General industrial processes associated with shipbuilding, conversion, repair, and maintenance include: metal fabrication, welding and brazing, abrasive blasting, hydroblasting, fiberglass work, paint and coating application, mechanical work, electrical work, wood work (including sanding), chemical cleaning of piping, line heating, and hazardous waste storage. Several shipbuilding and repair activities take place over water or near shore locations, while others may be performed in workshops or at work sites located inland on the shipyard property. Crane transportation of components and storage operations are also provided. Ships are constructed in the building ways or the graving dock. Ships can be repaired in the floating dry dock, graving dock, building ways, or pier side.

### **A. Description of Wastewater**

A description of these types of wastewater generated at the Facility is provided in the subsections below.

- 1. Graving Dock and Building Ways Hydrostatic Relief Water.** Hydrostatic relief water is water pumped from the ground to prevent seepage or buckling of the floor or walls of the graving dock and building ways. Discharges from the hydrostatic relief systems are

estimated at 208,000 gallons per day and are directed to the ion exchange treatment system.

2. **Building Ways Flood Water.** Building Ways 3 and Building Ways 4 are flooded with bay water to launch vessels. Flood water discharges from Building Ways 3 and Building Ways 4 are estimated at 750,000 gallons per launch pumped at a rate of 5,810 gallons per minute and are directed to the ion exchange treatment system.
3. **Ion Exchange Treatment System Effluent.** Hydrostatic relief water and flood water from Building Ways 3 and Building Ways 4 are directed to an ion exchange treatment system for treatment to remove copper, nickel, and zinc. The effluent from the ion exchange treatment system is discharged to San Diego Bay. The ion exchange treatment system consists of three 10.5K gallon storage tanks, two centrifugal pumps, three multimedia filter vessels in parallel, two granular activated carbon (GAC) vessels in parallel, and two ion exchange media vessels in series as shown in Flow Schematic C-2.

The previous permit contained individual outfalls for each of these wastewaters at Discharge Point Nos. HR-1, HR-2, HR-3, M-3, and M-4. These wastewaters are now directed to the ion exchange treatment system prior to discharging from the combined outfall of Discharge Point No. IX-1 to San Diego Bay.

4. **Floating Dry Dock Ballast Water.** The floating dry dock is a vessel which can be submerged and raised to bring another vessel out of the water to conduct repairs. Sinking and floating of the dry dock is accomplished by flooding and emptying the ballast tanks of the floating dry dock. Ballast tanks are also used to adjust the trim of the dock. Ballast water is discharged through Discharge Point No. M-1 to San Diego Bay. Discharges of floating dry dock ballast water are estimated at a maximum of 104,000 gallons per minute. Discharges of ballast water while docking or undocking a vessel are not regulated by this Order but are regulated by United States Environmental Protection Agency's (U.S. EPA) Vessel General Permit (VGP) under Permit Tracking No. VPAAO6620. Discharges of ballast water while the dry dock is not operating as a means of transportation, such as when the floating dry dock is at its mooring position to conduct ship repair activity, are regulated by this Order.
5. **Graving Dock Flood Water.** The graving dock is flooded with San Diego Bay water to launch and retrieve vessels. Flood water is discharged to San Diego Bay via Discharge Point No. M-2 when vessels are launched or retrieved. Estimates of the discharge volumes from flooding are approximately 18-22 million gallons per flooding event pumped at a rate of 18,000 gallons per minute. This Order includes a requirement for Best Management Practices (BMPs) for graving dock cleaning to prevent or minimize the discharge of pollutants prior to and during flooding.

The graving dock is primarily used for new construction of vessels and a non-copper based antifouling hull coating system is applied to new vessels as a best management practice to achieve compliance with the effluent limitation for copper. Occasionally, the graving dock is used for repair or minor maintenance of vessels with existing antifouling hull coating systems which may contain copper. NASSCO has no control over hull coating systems on existing vessels and does not remove or change these hull coating systems without the sole approval of the customer.

6. **Storm Water.** NASSCO operates and maintains a Storm Water Diversion System (SWDS) that is designed to capture storm water runoff from all industrial areas. NASSCO developed the SWDS to eliminate the discharge of industrial storm water to San Diego Bay with a capacity to retain in excess of 33,858,000 gallons, more than enough capacity to capture a 100-year storm event (approximately 3.5 inches of rain in 24 hours). All

storm water captured within the facility is discharged to the San Diego Metropolitan Sanitary Sewer System (SDMSSS). Storm water that flows into the graving dock during a graving dock flooding event will be discharged to San Diego Bay through Discharge Point No. M-2. Storm water exceeding the capacity of the SWSD will be discharged to San Diego Bay through SW-1 or SW-2.

**B. Discharge Points and Receiving Waters**

1. Wastewater is discharged into San Diego Bay as summarized in Table F-2 below:

**Table F-2. Discharge Points and Receiving Waters**

Discharge Point	Effluent Description	Discharge Point Latitude (North)	Discharge Point Longitude (West)	Receiving Water
IX-1 (Ion Exchange Treatment System)	Treated Hydrostatic Relief and Ways Dewatering	32° 41' 30" N	-117° 8' 26" W	San Diego Bay
M-1 (Floating Dry Dock)	Ballast Water	32° 41' 33" N	-117° 8' 37" W	San Diego Bay
M-2 (Graving Dock)	Dewatering Flood Water	32° 41' 27" N	-117° 8' 25" W	San Diego Bay
SW-1 (North Shipyard)	Northwest Storm Water Collection	32° 41' 25" N	-117° 8' 33" W	San Diego Bay
SW-2 (South Shipyard)	Southwest Storm Water Collection	32° 41' 21" N	-117° 8' 20" W	San Diego Bay

**C. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data**

1. Discharge prohibitions for all authorized discharges contained in Order No. R9-2009-0099 include:
  - a. The Discharger shall comply with all requirements of the Basin Plan Waste Discharge Prohibitions which are hereby included in this Order by reference.
  - b. The discharge of sewage, except as noted in the Basin Plan Waste Discharge Prohibitions, to San Diego Bay is prohibited.
  - c. The discharge of industrial process water, other than miscellaneous low volume water, is prohibited.
  - d. The discharge of the first flush of storm water runoff from high risk areas is prohibited, except if the pollutants in the discharge are reduced to the extent and demonstrated through testing that the discharge achieves compliance with the acute toxicity limitation specified in section IV.A.5 of this Order. The discharge of the remainder of the storm water must also achieve compliance with the acute toxicity limitations specified in section IV.A.5 of this Order but only needs to be demonstrated twice per year unless under accelerated testing.
  - e. The discharges of municipal and industrial waste sludge and untreated sludge digester supernatant, centrate, or filtrate to San Diego Bay is prohibited.
  - f. The discharge of rubbish, refuse, debris, materials of petroleum origin, waste zinc plates, abrasives, primer, paint, paint chips, solvents, and marine fouling

organisms, and the deposition of such wastes at any place where they could eventually be discharged is prohibited. This prohibition does not apply to the discharge of marine fouling organisms removed from unpainted, uncoated surfaces by underwater operations and discharges that result from floating booms that were installed for “Force Protection” purposes. Rubbish and refuse include, but are not limited to, any cans, bottles, paper, plastic, vegetable matter, or dead animals deposited or caused to be deposited by man.

- g. The discharge of materials of petroleum origin in sufficient quantities to be visible is prohibited.
  - h. The discharge or bypassing of untreated waste to San Diego Bay is prohibited. This prohibition does not apply to non-contact cooling water, miscellaneous low volume water, and fire protection water streams which comply with the requirements of this Order for elevated temperature waste discharges and which do not contain pollutants or waste other than heat.
  - i. The discharge of polychlorinated biphenyl compounds, such as those used for transformer fluid, is prohibited.
  - j. The discharge of wastes and pollutants from underwater operations, such as underwater paint and coating removal and underwater hull cleaning, is prohibited. This prohibition does not apply to the discharge of marine fouling organisms removed from unpainted and uncoated surfaces by underwater operations, or to discharges that result from the cleaning of floating booms that were installed for “Force Protection” purposes.
  - k. The discharge of wastes that cause or contribute to the violation of water quality standards (designated beneficial uses and water quality objectives developed to protect beneficial uses) is prohibited.
  - l. The discharge of flood waters from the graving dock (M-2), Ways 3 (M-3), and Ways 4 (M-4) more than 15 times per year total is prohibited.
2. Discharge effluent limitations for Discharge Point Nos. HR-1, HR-2, HR-3, M-1, M-2, M-3, M-4, and M-8 contained in the previous Order are summarized in Table F-3.

**Table F-3. Previous Effluent Limits and Monitoring Data – Discharge Point Nos. HR-1 through HR-3, M-1 through M-4, and M-8**

Parameter	Units	Effluent Limitations		
		Average Monthly	Average Weekly	Instantaneous Maximum
Oil and Grease	mg/L	25	40	75
Settleable Solids	mL/L	1.0	1.5	3.0
Turbidity	NTU	75	100	225
pH	pH units	--	--	<sup>1</sup>
Temperature	°F	--	--	<sup>2</sup>
Acute Toxicity	Pass/Fail	--	--	<sup>3</sup>
Chronic Toxicity	TUc	--	--	1

<sup>1</sup> Within limits of 7.0 – 9.0 at all times.

<sup>2</sup> At no time shall any discharge be greater than 20°F over the natural temperature of the receiving water.

<sup>3</sup> Discharges shall achieve a rating of “Pass” for acute toxicity with compliance determined as specified in section VII.I. of Order No. R9-2009-0099.

3. Discharge effluent limitations for Discharge Point Nos. HR-1, HR-2, and HR-3 contained in the previous Order are summarized in Table F-4.

**Table F-4. Previous Effluent Limits – Summary of Additional Effluent Limitations for Hydraulic Relief Water**

Discharge Location	Parameter	Units	Effluent Limitations		
			Annual Average	Average Monthly	Maximum Daily
HR-1 (Graving Dock Hydraulic Relief)	Copper, Total Recoverable	µg/L	<sup>1</sup>	--	11.9
	Zinc, Total Recoverable	µg/L	--	31.29	95.14
HR-2 (Ways 3 Hydraulic Relief)	Cadmium, Total Recoverable	µg/L	--	7.66	15.38
	Copper, Total Recoverable	µg/L	<sup>1</sup>	--	8.38
	Nickel, Total Recoverable	µg/L	--	6.84	13.43
	Zinc, Total Recoverable	µg/L	--	36.25	95.14
HR-3 (Ways 4 Hydraulic Relief)	Copper, Total Recoverable	µg/L	<sup>1</sup>	--	11.2
	Nickel, Total Recoverable <sup>2</sup>	µg/L	--	5.40	15.26

<sup>1</sup> Discharges shall achieve an annual average effluent concentration that is no greater than the running annual average of the receiving water concentration. The annual average of the effluent concentrations shall be calculated once each month and compared to the average of the receiving water concentrations for the same 12-month time period.

<sup>2</sup> These effluent limitations do not apply if the Discharger documents that the intake water concentration at the time of the discharge exceeds the effluent limitation. If the intake water concentration exceeds the effluent limitation, the Average Monthly and Maximum Daily effluent limitation shall be equal to the intake water concentration.

4. Discharge effluent limitations for Discharge Point Nos. M-2, M-3, and M-4 contained in the previous Order are summarized in Table F-5.

**Table F-5. Previous Effluent Limits – Summary of Additional Effluent Limitations for Flood Dewatering**

Discharge Location	Parameter	Units	Effluent Limitations
			Average Monthly
Flood Dewatering (Graving Dock, Building Ways 3, and Building Ways 4)	Copper, Total Recoverable	µg/L	12.8
	Nickel, Total Recoverable <sup>1</sup>	µg/L	13.60

<sup>1</sup> These effluent limitations do not apply if the Discharger documents that the Intake water concentration at the time of the discharge exceeds the effluent limitation. If the intake water concentration exceeds the effluent limitation, the Maximum Daily effluent limitation shall be equal to the intake water concentration.

5. The previous Order contained the following effluent limitation for industrial storm water:

Discharges of industrial contact storm water from the Facility shall achieve a rating of “Pass” for acute toxicity with compliance determined as specified in section VII.H of this Order.

6. Interim Effluent Limitations

- a. Interim effluent limitations for Discharge Point Nos. HR-1, HR-2, and HR-3 contained in the previous Order were effective from September 1, 2009 – May 18, 2010, and are summarized in Table F-6.

**Table F-6. Previous Interim Effluent Limitations for Hydraulic Relief**

Discharge Location	Parameter	Units	Interim Maximum Daily
HR-1 (Graving Dock Hydraulic Relief)	Copper, Total Recoverable	µg/L	13.12
	Zinc, Total Recoverable	µg/L	362
HR-2 (Ways 3 Hydraulic Relief)	Cadmium, Total Recoverable	µg/L	15.38
	Copper, Total Recoverable	µg/L	66.84
	Nickel, Total Recoverable	µg/L	13.60
HR-3 (Ways 4 Hydraulic Relief)	Zinc, Total Recoverable	µg/L	331
	Copper, Total Recoverable	µg/L	42.8
	Nickel, Total Recoverable	µg/L	15.26

- b. Interim effluent limitations for Discharge Point Nos. M-2, M-2, and M-3 contained in the previous Order were effective from September 1, 2009 – May 18, 2010 and are summarized in Table F-7.

**Table F-7. Previous Interim Effluent Limitations for Flood Dewatering**

Discharge Location	Parameter	Units	Interim Maximum Daily
M-2 (Graving Dock Flood Dewatering)	Copper, Total Recoverable	µg/L	41.5
	Nickel, Total Recoverable	µg/L	18.7
M-3 (Ways 3 Flood Dewatering)	Copper, Total Recoverable	µg/L	25.9
M-4 (Ways 4 Flood Dewatering)	Copper, Total Recoverable	µg/L	72.8

**D. Compliance Summary**

The following table summarizes the violations of effluent limitations and facility incidents based on data collected from September 2009 through May 2016.

**Table F-8. Compliance Summary**

Date	Violation Type	Incident Summary
12/9/2015	Unauthorized Discharge	40-50 gallons of wash water from the floating dry dock discharged into San Diego Bay
12/3/2015	Unauthorized Discharge	Less than two pounds of blast dust was discharged to San Diego Bay
11/13/2015	Unauthorized Discharge	Less than a half pound of blast dust was discharged to San Diego Bay

<b>Date</b>	<b>Violation Type</b>	<b>Incident Summary</b>
12/29/2014	Unauthorized Discharge	Water discharged to San Diego Bay from a pipe near the wastewater treatment facility
12/17/2014	Deficient Monitoring	Storm water discharged to San Diego Bay was not sampled.
8/22/2014	Unauthorized Discharge	Three separate instances of sewage leakages from restroom R-3 that flowed to San Diego Bay carried on into September 2014
6/10/2014	Unauthorized Discharge	5,000 gallons of hydrostatic relief water bypassed part of the ion exchange treatment system and was discharged into San Diego Bay
5/15/2014	Unauthorized Discharge	Paint overspray into San Diego Bay along the Graving Dock caisson gate
6/9/2013	Unauthorized Discharge	500 gallons of fresh water from a broken fresh water main between Buildings 19 and 11 was discharged into San Diego Bay
5/25/2013	Unauthorized Discharge	Sewage from a leaking hose at the head of the Floating Dry-dock was discharged to San Diego Bay
1/20/2013	Unauthorized Discharge	30 gallons of rusty water overflowed into San Diego Bay
11/30/2012	Late Report	The third Quarter 2012 monitoring report was submitted late
10/29/2012	Unauthorized Discharge	10,000 gallons of saltwater was discharged to San Diego Bay from Pier 12
3/22/2012	Effluent Limitation Violation	The total recoverable zinc concentration of 43 µg/L exceeded the effluent limitation of 31.29 µg/L at HR-1.
12/12/2011	Deficient Monitoring	500 gallons of storm water held in a containment area was discharged into San Diego Bay and not sampled.
6/2/2011	Late Report	The April 2011 monitoring report was submitted late
5/3/2011	Late Report	The March 2011 and first quarter 2011 monitoring reports were submitted late
4/1/2011	Late Report	The February 2011 monitoring report was submitted late
3/18/2011	Unauthorized Discharge	Paint chips, debris, and abrasive dust was observed floating in San Diego Bay on the side of the floating dry dock

#### **E. Planned Changes – Not Applicable**

### **III. APPLICABLE PLANS, POLICIES, AND REGULATIONS**

The requirements contained in this Order are based on the requirements and authorities described in this section.

#### **A. Legal Authorities**

This Order serves as WDRs pursuant to article 4, chapter 4, division 7 of the Water Code (commencing with section 13260). This Order is also issued pursuant to Clean Water Act (CWA) section 402 and implementing regulations adopted by the U.S. EPA and chapter 5.5, division 7 of the Water Code (commencing with section 13370). This Order shall serve as an NPDES permit waters authorizing the Discharger to discharge into waters of the U.S. at the discharge location described in Table 2 subject to the WDRs in this Order.

**B. California Environmental Quality Act (CEQA)**

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code, division 13, chapter 3 (commencing with section 21100).

**C. State and Federal Laws, Regulations, Policies, and Plans**

- 1. Water Quality Control Plan.** The San Diego Water Board adopted a Water Quality Control Plan for the San Diego Basin (Basin Plan) on September 8, 1994. The Basin Plan was subsequently approved by the State Water Board on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the San Diego Water Board and approved by the State Water Board. The Basin Plan was last amended by the San Diego Water Board on April 15, 2015. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, the Basin Plan implements State Water Board Resolution No. 88-63, which established State policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply. Requirements of this Order implement the Basin Plan. Beneficial uses applicable to the San Diego Bay are as follows:

**Table F-9. Basin Plan Beneficial Uses**

Discharge Point	Receiving Water Name	Beneficial Use(s)
IX-1; M-1; M-2	San Diego Bay and Mouth of Chollas Creek	Existing: Industrial service supply (IND); navigation (NAV); contact water recreation (REC1); non-contact water recreation (REC2); commercial and sport fishing (COMM); preservation of biological habitats of special significance (BIOL); estuarine habitat (EST); wildlife habitat (WILD); preservation of rare, threatened or endangered species (RARE); marine habitat (MAR); migration of aquatic organisms (MIGR); spawning, reproduction, and/or early development (SPWN), and shellfish harvesting (SHELL).

- 2. Thermal Plan.** The State Water Board adopted the Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters. Requirements of this Order implement the Thermal Plan.
- 3. Sediment Quality Plan.** The State Water Board adopted the *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality* (Sediment Quality Plan) on September 16, 2008, and it became effective on August 25, 2009. This plan supersedes other narrative sediment quality objectives, and establishes new sediment quality objectives and related implementation provisions for specifically defined sediments in most bays and estuaries. Requirements of this Order implement sediment quality objectives of this Plan.
- 4. National Toxics Rule (NTR) and California Toxics Rule (CTR).** U.S. EPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, U.S. EPA adopted the CTR. The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the

State. The CTR was amended on February 13, 2001. These rules contain federal water quality criteria for priority pollutants.

5. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the U.S. EPA through the NTR and to the priority pollutant objectives established by the San Diego Water Board in the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria promulgated by the U.S. EPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this Order implement the SIP.
6. **California Ocean Plan.** The State Water Board adopted the *Water Quality Control Plan for Ocean Waters of California, California* (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, 2005, 2009, and 2012. The State Water Board adopted the latest amendment on October 16, 2012, and it became effective on August 19, 2013. Ocean Plan biological characteristic water quality objectives have been included in this Order as receiving water limitations to protect the beneficial uses of BIOL, COMM, EST, WILD, RARE, MAR, MIGR, SPWN, and SHELL. It is appropriate to use these Ocean Plan objectives because San Diego Bay and the Pacific Ocean are contiguous, have similar salinities, and have many of the same aquatic species.
7. **Antidegradation Policy.** Title 40 Code of Federal Regulations (40 CFR) section 131.12 requires that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution 68-16. Resolution 68-16 is deemed to incorporate the federal antidegradation policy where the federal policy applies under federal law. Resolution 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The San Diego Water Board's Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. The permitted discharge must be consistent with the antidegradation provision of 40 CFR section 131.12 and State Water Board Resolution 68-16.
8. **Anti-Backsliding Requirements.** Sections 402(o) and 303(d)(4) of the CWA and federal regulations at 40 CFR section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.
9. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code, sections 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. sections 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the State, including protecting rare, threatened, or endangered species. The Discharger is responsible for meeting all requirements of the applicable Endangered Species Act.
10. **Uniform National Discharge Standards (UNDS).** In 1996, Congress passed legislation amending CWA section 312 to provide the Department Of Defense and the U.S. EPA

authority to jointly establish UNDS for incidental discharges from vessels of the Armed Forces in State waters and the contiguous zone. This comprehensive, three-phase, regulatory program applies to vessels of the Armed Forces including, but not limited to, the Navy, Military Sealift Command, Marine Corps, Army, Air Force, and Coast Guard. UNDS is designed to enhance environmental protection of coastal waters by creating protective standards to reduce environmental impacts associated with vessel discharges, stimulate the development of improved pollution control devices, and advance the development of environmentally sound ships by the Armed Forces. The Phase I final rule and preamble language, including a summary of the Phase I process and findings (64 Fed. Reg. 25126; 40 CFR part 1700), was published in the Federal Register on May 10, 1999. Phase I of UNDS determines the types of vessel discharges that require control by a Marine Pollution Control Device (MPCD) and those that do not require control, based on consideration of the anticipated environmental effects of the discharge and other factors listed in the CWA. In Phase I, the U.S. EPA and the Department of Defense identified 25 discharges to be controlled by MPCDs. Phase II of UNDS development focuses on promulgating MPCD performance standards for those vessel discharges identified during Phase I as requiring an MPCD. In this Phase, the Department of Defense and U.S. EPA are establishing discharge performance standards for different classes, types, and sizes of vessels. These standards are specific to existing vessels as well as future (new design) vessels and will be promulgated in batches for efficiency purposes. A draft rule proposing MPCD performance standards for the first batch of 11 discharges was promulgated on February 3, 2014. A Coastal Zone Management Act National Consistency Determination has been developed for the first batch and an Environmental Species Act consultation is underway. For the second batch of 11 discharges, federal and tribal consultations occurred in March 2016 and a Notice of Public Rulemaking is anticipated for Fall 2016. Phase III of UNDS development will focus on establishing requirements for the design, construction, installation, and use of MPCDs. After completion of Phase III, states will be prohibited from regulating these UNDS discharges. In anticipation of the completion of UNDS, this Order does not regulate naval vessel discharges with applicable MPCDs (as BMPs) identified in the draft UNDS rule.

11. **Vessel General Permit.** U.S. EPA issued the Vessel General Permit (VGP) on March 28, 2013, with an effective date of December 19, 2013. The VGP provides NPDES permit coverage for ballast water and for other discharges incidental to the normal operation of commercial vessels greater than or equal to 79 feet in length and operating as a means of transportation. The U.S. EPA issued a Small Vessel General Permit (sVGP) for discharges incidental to the normal operation of small vessels on August 21, 2014. The sVGP provides NPDES permit coverage for small vessels defined as non-military, non-recreational vessels less than 79 feet in length and operating as a means of transportation. Discharges from vessels not operating as a means of transportation as described below are regulated by this Order:
  - a. Vessels in a dry dock are not operating as a means of transportation.
  - b. Floating dry docks have been determined to be operating as a means of transportation when they are docking or undocking a vessel inclusive of the transition from that operation. Floating dry docks are not operating as a means of transportation when docked at the Facility. Ballast water and other discharges from floating dry docks which are docked at the Facility are regulated by this Order.

**D. Impaired Water Bodies on the CWA section 303(d) List**

Under Section 303(d) of the 1972 CWA, states, territories and authorized tribes are required to develop lists of water quality limited segments. The waters on these lists do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology. On July 30, 2015, the U.S. EPA approved a revised 303(d) List of Water Quality Limited Segments in California. San Diego Bay, as a whole, is listed as impaired for polychlorinated biphenyls (PCBs). Additional portions of San Diego Bay are listed as impaired for additional parameters. Portions of San Diego Bay applicable to the Facility include, "San Diego Bay Shoreline, between Sampson and 28<sup>th</sup> Streets" and "San Diego Bay Shoreline, near Chollas Creek". These portions of San Diego Bay are listed in the 303(d) list as impaired for: benthic community effects, copper, mercury, polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), sediment toxicity, and zinc. The table below lists San Diego Bay impairments near the Facility:

**Table F-10. San Diego Bay CWA 303(d) Impairments near the Facility**

Waterbody	Location	Constituent
San Diego Bay	San Diego Bay	Polychlorinated biphenyls (PCBs)
San Diego Bay	San Diego Bay Shoreline, between Sampson and 28th Streets	Copper, Mercury, Zinc, Polycyclic Aromatic Hydrocarbons (PAHs), Polychlorinated Biphenyls (PCBs) in Sediment
San Diego Bay	San Diego Bay Shoreline, near Chollas Creek	Benthic Community Effects, Sediment Toxicity

An applicable Total Maximum Daily Load (TMDL) for these impairments has not yet been adopted by the San Diego Water Board and approved by U.S. EPA. Investigative Order No. R9-2015-0058 was issued on October 26, 2015, to NASSCO, the California Department of Transportation, the City of La Mesa, the City of Lemon Grove, the City of San Diego, the San Diego Unified Port District, and the U.S. Navy to address the "San Diego Bay Shoreline, Mouth of Chollas Creek".

Cleanup and Abatement Order No. R9-2012-0024 was issued to the Discharger, BAE Systems San Diego Ship Repair, the City of San Diego, Campbell Industries, San Diego Gas and Electric, the U.S. Navy, the San Diego Unified Port District on March 14, 2012, to address the "San Diego Bay Shoreline, between Sampson and 28th Streets". The *South Shipyard Remedial Action Plan Implementation Report, San Diego Shipyard Sediment Site – South Shipyard* was submitted to the Water Board in April 2015 and documents and verifies the completion of remedial activities at the South Shipyard portion of the San Diego Shipyard Sediment Site. The report documents South Shipyard compliance with Directives A.2.a and A.2.b of the Cleanup and Abatement Order, while compliance with Directive A.2.c will be determined pending post-remedial monitoring to occur 2 and 5 years after completion of cleanup work at the entire San Diego Shipyard Sediment Site.

**E. Other Plans, Policies and Regulations**

- 1. Bays and Estuaries Policy.** The State Water Board adopted a Water Quality Control Policy for Enclosed Bays and Estuaries of California (Bays and Estuaries Policy) on May 16, 1974 (last amended in 1995). The Bays and Estuaries Policy establishes principles for management of water quality, quality requirements for waste discharges, discharge prohibitions, and general provisions to prevent water quality degradation and to protect

the beneficial uses of waters of enclosed bays and estuaries. These principles, requirements, prohibitions and provisions have been incorporated into this Order.

- a. The Bays and Estuaries Policy contains the following principle for management of water quality in enclosed bays and estuaries, which includes San Diego Bay:
  - i. The discharge of municipal wastewaters and industrial process waters (exclusive of cooling water discharges) to enclosed bays and estuaries shall be phased out at the earliest practicable date. Exceptions to this provision may be granted by the San Diego Water Board only when the Board finds that the wastewater in question would consistently be treated and discharged in such a manner that it would enhance the quality of receiving waters above that which would occur in the absence of the discharge. For the purpose of this policy, ballast waters and innocuous non-municipal wastewaters such as clear brines, washwater, and pool drains are not necessarily considered industrial process wastes, and may be allowed by the San Diego Water Board under waste discharge requirements that provide protection to the beneficial uses of the receiving water.
  - ii. The Bays and Estuaries Policy also prohibits the discharge or by-passing of untreated wastes. This Order prohibits the discharge and by-passing of untreated waste except for non-contact fire protection system water, hydrostatic relief water, and flood water. For the purpose of the Bays and Estuaries Policy and this Order, the discharges of fire protection water; potable water leaks from hoses, and steam condensate leaks from hoses effluent will be considered innocuous non-municipal wastewaters and, as such, will not be considered industrial process wastes.
- b. The following Principles for the Management of Water Quality in Enclosed Bays and Estuaries, as stated in the Bays and Estuaries Policy, apply to all of California's enclosed bays and estuaries including San Diego Bay:
  - i. Persistent or cumulative toxic substances shall be removed from the waste to the maximum extent practicable through source control or adequate treatment prior to discharge.
  - ii. Bay or estuarine outfall and diffuser systems shall be designed to achieve the most rapid initial dilution practicable to minimize concentrations of substances not removed by source control or treatment.
  - iii. Wastes shall not be discharged into or adjacent to areas where the protection of beneficial uses requires spatial separation from waste fields.
  - iv. Waste discharges shall not cause a blockage of zones of passage required for the migration of anadromous fish.
  - v. Non-point sources of pollutants shall be controlled to the maximum practicable extent.

The San Diego Water Board has considered the Principles for the Management of Water Quality in Enclosed Bays in Estuaries, in adopting this Order. The terms and conditions of this Order are consistent with the Principles for the Management of Water Quality in Enclosed Bays and Estuaries.

#### **IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS**

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the U.S. The control of

pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the Code of Federal Regulations: 40 CFR section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 CFR section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

#### **A. Discharge Prohibitions**

- 1. Discharge Prohibition III.A.** This prohibition is based on the requirements of the Basin Plan.
- 2. Discharge Prohibition III.B. and III.C.** Ship repair and maintenance activities may result in the discharge of pollutants and wastes to waters of the U.S. Discharge Prohibition III.B prohibits the discharge of wastes associated with ship repair and maintenance activities. These prohibitions are based on the requirements of the Enclosed Bays and Estuaries Policy and 40 CFR section 122.21(a) and Water Code section 13260. Water Code section 13260 requires filing an application and Report of Waste Discharge before a discharge can occur. Discharges not described in the application and Report of Waste Discharge, and subsequently in this Order, are prohibited.
- 3. Discharge Prohibition III.D.** This prohibition is based on the requirements of the Enclosed Bays and Estuaries Policy.
- 4. Discharge Prohibition III.E.** This prohibition is based on the requirements of the Bays and Estuaries Policy and is consistent with prohibitions established for similar facilities.
- 5. Discharge Prohibition III.F.** This Order prohibits the discharge of hazardous substances equal to or in excess of reportable quantities listed in 40 CFR part 117 and/or CFR part 302.
- 6. Discharge Prohibition III.G.** This prohibition is based on the requirements of the Bays and Estuaries Policy and is consistent with prohibitions established for similar facilities.
- 7. Discharge Prohibition III.H.** This prohibition is retained from the previous Order No. R9-2009-0099 based on the 303(d) listing for PCB compounds in San Diego Bay and prohibits the discharge of PCBs to the Bay.
- 8. Discharge Prohibition III.I.** This prohibition is retained from the previous Order No. R9-2009-0099 because the intake water credit effluent limitation for copper is a maximum daily effluent limitation without an average monthly effluent limitation.
- 9. Discharge Prohibition III.J.** This requirement prohibits the addition of chlorine or other additive pollutants to the fire protection system, potable water system, steam system, or dry dock ballast tanks to ensure that the minimum of pollutants is discharged.
- 10. Discharge Prohibition III.K.** Waste discharges from ship repair and maintenance activities on ships, piers, and shore side facilities can cause high concentrations of copper, zinc, other metals, and oil and grease in industrial storm water runoff. High concentrations of these pollutants in the industrial storm water runoff can be toxic to aquatic organisms. Discharge Prohibition III.E is based on the toxicity requirements contained in the Basin Plan and prohibits the discharge of the first 1 inch (first flush) of storm water runoff from Industrial High Risk Areas, as defined in section IV.A of this Order, unless the discharge can be demonstrated to meet the effluent limitations of this Order.

## **B. Technology-Based Effluent Limitations (TBELs)**

### **1. Scope and Authority**

Section 301(b) of the CWA and implementing U.S. EPA permit regulations at 40 CFR section 122.44 require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards. The discharges authorized by this Order must meet minimum federal technology-based requirements based on Best Professional Judgment (BPJ) in accordance with 40 CFR section 125.3.

The CWA requires that technology-based effluent limitations be established based on several levels of controls:

- a. Best practicable treatment control technology (BPT) represents the average of the best existing performance by well-operated facilities within an industrial category or subcategory. BPT standards apply to toxic, conventional, and non-conventional pollutants.
- b. Best available technology economically achievable (BAT) represents the best existing performance of treatment technologies that are economically achievable within an industrial point source category. BAT standards apply to toxic and non-conventional pollutants.
- c. Best conventional pollutant control technology (BCT) represents the control from existing industrial point sources of conventional pollutants including Biochemical Oxygen Demand 5-day @ 20 °C (BOD), Total Suspended Solids (TSS), fecal coliform, pH, and oil and grease. The BCT standard is established after considering the “cost reasonableness” of the relationship between the cost of attaining a reduction in effluent discharge and the benefits that would result, and also the cost effectiveness of additional industrial treatment beyond BPT.
- d. New source performance standards (NSPS) represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA requires U.S. EPA to develop effluent limitations, guidelines and standards (ELGs) representing application of BPT, BAT, BCT, and NSPS. Section 402(a)(1) of the CWA and 40 CFR section 125.3 authorize the use of best professional judgment (BPJ) to derive technology-based effluent limitations on a case-by-case basis where ELGs are not available for certain industrial categories and/or pollutants of concern. Where BPJ is used, the San Diego Water Board must consider specific factors outlined in 40 CFR section 125.3.

### **2. Applicable Technology-Based Effluent Limitations**

- a. The State Water Board adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on October 16, 2012, which became effective on August 19, 2013. Although the Ocean Plan is not directly applicable to enclosed bays, such as San Diego Bay, the salinity and beneficial uses of San Diego Bay are similar to those of the ocean waters of the State. Therefore, in order to protect the beneficial uses of San Diego Bay, the previous Order used the Ocean Plan as a reference for developing discharge specifications, receiving water prohibitions, and narrative limitations and to supplement the provisions contained in the CTR, the SIP, and the Bays and Estuaries Policy.

The Ocean Plan establishes water quality objectives, general requirements for management of waste discharged to the ocean, effluent quality requirements for waste discharges, discharge prohibitions, and general provisions. Further, Table 2 of the Ocean Plan establishes technology-based effluent limitations for discharges for which ELGs have not been established pursuant to sections 301, 302, 304, or 306 of the federal CWA.

Based on Table 2 of the Ocean Plan, Board Order No. R9-2009-0099 established numeric effluent limitations for the discharge of industrial discharges from the facility.

The effluent limitations contained in Table 2 of the Ocean Plan are summarized below:

**Table F-11. Ocean Plan Table 2 Effluent Limitations**

Parameter	Units	Table 2 Effluent Limitations		
		Average Monthly	Weekly Average	Instantaneous Maximum
Oil and Grease	mg/L	25	40	75
Settleable Solids	mL/L	1.0	1.5	3.0
Turbidity	NTU	75	100	225
pH	standard units	Within 6.0 - 9.0 at all times.		

Effluent limitations for oil and grease, settleable solids, turbidity, and pH have been carried over based on anti-backsliding requirements.

- b. In addition to numeric TBELs and in accordance with 40 CFR 122.44(k), the previous Order determined that the implementation of BMPs for the discharge of industrial wastes associated with ship construction, repair and maintenance activities were appropriate. To carry out the purpose and intent of the CWA, the previous Order required the Discharger to develop and implement a BMP plan, as authorized by CWA section 304(e) and section 402(p), for toxic pollutants and hazardous substances.
- c. The requirement to implement an appropriate BMP plan for non-storm water discharges is carried over from Order No. R9-2009-0099. The BMP plan shall be incorporated into the Facility’s Storm Water Pollution Prevention Plan (SWPPP).
- d. The requirement to implement appropriate BMPs for shipyard activities to prevent discharges of waste is carried over from Order No. R9-2009-0099, and in the form of a SWPPP.
- e. In addition to the retention of BMPs in a SWPPP, this Order establishes Numeric Action Levels (NALs) for storm water from areas identified as Industrial High Risk Areas. The statewide Industrial Storm Water General Permit, *General Permit for Storm Water Discharges Associated with Industrial Activities*, Order No. 2014-00570DWQ, NPDES No. CAS000001, was adopted on April 1, 2014, by the State Water Board and became effective on July 1, 2015. This statewide Industrial Storm Water General Permit contains NALs based on benchmarks in U.S. EPA’s *Multi-Sector General Permit for Stormwater Discharges Associated with Industrial Activity* (MSGP) which became effective May 27, 2009. Consistent with the intent of the State Water Board, this Order establishes NALs with a tiered compliance strategy. The San Diego Water Board finds that the State Water Board’s NALs

serve as an appropriate set of technology-based, measureable criteria that demonstrate compliance with BAT/BCT.

## **C. Water Quality-Based Effluent Limitations (WQBELs)**

### **1. Scope and Authority**

CWA Section 301(b) and 40 CFR section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards.

Section 122.44(d)(1)(i) of 40 CFR requires that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) U.S. EPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed State criterion or policy interpreting the State's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in other State plans and policies, or any applicable water quality criteria contained in the CTR and NTR.

### **2. Applicable Beneficial Uses and Water Quality Criteria and Objectives**

- a. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. The beneficial uses applicable to the San Diego Bay and the mouth of Chollas Creek contained in the Basin Plan are summarized in section III.C.1 of this Fact Sheet. The Basin Plan includes both narrative and numeric water quality objectives applicable to the receiving water.

The CTR promulgated toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the State. Priority pollutant water quality criteria in the CTR are applicable to discharges to San Diego Bay. The CTR contains both saltwater and freshwater criteria. Because a distinct separation generally does not exist between freshwater and saltwater aquatic communities, the following apply: in accordance with 40 CFR section 131.38(c)(3), freshwater criteria apply to areas where salinities are at or below 1 part per thousand (ppt) 95 percent or more of the time. The San Diego Water Board has determined that because the discharges are to San Diego Bay, saltwater CTR criteria are applicable. The CTR criteria for saltwater aquatic life or human health for consumption of organisms, whichever is more stringent, are used to prescribe the effluent limitations in this Order to protect the beneficial uses of San Diego Bay, a water of the U.S. in the vicinity of the discharges.

The SIP procedures for implementation of CTR and NTR criteria are applicable to non-storm water discharges. Discharges from the Facility to San Diego Bay include discharges treated hydrostatic relief water and Ways dewatering, floating dry dock

ballast water, and graving dock dewatering. A Reasonable Potential Analysis (RPA) was conducted for the non-storm water discharges to San Diego Bay using all the available data.

The table below summarizes the applicable water quality criteria/objectives for priority pollutants in the effluent or receiving water. These criteria were used in conducting the RPAs for this Order.

**Table F-12. Applicable CTR/NTR Water Quality Criteria**

Constituent	Selected Criteria	Freshwater		Saltwater		Human Health for Consumption of:	
		Acute	Chronic	Acute	Chronic	Water & Organisms	Organisms Only
		µg/L	µg/L	µg/L	µg/L	µg/L	µg/L

- b. Section 1.4.2 of the SIP establishes procedures for granting mixing zones and the assimilative capacity of the receiving water. Before establishing a dilution credit for a discharge, it must first be determined if, and how much, receiving water is available to dilute the discharge.

In the absence of a dilution credit, the worst-case dilution is assumed to be zero to provide protection for the receiving water beneficial uses. The impact of assuming zero assimilative capacity within the receiving water is that discharge limitations are applied end-of-pipe with no allowance for dilution within the receiving water.

Dilution was not requested by the Discharger. No supporting documentation for granting dilution was submitted. Thus, no dilution was applied in the implementation of WQBELs for discharges associated with the Facility.

**3. Determining the Need for WQBELs**

- a. Federal regulations require effluent limitations for all pollutants that are or may be discharged at a level that will cause or have the reasonable potential to cause, or contribute to an in-stream excursion above a narrative or numerical water quality standard.

The San Diego Water Board conducted the RPA in accordance with section 1.3 of the SIP. A summary of the results for the parameters which demonstrated reasonable potential, for each applicable discharge, is provided in the table below.

**Table F-13. Summary of RPA Results**

Discharge Location No.	Parameter	Maximum Effluent Concentration (MEC) (µg/L)	Background (B) (µg/L)	Criteria (C) (µg/L)	Reason <sup>1</sup>
IX-1	Copper	2.8	10.0	3.7	B>C & pollutant detected in effluent
M-1	Copper	3.8	10.0	3.7	MEC & B>C
M-2	Copper	22	10.0	3.7	MEC & B>C
	Zinc	90	23	86	MEC>C

<sup>1</sup> MEC = Maximum Effluent Concentration; B = Background Concentration; C = Criteria (Water Quality)

<sup>2</sup> Step 6 of section 1.3 of the SIP states that if B is greater than C and the pollutant is detected in the effluent, an effluent limitation is required and the analysis for the subject pollutant is complete.

**4. WQBEL Calculations**

- a. **Ballast Water.** As shown in Table F-13, the San Diego Water Board finds that discharges of ballast water from the dry dock at Discharge Point No. M-1 have the reasonable potential to exceed water quality criteria for copper. However, section 4.2.3 of the VGP Fact Sheet states that "*vessel operators cannot install equipment onboard their vessels until that equipment has been approved by the Coast Guard and, in some cases, their class societies. Hence, EPA cannot require use of equipment or technologies that would conflict with the requirements of these organizations without fully understanding the implications of such requirements. These factors create a situation where, at this time, it is generally not feasible for EPA to calculate numeric effluent limitations to effectively regulate vessel discharges.*" Consistent with the VGP, the San Diego Water Board is not establishing numeric effluent limitations for ballast water in this Order. This Order contains a provision requiring the Discharger to continue the implementation of BMPs to reduce

the discharge of pollutants from ballast water. In addition, this Order prohibits the addition of chlorine or other additives to the ballast water tanks.

- b. The WQBEL for pH is based on the water quality objective contained in the Basin Plan, which states, "In bays and estuaries the pH shall not be depressed below 7.0 nor raised above 9.0." The WQBEL for temperature is based on Part 4.B.(1) of the Thermal Plan.
- c. Effluent limitations for copper and zinc were calculated in accordance with section 1.4 of the SIP. The following paragraphs describe the methodology used for calculating effluent limitations for these parameters.
- d. Effluent Limitation Calculations. In calculating maximum effluent limitations, the effluent concentration allowances were set equal to the criteria/standards/objectives.

$$ECA_{\text{acute}} = \text{CMC}$$

$$ECA_{\text{chronic}} = \text{CCC}$$

For the human health, agriculture, or other long-term criterion/objective, a dilution credit can be applied. The ECA is calculated as follows:

$$ECA_{\text{HH}} = \text{HH} + D (\text{HH} - B)$$

where:

$ECA_{\text{acute}}$  = effluent concentration allowance for acute (1-hour average) toxicity criterion

$ECA_{\text{chronic}}$  = effluent concentration allowance for chronic (4-day average) toxicity criterion

$ECA_{\text{HH}}$  = effluent concentration allowance for human health, agriculture, or other long-term criterion/objective

CMC = criteria maximum concentration (1-hour average)

CCC = criteria continuous concentration (4-day average, unless otherwise noted)

HH = human health, agriculture, or other long-term criterion/objective

D = dilution credit

B = maximum receiving water concentration

Acute and chronic toxicity ECAs were then converted to equivalent long-term averages (LTA) using statistical multipliers and the lowest is used. Additional statistical multipliers were then used to calculate the maximum daily effluent limitation (MDEL) and the average monthly effluent limitation (AMEL). Human health ECAs are set equal to the AMEL and a statistical multiplier is used to calculate the MDEL.

Human health ECAs are set equal to the AMEL and a statistical multiplier is used to calculate the MDEL.

$$AMEL = mult_{AMEL} [\min(M_A ECA_{\text{acute}}, M_C ECA_{\text{chronic}})]$$

$$MDEL = mult_{MDEL}[\min(M_A ECA_{acute}, M_C ECA_{chronic})]$$

$$MDEL_{HH} = \left(\frac{mult_{MDEL}}{mult_{AMEL}}\right) AMEL_{HH}$$

where: mult AMEL = statistical multiplier converting minimum LTA to AMEL  
 mult MDEL = statistical multiplier converting minimum LTA to MDEL  
 M A = statistical multiplier converting CMC to LTA  
 M C = statistical multiplier converting CCC to LTA

WQBELs were calculated for copper and zinc as follows in Tables F-14 and F-15, below.

**Table F-14. WQBEL Calculations for Copper**

	IX-1		M-2	
	Acute	Chronic	Acute	Chronic
Criteria (µg/L) <sup>1</sup>	5.8	3.7	5.8	3.7
Dilution Credit	No Dilution	No Dilution	No Dilution	No Dilution
ECA	5.8	3.7	5.8	3.7
ECA Multiplier	0.41	0.62	0.40	0.60
LTA	2.4	2.3	2.3	2.3
AMEL Multiplier (95th%)	<sup>2</sup>	1.40	<sup>2</sup>	1.47
<b>AMEL (µg/L)</b>	<sup>2</sup>	<b>3.2</b>	<sup>2</sup>	<b>3.2</b>
MDEL Multiplier (99th%)	<sup>2</sup>	2.43	<sup>2</sup>	2.77
<b>MDEL (µg/L)</b>	<sup>2</sup>	<b>5.6</b>	<sup>2</sup>	<b>5.7</b>
<sup>1</sup> CTR Aquatic Life Criteria				
<sup>2</sup> Limitations based on chronic LTA (Acute LTA > Chronic LTA)				

**Table F-15. WQBEL Calculations for Zinc**

	M-2	
	Acute	Chronic
Criteria	95	86
Dilution Credit	No Dilution	No Dilution
ECA	95	86
ECA Multiplier	0.51	0.70
LTA	48	60
AMEL Multiplier (95th%)	1.28	<sup>2</sup>
<b>AMEL (µg/L)</b>	<b>62</b>	<sup>2</sup>
MDEL Multiplier (99th%)	1.98	<sup>2</sup>
<b>MDEL (µg/L)</b>	<b>95</b>	<sup>2</sup>
<sup>1</sup> CTR Aquatic Life Criteria		
<sup>2</sup> Limitations based on acute LTA (Chronic LTA > Acute LTA)		

- e. A summary of the applicable WQBELs for the Discharger are summarized below:
  - i. The applicable CTR WQBELs are summarized in the following table:

**Table F-16. Summary of CTR WQBELs**

Discharge Locations	Parameter	Units	Effluent Limitations	
			Average Monthly <sup>1</sup>	Maximum Daily
IX-1	Copper	µg/L	3.2	5.6
M-2	Copper	µg/L	3.2	5.7
	Zinc	µg/L	62	95

<sup>1</sup> Average Monthly Effluent Limitations are not applicable for graving dock flood water discharges (M-2) unless there is a discharge more than one day in a 30 day period due to the short term and intermittent nature of the discharge.

- ii. All discharges shall maintain a pH of between 7.0 and 9.0 standard units at all times.
- iii. At no time shall any discharge be greater than 20°F over the natural temperature of the receiving water.

**5. Intake Water Credits**

Section 1.4.4 of the SIP provides that the San Diego Water Board may consider priority pollutants in intake water, through the application of intake water credits. By request of the Discharger, the previous order established intake water credits for certain discharges, including discharges of hydrostatic relief water at Discharge Point Nos. HR-1, HR-2 and HR-3, and flood water from the building ways and graving dock at Discharge Point Nos. M-2, M-3, and M-4 for copper and nickel. The discharges of hydrostatic relief water at Discharge Point Nos. HR-1, HR-2 and HR-3, and flood water from the building ways at Discharge Point Nos. M-3 and M-4 have been combined into the ion exchange treatment system discharging at Discharge Point No. IX-1.

The SIP gives the San Diego Water Board the discretion to allow intake water credits. Intake water credits are not appropriate for copper at Discharge Point No. IX.1 because the Maximum Effluent Concentration (MEC) for copper is well below the water quality criteria, the background concentration, and the effluent limitations established by this Order. Intake water credits are not appropriate for nickel at Discharge Point No. IX-1 because no reasonable potential was determined for nickel at Discharge Point IX.-1.

Reasonable potential was again determined at Discharge Point No. M-2 for copper, however there is no longer reasonable potential for nickel. Effluent data indicates that the Discharger cannot comply with applicable WQBELs for copper (effluent data ranges from 4.2 µg/L to 22 µg/L, with an average of 9.4 µg/L). This Order continues the application of intake water credits for copper at Discharge Point No. M-2.

The previous Order established intake water credits at Discharge Point No. M-2 based on the background copper concentration of 12.8 µg/L, applied as a maximum daily effluent limitations. The maximum effluent concentration for copper within the receiving water from September 2009 through February 2016 was 10.0 µg/L on February 22, 2011. As such, this Order establishes an intake water credit of 10.0 µg/L for discharges from Discharge Point No. M-2 as a daily maximum effluent limitation.

## 6. Whole Effluent Toxicity (WET)

### a. Background and Rationale

The Basin Plan defines toxicity as the adverse response of organisms to chemicals or physical agents.

The Basin Plan establishes a narrative water quality objective for toxicity:

*“All waters shall be maintained free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life.”*

Order No. R9-2009-0099 established acute toxicity effluent limitations for all discharges. Available acute toxicity data from 2009 through 2016 do not indicate the presence of acute toxicity. Available chronic toxicity data from 2009 through 2016 do not indicate the presence of chronic toxicity. However, reasonable potential for chronic toxicity has been established for Discharge Point No. IX-1 due to copper and for Discharge Point No. M-2 for copper and zinc being present in the discharge of the waters at concentrations greater than applicable aquatic life water quality criteria.

U.S. EPA Region 9 has informed San Diego Water Board staff that the application of chronic toxicity monitoring and effluent limitations for all discharges are more desirable than acute toxicity because chronic toxicity is more conservative and provides a better indicator of chronic effects to organisms in the receiving water, other than percent survival. Chronic effects, such as detrimental physiological responses (affecting fertilization, growth, reproduction, etc.) may be present, even when acute effects such as the death of an organism are not apparent. The use of chronic toxicity allows for a more accurate determination of the narrative water quality objective, which specifies *“detrimental physiological responses”*. Many detrimental physiological responses are not addressed when the test is limited to simply percent survival.

Based on the U.S. EPA Region 9 guidance, chronic toxicity monitoring and effluent limitations are established in this Order for discharges at the Facility. Because chronic toxicity is considered to be a more sensitive indicator of toxicity, and the monitoring of all industrial process wastewater sample locations for both acute and chronic toxicity would be costly and redundant, the monitoring requirements and effluent limitations for acute toxicity have been removed for industrial process water based on the application of the more conservative chronic toxicity requirements. If the Discharger complies with effluent limitations for chronic toxicity, they will achieve water quality greater than that necessary to achieve compliance with acute toxicity effluent limitations.

The San Diego Water Board has considered the following information in developing toxicity monitoring and effluent limitations:

- Discussions with U.S. EPA Region 9.
- U.S. EPA's June 2010 guidance document titled *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document, An Additional Whole Effluent Toxicity Statistical Approach for Analyzing Acute and Chronic Data* (EPA 833-R-10-003).
- U.S. EPA's June 2010 guidance document titled *National Pollutant Discharge Elimination System Test of Significant Toxicity Technical Document, An Additional*

*Whole Effluent Toxicity Statistical Approach for Analyzing Acute and Chronic Data (EPA 833-R-10-004).*

- State Water Board’s 2015 Ocean Plan.
- The narrative water quality for objective for toxicity contained in the Water Quality Control Plan for the San Diego Basin (Basin Plan).
- An interpretation of applicable State and federal regulations.

Chronic toxicity monitoring requirements and effluent limitations have been established for industrial storm water, ion exchange system, and graving dock flood water discharges demonstrated to have toxic pollutants in toxic concentrations. These chronic toxicity requirements are consistent with U.S. EPA’s Test of Significant Toxicity (TST) hypothesis approach. The chronic toxicity effluent limitations are expressed as “Pass” for the median monthly summary results and as “Pass” or “<50% Effect” for each maximum daily individual result.

This Order also requires the Discharger to implement BMPs to prevent or eliminate toxicity, investigate the causes of any toxicity, and identify and implement corrective actions to reduce or eliminate effluent toxicity.

**D. Final Effluent Limitation Considerations**

1. Applicable TBELs and WQBELs described in sections IV.B and IV.C of this Fact Sheet have been applied in this Order. Both WQBELs and TBELs for pH were applicable the discharges (6.0 – 9.0 standard units and 7.0 – 9.0 standard units, respectively). To insure the protection of water quality, the more stringent lower and upper limitations for pH have been applied as the final effluent limitations in this Order.
2. Discharges from the Facility shall not exceed the effluent limitations summarized below:

**Table F-17. Effluent Limitations for All Discharges**

Parameter	Units	Effluent Limitations			
		Average Monthly	Average Weekly	Maximum Daily	Instantaneous Maximum
Oil and Grease	mg/L	25	40	40	75
Settleable Solids	mL/L	1.0	1.5	1.5	3.0
Turbidity	NTU	75	100	100	225
pH	pH units	--	--	--	1
Temperature	°F	--	--	--	2
Chronic Toxicity	Pass or Fail	--	--	3	--

<sup>1</sup> Within limits of 7.0 - 9.0 at all times

<sup>2</sup> At no time shall any discharge be greater than 20°F over the natural temperature of the receiving water.

<sup>3</sup> Discharges shall achieve compliance with chronic toxicity effluent limitations as specified in section VII.I of this Order.

3. Discharges from the Facility shall meet the location-specific effluent limitations specified below:

**Table F-18. Summary of Final Effluent Limitations for Specific Discharge Locations**

Discharge Locations	Parameter	Units	Effluent Limitations	
			Average Monthly	Maximum Daily
IX-1	Copper, Total Recoverable	µg/L	3.2	5.6
M-2	Copper, Total Recoverable	µg/L	<sup>1</sup>	10.0
	Zinc, Total Recoverable	µg/L	<sup>1</sup>	95

<sup>1</sup> Average Monthly Effluent Limitations are not applicable for the flood water discharges (M-2, 3, and 4) due to the short term and intermittent nature of the discharges.

**4. Satisfaction of Anti-Backsliding Requirements**

Sections 402(o) and 303(d)(4) of the CWA and federal regulations at 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed.

Numeric effluent limitations have been removed for floating dry dock ballast water (M-1) because of new information pursuant to CWA section 402(o)(2)(B)(i). The floating dry dock is a vessel regulated under the VGP. Section 4.2.3 of the VGP Fact Sheet states that *"vessel operators cannot install equipment onboard their vessels until that equipment has been approved by the Coast Guard and, in some cases, their class societies. Hence, EPA cannot require use of equipment or technologies that would conflict with the requirements of these organizations without fully understanding the implications of such requirements. These factors create a situation where, at this time, it is generally not feasible for EPA to calculate numeric effluent limitations to effectively regulate vessel discharges."* During the previous permit cycle the VGP was issued by U.S. EPA. For the same reasons described by U.S. EPA in the VGP, the San Diego Water Board is not establishing numeric effluent limitations for ballast water in this Order. This Order instead contains a provision requiring the Discharger to continue the implementation of BMPs to reduce or prevent the discharge of pollutants from ballast water. In addition, this Order prohibits the addition of chlorine or other pollutant additives to the ballast water tanks. Removal of the limitations is not expected to negatively impact water quality.

As discussed in section IV.C.5 of this Fact Sheet, discharges from the Facility did not contain reasonable potential for acute toxicity. Further, this Order establishes effluent limitations for chronic toxicity for discharges of storm water, ion exchange treatment system discharge, and graving dock flood water at Discharge Point Nos. SW-1, SW-2, IX-1, and M-2. Chronic toxicity effluent limitations are protective of acute toxicity. The removal of the acute toxicity effluent limitations are consistent with State and federal anti-backsliding requirements and is not expected to negatively impact water quality.

Reasonable potential was not found for nickel in discharges of graving dock flood water from Discharge Point No. M-2 or for nickel, cadmium, or zinc in discharges from the ion exchange treatment system at Discharge Point No. IX.1 so these effluent limitations have been removed from this Order. The removal of these effluent limitations for nickel at Discharge Point No. M-2 and nickel, cadmium, and zinc at Discharge Point No. IX-1 is consistent with State and federal anti-backsliding requirements and is not expected to negatively impact water quality.

With the exception of the removal of effluent limitations discussed above, discharge prohibitions, and specifications in this Order are at least as stringent as the effluent limitations in Order No. R9-2009-0099 and meet State and federal anti-backsliding requirements.

