funded by the member agencies through contributions proportional to their area and population. The General Program budget for fiscal year 2001-2002 is $2.1 million. A copy of the General Program component tasks and budgets for fiscal year 2001-2002 is included in Appendix B.

PROGRAM ACHIEVEMENTS

The Program has enjoyed significant achievements, such as, increasing public awareness, developing a model inspection program, initiating a watershed approach, and identifying diazinon as a significant stormwater toxicant. A few of the Program's achievements are described below; other achievements are described in the component work plans.

Public Awareness

A major focus of the Program's effort has been to raise the public's awareness of stormwater pollution and the public's role in preventing it. To accomplish that goal the Program initiated numerous activities; including, (1) participated in the Bay Area Stormwater Management Agencies Association's regional television advertising campaign "When Ants Invade," which promoted the use of less toxic pest control practices and won a national advertising industry award; (2) sponsored the development of innovative outreach programs such as *Bay Savers* and *Kids in Creeks,* which encourage watershed awareness and pollution prevention among elementary school students; (3) distributed over 100,000 educational brochures, fact sheets and promotional items; (4) stenciled over 10,000 drop inlets with the "No Dumping Drains to Bay" message; (5) provided over fifty community stewardship grants to local teachers and student groups, environmental groups, service clubs, homeowner associations, and other clean water partners; and (6) implemented two major point of purchase campaigns to educate consumers about less toxic alternatives to pesticides. These efforts have been very successful: in a recent survey of Alameda County residents, 45% of respondents mentioned stormwater runoff as a major cause of water pollution and 74%, believed that their behavior could affect water quality.[1]

Model Industrial/Commercial Stormwater Inspection Program

In 1993 the Program's municipalities started to conduct stormwater inspections combined with educational outreach to businesses. Since then, more than 10,000 inspections have been

conducted. Based on an evaluation of approximately 1,200 businesses inspected two or more times, the accomplishments of this inspection and educational effort include the following: 1) The number of non-stormwater discharges decreased by about one-fourth; 2) a decline of almost one-half occurred in the number of businesses judged to have a high potential to discharge pollutants to stormwater; and 3) an increase was observed in the use of Best Management Practices. In some ways the program has served as a model as judged by the use of Program's municipal inspection staff in 2000 to help train staff from the Regional Boards; the Program's receipt of a state grant in 1996 to develop a statewide inspection handbook; and the use of several of the inspection program's ideas by other municipal stormwater programs in the Bay area.

Watershed Approach

During the past five years the Program has worked closely with its member agencies and local organizations to begin building successful collaborations in local watersheds. The Program has funded the development of watershed maps, which have been very useful to community groups, and has developed a countywide geographic information system (GIS) that includes data on topography, soil type, impervious surfaces, creeks, storm drains, sanitary sewer lines, water quality, fisheries, and habitat quality. In addition, the Program's member agencies have provided funding to support the development of creek groups and have been participating in numerous ongoing watershed efforts, including, Sausal Creek, Alameda Creek, Laguna Creek, San Leandro Creek, San Lorenzo Creek, and Lake Merritt. This has resulted in improved stewardship for these creeks and thousands of volunteer hours dedicated to advocacy, clean up, educational outreach, restoration and other improvements to water quality.

Diazinon

When the Program conducted its stormwater pollutant characterization effort (1990 through 1992), it was not anticipated that current generation pesticides would cause impairment of local creeks. However, through the use of toxicity tests and toxicity identification evaluations, the Program found that diazinon, a widely used insecticide, was a significant cause of stormwater toxicity.[2] That finding led to the eventual listing of local creeks as being impaired due to diazinon. After determining that diazinon was a prevalent toxicant, the Program conducted several studies to determine the sources of diazinon in stormwater. One of these studies found that the application of diazinon in accordance with label directions may be responsible for much of the diazinon found in stormwater.[3] The results of that study were cited in U. S. EPA's recent assessment of diazinon that resulted in a national ban on the sale of diazinon for urban use after 2004.[4]

EVOLUTION OF THE PROGRAM

A great deal has been accomplished over the past ten years. However, as the Program moves into its third permit, it faces significant challenges. In particular, the listings of the bay and creeks as impaired by specific pollutants will require increased efforts to reduce the discharges of these pollutants in

stormwater prior to and as part of TMDLs. The increased focus on other stormwater impacts to local creeks will also require additional effort.

Response to Impairment

The Regional Board conducts periodic reviews of data on water bodies in the region to determine if any pollutant is causing an impairment. As a result of the Regional Board's 1998 review of existing data, the State Board and U. S. EPA listed San Francisco Bay as impaired due to several pollutants, including, mercury, polychlorinated biphenyls (PCBs), diazinon, chlorinated insecticides, and copper. Several creeks in Alameda County are also listed as impaired due to diazinon.

There are often multiple sources of these pollutants, for example, sources may include industrial and sanitary discharges, air emissions and deposition, historic deposits, or stormwater discharges. To address the contribution of these pollutants coming from Alameda County's stormwater discharge, the Program has developed Pollutant Reduction Plans (see Section 4). These Pollutant Reduction Plans provide a description of the problem the pollutants are causing, the known or suspected sources of the pollutant, and the Program's approach to minimizing its discharge of the pollutant. Also included is a list of tasks the Program will complete during the next two years (i.e., FY 2001/02 and 2002/03). These work plans are based on our current understanding of the sources and the appropriate next steps. Beginning in 2002, proposed tasks for future years will be submitted to the Board along with the Program's Annual Report.

Local Watershed Efforts

The previous stormwater management plan recognized that the Program should investigate the watershed management approach as an alternative method for solving local environmental problems. In contrast to the traditional command and control regulatory approach, the watershed approach is characterized by collaborative planning among the various stakeholders in a watershed. The solutions derived from this approach typically take longer to develop, but are more tailored to the unique problems and characteristics of individual watersheds. During the past five years the Program has worked closely with its member agencies and other local organizations to begin building successful collaborations in local watersheds. As expected, each watershed has a unique combination of environmental problems, existing organizations, and restoration opportunities, requiring a patient and flexible approach to developing solutions.

This Plan commits the Program to continuing and expanding the use of the watershed management approach. In addition to the extensive effort that will be conducted under the Watershed Assessment component, the Program will conduct the following activities: (1) provide support to watershed stewardship efforts (Public Information and Participation: Task 3); (2) incorporate results of watershed resource inventories into General Plan amendments (New Development: Performance Standard VII); and, (3) provide Program-wide coordination of watershed activities (Planning and Regulatory Compliance: Task 4). The Program and its member agencies will

also continue to work with key stakeholders in local watersheds to determine how the management of stormwater quality can contribute to local creek protection and improvement efforts. To guide the implementation of the watershed approach, the Program will develop a watershed framework The framework will lay out specific goals and a process for the Program's and its member agencies' participation in watershed management efforts.

Increased Planning and Evaluation

Work plans and performance standards are divided into components. As in the past, the implementation of each component will be guided by a subcommittee. This structure has been very effective at allowing the Program to focus on specific areas of activity. However, there remains a need for greater planning and coordination across components. The Program has taken a number of steps to address this need. First, to provide a Program-wide focus to our efforts, the Program has developed mission and vision statements as well as strategic objectives. Second, the Plan includes a task to establish and maintain a work group to provide Program-wide planning and coordination (Planning and Regulatory Compliance: Task 6). The work group will meet on a regular basis and be attended by representatives of the various subcommittees. The development and implementation of Pollutant Reduction Plans will also promote coordination across components.

Another ongoing challenge for the Program, as well as for other stormwater management programs, is evaluating the effectiveness of its stormwater management practices. Due to the tremendous variability in stormwater flow and the ubiquitous nature of stormwater pollutants, it is extremely difficult to detect reductions in pollutant concentrations. Therefore, alternative evaluation methods need to be developed and employed. To address this, the Program has begun to develop methods of assessment for each major task in the component work plans. The Program will continue to develop and implement these methods of assessment over the course of the permit. The Program will also conduct periodic Program-wide evaluations of effectiveness (Planning and Regulatory Compliance: Task 6).

SECTION 3 COMPONENT OBJECTIVE AND TASKS

PLANNING AND REGULATORY COMPLIANCE

Introduction

This component encompasses the major planning, regulatory compliance, watershed management, and administrative activities of the Program. The Policy Level Subcommittee oversees this component's activities.

Component Objectives

1. Promote the implementation of effective and reasonable stormwater regulations by participating in regulatory processes. This may include advocating legislation that benefits member agencies.
2. Promote permit compliance by assisting member agencies with reporting and related activities.
3. Improve Program effectiveness by partnering with outside organizations.
4. Protect and improve the physical, chemical and biological integrity of waters in Alameda County through the development of watershed partnerships and the coordination of watershed management efforts.
5. Develop and implement measures to effectively reduce pollutants causing or threatening to cause impairment.
6. Promote Program coordination through Program-wide planning and evaluation.
7. Provide essential management and legal services.

Major Tasks

1. **Participate in the Regulatory Process:**

   - Review and comment on draft legislation and proposed regulations affecting stormwater
   - Confer with the Regional Board and other stakeholders during reissuance or amendment of permit
   - Participate in TMDL development and implementation process
   - Coordinate with other storm water programs through the Bay Area Stormwater Management Agencies Association and the California Stormwater Quality Task Force

   Task Evaluation: The evaluation of this task may include: 1) a review of the Program's participation in the regulatory process; and 2) an evaluation of the effectiveness of that participation.

2. **Assist Members with Permit Compliance:** A fundamental objective of the Program is to ensure that the member agencies comply with the requirements of their permit. The objective of this task is to assist member agencies with the reporting requirements and ensure that reports are submitted on schedule.

- Develop deliverable report forms
- Compile and submit completed deliverable reports to the Regional Board by required dates
- Review member agencies' performance
- Provide additional assistance with permit compliance as requested by member agencies, such as by providing orientation to new staff

Task Evaluation: The evaluation of this task may include: 1) a review of the completeness, and timeliness of report submittals; 2) a review of what the Regional Board staff needs included in the reporting; and 3) an assessment of any impediments to reporting as part reviewing the effectiveness of reporting formats and processes.

3. **Develop Partnerships:** Many public and private organizations have objectives that overlap with the Program's objectives, examples include, Alameda County Household Hazardous Waste Program, Green Business Program, and the Alameda County Waste Management Authority. By working together with these groups and others, the Program will be able to improve its cost-effectiveness. The Program has already begun to build working relationships with these groups and others. The purpose of this task is to expand upon those partnerships and to pursue opportunities to create additional partnerships.

   - Identify and prioritize issues where partnerships could significantly improve effectiveness
   - Seek to develop or enhance partnerships with public and private organizations that have similar interests

   Task Evaluation: The evaluation of this task may include: 1) enumeration of new or expanded partnerships, or 2) assessment of the benefits of those partnerships.

4. **Facilitate Watershed Approach:** The Program is engaged in promoting a watershed approach through activities within several components: the Watershed Assessment component provides technical assistance such as habitat assessments and watershed mapping; the Public Information and Participation component sponsors projects that increase watershed awareness; and, the New Development and Construction Site Controls component's performance standards incorporate results of watershed resource inventories into General Plan amendments. In addition, throughout the county member agencies are participating in numerous watershed efforts. The purpose of this task is to coordinate and assist with these activities.

   - Assess roles for and develop relationships with potential watershed partners: Regional organization such as the East Bay Municipal Utility District, Alameda County Water District, East Bay Regional Park District, and the Urban Creeks Council are potential partners in several county watersheds.
   - Establish a work group to promote information exchange

and coordination among watershed efforts
- Update Watershed Framework Document and implement as appropriate

Task Evaluation: The evaluation of this task may include: 1) the number of new or expanded partnerships, and 2) a survey of agency staff regarding the usefulness of the coordination effort.

5. **Support Pollutant Reduction Plans:** The Program has developed measures to address specific pollutants that are believed to be causing impairment to local water bodies. Planning activities related to the implementation and evaluation of those Plans will be conducted under this task.

   - Implement aspects of the Pollutant Reduction Plans that fall within this component
   - Coordinate implementing and updating the Pollutant Reduction Plans

   Task Evaluation: Evaluation may include: 1) assessment of the level of implementation; and 2) qualitative assessment of effectiveness.

6. **Plan and Evaluate:** Planning and evaluation are essential if the Program is to be effective. This task provides for establishing a work group to coordinate planning and evaluation across all components.

   - Evaluate Program performance and coordinate development of Program-wide annual work plans
   - Develop and maintain newsletter and website

   Task Evaluation: The evaluation for this task may include an assessment of the Program's planning and evaluation process.

7. **Provide Management Services:** The objective of this task is to provide essential administrative services to the member agencies.

   - Provide Program management, contracting, accounting, and other administrative services, and produce reports on Program activities, expenditures, and performance
   - Facilitate the Policy and Management Committee meetings

   Task Evaluation: The evaluation for this task may include a review of the reporting processes and assessment of areas for possible improvement.

WATERSHED ASSESSMENT

Introduction

The Program's objectives for monitoring and assessment have evolved during its first ten years. Early monitoring emphasized testing stormwater, dry weather discharges and sediment to assess pollutant loads and stormwater impacts on San Francisco Bay.

However, in August 1996 the Regional Board staff requested that the Program and other municipal stormwater programs in the region redirect their monitoring resources from fixed-station, wet-weather monitoring, to increased watershed assessment and long-term monitoring plans for creeks and other waterbodies.

In November 1999 the Regional Board staff released the Regional Monitoring and Assessment Strategy (RMAS) that describes a regional framework and schedule for assessment of pilot watersheds by various agencies. A letter sent to stormwater agencies in February 2000 affirmed that their participation in the RMAS would meet the intent of NPDES permit's requirements for assessing watersheds and estimating pollutant loading. The letter supported a functional approach to watershed assessment, which would vary according to the conditions and beneficial uses found in each watershed. The Program has incorporated this approach into its Watershed Assessment component.

These assessments will vary depending on the condition of the watershed. Functional assessment of relatively undeveloped watersheds may focus on habitat and flow conditions needed to sustain fishery resources and other creek-dependent life.

In contrast, urbanized creeks are usually highly altered by land use changes in their watersheds, and assessment of such systems might focus on their ability to support existing uses, such as non-contact recreation and industrial water supply. In a report funded by the Program, Gunther et al. (2000) identified potential indicators or benchmarks for evaluating the condition of a creek's beneficial uses. These include measurements of individual pollutants, characterization of the amount and timing of creek flow, and surveys of diversity and composition of plant and animal communities living in creeks and adjacent riparian areas.

The Program's 1996-2001 Plan included activities aimed at exploring waterbody-specific approaches for improving water quality and increasing awareness and stewardship by local residents. Experiences from these pilot watershed activities have led to development of the Alameda County Watershed Framework. The Watershed Framework is a working document that describes potential roles for the Program, member agencies, and others in local watershed efforts.

The Watershed Assessment component includes activities to coordinate, manage and present watershed-specific information and spatial data. Component tasks also include refining a suite of indicators of creek health and tailoring the content and presentation of data to make it more useful to managers and other stakeholders of local watershed-based initiatives. Activities under the

Monitoring and Special Studies component continue to include monitoring pollutant trends, evaluating the effectiveness of BMPs, and conducting special studies that have regional scope or are applicable to multiple watersheds. Coordination and facilitation of watershed-based activities are incorporated into the Planning and Regulatory Compliance component.

Component Objectives

1. Develop and maintain a GIS resource for watershed information
2. Use a variety of indicators to assess the functional condition of creeks and watersheds.
3. Provide useful watershed information to the Program and other watershed stakeholders
4. Evaluate component effectiveness

Major Tasks

1. **Develop and Maintain GIS for Watershed Information:** A Geographical Information System (GIS) is the most effective way to manage and analyze complex and diverse types of watershed data. The Program initiated a GIS-based inventory of ten pilot watersheds in FY 2000/01, building on an existing system developed for the San Lorenzo Creek watershed by the District. The objective of this task is to build a coordinated resource for watershed information that can be used by the Program, its member agencies and other watershed partners.

    - Expand available countywide coverages through conversion and data sharing with other agencies
    - Develop task list and schedule for adding GIS data and tools based on priorities of Program and local watershed efforts
    - Maintain and update coverages, metadata standards and data-sharing agreements
    - Coordinate with Program members, Monitoring and other Program components to incorporate additional data types
    - Coordinate with the Monitoring and Special Studies component to integrate stormwater and sediment monitoring databases and establish protocols for linking rainfall and flow data

    Task Evaluation: The evaluation of this task may include 1) review of completeness and quality of GIS coverages; and 2) evaluation of levels of participation in data-sharing by members and other agencies

2. **Characterize Functional Attributes of Creeks and Potential for Stormwater Impacts:** Beneficial uses, such as fisheries and wildlife, depend on natural ecosystem functions of creeks which link physical and chemical processes with biological populations of animals and plants, both in the creek channel and in the watershed as a whole. Because these systems are complex, watershed managers seek quantifiable indicators that may be applied over a range of conditions to help screen and characterize problems. Regional and national proposals for various indicators must be evaluated, calibrated and

refined for use in Alameda County creeks.

- Establish expected values for selected biological indicators (e.g., macroinvertebrates and fish) in relatively natural channels
- Explore ranges of application of additional measures of creek function, e.g., habitat, riparian buffers, and alterations to flow regime
- Promote consistent, effective indicator application among the Program, its members and other partners including volunteer monitors.
- Coordinate with regional initiatives and assessment strategies

Task Evaluation: The evaluation of this task may include 1) review of where various indicators have been applied; and 2) evaluation of indicators' consistency and usefulness in guiding management in pilot watersheds.

3. **Provide Useful Information To Assist Watershed Management Efforts:** As the General Program and its member agencies increase their participation in local stakeholder meetings and watershed management groups, specialized assessment needs will arise. Effective information presentation and data reporting may require tailoring to a variety of audiences ranging from agency workers to regulators and community groups. Products might include guidance on GIS mapping approaches, supporting materials for grant applications, and "report cards" or descriptions of constraints and opportunities for watershed management.

- Continue inventory and assessment of the pilot group of creek segments or lakes, and establish a plan for assessing other creeks or lakes within the County
- Work with member agencies and other watershed stakeholders in mapping and identifying data needs for individual watersheds
- Explore ways to inventory existing patterns of BMP application and other localized spatial data
- Develop models for data presentation for different types of representative watersheds
- Present watershed and other spatial data on the Program website and provide user-friendly guidance for its use
- Coordinate data definitions and data management structures through regular meetings with the Regional Board staff, BASMAA Monitoring Committee, and other partners
- Compile assessment data requested by Regional Board staff for water quality assessment reports (Clean Water Act section 305(b))

Task Evaluation: The evaluation of this task may include 1) evaluation of overall assessment effort; and 2) review of form, content and distribution methods for assessment information products, with comments and feedback from partners and other data users.

4. **Management and Evaluation of Component Effectiveness:** The Program will prepare reports, budgets and other items to assist with management and implementation of this component. The effectiveness of implementation will be evaluated as part of the annual report. Annual activities and work plans will be guided by (a) priorities and objectives developed under task 1; and (b) annual review of Watershed Management-related tasks conducted under the Planning and Regulatory Compliance component. Implementation of this component will initially focus on establishing a GIS resource (Task 1), and emphasis will gradually shift to providing other useful data to stakeholders.

   Task Evaluation: The evaluation of this task may include 1) review of progress towards goals in the long-term strategy; and 2) comments and feedback from Program's Management Committee.

MONITORING AND SPECIAL STUDIES

Introduction

Since its inception, the Program has tried to improve its understanding of stormwater pollution and to develop effective ways to control pollutants through monitoring and related activities. It has participated in the Regional Monitoring Program for Trace Substances (RMP), which monitors water and sediment in the Bay, and it has also conducted testing of stormwater and sediment at an array of fixed storm drain and creek stations throughout the urbanized portion of the county. This monitoring helped to identify a number of pollutants of concern that could be impairing the bay and urban creeks. Current knowledge about these pollutants, and the evolving strategies for addressing them, are described in Section 4 (Pollutants of Concern) and the Pollutant Reduction Plans in Appendix C.

In 1996, the Regional Board staff directed the Program to cease fixed-station wet-weather monitoring and redirect resources to watershed assessment and development of the long-term monitoring strategy for creeks. A draft plan for Long Term Monitoring and Assessment (Gunther et al., 2000) identified the need to link Program monitoring objectives more closely to beneficial uses of waters. Because of the wide range of watershed factors that can affect a waterbody's ability to support beneficial uses, a separate Watershed Assessment component has been developed to collect and manage complex spatial data. Monitoring and Special Studies component tasks will focus on the occurrence, long-term trends and control strategies for pollutants of concern, including the development of a long-term monitoring work plan for representative urban creeks.

The Program has conducted a variety of special studies to refine information needed to implement the requirements of previous Plans. Examples include studies of the effectiveness of specific BMPs, the use of Toxicity Identification Evaluations to identify diazinon as a probable source of toxicity in urban creeks, and studies to better identify the sources of diazinon and other pollutants.

The Program will continue to identify information gaps and conduct special studies on stormwater pollution to fill these gaps. These studies can be grouped into two categories: 1) studies focused on the pollutants of concern and other widespread pollutant problems; and 2) studies of pollutants responsible for more localized problems, such as litter and construction-related discharges. The implementation of BMPs to address pollutants that are local problems may need to be tailored to physical, social or jurisdictional conditions in specific watersheds. The evaluation of the effectiveness of these BMPs may need to consider conditions as well.

Component Objectives

1. Improve characterization and tracking of pollutants of concern that are found in stormwater
2. Evaluate the effectiveness of stormwater BMPs
3. Provide technical information to member agencies about pollutants

that may cause localized stormwater problems
4. Coordinate planning and reporting with related monitoring efforts
5. Evaluate component effectiveness and develop ways to measure the Program's effectiveness over time, including information on cost effectiveness

Major Tasks

1. **Characterize Concentrations and Long-Term Trends for Pollutants of Concern:** Section 4 (Pollutants of Concern) describes several pollutants that the Regional Board or U.S. EPA have identified as causing impairment of the bay or local creeks. Because the Regional Board needs to develop TMDLs for these pollutants it will require the Program's assistance in developing information about pollutant loading and changes in pollutant concentrations that result from the implementation of Pollutant Reduction Plans (Appendix C) and TMDLs. Past monitoring experience indicates that stormwater testing is useful for characterizing some constituents, and it will be continued at a long-term site on Castro Valley Creek. The Program will also sample sediment from creek beds, which is useful for surveying the occurrence of pollutants that are associated with fine particles.

   Activities for this task are described in the Annual Monitoring Work Plans submitted to the Regional Board. In addition to participating in coordinated regional data collection, the Program will develop a strategy for creek monitoring that incorporates the following objectives:

   - Review existing stormwater and sediment data to select effective sampling methodologies
   - Evaluate long-term trends in pollutant concentrations and toxicity in urban runoff
   - Establish expected baseline concentrations of mercury, PCBs and targeted organochlorine pesticides in sediment of creeks and storm drains and estimate loadings using available total suspended solids and discharge data.

   The Program has a database with the results of the fixed-station stormwater and sediment monitoring results collected during 1988-1995. This database will be updated with pollutant data from relevant special studies conducted by the Program and other local entities. Additional database modules for yearly rainfall patterns and flow history for one or more benchmark sites will be added to assist with assessment of long-term trends in water quality. Objectives for improving data interpretation include:

   - Incorporate grab sampling, rainfall and other types of data into the existing database
   - Facilitate linkages among pollutant concentrations, rainfall and spatial GIS data

   Task Evaluation: The evaluation of this task may include review of the Program's effectiveness in identifying long-term pollutant trends.

2. **Characterize Sources and Evaluate BMP Effectiveness for Pollutants of Concern:** Sources of pollutants must be understood in order to develop effective pollutant reduction measures. The impairments caused by the Pollutants of Concern are generally widespread because of the ubiquitous nature of the pollutants and the transport of many of these pollutants through the atmosphere. Because of the regional nature of these pollutants, the Program will need to coordinate closely with the Regional Board staff and with other BASMAA agencies. This task may involve a range of activities, including:

   - Special studies of specific watersheds with high pollutant concentrations
   - Special studies of sources or pathways
   - Modeling pollutant transport in runoff
   - Participation in coordinated regional studies such as the North Bay Copper Study
   - Participation in national pollutant prevention initiatives such as the Brake Pad Partnership

   Program members have implemented a variety of BMPs, but information about their effectiveness is not always readily available. While the new permit may incorporate additional provisions for treating runoff from new development, past studies by the Program and other stormwater agencies have shown that the effectiveness of treatment devices varies according to site-specific conditions. Evaluation of overall BMP effectiveness may necessitate evaluations of:

   - Structural treatment controls
   - Pollutant control tasks listed in the Pollutant Reduction Plans, such as fluorescent bulb recycling for mercury source control

   Task Evaluation: The evaluation of this task may include 1) tracking changes in the level of understanding of pollutant sources and controls; and 2) identifying ways to improve the effectiveness and application of BMPs.

3. **Assist Local Watershed Managers in Identifying Localized Stormwater Impacts and Provide Tools for Addressing These Impacts:** In contrast to the pollutants described in Section 4, some pollutants mainly affect waters nearby the source of the pollutant's release. Some beneficial uses, such as contact and non-contact recreation, are very location specific. Assessing stormwater impacts on these beneficial uses may involve a variety of site-specific factors, and the member agencies play a large role in choosing which specific factors and management objectives they would like better understood through studies. High-priority objectives identified by the Watershed Assessment and Monitoring Subcommittee include:

   - Evaluate toxicity or other impacts on bay fisheries
   - Characterize sediment and litter problems
   - Evaluate fecal coliforms and other indicators of human

health risk for light contact recreation areas
- Provide technical assistance to local watershed managers by providing data and guidance information

Task Evaluation: The evaluation of this task may include 1) review of successes and limitations of various approaches to managing localized issues under different conditions; 2) assess feedback from the Program's member agencies and other users about the effectiveness of Program-produced data and guidance materials.

4. **Coordinate with and Support BASMAA and Other Regional Monitoring Efforts:** The Regional Monitoring Program (RMP) is a collaborative effort to monitor the condition and health of San Francisco Bay. The Program, along with other NPDES-permitted dischargers, contributes to this effort annually. In addition, the BASMAA Monitoring Committee has worked with the Regional Board staff to establish the following three priorities for regional coordination of information: watershed assessment; BMP effectiveness; and characterization of pollutant loads and potential sources. The Program's participation in these regional activities increases opportunities for collaboration and coordination with other stormwater agencies.

   - Continue participation in the RMP
   - Participate in BASMAA Monitoring Committee and other regional monitoring groups
   - Explore monitoring partnerships with other agencies and organizations

   Task Evaluation: The evaluation of this task may include a review of useful information exchanged and partnerships that are initiated or enhanced.

5. **Management and Evaluation of Component Effectiveness:** The Program will prepare reports, budgets and other items to assist with management and implementation of this component. The effectiveness of implementation will be evaluated as part of the annual report.

   - Coordinate annual work plans to reflect the priorities of the Program's Long-Term Monitoring Plan
   - Promote cost-effective monitoring by designing data collection to meet multiple monitoring objectives, where possible.
   - Facilitate and support the Watershed Assessment and Monitoring Subcommittee meetings

   Task Evaluation: The evaluation of this task may include 1) a review of work plan development process; and 2) evaluation of accomplishments against Program objectives.

PUBLIC INFORMATION AND PARTICIPATION

Introduction

Most people are unaware that the largest source of pollutants to local creeks, lakes and the bay comes from the stormwater that flows off the cityscape picking up drops of motor oil, brake pad dust, exhaust emissions, pesticides, dirt and litter and, in most cases, receiving no treatment. These sources of pollutants result from the small, incremental and collective activities of everyone in Alameda County. Public information and participation is one of the keys to preventing stormwater pollution. The better that everyone understands the importance of stormwater pollution, their own, often unintentional, contribution to the problem, and simple things that we can do about it, the cleaner our creeks and the bay will become.

This component of the program focuses on providing information to residents in order to enlist their help in preventing stormwater pollution. The Public Information and Participation Subcommittee oversees this component's activities. This subcommittee is also responsible for ensuring the consistency of terminology, format and style among all of the Program's educational outreach efforts.

A summary of the progress being made in public awareness is described in the Program Description Section under Program Achievements.

Component Objectives

1. Educate residents about stormwater pollution problems.
2. Encourage residents to adopt less polluting and more environmentally beneficial behavior.
3. Assist member agencies with watershed awareness efforts and provide stewardship opportunities.
4. Improve public information and participation effectiveness through partnering with other organizations.
5. Evaluate component effectiveness and make improvements.

Major Tasks

1. **Implement Targeted Outreach:** The Clean Water Program has been working with other municipal stormwater agencies through BASMAA to identify categories of pollutants and pollutant generating behavior to target as part of regional advertising and action campaigns. This pooling of resources has helped to generate more effective campaigns than could be achieved by working independently.

   It is anticipated that future targeted campaigns will focus on helping to implement the Pollutant Reduction Plans for specific water quality impairing pollutants. The pollutants that appear to be priorities on the Regional Board's list include mercury, PCBs and dioxin compounds, and pesticides (diazinon, chlordane, dieldrin and DDT). Another possibility would be to develop and implement a countywide anti-littering campaign. The campaigns will focus primarily on targeting

residential sources and encouraging residents to prevent pollution.

The Public Information and Participation (PIP) Subcommittee will develop and update a list of priorities for helping to select future campaigns. Criteria for the selection of priorities will include that a significant portion of the pollutant-generating behavior originates from residents. It will be important to continue to evaluate the effectiveness of each campaign and not to focus too much on the same type of pollutant or category of pollutants.

The General Program will also collaborate with groups such as the Bay Area Air Quality Management District, the Alameda County Waste Management Authority, Home Builders Association of Northern California, and other groups to expand the impact of any targeted outreach.

2. **Continue to Reinforce General Outreach Messages:** Existing PIP materials that the PIP Subcommittee determines are useful enough to continue in circulation will be updated, as needed, and reprinted or produced for each agency to distribute and for distribution by the General Program on its website and through other methods. The PIP Subcommittee may choose to have more of the existing materials translated into additional languages, if this has been identified as an effective way to reach groups whose primary language is not English. The continued reinforcement will also occur through increased collaboration with other public agencies and private organizations with common interests.

3. **Provide Educational Support and Watershed Stewardship Support:** This task will include helping to educate students about stormwater pollution prevention and related environmental issues. The General Program has actively supported a number of school focused educational endeavors, including Bay Savers (targeted to fourth graders), Kids in Creeks/Gardens/Watersheds (targeted to teachers) and Estuary Action Challenge. The PIP Subcommittee will decide at least every two years which educational activities to support based on the known or expected effectiveness of the activity and how well it addresses the objectives of the PIP component.

   This task will also involve continued support for the Community Stewardship Grant program.

   Lastly, this task will include training for member agency staff responsible for PIP. This training may also be expanded to include other targeted groups such as was done with the *East Bay Watershed Management Symposium* in 1998 and *Turning the Tide: Balancing New Development and Clean Waters* symposium in 2001.

4. **Assist Member Agencies Implement and Improve the Performance Standards:** This task will include assisting the member agencies to implement their PIP performance standards. This assistance may include undertaking any project that will

result in additional tools and means for the member agencies to better implement the performance standards. In the past this has included such things as purchasing kiosk displays and dioramas for the member agencies to use at public events.
This task will also include review and, if needed, improvement in the performance standards at least every two years. This review will occur as part of PIP Subcommittee meetings. The evaluation information collected as part of Task 5 will be used to decide how and where to make improvements.

5. **Manage Component and Evaluate and Improve Its Effectiveness:** The General Program will assist the PIP Subcommittee and its work groups to conduct its meetings and prepare any needed NPDES permit required reports and work plans. This task will also include assisting with the development of annual General Program component work plans and budgets.

   The effectiveness of this component will be evaluated as part of the following types of activities, which are offered as examples:

   - Conduct a public awareness survey similar to the one conducted in 2000.
   - Evaluate the information being submitted as part of the annual reports.
   - Survey member public agencies to obtain information about how well this component and the performance standards are working.
   - Evaluate the Regional Board staff's reviews of the Clean Water Program's performance in this area.
   - Review information collected elsewhere of tangible progress. This may include tracking changes in behavior based on pre and post- campaign surveys paid through participation in BASMAA.

   The PIP Subcommittee as part of developing its annual work plan and budget will consider improvements to the General Program at least annually.

MUNICIPAL MAINTENANCE ACTIVITIES

Introduction

Municipal maintenance staff comprises one of the largest group's of public employees whose everyday work sweeping and repairing streets, cleaning storm drains, and applying herbicides can directly help to prevent stormwater pollution. In addition, the hundreds of maintenance field personnel play an essential role in reporting on illicit discharges and pollution problems that need to be fixed. The maintenance staff also helped to spread the word about stormwater pollution prevention among its maintenance counterparts in other public agencies.

The Maintenance Subcommittee, which is one of the oldest in the Program, is responsible for helping to implement this component's activities.

Component Objectives

1. Optimize pollutant removal during routine maintenance activities such as street sweeping and maintenance of storm drainage facilities.
2. Prevent or minimize discharges to storm drains and watercourses from road maintenance, parks, corporation yards and other publicly owned facilities.
3. Provide information and education about the Alameda Countywide Clean Water Program to agency employees.
4. Evaluate component effectiveness and make improvements.
5. Facilitate reporting.

Achievements

One of the accomplishments of the Program has been to reach a consensus among the member agencies on how to implement the diverse activities involved in municipal maintenance so as to minimize the stormwater pollution. This resulted in the development of performance standards for street cleaning; storm drainage and watercourse maintenance; litter control; road repair and maintenance; and corporation yard operations.

One of the core maintenance areas has been the use of street sweeping to remove potential pollutants prior to their being flushed into local creeks and the bay. All of the municipalities report their street sweeping and storm drainage cleaning activities on a standardized monthly form. In Fiscal Year 1999/00 the collective street sweeping effort of all of the municipalities resulted in the sweeping of about one quarter of a million curb miles of street with the removal of over 78,000 cubic yards and 1,000 tons of material. These amounts are similar to what has been achieved in most recent years, except during the El Nino year in 1998 when the amount of material removed by sweeping was reduced probably because the persistent rains flushed material away before it could be swept up.

The Program has well attended annual training workshops for municipal maintenance staff. During the last three years this training has been augmented creatively by the sweeper rodeo and similar events to demonstrate Best Management

Practices usage in an engaging manner. In addition, in 2000 the Program hosted an educational outreach workshop that was attended by representatives from public agencies outside of the Program and by PG&E.

Major Tasks

1. **Implement and Assist with Performance Standards:** Each agency will implement the municipal maintenance performance standards presented in Section IV. The performance standards include the following major activities:

   - Street Sweeping
   - Storm Drain Cleaning
   - Training
   - Reporting

   The General Program will work through the Maintenance Subcommittee to resolve implementation and consistency issues.

2. **Coordinate Maintenance-Related Activities with Other Subcommittees of the ACCWP, Other Agencies and Private Industries**: The subcommittee will work with appropriate staff from other Subcommittees of the ACCWP, park and recreation departments, and other public agencies and private industries whose activities are similar to or potentially affect municipal maintenance activities to identify activities of concern. Examples of other public agencies and private industries include PG&E, water suppliers and utilities, garbage collection companies, the Port of Oakland, golf courses, private recreational facilities and animal confinement areas.

3. **Optimize Data Management and Analysis**: The General Program will optimize ongoing collection, recording and analysis of maintenance data. This will include continuing to evaluate if the types of maintenance data being collected are useful and if other types of data should be collected. Examples of potential studies and data analysis include the following:

   - Leaf collection programs
   - Litter abatement programs

4. **Outreach and Training:** The General Program will facilitate outreach and training activities aimed at preventing discharges from maintenance activities, with direction from the Maintenance Subcommittee. This includes selecting the appropriate forum (e.g., workshops, round table meetings, work groups, inter/intra-agency coordination meetings, etc.) depending on the target audiences (e.g., ACCWP agencies, other agencies, property owners, residence, etc.). The Maintenance Subcommittee will also coordinate outreach activities with other ACCWP Subcommittees when the objectives of a planned outreach and training activity conducted by the Maintenance Subcommittee overlap with the objectives of another Subcommittee.

   The Maintenance Subcommittee will identify a target audience at least once every two years; the Subcommittee will select the appropriate forum for the outreach depending on the selected audience.

The General Program will develop and update materials (such as BMP flyers, brochures, posters, etc.) that are needed to support outreach and training activities, as determined by the Maintenance Subcommittee.

5. **Manage Component and Evaluate and Improve Its Effectiveness:** The General Program will assist the Maintenance Subcommittee and its work groups to conduct meetings and prepare any needed NPDES permit reports and work plans related to this component. This includes assisting with the development of annual General Program budgets. The following activities are examples of how the effectiveness of this component may be evaluated:

   - Survey member agencies to obtain information about how well this component and the performance standards are working.
   - Evaluate the information being submitted as part of the annual reports.
   - Evaluate the Regional Board staff's reviews of the Clean Water Program's performance in this area.

NEW DEVELOPMENT AND CONSTRUCTION CONTROLS

Introduction

New development offers a unique opportunity to construct projects that prevent stormwater pollution. Historically projects were constructed by building up to or over culverted creeks, constructing drainage ways to convey runoff off of project sites quickly, and ignoring opportunities to prevent or treat stormwater runoff. These developments lead to the destruction of flood plains and alterations in the natural structure and function of creeks, as well as to increases in the amount of stormwater pollution.

Better ways to design and construct new projects have received a considerable amount of attention in recent years. In 1994 the Regional Board staff developed its *Staff Recommendations for New and Redevelopment Controls for Storm Water Programs.*

The concepts in this document were used to develop the performance standards for New Development. In 1998 the Program and other Bay area municipal stormwater programs developed through BASMAA the *Start at the Source* manual. This manual describes a comprehensive approach to planning environmentally sensitive developments that minimize increases in the amount of impervious cover and combine stormwater treatment systems into the landscaping. Additional models will be developed as part of meeting the new Standard Urban Stormwater Mitigation Plan requirements described in the Background Section under Recent Developments.

Component Objectives

1. Identify and help implement source controls, site design measures and post-construction stormwater pollutant and hydromodification controls.
2. Assist with incorporating controls on impairing pollutants prior to and following completion of load and waste load allocations as part of a Total Maximum Daily Loads process.
3. Ensure that public works construction and maintenance projects conform to the same standards as private projects.
4. During construction promote the use of controls to reduce the discharge of pollutants to the maximum extent practicable and effectively control non-stormwater discharges.
5. Evaluate component effectiveness and make improvements.

Achievements

The Clean Water Program has emphasized the development of tools to help implement this component of the Stormwater Quality Management Plan. This included developing suggested Conditions of Approval for residential, commercial and industrial developments and compiling a *Catalog of Structural Stormwater Quality Control Measures.* Training focused on Planning Commissioners and individual municipality planning and engineering staffs. Municipalities have begun to implement the *Start at the Source* types of stormwater design measures. This has included the use of

grassy swales at residential, commercial, industrial and public works developments in a number of cities and the District's construction and operation of a stormwater treatment pond draining about 500 acres of residential area in Fremont. With assistance from the Regional Board staff, other areas of emphasis have included improving controls on erosion and sedimentation and preventing the releases of construction related discharges.

Major Tasks

1. **Identify How To Implement Source, Site Design, Post-Construction Stormwater Treatment and Hydromodification Controls:** As part of the previous Stormwater Management Plan, the Clean Water Program emphasized the use of pollutant source controls and site planning measures, such as those found in the *Start at the Source* manual. The Regional Water Quality Control Board and municipal planning staff are interested in specifying more clearly how source, design, treatment and hydromodification controls need to be used as part of the maximum extent practicable control of pollutants from stormwater.

   This task will include the following activities:

   - Review the Santa Clara Valley Urban Runoff Pollution Prevention Program's work on implementing its new permit requirements that address these types of controls. This will also include identifying and reviewing useful approaches of other municipal stormwater programs in California and elsewhere.
   - Identify and work with a stakeholder group to develop a method for appropriately integrating pollutant and hydromodification controls as requirements for new development.
   - Submit the Clean Water Program's agreed upon method for implementing pollutant and hydromodification controls to the Regional Board staff and, based on feedback, make any needed changes.
   - Identify assistance that the Clean Water Program's member agencies will need in order to implement the new, agreed upon controls.
   - Every two years review and, if appropriate, improve the agreed upon controls based upon implementation experience and other new information.

   Task Evaluation: The evaluation of this task may include 1) determine whether the General Program was able to achieve consensus among the stakeholders regarding the new controls and 2) obtain feedback from the Regional Board staff on how well the agreed upon controls met its expectations.

2. **Help Implement Source, Site Design, Post Construction Stormwater Treatment and Hydromodification Controls:** This task will include assisting the member agencies to implement the agreed upon more specific pollutant and hydromodification controls. This may include the following types of activities, which are offered as examples:

- Modify and improve the performance standards to incorporate the agreed upon control methods.
- Develop and update the Conditions of Approval, development guidance and review checklists.
- Track and discuss at New Development Subcommittee meetings municipal case studies of new development/redevelopment projects that are illustrative of successes, problems and questions about the control method.
- Develop guidance on cost-effective ways to implement the controls, such as, updating the "Project Worksheet for Permanent Stormwater Quality Controls."

Task Evaluation: The evaluation of this task may include: 1) assess the information being submitted as part of the annual reports; 2) obtain feedback from the municipalities about how successful the implementation of the controls has been; and 3) survey builders on how helpful the more specific controls and implementation tools have been and ways that they can be improved.

3. **Assist with the Development of Watershed Information and Facilitate Its Use:** This task will involve identifying the watershed information needs of the member agencies so that this information may be collected for use by agency planning and engineering staff. The actual collection of most watershed information will be conducted as part of the Watershed Assessment component. This task will also include assisting the member agencies with the use of watershed information that has been collected.

   Task Evaluation: The evaluation of this task may include a survey of the agencies' planning and engineering staffs to see how well their watershed information needs were met.

4. **Promote Outreach and Training:** This task will include reinforcing and expanding educational outreach to agency planning and engineering staff, Planning Commissions, City Councils, builders, and builders' consultants and contractors. The next wave of this outreach and training will focus on helping everyone to understand and implement the more specific pollutant and hydromodification controls developed as part of Task 1. This outreach and training will include the following:
   - Conduct at least one outreach and/or training event annually that is targeted to either agency staff or to the building industry. This may be conducted in collaboration with other agencies, organizations or groups.
   - Develop and distribute outreach material that goes beyond the trifolds that have been developed in the past.
   - Compile and distribute, in binders, to agency staff copies of all of the guidance and educational material that have been developed by the subcommittee.
   - Develop and maintain a mailing list of designers,

builders, developers that may be used by member agencies to do outreach.

Task Evaluation: The evaluation of this task may include 1) the number of staff trained from each of the targeted groups; and 2) summaries of the feedback obtained from recipients of training and outreach.

5. **Manage Component and Evaluate and Improve Its Effectiveness:** The General Program will assist the New Development Subcommittee and its work groups to conduct its meetings and prepare any needed NPDES permit required reports and products. This task will also include assisting with the development of annual General Program work plans and budgets. As part of developing the annual work plan and budgets, the New Development Subcommittee will consider ways to improve the General Program.

   Task Evaluation: The evaluation of this task may include: 1) review how well the municipalities are meeting the new NPDES permit requirements that affect new development and redevelopment, this may include summarizing the Regional Board staff's reviews of member agency performance in this area; and 2) review information collected elsewhere of tangible progress, such as changes in environmental indicators developed by the Stormwater Environmental Indicators Pilot Demonstration Project in Santa Clara Valley.

ILLICIT DISCHARGE CONTROLS

Introduction

One of the most visible reasons for having a Program is to eliminate pollution caused by materials being poured, spilled, dumped, washed, or discharged into the municipal storm drain system. One of the Clean Water Act's few explicit stormwater dictates is that permits include a "requirement to effectively prohibit non-stormwater discharges into the storm" drain systems. The federal regulations allow the discharge of some minor types of non-stormwater discharges, such as under specified conditions.

The Program has been proactive in identifying and eliminating illicit discharges to the municipal storm drain system. This has included enlisting the help of each agency's municipal maintenance and other field staff who are most likely to see what is being discharged to the storm drain system or dumped where it may become waterborne. A brief summary of the progress being made is described in the Achievements section below.

Component Objectives

1. Control illicit discharges by conducting field surveys of the municipal storm drainage conveyance system and identifying and eliminating the sources of non-stormwater discharges.
2. Effectively coordinate spill response and clean-up with existing programs.
3. Optimize illicit discharge control activities through planning and prioritization.
4. Address discharges that may not be considered illicit if properly managed.
5. Partner with other Subcommittees, agencies, and groups to increase public awareness on how to effectively and efficiently prevent pollutant discharges to the storm drains.

Achievements

The Program has conducted several training workshops for illicit discharge inspectors to improve member agencies' familiarity with Best Management Practices for identifying and eliminating illicit discharges. In 1995 the Program developed a standardized form for documenting illicit discharge findings and controls. This systematic approach has helped to identify the predominant types of illicit discharges so that additional, targeted educational outreach could be undertaken.

Since 1995 the member agencies have identified and eliminated approximately 5,000 illicit discharges. During this period the number of illicit discharges being found each year has about doubled and the number of illicit discharges that led to enforcement has approximately quadrupled. The increase in the number of illicit discharges being found may reflect an improvement by illicit discharge inspectors, maintenance staff, outside agency staff and the general public in identifying and reporting illicit discharges incidents.

Major Tasks

1. **Implement and Assist with Performance Standards:** Each agency will implement the performance standards specified in Section 5 for illicit discharge control activities. The performance standards include the following major activities.
   - Developing a five-year Action Plan for conducting field surveys of the agency's watershed.
   - Conducting field surveys.
   - Investigating illicit discharge reports and conduct appropriate follow-up.
   - Effectively eliminate illicit discharges through education and enforcement.

   The Industrial & Illicit Discharge Control (I&IDC) Subcommittee will review the performance standards at least every two years and make any needed improvements. The General Program will work through the I&IDC Subcommittee to resolve implementation and consistency questions.

2. **Assist Member Agencies Comply with Requirements for Conditionally Exempt Non-Stormwater Discharges:** The General Program will continue to facilitate compliance with non-stormwater discharges identified in the NPDES permit as conditionally exempt from discharge prohibitions to the storm drains. The General Program will work through the I&IDC Subcommittee and its work groups to identify effective control measures. The General Program will also facilitate the process for adding any non-stormwater discharges identified to the list of conditionally exempt non-stormwater discharges, and developing the appropriate BMPs.

3. **Track and Analyze Non-stormwater Discharge Reports:** Each agency submits quarterly summary reports on illicit discharge control activities as described in the performance standards. The General Program will collect and analyze this information for trends and other useful information to better plan and help improve illicit discharge control program activities, with direction from the I&IDC Subcommittee. For example, information on non-stormwater discharges can be used to identify needs for additional information or to develop discharge elimination/disposal priorities for categories of discharges.

4. **Conduct Outreach and Training:** The General Program will facilitate outreach and training activities to prevent illicit discharges, with direction from the I&IDC Subcommittee. This includes selecting the appropriate forum (e.g., workshops, round table meetings, work groups, inter/intra-agency coordination meetings, etc.) depending on the target audiences (e.g., ACCWP agencies, other agencies, property owners, residences, etc.). The I&IDC Subcommittee will also coordinate outreach activities with other ACCWP Subcommittees when the objectives of a planned outreach and training activity conducted by the I&IDC Subcommittee overlap with the objectives of another

Subcommittee. For example, the I&IDC Subcommittee will coordinate with the Watershed and Monitoring Subcommittee when conducting outreach activities that address pollutants targeted in Pollutant Reduction Plans.

The I&IDC Subcommittee will better define and identify the target audience at least once every two years; the Subcommittee will select the appropriate forum for the outreach depending on the selected audience. The General Program will develop materials (such as BMP flyers, brochures, posters, etc.) that are needed to support outreach and training activities, as determined by the I&IDC Subcommittee.

5. **Manage Component and Evaluate and Improve Its Effectiveness:** The General Program will assist the I&IDC Subcommittee and its work groups to conduct meetings and prepare any needed NPDES permit reports and work plans related to this component. This includes assisting with the development of annual General Program budgets. The following activities are offered as examples of how the effectiveness of this component may be evaluated.
   - Evaluate the information being submitted by ACCWP agencies as part of the annual reports.
   - Coordinate with the PIP Subcommittee to survey the general public on illicit discharges and BMPs to prevent the discharge of pollutants.
   - Evaluate the Regional Board staff's reviews of the Program's performance in this area.

INDUSTRIAL/COMMERCIAL DISCHARGE CONTROLS

Introduction

The prevention and control of stormwater pollution from commercial and industrial businesses is one of the major activities of the Program. The Program emphasizes educating businesses about methods to prevent and control stormwater pollution. Educational outreach to businesses has occurred primarily during facility inspections and through working with trade and business organizations on identifying appropriate Best Management Practices.

Educational outreach materials for the automotive repair shops and restaurants, the two most common businesses countywide, has included the development of brochures, posters, and flyers. In addition, there are manufacturers and other more industrial types of businesses that are required to have coverage under the California Industrial Stormwater NPDES General Permit. Since the municipalities are required to control any type of stormwater that discharges to their municipal storm drain system, the municipalities do not treat one type of business differently than another.

The Industrial & Illicit Discharge Control Subcommittee is responsible for overseeing the implementation of this component and the Illicit Discharge Controls component.

Component Objectives

1. Reduce the amount of pollutants in stormwater runoff to the maximum extent practicable from industrial and commercial facilities.
2. Eliminate effectively non-stormwater discharges from industrial and commercial facilities to the municipal storm drain system.
3. Identify and eliminate potential stormwater pollution sources through facility inspections, outreach activities, and appropriate follow-up including enforcement.
4. Provide incentives, both positive and regulatory, for businesses to comply with stormwater requirements.
5. Evaluate component effectiveness and make improvements.

A summary of the progress being made in preventing and controlling businesses' contribution to stormwater pollution is described in the Program Description Section under Program Achievements.

Major Tasks

1. **Implement and Assist with Performance Standards:** Each agency will implement the performance standards specified in Section 5 for industrial/commercial discharge control activities. The performance standards include the following major activities.
   - Developing a five-year Inspection Plan and an annual Inspection Workplan for conducting business inspections.
   - Conducting business inspections.
   - Conducting outreach and enforcement to businesses to obtain compliance.

   The five-year Inspection Plan is a one-time permit requirement. Each agency will

describe its industrial and commercial base, as well as business inspection priorities and procedures. The description will include an estimate of the number of industrial and commercial sites requiring inspection for the five-year permit period and the numbers of facilities under each business type.

The Industrial & Illicit Discharge Control (I&IDC) Subcommittee will review the performance standards at least every two years and make any needed improvements. The General Program will work through the I&IDC Subcommittee to resolve implementation and consistency questions.

2. **Develop BMP Guidance:** With direction from the I&IDC Subcommittee, the General Program will develop materials to support illicit discharge control and industrial/commercial discharge control activities. This includes identifying target audiences and the format (e.g., brochures, flyers, checklist, poster, etc.) of the guidance material best suited for the target audience.

3. **Track and Analyze Facility Inspection Reports:** Each municipality submits inspection information on the standard report form as described in the performance standards. The General Program will continue to collect and analyze this information for trends and other useful information to better plan and help improve business inspection, outreach, and enforcement activities, with direction from the I&IDC Subcommittee. For example, information on the potential to discharge pollutants can be used to identify priority businesses for the following year's inspection or outreach activities.

4. **Conduct Outreach and Training:** The General Program will facilitate outreach and training activities to prevent pollutant discharges from business activities, with direction from the I&IDC Subcommittee. This includes providing incentives, both education/outreach and enforcement, for businesses to comply. The audience can include both agency and business groups or organizations. The I&IDC Subcommittee will also coordinate outreach activities with other ACCWP Subcommittees when the objectives of a planned outreach and training activity conducted by the I&IDC Subcommittee overlap with the objectives of another Subcommittee.

   The I&IDC Subcommittee will identify a target audience at least once every two years; the Subcommittee will select the appropriate forum for the outreach depending on the selected audience.

5. **Manage Component and Evaluate and Improve Its Effectiveness:** The General Program will assist the I&IDC Subcommittee and its work groups to conduct meetings and prepare any needed NPDES permit reports and work plans related to this component. This includes assisting with the development of annual General Program budgets. The following activities are offered as examples of how the effectiveness of this component may be evaluated:
   - Evaluate the information being submitted by ACCWP agencies as part of the annual reports.
   - Survey businesses on how the effectiveness of outreach and inspection activities described in this component and its performance standards.
   - Evaluate the Regional Board staff's reviews of the ACCWP's performance in this area.

SECTION 4 POLLUTANTS OF CONCERN

As a result of its 1998 assessment of water bodies in the Bay Area, the Regional Board listed San Francisco Bay as impaired due to the following pollutants: diazinon, mercury, polychlorinated biphenyls (PCBs), copper, nickel, chlordane, DDT, dieldrin, and selenium. The U.S. EPA subsequently added dioxin-like compounds as one of the bay's impairing pollutants; listed several creeks in Alameda County as impaired by diazinon; and listed Lake Merritt as impaired due to litter and low dissolved oxygen.

To address the contribution of these pollutants from stormwater, the Program is developing pollutant reduction plans (PRPs). PRPs provide a comprehensive list of actions the Program will take to further reduce the discharge of impairing pollutants that are the highest priority for the Regional Board: diazinon, mercury, copper, and PCBs (see Appendix C). This section of the Plan provides information on each of these pollutants, including, problem definition, sources, challenges, and the Program's approach to reducing the level of these pollutants in stormwater. Other pollutant reduction plans will be developed as needed.

DIAZINON

Problem Definition

Diazinon is a widely used organophosphate insecticide that has been detected in creeks throughout the Bay Area. During storm events, the concentration of diazinon in local creeks is often high enough to be toxic to some species of aquatic life. For example, 71% of stormwater samples collected from Bay Area creeks were lethal to a small crustacean, *Ceriodaphnia dubia*, and Toxicity Identification Evaluations (TIEs) have determined that diazinon was the primary cause of this toxicity (Katznelson, 1997). *C. dubia* is a standard U.S. EPA test species, and although it is not a resident species in local creeks, toxicity to *C. dubia* suggests that other aquatic insects that inhabit local creeks could also be adversely affected by the presence of diazinon. Based on the prevalence of stormwater toxicity and the results of the TIEs, the U.S. EPA listed Alameda, San Leandro, and San Lorenzo creeks as impaired by diazinon.

U.S. EPA has banned the sale of diazinon for urban use after 2004 due to concerns regarding potential environmental and human health impacts. However, the application of diazinon will be allowed to continue until the stock of diazinon sold prior to the end of 2004 has been depleted. Therefore, the level of diazinon in stormwater may continue to exceed toxic concentrations for several years after its sale is banned.

Diazinon is not the only insecticide found in Bay Area creeks. Other commonly used insecticides, such as chlorpyrifos, carbaryl, and malathion, also have been detected and may be contributing to toxicity. As diazinon and other insecticides such as chlorpyrifos are banned, other insecticides will be used in their place. The replacement

pesticides may cause equal or increased toxicity in stormwater discharges.

Sources

The primary source of diazinon in Alameda County creeks is stormwater runoff from urbanized areas. Diazinon is applied by both professional and non-professional applicators. About half of the estimated 30,000 pounds of diazinon used in Alameda County in 1995 was applied by residents who purchased the product at retail outlets. The remainder was applied by commercial pest control applicators. The most common target pests were ants, fleas, and spiders (Scanlin and Cooper, 1997).

Although improper use or disposal may account for some of the diazinon in stormwater, recent studies suggest that a major source is use in accordance with label directions (Scanlin and Feng, 1997). Only a small amount of pesticide causes toxicity in creeks, therefore, even proper use could account for the toxic concentrations observed. For example, Scanlin and Feng (1997) often observed toxic concentrations in a creek where it was estimated that only 0.3% of the diazinon used in a small, urbanized watershed ended up in the creek. This percentage of pesticide entering runoff is what would be expected for runoff from proper use. For example, Balogh and Walker (1992), in a study of agricultural runoff, estimated the maximum runoff rate for most pesticides under normal conditions at between 0.5% and 1% of the total quantity applied, and initial results of a study to assess diazinon runoff from urban sites suggests that pesticide runoff from these sites is of about the same proportion as in agricultural applications (ACCWP).

Challenges

There are major regulatory, economic, social and technical obstacles to significantly reducing the level of insecticides in stormwater runoff. Following is a brief description of some of these obstacles.

Regulatory Obstacles: Nationally, insecticides are regulated under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA). The criterion for acceptability under FIFRA is that "the insecticide *does not cause unreasonable adverse effects* to people or the environment when it is used according to the product label directions and restrictions" [emphasis added]. Under FIFRA, the economic benefit is weighed against the environmental impact when determining what is "unreasonable". Under the Clean Water Act, however, the water quality standard is much more restrictive and is stated as "no toxics in toxic amounts". The effect of this discrepancy is that one office of U.S. EPA may allow the use of an insecticide, while another office may require the development of a TMDL to address a water quality impairment due to its use.

In California, the use of insecticides is also regulated by the California Department of Pesticide Regulation (CDPR), and with the exception of some very limited authority granted to the county agricultural commissioner, local government is prohibited from regulating insecticide use (section 11501.1 of the California Code of Regulations).

Economic Obstacles: Pest control is a big business. Based on the estimated 15,000 pounds of diazinon (active

ingredient) sold annually, retail sales in Alameda County are in the neighborhood of $250,000 annually for diazinon alone. In addition to retail sales, there are approximately 50,000 licensed applications of diazinon for structural and landscape pest control in Alameda County every year (Scanlin and Cooper, 1997). Assuming an average per-application cost of $50, this use would generate over $2 million annually. Considering the financial resources available to the pesticide industry, it would be difficult for the Program to compete effectively through the use of public outreach/advertising.

Social Obstacles: Some people do not like bugs, and view one spider or ant around their house as one too many. This strongly ingrained perception is difficult to alter. Many people will still choose to use insecticides even if they are aware of the harm it causes aquatic ecosystems.

Technical Obstacles: Preventing the improper use or disposal of diazinon will not solve the problem. Previous and ongoing studies (Scanlin and Feng, 1997; and ACCWP) indicate that a significant portion of diazinon applied according to label directions moves off-site and eventually ends up in creeks. Many other insecticides migrate in a similar fashion. An effective solution must involve the development of an insecticide formulation that does not migrate from the site of application or one that is toxic only to the target pest.

Direct treatment of runoff to reduce diazinon or other insecticides is impractical for two main reasons. It is difficult to treat a large volume of water in a short period of time as occurs during storm events. Furthermore, diazinon in its dissolved form causes toxicity and it is not readily removed by the usual filtration or settling technologies.

Program's Approach

Lead by Example: Although municipal use accounts for a small fraction of the insecticides used in the county, the member agencies believe they should set an example by ensuring that they minimize risk to the environment and human health. Their first step is to conduct a review of annual insecticide use to determine the quantity used and the targeted insects. The next step is to evaluate the audit results to determine if additional actions could be taken to minimize risk. The results of the audit and evaluation will be submitted to the Regional Board. Member agencies will review existing practices, policies and ordinances to determine where improvements can be made to minimize risk to the environment and human health to the maximum extent practicable. If it is determined that they are not adequate, additional or revised policies or ordinances will be adopted. A summary of the review and recommended revisions will be submitted to the Regional Board.

Outreach to Residents: Advertising Campaigns over the past four years the Program has spent over $500,000 on outreach campaigns aimed at reducing the use of insecticides. For example, the Program participated in the Bay Area Stormwater Management Agencies Association's (BASMAA) regional television advertising campaign "When Ants Invade," which promoted less toxic pest control practices and won a national advertising industry award. The Program has also funded radio, billboard and

newspaper ads. The Program will continue to employ various media to reach residential audiences and encourage the use of a less toxic, integrated pest management (IPM) approach.

Point of Purchase Campaign The Program is participating in the innovative "Our Water, Our World" IPM campaign. Through the campaign the Program encourages stores that sell insecticides to also stock and promote the sale of less-toxic alternatives. Over 20 stores in the county are currently participating. The Program will aggressively market the IPM campaign to other stores with the goal of having at least 40 stores participating within the next two years. Through the distribution of printed material and information on its website, the Program will promote the IPM campaign to residents

Distribution of Informational Material The Program has printed and distributed over 250,000 pesticide-related brochures, fact sheets and informational guides. These materials are distributed by the Program and its member agencies. The Program has been constructing and staffing a stormwater exhibit at the County Fair for the past seven years and has maintained a booth at the Home and Garden show twice a year. Member agencies have been distributing material at their offices and at events such as watershed festivals and Earth Day fairs. The Program will continue these activities and will also distribute material through its website (www.cleanwaterprogram.com).

Outreach to Commercial Facilities: Some commercial facilities hire licensed applicators or self- apply insecticides. Through the Industrial/Commercial Discharge Control Component of the Program, the municipalities will conduct outreach to selected business sectors. The Program will develop or adapt outreach materials that are appropriate for specific business sectors. These materials will be distributed by the municipalities as part of their regular inspection programs. The Program intends to target retail food establishments in Fiscal Year 2001/02.

Partner with Licensed Pest Control Applicators: Licensed pest control applicators apply approximately half of the diazinon used in Alameda County (Scanlin and Cooper, 1997). Any successful effort to minimize the environmental impact associated with insecticide use will need to have the support of the licensed applicators. The Program is committed to working with the licensed applicators to develop an approach that will allow them to maintain their profitability and provide an effective service to their customers in a way that minimizes environmental impacts. The Program will contact licensed applicators in the county, and will work (with those who are willing) to set up a program to minimize water quality impacts from structural pest control applications. The Program will attempt to coordinate this effort with other programs such as the Bio-Integral Resource Center.

Partner with Other Agencies: County Agricultural Commission The Alameda County Agricultural Commission (Commission) has been very involved in the effort to reduce environmental impacts of insecticide use. Representatives of the Commission have attended the Urban Pesticide Committee

and other related meetings. The Program will coordinate with the Commission in the development of outreach efforts, particularly for licensed applicators.

Household Hazardous Waste There are three permanent household hazardous waste (HHW) facilities in Alameda County. The Program has coordinated with the HHW program in the past and will continue to coordinate with the HHW program to promote the proper disposal of insecticides.

Monitoring and Special Studies: The Program has taken a lead in evaluating the sources of diazinon in stormwater in the Bay Area. In fact, one of the Program's studies, Scanlin and Feng (1997), was cited extensively in U.S. EPA's diazinon reregistration (U.S. EPA, 1999). The Program will continue its effort to provide information that will assist in the development of effective control measures.

Develop an Application/Runoff Model The Program is in the process of developing a computer model of the application and runoff of insecticides from an urban area. Certain insecticides or formulations of insecticides may be more likely to be transported by stormwater. The SWMM-based model uses properties such as water solubility, vapor pressure, and environmental persistence to predict stormwater impacts of insecticide use. The Program believes that the model will be useful as a tool to evaluate the impact of alternative control strategies as well as in evaluating the potential impacts of insecticides that will replace diazinon.

Track Trends in Diazinon Concentrations and Stormwater Toxicity The Program will continue to track diazinon concentrations and toxicity in stormwater runoff to assess the effectiveness of its control activities and monitor the effect of the diazinon ban. A detailed sampling plan will be included in the Program's Long Term Monitoring Plan (draft available, August 2001).

Participate in the Regulatory Process: The Program will coordinate with BASMAA, the California Stormwater Quality Task Force, and the Urban Pesticide Committee to provide data, express concerns, and request consideration of its issues in U.S. EPA's and CDPR's insecticide registration decisions.

MERCURY

Problem Definition

Human exposure to mercury has been shown to cause damage to the liver, kidneys, brain and central nervous system; resulting in loss of physical coordination, mental retardation blindness and even death. Developing fetuses and young children are especially susceptible to poisoning.

Table 4-1: Estimated Annual Loadings of Mercury to San Francisco Bay

Source	Estimate of Annual Load (kg/yr)
Central Valley Watershed Sources	607
Within Basin Watershed Sources	168
Atmospheric Deposition	15
Sediment Remobilization	500
Wastewater Discharge	44
Total	1304

(Modified from Abu-Saba and Tang, 2000)

The National Academy of Sciences[1] (NAS) recently completed an independent study of the toxicological effects of methyl mercury to assist the U.S. EPA. Fish consumption is the major source of human exposure to methyl mercury in the U.S. The study found that chronic, low-level prenatal methyl mercury exposure from maternal consumption of fish has been associated with poor performance by offspring on neurobehavioral tests. The study found that these neurodevelopmental deficits are the most sensitive, well-documented effects of low-level, chronic exposure to methyl mercury. While the majority of the U.S. population has a low risk of adverse effects from methyl mercury exposure, individuals who regularly consume fish may have high methyl mercury exposure and demonstrate observable effects. The study also concluded "because of the beneficial effects of fish consumption, the long-term goal needs to be a reduction in the concentrations of MeHg in fish rather than a replacement of fish in the diet by other foods. In the interim, the best method of maintaining fish consumption and minimizing Hg [mercury] exposure is the consumption of fish known to have lower MeHg concentrations."

Analysis of fish tissue samples conducted on fish caught in the San Francisco Bay between 1994 and 1997 showed that concentrations of mercury exceeded established screening levels, suggesting potential health concerns for consumers of Bay fishes (Davis, 1998). Subsequent to the 1994 fish sampling, the California Office of Environmental Health and Hazard Assessment issued an interim Fish Consumption Advisory for all of San Francisco Bay, partly based on mercury concentrations.

Sources and Loadings

Mercury is used in the manufacturing of such items as thermometers, fluorescent lamps, batteries, paints, and other household products. Of particular importance to the Bay Area is the presence of several large natural deposits of mercury within the San Francisco Bay watershed. Much of this mercury was mined during and after the Gold Rush for use in mining operations.

The two largest sources of mercury to Bay waters are inflow from Central Valley watersheds and remobilization of Bay sediment, which account for 46% and 38% of the total load respectively (see Table 4-1). Much of the mercury in

these two sources is a remnant of its historic use in amalgamating gold.

The next largest category of sources of mercury to Bay Waters, is input from local watersheds, which accounts for approximately 13% of the total load. This category encompasses numerous sources, the largest being mercury from the New Almaden mining area in Santa Clara County that accounts for about 30% of the load from local watersheds (that is, 4% of total Bay load). Other sources contributing to the load from local watersheds include air deposition and soil erosion. Local sources contributing to air deposition are not well quantified but significant sources are believed to include crematoria, cement processing plants, stationary and mobile sources of fossil fuel combustion, and broken fluorescent lamps. Some portion of this mercury is deposited on urbanized surfaces in the county and flows to the Bay in stormwater runoff.

Challenges

Reducing levels of mercury in stormwater discharges poses a number of regulatory and technical challenges. Following is a brief description of some of these challenges.

Regulatory Obstacles: Many of the sources contributing mercury to stormwater runoff are beyond the control of local government, for example, some of the mercury is from global sources, and some is from local air sources, such as cement processing plants and crematoria that are regulated by the California Air Resources Board. The California Department of Toxic Substances Control (DTSC) under the Universal Waste Rule regulates the recycling and disposal of fluorescent lamps.

Technical Obstacles: Because mercury bioaccumulates in the food web, minute quantities of mercury in water and sediment can be hazardous. As with other pollutants, removing these minute quantities of mercury from a large volume of water in a short period of time poses a significant challenge. In addition, standard treatment technologies such as detention basins and wetland treatment systems may actually increase the methylation of mercury. This would exacerbate the problem because methyl mercury is the form that bioaccumulates in fish the most rapidly.

Program's Approach

Focus on Fluorescent Lamps:
Fluorescent lamps contain a small amount of mercury with most current generation lamps containing from 10 to 21 mg/bulb. Abu-Saba and Tang (2000) estimate that 13 million fluorescent lamps are disposed of each year in the Bay Area and from this 10-130 kg/year of mercury is released to the environment. Recycling technology is available, and the Regional Board staff has concluded that the recycling of fluorescent lamps is "one of the most effective, readily implementable measures" to reduce the discharge of mercury to the Bay (Abu-Saba and Tang, 2000).

Lead by Example As is the case with the use of insecticides, municipalities use only a tiny fraction of the fluorescent lamps used in the Bay Area. However, the member agencies believe they should set an example for county residents and businesses by ensuring that they minimize the risk to the environment

and human health. The agencies first step will be to conduct a review of their current practices regarding the recycling or disposal of fluorescent lamps. The next step will be to evaluate the results of the survey to determine if these practices could be revised to minimize the risk of mercury release to the environment. The results of the survey and evaluation will be submitted to the Regional Board.

Outreach to Businesses The commercial sector is the largest user of fluorescent lamps. Therefore, the Program will target its initial outreach effort towards businesses. The Program will work with the business community to identify current fluorescent lamp recycling and disposal practices and potential obstacles to increasing the level of recycling. The Program plans to work with the commercial sector and relevant entities such as the Department of Toxic Substances Control (DTSC), the Household Hazardous Waste program, recycling facilities, and the Regional Board to minimize obstacles and provide incentives for recycling. The Program will also develop or adopt outreach material and distribute it to businesses, either through direct mail or in conjunction with the municipalities' Industrial/Commercial inspection program.

Support Changes to Fluorescent Lamp Regulations Current regulations allow businesses to dispose of up to 25 fluorescent lamps at a time as solid waste. The Program will attempt to work with DTSC and other agencies to support and encourage changes to regulations that would promote increased recycling of fluorescent lamps.

Coordinate with Green Business Program The Green Business Program (GBP) helps businesses comply with environmental regulations, and then go beyond compliance to conserve energy, water and other resources, and reduce pollution and waste (www.abag.ca.gov/bayarea/enviro/gbus/gb.html). The Program has been a major supporter of the GBP for several years, and will coordinate with them to promote the recycling of fluorescent lamps at GBP facilities.

Coordinate with Household Hazardous Waste There are three permanent household hazardous waste (HHW) facilities in Alameda County. The Program will coordinate with the HHW program to promote the recycling of fluorescent lamps and other mercury containing products.

Other Mercury Related Efforts:

Participate in the Regulatory Process The Program has been an active participant in the Regional Board's Mercury Council and will continue to support the Regional Board's effort to develop a reasonable approach to solving the mercury problem in the Bay. The Program will also coordinate with BASMAA and the California Stormwater Quality Task Force to develop or support legislation that will help reduce levels of mercury in the Bay.

Track Trends in Mercury Concentrations in Creek Sediment During FY 2000/01 the Program conducted an extensive survey of mercury levels in creek and storm drain sediments throughout the county (Gunther, et al., 2001). During FY 2001/01 the Program will conduct a follow up survey. The Program will

continue its effort to develop information that will assist in the development of effective control measures. The Program is in the process of developing a long-term monitoring plan that will incorporate sediment sampling for mercury. A detailed sampling plan will be included in the Program's Long Term Monitoring Plan (draft available, August 2001).

COPPER

Problem Definition

At very low concentrations, copper is beneficial to aquatic organisms, but at higher concentrations it can be extremely toxic. This toxicity to aquatic life can occur at levels that are not harmful to humans.

The Bay is currently listed as impaired due to copper. However, recent studies have suggested that the Bay should not be listed as impaired, and the Regional Board has indicated that copper may be removed from the list of impairing pollutants on the condition that activities are undertaken to prevent increases in discharges of copper.

Sources and Loadings

Copper is a naturally occurring element that is found in many everyday items, including products associated with building construction, electronic equipment, automobiles, and agriculture. There are a number of significant sources for copper loadings to Bay, but the most significant is automotive vehicle usage. Automobile emissions often contain small amounts of copper. More significantly, brake pads can contain as much as 20% copper by weight. Recent research suggests that brake pad wear may be the largest single contributor of copper to the Bay, adding as much as 40% of the copper in stormwater runoff (Regional Water Quality Control Plant, 1997).

Another potentially significant source of copper to urban runoff is from its use in building construction. The use of copper materials in ornamental applications, gutters, down-spouts, roofs, and algae-resistant treatments for shingles all have the potential for contributing copper to stormwater runoff. Additional significant sources of copper loadings to the Bay include industrial and wastewater discharges; the use of copper in agricultural operations and water treatment systems; and the erosion of native soils, which contain small quantities of copper.

Challenges

Reducing copper levels in stormwater offers challenges similar to reducing diazinon and mercury for both source control and treatment. For example, the largest source of copper to stormwater is believed to be brake-pad wear. As local government agents, Program members are not able to regulate the manufacturing or use of brake pads. Treatment is also problematic since the dissolved form of copper causes toxicity and occasionally exceeds the chronic water quality standard. As with diazinon, dissolved constituents cannot be removed by standard treatment technologies, which rely on filtration or settling of particulates.

Program's Approach

Brake Pad Partnership: The Brake Pad Partnership is a nationwide effort to reduce the level of copper in brake pads. A coalition including stormwater programs, brake pad manufacturers, and the U.S. EPA are working together to find a solution. The partnership was initiated in the Bay Area, and the Program was one of its initial sponsors. The Program continues to support the effort and believes it is the best approach to addressing the problem.

Copper in Building Materials: Barron (2000) estimated that 20% of the copper in runoff from the Palo Alto (CA) area was from the use of copper in building materials. This was partly associated with a large number of luxury homes being constructed in that area at this time. The conditions in Alameda County may be quite different. However, the Program believes that this source of copper is worth looking into, since it could be significant and is one of the few areas where local governments have the potential to initiate a source control effort. The first step the Program will take will be to review construction practices in the county to assess their potential copper contribution. Based on the results of the assessment, municipalities will review and revise their practices if appropriate.

Municipal Maintenance Activities: Street sweeping has the potential to remove some of the copper from brake pad wear and other sources. The municipalities will continue their street sweeping activities in accordance with the municipal maintenance performance standards.

Monitoring and Special Studies: The Program will continue to track the concentration of copper in stormwater runoff in accordance with its Long Term Monitoring Plan (draft available in August 2001), the Program will conduct field studies or literature reviews as necessary to assist with the development and implementation of control measures. The Program also is contributing funding to the North Bay Copper and Nickel Study to investigate the effects of copper on aquatic life.

POLYCHLORINATED BIPHENYLS

Problem Definition

U.S. EPA lists Polychlorinated Biphenyls (PCBs) as a potential carcinogen. Additionally, PCBs are suspected of having negative impacts on the human immune system, reproductive system, nervous system, endocrine system, and digestive system (additional health effects information available at http://www.epa.gov/opptintr/pcb/effects.htm). Although their manufacture is now banned in the United States, PCBs continue to pose a serious risk due to their persistence in the environment.

PCBs accumulate in fatty tissue, hence organisms with a higher fat content will tend to accumulate more PCBs than organisms with a lower fat content. This is important to human health in that several of the more common food fishes in the Bay (e.g., striped bass, white croaker) are marked by relatively high fat content. Sampling conducted on Bay food fishes between 1994 and 1997 showed that concentrations of PCBs in fish tissue exceeded screening values, suggesting potential health concerns for consumers of these fishes (Davis *et al.*, 1998). Subsequent to the 1994 fish

sampling, the California Office of Environmental Health and Hazard Assessment issued an interim fish consumption advisory for all of San Francisco Bay, partly based on PCB concentrations found in Bay fishes.

Sources and Loading

PCBs were used in the past in a number of industrial and commercial applications; most importantly as coolants, lubricants, and insulators in electrical equipment such as transformers and capacitors. Additionally, PCBs at one time found many other uses in products such as paints, sealants, preservatives, and fire retardants.

In the mid-1960s, questions regarding the widespread presence of PCBs and their potential health impacts began to raise concern. Commercial production and import of PCBs into this country was banned by the U.S. EPA in 1979, though some manufacture of "closed system" products (having little potential for escape of PCBs from the system) was allowed to continue. By 1984, virtually all manufacture and distribution of products containing detectable levels of PCBs was banned by the U.S. EPA (Hetzel, 2000).

As with mercury, a large source of PCBs to the Bay water and biota is contaminated Bay sediment. The Regional Monitoring Program's sampling effort has detected areas of contaminated sediment adjacent to heavily industrialized land use. Of particular interest to the Program are elevated concentrations found in the Oakland Estuary, San Leandro Bay, and Emeryville Crescent.

Additional contaminated sediment may still be moving towards the Bay from contaminated sites within local watersheds. An initial survey of creek and storm drain sediment conducted in 2000 found a few sites with elevated concentrations (Gunther, et al., 2001). A follow-up study will be conducted in 2001 to determine if sources can be identified.

Challenges

The immediate obstacle to addressing PCB contamination is that the sources are dispersed and largely unidentified.

Program's Approach

Monitoring and Special Studies: The first step in addressing the discharge of PCBs in stormwater is to develop a better understanding of sources within the county. To do this the Program has initiated a multi-year study of the level of PCBs in creek and storm drain sediments throughout the county. A report on the initial round of sampling has been completed (Gunther et al., 2001). Follow-up sampling upstream of sites where elevated concentrations were found will be conducted during FY 2001-2001.

Participate in the Regulatory Process: The Program has been participating actively in the Regional Board's TMDL stakeholder process and will continue to do so.

Notes

[1] National Research Council. 2000. Toxicological Effects of Methylmercury. Prepublication copy.

SECTION 5 PERFORMANCE STANDARDS

Performance standards that are implemented by member agencies exist for the following five areas of the Plan:

- Public Information and Participation
- Municipal Maintenance Activities
- New Development and Construction Controls
- Illicit Discharge Controls, and
- Industrial and Commercial Discharge Controls

These performance standards define a large part of what each member agency must do to implement the Plan and comply with the NPDES permit. In addition, the Plan's Pollutant Reduction Plans for specific impairing pollutants also describe what the member agencies need to do to implement the Plan. It is expected that agency-led activities in the Pollutant Reduction Plans that prove worthwhile for long-term implementation will eventually be integrated into the performance standards.

CHANGES FROM PREVIOUS PERFORMANCE STANDARDS

The following performance standards are generally the same as during the previous SWMP. Some relatively minor modifications have been made to clarify and improve the performance standards. For example, the performances standards for Municipal Maintenance have been reduced and simplified by eliminating details about Best Management Practices and by retaining the more substantive sections that describe what the performance standards are intended to accomplish. A more substantive change was to move requirements for insect management from these performance standards to the Pollutant Reduction Plans. This change reflects the priority that will be placed on controlling the use of insecticides, the still developing approach for controlling insecticides and the need to involve all of the departments within the member agencies in minimizing insecticide usage.

The improvements in the performance standards reflect the collective experience of everyone who has been implementing the performance standards. Each of the proposed changes was discussed at length by the subcommittee that is directly involved in helping the member agencies to understand and implement the performance standards.

OPPORTUNITY TO PROPOSE ALTERNATIVE PERFORMANCE STANDARDS

As the Program continues to evolve, it is becoming increasingly important to recognize agency and watershed-specific differences. In order to allow appropriate tailoring and improvement of the performance standards, each agency retains the flexibility to propose alternative performance standards for its use that will accomplish equivalent or better water quality improvements than the area-wide performance standards described in the subsequent sections. Alternative agency-specific performance standards must be submitted in writing to the Regional Board's Executive Officer, and the alternative performance standards will not become effective until

approved by the Executive Officer, and that approval will be presumed unless it is rejected in writing within 90 days of submittal.

FLOOD CONTROL DISTRICT RESPONSIBILITIES

Some of the performance standards are appropriate for the Alameda County Flood Control and Water Conservation District (District) and Zone 7 of the District, and others are not. For example, the ACFC&WCD and Zone 7 do not conduct business inspection, nor do they sweep streets. Performance standards that each city, the county, ACFC&WCD and Zone 7 are responsible for implementing use the term "agency(ies)" in the performance standard. Performance standards that each city and the county are responsible for implementing, but not the District and Zone 7 of the District, use the term "municipality(ies)."

PUBLIC INFORMATION AND PARTICIPATION

I. PARTICIPATION IN PI/P SUBCOMMITTEE AND GENERAL PROGRAM ACTIVITIES

1. Each agency will designate a person responsible for implementing its Public Information/Participation (PI/P) activities and for acting as a liaison with the PI/P Subcommittee. This designated person will stay sufficiently informed by attending Subcommittee meetings or using other means to participate constructively in PI/P Subcommittee decisions and activities.

2. Each agency will chair the PI/P Subcommittee on a rotating basis so that the burden of providing leadership for the Program is shared in an equitable manner among all of the agencies.

3. Each agency will complete its PI/P quarter or semiannual deliverable reports within the schedule established by the General Program.

II. INTERNAL AGENCY COMMUNICATION AND TRAINING

City Staff and Officials

Each agency is responsible for identifying, developing, and communicating information about the Program so that its clean water staff, new employees involved with the Program, agency managers, and elected officials are well informed about their role in implementing the Program and the Program's requirements and progress. Each agency will provide information at least annually to these targeted groups.

Procedures and Training for Handling Telephone Calls from the Public about Stormwater

- Each agency will have a procedure that it follows for answering and efficiently routing stormwater related telephone calls to the appropriate municipal staff for handling.

- Agency staff assigned to answering or responding to telephone calls will be trained and familiar with the established procedures.

III. USE OF PROGRAM OUTREACH

As described in Task 5 of the PIP component work plan (Section 3), the General Program will be responsible for conducting surveys to evaluate the effectiveness of public education and outreach efforts implemented by the member agencies and by the General Program.

Distribution of Program Information Pieces

- Each agency will be responsible for identifying, in a written plan maintained at its offices, how it will distribute copies of General Program informational materials.

This plan will be available to the Regional Board upon request.

- Within two years of receiving its allotment from the General Program, each agency will have the goal of completing distribution of these materials to the target audience. Approximately one-half or more of the materials should be distributed within twelve months of receiving the allotment.

- Each agency will be responsible for tracking its inventory of General Program educational materials in order to be able to determine the need to re-order.

Storm Drain Inlet Stencils and Signs

- Each municipality will have stenciled or in some other ways signed ninety percent of its municipality-owned storm drain inlets or conducted activities that are demonstrably equivalent in terms of achieving awareness by residents that materials should not be disposed down storm drains. Demonstrably equivalent means that the municipality will provide examples of comparable alternative activities or have available a valid survey to show that its residents are as aware of where storm drains lead as are residents in comparable communities with stencils or signs. A description of the demonstrably equivalent activities must be submitted in writing and approved in advance by the Regional Board's Executive Officer, and this approval will be presumed unless disapproved in writing within 90 days of its submittal.

- As a goal all stencils and signs installed will be maintained sufficiently to be readable.

- In order to provide an educational opportunity, each municipality will optimize the use of local volunteers to assist with the stenciling or signage activities.

IV. AGENCIES' COMMUNITY OUTREACH PROGRAM

General Needs

The community outreach activity must be reasonably significant in terms of either the level of participation of the member agency and/or the number of people reached by the event.

Agencies will participate in community outreach activities from the areas listed below (under A. through F.) for the purpose of communicating the general stormwater pollution prevention message and complementing the General Program's specific message(s) for its targeted audience(s). Every other year at least one of these activities must be from Category F. The following provides the number of different activities that will be participated in annually:

Over 100,000 in population

- each municipality will participate in eight activities;

Between 50,000 and 100,000

- each municipality will participate in six activities;

Less than 50,000; Alameda County Flood Control and Water Conservation District (District); and Zone 7 of District

- each agency will participate in four activities.

A. Participate in Existing Community Events

Distribute ACCWP information by participating in existing community events (fairs, festivals, exhibits, etc.) held within its or a nearby jurisdiction. This participation may include the setting up of a booth, kiosk display, or other creative means of communicating the general stormwater pollution prevention message, using a specific message to a target group, or make a presentation to a local community service group.

B. Plan/Implement New Community Events

Play a major role in planning and staging a community or citywide event, examples include the following:

- Earth Day or other festival or fair;
- Business mixer;
- Seminar or target group; and/or
- Contests.

C. Contact Media and Conduct Advertising

Maintain local media contacts with local newspaper, radio, and television stations to be able to communicate the general stormwater pollution prevention message, complement the General Program's specific targeted audience(s) and message(s) and complement regional PI/P activities. This local media contact may include: adaptation and/or development and distribution of stormwater related press releases or use of paid advertising including advertising in local telephone directories.

D. Provide Program Information Through Other Venues

The following types of venues may be used:

- Agency newsletter;
- Other municipal newsletter;
- Local magazine;
- Utility bill inserts;
- Mailing to target group; and
- WebPages.

E. Develop and Implement Integrated Outreach Approaches

This area includes activities, such as the following:

- Point of purchase display and giveaway;
- Plan, create and distribute videos;
- Create and stage a play;
- Develop special displays or kiosks for your message especially interactive ones (such as slides in movie theaters);
- Develop/implement program for school curriculum and provide equipment;
- Support and partner with

other agencies to increase or improve pollution prevention capabilities (e.g., helping set up oil and/or antifreeze collection facilities); and
- Make and place signs on sweepers or other vehicles; and
- Place messages on workers' T-shirts.

F. Develop Watershed Awareness

This area includes one or more of the following types of activities that are listed as examples:
- Identify and support a friends of a watershed group and encourage creek cleanups (or if this is infeasible, lagoon or shoreline cleanups) or adopt-a-creek or other volunteer monitoring and resource inventorying activities.
- Conduct a creek cleanup (or if this is not feasible, lagoon or shoreline cleanups) within its jurisdiction on an annual basis; and
- Participate in a local event in its jurisdiction or neighboring jurisdiction as part of the Coastal Commission's annual Coastal Clean-Up Day and/or as part of Earth Day.

Special Needs

Each municipality will identify whether there are any special needs of some of its residents. An example of a special need would be if a significant percentage of the residents are native speakers of a language other than English or Spanish who would be able to better participate in the municipality's stormwater pollution prevention efforts by having materials available in their native language.
If a municipality has identified a special need not being addressed by the General Program, it will, on its own or in collaboration with other member agencies, develop and distribute translated materials or other special materials needed to fill the special need.

V. COORDINATION WITH SCHOOLS

1. If not being performed by others, each municipality will help to distribute to schools within its jurisdiction information provided by the General Program about its school outreach activities, such as, the Bay Savers, Kids in Creeks/Gardens/Marshes/Watersheds workshops, and community stewardship grants.

2. The General Program will continue to develop and produce materials for outreach to schools. Each municipality will make these materials available to schools in its jurisdiction, if not distributed by the General Program or other methods. This may include each municipality disseminating information on how to obtain copies of these materials if this is a more efficient way to achieve distribution.

3. Each municipality will also work with the local school district to encourage that appropriate stormwater pollution prevention and aquatic resource protection information will be taught to

school children within its jurisdiction.

MUNICIPAL MAINTENANCE – GENERAL

The following General Performance Standards apply to all municipal maintenance activities.

I. SPILL RESPONSE

1. If the spill is suspected to be toxic or hazardous materials, maintenance staff will call the public safety dispatcher, 911, and/or the local illicit discharge coordinator.

2. If non-hazardous materials are spilled, maintenance staff will contain the spill area immediately to prevent additional discharge of pollutants into the storm drain system and clean as soon as practicable.

3. Maintenance staff will report spills to, and work with, the agency's illicit discharge coordinator, or appropriate party, to determine the appropriate follow up response (e.g., track the source of the spill and identify product labels that have a bar code identifying the originating agency, contact Building and Planning Departments, send a clean-up bill to the responsible party, etc.).

II. TRAINING

Each agency will train employees and contractors in the use of the Spill Response Performance Standards as appropriate.

III. DISPOSAL OF WASTE MATERIAL AND CHEMICALS

1. Each agency will ensure proper handling and disposal of material removed from streets and storm drainage facilities to prevent discharges of pollutants to surface waters or groundwater.

2. Each agency will dispose of excess chemicals at an Alameda County Household Hazardous Waste Facility or other approved disposal location (or recycle the chemical.)

3. Each agency will properly dispose of or recycle used solvents/chemicals.

IV. CONTRACTORS

1. Each agency shall incorporate the municipal maintenance performance standards into municipal contract specifications.

2. Each agency shall provide volunteers and contractors with educational material describing the Municipal Maintenance Performance Standards as appropriate.

MUNICIPAL MAINTENANCE – STREET CLEANING

I. STREET CLEANING FREQUENCY

1. Each municipality will clean streets on at least a monthly average unless an alternative schedule is approved as described in number 2 below. In calculating this average, the number of curb miles swept in a fiscal year divided by the number of curb miles within a municipality will equal twelve or greater. The removal of cars should be encouraged by having a fixed sweeping schedule. Sweeping will be prioritized to clean the streets that have been found to be typically the dirtiest and to conduct sweeping prior to the rainy season.

2. If a municipality chooses to clean streets less than on a monthly average the rationale for the alternative standard must be describe in a written action plan. The rationale should demonstrate that the alternative schedule is equivalent in terms of protecting water quality as the annual average sweeping. The action plan must be submitted to the Regional Board as part of the Mid Fiscal Year Report or the Annual Report. The alternative standard will not be effective until approved by the Regional Board's Executive Officer, and that approval will be presumed unless it is rejected in writing within 90 days of its submittal.

II. STREET CLEANING OPERATION TO MAXIMIZE POLLUTANT REMOVAL

1. Each municipality will utilize, as appropriate, the Street Cleaning BMPs to maximize pollutant removal during sweeping activities. When purchasing new sweepers, each municipality will review alternative equipment and new technologies to maximize pollutant removal.

III. PROBLEMS ASSOCIATED WITH EFFICIENT STREET CLEANING

Getting Parked Cars Off Streets

1. Each municipality will maintain a consistent sweeping schedule.

2. Each Agency will utilize, as appropriate, the Street Cleaning BMPs to keep curbed areas clear during street cleaning.

Removing Large Accumulations of Leaves Just Prior to Sweeping

Each municipality will have a leaf removal option available to residents. The leaf removal may be conducted by an entity other than the municipality, for example, curbside leaf pick up by a waste management company. Each municipality will utilize, as appropriate, the Street Cleaning BMPs for specific leaf handling methods.

Maintaining Trees Near Streets

Each municipality will provide operators with adequate resources to conveniently report trees interfering with street cleaning.

IV. RECORD KEEPING

1. Each municipality will track miles swept using a broom odometer or by tracking mileage only when cleaning (do not include mileage to an area).

2. Each municipality will track volume or weight of material removed.

MUNICIPAL MAINTENANCE – STORM DRAIN FACILITIES AND WATERCOURSES

I. ROUTINE INSPECTION AND CLEANING

1. Each agency will inspect, and clean as necessary, storm drainage facilities (inlets, culverts, V-ditches, pump stations, open channels, and watercourses), once a year on average unless an alternative schedule is approved as described in number 2 below. The inspections and needed cleaning will preferably occur prior to the rainy season. In calculating this average, some facilities may be inspected more than once per year and others less than once per year.

2. If an agency chooses to inspect, and clean as necessary, storm drainage facilities (inlets, culverts, V-ditches, pump stations, open channels, and watercourses), less than an annual average the rationale for the alternative standard must be described in a written action plan. The rationale should demonstrate that the alternative schedule is equivalent in terms of protecting water quality as the annual average inspection. The action plan must be submitted to the Regional Board as part of the Mid Fiscal Year Report or the Annual Report. The alternative standard will not be effective until approved by the Regional Board's Executive Officer, and that approval will be presumed unless it is rejected in writing within 90 days of its submittal.

3. When cleaning storm drainage facilities, each agency will remove the maximum amount of material at the nearest access point to minimize discharges to watercourses.

4. Each agency will maintain a storm drainage facility inspection and maintenance plan. The Plan includes:

   a. Schedule for inspecting storm drainage facilities;

   b. Rational for determining when to clean inlets, etc.;

   c. Results of an evaluation to install additional screens or grates near or in inlets to inhibit discharge of litter, but where flooding is not a concern;

   d. Identification of target areas that tend to accumulate excessive pollutants for cleaning and/or public education; and

   e. Inventory of the storm drain system.

5. Unless provided for in an alternative plan approved by the Regional Board's Executive Officer, each agency will inspect twice a year storm drainage facilities that tend to accumulate excessive sediment and debris: prior to the rainy season to prevent flooding and discharge of pollutants and after the rainy season to remove sediment and debris.

6. Each agency will inspect storm drain inlets monthly during the wet season

in areas suspected of containing illegal dumping, and clean as necessary.

II. RECORD KEEPING

1. Each agency will report the amount of material removed when cleaning storm drainage facilities in monthly record keeping forms.

2. Each agency will document and track spill incidents and response to spill incidents either as described in the "Monthly Record Keeping Form" or as part of the Illicit Discharge Quarterly Summary Form.

3. Each agency will document and maintain the following records monthly for pump stations and watercourses:

   a. Areas/sites inspected,
   b. Silt and vegetation removal practices,
   c. Areas where man-made materials are removed, type and estimate of quantity or weight removed,
   d. Disposal practices and any testing results,
   e. Spill incidents and follow-up actions,
   f. Application of chemicals (type used, areas applied), and
   g. Areas for possible improvements.

III. INSPECTION AND MAINTENANCE

1. Each agency will inspect pump stations after the wet season and develop a schedule for maintenance activities prior to the next wet season.

2. Each agency will inspect trash racks and oil absorbent booms during or after significant storms. Remove debris in trash racks and replace oil absorbent booms as needed.

IV. PERMITS AND OTHER REGULATORY REQUIREMENTS

Each agency will coordinate with the California Department of Fish and Game, the U.S. Army Corps of Engineers, and other agencies as appropriate in order to comply with regulatory requirements prior to commencing work.

V. VEGETATION

See procedures in the Municipal Maintenance BMP Manual.

MUNICIPAL MAINTENANCE – CORPORATION YARDS AND AUXILIARY STORAGE AREAS

I. GENERAL BMPS

1. Each agency will ensure that necessary safety equipment and spill containment kits are readily accessible in areas where chemicals are used, in fueling areas, and in areas that have a potential for spills. Each agency will inspect safety equipment (eye flushing stations, etc.) regularly to ensure they are operational.

2. Each agency will assign one person the primary responsibility for ensuring that BMPs are implemented. This person will also be responsible for ensuring that all persons using the facility are aware of BMPs.

3. Each agency will stencil inlets to the storm drainage system with a message such as "No Dumping, Drains to Bay".

4. Each agency will conduct facility surveys annually - possibly in conjunction with hazardous materials management and/or spill prevention inspections.

5. Each agency will have a Storm Water Pollution Prevention Plan (SWPPP) for each corporation yard.

6. Each agency will inspect the yard routinely to ensure that there are no illegal discharges to the storm drain system and that during storms, pollutant discharges are controlled to the maximum extent practicable.

7. Each agency will sweep the corporation yard. The agency will dispose of material removed from streets and storm drainage facilities often to eliminate exposure to rainwater and runoff to the storm drain system.

II. WASHING VEHICLES/EQUIPMENT

1. Each agency will clean all vehicles/equipment on designated wash pad areas or off-site if needed so washwater drains to the sanitary sewer or is recycled.

2. Each agency will ensure that wash pad area and sump are large enough so that all washwater drains to the sanitary sewer or recycling system. The agency will re-grade area if necessary or install dikes to convey washwater.

III. REFUSE HOLDING AREAS

Each agency will store material removed from storm drainage facilities and streets on a concrete or asphalt pad in a contained area. The agency will drain liquids to the sanitary sewer or allow it to evaporate. If feasible, the agency will cover the storage area during the rainy season.

IV. FUEL DISPENSING AREAS

1. Each agency will store spill

containment kits nearby. If spills occur, the agency will use dry methods to clean the fueling area and follow procedures in the Hazardous Materials Business Plan (HMBP) and/or Spill Prevention Control and Countermeasure Plan.

2. Each agency will maintain signs reminding people not to "top off" tanks.

3. Appropriate spill equipment will be used when mobile fueling is implemented.

4. Each agency will cover fuel dispensing areas, when feasible. The agency will not conduct fueling over open ground (ground should be covered by concrete or asphalt protected with a sealant).

V. CHEMICAL USAGE AND STORAGE

1. Each agency will store paint and other chemicals in an approved covered containment area. If 55-gallon drums containing hazardous materials or wastes are stored outside, each agency will keep drums in an approved containment area.

2. Each agency will minimize use of chemicals. The agency will use water-based paints and non-toxic chemicals as much as possible.

VI. FLEET MAINTENANCE/VEHICLE PARKING AREAS

1. Each agency will minimize leaks from vehicles by performing routine inspections, repairing vehicles with significant leaks, and employing drips pans where appropriate.

2. Each agency will periodically dry sweep the area.

MUNICIPAL MAINTENANCE – LITTER CONTROL, ROAD REPAIR AND GRAFFITI REMOVAL

LITTER

1. Each agency will provide an adequate number of litter receptacles in commercial areas and other litter source areas. Agencies will make every effort to contain litter in receptacles.

2. Each agency will ensure litter receptacles are maintained on a frequent enough basis to minimize or prevent spillage.

3. Each agency will document and maintain the following records monthly:

   a. Areas targeted for litter removal

   b. Total amount of material removed

ROAD REPAIR

I. General

1. Each agency will schedule excavation and road maintenance activities for dry weather, if feasible.

2. Each agency will perform major equipment repairs at the corporation yard, when practical.

3. When refueling or maintaining vehicles and equipment on-site, each agency will use a location away from storm drain inlets and creeks.

4. Each agency will recycle used motor oil, diesel oil, concrete, broken asphalt, etc. whenever possible.

5. Each agency will contain diesel oil used to lubricate or clean equipment or parts.

II. ASPHALT/CONCRETE REMOVAL

Each agency will utilize, as appropriate, the Road Repair BMPs for protecting storm drain inlets prior to breaking up asphalt or concrete. The agencies will clean afterwards by sweeping up as much material as possible.

III. PATCHING AND RESURFACING

1. Each agency will utilize, as appropriate, the Road Repair BMPs for protecting storm drain inlets prior to patching and resurfacing activities.

2. Agencies will not stockpile materials in streets, gutter areas or near storm drain inlets or creeks unless these areas are protected.

3. Agencies will never wash excess material from exposed aggregate concrete or similar treatments into a street or storm drain inlet. Each agency will designate an unpaved area for clean up and proper disposal of excess materials.

IV. EQUIPMENT CLEAN UP/STORAGE

Each Agency will clean equipment at the end of the day at the corporation yard, when possible, and will cover sprayers and patching and paving equipment to prevent rainfall from contacting pollutants.

GRAFFITI REMOVAL

See graffiti removal BMPs in the Municipal Maintenance BMP Manual.

NEW DEVELOPMENT AND CONSTRUCTION SITE CONTROLS

The following performance standards apply to all Clean Water Program member agencies for all construction activity including clearing, grading and excavation activities that result in the cumulative disturbance of 10,000 or greater square feet of land that would discharge stormwater to the municipally-owned storm drain system. A member agency may consider a project exempt from these performance standards if it would disturb less than 10,000 square feet of land and it does not cause substantial or potentially substantial adverse change in the quantity and/or quality of stormwater runoff generated from the site considering all four of the following conditions:

- The size of the project is negligible;
- The amount of land disturbed is insignificant;
- The potential impact on stormwater quality and quantity is insignificant; and
- The intensity of the construction activity is minimal.

I. MEASURES AND POLICIES TO CONTROL THE QUALITY OF STORMWATER RUNOFF

1. Each agency will incorporate the New Development Subcommittee's conditions of approval into its standards for development, as appropriate.

2. Each agency will document permanent erosion and stormwater quality controls, controls during construction, and operation and maintenance of structural controls in conditions of approval for both public and private projects. Best management practices (BMPs) will be selected from appropriate guidance materials.

3. Each agency will ensure that stormwater quality requirements are included in plans and contract specifications for municipal construction projects.

4. Each agency will implement design guidelines and practices that incorporate water quality protection measures for both public and private projects.

The Following Will Be Implemented when General Plans and Ordinances are Amended:

1. Each agency will review and update General Plan policies and implementation measures that help preserve and enhance water quality.

2. Each agency will review and update legal authority provided in erosion control and stormwater management and discharge control ordinances.

II. EDUCATIONAL ACTIVITIES

1. Each agency will provide educational materials (BMP flyers, Blueprint for a Clean Bay, etc.) to municipal staff, developers, contractors, construction site operators, and owner/builders, as appropriate. (Requires coordination with the PIP Subcommittee.)
2. Each agency will educate:

- Staff responsible for development application and plan review on stormwater quality issues and controls. Agencies will provide information on municipal design guidelines, ordinances, conditions of approval, contract specifications and protected sensitive areas.

- Construction site inspectors on proper implementation and maintenance of erosion and sediment controls and materials/waste management BMPs.

- Other municipal staff involved in development and redevelopment projects (e.g., capital improvement, public works, and/or building inspectors).

3. Each agency will provide pre-application materials containing information on stormwater controls and requirements to developers.

4. Each agency will attach appropriate BMP information to building permits, as needed.

III. DEVELOPMENT APPLICATION AND PLAN REVIEW

1. Each agency will continue to evaluate the effects of development on stormwater runoff and wetlands in the CEQA process.

2. Each agency will consider water quality impacts in the context of their review and possible approval of both public and private development projects.

3. Agencies will require public and private development projects to include site planning and design techniques to prevent and minimize impacts to water quality. These may include the following:

   a. Minimize land disturbance.

   b. Minimize impervious surfaces, especially directly connected impervious areas.

   c. Use of clustering.

   d. Preservation of quality open space.

   e. Maintain (and/or restore, if possible) riparian areas and wetlands as project amenities, establishing vegetation buffer zones to reduce runoff into waterways.

4. Each agency will require public and private development projects to include permanent stormwater quality controls, as appropriate, if sufficient site planning measures are not implemented or feasible.

IV. EROSION AND SEDIMENTATION CONTROL

1. Each agency will review its erosion control program for adequacy, and identify and implement any improvements needed in the following areas:

   a. Enforcement authority (grading, erosion, and/or

stormwater control ordinances).

b. Minimum BMPs required.

c. Training and tools for inspectors.

d. Information for developers and contractors.

2. As a condition of issuance of a grading permit, each agency will require developers to prepare, submit to the agency for review and approval, and implement an effective erosion and sediment control plan or similar administrative document that contains erosion and sediment control provisions.

3. Each agency will require developers to provide permanent erosion and stormwater controls on plans submitted for projects.

V. STATE GENERAL PERMIT

Prior to construction of a project that disturbs ≥ 5 acres, each agency will require a copy of the Notice of Intent (NOI) sent to the State Water Resources Control Board for coverage under the Construction Activity Stormwater NPDES General Permit.

The Following Will Be Implemented upon Adoption of the New Construction General Permit:[1]

1. Prior to construction of a project that disturbs ≥ 1 acres, each agency will require a copy of the Notice of Intent (NOI) sent to the State Water Resources Control Board for coverage under a Construction Activity Stormwater NPDES General Permit.

2. Prior to the construction of a project that requires the filing of an NOI, each agency will require a copy of the project's Stormwater Pollution Prevention Plan (SWPPP).

VI. CONSTRUCTION SITE FIELD CONTROLS

1. Each agency will require that project applicants prepare and submit a Stormwater Quality Protection Plan[2] prior to the start of construction activity, to demonstrate that the owner, developer, and/or contractor has evaluated BMPs and provided those appropriate for protection of stormwater quality during construction activities.

2. Each agency will coordinate construction inspections and enforcement of corrective actions with Regional Board staff, if appropriate.

3. Each agency will inspect construction sites for adequacy of stormwater quality control measures on a regular basis, with the frequency of inspections based on considerations such as the size of the project, its potential impact on stormwater quality, and the amount of construction activity.

4. For construction sites requiring erosion sediment control plans, each agency will inspect sites prior to the beginning of the wet season

each year, to ensure that measures have been taken to prevent erosion and minimize discharges of sediment from disturbed areas.

5. For construction sites requiring erosion sediment control plans, each agency will inspect sites following each major storm event or series of events during the wet season of each year, to observe the effectiveness of erosion sediment control measures.

6. For project site inspections, inspectors will:
   a. If available, review the Stormwater Quality Protection Plan prior to conducting the inspection.

   b. Inspect for and effectively prohibit non-stormwater discharges, except those discharges which contain no pollutants.

   c. Whenever possible, visually observe the quality of stormwater runoff after a major storm event.
   d. Require proper implementation and maintenance of erosion sediment controls and material/waste management BMPs (e.g., covering stockpiled materials, designating work and storage areas) to minimize the discharge of pollutants.

   e. If appropriate, document stormwater violations and corrective actions.

VII. WATERSHED RESOURCE INVENTORY AND PLANNING

These activities will be coordinated with the Watershed Assessment and Monitoring (WAM) Subcommittee.

1. Each agency will develop and submit with the *Annual Report*[3] an approach and schedule for conducting a watershed management issues assessment based on guidance from the Regional Board and guidance being developed by the WAM Subcommittee as it becomes available.

The Following Will Be Implemented when General Plans and Ordinances are Amended:

1. Each agency will consider the criteria for sensitive areas as guidance when amending their General Plans.

2. Each agency will incorporate findings from the watershed resource inventories conducted by the WAM Subcommittee into General Plan amendments.

VIII. POLICIES FOR MAINTAINANCE AND OPERATIONS OF FLOOD CONTROL CHANNELS AND WATER COURSES) –

These performance standards apply to all agencies that maintain creeks and flood control channels.

Each agency will consider potential benefits to habitat,

education, recreation, and water quality when planning flood control channel maintenance and improvements.

IX. SUBCOMMITTEE MEETINGS AND WORKSHOPS

1. At least one representative from each agency will attend the Program's New Development workshops.

2. Each agency will chair the New Development Subcommittee on a rotating basis so that the burden of providing leadership is shared equitably.

3. Each agency will designate a person responsible for implementing the New Development, Redevelopment, and Construction Site Controls Component and for acting as a liaison with the New Development Subcommittee. This designated person will stay informed sufficiently to participate in New Development Subcommittee decisions and activities.

ILLICIT DISCHARGE CONTROLS

I. ILLICIT DISCHARGE CONTROL INSPECTION PROGRAM –

These performance standards apply to all agencies.

1. Each agency will prepare a written Five-Year Action Plan that demonstrates the agency's commitment to conducting effective investigation, tracking, and elimination of illicit discharges and describes the level of effort for conducting these activities. The Action Plan will demonstrate that the agency has:

    a. Identified, verified, and prioritized problem areas for investigation and/or repeat inspections.

    b. Defined priority for investigation of all areas within their jurisdiction.

    c. Demonstrated commitment to survey high priority areas annually.

    d. Defined frequency of survey for second and/or third priority areas, until the entire agency's drainage area has been inspected at least once during the five-year period of the Action Plan.

    e. Selected which agency or group will conduct the field surveys and estimated the number of labor hours required to implement the program. When more than one department is involved with conducting field surveys, determined how illicit discharge surveys and follow-up activities will be coordinated.

    f. Established how activities will be documented.

    g. Adopted the minimum enforcement procedures.

    h. Developed procedures for enforcement or referral to an outside agency, including appropriate time periods for action.