#### 5. **Satisfaction of Antidegradation Policies**

WDRs for the Discharger must conform with federal and State antidegradation policies provided at 40 CFR 131.12 and in State Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality of Waters in California*. The antidegradation policies require that beneficial uses and the water quality necessary to maintain those beneficial uses in the receiving waters of the discharge shall be maintained and protected, and, if existing water quality is better than the quality required to maintain beneficial uses, the existing water quality shall be maintained and protected unless allowing a lowering of water quality is necessary to accommodate important economic and social development or is consistent with maximum benefit to the people of California. When a significant lowering of water quality is allowed by the San Diego Water Board, an antidegradation analysis is required in accordance with the State Water Board's Administrative Procedures Update (July 2, 1990), *Antidegradation Policy Implementation for NPDES Permitting*.

This Order establishes the same BMP requirements as the federal VGP for ballast water discharges from the dry dock in lieu of numeric effluent limitations because the floating dry dock is a vessel already regulated by the VGP. This Order also prohibits the addition of any chlorine or other pollutant additives to the ballast water tanks. Implementation of BMPs in lieu of numeric effluent limitations is expected to reduce or prevent the discharge of pollutants to San Diego Bay and this change is consistent with State and federal antidegradation requirements.

This Order establishes chronic toxicity effluent limitations and removes acute toxicity effluent limitations for Discharge Points SW-1, SW-2, IX-1, and M-2 due to a lack of reasonable potential for acute toxicity and adequate protection provided by the chronic toxicity effluent limitations. Because of a lack of reasonable potential due to an increase in discharge quality, effluent limitations have been removed in this Order for nickel at Discharge Point No. M-2 and nickel, cadmium, and zinc at Discharge Point No. IX-1.

The permitted discharges are consistent with the antidegradation provisions of 40 CFR 131.12 and State Water Board Resolution No. 68-16. Compliance with these requirements will result in the use of best practicable treatment or control of the discharge. The changes described above will not result in an increase in mass emissions of pollutants to San Diego Bay from dry dock ballast water.

#### 6. **Stringency of Requirements for Individual Pollutants**

The implementation of BMPs for the discharge of industrial wastes associated with ship construction, repair and maintenance activities are appropriate in accordance with 40 CFR 122.44(k). Section VI.C.3 of this Order requires the continued implementation of a BMP Program. This Order's technology-based pollutant restrictions implement the minimum, applicable federal technology-based requirements. These limitations are not more stringent than required by the CWA.

WQBELs have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. All beneficial uses and water quality objectives contained in the Basin Plan

were approved under State law and submitted to and approved by U.S. EPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to U.S. EPA prior to May 30, 2000, but not approved by U.S. EPA before that date, are nonetheless "*applicable water quality standards for purposes of the CWA*" pursuant to section 131.21 (c)(1). Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement the requirements of the CWA.

#### **D. Storm Water Risk Level Designation Definition**

All industrial areas of the Facility have been designated as Industrial High Risk Areas due to the activities performed on-site and the contact of storm water within the industrial areas of the Facility.

#### **E. Industrial Storm Water Discharge Specifications**

- 1. Pollutant Reduction to BAT/BCT.** NPDES Permits for storm water discharges must meet all applicable provisions of sections 301 and 402 of the CWA. These provisions require control of pollutant discharges using BAT and BCT to prevent and reduce pollutants and any more stringent controls necessary to meet water quality standards
- 2. Storm Water Pollution Prevention Plan (SWPPP) for Industrial Areas.** This Order requires the Discharger to continue to implement and regularly update an adequate SWPPP as specified in Attachment G. The SWPPP requirement is explained in more detail in section IV.B.2 of this Fact Sheet.
- 3. Numeric Action Levels (NALs).** Consistent with the direction of the State Water Board, and the Statewide Industrial Storm Water General Permit adopted on April 1, 2014, this Order establishes NALs based on U.S. EPA's benchmarks with a tiered compliance strategy. The Facility was deemed as an Industrial High Risk Area which is defined in section IV.A of this Order and the risk level strategy is explained in more detail in section IV.D. of this Fact Sheet.
- 4. Storm Water Retention and Treatment Control BMPs.** The Discharger has installed a Storm Water Diversion System (SWDS) capable of retaining runoff from a 100-year storm event, or 3.5 inches over a 24-hour period. The Discharger is required to maintain and operate the Facility's storm water diversion system. Storm water that flows into the graving dock during a graving dock flooding event will be discharged to San Diego Bay through Discharge Point No. M-2. Storm water exceeding the capacity of the SWSD will be discharged to San Diego Bay through SW-1 or SW-2.

#### **F. Floating Dry Dock, Graving Dock, and Building Ways Discharge Specifications**

This Order requires specific BMPs for floating dry dock, graving dock, and building ways operation to prevent or minimize the discharge of pollutants.

#### **G. Land Discharge Specifications – Not Applicable**

#### **H. Recycling Specifications – Not Applicable**

### **V. RATIONALE FOR RECEIVING WATER LIMITATIONS**

#### **A. Surface Water**

Receiving water limitations in this Order are derived from the water quality objectives for bays and estuaries established by the Basin Plan (1994), the Bays and Estuaries Policy (1974), the CTR (2000), the State Implementation Policy (2005), the Ocean Plan (2015) and the Sediment Quality Plan (2008). San Diego Bay is listed as impaired for polychlorinated biphenyls (PCBs), sediment copper, sediment mercury, sediment zinc, sediment polycyclic aromatic hydrocarbons (PAHs), sediment PCBs, sediment toxicity, and benthic community in

the area directly off shore of the Facility. This 303(d) impairment and elevated effluent concentrations demonstrates that there is reasonable potential to cause or contribute to an exceedance of the sediment quality objectives which have been included as receiving water limitations.

## **VI. RATIONALE FOR PROVISIONS**

### **A. Standard Provisions**

Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR section 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR section 122.42, are provided in Attachment D. The discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42.

Sections 122.41(a)(1) and (b) through (n) of 40 CFR establish conditions that apply to all state-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in the Order. Section 123.25(a)(12) of 40 CFR allows the State to omit or modify conditions to impose more stringent requirements. In accordance with 40 CFR section 123.25, this Order omits federal conditions that address enforcement authority specified in 40 CFR sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

### **B. Monitoring and Reporting Program (MRP) Requirements**

The Discharger is required to comply with the MRP in Attachment E and submit notifications as provided.

### **C. Special Provisions**

#### **1. Reopener Provisions**

This Order includes a list of circumstances when this Order may be reopened.

#### **2. Special Studies and Additional Monitoring Requirements**

Requirements for a toxicity reduction evaluation/toxicity investigation evaluation TRE/TIE have been incorporated in the MRP (Attachment E).

#### **3. Best Management Practices**

To carry out the purpose and intent of the CWA, the previous Order required the Discharger to develop and implement a BMP Program, as authorized by CWA section 304(e) and section 402(p), for toxic pollutants and hazardous substances, and for the control of storm water discharges. This Order requires the Discharger to continue to implement and regularly update a BMP Program which incorporates a SWPPP as specified in Attachment G and addresses, at a minimum, dry dock pre-flood cleaning, building ways pre-flood cleaning, graving dock pre-flood cleaning, dry dock ballast water, and spills of including fire protection water, potable water, steam condensate.

#### **4. Construction, Operation, and Maintenance Specifications – Not Applicable**

#### **5. Special Provisions for Municipal Facilities (POTWs Only) – Not Applicable**

#### **6. Other Special Provisions – Not Applicable**

## VII. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorize the San Diego Water Board to require technical and monitoring reports. The MRP (Attachment E) establishes monitoring and reporting requirements that implement federal and State requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP (Attachment E) for this facility.

### A. Influent Monitoring – Not Applicable

### B. Effluent Monitoring

Pursuant to the requirements of 40 CFR section 122.44(i)(2) effluent monitoring is required for all constituents with effluent limitations. Effluent monitoring is necessary to assess compliance with effluent limitations, assess the effectiveness of BMPs and pollution prevention plans, to assess the impacts of the discharge on the receiving water, and determine compliance with effluent limitations.

1. Based on the industrial types of activities that occur on-site, and the types of discharges from the Facility, effluent monitoring at all effluent monitoring locations for settleable solids, turbidity, total suspended solids, oil and grease, total petroleum hydrocarbons, and chronic toxicity have been carried over from MRP No. R9-2009-0099. The frequency of sampling has been increased to annually for the remaining priority pollutants to ensure proper data collection.

#### 2. Ion Exchange Treatment System (Monitoring Location IX-1)

- a. Monthly flow monitoring has been retained from the previous permit because three 10,500 gallon surge tanks ensure a generally constant flow rate.
- b. Monthly pH and temperature monitoring has been carried over from the previous permit.
- c. Annual monitoring for settleable solids, turbidity, total suspended solids, and oil and grease has been increased from annually to monthly to better characterize the effluent.
- d. Monthly monitoring for copper and zinc has been carried over from the previous permit.
- e. Annual monitoring for total petroleum hydrocarbons has been increased to semiannual.
- f. Annual chronic toxicity monitoring has been increased to semiannual from the previous permit to better characterize the effluent and to better understand the impacts of copper and zinc on the receiving water. Acute toxicity monitoring has been eliminated because chronic toxicity monitoring will achieve water quality greater than that necessary to achieve compliance with acute toxicity monitoring as explained in section IV.C.5 of this Fact Sheet, Attachment F to this Order.
- g. Monitoring twice per permit term for the remaining CTR priority pollutants has been increased from the previous permit to semiannual monitoring to better characterize the effluent.

#### 3. Ballast Water (Monitoring Location M-1)

Numeric effluent limitations have been removed for ballast water to be consistent with U.S. EPA's VGP. Therefore, all monitoring except submergence/emergence reporting has been eliminated.

**4. Graving Dock Flood Water (Monitoring Location M-2)**

- a. Sampling is only required when a discharge occurs (i.e. flooding of the graving dock during a launch or retrieval evolution)
- b. Monthly effluent flow monitoring has been revised from the previous permit to daily flow monitoring to accurately determine the volume of effluent being discharged from the Facility into San Diego Bay. Monitoring is only required when a discharge occurs (i.e. flooding of the graving dock during a launch or retrieval evolution)
- c. Monthly effluent monitoring of pH and temperature has been carried over from the previous permit to characterize the discharge of graving dock flood water from the Facility into the San Diego Bay.
- d. Annual monitoring for settleable solids, turbidity, total suspended solids, and oil and grease has been increased from annually to monthly to better characterize the effluent.
- e. Monthly effluent monitoring for copper has been carried over from the previous permit and quarterly monitoring for zinc has been increased to monthly because reasonable potential was indicated for these pollutants and therefore required monitoring to evaluate compliance with applicable effluent limitations.
- f. Annual monitoring for total petroleum hydrocarbons has been increased to semiannual.
- g. Annual chronic toxicity monitoring has been revised from the previous permit to semiannual to better characterize the effluent and to better understand the impacts of copper and zinc on the receiving water. Acute toxicity monitoring has been eliminated because chronic toxicity monitoring will achieve water quality greater than that necessary to achieve compliance with acute toxicity monitoring as explained in section IV.C.5 of this Fact Sheet, Attachment F to this Order.
- h. Monitoring twice per permit term of the graving dock flood water for the remaining CTR priority pollutants has been changed from the previous permit to semiannual monitoring to better characterize the effluent.
- i. The graving dock may be used for constructing new vessels or for repairing existing vessels. When constructing new vessels, the Discharger applies a non-copper-based antifouling hull coating system as a BMP to achieve compliance with the copper effluent limitation at Discharge Point No. M-2. The graving dock can also be used for repair or minor maintenance of vessels with existing antifouling hull coatings which may contain copper. Copper-based antifouling hull coatings are regulated by the California Department of Pesticide Regulation (DPR) and are designed to leach copper into the surrounding water which could cause an exceedance of the numeric copper effluent limitation at Discharge Point No. M-2. Because the leaching of copper from antifouling hull coatings on existing vessels needing repair and maintenance is regulated by DPR, an alternate sample location has been determined appropriate to obtain a sample which is representative of the activities at NASSCO without contributions from the copper-based antifouling hull coating. For vessels with existing copper-based antifouling hull coatings, the Discharger is required to collect the sample of flood water before the vessel hull contacts the flood water.

Representative samples of graving dock flood water shall be collected as follows.

- For newly constructed vessels, the sample shall be collected when the graving dock is full of water and ready to launch the vessel immediately before the gate is opened.
- For repair of vessels with a preexisting copper-based antifouling hull coating, the sample shall be collected when the graving dock is full of water, before the gate is opened, and before the vessel enters the graving dock.
- For launching vessels with a preexisting copper-based antifouling hull coating, the sample shall be collected immediately before the flood water is deep enough to reach the vessel hull.

## 5. Storm Water Monitoring

The discharge of industrial contact storm water to San Diego Bay may contain pollutants from the surrounding areas which could contribute to the exceedance of the water quality criteria/objectives of the receiving waters. Industrial storm water monitoring requirements have been modified from the previous Order to be consistent with the State Water Board's Statewide Industrial Storm Water Permit. The purpose of the monitoring is to determine the effects of storm water discharges on the receiving water and monitor the effectiveness of the SWPPP to meet applicable effluent limitations, NALs, and receiving water limits. Storm water sampling has been increased from two storms per year to two storms per semiannual period consistent with the Statewide Industrial Storm Water Permit.

## C. Whole Effluent Toxicity Testing Requirements

The WET testing is designed to address the following primary questions:

1. Does the effluent meet permit effluent limits for toxicity thereby ensuring that water quality standards are achieved in the receiving water?
2. If the effluent does not comply with permit effluent limitations for chronic toxicity, are unmeasured pollutants causing risk to aquatic life? Are unmeasured pollutants causing risk to aquatic life?
3. If the effluent does not comply with permit effluent limitations for chronic toxicity, are pollutants in combinations causing risk to aquatic life? Are conditions in receiving water getting better or worse with regard to toxicity?

As discussed above in section IV.C.5 of this Fact Sheet, chronic toxicity effluent limitations established in this Order are based on U.S. EPA's TST and percent effect. Chronic toxicity effluent limitations and monitoring are established for industrial storm water, ion exchange treatment system discharges, and graving dock flood water. Chronic toxicity monitoring is required to evaluate compliance with effluent limitations. This Order increases the chronic toxicity monitoring requirement from Order No. R9-2009-00099 of at least two industrial storm water discharge events annually to be consistent with the Statewide Industrial Storm Water Permit of two storms per semiannual period. This Order increases the annual chronic toxicity monitoring from the previous permit for the ion exchange treatment system and graving dock flood water to semiannual monitoring. Acute toxicity monitoring has been eliminated because chronic toxicity monitoring will achieve water quality greater than that necessary to achieve compliance with acute toxicity monitoring as explained in section IV.C.5 of this Fact Sheet, Attachment F to this Order.

This Order requires the Discharger to conduct an additional toxicity test for exceedances of the toxicity effluent limitations. If the additional test demonstrates toxicity, the Discharger is required to implement accelerated monitoring. If an accelerated monitoring test demonstrates

toxicity, the Discharger is required to submit a Toxicity Reduction Evaluation (TRE) Workplan in accordance with U.S. EPA guidance which shall include: further steps taken by the Discharger to investigate, identify, and correct the causes of toxicity; actions the Discharge will take to mitigate the effects of the discharge and prevent the recurrence of toxicity; and a schedule for these actions. This provision also includes requirements to initiate the TRE/TIE process if the results of toxicity testing exceed the effluent limitation for chronic toxicity.

#### **D. Receiving Water Monitoring**

##### **1. Monitoring Questions**

Receiving water and sediment monitoring shall be designed and conducted to address the following primary questions:

- Does the discharge cause or contribute to violations of the receiving water limitations in section V of this Order?
- Are the receiving water conditions getting better or worse over time?
- Does the Facility cause or contribute to violations of the receiving water limitations in section V of this Order?
- Is the sediment condition changing over time?

##### **2. Water and Sediment Monitoring Plan**

The Discharger is required to submit a Water and Sediment Monitoring Plan within 12 months of the effective date of this Order. The Water and Sediment Monitoring Plan has all the elements required by the State Water Board's Sediment Quality Plan, which became effective on August 25, 2009, to be implemented for both water and sediment for consistency. A conceptual model, existing data, and ongoing monitoring must be considered in the development of the Water and Sediment Monitoring Plan.

##### **3. Receiving Water Monitoring**

- a. Monitoring of the receiving water is necessary to determine if the discharges from the Facility are impacting the water quality objectives for San Diego Bay, applicable beneficial uses, and aquatic life.
- b. Monitoring locations will be determined in the Water and Sediment Monitoring Plan.
- c. Monthly monitoring of copper has been retained from the previous permit to help determine future intake credits. Quarterly monitoring of zinc has been retained from the previous permit.
- d. This Order establishes annual monitoring of receiving water for chronic toxicity.
- e. Annual monitoring of the CTR priority pollutants has been retained from the previous permit.

##### **4. Sediment Monitoring**

- a. This Order establishes monitoring and analysis requirements consistent with the Sediment Quality Plan.
- b. Monitoring locations will be determined in the Water and Sediment Monitoring Plan.

- c. Sediment chemistry, toxicity, and benthic community monitoring are required in accordance with, and at a minimum, the requirements under the Sediment Quality Control Plan.

#### **5. Monitoring Coalitions**

Monitoring coalitions enable the sharing of technical resources, trained personnel, and associated costs and create an integrated water and sediment monitoring program within each water body. Focusing resources on water body issues and developing a broader understanding of pollutants effects in these water bodies enables the development of more rapid and efficient response strategies and facilitates better management of water and sediment quality.

To achieve maximum efficiency and economy of resources, the Discharger may establish or join a San Diego Bay water body monitoring coalition. If a San Diego Bay monitoring coalition is formed, revised monitoring requirements will be established to ensure that appropriate monitoring is conducted in a timely manner.

#### **6. Water and Sediment Monitoring Reports**

The Discharger or water body monitoring coalition is required to submit annual Receiving Water Monitoring Reports and a Sediment Monitoring Report at least twice during a permit cycle in accordance with the Water and Sediment Monitoring Plan unless otherwise directed by the San Diego Water Board.

### **E. Regional Monitoring Requirements**

The San Diego Water Board may modify the receiving waters monitoring and reporting requirements, regional monitoring requirements, and/or special studies requirements of this Order as necessary for cause, including but not limited to a) revisions necessary to implement recommendations from Southern California Coastal Water Research Project (SCCWRP); b) revisions necessary to develop, refine, implement, and/or coordinate a regional monitoring program; and/or c) revisions necessary to develop and implement improved monitoring and assessment programs in keeping with San Diego Water Board Resolution No. R9-2012-0069, *Resolution in Support of a Regional Monitoring Framework*.

### **F. Other Monitoring Requirements**

1. Monitoring requirements for floating dry dock submergence/emergence, shipbuilding ways flooding, and graving dock flooding; floating dry dock ballast tank monitoring; floating boom cleaning; and spill and illicit discharges have been carried over from Order No. R9-2009-0099 to help determine the effectiveness of the BMP Plan and ensure that appropriate BMPs are properly implemented.
2. Under the authority of section 308 of the CWA (33 U.S.C. § 1318), U.S. EPA requires major permittees under the NPDES Program to participate in the annual DMR-QA Study Program. The DMR-QA Study evaluates the analytical ability of laboratories that routinely perform or support self-monitoring analyses required by NPDES permits. There are two options to satisfy the requirements of the DMR-QA Study Program: (1) The Discharger can obtain and analyze a DMR-QA sample as part of the DMR-QA Study; or (2) Per the waiver issued by U.S. EPA to the State Water Board, the Discharger can submit the results of the most recent Water Pollution Performance Evaluation Study from its own laboratories or its contract laboratories. A Water Pollution Performance Evaluation Study is similar to the DMR-QA Study. Thus, it also evaluates a laboratory's ability to analyze wastewater samples to produce quality data that ensure the integrity of the NPDES Program. The Discharger shall ensure that the results of the DMR-QA Study or the results of the most recent Water Pollution Performance Evaluation Study are

submitted annually to the State Water Board. The State Water Board's Quality Assurance Program Officer will send the DMR-QA Study results or the results of the most recent Water Pollution Performance Evaluation Study to U.S. EPA's DMR-QA Coordinator and Quality Assurance Manager.

## VIII. PUBLIC PARTICIPATION

The San Diego Water Board has considered the issuance of WDRs in this Order that will serve as an NPDES permit for the Discharger. As a step in the adoption process of this Order for the Facility, the San Diego Water Board developed a Tentative Order and encouraged public participation in the Board's proceedings to consider adoption of the Tentative Order in accordance with the requirements of 40 CFR section 124.10 and Water Code section 13167.5.

### A. Notification of Public Hearing and Public Comment Period

By electronic mail dated October 10, 2016 the San Diego Water Board notified the Discharger and interested agencies and persons of its intent to consider adoption of the Tentative Order in a public hearing during a regularly scheduled Board Meeting on December 14, 2016. The San Diego Water Board also provided notice that the Tentative Order was posted on the Board website and provided a period of 30 days for public review and comment. On October 10, 2016, notice of the public hearing and public comment period was also published in the San Diego Union Tribune, a daily newspaper within the area affected by the Facility.

The public also had access to the agenda including all supporting documents and any changes in meeting dates and locations through the San Diego Water Board's website at: <http://www.waterboards.ca.gov/rwqcb9/>.

### B. Written Comments and Responses

Interested persons were invited to submit written comments concerning the Tentative Order as provided through the notification process. Written comments or e-mailed comments were required to be received in the San Diego Water Board office at 2375 Northside Drive, Suite 100, San Diego, CA 92108.

To be fully responded to by staff and considered by the San Diego Water Board, the written or e-mailed comments were due at the San Diego Water Board office by 5:00 p.m. on November 9, 2016. The San Diego Water Board provided written responses to all timely received public comments on the Tentative Order and posted the response to comments document on the Board's website in advance of the public hearing date.

### C. Public Hearing

The San Diego Water Board held a public hearing on the Tentative Order during its regular Board meeting on the following date and time and at the following location:

Date: December 14, 2016  
Time: 9:00 am  
Location: San Diego Water Board  
Regional Board Meeting Room  
2375 Northside Drive, Suite 100, San Diego CA 92108

Interested persons were invited to attend. At the public hearing, the San Diego Water Board heard and considered all comments and testimony pertinent to the discharge and the Tentative Order,. For accuracy of the record, important testimony was requested in writing.

### D. Petition for State Water Board Review

Any aggrieved person may petition the State Water Board to review the decision of the San Diego Water Board regarding the final WDRs of this Order/Permit in accordance with Water

Code section 13320 and the CCR, title 23, sections 2050 and following. The State Water Board must receive the petition by 5:00 p.m., 30 days after the adoption date of this Order, except that if the thirtieth day following the adoption date of this Order/Permit falls on a Saturday, Sunday, or State holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the State Water Board website at [http://www.waterboards.ca.gov/public\\_notices/petitions/water\\_quality](http://www.waterboards.ca.gov/public_notices/petitions/water_quality) or will be provided upon request.

For instructions on how to file a petition for review, see the State Water Board website at: [http://www.waterboards.ca.gov/public\\_notices/petitions/water\\_quality/wqpetition\\_instr.shtml](http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml)

#### **E. Public Access to Records**

Records pertinent to the San Diego Water Board's proceedings to adopt this Order including but not limited to the Report of Waste Discharge (ROWD), public notices, draft and finalized versions of the Tentative Order, public comments received, Board responses to comments received, and other supporting documents are maintained by the San Diego Water Board. These records are available for public access Monday through Friday between the hours of 8:00 a.m. to 5:00 p.m. at the San Diego Water Board office.

The San Diego Water Board website contains information and instructions on how to request access and obtain copies of these records at:

[http://www.waterboards.ca.gov/sandiego/about\\_us/contact\\_us/records.shtml](http://www.waterboards.ca.gov/sandiego/about_us/contact_us/records.shtml)

Before making a request to view public records in the San Diego Water Board office you may wish to determine if the information is already available on the San Diego Water Board's website at <http://www.waterboards.ca.gov/sandiego/>

#### **F. Register of Interested Persons**

Any person interested in being placed on the mailing list for information regarding this Order should contact the San Diego Water Board at the e-mail address below, reference this Facility or Order, and provide a name, address, e-mail address (if available), and phone number.

#### **G. Additional Information**

Requests for additional information or questions regarding this Order should be directed to Kristin Schwall at (619) 521-3368 or [kristin.schwall@waterboards.ca.gov](mailto:kristin.schwall@waterboards.ca.gov) or to the San Diego Water Board via e-mail at [rb9\\_questions@waterboards.ca.gov](mailto:rb9_questions@waterboards.ca.gov).

**ATTACHMENT G – BEST MANAGEMENT PRACTICES PROGRAM AND STORM WATER POLLUTION PREVENTION PLAN REQUIREMENTS FOR INDUSTRIAL AREAS****I. IMPLEMENTATION SCHEDULE**

The Discharger shall continue to implement the existing storm water pollution prevention plan (SWPPP) until the Discharger has fully completed the implementation of SWPPP requirements specified in section IV.C of this Order. The Discharger shall implement any necessary revisions to its SWPPP to comply with the requirements of this Order within 1 year of the effective date of this Order.

**II. SWPPP OBJECTIVES**

**A.** The Discharger's SWPPP shall be prepared to achieve these objectives:

1. To reduce or prevent the discharge of pollutants from industrial activities to the technology –based standards of best available technology economically achievable (BAT) for toxic and non-conventional pollutants, and best conventional pollutant control technology (BCT) for conventional pollutants.
2. To achieve compliance with the receiving water limitations in section V of this Order.
3. To identify and evaluate sources of pollutants associated with industrial activities that may affect the quality of the waters of the State and waters of the U.S.
4. To identify, describe, and implement site-specific Best Management Practices (BMPs) to reduce or prevent the discharge of pollutants associated with industrial activities to waters of the State and waters of the U.S.
5. To identify and implement timely revisions and/or updates to the SWPPP.

**B.** To achieve the SWPPP objectives, the Discharger shall prepare a written Facility-specific SWPPP in accordance with all applicable SWPPP requirements of this attachment. The SWPPP shall include all required maps, descriptions, schedules, checklists, and relevant copies or specific references to other documents that satisfy the requirements of this attachment. The typical development and implementation steps necessary to achieve the described objectives are summarized in Item A-2, located at the end of this attachment.

**III. PLANNING AND ORGANIZATION****A. SWPPP Checklist**

The SWPPP shall include a SWPPP Checklist (Example checklist is included as Item A-1 below) located at the end of this section. For each requirement listed, the Discharger shall identify the page number where the requirement is located in the SWPPP (or the title, page number, and location of any reference documents), the implementation date or last revision date, and any SWPPP requirements that may not be applicable to the Facility.

**B. Pollution Prevention Team**

1. The SWPPP shall identify specific individuals and their positions within the Facility organization as members of a storm water pollution prevention team responsible for developing the SWPPP, assisting the Facility manager in SWPPP implementation and revision, and conducting all monitoring program activities required in Attachment E of this Order.
2. The SWPPP shall clearly identify the responsibilities, duties, and activities of each team member.

3. The SWPPP shall identify, as appropriate, alternative individuals to perform the required SWPPP and monitoring program activities when team members are temporarily unavailable (due to vacation, illness, out of town meetings, etc.).

**C. Review Other Requirements and Existing Facility Plans**

1. The SWPPP shall be developed, implemented, and revised as necessary to be consistent with any applicable municipal, State, and Federal requirement that pertains to the requirements of this Order.
2. The SWPPP may incorporate or reference the elements of the Discharger's existing plans, procedures, or regulatory compliance documents that contain storm water pollution control practices or otherwise relate to the requirements of this Order. For example, facilities subject to Federal Spill Prevention Control and Countermeasures' requirements should already have instituted a plan to control spills of certain hazardous materials, or facilities subject to regional air quality emission controls may already have evaluated industrial activities that emit dust or particulate pollutants.

**IV. SITE MAP**

The SWPPP shall include a site map. The site map shall be provided on an 8 ½ x 11 inch or larger sheet and include notes, legends, north arrow, and other data as appropriate to ensure that the site map is clear and understandable. If necessary, the Discharger may provide the required information on multiple site maps. The following information shall be included on the site map:

- A. Boundaries and Drainage Ares.** Outlines of the Facility boundary, storm water drainage areas within the Facility boundary, and portions of any drainage area impacted by discharges from surrounding areas. Include the flow direction of each drainage area; on-site surface water bodies; areas of soil erosion; and location(s) of near-by water bodies (such as rivers, lakes, wetlands, etc.) or municipal storm drain inlets that may receive the Facility's storm water discharges and authorized non-storm water discharges.
- B. Storm Water Collection and Conveyance System.** The location of the storm water collection and conveyance system, associated points of discharge, and direction of flow. Include any structural control measures that affect storm water discharges, authorized non-storm water discharges, and run-on. Examples of structural control measures are catch basins, berms, detention ponds, secondary containment, oil/water separators, diversion barriers, etc.
- C. Impervious Ares.** The outline of all impervious areas of the Facility, including paved areas, buildings, covered storage areas, or other roofed structures.
- D. Materials, Spills, and Leaks Locations.** Locations where materials are directly exposed to precipitation and the locations where significant spills or leaks, identified in accordance with section VI.A.4 below, have occurred.
- E. Ares of Industrial Activity.** Areas of industrial activity. Identify all storage areas and storage tanks, shipping and receiving areas, fueling areas, vehicle and equipment storage/maintenance areas, material handling and processing areas, waste treatment and disposal areas, dust or particulate generating areas, cleaning and reusing areas, and other areas of industrial activity which are potential pollutant sources.
- F. Storm Water Risk Level Boundaries.** Identify the boundaries of the Industrial High Risk areas as defined in section IV.A of the Order.

## V. LIST OF SIGNIFICANT MATERIALS

The SWPPP shall include a list of significant materials handled and stored at the site. For each material on the list, the locations where the material is stored, received, shipped, and handled, as well as the typical quantities and frequencies, shall be described. The materials list shall include raw materials, intermediate products, final or finished products, recycled materials, and waste or disposed materials.

## VI. DESCRIPTION OF POTENTIAL POLLUTANT SOURCES

- A. For each area identified in section IV.E of this Attachment, the SWPPP shall include a narrative description of the Facility's industrial activities, potential pollutant sources, and potential pollutants that could be exposed to storm water or authorized non-storm water discharges or otherwise be discharged. At a minimum, the following industrial activities shall be described as applicable:
1. **Industrial Processes.** Describe each industrial process including the manufacturing, cleaning, maintenance, recycling, disposal, or other activities related to the process. Include the type, characteristics, and approximate quantity of significant materials used in or resulting from the process. Areas protected by containment structures and the corresponding containment capacity shall be identified and described.
  2. **Material Handling and Storage Areas.** Describe each handling and storage area including the type, characteristics, and quantity of significant materials handled or stored, description of the shipping, receiving, and loading procedures, and the spill or leak prevention and response procedures. Areas protected by a containment structure and the corresponding containment capacity shall be identified and described.
  3. **Dust and Particulate Generating Activities.** Describe all industrial activities that generate dust or particulates that may be deposited within the Facility's boundaries. Include their discharge locations and the type, characteristics, and quality of dust and particulate pollutants that may be deposited within the Facility's boundaries. Identify the primary areas of the Facility where dust and particulate pollutants would settle.
  4. **Significant Spills and Leaks.** Identify and describe materials that have spilled or leaked in significant quantities in storm water discharges or non-storm water discharges. Include toxic chemicals (listed in 40 CFR part 302) that have been discharged to storm water as reported in United States Environmental Protection Agency (U.S. EPA) Form R, and oil and hazardous substances in excess of reportable quantities (see 40 CFR parts 110, 117, and 302).

The description shall include the location, characteristics, and approximate quantity of the materials spilled or leaked, the cleanup or remedial actions that have occurred or are planned, the approximate remaining quantity of materials that may be exposed to storm water or non-storm water discharges; and the preventative measures taken to ensure spills or leaks of the material do not reoccur.

5. **Non-Storm Water Discharges.** The Discharger shall inspect the Facility to identify all non-storm water discharges, sources, and drainage areas. All drains (inlets and outlets) shall be evaluated to identify whether they connect to the storm drain system.

All non-storm water discharges shall be described. The description shall include the source, quantity, frequency, and characteristics of the non-storm water discharges and associated drainage area and shall identify whether the discharge is an authorized or unauthorized non-storm water discharge. Examples of unauthorized non-storm water discharges are rinse and wash water (whether detergents are used or not, contact and non-contact cooling water, boiler blow-down, etc.

6. **Soil Erosion.** Describe the Facility locations where soil erosion may occur as a result of industrial activity, storm water discharges associated with industrial activity, or authorized non-storm water discharges.
7. **Non-Industrial Storm Water Discharges.** Describe the Facility locations of non-industrial storm water discharges such as parking lots and rooftops. Explain how these discharges are kept separate from industrial activities and industrial materials. Describe good housekeeping and other non-structural BMPs, at a minimum, which are employed to reduce and minimize pollution from these areas.

## VII. ASSESSMENT OF POTENTIAL POLLUTANT SOURCES

- A. The SWPPP shall include a narrative assessment of all industrial activities and potential pollutant sources as described in accordance with section VI of this Attachment. To determine the likelihood that significant materials will be exposed to storm water or authorized non-storm water discharges, the assessment shall include consideration of the quantity, characteristics, and locations of each significant material handled, produced, stored, recycled, or disposed; the direct and indirect pathways that significant materials may be exposed to storm water or authorized non-storm water discharges; history of spills or leaks; non-storm water discharges; prior sampling; visual observation, and inspection records; discharges from adjoining areas; and the effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. At a minimum, the Discharger shall consider:
  1. The quantity, physical characteristics (liquid, powder, solid, etc.), and locations of each significant material handled, produced, stored, recycled, or disposed.
  2. The degree pollutants associated with those materials are exposed to and mobilized by contact with storm water.
  3. The direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.
  4. Sampling, visual monitoring, and inspection records.
  5. Effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.
- B. Based upon the assessment above, the SWPPP shall identify any areas of industrial activity and corresponding pollutant sources where significant materials are likely to be exposed to storm water or authorized non-storm water discharges and where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

## VIII. STORM WATER BEST MANAGEMENT PRACTICES

- A. The SWPPP shall include a narrative description of BMPs implemented at the Facility. The BMPs, when developed and implemented, shall be effective in reducing or preventing pollutants in storm water discharges and authorized non-storm water discharges.

The BMPs narrative description shall include:

1. The type of pollutants the BMPs are designed to reduce or prevent.
2. The frequency, time(s) of day, or conditions when the BMPs are scheduled for implementation.
3. The locations within each area of industrial activity or pollutant source where the BMPs shall be implemented.

4. Identification of the person and/or position responsible for implementing the BMPs.
5. The procedures, including maintenance procedures, and/or instructions to implement the BMPs.
6. The equipment and tools necessary to implement the BMPs.

**B. Non-Structural BMPs.** The Discharger shall consider non-structural BMPs for implementation at the Facility. Non-structural BMPs generally consist of processes, prohibitions, procedures, training, schedule of activities, etc. that prevent pollutants associated with industrial activity from contact with storm water discharges and authorized non-storm water discharges. Below is a list of non-structural BMPs that shall be considered:

1. **Good Housekeeping.** Good housekeeping generally consists of practical procedures to maintain a clean and orderly facility.
2. **Preventative Maintenance.** Preventative maintenance includes regular inspection and maintenance of storm water structural controls (i.e. catch basins, oil/water separators, etc.) as well as other facility equipment and systems.
3. **Spill Response.** This includes spill clean-up procedures and necessary clean-up equipment based upon the quantities and locations of significant materials that may spill or leak.
4. **Material Handling and Storage.** This includes all procedures to minimize the potential for spills and leaks and to minimize exposure to significant materials to storm water and authorized non-storm water discharges.
5. **Employee Training Program.** This includes the development of a program to train personnel responsible for implementing the various compliance activities of this Order including BMPs implementation, inspections and evaluations, monitoring activities, and storm water compliance management. The training program shall include:
  - a. A description of the training program and any training manuals or training materials.
  - b. A discussion of the appropriate training frequency.
  - c. A discussion of the appropriate personnel to receive training.
  - d. A training schedule.
  - e. Documentation of all completed training classes and the personnel who received training.
6. **Waste Handling/Recycling.** This includes the procedures or processes to handle, store, or dispose of waste or recyclable materials.
7. **Record Keeping and Internal Reporting.** This includes the procedures to ensure that all records of inspections, spills, maintenance activities, corrective actions, visual observations, etc. are developed, retained, and provided, as necessary to the appropriate Facility personnel.
8. **Erosion Control and Site Stabilization.** This includes a description of all sediment and erosion control activities. This may include the planting and maintenance of vegetation, diversion of run-on and runoff, placement of sandbags, silt screens, or other sediment control devices.
9. **Inspections.** Periodic visual inspections of the Facility are necessary to ensure that the SWPPP addresses any significant changes to the Facility's operations or BMP implementation procedures.

- a. A minimum of four quarterly visual inspections of all areas of industrial activity and associated potential pollutant sources shall be completed each reporting year. The annual comprehensive site compliance evaluation described in section IX of this attachment may substitute for one of the quarterly inspections.
  - b. Tracking and follow-up procedures shall be described to ensure appropriate corrective actions and/or SWPPP revisions are implemented.
  - c. A summary of the corrective actions and SWPPP revisions resulting from quarterly inspections shall be reported in the annual report.
  - d. Dischargers shall certify in the annual report that each quarterly visual inspection was completed.
  - e. All corrective actions and SWPPP revisions shall be implemented in accordance with sections XII.D and XII.E of this attachment.
10. **Quality Assurance.** This includes the management procedures to ensure that the appropriate staff adequately implements all elements of the SWPPP and Monitoring Program.
- C. Structural BMPs.** Where non-structural BMPs identified in section VIII.B above are not effective, structural BMPs shall be considered. Structural BMPs typically consist of structural devices that reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. Below is a list of structural BMPs that shall be considered:
1. **Overhead Coverage.** This includes structures that protect materials, chemicals, and pollutant sources from contact with storm water and authorized non-storm water discharges.
  2. **Retention Ponds.** This includes basins, ponds, surface impoundments, bermed areas, etc. that do not allow storm water to discharge from the Facility.
  3. **Control Devices.** This includes berms or other devices that channel or route run-on and runoff away from pollutant sources.
  4. **Secondary Containment Structures.** This includes containment structures around storage tanks and other areas that collect any leaks or spills.
  5. **Treatment.** This includes inlet controls, infiltration devices, oil/water separators, detention ponds, vegetative swales, etc. which reduce the pollutants in storm water discharges and authorized non-storm water discharges.
- D.** The SWPPP shall include a summary identifying each area of industrial activity and associated pollutant sources, pollutants, and BMPs in a table similar to Item A-3 at the end of this attachment.

## IX. ANNUAL COMPREHENSIVE SITE COMPLIANCE EVALUATION

The Discharger shall conduct one comprehensive site compliance evaluation (evaluation) in each reporting period (July 1 – June 30). Evaluations shall be conducted no less than 8 months from each other. The SWPPP shall be revised, as appropriate, and the revisions implemented within 90 days of the evaluation. Evaluations shall include the following:

- A.** A review of all visual observation records, inspection records, and sampling and analysis results.
- B.** A visual inspection of all areas of industrial activity and associated potential pollutant sources for evidence of, or the potential for, pollutants entering the drainage system. A visual inspection of equipment needed to implement the SWPPP.

- C. A review and evaluation of all BMPs, both structural and non-structural, for each area of industrial activity and associated potential pollutant sources to determine whether the BMPs are properly designed, implemented, and are effective in reducing and preventing pollutants in storm water discharges and authorized non-storm water discharges.
- D. An evaluation report that includes:
  1. Identification of personnel performing the evaluation,
  2. Date(s) of the evaluation,
  3. Summary and implementation dates of all significant corrective actions and SWPPP revisions for the reporting year,
  4. Schedule for implementing any incomplete corrective actions and SWPPP revisions,
  5. Any incidents of non-compliance and the corrective actions taken, and
  6. A certification that the Discharger has completed the quarterly inspections specified in section VIII.B.9, above and that the Discharger is complying with this Order.
  7. The evaluation report shall be submitted as part of the annual report, retained for at least 5 years, and signed and certified in accordance with Standard Provision V.B of Attachment D of this Order.

**X. NUMERIC ACTION LEVELS (NALS)**

- A. Numeric Action Levels (NALs) for all storm water discharges are appropriate numeric thresholds that allow a discharger to take corrective action when the Instantaneous Maximum or Annual Average NAL are exceeded. Exceedances of NAL values are not a violation of the Order. Dischargers that exceed one of the NAL values shall take the appropriate corrective action as set forth in section IV.C.3. of the Order.

NALs are specified as follows:

**Table G-1.NALs for Storm Water**

PARAMETER	TEST METHOD <sup>1</sup>	REPORTING UNITS	ANNUAL NAL VALUE	INSTANTANEOUS MAXIMUM NAL
pH	Field test with calibrated portable instrument, or lab sample in accordance with 40 CFR § 136.	pH units	N/A	6.0-9.0
Suspended Solids (TSS), Total	SM2540-D	mg/L	100	400
Oil & Grease (TOG), Total	EPA 1664A	mg/L	15	25
Zinc, Total (H)	EPA 200.8	mg/L	0.26 <sup>2</sup>	-
Copper, Total (H)	EPA 200.8	mg/L	0.0332 <sup>2</sup>	-
Cyanide, Total	SM 4500-CN C, D, or E	mg/L	0.022	-
Lead, Total (H)	EPA 200.8	mg/L	0.262 <sup>2</sup>	-
Chemical Oxygen Demand	SM 5220C	mg/L	120	-
Aluminum, Total (pH 6.5-9.0)	EPA 200.8	mg/L	0.75	-
Iron, Total	EPA200.8	mg/L	1.0	-
Nitrate + Nitrite	SM 4500-NO3- E	mg/L as N	0.68	-

PARAMETER	TEST METHOD <sup>1</sup>	REPORTING UNITS	ANNUAL NAL VALUE	INSTANTANEOUS MAXIMUM NAL
Nitrogen				
Total Phosphorus	SM 4500-P B+E	mg/L as P	2.0	-
Ammonia	SM 4500-NH3 B+ C or E	mg/L	2.14	-
Magnesium, total	EPA 200.7	mg/L	0.064	-
Arsenic, Total (c)	EPA 200.8	mg/L	0.15	-
Cadmium, Total (H)	EPA 200.8	mg/L	0.0053 <sup>2</sup>	-
Nickel, Total (H)	EPA 200.8	mg/l	1.02 <sup>2</sup>	-
Mercury, Total	EPA 245.1	mg/L	0.0014	-
Selenium, Total	EPA 200.8	mg/L	0.005	-
Silver, Total (H)	EPA 200.8	mg/L	0.0183 <sup>2</sup>	-
Biochemical Oxygen Demand	SM 5210B	mg/L	30	-

SM – Standard Methods for the Examination of Water and Wastewater, 18<sup>th</sup> edition

EPA – EPA test methods

<sup>1</sup> Test methods with lower detection limits may be necessary when discharging to impaired water bodies.

Alternate test methods may be approved by the San Diego Water Board.

<sup>2</sup> The NAL is based on the highest hardness because the water near the mouth of the creeks is very saline.

**B.** On January 1 of the reporting year following the submittal of the Level 2 ERA Action Plan, a Discharger with Level 2 status shall certify and submit a Level 2 ERA Technical Report that includes one or more of the following demonstrations:

**1. Industrial Activity BMPs Demonstration.** This shall include the following requirements as applicable:

- a. A description of the industrial pollutant sources and corresponding industrial pollutants that are or may be related to the NAL exceedance(s);
- b. An evaluation of all pollutant source(s) associated with industrial activity that are or may be related to the NAL exceedance(s);
- c. Where all of the Discharger’s implemented BMPs, including additional BMPs identified in the Level 2 ERA Action Plan, achieve compliance with the effluent limitations of this Order and are expected to eliminate future NAL exceedance(s), the Discharger shall provide a description and analysis of all implemented BMPs;
- d. In cases where all of the Discharger’s implemented BMPs, including additional BMPs identified in the Level 2 ERA Action Plan, achieve compliance with the effluent limitations of this Order but are not expected to eliminate future NAL exceedance(s), the Discharger shall provide the following, in addition to a description and analysis of all implemented BMPs:
  - i. An evaluation of any additional BMPs that would reduce or prevent NAL exceedances;
  - ii. An estimated costs of the additional BMPs evaluated; and,

- iii. An analysis describing the basis for the selection of BMPs implemented in lieu of the additional BMPs evaluated but not implemented.
- e. The description and analysis of BMPs required in section X.B.1.d.iii above shall specifically address the drainage areas where the NAL exceedance(s) responsible for the Discharger's Level 2 status occurred, although any additional Level 2 ERA Action Plan BMPs may be implemented for all drainage areas; and,
- f. If an alternative design storm standard for treatment control BMPs in lieu of the design storm standard for treatment control BMPs in section IV.C.4 of the Order will achieve compliance with the effluent limitations of the Order, the Discharger shall provide an analysis describing the basis for the selection of the alternative design storm standard.

**2. Non-Industrial Pollutant Source Demonstration.** This shall include:

- a. A statement that the Discharger has determined that the exceedance of the NAL is attributable solely to the presence of non-industrial pollutant sources. (The pollutant may also be present due to industrial activities, in which case the Discharger must demonstrate that the pollutant contribution from the industrial activities by itself does not result in an NAL exceedance.) The sources shall be identified as either run-on from adjacent properties, aerial deposition from man-made sources, or as generated by on-site non-industrial sources;
- b. A statement that the Discharger has identified and evaluated all potential pollutant sources that may have commingled with storm water associated with the Discharger's industrial activity and may be contributing to the NAL exceedance; and,
- c. A description of any on-site industrial pollutant sources and corresponding industrial pollutants that are contributing to the NAL exceedance that are or may be discharged;
- d. An assessment of the relative contributions of the pollutant from (1) storm water run-on to the facility from adjacent properties or non-industrial portions of the Discharger's property or from aerial deposition and (2) the storm water associated with the Discharger's industrial activity;
- e. A summary of all existing BMPs for that parameter; and,
- f. An evaluation of all on-site/off-site analytical monitoring data demonstrating that the NAL exceedances are caused by pollutants in storm water run-on to the facility from adjacent properties or non-industrial portions of the Discharger's property or from aerial deposition.

**3. Natural Background Pollutant Source Demonstration.** The Natural Background Pollutant Source Demonstration Technical Report shall at a minimum, include the following:

- a. A statement that the Discharger has determined that the NAL exceedance of the NAL is attributable solely to the presence of the pollutant in the natural background that has not been disturbed by industrial activities. (The pollutant may also be present due to industrial activities, in which case the Discharger must demonstrate that the pollutant contribution from the industrial activities by itself does not result in an NAL exceedance);

- b. A summary of all data previously collected by the Discharger, or other identified data collectors, that describes the levels of natural background pollutants in the storm water discharge;
- c. A summary of any research and published literature that relates the pollutants evaluated at the facility as part of the Natural Background Demonstration;
- d. A map showing the reference site location in relation to facility along with available land cover information;
- e. Reference site and test site elevation;
- f. Available geology and soil information for reference and test sites;
- g. Photographs showing site vegetation;
- h. Site reconnaissance survey data regarding presence of roads, outfalls, or other human-made structures; and
- i. Records from relevant state or federal agencies indicating no known mining, forestry, or other human activities upstream of the proposed reference site.

## **XI. MONITORING REQUIREMENTS**

Monitoring shall be conducted as specified in the Monitoring and Reporting Program (MRP) (Attachment E). The SWPPP shall include a description of the following items:

- A.** Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.
- B.** Storm Water Diversion System (SWDS) evaluation procedures.
- C.** Sampling locations and sample collection procedures. This shall include procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained.
- D.** Identification of the analytical methods and related method detection limits (if applicable) used to detect pollutants in storm water discharges, including a justification that the method detection limits are adequate.

## **XII. SWPPP GENERAL REQUIREMENTS**

- A.** The SWPPP shall be retained at the Facility and made available upon request of a representative of the California Regional Water Quality Control Board, San Diego Region (San Diego Water Board) or U.S. EPA.
- A.** Upon notification by the San Diego Water Board and/or U.S. EPA that the SWPPP does not meet one or more of the minimum requirements of this Order or this attachment, the Discharger shall revise the SWPPP and implement additional BMPs that are effective in reducing and eliminating pollutants in storm water discharges and authorized non-storm water discharges. As requested, the Discharger shall provide an implementation schedule and/or completion certification to the San Diego Water Board and/or U.S. EPA.
- B.** The SWPPP shall be revised, as appropriate, and implemented prior to changes in industrial activities, which
  - 1. May significantly increase the quantities of pollutants in storm water discharges; or

2. Cause a new area of industrial activity at the Facility to be exposed to storm water; or
  3. Begin an industrial activity that would introduce a new pollutant source at the Facility.
- C.** The Discharger shall revise the SWPPP and implement the appropriate BMPs in a timely manner and in no case more than 90 days after a Discharger determines that the SWPPP is in violation of any Order requirement.
- D.** When any part of the SWPPP is infeasible to implement by the deadlines specified above due to proposed significant structural changes, the Discharger shall:
1. Submit a report to the San Diego Water Board that:
    - a. Identifies the portion of the SWPPP that is infeasible to implement by the deadline.
    - b. Provides justification for a time extension, provides a schedule for completing and implementing that portion of the SWPPP.
    - c. Describes the BMPs that will be implemented in the interim period to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.
  2. Comply with any request by the San Diego Water Board to modify the report required in Subsection XII.D.1 above, or provide certification that the SWPPP revisions have been implemented.
- E.** The SWPPP shall be provided, upon request, to the San Diego Water Board, U.S. EPA, local agency, or Compliance Inspection Designees. The San Diego Water Board under section 308(b) of the Clean Water Act (CWA) considers the SWPPP a report that shall be available to the public.

### **XIII. AUTHORIZED NON-STORM WATER DISCHARGES SPECIAL REQUIREMENTS**

The SWPPP shall address authorized non-storm water discharges and incorporate appropriate BMPs to prevent the discharge of pollutants.

**FIVE PHASES FOR DEVELOPING AND IMPLEMENTING INDUSTRIAL  
STORM WATER POLLUTION PREVENTION PLANS**

**PLANNING AND ORGANIZATION**

- \*Form Pollution Prevention Team
- \*Review other plans

**ASSESSMENT PHASE**

- \*Develop a site map
- \*Identify potential pollutant sources
- \*Inventory of materials and chemicals
- \*List significant spills and leaks
- \*Identify non-storm water discharges
- \*Assess pollutant risks

**BEST MANAGEMENT PRACTICES IDENTIFICATION PHASE**

- \*Non-structural BMPs
- \*Structural BMPs
- \*Select activity and site-specific BMPs

**IMPLEMENTATION PHASE**

- \*Train employees
- \*Implement BMPs
- \*Collect and review records

**EVALUATION/MONITORING**

- \*Conduct annual site evaluation
- \*Review monitoring information
- \*Evaluate BMPs
- \*Review and revise SWPPP

**ITEM A-3  
 EXAMPLE  
 ASSESSMENT OF POTENTIAL POLLUTION SOURCES AND  
 CORRESPONDING BEST MANAGEMENT PRACTICES SUMMARY**

Area	Activity	Pollutant Source	Pollutant	Best Management Practices
Vehicle & Equipment Fueling	Fueling	Spills and leaks during delivery	fuel oil	- Use spill and overflow protection
		Spills caused by topping off fuel tanks	fuel oil	- Minimize run-on of storm water into the fueling area
		Hosing or washing down fuel area	fuel oil	- Cover fueling area
		Leaking storage tanks	fuel oil	- Use dry cleanup methods rather than hosing down area
		Rainfall running off fuel area, and rainfall running onto and off fueling area	fuel oil	- Implement proper spill prevention control program

**ATTACHMENT H – DISCHARGE PROHIBITIONS CONTAINED IN THE BASIN PLAN****I. BASIN PLAN DISCHARGE PROHIBITIONS**

- A.** The discharge of waste to waters of the State in a manner causing, or threatening to cause a condition of pollution, contamination or nuisance as defined in California Water Code (Water Code) section 13050, is prohibited.
- B.** The discharge of waste to land, except as authorized by Waste Discharge Requirements (WDRs) of the terms described in Water Code section 13264 is prohibited.
- C.** The discharge of pollutants or dredged or fill material to waters of the U.S. except as authorized by an National Pollutant Discharge Elimination System (NPDES) permit or a dredged or fill material permit (subject to the exemption described in Water Code section 13376) is prohibited.
- D.** Discharges of recycled water to lakes or reservoirs used for municipal water supply or to inland surface water tributaries thereto are prohibited, unless this California Regional Water Quality Control Board, San Diego Region (San Diego Water Board) issues an NPDES permit authorizing such a discharge; the proposed discharge has been approved by the State of California Department of Public Health and the operating agency of the impacted reservoir; and the discharger has an approved fail-safe long-term disposal alternative.
- E.** The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited. Allowances for dilution may be made at the discretion of the San Diego Water Board. Consideration would include streamflow data, the degree of treatment provided and safety measures to ensure reliability of facility performance. As an example, discharge of secondary effluent would probably be permitted if streamflow provided 100:1 dilution capability.
- F.** The discharge of waste in a manner causing flow, ponding, or surfacing on lands not owned or under the control of the discharger is prohibited, unless the discharge is authorized by the San Diego Water Board.
- G.** The dumping, deposition, or discharge of waste directly into waters of the State, or adjacent to such waters in any manner which may permit it being transported into the waters, is prohibited unless authorized by the San Diego Water Board.
- H.** Any discharge to a storm water conveyance system that is not composed entirely of storm water is prohibited unless authorized by the San Diego Water Board. [The federal regulations, 40 CFR 122.26(b)(13), define storm water as storm water runoff, snow melt runoff, and surface runoff and drainage. 40 CFR 122.26(b)(2) defines an illicit discharge as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to an NPDES permit and discharges resulting from firefighting activities.] [Section 122.26 amended at 56 FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992.]
- I.** The unauthorized discharge of treated or untreated sewage to waters of the State or to a storm water conveyance system is prohibited.
- J.** The discharge of industrial wastes to conventional septic tank/ subsurface disposal systems, except as authorized by the terms described in Water Code section 13264, is prohibited.
- K.** The discharge of radioactive wastes amenable to alternative methods of disposal into the waters of the State is prohibited.
- L.** The discharge of any radiological, chemical, or biological warfare agent into waters of the State is prohibited.

- M.** The discharge of waste into a natural or excavated site below historic water levels is prohibited unless the discharge is authorized by the San Diego Water Board.
- N.** The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in waters of the State or which unreasonably affect, or threaten to affect, beneficial uses of such waters is prohibited.
- O.** The discharge of treated or untreated sewage from vessels to Mission Bay, Oceanside Harbor, Dana Point Harbor, or other small boat harbors is prohibited.
- P.** The discharge of untreated sewage from vessels to San Diego Bay is prohibited.
- Q.** The discharge of treated sewage from vessels to portions of San Diego Bay that are less than 30 feet deep at MLLW is prohibited.
- R.** The discharge of treated sewage from vessels, which do not have a properly functioning USCG certified Type 1 or Type II marine sanitation device, to portions of San Diego Bay that are greater than 30 feet deep at MLLW is prohibited.

**ATTACHMENT I – SEDIMENT CHEMISTRY ANALYTES**

All samples shall be tested for the analytes specified in Table I-1. If other toxic pollutants are believed to pose risk to benthic communities, aquatic-dependent wildlife, or human health, those toxic pollutants shall be identified and included by the Discharger. Analytes not on Attachment A of the *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality* (Sediment Quality Plan) cannot be used in the exposure assessment in section V of the Sediment Quality Plan; however the data can be used to conduct more effective stressor identification studies as described in section VII.F of the Sediment Quality Plan.

NPDES NO. CA0109185**

**WASTE DISCHARGE REQUIREMENTS  
FOR THE  
UNITED STATES DEPARTMENT OF THE NAVY  
NAVAL BASE CORONADO  
SAN DIEGO COUNTY**

The following Discharger is subject to waste discharge requirements as set forth in this Order:

**Table 1. Discharger Information**

<b>Discharger</b>	United States Department of the Navy
<b>Name of Facility</b>	Naval Base Coronado (NBC)
<b>Facility Address</b>	937 N. Harbor Drive San Diego, CA 92132-0058 San Diego County
<b>Facility Contact, Title, and Phone at adoption</b>	Mr. Jason Golumbfskie Installation Environmental Program Director for NBC (619) 545-3429
<b>Mailing Address</b>	Naval Base Coronado PWO, Bldg.3 PO Box 357088 San Diego, CA 92135-7088
<b>Type of Facility</b>	Naval Base
<b>Facility Design Flow</b>	Not Applicable
The United States Environmental Protection Agency (USEPA) and the California Regional Water Quality Control Board, San Diego Region (San Diego Water Board) have classified this discharge as a major discharge.