The Five-Year Action Plan will be submitted to the Regional Board by May 30, 2003.

2. Each agency will review annually and update as necessary its Five-Year Action Plan. The review will include an evaluation of field survey results from the previous year and an assessment of which types of non-stormwater discharges were most prevalent. Changes for the coming fiscal year will be submitted to the Regional Board by March 1.

3. Each agency will ensure that designated illicit discharge inspectors are trained. Agencies

will provide inspectors with the knowledge and skills necessary to conduct effective field investigations, with guidance from the Industrial & Illicit Discharge Control (I&IDC) Subcommittee and Regional Board staff.

4. Each agency will develop or obtain accurate maps of the agency's storm drain system including major drain segments, reaches, and outfalls within the agency's jurisdiction.

II. CONDUCTING FIELD INVESTIGATIONS

These performance standards apply to all agencies.

1. Each agency will conduct field investigations that include inspecting portions of the municipal storm drain system for potential sources of illicit discharges. Inspectors will:

    a. Survey priority areas as defined in the Five-Year Action Plan and make observations. Record observed or suspected dry weather flows.

    b. As possible, attempt to determine the type of flow and try to trace the flow to its source by following storm drain maps, inspecting manholes, and making surface observations. Record findings.

    c. If the responsible party is identified, educate the party on the impacts of his or her actions, explain the stormwater requirements, and provide BMPs. Initiate follow-up and/or enforcement procedures, if applicable. (Follow-up and enforcement activities are detailed further in Section III below.) Record activities.

2. Each agency will send at least one representative to General Program workshops to obtain additional training and share experiences with other agencies. The I&IDC Subcommittee will annually assess inspector training needs.

III. EVALUATING COMPLIANCE OF NON-STORMWATER DISCHARGER

These performance standards apply to all agencies.

Follow-up Activities

1. Each agency will continue inspection and follow-up activities until compliance is achieved. Record activities.

2. Agency staff will meet with the responsible party to discuss methods for eliminating the illicit discharge, including disposal options, recycling and possible discharge to the sanitary sewer, as appropriate. Provide ACCWP information to the responsible party. In the case of washwaters, refer to the incremental BMPs in *Recommended Discharge Elimination/Disposal Priorities for Washwaters* (September, 1994).

3. If the discharge is traced to a business, inspectors will coordinate information on the illicit discharge with the industrial/commercial discharge control program.

4. The appropriate agency will begin enforcement procedures, if necessary.

Enforcement

1. Agencies will conduct enforcement activities and report these activities as outlined in the *Protocol for Reporting Enforcement Activities* (*Protocols*). These activities are set forth by the individual municipality ordinances.

2. Agencies will provide inspectors with sufficient authority to initiate enforcement procedures.

IV. SPILL REPORTS/COMPLAINTS

These performance standards apply to all agencies.

Since a network of spill response and clean up programs already exists, establishing a new and separate stormwater response program would duplicate many of the services already being provided by these programs. The approach of the ACCWP illicit discharge control component is to supplement these services and respond to spill incidents that are not under the purview of previously existing clean-up programs. Within this context, each agency will implement the following performance standards.

1. Inspectors will investigate spill reports and/or complaints within their jurisdiction and record their activities.

2. Inspectors will become familiar with the existing spill response and clean-up programs that cover the agency's jurisdiction, and coordinate illicit discharge program activities with these existing programs.

3. Through internal communication and public education, agencies will encourage the use of "911" to report large or hazardous spills. If the use of "911" is not appropriate in a particular agency, establish and publicize an alternative telephone number for reporting spills.

4. Each agency will establish a mechanism for obtaining information about spill incidents so that source identification and follow-up actions can be conducted.

5. Each agency will identify an appropriate role for its participation in spill response drills, in cooperation with other agencies or industries.

V. DOCUMENTATION AND REPORTING

These performance standards apply to all agencies.

1. Each agency will summarize field investigations and follow-up activities using the Illicit Discharge Inspection Quarterly Summary Report form. These forms will be incorporated into the ACCWP's annual reports to the Regional Board.

2. Each agency will document the number and types of spill incidents reported and responded to within the agency's jurisdiction, based on direct calls, "911" dispatch records, referrals from the General Program, and other sources. (Agencies do not need to document automotive fluid spills for traffic accidents.) This information will be incorporated into the ACCWP's annual reports to the Regional Board.

3. Location of field investigations and incidents responded to must be tracked and recorded internally and be available for Regional Board staff review. This data does not need to be included in the ACCWP's annual reports to the Regional Board.

4. Each agency will describe training and coordination of staff involved with illicit discharges. This information will be incorporated into the ACCWP's annual reports to the Regional Board.

INDUSTRIAL AND COMMERCIAL DISCHARGE CONTROLS

I. INDUSTRIAL AND COMMERCIAL BUSINESS INSPECTION PROGRAM

These performance standards apply to all municipalities.

1. Each municipality will prepare a written five-year Inspection Plan that describes industrial and commercial sectors, as well as business inspection procedures and priorities. The five-year Inspection Plan will be submitted to the Regional Board by May 30, 2003.

2. Each municipality will prepare annually a written Inspection Workplan that outlines specific steps the municipality will take to conduct effective inspections in the following year. The Inspection Workplan will include:

    a. An evaluation of inspection results from the previous year to assess which industry types had the most impact on stormwater quality.

    b. An estimate of the number of facilities to be inspected in the coming fiscal year listed by type of business. If a business is being inspected due to geographical location, then it will be listed by geographical sector.

    c. An estimate of the number of high priority facilities that will be inspected in the coming fiscal year. The goal is to inspect the business community that has the potential to impact stormwater quality, at least once during the five-year permit period.

    d. As appropriate, a summary of efforts to coordinate inter/intra-agency issues.

    The Inspection Workplan for the coming fiscal year will be submitted to the Regional Board by March 1 of each year, except the FY 2003/4 workplan which will be submitted by May 30, 2003.

3. Each municipality will ensure facility inspectors are adequately trained. This includes the knowledge and skills necessary to conduct effective stormwater inspections, with direction from the Industrial & Illicit Discharge Control (I&IDC) Subcommittee. This may include: stormwater regulations and requirements (including the municipality's ordinance, municipal stormwater permit, and the industrial stormwater general permit); the impacts of non-stormwater discharges to the storm drains; inspection techniques and procedures; follow-up and enforcement procedures; and stormwater BMPs.

4. Each municipality will conduct outreach in addition to inspection activities, to inform facility representatives about appropriate stormwater BMP information. This may be satisfied by responding to telephone calls from business representatives, making presentations to business groups, or participating in focused outreach efforts coordinated by the I&IDC Subcommittee for targeted business groups.

5. Municipalities may coordinate outreach information with other ACCWP Subcommittees and other inspection programs.

II. INSPECTION ACTIVITIES

These performance standards apply to all agencies.

1. Each agency will respond to complaints or referrals concerning a facility. The response may include actions such as: interviewing the caller concerning the specific nature of the discharge; inspecting the site; locating any non-stormwater discharges to the storm drains; informing the facility representative of appropriate stormwater BMPs; and conducting follow-up measures to ensure compliance is achieved.

2. Each municipality will update their list of businesses from the following as appropriate: inter/intra-agency referrals; other agency and department lists; business licenses; water/utility bills; etc.

Preparing for the Site Visit

Inspectors will review existing information on the site and its regulatory history.

During the Site Visit

1. Inspectors will review the facility layout to locate the storm drain system and/or stormwater drainage path for storage areas, process areas, vehicle and heavy equipment wash and maintenance areas, and stormwater sampling locations, if applicable.

2. Inspectors will review/inspect the following areas for the potential to discharge pollutants from non-stormwater discharges or exposure to runoff. The areas that are inspected will depend on facility operations.

   a. Outdoor process/manufacturing areas;

   b. Outdoor material storage areas;

   c. Outdoor waste storage and disposal areas;

   d. Outdoor vehicle and heavy equipment storage and maintenance areas;

   e. Outdoor parking areas and

access roads;

f. Equipment on rooftops;

g. Outdoor wash areas;

h. Outdoor drainage from indoor areas; and

i. Stormwater conveyance system maintenance, and emergency response practices.

3. Inspectors will collect the information on the most recently adopted Standard Stormwater Facility Inspection Report Form.

4. Inspectors will use the facility's SWPPP, if available, as a tool in assessing the facility's stormwater pollution control activities. This will not imply review or approval of the adequacy of the SWPPP.

5. Inspectors will identify and inform the facility representative about problems and violation(s), if applicable. A schedule for correcting problems identified during the inspection and a means for verifying its implementation will be coordinated between the inspector and the facility representative. This information will also be noted on the inspection form.

6. Inspectors will provide facility representatives with appropriate BMP information, education materials, and inter/intra-agency referrals as appropriate.

7. Inspectors will obtain ongoing training to support inspection activities and to continue to improve program implementation. Inspector(s) representing each municipality will attend General Program inspector training workshops. The Industrial & Illicit Discharge Control Subcommittee will annually assess inspector training needs.

III. FACILITY COMPLIANCE EVALUATION

These performance standards apply to all agencies.

Repeat/Follow-up Inspection

1. The inspector will determine if the facility is in compliance with the municipality's stormwater ordinance (i.e., there are no unpermitted non-stormwater discharges and pollutant exposure to rain is minimized).

2. Inspectors will prioritize the facility for re-inspection. If a problem was identified during the inspection, inspectors will perform a follow-up inspection or initiate a self-certification process where the facility representative certifies in writing that the problem has been removed or corrected within the time specified by the inspector.

3. Inspectors will begin enforcement procedures as appropriate.

Enforcement

4. Agencies will conduct enforcement activities and report these activities as outlined in the *Protocol for Reporting Enforcement Activities*

adopted by the Industrial & Illicit Discharge Control Subcommittee and the Management Committee. These activities are set forth by the individual agency ordinances.

IV. DOCUMENTATION AND REPORTING

These performance standards apply to all agencies.

Each municipality will annually review inspection results and assess whether goals were met. The General Program will summarize inspection activity, follow-up activities, and enforcement action taken against businesses determined to be in non-compliance. This review will be incorporated into the Program's *Annual Report* to the Regional Board.

Notes

[1] Implement when State Board adopts a Construction Activity Stormwater NPDES General Permit for construction activities ≥ 1 acres.
[2] For projects that require a NOI, the SWPPP is equivalent to a Stormwater Quality Protection Plan.
[3] Approach and schedule to be submitted with the second *Annual Report* after permit adoption.

SECTION 5

Approach and schedule to be submitted with the second *Annual Report* after permit adoption.

Implement when State Board adopts a Construction Activity Stormwater NPDES General Permit for construction activities ≥ 1 acres.

For projects that require a NOI, the SWPPP is equivalent to a Stormwater Quality Protection Plan.

Appendix A: Memorandum of Agreement

AGREEMENT

TO IMPLEMENT THE ALAMEDA COUNTY

URBAN RUNOFF CLEAN WATER PROGRAM

(Including First and Second Amendments)

AGREEMENT

PROVIDING FOR IMPLEMENTATION OF THE
ALAMEDA COUNTY URBAN RUNOFF CLEAN WATER PROGRAM

THIS AGREEMENT is made and entered into this day of , 1991 by and between the following undersigned public agencies, all which are referred to collectively as the Parties.

ALAMEDA COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, a public agency of the State of California;

Zone 7 of ALAMEDA COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, a local public agency of the State of California;

COUNTY OF ALAMEDA, a subdivision of the State of California;

CITY OF ALAMEDA, a municipal corporation of the State of California;

CITY OF ALBANY, a municipal corporation of the State of California;

CITY OF BERKELEY, a municipal corporation of the State of California;

CITY OF DUBLIN, a municipal corporation of the State of California;

CITY OF EMERYVILLE, a municipal corporation of the State of California;

CITY OF FREMONT, a municipal corporation of the State of California;

CITY OF HAYWARD, a municipal corporation of the State of California;

CITY OF LIVERMORE, a municipal corporation of the State of California;

CITY OF NEWARK, a municipal corporation of the State of California;

CITY OF OAKLAND, a municipal corporation of the State of California;

CITY OF PIEDMONT, a municipal corporation of the State of California;

CITY OF PLEASANTON, a municipal corporation of the State of California;

CITY OF SAN LEANDRO, a municipal corporation of the State of California; and CITY OF UNION CITY, a municipal corporation of the State of California.

RECITALS

A. The 1986 Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan), adopted by the Regional Water Quality Control Board in implementation of the Federal Clean Water Act, requires that the PARTIES develop a Program to control the discharge of pollutants from urban runoff.

B. In furtherance of their responsibilities pursuant to the Basin Plan, the PARTIES, have previously entered into a series of agreements to jointly fund the cost of preparing an action plan to evaluate nonpoint source pollutants, monitor identified pollutants and develop control measures to mitigate or reduce nonpoint sources of pollutants. Collectively, the measures undertaken pursuant to the previous agreements and anticipated to continue pursuant to this Agreement, are known as the Alameda County Urban Runoff Clean Water Program (hereinafter "Program"). The Program contains certain elements which provide a general benefit to the parties (such as monitoring, public education, program administration, etc.) and these elements of joint responsibility among the parties are termed the "General Program". In addition, the Program contains other elements which are an individual Party responsibility and which provide individual benefits (such as construction site controls, catch basin cleaning, and illicit and illegal connection

inspections, monitoring and enforcement), and these elements are termed the "Individual Programs". A description of the General and Individual Programs' elements, major tasks, schedules, and budgets will be developed as part of the "Work Plan for Cities in Alameda County, Alameda County, and the Alameda County Flood Control and Water Conservation District to file for a NPDES Permit" dated August 24, 1990.

C. The previous Agreements that have been executed are the following: The November 10, 1987 "Agreement Regarding Evaluation of the Non-Point Source of Water Pollution" and the October 17, 1989 "Agreement Regarding Implementation of Nonpoint Source Control Evaluation Program". In addition there is a pending agreement titled "Agreement Regarding Development of a Proposed Alameda County Nonpoint Source Control Management Plan" which will provide funding through June 1991 for implementation of the August 24, 1990 work plan.

D. The PARTIES desire to continue the Program and to enter into this Agreement for the purpose of ensuring continued participation, in terms of cost and administrative responsibilities.

E. This Agreement does not amend or supersede any prior agreement among the PARTIES regarding the Program, but is to be read as in accord with and

implementation thereof.

F. The Alameda County Flood Control and Water Conservation District (District) is a local public agency of the State of California duly organized and existing and empowered to conserve water and to provide maintenance and flood control management of the water courses and has the authority to control the discharge of surface waters to its facilities. The County of Alameda and all of the cities therein are subdivisions of the State with authority to control the discharge of surface waters from their respective jurisdictions.

NOW, THEREFORE, THE PARTIES AGREE AS FOLLOWS:

1. A Management Committee is hereby created to provide overall program direction, review and recommend an annual budget for approval by the PARTIES, and budget oversight, all in accordance with the Alameda County Urban Runoff Clean Water Program. Management Committee members, and their alternates, shall be appointed by the City Manager or the equivalent of the respective Parties and a confirming letter sent to the authorized representative of the District. The Management Committee shall adopt bylaws for its governance.

(a) Each Party to this agreement is allocated the number (or fraction thereof) of votes shown in Exhibit A. This allocation of voting strength is based on the formulas stated in Exhibit B to the Agreement.

(b) A quorum for the conduct of business by the Management Committee shall be a majority of the voting Parties to the Agreement. The voting strength allocated to a Party shall not be considered in the determination of a quorum.

(c) Approval of actions by the Management Committee shall require a two-thirds affirmative vote of all allocated votes as shown in Exhibit A.

No action shall be taken by the District which requires expenditures by any party other than the District without prior Management Committee approval.

2. Pursuant to direction of the Management Committee, the District shall administer and coordinate the Program, which duties include but are not limited to:

(a) Reapplying on behalf of the PARTIES to become co-applicants for a National Pollutant Discharge Elimination System (NPDES) permit;

(b) Preparing draft annual budget and, periodic status reports on Program activities and expenditure and distributing same to PARTIES at least annually;

(c) Consolidating and submitting reports prepared by the several PARTIES required by the NPDES permit;

(d) Letting and administering approved consultant contracts according to District policies and procedures and considering other members' requirements. All consultant contracts will contain hold harmless and indemnity provisions and insurance requirements for the benefit of all PARTIES;

(e) Conducting audits of consultant contracts in accordance with District policies and procedures;

(f) Maintaining knowledge of and advising the PARTIES regarding current and proposed state and federal policies, regulations and programs that impact nonpoint source pollutant control programs; assisting the PARTIES in development and presentation of positions on these issues before local, State, and Federal agencies;

(g) Preparing an annual report on the implementation of the Program;

(h) Representing the PARTIES in participation in the Bay Area Stormwater Management Agencies Association; and

(i) Formally advising the appropriate State and Federal agencies of termination or amendment of this Agreement.

3. The PARTIES accept and agree to perform the following duties:

(a) Each will authorize a representative to reapply for an NPDES permit as co-applicants with the other Parties;

(b) Each will fully comply with the NPDES permit conditions applicable to its Individual Program and its identified portion of the General Program;

(c) Each will select a representative and an alternate to participate in Management Committee meetings and other required meetings of the PARTIES;

(d) Each will fund and implement its own Individual Program, and will fund and implement its share of the General Program. The District intends to provide funding to support new and expanded activities required by the General and Individual Programs for Cities locate in District zones with Benefit Assessment Programs. Such funding will be provided to the extent that it is available and with the concurrence of the applicable City if it results in deferring flood control projects.

(e) Each will provide agreed upon reports (certified under penalty of perjury) to the District on compliance with applicable provisions of the NPDES permit and program implementation.

4. A proper accounting of funds and reports of all receipts and disbursements shall be made, including funds disbursed to individual parties for implementation of permit programs. Upon completion of the purposes of this Agreement, any surplus money on hand shall be returned in proportion to the

contributions made. In the event a Party terminates this Agreement, any unexpended portion of its share of cost funds shall be returned to it.

5. By agreement of the PARTIES, budget allocations and voting shares for the General Program shall be made according to a formula which for the municipalities allocates proportional shares based on a 50 percent weight given to the area and a 50 percent weight given to the population within each municipalities' jurisdiction (excluding open water and wetland areas of San Francisco Bay). The attached Exhibit B provides a copy of the formulas which are used to allocate costs. Each Parties' share of the General Program's costs for fiscal year 1991/92 will be according to the percentages provided in Exhibit A. Cost shares will be recalculated based on updated information on population and area using the formulas in Exhibit B for fiscal year 1992/93 and at appropriate future intervals as specified in the bylaws. The budget allocation for the Individual Programs shall be made directly by the individual responsible parties.

6. This Agreement shall have a term of six (6) years from the first day of April 1991, subject to automatic renewal for a five (5) year period in the absence of objection thereto made in writing by any Party 90 days in advance of the renewal date. This Agreement shall have an additional term of six (6) years from the first day of April 2002, subject to an additional automatic renewal for a five (5) year period in the absence of objection thereto made in writing by any Party 180 days in advance of the renewal date. The participation of any Party to this Agreement may be terminated by a two-thirds affirmative vote of all allocated votes in any year in which the funds necessary for its continued involvement are not appropriated by its legislative body.

7. The PARTIES shall retain the ability to individually (or collectively) request permit modifications and initiate permit appeals for permit provisions to the extent that a provision affects an individual party or group of PARTIES.

8. This agreement may be amended from time to time by written agreement of the Parties' governing bodies representing two-thirds or more of all allocated votes as shown in Exhibit A.

9. Participation in this Agreement may be terminated by any Party for any reason after the Party complies with all of the conditions of termination. The conditions of termination include the following: the Party shall notify all of the other Parties to the Agreement 90 days prior to its termination in the Agreement, the Party shall obtain its own NPDES permit for urban runoff, and the Party shall have its name deleted as a co-permittee of the Parties' NPDES permit. Any expenses associated with terminating the Agreement including but not limited to filing for and obtaining the individual NPDES permit and the amendment of the Parties' NPDES permit will be solely the responsibility of the Party terminating its participation in the Agreement.

10. It is understood and agreed that, pursuant to Government Code 895.4, each Party ("indemnitor") shall, to the extent permitted by law, defend, indemnify and save harmless each other Party, and its officers and employees from all claims, suits or actions of every name, kind and description resulting from indemnitor's performance of this Agreement, excluding any injuries, death, damage or liability resulting from the negligence or willful misconduct of the other Parties or their officers or employees.

Appendix B: General Program Tasks and Budget for FY 2001/02

Program Component	FY 2001/02 Budget
Planning and Regulatory Compliance	$519,000

FY 2001/02 General Program Budget Summary

Watershed Assessment	$151,000
Monitoring and Special Studies	$448,000
Public Information/Participation	$555,000
Municipal Maintenance Activities	$88,000
New Development and Construction Site Controls	$82,000
Illicit Discharge Controls	$46,000
Industrial and Commercial Discharge Controls	$124,000
Contingency	$87,000
BUDGET TOTAL	**$2,100,000**

Planning and Regulatory Compliance General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rationale/Background (if necessary)	Budget	Schedule/ Due Date
PRC-1. Participate in the Regulatory Process:		$99,000	
• Review and comment on legislation and regulation affecting stormwater management. Confer with Regional board on permit reissuance. (Includes all legal assistance to the Program.)	Previously funded under Task 2.3 (Respond to Regulatory Initiatives).	($59,000)	Ongoing
• Represent Program in TMDL and permit processes and on BASMAA and California Stormwater Quality Task Force.	Previously part of Task 2.2 (Lead and Represent).	($40,000)	Ongoing
PRC-2. Assist with Permit Compliance:		$87,000	Ongoing
• Develop deliverable forms. Compile and submit required reports to Regional Board.	Previously funded under Task 2.1 (Assist with Compliance).	($52,000)	
• Review member agencies' performance and provide additional assistance with permit compliance.	Previously funded under Task 2.4 (Continuous Improvement).	($35,000)	
PRC 3 & 4. Develop Partnerships and Facilitate Watershed Approach:		$40,000	Ongoing
• The purpose of this task is to expand upon existing partnerships and to pursue opportunities to create additional partnerships.	Previously part of Task 2.2 (Lead and Represent).	($15,000)	
• The purpose of this task is to coordinate the Program's involvement in watershed management activities.	Funding transferred from Watershed Assessment component.	($25,000)	
PRC 5. Control Measure Plans:		$50,000	Ongoing
• Implement the planning component tasks of the Control Measure Plans and coordinate the implementation and updating of Control Measure Plans	$22,000 from Task 2.2 (Lead and Represent); $28,000 in additional funding.		
PRC 6. Planning and Evaluation:		$57,000	Ongoing
• Program planning, coordination and evaluation.	Previously funded under Task 2.5.1.	($20,000)	
• Newsletter and website.	Previously funded under Task 2.6 (Website and Newsletter).	($37,000)	
PRC 7. Management Services		$101,000	Ongoing
• Program management, budgeting, contracting, accounting, and reporting.	Previously funded under Task 2.5.2 (Management Services	($61,000)	
• Facilitate Management and Policy Level Subcommittee meetings and project management.	Previously funded under Task 2.5.1	(40,000)	
PRC 8. Fees and Dues:		$85,000	

Planning and Regulatory Compliance General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rationale/Background (if necessary)	Budget	Schedule/ Due Date
• Annual NPDES Permit Fee. • BASMAA and California SWQTF contributions		($10,000) ($75,000)	
Total Budget		$519,000	

Watershed Assessment General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rationale/Background (if necessary)	Budget	Schedule/ Due Date
WA-1. Develop and maintain a GIS resource for watershed information: • Continue mapping of pilot watersheds, and fill high-priority data needs such as digital conversion of available data or maps. Priorities and map projects to be developed in consultation with the local co-permittees or other watershed partners, and in coordination with other regional efforts. • Develop framework for long-term inventory of other Alameda County watersheds. Identify needs and priorities for incorporating data.	These tasks are all based on the Draft SWQMP, and support Objective #1 of the BASMAA Regional Monitoring Strategy.	$55,000 ($45,000) ($10,000)	Ongoing Target completion January 2002
WA-2. Use a variety of indicators to assess the condition of streams and watersheds: • Coordinate development of creek indicators (macroinvertebrate community, flow or imperviousness) with the proposed Stream Protection Policy and other regional initiatives. • Provide resources and training to citizen monitoring groups that are working with local watershed partners. May use services for training and technical assistance provided by Watershed Assessment Resource Center or other regional information sources.		$30,000 ($15,000) ($15,000)	Ongoing
WA-3. Provide useful watershed information to the Program and other watershed stakeholders: • Continue testing and application of selected indicators for contact recreation and human health risk (e.g. microbiological, chemical); provide tools and guidance to co-permittees and other local managers. • Conduct local pilot projects or assist member agencies in conducting watershed inventory and planning. • Prepare watershed maps and other creek information for display on ACCWP website.		$56,000 ($16,000) ($30,000) ($10,000)	Ongoing
WA-4. Reporting and component management: • Develop budgets, manage projects, compile reports, and evaluate component activities.		$10,000	Ongoing
Total Budget		$151,000	

Monitoring and Special Studies General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rationale/Background (if necessary)	Budget	Schedule/ Due Date
MS-1. Characterize and track pollutants of concern in urban runoff:	These tasks are based on the Draft SWQMP, and support Objective #2 of the BASMAA Regional Monitoring Strategy.	$267,000	Ongoing
• Required contribution to Regional Monitoring Program for Trace Substances.	An anticipated increase in the annual RMP fee has been estimated at 10% for calendar year 2002.	($147,000)	
• Continue sediment sampling for Mercury, PCB and organochlorine pesticides, and investigate potential sources in high priority watersheds as requested by Regional Board staff to support TMDL development.	One-time allocation for review of past data and preparation of long-term plan, to be updated after several years of sampling.	($50,000)	
• Review past Program fixed-station sampling data and develop statistically sound design for long-term monitoring plan to track metals, pesticides and toxicity.		($30,000)	
• Conduct stormwater monitoring in accordance with long-term plan.		($15,000)	
• Refine database of past sampling data; incorporate additional data types and develop queries or other user interfaces to facilitate analysis of long-term trends.		($25,000)	
MS-2. Evaluate the effectiveness of urban runoff BMPs:	These tasks are based on the Draft SWQMP, and support Objective #3 of the BASMAA Regional Monitoring Strategy.	$75,000	Ongoing
• Conduct special studies focusing on TMDL priority pollutants and their sources. These studies may include: planning of data collection for future TMDLs; local source identification; identification or refinement of specific control measures.		($35,000)	
• Conduct studies to assist establishment of local design standards for treatment and retention of runoff from new developments and redevelopment areas, similar to the SUSWMP requirements being discussed in relation to Santa Clara's NPDES permit renewal.	ACCWP's next NPDES permit is likely to include similar requirements, pursuant to recent "Bellflower" decision.	($40,000)	
MS-3. Provide technical information on management issues involving urban runoff:	These tasks support stormwater management and pollution prevention by co-permittees	$37,000	Ongoing
• Conduct special studies to address data gaps or management issues concerning pollutants of concern and urban runoff impacts.		($27,000)	
• Provide miscellaneous technical on-call support as needed.		($10,000)	

Monitoring and Special Studies General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rationale/Background (if necessary)	Budget	Schedule/ Due Date
MS-4. Coordinate with RMP and BASMAA: • Participate in BASMAA Monitoring Committee, RMP technical review, other regional stakeholder discussions.		$24,000	Ongoing
MS-5. Reporting and component management: • Facilitate and support Watershed Assessment and Monitoring Subcommittee. • Develop component budgets, track expenditures, conduct special studies needs assessment, evaluate component activities and manage component tasks.		$45,000 ($20,000) ($25,000)	Ongoing
Total Budget		$448,000	

Public Information/Participation General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rationale/Background (if necessary)	Budget	Schedule/ Due Date
PI/P 1. Implement targeted outreach:		$205,000	Ongoing
• Targeted campaigns will focus on helping to implement the control measure plans for specific water quality impairing pollutants. The pollutants that appear to be priorities on the Regional Board's list include mercury, PCBs and dioxin compounds, and pesticides. The campaigns will focus primarily on targeting residential usage and encouraging residents to prevent pollution.	Regional Advertising Campaign	($100,000)	
	Local Placement of Advertising	($95,000)	
	Collaboration with BASMAA and others	($10,000)	
PI/P 2. Continue to reinforce storm water messages:		$41,000	Ongoing
• This task supports reinforcing general and specific storm water messages.	IPM partnership	($21,000)	
	Media Relations	($10,000)	
	Outreach Events	($10,000)	
PI/P 3. Support educational and watershed-based approaches:		$170,000	Ongoing
• This task will provide support for programs that educate students about stormwater pollution (for example, Bay Savers, Kids in Creeks, or Estuary Action Challenge), the Community Stewardship Grants program, and outreach events such as the *Watershed Symposium*.	Bay Savers	($56,000)	
	Aquatic Outreach Institute	($70,000)	
	Estuary Action	($15,000)	
	Community Stewardship	($17,500)	
	Symposium	($10,000)	
	BAEER Fair	($2,500)	
PI/P 4. Support municipalities:		$74,000	Ongoing
• This task includes: developing and obtaining promotional materials for use by the municipalities; updating, reprinting, and distributing existing ACCWP materials; and, responding to requests for information from the public and member agencies.	Materials	($50,000)	
	Support	($24,000)	
PI/P 5. Component management and evaluation:		$67,000	Ongoing
• This task includes: subcommittee support, component evaluation, task management, and the development of work plans and budgets.	Subcommittee Support $20,000	($20,000)	
	Component Evaluation $7,000	($7,000)	
	Component Management $40,000	($40,000)	
Total Budget		$555,000	

Municipal Maintenance Activities General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rationale/Background (if necessary)	Budget	Schedule/ Due Date
MN-1. Implement and Assist with Performance Standards: • Each agency will implement the performance standards for municipal maintenance activities. The performance standards include the following major activities: – Street Sweeping – Storm Drain Cleaning – Conducting Training – Reporting The General Program will work through the Maintenance Subcommittee to resolve implementation and consistency issues.	Performance standards are the primary method for implementing the SWMP and complying with requirements of the NPDES permit.	$15,000	Ongoing
MN-2. Coordinating Maintenance-Related Activities with Other Subcommittees of the ACCWP, Other Agencies and Private Industries: • The subcommittee will work with appropriate staff from other Subcommittees of the ACCWP, park and recreation departments, and other public agencies and private industries whose activities are similar to or potentially affect municipal maintenance activities to identify activities of concern. Examples of other public agencies and private industries include PG&E, water suppliers and utilities, garbage collection companies, the Port of Oakland, golf courses, private recreational facilities and animal confinement areas. private recreational facilities and construction contractors.	Coordination among agencies and industries whose activities affect municipal maintenance will result in greater efficiency and effectiveness in meeting this component's goals.	$15,000	Ongoing
MN-3. Optimize Data Management and Analysis: • The General Program will optimize ongoing collection, recording and analysis of maintenance data. This will include continuing to evaluate if the types of maintenance data being collected are useful and if other types of data should be collected. Examples of potential studies and data analysis include the following: – Leaf collection programs – Litter abatement programs.	This task is based on the SWMP.	$15,000	Ongoing
MN-4. Outreach and Training: • The General Program will facilitate outreach and training activities aimed at preventing discharges from maintenance activities, with direction from the Maintenance Subcommittee. This includes selecting the appropriate forum (e.g., workshops, round table meetings, work groups, inter/intra-agency coordination meetings, etc.) depending on the target audiences (e.g., ACCWP agencies, other agencies, property owners, residence, etc.). • The Maintenance Subcommittee will also coordinate outreach activities with	Outreach activities will educate maintenance staff and the public about the ACCWP's goals related to municipal maintenance and provide information on how the public can help the municipalities achieve these goals.	$33,000	Ongoing

Municipal Maintenance Activities General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rationale/Background (if necessary)	Budget	Schedule/ Due Date
other ACCWP Subcommittees when the objectives of a planned outreach and training activity conducted by the Maintenance Subcommittee overlap with the objectives of another Subcommittee.			
MN-5. Manage Component and Evaluate and Improve Its Effectiveness: • The General Program will assist the Maintenance Subcommittee and its workgroups to conduct meetings and prepare any needed NPDES permit reports and work plans related to this component. This includes assisting with the development of annual General Program budgets. The following activities are examples of how the effectiveness of this component may be evaluated: – Survey member public agencies to obtain information about how well this component and the performance standards are working. – Evaluate the information being submitted as part of the annual reports. – Evaluate the Regional Board staff's reviews of the Clean Water Program's performance in this area.	This task is based on the SWMP.	$10,000	Ongoing
Total Budget		$88,000	

New Development and Construction Site Controls General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rational/Background (if necessary)	Budget	Schedule/ Due Date
ND-1. Identify More Specific Stormwater Controls for New Development: • Identify and work with a stakeholder group to develop a method for integrating pollutant and hydromodification controls. Submit method to Regional Board staff and make changes based on their feedback. • Identify assistance needed by ACCWP agencies to implement these controls.	This task is based on the SWMP and Regional Board interest in more directly specifying how treatment, hydromodification, source and design controls, will be used.	$18,000	06-30-2002 Ongoing
ND-2. Assist with Implementation of More Specific Stormwater Controls: • Perform activities identified by New Development Subcommittee as helpful to implementation of the new, more specific controls such as: incorporate the controls into performance standards; develop revised Conditions of Approval and other planning materials; provide information on successful development/redevelopment projects employing the controls and information on cost-effective ways to implement the controls; and assist with implementation of any new development control measures related to a specific pollutant.	This task is based on the SWMP and municipal planning staff's need to implement treatment, hydromodification, source and design controls.	$18,000	Ongoing
ND-3. Assist Development and Facilitate Use of Watershed Information: • Identify watershed information needs related to New Development. Communicate these needs to the Watershed Monitoring and Management Subcommittee. • Facilitate municipal planning and engineering staff's use of this information as it becomes available.	This task is based on the SWMP and the ACCWP's emphasis on watershed management.	$3,000 ($1,000) ($2,000)	Ongoing
ND-4. Promote Outreach and Training: • Conduct one outreach and/or training event to a target group (agency staff or building industry) chosen by the New Development Subcommittee. • Develop and distribute outreach materials with direction from New Development Subcommittee. Compile and distribute guidance and educational material to agency staff.	This task is based on the SWMP. The focus of training and outreach materials will be on the specific pollutant and hydromodification controls developed in Task 7.1.	$18,000 ($10,000) ($8,000)	06-30-2002

New Development and Construction Site Controls General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rational/Background (if necessary)	Budget	Schedule/ Due Date
ND-5. Assist with NPDES Permit Requirements, Reports, and Budgets: • Provide support for monthly New Development Subcommittee meetings and any needed work group meetings. Prepare reports, budgets, and other items to assist with implementation and documentation of this component. Evaluate effectiveness of this component so that the New Development Subcommittee can make improvements to the General Program.	This task is based on the SWMP and the ACCWP desire to implement a process of continuous improvement.	$25,000	Ongoing
Total Budget		$82,000	

Illicit Discharge Controls General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rational/Background (if necessary)	Budget	Schedule/ Due Date
ID-1. Implement and Assist with Performance Standards: • Provide input and direction on the next Stormwater Management Plan and permit application based on comments from the I&IDC Subcommittee.[1] Review component performance standards and update as needed.	This task is based on the SWMP. Performance standards are reviewed annually, and updated as necessary.	$1,000	Ongoing 01-01-2002
ID-2. Assist Member Agencies Comply with Requirements for Conditionally Exempt Non-Stormwater Discharges: • Facilitate compliance with conditionally exempt non-stormwater discharges. Work with the I&IDC Subcommittee to identify effective control measures. Facilitate process for adding new conditionally exempt non-stormwater discharges and developing appropriate BMPs.	This task is based on the SWMP, the municipal stormwater NPDES permit, and "Table 5. Summary of Conditionally Exempt Discharges, Follow-up, and Schedule" of the ACCWP *1997/98 Annual Report*.	$7,000	09-15-2002
ID-3. Track and Analyze Non-Stormwater Discharge Reports: • Collect and analyze information on illicit discharge control activities reported in the ACCWP agencies' quarterly summary reports. Analyze information to detect trends and to improve planning and management of illicit discharge control program activities, with direction from the I&IDC Subcommittee.	This task is based on the SWMP and the municipal stormwater NPDES permit.	$20,000	03-15-2002 & 09-15-2002
ID-4. Conduct Outreach and Training: • Facilitate outreach and training activities to prevent illicit discharges, with direction from the I&IDC Subcommittee. Develop materials to support outreach and training activities. • Identify a target audience and select appropriate outreach activity at least once every two years.	This task is based on the SWMP.	$12,000 ($2000) ($10,000)	07-01-2002
ID-5. Manage Component and Evaluate and Improve Its Effectiveness: • Assist I&IDC Subcommittee and its workgroups to conduct meetings and prepare NPDES permit reports, work plans and associated budgets related to this component.	This task is based on the SWMP. All agencies will submit their action plan using the same form to help ensure the information reported is consistent countywide.	$6,000	12-15-2001 03-15-2002 & 09-15-2002
Total Budget		$46,000	

[1] The majority of the budget for I&IDC Subcommittee coordination of illicit discharge control consistency issues is included in Task 9.2.

Industrial and Commercial Discharge Controls General Program Work Plan and Budget - FY 2001/02

Task Number and Description	Rational/Background (if necessary)	Budget	Schedule/ Due Date
ICD-1. Assist with the Implementation of Business Inspections, Enforcement and Educational Outreach Activities: • Assist Agencies to implement business inspections and related performance standards and encourage Program-wide consistency under the auspices of the Industrial/Commercial & Illicit Discharge Control (I&IDC) Subcommittee and its work groups. • Review performance standards and make improvements on a biannual or more frequent basis.	This task is based on SWMP. *Illicit Discharge Control Program coordination is incorporated into this budget.*	$45,000	Ongoing 06-30-2003
ICD-2. Develop BMP Guidance Materials: • Identify target audiences and which format to use for materials under the direction of the Industrial/Commercial & Illicit Discharge Control Subcommittee. Produce materials.	This task is based on SWMP. Guidance materials will support both illicit discharge control and industrial/commercial discharge control activities.	18,000	Ongoing
ICD-3. Track and Analyze Facility Inspection Reports: • Collect and analyze facility inspection report forms. Discuss findings with and perform additional analysis at the request of the Industrial/Commercial & Illicit Discharge Control Subcommittee.	This task is based on SWMP.	$20,000	Ongoing
ICD-4. Conduct Outreach and Training: • Identify a target audience (agency, business groups or industrial/ commercial associations), select appropriate forum for outreach under the direction of the Industrial/Commercial & Illicit Discharge Control Subcommittee. Conduct outreach or training activity(s) on a biannual or more frequent basis. When common objectives exist, coordinate training or outreach events with other General Program subcommittees.	This task is based on the SWMP.	$15,000	06-30-2003
ICD-5. Assist with NPDES Permit Requirements, Reports, Budgets and Evaluation of Industrial Discharge Control Activities: • Support the meetings of the Industrial/Commercial & Illicit Discharge Control Subcommittee and work groups. Prepare reports, budgets and other items necessary for administering this component and ensuring NPDES Permit compliance. Evaluate effectiveness of component through business surveys, analysis of agency annual report submittals and Regional Board staff's reviews. Based on evaluation, suggest policy and procedure improvements.	This task is based on the SWMP.	26,000	Ongoing
Total Budget		$124,000	

Appendix C: Pollutant Reduction Plans

Table C1- Diazinon Pollutant Reduction Plan: FYs 2001/02 and 2002/03

These plans will be replaced by new plans when available according to the reissued NPDES permit's requirements

Area of Activity	Specific Tasks	Schedule	Conducted by:
Municipal Activities			
MA-1: Survey agency use of insecticides	1) Conduct survey of insecticide use by municipal employees or contractors. 2) Assess results of survey and develop a plan to minimize the potential for municipal use of insecticides to impact storm water quality. 3) Begin implementation of recommended activities	1) FY 01/02 2) FY 01/02 3) FY 01/02	1) Municipalities/ Program 2) Municipalities/ Program 3) Municipalities
MA-2: Train municipal employees who use insecticides about insecticide-related surface water toxicity, proper use and disposal of insecticides, and less-toxic methods of prevention and control.	1) Conduct survey of established training requirements for municipal employees who use insecticides. Report on results. 2) Assess results of survey and develop a plan to augment existing training activities. 3) Implement training activities	1) FY 01/02 2) FY 01/02 3) FY 01/02	1) Municipalities/ Program 2) Planning Comp. 3) Municipalities/ Planning Comp.
MA-3: Integrated Pest Management (IPM) practices, policies, or ordinances.	1) Review established IPM practices, policies, or ordinances. Determine if additional practices, policies or ordinances should be developed. Submit written report on findings and recommended actions to Regional Board. 2) Compile examples of IPM practices, policies, and ordinances and provide to member agencies. Assist member agencies with implementation as appropriate. 3) Implement recommendations from Task 1.	1) FY 01/02 2) FY 01/02 3) FY 01/02	1) Municipalities/ Program 2) Planning Comp. 3) Municipalities

Table C1- Diazinon Pollutant Reduction Plan: FYs 2001/02 and 2002/03

These plans will be replaced by new plans when available according to the reissued NPDES permit's requirements

Area of Activity	Specific Tasks	Schedule	Conducted by:
Outreach			
OR-1 Outreach to Residents: Continue to develop and distribute information to the general public on pesticide-related toxicity, proper use and disposal of pesticides, and less-toxic methods of pest prevention and pest control.	1) Support "Our Water, Our World" point of purchase campaign. 2) Develop distribution plan for insecticide related outreach materials. 3) Implement distribution plan	1) FY 01/02 2) FY 01/02 3) FY 01/02	1) PI/P Comp. 2) Municipalities and PI/P Comp. 3) Municipalities and PI/P Comp.
OR-2 Outreach to Commercial Facilities: Provide information to selected businesses (e.g., restaurants, and supermarkets) about insecticide-related surface water toxicity, proper use and disposal of insecticides, and less-toxic methods of prevention and control.	1) Select business sector and develop or adopt outreach material 2) Distribute Material in conjunction with Industrial/Commercial Inspection Program	1) FY 01/02 2) FY 02/03	1) II&ID Comp. / Planning Comp. 2) Municipalities
Develop Partnerships			
DP-1 PCOs: The Program will contact licensed applicators in the county, and will work with those who are willing, to set up a program to minimize water quality impacts from structural pest control applications.	1) Contact licensed applicators and coordinate development of IPM approach 2) Begin implementation of IPM approach	1) FY 01/02 2) FY 02/03	1) Planning Comp. 2) Planning Comp.
DP-2 HHW facilities: Continue to support and promote household hazardous waste collection as an important insecticide disposal option for residents.	1) HHW info on P^2 Outreach material. 2) Conduct meeting(s) with HHW staff to discuss additional opportunities for coordination. 3) Begin Implementation of activities developed in Task 2.	1) Ongoing 2) FY 01/02 3) FY 01/02	1) PI/P Comp. 2) Planning Comp. 3) Program or municipalities as appropriate
DP-3 Agricultural Commission:	1) Conduct meeting(s) with County Agriculture staff to coordinate development of outreach for PCOs.	1) FY 01/02	1) Planning Comp.

Table C1- Diazinon Pollutant Reduction Plan: FYs 2001/02 and 2002/03

These plans will be replaced by new plans when available according to the reissued NPDES permit's requirements

Area of Activity	Specific Tasks	Schedule	Conducted By
Monitoring			
M-1: Use monitoring and science to investigate local impacts and sources.	1) Develop insecticide application/runoff model. 2) Track long term trends in storm water toxicity and insecticide concentrations (will be included in long-term monitoring plan)	1) FY 01/02 2) Ongoing	1) Monitoring Comp. 2) Monitoring Comp.
Regulatory			
R-1: Participate in the pesticide regulatory processes as appropriate.	1) Provide written comments to Regional Board, U.S. EPA and California Department of Pesticide Regulation as appropriate. 2) Provide monitoring data to Regional Board, U.S. EPA and California Department of Pesticide Regulation as appropriate.	1) Ongoing 2) Ongoing	1) Planning Comp. 2) Monitoring Comp.
Coordination			
C-1: Coordinate implementation of the PRP.	1) Establish work group to coordinate implementation across components, develop reporting forms and assist municipalities. 2) Coordinate with BASMAA, the California Storm Water Quality Task Force and the Urban Pesticide Committee as appropriate.	1) Ongoing 2) Ongoing	1) Planning Comp. 2) Planning Comp.
Evaluation			
V-1: Evaluate implementation of the PRP	1) Review each of the action items and develop and conduct evaluations as appropriate. 2) Report on the results of the evaluations to the Regional Board	1. Annually 2. Annually	1. Planning Comp. 2. Planning Comp.

Table C2- Mercury Pollutant Reduction Plan: FYs 2001/2, 2002/3 and 2003/4

These plans will be replaced by new plans when available according to the reissued NPDES permit's requirements

Area of Activity	Specific Tasks	Schedule	Conducted by:
Municipal Activities			
MA1 Fluorescent Bulb Recycling	1) Conduct survey of fluorescent bulb recycling practices currently employed by municipalities. 2) Assess potential for improvement in recycling practices. 3) Implement improved practices	1) FY 02/03 2) FY 02/03 3) FY 03/04	1) Municipalities 2) Municipalities 3) Municipalities
MA2- Mercury Reduction Policies/Ordinances	1) Assess feasibility of implementing purchasing policies to reduce the use of mercury containing products. 2) Implement activities from assessment as appropriate.	1) FY 02/03 . 2) FY 03/04	1) Municipalities 2) Municipalities
Outreach			
OR1- Outreach to Businesses: Work with business community to increase level of fluorescent lamp recycling.	1) Identify obstacles to increased fluorescent lamp recycling. 2) Work with appropriate entities to try to minimize obstacles.	1) FY 02/03 2) FY 02/03	1) Planning Comp. 2) Planning Comp.
OR2- Outreach to Residents: Develop and distribute information to the general public on mercury related hazards, proper use and disposal of mercury containing products, and mercury free alternatives.	1) Develop mercury related outreach program 2) Conduct public outreach	1) FY 02/03 2) FY 03/04	1) PI/P Comp. 2) PI/P Comp. and/or Municipalities
Partner with Other Agencies			
P1- Household Hazardous Waste: Continue to support and promote household hazardous waste collection as a mercury disposal option for residents.	1) HHW info on P^2 Outreach material. 2) Conduct meeting(s) with HHW staff to discuss opportunities for coordination. 3) Begin implementation of activities developed in Task 2.	1) Ongoing 2) FY 01/02 3) FY 02/03	1) PI/P Comp. 2) Planning Comp. 3) Program or municipalities as appropriate

Table C2- Mercury Pollutant Reduction Plan: FYs 2001/2, 2002/3 and 2003/4

These plans will be replaced by new plans when available according to the reissued NPDES permit's requirements

Area of Activity	Specific Tasks	Schedule	Conducted by:
P2- Green Business Program:	1) Evaluate funding Green Business Program 2) Assess potential for improving Green Business Program's fluorescent bulb recycling component 3) Promote Program's and municipalities' use of Green Businesses 4) Promote public's use of Green Businesses	1) FY 01/02 & 02/03 2) FY 01/02 3) Starting 02/03 4) Starting 02/03	1) II&ID Comp. 2) II&ID Comp. 3) Planning Comp. and Municipalities 4) PI/P
Regulatory Involvement			
R1: Participate in the mercury TMDL process.	1) Attend mercury TMDL meetings as appropriate. 2) Provide written comments to U.S. EPA and the Regional Board as appropriate. 3) Support legislation to reduce mercury use.	1) Ongoing 2) Ongoing 3) Ongoing	1) Planning Comp. 2) Planning Comp 3) Planning Comp
R2: Fluorescent Bulb Recycling	1) Encourage the Department of Toxic Substances Control to promote recycling of fluorescent bulbs through revisions to Universal Waste Rule.	1) Ongoing	1) Planning Comp.
Monitoring			
M1: Use monitoring and science to investigate local impacts and sources.	1) Conduct survey of stream sediments to assess concentrations and loading of mercury. 2) Conduct additional surveys or special studies as appropriate.	1) FY 01/02 2) As appropriate	1) Monitoring Comp. 2) Monitoring Comp.
Coordination and Evaluation			
CE1: Coordinate implementation of the mercury PRP.	1) Coordinate implementation across components. 2) Coordinate with BASMAA, the Regional Board, and U.S. EPA as appropriate.	1) Ongoing	1) Planning Comp.
CE2: Evaluate implementation of the mercury PRP	1) Review each of the action items and develop and conduct evaluations as appropriate. 2) Report on the results of the evaluations to the Regional Board	1) Annually 2) Annually	1) Planning Comp. 2) Planning Comp.

Table C3- Copper Pollutant Reduction Plan: FYs 2001/2 and 2002/3

These plans will be replaced by new plans when available according to the reissued NPDES permit's requirements

Area of Activity	Specific Tasks	Schedule	Conducted by:
Brake Pad Partnership			
B-1: Brake Pad Partnership	1) Contribute funds to support Brake Pad Partnership effort.	1) FY 01/02 & 02/03	1) Planning Comp.
Municipal Activities			
MA1: Architectural uses of copper	1) Assess feasibility and effectiveness of reducing the use of copper in roofs or gutters. 2) Implement actions based on results of assessment.	1) FY 01/02 2) FY 02/03	1) New Development and Monitoring Comp. 2) Municipalities
MA2: Street Sweeping	1) Continue street sweeping in accordance with Municipal Maintenance Performance Standard.	1) Ongoing	1) Municipalities.
MA3- Outreach to Businesses: Conduct outreach to selected business sector (e.g., metal finishers, pool maintenance, auto repair) regarding BMPs to reduce copper discharge.	1) Select Business Sector and Develop Outreach 2) Distribute material in conjunction with Industrial/Commercial inspection program	1) FY 02/03 2) FY 03/04	1) II&ID Comp. 2) Municipalities
Monitoring			
M-1: Use monitoring and science to investigate local impacts and sources.	1) Track long term trends for copper concentrations in storm water. (Will be included in long-term monitoring plan.) 2) Conduct special studies as appropriate	1) Ongoing 2) As appropriate	1) Monitoring Comp. 2) Monitoring Comp.
Coordination			
C-1: Coordinate implementation of the CMP.	1) Coordinate implementation across components. 2) Coordinate with BASMAA, the Brake Pad Partnership, and others as appropriate.	1) Ongoing 2) Ongoing	1) Planning Comp. 2) Planning Comp.
Evaluation			
V-1: Evaluate implementation of the CMP	1) review each of the action items and develop and conduct evaluations as appropriate. 2) report on the results of the evaluations to the Regional Board	1) Annually 2) Annually	1) Planning Comp. 2) Planing Comp.

Subject: Submittal of "Stormwater Management Plan" and Other Parts of the ACCWP's Municipal Stormwater NPDES Permit Re-application

Dear Mr. Bowyer:

Attached is the Alameda Countywide Clean Water Program's (ACCWP) "Stormwater Management Plan" (SWMP) for the five-year period beginning July 1, 1996. This SWMP reflects a continuing, gradual evolution of the successful stormwater pollution prevention and control methods identified and implemented during the initial NPDES permit period. The refinements incorporated into the new SWMP are based on the practical experience of the ACCWP member agencies, as well as the guidance provided by the Regional Board staff.

The SWMP is divided into three major sections. First is the Executive Summary which contains a concise overview of the tasks, schedule, and parties responsible for implementing the SWMP. The Executive Summary is intended to provide sufficient information for policy makers and elected officials to grasp what the Alameda Countywide Clean Water Program is committed to accomplishing. The second major section consists of each of the components of the SWMP. This section describes in more detail what was accomplished during the initial NPDES permit period and the tasks that will be conducted over the next five years. The last major section consists of the appendices to the SWMP. These appendices include sections on the work plan and budget for FY 1996/97 (which will serve as a base plan for future annual work plans and budgets), performance standards, and other useful information.

In addition to the SWMP, this NPDES permit re-application package includes as separate items, EPA Application Form 1 and additional Supplemental Re-application Materials dealing with the applicants' stormwater finances, maps and other required information.

We look forward to working with you to obtain the next NPDES permit. If you have any questions or comments, please contact Fred Jarvis at 832-2852 or me at 670-5563.

Sincerely,

G. Robert Hale, Ph.D

Loretta Barsamian
Executive Officer
Regional Water Quality Control Board
2101 Webster St., Suite 500
Oakland, CA 6412

Dear Ms. Barsamian:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

Sincerely,

G. Robert Hale, Ph.D
ACCWP Coordinator

Definitions

BMPs	Practices implemented by private industry and public agencies which prevent or reduce water pollution.
General Program	Activities implemented for the joint benefit of the member agencies.
Member Agencies	The 14 cities in Alameda County, unincorporated Alameda County, the ACFC&WCD, and Zone 7 of the ACFC&WCD.
Municipalities	The 14 cities in Alameda County and unincorporated Alameda County.
Performance Standards	Pollution prevention practices the member agencies have made a commitment to implement.