<sup>[1]</sup> TBD

**Table 3. Administrative Information**

This Order was adopted by the San Diego Water Board on:	<b>November 18, 2015</b>
This Order shall become effective on:	<b>January 1, 2016</b>
This Order shall expire on:	<b>December 31, 2020</b>
The Discharger shall file a Report of Waste Discharge as an application for renewal of waste discharge requirements in accordance with title 23, California Code of Regulations, and an application for reissuance of a National Pollutant Discharge Elimination System (NPDES) permit no later than:	<b>180 days prior to this Order expiration date</b>
The USEPA and the San Diego Water Board have classified this discharge as follows:	<b>Major</b>

I, **David W. Gibson**, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of this Order adopted by the California Regional Water Quality Control Board, San Diego Region, on **November 18, 2015**.

## I. FACILITY INFORMATION

Information describing Naval Base Coronado (Facility) is summarized above in Table 1 and in sections I and II of the Fact Sheet (Attachment F). Section I of the Fact Sheet also includes information regarding the Facility's permit application.

## II. FINDINGS

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board), finds:

- A. Legal Authorities.** This Order serves as Waste Discharge Requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the California Water Code (CWC) commencing with section 13260. This Order is also issued pursuant to section 402 of the CWA and implementing regulations adopted by the USEPA and chapter 5.5, division 7 of the CWC commencing with section 13370. This Order shall serve as an NPDES permit for point source discharges from this facility to surface waters.
- B. Background and Rationale for Requirements.** The San Diego Water Board developed the requirements in this Order based on information submitted as part of the application, through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F), which contains background information and rationale for the requirements in this Order, is hereby incorporated into and constitutes Findings for this Order. Attachments A through E and G through M are also incorporated into this Order.
- C. Provisions and Requirements Implementing State Law.** Some of the provisions/requirements in subsections VI.A.2 and VI.C.4 of this Order are included to implement state law only. These provisions/requirements are not required or authorized under the federal CWA; consequently, violations of these provisions/requirements are not subject to the enforcement remedies that are available for NPDES violations.
- D. Executive Officer Delegation of Authority.** The San Diego Water Board by prior resolution has delegated all matters that may legally be delegated to its Executive Officer to act on its behalf pursuant to CWC section 13223. Therefore, the Executive Officer is authorized to act on the San Diego Water Board's behalf on any matter within this Order unless such delegation is unlawful under CWC section 13223 or this Order explicitly states otherwise.
- E. Notification of Interested Parties.** Prior to the adoption of this Order, the San Diego Water Board notified the Discharger and other interested agencies and persons of its intent to prescribe WDRs for the discharge and provided them with an opportunity to submit their written comments and recommendations. Details of this notification are provided in the Fact Sheet of this Order.
- F. Consideration of Public Comment.** The San Diego Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet of this Order.

THEREFORE, IT IS HEREBY ORDERED that this Order supersedes Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 except for enforcement purposes, and, in order to meet the provisions contained in division 7 of the CWC (commencing with section 13000) and regulations adopted thereunder, and the provisions of the CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order.

### III. DISCHARGE PROHIBITIONS

- A.** The dumping, deposition or discharge of the following wastes directly into Waters of the United States (U.S.), including but not limited to the Pacific Ocean, San Diego Bay, the Tijuana River Estuary, Morena Reservoir, a tributary to the San Luis Rey River watershed, and waters in the Canyon City Hydrologic Area, or adjacent to such waters in any manner which may permit its being transported into the waters is prohibited:
1. Paint chips;
  2. Blasting materials;
  3. Paint over spray;
  4. Paint spills;
  5. Water contaminated with abrasive blast materials, paint, oils, fuels, lubricants, solvents, or petroleum;
  6. Hydro-blast water;
  7. Treated or untreated sewage;
  8. Tank cleaning water such as to remove sludge and/or dirt;
  9. Clarified water from an oil and water separator, except for storm water discharges treated by an oil and water separator and having coverage under this Order;
  10. Steam cleaning water;
  11. Pipe and tank hydrostatic test water, unless regulated by an NPDES permit;
  12. Saltbox water;
  13. Hydraulic oil leaks and spills;
  14. Fuel leaks and spills;
  15. Trash;
  16. Refuse and rubbish including but not limited to cans, bottles, paper, plastics, vegetable matter or dead animals;
  17. Fiberglass dust;
  18. Swept materials;
  19. Ship repair and maintenance activity debris;
  20. Waste zinc plates;
  21. Demineralizer and reverse osmosis brine; and
  22. Oily bilge water.
- B.** Diesel engine cooling water discharges having a maximum temperature greater than 4°F above the natural temperature of the receiving water are prohibited.
- C.** The discharge of any radiological, chemical, or biological warfare agent or high-level radioactive waste into San Diego Bay or the Pacific Ocean is prohibited.
- D.** The discharge of waste to Waters of the U.S. including but not limited to San Diego Bay, the Pacific Ocean, the Tijuana River Estuary, Morena Reservoir, a tributary to the San Luis Rey River watershed, and waters in the Canyon City Hydrologic Area is prohibited except as specifically authorized by this Order or another NPDES permit.

- E. All discharges regulated under this Order shall comply with waste discharge prohibitions contained in the San Diego Water Board's *Water Quality Control Plan for the San Diego Basin* (Basin Plan) and other applicable statewide water quality control plans described in Attachment F of this Order. The Basin Plan waste discharge prohibitions are listed in Attachment J to this Order.
- F. Except as provided in Non-Storm Water Specifications, section IV.F of this Order or as otherwise regulated by this Order, discharges of liquids or materials others than storm water (i.e. non-storm water discharges) either directly or indirectly to Waters of the U.S., including but not limited to San Diego Bay, the Pacific Ocean, the Tijuana River Estuary, Morena Reservoir, a tributary to the San Luis Rey River watershed, or waters in the Canyon City Hydrologic Area are prohibited.
- G. The discharge of the first ¼ inch of storm water runoff (First Flush) from all areas designated as Industrial High Risk areas, as defined in section IV.B.1.d of this Order, is prohibited, unless the First Flush complies with the effluent limitations in section IV.C. Effluent limitations contained in section IV.C are applicable to all discharges of storm water from Industrial High Risk Areas on the Facility.
- H. The discharge of materials of petroleum origin in sufficient quantities to be visible in the receiving water is prohibited.
- I. Discharges to Waters of the U.S., including but not limited to San Diego Bay, the Pacific Ocean, the Tijuana River Estuary, Morena Reservoir, a tributary to the San Luis Rey River watershed, and waters in the Canyon City Hydrologic Area, containing a hazardous substance equal to or in excess of a reportable quantity listed in 40 CFR part 117, *Security Classification Regulations Pursuant To Executive Order 11652*, and/or 40 CFR part 302, *Designation, Reportable Quantities, and Notification*, are prohibited.
- J. The discharge of Polychlorinated Biphenyls (PCBs) to Waters of the U.S., including but not limited to San Diego Bay, the Pacific Ocean, and the Tijuana River Estuary, Morena Reservoir, a tributary to the San Luis Rey River watershed, and waters in the Canyon City Hydrologic Area is prohibited.

#### IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

##### A. Effluent Limitations for Industrial Process Wastewater

Industrial process wastewater discharges regulated under this order include pier washing, utility vault and manhole dewatering, pier boom cleaning, boat rinsing, steam condensate, and diesel engine cooling water.

1. **BMP Regulated Industrial Process Wastewater.** The discharge of pier washing wastewater at Discharge Point No. PW-001 and Utility Vault and Manhole Dewatering at Discharge Point No. UV-001 through UV-013 in Table 4 is regulated using a narrative effluent limitation BMP approach under section VI.C.3 of this Order. Pier boom cleaning and boat rinsing have no discharge to surface waters require BMPs under section VI.C.3 of this Order to prevent discharges.

**Table 4. Industrial Process Wastewaters Regulated with BMPs**

Type of Discharge	Discharge Point Nos.
Pier Washing Wastewater	PW-001
Utility Vault and Manhole Dewatering	UV-001 through UV-013
Boat Rinsing	No Discharge
Pier Boom Cleaning	No Discharge

**2. Steam Condensate Discharges.** Effluent Limitations for Steam Condensate – Discharge Point Nos. SC-001 through SC-010

The Discharger shall maintain compliance with the effluent limitations in Table 5 at Discharge Point Nos. SC-001 through SC-010 with compliance measured at Monitoring Locations SC-001 through SC-010 as described in the Monitoring and Reporting Program (MRP), Attachment E of this Order.

**Table 5. Effluent Limitations for Steam Condensate**

Parameter	Units	Effluent Limitations				
		6-Month Median	Average Monthly	Weekly Average	Maximum Daily	Instantaneous Maximum
<b>Discharges to the San Diego Bay – Discharge Point Nos. SC-001 through SC-009</b>						
Oil and Grease	mg/L	--	25	40	--	75
Turbidity	NTU	--	75	100	--	225
pH	standard units	--	--	--	--	1
Settleable Solids	ml/L	--	1.0	1.5	--	3.0

TCDD Equivalents	µg/L	--	3.9x10 <sup>-9</sup>	--	--	--
Bis(2-Ethylhexyl)Phthalate	µg/L	--	3.5	--	--	--

<sup>1</sup> Within limits of 7.0 – 9.0 standard units at all times.

<sup>2</sup> As defined in section VII.J of this Order.

**3. Diesel Engine Cooling Water Discharges.** Effluent Limitations for Diesel Engine Cooling Water – Discharge Point No. CW-001

The Discharger shall maintain compliance with the effluent limitations in Table 6 at Discharge Point No. CW-001 with compliance measured at Monitoring Location CW-001 as described in the MRP, Attachment E of this Order.

**Table 6. Effluent Limitations for Diesel Engine Cooling Water**

Parameter	Units	Effluent Limitations			
		Average Monthly	Weekly Average	Maximum Daily	Instantaneous Maximum
Oil and Grease	mg/L	25	40	--	75
Turbidity	NTU	75	100	--	225
pH	standard units	--	--	--	1
Settleable Solids	ml/L	1.0	1.5	--	3.0
Chronic Toxicity	Pass/Fail	<sup>2</sup>	--	<sup>2</sup>	--
Arsenic, Total Recoverable	µg/L	20	--	62	--
Chromium VI, Total Recoverable	µg/L	27	--	85	--
Copper, Total Recoverable	µg/L	2.0	--	5.8	--
Lead, Total Recoverable	µg/L	5.8	--	15	--
Nickel, Total Recoverable	µg/L	5.7	--	15	--
Selenium, Total Recoverable	µg/L	58	--	120	--
Zinc, Total Recoverable	µg/L	37	--	95	--
4,4-DDT	µg/L	0.00059	--	0.0017	--
4,4-DDE	µg/L	0.00059	--	0.0012	--
4,4-DDD	µg/L	0.00084	--	0.0017	--

<sup>1</sup> Within the limit of 7.0 – 9.0 standard units at all times.

<sup>2</sup> As defined in section VII.J of this Order.

## B. Storm Water Risk Level Designations

### 1. Storm Water Risk Level Designation Definitions

- a. **Small (Military Base) Municipal Separate Storm Sewer System (Small Military Base MS4) Areas.** Areas where no industrial activities occur. Areas designated as “Small Military Base MS4 Areas” are subject to the technology-based standard of maximum extent practicable (MEP) and Storm Water Management Program (SWMP) requirements contained in section IV.D of this Order.
- b. **Industrial No Exposure Areas.** Areas where all industrial materials and activities are protected by a storm resistant shelter<sup>1</sup> to prevent exposure to rain, snow, snowmelt, and/or runoff. “Industrial materials and activities” include, but are not limited to, material handling<sup>2</sup> equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, and waste products.
- c. **Industrial Low Risk Areas.** All areas where wastes or pollutants from industrial activities are subject to precipitation, run-on, and/or runoff and which are not classified as Industrial No Exposure Areas or Industrial High Risk Areas.
- d. **Industrial High Risk Areas.** All areas where wastes or pollutants of significant quantities from ship construction, modification, repair, and maintenance activities (including abrasive blast grit material, primer, paint, paint chips, solvents, oils, fuels, sludges, detergents, cleansers, hazardous substances, toxic pollutants, non-conventional pollutants, materials of petroleum origin, or other substances of water quality significance) are subject to precipitation, run-on, and/or runoff.

### 2. Annual Storm Water Risk Designation Level Report

Annually, the Discharger shall conduct a complete and thorough survey of the Facility to identify and categorize all areas and the associated storm water drainage system(s) and outfall(s) (i.e. discharge point(s)) in accordance with the risk level designations. Storm water drainage systems and outfalls that receive storm water runoff from areas that have multiple risk levels shall be designated as having the highest risk level occurring in that area. The Discharger shall prepare and submit an Annual Storm Water Risk Level Designation Report by September 1 of each year containing the results of the surveys conducted in the previous July 1 through June 30 period including the following information:

- a. **Master Risk Designation List.** An updated list of all facility discharge locations containing discharge point identification numbers, summary activity descriptions of the drainage area(s) tributary to each discharge point, the storm water risk level designation, the longitude and latitude of the outfall location, and the name of the receiving water. The current Storm Water Risk Level Designation Tables are included as Attachment M of this Order and the updated master list shall be in a format suitable for the replacement of Attachment M.

---

<sup>1</sup> “Storm-resistant shelters” include completely roofed and walled buildings or structures. They also include structures with only a top cover supported by permanent supports but with no side coverings provided material within the structure is not subject to wind dispersion (sawdust, powders, etc.), track-out, and there is no storm water discharged from within the structure that has come into contact with any materials.

<sup>2</sup> “Material handling activities” include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product, or waste product.

- b. Facility Map.** A Facility map clearly labeled with (i) storm water discharge points; (ii) storm drain systems, features, drainage basin boundaries, and risk level designations; and (iii) land uses. The current storm water outfall maps are included in Attachment B of this Order and updated maps shall be in a format suitable for the replacement of the figures in Attachment B.
- c. Proposed Revisions.** A description of any proposed changes to the (i) storm water discharge points; (ii) storm drain systems, features, drainage basin boundaries, and risk levels; and (iii) land use designations from the previous year.

### **3. Annual Storm Water Risk Level Designation Implementation**

The updated Master Risk Designation List and Facility Map in the Annual Storm Water Risk Level Designation Implementation will supersede Attachment M of this Order, except for enforcement purposes, and shall become an enforceable condition of this Order, unless directed otherwise in writing by the San Diego Water Board. The San Diego Water Board retains the right to require revisions to the Discharger designated risk levels based on relevant evidence, whether direct or circumstantial, including but not limited to, evidence in the following categories:

- a. Site characteristics and location in relation to potential sources of a discharge;
- b. Industry-wide operational practices that have led to discharges;
- c. Evidence of poor management of materials or wastes, such as improper storage practices or inability to reconcile inventories;
- d. Lack of documentation of responsible management of materials or wastes, such as lack of manifests or lack of documentation of proper disposal;
- e. Physical evidence, such as analytical data, soil or pavement staining, or unusual odor or appearance;
- f. Reports or complaints;
- g. Other agencies' records of possible or known discharges; and
- h. Refusal or failure to respond to San Diego Water Board inquiries.

### **4. Storm Water Risk Level Inspections**

The Discharger shall conduct periodic inspections throughout the year to ensure that storm water risk level designations remain applicable and on-site operations have not changed sufficiently to warrant a revised risk level. These inspections may be conducted simultaneously with inspections conducted pursuant to other sections of this Order. If at any time the Discharger identifies a necessary revision to an area's risk level, the Discharger shall implement Best Management Practices (BMPs) and other requirements of the area's new risk level by the next storm event, unless additional time is approved by the San Diego Water Board. All risk level revisions shall be included in the Annual Storm Water Risk Level Designation Report.

**C. Effluent Limitations for Discharges from Industrial High Risk Areas**

For discharges of pollutants in storm water discharges, from areas designated as Industrial High Risk Areas as defined in section IV.B.1.d of this Order, the Discharger shall maintain compliance with the following Maximum Daily Effluent Limitations (MDEL) for acute toxicity with compliance measured at Monitoring Locations as described in the MRP Attachment E and Attachment M as updated annually of this Order:

**Table 7. Effluent Limitations for Industrial Storm Water**

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Acute Toxicity	Pass/Fail	--	Pass or % effect <40 <sup>a</sup>	--	--

<sup>a.</sup> Compliance with the Maximum Daily Effluent Limitation shall be based on the procedures specified in section IV. of the MRP, Attachment E, of this Order.

**D. Small Military Base MS4 Discharge Specifications**

1. **Pollutant Reduction to MEP.** The Discharger shall reduce pollutants in storm water discharges from areas, designated as “Small Military Base MS4 Areas” as defined in section IV.B.1 of this Order, to the technology–based standard of MEP to attain compliance with water quality standards set forth in section V, Receiving Water Limitations of this Order.
2. **Storm Water Management Plan (SWMP) Implementation.** The Discharger shall prepare and submit to the San Diego Water Board, an adequate SWMP no later than 18 months following the effective date of this Order. The Discharger shall implement the SWMP no later than 24 months following the effective date of this Order. The Discharger shall make revisions to the SWMP as necessary or as required by the San Diego Water Board. The SWMP shall be designed to reduce the discharge of pollutants from “Small Military Base MS4 Areas” to the technology–based standard of MEP to protect receiving water quality. The SWMP shall serve as the framework for identification, assignment, and implementation of measures and BMPs to control Small Military Base MS4 discharges. Existing programs such as street sweeping that have storm water quality benefits should be identified in the SWMP and be a part of the Discharger’s storm water program. The SWMP shall at a minimum contain the elements described in Attachment L of this Order. A SWMP is not required if the Discharger certifies annually in the Annual Storm Water Risk Designation Level Report the following for any installation unless otherwise directed by the San Diego Water Board in writing within 90 days of submission:
  - a. Population of staff and visitors is under 1,000 and;
  - b. The installation MS4 system is not contributing substantially to the pollutant loadings of a physically interconnected regulated MS4 and can demonstrate the following:
    - i. The installation discharges less than ten percent of its storm water to the regulated MS4 or;
    - ii. The installation’s discharge makes up less than ten percent of the permitted MS4’s total storm water volume; and
  - c. If the Installation discharges any pollutants identified as a cause of Clean Water Act Section 303(d) impairment of any water body to which it discharges, storm water

controls are not needed to comply with Waste Load Assessments of an adopted Total Maximum Daily Load that addresses pollutants of concern.

**3. Bacteria Project I – Twenty Beaches and Creeks TMDL.** The Remote Training Site Warner Springs (RTSWS) shall take the following actions to meet the requirements of the TMDL:

- a. Implement the SWMP required by section IV.D.2 of this Order and any other additional measures necessary to achieve reductions in fecal coliform, enterococcus, and total coliform by the final compliance dates as required by the TMDL. The SWMP must include short term and long term BMP strategies appropriate for the prioritization schedule in Attachment A page A-65 of Resolution No. R9 2010- 0001.
- b. Collaborate and coordinate, to the extent feasible, with Phase I MS4s and other responsible parties to the Bacteria TMDL using an adaptive framework approach as part of the waste load reduction planning and implementation strategies in the required SWMP pursuant to section IV.D.2 of this Order. Coordinated efforts by all responsible parties are encouraged by the San Diego Water Board and will accomplish the waste load reductions required in the TMDLs faster and achieve the ultimate goal of improving water quality as soon as possible.
- c. Monitor discharges from their facilities including MS4 discharge locations to demonstrate progress towards compliance with final waste load allocations. The monitoring and assessment results must be submitted as part of the Annual Reports required under section E.16 of this Order.

**E. Industrial Storm Water Discharge Specifications – No Exposure Areas, Industrial Low Risk Areas, and Industrial High Risk Areas**

**1. Pollutant Reduction to Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT).** The Discharger shall reduce pollutants in storm water discharges from areas, designated as Industrial No Exposure Areas, Industrial Low Risk Areas, and Industrial High Risk Areas as defined in section IV.B.1 of this Order to do the following:

- a. Attain the technology-based standards of BAT for toxic and non-conventional pollutants, and BCT for conventional pollutants; and
- b. Attain compliance with applicable effluent limitations set forth in section IV, Effluent Limitations and Discharge Specifications of this Order and water quality standards set forth in section V, Receiving Water Limitations of this Order.

**2. Storm Water Pollution Prevention Plan (SWPPP) Requirements.**

- a. The Discharger shall continue to maintain and implement an effective SWPPP designed to reduce or prevent the discharge of pollutants from industrial activities conducted in Industrial No Exposure Areas, Industrial Low Risk Areas, and Industrial High Risk Areas to the technology-based standards of BAT for toxic and non-conventional pollutants, and BCT for conventional pollutants.
- b. The SWPPP shall include identification, assignment, and guidance for implementation of measures and BMPs to control discharges from industrial activities in the Industrial No Exposure, Industrial Low Risk and Industrial High Risk Areas of NBC. The BMPs and

measures shall be selected to achieve BAT/BCT and compliance with all receiving water limitations.

- c. At a minimum, the SWPPP shall contain the elements and be implemented in accordance with Attachment G of this Order. The Discharger shall implement any necessary revisions to its SWPPP to comply with the requirements of this Order within 1 year of the effective date of this Order and submit the revised SWPPP.

### 3. Numeric Action Levels (NALs) for Industrial High Risk Areas and Industrial Low Risk Areas.

The NALs described in Table G-1 of Attachment G of this Order are used as numeric thresholds for corrective action. An exceedance of an NAL is not a violation of this Order. The Discharger shall implement corrective actions as described below.

#### a. NAL Exceedance Determination Method:

- i. **Annual NAL Exceedance.** The Discharger shall determine the average concentration for each parameter using the results of all the industrial storm water sampling and analytical results for the entire Facility for the reporting year (i.e., all "effluent" data). This average concentration for each parameter shall be compared to the corresponding annual NAL values in Table G-1. For Dischargers using composite sampling or flow-weighted measurements in accordance with standard practices, the average concentrations shall be calculated in accordance with the USEPA *Industrial Stormwater Monitoring and Sampling Guide*.<sup>3</sup> An annual NAL exceedance occurs when the average of all the analytical results for a parameter from samples taken within a reporting year exceeds an annual NAL value, or is outside the NAL range, for a parameter listed in Table G-1. The Discharger has the option of calculating the flow weighted average concentration for all industrial storm water effluent data for the entire Facility as shown below to compare the corresponding annual NAL values in Table G-1:

$$FWAC = \frac{\sum_{n=1}^{n=5} Q_n C_n}{\sum_{n=1}^{n=5} Q_n}$$

Where:

FWAC = Flow weighted average concentration

$Q_n$  = Flow rate of discharge at time of sample collection

$C_n$  = Concentration of chemical in the collected sample

n = Number of discharge points

The flow rate for each discharge point is multiplied by the concentration (C) in the sample from that discharge point. This sum is divided by the total flow rate for all of the discharge points.

---

<sup>3</sup> US EPA. "Industrial Stormwater Monitoring and Sampling Guide." March 2009. EPA 832-B-09-003 Web 7 April 2014. <[http://www.epa.gov/npdes/pubs/msgp\\_monitoring\\_guide.pdf](http://www.epa.gov/npdes/pubs/msgp_monitoring_guide.pdf)>.

For calculating the average, all effluent sampling analytical results that are reported by the laboratory as less than the Minimum Level (ML), a value of zero shall be used.

- ii. **Instantaneous Maximum NAL Exceedance.** The Discharger shall compare all industrial storm water analytical results from each distinct sample (grab or composite) to the corresponding instantaneous maximum NAL values in Table G-1. An instantaneous maximum NAL exceedance occurs when two or more analytical results from samples taken for any parameter within a reporting year exceed the instantaneous maximum NAL value (TSS, oil and grease), or are outside the NAL range (pH).
- iii. Exceedances of the Annual NAL or Instantaneous Maximum NAL are not violations of this Order.

**b. NAL Exceedance Response Actions (ERAs)**

**i. Baseline Status – No Exceedance**

- (a) The Discharger will automatically be placed in Baseline status at the beginning of the permit term.

**ii. Level 1 Status**

A Discharger's Baseline status for any given parameter shall change to Level 1 status if sampling results indicate an NAL exceedance for that same parameter. Level 1 status will commence on July 1 following the reporting year during which the exceedance(s) occurred.

- (a) **Level 1 ERA Evaluation.** By October 1 following commencement of Level 1 status for any parameter with sampling results indicating an NAL exceedance, the Discharger shall:

- (1) Complete an evaluation of the industrial pollutant sources at the facility that are or may be related to the NAL exceedance(s); and,
- (2) Identify in the evaluation the corresponding BMPs in the SWPPP and any additional BMPs and SWPPP revisions necessary to prevent future NAL exceedances and to comply with the requirements of this Order. Although the evaluation may focus on the drainage areas where the NAL exceedance(s) occurred, all drainage areas shall be evaluated.

- (b) **Level 1 ERA Report.** Based on the above evaluation, the Discharger shall, as soon as practicable, but no later than January 1 following commencement of Level 1 status:

- (1) Revise the SWPPP as necessary and implement any additional BMPs identified in the evaluation;
- (2) Certify and submit a Level 1 ERA Report that includes the following:
  - a) A summary of the Level 1 ERA Evaluation required in section IV.E.3.b.ii.(a) above; and

b) A detailed description of the SWPPP and any additional BMPs for each parameter that exceeded an NAL.

**(c) Return to Baseline.** A Discharger's Level 1 status for a parameter will return to Baseline status once a Level 1 ERA report has been completed, all identified additional BMPs have been implemented, and results from four (4) consecutive Qualifying Storm Events (QSEs) that were sampled subsequent to BMP implementation indicate no additional NAL exceedances for that parameter.

**(d) NAL Exceedances Prior to Implementation of Level 1 Status BMPs.** Prior to the implementation of an additional BMP identified in the Level 1 ERA Evaluation or October 1, whichever comes first, sampling results for any parameter(s) being addressed by that additional BMP will not be included in the calculations of annual average or instantaneous NAL exceedances.

**iii. Level 2 Status**

A Discharger's Level 1 status for any given parameter shall change to Level 2 status if sampling results indicate an NAL exceedance for that same parameter while the Discharger is in Level 1. Level 2 status will commence on July 1 following the reporting year during which the NAL exceedance(s) occurred.

**(a) Level 2 ERA Action Plan**

- (1) Dischargers with Level 2 status shall certify and submit a Level 2 ERA Action Plan that addresses each new Level 2 NAL exceedance by January 1 following the reporting year during which the NAL exceedance(s) occurred. For each new Level 2 NAL exceedance, the Level 2 Action Plan will identify which of the demonstrations in section X.B of Attachment G the Discharger has selected to perform. A new Level 2 NAL exceedance is any Level 2 NAL exceedance for 1) a new parameter in any drainage area, or 2) the same parameter that is being addressed in an existing Level 2 ERA Action Plan in a different drainage area.
- (2) The Level 2 ERA Action Plan shall at a minimum address the drainage areas with corresponding Level 2 NAL exceedances.
- (3) All elements of the Level 2 ERA Action Plan shall be implemented as soon as practicable and completed no later than 1 year after submitting the Level 2 ERA Action Plan.
- (4) The Level 2 ERA Action Plan shall include a schedule and a detailed description of the tasks required to complete the Discharger's selected demonstration(s) as described below in section X.B of Attachment G.

**(b) Level 2 ERA Technical Report**

- (1) On January 1 of the reporting year following the submittal of the Level 2 ERA Action Plan, a Discharger with Level 2 status shall certify and submit a Level 2 ERA Technical Report that includes one or more of the following demonstrations described in section X.B of Attachment G to this order:

a) Industrial Activity BMPs Demonstration:

- b) Non-Industrial Pollutant Source Demonstration; or
  - c) Natural Background Pollutant Source Demonstration.
- (2) The San Diego Water Board may review the submitted Level 2 ERA Technical Reports. Upon review of a Level 2 ERA Technical Report, the San Diego Water Board may reject the Level 2 ERA Technical Report and direct the Discharger to take further action(s) to comply with this Order.
- (3) Dischargers with Level 2 status who have submitted the Level 2 ERA Technical Report are only required to annually update the Level 2 ERA Technical Report based upon additional NAL exceedances of the same parameter and same drainage area, facility operational changes, pollutant source(s) changes, and/or information that becomes available via compliance activities (monthly visual observations, sampling results, annual evaluation, etc.). The Level 2 ERA Technical Report shall be certified and submitted by the Discharger with each Storm Water Annual Report. If there are no changes prompting an update of the Level 2 ERA Technical Report, as specified above, the Discharger will provide this certification in the Annual Report that there have been no changes warranting re-submittal of the Level 2 ERA Technical Report.
- (4) Dischargers are not precluded from submitting a Level 2 ERA Action Plan or ERA Technical Report prior to entering Level 2 status if information is available to adequately prepare the report and perform the demonstrations described above. A Discharger who chooses to submit a Level 2 ERA Action Plan or ERA Technical Report prior to entering Level 2 status will automatically be placed in Level 2 in accordance to the Level 2 ERA schedule.

**(5) Eligibility for Returning to Baseline Status**

- a) Dischargers with Level 2 status who submit an Industrial Activity BMPs Demonstration in accordance with section X.B.1 of Attachment G and have implemented BMPs to prevent future NAL exceedance(s) for the Level 2 parameter(s) shall return to baseline status for that parameter, if results from four (4) subsequent consecutive QSEs sampled indicate no additional NAL exceedance(s) for that parameter(s). If future NAL exceedances occur for the same parameter(s), the Discharger's Baseline status will return to Level 2 status on July 1 in the subsequent reporting year during which the NAL exceedance(s) occurred. These Dischargers shall update the Level 2 ERA Technical Report as required above in section IV.E.3.b.iii.(b)(3).
- b) Dischargers are ineligible to return to baseline status if they submit any of the following:
  - (i) A industrial activity BMP demonstration that is not expected to eliminate future NAL exceedance(s) in accordance with section X.B.1.d of Attachment G;
  - (ii) An non-industrial pollutant source demonstration; or,

(iii) A natural background pollutant source demonstration.

#### **(6) Level 2 ERA Implementation Extension**

- a) Dischargers that need additional time to submit the Level 2 ERA Technical Report shall be automatically granted a single time extension for up to six (6) months upon submitting the following items as applicable:
  - (i) Reasons for the time extension;
  - (ii) A revised Level 2 ERA Action Plan including a schedule and a detailed description of the necessary tasks still to be performed to complete the Level 2 ERA Technical Report; and
  - (iii) A description of any additional temporary BMPs that will be implemented while permanent BMPs are being constructed.
- b) The San Diego Water Board will review Level 2 ERA Implementation Extensions for completeness and adequacy. Requests for extensions that total more than six (6) months are not granted unless approved in writing by the San Diego Water Board. The San Diego Water Board may (1) reject or revise the time allowed to complete Level 2 ERA Implementation Extensions, (2) identify additional tasks necessary to complete the Level 2 ERA Technical Report, and/or (3) require the Discharger to implement additional temporary BMPs.

#### **4. Design Storm Standards for Storm Water Retention and Treatment Control BMPs**

All new treatment control BMPs employed by Discharger to comply with this Order shall be designed to comply with minimum design storm standards in this section. A factor of safety shall be incorporated into the design of all treatment control BMPs to ensure that storm water is sufficiently treated throughout the life of the treatment control BMPs. The design storm standards for treatment control BMPs are as follows:

- a. **Volume-based BMPs:** The Discharger shall, at a minimum, calculate<sup>4</sup> the volume to be treated using one of the following methods:
  - i. The volume of runoff produced from an 85th percentile storm event as determined from local, historical rainfall records. Isopluvial maps for the 85th percentile storm event are available on the internet<sup>5</sup>;
  - ii. The volume of runoff produced by the 85th percentile storm event, determined as the maximized capture runoff volume for the facility, from the formula recommended in the Water Environment Federation's (WEF's) Manual of Practice<sup>6</sup>; or,

---

<sup>4</sup> All hydrologic calculations shall be certified by a California licensed professional engineer in accordance with the Professional Engineers Act (Bus. & Prof. Code § 6700, et seq).

<sup>5</sup> The County of San Diego isopluvial map is located at [http://www.sdcounty.ca.gov/dpw/watersheds/susmp/susmppdf/susmp\\_85precip.pdf](http://www.sdcounty.ca.gov/dpw/watersheds/susmp/susmppdf/susmp_85precip.pdf) may be used.

<sup>6</sup> Water Environment Federation (WEF). Manual of Practice No. 23/ ASCE Manual of Practice No. 87, pg. 175 Equation 5.2 (1998).

- iii. The volume of annual runoff required to achieve 80% or more treatment, determined in accordance with the methodology set forth in the latest edition of *California Stormwater Best Management Practices Handbook*<sup>7</sup> using local historical rainfall records.
- b. **Flow-based BMPs:** The Discharger shall calculate the flow needed to be treated using one of the following methods:
  - i. The maximum flow rate of runoff produced from a rainfall intensity of at least 0.2 inches per hour for each hour of a storm event;
  - ii. The maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity, as determined from local historical rainfall records, multiplied by a factor of two; or,
  - iii. The maximum flow rate of runoff, as determined using local historical rainfall records, that achieves approximately the same reduction in total pollutant loads as would be achieved by treatment of the 85th percentile hourly rainfall intensity multiplied by a factor of two.
- c. In lieu of complying with the design storm standards for treatment control BMPs in this section, the Discharger may certify and submit a BAT/BCT Compliance Demonstration Technical Report.
- d. The San Diego Water Board may revise the treatment design storm standard provided in this Order. The revision must be in writing and based upon sampling data indicating that a revised design storm standard would be protective of water quality, or based upon the San Diego Water Board's determination that the treatment technology associated with the revised design storm standard meets BAT/BCT.

## F. Non-Storm Water Discharge Specifications

- 1. **Non-Storm Water Discharges.** Discharges through the MS4 of material other than storm water to Waters of the U.S. are prohibited, except as allowed under this Provision or as otherwise authorized by a separate NPDES permit. The following non-storm water discharges are authorized under this Order unless the Discharger or the San Diego Water Board identifies the discharges as a significant source of pollutants to Waters of the U.S. as provided in section IV.F.3 below:
  - a. Diverted stream flows;
  - b. Rising groundwaters;
  - c. Uncontaminated groundwater infiltration [as defined at 40 CFR section 35.2005(b)(20)] to MS4s;
  - d. Uncontaminated pumped groundwater, foundation drains, crawl space pumps and, footing drain discharges not subject to a groundwater extraction permit such as NPDES Permit No. CAG919003, (*General Waste Discharge Requirements for Groundwater*

---

<sup>7</sup> California Stormwater Quality Association. Stormwater Best Management Practice New Development and Redevelopment Handbook. Web. 28 February 2013. <<http://www.cabmphandbooks.com/Development.asp>>.

*Extraction Discharges to Surface Waters within the San Diego Region*) or subsequent superseding NPDES renewal permit;

- e. Springs;
- f. Drinking fountain water and emergency eye wash/shower station test water;
- g. Atmospheric condensate including refrigeration, air conditioning and compressor condensate;
- h. Flows from riparian habitats and wetlands;
- i. Discharges from potable water sources not subject to an NPDES permit such as NPDES Permit No. CAG140001 (*Statewide National Pollutant Discharge Elimination System (NPDES) Permit for Drinking Water system Discharges to Waters of the United States*) or subsequent superseding NPDES renewal permit;
- j. Individual residential car washing;
- k. Dechlorinated swimming pool discharges;
  - i. Residual chlorine, algaecide, filter backwash, or other pollutants from swimming pools must be eliminated prior to discharging to the MS4; and
  - ii. The discharge of saline swimming pool water must be directed to the sanitary sewer, landscaped areas, or other pervious surfaces that can accommodate the volume of water, unless the saline swimming pool water can be discharged via a pipe or concrete channel directly to a naturally saline water body (e.g. San Diego Bay or the Pacific Ocean).
- l. Seawater infiltration where the seawater is discharged back into the seawater source;
- m. Building fire suppression system maintenance discharges (e.g. sprinkler line flushing) not otherwise regulated by this Order; and
- n. Non-storm water discharges explicitly authorized elsewhere in this Order.

**2. Conditions for Authorized Non-storm Water Discharges.** The non-storm water discharges identified in section IV.F.1 above are authorized by this Order only if all of the following conditions are satisfied:

- a. The non-storm water discharges are not in violation of any San Diego Water Board requirement;
- b. The non-storm water discharges are not in violation of any municipal or federal agency ordinance or requirement;
- c. BMPs are included in the SWMP for Small Military Base MS4 areas and in the SWPPP for industrial areas that are designed to do the following:
  - i. Prevent or reduce the contact of non-storm water discharges with significant materials or equipment; and

- ii. Minimize, to the extent practicable, the flow or volume of non-storm water discharges;
  - d. The non-storm water discharges do not contain quantities of pollutants that may cause or contribute to an exceedance of a water quality standard(s);
  - e. The non-storm water discharges and identified sources in industrial areas are visually inspected quarterly in accordance with the SWPPP to ensure adequate BMP implementation and effectiveness; and
  - f. The non-storm water discharges from Industrial Low Risk and Industrial High Risk Areas are reported in the Storm Water Annual Report required under section VII.C of the MRP in Attachment E of this Order.
- 3. Identification of Non-Storm Water Significant Sources of Pollutants.** Where the Discharger or the San Diego Water Board determines that any individual or category of non-storm water discharge(s) listed in section IV.F.1 above may be a significant source of pollutants to Waters of the U.S. or physically interconnected MS4, or poses a threat to water quality standards (e.g. beneficial uses), the individual or category of non-storm water discharge(s) must be addressed by the Discharger as an illicit discharge(s) and prohibited through ordinance, order, or similar means unless the discharge is from a non-anthropogenic source. For a non-anthropogenic source determined to be a significant source of pollutants, the Discharger must either prohibit the discharge or develop and implement appropriate control measures to prevent the discharge of pollutants to the MS4.
- 4. Firefighting Discharges.** Emergency firefighting flows (i.e., flows necessary for the protection of life or property) are excluded from the effective prohibition against non-storm water and need only be addressed where they are identified as significant sources of pollutants to Waters of the U.S. The Discharger should develop and encourage implementation of BMPs to reduce or eliminate pollutants in emergency firefighting discharges to the MS4s and receiving waters within its jurisdiction. During emergency situations, priority of efforts should be directed toward life, property, and the environment (in descending order). BMPs should not interfere with immediate emergency response operations or impact public health and safety.
- 5. Non-Fire Fighting Discharges.** Non-emergency firefighting discharges (i.e., discharges from controlled or practice blazes, firefighting training, and maintenance activities not associated with building fire suppression systems) must be addressed by a program, to be developed and implemented by the Discharger, to reduce or eliminate pollutants in such discharges from entering the MS4 or the receiving water. Building fire suppression system maintenance discharges (e.g. sprinkler line flushing) to the MS4 must be addressed as illicit discharges unless BMPs are implemented to prevent pollutants associated with such discharges from entering the MS4.
- 6. Utility Vault & Manhole Dewatering (Utility Vault) Discharges.** The Discharger shall reduce or prevent pollutants associated with utility vault and manhole dewatering discharges through implementation of BAT for toxic and non-conventional pollutants, and BCT for conventional pollutants.
- 7. Incidental Runoff from Landscaped Areas.** Incidental runoff is defined as unintended amounts (volume) of landscape irrigation that escapes the area of intended use. The Discharger shall control incidental runoff through the following means:

- a. Detection of leaks (e.g. broken sprinkler heads) and correction of the leaks within 72 hours of learning of the leaks;
- b. Proper design and aiming of sprinkler heads; and
- c. Elimination of landscape irrigation during precipitation events.

The discharge of incidental runoff from landscaped areas that is not controlled by the above requirements is prohibited.

## V. RECEIVING WATER LIMITATIONS

- A.** The receiving water limitations set forth in sections V.B. and V.C. of this Order for San Diego Bay, the Tijuana River Estuary, the Pacific Ocean, Morena Reservoir, tributaries to the San Luis Rey River, and waters in the Canyon City Hydrologic Area are based on applicable water quality standards contained in water quality control plans and policies and federal regulations listed below. These plans, policies, and regulations set forth limits or levels of water quality characteristics to ensure the reasonable protection of beneficial uses and the prevention of nuisance. The discharges of waste regulated under this Order shall not cause or contribute to violations of these water quality standards.
1. The San Diego Water Board's Basin Plan, including beneficial uses, water quality objectives, and implementation plans;
  2. State Water Board water quality control plans and policies including the following:
    - a. *Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries* (Thermal Plan);
    - b. *Water Quality Control Plan for Ocean Waters of California* (Ocean Plan);
    - c. *Water Quality Control Policy for the Enclosed Bays and Estuaries of California* (Bays and Estuaries Policy);
    - d. *Policy for Implementation of Toxics Standards for Inland Surface Waters, and Enclosed Bays, and Estuaries of California* (State Implementation Plan or SIP);
    - e. *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality* (Bays and Estuaries Plan – Sediment Quality Plan [SQO]); and
    - f. *The Statement of Policy with Respect to Maintaining High Quality of Waters in California* (State Water Board Resolution No. 68-16).
  3. Priority pollutant criteria promulgated by the USEPA through the following:
    - a. National Toxics Rule (NTR)<sup>8</sup> (promulgated on December 22, 1992 and amended on May 4, 1995); and
    - b. California Toxics Rule (CTR).<sup>9,10</sup>

---

<sup>8</sup> 40 CFR 131.36

**B. Discharges to San Diego Bay and the Tijuana River Estuary.** Discharges from the Facility to San Diego Bay and the Tijuana River Estuary shall not by itself or jointly with any other discharge(s) cause or contribute to violations of the following receiving water limitations:

### 1. Physical Characteristics

- a. Waters shall be free of coloration that causes nuisance or adversely affects beneficial uses. [Basin Plan]
- b. Waters shall not contain oils, greases, waxes, or other materials in concentrations which result in visible film or coating on the surface of the water or on objects in the water, or which cause nuisance or which otherwise adversely affect beneficial uses. [Basin Plan]
- c. Waters shall not contain floating material, including solids, liquids, foams, and scum in concentrations which cause nuisance or adversely affect beneficial uses. [Basin Plan]
- d. The suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance or adversely affect beneficial uses. [Basin Plan]
- e. Waters shall not contain suspended and settleable solids in concentrations of solids that cause nuisance or adversely affect beneficial uses. [Basin Plan]
- f. Waters shall not contain taste or odor producing substances at concentrations which cause a nuisance or adversely affect beneficial uses. [Basin Plan]
- g. Waters shall be free of changes in turbidity that cause nuisance or adversely affect beneficial uses. In addition, within San Diego Bay, the transparency of bay waters, insofar as it may be influenced by any controllable factor, either directly or through induced conditions, shall not be less than 8 feet in more than 20 percent of the readings in any zone, and measured by a standard Secchi disk. Wherever the water is less than 10 feet deep, the Secchi disk reading shall not be less than 80 percent of the depth in more than 20 percent of the readings in any zone. [Basin Plan]
- h. The discharge of waste shall not cause the temperature of the receiving water to be altered in a manner that adversely impacts beneficial uses. [Thermal Plan]

### 2. Chemical Characteristics

- a. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally. The pH shall not be depressed below 7.0 nor raised above 9.0. [Basin Plan]
- b. The dissolved oxygen concentration shall not at anytime be less than 5.0 mg/L. The annual mean dissolved oxygen concentration shall not be less than 7 mg/L more than 10 percent of the time. [Basin Plan]
- c. San Diego Bay waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growths cause nuisance or adversely affect beneficial uses. [Basin Plan]

---

<sup>9</sup> 65 Federal Register 31682-31719 (May 18, 2000), adding section 131.38 to 40 CFR

<sup>10</sup> If a water quality objective and a CTR criterion are in effect for the same priority pollutant, the more stringent of the two applies

- d. The discharge of wastes shall not cause concentrations of un-ionized ammonia (NH<sub>3</sub>) to exceed 0.025 mg/L (as N) in the San Diego Bay. [Basin Plan]
- e. No individual pesticide or combination of pesticides shall be present in the water column, sediments, or biota at concentration(s) that adversely affect beneficial uses. Pesticides shall not be present at levels which will bioaccumulate in aquatic organisms to levels which are harmful to human health, wildlife, or aquatic organisms. [Basin Plan]

### **3. Biological Characteristics**

- a. Marine communities, including vertebrate, invertebrate, and plant species, shall not be degraded. [Ocean Plan-BPJ]<sup>11</sup>
- b. The natural taste, odor, and color of fish, shellfish, or other marine resources used for human consumption shall not be altered. [Ocean Plan-BPJ]
- c. The concentration of organic materials in fish, shellfish, or other marine resources used for human consumption shall not bioaccumulate to levels that are harmful to human health. [Ocean Plan-BPJ]

### **4. Bacterial Characteristics**

- a. The most probable number of total coliform organisms in the upper 60 feet of the water column shall be less than 1,000 organisms per 100 ml (10 organisms per ml); provided that not more than 20 percent of the samples at any sampling station, in any 30-day period, may exceed 1,000 organisms per 100 ml (10 per ml); and provided further that no single sample shall exceed 10,000 organisms per 100 ml as described in the Basin Plan. [Basin Plan]
- b. The median total coliform concentration throughout the water column for any 30-day period shall not exceed 70 organisms per 100 ml nor shall more than 10 percent of the samples collected during any 30-day period exceed 230 organisms per 100 ml for a five-tube decimal dilution test or 330 organisms per 100 ml when a three-tube decimal dilution test is used where shellfish harvesting is designated. [Basin Plan]
- c. Where bay waters are used for whole fish handling, the density of E. coli shall not exceed 7 organisms per ml in more than 20 percent of any 20 daily consecutive samples of bay water. [Basin Plan]

### **5. Radioactivity**

- a. Radionuclides shall not be present in concentrations that are deleterious to human, plant, animal, or aquatic life nor that result in the accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal or aquatic life. [Basin Plan]
- b. The radioactivity in the receiving waters shall not exceed limits specified in title 17, division 1, chapter 5, subchapter 4, group 3, article 1, section 30253 of the California Code of Regulations (CCR).

---

<sup>11</sup> Ocean Plan-BPJ means that Best Professional Judgment (BPJ) was used to apply standards from the Ocean Plan to San Diego Bay.

## 6. Toxicity

- a. All waters shall be maintained free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life. Compliance with this objective will be determined by use of indicator organisms, analyses of species diversity, population density, growth anomalies, bioassays of appropriate duration, or other appropriate methods as specified by the Regional Board. [Basin Plan]
- b. Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities. [Bays and Estuaries Plan - SQO]
- c. Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health. [Bays and Estuaries Plan - SQO]

**C. Discharges to the Pacific Ocean.** Discharges from the Facility to the Pacific Ocean shall not by itself or jointly with any other discharge(s) cause or contribute to violations of the following receiving water limitations:

### 1. Bacterial Characteristics

- a. Within a zone bounded by the shoreline and a distance of 1,000 feet from the shoreline or the 30-foot depth contour, whichever is further from the shoreline, and in areas outside this zone used for water contact sports, as determined by the Regional Board (i.e., waters designated as REC-1), but including all kelp beds, the following bacterial objectives shall be maintained throughout the water column:
  - i. 30-day Geometric Mean – The following standards are based on the geometric mean of the five most recent samples from each site:
    - (a) Total coliform density shall not exceed 1,000 per 100 mL;
    - (b) Fecal coliform density shall not exceed 200 per 100 mL; and
    - (c) Enterococcus density shall not exceed 35 per 100 mL. [Ocean Plan]
  - ii. Single Sample Maximum:
    - (a) Total coliform density shall not exceed 10,000 per 100 mL;
    - (b) Fecal coliform density shall not exceed 400 per 100 mL;
    - (c) Enterococcus density shall not exceed 104 per 100 mL; and
    - (d) Total coliform density shall not exceed 1,000 per 100 mL when the fecal coliform/total coliform ratio exceeds 0.1. [Ocean Plan]
- b. At all areas where shellfish may be harvested for human consumption, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column:

- i. The median total coliform density shall not exceed 70 per 100 mL, and not more than 10 percent of the samples shall exceed 230 per 100 mL. [Ocean Plan]

## **2. Physical Characteristics**

- a. Floating particulates and grease and oil shall not be visible. [Ocean Plan]
- b. The discharge of waste shall not cause aesthetically undesirable discoloration of the ocean surface. [Ocean Plan]
- c. Natural light shall not be significantly reduced as the result of the discharge of waste. [Ocean Plan]
- d. The rate of deposition of inert solids and the characteristics of inert solids in ocean sediments shall not be changed such that benthic communities are degraded. [Ocean Plan]
- e. The discharge of waste shall not cause the temperature of the receiving water to be altered in a manner that adversely impacts beneficial uses. [Thermal Plan]

## **3. Chemical Characteristics**

- a. The dissolved oxygen concentration shall not at any time be depressed more than 10 percent from that which occurs naturally, as the result of the discharge of oxygen demanding waste materials. [Ocean Plan]
- b. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally. [Ocean Plan]
- c. The dissolved sulfide concentration of waters in and near sediments shall not be significantly increased above that present under natural conditions. [Ocean Plan]
- d. The concentration of substances set forth in the Ocean Plan chapter II, Table 1, in marine sediments shall not be increased to levels which would degrade indigenous biota. [Ocean Plan]
- e. The concentration of organic materials in marine sediments shall not be increased to levels which would degrade marine life. [Ocean Plan]
- f. Nutrient materials shall not cause objectionable aquatic growths or degrade indigenous biota. [Ocean Plan]

## **4. Numerical Water Quality Objectives**

- a. Ocean Plan Table 1 water quality objectives apply to all discharges under this Order that are within the jurisdiction of the Ocean Plan. Unless otherwise specified, all metal concentrations are expressed as total recoverable concentrations. [Ocean Plan]

## **5. Biological Characteristics**

- a. Marine communities, including vertebrate, invertebrate, and plant species, shall not be degraded. [Ocean Plan]

- b. The natural taste, odor, and color of fish, shellfish, or other marine resources used for human consumption shall not be altered. [Ocean Plan]
- c. The concentration of organic materials in fish, shellfish, or other marine resources used for human consumption shall not bioaccumulate to levels that are harmful to human health. [Ocean Plan]

## 6. Radioactivity

- a. The discharge of radioactive waste shall not degrade marine life. [Ocean Plan]
- b. The radioactivity in the receiving waters shall not exceed limits specified in title 17, division 1, chapter 5, subchapter 3, group 3, article 3, section 30253 of the CCR.

**D. Discharges to Inland Surface Waters.** Discharges from the Facility to Morena Reservoir, tributaries to the San Luis Rey River, or waters in the Canyon City Hydrologic Area shall not by itself or jointly with any other discharge(s) cause or contribute to violations of the following receiving water limitations:

### 1. Bacterial Characteristics

- a. **Total Coliform Organisms [Basin Plan]:** Total coliform organisms concentration shall not exceed the following:
  - i. 1,000 MPN/100 mL geometric mean, based on a minimum of not less than five samples for any 30-day period; and
  - ii. 10,000 MPN/100 mL at any time.
- b. **Fecal Coliform [Basin Plan]:** Fecal coliform organisms concentration shall not exceed the following:
  - i. 200 MPN/100 mL geometric mean, based on a minimum of not less than five samples for any 30-day period; and
  - ii. 400 MPN/100 mL for more than 10 percent of the total samples during any 30-day period.
- c. **Enterococci [Basin Plan]:** Enterococci concentration shall not exceed the following:
  - i. 33 MPN/100 mL geometric mean, based on all samples during a 30-day period; and
  - ii. 61 MPN/100 mL at any time.
- d. **Escherichia coli [Basin Plan]:** Escherichia coli concentration shall not exceed the following:
  - i. 126 MPN/100 mL geometric mean, based on all samples during a 30-day period; and
  - ii. 235 MPN/100 mL at any time.

## 2. Chemical Characteristics

- a. The dissolved oxygen concentration shall not at any time be less than five mg/L in inland surface waters with designated WARM beneficial use or less than six mg/L in waters designated COLD beneficial use. The annual mean dissolved oxygen concentration shall not be less than seven mg/L more than 10 percent of the time. [Basin Plan]
- b. Changes in normal ambient pH levels shall not exceed 0.5 units. The pH shall not be depressed below 6.5 nor raised above 8.5. [Basin Plan]
- c. Concentrations of nitrogen and phosphorus, by themselves or in combination with other nutrients, shall be maintained at levels below those which stimulate algae and emergent plant growth. [Basin Plan]
- d. The discharge of wastes shall not cause concentrations of un-ionized ammonia (NH<sub>3</sub>) to exceed 0.025 mg/L as nitrogen. [Basin Plan]

## 3. Physical Characteristics

- a. Water shall be free of coloration that causes nuisance or adversely affects beneficial uses. The natural color of fish, shellfish, or other resources shall not be impaired. [Basin Plan]
- b. Waters shall not contain oils, greases, waxes, or other materials in concentrations which result in a visible film or coating on the surface of the water or on objects in the water, or which cause nuisance or otherwise adversely affect beneficial uses. [Basin Plan]
- c. Waters shall not contain floating material, including solids, liquids, foams, and scum in concentrations which cause nuisance or adversely affect beneficial uses. [Basin Plan]
- d. The suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance or adversely affect beneficial uses. [Basin Plan]
- e. Waters shall not contain suspended and settleable solids in concentrations of solids that cause nuisance or adversely affect beneficial uses. [Basin Plan]
- f. Waters shall not contain taste or odor producing substances at concentrations which cause a nuisance or adversely affect beneficial uses. [Basin Plan]
- g. Waters shall be free of changes in turbidity that cause nuisance or adversely affect beneficial uses.
- h. The natural receiving water temperature of intrastate waters shall not be altered unless it can be demonstrated to the satisfaction of the San Diego Water Board that such alteration in temperature does not adversely affect beneficial uses. At no time or place shall the temperature of any waters with designated cold freshwater habitat be increased more than 5°F above the natural receiving water temperature.

4. **Toxicity.** All waters shall be maintained free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or

aquatic life. Compliance will be determined by use of indicator organisms, analysis of species diversity, population density, growth anomalies, bioassays of appropriate duration, or other appropriate methods, as specified by the San Diego Water Board.

5. **Radioactivity.** Radionuclides shall not be present in concentrations that are harmful/deleterious to human, plant, animal, or aquatic life nor that result in the accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life.

## **E. Corrective Actions for Receiving Water Limitations Violations**

Upon determination by the Discharger or written notification by the San Diego Water Board that storm water discharges are causing or contributing to an exceedance of Receiving Water Limitations in section V of this Order, the Discharger shall implement the following corrective actions at a minimum:

1. Notify the San Diego Water Board that discharges are causing or contributing to an exceedance of Receiving Water Limitations in section V of this Order.
2. Conduct a facility evaluation to determine whether there are pollutant source(s) within the Facility and whether BMPs described in the SWPPP, the SWMP, BMP Plans, the Pollution Prevention Plan (PPP), and other requirements of this Order have been properly implemented.
3. Conduct an assessment of the Facility's SWPPP, SWMP, BMP Plans, PPP, and other requirements of this Order to determine whether additional BMPs or implementation measures are necessary to prevent or reduce pollutants in storm water discharges to meet Receiving Water Limitations set forth in section V of this Order.
4. Prepare a certification statement, based upon the Facility evaluation and assessment required above, that one of the following applies:
  - a. Additional BMPs and/or implementation measures have been identified and included in the appropriate plan to meet Receiving Water Limitations, as specified in section V of this Order; or
  - b. No additional BMPs or implementation measures are required to reduce or prevent pollutants in storm water discharges to meet Receiving Water Limitations, as specified in section V of this Order; or
  - c. There are no sources of the pollutants at the Facility causing or contributing to the Receiving Water Limitations exceedance(s).
5. If a certification statement provides that no additional BMPs or implementation measures are required to reduce or prevent pollutants in storm water discharges to comply with Receiving Water Limitations specified in section V of this Order, the Discharger must demonstrate why the exceedance occurred and why it will not occur again under similar circumstance.
6. Implement additional BMPs and corrective measures as soon as is practicable in accordance with an approved schedule.

7. Prepare and submit a report, within 60 days from the date of the determination of the exceedance of Receiving Water Limitations, to the San Diego Water Board that does the following:
  - a. Describes the facility evaluation;
  - b. Describes the assessment of the SWPPP, SWMP, BMP Plans, PPP, and other requirements of this Order;
  - c. Identifies the BMPs and corrective actions that are currently being implemented to assure compliance with Receiving Water Limitations;
  - d. Identifies additional BMPs and corrective actions that will be implemented to assure compliance with Receiving Water Limitations with an implementation schedule for any additional BMPs or corrective actions not yet implemented; and
  - e. Includes the certification required above. The implementation schedule shall not exceed 90 days from the date of the determination of the exceedance of Receiving Water Limitations as specified in section V of this Order.
8. Submit any modifications to the report required by the San Diego Water Board within 30 days of notification.
9. Within 30 days following submittal of the report or modifications to the San Diego Water Board, the Discharger shall revise the SWPPP, SWMP, BMP Plans, PPP, and other plan required by this Order and monitoring program to incorporate a) the additional BMPs and corrective actions that have been and will be implemented, b) the implementation schedule, and c) a description of any additional monitoring required.
10. Nothing in this section shall prevent the San Diego Water Board from enforcing any provisions of this Order while the Discharger prepares and implements the report described above.
11. So long as the Discharger has complied with the procedures set forth above and is implementing the actions, the Discharger does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the San Diego Water Board.

## VI. PROVISIONS

### A. Standard Provisions

1. **Federal Standard Provisions.** The Discharger shall comply with all Standard Provisions included in Attachment D of this Order.
2. **San Diego Water Board Standard Provisions.** The Discharger shall comply with the following provisions:
  - a. The Discharger shall comply with all applicable federal, state, and local laws and regulations for handling, transport, treatment, or disposal of waste or the discharge of waste to Waters of the State in a manner which causes or threatens to cause a condition of pollution, contamination or nuisance as those terms are defined in CWC section 13050.

- b. This Order expires on December 31, 2020, after which, the terms and conditions of this permit are automatically continued pending issuance of a new Order, provided that all requirements of USEPA's NPDES regulations at 40 CFR section 122.6 and the state's regulations at CCR title 23, section 2235.4 regarding the continuation of expired Orders and waste discharge requirements are met.
- c. A copy of this Order shall be maintained on-site at the Facility, and shall be available to San Diego Water Board, State Water Board, and USEPA personnel and/or their authorized representative at all times.

**B. Monitoring and Reporting Program (MRP) Requirements**

- 1. The Discharger shall comply with the MRP and future revisions thereto, in Attachment E of this Order.
- 2. Reports required to be submitted to the San Diego Water Board shall be sent to the following address and phone numbers unless required to be submitted electronically:

Executive Officer  
California Regional Water Quality Control Board  
San Diego Region  
2375 Northside Drive, Suite 100  
San Diego, CA 92108

Notifications required to be provided to this San Diego Water Board shall be made to:

Telephone – (619) 516-1990  
Facsimile – (619) 516-1994

**C. Special Provisions**

**1. Reopener Provisions**

- a. This Order may be re-opened and modified in accordance with NPDES regulations at 40 CFR parts 122 and 124, as necessary, to include additional conditions or limitations based on newly available information or to implement any USEPA approved, new, state water quality objective.
- b. This Order may be modified, revoked and reissued or terminated for cause in accordance with the provisions of 40 CFR parts 122, 124, and 125 at any time prior to its expiration under any of the following circumstances:
  - i. Violations of any terms or conditions of this Order;
  - ii. Endangerment to human health or the environment resulting from the permitted activity;
  - iii. Obtaining this Order by misrepresentation or failure to disclose fully all relevant facts; or

- iv. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.
- c. This Order may be re-opened and modified for cause at any time prior to its expiration under any of the following circumstances:
  - i. Present or future investigations demonstrate that the discharge(s) regulated by this Order may have the potential to cause or contribute to adverse impacts on water quality and/or beneficial uses.
  - ii. New or revised Water Quality Objectives come into effect, or any total maximum daily load (TMDL) is adopted or revised that is applicable to the Discharger.
  - iii. Modification is warranted to those provisions of this Order addressing compliance with water quality standards in the receiving water or those provisions of this Order laying out an iterative process for implementation of management practices to achieve compliance with water quality standards in the receiving water.
  - iv. Modification is warranted to incorporate additional effluent limitations, prohibitions, and requirements, based on the results of additional monitoring required by the MRP in Attachment E of this Order.
  - v. Modification of the receiving waters monitoring and reporting requirements and/or special studies requirements of this Order is necessary for cause, including but not limited to a) revisions necessary to implement recommendations from Southern California Coastal Water Research Project (SCCWRP); b) revisions necessary to develop, refine, implement, and/or coordinate a regional monitoring program; and/or c) revisions necessary to develop and implement improved monitoring and assessment programs in keeping with San Diego Water Board Resolution No. R9-2012-0069, *Resolution in Support of a Regional Monitoring Framework*.
  - vi. Modification is warranted to address acute or chronic toxicity in Facility wastewater discharges, storm water discharges, or receiving waters through new or revised effluent limitations or other permit toxicity requirements or to implement new, revised, or newly interpreted water quality standards applicable to acute or chronic toxicity.
  - vii. The Discharger has requested, and submitted technical information demonstrating to the satisfaction of the San Diego Water Board, that technology-based or water quality based effluent limitations may be adjusted on a pollutant-by-pollutant or discharge by discharge basis to reflect credit for pollutants in the Discharger's intake water in conformance with the applicable requirements of 40 CFR section 122.45(g) and section 1.4.4 of the State Water Board's Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays and Estuaries of California (SIP).
  - viii. The Discharger has submitted technical information in accordance with the Ocean Plan to the satisfaction of the San Diego Water Board documenting the basis for a mixing zone of initial dilution for storm water discharges to the Pacific Ocean.

- d. The filing of a request by the Discharger for modifications, revocation and reissuance, or termination of this Order, or a notification of planned change in or anticipated noncompliance with this Order does not stay any condition of this Order.

## **2. Special Studies, Technical Reports and Additional Monitoring Requirements<sup>12</sup>**

### **a. Future Development of Chronic Toxicity Effluent Limitations for Industrial High Risk Storm Water Areas**

The San Diego Water Board may establish chronic toxicity effluent limitations for Industrial High Risk Areas storm water discharges in the future. In developing such effluent limitations, an instream waste concentration (IWC) of 100 percent will be assumed whenever mixing zones or dilution credits are not authorized by the San Diego Water Board.

The Discharger may, at their discretion, propose a work plan for a detailed study to support a Basin Plan Amendment on the possible application of chronic toxicity effluent limitations with mixing zones and dilution credits applicable to industrial storm water discharges to San Diego Bay. The study may also encompass the possible application of mixing zones and dilution credits applicable to municipal storm water discharges.

The work plan shall include the following elements:

- i. A detailed proposal describing the goals, technical approach, methods, data evaluation framework, and a schedule for completion of all study activities and submission of a draft Basin Plan Amendment for consideration of adoption by the San Diego Water Board;
- ii. Formation of a stakeholder advisory panel with the San Diego Water Board, USEPA, federal and state resource agencies, representatives of environmental non-governmental organizations, San Diego County Department of Health Services, and representatives of storm water dischargers to San Diego Bay. The panel shall be notified of proposed work and results; and the panel shall be provided opportunity for comment;
- iii. An analysis of storm water impacts to San Diego Bay that considers circulation and flushing, pollutant movement and accumulation, and fate to determine mixing zones and dilution factors appropriate for storm water discharges to San Diego Bay. The analysis shall include consideration of relevant State of California and USEPA polices and guidance pertaining to the establishment of mixing zones and dilution credits in receiving waters; and
- iv. Provisions for establishment of an external scientific peer review panel comprised of experts in the fields of plume dilution modeling, toxicology, and marine ecology to guide the technical approach, review the study results and make recommendations for a proposed Basin Plan amendment and toxicity monitoring strategies for storm water discharges.

## **3. Best Management Practices (BMP) and Pollution Prevention Plan (PPP)**

---

<sup>12</sup> See section V.F of the MRP (Attachment E) for an overview of TRE Requirements

**a. BMP and PPP for Utility Vault and Manhole Dewatering Discharges (Utility Vault Plan)**

The Discharger shall continue to implement a Utility Vault Plan for utility vault and manhole dewatering discharges to prevent the discharge of pollutants into the receiving waters at levels that would contribute to the degradation of the receiving waters or otherwise adversely affect the beneficial uses of the receiving water. At a minimum, the Utility Vault Plan shall be maintained and implemented in accordance with Attachment H to prevent, or minimize the potential for, the release of pollutants to Waters of the State and Waters of the U.S.

**b. BMP Plan for Pier Washing, Pier Boom Cleaning, and Boat Rinsing**

The Discharger shall develop and implement a BMP Plan for discharges from pier washing that prevents the discharge of pollutants at Discharge Point No. PW-001 into the receiving waters at levels that would contribute to the degradation of the receiving waters or otherwise adversely affect the beneficial uses of the receiving water. Additionally within the BMP Plan, the Discharger shall include BMPs to prevent discharges to Waters of the U.S. from pier boom cleaning and boat rinsing activities performed at NBC. At a minimum, the BMP Plan shall be developed and implemented in accordance with Attachment I of this Order to prevent, or minimize the potential for, the release of pollutants to Waters of the State and Waters of the U.S.

**c. PPP for Industrial Storm Water**

The Discharger shall prepare and implement a PPP for storm water discharges associated with the Industrial High Risk Areas for acute toxicity and copper and zinc (Discharge Points specified in Attachment M of this Order, as updated annually pursuant to section IV.B.2 of this Order).

The PPP shall be developed in accordance with CWC section 13263.3(d)(2). The minimum requirements for the PPP are outlined in the Fact Sheet of this Order, Attachment F, section VII.C.3.c. A work plan and time schedule for preparation of the PPP shall be completed and submitted to the San Diego Water Board within 90 days of the effective date of this Order. The PPP shall be completed and submitted to the San Diego Water Board within 9 months of the effective date of this Order.

**4. Flood and Runoff Protection Requirements**

- a. All waste treatment, containment, and disposal facilities shall be protected against 100-year peak stream flows as defined by the San Diego County Flood Control Agency.
- b. All waste treatment, containment, and disposal facilities shall be protected against erosion, overland runoff, and other impacts resulting from a 100-year frequency 24-hour storm.

**5. Other Special Provisions – Not Applicable**

## VII. COMPLIANCE DETERMINATION

Compliance with the effluent limitations contained in section IV of this Order will be determined as specified below.

### A. General

Compliance with effluent limitations shall be determined using sample reporting protocols defined in the MRP and Attachment A of this Order. For purpose of reporting and administrative enforcement by the San Diego Water Board, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the constituent in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL) or lowest quantifiable level.

### B. Multiple Sample Data

When determining compliance with an average annual effluent limitation (AAEL), average monthly effluent limitation (AMEL) or maximum daily effluent limitation (MDEL) and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determination of "Detected, but Not Quantified" (DNQ) or "Not Detected" (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

1. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, following by quantified values (if any). The order of individual ND or DNQ determinations is unimportant.
2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

### C. Mass Emission Rate

The mass emission rate (MER), in pounds per day, shall be obtained from the following calculation for any calendar day:

$$\text{Mass Emission Rate (lb/day)} = 8.34 \times Q \times C$$

In which Q and C are the flow rate in million gallons per day and the constituent concentration in mg/L, respectively, and 8.34 is a conversion factor. Q is the flow rate for the two hours of chlorination and C is the concentration during a chlorination event. If a composite sample is taken, then C is the concentration measured in the composite sample and Q is the average flow rate occurring during the period over which the samples are composited.

### D. Average Monthly Effluent Limitation (AMEL)

If the average (or when applicable, the median determined by section VII.B above for multiple sample data) of daily discharges over a calendar month exceeds the AMEL for a given parameter, this will represent a single violation for the purpose of assessing mandatory

minimum penalties under CWC section 13385, though the Discharger will be considered out of compliance for each discharge day of that month for that parameter (e.g., resulting in 31 days of non-compliance in a 31-day month) for discretionary penalties. If only a single sample is taken during the calendar month and the analytical result for that sample exceeds the AMEL, the Discharger will be considered out of compliance for days when the discharge occurs. For any one calendar month during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar month.

#### **E. Maximum Daily Effluent Limitation (MDEL)**

If a daily discharge (or when applicable, the median determined by section VII.B above for multiple sample data of a daily discharge) exceeds the MDEL for a given parameter, the Discharger will be considered out of compliance for that parameter for that 1 day only within the reporting period. For any 1 day during which no sample is taken, no compliance determination can be made for that day.

#### **F. Instantaneous Minimum Effluent Limitation**

If the analytical result of a single grab sample is lower than the instantaneous minimum effluent limitation for a parameter, the Discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of 2 grab samples taken within a calendar day that both are lower than the instantaneous minimum effluent limitation would result in two instances of non-compliance with the instantaneous minimum effluent limitation).

#### **G. Instantaneous Maximum Effluent Limitation**

If the analytical result of a single grab sample is higher than the instantaneous maximum effluent limitation for a parameter, the Discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of 2 grab samples taken within a calendar day that both exceed the instantaneous maximum effluent limitation would result in 2 instances of non-compliance with the instantaneous maximum effluent limitation).

#### **H. Median Monthly Effluent Limit (MMEL)**

If the median result of three independent toxicity tests, conducted within the same calendar month, and analyzed using the TST is a "fail" (i.e. two out of three is "fail"), this will represent a single violation for the purpose of assessing mandatory minimum penalties under CWC section 13385, though the Discharger will be considered out of compliance for each discharge day of that month for that parameter (e.g., resulting in 31 days of non-compliance in a 31-day month) for discretionary penalties. If median result is "fail", the Discharger will be considered out of compliance for days when the discharge occurs. For any one calendar month during which fewer than 3 samples are taken, no compliance determination can be made for that calendar month.

#### **I. Acute Toxicity for Discharges**

1. The Maximum Daily Effluent Limitation (MDEL) for acute toxicity is exceeded and a violation will be flagged when a toxicity test results in a "fail" in accordance with the TST approach and the percent effect is greater than or equal to 40%.

2. The determination of “Pass” or “Fail” from a single-effluent concentration acute toxicity test at the IWC of 100 percent effluent shall be determined using the TST approach described in the *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010).
3. The Discharger shall report the results of reasonable potential analyses (RPA), species sensitivity screenings, and routine toxicity tests to the San Diego Water Board as either a “pass” or a “fail” at the IWC, in accordance with the TST approach and provide the calculated percent effect at the IWC.

### **Pass**

A test result that rejects the null hypothesis (Ho) below is reported as “Pass” in accordance with the TST approach:

Ho: Mean response (100 percent effluent)  $\leq 0.80 \times$  Control mean response

### **Fail**

A test result that does not reject the null hypothesis (Ho) above is reported as “Fail” in accordance with the TST approach.

4. The presence or absence of acute toxicity shall be determined as specified in section IV of the MRP.

## **J. Chronic Toxicity**

The discharge is subject to determination of “Pass” or “Fail” from a chronic toxicity test using the Test of Significant Toxicity (TST) statistical t-test approach described in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010), Appendix A, Figure A-1 and Table A-1, and Appendix B, Table B-1. The null hypothesis (Ho) for the TST statistical approach is: Mean discharge IWC response  $\leq 0.75 \times$  Mean control response. A test result that rejects this null hypothesis is reported as “Pass”. A test result that does not reject this null hypothesis is reported as “Fail”. The relative “Percent Effect” at the discharge IWC is defined and reported as:  $((\text{Mean control response} - \text{Mean discharge IWC response}) \div \text{Mean control response}) \times 100$ . This is a t-test (formally Student’s t-Test), a statistical analysis comparing two sets of replicate observations—in the case of WET, only two test concentrations (i.e., a control and IWC). The purpose of this statistical test is to determine if the means of the two sets of observations are different (i.e., if the IWC or receiving water concentration differs from the control (the test result is “Pass” or “Fail”). The Welch’s t-test employed by the TST statistical approach is an adaptation of Student’s t-test and is used with two samples having unequal variances.

The Maximum Daily Effluent Limitation (MDEL) for chronic toxicity is exceeded and a violation will be flagged when a chronic toxicity test, analyzed using the TST statistical approach, results in “Fail” and the “Percent Effect” is  $\geq 50\%$ .

The Median Monthly Effluent Limitation (MMEL) for chronic toxicity is exceeded and a violation will be flagged when the median results of three independent toxicity tests, conducted within the same calendar month, and analyzed using the TST, (i.e. 2 out of 3) is a “fail.” The MMEL for chronic toxicity shall only apply when there is a discharge more than one day in a calendar

month period. During such calendar months, up to three independent toxicity tests may be conducted when one toxicity test results in "Fail".

The chronic toxicity MDEL and MMEL are set at the IWC for the discharge (100% effluent) and expressed in units of the TST statistical approach ("Pass" or "Fail", "Percent Effect"). All NPDES effluent compliance monitoring for the chronic toxicity MDEL and MMEL shall be reported using the 100% effluent concentration and negative control, expressed using the TST outcome and percent effect. The TST hypothesis (Ho) (see above) is statistically analyzed using the IWC and a negative control. Effluent toxicity tests shall be run using a multi-concentration test design when required by *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms, Third Edition (EPA-821-R-02-014)*. Standard Operating Procedures used by the toxicity testing laboratory to identify and report valid, invalid, anomalous, or inconclusive effluent (and receiving water) toxicity test measurement results from the TST statistical approach, including those that incorporate a consideration of concentration-response patterns, must be submitted to the Regional Water Board (40 CFR section 122.41(h)). The Regional Water Board will make a final determination as to whether a toxicity test result is valid, and may consult with the Discharger, USEPA, the State Water Board's Quality Assurance Officer, or the State Water Board's Environmental Laboratory Accreditation Program as needed. The Board may consider results of any TIE/TRE studies in an enforcement action.

## ATTACHMENT A – ABBREVIATIONS AND GLOSSARY

### Part 1 – Abbreviations

Abbreviation	Definition
AAEL	Average Annual Effluent Limitation
AMEL	Average Monthly Effluent Limitation
ASBS	Areas of Special Biological Significance
AWEL	Average Weekly Effluent Limitation
Basin Plan	Water Quality Control Plan for the San Diego Basin
BAT	Best Available Technology Economically Achievable
BCT	Best Conventional Pollutant Control Technology
BMP	Best Management Practices
BOD <sub>5</sub>	Biochemical Oxygen Demand (5-Day at 20°C)
BPJ	Best Professional Judgment
BPT	Best Practicable Treatment Control Technology
CCR	California Code of Regulations

µg/L	Micrograms per Liter

**Part 2 – Glossary of Common Terms**

**Acute Toxicity Tests**

A measurement of the adverse effect (usually mortality) of a waste discharge or ambient water sample on a group of test organisms during a short-term exposure.

**Arithmetic Mean (µ)**

Also called the average, is the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

$$\text{Arithmetic mean} = \mu = \Sigma x / n$$

where:  $\Sigma x$  is the sum of the measured ambient water concentrations, and n is the number of samples.

**Armed Forces Vessel**

A vessel owned or operated by the United States Department of Defense or the United States Coast Guard, other than time or voyage chartered vessels, vessels of the U.S. Army Corps of Engineers, vessels that are memorials or museums, vessels under construction, or vessels in drydock.

**Average Monthly Effluent Limitation (AMEL)**

The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

**Average Weekly Effluent Limitation (AWEL)**

The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

**Bioaccumulative Pollutants**

Those substances taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

**Best Management Practices (BMPs)**

Schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of Waters of the United States (U.S.). The BMPs also include treatment measures, operating procedures, and practices to control facility site runoff,

spillage or leaks, sludge or waste disposal, or drainage from raw material storage. The BMPs may include any type of pollution prevention and pollution control measure necessary to achieve compliance with this Order.

### **Best Professional Judgment (BPJ)**

The method used by permit writers to develop technology-based NPDES permit conditions on a case-by-case basis using all reasonably available and relevant data.

### **Carcinogenic**

Carcinogenic pollutants are substances that are known to have the potential to cause cancer in living organisms.

### **Clean Water Act (CWA)**

The Federal Water Pollution Control Act enacted by Public Law 92-500 as amended by Public Laws 95-217, 95-576, 96-483, and 97-117; 33 USC 1251 et seq.

### **Chronic Toxicity Tests**

A measurement of the sub-lethal effects of a discharge or ambient water sample (e.g. reduced growth or reproduction). Certain chronic toxicity tests include an additional measurement of lethality.

### **Coefficient of Variation (CV)**

CV is a measure of the data variability and is calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

### **Contamination**

“Contamination” means an impairment of the quality of the Waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of disease. “Contamination” includes any equivalent effect resulting from the disposal of waste, whether or not Waters of the State are affected. [CWC section 13050(k)]

### **Daily Discharge**

Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

### **Detected, but Not Quantified (DNQ)**

DNQ are those sample results less than the RL, but greater than or equal to the laboratory’s MDL.

### **Dilution Credit**

Dilution Credit is the amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation (WQBEL), based on the allowance of a specified mixing zone. It is

calculated from the dilution ratio or determined through conducting a mixing zone study or modeling of the discharge and receiving water.

### **Discharge incidental to the normal operation of a vessel**

A discharge, including, but not limited to: graywater, bilgewater, cooling water, weather deck runoff, ballast water, oil water separator effluent, and any other pollutant discharge from the operation of a marine propulsion system, shipboard maneuvering system, crew habitability system, or installed major equipment, such as an aircraft carrier elevator or a catapult, or from a protective, preservative, or absorptive application to the hull of a vessel; and a discharge in connection with the testing, maintenance, and repair of any of the aforementioned systems whenever the vessel is waterborne, including pierside. A discharge incidental to normal operation does not include:

- (1) Sewage;
- (2) A discharge of rubbish, trash, or garbage;
- (3) A discharge of air emissions resulting from the operation of a vessel propulsion system, motor driven equipment, or incinerator;
- (4) A discharge that requires a National Pollutant Discharge Elimination System (NPDES) permit under the Clean Water Act; or
- (5) A discharge containing source, special nuclear, or byproduct materials regulated by the Atomic Energy Act.

### **Effluent Concentration Allowance (ECA)**

ECA is a value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the coefficient of variation for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in USEPA guidance (Technical Support Document For Water Quality-based Toxics Control, March 1991, second printing, EPA/505/2-90-001).

### **Enclosed Bays**

Enclosed Bays means indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

### **Estimated Chemical Concentration**

The estimated chemical concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

### **Estuaries**

Estuaries means waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater. Estuarine waters included, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

### **Facility**

Naval Base Coronado (NBC). NBC consists of the following eight installations: Naval Air Station, North Island (NASNI), Naval Amphibious Base, Coronado (NAB), Naval Outlying Landing Field, Imperial Beach (NOLF), Silver Strand Training Complex (SSTC), formerly known as the Naval Radio Receiving Facility (NRRF), Naval Auxiliary Landing Field, San Clemente Island (NALF), Remote Training Site Warner Springs (RTSWS), Camp Michael Monsoor, and Camp Morena. Of the eight installations aligned under NBC, only seven are regulated by this Order. NALF is located in the Los Angeles Regional Water Quality Control Board jurisdictional area and, therefore, is not regulated by this Order.

### **Industrial High Risk Areas**

All areas where wastes or pollutants of significant quantities from ship construction, modification, repair, and maintenance activities (including abrasive blast grit material, primer, paint, paint chips, solvents, oils, fuels, sludges, detergents, cleansers, hazardous substances, toxic pollutants, non-conventional pollutants, materials of petroleum origin, or other substances of water quality significance) are subject to precipitation, run-on, and/or runoff.

### **Industrial Low Risk Areas**

All areas where wastes or pollutants from industrial activities are subject to precipitation, run-on, and/or runoff which are not classified as Industrial No Exposure Areas or Industrial High Risk Areas.

### **Industrial No Exposure Areas**

Areas where all industrial materials and activities are protected by a storm resistant shelter<sup>1</sup> to prevent exposure to rain, snow, snowmelt, and/or runoff. "Industrial materials and activities" include, but are not limited to, material handling<sup>2</sup> equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products.

### **Inland Surface Waters**

All surface Waters of the State that do not include the ocean, enclosed bays, or estuaries.

### **Instantaneous Maximum Effluent Limitation**

The highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

### **Instantaneous Minimum Effluent Limitation**

The lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

### **Instream Waste Concentration (IWC)**

The concentration of a toxicant or effluent in the receiving water after mixing (the inverse of the dilution factor). A discharge of 100 percent effluent will be considered the IWC whenever mixing zones or dilution credits are not authorized by the applicable Water Board.

### **Marine Pollution Control Device, (MPCD)**

Any equipment or management practice installed or used on an Armed Forces vessel that is

---

<sup>1</sup> "Storm-resistant shelters" include completely roofed and walled buildings or structures. They also include structures with only a top cover supported by permanent supports but with no side coverings provided material within the structure is not subject to wind dispersion (sawdust, powders, etc.), track-out, and there is no storm water discharged from within the structure that has come into contact with any materials.

<sup>2</sup> "Material handling activities" include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product, or waste product.

designed to receive, retain, treat, control, or discharge a discharge incidental to the normal operation of a vessel, and that is determined by the Administrator of USEPA and Secretary of the Department of Defense to be the most effective equipment or management practice to reduce the environmental impacts of the discharge consistent with the considerations in Clean Water Act section 312(n)(2)(B).

### **Maximum Daily Effluent Limitation (MDEL)**

The highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

### **Maximum Extent Practicable (MEP)**

MEP is the technology-based standard established by Congress in CWA section 402(p)(3)(B)(iii) that municipal dischargers of storm water must meet. MEP is the result of emphasizing pollution prevention and source control BMPs as the first lines of defense in combination with structural and treatment methods where appropriate serving as additional lines of defense.

### **Median Monthly Effluent Limitation (MMEL)**

An effluent limit based on the median results of three independent toxicity tests, conducted within the same calendar month, and analyzed using the TST. The MMEL is exceeded when the median result (i.e. two out of three) is a "fail."

### **Median**

The middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements ( $n$ ) is odd, then the median =  $X_{(n+1)/2}$ . If  $n$  is even, then the median =  $(X_{n/2} + X_{(n/2)+1})/2$  (i.e., the midpoint between the  $n/2$  and  $n/2+1$ ).

### **Method Detection Limit (MDL)**

MDL is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in title 40 of the Code of Federal Regulations, Part 136, Attachment B, revised as of July 3, 1999.

### **Minimum Level (ML)**

ML is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

### **Mixing Zone**

Mixing Zone is a limited volume of receiving water that is allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

### **Non-Storm Water Discharge**

Any discharge to storm sewer systems that is not composed entirely of storm water.

### **Not Detected (ND)**

Sample results which are less than the laboratory's MDL.

### **Nuisance**

“Nuisance” means anything which meets all of the following requirements: (1) Is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property. (2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal. (3) Occurs during, or as a result of, the treatment or disposal of waste. [CWC section 13050(m)]

### **Numeric Action Level (NAL)**

Numeric Action Levels (NALs), found in Table G-1 of Attachment G and Table H-1 of Attachment H of this Order are used as numeric thresholds for corrective action. An exceedance of an NAL is not a violation of this Order.

### **Ocean Waters**

The territorial marine Waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Water Board’s California Ocean Plan.

### **Percent Effect**

The value that denotes the difference in response between the IWC and the control, divided by the mean response, and multiplied by 100 using the following equation:

$$\% \text{ Effect at IWC} = \frac{\text{Mean Control Response} - \text{Mean IWC Response}}{\text{Mean Control Response}} * 100$$

### **Persistent Pollutants**

Persistent pollutants are substances for which degradation or decomposition in the environment is nonexistent or very slow.

### **Pollutant**

“Pollutant” means dredged spoil, solid waste, incinerator residue, filter backwash, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials (except those regulated under the Atomic Energy Act of 1954, as amended (42 U.S.C. 2011 et seq.)), heat, wrecked or discarded equipment, rock, sand, cellar dirt and industrial, municipal, and agricultural waste discharged into water. It does not mean: (a) Sewage from vessels; or (b) Water, gas, or other material which is injected into a well to facilitate production of oil or gas, or water derived in association with oil and gas production and disposed of in a well, if the well, used either to facilitate production or for disposal purposes, is approved by authority of the state in which the well is located, and if the state determines that the injection or disposal will not result in the degradation of ground or surface water resources. NOTE: Radioactive materials covered by the Atomic Energy Act are those encompassed in its definition of source, byproduct, or special nuclear materials. Examples of materials not covered include radium and accelerator-produced isotopes. See *Train v. Colorado Public Interest Research Group, Inc.*, 426 U.S. 1 (1976). (40 CFR section 122.2)

### **Pollution**

“Pollution” means an alteration of the quality of the Waters of the State by waste to a degree which unreasonably affects either of the following: (A) The waters for beneficial uses. (B) Facilities which serve these beneficial uses. “Pollution” may include “contamination.” [CWC section 13050(l)]

### **Pollution Prevention**

Pollution Prevention means any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation

(as defined in CWC section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State or San Diego Water Board.

### **Pollution Prevention Plan (PPP)**

A PPP is a plan for implementing pollution prevention containing, at a minimum, the elements identified in CWC section 13263.3(d)(2).

### **Priority Pollutants**

Priority pollutants are all compounds with criteria in the California Toxics Rule (CTR).

### **Qualifying Storm Event**

A Qualifying Storm Event (QSE) is a precipitation event that produces a discharge for at least one drainage area; and is preceded by 48 hours with no discharge from any **drainage area**.

### **Reporting Level (RL)**

RL is the ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the San Diego Water Board either from Appendix 4 of the SIP in accordance with section 2.4.2 of the SIP or established in accordance with section 2.4.3 of the SIP. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

### **San Diego Water Board**

As used in this document the term "San Diego Water Board" is synonymous with the term "Regional Board" as defined in CWC section 13050(b) and is intended to refer to the California Regional Water Quality Control Board for the San Diego Region as specified in CWC section 13200.

### **Significant Materials**

Raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under section 101 (14) of Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA); and chemicals the facility is required to report pursuant to section 313 of title III of Superfund Amendments and Reauthorization Act (SARA); fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be discharged.

### **Significant Quantities**

Volumes, concentrations, or masses of pollutants that can cause or threaten to cause pollution, contamination, or nuisance; adversely impact human health or the environment; and/or cause or contribute to a violation of any applicable water quality standard for the receiving water or any receiving water limitation.

### **Significant Spills**

Include, but are not limited to, releases of oil or hazardous substances in excess of reportable quantities under section 311 of the CWA (see 40 CFR part 110 and section 117.21) or section 102 of CERCLA (see 40 CFR section 302.4).

### **Small Military Base Municipal Separate Storm Sewer System (Small Military Base MS4) Areas**

Areas where no industrial activities occur. Areas designated as “Small Military Base MS4 Areas” shall be applicable to the Storm Water Management Program (SWMP) requirements contained within section IV.D.2 of this Order.

### **Standard Deviation ( $\sigma$ )**

Standard Deviation is a measure of variability that is calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

- x is the observed value;
- $\mu$  is the arithmetic mean of the observed values; and
- n is the number of samples.

### **Storm Water**

Includes storm water runoff, snowmelt runoff, and storm water surface runoff and drainage. It excludes infiltration and runoff from agricultural land.

### **Storm Water Discharge Associated with Industrial Activity**

The discharge from any conveyance that is used for collecting and conveying storm water and that is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program under 40 CFR part 122. The term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters; sites used for residual treatment, storage areas (including tank farms) for raw materials, and intermediate and final products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the purposes of this paragraph, material handling activities include storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product, by-product, or waste product. The term excludes areas located on plant lands separate from the plant’s industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are federally, state, or municipally owned or operated that meet the description of the facilities referenced in this paragraph) include those facilities designated under 40 CFR section 122.26(a)(1)(v).

### **Storm Water Management Plan (SWMP)**

The Storm Water Management Plan (SWMP) is a written plan to reduce the discharge of pollutants from “Small Military Base MS4 Areas” to the technology-based standard of MEP to protect receiving water quality.

### **Storm Water Pollution Prevention Plan (SWPPP)**

A SWPPP is a written document that identifies the industrial activities conducted at the site, including any structural control practices, which the industrial facility operator will implement to prevent pollutants from making their way into storm water runoff. The SWPPP also must include descriptions of other relevant information, such as the physical features of the facility, and procedures for spill prevention, conducting inspections, and training of employees. The SWPPP is intended to be a “living” document, updated as necessary, such that when industrial activities or

storm water control practices are modified or replaced, the SWPPP is similarly revised to reflect these changes.

### **Test of Significant Toxicity (TST)**

A statistical approach used to analyze toxicity test data. The TST incorporates a restated null hypothesis, Welch's t-test, and biological effect thresholds for chronic and acute toxicity.

### **Toxicity Reduction Evaluation (TRE)**

TRE is a study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.)

### **Vessel**

Includes every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on navigable Waters of the U.S. or waters of the contiguous zone, but does not include amphibious vehicles.

### **Water Quality Objectives**

Numerical or narrative limits on constituents or characteristics of water designed to protect designated beneficial uses of the water.

### **Water Quality Standards**

Water quality standards, as defined in CWA section 303(c) and 40 CFR131.6, consist of 1) the beneficial uses of a water body, 2) criteria (referred to as water quality objectives in California law) to protect those uses, and 3) an anti-degradation policy. Under state law, the water boards establish beneficial uses and water quality objectives in their water quality control or basin plans. Together with an anti-degradation policy (State Water Board Resolution 68-16), these beneficial uses and water quality objectives serve as water quality standards under the CWA. In CWA parlance, state beneficial uses are called "designated uses" and state water quality objectives are called "criteria." Throughout this Order, the relevant term is used depending on the statutory scheme. The water quality standards described in section V of this Order are enforceable receiving water limitations for the surface water bodies for which they are established.

### **Waters of the State**

Waters of the State means any surface water or groundwater, including saline waters, within the boundaries of the state.

### **Waters of the United States (U.S.)**

Waters of the U.S. are defined as: "(a) All waters, which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters, including interstate "wetlands;" (c) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation or destruction of which would affect or could affect interstate or foreign commerce including any such waters: (1) Which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) Which are used or could be used for industrial purpose by

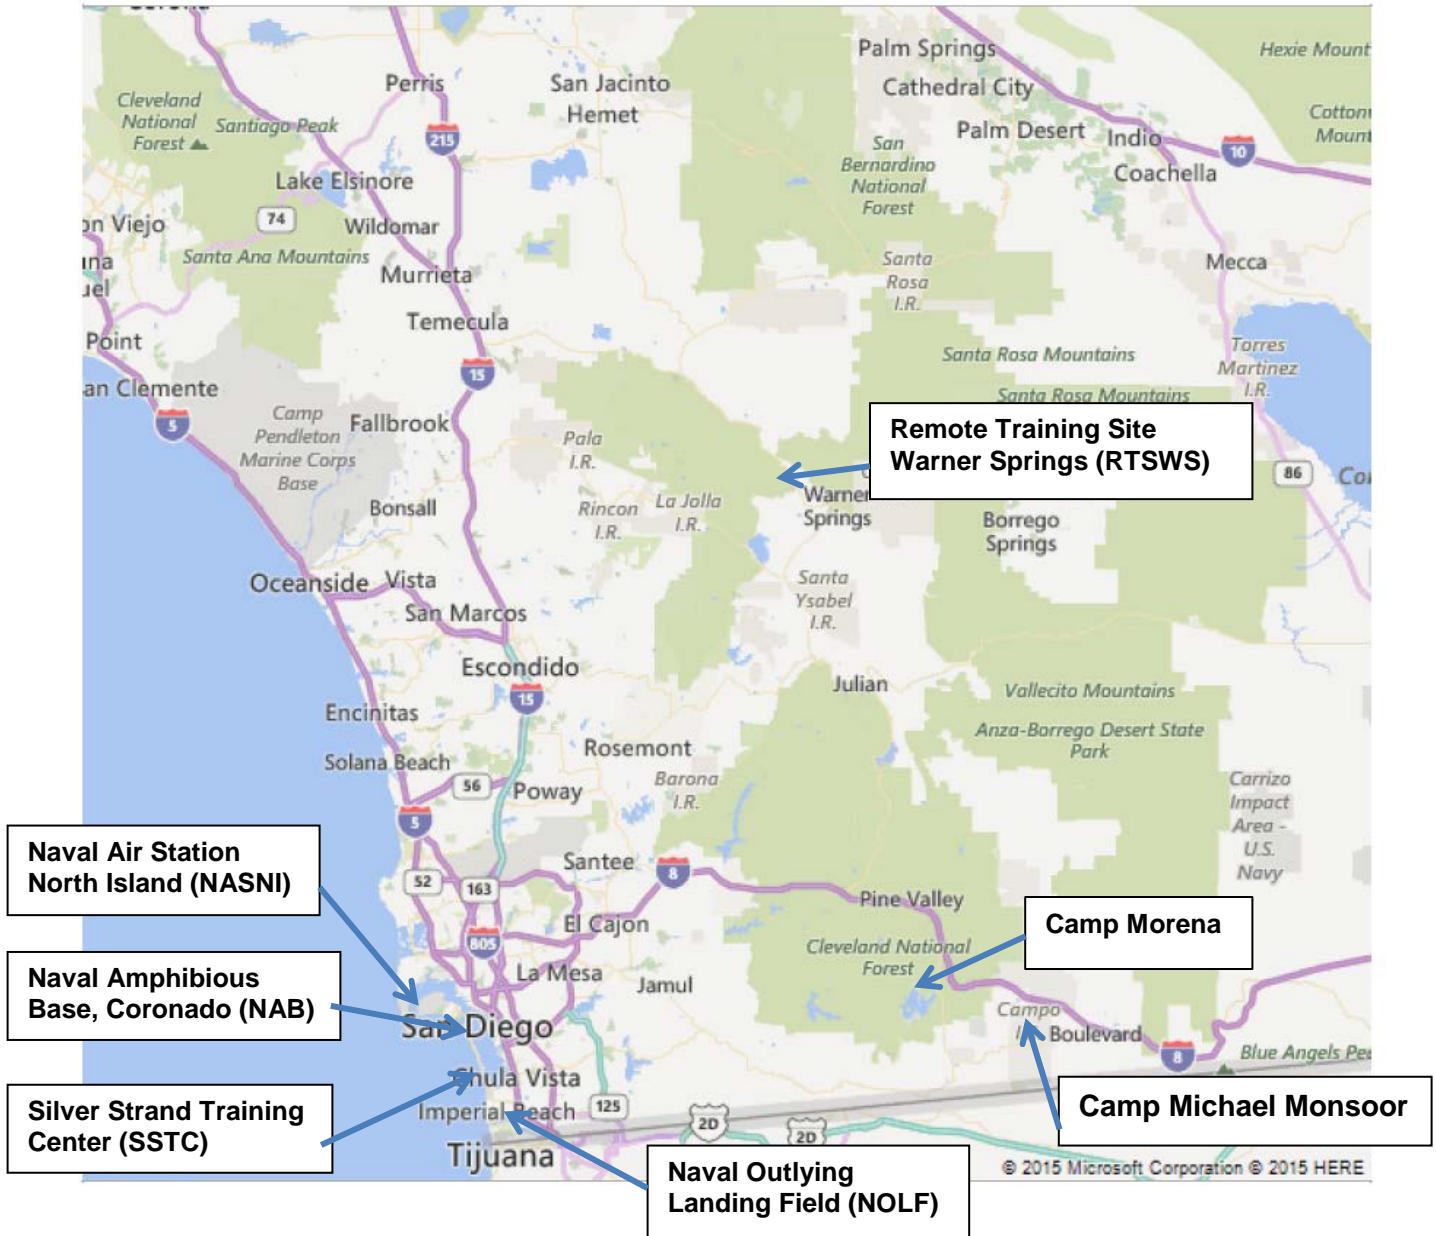

industries in interstate commerce; (d) All impoundments of waters otherwise defined as Waters of the U.S. under this definition; (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial seas; and (g) "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition. Waters of the U.S. do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with the EPA." (40 CFR section 122.2)

**Whole Effluent Toxicity (WET)**

The aggregate toxic effect of a waste discharge measured directly by a chronic or acute toxicity test.

## ATTACHMENT D – STANDARD PROVISIONS

### I. STANDARD PROVISIONS – PERMIT COMPLIANCE

#### A. Duty to Comply

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code (CWC) and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 CFR section 122.41(a).)
2. The Discharger shall comply with effluent standards or prohibitions established under section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 CFR section 122.41(a)(1).)

#### B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 CFR section 122.41(c).)

#### C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 CFR section 122.41(d).)

#### D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 CFR section 122.41(e).)

#### E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 CFR section 122.41(g).)
2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 CFR section 122.5(c).)

## **F. Inspection and Entry**

The Discharger shall allow the San Diego Water Board, State Water Board, United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 CFR section 122.41(i); CWC, section 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (40 CFR section 122.41(i)(1));
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (40 CFR section 122.41(i)(2));
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (40 CFR section 122.41(i)(3)); and
4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 CFR section 122.41(i)(4).)

## **G. Bypass**

1. Definitions
  - a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 CFR section 122.41(m)(1)(i).)
  - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 CFR section 122.41(m)(1)(ii).)
2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 CFR section 122.41(m)(2).)
3. Prohibition of bypass. Bypass is prohibited, and the San Diego Water Board may take enforcement action against a Discharger for bypass, unless (40 CFR section 122.41(m)(4)(i)):
  - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 CFR section 122.41(m)(4)(i)(A));
  - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering

judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 CFR section 122.41(m)(4)(i)(B)); and

- c. The Discharger submitted notice to the San Diego Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 CFR section 122.41(m)(4)(i)(C).)
4. The San Diego Water Board may approve an anticipated bypass, after considering its adverse effects, if the San Diego Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above. (40 CFR section 122.41(m)(4)(ii).)
5. Notice
  - a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass. (40 CFR section 122.41(m)(3)(i).)
  - b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). (40 CFR section 122.41(m)(3)(ii).)

## H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 CFR section 122.41(n)(1).)

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 CFR section 122.41(n)(2).)
2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 CFR section 122.41(n)(3)):
  - a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 CFR section 122.41(n)(3)(i));
  - b. The permitted facility was, at the time, being properly operated (40 CFR section 122.41(n)(3)(ii));
  - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) (40 CFR section 122.41(n)(3)(iii)); and

- d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above. (40 CFR section 122.41(n)(3)(iv).)
3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 CFR section 122.41(n)(4).)

## **II. STANDARD PROVISIONS – PERMIT ACTION**

### **A. General**

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 CFR section 122.41(f).)

### **B. Duty to Reapply**

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 CFR section 122.41(b).)

### **C. Transfers**

This Order is not transferable to any person except after notice to the San Diego Water Board. The San Diego Water Board may require modification or revocation and reissuance of this Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 CFR section 122.41(l)(3); section 122.61.)

## **III. STANDARD PROVISIONS – MONITORING**

- A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 CFR section 122.41(j)(1).)
- B. Monitoring results must be conducted according to test procedures under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503 unless other test procedures have been specified in this Order. (40 CFR section 122.41(j)(4); section 122.44(i)(1)(iv).)

## **IV. STANDARD PROVISIONS – RECORDS**

- A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by Part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board Executive Officer at any time. (40 CFR section 122.41(j)(2).)

**B. Records of monitoring information shall include:**

1. The date, exact place, and time of sampling or measurements (40 CFR section 122.41(j)(3)(i));
2. The individual(s) who performed the sampling or measurements (40 CFR section 122.41(j)(3)(ii));
3. The date(s) analyses were performed (40 CFR section 122.41(j)(3)(iii));
4. The individual(s) who performed the analyses (40 CFR section 122.41(j)(3)(iv));
5. The analytical techniques or methods used (40 CFR section 122.41(j)(3)(v)); and
6. The results of such analyses. (40 CFR section 122.41(j)(3)(vi).)

**C. Claims of confidentiality for the following information will be denied (40 CFR section 122.7(b)):**

1. The name and address of any permit applicant or Discharger (40 CFR section 122.7(b)(1)); and
2. Permit applications and attachments, permits and effluent data. (40 CFR section 122.7(b)(2).)

**V. STANDARD PROVISIONS – REPORTING**

**A. Duty to Provide Information**

The Discharger shall furnish to the San Diego Water Board, State Water Board, or USEPA within a reasonable time, any information which the San Diego Water Board, State Water Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the San Diego Water Board, State Water Board, or USEPA copies of records required to be kept by this Order. (40 CFR section 122.41(h); Water. Code, section 13267.)

**B. Signatory and Certification Requirements**

1. All applications, reports, or information submitted to the San Diego Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 CFR section 122.41(k).)
2. All permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA). (40 CFR section 122.22(a)(3).)
3. All reports required by this Order and other information requested by the San Diego Water Board, State Water Board, or USEPA shall be signed by a person described in

Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

- a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above (40 CFR section 122.22(b)(1));
  - b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 CFR section 122.22(b)(2)); and
  - c. The written authorization is submitted to the San Diego Water Board and State Water Board. (40 CFR section 122.22(b)(3).)
4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V.B.3 above must be submitted to the San Diego Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 CFR section 122.22 (c).)
5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:

“I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.” (40 CFR section 122.22(d).)

### **C. Monitoring Reports**

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order. (40 CFR section 122.22(l)(4).)
2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the San Diego Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 CFR section 122.41(l)(4)(i).)
3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the San Diego Water Board. (40 CFR section 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 CFR section 122.41(l)(4)(iii).)

#### **D. Compliance Schedules**

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 CFR section 122.41(l)(5).)

#### **E. Twenty-Four Hour Reporting**

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 CFR section 122.41(l)(6)(i).)
2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 CFR section 122.41(l)(6)(ii)):
  - a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 CFR section 122.41(l)(6)(ii)(A).)
  - b. Any upset that exceeds any effluent limitation in this Order. (40 CFR section 122.41(l)(6)(ii)(B).)
3. The San Diego Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 CFR section 122.41(l)(6)(iii).)

#### **F. Planned Changes**

The Discharger shall give notice to the San Diego Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 CFR section 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in section 122.29(b) (40 CFR section 122.41(l)(1)(i)); or
2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (40 CFR section 122.41(l)(1)(ii).)
3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application

process or not reported pursuant to an approved land application plan. (40 CFR section 122.41(l)(1)(iii).)

### **G. Anticipated Noncompliance**

The Discharger shall give advance notice to the San Diego Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements. (40 CFR section 122.41(l)(2).)

### **H. Other Noncompliance**

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above. (40 CFR section 122.41(l)(7).)

### **I. Other Information**

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the San Diego Water Board, State Water Board, or USEPA, the Discharger shall promptly submit such facts or information. (40 CFR section 122.41(l)(8).)

## **VI. STANDARD PROVISIONS – ENFORCEMENT**

- A.** The San Diego Water Board is authorized to enforce the terms of this permit under several provisions of the CWC, including, but not limited to, sections 13385, 13386, and 13387.

## **VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS**

### **A. Non-Municipal Facilities**

Existing manufacturing, commercial, mining, and silvicultural Dischargers shall notify the San Diego Water Board as soon as they know or have reason to believe (40 CFR section 122.42(a)):

- 1.** That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 CFR section 122.42(a)(1)):
  - a.** 100 micrograms per liter ( $\mu\text{g/L}$ ) (40 CFR section 122.42(a)(1)(i));
  - b.** 200  $\mu\text{g/L}$  for acrolein and acrylonitrile; 500  $\mu\text{g/L}$  for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 CFR section 122.42(a)(1)(ii));
  - c.** Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 CFR section 122.42(a)(1)(iii)); or
  - d.** The level established by the San Diego Water Board in accordance with section 122.44(f). (40 CFR section 122.42(a)(1)(iv).)

2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 CFR section 122.42(a)(2)):
  - a. 500 micrograms per liter ( $\mu\text{g/L}$ ) (40 CFR section 122.42(a)(2)(i));
  - b. 1 milligram per liter ( $\text{mg/L}$ ) for antimony (40 CFR section 122.42(a)(2)(ii));
  - c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 CFR section 122.42(a)(2)(iii)); or
  - d. The level established by the San Diego Water Board in accordance with section 122.44(f). (40 CFR section 122.42(a)(2)(iv).)

## **ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)**

Section 308 of the federal Clean Water Act (CWA) and sections 122.41(h), (j)-(l), 122.44(i), and 122.48 of title 40 of the Code of Federal Regulations (40 CFR) require that all National Pollutant Discharge Elimination System (NPDES) permits specify monitoring and reporting requirements. California Water Code (Water Code) sections 13267 and 13383 also authorize the San Diego Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. Pursuant to this authority this Monitoring and Reporting Program (MRP) establishes conditions for Naval Base Coronado (Discharger or NBC) to conduct routine or episodic self-monitoring of the discharges regulated under this Order at specified effluent, and receiving water monitoring locations. The MRP requires the Discharger to report the results to the San Diego Water Board with information necessary to evaluate discharge characteristics and compliance status.

The purpose of the MRP is to determine and ensure compliance with effluent limitations and other requirements established in this Order, assess treatment efficiency, characterize effluents, characterize wastewater flows, and characterize the receiving water and the effects of the discharge on the receiving water. The MRP also specifies requirements concerning the proper use, maintenance, and installation of monitoring equipment and methods, and the monitoring type intervals and frequency necessary to yield data that are representative of the activities and discharges regulated under this Order.

Each monitoring section contains an introductory paragraph summarizing why the monitoring is needed and the key management questions the monitoring is designed to answer. In developing the list of key management questions the San Diego Water Board considered four basic types of information for each question:

- Management Information Need – Why does the San Diego Water Board need to know the answer?
- Monitoring Criteria – What monitoring will be conducted for deriving an answer to the question?
- Expected Product – How should the answer be expressed and reported?
- Possible Management Actions – What actions will be potentially influenced by the answer?

The framework for this monitoring program has three components that comprise a range of spatial and temporal scales: 1. core monitoring, 2. regional monitoring, and 3. special studies.

1. Core monitoring consists of the basic site-specific monitoring necessary to measure compliance with individual effluent limits and/or impacts to receiving water quality. Core monitoring is typically conducted in the immediate vicinity of the discharge by examining local scale spatial effects.
2. Regional monitoring provides information necessary to make assessments over large areas and serves to evaluate cumulative effects of all anthropogenic inputs. Regional monitoring data also assists in the interpretation of core monitoring studies. In the event that a regional monitoring effort takes place during the permit cycle in which the MRP does not specifically address regional monitoring, the San Diego Water Board may allow relief from aspects of core monitoring components in order to encourage participation pursuant to section VI of this MRP.
3. Special studies are directed monitoring efforts designed in response to specific management or research questions identified through either core or regional monitoring programs. Often they are used to help understand core or regional monitoring results, where a specific environmental process is not well understood, or to address unique issues of local importance.

## I. GENERAL MONITORING PROVISIONS

- A. Samples and measurements taken as required herein shall be representative of the volume and nature of the monitored discharge. All samples shall be taken at the monitoring locations specified below and, unless otherwise specified, before the monitoring flow joins or is diluted by any other waste stream, body of water, or substance. Monitoring locations shall not be changed without notification to and the approval of the San Diego Water Board.
- B. Monitoring must be conducted according to United States Environmental Protection Agency (USEPA) test procedures approved at 40 CFR part 136, *Guidelines Establishing Test Procedures for the Analysis of Pollutants under the Clean Water Act* as amended, unless other test procedures are specified in this Order and/or in this MRP. Alternative test procedures not specified in this Order are subject to San Diego Water Board and USEPA approval.
- C. The monitoring reports, signed and certified as required by Attachment D, Standard Provisions V.B, of this Order, shall be submitted electronically using the State Water Board's California Integrated Water Quality System (CIWQS) Program website in accordance with section VIII.B.1 this MRP.
- D. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring, instrumentation, copies of all reports required by this Order and this MRP, and records of all data used to complete the application for this Order. Records of monitoring information shall include information required under Attachment D, Standard Provisions, section IV. Records shall be maintained for a minimum of five years from the date of sample, measurement, report, or application. This period may be extended by request of the San Diego Water Board or by the USEPA at any time.
- E. All analyses shall be performed in a laboratory certified to perform such analyses by the State Water Board's Division of Drinking (DDW) or by a laboratory approved by the San Diego Water Board. The laboratory must be accredited under the DDW Environmental Laboratory Accreditation Program (ELAP) to ensure the quality of analytical data used for regulatory purposes to meet the requirements of this Order. Additional information on ELAP can be accessed at [http://www.waterboards.ca.gov/drinking\\_water/certlic/labs/index.shtml](http://www.waterboards.ca.gov/drinking_water/certlic/labs/index.shtml).
- F. All monitoring instruments and devices used by the Discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy. All flow measurement devices shall be calibrated at least once per year to ensure continued accuracy of the devices.
- G. The Discharger shall have, and implement, an acceptable written quality assurance (QA) plan for laboratory analyses. When requested by USEPA or the San Diego Water Board, the Discharger will participate in the NPDES discharge monitoring report QA performance study. The Discharger should have a success rate equal to or greater than 80 percent.
- H. Monitoring results shall be reported at intervals and in a manner specified in this Order or in this MRP.
- I. This MRP may be modified by the San Diego Water Board as appropriate.
- J. This Order may be modified by the San Diego Water Board or the USEPA to enable the Discharger to participate in comprehensive regional monitoring activities.

## II. MONITORING LOCATIONS

### A. Monitoring Station Locations

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

**Table E-1. Monitoring Station Locations**

Discharge Point Name	Monitoring Location Name	Monitoring Location Description
SC-001	SC-001	A location where a representative sample of the Steam Condensate can be obtained: 32° 42' 22" N; 117° 11' 23" W
SC-002	SC-002	A location where a representative sample of the Steam Condensate can be obtained: 32° 42' 22" N; 117° 11' 22" W
SC-003	SC-003	A location where a representative sample of the Steam Condensate can be obtained: 32° 42' 23" N; 117° 11' 22" W
SC-004	SC-004	A location where a representative sample of the Steam Condensate can be obtained: 32° 42' 21" N; 117° 11' 20" W
SC-005	SC-005	A location where a representative sample of the Steam Condensate can be obtained: 32° 42' 21" N; 117° 11' 18" W
SC-006	SC-006	A location where a representative sample of the Steam Condensate can be obtained: 32° 42' 20" N; 117° 11' 16" W
SC-007	SC-007	A location where a representative sample of the Steam Condensate can be obtained: 32° 42' 20" N; 117° 11' 15" W
SC-008	SC-008	A location where a representative sample of the Steam Condensate can be obtained: 32° 42' 19" N; 117° 11' 13" W
SC-009	SC-009	A location where a representative sample of the Steam Condensate can be obtained: 32° 42' 29" N; 117° 11' 23" W
SC-010	SC-010	A location where a representative sample of the Steam Condensate can be obtained: 32° 41' 46" N; 117° 11' 59" W
CW-001	CW-001	A location where a representative sample of Diesel Engine Cooling Water can be obtained: 32° 41' 43" N; 117° 13' 36" W
UV-001	UV-001	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 8" N; 117° 10' 57" W
UV-002	UV-002	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 17" N; 117° 11' 11" W
UV-003	UV-003	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 20" N; 117° 11' 27" W
UV-004	UV-004	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 37" N; 117° 11' 24" W
UV-005	UV-005	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 36" N; 117° 11' 22" W
UV-006	UV-006	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 45" N; 117, 11° 25" W
UV-007	UV-007	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 42" N; 117° 12' 12" W
UV-008	UV-008	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 26" N; 117° 11' 39" W
UV-009	UV-009	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 15" N; 117° 11' 57" W

Discharge Point Name	Monitoring Location Name	Monitoring Location Description
UV-010	UV-010	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 42' 2" N; 117° 11' 25" W
UV-011	UV-011	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 40' 31" N; 117° 9' 38" W
UV-012	UV-012	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 40' 23" N; 117° 10' 1" W
UV-013	UV-013	A location where a representative sample of Utility Vault and Manhole Dewatering can be obtained: 32° 35' 57" N; 117° 7' 25" W
PW-001	PW-001	A location where a representative sample of Pier Washing Water can be obtained: 32° 41' 43" N; 117° 13' 36" W
--	Industrial Storm Water See Attachment M	The Discharger shall identify storm water monitoring locations at a point prior to or at the point of discharge for all "Industrial High Risk Areas" and "Industrial Low Risk Areas), as identified in Attachment M of this Order. The Discharger shall establish monitoring locations as described in section II.B of the MRP.
--	Municipal Storm Water See Attachment M	The Discharger shall identify storm water monitoring locations at a point prior to or at the point of discharge for Small Military Base MS4 Areas, as identified in Attachment M of this Order. The Discharger shall establish monitoring locations sufficient to meet the requirements described in section VII.B of the MRP. The number and location of monitoring locations shall be sufficient to characterize storm water runoff to the MS4 throughout the Facility.