Executive Summary

INTRODUCTION

Initial Efforts

Efforts to better understand the characteristics of the stormwater pollution problem in Alameda County and ways to solve it were initiated in 1987 with the formation of the Alameda County Task Force (Task Force). This Task Force consisted of representatives from all of the municipalities in Alameda County, and the Alameda County Flood Control and Water Conservation District (ACFC&WCD) agreed to serve as the coordinator. The Task Force's efforts responded to requirements adopted by the San Francisco Bay Regional Water Quality Control Board (Regional Board) in its 1986 Water Quality Control Plan.

Federal Clean Water Act Stormwater Control and Permit Mandate

About the same time that the Regional Board was beginning to place increased emphasis on stormwater pollution prevention, the federal Clean Water Act was amended in 1987 to require that stormwater discharges from municipal storm drain systems, such as those operated by Alameda County municipalities and the ACFC&WCD (including Zone 7 of the ACFC&WCD), obtain coverage under a nationwide surface water permit program called the National Pollutant Discharge Elimination System (NPDES). The U.S. Environmental Protection Agency has delegated to the State of California, including the local Regional Board, the authority to adopt and enforce these permits. In 1990, the U.S. Environmental Protection Agency completed regulations for how municipalities apply for municipal stormwater NPDES permits.

Based on the NPDES permit application requirements, the Task Force re-focused its activities to develop a comprehensive, area-wide stormwater pollution prevention and management program that has become known as the Alameda Countywide Clean Water Program (*Countywide Program*). One of the keys to these efforts was the completion in 1991 of a five-year plan[1] for implementation during the period from July 1991 through June 1996. This plan was incorporated by reference into the *Countywide Program*'s five-year municipal stormwater NPDES permit adopted by the Regional Board in October 1991. The Regional Board found that the U.S. Environmental Protection Agency's regulations for applying for a municipal stormwater NPDES permit were met as part of the *Countywide Program*'s original NPDES permit application package. All of the major activities contained in the initial plan have been completed.

Stormwater Pollution Problem

One of the key areas that continues to be addressed by a number of municipal stormwater programs, including the *Countywide Program*, is to better define the stormwater pollution problem in terms of the pollutants of concern, their sources, and measures needed to control these pollutants. Studies conducted thus far have concluded that in addition to problems such as excessive sedimentation of watercourses, principal pollutants of concern include the following: organophosphate pesticides (diazinon and chlorpyrifos), organochlorine pesticides (DDT, chlordane and dieldrin), copper,lead, zinc, mercury, polycyclic aromatic hydrocarbons (PAHs),

and polychlorinated biphenyls (PCBs). The list includes pollutants that may be having an adverse impact on local creeks and/or San Francisco Bay.

The concern with diazinon, chlorpyrifos, copper, lead, and zinc is their potential to cause chronic toxicity to aquatic life. This contrasts with organochlorine pesticides, mercury, PAHs, and PCBs which are pollutants that tend to bioaccumulate in the tissue of fish, clams, and other organisms. These bioaccumulative pollutants pose a potential long-term risk to the health of humans and to wildlife, such as harbor seals, that consume these contaminated animals.

An effective tool for correcting stormwater pollution is source control or pollution prevention; preventing pollutants from getting into stormwater is easier than removing them once they are there. Another promising tool is to work from a watershed-based approach to identify the most controllable sources of pollutants and to implement the most cost-effective solutions on the highest priority sources. In addition to taking a broader perspective on the sources of the problem, the watershed-based approach also encourages a broader view of defining problems. In some cases, water quality problems are inextricably linked to problems of aquatic habitat protection and restoration, which, on this basis, demand more comprehensive solutions than have been considered previously.

New Stormwater Management Plan

A requirement of the original NPDES permit is to re-apply for a subsequent NPDES permit. One of the essential elements of this re-application has been to prepare this new Stormwater Management Plan. EPA has not adopted specific NPDES permit re-application requirements for programs, such as the *Countywide Program*, that have met the initial NPDES permit application requirements with their original submittal.

This new Stormwater Management Plan covers the period from July 1996 through June 2001 and was prepared under the direction of the *Countywide Program*'s Management Committee. The suggestions contained in Thomas Mumley's (Regional Board staff) working draft memorandum[2] for establishing a consistent framework for municipal Stormwater Management Plans were considered in developing this new Stormwater Management Plan.

The Management Committee, comprised of representatives from each of the 14 cities in Alameda County, Alameda County, the ACFC&WCD and Zone 7 of the ACFC&WCD (member agencies), directed the development of this Stormwater Management Plan. The Management Committee was the successor to the Task Force. The Management Committee representatives are appointed by each agency's City Manager or equivalent as provided by the basic agreement[3] that established the *Countywide Program*. This agreement institutionalized the role of the ACFC&WCD as the administrator and coordinator of the General Program; the General Program consists of the portion of the *Countywide Program* conducted jointly for the mutual benefit of member agencies by the ACFC & WCD and its consultants. Under this arrangement, each agency remains responsible for controlling the discharge of pollutants to the municipal storm drains and conveyance systems that it owns and operates (as specified in agreed upon performance standards).

PURPOSE OF THE STORMWATER MANAGEMENT PLAN

The main purpose of this Stormwater Management Plan (SWMP) is to describe

in a clear and concise manner the stormwater pollution prevention and management activities to be implemented, who is responsible for implementing these activities, how implementation will be accomplished, and a schedule for completion. Similar to the previous five-year plan, the current plan is expected to be incorporated, by reference, into the re-issued NPDES permit. The re-issued NPDES permit is expected to be adopted by the Regional Board in the fall of 1996. The five-year period of this new Stormwater Management Plan coincides, approximately, with the five-year period of the next NPDES permit.

MAJOR CHANGES FROM THE PREVIOUS STORMWATER MANAGEMENT PLAN

There are a number of improvements incorporated into this SWMP that have evolved from the previous plan and from the member agencies' practical experience implementing the *Countywide Program*. There has been no reason for radical change because the previous SWMP, and the *Countywide Program* that evolved, have been basically successful. In recognition of this success, the *Countywide Program* was awarded the U.S. Environmental Protection Agency's 1994 Second Place National Stormwater Control Program Excellence Award. The most important of these improvements are briefly summarized below.

Expanded Focus on Creeks

The previous SWMP was primarily focused on tasks to protect the beneficial uses of San Francisco Bay and placed less emphasis on the numerous creeks, estuaries and wetlands located in Alameda County. The new SWMP provides a strong emphasis on the role that the *Countywide Program* has, in concert with other agencies, in promoting creek protection and restoration. A reflection of this recognition is the addition of the new Focused Watershed Approach component to this SWMP.

Annual Plans within Structure of Focused Five-Year Plan

Another improvement is to structure the SWMP to serve as a focused guide for what will be done during the next five years. The details of what will be accomplished during each subsequent fiscal year will be included as annual work plans. (The FY 1996/97 Work Plan and Budget is contained in Appendix A.) The proposed Work Plan and Budget for each subsequent fiscal year will be submitted to the Regional Board staff by March 1 each year and inserted as an addition to Appendix A following its approval by the Management Committee.

It was found that the previous SWMP attempted to forecast details about how future tasks would be implemented that proved to be unworkable and counterproductive. The new SWMP is structured so that the *Countywide Program* can determine flexibly the best way to implement the prescribed tasks. This type of approach is well-suited to a field such as stormwater pollution prevention and management given the relatively rapid increases in understanding and partnerships that are occurring and the benefits of incorporating this information iteratively.

Greater Member Agency Participation in Stormwater Management Plan Development

The new SWMP has had much greater member agency participation in its creation than the previous plan. This was possible because of the well-organized subcommittees that currently exist to help implement each of the different components of the SWMP. One of the benefits of this greater participation is that the SWMP now better represents the views of the member agencies and what

they believe is the best way to implement the *Countywide Program*.

Performance Standards

Another improvement is to incorporate into this SWMP performance standards that describe implementation goals and what *Countywide Program* member agencies have agreed to do. Appropriate performance standards can now be refined since the member agencies have had hands-on experience implementing the various aspects of the *Countywide Program* within their jurisdictions. This topic is described further under the Implementation Strategy section of this summary.

ORGANIZATION OF THE STORMWATER MANAGEMENT PLAN

This SWMP consists of the following eight major components:

2.0 Regulatory Compliance, Planning, and Program Management
3.0 Focused Watershed Management Approach
4.0 Monitoring and Special Studies
5.0 Public Information/Participation
6.0 Municipal Maintenance Activities
7.0 New Development and Construction Controls
8.0 Illicit Discharge Controls
9.0 Industrial and Commercial Discharge Controls

Each of these components contains sections describing goals, existing conditions, and major tasks.

COMPONENT GOALS, MAJOR TASKS, AND PERFORMANCE STANDARDS

The following reviews the goals and major tasks of each of these components as well as the highlights of the applicable performance standards for components 5.0 - 9.0 (Appendix B). Since performance standards summarize member agency activities, most of the major tasks described in the new SWMP are conducted by the General Program for the mutual benefit of member agencies. A quick reference to SWMP tasks and schedules, and General Program and member agency roles in implementing SWMP tasks, is provided in Figure ES-1 and Table ES-1, respectively.

2.0 Regulatory Compliance, Planning, and Program Management

The goals of this component include assisting the *Countywide Program* member agencies comply with the NPDES permit; maximizing regulatory certainty by participating in regulatory planning processes that affect the *Countywide Program*; and providing the leadership and essential program management services needed to implement the General Program.

Examples of the General Program's assistance with regulatory compliance (Task 2.1) include supplying each member agency with reporting forms; summarizing the information submitted as NPDES permit required semiannual reports; and continuing to provide annual individual reviews of each member agencies' performance. Other major tasks listed in this section include representing the *Countywide Program* at Bay Area Stormwater Management Agencies Association (BASMAA), California Stormwater Quality Task Force, and other meetings (Task 2.2); planning, initiating, and responding to regulatory and grant funding initiatives (Task 2.3); continuing to improve the *Countywide Program* (Task 2.4); and providing essential management services (Task 2.5). The *Countywide Program* has been successful in obtaining several U.S. Environmental Protection Agency grant funded projects in the past, but these funds will likely be scarcer in the future.

All of the tasks will be conducted on an ongoing basis throughout the next five years.

While the General Program is primarily responsible for implementing these tasks, the participation of the *Countywide Program* member agencies is essential (Table ES-1). One example of this is the need for each agency to complete and submit information on its progress using the agreed upon format developed as part of Task 2.1. There are no agency-specific performance standards for this component.

3.0 Focused Watershed Management Approach

Although this component is new, the previous SWMP and the other sections of this SWMP, in essence, constitute a watershed management approach. The primary purpose of this component is to determine the tangible water quality and aquatic resource benefits of using a focused, water body-specific (e.g., estuary, creek), management approach in urbanized watersheds.

The four major tasks that will be conducted as part of this component include the following: participating in watershed management projects led by other agencies (Task 3.1); conducting a pilot watershed project within a portion of the San Leandro Creek watershed where a number of successful watershed awareness activities have already been implemented (Task 3.2); identifying useful results from the pilot study and incorporating these into the *Countywide Program* (Task 3.3); and managing this component (Task 3.4). All of these tasks, except Task 3.3, will be conducted on an ongoing basis throughout the next five years. Task 3.3 will be conducted annually starting the third year.

There are no agency-specific performance standards for this component, but the continuing participation of a representative group of *Countywide Program* member agencies on the Monitoring and Special Studies Subcommittee is essential to direct this component.

4.0 Monitoring and Special Studies

The role of monitoring and special studies is to better characterize stormwater pollutant problems and identify improved solutions. The results from monitoring and special studies can help focus other *Countywide Program* program components.

Major tasks over the next five years include tracking and coordinating with the San Francisco Estuary Institute's (SFEI) Regional Monitoring Program (RMP) and BASMAA's Monitoring Committee (Task 4.1); continuing routine monitoring at selected locations in Alameda County (Task 4.2); conducting special studies to identify sources of pollutants and potential controls and support other program components and (Task 4.3); and managing data (Task 4.4).

There are no agency-specific performance standards for this component, but the continuing participation of a representative group of *Countywide Program* member agencies on the Monitoring and Special Studies (MSS) Subcommittee is essential to direct this component.

5.0 Public Information/Participation

The *Countywide Program* has made good progress in educating area residents about stormwater pollution and in encouraging changes to less polluting behavior. The purpose of this component is to continue this progress through a more targeted approach.

The primary task during the first two years of the SWMP is to target outreach about residential yard and garden care (Task 5.1). This is an important area to

focus on given the *Countywide Program*'s studies that found that organophosphate pesticides are the primary cause of toxicity found in stormwater. A second subject area for targeting will be selected during the second year of the SWMP. The other tasks in this component include the following: continuing to re-enforce existing stormwater pollution prevention messages (Task 5.2); supporting watershed-based approaches (Task 5.3); evaluating effectiveness (Task 5.4); implementing and updating the performance standards (Task 5.5); assisting with staff training (Task 5.6); continuing to partner with other groups for collaborative educational outreach (Task 5.7); and managing this component (Task 5.8). All of these tasks, except Task 5.4, will be conducted on an ongoing basis throughout the next five years. Task 5.4 will be conducted during the third year following the completion of the residential yard and garden care educational campaign.

The performance standards require that each member agency continue to educate its own staff and officials about stormwater pollution prevention and management; participate in the Public Information/Participation Subcommittee directly or indirectly through a liaison; and conduct community outreach activities to communicate the general stormwater pollution prevention message. There are specific requirements for the number of community outreach events each agency must participate in that are generally based on population. There are a wide variety of events listed in the performance standards that an agency may choose from to achieve community outreach. Additionally, the performance standards require that municipalities coordinate with their local schools about some of the educational activities available from the General Program, such as the Bay Saver Club for fourth grade students.

6.0 Municipal Maintenance Activities

Municipal maintenance activities include street sweeping, storm drain cleaning, and other maintenance-related activities that may have an impact on stormwater quality. The purpose of this component is to continue to work with municipal public works and other maintenance staff to identify ways to optimize the removal of pollutants and minimize discharges during routine maintenance activities.

The two primary tasks include implementing and updating the existing performance standards (Task 6.1) and developing additional performance standards (Task 6.2) for parking lots and sidewalks, flood control operations, and municipal swimming pools, fountains and recreational water bodies. The other tasks in this component include the following: coordinating with other public agencies and private parties who perform maintenance that affects the member agencies (Task 6.3); identifying new technologies for treating stormwater in storm drain inlets and lines and their maintenance requirements (Task 6.4); optimizing the maintenance data being collected by the member agencies (Task 6.5); continuing to train maintenance staff about stormwater (Task 6.6); and managing this component (Task 6.7). All of these tasks will be conducted on an ongoing basis throughout the next five years.

The Maintenance Subcommittee, consisting of municipal public works supervisors, has developed several categories of performance standards including street sweeping, maintenance of storm drainage facilities, corporation yards, and road maintenance and repair. To assist in developing other types of maintenance-related performance standards, a Park and Recreation Workgroup was formed consisting of municipal parks and flood control district supervisors as well as representatives from other public agencies including the

Alameda County Water District, Caltrans and the East Bay Regional Park District. The Park and Recreation Workgroup has completed performance standards for pesticide usage and pest management practices and fertilizer usage.

7.0 New Development and Construction Controls

Guidance from the *Countywide Program* and Regional Board to municipal planners and engineers has resulted in stormwater quality controls being evaluated and incorporated, as appropriate, into the design of new development and redevelopment projects. More recently, outreach efforts have also focused on municipal construction inspectors to ensure adequate implementation of stormwater quality and erosion controls during the construction phase. Outreach efforts will be expanded during the next five years to include developers and contractors.

Ongoing tasks during the next five years include tracking new development projects (Task 7.1); identifying and providing guidance on cost-effective stormwater quality controls (Task 7.2); controlling discharges from construction-related activities (Task 7.3); promoting outreach (Task 7.4); implementing and updating performance standards (Task 7.5); and managing this component (Task 7.8). Efforts will also be made during the next five years to initiate implementation of the remaining management practices listed in the Regional Board *Staff Recommendations for New and Redevelopment Controls for Stormwater Programs (Staff Recommendations)* including conducting watershed resource inventory and planning activities (Task 7.6) and coordinating with the ACFC&WCD (Task 7.7).

The performance standards were primarily based on the *Staff Recommendations* and specify tasks to be implemented now and within a specified time frame. During the development application and plan review phase, municipal staff require developers to address site planning and design techniques to prevent and minimize impacts to water quality. Stormwater quality controls are then incorporated into conditions of approval for projects. Regular in-house training involving all staff responsible for development application and plan review as well as construction site inspectors will ensure consistent requirements for stormwater quality and erosion control.

8.0 Illicit Discharge Controls

The goal of this component is to control illicit discharges by conducting field surveys of the storm drainage system and identifying sources of non-stormwater discharges. Another aspect of this component is to provide technical assistance in identifying the sources of spills to non-member agencies with existing programs that conduct spill response and clean-up.

The primary role of the General Program is to help municipalities implement a countywide consistent approach to effectively eliminate illicit discharges by developing Best Management Practices (BMPs) guidance and implementing and updating performance standards (Task 8.4); tracking and analyzing illicit discharge control program findings to better evaluate and improve future activities (Task 8.5); sharing information on the sources of illicit discharges with other agencies and *Countywide Program* Subcommittees (Task 8.6); and conducting training for illicit discharge inspectors (Task 8.7).

Illicit discharge control activities for member agencies are detailed in the performance standards which include developing an Action Plan (Task 8.1) for conducting field surveys of the storm drains (Task 8.2) and investigating spill

reports/complaints (Task 8.3) for the coming fiscal year.

9.0 Industrial and Commercial Discharge Controls

The goals of this component are to reduce the amount of pollutants in stormwater runoff and effectively eliminate non-stormwater discharges to storm drains from industrial and commercial facilities. This will be accomplished by identifying and minimizing potential pollutant sources through facility inspections, outreach activities with businesses, and appropriate follow-up and enforcement.

The primary role of the General Program is to help municipalities implement a countywide consistent approach to conducting facility inspections, outreach, and follow-up/enforcement by implementing and updating performance standards and refining BMP guidance (Task 9.2 and 9.5); tracking and analyzing inspection findings to better evaluate and improve future inspections (Task 9.3); sharing the findings from the inspection program with other agencies and *Countywide Program* Subcommittees (Task 9.4); and conducting training for industrial discharge inspectors (Task 9.6).

Component activities for member agencies are detailed in the performance standards which include developing an Inspection Plan (Task 9.1) for conducting inspections, outreach, and follow-up/enforcement (Task 9.2) for the coming fiscal year.

IMPLEMENTATION STRATEGY

Each component of the SWMP contains elements of a strategy that are unique to that component as well as elements that are common to other components. The following provides a brief summary of some of the most common recurring elements of the implementation strategy.

1) Continue to improve performance standards;

2) Improve the focus of some *Countywide Program* activities by targeting key areas for concentrated effort and accomplishment; and

3) Continue to extend the breadth of activities covered as part of the *Countywide Program* and encourage inter-agency coordination.

Improve Performance Standards

As mentioned, performance standards have been developed for all five of the major member agency activity areas (Appendix B). These performance standards are divided into three tiers: Tier I performance standards comprise the baseline level of effort that each agency is required to be currently implementing; Tier II contains performance standards that will be implemented within the next one to five years; and Tier III performance standards contain ideas that will be evaluated further for possible future implementation. The performance standards will be updated and improved annually, and revised versions will be submitted to the Regional Board staff following approval by the Management Committee and inserted as revisions to Appendix B.

There are three major reasons why it is essential to continue to improve the performance standards that each agency is required to implement. First, because most of the performance standards have been adopted recently, it is valuable to capture the practical experience of the member agencies by refining or better tailoring the standards. Second, many of the performance standards are listed in Tiers II and III. This reflects the uncertainty about what the optimum standards are and the need for additional information from special studies and other sources to continue to improve and expand on the list of Tier I performance

standards. Third, the overall philosophy of the *Countywide Program* is to be able to continuously improve all aspects of the *Countywide Program* including its performance standards.

Improve Focus of Some *Countywide Program* Activities

Several of the components of the SWMP incorporate tasks to better focus or target activities to achieve improved results. This strategy reflects a recognition that the amount of progress that can continue to be made with general initiatives is diminishing. One of the keys to being able to establish targets is having sufficient information to prioritize where additional focus is needed and likely to be effective.

The three components where targeting is most evident include Focused Watershed Management Approach, Public Information/Participation, and Monitoring and Special Studies. The entire Focused Watershed Management Approach represents a more targeted effort to achieve tangible improvements in water quality and aquatic habitat. Public Information/Participation identified residential yard and garden care as a target given the magnitude of the problem of pesticides and other pollutants originating from this source. The Monitoring and Special Studies component also reflects an improvement in targeting. The emphasis on collecting descriptive baseline information about stormwater quality and pollutant loading has shifted to obtaining information needed to further improve the stormwater pollution prevention and management activities and performance standards. This gradual shift to better targeting has been ongoing for the past few years and is reflected in special studies to resolve questions about the effectiveness of BMPs that have been requested by several *Countywide Program* Subcommittees, such as Municipal Maintenance Activities and New Development and Construction Site Controls.

Extend Breadth of Activities Covered and Inter-Agency Coordination

As the most obvious activities that contribute to stormwater pollution are being addressed, a natural progression is to identify other sources and ways to minimize the impacts from these sources. The two components that are examples of this progression are the Municipal Maintenance Activities and New Development and Construction Controls.

Another aspect of this trend to extend the breadth of activities covered is to increasingly work with other public agencies, such as the Alameda County Resource Conservation District, Alameda County Water District, Caltrans, and the East Bay Regional Park District to share information and develop agreed upon performance standards that these other agencies will implement. The involvement of other public agencies that potentially affect the quality of stormwater in member agencies' stormwater facilities or that can assist with resolving stormwater pollution problems, is invaluable to the continued improvement of the *Countywide Program* and its effectiveness in bringing about watershed-wide changes.

Lastly, the Countywide Program has also provided seed money to assist the Stanford Law School's Common Ground for the Environment work with manufacturers of automotive brake pads to evaluate less toxic formulations. (Automotive brake pads have been identified as a major source of copper.)

Notes:

1. "A Storm Water Management Plan for the Alameda County Urban Runoff Clean Water Program," June 1991.

2. Thomas Mumley, September 8, 1994 memorandum to the Stormwater Permit Program Coordinators regarding Municipal Stormwater Management Plan Components.

3. "Agreement to Implement the Alameda County Urban Runoff Clean Water Program," adopted in 1991 by the elected officials responsible for governing each of the participating agencies.

TABLE ES-1
GENERAL PROGRAM AND MEMBER AGENCY ROLES

Task Description	General Program Roles	Member Agency Roles
	2.0 Planning and Regulatory Compliance	
Task 2.1 Assist with Regulatory Compliance	Provide permit compliance information and assistance to member agencies. Prepare and submit semiannual reports to the Regional Board.	Use information provided and participate in decisions.
Task 2.2 Lead and Represent the *Countywide Program*	Participate in meetings with other agencies to represent *Countywide Program* views.	Participate in decisions so views can be represented.
Task 2.3 Plan, Initiate, and Respond to Regulatory and Grant Funding Initiatives	Identify regulatory and grant funding initiatives; assist with development of responses and manage grant funded projects.	Identify and provide information about regulatory and grant funding initiatives. Participate in decisions.
Task 2.4 Continue to Institute a Process for Continuous Improvement	Compile agencies' suggestions for General Program improvement and implement agreed upon improvements.	Provide suggestions for improvement and participate in decisions.
Task 2.5 Provide Management Services	Make sure needed management is provided.	Provide agreed upon General Program funding when invoiced.
	3.0 Focused Watershed Management Approach	
Task 3.1 Participate in Watershed Management Projects	Participate in selected watershed management projects.	Provide input/direction to General Program on *Countywide Program* role.
Task 3.2 Prepare for, Conduct, and Complete Pilot Project	Conduct Pilot Project.	Participate as needed in Pilot Project.
Task 3.3 Identify Approach for Incorporating Watershed Management as Part of 3rd SWMP	Develop approach with direction from the Monitoring and Special Studies (MSS) Subcommittee.	Participate in MSS Subcommittee meetings/discussions and review work products.
Task 3.4 Component Management	Make sure needed management is provided. Prepare reports and budgets related to watershed management activities.	Provide necessary information to the General Program. Participate in MSS Subcommittee's decisions related to watershed management activities.

TABLE ES-1
GENERAL PROGRAM AND MEMBER AGENCY ROLES

Task Description	General Program Roles	Member Agency Roles
	4.0 Monitoring and Special Studies	
Task 4.1 Coordinate with RMP and BASMAA	Participate in meetings with other agencies to represent *Countywide Program* views.	Provide input/direction to General Program on *Countywide Program* role in RMP and BASMAA.
Task 4.2 Creek Monitoring	Conduct monitoring.	Participate in decisions so views can be represented.
Task 4.3 Special Studies	Conduct studies under direction from the MSS Subcommittee.	Participate in decisions on which studies to conduct.
Task 4.4 Data Management	Input annual monitoring data into a database. Provide data to SFEI for integration into the BASMAA and RMP databases.	
Task 4.5 Component Management	Make sure needed management is provided. Prepare reports and budgets related to monitoring and special studies activities.	Provide necessary information to the General Program. Participate in MSS Subcommittee's decisions related to monitoring and special studies activities.

TABLE ES-1
GENERAL PROGRAM AND MEMBER AGENCY ROLES

Task Description	General Program Roles	Member Agency Roles
	5.0 Public Information/Participation	
Task 5.1 Implement Targeted Outreach	Identify what and how to target outreach. Implement agreed upon approach.	Participate in decisions on selecting and implementing targeted outreach.
Task 5.2 Continue to Re-enforce Old Messages	Update, re-print, and circulate existing PI/P materials.	Provide information on value of existing materials. Participate in decisions concerning updating and re-printing materials.
Task 5.3 Support Watershed-Based Approaches	Identify and implement public education activities to support watershed pilot study.	Participate in decisions.
Task 5.4 Evaluate Effectiveness	Conduct survey to measure effectiveness of targeted outreach.	Participate in survey related decisions.
Task 5.5 Implement and Update Performance Standards	Facilitate development of consensus position on updating performance standards.	Implement performance standards. Review existing standards and propose revisions.
Task 5.6 Assist with Focused Staff Training	Identify training needs and implement agreed upon training.	Identify agency's training needs, participate in decisions, and have appropriate staff attend training.
Task 5.7 Seek Partnerships and Build Coalitions	Participate in BASMAA and other agreed upon interagency projects.	Identify desired partners and participate in decisions.
Task 5.8 Component Management	Make sure needed management is provided. Prepare reports and budgets. Annually review each member agencies' compliance with performance standards and provide needed assistance.	Provide necessary information to the General Program. Participate in PI/P Subcommittee's decisions.

TABLE ES-1
GENERAL PROGRAM AND MEMBER AGENCY ROLES

Task Description	General Program Roles	Member Agency Roles
	6.0 Municipal Maintenance Activities	
Task 6.1 Implement and Update Performance Standards	Facilitate development of consensus position on updating performance standards.	Implement performance standards. Review existing standards and propose revisions.
Task 6.2 Develop Additional Performance Standards	Develop new performance standards with the assistance of the Maintenance Subcommittee and the Park and Recreation Workgroup.	Assist the General Program develop new performance standards.
Task 6.3 Coordinate with Maintenance-Related Activities by Other Subcommittees, Other Agencies, and Private Industries	Coordinate forming the appropriate workgroups to identify activities of concern and possible BMPs.	Participate in workgroups as appropriate.
Task 6.4 Identify Maintenance Requirements of Structural Controls and Target Locations for Use	Provide information on structural controls.	Identify maintenance requirements of structural controls. Target locations for possible controls.
Task 6.5 Optimize Data Management and Analysis	Optimize ongoing collection, recording and analysis of maintenance data.	Provide necessary maintenance data. Work with the General Program to optimize data collection.
Task 6.6 Outreach to Maintenance Staff and the Public Concerning Activities Affecting Maintenance	Conduct workshops and develop educational materials.	Promote and participate in workshops. Assist in developing and distributing outreach materials.
Task 6.7 Component Management	Make sure needed management is provided. Prepare reports and budgets. Annually review each member agency's' compliance with performance standards and provide needed assistance.	Provide necessary information to the General Program. Participate in Maintenance Subcommittee and Park and Recreation Workgroup decisions.

TABLE ES-1
GENERAL PROGRAM AND MEMBER AGENCY ROLES

Task Description	General Program Roles	Member Agency Roles
	7.0 New Development and Construction Controls	
Task 7.1 Track Municipal New Development Projects	Request and seek information from municipalities on new development projects. Compile and distribute information.	Provide information on new development projects and erosion and stormwater quality controls.
Task 7.2 Identify and Provide Guidance on Cost-Effective Stormwater Quality Controls	Seek and compile information on stormwater quality controls.	Provide information on existing stormwater quality controls, if applicable.
Task 7.3 Control Discharges from Construction-Related Activities	Assist member agencies in educating contractors about BMPs.	Educate contractors on BMPs. Inspect for construction-related discharges.
Task 7.4 Promote Outreach	Conduct outreach to municipal staff and initiate other outreach efforts. Prepare and distribute educational materials.	Promote and participate in General Program outreach activities. Conduct in-house training. Distribute educational materials to the public and municipal staff.
Task 7.5 Implement and Update Performance Standards	Facilitate development of consensus position on updating performance standards.	Implement performance standards. Review existing standards and propose revisions.
Task 7.6 Conduct Watershed Resource Inventory and Planning	Coordinate with BASMAA to assist municipalities comply with Management Practice A of the Regional Board *Staff Recommendations*.	Determine criteria for sensitive areas. Review local information on sensitive areas. Conduct activities following guidance from BASMAA or the General Program.
Task 7.7 Coordinate with the ACFC&WCD	Coordinate with BASMAA and conduct meetings with the ACFC&WCD to assist the comply with Management Practices I and K of the Regional Board *Staff Recommendations*.	Participate in meetings with the ACFC&WCD.
Task 7.8 Component Management	Make sure needed management is provided. Prepare reports and budgets. Annually review each member agency's' compliance with performance standards and provide needed assistance.	Provide necessary information to the General Program. Participate in New Development Subcommittee's decisions.

TABLE ES-1
GENERAL PROGRAM AND MEMBER AGENCY ROLES

Task Description	General Program Roles	Member Agency Roles
	8.0 Illicit Discharge Control	
Task 8.1 Develop an Annual Action Plan	(Report form is developed under Task 8.8)	Prepare Action Plan.
Task 8.2 Conduct Field Surveys	(Consistency issues are coordinated under Task 8.4)	Survey storm drains for illicit discharges and conduct follow-up to identify and eliminate sources, as possible.
Task 8.3 Investigate Spill Reports/Complaints	(Consistency issues are coordinated under Task 8.4)	Investigate illicit discharge reports/ complaints and conduct follow-up to identify sources, as possible.
Task 8.4 Effectively Eliminate Illicit Discharges; Implement and Update Performance Standards	Coordinate consistency issues with the Industrial & Illicit Discharge Control (I&IDC) Subcommittee. Facilitate development of consensus position on updating performance standards.	Participate in decisions concerning consistency issues. Implement performance standards. Review existing standards and propose revisions.
Task 8.5 Track and Analyze Illicit Discharge Findings	Maintain and analyze quarterly summary reports for ways to improve future activities with direction from the I&IDC Subcommittee.	Participate in evaluating report summaries.
Task 8.6 Share Information on Illicit Discharges and Their Sources	Compile and distribute information to Subcommittees.	Disseminate information to other departments and agencies, as appropriate.
Task 8.7 Conduct Training for Illicit Discharge Inspectors	Identify training needs and implement agreed upon training.	Identify agency's training needs, participate in decisions, and have appropriate staff attend training.
Task 8.8 Component Management	Make sure needed management is provided. Prepare reports and budgets. Prepare Annual Action Plan reporting form. Annually review each member agencies' compliance with performance standards.	Provide necessary information to the General Program. Participate in I&IDC Subcommittee's decisions.

TABLE ES-1
GENERAL PROGRAM AND MEMBER AGENCY ROLES

Task Description	General Program Roles	Member Agency Roles
9.0 Industrial and Commercial Discharge Control		
Task 9.1 Develop an Annual Inspection Plan	(Report form is developed under Task 9.7)	Complete Inspection Plan using reporting forms.
Task 9.2 Conduct Facility Inspection and Outreach Activities; Implement and Update Performance Standards	Coordinate consistency issues with the I&IDC Subcommittee. Facilitate development of consensus position on updating performance standards.	Conduct facility inspections, outreach, and follow-up/enforcement, as appropriate. Participate in decisions concerning consistency issues. Implement performance standards. Review existing standards and propose revisions.
Task 9.3 Track and Analyze Inspection Findings	Maintain *Countywide Program* facility database with direction from I&IDC Subcommittee.	Participate in discussions and decisions on using the database to evaluate inspection activities.
Task 9.4 Share Information on Pollutant Contributions from Facilities	Compile and distribute information to Subcommittees.	Disseminate information to other departments and agencies, as appropriate.
Task 9.5 Refine BMP Guidelines (as appropriate)	Coordinate discussions on updating and/or refining BMP guidance.	Participate in discussions and decisions on refining BMP guidelines. Disseminate new BMPs, as appropriate.
Task 9.6 Conduct Training for Facility Inspectors	Identify training needs and implement agreed upon training.	Identify agency's training needs, participate in decisions, and have appropriate staff attend training.
Task 9.7 Component Management	Make sure needed management is provided. Prepare reports and budgets. Prepare Annual Inspection Plan reporting form. Annually review each member agencies' compliance with performance standards.	Provide necessary information to the General Program. Participate in I&IDC Subcommittee's decisions.

SECTION 1

Introduction and Background

INTRODUCTION

This Stormwater Management Plan (SWMP) serves as the basis of the Alameda Countywide Clean Water Program's National Pollutant Discharge Elimination System (NPDES) permit application renewal package and stormwater program for the next five fiscal years (July 1996 - June 2001). The Alameda Countywide Clean Water Program's initial, five-year NPDES permit expires in October 1996.

The Alameda Countywide Clean Water Program consists of the 14 cities in Alameda County, Alameda County, the Alameda County Flood Control and Water Conservation District (ACFC&WCD), and Zone 7 of the ACFC&WCD.

The SWMP describes specific, area-wide, stormwater pollution prevention and management goals, tasks and completion schedules. In addition, one-year work plans (Appendix A), which describe in more detail how the five-year SWMP will be completed, will be submitted annually to the San Francisco Bay Regional Water Quality Control Board (Regional Board). These annual work plans will be added to Appendix A as they are developed and approved by the Alameda Countywide Clean Water Program and Regional Board staff.

The SWMP also contains detailed performance standards (see Appendix B) that identify what each participating agency is required to do to control stormwater pollutants from the storm drains and conveyance systems that it owns and operates. The Alameda Countywide Clean Water Program (*Countywide Program*) will review these performance standards annually and revise them as needed. Modified performance standards will be incorporated into Appendix B following approval by the Management Committee and submittal to the Regional Board staff.

BACKGROUND

Regulatory requirements for developing a stormwater pollution prevention and management program in Alameda County originated from the following two sources:

- San Francisco Bay Regional Water Quality Control Board's 1986 amendments to its Water Quality Control Plan; and
- 1987 amendments to the federal Clean Water Act.

The Regional Board initially required that all the cities in Alameda County, Alameda County, the ACFC&WCD, and Zone 7 of the ACFC&WCD develop basic information about the characteristics of the stormwater pollution problem in Alameda County and ways to solve it. A summary of the results of *Countywide Program*'s monitoring and special studies to identify stormwater pollutants of concern, pollutant sources, and the effectiveness of control measures is contained in the Monitoring and Special Studies Component of this plan.

The federal Clean Water Act's 1987 amendments require municipalities to effectively prohibit non-stormwater discharges to municipal storm drain systems and to implement controls to reduce pollutants in stormwater to the maximum extent practicable. These federal Clean Water Act requirements are implemented through NPDES permits. In 1990, the U.S. Environmental Protection Agency (EPA) adopted regulations that

prescribed the NPDES permit application requirements for municipal stormwater programs.

In 1991 the *Countywide Program* developed a comprehensive, area-wide stormwater pollution prevention and management program. The requirements of this program were incorporated into "A Storm Water Management Plan for the Alameda County Urban Runoff Clean Water Program[1]." The 1991 SWMP included tasks, schedules and parties responsible for implementation of tasks during the initial five year NPDES permit period.

The Regional Board adopted Order No. 91-146 (NPDES Permit No. CA0029831) for the *Countywide Program* in October 1991. The permit covered the discharge of municipal stormwater from the 14 cities in Alameda County, Alameda County, the ACFC&WCD, and Zone 7 of the ACFC&WCD. One of the NPDES permit's findings was that the SWMP (and other information contained in the NPDES permit application package) satisfied U.S. EPA's NPDES permit application requirements for municipal stormwater dischargers.

Almost all of the tasks in the 1991 SWMP were completed on schedule. One task in the Municipal Maintenance component was delayed (develop BMPs for erosion control on undeveloped lands) and two tasks in the New Development and Construction Site Control component were re-scoped (development of a planning procedures manual and a BMP guidance manual for public agencies and developers).

After the Park and Recreation Workgroup was formed to develop BMPs for erosion control on undeveloped lands, it was clear that management of pesticides and fertilizers was a higher priority. Following development of performance standards for pesticide and fertilizer usage, the erosion control on undeveloped lands performance standards were developed.

The manuals for new development were re-scoped following development of the California Stormwater Construction BMP Handbook in March 1993 and Regional Board *Staff Recommendations for New and Redevelopment Controls for Stormwater Programs (Staff Recommendations)* in April 1994. To avoid duplication of effort and assist member agencies comply with the *Staff Recommendations*, a Bay Area Preamble to the California Stormwater Construction BMP Construction Handbook and *Staff Recommendations* was prepared in July 1994.

GEOGRAPHIC DESCRIPTION

Bordering the east bay shoreline of San Francisco Bay, Alameda County encompasses 738 square miles of land and has a total population of approximately 1.4 million. Highly urbanized in the western portion, eastern Alameda County still has considerable agricultural and open space lands (although substantial land development is predicted during the next 10 years). The topography of Alameda County is flat near San Francisco Bay, rises in elevation to the hills formed by the Diablo Range, and then becomes relatively flat heading east into the Livermore Valley. Figure 1-1 shows municipal jurisdictions and major watercourses in Alameda County which discharge directly to San Francisco Bay.

BASELINE CONDITIONS

As part of the initial NPDES permit application submittal, the *Countywide Program* developed baseline information in several essential areas. These included evaluating the status of the *Countywide Program* agencies' legal authority to control stormwater pollutants, reviewing the status of local new development erosion and pollutant controls, evaluating

existing commercial and industrial inspection programs, and establishing accurate information on stormwater pollutants. Some of this information is summarized here to provide additional background for what was accomplished during the initial NPDES permit period and what will be accomplished as part of this SWMP. In addition, this section summarizes information on pollutant trends from an industrial area.

Legal Authority

Baseline information on each agencies' legal authority to regulate discharges to its municipal storm drains was summarized in Appendix A of the initial SWMP. The deficiencies identified as part of this review led to the development by Alan Waltner, Attorney at Law, of a model stormwater ordinance. This basic ordinance was adopted by each of the municipalities participating in the *Countywide Program*. This ordinance was also used in the *California Storm Water Best Management Practice Handbooks*. Several other municipal stormwater programs in the Bay Area also modeled their local ordinances after the *Countywide Program's* model ordinance.

Review of Local Construction Site Control Programs

As part of Appendix B of the initial SWMP, the *Countywide Program* developed a summary of each municipality's erosion and sedimentation control regulations. The baseline review did not include a review of local enforcement and building inspection programs. During the initial NPDES permit period, municipalities have made improvements to their regulations and procedures.

One example of improvement is the grading ordinance adopted by the City of San Leandro in 1993. Not only does the San Leandro grading ordinance require the preparation of an erosion and sedimentation control plan, but it also requires the preparation of a pollutant control plan. The pollutant control plan must identify potential pollutants to stormwater and controls both during and after construction. Lastly, the ordinance requires that the City Engineer review and approve the Stormwater Pollution Prevention Plan, if coverage is required by the State Water Resources Control Board's General Construction Permit.

The Regional Board staff provided additional guidance on its expectations for erosion and sedimentation control as part of its April 1994 *Staff Recommendations for New and Redevelopment Controls for Storm Water Programs*. Its June 1995 "Benchmarks for Evaluating Implementation of Municipal New Development Controls" also contains a section titled "Erosion Control Program Review."

The Regional Board staff's review of the *Fiscal Year 1994/95 Annual Report* found that thirteen municipalities had acceptable programs for controlling pollutants from new development and redevelopment. Two municipalities had conditionally acceptable programs, but were not found to have deficient erosion and sedimentation control programs.

Evaluation of Initial Commercial and Industrial Inspection Programs

As part of Appendix C of the initial SWMP, the *Countywide Program* evaluated the commercial and industrial inspection programs that existed in 1990. In addition, a database was developed containing industrial and commercial facilities and information to help municipalities decide which department or outside agency would be most suitable for conducting stormwater inspections and educational outreach activities. Approximately, 4000 of these facilities were identified as being inspected and tracked by existing regulatory programs.

Based on this information, municipalities incorporated, when necessary through interagency contracts, the stormwater inspections of commercial and industrial facilities into these existing inspection programs. Depending on the municipality, the stormwater inspections were incorporated into wastewater treatment source control inspections, hazardous materials inspections, or fire safety inspections.

The stormwater inspections include facilities also covered under the California General Industrial Storm Water NPDES permit (General Industrial Permit). Municipalities cooperate with the Regional Board staff, which has jurisdiction and responsibility for General Permit inspections, by providing information about these sites to the Regional Board staff under the terms of the 1992 agreement and subsequent letter agreements. The 1992 agreement is described in more detail under the Existing Agreements subsection of the Regulatory Compliance, Planning and Program Management component (Section 2).

As the *Countywide Program* gained more experience during the initial NPDES permit period, the original database was modified and updated to be able to achieve three objectives. One objective is to assist municipalities manage their inspection programs by providing information to help identify high priority facilities for annual inspection. The second objective is to assist with the *Countywide Program's* NPDES permit reporting requirements. The last objective is to be able to evaluate the effectiveness of inspections and educational outreach in eliminating illicit discharges and minimizing pollutants in stormwater.

Loads Assessment

During the 1989-90 and 1990-91 wet seasons, the *Countywide Program* conducted testing to determine the types and concentrations of pollutants in stormwater from different categories of Alameda County land uses and from dry weather runoff. This baseline testing was conducted prior to the initial NPDES permit and was summarized in the *Loads Assessment* report completed in 1991 by Woodward-Clyde Consultants.

Once this baseline was established, the *Countywide Program* directed its efforts to identifying the sources of pollutants and to conducting studies on how to improve BMPs for controlling pollutants in stormwater. Information on what has been learned about pollutant sources and BMP effectiveness is summarized in the Monitoring and Special Studies component, Section 4.

Some of the major findings of the *Loads Assessment* report include the following:

1) The concentrations of metals in dry-weather flows were often below detection levels and were significantly less than the concentrations of metals in stormwater runoff; the metal loading from dry weather contributed less than 2 percent of the total metals load to San Francisco Bay.

2) The principal source of metals was residential areas; residential areas covered about one-third of the area studied but accounted for about two-thirds of the metal loading. The remaining one-third of the load came from commercial, transportation, and industrial land uses which covered about 13 percent of the area studied. Open space areas constituted about 55 percent of area studied, but contributed less than 1 percent of the metal loading.

3) Comparing stormwater with wastewater treatment plant metal loading to San Francisco Bay showed that during an average hydrologic year more than one-half the metals from

Alameda County originated from stormwater; the rest of the metals from Alameda County originated from wastewater treatment plants. The estimates of stormwater metal loading were imprecise with a 90 percent confidence interval of plus or minus 30 percent. There is also further uncertainty about the testing because it was conducted during a drought period.

4) Approximately 70 to 80 percent of each metal tested was associated with particulate matter and the rest was dissolved, except for lead. Approximately 94 percent of the lead was associated with particulate matter. The portion of a metal associated with particulates is generally of less concern to water quality than the portion that is dissolved.

5) Among organic chemicals, a group commonly associated with combustion products and oil, known as PAHs (polycyclic aromatic hydrocarbons), were frequently detected in stormwater. Volatile organics, organophosphorus pesticides, chlorinated herbicides, and organochlorine pesticides were not detected during a one-time analysis of stormwater.

The conclusions of the *Loads Assessment* study helped to guide the *Countywide Program's* subsequent work, as shown in the following examples.

The lack of dry weather flows in many areas and the low levels of pollutants in the dry weather flows tested helped to confirm that the *Countywide Program* was not plagued by major, widespread sources of non-stormwater discharges. The approach used to identify and eliminate the small and episodic non-stormwater discharges typically found is described in the Illicit Discharge Controls component (Section 8).

Based on these and subsequent monitoring studies, the *Countywide Program* worked with the Bay Area Stormwater Management Agencies Association (BASMAA) to develop a strategy for detecting long-term trends in stormwater quality. The high variability of pollutant concentrations in stormwater makes it difficult to detect possible reductions in pollutants over time. The strategy developed was to combine efforts with the Santa Clara Valley Nonpoint Source Pollution Control Program and the Contra Costa Clean Water Program to monitor about five storm events annually at two stations in each county.

Industrial Catchment Study

One of the studies conducted during the initial NPDES permit period was to determine whether the implementation of pollutant control measures would result in a detectable reduction of pollutants in stormwater. Efforts are planned to continue to quantitatively assess the effectiveness of pollutant control measures during the next five-year period.

Stormwater sampling was conducted during the 1990-91 through 1994-95 wet seasons in an industrial catchment area to characterize stormwater quality, identify pollutants of concern and possible sources, and evaluate the effectiveness of control measures. During initial stormwater sampling, high concentrations of zinc were detected. A metal galvanizer was suspected of being the primary source of zinc, and other industries such as auto wreckers and repair shops, steel shipping, and trucking were suspected of contributing other pollutants.

Beginning in 1993, the local municipality implemented various control measures including industrial inspections, educational outreach to the local business community, increased street sweeping

and litter removal, and installation of "no dumping" signs. The results of stormwater sampling conducted after implementation of control measures in the 1993-94 and 1994-95 wet seasons indicate a significant decrease in total copper, total zinc and dissolved zinc compared to the pre-implementation period.

While the number of samples and sampling time period are relatively limited, the data illustrate the potential value of targeting specific industrial areas for inspection of illicit discharges, educational outreach activities and coordination with the business community, and other control measures.

MANAGEMENT STRUCTURE

The "Agreement to Implement the Alameda County Urban Runoff Clean Water Program" was adopted in 1991 by the elected officials responsible for governing each of *Countywide Program*'s participating agencies. This agreement runs until March 1997 and will be amended as part of its continuance through June 2002. This Agreement provided for the establishment of a Management Committee with representatives and alternates appointed by the City Manager or equivalent from each participating agency.

The Management Committee has been responsible for all of the major decisions involving the *Countywide Program*, including decisions on expenditures for General Program activities to assist the member agencies. To assist the Management Committee in implementing the various components of the SWMP, the General Program, which implements activities for the joint benefit of the participating agencies, formed various subcommittees and municipalities assigned appropriate staff to these subcommittees. The current organization structure for implementing the various components of this SWMP is illustrated in Figure 1-2. The Policy Level Subcommittee develops recommendations on policy and budget issues for the Management Committee which has ultimate authority for making decisions recommended by all the Subcommittees.

ORGANIZATION OF THE STORMWATER MANAGEMENT PLAN

Program components in this SWMP are similar to the initial SWMP as shown in Table 1-1.

Although similar, the current SWMP contains three major organizational changes compared to the previous SWMP:

1) A Legal Authority component is not prescribed since all municipalities have adopted stormwater quality control ordinances fully satisfying this obligation (see Appendix C);

2) A new section entitled Focused Watershed Management Approach has been added to support the implementation of creek-specific water quality and aquatic habitat protection and improvement. This work is a continuation of similar work initiated by the ACFC&WCD in San Leandro Creek and elsewhere; and

3) The Monitoring and Management of Stormwater Facilities components have been combined into one component, Monitoring and Special Studies, since the pilot and monitoring studies conducted for these components are similar and both components are implemented through the Monitoring and Special Studies Subcommittee.

In addition, rather than listing measures of effectiveness (or Evaluation of Controls) in a separate component, the

current SWMP now specifies that the fiscal year-end reports will include an evaluation of effectiveness for each program component.

Each of the program components contains sections describing goals, existing conditions, major tasks, and an implementation strategy. The existing conditions sections summarize activities and progress during the initial NPDES permit period, information essential to understanding each component's direction over the next five year period. This background information is not intended to be comprehensive.

The current SWMP is an ongoing program and many of the requirements of the EPA stormwater regulations were satisfied by the initial permit application and activities during the first five years. To document this compliance and provide additional information on baseline conditions, the following documents are incorporated by reference into this SWMP:

- The original SWMP, entitled "A Storm Water Management Plan for the Alameda County Urban Runoff Clean Water Program," including appendices, dated June 28, 1991;

- Semiannual reports submitted to the Regional Board setting forth detailed information on what the *Countywide Program* has accomplished, and documenting the levels of effort and environmental results to date; and

- Additional reports, agreements and documents developed during the initial NPDES period, listed in Appendix C.

The current SWMP is a continuation and enhancement of the ongoing *Countywide Program.* Refinements and improvements are also anticipated during the next five years. To implement this approach, the ongoing program serves as the base proposal for the next five-year phase, to be adjusted as proposed in this SWMP.

Similarly, during each of the next five years, the program for the preceding year will serve as the base proposal for the following year, subject to appropriate modifications and improvements as experience develops, documented in annual work plans and budgets. In this way, planning continuity and certainty will be retained, while allowing necessary flexibility to take advantage of an expanding knowledge base.

Similarly, many components already developed will be retained throughout the next five-year phase, again subject to necessary revisions. For example, each of the co-permittees have adopted stormwater management ordinances to effectively prohibit non-stormwater discharges to the stormwater system and to reduce pollutants in stormwater to the maximum extent practicable. These adopted ordinances will remain in effect, and if revised will be no less effective in eliminating illicit discharges or reducing pollutants in stormwater to the maximum extent practicable.

Notes:

1. The Alameda County Urban Runoff Clean Water Program changed its name to the Alameda Countywide Clean Water Program in December 1994.

SECTION 2

Regulatory Compliance, Planning, and Program Management

GOALS

The *Countywide Program* is driven by the regulatory requirements of the San Francisco Bay *Water Quality Control Plan, San Francisco Bay Basin (Basin Plan)*, the Clean Water Act, the California Water Code, and other federal and state regulations as addressed in the *Countywide Program*'s stormwater NPDES permit and this SWMP. As a regulated program, the SWMP is of primary importance to comply with the NPDES permit. The General Program assists all member agencies to understand and comply with their NPDES permit reporting and other requirements. It is also important that the *Countywide Program* help to shape new proposed requirements that will affect its future. If the *Countywide Program* fails to shape its own future, others will do so by default.

The three primary goals of this component include the following:

- Assist member agencies meet their obligations under the stormwater NPDES permit;
- Help maximize regulatory certainty by participating in the regulatory planning process to make sure the views and experience of the *Countywide Program* are represented; and
- Provide leadership and essential program management services to implement the General Program.

EXISTING CONDITIONS

This section of the SWMP briefly summarizes what has been accomplished during the initial NPDES permit period from 1991 through 1996.

Regulatory Compliance

Since FY 1992/93 the General Program has met annually with each of its individual member agencies. One of the purposes of these meetings has been to informally review each agency's progress and to provide suggestions for improvement, if needed. An additional purpose has been to obtain suggestions for improving the *Countywide Program*. Starting in FY 1994/95, the Regional Board staff has participated in these meetings to hear directly from each agency about its problems and to provide verbal direction on the Regional Board staff's expectations. These meetings have been invaluable in helping some of the participating agencies better understand how to comply with the requirements of their stormwater NPDES permit.

One of the recurring problems identified in these meetings is a failure of the member agencies to take full credit for many of their oil recycling, creek cleanup, and other activities when preparing their progress reports for the stormwater program. Improvements are being made. In particular, the major push to develop and provide training on performance standards is helping. Performance standards, contained in Appendix B, have been developed for all of the major member agency-specific activity areas. These performance standards are divided into three tiers: Tier I performance standards comprise the baseline level of effort that each agency is required to be currently implementing; Tier II contains performance standards that will be implemented within the next one to five years; and Tier III performance standards

contain ideas that will be evaluated further for possible future implementation.

Planning

The *Countywide Program* participated actively in helping to shape stormwater quality-related regulatory initiatives that have been developed by the Regional Board and others. The *Countywide Program* has taken the initiative in modifying proposed amendments to the Regional Board's Basin Plan and improving other Regional Board policies and plans. This participation has resulted in improvements to many of these documents.

At the state level, the *Countywide Program* participates through the California Stormwater Quality Task Force to advise the State Water Resources Control Board (State Board) on proposed plans and policies. In addition, the *Countywide Program* participated in helping to develop the External Program Review Recommendations for improving the operations of the State Board. Another area where the *Countywide Program* assisted the State Board was on the State Toxicity Task Force which has provided input on the development of the next version of the *Enclosed Bays and Estuaries* and *Inland Surface Waters Plans*.

At the national level, the *Countywide Program* has participated in the dialogue on the long-awaited Clean Water Act reauthorization. This has included a visit to Congressional staff by the Management Committee Chair and the submittal of comments on some of the many versions of this proposed legislation.