**B. Industrial Storm Water Monitoring Location Report**

1. The Discharger shall prepare and submit, no later than May 1, 2016, an Industrial Storm Water Monitoring Location Plan to identify representative monitoring locations for industrial storm water discharges from Industrial High Risk Areas, and Industrial Low Risk Areas. The Plan shall contain the following information:
  - a. The criteria and methods used to identify the representative monitoring locations.
  - b. A map of monitoring locations for each Industrial High Risk Area and Industrial Low Risk Area storm water discharge point. Where a single drainage area, or similar drainage areas to the same receiving water, discharge to multiple discharge points, the Discharger may propose a single monitoring location for that drainage area (or similar drainage areas), provided the Discharger submits supporting rationale demonstrating that a single monitoring location is representative for that drainage area (or similar drainage areas) (i.e., similar industrial activities and best management practices (BMPs)).
  - c. A tabulation of the proposed representative monitoring locations for industrial storm water discharges from Industrial High Risk Areas and Industrial Low Risk Areas. The tabulation shall include the discharge points, the representative monitoring locations for each discharge point, a brief description of the representative monitoring location (including the drainage area for storm water discharges only), and the latitude and longitude for each representative monitoring location.
2. In the Storm Water Annual Report for industrial storm water discharges, the Discharger shall submit a summary of any proposed changes to the representative monitoring locations, a rationale for each change in monitoring location, and a certification that all monitoring locations are representative of their respective discharge locations.

- The Discharger shall implement the Industrial Storm Water Monitoring Location Report unless otherwise directed in writing by the San Diego Water Board. The Discharger shall comply with any conditions set by the San Diego Water Board including modification of proposed monitoring locations.

### III. CORE MONITORING REQUIREMENTS

#### A. Influent Monitoring Requirements – Not Applicable

#### B. Steam Condensate Monitoring Locations SC-001 through SC-010

The Discharger shall monitor steam condensate discharges at a minimum of three representative monitoring locations from Monitoring Locations SC-001 through SC-010 as specified below to answer the following primary questions:

- Does the effluent meet permit effluent limitations based on water quality standards for the receiving water?
- What is the mass discharged annually of each constituent monitored?
- Is the effluent concentration or mass changing over time?

The three representative monitoring locations shall be chosen at random and may be different each year depending upon which steam systems are active.

**Table E-2. Effluent Monitoring for Steam Condensate**

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Flow	GPD	Grab or Estimate	Quarterly	Estimate
Oil and Grease	mg/L	Grab	Quarterly	1
Turbidity	NTU	Grab	Quarterly	1
Settleable Solids	ml/L	Grab	Quarterly	1
Chronic Toxicity	Pass/Fail	Grab	Annually	1,2
pH	standard units	Grab	Quarterly	1
<b>Priority Pollutants</b>				
Antimony, Total Recoverable	µg/L	Grab	Quarterly	1
Arsenic, Total Recoverable	µg/L	Grab	Quarterly	1
Copper, Total Recoverable	µg/L	Grab	Quarterly	1
Lead, Total Recoverable	µg/L	Grab	Quarterly	1
Nickel, Total Recoverable	µg/L	Grab	Quarterly	1
Selenium, Total Recoverable	µg/L	Grab	Quarterly	1
Zinc, Total Recoverable	µg/L	Grab	Quarterly	1
2,3,7,8-TCDD <sup>3</sup>	µg/L	Grab	Quarterly	1
TCDD Equivalents <sup>4</sup>	µg/L	Grab	Quarterly	1

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Bis(2-Ethylhexyl)Phthalate	µg/L	Grab	Quarterly	1
Aldrin	µg/L	Grab	Quarterly	1
4,4'-DDT	µg/L	Grab	Quarterly	1
4,4'-DDE	µg/L	Grab	Quarterly	1
4,4'-DDD	µg/L	Grab	Quarterly	1
Heptachlor	µg/L	Grab	Quarterly	1
Heptachlor Epoxide	µg/L	Grab	Quarterly	1
Remaining CTR Priority Pollutants	µg/L	Grab	Annual	1

<sup>1</sup> As specified in 40 CFR part 136.

<sup>2</sup> As described in section IV.B of this MRP.

<sup>3</sup> Applicable to discharges to San Diego Bay, SC-001 to SC-009 only.

<sup>4</sup> Applicable to discharges to the Pacific Ocean, SC-010 only.

### C. Diesel Engine Cooling Water Location CW-001

The Discharger shall monitor diesel engine cooling water discharges at Monitoring Location CW-001 as specified below to answer the following primary questions:

1. Does the effluent meet permit effluent limitations based on water quality standards for the receiving water?
2. What is the mass discharged annually of each constituent monitored?
3. Is the effluent concentration or mass changing over time?

**Table E-3. Effluent Monitoring for Diesel Engine Cooling Water**

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Flow	GPD	Grab or Estimate	Quarterly	Estimate
Oil and Grease	mg/L	Grab	Quarterly	1
Turbidity	NTU	Grab	Quarterly	1
pH	standard units	Grab	Quarterly	1
Temperature	°F	Grab	Quarterly	1
Settleable Solids	ml/L	Grab	Quarterly	1
Chronic Toxicity	Pass/Fail	Grab	Annually	1,2
<b>Priority Pollutants</b>				
Arsenic, Total Recoverable	µg/L	Grab	Quarterly	1
Chromium VI, Total Recoverable	µg/L	Grab	Quarterly	1
Copper, Total Recoverable	µg/L	Grab	Quarterly	1
Lead, Total Recoverable	µg/L	Grab	Quarterly	1
Nickel, Total Recoverable	µg/L	Grab	Quarterly	1

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Selenium, Total Recoverable	µg/L	Grab	Quarterly	1
Zinc, Total Recoverable	µg/L	Grab	Quarterly	1
4,4-DDT	µg/L	Grab	Quarterly	1
4,4-DDE	µg/L	Grab	Quarterly	1
4,4-DDD	µg/L	Grab	Quarterly	1
Remaining CTR Priority Pollutants	µg/L	Grab	Annually	1

<sup>1</sup> As specified in 40 CFR part 136.

<sup>2</sup> As described in section IV.B of this MRP.

#### D. Pier Washing Monitoring Location PW-001

The Discharger shall submit a log of pier washing wastewater discharges at Monitoring Locations PW-001 annually. The log shall include the date, location, duration, approximate discharge volume, water source, visual assessment of discharge and receiving water quality, and any other relevant comments. The log is designed to address the following primary questions:

1. How much pier washing occurs?

#### E. Utility Vault and Manhole Monitoring Locations UV-001 through UV-013

1. The Discharger shall monitor utility vault and manhole dewatering discharges at Monitoring Locations UV-001 through UV-013 at a minimum of three representative monitoring locations, including at least one electrical vault discharge and one manhole discharge as shown in Table E-4 below to address the following primary questions:

- a. Does the effluent comply with Numeric Action Levels in Attachment H?
- b. What is the mass discharged annually of each constituent monitored?
- c. Is the effluent concentration or mass changing over time?

The electrical vault representative shall be chosen from Monitoring Location Nos. UV-001 through UV-013 and shall change each year. The manhole discharge and steam vault discharge monitoring location shall be chosen at random and may be different each year.

**Table E-4. Effluent Monitoring Utility Vault and Manhole Dewatering for Discharges**

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Flow	GPD	Grab or Estimate	Annually	Estimate
Oil and Grease	mg/L	Grab	Annually	3
pH	standard units	Grab	Annually	1
Total Suspended Solids	mg/L	Grab	Annually	1
Total Petroleum Hydrocarbons—Gasoline Range Organics <sup>2</sup>	mg/L	Grab	Annually	1

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Total Petroleum Hydrocarbons— Diesel Range Organics <sup>3</sup>	mg/L	Grab	Annually	1

<sup>1</sup> As specified in 40 CFR part 136.

<sup>2</sup> TPH Gasoline (TPH-g) – Report Benzene, Ethylbenzene, Toluene, and Xylene.

<sup>3</sup> TPH Diesel (TPH-d).

2. Annually in accordance with Table E-8, the Discharger shall submit a log of the utility vault and manhole dewatering discharges. For vaults with automatic sump pumps, the log shall include the total volume of each discharge point for each calendar quarter. For vaults or manholes that are dewatered manually, the log shall describe the estimated annual volume, flow rate, location of the discharge, date, and receiving water body. This Order does not require the Discharger to enter utility vaults if there is a human health/safety concern. If the Discharger cannot comply with these requirements due to human health/safety concerns, the Discharger shall submit a description of the circumstances for omitting required information. The log is designed to address the following primary questions:
  - a. How often does the discharge occur?
  - b. Is the discharge a major source of pollutants?
3. Annually in accordance with Table E-8, the Discharger shall submit an Annual Utility Vault Report containing, at a minimum, the following information:
  - a. An executive summary that includes a discussion of utility vault compliance and/or violation(s) of this Order including utility vault NAL exceedances.
  - b. The results of the annual Utility Vault Plan evaluation and any revisions to the Utility Vault Plan in accordance with section III.E.2 and 3 of Attachment H.
  - c. A summary of monitoring data generated with comparison to NALs.
  - d. A summary of relevant field observations.
  - e. A map showing the location of each monitored (i.e., annual sampling) discharge location.

#### IV. WHOLE EFFLUENT TOXICITY (WET) TESTING REQUIREMENTS

Whole effluent toxicity (WET) refers to the overall aggregate toxic effect of an effluent measured directly by an aquatic toxicity test(s). The control of WET is one approach this Order uses to control the discharge of toxic pollutants. WET tests evaluate the 1) aggregate toxic effects of all chemicals in the effluent including additive, synergistic, or antagonistic toxicity effects; 2) the toxicity effects of unmeasured chemicals in the effluent; and 3) variability in bioavailability of the chemicals in the effluent.

Monitoring to assess the overall toxicity of the effluent is required to answer the following questions:

- (1) Does the effluent meet permit effluent limitations for toxicity based on water quality standards for the receiving water?

If not:

- a. Are unmeasured pollutants causing risk to aquatic life?
  - b. Are pollutants in combination causing risk to aquatic life?
- (2) Does the storm water runoff meet receiving water limitations for toxicity in the receiving water?
- (3) Are conditions in receiving water getting better or worse with regard to toxicity?
- (4) What is the relative storm water runoff contribution to the receiving water toxicity?
- (5) What are the causes of the toxicity and the sources of the constituents responsible?

## **A. Acute Toxicity**

### **1. Monitoring Frequency for Industrial High Risk Storm Water Discharges**

The Discharger shall conduct acute toxicity monitoring at the frequencies specified in Table E-7 and section VII.A.4. of this MRP. For storm water sampling, sampling shall occur during storm events or if storm water is collected, prior to the release of storm water to the receiving water.

### **2. Marine and Estuarine Species and Test Methods**

The Discharger shall conduct a species sensitivity screening for acute toxicity on a representative sample which shall include one vertebrate and one invertebrate during the first required monitoring period. The species sensitivity screening samples shall also be analyzed for the parameters required for the discharge. The test species that exhibits the highest percent effect at the instream waste concentration (IWC) during a species sensitivity screening (i.e. the most sensitive species) shall be utilized for routine monitoring during the permit cycle. Routine toxicity test design shall, at a minimum, include a single-concentration analysis of the IWC compared to a control.

The Discharger shall follow the methods for acute toxicity tests as established in 40 CFR section 136.3 using a single-concentration test design for routine monitoring, or a five-concentration test design for accelerated monitoring. The USEPA method manuals referenced therein include *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms, Fifth Edition* (EPA-821-R-02-012).

The total sample volume shall be determined by the specific toxicity test method used. Sufficient sample volume shall be collected to perform the required toxicity test. Sufficient sample volume shall also be collected during accelerated monitoring for subsequent TIE studies, if necessary, at each sampling event. All toxicity tests shall be conducted as soon as possible following sample collection. The 36-hour sample holding time for test initiation shall be targeted. However, no more than 72 hours shall elapse before the conclusion of sample collection and test initiation.

### **3. Compliance Determination**

The acute toxicity Maximum Daily Effluent Limitation (MDEL) is exceeded and a violation will be flagged when a toxicity test during routine monitoring results in a "fail" in accordance with the Test of Significant Toxicity (TST) approach and the percent effect is greater than or equal to 40%.

The determination of “pass” or “fail” from a single effluent concentration acute toxicity test at the IWC of 100 percent effluent shall be determined using the TST approach described in the *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010).

The Discharger shall report the results of a reasonable potential analysis (RPA), species sensitivity screenings, and routine toxicity tests to the San Diego Water Board as either a “pass” or a “fail” at the IWC, in accordance with the TST approach and provide the calculated percent effect at the IWC. The methodology for determining “pass”, “fail” and “percent effect” is provided below.

### **Pass**

An acute toxicity test result that rejects the null hypothesis (Ho) below is reported as “pass” in accordance with the TST approach:

Ho: Mean response (100 percent effluent)  $\leq$  0.80  $\times$  Control mean response

### **Fail**

An acute toxicity test result that does not reject the null hypothesis (Ho) above is reported as “fail” in accordance with the TST approach.

### **Percent Effect**

The percent effect at the IWC is calculated for each acute toxicity test result using the following equation:

$$\% \text{ Effect at IWC} = \frac{\text{Mean Control Response} - \text{Mean IWC Response}}{\text{Mean Control Response}} * 100$$

## **4. Acute Toxicity MDEL Exceedance Follow-up Action**

If an acute toxicity test result during routine monitoring exceeds the acute toxicity MDEL, the Discharger shall implement corrective action to abate the source of the toxicity within 24 hours from the time the Discharger becomes aware of an MDEL exceedance, if the source of toxicity is known (e.g. operational upset). The Discharger shall also conduct an additional acute toxicity test within the same calendar month that the exceedance occurred or, the next qualifying storm event after receiving results of an exceedance for storm water discharges.

## **5. Evaluation of Additional Toxicity Tests for Industrial Storm Water from High Risk Areas**

If the additional test result for industrial storm water from high risk areas results in a “pass”, the Discharger may return to routine monitoring for the following monitoring period. If the verification test results in a “fail” at a percent effect greater than or equal to 0.20, the Discharger shall implement an approved Toxicity Reduction Evaluation (TRE) Work Plan as set forth below in section IV.E of this MRP. The requirement for a TRE may be waived by the San Diego Water Board on a case-by-case basis if implementation of a previously approved TRE Work Plan is already underway for the sampled discharge point.

## **B. Chronic Toxicity**

### **1. Monitoring Frequency for Chronic Toxicity**

The Discharger shall conduct chronic toxicity monitoring at the frequencies specified in Table E-2 and E-3.

### **2. Marine and Estuarine Species and Test Methods**

The Discharger shall conduct a species sensitivity screening for chronic toxicity on a representative sample which shall include one vertebrate, one invertebrate, and one aquatic plant during the first required monitoring period. The species sensitivity screening samples shall also be analyzed for the parameters required for the discharge. The test species that exhibits the highest percent effect at the IWC during a species sensitivity screening (i.e. the most sensitive species) shall be utilized for routine monitoring during the permit cycle. If the result of all three species is "Pass", then the species that exhibits the highest "Percent Effect" at the discharge IWC during species sensitivity screening shall be used for routine monitoring during the permit cycle. If only one species fails, then that species shall be used for routine monitoring during the permit cycle. If two or more species result in "Fail," then the species that exhibits the highest "Percent Effect" at the discharge IWC during the suite of species sensitivity screening shall be used for routine monitoring during the permit cycle.

The Discharger shall follow the methods for chronic toxicity tests as established in 40 CFR section 136.3. The USEPA method manuals referenced therein include *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms, Fourth Edition* (EPA-821-R-02-013), and *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms, Third Edition* (EPA-821-R-02-014). Additional methods for chronic toxicity monitoring are outlined in *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms, First Edition* (EPA-600-R-95-136).

For discharges to marine and estuarine waters, the Discharger shall conduct a static renewal toxicity test with the topsmelt, *Atherinops affinis* (Larval Survival and Growth Test Method 1006.01); a static non-renewal toxicity test with the giant kelp, *Macrocystis pyrifera* (Germination and Growth Test Method 1009.0); and a static non-renewal toxicity test with the purple sea urchin, *Strongylocentrotus purpuratus*, or the sand dollar, *Dendraster excentricus* (Fertilization Test Method 1008.0 or Embryo-Larval Development Test Method).

If laboratory-held cultures of the topsmelt, *Atherinops affinis*, are not available for testing, then the Discharger shall conduct a static renewal toxicity test with the inland silverside, *Menidia beryllina* (Larval Survival and Growth Test Method 1006.01), found in the third edition of *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms* (EPA/821/R-02/014, 2002; Table IA, 40 CFR Part 136). Additional species may be used by the Discharger if approved by the San Diego Water Board.

The total sample volume shall be determined by the specific toxicity test method(s) used. Sufficient sample volume shall be collected to perform the required toxicity test. Sufficient sample volume shall also be collected during accelerated monitoring for subsequent TIE studies, if necessary, at each sampling event. All toxicity tests shall be conducted as soon as possible following sample collection. The 36-hour sample holding time for test initiation

shall be targeted. However, no more than 72 hours shall elapse before the conclusion of sample collection and test initiation.

### 3. Compliance Determination

The MDEL for chronic toxicity is exceeded and a violation will be flagged when a toxicity test during monitoring results in a “fail” in accordance with the TST approach and the percent effect relative to a control is greater than or equal to 50%.

The Median Monthly Effluent Limitation (MMEL) for chronic toxicity is exceeded and a violation will be flagged when the median results of three independent toxicity tests, conducted within the same calendar month, and analyzed using the TST, (i.e. 2 out of 3) is a “fail.”

The determination of “Pass” or “Fail” from a chronic toxicity test at the IWC of 100 percent effluent shall be determined using the TST approach described in the *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010).

The Discharger shall report the results of reasonable potential analyses, species sensitivity screenings, and routine toxicity tests to the San Diego Water Board as either a “pass” or a “fail” at the IWC, in accordance with the TST approach and provide the calculated percent effect at the IWC. The methodology for determining “pass”, “fail” and “percent effect” is provided below.

#### Pass

A chronic toxicity test result that rejects the null hypothesis (Ho) below is reported as “pass” in accordance with the TST approach:

Ho: Mean response (100 percent effluent)  $\leq 0.75 \times$  Control mean response

#### Fail

A chronic toxicity test result that does not reject the null hypothesis (Ho) above is reported as “fail” in accordance with the TST approach.

#### Percent Effect

The percent effect at the IWC is calculated for each chronic toxicity test result using the following equation:

$$\% \text{ Effect at IWC} = \frac{\text{Mean Control Response} - \text{Mean IWC Response}}{\text{Mean Control Response}} * 100$$

The discharge is subject to determination of “Pass” or “Fail” from a chronic toxicity test using the Test of Significant Toxicity (TST) statistical t-test approach described in National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document (EPA 833-R-10-003, 2010), Appendix A, Figure A-1 and Table A-1 and Appendix B, Table B-1. The null hypothesis (Ho) for the TST statistical approach is: Mean discharge IWC response  $\leq 0.75 \times$  Mean control response. A test result that rejects this null hypothesis is reported as “Pass”. A test result that does not reject this null hypothesis is reported as

“Fail”. The relative “Percent Effect” at the discharge IWC is defined and reported as:  $((\text{Mean control response} - \text{Mean discharge IWC response}) \div \text{Mean control response}) \times 100$ . This is a t-test (formally Student’s t-Test), a statistical analysis comparing two sets of replicate observations—in the case of WET, only two test concentrations (i.e., a control and IWC). The purpose of this statistical test is to determine if the means of the two sets of observations are different (i.e., if the IWC or receiving water concentration differs from the control (the test result is “Pass” or “Fail”). The Welch’s t-test employed by the TST statistical approach is an adaptation of Student’s t-test and is used with two samples having unequal variances.

#### **4. Chronic Toxicity MDEL Exceedance Follow-up Action**

A chronic toxicity test result during routine monitoring indicating a “fail” with a percent effect at or above 50% is an exceedance of the chronic toxicity MDEL. The Discharger shall implement corrective action to abate the source of the toxicity within 24 hours from the time the Discharger becomes aware of an MDEL exceedance, if the source of toxicity is known (e.g. operational upset). The Discharger shall also conduct an additional toxicity test within the same calendar month that the exceedance occurred or, in the event laboratory monitoring results are not received during the same month when the sampling was performed, the next discharge event after receiving results of an exceedance.

#### **5. Evaluation of Additional Toxicity Tests for Industrial Process Wastewater (Steam Condensate and Diesel Engine Cooling Water)**

If the additional test result for industrial process wastewater results in a “pass”, the Discharger may return to routine monitoring for the following monitoring period. If the verification test results in a “fail” at a percent effect greater than or equal to 25%, the Discharger shall implement an accelerated monitoring schedule for chronic toxicity as set forth below in section IV.D of this MRP.

#### **6. Evaluation of Additional Toxicity Tests for High Risk Industrial Storm Water**

The chronic toxicity test results shall be used in the Discharger’s study on chronic toxicity described in section VI.C.2.a of this Order. If both the chronic toxicity test results at the end of pipe for high risk industrial storm water and the concurrent receiving water chronic toxicity test result in a “fail”, the discharger shall conduct a TRE as required in section IV.E of this MRP. The requirement for a TRE may be waived by the San Diego Water Board on a case-by-case basis if implementation of a previously approved TRE Work Plan is already underway for the sampled discharge point.

### **C. Quality Assurance**

1. Quality assurance measures, instructions, and other recommendations and requirements are found in the test methods manual previously referenced. Additional requirements are specified below.
  - a. This discharge is subject to a determination of “pass” or “fail” from a toxicity test at the IWC (for statistical flowchart and procedures, see *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document*, Appendix A, Figure A-1).
  - b. The IWC for applicable discharges is 100 percent effluent.

- c. If either the reference toxicant or effluent toxicity tests do not meet all test acceptability criteria in the test methods manual, then the Discharger shall resample and retest within 14 days (or as soon as possible for storm water).
- d. Effluent dilution water and control water should be prepared and used as specified in the test methods manual *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms* (EPA/821/R-02/012, 2002); or, for *Atherinops affinis*, *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms* (EPA/600/R-95/136, 1995). If the dilution water is different from test organism culture water, then a second control using culture water shall also be used.
- e. If organisms are not cultured in-house, then concurrent testing with a reference toxicant shall be conducted. If organisms are cultured in-house, then monthly reference toxicant testing is sufficient. Reference toxicant tests and effluent toxicity tests shall be conducted using the same test conditions (e.g., same test duration, etc.).
- f. All multi-concentration reference toxicant test results must be reviewed and reported according to USEPA guidance on the evaluation of concentration-response relationships found in Method Guidance and Recommendations for Whole Effluent Toxicity (WET) Testing (40 CFR part 136) (EPA 821-B-00-004, 2000).

#### **D. Accelerated Chronic Toxicity Testing Monitoring Schedule**

The Discharger shall implement an accelerated chronic toxicity monitoring schedule, as required by section IV.B.5 of this MRP for industrial process wastewater discharges, consisting of four, five-concentration chronic toxicity tests, conducted at approximately two-week intervals, over an eight-week period. All toxicity tests conducted during an accelerated monitoring schedule shall, at a minimum, include the IWC and four additional concentrations. The additional effluent concentrations should provide useful information regarding the intensity and persistence of the toxic effect(s). If all of the additional tests result in a “pass” or “fail” with less than 25% percent effect, the Discharger may return to routine monitoring for the following monitoring period. If any one of the additional tests result in a “fail” and exhibit a percent effect equal to or greater than 25%, the Discharger shall implement an approved TRE Work Plan as set forth below in section IV.E of this MRP. The requirement for a TRE may be waived by the San Diego Water Board on a case-by-case basis if implementation of a previously approved TRE Work Plan is already underway for the sampled discharge point

#### **E. Toxicity Reduction Evaluation (TRE)**

- 1. TRE Work Plan Submittal.** The Discharger shall prepare and submit a TRE Work Plan to the San Diego Water Board no later than 30 days from the time the Discharger becomes aware of the following:
  - a. A TRE work plan is required for an industrial process wastewater discharge which had a chronic toxicity test result during accelerated monitoring that resulted in a “fail” and exhibited a percent effect greater than or equal to 25%; or
  - b. A TRE work plan is required for a high risk industrial storm water discharge which had an additional acute toxicity test conducted following an MDEL exceedance that results in a “fail” and exhibits a percent effect greater than or equal to 20%; or

- c. A TRE work plan is required for a high risk industrial storm water discharge which had a chronic toxicity test and a concurrent receiving water sample test both result in a “fail” and exhibit a percent effect greater than or equal to 25%.
- 2. TRE Work Plan.** The TRE Work Plan shall be in conformance with the USEPA manual “*Generalized Methodology for Conducting Industrial Toxicity Reduction Evaluations (EPA/600/2-88/070, 1989)*.” The TRE Work Plan shall also include the following information:
  - a. A description of the actions to be undertaken by the Discharger to investigate, identify, and correct the causes of toxicity;
  - b. If the MDEL noncompliance has not been corrected, the amount of time it is expected to continue;
  - c. A description of the steps taken or planned to reduce, eliminate and prevent recurrence of the MDEL noncompliance; and
  - d. A schedule for completion of all activities, the expected duration of the toxicity noncompliance, and submission of a final report.
- 3. TRE Work Plan Implementation.** The Discharger shall implement the TRE Work Plan unless otherwise directed in writing by the San Diego Water Board. The Discharger shall comply with any additional conditions set by the San Diego Water Board.
- 4. TRE Progress Reports.** The Discharger shall prepare and provide written semiannual progress reports which: (1) describe the actions that have been taken toward achieving compliance with the acute or chronic toxicity effluent limitation for the previous six months; (2) describe all activities including, data collection and other field activities which are scheduled for the next year and provide other information relating to the progress of work; (3) identify any modifications to the compliance plans that the Discharger proposed to the San Diego Water Board or that have been approved by San Diego Water Board during the previous six months; and (4) include information regarding all delays encountered or anticipated that may affect the future schedule for completion of the actions required to attain compliance with the MDEL, and a description of all efforts made to mitigate those delays or anticipated delays. These progress reports shall be submitted to the San Diego Water Board semiannually by February 1 and August 1 each year following the adoption of this Order in accordance with the reporting schedule in Table E-11. Submission of these progress reports shall continue until compliance with the MDEL is achieved.
- 5. Toxicity Identification Evaluation (TIE).** Based upon the magnitude and persistence of the acute and chronic toxicity, the Discharger may initiate a TIE as part of a TRE to identify the causes of toxicity using the same species and test method and, as guidance, EPA manuals: *Methods for Aquatic Toxicity Identification Evaluations: Phase I Toxicity Characterization Procedures (EPA/600/6-91/003, 1991)*; *Methods for Aquatic Toxicity Identification Evaluations, Phase II Toxicity Identification Procedures for Samples Exhibiting Acute and Chronic Toxicity (EPA/600/R-92/080, 1993)*; *Methods for Aquatic Toxicity Identification Evaluations, Phase III Toxicity Confirmation Procedures for Samples Exhibiting Acute and Chronic Toxicity (EPA/600/R-92/081, 1993)*; and *Marine Toxicity Identification Evaluation (TIE): Phase I Guidance Document (EPA/600/R-96-054, 1996)*. If a TIE is undertaken, the Discharger shall prepare and submit a work plan to the San Diego Water

Board containing the following elements and comply with any conditions set by the Board:

- a. Criteria for initiating a TIE on a sample;
- b. Roles and responsibilities of the team conducting the TIE;
- c. Study design, sample treatments, and chemical analysis;
- d. Data evaluation and communication;
- e. Follow-up actions; and
- f. A schedule for completion of all activities and submission of a final report.

## **F. Violations**

An exceedance of the MDEL or MMEL during routine monitoring is a violation. Any exceedances occurring during a required accelerated monitoring period and, if appropriate, a TRE period shall not constitute additional violations provided that (1) the Discharger proceeds with the accelerated monitoring and TRE (if required) in a timely manner; and (2) the accelerated monitoring and TRE are completed within one year of the initial exceedance. The San Diego Water Board has the discretion to impose additional violations and initiate an enforcement action for toxicity tests that result in a "fail" after one year from the initial violation. Additionally, a discharger's failure to initiate an accelerated monitoring schedule or conduct a TRE, as required by this Order, will result in all exceedances being considered violations of the MDEL or MMEL and may result in the initiation of an enforcement action.

## **G. Reporting of Toxicity Monitoring Results**

1. The Discharger shall submit:
  - a. A full laboratory report for all toxicity testing as an attachment to the monitoring report. The laboratory report shall contain the toxicity test results; the dates of sample collection and initiation of each toxicity test; and all results for effluent parameters monitored concurrently with the toxicity test(s). All toxicity test results (whether identified as valid or otherwise) conducted during the calendar month shall be reported.
  - b. The actual test endpoint responses for the control (i.e., the control mean) and the IWC (i.e., the IWC mean) for each toxicity test to facilitate the review of test results and determination of reasonable potential for toxicity by the permitting authority.
  - c. A summary of water quality measurements for each toxicity test (e.g. pH, dissolved oxygen, temperature, conductivity, hardness, salinity).
  - d. All results for effluent parameters monitored concurrently with the toxicity tests.
  - e. Statistical program (e.g. TST Calculator, CETIS, etc.) output results, including graphical plots for each toxicity test.
  - f. Any additional QA/QC documentation or any additional toxicity related information.

2. The Discharger shall notify the San Diego Water Board in writing within 14 days of receipt of any test result with an exceedance of the toxicity limit. This notification shall describe actions the Discharger has taken or will take to investigate, identify, and correct the causes of toxicity; the status of actions required by this permit; and schedule for actions not yet completed; or reason(s) that no action has been taken.

## V. RECEIVING WATER AND SEDIMENT MONITORING REQUIREMENTS

The receiving water and sediment monitoring requirements set forth below are designed to measure the effects of the Facility discharges on San Diego Bay receiving waters. The overall receiving water monitoring program is intended to answer the following questions:

- (1) Does the receiving water meet water quality standards listed in section V of this Order, Receiving Water Limitations?
- (2) Are the receiving water conditions getting better or worse over time?
- (3) Does the Facility cause or contribute to violations of the Receiving Water Limitations in section V of this Order?

At this time, receiving water and sediment monitoring in the vicinity of the Facility shall be conducted as specified below. This program is intended to document conditions of receiving waters and bay bottom sediments within the vicinity of the Facility discharges. Station location, sampling, sample preservation and analyses, when not specified, shall be by methods approved by the San Diego Water Board. The monitoring program may be modified by the San Diego Water Board at any time. The Discharger may also submit proposals, including the supporting rationale, for reductions or other changes to these monitoring requirements that it considers to be appropriate to the San Diego Water Board for approval.

During monitoring events sample stations shall be located using a land-based microwave positioning system or a satellite positioning system such as Global Positioning System (GPS). If an alternate navigation system is proposed, its accuracy should be compared to that of microwave-based and satellite-based systems, and any compromises in accuracy shall be justified.

- A. Monitoring Responsibility.** Receiving water and sediment monitoring shall be performed individually by the Discharger to assess compliance with receiving water limits or through the Discharger's participation in a regional or water body monitoring coalition or both as determined by the San Diego Water Board.
- B. Monitoring Coalition Reopener.** To achieve maximum efficiency and economy of resources, the Discharger may establish or join a San Diego Bay water body monitoring coalition. If a San Diego Bay monitoring coalition is formed, revised monitoring requirements will be established to ensure that appropriate monitoring is conducted in a timely manner.
- C. Water and Sediment Monitoring Plan.** The Discharger shall prepare and submit a Water and Sediment Monitoring Plan to assess compliance with Receiving Water Limitations of this Order. The Water and Sediment Monitoring Plan shall be submitted within 12 months of the effective date of this Order. The Water and Sediment Monitoring Plan shall contain the following elements:
  1. **Quality Assurance Project Plan (QAPP).** A QAPP describing the project objectives and organization, functional activities, and quality assurance/quality control (QA/QC) protocols for the water and sediment monitoring.

**2. Sampling and Analysis Plan.** A Sampling and Analysis Plan based on methods or metrics described in 40 CFR part 136, *Guidelines Establishing Test Procedures for the Analysis of Pollutants under the Clean Water Act* and the State Water Board's *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality* (Sediment Quality Plan). The Sampling and Analysis Plan shall include a list of chemical analytes for the water column and sediment as well as the monitoring frequency and sample station locations.

**3. Receiving Water Monitoring**

Pollutants and Frequency: The Sampling and Analysis Plan shall propose the pollutants to be monitored, and the frequency and timing for water column sampling to be performed in San Diego Bay. At a minimum, monitoring shall include the pollutants and frequency in Table E-5 below. The proposed sampling shall be based upon results on the fate and transport of pollutants from the conceptual model (see V.C.5 below).

**Table E-5. Minimum Receiving Water Column Monitoring Requirements**

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
<b>Priority Pollutants</b>				
Arsenic, Total Recoverable	µg/L	Grab	Annually	1
Copper, Total Recoverable	µg/L	Grab	Annually	1,2
Lead, Total Recoverable	µg/L	Grab	Annually	1
Nickel, Total Recoverable	µg/L	Grab	Annually	1
Zinc, Total Recoverable	µg/L	Grab	Annually	1
Other Pollutants Identified by the Discharger	µg/L	Grab	Annually	1
<b>Non-Conventional Pollutants</b>				
Temperature	°F	Grab	Semiannually	1
Chronic Toxicity	Pass/Fail	Grab	Semiannually	3

<sup>1</sup> As specified in 40 CFR part 136.

<sup>2</sup> Effluent samples shall be analyzed for copper according to method 1638 or 1640. The commonly used methods 6010B (Inorganics by ICP-Atomic Emission Spectroscopy) and 200.7 (Trace Elements-ICP) have been found to give inaccurate copper readings in saline-matrix samples due to interference with the sodium-argon complex, which has a molecular weight similar to copper. Method 1638 (ICP/MS) or 1640 (On-Line Chelation) will eliminate the sodium-argon complex before the sample is tested for copper. No inaccurate readings for other metals in a saline-matrix sample is analyzed by methods 6010B or 200.7 are known.

<sup>3</sup> The Discharger shall monitor receiving water chronic toxicity twice per year concurrently with chronic toxicity monitoring at one location for end-of-pipe high risk industrial storm water discharge monitoring required in Table E-7 of this MRP during one storm event per semiannual period. The receiving water chronic toxicity sample shall be collected in the receiving water adjacent to the storm drain outfall sampled in Table E-7 during the storm event. The data for this chronic toxicity sampling shall be reported annually in the Annual Storm Water Report.

**4. Sediment Monitoring**

**a. Frequency.** Sediment chemistry, toxicity and benthic community monitoring shall be done at least twice during the term of this Order. For stations that are consistently classified as unimpacted or likely unimpacted, the frequency may be reduced to once per permit cycle in the next permit.

**b. Station Locations.** Triad station locations shall be identified after evaluating the items in section V.C.5 through V.C.9 below.

- c. Sediment Chemistry, Toxicity, and Benthic Community Condition.** Sediment chemistry, toxicity and benthic community monitoring shall be done in accordance with, at a minimum, the requirements set forth in the State Water Board's Sediment Quality Plan. The proposal must also include the following:
- i. Sediment Chemistry. Bulk sediment chemical analysis shall include at a minimum the pollutants identified in Attachment A of the State Water Board's Sediment Quality Plan and listed in Attachment K of this Order.
  - ii. Sediment Toxicity. Short term survival tests and sublethal tests shall be performed as specified in section V.F of the State Board's Sediment Quality Plan. The results shall be recorded as "Percent of control response".
  - iii. Benthic Community - Subtidal Habitat The benthic community shall be evaluated using the line of evidence approach described in section V.G of the State Water Board's Sediment Quality Plan.
- 5. Conceptual Model.** A Conceptual Model identifying the physical and chemical factors that control the fate and transport of pollutants and receptors that could be exposed to pollutants in the water and sediment shall be developed and included in the Water and Sediment Monitoring Plan. The Conceptual Model will serve as the basis for assessing the appropriateness of the Water and Sediment Monitoring Plan design. The Conceptual Model shall consider:
- a. Points of discharge into the segment of the water body or region of interest;
  - b. Tidal flow and/or direction of predominant currents;
  - c. Historic or legacy conditions in the vicinity;
  - d. Nearby land and marine uses or actions;
  - e. Beneficial Uses;
  - f. Potential receptors of concern;
  - g. Change in grain size salinity water depth and organic matter; and
  - h. Other sources or discharges in the immediate vicinity.
- 6. Spatial Representation.** The Water and Sediment Monitoring Plan shall be designed to ensure that the sample stations are spatially representative of the water and sediment within the water body segment or region of interest.
- 7. Existing Data and Information.** The Water and Sediment Monitoring Plan design shall take into consideration existing data and information of appropriate quality including ongoing monitoring programs conducted by other entities.
- 8. Strata.** Identification of appropriate strata shall consider characteristics of the water body including sediment transport, hydrodynamics, depth, salinity, land uses, inputs (both natural and anthropogenic) and other factors that could affect the physical, chemical, or biological condition of the sediment.
- 9. Index Period.** All sediment stations shall be sampled between the months of June through September to correspond with the benthic community index period.

**10. Report Completion Schedule.** The Water and Sediment Monitoring Plan shall include a schedule for completion of all sample collection and analysis activities and submission of the Water Column Monitoring Report and the Sediment Monitoring Report described section V.E. of this MRP.

**D. Water and Sediment Monitoring Plan Implementation.** The Discharger or water body monitoring coalition shall implement the Water and Sediment Monitoring Plan in accordance with the schedule contained in the Water and Sediment Monitoring Plan unless otherwise directed in writing by the San Diego Water Board within 90 days of submission. At the latest, implementation of the receiving water monitoring shall begin within 24 months of the effective date of this Order. Before beginning sample collection activities, the Discharger or water body monitoring coalition shall comply with any conditions set by the San Diego Water Board with respect to sample collection methods such as providing split samples.

**E. Water Column and Sediment Monitoring Reports.** The Discharger or water body monitoring coalition shall submit a Sediment Monitoring Report twice during the term of the permit by February 1 of the year after the sampling occurs. The Water Column and Sediment Monitoring Report shall contain the following information:

- 1. Monitoring Results.** The results of the monitoring in tabular and graphical form.
- 2. Data Analysis, Interpretations, and Conclusions.** An analysis of the data to evaluate trends and interpretations and conclusions on the data.
- 3. Sediment Aquatic Life Analysis.** The data, analyses, interpretation, and integration of the multiple lines of evidence (MLOE), and station assessment shall be performed using the MLOE approach as prescribed in the State Water Board Sediment Quality Plan. Compliance with receiving water limitations for sediment quality shall be determined for each station by integrating the sediment chemistry, toxicity, and benthic community lines of evidence to derive a benthic triad station assessment in accordance with the methodology in section V.I of the State Water Board Sediment Quality Plan.
- 4. Receiving Water Limitation Determination.** A determination shall be made for each station of attainment of the applicable Receiving Water Limitations.
- 5. Sample Location Map.** The locations, type, and number of samples shall be identified and shown on a site map(s).
- 6. Laboratory Reports.** The reports from laboratories with the original analysis results including any QA/QC information.

## VI. REGIONAL MONITORING REQUIREMENTS

Regional receiving water monitoring provides information about the sources, fates, and effects of anthropogenic contaminants in the receiving water necessary to make assessments over large areas. The large scale assessments provided by regional monitoring describe and evaluate cumulative effects of all anthropogenic inputs and enable better decision making regarding protection of beneficial uses of receiving waters. Regional monitoring data assists in the interpretation of core monitoring studies by providing a more accurate and complete characterization of reference conditions and natural variability. Regional monitoring also leads to methods standardization and improved quality control through intercalibration exercise. The coalitions implementing regional monitoring enable sharing of technical resources, trained personnel and associated costs. Focusing these resources on regional issues and developing a broader understanding of pollutants effects in receiving waters enables the development of more

rapid and effective response strategies. Based on all of these considerations the San Diego Water Board supports regional approaches to monitoring receiving waters.

The Discharger shall, as directed by the San Diego Water Board, participate with other regulated entities, other interested parties, and the San Diego Water Board in development and implementation of new and improved monitoring and assessment programs for receiving waters in the San Diego Region and discharges to those waters. These programs shall be developed and implemented so as to:

- (1) Determine the status and trends of conditions in ocean waters in the San Diego Region with regard to beneficial uses, e.g.,
  - i. Are fish and shellfish safe to eat?
  - ii. Is water quality safe for swimming?
  - iii. Are ecosystems healthy?
- (2) Identify the primary stressors causing or contributing to conditions of concern;
- (3) Identify the major sources of the stressors causing or contributing to conditions of concern; and
- (4) Evaluate the effectiveness (i.e., environmental outcomes) of actions taken to address such stressors and sources.

Development and implementation of new and improved monitoring and assessment programs for receiving waters will be guided by the following:

- (1) San Diego Water Board Resolution No. R9-2012-0069, *Resolution in Support of A Regional Monitoring Framework*;
- (2) San Diego Water Board staff report entitled *A Framework for Monitoring and Assessment in the San Diego Region*; and
- (3) Other guidance materials, as appropriate.

The San Diego Water Board may modify the receiving waters monitoring and reporting requirements, regional monitoring requirements, and/or special studies requirements of this Order as necessary for cause, including but not limited to a) revisions necessary to implement recommendations from Southern California Coastal Water Research Project (SCCWRP); b) revisions necessary to develop, refine, implement, and/or coordinate a regional monitoring program; and/or c) revisions necessary to develop and implement improved monitoring and assessment programs in keeping with San Diego Water Board Resolution No. R9-2012-0069, *Resolution in Support of a Regional Monitoring Framework*.

## **VII. OTHER MONITORING REQUIREMENTS**

### **A. Storm Water Discharges from Industrial High Risk Areas, Industrial Low Risk Areas, and Industrial No Exposure Areas**

- 1. Monitoring Questions.** The industrial storm water monitoring program is designed to address the following primary questions:
  - a. Does the runoff comply with permit effluent limitations for toxicity thereby ensuring water quality standards are achieved in the receiving water?
  - b. Does the runoff comply with the Numeric Action Levels (NALs) in Attachment G?
  - c. Is the Storm Water Pollution Prevention Plan (SWPPP) being properly implemented?

- d. Is the Facility achieving standards of Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT)?

## **2. Non-Storm Water Discharge Visual Observations and Assessment**

- a. Monthly, the Discharger shall visually assess each drainage area for the presence or indications of prior, current, or potential unauthorized non-storm water discharges and their sources.
- b. The Discharger shall visually observe the Facility's authorized non-storm water discharges and their sources;
- c. The monthly visual observations shall be conducted during daylight hours, on days without precipitation, and during scheduled facility operating hours<sup>1</sup>.
- d. Visual observations shall document the presence of or the indication of any non-storm water discharge, pollutant characteristics (floating and suspended material, oil and grease, discoloration, turbidity, odor, etc.), and source.
- e. The Discharger shall maintain records of the personnel performing the visual observations, the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to reduce or prevent pollutants from contacting non-storm water discharges. The SWPPP shall be revised, as necessary, and implemented in accordance with Attachment G of this Order.
- f. The Discharger shall provide an explanation in the Annual Report for uncompleted monthly visual observations.

## **3. Industrial Storm Water Discharge and Other Visual Observations**

- a. Sampling event visual observations shall be conducted at the same time sampling occurs at a discharge location. At each discharge location where a sample is obtained, the Discharger shall observe the discharge of storm water associated with industrial activity.
- b. The Discharger shall ensure that visual observations of discharge(s) from contained storm water are conducted at the time of discharge. If the discharge is not likely to occur during scheduled Facility operating hours (based upon rainfall forecasts and containment freeboard), the visual observations of the contained storm water shall be conducted prior to the discharge. Visual observations shall confirm that the discharge is complying with the section III. Discharge Prohibitions of this Order.
- c. If the Discharger is employing volume-based or flow-based treatment BMPs, any bypass that occurs while the visual observations and/or sampling of storm water discharges are conducted shall be sampled.

---

<sup>1</sup> *Scheduled facility operating hours* are the time periods when the facility is staffed to conduct any function related to industrial activity, but excluding time periods where only routine maintenance, emergency response, security, and/or janitorial services are performed.

- d. The Discharger shall visually observe and record the presence or absence of floating and suspended materials, oil and grease, discolorations, turbidity, odors, trash/debris, and source(s) of any observed pollutants.
- e. In the event that a discharge location is not visually observed during the sampling event, the Discharger shall record which discharge locations were not observed during sampling or that there was no discharge from the discharge location. The Discharger shall provide an explanation in the Annual Report for uncompleted sampling event visual observations.
- f. Dischargers shall maintain records of all visual observations. Records shall include the condition of the water, date, approximate time, locations observed, name of person(s) that conducted the observations, and any response actions and/or additional SWPPP revisions necessary in response to the visual observations.
- g. The Discharger shall revise BMPs as necessary when the visual observations indicate pollutant sources have not been adequately addressed in the SWPPP.

#### **4. Industrial Storm Water Sampling and Analysis**

- a. A Qualifying Storm Event (QSE) is a precipitation event that:
  - i. Produces a discharge for at least one drainage area; and
  - ii. Is preceded by 48 hours with no discharge from any drainage area.
- b. The Discharger shall collect storm water samples from two QSEs during each semiannual period (i.e. January – June, July – December). Representative storm water discharge locations for “Industrial High Risk” and “Industrial Low Risk” areas, as designated under section IV.B.1 of this Order, shall be sampled as specified in Tables E-6 and E-7.
- c. Sampling of stored or contained storm water shall occur at the time the stored or contained storm water is discharged. Samples shall be collected from two QSE during each semiannual period (i.e. January –June, July – December).
- d. Samples shall be collected from each drainage location within four hours of the following:
  - i. The start of the discharge, or
  - ii. The start of facility operations if the QSE occurs within the previous 12 hour period (storms that begin the previous night) and representative discharge of the facility is determined to still be occurring. Sample collection is required during scheduled facility operating hours and when sampling conditions are safe.
- e. Composite samples shall be flow-weighted storm water samples for the duration of the storm. If composite samples are collected, all parameters identified in Tables E-6 and E-7 with a sample type of grab or composite must be analyzed using composite samples.
- f. In the event that the first QSE in a semi-annual period does not produce a discharge that can be sampled at one or more sampling locations, the Discharger shall record which sampling locations were observed that did not discharge, and collect samples from those

locations during the next QSE(s) that produces a discharge in that semi-annual period. If the Discharger fails to collect a sample at one or more sampling locations that did produce a discharge, the Discharger is required to fulfill the sampling requirement from an additional QSE that produces a discharge. For each discharge location, the maximum number of storm water samples required per reporting year is four.

- g. Section IX.A.3 of the MRP of Order No. R9-2009-0081 is incorporated by reference as if set forth herein. The Discharger shall continue monitoring in accordance with section IX.A.3 of the MRP of Order No. R9-2009-0081 until June 30, 2016, with the annual report due September 1, 2016, as required by Table E-8 of this MRP.
- h. Beginning July 1, 2016, the industrial storm water discharges shall be sampled and analyzed in accordance with Table E-6 and Table E-7 below.

**Table E-6. Monitoring Requirements for Industrial Storm Water Discharges from “Industrial Low Risk” Areas**

Parameter	Unit	Sample Type	Minimum Frequency <sup>5</sup>	Required Analytical Test Method
Discharge Volume	gallons	Estimate <sup>1</sup>	Two storms per semi-annual period	Estimate
<b>Conventional Pollutants</b>				
Oil and Grease	mg/L	Grab	Two storms per semi-annual period	<sup>2</sup>
pH	pH Units	Grab	Two storms per semi-annual period	<sup>4</sup>
Total Suspended Solids	mg/L	Grab	Two storms per semi-annual period	<sup>2</sup>
<b>Priority Pollutants</b>				
Copper, Total Recoverable <sup>6</sup>	mg/L	Grab or Composite	Two storms per semi-annual period	<sup>2</sup>
Zinc, Total Recoverable <sup>6</sup>	mg/L	Grab or Composite	Two storms per semi-annual period	<sup>2</sup>
<b>Non-Conventional Pollutants</b>				
Other Pollutants <sup>3</sup>	µg/L	Grab or Composite	Two storms per semi-annual period	<sup>2</sup>

<sup>1</sup> The volume of storm water discharge can be estimated by multiplying: amount of rainfall in feet × square feet of surface area × impervious factor. There are 7.5 gallons per cubic foot.

<sup>2</sup> As specified in 40 CFR section 136.3.

<sup>3</sup> Pollutants that are likely to be present in storm water discharges in significant quantities shall be sampled. The pollutants shall be selected based upon the pollutant source assessment required in section VII of the SWPPP requirements contained in Attachment G, visual observations, and inspection records. If these pollutants are not detected in significant quantities after two consecutive sampling events, the Discharger may eliminate the pollutant from future analysis until the pollutant is likely to be present again. The Discharger shall select appropriate analytical test methods that indicate the presence of pollutants in storm water discharges in significant quantities.

<sup>4</sup> Field test with pre- and post-calibrated portable instrument, or lab sample in accordance with 40 CFR part 136.

<sup>5</sup> Sampling shall occur during qualifying storm events each semiannual calendar period (January – June, July – December) prior to release to receiving water. If there are no qualifying storm events during the semiannual period, then sampling shall occur as soon as possible.

<sup>6</sup> After four consecutive sample events where parameters are not detected or below the Annual NAL values, analysis for those parameters may be discontinued at any affected outfall.

**Table E-7. Monitoring Requirements for Storm Water Discharges from “Industrial High Risk” Areas.**

Parameter	Unit	Sample Type	Minimum Frequency <sup>7</sup>	Required Analytical Test Method
Discharge Volume	gallons	Estimate <sup>1</sup>	Two storms per semiannual period.	Estimate
<b>Conventional Pollutants</b>				
Chemical Oxygen Demand	mg/L	Grab or Composite	Two storms per semiannual period.	2
Oil and Grease	mg/L	Grab	Two storms per semiannual period.	2
pH	pH Units	Grab	Two storms per semiannual period.	5
Total Suspended Solids	mg/L	Grab	Two storms per semiannual period.	2
<b>Priority Pollutants</b>				
Arsenic, Total Recoverable <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
Cadmium, Total Recoverable <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
Copper, Total Recoverable	mg/L	Grab or Composite	Two storms per semiannual period.	2
Mercury, Total Recoverable <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
Nickel, Total Recoverable <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
Selenium, Total Recoverable <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
Silver, Total Recoverable <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
Zinc, Total Recoverable	mg/L	Grab or Composite	Two storms per semiannual period.	2
Lead, Total Recoverable <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
<b>Non-Conventional Pollutants</b>				
Aluminum, Total Recoverable <sup>8</sup>	µg/L	Grab or Composite	Two storms per semiannual period.	2
Iron, Total Recoverable <sup>8</sup>	µg/L	Grab or Composite	Two storms per semiannual period.	2
Magnesium, Total Recoverable <sup>8</sup>	µg/L	Grab or Composite	Two storms per semiannual period.	2
Nitrate+Nitrite Nitrogen <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
Phosphorus, Total <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
Ammonia <sup>8</sup>	mg/L	Grab or Composite	Two storms per semiannual period.	2
Acute Toxicity <sup>3</sup>	Pass or Fail	Grab or Composite	Two storms per semiannual period.	3

Parameter	Unit	Sample Type	Minimum Frequency <sup>7</sup>	Required Analytical Test Method
Chronic Toxicity <sup>3,6</sup>	Pass or Fail	Grab or Composite	Two storms per semiannual period.	3
Other Pollutants <sup>4</sup>	µg/L	Grab or Composite	Two storms per semiannual period.	2

<sup>1</sup> The volume of storm water discharge can be estimated by multiplying: amount of rainfall in feet × square feet of surface area × impervious factor. There are 7.5 gallons per cubic foot.

<sup>2</sup> As specified in 40 CFR section 136.3.

<sup>3</sup> The presence of acute or chronic toxicity in the storm water shall be determined as specified in section IV of this MRP.

<sup>4</sup> Pollutants that are likely to be present in storm water discharges in significant quantities shall be sampled. The pollutants shall be selected based upon the pollutant source assessment required in section VII of the SWPPP requirements contained in Attachment G, visual observations, and inspection records. If these pollutants are not detected in significant quantities after two consecutive sampling events, the Discharger may eliminate the pollutant from future analysis until the pollutant is likely to be present again. The Discharger shall select appropriate analytical test methods that indicate the presence of pollutants in storm water discharges in significant quantities.

<sup>5</sup> Field test with pre- and post-calibrated portable instrument, or lab sample in accordance with 40 CFR part 136.

<sup>6</sup> Chronic toxicity will be sampled at one representative high risk industrial storm water discharge location.

<sup>7</sup> Sampling shall occur during qualifying storm events, or if collected, prior to release to receiving water. If there are no qualifying storm events during the year, then sampling shall occur as soon as possible. If there are no qualifying storm events during the fifth year and conditions for administrative extension are met, then sampling shall occur as soon as possible.

<sup>8</sup> After four consecutive sample events where parameters are not detected or below the Annual NAL values, analysis for those parameters may be discontinued at any affected outfall.

g. Sampling Frequency Reduction Certification

- 1) The Discharger is eligible to reduce the number of QSEs sampled each reporting year in accordance with the following requirements:
  - a) Results from four (4) consecutive QSEs that were sampled (QSEs may be from different reporting years) did not exceed any NALs; and
  - b) The Discharger is in full compliance with the requirements of this Order and has updated, certified and submitted all documents, data, and reports required by this Order during the time period in which samples were collected.
- 2) The San Diego Water Board may notify a Discharger that it may not reduce the number of QSEs sampled each reporting year if the Discharger is subject to an enforcement action.
- 3) An eligible Discharger shall certify that it meets the conditions in section VII.A.4.g.1) of this MRP above.
- 4) Upon Sampling Frequency Reduction certification, the Discharger shall collect and analyze samples from one (1) QSE within the first half of each reporting year (July 1 to December 31), and one (1) QSE within the second half of each reporting year (January 1 to June 30). All other monitoring, sampling, and reporting requirements remain in effect.
- 5) A Discharger may reduce sampling per the Sampling Frequency Reduction certification unless notified by the San Diego Water Board that: (1) the Sampling

Frequency Reduction certification has been rejected or (2) additional supporting documentation must be submitted. In such instances, a Discharger is ineligible for the Sampling Frequency Reduction until the San Diego Water Board provides Sampling Frequency Reduction certification approval. Revised Sampling Frequency Reduction certifications shall be certified and submitted by the Discharger.

- 6) A Discharger loses its Sampling Frequency Reduction certification if an NAL exceedance occurs.

## 5. Visual Observation and Sample Collection Exceptions

The Discharger shall be prepared to collect samples and conduct visual observations at the beginning of the semi-annual period until the minimum requirements of this section are completed with the following exceptions:

- a. The Discharger is not required to collect samples or conduct visual observations under the following conditions:
  - i. During dangerous weather conditions such as flooding and electrical storms; or
  - ii. Outside of scheduled Facility operating hours. The Discharger is not precluded from collecting samples or conducting visual observations outside of scheduled Facility operation hours.
- b. If the Discharger does not collect the required samples or conduct the visual observations during a wet season due to these exceptions, then the Discharger shall include an explanation in the Annual Report why the sampling or visual observations were not conducted.
- c. The Discharger shall ensure that all industrial storm water discharge sampling locations are representative of drainage areas associated with industrial activities, where practicable. The storm water discharge observed and collected from these sampling locations shall be representative of the storm water discharge generated in each drainage area. For sheet flow, the Discharger shall determine the appropriate sampling location(s) which represent industrial storm water discharges generated from the corresponding drainage area.
- d. The Discharger shall identify practicable alternate sample collection locations representative of the Facility's storm water discharge if:
  - i. Specific drainage areas at the Facility are affected by storm water run-on from off-site areas or on-site non-industrial areas; or
  - ii. Specific sampling locations are difficult to sample such as submerged discharge outlets, dangerous discharge location accessibility.

## B. Non-Industrial Storm Water Monitoring for Small Military Base Municipal Separate Storm Sewer System (MS4) Areas (Small Military Base MS4 Areas)

1. **Monitoring Questions.** The Small Military Base MS4 monitoring program shall be designed to address the following primary questions:
  - a. Is the Storm Water Management Plan (SWMP) being properly implemented?

- b. Is the Facility achieving the standard of reducing pollutants in Small Military Base MS4 discharges to the Maximum Extent Practicable (MEP)?

**2. Small Military Base MS4 Monitoring Plan.** Within 24 months of the effective date of this Order, the Discharger shall prepare and submit to the San Diego Water Board a written plan for monitoring discharges and pollutants in non-industrial storm water discharges from Small Military Base MS4 Areas designed to answer the monitoring questions above. The monitoring plan shall include the following information:

- a. A list of pollutants to be monitored in non-industrial storm water and non-storm water from Small Military Base MS4 areas.
  - b. Specific monitoring procedures for pollutants identified by the Discharger, with the goal of evaluating SWMP implementation throughout the Facility. Dry weather monitoring also has the goal of identifying and eliminating unauthorized non-storm water discharges.
  - c. A minimum subset of three representative monitoring locations for storm water and dry-weather discharges within the Small Military Base MS4 Areas of the Facility. These monitoring locations shall be sampled for pollutants identified by the Discharger.
  - d. A schedule for monitoring. Pollutant monitoring shall be performed a minimum of twice per year at the representative monitoring locations for storm water, and twice per year for dry-weather discharges, beginning 24 months after the effective date of this Order. Dry weather stations only need to be sampled if there is unauthorized non-storm water flowing at the time of sampling.
  - e. A program for at least quarterly visual observations to identify and correct unauthorized non-storm water discharges.
- 3.** The Discharger shall implement the Small Military Base MS4 Monitoring Plan no later than 28 months after the effective date of this Order unless otherwise directed in writing by the San Diego Water Board. The Discharger shall comply with any conditions set by the San Diego Water Board including modification of proposed monitoring locations and constituents.
- 4.** Monitoring results shall be submitted annually with the Storm Water Annual Report.

**C. Storm Water Annual Report for Industrial High Risk Areas, Industrial Low Risk Areas, and Small Military Base MS4 Areas**

The Discharger shall submit an Industrial Storm Water Annual Report by September 1 of each year to the San Diego Water Board. The report shall include the following:

1. Identification of any changes to "Industrial High Risk", "Industrial Low Risk", "Industrial No-Exposure", and "Small Military Base MS4 Areas" at the Facility, as defined in section IV.B.1 of this Order;
2. A summary of visual observations and sampling and analysis results;
3. An evaluation of the visual observation and sampling and analysis results;

4. The Annual Comprehensive Site Compliance Evaluation Report as required by section IX of the SWPPP requirements contained in Attachment G;
5. Laboratory reports; and
6. A list of authorized and non-authorized non-storm water discharges.

**D. Spill and Illicit Discharge Log (within all industrial storm water risk areas)**

This requirement for a Spill and Illicit Discharge log is designed to answer the following primary monitoring questions:

1. Are there more frequent and/or bigger spills at this Facility than at other similar facilities?
2. Are spills and illicit discharges properly addressed and are measures being taken or planned to reduce, eliminate, and prevent recurrence of them in the future?

The Discharger shall log and report all spills of significant quantities to surface waters and all illicit discharges of any quantity within the Facility including spills and illicit discharges from vessels that are at the Facility for service. The spill / illicit discharge reports shall identify the following:

- a. The time and date of the spill or illicit discharge;
- b. The cause of the spill or illicit discharge;
- c. The materials or wastes involved in the spill or illicit discharge;
- d. The estimated volume of the spill or illicit discharges;
- e. The specific location where the spill or illicit discharge originated including storm water risk level;
- f. The fate of the spill or illicit discharge (e.g., San Diego Bay, etc.);
- g. The physical extent or size of the area(s) affected by the spill;
- h. Whether the spill or illicit discharge contained pollutants;
- i. The public agencies notified;
- j. The corrective actions taken or planned; and
- k. The measures taken or planned to prevent or minimize future spills or illicit discharges.

The reports shall be submitted annually to the San Diego Water Board in accordance with Table E-8 of this MRP.

The Discharger shall include in its Annual Report a summary of the spills and illicit discharges that occurred in or on the Facility during the annual reporting period. The spill/illicit discharge summary report shall indicate the total number of spills and illicit discharges for the year, categorize the spills and illicit discharges, and provide the percentages of each type of spill or illicit discharge in a graphical representation. The summary report shall also indicate the efforts the Discharger used in during the annual reporting period to prevent or minimize spills.

**VIII. REPORTING REQUIREMENTS**

**A. General Monitoring and Reporting Requirements**

1. The Discharger shall comply with all Standard Provisions (Attachment D) related to monitoring, reporting, and recordkeeping.
2. The Discharger shall report all instances of noncompliance not reported under Attachment D, sections V.E, V.G, and V.H, of this Order at the time monitoring reports are submitted.
3. The Discharger shall submit an annual report discussing the compliance record and corrective actions taken, or which may be taken, or which may be needed to bring the discharge into full compliance with the requirements of this Order in accordance with Table E-8.

**B. Self-Monitoring Reports (SMRs)**

1. The Discharger shall electronically submit SMRs using the State Water Board's California Integrated Water Quality System (CIWQS) Program website (<http://www.waterboards.ca.gov/ciwqs/index.html>). The CIWQS website will provide additional information for SMR submittal in the event there will be a planned service interruption for electronic submittal. Any reports not in CIWQS shall be submitted electronically to the San Diego Water Board's e-mail at [sandiego@waterboards.ca.gov](mailto:sandiego@waterboards.ca.gov) or as otherwise directed by the San Diego Water Board.
2. The Discharger shall report in the SMR the results for all monitoring specified in this MRP. The Discharger shall submit quarterly, semiannual, and annual SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order. If the Discharger monitors any pollutant more frequently than required by this Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.
3. Monitoring periods and reporting for all required monitoring shall be completed according to the following schedule:

**Table E-8. Monitoring Periods and Reporting Schedule**

<b>Sampling Frequency</b>	<b>Monitoring Period Begins On...</b>	<b>Monitoring Period</b>	<b>SMR Due Date</b>
Continuous	Permit effective date	All	Submit with quarterly SMR
Daily	Permit effective date	(Midnight through 11:59PM) or any 24-hour period that reasonably represents a calendar day for purposes of sampling	Submit with quarterly SMR
Monthly	First day of calendar month following permit effective date or on permit effective date if that date is first day of the month	First day of calendar month through last day of calendar month	Submit with quarterly SMR

Sampling Frequency	Monitoring Period Begins On...	Monitoring Period	SMR Due Date
Quarterly	Closest of January 1, April 1, July 1, or October 1 following (or on) permit effective date	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31	May 1 August 1 November 1 February 1
Semiannually	Closest of January 1 or July 1 following (or on) permit effective date	January 1 through June 30 July 1 through December 31	August 1 February 1
Annually	Permit effective date	July 1 through June 30	September 1
First Annual Storm Report	July 1, 2015 for Order R9-2009-0081 storm water sampling and the permit effective date for section VII.A.4.g of this MRP	July 1 through June 30	September 1, 2016
Annual Storm Water Report (section VII.C of this MRP)	July 1, 2016	July 1 through June 30	September 1

**C. Reporting Protocols**

1. The Discharger shall report with each sample result the applicable reported Minimum Level (ML) and the current Method Detection Limit (MDL), as determined by the procedure in 40 CFR part 136.
2. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:
  - a. Sample results greater than or equal to the reported ML shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).
  - b. Sample results less than the Reporting Level (RL), but greater than or equal to the laboratory’s MDL, shall be reported as “Detected, but Not Quantified,” or DNQ. The estimated chemical concentration of the sample shall also be reported.

For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words “Estimated Concentration” (may be shortened to “Est. Conc.”). The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (+ a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

- c. Sample results less than the laboratory’s MDL shall be reported as “Not Detected,” or ND.
- d. Dischargers are to instruct laboratories to establish calibration standards so that the ML value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.

3. Compliance Determination. Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined above and Attachment A of this Order. For purposes of reporting and administrative enforcement by the Regional and State Water Boards, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the RL.
4. Multiple Sample Data. When determining compliance with an AMEL or MDEL for priority pollutants and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of "Detected, but Not Quantified" (DNQ) or "Not Detected" (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:
  - a. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
  - b. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.
5. The Discharger shall submit SMRs in accordance with the following requirements:
  - a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the Facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that is entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.
  - b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.

#### **D. Discharge Monitoring Reports (DMRs)**

1. The Discharger shall electronically submit DMRs using the State Water Board's California Integrated Water Quality System (CIWQS) Program website (<http://www.waterboards.ca.gov/ciwqs/index.html>). The CIWQS website will provide additional information for DMR submittal in the event there will be a planned service interruption for electronic submittal.
2. DMRs must be signed and certified as required by the standard provisions (Attachment D).

**E. Other Reports**

- 1. Special Reports.** As specified in this Order, special reports or program components shall be submitted in accordance with the following reporting requirements. At minimum, the progress reports shall include a discussion of the status of final compliance, whether the Discharger is on schedule to meet the final compliance date, and the remaining tasks to meet the final compliance date.

**Table E-9. Reporting Requirements for Special Provisions Progress Reports**

<b>Report Name</b>	<b>Section No.</b>	<b>Report Due Date</b>
Industrial Storm Water Monitoring Location Report	MRP section II.B.1	April 1, 2016
Toxicity Reduction Evaluation (TRE) Work Plan	MRP section IV.E.1	Within 30 days of a requirement to complete a TRE Work Plan
Water and Sediment Monitoring Plan	MRP section V.C	Within 12 months of the effective date of this Order
Annual Storm Water Risk Level Designation Report	Order section IV.B.2	Annually by September 1 <sup>st</sup>
Revised Storm Water Pollution Prevention Plan	Order section IV.E.2.c	Within 1 year of the effective date of this Order
Small Military Base Municipal Separate Storm Sewer System (MS4) – Storm Water Management Program (SWMP)	Order section IV.D.2	Within 18 months of the effective date of this Order
Small Military Base MS4 Storm Water Monitoring Plan	MRP section VII.B.2	Within 24 months of the effective date of this Order
Future Development of Chronic Toxicity Effluent Limitations for Industrial High Risk Storm Water Areas	Order section VI.C.2.a	At Discharger’s discretion
Revised Utility Vault Plan	Order section VI.C.3.a	Within 1 year of the effective date of this Order
BMP Plan for Industrial Process Wastewater Discharges	Order section VI.C.3.b	Within 1 year of the effective date of this Order
Pollution Prevention Plan (PPP) Work Plan and Time Schedule	Order section VI.C.3.c	Within 90 days of the effective date of this Order
PPP	Order section VI.C.3.c	Within 9 months of the effective date of this Order

**ATTACHMENT F – FACT SHEET**

As described in section II.B of this Order, the California Regional Water Quality Control Board, San Diego Region (San Diego Water Board) incorporates this Fact Sheet as findings of the San Diego Water Board supporting the issuance of this Order. This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for Dischargers in California. Only those sections or subsections of this Order that are specifically identified as “not applicable” have been determined not to apply to this Discharger. Sections or subsections of this Order not specifically identified as “not applicable” are fully applicable to this Discharger.

**I. PERMIT INFORMATION**

A. The following table summarizes administrative information related to the facility.

**Table F-1. Facility Information**

<b>WDID</b>	9 000000495
<b>Discharger</b>	United States Department of the Navy
<b>Name of Facility</b>	Naval Base Coronado (NBC)
<b>Facility Address</b>	937 N. Harbor Drive
	San Diego, CA 92132-0058
	San Diego County
<b>Facility Contact, Title and Phone</b>	Mr. Jason Golumbfskie, Installation Environmental Program Director for NBC, (619) 545-3429
<b>Authorized Person to Sign and Submit Reports</b>	Mr. Jason Golumbfskie, Installation Environmental Program Director for NBC, (619) 545-3429
<b>Mailing Address</b>	Same as Facility Address
<b>Billing Address</b>	Same as Facility Address
<b>Type of Facility</b>	Naval Base
<b>Major or Minor Facility</b>	Major
<b>Threat to Water Quality</b>	1
<b>Complexity</b>	A
<b>Pretreatment Program</b>	Not Applicable
<b>Reclamation Requirements</b>	Not Applicable
<b>Facility Permitted Flow</b>	Not Applicable
<b>Facility Design Flow</b>	Not Applicable
<b>Watershed</b>	Pacific Ocean, San Diego Bay, Tijuana River Estuary (Hydrologic Areas 10.10 and 11.11), San Luis Rey River (Warner Hydrologic Subarea 3.31), Tijuana River (Canyon City Hydrologic Subarea 11.82), and Morena Reservoir (Hydrologic Area 11.50)
<b>Receiving Water</b>	Pacific Ocean, San Diego Bay, Tijuana River Estuary, tributary to San Luis Rey River, waters in the Canyon City Hydrologic Subarea 11.82, and Morena Reservoir
<b>Receiving Water Type</b>	Ocean, Enclosed Bay, Estuary, Inland Surface Water

B. The United States (U.S.) Department of the Navy (Navy or Discharger) is the owner and operator of Naval Base Coronado (Facility or NBC), a U.S. Naval Base. The Facility is comprised of eight installations which are described in section II and are hereinafter jointly referred to as the “Facility”.

For the purposes of this Order, references to the “discharger” or “Discharger” in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

- C. The Discharger was previously regulated by Order No. R9-2009-0081 as modified by Order No. R9-2010-0057, National Pollutant Discharge Elimination System (NPDES) Permit No. CA0109185, for wastewater discharges from multiple discharge points within the Facility to the Pacific Ocean, San Diego Bay, and the Tijuana River Estuary, a Water of the U.S. The regulated discharges included wastewater from the following sources/activities:

- Boat rinsing discharges;
- Diesel engine cooling water;
- Discharges associated with the housing of marine mammals within pens;
- Pier boom cleaning;
- Steam condensate;
- Product water for the reverse osmosis water purification unit;
- Utility vault and manhole dewatering; and
- Industrial storm water.

During the term of Order No. R9-2009-0081, discharges associated with boat rinsing, marine mammals, pier boom cleaning, and the operation of the reverse osmosis water purification unit were eliminated by the Discharger.

Order No. R9-2009-0081 was adopted on June 10, 2009, and expired on June 10, 2014. Order No. R9-2009-0081 was modified by Order No. R9-2010-0057, adopted September 8, 2010. The terms and conditions of the 2009 and 2010 orders were automatically continued and remained in effect until a new Waste Discharge Requirements (WDRs) and NPDES permit was adopted pursuant to this Order.

- D. The Discharger filed a report of waste discharge (ROWD) dated December 12, 2013. A formal request for additional information deemed to be lacking in the initial submission was sent on February 23, 2014. An updated ROWD was filed February 27, 2014. The application was deemed complete on March 5, 2014. A site visit was conducted on May 22, 2015 to observe operations and collect additional data to develop permit limitations and conditions.

## II. FACILITY DESCRIPTION

### A. Installations

The Discharger manages three naval bases in the San Diego area under the Commander, Navy Region Southwest (CNRSW) command structure. These three major naval bases are Naval Base Point Loma (NBPL); Naval Base San Diego (NBSD); and Naval Base Coronado (NBC). NBC consists of the following eight installations:

- Naval Air Station, North Island (NASNI)
- Naval Amphibious Base, Coronado (NAB)
- Naval Outlying Landing Field, Imperial Beach (NOLF)
- Silver Strand Training Complex (SSTC), formerly known as the Naval Radio Receiving Facility (NRRF)
- Naval Auxiliary Landing Field, San Clemente Island (NALF)

- Remote Training Site Warner Springs, (RTSWS) formerly known as Survival, Evasion, Resistance, and Escape (SERE) Training School
- Camp Michael Monsoor formerly known as La Posta Mountain Warfare Training Center (La Posta MWTC)
- Camp Morena

Of the eight installations aligned under the Facility, only NASNI, NAB, NOLF, SSTC, and NALF have discharges subject to NPDES permitting. NALF is located in the Los Angeles Regional Water Quality Control Board jurisdictional area and, therefore, is not regulated by this Order.

## **1. Naval Air Station, North Island (NASNI)**

NASNI is located on the northern end of the Coronado Peninsula west of the city of San Diego's downtown district and adjacent to the city of Coronado. San Diego Bay borders NASNI on the north and east, and the Pacific Ocean borders it on the west. The base consists of 2,803 acres (2,397 on land and 406 acres in water). NASNI is located within the Coronado Hydrologic Area (910.10) in the Otay Hydrologic Unit (910.00).

The mission of NASNI is to arm, repair, provision, service, and support the U.S. Pacific Fleet and other operating forces. It is the only aviation industrial complex on the west coast and the only naval air station in California with an airfield having 24-hour support capabilities. The installation houses the California Least Tern Preserve and Nesting area. NASNI is also the only military installation in southern California capable of berthing and maintaining a Nimitz Class aircraft carrier. The Discharger's largest Naval Aviation Depot and the Defense Distribution Center are located at NASNI. It is distinguished as headquarters for several major military flag staffs, including Commander, U.S. Naval Air Forces (CNAF); Commander, Strike Force Training Pacific (CSFTP); Commander, Carrier Strike Group Seven (CCSG7); and Commander, Naval Air Force Reserve. NASNI provides aviation support shore facilities, three aircraft carrier piers, industrial maintenance support, aircraft maintenance, bachelor quarters and dining facilities, training facilities and the attendant support infrastructure of utilities, roads and grounds. The airport at NASNI has two runways. One runway is 7,500 feet long the other runway is 8,000 feet long. Approximately 70 percent of the total area is impervious to storm water infiltration.

The three piers at NASNI are used to berth aircraft carriers, support vessels, and barges. The aircraft carriers, support vessels, and barges receive various ship support services such as supplies and minor maintenance when berthed. Ship support services on the three piers include loading supplies and equipment onto the ships. Berth-side ship maintenance (that is, maintenance while the vessel is docked at the pier) may include abrasive blasting, hydro-blasting, metal grinding, painting, tank cleaning, removal of bilge and ballast water, removal of anti-fouling paint, sheet metal work, electrical work, mechanical repair, engine repair, hull repair, and sewage disposal. Berth-side ship repair activities are generally less complex than the ship repair activities conducted at commercial shipyards or at the Navy's graving dock or floating dry-dock (not located at NBC). Berth-side maintenance may be conducted by naval personnel (ships' force), civil service personnel, or civilian contractors.

Ship maintenance activities may also be conducted on the piers. Boats, ship sections, or parts can be placed on the piers or adjacent lands for repairs. The ship maintenance activities may be conducted by naval personnel (ships' force), civil service personnel, or by civilian contractors. The breadth of work performed by the civilian contractors is typically greater than the work performed by ships' force. Some complex ship repair work is

conducted inside various support buildings near the piers. Typically, civilian contractors will store materials and supplies on the piers while working aboard the ships.

NASNI has an Industrial Wastewater Treatment Plant (IWTP) which discharges treated industrial wastewater to the San Diego Metropolitan Sewage System (SDMSS). The wastewater is from metal plating facilities, etc. The IWTP is permitted by the city of San Diego to discharge to the SDMSS up to 3,097 gallons per day (GPD).

NASNI also has an Oil Recovery Plant (ORP) which discharges treated oily wastewater to the SDMSS. The oily wastewater is from the ships, ballast and bilge water, and other facilities at NASNI. The ORP is permitted by the City of San Diego to discharge to the sanitary sewer up to 26,100 GPD. The IWTP and ORP are located on the same facility plot. The storm water at the IWTP and ORP facility is collected and diverted to the SDMSS.

Point source discharges subject to NPDES permitting from NASNI are listed in Table F-2 below and are classified as discharges associated with steam condensate, diesel engine cooling water, utility vault and manhole dewatering, pier washing, and storm water.

**Table F-2. Discharges from the Main NASNI**

Types of Discharge	Discharge Point Nos.
Steam Condensate	SC-001 through SC-010
Diesel Engine Cooling Water	CW-001
Utility Vault and Manhole Dewatering	UV-001 through UV-010
Pier Washing	PW-001
Municipal Storm Water	1
Industrial Storm Water	1

Various locations as discussed in section II.B.1 of this Fact Sheet.

**2. Naval Amphibious Base, Coronado (NAB)**

NAB is located on a sand-spit strip known as the Silver Strand in the north-central section of the Coronado Peninsula, just west of the city of San Diego. NAB is within the city of Coronado. The Glorietta Bay area of San Diego Bay borders NAB on the north, San Diego Bay borders NAB on the east, and the Pacific Ocean borders it on the west. The base consists of 1,006 acres, including 257 beachfront acres leased from the State along the Pacific Ocean. NAB is located within the Coronado Hydrologic Area (910.10) in the Otay Hydrologic Unit (910.00).

NAB is a major shore command. The mission of NAB is to provide on-base facilities and services for the support of U.S. and allied forces engaged in amphibious, inshore, clandestine, unconventional and special warfare training operations. The primary land uses include the administrative areas, training beaches, California Least Tern Preserve, recreational marina, and housing. There are 21 piers at NAB. The piers are used to berth coastal patrol boats, MK-5 boats, Mike 8 boats, LCU boats, and ferry barges.

Point source discharges from NAB are classified as utility vault and manhole dewatering. These discharges are not sampled at NAB because they are substantially similar to utility vault and manhole dewatering discharges at NASNI, which are sampled. State Highway 75 separates NAB into two areas known as surfside (oceanside) and bayside. The bayside administrative area consists of over 170 buildings for housing, administration, operations, recreation, community support facilities, utilities, and maintenance facilities. The surfside administrative area houses the Naval Special Warfare Command. Approximately 60 percent of the total area is impervious to storm water infiltration.

Point source discharges from NAB are listed in Table F-3 and include discharges associated with utility vault and manhole dewatering, and storm water.

**Table F-3. Discharges from NAB**

Types of Discharge	Discharge Point Nos.
Utility Vault and Manhole Dewatering Water	UV-011 and UV-012
Municipal Storm Water	1
Industrial Storm Water	1

1 Various locations as discussed in section II.B.1 of this Fact Sheet.

**3. Silver Strand Training Complex (SSTC)**

SSTC, formerly known as the Naval Radio Receiving Facility (NRRF), is a training facility for U.S. Special Operations Forces. SSTC occupies approximately 450 acres on the southern tip of the Silver Strand. The city of Imperial Beach adjoins the SSTC on the southern end, while Silver Strand State Beach is adjacent on the north. State Highway 75 parallels the eastern end of the SSTC. There are a few structures on the SSTC, and only one, a maintenance shop, is in use on a daily basis. The Wullenweber antenna at SSTC is not working. The installation is primarily used for Naval Special Warfare training. SSTC is located within the Coronado Hydrologic Area (910.10) in the Otay Hydrologic Unit (910.00).

One point source discharge, a utility vault and manhole dewatering discharge, originates from SSTC. Storm water discharges from SSTC are considered non-industrial. South and southwest of the installation is Camp Surf, a Young Men’s Christian Association (YMCA) aquatic activities and education camp for youth on land leased from the Navy. Camp Surf has a wetland that fills with storm water runoff during the rainy season. A concrete-lined swale drains the wetland area of excess rainwater to the ocean. This swale also brings storm water runoff from an Imperial Beach residential area south of Camp Surf. Because the wetland area and swale are below sea level, a water-level-controlled pump house is activated to pump the storm water to an ocean outfall at approximately 20 gallons per minute. The storm water outfall (SSTC-01) is located on the beach adjacent to Camp Surf as shown on the map in Attachment B to this Order.

Point source discharges subject to NPDES permitting from SSTC are listed in Table F-4 below and are classified as discharges associated with utility vault and manhole dewatering.

**Table F-4. Discharges from SSTC**

Types of Discharge	Discharge Point Nos.
Utility Vault and Manhole Dewatering	UV-013
Municipal Storm Water	SSTC-01 <sup>1</sup>

1 Various locations as discussed in section II.B.1 of this Fact Sheet.

**4. Naval Outlying Landing Field, Imperial Beach (NOLF)**

NOLF is located 10 miles south of NASNI and 1.5 miles north of the U.S. - Mexican border, and is within the San Ysidro Hydrologic Subarea (911.11) of the Tijuana Valley Hydrologic Area (911.10) of the Tijuana Hydrologic Unit (911.00). NOLF contains approximately 1,295 acres in the Tijuana River Valley, south of the Silver Strand peninsula. Approximately 283 acres of NOLF is part of the Tijuana River National Estuarine Sanctuary Management Authority. This area and certain adjoining lands of the Tijuana River Valley have been designated a National Natural Landmark.

The mission of NOLF, as an extension of NASNI, is to provide a practice field for helicopter operations and miscellaneous personnel support facilities that serve the military population in the Imperial Beach area. Naval helicopters from NASNI conduct daily landing practice and lift-training operations at NOLF. Helicopters are not stationed at NOLF. Approximately 30 percent of the total area is impervious to storm water infiltration.

Point source discharges subject to NPDES permitting from NOLF are listed in Table F-5 below and include storm water.

**Table F-5. Discharges from NOLF**

Types of Discharge	Discharge Point Nos.
Municipal Storm Water	1

Various locations as discussed in section II.B.1 of this Fact Sheet.

**5. Naval Auxiliary Landing Field, San Clemente Island (NALF)**

NALF is located within the Los Angeles Regional Water Quality Control Board jurisdictional area, and therefore not regulated under this Order.

**6. Remote Training Site Warner Springs (RTSWS) formerly known as Survival, Evasion, Resistance, and Escape (SERE) Training School**

The RTSWS is located in Cleveland National Forest in northern, inland San Diego County, near the community of Warner Springs. The school teaches military personnel the skills to survive and evade capture, or if captured, to resist interrogation and plan their escape. The RTSWS is a remote facility with no industrial storm water or point source discharges. The RTSWS is located within the Warner Hydrologic Subarea (903.31) of the Warner Valley Hydrologic Area (903.30) of the San Luis Rey Hydrologic Unit (903.00). Storm water discharges from the RTSWS are considered to be non-industrial Small Military Base MS4 discharges. There are no identified point source discharges at the RTSWS. An onsite wastewater treatment system / advanced treatment unit produces up to 10,000 gallons per day of secondary treated effluent which is discharged to a spray field under Order R9-2015-0012.

**7. Camp Michael Monsoor formerly known as La Posta Mountain Warfare Training Center (MWTC)**

The Camp Michael Monsoor is a Navy Special Warfare Command facility located on approximately 1,079 mountainous acres in eastern San Diego County. It is bordered by National Forest lands on the north, and Bureau of Land Management lands on the remaining three sides, with a small privately-held parcel to the southwest. The facility primarily supports training for SEAL teams and platoons, but is occasionally used by Explosive Ordnance Disposal Units, Marines, and the Army and California National Guard for training. Camp Michael Monsoor is a remote facility has only non-industrial Small Military Base MS4 storm water or point source discharges. Camp Michael Monsoor is located within the Canyon City Hydrologic Subarea (911.82) of the Campo Hydrologic Area (911.80) of the Tijuana Hydrologic Unit (911.00). Storm water discharges from Camp Michael Monsoor are considered to be non-industrial. There are no identified point source discharges at the Camp Michael Monsoor.

## **8. Camp Morena**

Camp Morena is located on approximately 62 acres in mountainous eastern San Diego County approximately 55 miles east of the city of San Diego. It is bordered by National Forest lands on the north and east. The Morena Reservoir high water line is across Morena Stokes Valley Road from the camp and the North Shore Camp of the San Diego County Lake Morena Regional Park borders the camp on the southwest side. The facility primarily supports training for military and homeland security personnel. Camp Morena is a remote facility with no industrial storm water or point source discharges. Camp Morena is located within the Morena Hydrologic Area (911.50) of the Tijuana Hydrologic Unit (911.00). Storm water discharges from Camp Morena are considered to be non-industrial Small Military Base MS4 discharges. There are no identified point source discharges at Camp Morena.

### **B. Description of Wastewater Discharges**

During the term of Order No. R9-2009-0081, as modified by Order No. R9-2010-0057, discharges to receiving waters have been eliminated for boat rinsing, pier boom cleaning, swimmer rinsing, marine mammal enclosure cleaning, and product water from the reverse osmosis water purification unit. Wastewater discharges at NBC consist of the following:

#### **1. Storm Water Discharges**

A total of approximately 191 storm water discharge points drain storm water runoff from the Facility. In the ROWD submitted in February 2014, the Discharger indicated that there were industrial runoff points from three of the installations at the Facility. Three installations at the Facility have municipal storm water discharges.

This Order establishes requirements for storm water discharges from industrial and non-industrial areas of the Facility (including Industrial High Risk Areas, Industrial Low Risk Areas, Industrial No Exposure Areas, and Small Military Base MS4 Areas).

##### **a. Small Municipal Separate Storm Sewer System Areas (Small Military Base MS4s)**

Section 402(p) of the Clean Water Act (CWA) establishes a framework for regulating storm water discharges under the NPDES Program. In 1990, the United States Environmental Protection Agency (USEPA) promulgated regulations for permitting storm water discharges from industrial sites and from municipal separate storm sewer systems (MS4s) serving a population of 100,000 people or more. These regulations, known as the Phase I regulations, require operators of medium and large MS4s to obtain storm water permits. On December 8, 1999, USEPA promulgated regulations, known as Phase II regulations, requiring permits for storm water discharges from Small MS4s.

As defined by 40 CFR section 122.26(b)(8), an MS4 is a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) designed or used for collecting or conveying storm water; (ii) which is not a combined sewer; and (iii) which is not part of a publicly owned treatment works (POTW).

A Small MS4 is an MS4 that is not permitted under the municipal Phase I regulations, but is permitted under the municipal Phase II regulations. A Small MS4 is owned or operated by the U.S., a state, a city, a town, a borough, a county, a parish, a district, an association, or another public body having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes. Small MS4s include systems similar to separate

storm sewer systems in large municipalities, such as systems at military bases. In this Order, Small Military Base MS4 is the non-industrial part of a Small MS4.

Storm water runoff from non-industrial portions of the Facility such as administrative buildings, roads, parking lots, and other municipal type discharges, are subject to regulation under Phase II MS4 requirements.

Discharges through the MS4 of material other than storm water to Waters of the U.S. are effectively prohibited except as allowed under the provisions of section IV.F of this Order or as otherwise authorized by a separate NPDES permit. A list of authorized non-storm water discharges is provided in section IV.F of this Order and includes diverted stream flows, rising groundwater, uncontaminated groundwater, springs, drinking fountain water, emergency eye wash/shower water, condensate, and several other categories of discharge. These discharges are authorized under this Order unless the Discharger or the San Diego Water Board identifies the discharges as a significant source of pollutants to Waters of the U.S. or physically interconnected MS4. If the discharges meet the conditions in section IV.F, the Discharger must ensure that steps are taken to prevent or reduce the contact of non-storm water discharges with significant materials or equipment; and minimize, to the extent practicable, the flow or volume of non-storm water discharges. The Discharger is required to prepare a Storm Water Management Plan (SWMP) with Best Management Practices (BMPs) for Small Military Base MS4 discharges including authorized non-storm water.

This Order establishes requirements for Small Military Base MS4 storm water discharges from the Facility based on Phase II MS4 requirements, similar to those established in the State Water Resources Control Board (State Water Board) General NPDES Permit for the Discharge of Storm Water From Small Municipal Separate Storm Sewer Systems (WQ Order No. 2013-0001-DWQ), adopted on February 5, 2013.

#### **b. Industrial Storm Water**

This Order establishes requirements for the discharge of storm water runoff from "Industrial High Risk Areas," which are defined in section IV.B.1 of this Order as *"All areas where wastes or pollutants of significant quantities from ship construction, modification, repair, and maintenance activities (including abrasive blast grit material, primer, paint, paint chips, solvents, oils, fuels, sludges, detergents, cleansers, hazardous substance, toxic pollutants, non-conventional pollutants, materials of petroleum origin, or other substances of water quality significance) are subject to precipitation, run-on, and/or runoff."*

This Order also establishes requirements for storm water runoff from industrial areas not associated with ship construction, modification, repair, or maintenance activities, and are designated as "Industrial Low Risk Areas," and from "Industrial No Exposure Areas," where all industrial materials and activities are protected from contact with storm water.

Section IV.B.1. of this Order defines Industrial No Exposure Areas, Industrial Low Risk Areas, and Industrial High Risk Areas. Section IV.B.2 of this Order requires that the risk level of storm water discharges shall be categorized annually by the Discharger based on the activities conducted in the drainage area for each outfall.

Pollutants that may be present in the discharge include pollutants that the storm water is likely to contact, including, but not limited to sediment, solids, oil and grease, and metals.

## **2. Steam Condensate**

NBC currently uses a pressurized steam system for both shore and afloat operations. Within NBC, only NASNI has an on-base steam system. During the generation and distribution of steam at NASNI, condensate is formed. This condensate is discharged both on land and to San Diego Bay and the Pacific Ocean.

Currently, steam is produced at NASNI by an on-site cogeneration plant that is operated by Applied Energy, a Navy contractor. During the production of steam, one or more of the following chemical additives are injected to the steam to assist in controlling the pH in the steam system: Trident 3506 (into boiler feed water), Trident 2301 (into boiler feed water), Trident 1003 (into boiler), and Trident 1103 (into boiler). It is important to control the pH and the goal is to maintain the pH between 8.5 and 9 to avoid the creation of acids in the steam distribution system. Specific chemicals that may be present in steam condensate as a result of additives, as presented in prior annual reports, include: cyclohexylamine (20%), diethylaminoethanol, diethylhydroxylamine, hydroquinone, and morpholine.

After leaving the plant, the steam enters the distribution system, which consists of high- and low-pressure steam lines; pressure reducing valve stations; and expansion joints. The steam is provided to buildings and surface ships. The steam system has traps in the steam lines designed to discharge steam condensate to ensure the steam supplied to users meets quality assurance specifications and is free of condensate. When water collects in the steam lines it is essential for the system to remove the water as soon as possible.

The only steam condensate discharge at NBC to San Diego Bay is from NASNI. There were 66 steam discharge points during the term of Order No. R9-2009-0081, but only 10 remain. Fifty-six discharges were eliminated during the current permit term as a result of removal, change of status, or discharge to permeable ground surface. At most locations, the system releases steam condensate from traps in a cloud of steam that has a temperature in excess of 100 degrees Celsius. A portion of this steam discharge evaporates prior to forming a condensate and discharging to the land or to San Diego Bay. The pier discharge points, in addition to releasing steam, drip small amounts of water to the bay between steam discharges. The estimated discharge rate for the steam lines is one ounce per minute. Based on two years of self-monitoring report (SMR) data for discharge points SC-001 through SC-008, the discharge volume has been modified from 750 GPD to approximately 456 GPD. Out of the ten steam condensate discharges still active on NASNI, nine discharge to the San Diego Bay, and one discharges to the golf course pond and then to the Pacific Ocean.

A map of the steam condensate discharge locations is shown in Attachment B (Figure B-3). A line drawing for the steam condensate discharge is shown in Attachment C (Figure C-1).

## **3. Diesel Engine Cooling Water Discharges**

NASNI has historically used diesel engines to supply water to the fire suppression system (sprinklers). These diesel engines discharge non-contact engine cooling water. Order No. R9-2009-0081 regulated four diesel engine cooling water systems, Discharge Points CW-001 through CW-004. Only one diesel engine cooling water system remains on NBC and is located at Building 812 on NASNI (Discharge Point CW-001). Discharge Points CW-002 through CW-004 have been eliminated and are no longer regulated by this Order.

The diesel engine at Discharge Point CW-001 has been out of service for more than a year and is not expected to be in use for another year or more. Moreover, the Navy is currently

evaluating ways to eliminate the discharge from Building 812 in the future by directing the cooling water to the sanitary sewer or otherwise managing it to prevent a discharge. However, the Report of Waste Discharge includes information on the Diesel Engine Cooling Water discharge as it most recently occurred, in case it should continue.

When operational, the diesel engines must be tested regularly to ensure the operability of the fire sprinkler pump. During the pump tests, non-contact bay water will be used to cool the diesel engine that supplies water to the fire sprinkler pump. During an emergency, the pump will supply water to the fire sprinkler system in adjacent buildings. During non-emergency weekly tests, cooling water is discharged into the San Diego Bay. The fire sprinkler systems in adjacent buildings are not activated during these weekly tests.

If the pump becomes operational and the weekly pump tests are conducted, non-contact seawater will be pumped from San Diego Bay through a steel pipe that is approximately 48 feet long and 15 inches in diameter. The diesel engine will discharge non-contact cooling seawater through a 2-inch steel pipe that runs approximately 12 feet into a sump that channels into the San Diego Bay. The flow rate is expected to be 450 gallons per week (GPW). A pollution prevention plan has been developed and implemented to address potential chemical pollutants in the cooling water discharge of the diesel-engine-powered pump in Building 812.

A map of the diesel engine cooling discharge locations is shown in Attachment B (Figure B-4). A line drawing for the utility vault dewatering discharge is shown in Attachment C (Figure C-2).

#### **4. Utility Vault and Manhole Dewatering**

NBC has electrical and steam utility vaults and manholes that may discharge water to surface waters. The utility vaults and manholes are located at NASNI, NAB, and SSTC. Only NASNI has steam vaults. NAB and SSTC have only electrical switch or substation vaults. Utility companies or agencies, including NAVFAC SW, supply utility resources (excluding water), as necessary for day-to-day living and operations. This includes, but is not limited to, supplies of natural gas, electricity, and telephone service. Electrical and steam utilities are owned and maintained by NAVFAC SW. The utility vault discharges are short-term intermittent discharges of contained water from utility vaults and underground structures. Navy installations in San Diego require electrical power for both shore and afloat operations. The on-base electrical power is carried through an extensive underground conduit system. Electrical utility vaults and manholes contain high voltage electrical equipment, transformers, switchgear, and/or below ground cables.

The steam utility manholes can also accumulate steam condensate water. High-pressure steamlines are also located in underground conduit systems and are accessed through utility manholes. NAVFAC SW dewater utility vaults and manholes as needed to protect equipment, or prior to performing repair, maintenance, or installation of equipment. Water collected in utility vaults or manholes is either automatically or manually pumped out for disposal. The volume of water pumped is dependent upon rainfall amounts and infiltration. The automatic sump pumps are used to dewater the utility electrical vaults and the water is discharged to landscaped areas, gutters, catch basins, or channels depending on the location of the vault. Only those vaults that use automatic pumping that discharge to receiving waters are subject to this permit. Vaults are not included in the permit where NBC staff or contractors deliver or direct water removed from the vaults to the sanitary sewer or a pervious area where it will not discharge to receiving waters.

There are a total of 13 utility vaults located across the NBC installations that could potentially have point source discharges. Of the 13 vaults, 10 electrical vaults are located at NASNI. These vaults can accumulate groundwater and storm water and are dewatered using automatic sump pumps. Depending on the volume, these discharges may reach a storm drain inlet that drains to San Diego Bay.

There are two electrical switch or substation vaults located at NAB. These vaults are located inside buildings and are away from the quay walls and piers. These vaults can also accumulate groundwater and storm water and are dewatered using automatic sump pumps. Depending on the volume, these discharges may reach a storm drain inlet that drains to San Diego Bay or the Pacific Ocean. All 13 vaults have meters on the pumps and most record little to no discharge. The Navy is currently evaluating the actual discharge potential at these locations.

There is one electrical switch or substation vault at SSTC. This substation is located inside a building and has an automated sump pump to dewater the vaults of groundwater seepage and storm water. The sump pump prevents the water from contacting the electrical equipment. The sump discharges to the ground surface around the building. Depending on the volume, these discharges may reach a storm drain that drains to the Pacific Ocean.

Vaults without sump pumps and manholes at NBC are manually dewatered when necessary, using a portable pump or pump truck. NAVFAC SW has implemented procedures to eliminate dewatering discharges to surface waters from vaults without sump pumps and manholes, which can be found in the recently updated Pollution Prevention Plan (PPP) for Utility Vault and Manhole Dewatering Discharges at NBSD/NBC/NBPL (August 2013). NAVFAC SW either pumps the water into an adjacent utility manhole or transfers the water to the sanitary sewer system. However, there could be rare emergency situations that would require dewatering vaults without sump pumps or manholes onto the ground surface.

Prior to the adoption of Order No. R9-2003-0008 for the Facility, discharges from utility vaults and manholes were regulated by the statewide *General Order for Discharges from Utility Vaults and Underground Structures to Surface Waters* (Order No. 96-12-DWQ, NPDES No. CAG990002). At the time of adoption of Order No. R9-2003-0008, the State Water Board was awaiting USEPA approval of the re-issued General Order (Order No. 2001-11-DWQ). In order to regulate all of the discharges at the Facility under one Order, the San Diego Water Board incorporated the pertinent specifications, limitations, and monitoring requirements of Order No. 2001-11-DWQ into Order No. R9-2003-0008. Order No. R9-2009-0081 incorporated the pertinent specifications, limitations, and monitoring requirements of Order No. 2006-0008-DWQ, *General National Pollutant Discharge Elimination System (NPDES) Permit for Discharges from Utility Vaults and Underground Structures to Surface Waters*. It is the practice of the San Diego Water Board to incorporate the provisions of the most current applicable permit. This Order incorporates the pertinent requirements from the State Water Board's *General National Pollutant Discharge Elimination System (NPDES) Permit for Discharges from Utility Vaults and Underground Structures to Surface Waters* (Order No. 2014-0174-DWQ).

A map of the utility vault dewatering discharge locations is shown in Attachment B (Figures B-5 through B-7). A line drawing for the utility vault dewatering discharge is shown in Attachment C (Figure C-3).

## 5. Pier Washing Discharge

Bird feces are washed from the ammunition pier (Bravo Pier) at NASNI and discharged to San Diego Bay. No industrial activities are performed on the ammunition pier, only loading and unloading of ammunition and ordnance from ships. Bravo Pier is swept with a street sweeper prior to being washed. A pump located on the pier is used to supply potable water for washing. The pump is rated at 100 gpm, but the actual rate varies. Duration of pier washing varies from 45-90 minutes. The discharge volume is approximately 6,700 gallons for each washing event. Washing occurs 4 times per week during the seagull migration period and about 100 times per year depending on duration of the migration period which may start as early as late May and go through November. The wash water discharges to San Diego Bay from several drains located on the pier. Discharges from the Bravo Pier occur over the edge of the pier and through numerous rectangular drains located on the pier.

A map of the pier washing discharge locations is shown in Attachment B (Figure B-8). A line drawing for the pier washing discharge is shown in Attachment C (Figure C-4).

### C. Discharge Points and Receiving Waters

1. The eight installations of the Facility are described in section II.A of this Fact Sheet and the four installations which are regulated by this Order are shown in Attachment B (Figure B-1).

Wastewater is discharged into the San Diego Bay, Pacific Ocean, Tijuana River Estuary, Morena Reservoir, tributaries to the San Luis Rey River, and waters in the Canyon City Hydrologic Area as summarized in Table F-6 below:

**Table F-6. Discharge Locations**

Discharge Point	Discharge Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water
<b><i>Industrial Process Water Effluent Discharges</i></b>				
SC-001	Steam Condensate	32° 42' 22" N	117° 11' 23.26	San Diego Bay

**D. Summary of Previous Requirements and Self-Monitoring Report (SMR) Data**

1. Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 contained the following Discharge Prohibitions:
  - a. The dumping, deposition or discharge of the following wastes directly into Waters of the U.S., including but not limited to the Pacific Ocean and San Diego Bay, or adjacent to such waters in any manner which may permit its being transported into the waters is prohibited:
    - i. Paint chips;
    - ii. Blasting materials;
    - iii. Paint over spray;
    - iv. Paint spills;
    - v. Water contaminated with abrasive blast materials, paint, oils, fuels, lubricants, solvents, or petroleum;
    - vi. Hydro-blast water;
    - vii. Tank cleaning water such as to remove sludge and/or dirt;
    - viii. Clarified water from an oil and water separator, except for storm water discharges treated by an oil and water separator and having coverage under this Order;
    - ix. Steam cleaning water;
    - x. Pipe and tank hydrostatic test water, unless regulated by an NPDES permit;
    - xi. Saltbox water;
    - xii. Hydraulic oil leaks and spills;
    - xiii. Fuel leaks and spills;
    - xiv. Trash;
    - xv. Miscellaneous refuse and rubbish;
    - xvi. Fiberglass dust;
    - xvii. Swept materials;
    - xviii. Ship repair and maintenance activity debris;
    - xix. Demineralizer and reverse osmosis brine; and
    - xx. Oily bilge water.
  - b. Diesel engine cooling water discharges having a maximum temperature greater than 4°F above the natural temperature of the receiving water are prohibited.
  - c. Boat rinsing discharges having a maximum temperature greater than 20°F above the natural temperature of the receiving water are prohibited.

- d. The Discharger shall comply with all requirements of the Basin Plan Waste Discharge Prohibitions.
  - e. Discharges of waste not specifically authorized by this Order or in a manner or location not specifically described in this Order are prohibited unless regulated by applicable WDRs.
  - f. Except as allowed in [the Storm Water Pollution Prevention Plan], non-storm water discharges that discharge either directly or indirectly to Waters of the United States (U.S.) are prohibited. Prohibited non-storm water discharges must be either eliminated or permitted by a separate NPDES permit.
  - g. Industrial storm water discharges and authorized or permitted non-storm water discharges shall not cause or threaten to cause pollution, contamination, or nuisance as defined in CWC section 13050.
  - h. Wastes shall not be discharged into or adjacent to areas where the protection of beneficial uses requires spatial separation from waste fields.
  - i. The discharge of the first ¼ inch (first flush) of storm water runoff from high risk areas is prohibited, except if the pollutants in the discharge are reduced to the extent and demonstrate through testing that the discharge achieves compliance with the [applicable acute toxicity effluent limitations]. The discharge of the remainder of the storm water must also achieve compliance with the toxicity limitation specified in this Order but only needs to be demonstrated twice per year, unless under accelerated testing.
  - j. The discharge of wastes that cause or contribute to the violation of water quality standards (designated beneficial uses and water quality objectives developed to protect beneficial uses) is prohibited
2. Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 also established requirements for steam condensate, diesel engine cooling water, reverse osmosis product water, utility vault and manhole dewatering discharges, pier washing, pier boom cleaning, marine mammal enclosure cleaning, small boat rinsing, and miscellaneous discharges.
  3. Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 established acute toxicity effluent limitations for the discharge of industrial storm water.
  4. Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 established benchmark values for the discharge of storm water from any industrial activity for copper of 63.6 µg/L and zinc of 117 µg/L.

**Table F-7. Storm Water Benchmark Exceedances**

Reporting Period	No. of Outfall Discharge Events Exceeding Copper Benchmark	No. of Outfall Discharge Events Exceeding Zinc Benchmark
2011	55	83
2012	7	15
2013	11	82
2014	14	41

**E. Compliance Summary**

1. Review of the Facility’s self-monitoring reports from June 2009 to March 2015 identified the following violations:
  - a. Industrial Storm Water Acute Toxicity effluent limitation in section IV.A.5 of Order No. R9-2009-0081 of Pass was reported as Fail 105 times from June 2009 to June 2014 which includes the 2013/2014 monitoring year. In the 2013/2014 monitoring year, 51 samples were tested for toxicity and 14 samples were reported as Fail. Using the effluent limitation in this Order, only one sample would be in violation.
  - b. The Discharger reported 23 discharges of unauthorized cooling water in violation of the prohibitions in section A of Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 from 9/10/2009 to 8/2/2011. This discharge was discontinued after August 2011.
2. The following effluent limitation violations were found in reviewing the Facility’s self-monitoring reports from June 2009 to March 2015:

**Table F-8. Effluent Limitation Violations**

Discharge	Constituent	Number of Exceedances	Period	Effluent Limitation	Dates
Steam Condensate	Lead, Total Recoverable	3	Daily Maximum	15.5 µg/L	7/23/2012, 10/17/2013, & 8/4/2014
Steam Condensate	Lead, Total Recoverable	10	Monthly Average	6.3 µg/L	7/23/2012 to 3/3/2015
Steam Condensate	Copper, Total Recoverable	66	Daily Maximum	5.8 µg/L	6/2/2010 to 5/4/2014
Steam Condensate	Copper, Total Recoverable	116	Monthly Average	2.0 µg/L	6/10/2010 to 3/3/2015
Steam Condensate	Bis (2-Ethylhexyl) Phthalate	1	Daily Maximum	11.8 µg/L	12/22/2011
Steam Condensate	Bis (2-Ethylhexyl) Phthalate	4	Monthly Average	5.9 µg/L	12/22/2011 to 10/20/2014
Steam Condensate	pH	3	Instantaneous Maximum	9.0	9/10/2009 to 3/10/2010
Steam Condensate	pH	2	Instantaneous Minimum	7.0	10/20/2014
Diesel Engine Cooling Water	Turbidity	1	Monthly Average	75 NTU	12/9/2009
Diesel Engine Cooling Water	Zinc, Total Recoverable	1	Daily Maximum	150 µg/L	11/5/2009
Diesel Engine Cooling Water	Copper, Total Recoverable	6	Daily Maximum	97 µg/L	7/22/2009 to 12/9/2009

3. On 05/22/2015, the Facility was inspected by the San Diego Water Board to determine compliance with Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 and to verify the information contained in the ROWD. No violations were observed.
4. On 01/24/2013, the Facility was inspected by a USEPA contractor to determine compliance with Order No. R9-2009-0081 as modified by Order No. R9-2010-0057. No violations were observed.

## F. Planned Changes

1. The steam cogeneration plant contract is due to expire in 2018, and NBC is currently pursuing efforts toward full decentralization of the system. The steam condensate discharges are expected to be eliminated following conversion to the new systems which will include return systems for steam condensate. While the overall category of steam condensate discharges will remain in this Order, multiple individual steam condensate discharges have been eliminated since the previous permit.
2. The diesel engine sprinkler station at Building 812 on NASNI has been out of service for more than a year and is not expected to be in use for another year or more. The Discharger plans to direct the cooling water to the sanitary sewer or otherwise manage it to prevent discharge.

## III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in this Order are based on the requirements and authorities described in this section.

### A. Legal Authorities

This Order is issued pursuant to CWA section 402 and implementing regulations adopted by the USEPA and chapter 5.5, division 7 of the California Water Code (Water Code or CWC; commencing with section 13370). This Order shall serve as a NPDES permit for point source discharges from this facility to surface waters. This Order also serves as WDRs pursuant to article 4, chapter 4, division 7 of the Water Code (commencing with section 13260).

### B. California Environmental Quality Act (CEQA)

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code sections 21100 through 21177.

### C. State and Federal Regulations, Policies, and Plans

1. **Water Quality Control Plans.** The San Diego Water Board adopted a *Water Quality Control Plan for the San Diego Basin* (Basin Plan) on September 8, 1994 which was last amended on April 4, 2011. The Basin Plan was subsequently approved by the State Water Board on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the San Diego Water Board and approved by the State Water Board. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, the Basin Plan implements State Water Board Resolution No. 88-63, which established state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply. Requirements of this Order implement the Basin Plan. Beneficial uses applicable to the San Diego Bay, Pacific Ocean, Tijuana River Estuary, Morena Reservoir, tributaries to the San Luis Rey River, and waters in the Canyon City Hydrologic Area are as follows:

**Table F-9. Basin Plan Beneficial Uses.**

Discharge Point	Receiving Water Name	Beneficial Use(s)
SC-001 through SC-009, CW-001, UV-001 through UV-013, PW-001, and storm water discharges as identified in Attachment M of this order.	San Diego Bay	Industrial service supply (IND); navigation (NAV); contact water recreation (REC1); non-contact water recreation (REC2); commercial and sport fishing (COMM); preservation of biological habitats of special significance (BIOL); estuarine habitat (EST); wildlife habitat (WILD); preservation of rare, threatened or endangered species (RARE); marine habitat (MAR); migration of aquatic organisms (MIGR); spawning, reproduction, and/or early development (SPWN); and, shellfish harvesting (SHELL).
SC-010, and storm water discharges, as identified in Attachment M of this order.	Pacific Ocean	IND, REC1, REC2, NAV, COMM, aquaculture (AQUA), BIOL, WILD, RARE, MAR; MIGRA, SPWN, and SHELL.
Storm water discharges, as identified in Attachment M of this order.	Tijuana River Estuary	REC1, REC2, COMM, BIOL, EST, WILD, RARE, MAR, MIGR, SPWN, and SHELL.
Municipal storm water discharges from the Remote Training Site Warner Springs.	San Luis Rey River Watershed	Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), IND, Freshwater Replenishment (FRESH), Hydropower Generation (POW), REC1, REC2, Warm Freshwater Habitat (WARM), WILD
Municipal storm water discharges from Camp Morena	Morena Reservoir	MUN, AGR, IND, Industrial Process Supply (PROC), FRESH, REC1, REC2, WARM, Cold Freshwater Habitat (COLD), WILD, RARE
Municipal storm water discharges from Camp Michael Monsoor	Canyon City Hydrologic Area	REC1, REC2, WARM, WILD

**2. Thermal Plan.** The State Water Board adopted the *Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California* (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. The Thermal Plan contains temperature objectives for surface waters.

The Thermal Plan defines elevated temperature waste as “*liquid, solid, or gaseous material including thermal waste discharged at a temperature higher than the natural temperature of receiving water.*” The Thermal Plan also defines a new discharge as “*any discharge (a) which is not presently taking place unless waste discharge requirements have been established and construction as defined in Paragraph 10 has commenced prior to adoption of this plan or (b) which is presently taking place and for which a material change is proposed but no construction as defined in Paragraph 10 has commenced prior to adoption of this plan.*”

Thermal objectives for new discharges to an enclosed bay are applicable for diesel engine cooling water. This objective is:

*Thermal waste discharges having a maximum temperature greater than 4°F above the natural temperature of the receiving water are prohibited.*

Requirements of this Order implement the Thermal Plan.

- 3. California Ocean Plan.** The State Water Board adopted the *Water Quality Control Plan for Ocean Waters of California, California Ocean Plan* (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, 2005, 2009, and 2012. The State Water Board adopted the latest amendment on October 16, 2012, and it became effective on August 19, 2013. The Ocean Plan is applicable, in its entirety, to point source discharges to the ocean. The Ocean Plan identifies beneficial uses of ocean Waters of the State to be protected as summarized below:

**Table F-10. Ocean Plan Beneficial Uses**

Discharge Point	Receiving Water	Beneficial Uses
SC-010, and storm water discharges, as identified in Attachment M of this Order.	Pacific Ocean	Industrial water supply; water contact and non-contact recreation, including aesthetic enjoyment; navigation; commercial and sport fishing; mariculture; preservation and enhancement of designated Areas of Special Biological Significance (ASBS); rare and endangered species; marine habitat; fish spawning and shellfish harvesting

In order to protect the beneficial uses, the Ocean Plan establishes water quality objectives and a program of implementation. Requirements of this Order implement the Ocean Plan.

- 4. Sediment Quality Plan.** The State Water Board adopted the *Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality* (Sediment Quality Plan) on September 16, 2008, and it became effective on August 25, 2009. This Sediment Quality Plan supersedes other narrative sediment quality objectives, and establishes new sediment quality objectives and related implementation provisions for specifically defined sediments in most bays and estuaries. Requirements of this Order implement the sediment quality objectives of this Sediment Quality Plan.
- 5. National Toxics Rule (NTR) and California Toxics Rule (CTR).** Federal water quality criteria were adopted by USEPA through the NTR in 40 CFR section 131.36 (promulgated on December 22, 1992, amended on May 4, 1995 and November 9, 1999). About forty criteria in the NTR applied to California waters. On May 18, 2000, USEPA published the CTR in the Federal Register (65 Fed. Register 31682-31719), adding 40 CFR section 131.38. The CTR established new priority pollutant criteria for California waters and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These regulations contain federal water quality criteria for priority pollutants.
- 6. State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the San Diego Water Board in the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this Order implement the SIP.

- 7. Antidegradation Policy.** Federal regulations at 40 CFR section 131.12 require that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 is deemed to incorporate the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68 16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The San Diego Water Board's Basin Plan implements, and incorporates by reference, both the state and federal antidegradation policies. The permitted discharge must be consistent with the antidegradation provision of 40 CFR section 131.12 and State Water Board Resolution No. 68-16.
- 8. Anti-Backsliding Requirements.** Sections 402(o) and 303(d)(4) of the CWA and federal regulations at 40 CFR section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.
- 9. Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code, sections 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. sections 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of Waters of the State, including protecting rare, threatened, or endangered species. The Discharger is responsible for meeting all requirements of the applicable Endangered Species Act.
- 10. Atomic Energy Act.** Pursuant to the *Atomic Energy Act*, the San Diego Water Board does not have jurisdictional authority to regulate the discharge of radioactive wastes from United States naval nuclear propulsion plants and their support facilities. The U.S. Department of the Navy and the Department of Energy have jurisdiction for discharges of radioactive material. The Navy has a monitoring program for the discharge of radioactive wastes from naval vessels. Consistent with the Atomic Energy Act, this Order does not regulate the discharge of radioactive wastes and does not include monitoring for radioactivity.
- 11. Uniform National Discharge Standards (UNDS).** In 1996, Congress passed legislation amending CWA section 312 to provide the Department Of Defense and the USEPA authority to jointly establish UNDS for incidental discharges from vessels of the Armed Forces in state waters and the contiguous zone. This comprehensive, three-phase, regulatory program applies to vessels of the Armed Forces including, but not limited to, the Navy, Military Sealift Command, Marine Corps, Army, Air Force, and Coast Guard. UNDS is designed to enhance environmental protection of coastal waters by creating protective standards to reduce environmental impacts associated with vessel discharges, stimulate the development of improved pollution control devices, and advance the development of environmentally sound ships by the Armed Forces. The Phase I final rule and preamble language, including a summary of the Phase I process and findings (64 Fed. Reg. 25126; 40 CFR part 1700), was published in the Federal Register on May 10, 1999. Phase I of UNDS determines the types of vessel discharges that require control by a Marine Pollution Control Device (MPCD) and those that do not require control, based on consideration of the anticipated environmental effects of the discharge and other factors listed in the CWA. In Phase I, the USEPA and the Department Of Defense identified 25 discharges to be controlled by MPCDs. Phase II of UNDS development focuses on promulgating MPCD

performance standards for those vessel discharges identified during Phase I as requiring an MPCD. In this Phase, Department Of Defense and USEPA are establishing discharge performance standards for different classes, types, and sizes of vessels. These standards are specific to existing vessels as well as future (new design) vessels and will be promulgated in batches for efficiency purposes. A draft rule establishing MPCD for the first batch of 11 discharges was promulgated on February 3, 2014. Phase III of UNDS development will focus on establishing requirements for the design, construction, installation, and use of MPCDs. After completion of Phase III, states will be prohibited from regulating these UNDS discharges. In anticipation of the completion of UNDS, this Order does not regulate vessel discharges with applicable MPCDs (as BMPs) identified in the draft UNDS rule.