Program Structure and Function

Existing Agreements

The *Countywide Program* has an existing "Agreement to Implement the Alameda County Urban Runoff Clean Water Program" (Agreement) that all of the participating agencies' elected bodies adopted in 1991. This Agreement will terminate on April 1, 1997, but is subject to automatic renewal for a five year period in the absence of any written objections.

One of the requirements of this Agreement was the development of the "Bylaws of the Alameda County Urban Runoff Clean Water Program's Management Committee" (Appendix D). These bylaws provide the agreed upon details for a number of essential activities that will be conducted including the following: 1) how the Management Committee and its Subcommittees function; 2) how often information on populations and areas are updated for allocating General Program costs; and 3) the procedures for developing budgets. The bylaws have been improved through the seven amendments adopted between 1992 and 1995.

The *Countywide Program* also has an existing agreement[1] with the Regional Board staff which establishes the respective roles and responsibilities of the *Countywide Program* and Regional Board staff in conducting stormwater facility inspections and educational outreach. Since this agreement's adoption in 1992, its interpretation has been clarified by letters from the *Countywide Program*. This agreement is an example of the initiative the *Countywide Program* takes to form partnerships for the coordinated and efficient implementation of its activities.

General Program and Agency-Specific Activities

The *Countywide Program*'s activities are divided into two basic categories depending on whether the General Program or member agencies are responsible for implementing the task.

General Program tasks are conducted for the mutual benefit of all of the *Countywide Program* member agencies, and member agency-specific tasks are conducted by and for the individual participating agency. The description of member agency-specific activities and responsibilities is addressed by the performance standards contained in Appendix B, the requirements imposed by the NPDES permit, and the tasks described in this SWMP. The General Program tasks are defined by this SWMP and the annual work plans and budgets contained in Appendix A.

Management Committee and Subcommittees: The Agreement provides the Management Committee with the central authority for adopting General Program budgets, establishing policies and procedures, and implementing the *Countywide Program*. The Management Committee has created six subcommittees to assist with these tasks. Many of the subcommittees have, in turn, relied on using small workgroups to evaluate issues and develop detailed recommendations for the subcommittees' consideration and approval. A list of Management Committee representatives is contained in Table 2-1. This list will be updated as needed.

Coordination with Local Agencies: Implementing any program that deals with as many diffuse sources of pollutants as stormwater depends on coordinating with other local agencies. Forming partnerships with the local wastewater treatment plants, the Alameda County Resource Conservation District, and County household hazardous waste recycling program have been essential to the progress that the *Countywide Program* has achieved to date. The Cities of Hayward, Livermore, and San Leandro operate their own wastewater treatment plants and their staff's participation has been essential in providing this perspective to the *Countywide Program*.

Funding Sources

Twelve of the seventeen member agencies have established stormwater user fees to fund their agency-specific tasks and share of the General Program costs. The Cities of Emeryville, Oakland, and Piedmont, the ACFC&WCD, and Zone 7 of the ACFC&WCD have not established these user fees. The City of Piedmont has relied on its sewer fund for revenue. Oakland has used reimbursements from the ACFC&WCD's Benefit Assessment Program fees which are supplemented with city funding. Emeryville has also relied on reimbursement from the ACFC&WCD. The ACFC&WCD relies on Benefit Assessment Program fees for revenue, while Zone 7 of the ACFC&WCD uses public taxes and drainage fees for revenue.

In addition, the *Countywide Program* has actively solicited and obtained U.S. EPA grant funds for the implementation of some of its activities. Examples of grant funded activities have included the quality assurance/quality control aspects of the initial loads assessment study completed in 1991, portions of the Demonstration Urban Stormwater Treatment (DUST) marsh studies, the study to identify the causes of stormwater's toxicity completed in 1994, and the development of a handbook on how to conduct industrial inspections completed in March 1996.

Legal Authority

In 1991 the *Countywide Program* conducted an extensive review of each municipality's legal authority and used this information to help develop a model stormwater ordinance. Alan Waltner, Attorney at Law, prepared this model

ordinance for the *Countywide Program* that has been adopted with modifications by each of the municipalities (Appendix C). These ordinances provide the municipalities with an adequate expression of their legal authority to control what is discharged to their storm drain systems and therefore to implement the requirements of the *Countywide Program*. The ordinance, as modified by Alameda County, is included in the California Stormwater Quality Task Force's Municipal BMP Handbook, and has been adapted for use throughout California.

MAJOR TASKS

The following major tasks will be conducted during the next five years.

Task 2.1 Assist with Regulatory Compliance

The purpose of this task is to provide the member agencies with the information and assistance they need to comply with their NPDES permit, and other related regulatory requirements, and to negotiate the NPDES permit and any other subsequent changes to the permit requirements. The activities included as part of this task include the following:

- Develop and provide deliverable forms to each of the member agencies that streamline the information that needs to be collected for reporting to the Regional Board as part of the NPDES permit. Forms will cover either quarterly or semiannual periods as selected by each agency. Each agency will complete and submit its reporting forms and other required information to the *Countywide Program* on time;

- Prepare NPDES permit required semiannual reports for submittal to the Regional Board by the required dates. This will include preparing draft reports for member agency review and comment prior to incorporating comments into final reports. The fiscal year-end reports will contain an evaluation of each agencies' work, including an assessment of compliance with applicable performance standards (Appendix B) along with an evaluation of the effectiveness of the activities being undertaken;

- Provide annual individual reviews of each member agencies' performance. It is anticipated that at least initially these reviews will continue to include individual meetings with each agency with a follow up letter. The optimum method of review may be refined in the future;

- Provide additional assistance to member agencies, as requested, to comply with the NPDES permit or other program requirements; and

- Coordinate with the Regional Board during renewal of the NPDES permit and any subsequent amendments.

Task 2.2 Lead and Represent the *Countywide Program*

This task is to provide essential leadership for the *Countywide Program*. This will include representing the *Countywide Program* whenever this participation is requested by a member agency or is otherwise valuable to further the goals of the *Countywide Program*. Part of providing leadership will be to identify opportunities for collaborating with other agencies, to make sure the activities of the *Countywide Program* are known and recognized, and to anticipate regulatory initiatives that affect the *Countywide Program*. The *Countywide Program*'s Management Committee Chair will usually serve as the *Countywide Program* representative, especially at BASMAA and California Stormwater Quality Task Force meetings, and

Regional Monitoring Program policy meetings.

As needed, the *Countywide Program* will develop and execute agreements between the General Program and other public agencies who are responsible for stormwater discharges that flow to storm drain systems operated by member agencies. These types of agreements will require the implementation of performance standards consistent with those applicable to member agencies.

Task 2.3 Plan, Initiate, and Respond to Regulatory and Grant Funding Initiatives

Given the continual changes to regulatory requirements[2], it is essential that the *Countywide Program* participate actively in these processes. The activities included as part of this task include the following:

- Identify, evaluate and participate in regulatory and grant funding initiatives and issues that may impact the *Countywide Program*. This will include identifying regulatory initiatives and issues that are essential to the interests of the *Countywide Program*;

- Prepare appropriate comments on essential regulatory initiatives and issues that represent the views of the member agencies. This process will normally involve the review and approval of the Policy Level Subcommittee and Management Committee;

- Present the *Countywide Program*'s agreed upon comments at public hearings and meetings, etc., as part of the public review process for regulatory initiatives and issues;

- Work through BASMAA, the California Stormwater Quality Task Force, and other organizations, as appropriate, to identify new regulatory initiatives that the *Countywide Program* should initiate and help sponsor. This also includes identifying and implementing cost-effective ways to respond within this SWMP to new water quality problems or new information about existing problems; and

- Apply for and manage grant funded projects awarded to the *Countywide Program*.

Task 2.4 Continue to Institute a Process for Continuous Improvement

This task is to make sure that the information and experience being acquired by the *Countywide Program* is used to continuously improve the implementation of the *Countywide Program*. Having this type of process in place will help achieve cost efficiencies and other benefits. The primary method used so far to improve the *Countywide Program* is to obtain suggestions from all of the participating agencies annually. These suggestions are considered and acted upon by the subcommittees and Management Committee.

Task 2.5 Provide Management Services

The purpose of this task is to provide all of the needed financial management, contracting, program management, and administrative support needed for the *Countywide Program*'s General Program. Activities include providing assistance to the Management Committee and Policy Level Subcommittee and financial support for BASMAA tasks of regional benefit. This task also includes conducting fiscal analysis, tracking and reporting on budget expenditures and tasks' status, processing accounts receivable and payable, and assisting with the preparation of each year's General Program budget.

IMPLEMENTATION STRATEGY

The overall strategy during the next five years includes the following elements:

Maximize Regulatory Certainty

The best way to minimize the uncertainties inherent in any regulatory compliance program is to anticipate possible problems and identify ways to prevent or correct them as quickly as possible. The *Countywide Program* General Program will continue to emphasize achieving open communication with the Regional Board staff and with its member agencies to address new regulatory initiatives in a way that maximizes the degree of certainty associated with implementing this SWMP. Some of the *Countywide Program's* creative solutions to help prevent potential problems, such as developing performance standards, are being copied by other stormwater programs.

Continue to Identify Ways to Minimize Costs

The *Countywide Program* needs to continue to identify ways to make the General Program and municipality-specific program more cost-effective. One of the strategies for doing this is to identify where each activity can be most cost-effectively implemented. Some activities can be handled best at the regional level by working with other stormwater agencies, such as BASMAA, other activities are best conducted at the local agency-specific level, and others are best done at the General Program level.

Continue to Improve by Taking a Flexible Approach Within the SWMP's Structure

One of the lessons learned with the previous SWMP is the value to taking a flexible, but structured implementation approach that iteratively improves the *Countywide Program* based on practical experience. The whole structure of the five-year plan with annual work plans captures this approach for continuous improvement of the SWMP.

Notes:

SECTION 3

Focused Watershed Management Approach

GOALS

The need to identify better ways to solve environmental problems than the traditional command and control regulatory approach is most evident when dealing with diffuse sources of pollutants and environmental degradation, such as stormwater. These types of problems are often difficult to correct, given the numerous causes of the problems and the diverse interests that must be reconciled to achieve solutions.

The U.S. EPA, Regional Board, and other groups believe that the watershed management approach provides a useful tool for solving environmental problems. The watershed management approach is defined by the U.S. EPA as having the following three major components: problem identification, stakeholder involvement, and integrated actions. This approach is characterized by identifying and solving particular priority problems in specific watersheds. In any given watershed, the priority problems will vary and may involve stormwater to a lesser or greater extent. The watershed management approach is based on principles similar to the Coordinated Resources Management and Planning (CRMP) process that the Natural Resources Conservation Service (formerly the Soil Conservation Service) has successfully used for years.

Although this section of the SWMP is new, the previous SWMP and other sections of this SWMP, in essence, constitute a watershed management approach. Specific watershed activities are identified in this section to focus on some of the more tangible aspects of this approach which are not specifically addressed by other sections of the SWMP.

The three primary goals of this component include the following:

- Determine the tangible benefits of using a focused (waterbody-specific) watershed management approach in urbanized watersheds;
- Increase the level of awareness of the residents in each municipality of their local neighborhood watersheds; and
- Build grass roots stewardship for local creeks, estuaries and lakes by supporting cleanup, aquatic habitat protection, and restoration projects.

EXISTING CONDITIONS

As shown in Figure 1-1, major open or partially open creeks in Alameda County which flow directly to San Francisco Bay include Cerrito, Codornices, Strawberry, Sausal, San Leandro, San Lorenzo, and Alameda Creeks. Many other creeks also exist or have existed historically prior to urbanization and creek channelization and culverting. Recent community activism has led to restoration or rehabilitation of portions of several creeks including daylighting sections, stabilizing creek banks, sponsoring creek cleanups, and promoting watershed awareness. Examples of the General Program, municipality-specific, and ACFC&WCD efforts to promote these types of activities are described below.

General Program Projects

Disposal of Wash Waters

The *Countywide Program* identified a

solution to the problem of wash water disposal by combining pollution prevention and watershed management approaches. The simplest solution is to cease generating the wash water in the first place, and the next best solution is to recycle wash water. When wash waters must be generated that cannot be recycled, it is better, generally, from a watershed perspective to dispose wash waters to the sanitary sewer than to the storm drain system.

The ability to see all sides of the wash water disposal problem and to develop an agreed upon solution was achieved by the *Countywide Program* working with the wastewater treatment plant agencies, Regional Board staff, and the Cleaning Equipment Trade Association to develop the "Recommended Discharge Elimination/Disposal Priorities for Wash Waters." This work also led to the Cleaning Equipment Trade Association's development of its "Best Management Practices for Waste Water Runoff." Work on wash water disposal that the Santa Clara Valley Nonpoint Source Pollution Control Program completed also contributed to a solution.

Identification of Current Watershed Projects

The *Countywide Program* conducted a survey to identify projects in Alameda County that it may have an interest in participating in as a stakeholder or tracking to avoid duplication of efforts. Among these projects the Department of Fish and Game's and U.S. Fish and Wildlife Service's Biodiversity Working Group and the Seasonal Wetlands Enhancement Committee's activities to restore wetlands in Union City may be worth tracking by the *Countywide Program*. The results of this work culminated in a plan for integrating the watershed management approach in the *Countywide Program* Management Plan, distributed to the Management Committee in September 1995.

Pilot Citizen Monitoring and Habitat Assessment Project

The *Countywide Program* supported the training of volunteers to conduct water quality monitoring and aquatic habitat assessment of San Leandro Creek. The goal of this project was to test the applicability of three protocols developed by other entities for use in Alameda County and by citizen volunteers.

The project was conducted with the assistance of 35 volunteers from the Friends of San Leandro Creek. Over a ten-week period in 1995 the volunteers measured water quality at four locations along the lower third of the creek, assessed fish habitat, and conducted bird counts.

Community Stewardship Grants

The General Program also awarded Community Stewardship Grants for creek education, inventorying, and monitoring projects located on nine different creeks throughout the county. Many of the grants have been awarded to schools ranging from the elementary through college level. One example of an elementary school project in Berkeley is to study and observe wildlife in and around Codornices Creek using science, writing, art, and history. A high school in Castro Valley will be conducting water quality monitoring and research on San Leandro Creek. At the college level, members of the Geography Awareness and Environmental Action Club at California State College in Hayward will lead monthly interpretive/mapping surveys of San Lorenzo Creek to teach students how to monitor water quality, map riparian habitat, and identify different types of wildlife. All of the individual grant projects were $2,000 or less.

Municipality-Specific Projects

Many of the municipalities have supported creek clean up and restoration projects being implemented by citizen volunteers. In recent years, Alameda County, Albany, Berkeley, Dublin, Fremont, Hayward, Oakland, Piedmont, Pleasanton, and San Leandro have conducted these type of events. One of the largest events has been the City of Oakland's creek cleanups on five to six different creeks during 1994 and 1995. The City of Albany is spearheading improvements to Codornices and Cerrito Creeks by working with local volunteers and the other cities (Berkeley, El Cerrito, Kensington and Richmond) within these watersheds. In addition, several municipalities also support the Coastal Commission's Annual Coastal Cleanup Day.

ACFC&WCD Projects

The ACFC&WCD recognizes that there are benefits for it to participate actively in watershed management projects as part of a comprehensive and integrated approach for achieving flood control, improving stormwater quality, and protecting aquatic resources. One of the possible benefits for using this approach would be to increase the certainty of obtaining U.S. Army Corps of Engineers (COE) permits and Regional Board water quality certifications for maintenance activities and other projects. Regulatory oversight of maintenance of flood control channels and water quality is merging as the Regional Board is being delegated authority from the COE under a pilot project to issue Nationwide Permits.

Some of the projects that the ACFC&WCD supports include the San Leandro Creek Watershed Awareness Program; the Southern Alameda Creek Watershed project; the San Lorenzo/Castro Valley Creeks Watershed project; preparation of the *Guide to East Bay Creeks* and a companion map for Southern Alameda County; a Clean Creeks Campaign for Zone 12 (Oakland/Emeryville) and a friends of Sausal Creek group which has been initiated with the City of Oakland. These are the type of start-up projects that the Regional Board staff will be requiring of major flood control agencies; the Regional Board staff require that flood control agencies solve flood control, water quality, and aquatic resource problems in a more comprehensive and integrative, watershed-based fashion.

MAJOR TASKS

The following major tasks will be conducted during the next five years. In addition, other parts of the SWMP contain watershed-related tasks that will be coordinated to achieve the goals of this and other sections of the SWMP. Refer to "Task 5.3 Support Watershed-Based Approaches" in the Public Information/Participation section of this SWMP and to the performance standards for Public Information/Participation (Appendix B) for descriptions of other related tasks.

Task 3.1 Participate in Watershed Management Projects Led by Others

The *Countywide Program* will seek out information and track watershed management projects that other agencies and parties have the lead on and participate in a selected subset of these projects to represent the *Countywide Program*'s perspective and interests. The participation will include such things as attending meetings, briefing the *Countywide Program* on issues, and soliciting direction from the *Countywide Program* through its Management Committee and Subcommittees.

Task 3.2 Prepare for, Conduct, and Complete a Pilot Watershed Project

The pilot watershed project will be conducted in the San Leandro Creek

watershed for the following reasons: 1) rainbow trout were initially identified in the creek and there is a lot of local interest in the watershed, such as that expressed by the Friends of San Leandro Creek group; 2) a number of successful watershed awareness activities have been completed there, including the *Countywide Program*'s Pilot Citizen Monitoring and Habitat Assessment Program; 3) the watershed includes multiple political jurisdictions which is typical of most of the larger watersheds in Alameda County; 4) the watershed contains the type of problems that are characteristic of much of Alameda County; and 5) the ACFC&WCD plans to sponsor the development of a CRMP for the watershed and is interested in and willing to use its resources to assist with improvements to the watershed.

This project will consist of the following elements:

- Continue to identify water quality and aquatic habitat problems in the San Leandro Creek watershed using citizen volunteers and other appropriate methods;

- Identify a specific pilot project to be implemented in a portion of San Leandro Creek to correct a high priority water quality and/or aquatic habitat problem;

- Implement the specific pilot project to achieve tangible and observable improvements before the completion of this SWMP in June 2001. The ACFC&WCD will play a key role in providing fiscal and other resources needed to implement any capital improvement parts of the pilot project;

- Based on the pilot study, the General Program will develop a written report summarizing the results of the pilot project. This report will include an assessment from the member agencies' perspective of the pros and cons of using a watershed management approach for correcting water quality and aquatic habitat problems. This assessment will include recommendations for future work, if any; and

- On an annual basis, the results of the progress being made by the pilot study will be reviewed to identify potential opportunities to improve any aspect of the *Countywide Program*; identified opportunities will be implemented by the *Countywide Program* as part of the subsequent year's annual work plan and/or through modifications to the performance standards.

Task 3.3 Identify Approach for Further Incorporating Focused, Waterbody-Specific Watershed Management into the *Countywide Program* As Part of the Subsequent SWMP

Based on the results of the *Countywide Program*'s participation in watershed management projects led by others, the information generated during the pilot study, and other sources of information, the Management Committee will decide how to expand the focused watershed management approach in the subsequent SWMP (July 2001 - June 2006).

Task 3.4 Reporting and Budget Development\Component Management

The General Program will prepare reports, budgets and other items to assist with implementation, documentation and management of this component. The General Program will complete these items under the guidance of the Monitoring and Special Studies Subcommittee. Any substantive policy issues that this Subcommittee identifies will be forwarded to the Policy Level Subcommittee and the Management Committee, as needed.

IMPLEMENTATION STRATEGY

The overall strategy during the next five years includes determining how well a focused watershed management approach may help achieve improvements in urbanized watersheds as required of stormwater management programs. This testing period will be accomplished in the following two ways:

Participate as a Stakeholder in Watershed Projects Led by Others

One of the ways for the *Countywide Program* to represent its interests and to gain experience with the watershed management approach is to participate as a stakeholder in other watershed projects. The opportunities for this type of participation should be increasing as the number and variety of these type of projects appear to be increasing. The results of the *Countywide Program's* stakeholder experience will be one basis for determining how a focused watershed management approach should be incorporated into the subsequent SWMP beginning in July 2001.

Conduct a *Countywide Program* Led Watershed Management Pilot Project

The possible benefits of achieving tangible improvements in water quality and/or aquatic habitat will be tested in a specific area during the pilot project. The scope of the pilot project will be scaled to a size that is appropriate for what can realistically be accomplished during the time period of this SWMP. The concept is to really identify how to make a focused watershed management approach work.

SECTION

Monitoring and Special Studies 4

GOALS

Monitoring and special studies have a major role in the development and implementation of a successful SWMP. Because stormwater regulations are relatively new, understanding of the exact nature of the problems caused by stormwater runoff as well as the sources of and BMPs for control of suspected pollutants is evolving. The role of monitoring and special studies is to identify specific problems or concerns caused by stormwater runoff in order to better identify sources of specific pollutants and optimize BMPs and performance standards for their control.

The primary goals of this component include the following:

- Identify problems in San Francisco Bay and Alameda County creeks resulting from stormwater runoff;
- Identify the effectiveness of and ways to improve BMPs;
- Integrate results of monitoring and special studies into BMP implementation;
- Track long-term trends in pollutant concentrations in representative creeks;
- Coordinate with BASMAA, the California Stormwater Quality Task Force, San Francisco Estuary Institute (SFEI), and others to develop an equitable division of monitoring and special studies work; and
- Coordinate with the Public Information/Participation Subcommittee and other subcommittees for technology transfer.

EXISTING CONDITIONS

Environmental Setting - San Francisco Bay and Alameda County Creeks

Monitoring of San Francisco Bay and Alameda County creeks has been conducted by the Regional Board and Alameda County for a number of years. The key results of these investigations are summarized below:

San Francisco Bay

The Regional Monitoring Program (RMP) conducted for the Regional Board by SFEI has indicated that concentrations of organochlorine pesticides (total DDT, chlordane, dieldrin) and polychlorinated biphenyls (PCBs) in water exceed water quality objectives designed to protect human health from fish consumption. In response to these data, the Regional Board conducted a study of chemical concentrations in fish tissues to determine if the exceedances of water quality objectives corresponded to a human health risk for individuals consuming fish from the Bay. Results of the *Fish Tissue Study* indicated levels of PCBs, mercury and dioxin/furans often exceeded U.S. EPA screening values for protection of human health, and identified organochlorine pesticides as being of concern. As a result, the Department of Health Services issued a health advisory for San Francisco Bay recommending limited consumption of certain species of fish and recommending no consumption of

sharks and specific species of fish over a certain length.

Alameda County Creeks Wet Weather Monitoring: The *Countywide Program* has been conducting water quality monitoring of urban runoff since September 1988 to fulfill the requirements of the Regional Board's *Basin Plan*. In addition to wet weather monitoring of creeks, specific locations characteristic of stormwater runoff from known land uses were also sampled. Results indicated that total (dissolved and particulate) copper and zinc concentrations in creeks and upland areas (if these concentrations were experienced in downstream waters) generally exceed the acute and chronic water quality objectives for the protection of aquatic life.

Recently the U.S. EPA, in recognition of the fact that dissolved metals are the major metal form which are toxic to aquatic life, promulgated revised interim final dissolved metals criteria. Consequently, wet weather water quality generally attains the revised water quality criteria. For most creeks, the number of exceedances of acute criteria is within the allowable exceedance frequency of once every three years. When the data are compared to the chronic criteria, lead exceeds the allowable exceedance frequency for four of the five monitored creeks.

Regarding exceedances of water quality objectives for the protection of human health, total mercury and total polycyclic aromatic hydrocarbons (PAH) concentrations often exceed the human health based criteria for fish consumption (concentrations in water that are expected to result in fish tissue concentrations exceeding U.S. EPA screening values for one in a million cancer risk). (The *Countywide Program* monitors for PAHs using specialized laboratory techniques designed to detect low concentrations, parts-per-trillion, of individual PAH compounds.) Because storm events are transitory, it is not clear if the exposure duration of fish to stormwater runoff is sufficient to allow accumulation of mercury and PAHs in tissues to levels above the screening values. Also, Alameda County creeks are not major fisheries. Lastly, estimates of dissolved PAH concentrations are generally below human health based objectives based on consumption of fish. (U.S. EPA guidance states that mercury criteria should be compared with total concentrations.)

Toxicity monitoring has been conducted by the *Countywide Program* since 1988. Results indicate that runoff is generally toxic to aquatic invertebrates (*Ceriodaphnia dubia*), often causing mortality within four days of exposure. In conjunction with the Regional Board, the *Countywide Program* conducted Toxicity Identification Evaluations (TIE) to determine what compounds were causing toxicity. Results of the TIEs indicated the toxicity was caused by organophosphate insecticides specifically diazinon and chlorpyrifos.

Dry Weather Monitoring: As a part of monitoring conducted for the *Loads Assessment Study* (1988-1991), data on dry weather water quality in selected creeks was collected and compared to chronic water quality objectives for the protection of aquatic life. Results of the comparison indicated that during dry weather, total metal concentrations were generally substantially below chronic water quality objectives for most of the six creeks tested. Occasional exceedances of total copper and lead water quality objectives were observed at one station (Cabot Avenue). In general, dry weather water quality was much better than wet weather.

Sediment Sampling: Dry weather sediment sampling was also conducted as part of the *Loads Assessment Study* in selected creeks. Results indicated organochlorine pesticides, chlorinated herbicides, PCBs, and PAHs, which are seldom detected in water, were often found at detectable concentrations in sediment. Concentrations of metals in sediment were generally at least an order of magnitude lower than hazardous waste (Total Threshold Limit Concentrations or TTLC) levels.

Recently the ACFC&WCD has been conducting investigations of diazinon concentrations in creek sediments and in the DUST marsh. Results of these investigations found diazinon at detectable concentrations in sediments following storm events.

General Findings - Stormwater Impacts and Pollutants of Concern

The following summarizes the results of monitoring conducted by the *Countywide Program* and other agencies during the past seven years:

Stormwater Impacts on San Francisco Bay

- Loads of certain metals (cadmium, copper, lead, nickel) from stormwater are significant compared to point source discharges.

- A portion of particulate bound copper discharged during storms may be released to the Bay due to the higher pH of San Francisco Bay water.

Stormwater Impacts on Alameda County Creeks

- Concentrations of organophosphate insecticides in stormwater runoff, specifically diazinon and chlorpyrifos, often cause toxicity to *Ceriodaphina dubia* during laboratory toxicity testing and thus have the potential to cause adverse impacts to freshwater aquatic life;

- Concentrations of mercury and PAHs in stormwater have the potential to accumulate in fish tissue to levels above U.S. EPA screening values for one in a million lifetime cancer risk.

- In creeks with a high percentage of urban watershed (Castro Valley Creek - creek station S3, and Cabot Avenue near the Hayward Marsh - creek station S4), dissolved metals concentrations (copper, lead and zinc) exceed interim final chronic dissolved metal water quality criteria indicating the potential for impacts to aquatic life.

Based on these findings, diazinon, chlorpyrifos, copper, lead, zinc, mercury, PAHs, and organochlorine pesticides are principle pollutants of concern.

Monitoring and Special Studies

The current phase of the monitoring program began in October 1991 to fulfill the requirements of the *Countywide Program*'s NPDES permit. The monitoring program involves the following different types of monitoring and special studies:

Long-Term Creek Monitoring
This type of monitoring is used to determine how water quality in creeks compares to water quality objectives contained in the Regional Board's *Basin Plan*, the State Board's previous *Inland Surface Waters Plan* and Federal water quality criteria documents. In addition, long-term creek monitoring data can provide indications of pollutant sources and trends in pollutant concentrations. Creek flow and water quality at two to four stations have been monitored during

the initial NPDES permit period using equipment configured to collect flow-weighted composite samples. Results are reported in annual monitoring reports. In addition to gathering data, the *Countywide Program* also developed guidance for reporting toxicity data which is used to standardize the way data are reported by the laboratory to ensure maximum usability, and compiled its data into a water quality, toxicity and hydrology database.

Receiving Water Impacts Studies
Receiving water impact studies are used to determine the impact of specific pollutants on creeks and San Francisco Bay. If a particular pollutant is indicated as causing an adverse impact, sources of the pollutant are investigated and control measures developed to limit the input of the pollutant to the receiving water. Receiving water impact studies have been conducted using data collected in the long-term creek monitoring program through data analysis and toxicity testing. Toxicity testing is an example of an impact study which identified an impact (toxicity to *Ceriodaphia*) and conducted a TIE to determine the cause of the toxicity. Subsequent to the identification of diazinon and chlorpyrifos as the cause of toxicity, the *Countywide Program* has been participating in a coordinated pilot source identification and control study implemented by the Regional Board. The *Countywide Program* has also completed geochemical modeling of copper adsorption to estimate how much copper may be released from particulates upon discharge to San Francisco Bay.

Source Identification Studies
Identifying sources of pollutants to stormwater runoff is key to identifying effective control measures. During the initial NPDES permit period, the *Countywide Program* has spent considerable effort in identifying sources of specific pollutants to stormwater. Results of these studies are used to help select control measures for control of specific pollutants. Specific studies conducted include: a literature review of source identification data, a pilot source identification study of an industrial and residential area, TIEs, a *Roof Runoff Water Quality Literature Review* report, and a *Watershed Source Evaluation Method* report for the Sausal Creek watershed in Oakland.

Evaluating the Effectiveness of Control Measures
This type of monitoring is designed to complement the record keeping and reporting procedures summarized by providing data on the effectiveness of different control measures in order to select those that are most effective. During the initial NPDES permit period, the *Countywide Program* conducted the following studies on the effectiveness of control measures: *Storm Inlet Pilot Study*, *Vegetated Channels Study*, DUST Marsh Special Study, *Street Sweeping/Storm Inlet Modification Literature Review*, and *BMP Effectiveness Monitoring*; in an industrial catchment.

MAJOR TASKS

The following major tasks will be conducted during the next five years.

Task 4.1 Track and Coordinate with the RMP and BASMAA

The purpose of this task is to track and coordinate with other monitoring programs being conducted in the Bay Area. Currently the RMP conducts routine water, sediment and biological monitoring of San Francisco Bay. In addition, the RMP also conducts special studies and pilot projects. The *Countywide Program* will coordinate with the RMP to ensure questions relevant to

stormwater runoff and its effects on San Francisco Bay are not left out of the RMP.

The *Countywide Program* will also participate in BASMAA's Monitoring Committee. The BASMAA Monitoring Committee is used to coordinate routine monitoring and special studies among other Bay Area programs and has been involved in development of standardized monitoring protocols and compilation of special studies. One goal of this task will be to ensure an equitable distribution of monitoring and special studies work to all stormwater agencies in the Bay Area.

Task 4.2 Long-Term Creek Monitoring

The *Countywide Program* will continue to conduct long-term creek monitoring at selected locations in Alameda County. This activity will be coordinated with the BASMAA Monitoring Committee as the goal is to generate compatible data for the entire Bay Area which may be used to determine pollutants of concern in stormwater runoff. Selection of stations, monitoring methods, and parameters will be discussed with the Regional Board staff prior to submission of the annual work plan.

Task 4.3 Special Studies

Special studies continue to be conducted as necessary to support refinement and implementation of the SWMP. Specific types of special studies include the following:

Task 4.3.1 Special Studies Needs Assessment
The Monitoring and Special Studies (MSS) Subcommittee will coordinate with other subcommittees to determine what special studies are needed to support selection or refinement of control measures or performance standards. This task will be conducted on an annual basis.

Task 4.3.2 Effectiveness of Structural Treatment Measures
The *Countywide Program* will continue to conduct studies of the effectiveness of structural control measures. Currently the ACFC&WCD is considering construction of a wetlands treatment system in the City of Fremont (Tule Pond). The *Countywide Program* will evaluate this proposed project and participate in planning the monitoring of its effectiveness. The *Countywide Program* will also conduct studies of the effectiveness of other structural control measures, such as modified channel maintenance activities and storm drain inlet or storm drain line controls as requested by the New Development or Maintenance Subcommittees.

Task 4.3.3 Effectiveness of Other BMPs
The *Countywide Program* will conduct special studies to monitor the effectiveness of other non-structural BMPs implemented by other program components. Examples of non-structural BMPs include public and industrial outreach activities, product use modification or substitutions, and changes in maintenance activities or frequency.

Task 4.3.4 Source Identification and Control
The *Countywide Program* will conduct source identification and control studies to identify sources of problem pollutants and determine potential control measures. Potential activities include determining sources and control options for diazinon and chlorpyrifos, and investigating sources of PCBs and organochlorine pesticides or other problem pollutants as identified by receiving water impacts studies.

Task 4.4. Data Management

Data from the annual long-term monitoring including water quality, sediment, toxicity and hydrology data will be incorporated into a database. In order to facilitate coordination with other agencies conducting stormwater monitoring and special studies, the *Countywide Program* will continue to coordinate with BASMAA in its compilation of study descriptions and results into an annotated bibliography by providing brief abstracts of project results as they are completed. Additionally, data will be provided to SFEI for integration into the BASMAA and RMP databases, as requested.

Task 4.5 Reporting and Budget Development\Component Management

The General Program will prepare reports, budgets and other items to assist with implementation, documentation and management of this component. Results of the annual long-term stream monitoring will be reported to the Regional Board by October 1. This data report will include comparisons with applicable water quality objectives. Reports on special studies will be submitted to the Regional Board in a timely manner as the studies are completed.

IMPLEMENTATION STRATEGY

Implementation of this component relies on coordination with other *Countywide Program* subcommittees to provide them with information on the results of monitoring and special studies and to determine their needs for additional special studies. The development of annual work plans will enable the *Countywide Program* to define priorities each year as information is gained from implementation of performance standards and the RMP.

In addition, the MSS Subcommittee and *Countywide Program* will continue to coordinate with BASMAA, Regional Board staff and other agencies involved in studies of San Francisco Bay to determine pollutants of concern and help set priorities for monitoring and special studies.

SECTION 5

Public Information/Participation

GOALS

Stormwater pollution results from the small, incremental, and collective activities of everyone within Alameda County. The diffuse origins of the problem are often the result of the unintended and unrecognized consequences of thousands of routine, seemingly inconsequential, decisions made daily. Public Information/ Participation (PI/P) is one of the keys to preventing stormwater pollution. The better everyone understands what causes stormwater pollution and the simple things that we can do about it, the cleaner our local creeks and San Francisco Bay will become.

The two primary goals of this component include the following:

- Educate and encourage residents to adopt less polluting and more environmentally beneficial behavior; and

- Increase awareness of local watersheds and solicit volunteers to help solve creek specific problems and restore creeks.

EXISTING CONDITIONS

This section of the SWMP summarizes what PI/P accomplished during the initial NPDES permit period.

PI/P has been a particularly pro-active component of the *Countywide Program*. The PI/P Subcommittee was established in May 1991, prior to the adoption of the first NPDES permit, and has met nearly every month since. The PI/P Coordinator, employed by the Alameda County Public Works Agency, serves as General Program staff for implementing the PI/P component. Based on direction from the PI/P Subcommittee, the PI/P Coordinator is responsible for managing consultant contracts, representing the *Countywide Program* on BASMAA's and the California Stormwater Quality Task Force's PI/P Committees, interacting with the media, and providing other needed services. The PI/P Subcommittee's chairperson is responsible for running the Subcommittee meetings, communicating with the Management Committee, and working with the PI/P Coordinator to implement the Subcommittee's decisions.

Materials Produced and Distributed

General Program

The *Countywide Program* has developed or adapted more than 40 different types of PI/P materials including brochures, flyers, a mylar stencil, public service announcements for use on the radio, posters, give-away promotional items, guidance materials, and other items. In addition to items that the *Countywide Program* has taken the lead on, a number of educational materials have been developed recently through the *Countywide Program*'s participation in BASMAA and the San Francisco Bay Area Pollution Prevention Group. Several of the most important of these materials are briefly described below.

The *Countywide Program* began in 1991 by adapting the Santa Clara Valley brochure called "The Bay Begins at Your Front Door!" for use in Alameda County. This is a basic brochure to inform residents about the sources of stormwater pollution and simple things they can do to help prevent it. More copies of this brochure have been printed and

distributed than any other item.

Another important brochure developed and printed was the "Bugged?" brochure on integrated pest management. This brochure offers residents information on safe and effective ways to deal with unwanted pests. It has been distributed both as a point-of-purchase item and to residents at outreach events and in response to telephone requests.

Municipality-Specific Program

Municipalities have been actively targeting their own residents with information on the sources of stormwater pollution and things they can do to help prevent it. More than 280,000 pieces of informational materials were distributed to residents and businesses during the first four years of the *Countywide Program*. Municipalities have also been labeling storm drain inlets. Since the beginning of the *Countywide Program*, about 25,000 stencils or 60 % of all storm drain inlets have been labeled with the no dumping message. The public education benefits of stenciling are greatest when they are installed by volunteers or elected officials. The emphasis on stencilling is justified considering that "the stencil program was by far the most readily recognized element" of the stormwater program based on the *Countywide Program*'s February 1994 public awareness survey.

Educational Programs

The *Countywide Program* has placed a high priority on training teachers and students about stormwater pollution and ways to help alleviate the problem. The areas of emphasis include the education of teachers through the award winning "Kids in Creeks" program developed for the *Countywide Program* by SFEI. More than 200 teachers have been trained on how to educate students about creeks.

During the last two years the *Countywide Program* has complemented the Kids in Creeks teacher training with the direct classroom instruction offered by the Bay Saver Club. The Alameda County Resource Conservation District developed the Bay Saver Club in 1994 for the *Countywide Program*. The Bay Saver Club includes a flexible week-long in-class program for fourth graders. The instruction was well-received by the approximately 3,500 students who participated the first year.

Another educational activity that *Countywide Program* has helped support each year is the annual Bay Area Environmental Education Resources Fair for educators. In addition, the *Countywide Program* has also actively provided grants for educational activities related to stormwater pollution. This grant program has changed from being a purely teachers action grant program to becoming the Community Stewardship Grant program. For example, in FY 1994/95 a total of $16,000 was allocated to eleven projects. These included creek education, resource inventorying, and monitoring projects on nine different creeks.

Advertising and Media Relations

The *Countywide Program* has conducted advertising campaigns during several months in 1991, 1992 and 1994. The campaigns consisted of newspaper and, in some cases, billboard advertising. The 1994 campaign was the most elaborate with the inclusion of busboards.

While the basic "no-dumping" message conveyed in the advertising campaigns made for good copy, it also may have targeted a small audience. For example, less than 1 percent of the residents surveyed in another Bay Area county (no data were available from Alameda County) in 1994 confessed to actually dumping materials directly into gutters and storm drains. It is possible that many

residents may have ignored negative information that they viewed as irrelevant to their behavior.

The *Countywide Program* has been actively implementing a media strategy since FY 1993/94. This included developing and distributing press releases at least every other month and press kits. In addition, the PI/P Coordinator has conducted dozens of interviews on various radio and television stations. Several million total audience impressions have resulted from the press releases and radio and television broadcasts.

Regional Advertising Campaign

The BASMAA member agencies formally recognized the benefit of working jointly on some types of PI/P activities by creating a PI/P Committee in 1992. One of the benefits of the Committee has been to help stormwater agencies share information and PI/P products. Another of the high priority activities of this Committee has been to develop and implement a three year regional radio and television advertising campaign beginning in FY 1995/96. This is an excellent area for regional collaboration because radio and television advertising are prohibitively expensive for any individual stormwater program to fund on its own.

The content of the regional advertising campaign will re-enforce the basic messages that the *Countywide Program* has been conveying over the last five years. The goal of the first year of the three year regional advertising campaign (FY 1995/96) is to bring the issue of stormwater pollution to the public's attention; the goal of the second year is to focus on residents and what they are doing in the home and garden; and the goal of the third year is to target car-generated stormwater pollution.

Performance Standards for Municipalities

The performance standards for PI/P were developed by the PI/P Subcommittee and approved by the Management Committee in December 1995.

Measurable Accomplishments

The *Countywide Program* has made good progress in educating its residents about stormwater pollution. According to the February 1994 survey, approximately 22 percent of the residents either did not know where stormwater flows or mistakenly believe that it is treated before going to San Francisco Bay. Information on the level of understanding at the beginning of the *Countywide Program* is unavailable, but comparisons with the results from other public awareness surveys are useful. In March 1994, the Contra Costa Clean Water Program found that 75 percent of its residents either did not know where stormwater goes or believed it is treated before being discharged. This program was initiated about two years after the *Countywide Program*. After having a stormwater NPDES permit since 1990, the City of Sacramento found in July 1994 that 44 percent of its residents still "think that stormwater runoff is treated or are undecided."

Another major measurable accomplishment of the *Countywide Program* has been the percentage of the public who reported a change to less polluting behavior. This group increased from 21 to 29 percent of the residents over the course of the 1994 advertising campaign. Another 27 percent of the residents reported that they have always been careful about the way they handle pollutants.

In addition, there is anecdotal information from municipal maintenance personnel that storm drain inlets are being used less often as dumping places, and that the

dumping of trash and debris into creeks has decreased.

MAJOR TASKS

The following major tasks will be conducted during the next five years.

5.1. Implement Targeted Outreach

This task includes the following five basic steps:

- Identify a subject area to work on;
- Conduct market research to identify effective target messages and audiences;
- Develop a focused campaign;
- Implement the focused campaign; and
- Use public awareness surveys as one way to measure progress.

This sequence of steps will be largely completed twice during the next five years.

The first subject area that the *Countywide Program* has selected is residential yard and garden care. Residential yard and garden care is an appropriate subject for the following reasons: 1) it is a logical extension of the direct "no dumping" message to the more indirect and chronic discharges of pesticides, fertilizers, yard waste, and soil associated with yard and garden care or lack of care; 2) according to special studies conducted by the *Countywide Program*, the toxicity found in stormwater is primarily caused by pesticides; 3) it responds to a high priority problem identified by the Regional Board staff; 4) it is a primarily a residential issue which has been the focus of the PI/P component of the SWMP; 5) it is an extension of the "Bugged?" brochure and the pesticide and fertilizer performance standards developed by the Parks and Recreation Workgroup; and 6) it can lead to other related subject areas, such as commercial yard and pesticide control and storm-water pollution prevention practices applicable to golf courses.

Market research on residential yard and garden care will be conducted in FY 1995/96 and used to develop and implement a focused campaign during Year 1 of the SWMP. The second subject area will be identified in Year 2 for market research and development of a focused campaign in Year 3. The second campaign will begin in Year 4 and continue into Year 5. The public awareness survey of the second campaign may not be completed until Year 6.

Task 5.2 Continue to Re-enforce Existing General Outreach Messages

Existing PI/P materials that the PI/P Subcommittee determines are useful enough to continue in circulation will be updated, as needed, and re-printed or produced for each municipality to distribute. This task will also include the General Program's public relations activities, if any; the development and distribution of promotional materials that the PI/P Subcommittee decides are useful; and the PI/P Coordinator continuing to represent the *Countywide Program* by participating in the County Fair and other events.

Task 5.3 Support Watershed-Based Approaches

This task includes the PI/P Coordinator supporting the public education and information aspects of implementing watershed-based approaches including the solicitation of volunteers to protect, clean, and restore local creeks and watersheds. This task also complements the "Watershed Awareness" section of the performance standards.

Task 5.4 Evaluate Effectiveness

PI/P will continue to use easily measurable survey tools to measure its effectiveness and to help direct limited resources where they will do the most good. The timing and type of surveys that will be conducted are included as part of Task 5.1. As useful, the PI/P Coordinator may continue to track the number of telephone calls received by the General Program and the type and number of materials distributed based on these calls.

Task 5.5 Implement and Update Agreed Upon Performance Standards

Each agency will implement the PI/P performance standards, contained in Appendix B, as part of its compliance with the stormwater NPDES permit. The PI/P Subcommittee and Management Committee will review and update annually, as needed, the performance standards for PI/P.

Task 5.6 Assist with Focused Staff Training

The PI/P coordinators for each municipality will be provided information on how to stay informed on the basic stormwater pollution prevention information being developed both outside the *Countywide Program* and within the *Countywide Program* (especially through monitoring and special studies). On an annual basis, the PI/P Subcommittee will help identify and prioritize the training needs of PI/P staff, and the optimum ways to meet these needs. Any agreed upon training activities will be implemented.

Task 5.7 Seek Partnerships, Build Coalitions, and Provide Educational Support

The primary partnerships *Countywide Program* has established are with BASMAA member agencies and the California Stormwater Quality Task Force. These partnerships will continue. In particular, the participation of the *Countywide Program* in BASMAA's regional radio and television advertising campaign and a regional media campaign will occur during Years 1 and 2. The degree of success of this regional participation will be reviewed annually to determine the type and degree of participation in the subsequent year.

In addition, the PI/P Coordinator will evaluate annually the additional opportunities to collaborate on educational outreach with the local wastewater treatment plants, the County's Home Composting and Household Hazardous Waste Programs, the Congestion Management Program, the Bay Area Air Quality Management District, ABAG's Green Business Recognition Program, and others. Based on these evaluations, the PI/P Subcommittee will decide whether and how to coordinate with these other programs.

This task will also include providing assistance for educating students about stormwater pollution prevention and environmental issues. This assistance may include supporting activities such as the following: the Bay Area Environmental Education Resources Fair; the Bay Saver Club; the Kids in Creeks Program; and the Community Stewardship Grant Programs that the *Countywide Program* supported during the initial NPDES permit period. The PI/P Subcommittee will decide annually which educational activities to support based on the known or expected effectiveness of the activity, how well the activity complements the PI/P Subcommittee's efforts to target outreach (Task 5.1), and other factors.

Task 5.8 Reporting and Budget Development\Component Management

The General Program will prepare reports, budgets and other items to assist with implementation, documentation and management of this component. Annually, the General Program will review member agency compliance with performance standards.

IMPLEMENTATION STRATEGY

The overall strategy during the next five years includes the following elements:

Improve Targeting of PI/P Activities

The PI/P component will become more cost-effective by focusing on two subject areas for targeting and phasing messages and audiences over the next five years. Targeting will be achieved by conducting market research to understand what sorts of targeted messages and audiences will need to be addressed. This approach is more methodical and balanced than the first SWMP's diffuse approach. In addition, this approach provides an opportunity to measure progress and to optimize the activities found to be the most effective.

Shift More Responsibility to the Municipalities

Until FY 1995/96 the responsibilities and expectations of the municipalities in helping to implement the PI/P Component were largely undefined. The development of performance standards is a first step to formally shifting some of the responsibility for PI/P activities to the municipalities. Although many of the municipalities have been actively conducting PI/P activities, documenting responsibilities is new. The degree of this shift will depend on taking a phased and incremental approach to determining the optimum mix of local, General Program, and regional PI/P activities.

Continue to Build on Past Accomplishments

The *Countywide Program* will continue to use the basic PI/P materials and messages it has developed and successfully implemented during the first SWMP. An ideal opportunity to re-enforce the existing information is through the participation in the regional radio and television advertising campaign.

Continue to Take a Flexible and Creative Approach

One of the lessons learned during the previous SWMP is the value of taking a flexible and creative approach to PI/P implementation so that new information and ideas are evaluated and incorporated. The whole structure of the five-year plan with annual work plans is consistent with this approach of continuing to improve within the basic agreed upon framework of this SWMP.

SECTION 6

Municipal Maintenance Activities

GOALS

Municipal maintenance is an essential component because it provides the opportunity for the hundreds of maintenance staff working countywide to share information on how to optimize their activities to achieve stormwater quality goals. The Maintenance Subcommittee and recently formed Park and Recreation Workgroup provide a forum for sharing information and developing guidance materials.

The goals of this component include:

- Continuing to optimize pollutant removal during routine maintenance activities such as street sweeping, and maintenance of storm drainage facilities; and

- Identifying ways to prevent or minimize discharges to storm drains and watercourses from road maintenance and parks, corporation yards and other publicly-owned facilities.

EXISTING CONDITIONS

This section summarizes maintenance activities to control stormwater quality during the initial NPDES permit period.

Street Sweeping and Storm Drain System Maintenance

Significant municipal resources are spent on routine maintenance activities such as street sweeping and storm drain system maintenance for aesthetic purposes and flood control. These maintenance activities also remove pollutants that potentially would enter the storm drain system, creeks, estuaries and ultimately San Francisco Bay. Using agreed upon maintenance forms, municipalities have been keeping records of routine maintenance activities since June 1991. Municipalities compile street sweeping and storm drain system maintenance data on a monthly basis and submit it to the General Program. The street sweeping data include the volume of material removed and miles swept by each municipality. The storm drain system maintenance data include the number of inlets and other storm drainage facilities (e.g., creeks, channels, culverts and pump stations) inspected and cleaned and the total volume of material removed. The General Program compiles this information into a database which is used to generate tables for data presentation (see semiannual reports listed in Appendix C).

Cars parked on the street have been identified as a major obstacle to effective street sweeping. During the initial NPDES permit period, the Cities of Hayward, San Leandro and Union City made significant efforts to remove parked cars prior to sweeping (most other municipalities already had established routes and mechanisms for encouraging residents to remove parked cars). These cities have purchased new equipment and hired staff so sweeping routes could be established and residents notified of street sweeping schedules. The City of Oakland also made significant changes in its sweeping program including increasing the frequency of sweeping in residential areas, initiating cleaning in some areas, and essentially eliminating the practice of flushing streets.

Another area identified as a potential problem is gated or private communities where public works maintenance staff do not routinely clean streets or storm

drainage facilities. Insufficient maintenance by private contractors or homeowners associations in these communities (or any non-municipal or private areas that are not routinely maintained) not only results in discharges of pollutants, but may lead to flooding problems downstream.

Outreach

A major function of this component during the initial NPDES permit period has been to provide information about the *Countywide Program* to public works employees. This has primarily been accomplished through monthly or bimonthly meetings and annual workshops. A Maintenance Subcommittee, comprised of public works supervisors, was formed in January 1992 following the first annual workshop in the fall of 1991. At Maintenance Subcommittee meetings, performance standards have been developed and information presented by vendors on storm drain inlet retrofits for treating stormwater and alternatives for labeling storm drain inlets. The annual workshops have focused on educating maintenance field staff on the goals of the *Countywide Program* and obtaining their input on practices that may improve stormwater quality.

Maintenance Performance Standards

Performance standards have been developed for several activities. These standards specify municipal commitments within specified time frames. To date, performance standards for street sweeping, maintenance of storm drainage facilities and watercourses, litter control, corporation yards and road repair and maintenance have been developed by the Maintenance Subcommittee.

Corporation Yards

In March 1994 the Regional Board staff required that member agencies make any needed capital improvements to prevent washwater from entering the storm drain system by July 1, 1995. To assist the municipalities to comply with this requirement and identify other areas which may need improvement, the General Program inspected municipal corporation yards in Alameda County during the first half of 1995. Letters were sent to each municipality following the inspection identifying areas needing improvement, as appropriate.

Most municipalities who previously discharged washwater to the storm drain system have modified their practices by retrofitting the washpad to drain to the sanitary sewer, temporarily moving to a different location and/or adding a berm around the washpad area. In addition, most of the cities have implemented other recommended improvements such as covering materials stored outdoors and hauling wastes from the yard.

Park and Recreation Facilities

To address other maintenance activities of concern outside the realm of the Maintenance Subcommittee (e.g., maintenance of parks and open space lands) a workgroup was formed in the fall of 1994. The Park and Recreation Workgroup brought together for the first time personnel from municipal parks departments and outside public agencies such as the Alameda County Resource Conservation District, Alameda County Water District, Caltrans, East Bay Municipal Utility District, East Bay Regional Park District, and San Francisco Water Department. During the first year of the Park and Recreation Workgroup, performance standards for pesticide usage and pest management practices and fertilizer usage were developed. The fertilizer usage standards specifically address the need to properly design and

manage private and public golf courses to minimize pollutant discharges in stormwater runoff.

ACFC&WCD and Zone 7 Operations

Separate forms for documenting ACFC&WCD and Zone 7 activities have been prepared. These forms request information on illegal discharges observed, pesticide usage, public outreach efforts, restoration and planning activities. Workshops have been held with maintenance crews to discuss modifications to practices that would improve water quality without compromising flood control. Topics discussed have included identification of specific low-growing plant species that can be encouraged to grow in channels, identification of channel reaches that may be suitable for allowing trees and shrubs to grow on one bank, and discussion of locations where desilting practices could be modified.

MAJOR TASKS

The following major tasks will be conducted during the next five years.

Task 6.1 Implement and Update Performance Standards

Each agency will implement the Municipal Maintenance performance standards, contained in Appendix B, as part of its compliance with the countywide stormwater NPDES permit. The Maintenance Subcommittee and Management Committee will review and update annually, as needed, the performance standards for Municipal Maintenance.

Tracking
The General Program will develop and provide reporting forms to each of the member agencies to document the status of implementation of performance standards as appropriate. Completed reporting forms will be included in quarterly or semiannual municipal reports.

Corporation Yards
As mentioned earlier, the General Program inspected municipal corporation yards in Alameda County in 1995 and letters were sent to each municipality following the inspection identifying areas needing improvement. The General Program will assess whether these recommendations for improvement have been addressed.

Update Performance Standards
The Maintenance Subcommittee, Park and Recreation Workgroup and Management Committee will review and update annually, as needed, the performance standards. Examples of topics to address include promoting efforts to remove parked cars prior to street sweeping and enforcement of parking controls.