**D. Impaired Water Bodies on CWA 303(d) List**

Under section 303(d) of the 1972 CWA, states, territories and authorized tribes are required to develop lists of water quality limited segments. The waters on these lists do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology. On October 11, 2011 USEPA gave final approval to California's 2010 section 303(d) List of Water Quality Limited Segments (303(d) list). San Diego Bay, as a whole, is listed as impaired for polychlorinated biphenyls (PCBs). Additional portions of San Diego Bay are listed as impaired for additional parameters. San Diego Bay adjacent to the Facility is listed as impaired for copper. Table F-10 below lists the San Diego Bay impairments near the Facility.

**Table F-11. 303(d) Impairments near the Facility**

Water Body	Location	Constituent	Installation
San Diego Bay	Whole Bay	Polychlorinated biphenyls (PCBs)	All
San Diego Bay	Shoreline, Glorietta Bay	Copper	Adjacent to NAB
San Diego Bay	San Diego Bay Shoreline, G Street Pier	Total Coliform	Near NASNI and NAB <sup>1</sup>
San Diego Bay	San Diego Bay Shoreline, Vicinity of B St and Broadway Piers	Benthic Community Effects	Near NASNI and NAB <sup>1</sup>
San Diego Bay	San Diego Bay Shoreline, Vicinity of B St and Broadway Piers	Sediment Toxicity	Near NASNI and NAB <sup>1</sup>
San Diego Bay	San Diego Bay Shoreline, Vicinity of B St and Broadway Piers	Total Coliform	Near NASNI and NAB <sup>1</sup>
San Diego Bay	San Diego Bay Shoreline, Shelter Island Shoreline Park	Enterococcus, Fecal Coliform, and Total Coliform	Near NASNI and NAB <sup>1</sup>
San Diego Bay	San Diego Bay Shoreline, Tidelands Park	Enterococcus, Fecal Coliform, and Total Coliform	Near NASNI and NAB <sup>1</sup>
San Luis Rey River	East of Interstate 15	Total Nitrogen as N	Adjacent to RTSWS
San Luis Rey River	West of Interstate 15	Chloride, Enterococcus, Fecal Coliform, Phosphorus, Total Dissolved Solids, Total Nitrogen as N, and Toxicity	RTSWS is tributary
Pacific Ocean Shoreline	San Luis Rey River Mouth	Enterococcus and Total Coliform	RTSWS is tributary

Water Body	Location	Constituent	Installation
Morena Reservoir	Whole Reservoir	Ammonia as Nitrogen, Color, Manganese, Phosphorus, pH	Adjacent to Camp Morena
Tijuana River Estuary	1 Acre to 150 Acres	Eutrophic, Indicator Bacteria, Lead, Nickel, Dissolved Oxygen, Pesticides, Thallium, Trash, Turbidity	Adjacent to NOLF

<sup>1</sup> These impairments are not adjacent to the Facility but are near the Facility.

On February 10, 2010, the San Diego Water Board adopted Resolution No. R9-2010-0001, an Amendment to the Water Quality Control Plan for the San Diego Region to Incorporate the Revised Total Maximum Daily Loads for Indicator Bacteria, Project I - Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek). This TMDL Basin Plan amendment was subsequently approved by the State Water Resources Control Board on December 14, 2010, the Office of Administrative Law (OAL) on April 4, 2011, and the United States Environmental Protection Agency (USEPA) on June 22, 2011. RTSWS is a Phase II MS4 discharger to a tributary to the San Luis Rey River. The TMDL establishes the following Waste Load Allocations (WLAs) and compliance schedule for Phase II MS4 dischargers. This Order establishes requirements to implement these WLAs in accordance with the TMDL.

**Table F-12. WLAs for Phase II MS4s in the San Luis Rey HU**

Watershed	Fecal Coliform WLA		Enterococcus WLA		Total Coliform WLA	
	Wet Weather Billion MPN/year	Dry Weather Billion MPN/Month	Wet Weather Billion MPN/year	Dry Weather Billion MPN/Month	Wet Weather Billion MPN/year	Dry Weather Billion MPN/Month
San Luis Rey HU (903.00)	914,026	1,058	1,300,235	185	14,373,954	5,289

**Table F-13. Wet and Dry Weather Compliance Schedule and Reduction Milestones for Achieving Exceedance Frequency**

Implementation Action	Responsible Party	Date
Submit annual progress reports or Update SWPPPs/SWMPs/LRPs in accordance with RB Accepted LRPs	Phase II Permittees	Upon Enrollment in Phase II MS4 Requirements
Meet Wet and Dry Weather Frequency Exceedance Milestones	All Phase I, Phase II MS4s, Caltrans	
50% Reductions <sup>1</sup> – Priority <sup>2</sup> 1		April 4, 2016
50% Reductions <sup>1</sup> – Priority <sup>2</sup> 2		April 4, 2017
50% Reductions <sup>1</sup> – Priority <sup>2</sup> 3		April 4, 2018
100% Reductions <sup>1</sup> – Priority <sup>2</sup> 1,2,3		April 2, 2021+

Notes:

<sup>1</sup> Wet: single sample maximum REC-1 WQOs Dry: 30-day geometric mean REC-1 WQOs. The percent reduction for each compliance year applies to the total number of samples taken that comply with Resolution No. R9-2010-0001. The maximum allowable percent exceedance frequency for the single sample maximum (wet weather days only) is 22% (Resolution No. R9-2010-0001, Finding 10). For dry weather days, there is no maximum allowable exceedance and it is set at 0%. The Compliance Year percent reductions are based on the total number of samples taken. For Example: If in Year 5 of the compliance schedule, 100 samples are taken, only 50% of those samples can exceed the single sample maximum for wet weather by 22% of the maximum allowable percent exceedance frequency for the single sample maximum. By Year 10+, no samples can exceed

the Exceedance Frequency. Baseline years for wet and dry days shall be as identified in Order No R9 2015-0001 Attachment E for the Bacteria I TMDL.

<sup>2</sup> Priorities are defined in Resolution No. R9-2010-0001, Attachment A, pg. 63-65.

## E. Other Plans, Polices and Regulations

1. **Bays and Estuaries Policy.** The State Water Board adopted a Water Quality Control Policy for Enclosed Bays and Estuaries of California (Bays and Estuaries Policy) on May 16, 1974 (last amended in 1995). The Bays and Estuaries Policy establishes principles for management of water quality, quality requirements for waste discharges, discharge prohibitions, and general provisions to prevent water quality degradation and to protect the beneficial uses of waters of enclosed bays and estuaries. These principles, requirements, prohibitions and provisions have been incorporated into this Order.
  - a. The Bays and Estuaries Policy contains the following principle for management of water quality in enclosed bays and estuaries, which includes San Diego Bay and the Tijuana River Estuary:
    - i. The discharge of municipal wastewaters and industrial process waters (exclusive of cooling water discharges) to enclosed bays and estuaries shall be phased out at the earliest practicable date. Exceptions to this provision may be granted by the San Diego Water Board only when the San Diego Water Board finds that the wastewater in question would consistently be treated and discharged in such a manner that it would enhance the quality of receiving waters above that which would occur in the absence of the discharge. For the purpose of this policy, ballast waters and innocuous non-municipal wastewaters such as clear brines, washwater, and pool drains are not considered industrial process wastes, and may be allowed by the San Diego Water Board under discharge requirements that provide protection to the beneficial uses of the receiving water.

The San Diego Water Board finds that the discharges of steam condensate, diesel engine cooling water, pier washing wastewater, other miscellaneous facility-related discharges identified in the Discharger's ROWD storm water, and utility vault dewatering wastewater discharged in compliance with the terms of this Order are innocuous non-municipal wastewaters and, as such, are not subject to the above prohibition.
    - ii. The Bays and Estuaries Policy also prohibits the discharge or by-passing of untreated wastes. This Order prohibits the discharge and by-passing of untreated waste except for steam condensate, diesel engine cooling water, pier washing wastewater, other miscellaneous facility-related discharges identified in the Discharger's ROWD storm water, and utility vault dewatering wastewater.
  - b. The following Principles for the Management of Water Quality in Enclosed Bays and Estuaries, as stated in the Bays and Estuaries Policy, apply to all of California's enclosed bays and estuaries including San Diego Bay and the Tijuana River Estuary:
    - i. Persistent or cumulative toxic substances shall be removed from the waste to the maximum extent practicable through source control or adequate treatment prior to discharge.

- ii. Bay or estuarine outfall and diffuser systems shall be designed to achieve the most rapid initial dilution practicable to minimize concentrations of substances not removed by source control or treatment.
- iii. Wastes shall not be discharged into or adjacent to areas where the protection of beneficial uses requires spatial separation from waste fields.
- iv. Waste discharges shall not cause a blockage of zones of passage required for the migration of anadromous fish.
- v. Non-point sources of pollutants shall be controlled to the maximum practicable extent.

The San Diego Water Board has considered the Principles for the Management of Water Quality in Enclosed Bays in Estuaries, in adopting this Order. The terms and conditions of this Order are consistent with the Principles for the Management of Water Quality in Enclosed Bays and Estuaries.

#### **IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS**

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the Waters of the U.S. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the CFR: 40 CFR section 122.44(a) requires that permits include applicable technology-based effluent limitations (TBELs) and standards; and 40 CFR section 122.44(d) requires that permits include water quality-based effluent limitations (WQBELs) to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

##### **A. Discharge Prohibitions**

1. **Discharge Prohibition III.A.** Ship repair and maintenance activities may result in the discharge of pollutants and wastes to Waters of the U.S. Discharge Prohibition III.A prohibits the discharge of wastes associated with ship repair and maintenance activities. This prohibition is based on the requirements of the Enclosed Bays and Estuaries Policy. Water Code section 13260 requires filing an application and ROWD before a discharge can occur. Discharges not described in the application and ROWD, and subsequently in this Order, are prohibited.
2. **Discharge Prohibition III.B.** As discussed in section III.C.2 of this Fact Sheet, the discharges from diesel engine cooling water are considered a new discharge of thermal waste. The specific water quality objective for enclosed bays for new discharges contained in the Thermal Plan states that “thermal waste discharges having a maximum temperature greater than 4°F above the natural temperature of the receiving water are prohibited.” Discharge Prohibition III.B is based on the requirements of the Thermal Plan.
3. **Discharge Prohibitions III.C., III.D., III.E and III.F.** These prohibitions are based on the requirements of the Basin Plan.
4. **Discharge Prohibition III.G.** Waste discharges from ship repair and maintenance activities on ships, piers, and shoreside facilities can cause high concentrations of copper, zinc, other metals, and oil and grease in industrial storm water runoff. High concentrations of these

pollutants in the industrial storm water runoff can be toxic to aquatic organisms. Discharge Prohibition III.G is based on the toxicity requirements contained in the Basin Plan and prohibits the discharge of the first ¼ inch (first flush) of storm water runoff from High Risk areas unless the discharge can be demonstrated to meet the limits of this Order.

5. **Discharge Prohibition III.H.** This Prohibition is based on the requirements of the Bays and Estuaries Policy and is consistent with prohibitions established for similar facilities.
6. **Discharge Prohibition III.I.** This Order prohibits the discharge of hazardous substances equal to or in excess of reportable quantities listed in 40 CFR part 117 and/or 40 CFR part 302.
7. **Discharge Prohibition III.J.** This requirement prohibits the discharge of PCBs based on the 303(d) listing for these compounds for San Diego Bay.

## **B. Technology-Based Effluent Limitations (TBELs)**

### **1. Scope and Authority**

Section 301(b) of the CWA and implementing USEPA permit regulations at section 40 CFR section 122.44 require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards.

The CWA requires that TBELs be established based on several levels of controls:

- a. Best practicable treatment control technology (BPT) represents the average of the best performance by plants within an industrial category or subcategory. BPT standards apply to toxic, conventional, and non-conventional pollutants.
- b. Best available technology economically achievable (BAT) represents the best existing performance of treatment technologies that are economically achievable within an industrial point source category. BAT standards apply to toxic and non-conventional pollutants.
- c. Best conventional pollutant control technology (BCT) represents the control from existing industrial point sources of conventional pollutants including Biochemical Oxygen Demand 5-day @ 20 °C (BOD), Total Suspended Solids (TSS), fecal coliform, pH, and oil and grease. The BCT standard is established after considering the “cost reasonableness” of the relationship between the cost of attaining a reduction in effluent discharge and the benefits that would result, and also the cost effectiveness of additional industrial treatment beyond BPT.
- d. New source performance standards (NSPS) represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA also requires USEPA to develop effluent limitations guidelines and standards (ELGs) representing application of BPT, BAT, BCT, and NSPS. Section 402(a)(1) of the CWA and 40 CFR section 125.3 authorize the use of Best Professional Judgment (BPJ) to derive TBELs on a case-by-case basis where ELGs are not available for certain industrial categories and/or pollutants of concern. Where BPJ is used, the San Diego Water Board must consider specific factors outlined in 40 CFR section 125.3.

There are no applicable ELGs for the discharges in this Order. As such, the discharges authorized by this Order meet minimum federal technology-based requirements based on Best Professional Judgment (BPJ) in accordance with 40 CFR section 125.3.

**2. Applicable TBELs**

- a. **Steam Condensate and Diesel Engine Cooling Water.** The Ocean Plan is applicable in its entirety to point source discharges to the ocean. Steam condensate from Discharge Point No. SC-010 discharges to the Pacific Ocean. As such, effluent limitations based on Table 2 of the Ocean Plan for grease and oil, settleable solids, turbidity, and pH have been established in this Order for discharges of steam condensate to the Pacific Ocean at Discharge Point No. SC-010.

Although the Ocean Plan is not directly applicable to enclosed bays such as San Diego Bay, Order No. R9-2009-0081 determined that the salinity and beneficial uses of San Diego Bay are similar to those of ocean Waters of the State, and used the Ocean Plan as a reference for developing discharge specifications, receiving water prohibitions, and narrative limitations to supplement the provisions contained in the CTR, the SIP, and the Bays and Estuaries Policy. As such, Order No. R9-2009-0081 established effluent limitations for steam condensate at Discharge Points SC-001 through SC-66 and diesel engine cooling water discharges at Discharge Points CW-001 through CW-004 to the San Diego Bay, consistent with Table 2 of the Ocean Plan for grease and oil, settleable solids, turbidity, and pH. Steam condensate discharges except SC-001 through SC-010 and diesel engine cooling water discharges except CW-001 have been eliminated. Consistent with federal and state anti-backsliding requirements, effluent limitations for grease and oil, settleable solids, turbidity, and pH have been carried over for discharges of steam condensate and diesel engine cooling water to the San Diego Bay.

**Table F-14. Applicable Numeric Effluent Limitations from the Ocean Plan**

Parameter	Units	Effluent Limitations		
		Average Monthly	Weekly Average	Instantaneous Maximum
Oil and Grease	mg/L	25	40	75
Settleable Solids	ml/L	1.0	1.5	3.0
Turbidity	NTU	75	100	225
pH	standard units	--	--	1

<sup>1</sup> Within limits of 6.0 – 9.0 at all times

- b. **Utility Vaults.** The State Water Board found in section V.B.1.b of the Fact Sheet to Order No. 2014-0174-DWQ that it is not feasible to establish numeric effluent limitations for pollutants in discharges from utility vaults and underground structures. Instead, the State Water Board included a provision in Order No. 2014-0174-DWQ requiring implementation of pollution prevention practices to control and abate the discharge of pollutants to surface waters, achieve compliance utilizing BAT and BCT requirements, and achieve compliance with applicable water quality standards. Federal Regulations at 40 CFR sections 122.44(k)(3) and (4) authorize the San Diego Water Board to require BMPs to control or abate the discharge of pollutants when numeric effluent limitations are infeasible and when the practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the CWA. Consistent with the requirements of the Order No. 2014-0174-DWQ and Order No. R9-2009-0081 as modified by Order No. R9-2010-0057, this Order includes a provision requiring the Discharger to continue the implementation and maintenance of their BMPs and Pollution

Prevention Plan for Utility Vault and Manhole Dewatering Discharges (Utility Vault Plan) which includes BMPs to reduce the discharge of pollutants from utility vault and manhole dewatering. In addition, this Order establishes Numeric Action Levels (NALs) for utility vault discharges consistent with NALs in Order No. 2014-0174-DWQ.

- c. **Pier Washing.** Due to the nature of activities associated with discharges from pier washing, it is impractical to collect and treat the associated wastewaters prior to discharge. Therefore, the San Diego Water Board finds that it is not feasible to establish numeric effluent limitations for pollutants in discharges from pier washing. In accordance with 40 CFR sections 122.44(k)(3) and (4), the San Diego Water Board finds that the implementation of BMPs in lieu of numeric effluent limitations are appropriate. This Order includes a provision requiring the implementation of BMPs to control and abate the discharge of pollutants from pier washing.
- d. **Small Military Base MS4.** In accordance with 40 CFR section 122.44(k), the inclusion of BMPs in lieu of numeric effluent limitations is appropriate in storm water permits. The Discharger must implement BMPs that reduce pollutants in storm water runoff to the technology-based standard of Maximum Extent Practicable (MEP) to protect water quality. This Order requires the Discharger to develop and implement a SWMP that describes BMPs, measurable goals, and timetables for implementation in the six minimum control measures identified in 40 CFR section 122.34(b). This approach is consistent with the requirements of the current Naval Base San Diego Permit (Order No. R9-2013-0064) and Navy Base Point Loma Permit (Order No. R9-2014-0037) which include regulation of Phase II MS4 storm water discharges.
- e. **Industrial Storm Water.** In accordance with 40 CFR section 122.44(k), Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 determined that the implementation of BMPs for the discharge of industrial storm water were appropriate. To carry out the purpose of the CWA, Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 required the Discharger to develop and implement a SWPPP, as authorized by CWA section 304(e) and section 402(p), for toxic pollutants and hazardous substances, and for the control of storm water discharges. The requirement to implement an appropriate SWPPP for areas associated with industrial activity is retained from Order No. R9-2009-0081 as modified by Order No. R9-2010-0057.

In addition to the retention of a SWPPP, this Order establishes NALs for storm water from Industrial High Risk Areas and Industrial Low Risk Areas in lieu of benchmarks.

The statewide Industrial Storm Water General Permit was adopted on April 1, 2014, by the State Water Board and became effective on July 1, 2015. This statewide Industrial Storm Water General Permit contains NALs based on benchmarks in USEPA's *Multi-Sector General Permit for Stormwater Discharges Associated with Industrial Activity (MSGP)* which became effective May 27, 2009. Consistent with the intent of the State Water Board, this Order establishes NALs with a tiered compliance strategy. The San Diego Water Board finds that the State Water Board's NALs serve as an appropriate set of technology-based, measureable criteria that demonstrate compliance with BAT/BCT.

- f. **Non-storm water Discharges.** Non-storm water discharges as described in section IV.F of this Order include a wide variety of sources and may contribute significant pollutant loads to receiving waters. Measures to control spills, leakage, and dumping, and to prevent illicit connections must be addressed through structural as well as non-structural BMPs. The San Diego Water Board recognizes, however, that certain non-

storm water discharges may be necessary for general operation. Therefore, this Order authorizes such discharges provided they meet certain conditions that will minimize the discharge of pollutants to the receiving waters.

## **C. Water Quality-Based Effluent Limitations (WQBELs)**

### **1. Scope and Authority**

Section 301(b) of the CWA and 40 CFR section 122.44(d) require that permits include limitations more stringent than applicable technology-based requirements where necessary to achieve applicable water quality standards.

Section 122.44(d)(1)(i) of 40 CFR mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels with the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but no numeric criterion or objective for the pollutant has been established, WQBELs must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in 40 CFR section 122.44(d)(1)(vi).

The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in other state plans and policies, or any applicable water quality criteria contained in the CTR and NTR.

### **2. Applicable Beneficial Uses and Water Quality Criteria and Objectives**

- a. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. The beneficial uses applicable to San Diego Bay, the Tijuana River Estuary, a tributary to the San Luis Rey River watershed, Morena Reservoir, and waters in the Canyon City Hydrologic Area contained in the Basin Plan are summarized in section III.C.1 of this Fact Sheet. The Basin Plan includes both narrative and numeric water quality objectives applicable to the receiving waters.
- b. The CTR promulgated toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. Priority pollutant water quality criteria in the CTR are applicable to industrial process discharges to San Diego Bay. The CTR contains both saltwater and freshwater criteria. Because a distinct separation generally does not exist between freshwater and saltwater aquatic communities, the following apply: in accordance with 40 CFR section 131.38(c)(3), freshwater criteria apply to areas where salinities are at or below 1 part per thousand (ppt) 95 percent or more of the time. The San Diego Water Board has determined that because the discharges are to San Diego Bay, saltwater CTR criteria are applicable. The CTR criteria for saltwater aquatic life or human health for consumption of organisms, whichever is more stringent, are used to prescribe the effluent limitations in this Order to protect the beneficial uses of San Diego Bay, a water of the U.S. in the

vicinity of the discharges.

The SIP procedures for implementation of CTR and NTR criteria are not explicitly applicable to storm water discharges. However, the toxicity objectives contained in the Basin Plan and the Bays and Estuary Policy are applicable to the discharge of storm water from Facility to San Diego Bay, the Tijuana River Estuary, a tributary to the San Luis Rey River watershed, Morena Reservoir, and waters in the Canyon City Hydrologic Area. The applicable toxicity limitations are discussed in this section of the Fact Sheet.

The SIP procedures for implementation of CTR and NTR criteria are applicable to non-storm water discharges. The non-storm water discharges from the Facility to San Diego Bay include discharges associated with steam condensate, diesel engine cooling water, pier washing, and utility vault and manhole dewatering. A Reasonable Potential Analysis (RPA) was conducted for the non-storm water discharges to the San Diego Bay using all the available data. All data available for a type (e.g., steam condensate) was used to categorize the type of discharge and used for evaluating reasonable potential.

- Representative monitoring data for utility vault and manhole dewatering discharges was available from September 2009 through June 2015.
  - Representative monitoring data for discharges of diesel generator cooling water was available from July 2009 through August 2011 when the discharge last occurred.
  - Representative monitoring data for steam condensate was available from August 2009 through June 2015.
  - Representative monitoring data for pier washing water was available from September 2009 through June 2015.
  - Receiving water monitoring in the vicinity of the discharges was available from January 2011 through June 2015.
- c. For all ocean Waters of the State, the Ocean Plan establishes the beneficial uses summarized in section III.C.3 of this Fact Sheet. The Ocean Plan also includes water quality objectives for the ocean receiving water for bacterial characteristics, physical characteristics, chemical characteristics, biological characteristics, and radioactivity. Table 1 of the Ocean Plan establishes numeric water quality objectives that are applicable to all discharges within the jurisdiction of the Ocean Plan.

The Ocean Plan procedures for implementation of Table 1 criteria are applicable to non-storm water discharges. The non-storm water discharges from the Facility to San Diego Bay include the discharge of steam condensate at Discharge Point No. SC-010. A RPA was conducted for the non-storm water discharges to the Pacific Ocean. All data available for steam condensate was used to categorize the discharge and used for evaluating reasonable potential.

- Representative monitoring data for steam condensate was available from August 2009 through June 2015.
- Receiving water monitoring in the vicinity of the discharges was available from January 2011 through June 2015.

Tables F-13 and F-14 summarizes the applicable water quality criteria/objectives for priority pollutants reported in detectable concentrations in the effluent. These criteria were used in conducting the RPAs for this Order.

**Table F-15. Applicable CTR/NTR Water Quality Criteria with Detectable Concentrations**

Constituent	Selected Criteria	CTR/NTR Water Quality Criteria

b. **Dilution Credits.** Section 1.4.2 of the SIP establishes procedures for granting mixing zones and the assimilative capacity of the receiving water. Before establishing a dilution credit for a discharge, it must first be determined if, and how much, receiving water is available to dilute the discharge.

In the absence of a dilution credit, the worst-case dilution is assumed to be zero to provide protection for the receiving water beneficial uses. The impact of assuming zero assimilative capacity within the receiving water is that discharge limitations are applied end-of-pipe with no allowance for dilution within the receiving water. This Order uses a dilution of zero.

### 3. Determining the Need for WQBELs

Federal regulations require effluent limitations for all pollutants that are or may be discharged at a level that will cause or have the reasonable potential to cause, or contribute to an instream excursion above a narrative or numerical water quality standard.

The San Diego Water Board conducted the RPA for discharges to the San Diego Bay in accordance with section 1.3 of the SIP. The RPA for the discharge of steam condensate to the Pacific Ocean was conducted consistent with the requirements of Appendix VI of the Ocean Plan. A summary of the results for the parameters which demonstrated reasonable potential, for each applicable discharge, is provided in the tables below.

**Table F-17. Summary of CTR/NTR RPA Results (Discharges to San Diego Bay)**

Discharge Location No.	Parameter	Maximum Effluent Concentration (MEC) (µg/L)	Background (B) (µg/L)	Criteria (C) (µg/L)	Reason <sup>1,2</sup>
Steam Condensate to San Diego Bay (SC-001 through SC-009)	Arsenic, Total Recoverable	2.9	99	36	B > C

Discharge Location No.	Parameter	Maximum Effluent Concentration (MEC) (µg/L)	Background (B) (µg/L)	Criteria (C) (µg/L)	Reason <sup>1,2</sup>
	Heptachlor	0.04	0.004	0.00021	MEC > C
	Heptachlor Epoxide	0.02	0.002	0.00011	MEC > C

<sup>1</sup> MEC = Maximum Effluent Concentration; B = Background Concentration; C = Criteria (Water Quality)

<sup>2</sup> Step 6 of section 1.3 of the SIP states that if B is greater than C and the pollutant is detected in the effluent, an effluent limitation is required and the analysis for the subject pollutant is complete.

**Table F-18. Summary of Ocean Plan RPA Results (Discharges to the Pacific Ocean)**

Discharge Location No.	Parameter	Number of Samples	Maximum Effluent Concentration (MEC) (µg/L)	Background (B) (µg/L)	Criteria (C) (µg/L)	Endpoint <sup>1</sup>
Steam Condensate to the Pacific Ocean (SC-010)	Antimony, Total Recoverable	6	1.5	0	1,200	3
	Arsenic, Total Recoverable	6	2.9	3	8	3
	Copper, Total Recoverable	146	170	2	3	1
	Lead, Total Recoverable	146	15.6	0	2	1
	Nickel, Total Recoverable	6	2.2	0	5	3
	Zinc, Total Recoverable	6	1,100	8	20	1
	TCDD Equivalentents	160	0.0000139	0	3.9 x 10 <sup>-9</sup>	1
	Bis(2-Ethylhexyl)Phthalate	147	16	0	3.5	1

<sup>1</sup> Endpoint1 = Reasonable potential exists, limit required, establish monitoring.

Endpoint3 = The RPA is inconclusive. Monitoring has been established for these parameters.

#### 4. WQBEL Calculations

- a. **Utility Vaults.** As shown in Table F-15, the San Diego Water Board finds that discharges from utility vault and manhole dewatering have the reasonable potential to exceed water quality criteria for several priority pollutants. However, section V.B.2 of the Fact Sheet to Order No. 2014-0174-DWQ finds that the State Water Board believes that it is infeasible to establish numeric effluent limitations for utility vault and underground structure discharges due, in part to: discharges occurring intermittently and for short durations; dewatering of utility vaults and underground structures provide essential public services needs to be conducted promptly to facilitate restoration of those services; the uncertainty of the volume and characteristics of the discharge from a utility vault or an underground structure; and the general lack of data and information to characterize discharges from utility vaults. Consistent with Order No. 2014-0174-DWQ and Order No. R9-2009-0081 as modified by Order No. R9-2010-0057, the San Diego Water Board is not establishing numeric effluent limitations for utility vaults and manholes in this Order. This Order includes a provision requiring the Discharger to continue the implementation and maintenance of their Utility Vault Plan which includes BMPs to reduce the discharge of pollutants from utility vault and manhole dewatering.
- b. **Discharges associated with pier washing.** Based on BPJ, the San Diego Water Board finds that discharges associated with pier washing exhibit reasonable potential to

exceed water quality criteria for a number of priority pollutants. The minimal flow, duration, infrequent and disperse nature of this discharges precludes the implementation of practical treatment systems. Therefore, the San Diego Water Board finds that it is not feasible to establish numeric effluent limitations for pollutants in this discharge. In lieu of numeric effluent limitations, the San Diego Water Board finds that the implementation of BMPs is sufficient to adequately protect receiving waters. This Order includes a provision requiring the implementation of BMPs to control and abate the discharge of pollutants from pier washing.

- c. **The Thermal Plan.** The Thermal Plan applies to steam condensate discharges and diesel engine cooling and was adopted by the State Water Board on May 18, 1972.

Steam condensate discharges are considered discharges of elevated temperature wastes and must comply with the following water quality objectives for enclosed bays and for coastal waters. The Discharger installed the steam condensate system prior to adoption of the Thermal Plan on May 18, 1972, so this steam condensate discharge is an existing discharge. A numeric effluent limitation is not provided for existing discharges. The following Thermal Plan water quality objectives have been applied as a narrative receiving water limitation. Due to the low discharge rate of steam condensate into the receiving water, the discharge is not expected to degrade beneficial uses due to elevated temperatures.

Thermal Plan water quality objective for existing discharges to enclosed bays:

*“Elevated temperature waste discharges shall comply with limitations necessary to assure protection of beneficial uses.”*

Thermal Plan water quality objective for existing discharges to coastal waters:

*“Elevated temperature wastes shall comply with limitations necessary to assure protection of the beneficial uses and areas of special biological significance.”*

Diesel engine cooling water discharges are considered discharges of thermal waste. Because it commenced after the May 18, 1972, Thermal Plan adoption date, the discharge of diesel engine cooling water constitutes a new discharge of a thermal waste. The following Thermal Plan water quality objective for new thermal discharges to enclosed bays is implemented directly as a discharge prohibition:

*“Thermal waste discharges having a maximum temperature greater than 4° F above the nature temperature of the receiving water are prohibited.”*

- d. **pH.** The WQBEL for pH for discharges to the San Diego Bay is based on the water quality objective contained in the Basin Plan, which states, *“In bays and estuaries the pH shall not be depressed below 7.0 nor raised above 9.0.”* This limitation has also been applied in this Order to discharges of steam condensate to the Pacific Ocean.
- e. **SIP Effluent Limitation Calculations.** If a reasonable potential exists to exceed applicable water quality criteria or objectives, then a WQBEL must be established in accordance with one or more of the three procedures contained in section 1.4 of the SIP where numeric effluent limitations are feasible. These procedures include:
- i. If applicable and available, use the WLA established as part of a TMDL.

- ii. Use of a steady-state model to derive maximum daily effluent limitations (MDELs) and average monthly effluent limitations (AMELs).
- iii. Where sufficient effluent and receiving water data exist, use of a dynamic model, which has been approved by the San Diego Water Board.

WQBELs are calculated following the procedures in section 1.4 of the SIP. Where an applicable primary MCL or secondary MCL is more stringent than a CTR/NTR parameter, the MCL has been used as the applicable human health criteria for CTR/NTR parameter.

WQBELs Calculation Example:

Using total recoverable copper for the discharge of steam condensate as an example, the following demonstrates how WQBELs were established for CTR/NTR parameters in this Order.

The process for developing these limitations and performance goals is consistent with section 1.4 of the SIP.

*Calculation of aquatic life AMEL and MDEL:*

**Step 1:** For each constituent requiring an effluent limitation, identify the applicable water quality criteria or objective. For each criterion, determine the effluent concentration allowance (ECA) using the following steady state equation:

$$ECA = C + D(C-B) \quad \text{when } C > B, \text{ and}$$

$$ECA = C \quad \text{when } C \leq B,$$

Where C = The priority pollutant criterion/objective, adjusted if necessary for hardness, pH, and translators. For discharges from the Facility, criteria for saltwater are independent of hardness and pH.

D = The dilution credit, and

B = The ambient background concentration.

As discussed above, this Order does not allow for dilution (D=0); therefore, for copper:

$$ECA_{\text{acute}} = 5.8 \mu\text{g/L}$$

$$ECA_{\text{chronic}} = 3.7 \mu\text{g/L}$$

$$ECA_{\text{human health}} = \text{Not Applicable}$$

**Step 2:** For each ECA based on aquatic life criterion/objective, determine the long-term average discharge condition (LTA) by multiplying the ECA by a factor (multiplier). The multiplier is a statistically based factor that adjusts the ECA to account for effluent variability. The value of the multiplier varies depending on the coefficient of variation (CV) of the data set and whether it is an acute or chronic criterion/objective. Table 1 of the SIP provides pre-calculated values for the multipliers based on the value of the CV. Equations to develop the multipliers in

place of using values in the tables are provided in section 1.4, Step 3 of the SIP and will not be repeated here.

$$LTA = ECA \times \text{Multiplier}_{99}$$

The CV for the data set must be determined before the multipliers can be selected and will vary depending on the number of samples and the standard deviation of a data set. If the data set is less than 10 samples, or at least 80% of the samples in the data set are reported as non-detect, the CV shall be set equal to 0.6. If the data set is greater than 10 samples, and at least 20 percent of the samples in the data set are reported as detected, the CV shall be equal to the standard deviation of the data set divided by the average of the data set.

For copper in steam condensate, over 10 samples were available and only 2 percent were non-detect. A CV of 2.08 was calculated by dividing the standard deviation by the mean of the data set. Thus, the CV shall be set equal to 2.08 for all CTR/NTR parameters.

For copper in steam condensate, the following data was used to develop the acute and chronic LTAs using equations provided in section 1.4, Step 3 of the SIP (Table 1 of the SIP also provides this data up to three decimals).

No. of Samples	CV	ECA Multiplier <sub>acute</sub>	ECA Multiplier <sub>chronic</sub>
147	1.81	0.13	0.22

$$LTA_{acute} = 5.8 \mu\text{g/L} \times 0.13 = 0.73 \mu\text{g/L}$$

$$LTA_{chronic} = 3.7 \mu\text{g/L} \times 0.22 = 0.81 \mu\text{g/L}$$

**Step 3:** Select the most limiting (lowest) of the LTA.

$$LTA = \text{most limiting of } LTA_{acute} \text{ or } LTA_{chronic}$$

For copper, the most limiting LTA is  $LTA_{acute}$

$$LTA_{copper} = LTA_{acute} = 0.73 \mu\text{g/L}$$

**Step 4:** Calculate the WQBELs by multiplying the LTA by a factor (multiplier). WQBELs are expressed as AMEL and MDEL. The multiplier is a statistically based factor that adjusts the LTA for the averaging periods and exceedance frequencies of the criteria/objectives and the effluent limitations. The value of the multiplier varies depending on the probability basis, the CV of the data set, the number of samples (for AMEL) and whether it is a monthly or daily limit. Table 2 of the SIP provides pre-calculated values for the multipliers based on the value of the CV and the number of samples. Equations to develop the multipliers in place of using values in the tables are provided in section 1.4, Step 5 of the SIP and will not be repeated here.

$$AMEL_{aquatic\ life} = LTA \times AMEL_{multiplier95}$$

$$MDEL_{aquatic\ life} = LTA \times MDEL_{multiplier99}$$

AMEL multipliers are based on a 95th percentile occurrence probability, and the MDEL multipliers are based on the 99th percentile occurrence probability. If the number of samples is less than four (4), the default number of samples to be used is four (4).

For copper, the following data were used to develop the AMEL and MDEL for effluent limitations using equations provided in section 1.4, Step 5 of the SIP:

No. of Samples Per Month	CV	Multiplier <sub>MDEL99</sub>	Multiplier <sub>AMEL95</sub>
4	1.81	7.97	2.64

Copper

$$AMEL_{\text{aquatic life}} = 0.73 \mu\text{g/L} \times 2.64 = 1.92 \mu\text{g/L}$$

$$MDEL_{\text{aquatic life}} = 0.73 \mu\text{g/L} \times 7.97 = 5.78 \mu\text{g/L}$$

**Step 5:** For the ECA based on human health, set the AMEL equal to the ECA<sub>human health</sub>. For copper, there is no applicable human health criteria. Thus, heptachlor in steam condensate has been used as an example for calculating applicable human health effluent limitations below.

Heptachlor

$$AMEL_{\text{human health}} = ECA_{\text{human health}} = 0.00021 \mu\text{g/L}$$

**Step 6:** Calculate the MDEL for human health by multiplying the AMEL by the ratio of Multiplier<sub>MDEL</sub> to the Multiplier<sub>AMEL</sub>. Table 2 of the SIP provides pre-calculated ratios to be used in this calculation based on the CV and the number of samples. Heptachlor has a CV of 0.6 because there are fewer than 10 samples.

$$MDEL_{\text{human health}} = AMEL_{\text{human health}} \times (\text{Multiplier}_{\text{MDEL}} / \text{Multiplier}_{\text{AMEL}})$$

For the default CV of 0.6:

No. of Samples Per Month	CV	Multiplier <sub>MDEL 99</sub>	Multiplier <sub>AMEL 95</sub>	Ratio
4	0.6	3.1	1.6	2.0

For heptachlor:

$$MDEL_{\text{human health}} = 0.00021 \mu\text{g/L} \times 2.0 = 0.00042 \mu\text{g/L}$$

**Step 7:** Select the lower of the AMEL and MDEL based on aquatic life and human health as the WQBEL for the Order. In neither of the examples were both aquatic life and human health criteria applicable to both of the criteria, thus this step is not applicable for copper or heptachlor.

For discharges of steam condensate, the resulting effluent limitations are at least as stringent as those established in Order No. R9-2009-0081, with the exception of the MDEL for bis(2-ethylhexyl)phthalate. The MDEL of 13.7 µg/L would be less stringent than the MDEL of 11.8 µg/L established in the previous Order, thus the previous MDEL has been carried over consistent with state and federal anti-backsliding requirements.

For discharges of diesel engine cooling water, the resulting effluent limitations are at least as stringent as those established in Order No. R9-2009-0081, with some exceptions. The resulting AMEL for lead of 6.3 µg/L is less stringent than the AMEL

of 5.8 µg/L established in the previous Order, thus the previous AMEL has been carried over consistent with state and federal anti-backsliding requirements. Mercury did not demonstrate reasonable potential and the effluent limitation for mercury was removed consistent with state and federal anti-backsliding requirements.

A summary of the applicable CTR/NTR effluent limitations is provided below:

**Table F-19. CTR-based Effluent Limitations**

Parameters	Units	Effluent Limitations		
		Average Monthly	Average Weekly	Maximum Daily
<b>Steam Condensate</b>				
Arsenic, Total Recoverable	µg/L	30	--	59
Copper, Total Recoverable	µg/L	1.9	--	5.8
Lead, Total Recoverable	µg/L	3.4	--	12
Nickel, Total Recoverable	µg/L	6.8	--	14
Selenium, Total Recoverable	µg/L	58	--	120
Zinc, Total Recoverable	µg/L	47	--	95
2,3,7,8-TCDD	µg/L	1.4x10 <sup>-8</sup>	--	2.8x10 <sup>-8</sup>
Bis(2-Ethylhexyl)Phthalate	µg/L	5.9	--	15 <sup>1</sup>
Aldrin	µg/L	0.00014	--	0.00028
4,4'-DDT	ug/L	0.00059	--	0.00118
4,4'-DDE	ug/L	0.00059	--	0.00118
4,4'-DDD	ug/L	0.00084	--	0.00169
Heptachlor	µg/L	0.00021	--	0.00042
Heptachlor Epoxide	µg/L	0.00011	--	0.00022
<b>Diesel Engine Cooling Water</b>				
Arsenic, Total Recoverable	µg/L	20	--	62
Chromium VI, Total Recoverable	µg/L	27	--	85
Copper, Total Recoverable	µg/L	2.0	--	5.8
Lead, Total Recoverable	µg/L	6.3 <sup>2</sup>	--	15
Nickel, Total Recoverable	µg/L	5.7	--	15
Selenium, Total Recoverable	µg/L	58	--	120
Zinc, Total Recoverable	µg/L	37	--	95
4,4-DDT	µg/L	0.00059	--	0.0017
4,4-DDE	µg/L	0.00059	--	0.0012
4,4-DDD	µg/L	0.00084	--	0.0017

<sup>1</sup> Current Order R9-2009-0081 has an effluent limitation of 12 µg/L for Bis(2-Ethylhexyl)Phthalate which is more stringent so this Order establishes an MDEL of 12 µg/L.

<sup>2</sup> Current Order R9-2009-0081 has an effluent limitation of 5.8 µg/L for lead which is more stringent so this Order establishes an MDEL of 5.8 µg/L.

- f. **Ocean Plan Effluent Limitation Calculations.** If a reasonable potential exists to exceed applicable water quality objectives, then a WQBEL must be established consistent with the requirements of the Ocean Plan.

Effluent limitations for water quality objectives listed in Table 1 of the Ocean Plan, with the exception of acute toxicity and radioactivity, are determined through the use of the following equation:

$$\text{Equation 1: } C_e = C_o + D_m (C_o - C_s)$$

where:

$C_e$  = the effluent concentration limit,  $\mu\text{g/L}$ .

$C_o$  = the concentration (water quality objective) to be met at the completion of initial\* dilution,  $\mu\text{g/L}$ .

$C_s$  = background seawater concentration,  $\mu\text{g/L}$ . Background seawater concentrations are specified in Table 3 of the Ocean Plan for arsenic (3  $\mu\text{g/L}$ ), copper (2  $\mu\text{g/L}$ ), mercury (0.0005  $\mu\text{g/L}$ ), silver (0.16  $\mu\text{g/L}$ ), and zinc (8  $\mu\text{g/L}$ ). For all other Table 1 parameters,  $C_s = 0 \mu\text{g/L}$ .

$D_m$  = minimum probable initial dilution expressed as parts seawater per part wastewater. (There is no initial dilution for this discharge.)

Because there is no initial dilution for the discharge of steam condensate from Discharge Point No. SC-010, the effluent limitations will be equal to the objectives (i.e.  $C_e = C_o$ ).

In addition to concentration-based effluent limitations, section C.4.j of the Ocean Plan requires mass-based effluent limitations calculated based on the concentration-based effluent limitations and a maximum flow rate.

$$\text{Mass Emission Rate (lb/day)} = 8.34 \times Q \times C$$

where: Q and C are the flow rate in million gallons per day and the constituent concentration in mg/L, respectively. 8.34 is a conversion factor.

However, due to the type of discharge (steam condensate), and periodic and low flow, accurate flow measurement to evaluate compliance with a mass-based effluent limitation is not feasible. Further, due to the nature of the discharge, it is not possible for the effluent to be further diluted and large fluctuations in flow are not expected to occur. Consistent with the previous Order, this Order establishes concentration-based effluent limitations for discharges to the Pacific Ocean. Concentration-based effluent limitations are anticipated to be protective of water quality.

A summary of the applicable WQBELs for the Discharger are summarized below:

**Table F-20. Summary Applicable WQBELs for Steam Condensate to the Pacific Ocean**

Parameter	Units	Effluent Limitations			
		6-Month Median	30-Day Average	Maximum Daily	Instantaneous Maximum
Copper, Total Recoverable	$\mu\text{g/L}$	3	--	12 <sup>1</sup>	30
Lead, Total Recoverable	$\mu\text{g/L}$	2	--	8	20
Zinc, Total Recoverable	$\mu\text{g/L}$	20	--	80	200
TCDD Equivalents	$\mu\text{g/L}$	--	$3.9 \times 10^{-9}$	--	--
Bis(2-Ethylhexyl)Phthalate	$\mu\text{g/L}$	--	3.5	--	--

- <sup>1</sup> Current Order R9-2009-0081 has an effluent limitation of 5.8 µg/L which is more stringent so this Order establishes an MDEL of 5.8 µg/L.

## 5. Whole Effluent Toxicity (WET)

### a. Background and Rationale

The Basin Plan defines toxicity as the adverse response of organisms to chemicals or physical agents.

The Basin Plan establishes a narrative water quality objective for toxicity:

*“All waters shall be maintained free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life.”*

WET testing protects receiving waters from the aggregate toxic effect of a mixture of pollutants in the effluent. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a short or a longer period of time and may measure mortality, reproduction, and growth. A chemical at a low concentration could have chronic effects but no acute effects until the chemical was at a higher concentration.

Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 established acute toxicity effluent limitations for storm water discharges. The Discharger reported 105 failed acute toxicity tests from June 2009 to June 2014 which includes the 2013/2014 monitoring year, indicating the presence and reasonable potential for toxicity in the discharge of storm water from the Facility. Further, the presence of numerous priority pollutants present in the industrial wastewaters indicate reasonable potential for toxicity within those discharges as well.

In discussions with USEPA Region 9, USEPA has informed San Diego Water Board staff that the application of chronic toxicity monitoring and effluent limitations are more desirable than acute toxicity because chronic toxicity is more conservative and provides a better indicator of chronic effects to organisms in the receiving water, other than organism mortality. Chronic effects, such as detrimental physiological responses (affecting fertilization, growth, reproduction, etc.) may be present, even when acute effects such as the death of an organism are not apparent. The use of chronic toxicity allows for a more accurate determination of the narrative water quality objective, which specifies *“detrimental physiological responses”*. Many detrimental physiological responses are not addressed when the test is limited to simply percent survival.

Based on the USEPA Region 9 guidance, chronic toxicity monitoring and effluent limitations are established in this Order for the discharge of industrial process waters (steam condensate and diesel engine cooling water) at the Facility. Because chronic toxicity is considered to be a more conservative indicator of toxicity, and the monitoring of all industrial process wastewater sample locations for both acute and chronic toxicity would be costly and redundant, the monitoring requirements and effluent limitations for acute toxicity have been removed for industrial process water based on the application of the more conservative chronic toxicity requirements. If the Discharger complies with effluent limitations for chronic toxicity, they will achieve water quality greater than that necessary to achieve compliance with acute toxicity effluent limitations.

The State Water Board has not adopted a policy or plan for regulating toxicity in storm water discharges. NBC currently has acute toxicity effluent limitations for industrial storm water discharges which they have not been able to achieve. An acute toxicity effluent limitation from Order R9-2009-0081 as modified by Order No. R9-2010-0057 has been carried over to this Order for industrial storm water and incorporates USEPA's guidance on the Test of Significant Toxicity (TST) approach. This Order also allows the Navy to conduct a study on chronic toxicity in industrial storm water discharges to evaluate appropriate instream waste concentration (IWC) for discharges to San Diego Bay. Because there is no established policy and the potential effects on receiving waters from chronic toxicity in industrial storm water discharges are not well understood, this Order maintains the acute toxicity effluent limitation for Industrial High Risk Areas storm water discharges. The San Diego Water Board may choose to establish end-of-pipe chronic toxicity effluent limitations for Industrial High Risk Areas storm water discharges in the future. In developing such a limitation, an IWC of 100 percent will be assumed unless mixing zones or dilution credits are authorized by the San Diego Water Board.

#### Navy Acute Toxicity Effluent Limitation Challenge

During the previous renewal of the Discharger's NPDES permits for NBPL and NBC in 2002 and 2003, the Discharger challenged the acute toxicity limitation, asserting that the acute toxicity limitation is not based on scientific data, that it is overly stringent for protecting water quality, and that diversion of all storm water runoff to the sanitary sewer is the only effective BAT/BCT for meeting the effluent limitation. The Discharger's challenge to the acute toxicity effluent limitation is addressed below because this Order establishes acute toxicity effluent limitations for storm water and chronic toxicity effluent limitations for applicable industrial wastewaters.

The acute toxicity effluent limitation established in Order No. R9-2009-0081 was established to implement the Basin Plan water quality objective for toxicity in receiving waters. The effluent limitation was derived from, and is essentially the same as, the acute toxicity discharge standard contained in the Bays and Estuaries Policy.

The Discharger's NPDES permits contained provisions which allowed the Discharger to recommend, after conducting a required study, alternative scientifically valid survival rates for acute exposure to discharges of storm water from industrial areas at the Discharger's facilities. The Discharger conducted a study to develop a scientifically defensible, and appropriate, toxicity limitation for industrial storm water discharges from Naval facilities to San Diego Bay. The results of the study were summarized in a Final Report, *Storm Water Toxicity Evaluation Conducted at: Naval Station San Diego, Naval Submarine Base San Diego, Naval Amphibious Base Coronado, and Naval Air Station North Island*, dated May 2006.

The Discharger's final recommendations included in the report are summarized below:

- The use of appropriate USEPA WET test methods and data evaluation when declaring a test result as toxic.
- Acknowledge WET method variability and the minimum significant difference that laboratory testing can provide in declaring a toxic result.
- Consideration of realistic exposure conditions when using WET testing to infer toxicity in the receiving water.

In addition, the Discharger submitted comments regarding the current acute toxicity requirements. Comments of significant importance are summarized below:

- The Discharger requested that the existing storm water toxicity testing language be revised to require a statistical comparison of discharge toxicity results with control sample toxicity results using a student t-test, to determine whether a discharge is toxic or not.
- The Discharger requested that the existing storm water toxicity testing language be revised to require the use of percent minimum significant difference, using the 10<sup>th</sup> and 75<sup>th</sup> percentiles as lower and upper bounds, respectively, to account for inherent variability of toxicity testing procedures to determine whether a discharge is toxic or not.
- The Discharger requested that the existing storm water toxicity discharge specification language be revised according to two proposed alternatives that presumably consider realistic exposure conditions to infer toxicity in the receiving water.

San Diego Water Board staff stated in a memorandum to the Executive Officer dated August 22, 2006 that the Discharger's proposed toxicity alternatives should not be adopted in their entirety and, "*Toxicity in storm water discharges should not be ignored just because the causative agent is diluted in bay water. Testing times should not be shortened to ensure that the variability inherent to storm water discharges is not causing low level toxicity that may be missed in an acute test.*" However, Order R9-2009-0081 established acute toxicity effluent limitations based on comparison of the discharge and a control using a statistical analysis.

#### Toxicity Rationale

The San Diego Water Board has considered the following information in developing toxicity monitoring and effluent limitations:

- The May 2006 storm water toxicity study performed by the Discharger;
- Comments received from the Discharger;
- Discussions with USEPA Region 9;
- USEPA's June 2010 guidance document titled *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document, An Additional Whole Effluent Toxicity Statistical Approach for Analyzing Acute and Chronic Data* (EPA 833-R-10-003);
- USEPA's June 2010 guidance document titled *National Pollutant Discharge Elimination System Test of Significant Toxicity Technical Document, An Additional Whole Effluent Toxicity Statistical Approach for Analyzing Acute and Chronic Data* (EPA 833-R-10-004);
- The narrative water quality for objective for toxicity contained in the Water Quality Control Plan for the San Diego Basin (Basin Plan); and
- An interpretation of applicable state and federal regulations.

The implementation of toxicity monitoring requirements and effluent limitations for discharges to San Diego Bay and Pacific Ocean are based on a new statistical approach

developed by USEPA that assesses the whole effluent toxicity measurement of wastewater effects on specific test organisms' ability to survive, grow, and reproduce called the TST. This new approach is a statistical method that uses hypothesis testing techniques based on research and peer-reviewed publications. The approach examines whether an effluent at the critical concentration and a control within a whole effluent toxicity test differ by an unacceptable amount (the amount that would have a measured detrimental effect on the ability of aquatic organisms to thrive and survive).

Organism response to the effluent and control are unlikely to be exactly the same, even if no toxicity is present. They might differ by such a small amount that even if statistically significant, it would be considered negligible biologically. A more useful approach could be to rephrase the null hypothesis, "Is the mean response in the effluent less than a defined biological amount?" The Food and Drug Administration has successfully used that approach for many years to evaluate drugs, as have many researchers in other biological fields. In that approach, the null hypothesis is stated as the organism response in the effluent is less than or equal to a fixed fraction (*b*) of the control response (e.g., 0.75 of the control mean response):

Null hypothesis: Treatment mean  $\leq b$  \* Control mean

To reject the null hypothesis above means the effluent is considered non-toxic. To accept the null hypothesis means the effluent is toxic.

Before the TST null hypothesis expression could be recommended by USEPA, certain Regulatory Management Decisions (RMDs) were needed, including what effect level in the effluent is considered unacceptably toxic and the desired frequency of declaring a truly negligible effect within a test non-toxic.

In the TST approach, the *b* value in the null hypothesis represents the threshold for unacceptable toxicity. For chronic toxicity, the USEPA made the RMD that the *b* value is set at 0.75, which means that a 25 percent effect (or more) at the IWC is considered evidence of unacceptable chronic toxicity. For acute toxicity, the *b* value is set at 0.80.

USEPA's RMDs for the TST method are intended to identify unacceptable toxicity most of the time when it occurs, while also minimizing the probability that the IWC is declared toxic when in fact it is truly acceptable. Additional RMDs by USEPA to achieve this objective were made regarding acceptable maximum false positive ( $\beta$  using a TST approach) and false negative rates ( $\alpha$  using a TST approach).

In the TST approach, the RMDs are defined as follows:

1. Declare a sample toxic between 75 – 95 percent of the time ( $0.05 \leq \alpha \leq 0.25$ ) when there is unacceptable toxicity.
2. Declare an effluent non-toxic no more than 5 percent of the time ( $\beta \leq 0.05$ ) when the effluent effect at the critical effluent concentration is 10 percent.

USEPA used valid toxicity data from approximately 2,000 WET tests to develop and evaluate the TST approach. The TST approach was tested using nine different whole effluent toxicity test methods comprising twelve biological endpoints and representing most of the different types of whole effluent toxicity test designs in use. More than one

million computer simulations were used to select appropriate alpha error rates for each test method that also achieved USEPA's other RMDs for the TST approach.

Effluent limitations are established using the TST "pass" "fail" approach as well as a percent effect.

**Chronic Pass:** A test result that rejects the null hypothesis (Ho) below is reported as "Pass" in accordance with the TST approach:

Ho: Mean response (100 percent effluent)  $\leq 0.75 \times$  Control mean response

**Chronic Fail:** A test result that does not reject the null hypothesis (Ho) above is reported as "Fail" in accordance with the TST approach.

**Percent Effect:** The percent effect at the IWC is calculated for each test result using the following equation:

$$\% \text{ Effect at IWC} = \frac{\text{Mean Control Response} - \text{Mean IWC Response}}{\text{Mean Control Response}} * 100$$

A Maximum Daily Effluent Limitation (MDEL) and Median Monthly Effluent Limitation (MMEL) for chronic toxicity are established for applicable industrial process wastewaters (steam condensate and diesel engine cooling water). The MDEL is exceeded and a violation will be flagged when a toxicity test during routine monitoring results in a "fail" in accordance with the TST approach and the percent effect relative to a control is greater than or equal to 50%. The MMEL is exceeded when the median results of three independent toxicity tests, conducted within the same calendar month, and analyzed using the TST, (i.e. two out of three) is a "fail".

**Acute Pass:** An acute toxicity test result that rejects the null hypothesis (Ho) below is reported as "pass" in accordance with the TST approach:

Ho: Mean response (100 percent effluent)  $\leq 0.80 \times$  Control mean response

**Acute Fail:** An acute toxicity test result that does not reject the null hypothesis (Ho) above is reported as "fail" in accordance with the TST approach.

A MDEL for acute toxicity is established for Industrial High Risk Areas storm water discharges and is exceeded when a toxicity test during routine monitoring results in a "fail" in accordance with the TST approach and the percent effect relative to a control is greater than or equal to 40%.

In June 2010, USEPA published a guidance document titled, *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, June 2010), in which they recommend the following: "Permitting authorities should consider adding the TST approach to their implementation procedures for analyzing valid WET data for their current NPDES WET Program." The TST approach is another statistical option for analyzing valid WET test data. Use of the TST approach does not result in any changes to USEPA's WET test methods. USEPA's *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms, Third Edition (EPA-821-R-02-014)*, recognizes that, "the statistical methods in this manual are not the only possible methods of statistical

analysis.” The TST approach can be applied to acute (survival) and chronic (sublethal) endpoints and is appropriate to use for both freshwater and marine EPA WET test methods.