Task 6.2 Develop Additional Performance Standards

The Maintenance Subcommittee and Park and Recreation Workgroup will develop new performance standards. Draft performance standards will be submitted to the Management Committee for review and approval. The following describes activities for which performance standards will be developed. This list may be revised (in particular, other activities may be added to the list) during the five-year implementation period.

Graffiti Abatement
Pressure washing walls and building exteriors to remove graffiti may discharge and/or mobilize pollutants. Existing practices will be investigated and alternatives explored to minimize or eliminate non-stormwater discharges. For example, a vacuum hose may be attached to a pressure washer so that washwater can be collected for discharge to the sanitary sewer or recycling.

Parking Lots and Sidewalks
Another practice which may lead to non-stormwater discharges is flushing or pressure washing sidewalks and parking lots. Results of research performed on parking lots (including a recent study by the Santa Clara Valley Nonpoint Source Pollution Control Program at the Stanford Shopping Center) will be reviewed to help develop strategies for minimizing pollutant discharges.

ACFC&WCD Operations
The General Program will help coordinate efforts with ACFC&WCD staff to develop performance standards specific to operation and maintenance of flood control facilities. Areas to be addressed include routine maintenance of channels and watercourses, responding to and reporting illegal discharges, maintenance of regional treatment facilities, and pesticide and fertilizer usage.

Municipal Swimming Pools, Ponds, Fountains and Recreational Water Bodies
Municipal swimming pools, ponds, fountains and lakes are potential sources of pollutants to storm drain systems from practices such as adding chemicals to control algal growth and discharges of filter backwash from municipal swimming pools. The General Program will work with municipalities and other public agencies to better understand existing maintenance practices. If significant concerns exist, performance standards will be developed.

Task 6.3 Coordinate with Maintenance-Related Activities by Other Subcommittees of the ACCWP, Other Agencies and Private Industries

Workgroups with appropriate staff from other Subcommittees of the ACCWP, other public agencies and private industries whose activities are similar to or potentially affect municipal maintenance activities will be formed to identify activities of concern and possible BMPs. Examples of other public agencies and private industries include schools, PG&E, water suppliers and utilities, the Port of Oakland, golf courses, private recreational facilities and animal confinement areas. Efforts already initiated by other agencies and private industries to control discharges (e.g., BMPs developed by PG&E and results of the Alameda County Resource Conservation District's watershed protection plan for the Upper Alameda Creek watershed) will be reviewed prior to initiating coordination efforts.

Task 6.4 Identify Maintenance Requirements of Structural Controls to Improve Stormwater Quality and Target Locations for Use

The General Program will work with the Maintenance Subcommittee to identify new technologies for treating stormwater in storm drain inlets and lines and their maintenance requirements to help evaluate each technology's feasibility. The General Program will also work with municipalities to target locations for possible use.

Task 6.5 Optimize Data Management and Analysis

The General Program will optimize ongoing collection, recording and analysis of maintenance data. This data is primarily the street sweeping and storm drain system maintenance data described earlier. This will include continuing to evaluate the following:

- How reliable is the maintenance data reported by municipalities?
- Have parking controls, increased frequency of sweeping and other efforts such as public information

affected the volume of material removed?

- Are all of the types of maintenance data being collected useful or should other types of data be collected and the monthly record keeping form modified?

- How should the maintenance data be compiled for reporting purposes?

Task 6.6 Outreach

Outreach to both maintenance staff and the public is an important aspect of this component.

Maintenance Staff Outreach
The General Program will provide administrative support and guidance for the Maintenance Subcommittee and Park and Recreation Workgroup and will help coordinate annual workshops. In addition, materials designed to increase awareness of performance standards and encourage participation will be developed and distributed to maintenance field staff. Possible materials include bumper stickers and placards with the *Countywide Program* logo for maintenance vehicles and equipment, semi-annual newsletters, and laminated cards with guidance on implementing performance standards.

Public Outreach
The General Program will assist municipalities develop public outreach materials. Of particular interest will be educational materials that inform residents to remove parked vehicles from streets prior to street sweeping. In addition, development of outreach pieces directed at private communities where streets and storm drainage facilities may not be routinely maintained will be considered. The design of public outreach materials will be coordinated with the Public Information/Participation Subcommittee.

Task 6.7 Reporting and Budget Development\Component Management

The General Program will prepare reports, budgets and other items to assist with implementation, documentation and management of this component. Annually, the General Program will review member agency compliance with performance standards.

IMPLEMENTATION STRATEGY

The overall strategy during the next five years includes the following elements:

Provide Information and Feedback to Other Subcommittees of the *Countywide Program* that Affect Maintenance

Increased coordination with other subcommittees will help make the *Countywide Program* more effective. For example, coordination with the New Development Subcommittee is needed regarding proposed structural controls (e.g., storm drain inlet and line interceptors/treatment systems) and gated (private) communities that may affect maintenance downstream. In addition, close coordination with the Industrial and Illicit Discharge Control Subcommittee is needed since maintenance staff may discover and often respond to illicit discharges. Lastly, coordination with the Public Information/ Participation Subcommittee will help in targeting outreach and preparing effective educational materials.

Form Workgroups to Develop Performance Standards

Assembling short-term workgroups has proved to be an effective approach for developing performance standards. The General Program will help identify appropriate workgroup members and coordinate meetings. The workgroups

will include municipal maintenance staff and staff from other agencies and private industry, as appropriate.

Optimize Maintenance Practices to Maximize Water Quality/Aquatic Habitat

The Park and Recreation Workgroup will coordinate with the Monitoring and Special Studies Subcommittee and BASMAA's Operational Permits Committee to integrate the results of special studies into the *Countywide Program*. For example, the results of the vegetated channels study completed in January 1994 suggests that vegetated channels may help to remove pollutants by retaining sediments and associated pollutants. The maintenance of flood control channels and watercourses will be addressed to protect and possibly improve beneficial uses.

SECTION 7

New Development and Construction Controls

GOALS

Modifications of natural drainage systems associated with urbanization e.g., filling wetlands, engineering drainageways to convey runoff quickly, and the increase in impervious surfaces associated with constructing buildings and paved areas for roads and parking lots contribute significantly to stormwater pollution. These types of changes lead to increases in the volume and rate of runoff and discharge of pollutants. Although much of Alameda County is already urbanized, efforts should be made to minimize the impacts of existing and future development and construction projects on environmentally sensitive areas and receiving waters.

The primary goals of this component include the following:

- Provide guidance to municipalities on cost-effective stormwater quality controls applicable to new development, significant redevelopment, and construction projects in Alameda County;
- Incorporate stormwater quality controls into the planning and permitting of new development/significant redevelopment projects;
- Effectively prohibit non-stormwater discharges and require controls to reduce the discharge of pollutants to the maximum extent practicable during the construction phase;
- Ensure that public works construction and maintenance projects conform to the same standards as private projects; and
- Continue to promote implementation of the Regional Board *Staff Recommendations for New and Redevelopment Controls for Stormwater Programs*.

EXISTING CONDITIONS

This section of the SWMP summarizes existing and potential development in Alameda County and what has been accomplished to control stormwater pollution during the initial NPDES permit period.

New Development Potential in Alameda County

Although western Alameda County is highly urbanized, significant development/redevelopment potential exists throughout the County. Table 7-1 summarizes information from the Association of Bay Area Governments (ABAG) on projected increases in population and number of households during the next decade (1995 - 2005) for municipalities in Alameda County.

In summary, eastern Alameda County is expected to experience high growth rates (Dublin, Livermore, Pleasanton and unincorporated Alameda County); other cities with higher than average growth rates include the Cities of Emeryville and Union City. By the year 2005, Alameda County's population may exceed 1.5 million residents occupying approximately 50,000 new households. According to other ABAG statistics, an additional 39,100 acres of land may be used for residential and commercial/industrial

development by the year 2010 (approximately 123,000 acres were developed in 1990). ABAG acknowledges that infill potential is inherently more difficult to quantify than the development potential associated with vacant land and is often underestimated.

Although the majority of new development projects in Alameda County may be redevelopment or infill projects, major residential subdivisions are being built or planned in eastern Alameda County as well as in the Cities of Fremont, San Leandro and Union City. Sufficient land for these projects generally allows vegetative controls to be considered for incorporation into the project design. The following provides examples of stormwater quality controls incorporated in residential subdivisions and infill projects.

Residential Subdivisions

The Cities of Livermore and San Leandro have approved experimental designs for residential subdivisions which incorporate stormwater quality controls. The design for a planned development in the City of Livermore (up to 130 single-family units on 50 acres) includes detention ponds adjacent to Altamont Creek to retain peak flows, and grassy swales between the curb and sidewalks to treat stormwater prior to discharge to the Creek. City of Livermore staff will visually monitor this project, and a similar development, to determine their effectiveness in improving water quality. In the City of San Leandro, staff recently required the developer of 86 acres of Roberts Landing, located adjacent to San Lorenzo Creek and San Francisco Bay, to reduce the number of residential units from 760 to 634 to accommodate two wet ponds.

Worth noting is the development of a September 1995 draft Tri-Valley Subregional Planning Strategy (Strategy) for eastern Alameda and southern Contra Costa Counties (Cities of Dublin, Livermore, Pleasanton, Danville, San Ramon, and Alameda and Contra Costa Counties). Two of the most relevant objectives for the *Countywide Program* in the draft Strategy are: 1) "coordinate... best management practices for stormwater runoff to protect water quality"; and 2)"establish comprehensive guidelines and strategies to protect and enhance... wetlands, riparian areas and oak woodlands."

Infill Projects

According to a project inventory conducted by the *Countywide Program* in July 1995, every municipality in Alameda County except the City of Piedmont had ongoing or planned infill projects. Examples of infill projects include warehouses, commercial/industrial complexes and single family homes or condominiums. Since limited space exists for incorporating vegetative controls in the project design, municipalities generally have required stormwater quality controls as part of their conditions of approval. Typical controls include retrofitting storm drain inlets to treat stormwater runoff, covering loading docks and trash enclosures, and requiring that wash areas drain to the sanitary sewer.

Cost-Effective Stormwater Quality Controls

Limited information currently exists on the cost-effectiveness of stormwater quality controls, although several studies are ongoing or planned. For example, storm drain inlet retrofits were tested in the Stanford Shopping Center parking lot, and studies of Jensen stormwater interceptors are ongoing in Menlo Park (San Mateo County) and planned for San Ramon (Contra Costa County). Based on a recommendation from the New

Development Subcommittee, the Monitoring and Special Studies Subcommittee initiated a study on the effectiveness of grassy swales at a commercial facility in Newark in FY 1995/96. In addition, two related projects funded through BASMAA during FY 1995/96 are preparation of a site planning and design manual for residential subdivisions and guidance on monitoring the effectiveness of best management practices.

Outreach

The New Development Subcommittee assists municipalities implement this component. Recent accomplishments of the Subcommittee include development of recommended conditions of approval to be incorporated into conditions of approval for specific projects, and BMP flyers for construction controls. Letters were sent to municipal planning and public works directors in September 1995 encouraging use of these items.

The first workshop for municipal planners and engineers was conducted in October 1995 to assist municipalities to incorporate stormwater quality controls into new development projects. Presentations at the workshop included specific examples of appropriate stormwater quality controls for residential subdivisions. Workshops targeted to municipal construction inspectors will be conducted in May 1996.

Regional Board *Staff Recommendations*

The Regional Board staff helped BASMAA organize a New Development Committee and prepared *Staff Recommendations for New and Redevelopment Controls for Stormwater Programs (Staff Recommendations)* in April 1994. Municipalities are to implement the *Staff Recommendations* over a two year time frame and report their progress to the Regional Board in annual reports due September 1, 1994, 1995 and 1996. (The Regional Board staff concluded in their review of the *Countywide Program*'s FY 1995/96 annual report that thirteen municipalities had acceptable programs and two cities had conditionally acceptable programs.)

Examples of the Regional Board staff's highest priority recommendations include:

- Requiring all proposed projects with land disturbances of five acres or more to prove coverage under the State's General Construction Activity Stormwater NPDES Permit;
- Requiring all proposed projects to address stormwater quality issues during the environmental review phase;
- Requiring all development plans to include schematic information on permanent erosion and stormwater quality controls; and
- Reviewing current erosion control program effectiveness to identify improvements to protect stormwater.

To address all of the *Staff Recommendations*, performance standards were developed by the New Development Subcommittee which specify municipal commitments within specified time frames.

MAJOR TASKS

The following major tasks will be conducted during the next five years.

Task 7.1 Track Municipal New Development Projects

The General Program will track municipal and private development projects, stormwater quality controls, and municipal measures and policies to control the quality of stormwater runoff. Tracking will primarily be conducted through New Development Subcommittee

meetings and quarterly/biannual municipal reporting. Municipal case studies will also be featured at these meetings. Tracking projects will enable the General Program to assist municipalities comply with performance standards, offer recommendations, and compile information on existing stormwater quality controls.

Task 7.2 Identify and Provide Guidance on Cost-Effective Stormwater Quality Controls

Information on the cost-effectiveness of stormwater quality controls will be compiled from member agencies, other stormwater quality management programs, BASMAA's New Development Subcommittee, ABAG, literature reviews, and equipment/product vendors. As appropriate, the New Development Subcommittee will recommend projects to the Monitoring and Special Studies Subcommittee for monitoring. Criteria for evaluating effectiveness will include operation and maintenance requirements, costs, and treatment capabilities. Educational materials will ultimately be prepared describing cost-effective controls for various types of development including new residential subdivisions, significant redevelopment projects, and commercial/industrial developments.

Task 7.3 Control Discharges from Construction-Related Activities

Workshops and other outreach methods will be used to educate municipal inspectors on what to look for during inspections (e.g., grading, construction, building), best management practices, follow-up procedures, and reporting. Appropriate erosion and sedimentation controls will also be reviewed. Lastly, the General Program will track changes in the State Board's General Construction Activity Stormwater NPDES Permit which expires in August 1997.

Task 7.4 Promote Outreach

Expand Existing Programs

Initial outreach efforts have focused on education of municipal planners and engineers through monthly New Development Subcommittee meetings and workshops. While these efforts should continue to ensure that stormwater quality controls are addressed during the planning and design phase, additional outreach is needed. Thus, during the next five years, outreach efforts will target contractors, developers, Planning Commissions and City Councils. As needed, workgroups will be formed to implement specific tasks. The General Program will evaluate positive incentive programs to ensure that contractors implement best management practices. An example that will be considered as a possible model for use includes the "Green Card" erosion and sedimentation control training and certification program used in Maryland and Delaware. This program requires that at least one person on every construction site receive the training and possess a Green Card.

Prepare and Distribute Educational Materials

Educational materials will be prepared to promote awareness of appropriate stormwater quality controls and other issues of importance to the New Development Subcommittee. Outreach pieces will be designed based on the intended audience (e.g., Planning Commissions, contractors) and guidelines developed by the Public Information/Participation Subcommittee. Various mechanisms for distributing information will be explored including use of the Internet.

Task 7.5 Implement and Update Performance Standards

As noted above, most municipalities are implementing the Regional Board staff's highest priority tasks, and performance standards have been prepared defining the scope of work for prescribed tasks and time frame for implementation. Each agency will implement the New Development and Construction Site Controls performance standards, contained in Appendix B, as part of its compliance with the countywide stormwater NPDES permit.
The New Development Subcommittee and Management Committee will review and update annually, as needed, the performance standards for New Development.

Task 7.6 Conduct Watershed Resource Inventory and Planning

The General Program will assist municipalities to develop criteria for determining sensitive areas, and review existing information on sensitive areas to identify "water quality sensitive" areas according to the schedule in the performance standards. This information will be used to identify development constraints.

Task 7.7 Coordinate with the ACFC&WCD

The New Development Subcommittee will form a workgroup with the ACFC&WCD (and Monitoring and Special Studies Subcommittee, if appropriate) to establish policies on the operation and maintenance of regional flood control facilities to maximize stormwater quality benefits. This will be conducted according to the schedule in the performance standards.

Task 7.8 Reporting and Budget Development\Component Management

The General Program will prepare reports, budgets and other items to assist with implementation, documentation and management of this component. Annually, the General Program will review member agency compliance with performance standards.

IMPLEMENTATION STRATEGY

The overall strategy during the next five years includes the following elements:

Emphasize Source Controls for New Subdivisions

By addressing stormwater quality concerns during the planning and design phase of new subdivisions, the need for post-construction structural controls (e.g,, storm drain inlet retrofits, interceptors) should be reduced. Techniques to prevent and minimize impacts to water quality such as maximizing pervious surfaces, minimizing land disturbance and clustering dwellings will be evaluated along with vegetative controls for environmentally sensitive areas.

Seek Information on Cost-Effective Stormwater Quality Controls

Information will be compiled on cost-effective stormwater quality and erosion controls to assist municipalities to specify requirements to developers and contractors. In addition to information on vegetative controls for new subdivisions, erosion controls during construction, and operation and maintenance of structural controls will be pursued.

Enhance Implementation of the Regional Board *Staff Recommendations*

The Regional Board staff established April 1994 - June 1996 as a trial period for implementation of the Regional Board *Staff Recommendations*. Through guidance provided by the General Program and implementation of performance standards by municipalities,

implementation of the *Staff Recommendations* should be enhanced.

TABLE 7-1
PROJECTED INCREASES IN POPULATION AND NUMBER OF HOUSEHOLDS IN ALAMEDA COUNTY 1995 - 2005[1]

Municipality	Total Population 1995	Projected Increase in Population 1995 - 2005 (%)	Number of Households 1995	Projected Increase in # of Households 1995 - 2005 (%)

San Lorenzo	20,800	300 (1 %)	7,360	90 (1%)
Total	1,364,600	154,100 (11%)	491,350	48,280 (10 %)

1. *Projections '96*, Association of Bay Area Governments, December 1995.

SECTION 8

Illicit Discharge Controls

GOALS

Pollutants poured, spilled, dumped, washed into, or discharged through illicit connections to storm drains would often go undetected without an active municipal program to inspect stormwater conveyance structures. Another aspect of the illicit discharge control program is to provide technical assistance in identifying the sources of spills.

The goals of this component are to:

- Control illicit discharges by conducting field surveys of the storm drainage conveyance system and identifying and eliminating the sources of non-stormwater discharges;
- Analyze information illicit discharge inspectors have obtained to identify consistent methods for conducting field surveys countywide;
- Optimize activities through planning and prioritization; and
- Effectively coordinate spill response and clean-up with existing programs.

EXISTING CONDITIONS

Most tasks are conducted by member agencies; the General Program provides assistance only in areas that would benefit all member agencies such as training, reporting, and support for achieving a consistent countywide approach. The Industrial & Illicit Discharge Control (I&IDC) Subcommittee provides overall direction and coordination for component activities. The I&IDC Subcommittee can also assign issues to its Illicit Discharge Ad Hoc Workgroup for more in depth consideration. It should be noted that the federal regulations for municipal stormwater NPDES permit applications specify certain non-stormwater discharges that will not be considered a source of pollutants when properly managed. These non-stormwater discharges (e.g., springs and dechlorinated swimming pool discharges) are incorporated into municipal stormwater ordinances (see Appendix C).

The following section summarizes member agency accomplishments during the initial NPDES permit period.

Storm Drainage Facilities

An inventory of the storm drain system within each municipality is essential to implementing an effective field survey program. The *Countywide Program* has identified over 3,000 screening stations and over 400 miles of storm drain lines. Screening stations include all outfalls (12-inches and larger in diameter) and the first manhole at or downstream from the junction of two storm drain lines. Municipalities have this information on hard copy maps, as well as electronic file. (See *Desktop Computer Mapping Pilot Project*, October 1992 and *Storm Drain and Screening Point Mapping Report*, September 1994 for information on screening points and storm drain lines; and *Management of Storm Water Facilities in Alameda County*, August 1992 for information on operation and maintenance of existing storm drainage facilities.)

Performance Standards and Annual Municipal Action Plans

Performance standards for implementing illicit discharge control programs describe the information each municipality will

include in an Annual Action Plan for the coming fiscal year.

Field Surveys

The member agencies utilize staff from various municipal agencies to implement different methods for surveying the storm drain system throughout the county including hazardous materials inspectors, Public Works source control inspectors, POTW pretreatment inspectors, municipal maintenance crews, and designated illicit discharge inspectors. (A description of the methods implemented by individual municipalities is in the semiannual reports submitted to the Regional Board.) If a non-stormwater discharge is found, the field inspector tries to identify and eliminate the source. This often requires coordinating with illicit discharge inspectors from other jurisdictions. Because member agencies use different methods for conducting field surveys, there was little consistency on how they were reported until 1994 when the Subcommittee adopted a one page quarterly summary form to document field activities by screening points, channel miles, and effective drainage area. (See *Field Manual: Illicit Discharge Identification and Elimination Program*, August 1992 which describes field screening procedures and methods for detecting and preventing illicit discharges.)

Illicit Discharge Complaint Response\Source Identification Program

Since a network of spill response and clean up programs already exists, establishing a new and separate stormwater response program would duplicate many of the services already being provided by these programs. The approach of this component is to supplement these services and respond to spill incidents that are not under the purview of previously existing clean-up programs. Each agency tracks illicit discharge reports and when necessary, conducts field investigations to attempt to identify and eliminate the source. They also investigate complaints from residents and business owners about non-stormwater discharges. In addition, the *Countywide Program* has conducted workshops in which other agencies (e.g., Regional Board, Department of Fish and Game, Fire and/or Hazardous Materials Departments) participated in educating illicit discharge inspectors about existing spill response programs in order to foster better coordination.

Tracking and Follow-up

As previously mentioned, the *Countywide Program* has tracked the findings and results of illicit discharge field surveys countywide since 1994 using information from the quarterly summary report forms. Information from these reports, illustrated in Figure 8-1, shows that automotive fluids are the primary type of illicit discharge to storm drains. Though the *Countywide Program* continues to approach eliminating non-stormwater discharges primarily through education and outreach, over 230 violation notices (informal and formal) have been issued countywide to date. A *Minimum Enforcement Protocol* was also adopted in 1994 to provide a framework for enforcement actions.

MAJOR TASKS

All of the tasks that will be ongoing throughout the next five year period are described below and illustrated in Figure 8-2. Figure 8-2 also shows how the illicit discharge control program relates to the industrial and commercial discharge control program. It is important to note that although the ACFC&WCD and Zone 7 of the ACFC&WCD do not have to inspect industrial and commercial facilities, they are responsible for the storm drains that they own and operate and therefore also implement an illicit discharge control program.

Task 8.1 Develop an Annual Action Plan

In the Action Plan, each member agency will describe its planned level of effort for conducting field surveys and investigations for the coming year. Action Plans, which only describe *member agency-specific* activities, will provide information on high priority screening areas, a schedule for inspecting high priority areas, and describe how the agency will coordinate information if field surveys and follow-up activities are conducted by different agencies. As described in the performance standards, other information to adequately describe additional aspects of the agency's illicit discharge control program will also be included in the Action Plan including how each agency will achieve the goals described in the performance standards.

Task 8.2 Conduct Field Surveys

Each agency will continue to inspect its stormwater conveyance system for illicit connections and non-stormwater discharges. Inspection procedures include field surveys, follow-up activities to identify and eliminate the source of the discharge, and documentation for tracking. The goal of the *Countywide Program* is for each member agency to survey high priority areas within its jurisdiction at least once every year and the municipality's entire drainage area during the five year permit period.

Task 8.3 Investigate Illicit Discharge Reports\Complaints

Each member agency will continue to investigate the source of illicit discharges and/or complaints within its jurisdiction, as appropriate. Each member agency will conduct follow-up activities to identify the source of the spill and document these activities for tracking, permit compliance reporting, and prioritizing subsequent field surveys.

Task 8.4 Effectively Eliminate Illicit Discharges\Implement and Update Performance Standards

Activities to identify the source of non-stormwater discharges will be conducted by the illicit discharge inspector during field surveys, investigations, and/or conducted in response to spill reports/ complaints. Once the source is identified, the illicit discharge inspector may require that the responsible party use BMPs or other measures to effectively eliminate non-stormwater discharges to storm drains. Guidance will be developed by the I&IDC Subcommittee, as needed, to help ensure non-stormwater discharges are addressed consistently countywide. The illicit discharge inspector may also decide to initiate enforcement actions depending on the impact of the discharge. Activities conducted by illicit discharge inspectors will be coordinated with the industrial and commercial facility inspection program if the discharge is traced to a facility and/or other agencies if the discharge is traced upstream to another jurisdiction.

Each member agency will implement the illicit discharge control program performance standards, contained in Appendix B, as part of its compliance with the countywide Stormwater NPDES permit. The I&IDC Subcommittee and Management Committee will review and update annually, as needed, the performance standards for illicit discharge controls.

Task 8.5 Track and Analyze Illicit Discharge Control Program Findings

This task includes elements that each member agency is responsible for implementing as well as ones the General Program will conduct. Each agency will describe its illicit discharge activities and collect and track all the information necessary to identify and effectively eliminate the source of the discharge. This includes:

- field surveys of its storm drains;
- activities conducted in response to spill reports/complaints;
- the types of discharges that were identified;
- follow-up that was conducted to identify the source of the discharge;
- activities conducted to eliminate the discharge to the storm drains (e.g., BMPs, enforcement); and
- whether the discharge to the storm drains was eliminated.

Tracking information becomes especially important when more than one agency becomes involved in an investigation. Because illicit discharges are diffuse in nature, the illicit discharge inspector might be required to coordinate with other agencies if the discharge is traced to another jurisdiction.

The General Program will collect a subset of this information to demonstrate to the Regional Board staff each member agency's compliance with the municipal storm water permit. The minimum information reported (as defined by the I&IDC Subcommittee) to the General Program will be submitted in quarterly summary reports. The General Program will also analyze countywide information to help improve illicit discharge control program activities with direction from the I&IDC Subcommittee.

Task 8.6 Share Information on Identifying Illicit Discharges and Their Sources

Illicit discharge control program information can be useful to other *Countywide Program* components, such as PI/P for identifying outreach target groups or the industrial and commercial discharge control component for identifying needs for BMP guidance. The I&IDC Subcommittee will provide general guidance on the types of discharges associated with certain types of activities or categories of dischargers using information gathered by illicit discharge inspectors. The point of this task is to help other components find solutions for effectively eliminating non-stormwater discharges by providing a better understanding of their sources.

Task 8.7 Conduct Training for Illicit Discharge Inspectors

The I&IDC Subcommittee will continue to coordinate training workshops for illicit discharge inspectors. The *Countywide Program* will enhance its illicit discharge control program by using lessons learned from previous experiences to train inspectors on improved methods for conducting field surveys, investigating spills, applying BMPs and enforcement. This forum is important to help ensure the level of effort of illicit discharge control activities is consistent countywide. This forum is also a way for member agencies to improve their understanding of the roles and responsibilities of other agencies that respond to spill incidents.

Task 8.8 Reporting, Annual Action Plans and Budget Development\Component Management

The General Program will prepare reports, budgets and other items to assist with implementation, documentation and management of this component. The General Program will also develop a reporting format for the member agency-specific Annual Action Plans to ensure illicit discharge control program activities are reported consistently throughout the county. All consistency and coordination aspects of the task will be completed with direction from the I&IDC Subcommittee. Annually, the General Program will review member agency compliance with performance standards.

IMPLEMENTATION STRATEGY

The overall strategy during the next five years includes the following elements:

Improve Programs Using Existing Information

Information from previous illicit discharge control activities will continue to be used to improve and make more efficient field survey and spill response procedures. Two of the objectives of this strategy are to help inspectors find easier or better ways of finding, tracking and eliminating illicit discharges, and to obtain a better understanding of pollutant sources so the *Countywide Program* effectively prioritizes screening areas and selects topics for BMP guidance.

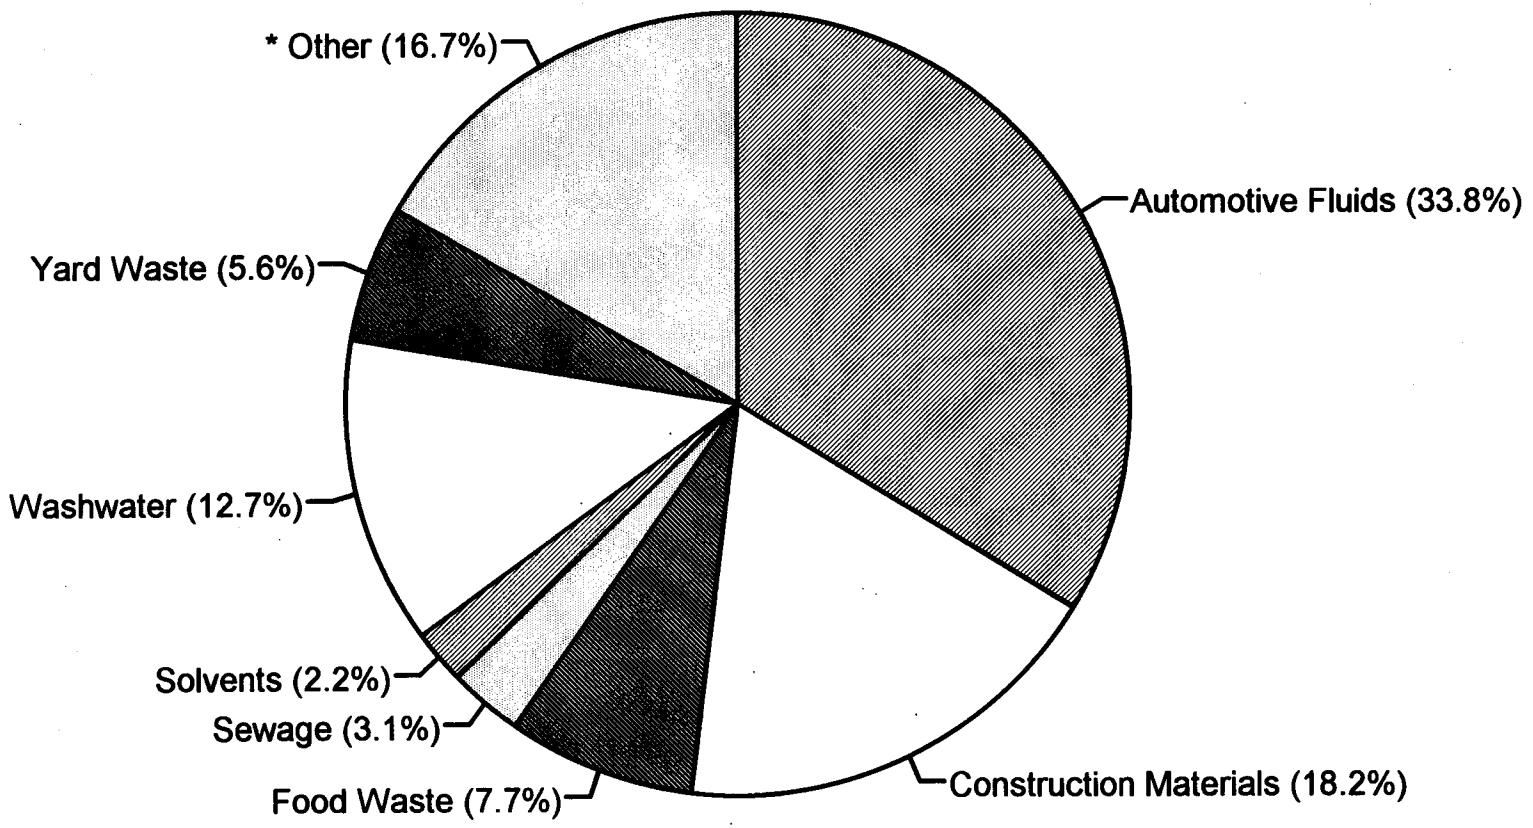
Enhance Level of Effort and/or Enforcement

As people are made more aware of the *Countywide Program* through PI/P, illicit discharge inspections, or facility inspections, municipalities will ramp up their level of effort and/or enforcement on repeat or continuing dischargers. It is important that the *Countywide Program* establishes its credibility through follow-up and enforcement that is equitable and consistent countywide.

Improve Intra/Interagency Coordination

It is essential that efforts are streamlined to prevent duplicate efforts and confusion. Effective communication among agencies both within and outside the member agencies is vital to eliminating discharges that involve more than one jurisdiction. When appropriate, the *Countywide Program* will coordinate illicit discharge control activities among departments and agencies.

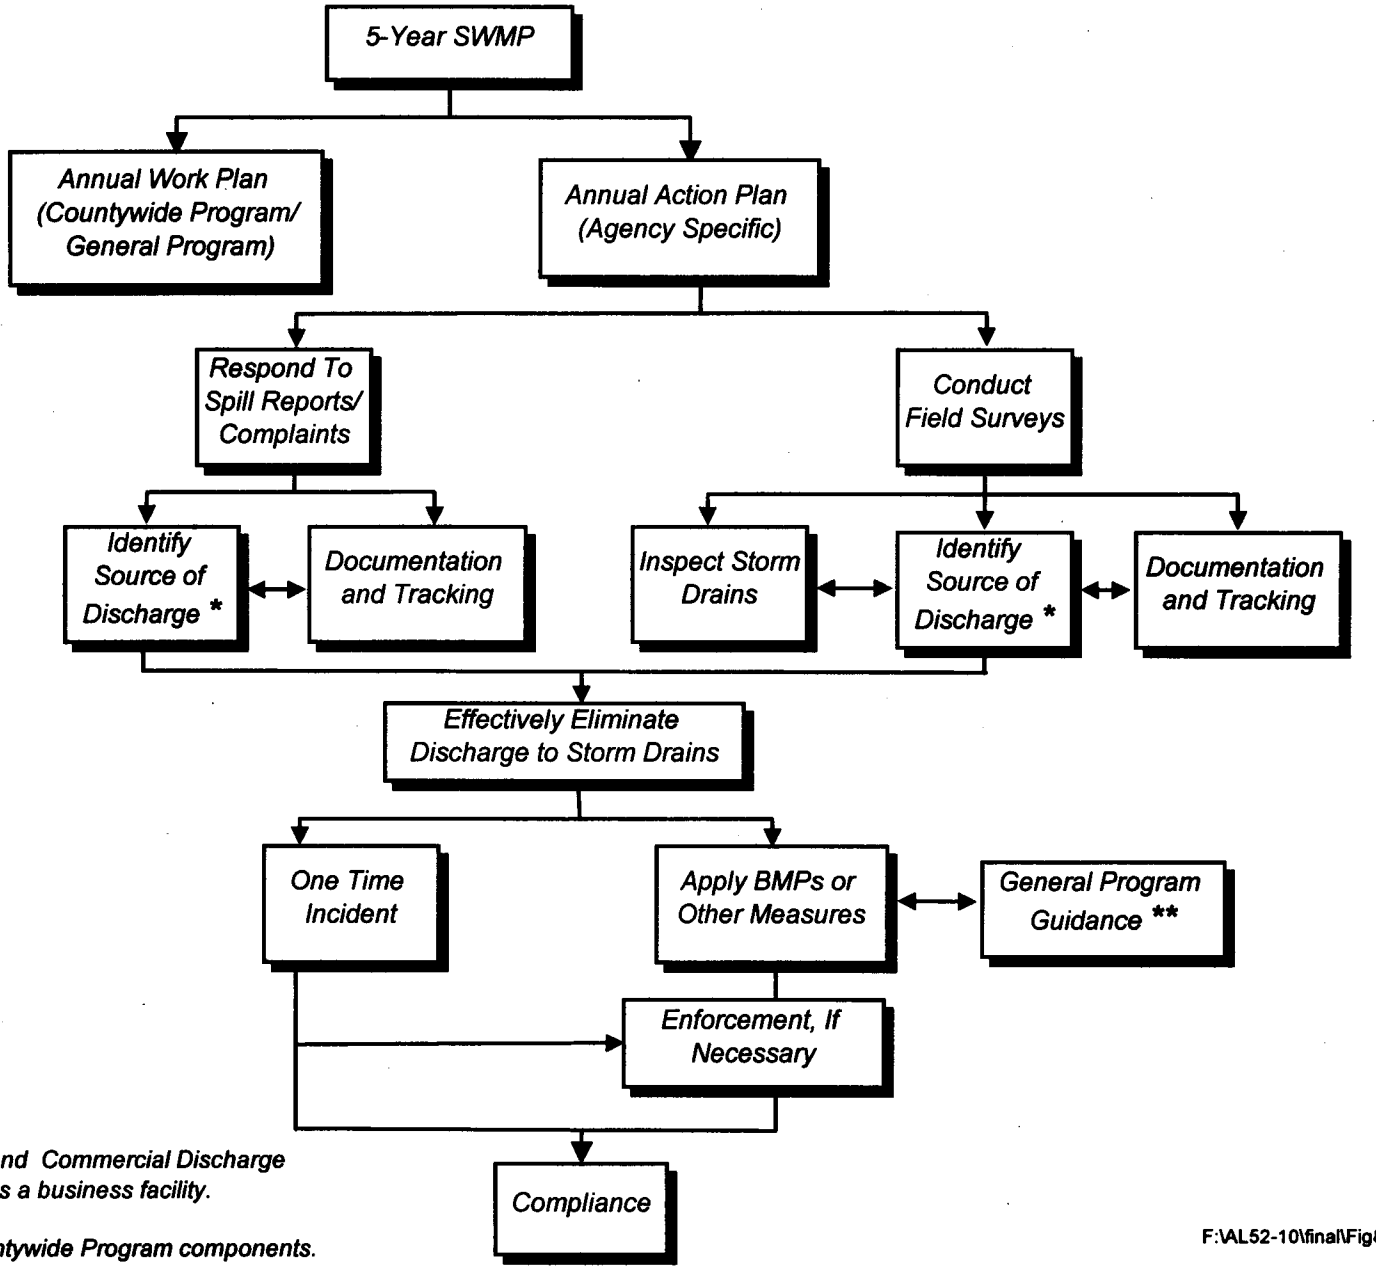
FIGURE 8-1
MATERIALS REPORTED DURING ILLICIT DISCHARGE INSPECTION ACTIVITIES
(JANUARY 1992 THROUGH JUNE 1995)



Total incidents reported = 1,430

* "Other" discharges include pools, carpet cleaning, process water, ink, litter,

FIGURE 8-2
IMPLEMENTATION APPROACH FOR ILLICIT DISCHARGE CONTROL PROGRAM ACTIVITIES



* Coordinate with Industrial and Commercial Discharge Control Program if source is a business facility.

** Coordinate with other Countywide Program components.

F:\AL52-10\final\Fig8-2.AF3

SECTION 9

Industrial and Commercial Discharge Controls

GOALS

The nature of outdoor activities conducted by industrial and commercial facilities results in the potential for pollutants to discharge to municipal storm drains.

The goals of this component are to:

- Reduce the amount of pollutants in stormwater runoff and eliminate non-stormwater discharges to municipal storm drains from industrial and commercial facilities; and

- Identify and minimize potential stormwater pollution sources through facility inspections, outreach activities with businesses, and appropriate follow-up including enforcement.

EXISTING CONDITIONS

The active participation of municipal representatives and Regional Board staff in the Industrial & Illicit Discharge Control (I&IDC) Subcommittee since it was formed in 1992 has been essential for developing guidance and reaching consensus on inspection issues. The I&IDC Subcommittee is very dynamic and often forms workgroups to address specific topics such as inspector training, BMP guidance, wash water information, and inspection data management. The General Program provides technical and administrative assistance to both the Illicit Discharge Controls and the Industrial and Commercial Discharge Controls components through close interaction with the I&IDC Subcommittee and its workgroups. The I&IDC Subcommittee also provides inspectors a forum for sharing experiences that might benefit others including discussions of unresolved problems in order to identify possible solutions.

The following summarizes accomplishments achieved by the Industrial and Commercial Discharge Control Program during the initial NPDES permit period.

Performance Standards and Annual Inspection Plans

Municipal performance standards for implementing industrial and commercial business inspection programs are included in Appendix B. The performance standards also outline the Annual Inspection Plan elements each municipality will prepare for the coming fiscal year.

Industrial and Commercial Facility Inspections

Between July 1992 to January 1996, the *Countywide Program* conducted over 4,500 industrial and commercial facility inspections. Depending on the municipality, stormwater facility inspections have been incorporated into POTW pretreatment, hazardous materials, Public Works source control, and fire department inspections. A subset of the facilities inspected by the *Countywide Program* include facilities also covered under the California General Industrial Activity Stormwater NPDES permit (these facilities are required to submit a Notice of Intent for coverage and are referred to as NOI facilities). Municipalities cooperate with the Regional Board, which has shared jurisdiction and responsibility for NOI facilities, by providing information about NOI sites under the terms of a Memorandum of Understanding and

subsequent letter agreements clarifying the *Countywide Program* inspectors' role with NOI facilities.

The *Countywide Program* has a "hands on" approach to training facility inspectors which has helped develop good inspection practices throughout the county. The *Countywide Program* training program has conducted field exercises and developed a slide show for training inspectors on BMPs (the slide show is also available to individual municipalities to train additional inspectors).

The *Countywide Program* has one of the most advanced and active facility inspection programs in California which contributed to the *Countywide Program* receiving a U.S. EPA National Excellence Award and a U.S. EPA grant to develop a handbook on how to develop and conduct an effective municipal stormwater facility inspection program. The handbook includes case studies from the *Countywide Program* and other stormwater programs throughout California.

Outreach to Businesses

In the spring of 1993, the *Countywide Program* conducted three similar workshops for businesses throughout the county entitled *Complying With the Alameda County Urban Runoff Clean Water Program*. The *Countywide Program* also conducted a pilot workshop as part of one of the West Oakland Commerce Association meetings. The workshop, developed with direction from West Oakland Commerce Association representatives and City of Oakland staff, brought stormwater training directly *to* the business owners. This workshop was then used to create a model workshop for municipalities to conduct with business groups and trade associations within their jurisdiction.

Tracking and Follow-up

The *Countywide Program* has undergone a progressive evolution of facility inspection forms during its first five years, from detailed inspection checklists to summary inspection reports. The current (one page) inspection report (adopted by the I&IDC Subcommittee in February 1996) incorporates input from nearly all of the municipalities as well as Regional Board staff and is not anticipated to change significantly during the next five year period.

The *Countywide Program* has developed facility databases to manage the inspection information including a mapping program that allows municipalities to visually identify trends based on information reported from facility and illicit discharge inspections.

Effective follow-up inspections are integral to the success of the facility inspection program. Stormwater inspectors work with facility operators to reduce the amount of pollutants exposed to stormwater runoff and eliminate non-stormwater discharges. Inspectors help facility operators learn about pollution prevention and BMPs. However, enforcement has also been necessary when the partnership approach was not effective. Since July 1993, approximately 300 violation notices (informal and formal) have been issued and two legal actions taken. The same protocol for the illicit discharge control program is also used for the facility inspection program (see *Minimum Enforcement Protocol* included with the performance standards).

Best Management Practices

The Subcommittee has formed a BMP Workgroup that reviews the needs of facility and illicit discharge inspectors for BMP educational materials. The *Countywide Program* has developed nine BMP flyers for industrial and commercial

business activities and three brochures that target specific automotive businesses. The *Countywide Program* also adapts outreach and BMP pieces from other stormwater programs, and contributes to regional efforts to develop BMPs, as appropriate. Examples of adapted materials include two BMP booklets (one for general industrial facilities and one for automotive businesses) adapted from the Santa Clara Valley Nonpoint Source Pollution Control Program and a BMP poster for restaurants adapted from the City of Santa Monica. Material developed or adapted by the General Program is often provided to municipalities as an electronic file on a floppy disk so municipalities can tailor the piece with information on local contacts and telephone numbers.

In addition to developing BMP outreach and information materials, the I&IDC Subcommittee also developed a priority list for wash water discharges. The list includes different categories of wash waters and acceptable disposal methods.

MAJOR TASKS

All of the tasks that will be ongoing throughout the next five year period are described below and illustrated in Figure 9-1 which also shows how this component relates to the illicit discharge control program. It is important to note that despite the parallels, the two inspection programs have different approaches. The Industrial and Commercial Discharge Controls component involves inspecting *businesses* to prevent pollutant discharge to the storm drains. The Illicit Discharge Controls component involves inspecting *storm drains* for discharges and traces the discharge to its source, which may or may not be a business facility.

Task 9.1 Develop an Annual Inspection Plan

Each municipality will describe its planned level of effort for conducting facility inspections for the coming year in an Inspection Plan (Plan). The Plan will only describe *municipality-specific* information including a priority list of facilities or business types and the number of facilities that will be inspected during the coming fiscal year. (For example, this list could include municipal landfills, hazardous waste treatment, disposal and recovery facilities, as appropriate, for specific municipalities.) Information to adequately describe additional aspects of the municipality's industrial and commercial inspection program will also be included in the Plan, as described in the performance standards (Appendix B). In general, the Plan describes how each municipality will achieve the goals described in the performance standards.

Task 9.2 Conduct Facility Inspections and Outreach Activities; Implement and Update Performance Standards

Each municipality will continue to conduct facility inspections and business outreach to effectively reduce pollutant discharges to its municipal storm drains. Each agency will implement the Industrial and Commercial Business Inspection Activities performance standards, contained in Appendix B, as part of its compliance with the countywide Stormwater NPDES permit. The I&IDC Subcommittee and Management Committee will review and update annually the performance standards for Industrial and Commercial Business Inspection Activities, as needed.

Facility Inspections

Conducting stormwater inspections at industrial and commercial businesses includes: 1) initial/regular site visits to assess the facility's current impact on stormwater; 2) follow-up to ensure BMPs are effectively applied and

pollutant discharge to storm drains is eliminated to the maximum extent practicable; 3) documentation and tracking; and 4) enforcement when necessary. The goal of the *Countywide Program* is for each municipality to inspect high priority facilities (defined in the municipality's Annual Inspection Plan) at least once every year, and the municipality's businesses/ facilities, that have the potential to impact stormwater, at least once during the five year NPDES permit period.

The *Countywide Program* will also continue to share information on NOI facility inspections with the Regional Board staff and work with them to identify how these inspections will be coordinated. Lastly, monitoring data from NOI facilities submitted in annual reports to the Regional Board will be obtained and reviewed.

Outreach to Businesses

The second component to this task is conducting outreach activities to business representatives. This includes educating individual representatives during stormwater facility inspections as well as working with trade associations and business groups to present program goals and offer ideas to solve general compliance issues. There have also been recent efforts to develop regional business recognition programs such as BASMAA's Clean Business Program for Mobile Cleaners and ABAG's Green Business Recognition Program. As requested, the I&IDC Subcommittee will investigate the potential for coordinating stormwater inspection information with these and other regional programs to help ensure that businesses who receive recognition are in compliance with *Countywide Program* NPDES permit requirements.

Task 9.3 Track and Analyze Inspection Findings

Facility inspection information will be summarized and reported to the Regional Board to demonstrate compliance with the NPDES permit. Municipalities will complete the one page report form to record the facility inspection and any follow up. The General Program will continue to compile the inspection information countywide in the facility database and work with the I&IDC Subcommittee to refine future inspection efforts.

Task 9.4 Share Information on Pollutant Contributions from Facilities

The Subcommittee will share inspection information with other components of the *Countywide Program* and other stormwater programs. The I&IDC Subcommittee will provide general guidance on business types or activities with potential to discharge pollutants to storm drains and how businesses have eliminated this potential by effectively applying BMPs.

Task 9.5 Refine BMP Guidelines

As the *Countywide Program* conducts more and more facility inspections, inspectors gain better knowledge of the effectiveness of certain stormwater BMPs. The Subcommittee will periodically review and revise existing BMP guidance, as appropriate, to ensure that they are current.

Task 9.6 Conduct Training for Facility Inspectors

The Subcommittee will continue to coordinate training workshops for facility inspectors. The *Countywide Program* will use lessons learned from inspections to train inspectors on improved methods for identifying issues that affect stormwater quality. Facility inspectors will also be trained on the effectiveness of BMPs as

they are refined and as new guidelines are developed. This forum is important to help ensure that the level of inspection and outreach efforts are consistent countywide.

Task 9.7 Reporting, Annual Inspection Plans, and Budget Development\ Component Management

The General Program will compile and summarize information on General Program and municipal activities to report to the Regional Board semi-annually. The General Program will also develop a reporting format for the municipality-specific Annual Inspection Plans to ensure that industrial and commercial discharge control program activities are reported consistently throughout Alameda County. All consistency and coordination aspects of this task will be completed with direction from the I&IDC Subcommittee. Lastly, the General Program will prepare budgets and other items to assist with implementation, documentation and management of this component including reviewing municipality compliance with performance standards.

IMPLEMENTATION STRATEGY

The overall strategy during the next five years includes the following elements:

Improve Inspection Programs Using Findings from Previous Years

Information from previous facility inspections will be used to improve the selection of priority businesses, inspection methods, and existing BMP guidance. Previous experience has also taught the *Countywide Program* that one of the best ways to exchange BMP information is through trade associations and business groups.

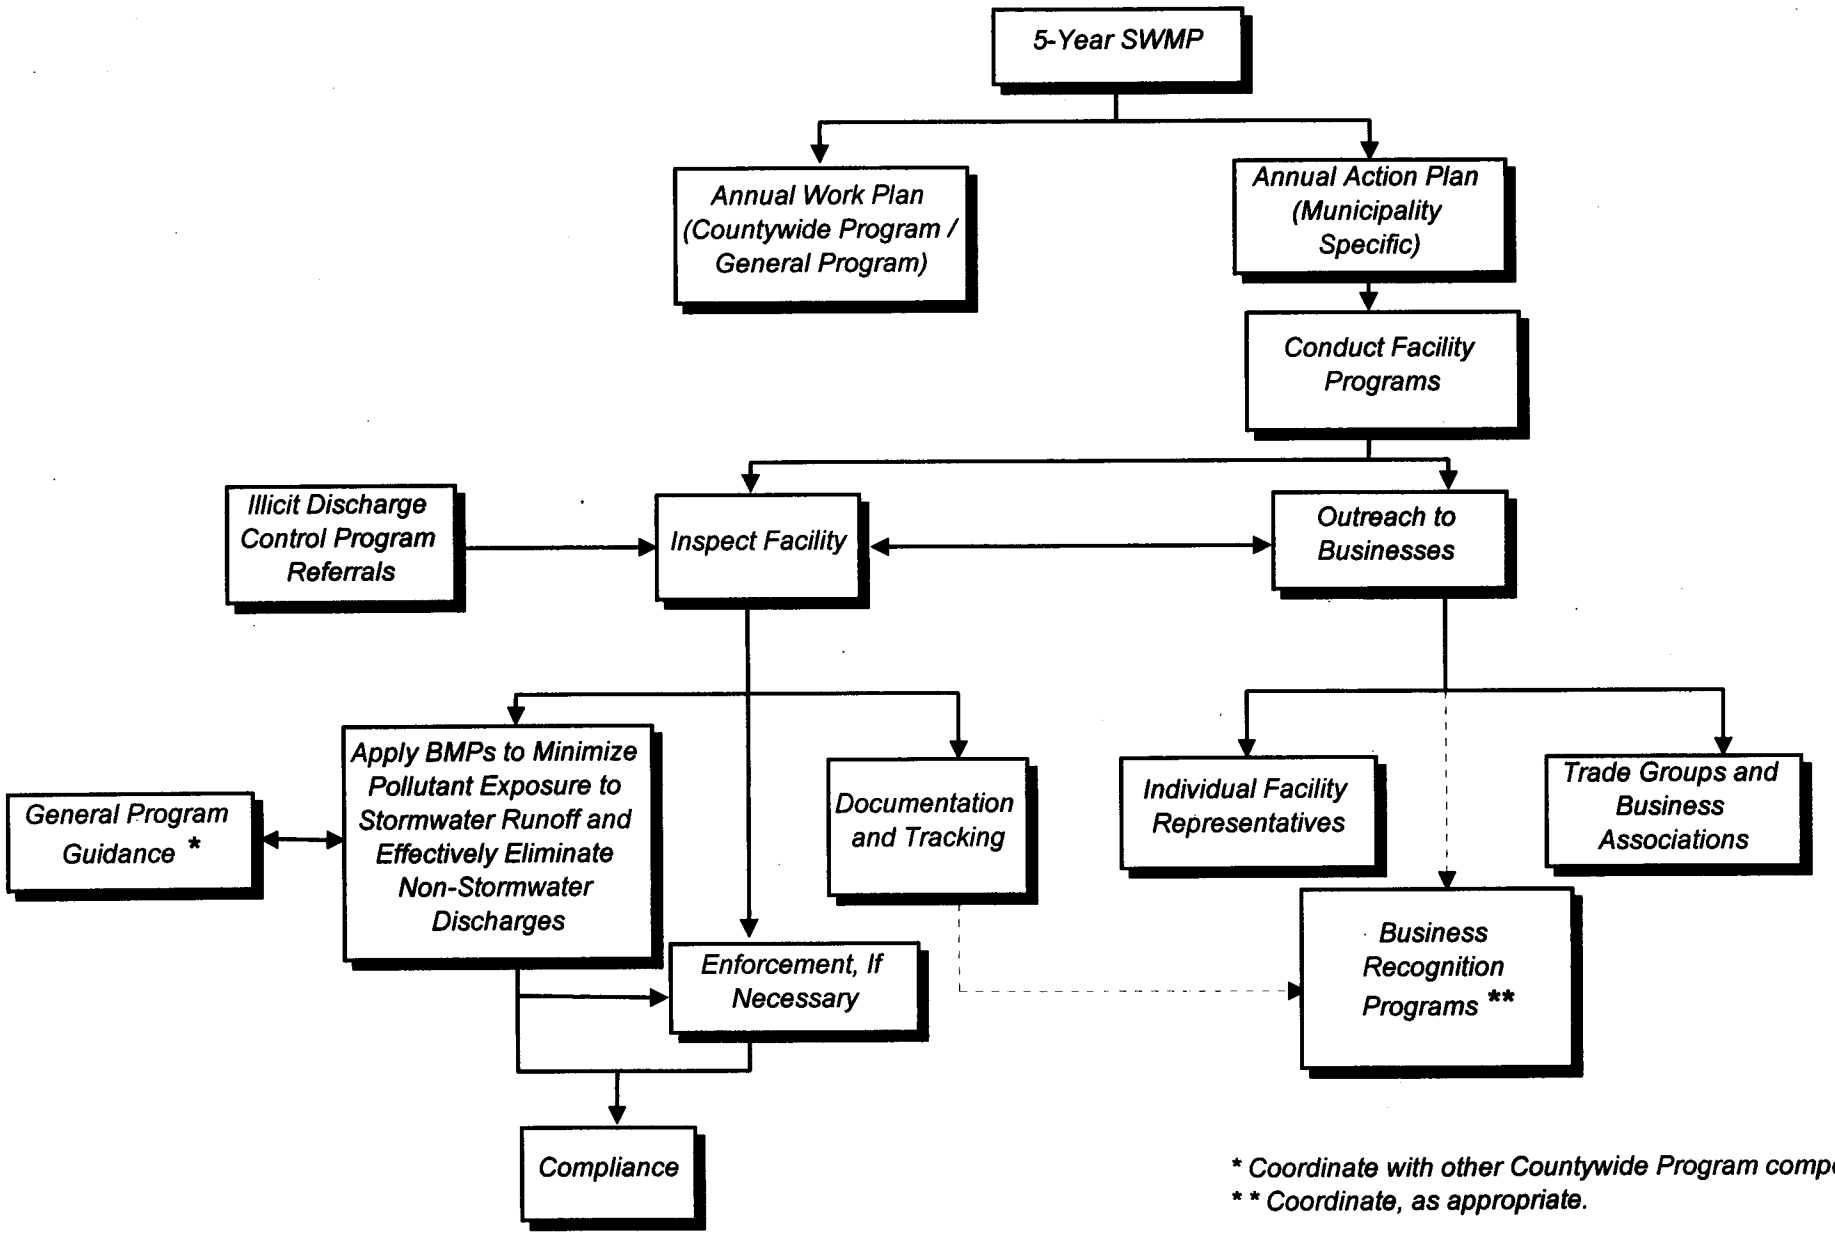
Prioritize Inspection Program

The General Program will continue to develop guidelines for an effective inspection program. Individual municipalities will prioritize their programs within these general guidelines while considering its mix of industrial and commercial businesses and the results of routine facility inspections and follow-up compliance inspections.

Enhance Level of Effort and/or Enforcement

Countywide Program facility inspections will continue to increase stormwater awareness among business owners and operators. The I&IDC Subcommittee will strive to develop a consistent approach to enforcement which is essential for the *Countywide Program* to maintain credibility among the business community.

FIGURE 9-1
IMPLEMENTATION APPROACH FOR INDUSTRIAL AND COMMERCIAL DISCHARGE CONTROL PROGRAM ACTIVITIES



* Coordinate with other Countywide Program components
* * Coordinate, as appropriate.

Appendix A

APPENDIX A

FY 1996/97 WORK PLANS AND BUDGET

List of Tables

Table A1. FY 1996/97 General Program Budget Summary

Program Component	FY 1996/97 Budget
2.0 Regulatory Compliance, Planning, and Program Management	$472,000
3.0 Focused Watershed Management Approach	$110,000
4.0 Monitoring and Special Studies	$514,500
5.0 Public Information/Participation	$530,000
6.0 Municipal Maintenance Activities	$83,000
7.0 New Development and Construction Site Controls	$77,000
8.0 Illicit Discharge Controls	$25,000
9.0 Industrial and Commercial Discharge Controls	$121,000
Contingency	$167,500
TOTAL	$2,100,000

Table A2. Regulatory Compliance, Planning and Program Management General Program Work Plan and Budget - FY 1996/97

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
2.1 Assist with Regulatory Compliance: • The General Program will prepare deliverable forms for member agencies to streamline the information that needs to be collected for reporting to the Regional Board. • Draft and final semiannual reports summarizing General Program and member agency activities will be prepared and submitted by the required dates in the NPDES permit. • The General Program will review each member agency's performance and meet with each agency to discuss its performance and ways to improve the ACCWP. Additional assistance will also be provided to member agencies as need to optimize regulatory compliance. • Negotiate with Regional Board staff on NPDES permit's findings and provisions	These tasks are all based on the SWMP.	$100,000 ($7,000) ($43,000) ($40,000) ($10,000)	 July 23, 1996 and January 27, 1997 October 1, 1996 April 1, 1997 June 30, 1997 August - October 1996
2.2 Lead and Represent the ACCWP: The Management Committee Chair or other designated personnel will represent the ACCWP at BASMAA, State Stormwater Quality Task Force, Regional Monitoring Program meetings and other meetings as appropriate or requested by member agencies. This task will also include anticipating regulatory initiatives that affect the ACCWP, promoting awareness of the ACCWP, and identifying opportunities for collaborating with other agencies.		$102,000	ongoing
2.3 Plan, Initiate, and Respond to Regulatory and Grant Funding Initiatives: The General Program will work through BASMAA, the State Stormwater Quality Task Force, and other organizations to identify and evaluate regulatory and grant funding initiatives and issues that may impact the ACCWP. Draft and final comments on regulatory issues will be prepared for the Management Committee's review and final comments submitted and/or presented at public hearings and meetings. Grants will be applied for and managed if awarded. Legal assistance will also be funded through this task, as needed.		$50,500	ongoing
2.4 Continue to Institute a Process for Continuous Improvement: The General Program will compile comments from member agencies on how to improve implementation of the ACCWP, forward these comments as appropriate, and track implementation of requested changes.		$0 (budget included as part of Task 2.1)	compile comments by August 1, 1996 (based on FY 1995/96 comments)

Table A2. Regulatory Compliance, Planning and Program Management General Program Work Plan and Budget - FY 1996/97 (Continued)

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
2.5 Provide ACCWP Management Services: • Support the Management Committee, Policy Level Subcommittee, and work groups as appropriate. • Provide financial, contract, and program management support activities. Specifically, the General Program will conduct fiscal analyses, process accounts receivable and payable, track consultants' work, prepare quarterly reports which document General Program budget expenditures and the status of tasks, and prepare the following year's General Program budget. • Provide quarterly reports about General Program progress and expenditures.	This task is based on the SWMP.	$ 147,000 ($56,000) ($61,500) ($29,500)	ongoing
Annual NPDES permit fee		$12,000	
Annual BASMAA dues		$60,500	
	TOTAL	$ 472,000	

Table A3. Focused Watershed Management General Program Work Plan and Budget - FY 1996/97

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
3.1 Participate in Watershed Management Projects Lead By Others	ACCWP will track and participate in watershed management projects led by others to represent ACCWP interests.	$0 (Task to be conducted by District Staff under Monitoring and Special Studies Task 4.1)	ongoing
3.2 Prepare for, Conduct, and Complete Pilot Project:			
3.2.1 Pilot Watershed Project Work Plan	Prepare five year work plan for Pilot Watershed Management Plan.	$30,000	February 1997
3.2.2 Data Compilation	Compile data for Draft Watershed Management Plan.	$30,000	July 1997
3.2.3 Volunteer Monitoring Technical Support	Provide technical support, training, quality assurance quality control for volunteer monitoring groups in San Leandro Creek to ensure data necessary for watershed management is gathered.	$30,000	October 1997
3.4 Assist with Implementing NPDES Permit Requirements, MOU Required reports, Annual Work Plans, and Budget Development	Bring issues for consideration by the general program to the policy committee and management committee as appropriate.	$20,000	ongoing
	TOTAL	$110,000	

Table A4. Monitoring and Special Studies General Program Work Plan and Budget - FY 1996/97

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
4.1 Track and Coordinate with Regional Monitoring Program, BASMAA and Watershed Management Projects Led By Others:	Continue to track and coordinate monitoring with RMP and BASMAA. Attend Technical advisory meeting and steering committee meetings.	$20,000[1]	ongoing
4.1.1 Regional Monitoring Program	This fee is the ACCWP portion of the Regional Monitoring Program costs. The RMP is conducted by the San Francisco Estuary Institute for the Regional Board.	$160,000[1]	ongoing
4.1.2 Bay Protection Toxic Clean-up Program	This fee is the ACCWP portion of the BPTCP costs.	$20,000[1]	ongoing
4.2 Long Term Stream Monitoring	Long term stream monitoring to be conducted by the Flood Control and Water Conservation District. Includes costs for sampling and chemical analysis.	$110,000[1]	ongoing

Table A4. Monitoring and Special Studies General Program Work Plan and Budget - FY 1996/97 (Continued)

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
Task 4.3 Special Studies: 4.3.1 Special Studies Needs Assessment	Attend other Subcommittees and conduct assessment of the need for special studies.	$10,000	December 1996
4.3.2.1 Effectiveness of Structural Treatment Measures	Conduct Pilot Project on modified maintenance of vegetation in channels at one location.	$15,000	October 1997
4.3.2.2 Structural Wetlands Treatment	Survey concentrations of DDT, PCBs, selected metals in fish tissues from urban runoff streams and impoundments.	$60,000	October 1997
4.3.4 Dry Weather Diazinon Monitoring	Collect data on diazinon in water in Crandell Creek and Castro Valley during dry weather.	$30,000	October 1997
4.4 Pilot Watershed Management Project	Initiate a Pilot Watershed Project in San Leandro Creek. Prepare a Work Plan for the project describing objectives, stakeholders, approach, schedule and budget.	$0 (budget included in Watershed Management Task 3.2)	October 1997
4.5 Component Management: 4.5.1 Quarterly Reporting	Prepare quarterly reports of monitoring and special studies activities.	$5,500	Each Quarter
4.5.2.1 Long-Term Stream Monitoring Data Management & QA/QC	QA/QC and update monitoring database.	$27,000[2]	October 1997
4.5.2.2 Long-Term Stream Monitoring Reporting	Prepare annual report on long-term stream monitoring.	$37,000[2]	October 1997
4.6 MSS Subcommittee Support	Provide technical support for MSS Subcommittee.	$20,000	ongoing

Table A4. Monitoring and Special Studies General Program Work Plan and Budget - FY 1996/97 (Continued)

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
	TOTAL	$514,500.	

Notes:

1- Task to be conducted by Alameda County Flood Control and Water Conservation District (District) Staff under General Program Budget;
2- Task to be conducted by District and Consultant under General Program Budget.

Table A5. Public Information/Participation General Program Work Plan and Budget - FY 1996/97

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
5.1 Implement Targeted Outreach: This task consists of developing an implementation plan for the residential yard and garden care audience based on the market research conducted in FY 95/96. This task also includes beginning to implement the plan, which may require the development of additional creatives. The last item this includes is the support for the printing and placement of local billboard and newspaper advertising, as appropriate, that will be developed by BASMAA for its yard and garden care program.	The costs for the printing and local placement of BASMAA created billboards and advertising has been included under this task since these items are likely to help further the campaign with the residential yard and garden care. Decisions on what exactly will be done need to wait until the market research and implementation plan have been completed.	$125,000	to be determined
5.2 Continue to Reinforce General Outreach Messages: This task includes the following items: General Program public relations; developing and obtaining promotional materials for use by the municipalities; updating and reprinting existing ACCWP materials; and continuing the PI/P coordinator participation in and representation at General Program at outreach events.	The amount of funding for General Program public relations has been reduced from $25,000 in FY 95/96 to $10,000 based on BASMAA developing a regional public relations activity (described under Task 7).	$70,000 ($10,000 public relations; $25,000 promotional materials; $20,000 reprinting; and $15,000 for the PI/P Coordinator to represent the ACCWP)	ongoing
5.3 Support Watershed-based Approaches: The PI/P Coordinator will act as a coordinator and information clearinghouse to assist municipalities conduct watershed type activities.	This task is meant to be within the PI/P Coordinator's existing role.	$0 (budget is under Task 5.8)	ongoing
5.4 Evaluate Effectiveness: This task in FY 96/97 is to continue to track number of telephone calls received and materials sent out by the General Program as a rough measure of the effectiveness of the PI/P component.	This task may include more formal surveys to measure public awareness in future years, but not in FY 96/97.	$0 (budget is under Task 5.8)	ongoing

Table A5. Public Information/Participation General Program Work Plan and Budget - FY 1996/97 (Continued)

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
5.5 Assist Municipalities Update and Implement Agreed Upon Performance standards: The PI/P Subcommittee and Management Committee will review and update, if needed, PI/P's performance standards. The PI/P Coordinator will also review each municipalities' compliance with the agreed upon performance standards and notify any municipalities in writing who are not meeting the performance standards.	These task are all based on the SWMP.	$0 (budget is under Task 5.8)	by December 1996
5.6 Assist with Focused Staff Training: This task will include the PI/P Coordinator working with the PI/P Subcommittee to identify its training priorities and to implement the desired training.		$10,000	evaluation by September 1996
5.7 Seek Partnerships, Build Coalitions, and Provide Educational Support: This task includes providing support for BASMAA's regional advertising campaign and for its regional public relations activities. The task also includes working with groups who are most associated with residential yard and garden care, such as the home composting program. Possible coordination on ABAG's Green Business Recognition Program will also be included as part of this task. Lastly, educational support for activities such as the Kids in Creek program, Bay Saver Club, BAER Fair, and Community Stewardship Grants are included as part of this task.	This task is based on the SWMP. The contribution to the BASMAA advertising campaign is the same as FY 95/96; the amount budgeted for educational support is also similar to FY 95/96.	$235,000 (BASMAA regional advertising - $100,000; BASMAA public relations - $10,000; and educational programs - $125,000)	ongoing
5.8 Assist with Implementing NPDES Permit Requirements, MOU Required Reports, Annual Work Plans, and Budget Development: This task includes the PI/P Coordinator completing these tasks. For budgeting purposes, the work under Tasks 3, 4, and 5 and the portion of Task 7 which addresses working with other groups is included in this task.	This task has been reduced by about $20,000 compared to FY 95/96 because of the completion of the performance standards and second SWMP.	$90,000	ongoing
	TOTAL	**$530,000**	

Table A6. Municipal Maintenance Activities General Program Work Plan and Budget - FY 1996/97

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
6.1 Implement and Update Performance Standards: *Tracking* - The General Program will develop and provide deliverable forms to each of the member agencies to document the status of implementation of performance standards as appropriate. The General Program will annually review each municipalities' compliance with the performance standards and provide needed assistance. *Updating Performance Standards* - The General Program will work with the Maintenance Subcommittee and Park and Recreation Workgroup to update existing performance standards as needed. Topics to address include promoting efforts to remove parked cars during street sweeping and enforcement of parking controls. Changes to the performance standards will be submitted to the Management Committee for approval.	Performance standards are the primary method for implementing the Stormwater Management Plan and complying with the requirements of the NPDES. Performance standards should be updated annually to reflect experience gained and lessons learned during the previous year.	$5,000 (the remainder of this budget is under Task 6.6)	Ongoing June 30, 1997
6.2. Develop Additional Performance Standards: The General Program will work with the Maintenance Subcommittee, the Park and Recreation Workgroup, other subcommittees of the ACCWP, other public agencies, flood control districts and private industry as needed to develop additional performance standards/BMPs for up to three new activities. Draft performance standards will be submitted to the Management Committee for approval.	Additional performance standards are needed to address maintenance-related activities not included in the existing performance standards.	$22,000	January - June 1997
6.3 Coordinate with Maintenance-Related Activities by Other Agencies and Private Industries: Workgroups will be formed with appropriate staff from other public agencies and private industries whose work affects municipal maintenance activities to identify activities of concern and possible BMPs. Examples include schools, PG&E, golf courses, private recreational facilities and construction contractors.	Coordination among agencies and industries whose activities affect municipal maintenance will result in greater efficiency and effectiveness in meeting this component's goals.	$0 (Budget is under Task 6.2)	Ongoing
6.4 Identify Maintenance Requirements of Structural Controls to Improve Stormwater Quality and Target Locations for Use: The General Program will work with the Maintenance Subcommittee to identify new technologies for treating stormwater in storm drain inlets and lines and maintenance requirements to help evaluate their feasibility. The General Program will also work with municipalities to target locations for possible use.	NA	$0 (Budget is under Task 6.6)	July - December 1996

Table A6. Municipal Maintenance Activities General Program Work Plan and Budget - FY 1996/97 (Continued)

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
6.5 Optimize Data Management and Analysis: The General Program will input, review, compile and analyze municipal government maintenance activities information from reports submitted by municipalities and optimize this data management and analysis. The General Program will continue to evaluate the use of the data and make recommendations for future data collection.	NA	$15,000	Ongoing
6.6 Outreach: The general program will provide administrative, regulatory and technical support to the Maintenance Subcommittee, the Park and Recreation Workgroup and other workgroups as needed. Outreach to maintenance staff will also include up to two one-half day workshops conducted to demonstrate existing maintenance procedures and equipment and new technologies. At least one outreach piece (e.g., door hanger) for maintenance staff and/or the public will be developed and distributed. Development of public outreach materials will be coordinated with the Public Information/Participation Subcommittee.	Outreach activities will educate maintenance staff and the public about the ACCWP's goals related to municipal maintenance and provide information on how the public can help the municipalities achieve these goals.	$31,000	Ongoing
6.7 Assist with Implementing NPDES Permit Requirements, Preparing MOU Required Reports and Budget Development: The General Program will prepare reports, budgets and other items to assist with implementation and documentation of this component.	NA	$10,000	Ongoing
	TOTAL	$83,000	

Table A7. New Development and Construction Site Controls General Program Work Plan and Budget - FY 1996/97

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
7.1 Track Municipal New Development Projects and Stormwater Quality Controls: The General Program will track significant municipal and private development projects and stormwater quality controls in Alameda County. This information will be compiled for inclusion in the annual report. In addition, municipal (primarily Bay Area) measures and policies (general plan sections, ordinances, contract specifications, etc.) to control the quality of stormwater runoff will be compiled and shared with member agencies.	Tracking municipal projects is required in the Regional Board *Staff Recommendations* (document test cases). Measures and policies to control the quality of stormwater runoff are required in the *Staff Recommendations* (D) and the performance standards.	$8,000	September 1, 1996 Ongoing
7.2 Provide Guidance on Cost-Effective Stormwater Quality Controls: Using readily available information, the cost-effectiveness of stormwater quality controls for new residential subdivisions, significant redevelopment projects, or hillside developments will be prepared. The catalogue of control measures will summarize information on the history of use, cost(s), operation and maintenance requirements, and treatment capabilities, if possible.	This task is based on the SWMP.	$12,000	June 30, 1997
7.3 Control Discharges from Construction-Related Activities: This task focuses on working with municipal inspectors to incorporate stormwater quality concerns into routine inspections, document and coordinate findings with the municipality's illicit discharge program, and educate municipal staff on best management practices. Specific items to be addressed will be based on the recommendations from the workshop for municipal inspectors to be conducted in May 1996. Lastly, the General Program will track the State Water Resources Control Board's process and recommendations for renewing the General Permit Construction Activity Stormwater NPDES Permit which expires in August 1997.	Improving construction inspection programs is required in the Regional Board *Staff Recommendations* (G) and the performance standards.	$8,000	ongoing
7.4 Promote outreach: This task includes providing administrative and technical support for monthly New Development Subcommittee meetings, conducting a workshop, if appropriate, and developing educational materials. At least one educational piece will be prepared and distributed for a targeted audience (e.g., Planning Departments, Planning Commissioners, contractors). The General Program will also explore possible home pages for distributing information via the Internet.	This task is based on the SWMP.	$ 35,000	ongoing

Table A7. New Development and Construction Site Controls General Program Work Plan and Budget - FY 1996/97 (Continued)

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
7.5 Assist municipalities update and implement agreed upon performance standards: • The General Program will develop reporting forms to document the status of implementation of performance standards. • The New Development Subcommittee and Management Committee will review and update, if needed, the performance standards. • The General Program will review each municipalities' compliance with the agreed upon performance standards and notify any municipalities in writing who are not meeting the performance standards.	This task is based on the SWMP.	$2,000 (the remainder of this budget is included in Task 7.4)	October 1, 1996 April 1, 1997 January 1, 1997 March 1, 1997
7.6 Initiate Watershed Resource Inventory and Planning: The New Development Subcommittee will assist municipalities develop criteria for sensitive areas to ultimately be used to identify development opportunities and constraints. Sensitive areas may include wetlands, nature preserves, endangered species habitat and areas based on input from citizens groups.	This task is required in the Regional Board *Staff Recommendations* (A) and the performance standards.	$0 (budget is included in Task 7.4)	by January 1, 1997
7.7 Coordinate with the Flood Control Districts: The General Program will work with the New Development Subcommittee and Flood Control Districts to form a workgroup to initiate discussions on the operation and maintenance of regional flood control facilities.	This task is based on the Regional Board *Staff Recommendations* (K), and the performance standards.	$2,000	June 30, 1997
7.8 Assist with implementing NPDES permit requirements, preparing MOU required reports, and budget development: The General Program will prepare reports, budgets and other items to assist with implementation and documentation of this component.	This task is based on the SWMP.	$10,000	ongoing
	TOTAL	$77,000	

Table A8. Illicit Discharge Controls General Program Work Plan and Budget - FY 1996/97

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
8.4 Effectively Eliminate Non-stormwater Discharges to the Storm Drains: 8.4.1 Resolve countywide consistency issues through the Industrial & Illicit Discharge Control Subcommittee. 8.4.2 Review component performance standards.	This task is based on the SWMP. Performance standards are reviewed annually and updated as necessary.	$2,000	Ongoing July 1, 1997
8.5 Track and Analyze Illicit Discharge Control Program Findings: 8.5.1 Track field survey and spill response activities countywide submitted in quarterly summary reports. 8.5.2 Illicit Discharge Work Group will analyze information and identify how programs can be improved.	This task is based on the SWMP. One of the component's implementation strategy is to improve the program by learning from previous experiences.	$6,000 ($4,000) ($2,000)	March 1,1997 & September 1, 1997 April 1, 1997 & October 1, 1997
8.6 Share information on identifying Non-stormwater Discharges and Their Sources: Illicit Discharge Work Group will develop general guidance on the types of discharges associated with certain types of activities or categories of dischargers. Share guidance with other ACCWP components through the Management Committee.	This task is based on the SWMP. One of the component's implementation strategy is to improve inter/intra-agency coordination.	$3,000	June 1, 1997
8.7 Conduct Training for Illicit Discharge Inspectors: 8.7.1 Form a Work Group to develop the agenda, workshop handouts, presentation materials,and announcement brochure. 8.7.2 Conduct the workshop.	This task is based on the SWMP.	$10,000	April 15, 1997
8.8 Assist with Implementing NPDES Permit Report Requirements, Annual Action Plans and Budget Development: 8.8.1 Develop report form for the Annual Action Plan. 8.8.2. Compile and summarize General Program and agency-specific activities for reporting to the Regional Board.	This task is based on the SWMP. All agencies will submit their action plan using the same form to help ensure the information reported is consistent countywide.	$4,000 ($2,000) ($2,000)	December 15, 1996 March 1, 1997 & September 1, 1997
	TOTAL	$25,000	

Table A9. Industrial and Commercial Discharge Controls General Program Work Plan and Budget - FY 1996/97

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
9.2 Conduct Facility Inspections and Outreach Activities: 9.2.1 Provide technical and administrative support to the Industrial & Illicit Discharge Control Subcommittee and its Work Groups. 9.2.2 Review component performance standards.	This task is based on the SWMP. Performance standards are reviewed annually and updated as necessary.	$38,000 ($36,000) ($2,000)	 Ongoing October 1, 1996
9.3 Track and Analyze Inspection Findings: 9.3.1 Update and maintain the facility database. 9.3.2 Form a Work Group to decide how the facility database should be used to evaluate the effectiveness of the facility inspection program. Build off of analysis of previous facility database work groups. 9.3.3 Conduct analysis and make recommendations to the Subcommittee for improving facility inspection programs.	Task is based on Draft SWMP. One of the component's implementation strategy is to improve the program by learning from previous inspections. The objective of this task is to use inspection information to improve inspection programs.	$45,000 ($30,000) ($5,000) ($10,000)	 Ongoing December 1, 1996 January 1, 1997
9.4 Share Information on Pollutant Contributions from Facilities: Develop general guidance on the types of business activities with potential to discharge pollutants to the storm drains, and how businesses have eliminated this potential by effectively applying BMPs. Share guidance with other ACCWP components and other stormwater programs.	This task is based on the SWMP. The objective of this task is to use inspection information to review the effectiveness of BMPs and share this information with others.	$8,000	March 1, 1997
9.5 Refine BMP Guidelines: 9.5.1 Form a BMP Work Group to review and update existing BMP guidelines. The BMPs Work Group will also review the need for additional BMPs as directed by the Subcommittee. 9.5.2 Make changes to update existing BMPs, as needed. 9.5.3 Develop additional BMPs, as needed.	This task is based on the SWMP. The objective of this task is to improve ACCWP BMPs based on Task 9.4.	$8,000	 April 1, 1997 to be determined to be determined
9.6 Conduct Training for Facility Inspectors: 9.6.1 Form a Work Group to develop the agenda, workshop handouts, presentation materials, and announcement brochure. 9.6.2. Conduct the workshop.	This task is based on the SWMP.	$12,000	September 1, 1997

Table A9. Industrial and Commercial Discharge Controls General Program Work Plan and Budget - 1996/97 (Continued)

Task Number and Description	Rationale/Background	Budget	Schedule/Due Date
9.7 Assist with Implementing NPDES Permit Report Requirements, Annual Inspection Plans, and Budget Development:	This task is based on the SWMP.	$10,000	December 15, 1996
9.7.1 Develop report form for the Annual Inspection Plan.		($2,000)	March 1, 1997
9.7.2 Compile and summarize General Program and municipality-specific activities for reporting to the Regional Board.		($8,000)	September 1, 1997
	TOTAL	$121,000	

Appendix B

APPENDIX B

PERFORMANCE STANDARDS

ATTACHMENTS:

A Monthly Record Keeping Form
B Protocols for Reporting Enforcement Activities
C Illicit Discharge Inspection Quarterly Summary Report
D Standards Stormwater Facility Inspection Report Form

INTRODUCTION TO PERFORMANCE STANDARDS

Performance standards to be implemented by member agencies have been developed for the following five areas of the SWMP:

- Public Information/Participation,
- Municipal Maintenance Activities,
- New Development and Construction Controls,
- Illicit Discharge Controls, and
- Industrial and Commercial Discharge Controls.

These performance standards define a large part of what each member agency will need to do to implement the SWMP and comply with the NPDES permit. The following provides a brief background on how these performance standards were developed and the process that will be used for their annual review and update, as needed.

BACKGROUND

Based on a meeting between the ACCWP's Policy Level Subcommittee and the Regional Board staff in March 1994, it was agreed that the ACCWP would work through its subcommittees to establish performance standards that define an appropriate level of effort for agency-specific, SWMP activities. The items agreed to by the Policy Level Subcommittee and Regional Board staff were put in writing, adopted by the Management Committee in May 1994, and submitted to the Regional Board staff as a one-page document titled "Agreed Upon Steps to Improve the ACURCWP and Communication with the Regional Board" (Attachment 1).

The performance standards were envisioned as being modeled after the Best Management Practices developed by the Maintenance Subcommittee in 1993. As part of the agreement it was recognized that the performance standards may be tailored to fit the different situations found in various municipalities.

Between March 1994 and December 1995 the subcommittees and Management Committee completed, and submitted to the Regional Board staff, performance standards for the major municipality-specific activities areas listed above. Regional Board staff helped to develop the performance standards for industrial and commercial discharge controls, illicit discharge controls, and public information/participation and has tacitly accepted the performance standards for municipal maintenance activities and new development and construction controls. One of the modifications to the performance standards made in response to Regional Board staff requests was to include a tentative schedule for the implementation of performance standards that are not being implemented currently.

The General Program has the role of advising municipalities on whether they are meeting the agreed upon performance standards and, where a lack of compliance is determined, of providing assistance. The status of each agencies' compliance with the performance

standards will be contained in the annual report to the Regional Board staff. Each subcommittee that developed a set of performance standards has been assigned responsibility for resolving general problems with interpreting and attaining the performance standards and for reviewing and updating them annually, as needed.

TIERS AND PROCESS FOR MODIFYING THE PERFORMANCE STANDARDS

The performance standards are divided into three tiers. Tier I performance standards comprise the baseline level of effort that each agency is required to be currently implementing; Tier II contains performance standards that will be implemented within the next one to five years; and Tier III performance standards contain ideas that will be evaluated further for possible future implementation.

Because very little individual tailoring of the Tier I performance standards has occurred to date, it is possible that some additional future modifications may be needed to better reflect individual member agency situations. In addition, one or two member agencies may not have fully reviewed and recognized the implications of the agreed upon performance standards, and these agencies may eventually need to propose and achieve some reasonable tailoring to fit their local situation.

The Tier II performance standards are on an anticipated time schedule for implementation over the next one to five years. The schedule provided was the best estimate at the time of development of the performance standard. Table B1 summarizes the time periods of Tier II standards for each area of the SWMP. Because the evolvement of performance standards may be faster or slower than originally anticipated, the schedules contained in Tier II are tentative. The shift of a performance standard from Tier II to I will only occur when the ACCWP's Management Committee amends these performance standards based generally on considering the recommendation of the originating subcommittee. Subcommittees will review and update performance standards during the first six months of each fiscal year. In addition, new Tier I performance standards may be identified and adopted without having to first be listed in Tier II.

Tier III represents brainstormed ideas about possible future performance standards that may or may not have sufficient merit for future implementation. The benefit of having Tier III is to identify needs for special studies and other ways to evaluate the listed ideas so that the worthwhile ones are identified and developed for incorporation into Tiers II or I.

TABLE B1. TIER II TIME PERIODS AND DEFINITIONS

Areas of Activity		Time Period
Public Information and Participation		1, 3, or 5 years
Municipal Maintenance		
	Street Cleaning	5 years
	Storm Drainage Facilities and Maintenance of Watercourses	5 years
	Litter Control	5 years
	Road Repair and Maintenance	5 years
	Corporation Yards	5 years
	Pesticide Usage and Pest Management	5 years
	Fertilizer Usage	5 years
New Development and Construction Site Controls		1, 3, or 5 years
Illicit Discharge Control		1 year
Industrial and Commercial Discharge Control		1 year

Definitions

Tier II(1) - Performance standards tentatively scheduled to become Tier I by July 1997.

Tier II(3) - Performance standards tentatively scheduled to become Tier I by July 1999.

Tier II(5) - Performance standards tentatively scheduled to become Tier I by July 2001.

Performance Standards for

PUBLIC INFORMATION AND PARTICIPATION

I. PARTICIPATION IN PI/P SUBCOMMITTEE AND GENERAL PROGRAM ACTIVITIES

Tier I

1. Each agency will designate a person responsible for implementing its Public Information/Participation (PI/P) activities and for acting as a liaison with the PI/P Subcommittee. This designated person will stay sufficiently informed by attending Subcommittee meetings or using other means to participate constructively in PI/P Subcommittee decisions and activities.

2. Each agency will chair the PI/P Subcommittee on a rotating basis so that the burden of providing local leadership for the ACCWP is shared in an equitable manner among all of the agencies.

3. Each agency will complete its PI/P quarter or semiannual deliverable reports within the schedule established by the General Program.

II. INTERNAL AGENCY COMMUNICATION AND TRAINING

City Staff and Officials

Tier I

1. Each agency is responsible for identifying, developing, and communicating information about the ACCWP so that its clean water staff and elected officials are well informed about the requirements of the ACCWP, their role in implementing the ACCWP, and the progress of the ACCWP. This will include the adaptation and/or development and distribution to all municipal staff and elected officials of at least one informational piece annually.

2. New employees involved with ACCWP activities will be provided with information about the ACCWP and the role of the new employee's staff position.

Procedures and Training for Handling Telephone Calls from the Public about Stormwater

Tier I

1. Each agency will have a written procedure that it follows for answering and efficiently routing stormwater related telephone calls to the appropriate municipal staff for handling.

2. Agency staff assigned to answering or responding to telephone calls will be trained and familiar with the established written procedures.

III. USE OF PROGRAM OUTREACH

Distribution of ACCWP Information Pieces

Tier I

1. Each agency will be responsible for identifying how it will distribute copies of General Program informational materials.

2. Within two years of receiving its allotment from the General Program, each agency will have the goal of completing distribution of these materials to the target audience. Approximately one-half or more of the materials should be distributed within twelve months of receiving the allotment.

3. Each agency will be responsible for tracking the number of General Program educational materials distributed with sufficient accuracy to be able to determine the need to re-order, to demonstrate compliance with No. 2 above, and document for NPDES permit reporting.

Storm Drain Inlet Stencils and Signs

Tier II(3)

1. Each municipality will have stencilled or in some other ways signed all of its storm drain inlets or conducted activities that are demonstrably equivalent in terms of achieving awareness by residents that materials should not be disposed down storm drains. Demonstrably equivalent means that the municipality will provide examples of comparable alternative activities or have available a valid survey to show that its residents are as aware of where storm drains lead as are residents in comparable communities with stencils or signs.

2. As a goal all stencils and signs installed will be maintained sufficiently to be readable.

3. In order to provide an educational opportunity, each municipality will optimize the use of local volunteers to assist with the stenciling or signage activities.

IV. AGENCIES' COMMUNITY OUTREACH PROGRAM

Tier I

1. Agencies will participate in community outreach activities from the areas listed below (under A. through F.) for the purpose of communicating the general stormwater pollution prevention message and complementing the General Program's specific message(s) for its targeted audience(s). The following number of different activities that will be participated in annually:

   <u>Over 100,000 in population</u>
   - each municipalities will participate in four events;

Between 50,000 and 100,000

- each municipality will participate in three events;

Less than 50,000; Alameda County Flood Control and Water Conservation District(District); and Zone 7 of District

- each agency will participate in two events.

A. Participate in Existing Community Events

Distribute ACCWP information by participating in existing community events (fairs, festivals, exhibits, etc.) held within its or a nearby jurisdiction. This participation may include the setting up of a booth, kiosk display, or other creative means of communicating the general stormwater pollution prevention message, using a specific message to a target group, or make a presentation to a local community service group.

B. Initiate New Community Events

Play a major role in planning and staging a community or city-wide event, examples include the following:

- Earth Day or other festival or fair;
- Business mixer;
- Seminar or target group; and/or
- Contests.

C. Contact Media and Conduct Advertising

Maintain local media contacts with local newspaper, radio, and television stations to be able to communicate the general stormwater pollution prevention message, complement the General Program's specific targeted audience(s) and message(s) and complement regional PI/P activities. This local media contact may include the adaptation and/or development and distribution of stormwater related press releases or the use of advertising in local telephone directories.

D. Provide Program Information Through Other Venues

The following types of venues may be used:

- Agency newsletter;
- Other municipal newsletter;
- Local magazine;
- Utility bill inserts;
- Mailing to target group; and
- Computer bulletin board or network.

E. Develop and Implement Integrated Outreach Approaches

This area includes approaches that increase the effectiveness of pollution prevention activities as follows:

- Point of purchase display and giveaway;
- Plan create, and distribute videos;
- Create and stage a play;
- Develop special displays or kiosks for your message especially interactive ones (such as slides in movie theaters);
- Develop/implement program for school curriculum and provide equipment;
- Support and partner with other agencies to increase or improve pollution prevention capabilities (e.g., helping set up oil and/or antifreeze collection facilities); and
- Make and place signs on sweepers or other vehicles; and
  Place messages on workers' tee-shirts.

F. Develop Watershed Awareness

This area includes one or more of the following activities:

- Identify and support a friends of a watershed group and encourage creek cleanups (or if this is infeasible, lagoon or shoreline cleanups) or adopt-a-creek or other volunteer monitoring and resource inventorying activities. The friends group for San Leandro Creek should be used as a model;
- Conduct a creek cleanup (or if this is infeasible, lagoon or shoreline cleanups) within its jurisdiction on an annual basis; and
- Participate in a local event in its jurisdiction or neighboring jurisdiction as part of the Coastal Commission's annual Coastal Clean-Up Day and/or as part of Earth Day.

Tier II (3)

1. Participate in twice as many outreach activities annually as listed in Tier I. In addition, one of these will be from "F. Develop Watershed Awareness" to be conducted every other year or more frequently.

2. Each municipality will identify whether there are any special needs of some of its residents. An example of a special need would be if a significant percentage (around 5 percent) of the residents are native speakers of a language other than English or Spanish who would be able to better participate in the municipality's stormwater pollution prevention efforts by having materials available in their native language.

Tier II(5)

1. Each municipality that has identified a special need of some of its residents will develop and distribute the translated materials or other special materials needed to address a special need.

V. COORDINATION WITH PUBLIC SCHOOLS (K-12)

Tier I

1. Information provided by the General Program about the Bay Saver Club, Kids in Creeks workshops, community stewardship grants, or other educational opportunities, will be provided by each municipality to all the public schools within its jurisdiction according to schedules developed by the PI/P Subcommittee.

2. Each municipality will distribute to the public schools in its area computer programs, children's educational activity booklets, and other information the General Program develops or helps develop. This may include disseminating information on how to obtain copies of material if this is a more efficient way to achieve distribution.

Tier III

1. The Program will develop materials for outreach to schools and each municipality will work with the local school district to ensure that appropriate stormwater pollution prevention and aquatic resource protection information is taught to every public school child within its jurisdiction.

VI. NON-COMPLIANCE WITH PERFORMANCE STANDARDS

Tier I

1. If the General Program identifies in writing to an agency that its implementation of these performance standards is deficient, the agency will respond within 30 days with a plan for correction of the deficiencies noted or correct the misinformation that led to the General Program's invalid conclusions. Agencies with deficiencies will notify the Regional Board staff of its recognition of the problems and plan for correction as part of the normal reporting process.

Tier III

1. If the General Program or others have conducted a valid survey of the level of awareness of the stormwater pollution and aquatic resources problems and solutions in each municipality and found that a municipality's residents have less of an understanding of stormwater pollution than comparable communities in the County, the municipality will identify and implement a program within one year to improve its performance in order to attain a level of understanding equivalent to that being achieved in comparable communities.

Performance Standards for

MUNICIPAL MAINTENANCE

Categories of performance standards for Municipal Maintenance Activities, developed by the Maintenance Subcommittee, cover the numerous routine maintenance practices conducted by public works staff such as

- Street Cleaning,
- Storm Drainage Facilities and Maintenance of Watercourses,
- Litter Control, and
- Road Repair and Maintenance.

The goal of these performance standards is to maximize removal of pollutants and/or minimize the discharge of pollutants to storm drain systems. In addition, performance standards were developed for practices such as washing vehicles and equipment and material usage and storage that typically occur in

- Corporation Yards.

The Maintenance Subcommittee has also identified the need to develop performance standards for related activities such as maintenance of parks and other undeveloped lands. Consequently, a Park and Recreation Workgroup was formed consisting of maintenance staff from municipal parks departments and public agencies such as Caltrans, EBMUD, EBRPD. Through this workgroup, performance standards were developed for:

- Pesticide Usage and Pest Management, and
- Fertilizer Usage.

I. STREET CLEANING FREQUENCY

Tier I

1. Each agency will clean streets at least monthly and preferably the same day, and time of day, each month to encourage voluntary removal of parked vehicles.

Tier III

1 Each agency will clean streets in business districts more often than once a month if needed - up to daily during the week.

2. If cleaning streets more frequently than once a month, the agency will maintain its current street cleaning frequency (do not reduce sweeping frequency).

II. STREET CLEANING OPERATION TO MAXIMIZE POLLUTANT REMOVAL

Tier I

1. Each agency will clean streets so that they look clean and no dirt tracks, trails or debris are visible.

2. Each agency will check that street cleaning equipment is in proper adjustment.

3. Each agency should operate street cleaning equipment at the speed specified by the manufacturer.

4. Each agency will minimize the number of operators assigned to each machine.

5. When using broom sweepers, the agency will check that the appropriate weight on main and gutter brooms are used.

6. Each agency will discourage allowing residents to "opt out" of the municipalities' street cleaning program.

Tier II(5)

1. When purchasing new sweepers, the agency will review alternative equipment and new technologies to maximize pollutant removal.

Tier III

1. Each agency will provide resources to maintain schedules if there is a holiday that week, staff are absent due to illness, or there is equipment failure, within one day of regularly scheduled day.

2. Each agency will schedule routes such that operators are working in close proximity to provide back-up if necessary.

3. Each agency will identify the most efficient street sweeping techniques (equipment, etc.) and begin phased purchase as allowed by budget constraints.

III. PROBLEMS ASSOCIATED WITH EFFICIENT STREET CLEANING

Getting Parked Cars Off Streets

Tier I

1. Each agency will maintain a consistent sweeping schedule.

Tier II(5)

1. Each agency will develop and distribute newsletters and other public education materials notifying residents and businesses of street sweeping schedules and/or

2. Post temporary "no stopping, no parking" signs in business districts, near large apartment complexes, etc.

Tier III

1. Each agency will post permanent street sweeping signs on streets where appropriate and enforce. OR,

2. Each agency will post temporary "no stopping, no parking" signs in Business Districts, near large apartment complexes, etc.

Removing Large Accumulations of Leaves Just Prior to Sweeping

Tier I

1. Each agency will investigate alternative methods of handling leaf fall and develop an appropriate leaf removal program, such as:

   - Operate street cleaning equipment in tandem;
   - Utilize a leaf removal machine just prior to street cleaning;
   - Utilize a front end loader with a dump truck just prior to cleaning; and/or
   - Encourage residents to collect and compost leaves or coordinate with a local composting program. If composting is infeasible, agencies should schedule for removal of bagged leaves.

Planting and Maintaining Trees Near Streets

Tier I

1. Each agency will provide operators with adequate resources to conveniently report

trees interfering with street cleaning.

Tier III

1. Each agency will trim trees to allow street cleaning equipment to pass under them.

2. Each agency will plant trees which do not require frequent trimming and whose roots will not destroy curbs as city street trees.

IV. SPILL RESPONSE

Tier I

1. See procedures under Storm Drainage Facilities and Maintenance of Watercourses.

V. RECORD KEEPING

Tier I

1. Each agency will track miles swept using a broom odometer or by tracking mileage only when cleaning (do not include mileage to an area).

2. Each agency will track volume or weight of material removed each street cleaning day.

3. Each agency will identify and target areas for: 1) more frequent cleaning throughout the year or just prior to the rainy season; 2) additional efforts to remove vehicles; 3) distributing public education materials to discourage illegal dumping, etc.

VI. CONTRACT SWEEPERS

Tier I

1. Each agency will specify in all new or re-bid contracts that in case of equipment failure, back up equipment must be available to ensure that the route is completed that day, and that all information necessary for record keeping will be provided.

VII. DISPOSAL OF STREET SWEEPING MATERIALS

Tier I

1. Each agency will ensure proper handling and disposal of material removed from streets to prevent discharges of pollutants to surface waters or groundwater.

I. ROUTINE INSPECTION AND CLEANING

Tier I

1. Each agency will inspect storm drainage facilities (inlets, culverts, V ditches, pump stations, open channels and watercourses), at least once a year, preferably prior to the rainy season, and clean as necessary.

2. When cleaning storm drain inlets and lines, each agency will remove the maximum amount of material at the nearest access point to minimize discharges to watercourses.

Tier II(5)

1. Each agency should develop a storm drainage facility inspection and maintenance plan. The plan shall include:

   a. Schedule for inspecting storm drainage facilities;

   b. Rationale for determining when to clean inlets, etc.;

   c. Results of an evaluation to install additional screens or grates near or in inlets to inhibit discharge of litter, but where flooding is not a concern;

   d. Identification of target areas for cleaning and/or public education; and

   e. Inventory of the storm drain system.

Tier III

1. Each agency will inspect storm drainage facilities twice a year: prior to the rainy season to prevent flooding and discharge of pollutants, and after the rainy season to remove pollutants and encourage proper disposal of waste material and to clean as needed. (Inlets which are clear of debris may discourage people from dumping wastes.)

2. Each agency will inspect storm drain inlets monthly during the wet season in areas suspected of containing illegal dumping, and clean as necessary.

3. When sweeping over storm drain inlets with broom sweepers, each agency will use the gutter broom only to remove as much debris as possible. The agency will keep the rear broom outside the grate area to prevent pushing debris into the inlet.

II. RECORD KEEPING

Tier I

1. Each agency will report the amount of material removed when cleaning storm drainage facilities in monthly record keeping forms.

2. Each agency will document and track spill incidents and response to spill incidents either as described in the "Monthly Record Keeping Form" (Attachment A) or as part of the Illicit Discharge Quarterly Summary Form (Attachment C).

3. Each agency will track storm drain inlets which require more frequent cleaning than once or twice a year for additional cleaning, different type of cleaning, and/or public education efforts.

4. Each agency will document and maintain the following records monthly for pump stations and watercourses:

   a. Areas/sites inspected,

   b. Silt and vegetation removal practices,

   c. Areas where man-made materials are removed, type and estimate of volume removed,

   d. Disposal practices and any testing results,

   e. Spill incidents and follow-up actions,

   f. Application of chemicals (type used, areas applied), and

   g. Areas for possible improvements.

III. DISPOSAL OF MATERIAL

Tier I

1. Each agency will store material removed from storm drainage facilities on a concrete pad or other type of impermeable material (during the rainy season, cover with impermeable material) and drain wastewater to the sanitary sewer or allow to evaporate to prevent discharges to the storm drain system. Agencies will dispose of the material at an appropriate facility.

IV. SPILL RESPONSE

Tier I

1. If the spill is suspected to be toxic or hazardous materials, maintenance staff will call the public safety dispatcher, 911, and/or the local illicit discharge coordinator.

2. If non-hazardous materials are spilled, maintenance staff should contain the spill area immediately to prevent additional dumping and discharge of pollutants into the storm drain system and clean as soon as practicable.

3. Each agency will establish response/removal procedure for spills after work hours with the illicit discharge coordinator.

4. Maintenance staff will report spills to, and work with, the municipalities' illicit discharge coordinator, or appropriate party, to determine the appropriate follow up response (e.g., track the source of the spill and identify product labels that have a bar code identifying the originating agency, contact Building and Planning Departments, send a clean-up bill to the responsible party, etc.).

Tier III

1. Each agency will request that local Fire and Police Departments respond to spills with engines and sirens to attract public attention.

2. Each agency will mail "notice of violation" letters and send copies to local Fire and Police Departments and Regional Board staff for possible future enforcement action.

V. GEOGRAPHICAL PROBLEM AREAS

Tier II(5)

Steep and Narrow Streets Where It Is Difficult to Use Street Sweepers or Vacuum Equipment

1. Instead of flushing streets and allowing water to drain into storm drain inlets, each agency will:

   a. Encourage residents to maintain streets by removing leaves, litter, etc.,

   b. Cover storm drain inlets, flush streets, and manually remove material.

   c. Flush streets, allow material to drain into storm drain inlets, etc. and collect debris downstream at clean outs or catch points.

Areas Where Cars Are Always On the Street and Temporary Posting Is Not Feasible

1. Instead of flushing streets and allowing water to drain into storm drain inlets, each agency will post temporary signs to remove cars and sweep according to posted schedule.

2. If flushing streets, the agency will cover the storm drain inlet, and remove material manually or using vacuum equipment.

3. The agency will consider posting No Parking signs on cleaning days to increase accessibility.

VI. INSPECTION AND MAINTENANCE

Tier I

1. Each agency will inspect pump stations after the wet season and develop a time schedule for maintenance activities prior to the next wet season.

2. Each agency will inspect trash racks and oil absorbent booms after significant storms. Remove debris in trash racks and replace oil absorbent booms as needed.

VII. PERMITS AND OTHER REGULATORY REQUIREMENTS

Tier I

1. Each agency will coordinate with the California Department of Fish and Game, the U.S. Army Corps of Engineers, and other agencies as appropriate in order to comply with regulatory requirements prior to commencing work.

VIII. TARGET AREAS FOR IMPROVEMENTS

Tier II(5)

1. Each agency will evaluate additional areas for trash racks, oil absorbent booms, outlet protection etc. to enhance watercourses.

2. Each agency will identify illegal dumping hot spots and communicate findings with the Illicit Discharge Coordinator for your municipality. Agencies will conduct regular inspections, posting and clean-up to discourage additional dumping incidents. Each agency will consider fencing off areas to minimize dumping.

3. Each agency will coordinate with local law enforcement officials to enforce laws in targeted areas to prevent illegal dumping.

IX. PESTICIDE USE

Tier II(5)

1. Each agency will eliminate the use of pesticides containing copper as an active ingredient such as copper sulphate used as an algicide in fountains and drinking water reservoirs especially if discharges may ultimately reach watercourses or San Francisco Bay.

2. Each agency will apply chemicals according to manufacturers' registered labelling.

X. DESILTING AND DISPOSAL

Tier II(5)

1. Each agency will minimize desilted areas and disturbance of channel bottoms during desilting. (Organic matter and fine clay particles may help adsorb metals.)

2. Each agency will dispose of desilted material properly and will not allow it to re-enter the watercourse after removal.

XI. VEGETATION

Tier II(5)

1. Each agency will consider retaining (design approved) low growing vegetation in channel bottoms and slopes to detain runoff, trap sediment and enhance riparian habitat when evaluating the need to maintain channel design capacity.

XII. VOLUNTEER MONITORING AND CLEAN UP

Tier II(5)

1. Each agency will work with volunteer citizen groups interested in monitoring and clean-up of watercourses and related trails and pathways.

2. Each agency will participate in the California Coastal Commission's annual "Adopt a Beach/Watercourse" clean up day in September each year. The agency will provide supplies such as garbage bags and arrange removal of bagged garbage. The agency will also organize and participate in additional clean up days in targeted areas as appropriate.

Tier I

1. Each agency will provide an adequate number of litter receptacles in commercial areas and other litter source areas. Agencies will make every effort to contain litter in receptacles.

2. Each agency will pick up litter receptacles on a frequent enough basis to prevent spillage.

Tier III

1. Each agency will encourage public education efforts to include an anti-littering message. The agency will specifically encourage: 1) residents to compost yard waste; 2) residents and businesses to remove litter from their property and properly containerize waste; and 3) owners of loading docks, restaurants and other litter source areas to sweep outdoor areas daily and properly containerize waste.

2. Each agency will encourage local law enforcement personnel to post signs and enforce anti-littering laws especially for owners of vacant lots where litter accumulates.

3. Each agency will document and maintain the following records monthly:

   a. Areas targeted for litter removal,

   b. Total amount of material removed, and

   c. Amount of material which should have been disposed as household hazardous waste or recycled.

4. Each agency will label litter receptacles with anti-littering messages when possible.

I. GENERAL PRACTICES

Tier I

1. Each agency will schedule excavation and road maintenance activities for dry weather.

2. Each agency will inspect and repair leaking equipment daily.

3. Each agency will perform major equipment repairs at the corporation yard, when practical.

4. When refueling or maintaining vehicles and equipment on-site, each agency will use a location away from storm drain inlets and creeks.

5. Each agency will recycle used motor oil, diesel oil, concrete, broken asphalt, etc. whenever possible.

6. Each agency will train employees in using these BMPs.

Tier II(5)

1. Each agency will contain diesel oil used to lubricate or clean equipment or parts.

II. ASPHALT/CONCRETE REMOVAL

Tier I

1. Each agency will take measures to protect storm drain inlets prior to breaking up asphalt or concrete (e.g., place hay bales or sand bags around inlets). The agencies will clean afterwards by sweeping up as much material as possible.

2. After breaking up old pavement, each agency will remove and recycle as much as possible to avoid contact with rainfall and storm water runoff.

3. During saw-cutting operations, each agency will block or berm around storm drain inlets using hay bales or an equivalent appropriate filter device, or absorbent materials such as pads, pillows and socks to contain slurry. If slurry enters the storm drain system, the agency will remove material immediately.

4. Each agency will remove saw-cut slurry (e.g., with a shovel or vacuum) before leaving at the end of the day.

III. PATCHING AND RESURFACING

Tier I

1. Agencies will not stockpile materials in streets, gutter areas or near storm drain inlets or creeks unless these areas are protected.

2. Each agency will cover and seal manholes before applying seal coat, slurry seal, etc. Agencies will prevent material from entering storm drain inlets and clean them if needed.

3. Agencies will never wash excess material from exposed aggregate concrete or similar treatments into a street or storm drain inlet. Each agency will designate an unpaved area for clean up and proper disposal of excess materials.

4. Agencies will use only as much water as necessary for dust control - avoid runoff.

5. Each agency will sweep up as much material as possible and dispose of properly. Agencies will only wash down streets if runoff is controlled or contained.

6. Each agency will catch drips from paving equipment with pans or absorbent material placed under the machines or berm the area around them.

7. Each agency will clean up all spills and leaks from other equipment and work site areas using "dry" methods (absorbent materials and/or rags). The agency will properly dispose of absorbent materials and rags. If spills occur on dirt areas, the agency will dig up and remove contaminated soil properly and on a timely basis.

8. After the job is complete, each agency will remove stockpiles (asphalt materials, sand, etc.) within five days and other extra materials immediately.

Tier III

1. If it rains unexpectedly, each agency will take appropriate action to prevent pollution of storm water runoff (e.g., divert runoff around work areas).

IV. SIGNING AND STRIPING

Tier I

1. Each agency will store spill absorbent materials on trucks to be used in the event of a spill.

2. Each agency will contain and clean up waste materials and dispose them of properly according to the Material Safety Data Sheet.

V. EQUIPMENT CLEAN UP/STORAGE

Tier I

1. Each agency will flush sprayer paint supply lines at the corporation yard. Agencies will use approved collection methods and dispose or recycle waste materials at an approved hazardous waste facility.

2. Each agency will clean sprayers, patch and paving equipment at the end of the day. Agencies will use approved collection methods and dispose or recycle waste materials at an approved facility.

Tier III

1. Each agency will cover sprayers, patch and paving equipment to prevent rainfall from contacting pollutants.

REFERENCES

Alameda Countywide Clean Water Program, New Development Subcommittee, BMP flyers, March 1995 (adapted from the Santa Clara Valley Nonpoint Source Pollution Control Program).

The Asphalt Institute, April 1965, The Asphalt Handbook (Manual Series No. 4).

I. GENERAL BMPS

Tier I

1. Each agency will assign one person the responsibility for ensuring that BMPs are implemented. This person will also be responsible for ensuring that all persons using the facility are aware of BMPs.

2. Each agency will prepare spill containment kits and store them in locations that have potential for spills (fueling areas, etc.).

3. Each agency will stencil inlets to the storm drainage system with a message such as "No Dumping, Drains to Bay".

4. Each agency will refer to existing plans (e.g., Hazardous Materials Business Plans and/or Spill Prevention Control and Countermeasures Plan), incorporate storm water BMPs in annual updates, and periodically review with persons using the facility.

5. Each agency will conduct facility surveys annually - possibly in conjunction with hazardous materials management and/or spill prevention inspections.

6. Each agency will propose structural modifications in FY 1994/95 budget, if appropriate, to ensure that washwater is directed to the sanitary sewer or recycled as soon as possible. In the interim, the agency will implement temporary measures to minimize the discharge of pollutants.

7. Each agency will prepare a Storm Water Pollution Prevention Plan (SWPPP) for each facility.

Tier II(5)

1. Each agency will consider developing and posting BMPs for other municipal public agencies that use its corporation yard.

2. Each agency will develop educational materials and post them in appropriate areas.

II. WASHING VEHICLES/EQUIPMENT

Tier I

1. Each agency will clean all vehicles/equipment on designated wash pad areas.

2. Each agency will wash vehicles and equipment off-site if needed so washwater drains to the sanitary sewer or is recycled.

Tier II(5)

1. Each agency will discharge washwater to the sanitary sewer or recycle. The agency will check with the local POTW regarding pretreatment requirements.

2. Each agency will ensure that wash pad area and sump are large enough so that all washwater drains to the sanitary sewer or recycling system. The agency will re-grade area if necessary or install dikes to convey washwater.

3. Each agency will monitor wash pad area to make sure it is consistently used.

4. Each agency will consider assigning schedules for use of wash pad area, if appropriate.

III. REFUSE HOLDING AREAS

Tier I

1. Each agency will store material removed from storm drainage facilities and streets on a concrete or asphalt pad in a contained area. The agency will drain liquids to the sanitary sewer or allow it to evaporate. During the rainy season, the agency will cover the area.

IV. FUEL DISPENSING AREAS

Tier I

1. Each agency will store spill containment kits nearby. If spills occur, the agency will use dry methods to clean the fueling area and follow procedures in the Hazardous Materials Business Plan (HMBP) and/or Spill Prevention Control and Countermeasure Plan.

2. Each agency will train employees in proper fueling and cleaning procedures.

Tier II(5)

1. Each agency will install signs reminding people not to "top off" tanks.

2. Each agency will discourage mobile fueling. If mobile equipment is fueled with a mobile fuel truck, the agency will establish a designated area for fueling.

Tier III

1. Each agency will cover fuel dispensing area. The agency will not conduct fueling over open ground (ground should be covered by concrete or asphalt protected with a sealant).

2. Each agency will design the fueling area to prevent "runon" of storm water and runoff of spills.

V. CHEMICAL STORAGE

Tier I

1. Each agency will store paint and other chemicals in an approved covered containment area. The agency will design the floor inside so that any spilled materials will be contained and easily removed. The agency will keep all 55 gallon drums containing hazardous materials or waste closed when not filling or emptying. The agency will label the outside according to Department of Transportation regulations. The agency will also protect the area from vandalism.

2. If 55 gallon drums containing hazardous materials or wastes are stored outside, each agency will keep drums in an approved containment area. Each agency will ensure that all of the drums are closed with tight-fitting lids.

3. Each agency will review the HMBP for hazardous materials storage requirements.

4. Each agency will review Material Safety Data Sheets to ensure that incompatible materials have the appropriate separation.

VI. CHEMICAL USAGE

Tier I

1. Each agency will ensure that necessary safety equipment and spill containment kits are readily accessible in areas where chemicals are used. The agency will inspect safety equipment (eye flushing stations, etc.) regularly to ensure they are operational.

2. Each agency will review Material Safety Data Sheets.

3. Each agency will minimize use of chemicals. The agency will use water-based paints and non-toxic chemicals as much as possible.

4. Each agency will dispose of excess chemicals at an Alameda County Household Hazardous Waste Facility.

Oil-based Paints

5. Each agency will wipe paint out of brushes. The agency will filter and reuse thinners or dispose as hazardous waste. The agency will dispose of the excess paint as hazardous waste or recycle it.

Water-based Paints

6. Each agency will rinse paint out of brushes and discharge rinsewater to the sanitary sewer. The agency will dry excess paint in cans and dispose of the cans in the trash. If there is too much paint to dry, the agency will dispose of the paint as hazardous waste or recycle it.

Automotive Fluids

7. Each agency will collect used fluids and dispose of them at an appropriate facility or recycle them.

Pesticides

8. See procedures under Pesticide Usage and Pest Management.

Solvents/Cleaning Solutions

9. Each agency will properly dispose of or recycle used solvents/chemicals.

VII. FLEET MAINTENANCE/VEHICLE PARKING AREAS

Tier I

1. Each agency will inspect equipment for leaks on a regular basis. The agency will use drip pans under leaky vehicles. The agency will repair vehicles with significant leaks.

2. Each agency will drain and replace motor oil and other fluids in a covered shop area. If fluids are changed outdoors, the agency will designate an area where there are no connections to storm drains or the sanitary sewer and where spills can be easily cleaned up.

3. Each agency will periodically dry sweep the area.

VIII. AUXILIARY STORAGE AREAS/YARDS

Tier I

1. Each agency will store chemicals in appropriate areas.

Tier III

1. Each agency will drain all fluids from vehicles and equipment. The agency will store materials under cover, if possible.

IX. GENERAL HOUSEKEEPING

Tier I

1. Each agency will inspect the yard routinely to ensure that there are no illegal discharges to the storm drain system and that during storms, pollutant discharges are controlled to the maximum extent practicable.

2. Each agency will keep chemical storage areas neat and orderly.

3. Each agency will sweep the corporation yard. The agency will dispose of material removed from streets and storm drainage facilities often to minimize exposure to rainwater and runoff to the storm drain system.

I. GENERAL BMPS

Tier I

1. Each agency will consider all alternatives for pest control including:

   a. No controls,

   b. Physical/mechanical controls (hand labor: EBCC and county work furlough crews, etc.),

   c. Cultural controls (mulching, alternative vegetation, prescribed burns)

   d. Biological controls (predators, parasites, goats, etc.),

   e. Less toxic chemical controls (e.g., soaps and oils), and/or

   f. Hot water.

2. Each agency will use the least toxic pesticides[1] that will do the job, provided there is a choice. The agency will take into consideration the LD_{50}, overall risk to the applicator and impact to the environment.

3. Each agency will follow all federal, state and local laws and regulations.

   a. Federal: U.S. EPA Air and Toxics Division, Pesticides 415-744-1087,

   b. State: Cal-EPA Department of Pesticide Regulation 916-445-4300,

   c. Local: Alameda County Agricultural Commissioner 510-670-5232

4. Appropriate agency personnel will read and follow label instructions.

5. Each agency will encourage applicators to attend U.C. Cooperative Extension classes, Pesticide Applicator Professional Association meetings and other professional avenues for continuing education.

6. Agencies will contact the U.C. Statewide IPM Project (916-752-7671), the U.C. Cooperative Extension Office (510-670-5200) as well as private consulting firms, and libraries for information on integrated pest management.

Tier III

1. Each agency will use state-certified pesticide applicators.

[1] Public agencies in Alameda County primarily use herbicides.

II. PESTICIDE USAGE

Tier I

1. Each agency will review the history of a site and determine pest conditions. Each agency will monitor problem areas periodically in order to identify level of pest condition. Each agency will establish an individual action threshold for each pest species as part of a pesticide use decision. Regular monitoring will detect whether pest populations are approaching or exceeding the established action threshold.

2. Each agency will apply pesticides at the appropriate time to maximize their effectiveness and minimize the likelihood of discharging non-degraded pesticides in stormwater runoff.

3. Agencies will not mix or load pesticides adjacent to a storm drain inlet, culvert or watercourse.

4. Each agency will select pesticides and application techniques along road sides which will retain some vegetative cover to help prevent soil erosion, trap pollutants and slow the rate of stormwater runoff, where possible.

5. Each agency will calibrate field equipment prior to use to ensure desired application rate. Agencies will mix only as much material as necessary for treatment.

6. Each agency will follow all legal requirements for Pesticide Management Zones (defined as areas where specific pesticide residues have been detected in groundwater) in Section 6800, Title 3 of the California Code of Regulations.

7. Each agency will train applicators in the safe use of pesticides and proper inspection of applicator equipment to prevent accidental pesticide leaks, spills and hazards to applicators and the environment.

Tier II(5)

1. Each agency will maintain a record of all treatments including pesticide use for each site.

2. Each agency will notify the public prior to spraying as needed or if requested.

III. COPPER AS AN ACTIVE INGREDIENT

Tier I

1. Each agency will minimize the use of copper-based pesticides. If applying copper as a algicide, the agency will consider using a chelated form of copper for greater solubility (less settling to the bottom).

2. Each agency will summarize annual copper usage (including usage by contractors) and provide this information to the Alameda Countywide Clean Water Program's General Program by February 15 for the previous calendar year.

Tier III

1. Each agency will eliminate the use of copper-based pesticides (when a comparable alternative exists).

IV. DIAZINON AS AN ACTIVE INGREDIENT

Tier I

1. Each agency will explore the possibility of using biological controls or less toxic chemicals before using diazinon (known to cause toxicity in aquatic life (*Ceriodaphnia dubia*/water flea) to manage a pest problem.

2. Each agency will promote public outreach efforts which educate homeowners about the effects of home use of diazinon (generally used to control ants) and other insecticides on aquatic life. Each agency will encourage the General Program to contact the Department of Pesticide Regulation to elicit their help similar to the program underway for home use of copper-sulfate root killer.

Tier III

1. Each agency will eliminate its use of diazinon.

V. PESTICIDE STORAGE

Tier I

1. Each agency will contact the local fire department and Alameda County Agricultural Commissioner to determine and implement storage requirements for pesticide products. The agency will provide secondary containment for liquids if required.

2. Each agency will prepare spill kits, store the kits near pesticides, and train employees to use them.

3. Each agency will store pesticides and other chemicals indoors in a locked and posted storage unit.

4. Each agency will store pesticides in labeled containers.

VI. PESTICIDE DISPOSAL

Tier I

1. Each agency will rinse empty pesticide containers and empty rinsewater in the spray per California Code of Regulations requirements.

2. Each agency will dispose of triple rinsed empty pesticide containers according to recommendations of the Alameda County Agricultural Commissioner and the manufacturer.

3. Each agency will try to find a qualified user for any unwanted pesticides, or return to the manufacturer if unopened. If disposal is required, the agency will contact Alameda County's household hazardous waste collection program to make an appointment (670-6460 8:30 A.M. - 5:00 P.M. Monday - Friday).

4. If changing pesticides or cleaning spray tanks, the agency will use tank rinsewater as product over a targeted area within the application site.

Santa Clara Valley Nonpoint Source Pollution Prevention Program, "Landscaping, Gardening and Pool Maintenance."

I. GENERAL BMPS

Tier II(5)

1. Each agency will work with the Public Information/Participation Subcommittee to develop educational materials to distribute to designers of golf courses, golf course operators, landscape service companies and nurseries.

2. Each agency will refer to these standards in contract specifications.

II. FERTILIZER APPLICATION

Tier I

1. Each agency will avoid applications if runoff is probable. On hillsides, the agency will avoid applying more water than the soil can absorb.

2. Prior to applying fertilizer, each agency will check the nitrogen/phosphorus/potassium (N/P/K) concentrations and calibrate the distributor to avoid excessive application.

3. Each agency will check irrigation equipment prior to applying fertilizer to make sure it is working properly. The agency will monitor irrigation systems to avoid over watering.

4. Each agency will avoid high applications when usage by the crop is low.

Tier II(5)

1. Each agency will confine fertilizer to targeted area. If fertilizer has been applied to hardscape areas (e.g., roadways, walkways, paved surfaces), the agency will sweep, vacuum, or blow back fertilizer from these areas before irrigating and/or rainfall. Agencies will not wash down hardscape areas.

Tier III

1. Each agency will use a drop spreader within the first four feet of paved surfaces.

III. PARK AND GENERAL LANDSCAPE AREAS

Tier I

1. Each agency will select fertilizers to suit local soil conditions, climate and plant health.

2. Each agency will fertilize plants based on plant type, physical appearance, soil or foliage testing.

Tier III

1. To avoid over application, each agency will test soil and/or plant tissue for nutrients and trace elements prior to applying fertilizer at least once a year. If **copper** is not needed, the agency will eliminate it from the micro-nutrient blend.

IV. GOLF COURSES

Tier I

1. Each agency will distribute this information performance standard to municipal golf course operators.

Tier II(5)

1. Each agency will test well water or other irrigation source water (e.g, for nitrates) to help determine fertilizer needs.

2. Each agency will test soil and foliage in **greens and tees** at least once a year to determine need for applications. If **copper** is not needed, the agency will eliminate it from the micro-nutrient blend.

Tier III

1. Each agency will design golf courses to restore and/or maintain riparian areas/wetlands and establish vegetation buffer zones along sensitive wetland areas to reduce runoff into waterways. Also, the agency will consider using detention ponds to control runoff and remove excess nutrients and/or divert excess irrigation water to areas where it can be used (e.g., roughs).

2. Each agency will prepare a management plan which includes: 1) a comprehensive review of existing practices; and 2) a plan for fertilizer (and pesticide) use to minimize the amount needed and to control runoff.

3. Each agency will test soil and foliage in **fairways** at least once a year to determine need for applications. If **copper** is not needed, the agency will eliminate it from the micro-nutrient blend.

V. FERTILIZER STORAGE

Tier I

1. Each agency will store fertilizers indoors or in a shed or storage cabinet.

REFERENCES

Farm Chemicals Handbook, 1990.

Performance Standards for

NEW DEVELOPMENT AND CONSTRUCTION SITE CONTROLS

I. MEASURES AND POLICIES TO CONTROL THE QUALITY OF STORMWATER RUNOFF

Tier II(1)

1. Each agency will incorporate the New Development Subcommittee's **conditions of approval** into its standards for development, as appropriate.

2. Each agency will document in conditions of approval permanent erosion and stormwater quality controls, controls during construction, and operation and maintenance of structural controls.

Tier II(5)

1. Each agency will review existing legal authority provided in erosion control and stormwater management and discharge control **ordinances** to determine the ability to implement General Plan policies and authorize discretionary review of development projects. If necessary, the agency will amend existing ordinance(s) or develop and adopt ordinances.

2. Each agency will develop and adopt **design guidelines and practices** which incorporate water quality protection measures.

3. Each agency will ensure that stormwater quality requirements are included **in plans and contract specifications** for municipal construction projects.

Tier II(*)[1]

1. Each agency will incorporate policies and implementation measures which will help preserve and enhance water quality in **General Plans**. Agencies will designate specific areas as "water-quality sensitive" to control the quality of stormwater runoff in these areas, if applicable.

II. EDUCATIONAL ACTIVITIES

Tier I

1. Each agency will provide educational materials (BMP flyers, Blueprint for a Clean Bay, etc.) to the public and its staff.

2. Each agency will educate its staff responsible for development application and plan review on stormwater quality issues and controls. Agencies will provide information on municipal design guidelines, ordinances, conditions of approval, contract specifications and protected sensitive areas.

3. Each agency will educate construction site inspectors on proper implementation and maintenance of erosion and sediment controls and materials/waste management BMPs.

---

[1] Implement when General Plans are amended.

4. Each agency will conduct in-house training to municipal staff (e.g., plan checkers, construction, capital improvement, permit, public works and/or building inspectors) on a regular basis as needed (suggest one hour/quarter).

Tier II(5)

1. Each agency will develop and provide pre-application materials containing information on stormwater controls and requirements to developers. One example is BASMAA's site planning and design guidance manual to be developed during FY 1995/96.

Tier III

1. Agencies will attach appropriate BMP flyer(s) to building permits.

III. DEVELOPMENT APPLICATION AND PLAN REVIEW

Tier I

1. Each agency will evaluate the effect of development on stormwater runoff and wetlands in the CEQA process (e.g., use a revised checklist).

Tier II(1)

1. Agencies will require developers to address site planning and design techniques to prevent and minimize impacts to water quality. These may include the following:

   a. Minimize land disturbance.

   b. Minimize impervious surfaces (e.g., roadway width) especially directly connected impervious areas (DCIA).

   c. Use of clustering.

   d. Preservation of quality open space.

   e. Maintain (and/or restore, if possible) riparian areas and wetlands as project amenities, establishing vegetation buffer zones to reduce runoff into waterways.

2. Each agency will require developers to evaluate permanent stormwater quality controls in their application if sufficient site planning measures are not implemented or feasible.

IV. EROSION AND SEDIMENTATION CONTROL

Tier I

1. Each agency will review its erosion control program for adequacy. Based on the *Recommendations* and ABAG's Manual of Standards for Erosion and Sediment

Control Measures, develop a plan for improving the program as needed in the following areas:

a. enforcement authority (grading, erosion and/or stormwater control ordinances),

b. minimum BMPs required,

c. training and tools for inspectors,

d. information for developers and contractors.

2. As a condition of issuance of a grading permit, each agency will require developers to prepare, submit to the municipality for review and approval, and implement an effective erosion and sediment control plan or similar administrative document that contains erosion and sediment control provisions.

Tier II(5)

1. Each agency will implement any tasks required to improve its erosion control program, identified in Tier I #1.

2. Each agency will require developers to provide permanent erosion and stormwater controls on plans submitted for projects.

V. STATE GENERAL PERMIT

Tier I

1. Prior to construction of a project that disturbs ≥ 5 acres, each agency will require a copy of the **Notice of Intent (NOI)** sent to the State Water Resources Control Board for coverage under the General Construction permit.

Tier III

1. Prior to construction of a project that disturbs ≥ 5 acres, each agency will require a copy of the project Storm Water Pollution Prevention Plan.

2. Each agency will require that projects which disturb < 5 acres prepare and submit an abbreviated Storm Water Pollution Prevention Plan (SWPPP) prior to the start of construction activity, to demonstrate that the owner, developer, and/or contractor has considered what BMPs are appropriate for protection of stormwater quality. Agencies will define and provide examples of the contents of the abbreviated SWPPP (e.g., the Fairfield-Suisun Urban Runoff Management Program's brochure).

3. Each agency will coordinate construction inspections and enforcement of corrective actions with Regional Board staff, if appropriate.

VI. CONSTRUCTION SITE FIELD INSPECTIONS

Tier I

1. Inspectors will review the Storm Water Pollution Prevention Plan, if available, prior to conducting the inspection.

2. During inspections, inspectors will:

   a. Inspect for and effectively prohibit non-stormwater discharges.

   b. Whenever possible, visually observe the quality of stormwater runoff after a major storm event.

   c. Require proper implementation and maintenance of erosion control and materials/waste management BMPs (e.g., covering stockpiled materials, designating work and storage areas) to minimize the discharge of pollutants.

3. If appropriate, inspectors will require problems to be corrected and will document illicit discharges (or contact your Illicit Discharge Coordinator) so that illicit discharges are reported to the General Program in the Illicit Discharge Inspection Quarterly Summary Report.

VII. WATERSHED RESOURCE INVENTORY AND PLANNING

Tier II(1)

1. Each agency will determine criteria for sensitive areas.

Tier II(3)

1. Each agency will review existing information on sensitive areas and watershed maps (e.g., from General Plans, the Alameda/Contra Costa Biodiversity Group, Bay Area Digital Geographic Resource (BADGER), San Francisco Estuary Project, Alameda County Flood Control & Resource Conservation District).

Tier III

1. Each agency will evaluate the need for conducting a watershed resource inventory to identify and map sensitive areas, and to use as a tool for identifying development opportunities and constraints. If appropriate, agencies will develop an approach and schedule for conducting a watershed resource inventory based on guidance from the Regional Board (e.g., from the Local Government Watershed Protection Project) and existing information as it becomes available.

VIII. COORDINATION WITH THE ALAMEDA COUNTY FLOOD CONTROL & WATER CONSERVATION DISTRICT (ACFC&WCD) AND ZONE 7 OF THE ACFC&WCD

Tier II(3)

1. Each agency will initiate discussions with the New Development Subcommittee to establish policies on the operation and maintenance of regional flood control facilities to maximize stormwater quality control benefits.

Tier III

1. Each agency will develop operation and maintenance agreements for regional flood control facilities which maximize stormwater treatment, if appropriate.

IX. SUBCOMMITTEE MEETINGS AND WORKSHOPS

Tier I

1. At least one representative from each agency will attend ACCWP annual workshops.

2. Each agency will chair the New Development Subcommittee on a rotating basis so that the burden of providing leadership is shared equitably.

3. Each agency will designate a person responsible for implementing the New Development component and for acting as a liaison with the New Development Subcommittee. This designated person will stay informed sufficiently to participate in New Development Subcommittee decisions and activities.

Tier III

2. A designated person from each agency will attend all New Development Subcommittee meetings. Or, agencies will appoint one representative for multiple jurisdictions.

Performance Standards for

ILLICIT DISCHARGE CONTROL

I. DEVELOP AN ILLICIT DISCHARGE INSPECTION CONTROL PROGRAM

Tier I

1. Each agency will prepare a written Action Plan that demonstrates the agency's commitment to conducting effective investigation, tracking, and elimination of illicit discharges and describes the level of effort for conducting these activities in the following fiscal year. The Action Plan will demonstrate that the agency has:

   a. Identified, verified and prioritized field screening areas for investigation and/or repeat inspections.

   b. Developed a schedule for conducting investigations of the high priority areas during the coming year.

   c. Selected which agency or group will conduct the field activities and estimated the number of labor hours required to implement the program.

   d. Determined how the illicit discharge investigations will be implemented.

   e. Established how activities will be documented (e.g., by including sample inspection forms).

   f. Adopted the minimum enforcement procedures.

   g. Developed procedures for follow-up enforcement or referral to another agency, including appropriate time periods for action.

   The Action Plan will be submitted to the Regional Board every year with the ACCWP Fiscal Year-End Report.

2. Each agency will ensure that designated illicit discharge inspectors are trained. Agencies will provide inspectors with the knowledge and skills necessary to conduct effective field investigations, with guidance from the Industrial & Illicit Discharge Control Subcommittee and the Regional Board staff.

3. Each agency will develop or obtain accurate maps of the agency's storm drain system including major drain segments, reaches, and outfalls within the agency's jurisdiction.

4. Agencies will survey high priority areas (defined in the Action Plan) at least once per year. The goal is to survey the agency's drainage area during the five year period.

Tier III

1. Include in the Action Plan an evaluation of inspection results from the previous year and an assessment of which types of non-stormwater discharges were most prevalent. Determine and implement appropriate outreach efforts to reduce these discharges.

2. Expand the illicit discharge inspection program to include medium or low priority field screening sites, until the entire drainage area of the agency has been inspected once.

3. Determine the appropriate frequency for repeat inspections of medium and low priority areas based on an investigation of the agency's entire drainage area.

4. Utilize the electronic information on significant storm drainage facilities and screening points to track illicit discharges from neighboring jurisdictions which may enter the agency's storm drain system.

II. CONDUCT FIELD INVESTIGATIONS

Tier I

1. Each agency will conduct field investigations which include inspecting portions of the municipal storm drain system for potential sources of illicit discharges. Inspectors will:

   a. Survey high priority areas (defined in the Action Plan) and make observations. Record observed or suspected dry weather flows.

   b. As possible, attempt to determine the type of flow and try to trace the flow to its source by following storm drain maps, inspecting manholes, and making surface observations. Record findings.

   c. If the responsible party is identified, educate the party on the impacts of his or her actions, explain the stormwater requirements, and provide BMPs, as appropriate. Initiate follow-up and/or enforcement procedures, if applicable. (Follow-up and enforcement are detailed further in Section III below.) Record activities.

2. Each agency will send at least one representative to General Program workshops to obtain additional training and share experiences with other agencies. The Industrial & Illicit Discharge Control Subcommittee will annually assess inspector training needs.

III. EVALUATE COMPLIANCE OF NON-STORMWATER DISCHARGER

A. Follow-up Activities

Tier I

If the discharge is traced to a residential source, inspectors will conduct the following or coordinate the following with the appropriate agency.

1. Each agency will continue inspection and follow-up activities until compliance is achieved. Record activities.

2. Agency staff will meet with the responsible party to discuss methods of eliminating the illicit discharge, including disposal options, recycling and possible discharge to the

sanitary sewer, as appropriate. In the case of discharges of wash waters, refer to the incremental BMPs in *Recommended Discharge Elimination/Disposal Priorities for Wash Waters* (September, 1994). Provide Program information to the responsible party.

3. The appropriate agency will begin enforcement procedures, if appropriate.

If the discharge is traced to a commercial or industrial activity, inspectors will coordinate information on the illicit discharge with the industrial and commercial discharge control program.

B. Enforcement

Tier I

1. Agencies will conduct enforcement activities and report these activities as outlined in the *Protocol for Reporting Enforcement Activities (Protocols)* adopted by the Industrial & Illicit Discharge Control Subcommittee and the Management Committee (Attachment A). These activities are set forth by the individual municipality ordinances.

2. Agencies will provide inspectors with sufficient responsibility and authority to initiate enforcement procedures.

Tier III

1. Agencies will develop criteria that would initiate each enforcement level described in the *Protocols*. The criteria will be developed by the Industrial & Illicit Discharge Control Subcommittee to help ensure enforcement actions are conducted consistently throughout the county.

IV. INVESTIGATE SPILL REPORTS/COMPLAINTS

Since a network of spill response and clean up programs already exists, establishing a new and separate stormwater response program would duplicate many of the services already being provided by these programs. The approach of the ACCWP illicit discharge control component is to supplement these services and respond to spill incidents that are not under the purview of previously existing clean-up programs. Within this context, each agency will assure that the following occurs.

Tier I

1. Inspectors will investigate spill reports and/or complaints within their jurisdiction and record their activities.

2. Inspectors will become familiar with the existing spill response and clean-up programs that cover the agency's jurisdiction, and coordinate illicit discharge program activities with these existing programs.

3. Through internal communication and public education, agencies will encourage the use of "911" to report large or hazardous spills. If the use of "911" is not appropriate in a particular agency, establish and publicize an alternative telephone number for reporting spills.

4. Each agency will establish a mechanism for obtaining information about spill incidents so that source identification and follow-up actions can be conducted.

Tier III

1. Each agency will identify an appropriate role for its participation in spill response drills, in cooperation with other agencies or industries, and ensure that adequate spill response supplies are available.

V. DOCUMENT AND REPORT COMPLETION

Tier I

1. Each agency will summarize field investigations and follow-up activities every three months using the Illicit Discharge Inspection Quarterly Summary Report form (Attachment B). These forms will be incorporated into the ACCWP's semi-annual reports to the Regional Board.

2. Each agency will document the number and types of spill incidents reported and responded to within the agency's jurisdiction, based on direct calls, "911" dispatch records, referrals from the General Program, and other sources. (Agencies do not need to document or report automotive fluid spills.) This information will be incorporated into the ACCWP's semi-annual reports to the Regional Board.

3. Each agency will review annually the Illicit Discharge Action Plan and investigation results; each agency will assess whether goals were met and what changes or improvements are necessary. This review will be incorporated into the ACCWP's Fiscal Year-End Report to the Regional Board.

Tier III

1. Agencies will develop a computerized data management system for managing and tracking information collected during field investigations and follow-up activities. Information will be linked through a data management system to storm drain and area maps through a GIS or other system to improve coordination and efficiency of future activities.

Performance Standards for

INDUSTRIAL AND COMMERCIAL DISCHARGE CONTROL

I. DEVELOP A INDUSTRIAL AND COMMERCIAL BUSINESS INSPECTION PLAN

Tier I

1. Each agency will prepare a written Inspection Plan that outlines specific steps the agency will take to conduct effective facility inspections in the following fiscal year. The written Inspection Plan will consist of:

   a. A review of the types of businesses within its jurisdiction that accounts for the variability of business types, complexity, and number;

   b. A listing by category of business types that have greater potential to cause stormwater pollution;

   c. A priority list of businesses or business types that includes the number of facilities that will be inspected during the coming fiscal year; and

   d. As appropriate, a summary of efforts to coordinate inter/intra-agency issues.

   The Inspection Plan will be submitted to the Regional Board every year with the ACCWP Fiscal Year-End Report.

2. Each agency will ensure facility inspectors are adequately trained. This includes the knowledge and skills necessary to conduct effective stormwater inspections, with direction from the Industrial & Illicit Discharge Control Subcommittee.

3. Each agency will inspect high priority facilities (defined in the Inspection Plan) at least once per year. The goal is to inspect the business community that has the potential to impact stormwater quality, at least once during the five year permit period.

Tier II(1)

1. Each agency will evaluate inspection results from the previous year to assess which industry types had the most impact on stormwater quality. Adjustments to the Inspection Plan will be made based on this assessment.

Tier III

1. Agencies will coordinate outreach information with other ACCWP subcommittees and stormwater inspection programs if such information is found to be effective

2. Each agency will expand the inspection program to include additional types of outreach and inspection activities. Such activities may be identified by the Subcommittee at a future date.

II. INSPECTION ACTIVITIES

A. Preparing for the Site Visit

Tier I

1. Inspectors will review existing information on the site and its regulatory history.

2. Whether the inspector notifies the facility representative of an inspection prior to the visit is discretionary.

B. During the Site Visit

Tier I

1. Inspectors will review the facility layout to locate the storm drain system and/or stormwater drainage path storage areas, process areas, vehicle and heavy equipment wash and maintenance areas, and stormwater sampling locations, if applicable.

2. Inspectors will review/inspect the following for the potential to discharge pollutants from non-stormwater discharges or exposure to runoff:

   a. Outdoor process/manufacturing areas;

   b. Outdoor material storage areas;

   c. Outdoor waste storage and disposal areas;

   d. Outdoor vehicle and heavy equipment storage and maintenance areas;

   e. Outdoor parking areas and access roads;

   f. Equipment on rooftops;

   g. Outdoor wash areas;

   h. Outdoor drainage from indoor areas, and

   i. Stormwater conveyance system maintenance, and emergency response practices.

3. Inspectors will collect the information on the most recently adopted Standard Industrial and Commercial Business Inspection Report (Attachment C).

4. Inspectors will use the facility's SWPPP, if available, as a tool in assessing the facility's stormwater pollution control activities. This will not imply review or approval of the adequacy of the SWPPP.

5. Inspectors will identify and inform the facility representative about problems and violation(s), if applicable. A schedule for correcting problems identified during the inspection and a means for verifying its implementation will be coordinated between

the inspector and the facility representative. This information will also be noted on the inspection form.

6. Inspectors will provide facility representatives with appropriate BMP information, education materials, and inter/intra-agency referrals as appropriate.

7. Inspectors will obtain ongoing training to support inspection activities and to continue to improve program implementation. Inspector(s) representing each agency will attend General Program inspector training workshops. The Industrial & Illicit Discharge Control Subcommittee will assess annually inspector training needs.

III. EVALUATING FACILITY COMPLIANCE

A. Repeat/Follow-up Inspection

Tier I

1. The inspector will determine if the facility is in compliance with the agency's stormwater ordinance (i.e. there are no unpermitted non-stormwater discharges and pollutant exposure to rain is minimized).

2. Inspectors will prioritize the facility for re-inspection. If a problem was identified during the inspection, inspectors will perform a follow-up inspection or initiate a self-certification process where the facility representative certifies in writing that the problem has been removed or corrected within the time specified by the inspector.

3. Inspectors will begin enforcement procedures, if appropriate.

B. Enforcement

Tier I

1. Agencies will conduct enforcement activities and report these activities as outlined in the *Protocol for Reporting Enforcement Activities (Protocols)* adopted by the Industrial & Illicit Discharge Subcommittee and the Management Committee (Attachment B). These activities are set forth by the individual agency ordinances.

IV. REPORTING

Tier I

1. Each agency will review annually the Inspection Plan and inspection results and assess whether goals were met. This review will be incorporated into the ACCWP's Fiscal Year-End Report to the Regional Board.

PROTOCOLS FOR REPORTING ENFORCEMENT ACTIVITIES

Alameda Countywide
Clean Water Program
A Consortium of Local Agencies

To: ACCWP Management Committee

From: Industrial & Illicit Discharge Control Subcommittee

The Subcommittee recommends the following breakdown of ACCWP follow-up/enforcement activities for reporting to the Regional Board. After some discussion, the Subcommittee decided not to include in the countywide protocol, specific time schedules for follow-up activities (e.g., written response, re-inspection, etc.) since an acceptable time to respond will vary on a case by case basis depending on the complexity of the site and the severity of the impact. However, it is understood that ACCWP agencies will escalate the level of enforcement until compliance is achieved. The Subcommittee agrees that this is a minimum procedure and does not prevent a municipality from skipping phases for more serious problems, as appropriate.

PROTOCOL FOR REPORTING ENFORCEMENT ACTIVITIES

Level I Enforcement (Warnings) Includes verbal notice to the facility owner/operator that is documented on the inspection form. This could also include a written informational letter to the facility owner/operator to follow-up inspection findings. A time frame to correct the identified problem should be specified based on the severity or complexity of the problem.

Level II Enforcement (Administrative Actions) Similar to Level I but with a more structured/formal notice or process. This includes a Notice of Violation, Cease and Desist Order, Order to Abate, Notice to Clean or any other similar notification outlined in the municipality's storm water ordinance that identifies a problem, requires correction or abatement but does not assess fines. A time frame to correct the identified problem will be specified based on the severity or complexity of the problem.

Level III Enforcement (Administrative Actions With Fine and/or Cost Recovery) Fine(s) are assessed administratively and/or the municipality's abatement costs are recovered.

Level IV Enforcement (Legal Actions) Includes any action taken by the municipality that brings the facility into the court system (e.g., Citation, Court Action, etc.).

APPENDIX D

BYLAWS OF THE ALAMEDA COUNTYWIDE CLEAN WATER PROGRAM'S MANAGEMENT COMMITTEE

The "Agreement to Implement the Alameda County Urban Runoff Clean Water Program" states that the Management Committee created pursuant to this agreement shall adopt bylaws for its governance. The following bylaws were originally adopted by the Management Committee on March 24, 1992 and have been amended since then to incorporate new procedures.

Article I

Section 1. Office of the Management Committee

The official office and mailing address of the Management Committee will be:

Alameda County Flood Control and Water Conservation District
951 Turner Court, Room 300
Hayward, CA 94545

Section 2. Meeting Place of the Management Committee

The Management Committee will normally meet at the following location:

Centennial Hall
Hayward, California

Anytime unexpected and temporary changes to the meeting place are necessary, the Chairperson shall find an alternative location and notify the Management Committee representatives and alternates.

Section 3. Regular Meetings.

The Management Committee will meet on an as needed basis typically as follows:

fourth Tuesday of a month
from 9:30 A.M. to no later than noon

Anytime unexpected and temporary changes to the meeting date and time are necessary, the Chairperson shall set an alternate date and time and notify the Management Committee representatives and alternates.

Section 4. Procedures

Except as provided by the Management Committee by a vote, the procedures to be followed by the Management Committee at its meetings and at any of the subcommittee meetings shall be that set forth in Deschler's Rules of Order. The failure to adhere to Deschler's Rules of Order shall not, however, result in the voiding of any action taken by the Management Committee.

Section 5. Chairperson/Vice Chairperson

The Chairperson of the Management Committee shall be the Management Committee representative from the Alameda County Flood Control and Water Conservation District (District). The Vice Chairperson shall be the alternate representative from the District or such person designated by vote of the Management Committee.

Section 6. Updating of Cost and Voting Shares

The "Agreement to Implement the Alameda County Urban Runoff Clean Water Program" provides that the cost and voting shares shall be updated based on changes in population and area at appropriate intervals as specified in the bylaws. This recalculation of cost and voting shares occurred in January 1992 for a five year period beginning in fiscal year 1992/93 (Attachment A), and cost and voting shares will be re-calculated every five years thereafter.

Section 7. Mailing List and Written Record of Meetings

A Management Committee mailing list consisting of member agencies and other interested parties shall be maintained for distribution of information about Management Committee meetings. The Management Committee may vote to charge for the costs associated with maintaining non-members on the mailing list. The District shall maintain and update this mailing list at least annually.

A written record shall be kept for at least five years of all Management Committee meetings and votes. The District shall maintain these records.

Section 8. Subcommittees

Subsection 8.1 General Information on Subcommittees

The Management Committee shall establish subcommittees to help implement the Stormwater Management Plan (Plan) for the Alameda Countywide Clean Water Program. Any of the current standing subcommittees may be eliminated and new subcommittees may be created by vote of the Management Committee to address short-term or long-term issues.

Each subcommittee shall designate a chairperson annually by simple majority vote of the subcommittee members.

Each subcommittee shall appoint a representative responsible for reporting to the Management Committee. Subcommittees shall provide recommendations on policy, fiscal, and substantive technical issues to the Management Committee for its consideration. In formulating these recommendations, the subcommittee members shall strive to reach a consensus, but if this is impossible, alternate recommendations and their rationale shall be reported to the Management Committee.

Subsection 8.2 Existing Standing Subcommittees and Their Objectives

The following standing subcommittees currently exist and their objectives are as described:

Policy Level Subcommittee: The objective of this subcommittee is to develop recommendations on policy and budget issues for the Management Committee.

Monitoring and Special Studies Subcommittee: The primary objective of this subcommittee is to provide management and technical review and guidance on activities being undertaken by the Program. This subcommittee will also assist in coordinating technical activities such as stormwater monitoring, special studies, watershed pilot projects, and other technical aspects of the Program with regional agencies such as BASMAA, the Regional Board, the S.F. Estuary Project and other local programs as necessary to assure that the goal and results of activities beneficial to all are shared and undertaken in a cost effective manner.

Public Information and Participation Subcommittee: The objective of this subcommittee is to help guide the implementation of the Public Information/Participation Component (Section 5) of the Plan.

New Construction and Development Subcommittee: The objective of this subcommittee is to serve as a center for exchange of information and as a means to provide guidance and assistance to the Management Committee for activities related to the New Development and Construction Controls Component (Section 7) of the Plan.

Maintenance Subcommittee: The objective of this subcommittee is to provide outreach to the municipal employees conducting maintenance activities; to identify, develop, and disseminate information on Best Management Practices to improve the pollutant removal effectiveness of these activities; and to aid the implementation of the Municipal Maintenance Activities Component (Section 6) of the Plan.

Industrial & Illicit Discharge Control Subcommittee: The objective of this subcommittee is to aid in the implementation of the Illicit Discharge Controls (Section 8) and Industrial and Commercial Discharge Controls (Section 9) Components of the Plan in a consistent manner county-wide. This includes establishing BMPs for use by commercial/industrial businesses and establishing consistent inspection, outreach, and compliance procedures and materials for use by inspectors.

Subsection 8.3 Subcommittee Membership and Membership Lists

Membership on the subcommittees shall be open to any representative or alternate of the Management Committee, to any employee recommended by a NPDES co-permittee agency, and to any other members which the Management Committee determines are needed to conduct the subcommittee's work. The chairperson of each subcommittee will be responsible for maintaining a list of each subcommittee member's name, address, phone numbers, and affiliation. Updated lists will be provided to the Management Committee as requested by the Chairperson of the Management Committee or by any Management Committee representative or alternate.

Subsection 8.4 Responsibilities for Providing Meeting Information

The Chairperson of the Management Committee shall be responsible for reporting subcommittee meeting dates, times, and locations at each Management Committee meeting for the subsequent month. The chairperson of each subcommittee will be responsible for providing this information to the Management Committee's Chairperson or his/her designee at least one week prior to each Management Committee meeting.

The chairperson of each subcommittee will be responsible for maintaining written documentation of subcommittee deliberations and recommendations to the extent needed to achieve the subcommittee's objectives.

Section 9. Amendment of Bylaws

These bylaws may be revised and amended at any time by a vote of the Management Committee.

Section 10. Public Participation

The Alameda Countywide Clean Water Program is a program funded by the public, and whose success depends on the active support and participation of its citizens. One of the major components of the Plan is to provide public information and encourage public participation to effectively control the diffuse sources of pollutants characteristic of urban runoff.

The Management Committee's policy is to encourage public input at its meetings. All meetings of the Management Committee are open to the public and notices of these meetings are distributed to any interested party who has requested placement on the Management Committee mailing list as described in Section 7 of the Bylaws. The public will be provided an opportunity to comment on items the Management Committee is considering for adoption or any other issues appropriate for the Management Committee to consider. The amount of time available for each member of the public to speak will be limited to a total of 5 minutes per Management Committee meeting. Exceptions to the time limits may be made on a case by case basis as agreed to in advance by the Policy Level Subcommittee.

Subcommittee meetings and workshops are staff functions generally closed to the public. Attendance by the public shall only be by invitation of the Subcommittee or its chair.

Section 11. Procedures for Budget Decision Making

The Management Committee's role in establishing and modifying the General Program's budget is described in the "Agreement to Implement the Alameda County Urban Runoff Clean Water Program." This agreement requires that "No action shall be taken by the District which requires expenditures by any party other than the District without prior Management Committee approval." This section describes the procedures which shall be used to implement this requirement and to provide for the routine management of the General Program's budget and expenditures.

The General Program's budget comprises tasks that are categorized either as providing "deliverable products" (which are unique to each fiscal year) or "on-call services" (which are typically budgeted for each fiscal year). Action plans shall be used to specify the budget, service/deliverable, and schedule for each budgeted task.

The funds budgeted for the completion of a deliverable product include all moneys necessary for the completion of the product. These funds shall remain available as necessary throughout the completion of the task. If the task is not completed within the fiscal year budgeted, the remaining funds within that task shall automatically roll over to the next fiscal year for continued work on that task. Consistent with No. 3 below, such funds shall only be used for the completion of the task(s) for which they were originally budgeted, unless modified by the Management Committee.

Funds budgeted for on-call services include all moneys necessary for the delivery of the specific on-call services. On-call services shall be budgeted each fiscal year. Action plans for on-call services shall require the completion of the service no later than the end of the first quarter of the subsequent fiscal year. Funds for on-call services that have not been incorporated into an approved action plan by the end of June for each fiscal year, shall not be carried forward or rolled over to the next fiscal year, unless specifically directed by the Management Committee to do so.

Other Management Committee responsibilities:

1. Approve the total annual General Program budget and any subsequent modifications to the total;

2. Determine the initial allocation of the annual General Program budget among the Plan's components; and

3. Approve any budget changes among program components and any significant changes in scope and/or budget within a component. A significant change in scope and/or budget is considered to be twenty percent or greater of the component amount; a change of substance which affects a product or deliverable; a substantial

delay in the planned completion of a deliverable product as determined by the task leader of the subcommittee responsible for oversight of that task; or a change which is highly sensitive to any participating entity of the ACCWP.

Program Administrator (District) responsibilities:

1. Determine individual task budgets and adjustments within the program components provided there are no substantial changes in scope. If there are substantial changes in scope the appropriate subcommittee for the component or Policy Level Subcommittee shall approve substantial scope changes and determine if the changes are sufficient to warrant approval by the Management Committee;

2. Approve action plans and modifications to action plans consistent with No. 1; and

3. Inform the Management Committee of the status of individual task implementation on a quarterly or more frequent basis.

Section 12. Procedures for Identifying, Prioritizing, Budgeting, and Managing Special Studies

1. All special studies shall be funded from the Focused Watershed Management Approach (Component 3) and/or the Monitoring and Special Studies (Component 4) budgets.

   - Other subcommittees, therefore, do not need to budget for special studies in their components;

   - If another subcommittee wishes to have a special study funded with moneys in its own component, it shall have that money transferred to the Components 3 or 4 budget.

2. Other subcommittees shall propose detailed ideas for special studies to the Monitoring and Special Studies (MSS) Subcommittee during the time that fiscal year budgets are being proposed.

   - These proposals shall be submitted in writing and must include the desired results of the proposed study.

3. Each special study (those proposed by other subcommittees and those proposed by the MSS Subcommittee) shall be prioritized by the MSS Subcommittee based on the merits of each requested study and benefits to the program, as well as funding availability.

4. All approved special studies, regardless of their origination, shall be managed by the MSS Subcommittee in consultation with the subcommittee requesting the study.

   - The District shall assign a General Program task leader (or "facilitator") to every

project.

- The Technical Consultant to the General Program shall perform the work, unless otherwise directed by the MSS Subcommittee.

- The task leader will be responsible to the MSS Subcommittee on all matters regarding the special study. In particular, the task leader shall:

  a. Present a schedule for project completion to the MSS Subcommittee for approval at the start of the project. This schedule shall include milestones such as subcommittee updates, draft product submittal to the appropriate subcommittee(s), and presentations by consultants to the subcommittees and/or Management Committee.

  b. Facilitate the work of the project with the subcommittee requesting the project. Specify in the project completion schedule what input the subcommittee will have in reviewing drafts of the project report.

  c. Bring all significant changes in budget and/or scope of the project (whether requested by the Consultant or the subcommittee requesting the special study) to the MSS Subcommittee for approval. The definition of a significant change is consistent with the definition provided in Section 11 of the ACCWP's Bylaws. Other changes should be disclosed during project updates to the Subcommittee.

  d. Coordinate submittal of all review comments to project report(s) and ensure their incorporation into the final product.

5. The MSS Subcommittee will review and reach agreement on project conclusions and implications for management (with input from the subcommittee requesting the special study), and will be the subcommittee which finally recommends the project to the Management Committee for acceptance at its completion.

Section 13.Procedures for PI/P Subcommittee Activities

Subsection 13.1 Language Translation

General education products intended for wide distribution to residents of Alameda County shall be translated into Spanish. Decisions related to the quantities of translated materials to print shall be based on demographic data. Products targeted for commercial, industrial, construction, and other activities shall be developed in English only, except in special circumstances where the target audience is substantially non-English speaking.

Subsection 13.2 PI/P Subcommittee Support for Other Plan Components

Subcommittees are encouraged to work with the PI/P Subcommittee on public

information and outreach activities they are planning in order to achieve the following:

1. Identify the appropriate roles and responsibilities of each subcommittee for the particular public information and outreach activities contemplated;

2. Ensure that public information products produced by and for the Alameda County Clean Water Program have a consistent image that clearly identifies and credits the program;

3. Coordinate the development and distribution of public information products in order to maximize their effectiveness and to avoid duplication, conflict, and inefficiencies;

4. Evaluate the effectiveness of public information products; and

5. Track public information products for sharing with other agencies and reporting to the Regional Water Quality Control Board.

Subsection 13.3 Cost Allocation

The approach is for the General Program to pay for the printing of an initial allotment for each municipality of all products (including language translations), and municipalities will pay for any additional copies they need beyond their initial allotments. The initial allotments will be based on objective criteria regarding the size of the target audience in each municipality (e.g., overall population, number of industries, etc.) and the number of products expected to be needed over the next two years. The advantages of this approach are:

1. All municipalities will receive all products, which will provide them the opportunity to fully participate in the PI/P effort;

2. The General Program will be able to more accurately budget the printing costs for each product and will be able to minimize the time spent collecting contributions from each municipality;

3. Municipalities will pay for most PI/P products as part of their contributions to the General Program and will not have to authorize separate payments for PI/P products very often.

Municipalities may request special tailoring of printed materials for their use. All costs associated with these special modifications shall be paid for entirely by the municipality(ies) making the request.

Appendix E

APPENDIX E

SUMMARY OF RELEVANT REGULATORY PROGRAMS/POLICIES

The following provides brief descriptions of regional, state, and federal regulatory requirements and programs that developed during the time period of the initial NPDES permit.

Regional, State and Federal Regulatory Requirements

S.F. Bay Regional Board Copper Mass Loading Reduction Policy: To comply with the S.F. Bay Regional Board's proposed site specific water quality objective for copper, a copper mass loading reduction policy was adopted as an amendment to the Basin Plan by the Regional Board in June 1993. The policy required all Bay Area stormwater quality control programs to reduce annual copper loadings by 20% by the year 2001: In Alameda County, the current estimated annual copper loading of 13,400 pounds would be required to be reduced by 2,700 pounds. However, the Regional Board's policy was returned by the State Water Resources Control Board (State Board) to the Regional Board for further consideration. The State Board's impasse with adopting this policy occurred when two Statewide Plans (*Enclosed Bays and Estuaries* and *Inland Surface Waters*) containing water quality objectives for copper and other pollutants were overturned in court. The State Board anticipates adopting new Statewide Plans by the end of 1997. One of the major considerations affecting whether this policy will be reinstituted is the water quality objective for copper in San Francisco Bay.

S.F. Bay Regional Board Staff Recommendations for New and Redevelopment Controls for Storm Water Programs (Staff Recommendations): The Regional Board staff prepared recommendations for the control of pollutants from new and redevelopment projects in April 1994. The Staff Recommendations incorporate CCMP actions and CZARA management measures (see pages 2-3) pertinent to new development. Municipalities are expected by the Regional Board staff to integrate the policies and practices in the *Staff Recommendations* (e.g., addressing stormwater quality issues during the environmental review phase, improving construction site inspections) as appropriate for their jurisdiction. Stormwater quality control programs are required to report their progress in implementing the *Staff Recommendations* in annual reports due September 1994, 1995 and 1996. In reviewing the *Countywide Program's* 1994/95 annual report, the Regional Board staff found that twelve cities and unincorporated Alameda County had acceptable programs and two cities had conditionally acceptable programs.

Bay Protection and Toxic Cleanup Program (BPTCP) and Regional Monitoring Program (RMP):

BPTCP: The State Board initiated the BPTCP in response to State legislation enacted in 1989 which required the State Board to develop and implement a monitoring plan to identify and prioritize "toxic hot spots" and develop remediation plans for priority sites. However, due to a lack of revenue, the State Board has focused the BPTCP on

throughout the Bay Area organized to form the Bay Area Stormwater Management Agencies Association. Furthermore, the California Stormwater Quality Task Force, initially formed in 1990 to assist the State Board implement the stormwater program, expanded its activities. Representatives of the *Countywide Program* actively participate in both organizations.

California Stormwater Quality Task Force (Task Force): The Task Force meets bi-monthly at various locations throughout the State and has established four committees (Public Information/Participation, Implementation, Stormwater Science and Standards, and Legislation, Policy and Regulations) to implement activities and respond to issues of statewide interest. Examples of committee activities include providing information on the reauthorization of the Clean Water Act, conducting surveys of municipal program activities, and developing a public/private partnership for distributing educational materials.

Bay Area Stormwater Management Agencies Association (BASMAA): Created in 1989, BASMAA coordinates stormwater quality control efforts and responds to issues of regional significance. BASMAA hired an Executive Director in 1994 to help facilitate meetings and obtain sponsorship for special projects. In addition to monthly BASMAA Committee meetings, four subcommittees also meet routinely: Public Information/Participation, New Development, Monitoring, and Operational Permits. Recently, BASMAA finalized and distributed BMPs for contractors (Blueprint for a Clean Bay), and hired consulting firms to develop a pilot source control program for mobile cleaners and prepare a Site Planning and Design Guidance Manual for Residential Development. It is also preparing to initiate a three-year regional advertising campaign.

DECLARATION OF SERVICE BY EMAIL

I, the undersigned, declare as follows:

I am a resident of the County of Sacramento and I am over the age of 18 years, and not a party to the within action. My place of employment is 980 Ninth Street, Suite 300, Sacramento, California 95814.

On December 21, 2016, I served the:

CRWQCB Response to the Request for Additional Briefing
California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074, Provisions C.2.b, C.2.c, C.2.e, C.2.f, C.8.b, C.8.c, C.8.d, C.8.e.i, ii and iv, C.8.f, C.8.g, C.10.a.i, ii, and iii, C.10.b, C.10.c, C.10.d, C.11.f, and C.12.f,
10-TC-01, 10-TC-02, 10-TC-03, and 10-TC-05
Cities of Alameda, Brisbane, and San Jose, and County of Santa Clara, Claimants

By making it available on the Commission's website and providing notice of how to locate it to the email addresses provided on the attached mailing list.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct, and that this declaration was executed on December 21, 2016 at Sacramento, California.