USEPA’s WET testing program and acute and chronic WET methods rely on the measurement result for a specific test endpoint, not upon achievement of specified concentration-response patterns to determine toxicity. USEPA’s WET methods do not require achievement of specified effluent or ambient concentration-response patterns prior to determining that toxicity is present. Nevertheless, USEPA’s acute and chronic WET methods require that effluent and ambient concentration-response patterns generated for multi-concentration acute and chronic toxicity tests be reviewed—as a component of test review following statistical analysis—to ensure that the calculated measurement result for the toxicity test is interpreted appropriately (EPA-821-R-02-012, section 12.2.6.2; EPA-821-R-02-013, section 10.2.6.2.). In 2000, EPA provided guidance for such reviews to ensure that test endpoints for determining toxicity based on the statistical approaches utilized at the time the guidance was written (NOEC, LC50’s, IC25s) were calculated appropriately (EPA 821-B-00-004).

Appropriate interpretation of the measurement result from USEPA’s TST statistical approach (pass/fail) for effluent and receiving water samples is, by design, independent from the concentration-response patterns of the toxicity tests for those samples. Therefore, when using the TST statistical approach, application of EPA’s 2000 guidance on effluent and receiving waters concentration-response patterns will not improve the appropriate interpretation of TST results as long as all Test Acceptability Criteria and other test review procedures—including those related to Quality Assurance for effluent and receiving water toxicity tests, reference toxicity tests, and control performance (mean, standard deviation, and coefficient of variation)—described by the WET test methods manual and TST guidance, are followed. The 2000 guidance may be used to identify reliable, anomalous, or inconclusive concentration-response patterns and associated statistical results to the extent that the guidance recommends review of test procedures and laboratory performance already recommended in the WET test methods manual. The guidance does not apply to single-concentration (IWC) and control statistical t-tests and does not apply to the statistical assumptions on which the TST is based. The Regional Water Board will not consider a concentration-response pattern as sufficient basis to determine that a TST t-test result for a toxicity test is anything other than valid, absent other evidence. In a toxicity laboratory, unexpected concentration-response patterns should not occur with any regular frequency and consistent reports of anomalous or inconclusive concentration-response patterns or test results that are not valid will require an investigation of laboratory practices.

Any Data Quality Objectives or Standard Operating Procedure used by the toxicity testing laboratory to identify and report valid, invalid, anomalous, or inconclusive effluent or receiving water toxicity test measurement results from the TST statistical approach which include a consideration of concentration-response patterns and/or Percent Minimum Significant Difference (PMSDs) must be submitted for review by the Regional Water Board, in consultation with USEPA and the State Water Board’s Quality Assurance Officer and Environmental Laboratory Accreditation Program (40 CFR section 122.44(h)). As described in the bioassay laboratory audit directives to the San Jose Creek Water Quality Laboratory from the State Water Resources Control Board dated August 7, 2014, and from the USEPA dated December 24, 2013, the PMSD criteria only apply to compliance for NOEC and the sublethal endpoints of the NOEC, and are not used to interpret TST results.

A percent effect of 50% for chronic toxicity and 40% for acute toxicity has been incorporated into the MDEL. The decision to conduct a Toxicity Identification Evaluation (TIE) is based upon consideration of multiple factors such as the magnitude and persistence of toxicity. The magnitude of toxicity present in effluent is an important consideration because a moderate to high level of toxicity typically yield more successful results. Usually, TIEs can be successfully conducted on samples producing at least 50 percent effect (e.g., >50% mortality or reduction in reproduction), and this value is recommended for general use in selecting samples for TIEs. Effective TIEs can also be conducted with less toxic samples (e.g., >25% effect), but there is a greater chance of the TIE being inconclusive due to changes in toxicity with storage or variability in response (Norberg-King et al. 2005). A percent effect of 50% for chronic toxicity and 40% for acute toxicity has been incorporated into the MDEL based on recommendations from USEPA and to facilitate a successful TIE.

The IWC for these discharges are established at 100% effluent. Because the San Diego Water Board has no documentation to support a different IWC, the IWC is defined as 100 percent effluent (undiluted). This IWC is consistent with other San Diego Water Board's NPDES permitted discharges to San Diego Bay which do not allow dilution. This Order allows further study on the appropriate IWC for chronic toxicity observed in industrial storm water discharges to San Diego Bay.

The San Diego Water Board finds that the application of USEPA's TST method with the 50% effect for chronic toxicity and 40% effect for acute toxicity is scientifically defensible and appropriate for the determination of compliance with the Basin Plan's narrative objective for toxicity and an acceptable alternative to the Ocean Plan's toxicity objective for discharges to the Pacific Ocean. As such, toxicity monitoring requirements, analysis, and effluent limitations are established in this Order based on USEPA's TST method and a 50% effect for chronic toxicity and 40% effect for acute toxicity. Taken together, these refinements of using chronic toxicity instead of acute toxicity for industrial process wastewater and using the TST approach with the appropriate percent effect clarifies the requirements for toxicity analyses, provide the Discharger with the positive incentive to generate high quality data, and affords greater protection of aquatic life.

#### **b. Acute Toxicity**

Acute toxicity effluent limitations have been maintained for industrial high risk storm water discharges and have been updated to use the USEPA's TST method with a percent effect of 40%.

#### **c. Chronic Toxicity**

As previously discussed, chronic toxicity monitoring requirements and effluent limitations have been established for industrial process wastewater discharges demonstrated to have toxic pollutants in toxic concentrations, consistent with the State Water Board's draft Toxicity Policy and USEPA's TST approach.

This Order also requires the Discharger to implement BMPs to prevent or eliminate toxicity, investigate the causes of any toxicity, and identify and implement corrective actions to reduce or eliminate effluent toxicity.

**D. Final Effluent Limitations**

Industrial process wastewater discharges regulated under this order include pier washing, utility vault and manhole dewatering, pier boom cleaning, boat rinsing, steam condensate, and diesel engine cooling water.

1. **BMP Regulated Industrial Process Wastewater.** The discharge of pier washing wastewater at Discharge Point No. PW-001 and Utility Vault and Manhole Dewatering at Discharge Point No. UV-001 through UV-013 in Table 4 is regulated using a narrative effluent limitation BMP approach under section VI.C.3 of this Order. Pier boom cleaning and boat rinsing have no discharge to surface waters require BMPs under section VI.C.3 of this Order to prevent discharges.

**Table F-21. Industrial Process Wastewaters Regulated with BMPs**

Type of Discharge	Discharge Point Nos.
Pier Washing Wastewater	PW-001
Utility Vault and Manhole Dewatering	UV-001 through UV-013
Pier Boom Cleaning	No Discharge
Boat Rinsing	No Discharge

2. **Steam Condensate Discharges.** Effluent Limitations for Steam Condensate – Discharge Point Nos. SC-001 through SC-010
  - a. Applicable TBELs and WQBELs for pH have been applied in this Order. Both TBELs and WQBELs are applicable to discharges to San Diego Bay (6.0 – 9.0 standard units and 7.0 – 9.0 standard units, respectively). To ensure the protection of water quality, the more stringent lower and upper limitations for pH (7.0 to 9.0) have been applied as final effluent limitations for discharges to San Diego Bay in this Order. These limits have also been applied as final effluent limitations for discharges of steam condensate to the Ocean (SC-10) to maintain the pH limitations from the current permit.
  - b. Order No. R9-2009-0081 has a maximum daily effluent limitation of 11.8 µg/L for Bis(2-Ethylhexyl)Phthalate in steam condensate discharges to San Diego Bay which is more stringent than the 14 µg/L maximum daily effluent limitation calculated above. The more stringent effluent limitation rounded to two significant figures has been applied in this Order.
  - c. Order No. R9-2009-0081 established effluent limitations for steam condensate discharges to San Diego Bay. New limitations have been calculated for steam condensate discharges from Discharge Point SC-010 to the Pacific Ocean based on the Ocean Plan except the maximum daily effluent limitation for copper of 5.8 µg/L has been retained from the current permit because it is more stringent than the 12 µg/L calculated above.
  - d. The Discharger shall maintain compliance with the following effluent limitations in Tables F-20 and F-21 at Discharge Point Nos. SC-001 through SC-010 with compliance measured at Monitoring Locations SC-001 through SC-010 as described in the Monitoring and Reporting Program (MRP), Attachment E of this Order.

**Table F-22. Effluent Limitations for Steam Condensate Discharges to San Diego Bay – Discharge Point Nos. SC-001 through SC-009**

Parameter	Units	Effluent Limitations			
		Average Monthly	Weekly Average	Maximum Daily	Instantaneous Maximum
Arsenic, Total Recoverable	µg/L	30	--	59	--

Chronic Toxicity	Pass/Fail	<sup>2</sup>	--	<sup>2</sup>	--

<sup>1</sup> Within limits of 7.0 – 9.0 standard units at all times.  
<sup>2</sup> As defined in section VII.J of the Order.

**Table F-23. Effluent Limitations for Steam Condensate Discharges to the Pacific Ocean – Discharge Point No. SC-010**

Parameter	Units	Effluent Limitations				
		6-Month Median	Average Monthly	Weekly Average	Maximum Daily	Instantaneous Maximum
Copper, Total Recoverable	µg/L	3	--	--	5.8	30
Lead, Total Recoverable	µg/L	2	--	--	8	20
Zinc, Total Recoverable	µg/L	20	--	--	80	200
TCDD Equivalents	µg/L	--	3.9x10 <sup>-9</sup>	--	--	--
Bis(2-Ethylhexyl)Phthalate	µg/L	--	3.5	--	--	--
Oil and Grease	mg/L	--	25	40	--	75
Settleable Solids	ml/L	--	1.0	1.5	--	3.0
Turbidity	NTU	--	75	100	--	225
pH	standard units	--	--	--	--	1
Chronic Toxicity	Pass/Fail	--	<sup>2</sup>	--	<sup>2</sup>	--

<sup>1</sup> Within limits of 7.0 – 9.0 standard units at all times.  
<sup>2</sup> As defined in section VII.J of the Order.

**3. Diesel Engine Cooling Water Discharges.** Final Effluent Limitations for Diesel Engine Cooling Water – Discharge Point No. CW-001

- a. The Discharger shall maintain compliance with the following effluent limitations in Table F-22 at Discharge Point No. CW-001 with compliance measured at Monitoring Location CW-001 as described in the MRP, Attachment E of this Order.

**Table F-24. Effluent Limitations for Diesel Engine Cooling Water**

Parameter	Units	Effluent Limitations			
		Average Monthly	Weekly Average	Maximum Daily	Instantaneous Maximum
Arsenic, Total Recoverable	µg/L	20	--	62	--
Chromium VI, Total Recoverable	µg/L	27	--	85	--
Copper, Total Recoverable	µg/L	2.0	--	5.8	--
Lead, Total Recoverable	µg/L	5.8	--	15	--
Nickel, Total Recoverable	µg/L	5.7	--	15	--
Selenium, Total Recoverable	µg/L	58	--	120	--
Zinc, Total Recoverable	µg/L	37	--	95	--
4,4-DDT	µg/L	0.00059	--	0.0017	--
4,4-DDE	µg/L	0.00059	--	0.0012	--
4,4-DDD	µg/L	0.00084	--	0.0017	--
Oil and Grease	mg/L	25	40	--	75
Settleable Solids	ml/L	1.0	1.5	--	3.0
Turbidity	NTU	75	100	--	225
pH	standard units	--	--	--	1
Chronic Toxicity	Pass/Fail	<sup>2</sup>	--	<sup>2</sup>	--

<sup>1</sup> Within the limit of 7.0 – 9.0 standard units at all times.

<sup>2</sup> As defined in section VII.J of the Order.

- b. Order No. R9-2009-0081 has an average monthly effluent limitation of 5.8 µg/L for lead in cooling water discharges to San Diego to San Diego Bay which is more stringent than the 6.3 µg/L effluent limitation calculated above. The more stringent effluent limitation has been applied in this Order.
4. The previous Order required the Discharger to develop and implement a SWPPP for storm water discharges throughout the Facility, as authorized by CWA section 304(e) and section 402(p). The requirements to update and implement a SWPPP are carried over from the previous Order.
  5. Discharges of pollutants in storm water discharges, from areas designated under section IV.B.1 of this Order as Industrial High Risk Areas, to Waters of the U.S. from Discharge Points specified in Attachment M of this Order shall maintain compliance with the MDEL for acute toxicity. The MDEL is based on the outcome of the TST approach and the resulting percent effect at the IWC in accordance with Compliance Determination, section VII. of this Order.

## **E. Satisfaction of Anti-Backsliding Requirements**

Sections 402(o) and 303(d)(4) of the CWA and federal regulations at 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. All effluent limitations in this Order are at least as stringent as the effluent limitations in Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 and meet state and federal anti-backsliding requirements. Effluent limitations for reverse osmosis product water have been removed because the Discharger no longer discharges this category of effluent. Further, effluent limitations for previous discharge points not authorized by this Order for steam condensate and diesel engine cooling water have been removed and discharges from these locations are prohibited.

## **F. Satisfaction of Antidegradation Policy**

WDRs for the Discharger must conform with federal and state antidegradation policies provided at 40 CFR section 131.12 and in State Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality of Waters in California*. The antidegradation policies require that beneficial uses and the water quality necessary to maintain those beneficial uses in the receiving waters of the discharge shall be maintained and protected, and, if existing water quality is better than the quality required to maintain beneficial uses, the existing water quality shall be maintained and protected unless allowing a lowering of water quality is necessary to accommodate important economic and social development or is consistent with maximum benefit to the people of California. When a significant lowering of water quality is allowed by the San Diego Water Board, an antidegradation analysis is required in accordance with the State Water Board's Administrative Procedures Update (July 2, 1990), *Antidegradation Policy Implementation for NPDES Permitting*.

The discharge of steam condensate at 66 discharge points to San Diego Bay was previously authorized in Order No. R9-2009-0081, however, some of these discharges were to the Pacific Ocean not San Diego Bay. This Order authorizes the discharge of steam condensate from Discharge Points SC-001 through SC-009 to San Diego Bay and Discharge Point SC-010 to the Pacific Ocean. Discharge Point SC-010 is in the same discharge location as Discharge Point SC-061 authorized in Order No. R9-2009-0081. The receiving water for SC-061 was mischaracterized in Order No. R9-2009-0081 as a discharge to San Diego Bay. Discharges from Discharge Point SC-010 (previously SC-061) are expected to be low volume and infrequent, and the Discharger has removed 62 discharge points for steam condensate, many of which are also anticipated to have been mischaracterized as discharges to San Diego Bay, and significantly reduced the total discharge flow. WQBELs have been established that are protective of water quality and are at least as stringent as in Order No. R9-2009-0081. The correction of this receiving water error is not anticipated to result in a lowering of water quality within the receiving water and is consistent with state and federal antidegradation requirements.

The limitations and requirements of this Order are more stringent than established in Order No. R9-2009-0081 as modified by Order No. R9-2010-0057. The permitted discharge is consistent with the antidegradation provisions of 40 CFR section 131.12 and State Water Board Resolution No. 68-16. Compliance with these requirements will result in the use of best practicable treatment or control of the discharge. The impact on existing water quality will be insignificant.

## **G. Stringency of Requirements for Individual Pollutants**

This Order contains both TBELs and WQBELs for individual pollutants. The TBELs applied in the Order consist of restrictions on oil and grease, settleable solids, turbidity, and pH as specified in Table 2 of the Ocean Plan; a requirement to continue to implement a BMP and PPP for utility vault and manhole dewatering discharges; a requirement to develop and maintain a BMP Plan to prevent discharges from pier boom, fender, and mooring cleaning; and a requirement to continue to implement a SWPPP for toxic pollutants and hazardous substances in storm water runoff. These restrictions and requirements are discussed in section IV.B.2. of this Fact Sheet. This Order's technology-based pollutant restrictions implement the minimum, applicable federal technology-based requirements. These limitations are not more stringent than required by the CWA.

WQBELs have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant WQBELs were derived from the CTR, the CTR is the applicable standard pursuant to 40 CFR section 131.38. The scientific procedures for calculating the individual WQBELs for priority pollutants are based on the CTR-SIP. WQBELs were also derived from the Ocean Plan using scientific procedures established in the Ocean Plan. All beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless *"applicable water quality standards for purposes of the CWA"* pursuant to section 131.21 (c)(1). Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement the requirements of the CWA.

## **H. Storm Water Risk Level Designations**

This Order addresses storm water discharges from various locations throughout the Facility, with varying degrees of industrial activity and potential to impact water quality. As such, a tiered approach has been applied in this Order to control storm water discharges, including MS4 requirements, industrial storm water requirements, and effluent limitations. To apply the appropriate controls for storm water, the Discharger is required to identify all storm water outfalls located at the Facility, and designate the outfalls as Industrial High Risk Areas, Industrial Low Risk Areas, Industrial No Exposure Areas, or Small Military Base MS4 Areas.

Because operations at the Facility are subject to change, annual site surveys are necessary to account for any operational changes that may occur at the Facility to ensure that appropriate regulatory mechanisms are being applied. In addition, the Discharger shall conduct periodic inspections throughout the year to ensure that storm water risk level designations remain applicable.

## **I. Small Military Base MS4 Discharge Specification**

The San Diego Water Board finds that Phase II MS4 requirements are applicable to storm water discharges from non-industrial portions of the Facility. As such, applicable requirements of the Phase II MS4 program, consistent with the requirements 40 CFR section 122.44(k) and the 6 minimum control measures identified in 40 CFR section 122.34(b) have been applied to ensure discharges of storm water from non-industrial areas meet the minimum requirement of MEP. Specific requirements have been established where necessary to increase the tracking and enforceability of the Discharger's SWMP. This approach is consistent with the requirements of

the current Naval Base San Diego Permit (Order No. R9-2013-0064) and Naval Base Point Loma Permit (R9-2014-0037) which include regulation of Phase II MS4 storm water discharges.

## **J. Industrial Storm Water Discharge Specifications**

- a. Pollutant Reduction to BAT/BCT.** NPDES Permits for storm water discharges must meet all applicable provisions of sections 301 and 402 of the CWA. These provisions require control of pollutant discharges using best available technology economically achievable (BAT) and best conventional pollutant control technology (BCT) to prevent and reduce pollutants and any more stringent controls necessary to meet water quality standards.
- b. Storm Water Pollution Prevention Plan (SWPPP) for Industrial Areas.** Prior to the adoption of Order No. 2002-0002, the storm water discharges at the Facility were regulated by the State Water Board's *General Order for Discharges of Storm Water Associated with Industrial Activities Excluding Construction Activities* (Order No. 97-03-DWQ, NPDES No. CAG000001). To carry out the purpose and intent of the CWA, Order No. 97-03-DWQ and subsequently Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 required the Discharger to develop and implement a SWPPP, as authorized by CWA section 304(e) and section 402(p), for toxic pollutants and hazardous substances, and for the control of storm water discharges. Consistent with Order No. 97-03-DWQ and Order No. R9-2009-0081 as modified by Order No. R9-2010-0057, this Order requires the Discharger to continue to implement and regularly update an adequate SWPPP as specified in Attachment G. The SWPPP requirement is explained in more detail in section IV.B.2 of this Fact Sheet and in Attachment G.
- c. Numeric Action Levels (NALs).** Consistent with the direction of the State Water Board, this Order establishes NALs based on USEPA's benchmarks with a tiered compliance strategy of establishing industrial storm water risk levels. This risk level strategy is explained in more detail in section IV.B. of this Order.

## **K. Non-Storm Water Discharge Specifications**

Discharge specifications for the discharge of exempted non-storm water discharges as specified in section IV.F of this Order are based on the requirements of 40 CFR section 122.26(d). These discharge specifications exempt the discharge of certain wastes from prohibition that are not currently expected to be a significant source of pollutants to the receiving waters.

## **V. RATIONALE FOR RECEIVING WATER LIMITATIONS**

### **A. Surface Water**

Receiving water limitations in this Order are derived from the water quality objectives for bays and estuaries established by the Basin Plan (1994), the Bays and Estuaries Policy (1974), the CTR (2000), the State Implementation Policy (2005), the Ocean Plan (2012) and the State Water Board's Sediment Quality Plan (2008). San Diego Bay is listed as impaired for copper, PCBs, sediment toxicity, and benthic community effects in the area near the Facility. This 303(d) impairment and elevated effluent concentrations for these parameters demonstrates that there is reasonable potential to cause or contribute to an exceedance of the sediment quality objectives which have been included as receiving water limitations.

## **VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS**

Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorize the San Diego Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP), Attachment E of this Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this facility.

### **A. Industrial Storm Water Monitoring Location Study and Annual Report**

In order to determine compliance with effluent limitations, action levels, and evaluate the effectiveness of BMPs specified in the SWPPP, this order establishes monitoring requirements for industrial storm water. The San Diego Water Board recognizes that establishing monitoring requirements at all discharge locations would be redundant and an inefficient use of resources. Monitoring is only necessary at representative discharge locations for industrial storm water. This directive requires the discharger to identify representative monitoring locations for these discharges, and verify these monitoring locations annually. Monitoring includes visual as well as sample collection.

### **B. Core Monitoring Requirements**

#### **1. Influent Monitoring – Not Applicable**

#### **2. Industrial Wastewater Effluent Monitoring**

Pursuant to the requirements of 40 CFR section 122.44(i)(2) effluent monitoring is required for all constituents with effluent limitations. Effluent monitoring is necessary to assess compliance with effluent limitations, assess the effectiveness of BMPs and pollution prevention plans, and to assess the impacts of the discharge on the receiving water. Effluent monitoring is necessary to address the following primary questions:

- Does the effluent meet permit effluent limitations based on water quality standards for the receiving water?
- What is the mass discharged annually of each constituent monitored?
- How much pier washing occurs?
- Is the discharge a major source of pollutants?

#### **1. Steam Condensate (Monitoring Locations SC-001 through SC-010)**

- a. Quarterly effluent flow monitoring has been established to determine the volume of condensate being discharged from the Facility into the receiving waters.
- b. Quarterly monitoring has been established to evaluate compliance with applicable WQBELs for pollutants that the discharge has reasonable potential to exceed or contribute to an exceedance of water quality.
- c. Quarterly monitoring has been established for antimony, arsenic, and nickel which had inconclusive reasonable potential analysis.

- d. Quarterly monitoring has been established to evaluate compliance with effluent limitations for oil and grease, turbidity, pH, and settleable solids.
- e. Annual monitoring has been established to evaluate compliance with the WET limitation.
- f. Monitoring the remaining priority pollutants has been established annually so that reasonable potential for all priority pollutants can be evaluated during the next permit renewal.

## **2. Diesel Engine Cooling Water (Monitoring Location CW-001)**

- a. Quarterly effluent flow monitoring has been established to determine the volume of condensate being discharged from the Facility into the receiving waters.
- b. Quarterly monitoring has been established to evaluate compliance with applicable WQBELs for pollutants that the discharge has reasonable potential to exceed or contribute to an exceedance of water quality.
- c. Quarterly monitoring has been established to evaluate compliance with effluent limitations for oil and grease, turbidity, pH, temperature, and settleable solids.
- d. Annual monitoring has been established to evaluate compliance with the WET limitation.
- e. Monitoring the remaining priority pollutants has been established annually so that reasonable potential for all priority pollutants can be evaluated during the next permit renewal.

## **3. Pier Washing Monitoring (Monitoring Location PW-001)**

An annual log of pier washing activities has been established to track this discharge. Monitoring requirements have been reduced to just those necessary to evaluate compliance with applicable NPDES permit requirements and are BMP focused.

## **4. Utility Vaults and Manhole Dewatering Monitoring (Monitoring Locations UV-001 through UV-013)**

- a. Annual effluent flow monitoring has been established to determine the volume of effluent being discharged from the Facility into the San Diego Bay.
- b. Annual effluent monitoring of total petroleum hydrocarbons-diesel range organics, total petroleum hydrocarbons- gasoline range organics, oil and grease, pH, and total suspended solids has been established to characterize the discharge of utility vault and manhole dewatering from the Facility into the San Diego Bay for these pollutants of concern for this category of effluent.
- c. In order to evaluate BMP implementation and characterize utility vault activities, this Order requires the Discharger to submit a log of the utility vault and manhole dewatering discharges annually.

## **C. Whole Effluent Toxicity (WET) Testing Requirements**

The WET testing is designed to address the following primary questions:

- Does the effluent meet permit effluent limitations for toxicity based on water quality standards for the receiving water?  
If not:
  - Are unmeasured pollutants causing risk to aquatic life?
  - Are pollutants in combination causing risk to aquatic life?
- Does the storm water runoff meet receiving water limitations for toxicity in the receiving water?
- Are conditions in receiving water getting better or worse with regard to toxicity?
- What is the relative storm water runoff contribution to the receiving water toxicity?
- What are the causes of the toxicity and the sources of the constituents responsible?

As discussed above in section IV.C.5 of this Fact Sheet, chronic and acute toxicity effluent limitations established in this Order are based on USEPA's TST and percent effect. Chronic toxicity effluent limitations have been established for industrial process water discharges established in Order No. R9-2009-0081 as modified by Order No. R9-2010-0057. Acute toxicity effluent limitations and monitoring are maintained for industrial storm water. Chronic toxicity monitoring is also required for industrial storm water.

Past sampling of storm water at the Facility shows the presence and reasonable potential for toxicity in the discharge of industrial storm water from the Facility (96 exceedances from December 7, 2009 through May 6, 2013). This Order requires the Discharger to conduct additional toxicity testing for exceedances of the toxicity effluent limitations. If the additional tests demonstrate toxicity, the Discharger is required to submit a Toxicity Reduction Evaluation (TRE) Workplan in accordance with USEPA guidance which shall include: further steps taken by the Discharger to investigate, identify, and correct the causes of toxicity; actions the Discharge will take to mitigate the effects of the discharge and prevent the recurrence of toxicity; and a schedule for these actions. This provision also includes requirements to initiate the TRE/Toxicity Identification Evaluation (TIE) process if the results of toxicity testing exceed the effluent limitation for toxicity.

#### **D. Receiving Water Monitoring**

Receiving water and sediment monitoring shall be designed and conducted to address the following primary questions:

- (1) Does the receiving water meet water quality standards listed in section V of this Order, Receiving Water Limitations?
- (2) Are the receiving water conditions getting better or worse over time?
- (3) Does the Facility cause or contribute to violations of the Receiving Water Limitations in section V of this Order?

##### **1. Water and Sediment Monitoring Plan**

The Discharger is required to submit a Water and Sediment Monitoring Plan within 12 months of the effective date of this Order. The Water and Sediment Monitoring Plan has all the elements required by the State Water Board's Sediment Quality Plan, which became effective on August 25, 2009, to be implemented for both water and sediment for

consistency. A conceptual model, existing data, and ongoing monitoring must be considered in the development of the Water and Sediment Monitoring Plan.

## **2. Receiving Water Monitoring**

- a. Monitoring of the receiving water is necessary to determine if the discharges from the Facility are impacting the water quality objectives, applicable beneficial uses, and aquatic life.
- b. Monitoring locations will be determined in the Water and Sediment Monitoring Plan.
- c. Annual monitoring of arsenic, copper, lead, nickel, and zinc in the Pacific Ocean and the San Diego Bay has been established to determine compliance with receiving water limitations and to help determine reasonable potential, as specified in section 1.3 of the SIP, for future permitting efforts. These constituents are required based on the RPA for the steam condensate and diesel engine cooling water, storm water benchmark exceedances, and BPJ.
- d. Semiannual temperature monitoring has been established in order to determine compliance with Prohibition III.B for the temperature effluent limitation for discharges of steam condensate.
- e. Semiannual chronic toxicity monitoring has been added to assess the impacts of storm water discharges on the receiving water. The Discharger is required to monitor chronic toxicity twice per year concurrently with the end of pipe high risk industrial storm water discharge monitoring required in Table E-8 of this MRP. The receiving water chronic toxicity sample is to be collected in the receiving water adjacent to the storm drain outfall sampled in Table E-8 during the storm event. The results of the chronic toxicity testing in the receiving water shall be included in the Annual Storm Water Report.
- f. Annual monitoring of other pollutants identified by the Discharger has been added for pollutants identified by the Discharger during routine monitoring of industrial process water or storm water.

## **3. Sediment Monitoring**

- a. This Order establishes monitoring and analysis requirements consistent with the State Water Board's Sediment Quality Plan.
- b. Monitoring locations will be determined in the Water and Sediment Monitoring Plan.
- c. Sediment chemistry, toxicity, and benthic community monitoring are required in accordance with, and at a minimum, the requirements under the State Water Board's Sediment Quality Plan.

## **4. Monitoring Coalitions**

To achieve maximum efficiency and economy of resources, the San Diego Water Board encourages and may require San Diego Bay dischargers to establish or join a San Diego Bay water body monitoring coalition. Monitoring coalitions enable the sharing of technical resources, trained personnel, and associated costs and create an integrated water and sediment monitoring program within each water body. Focusing resources on water body issues and developing a broader understanding of pollutants effects in these water bodies

enables the development of more rapid and efficient response strategies and facilitates better management of water and sediment quality.

## **5. Water Column and Sediment Monitoring Report**

The Discharger or water body monitoring coalition is required to submit a Water and Sediment Monitoring Report at least twice during a permit cycle in accordance with the schedule contained in the Water and Sediment Monitoring Plan unless otherwise directed in writing by the San Diego Water Board. Receiving water sampling will be done annually and sediment sampling will be done at least twice during the term of this Order, so two reports during a permit cycle will allow more samples to be collected and reported in one report.

## **E. Other Monitoring Requirements**

1. The discharge of industrial contact storm water to the San Diego Bay or the Pacific Ocean may contain pollutants from the surrounding area which could contribute to the exceedance of the water quality criteria/objectives of the receiving waters. Industrial storm water monitoring requirements have been established to determine the effects of storm water discharges on the receiving water and monitor the effectiveness of the SWPPP to meet applicable NALs and receiving water limits. Order No. R9-2009-0081 as modified by Order No. R9-2010-0057 required monitoring of industrial storm water for oil and grease, total suspended solids (TSS), pH, copper, zinc, acute toxicity, electrical conductivity, settleable solids, total organic carbon, total petroleum hydrocarbons, and other pollutants identified by the Discharger as likely to be present, at two storms per year. The Discharger was also required to monitor for remaining priority pollutants for two storm events for the first and last year of the permit term.

Under this Order, industrial areas on NBC have been divided into three categories: Industrial No-Exposure, Industrial Low Risk, and Industrial High Risk. Each category has different monitoring requirements. Industrial storm water monitoring has been retained for copper, zinc, acute toxicity, oil and grease pH, TSS, and other parameters identified by the Discharger as likely to be present within storm water discharges from highly industrial areas. Additional monitoring has been established for metals (arsenic, cadmium, mercury, nickel, selenium, and silver) that are either bioaccumulative and a greater risk to the receiving water, or are often found in the discharge of storm water from highly industrial areas. Additionally, monitoring for nutrients has been added to evaluate potential eutrophication impacts on the receiving waters. There is limited information on pollutants in storm water from the Facility. Because of this limited information, the Discharger is required to monitor industrial high risk areas for all of the NAL pollutants in Table G-1 of Attachment G to this Order. Monitoring of these additional pollutants can be discontinued after four consecutive sample events where the parameter is not detected or is below the Annual NAL values in Table G-1 of Attachment G to this Order.

Industrial storm water monitoring frequency has been increased to two storms per semiannual period in conformance with the statewide Industrial Storm Water General Permit.

Chronic toxicity monitoring has been established in addition to acute toxicity for discharges from "Industrial High Risk Areas" to determine reasonable potential. The industrial storm water monitoring program is designed to address the following primary questions:

- Does the runoff meet permit effluent limitations for toxicity thereby ensuring water quality standards are achieved in the receiving water?
  - Does the runoff meet the NALs?
  - Is the SWPPP being properly implemented?
  - Is the Facility achieving standards of BAT and BCT?
2. The Discharger is required to submit a sampling plan for Small Military Base MS4 storm water discharges within 24 months of the effective date of this Order. A minimum subset of three representative monitoring locations for storm water and dry-weather discharges within the Small Military Base MS4 Areas of the Facility. These monitoring locations shall be sampled for pollutants identified by the Discharger. Sampling and analysis is required twice per year for storm water and twice per year for dry-weather. The Small Military Base MS4 monitoring program shall be designed to address the following primary questions:
- Is the SWMP being properly implemented?
  - Is the Facility achieving the standard of reducing pollutants in MS4 discharges to the MEP?
3. Monitoring requirements for spill and illicit discharges are in this Order to help determine the effectiveness of the BMP Plan and ensure that appropriate BMPs are properly implemented. This log is designed to answer the following primary monitoring questions:
- Are there more frequent and/or bigger spills at this Facility than at other similar facilities?
  - Are spills and illicit discharges properly addressed and are measures being taken or planned to reduce, eliminate, and prevent them in the future?

## VII. RATIONALE FOR PROVISIONS

### A. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR section 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR section 122.42, are provided in Attachment D. The discharger must comply with all standard provisions and with those additional conditions that are applicable under 40 CFR section 122.42.

Section 122.41(a)(1) and (b) through (n) of 40 CFR establish conditions that apply to all state-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in this Order. 40 CFR section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with 40 CFR section 123.25, this Order omits federal conditions that address enforcement authority specified in 40 CFR sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

## **B. Monitoring and Reporting Program (MRP) Requirements**

Language in this section requires the Discharger to properly implement and submit self-monitoring reports (SMRs) to the San Diego Water Board and Discharger Monitoring Reports (DMRs) for USEPA to the State Water Board. Telephone and fax numbers are also provided. The San Diego Water Board office may be relocated. Dischargers will be notified of new contact information.

## **C. Special Provisions**

### **1. Reopener Provisions**

This Order includes a list of circumstances when this Order may be reopened.

### **2. Special Studies and Additional Monitoring Requirements**

Requirements for a TRE/TIE have been incorporated in the MRP. This section discusses a study on the future development of chronic toxicity effluent limitations for industrial high risk areas.

### **3. Best Management Practices and Pollution Prevention**

**a. Best Management Practices and Pollution Prevention Plan for Utility Vault and Manhole Dewatering Discharges (Utility Vault Plan).** As discussed in sections IV.B.2.b and IV.C.4.a of this Fact Sheet, the San Diego Water Board finds that numerical effluent limitations are not feasible for discharges from utility vault and manhole dewatering discharges. Federal Regulations at 40 CFR sections 122.44(k)(3) and (4) authorize the San Diego Water Board to require BMPs to control or abate the discharge of pollutants when numeric effluent limitations are infeasible and when the practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the CWA.

The development of pollution prevention practices (PPP) provides the flexibility necessary to establish controls which can appropriately address the various utility vault and manhole dewatering discharges. The pollution prevention practices have two major objectives:

- i. To identify situations which allow water to collect in the vault or underground structure and lead to a discharge; and
- ii. To describe and ensure the implementation of practices that will reduce pollutants in the discharge from normal operations of utility companies.

Similar to BMPs, pollution prevention practices are designed to prevent or control the discharge of pollutants. They may include a schedule of activities, prohibition of practices, maintenance procedures, or other management practices. The Best Management Practices and Pollution Prevention Practices Plan for Utility and Manhole Dewatering Discharges (Utility Vault Plan) is a written document that describes the operator's activities to comply with the requirements of this Order. The Utility Vault Plan is intended to evaluate potential pollutant sources at the site and select and implement appropriate measures designed to prevent or control the discharge of pollutants. Order No. R9-2003-0008 incorporated the pertinent requirements of Order No. 2001-11-DWQ, including the requirement to develop and implement a Utility Vault Plan that included

BMPs to achieve BAT and BCT. According to the *Case Study for Utility Vault and Manhole Dewatering Discharges at Naval Base Point Loma, Naval Base San Diego, and Naval Base Coronado* submitted by the Discharger in May 2007, the Discharger has maintained and implemented the *Pollution Prevention Plan for Utility Vault Dewatering Discharges*, which describes the types of discharges, prohibited discharges, pollution prevention practices and BMPs, and monitoring and inspections of utility vault and manhole discharges. Additionally, the case study states that the Discharger has implemented procedures to eliminate manhole dewatering discharges to surface waters and either pumps the water into an adjacent utility manhole or transfers the water to the sanitary sewer system. However, the Discharger acknowledges the potential for rare emergency situations that would require dewatering of a utility vault or manhole onto the ground surface.

Order No. 2014-0174-DWQ, replacing Order No. 2001-011-DWQ, includes additional specifications for pollution prevention practices for Utility Vault and Manhole Dewatering Discharges for dischargers of utility and manhole dewatering discharges. This Order incorporates the additional specifications from Order No. 2014-0174-DWQ. The Discharger is required to maintain and implement their Utility Vault Plan in accordance with the requirements of Provision VI.C.3.a of this Order. For assistance in developing the Utility Vault Plan, the Discharger may refer to the *California Stormwater BMP Handbook – Industrial/Commercial (January 2003 Edition)*, published by the California Stormwater Quality Association, which includes references the Discharger may find useful.

- b. BMP Plan for Industrial Process Water Discharges.** Due to the nature of activities associated with discharges of pier washing, collecting and treating the associated wastewaters prior to discharge is impractical. Therefore, the San Diego Water Board finds that establishing numeric effluent limitations for pollutants in the specified discharges is not feasible. In accordance with 40 CFR sections 122.44(k)(3) and (4), the San Diego Water Board finds that the implementation of BMPs in lieu of numeric effluent limitations are appropriate. This Order requires the Discharger to develop and implement a BMP Plan that includes, at a minimum, the requirements contained in Attachment I to prevent, or minimize the potential for, the release of pollutants to Waters of the State and Waters of the U.S.
- c. CWC section 13263.3(d)(2) Pollution Prevention Plans.** Section 13263.3 of the California Water Code states that pollution prevention should be the first step in the hierarchy for reducing pollution and managing wastes. Further, section 13263.3 (d)(1)(D) states that the San Diego Water Board may require a Discharger to complete and implement a pollution prevention plan the San Diego Water Board determines that pollution prevention is necessary to achieve a water quality objective. Based on storm water monitoring results discussed in section II.E.1 of this Fact Sheet, the Discharger has reasonable potential to exceed the water quality objectives for acute toxicity in industrial storm water. Based on storm water monitoring results discussed in section II.D.4 of this Fact Sheet, the Discharger has regularly exceed the benchmarks for copper and zinc in industrial storm water. Pollution prevention is necessary to achieve water quality objectives for these constituents. The Discharger shall develop and implement a Pollution Prevention Plan for acute toxicity, copper, and zinc in industrial storm water, which at a minimum, meets the requirements outlined in CWC section 13263.3(d)(2), for each applicable discharge.

The Pollution Prevention Plan shall, at a minimum, meet the requirements outlined in

CWC section 13263.3(d)(2) and in this Order, for each applicable discharge. The minimum requirements for the pollution prevention plans include the following:

- i. An analysis of one or more of the pollutants, as directed by the State Water Board, San Diego Water Board, or a POTW, that the Facility discharges into Waters of the State or introduces into POTWs, a description of the sources of the pollutants, and a comprehensive review of the processes used by the discharger that result in the generation and discharge of the pollutants.
- ii. An analysis of the potential for pollution prevention to reduce the generation of the pollutants, including the application of innovative and alternative technologies and any adverse environmental impacts resulting from the use of those methods.
- iii. A detailed description of the tasks and time schedules required to investigate and implement various elements of pollution prevention techniques.
- iv. A statement of the Discharger's pollution prevention goals and strategies, including priorities for short-term and long-term action.
- v. A description of the Discharger's existing pollution prevention methods.
- vi. A statement that the Discharger's existing and planned pollution prevention strategies do not constitute cross media pollution transfers unless clear environmental benefits of such an approach are identified to the satisfaction of the State Water Board, the San Diego Water Board, or the POTW, and information that supports that statement.
- vii. Proof of compliance with the Hazardous Waste Source Reduction and Management Review Act of 1989 (Article 11.9 (commencing with section 25244.12) of Chapter 6.5 of Division 20 of the Health and Safety Code) if the Discharger is also subject to that act.
- viii. An analysis, to the extent feasible, of the relative costs and benefits of the possible pollution prevention activities.
- ix. A specification of, and rationale for, the technically feasible and economically practicable pollution prevention measures selected by the Discharger for implementation.

#### **4. Flood and Runoff Protection Requirements**

The construction, operation, and maintenance specifications have been retained from Order No. R9-2009-0081 as modified by Order No. R9-2010-0057.

#### **5. Other Special Provisions – Not Applicable**

### **VIII. PUBLIC PARTICIPATION**

The San Diego Water Board has considered the issuance of WDRs to serve as an NPDES permit for the U.S. Department of the Navy, Naval Base Coronado. As a step in the WDR adoption process, the San Diego Water Board developed tentative WDRs and has encouraged public participation in the WDR adoption process.

### **A. Notification of Interested Parties**

The San Diego Water Board notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and has provided an opportunity to submit written comments and recommendations. Notification was provided through the following: Published in the San Diego Union-Tribune on September 11, 2015, posted on the San Diego Water Board website on September 11, 2015, and sent by e-mail on September 11, 2015.

The public had access to the agenda and any changes in dates and locations through the San Diego Water Board website at <http://www.waterboards.ca.gov/rwqcb9/>.

### **B. Written Comments**

Interested persons were invited to submit written comments concerning these tentative WDRs. Comments were due either in person or by mail to the Executive Office at the San Diego Water Board at the address above on the cover page of this Order.

To be fully responded to by staff and considered by the San Diego Water Board, written comments were due at the San Diego Water Board offices by 5:00 p.m. on October 12, 2015.

### **C. Public Hearing**

The San Diego Water Board held a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date: **November 18, 2015**  
Time: **9:00 a.m.**  
Location: **California Regional Water Quality Control Board, San Diego Region  
Board Meeting Room  
2375 North Side Drive, Suite 100  
San Diego, CA 92108**

Interested persons were invited to attend. At the public hearing, the San Diego Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony was requested in writing.

### **D. Reconsideration of Waste Discharge Requirements**

Any person aggrieved by this action of the San Diego Water Board may petition the State Water Board to review the action in accordance with CWC section 13320 and CCR title 23, sections 2050 and following. The State Water Board must receive the petition by 5:00 p.m. 30 days after the adoption date of this Order at the following address:

State Water Resources Control Board  
Office of Chief Counsel  
P.O. Box 100, 1001 I Street  
Sacramento, CA 95812-0100

Copies of the law and regulations applicable to filing petitions may be found on the internet at :

[http://www.waterboards.ca.gov/public\\_notices/petitions/water\\_quality](http://www.waterboards.ca.gov/public_notices/petitions/water_quality) or will be provided upon request.

## **E. Information and Copying**

The ROWD, other supporting documents, and comments received are on file and may be inspected at the San Diego Water Board address below at any time between 8:00 a.m. and 5:00 p.m., Monday through Friday. To request a file review please contact the San Diego Water Board receptionist at (619) 516-1990, or email [rb9\\_records@waterboards.ca.gov](mailto:rb9_records@waterboards.ca.gov), or fax (619) 516-1994 or mail requests to:

California Regional Water Quality Control Board  
San Diego Region  
Attention: File Review Request  
2375 Northside Drive, Suite 100  
San Diego, CA 92108

The office is closed on weekends and on all state holidays.

Before making a request to view public records in the San Diego Water Board office interested persons may wish to determine if the information is already available on the San Diego Water Board's website at <http://www.waterboards.ca.gov/sandiego> or the State Water Board's website at <http://www.waterboards.ca.gov>. New and updated information is constantly being added to these websites. For example the San Diego Water Board's website alphabetical index and the State Water Board's Website alphabetical index provide links to many volumes of key documents on the State and Regional Water Board's water quality programs.

The following is a partial list of the documents available:

- Board Meeting Agendas
- Board Meeting Minutes
- Adopted Orders
- Tentative Orders
- Basin Plan
- Ocean Plan

## **F. Register of Interested Persons**

Any person interested in being placed on the mailing list for information regarding this Order should contact the San Diego Water Board, reference this facility, and provide a name, address, and phone number. If possible, email address is preferred.

## **G. Additional Information**

Requests for additional information or questions regarding this Order should be directed to Kristin Schwall at (619) 521-3368 or [kschwall@waterboards.ca.gov](mailto:kschwall@waterboards.ca.gov).

## **ATTACHMENT G – STORM WATER POLLUTION PREVENTION PLAN (SWPPP) REQUIREMENTS FOR INDUSTRIAL AREAS**

### **I. IMPLEMENTATION SCHEDULE**

The Discharger shall continue to implement the existing storm water pollution prevention plan (SWPPP) for all storm water outfalls from the Facility regulated by Order No. R9-2009-0081 until the Discharger has fully completed the implementation of the Storm Water Management Program Requirements specified in section IV.D.2 of the Order. Following full compliance with section IV.D.2 of the Order, the Discharger may phase out coverage of areas designated as “Small Military Base MS4 Area”, as defined in section IV.B.1 of the Order, that are adequately addressed under the Storm Water Management Program (SWMP). All storm water outfalls from the Facility are subject to either the SWPPP or the SWMP.

The Discharger shall implement any necessary revisions to its SWPPP to comply with the requirements of this Order within 1 year of the effective date of this Order.

### **II. SWPPP OBJECTIVES**

**A.** The Discharger’s SWPPP shall be prepared and maintained to achieve the following objectives:

- 1.** To reduce or prevent the discharge of pollutants from industrial activities to the technology-based standards of best available technology economically achievable (BAT) for toxic and non-conventional pollutants, and best conventional pollutant control technology (BCT) for conventional pollutants;
- 2.** To achieve compliance with the Receiving Water Limitations in section V of this Order;
- 3.** To identify and evaluate sources of pollutants associated with industrial activities that may affect the quality of the Facility’s industrial storm water discharges and authorized non-storm water discharges;
- 4.** To identify, describe, and implement site-specific Best Management Practices (BMPs) to reduce or prevent pollutants associated with industrial activities in storm water discharges and authorized non-storm water discharges;
- 5.** To identify and implement timely revisions and/or updates to the SWPPP.

**B.** To achieve the SWPPP objectives, the Discharger shall prepare a written Facility-specific SWPPP in accordance with all applicable SWPPP requirements of this attachment. The SWPPP shall include all required maps, descriptions, schedules, checklists, and relevant copies or specific references to other documents that satisfy the requirements of this attachment. The typical development and implementation steps necessary to achieve the described objectives are summarized in Item A-2, located at the end of this attachment.

### III. PLANNING AND ORGANIZATION

#### A. SWPPP Checklist

The SWPPP shall include a SWPPP Checklist (Example checklist is included as Item A-1 below) located at the end of this section. For each requirement listed, the Discharger shall identify the page number where the requirement is located in the SWPPP (or the title, page number, and location of any reference documents), the implementation date or last revision date, and any SWPPP requirements that may not be applicable to the Facility.

#### B. Pollution Prevention Team

1. The SWPPP shall identify specific individuals and their positions within the Facility organization as members of a storm water pollution prevention team responsible for developing the SWPPP, assisting the Facility manager in SWPPP implementation and revision, and conducting all monitoring program activities required in Attachment E of this Order.
2. The SWPPP shall clearly identify the responsibilities, duties, and activities of each team member.
3. The SWPPP shall identify, as appropriate, alternative individuals to perform the required SWPPP and monitoring program activities when team members are temporarily unavailable (due to vacation, illness, out of town meetings, etc.).

#### C. Review Other Requirements and Existing Facility Plans

1. The SWPPP shall be developed, implemented, and revised as necessary to be consistent with any applicable municipal, state, or federal requirement that pertains to the requirements of this Order.
2. The SWPPP may incorporate or reference the elements of the Discharger's existing plans, procedures, or regulatory compliance documents that contain storm water pollution control practices or otherwise relate to the requirements of this Order. For example, facilities subject to Federal Spill Prevention Control and Countermeasures' requirements should already have instituted a plan to control spills of certain hazardous materials, or facilities subject to regional air quality emission controls may already have evaluated industrial activities that emit dust or particulate pollutants.

### IV. SITE MAP

The SWPPP shall include a site map. The site map shall be provided on an 8 ½ x 11 inch or larger sheet and include notes, legends, north arrow, and other data as appropriate to ensure that the site map is clear and understandable. If necessary, the Discharger may provide the required information on multiple site maps. The following information shall be included on the site map:

- A. Boundaries and Drainage Areas.** Outlines of the Facility boundary, storm water drainage areas within the Facility boundary, and portions of any drainage area impacted by discharges from surrounding areas. Include the flow direction of each drainage area; on-site surface water bodies; areas of soil erosion; and location(s) of near-by water bodies (such as rivers, lakes, wetlands, etc.) or municipal storm drain inlets that may receive the Facility's storm water

discharges and authorized non-storm water discharges.

- B. Storm Water Collection and Conveyance System.** The location of the storm water collection and conveyance system, associated points of discharge, and direction of flow. Include any structural control measures that affect storm water discharges, authorized non-storm water discharges, and run-on. Examples of structural control measures are catch basins, berms, detention ponds, secondary containment, oil/water separators, diversion barriers, etc.
- C. Impervious Areas.** The outline of all impervious areas of the Facility, including paved areas, buildings, covered storage areas, or other roofed structures.
- D. Materials, Spills, and Leaks Locations.** Locations where materials are directly exposed to precipitation and the locations where significant spills or leaks, identified in accordance with section VI.A.4 below, have occurred.
- E. Areas of Industrial Activity.** Identify all storage areas and storage tanks, shipping and receiving areas, fueling areas, vehicle and equipment storage/maintenance areas, material handling and processing areas, waste treatment and disposal areas, dust or particulate generating areas, cleaning and reusing areas, and other areas of industrial activity which are potential pollutant sources.
- F. Storm Water Risk Level Boundaries.** Identify the boundaries of the Industrial High Risk areas, Industrial Low Risk areas, Industrial No-Exposure areas, and Small Military Base MS4 areas, as defined in section IV.B.1 of the Order.

## V. LIST OF SIGNIFICANT MATERIALS

The SWPPP shall include a list of significant materials handled and stored at the site. For each material on the list, the locations where the material is stored, received, shipped, and handled, as well as the typical quantities and frequencies, shall be described. The materials list shall include raw materials, intermediate products, final or finished products, recycled materials, and waste or disposed materials.

## VI. DESCRIPTION OF POTENTIAL POLLUTANT SOURCES

- A.** For each area identified in section IV.E of this Attachment, the SWPPP shall include a narrative description of the Facility's industrial activities, potential pollutant sources, and potential pollutants that could be exposed to storm water or authorized non-storm water discharges. At a minimum, the following industrial activities shall be described as applicable:
  - 1. Industrial Processes.** Describe each industrial process including the manufacturing, cleaning, maintenance, recycling, disposal, or other activities related to the process. Include the type, characteristics, and approximate quantity of significant materials used in or resulting from the process. Areas protected by containment structures and the corresponding containment capacity shall be identified and described.
  - 2. Material Handling and Storage Areas.** Describe each handling and storage area including the type, characteristics, and quantity of significant materials handled or stored, description of the shipping, receiving, and loading procedures, and the spill or leak prevention and response procedures. Areas protected by a containment structure and the corresponding

containment capacity shall be identified and described.

- 3. Dust and Particulate Generating Activities.** Describe all industrial activities that generate dust or particulates that may be deposited within the Facility's boundaries. Include their discharge locations and the type, characteristics, and quality of dust and particulate pollutants that may be deposited within the Facility's boundaries. Identify the primary areas of the Facility where dust and particulate pollutants would settle.
- 4. Significant Spills and Leaks.** Identify and describe materials that have spilled or leaked in significant quantities in storm water discharges or non-storm water discharges. Include toxic chemicals (listed in 40 CFR Part 302) that have been discharged to storm water as reported in USEPA Form R, and oil and hazardous substances in excess of reportable quantities (see 40 CFR Parts 110, 117, and 302).

The description shall include the location, characteristics, and approximate quantity of the materials spilled or leaked, the cleanup or remedial actions that have occurred or are planned, the approximate remaining quantity of materials that may be exposed to storm water or non-storm water discharges; and the preventative measures taken to ensure spills or leaks of the material do not reoccur.

- 5. Non-Storm Water Discharges.** The Discharger shall inspect the Facility to identify all non-storm water discharges, sources, and drainage areas. All drains (inlets and outlets) shall be evaluated to identify whether they connect to the storm drain system.

All non-storm water discharges shall be described. The description shall include the source, quantity, frequency, and characteristics of the non-storm water discharges and associated drainage area and shall identify whether the discharge is an authorized or unauthorized non-storm water discharge in accordance with section IV.F of the Order. Examples of unauthorized non-storm water discharges include but are not limited to rinse and wash water (whether detergents are used or not), contact and non-contact cooling water, and boiler blow-down.

- 6. Soil Erosion.** Describe the Facility locations where soil erosion may occur as a result of industrial activity, storm water discharges associated with industrial activity, or authorized non-storm water discharges.

## **VII. ASSESSMENT OF POTENTIAL POLLUTANT SOURCES**

- A.** The SWPPP shall include a narrative assessment of all industrial activities and potential pollutant sources as described in accordance with section VI of this Attachment. To determine the likelihood that significant materials will be exposed to storm water or authorized non-storm water discharges, the assessment shall include consideration of the quantity, characteristics, and locations of each significant material handled, produced, stored, recycled, or disposed; the direct and indirect pathways that significant materials may be exposed to storm water or authorized non-storm water discharges; history of spills or leaks; non-storm water discharges; prior sampling; visual observation, and inspection records; discharges from adjoining areas; and the effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. At a minimum, the Discharger shall consider:
  - 1.** The quantity, physical characteristics (liquid, powder, solid, etc.), and locations of each significant material handled, produced, stored, recycled, or disposed.

2. The degree pollutants associated with those materials are exposed to and mobilized by contact with storm water.
  3. The direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.
  4. Sampling, visual monitoring, and inspection records.
  5. Effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.
- B.** Based upon the assessment above, the SWPPP shall identify any areas of industrial activity and corresponding pollutant sources where significant materials are likely to be exposed to storm water or authorized non-storm water discharges and where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

## **VIII. STORM WATER BEST MANAGEMENT PRACTICES**

- A.** The SWPPP shall include a narrative description of BMPs implemented at the Facility. The BMPs, when developed and implemented, shall be effective in reducing or preventing pollutants in storm water discharges and authorized non-storm water discharges.

The BMPs narrative description shall include:

1. The type of pollutants the BMPs are designed to reduce or prevent.
  2. The frequency, time(s) of day, or conditions when the BMPs are scheduled for implementation.
  3. The locations within each area of industrial activity or pollutant source where the BMPs shall be implemented.
  4. Identification of the person and/or position responsible for implementing the BMPs.
  5. The procedures, including maintenance procedures, and/or instructions to implement the BMPs.
  6. The equipment and tools necessary to implement the BMPs.
- B.** The Discharger shall consider non-structural BMPs for implementation at the Facility. Non-structural BMPs generally consist of processes, prohibitions, procedures, training, schedule of activities, etc., that prevent pollutants associated with industrial activity from contact with storm water discharges and authorized non-storm water discharges. Below is a list of non-structural BMPs that shall be considered:
1. **Good Housekeeping.** Good housekeeping generally consists of practical procedures to maintain a clean and orderly facility.

2. **Preventative Maintenance.** Preventative maintenance includes regular inspection and maintenance of storm water structural controls (i.e., catch basins, oil/water separators, etc.) as well as other facility equipment and systems.
3. **Spill Response.** This includes spill clean-up procedures and necessary clean-up equipment based upon the quantities and locations of significant materials that may spill or leak.
4. **Material Handling and Storage.** This includes all procedures to minimize the potential for spills and leaks and to minimize exposure to significant materials to storm water and authorized non-storm water discharges.
5. **Employee Training Program.** This includes the development of a program to train personnel responsible for implementing the various compliance activities of this Order including BMP implementation, inspections and evaluations, monitoring activities, and storm water compliance management. The training program shall include:
  - a. A description of the training program and any training manuals or training materials.
  - b. A discussion of the appropriate training frequency.
  - c. A discussion of the appropriate personnel to receive training.
  - d. A training schedule.
  - e. Documentation of all completed training classes and the personnel who received training.
6. **Waste Handling/Recycling.** This includes the procedures or processes to handle, store, or dispose of waste or recyclable materials.
7. **Record Keeping and Internal Reporting.** This includes the procedures to ensure that all records of inspections, spills, maintenance activities, corrective actions, visual observations, etc., are developed, retained, and provided, as necessary to the appropriate Facility personnel.
8. **Erosion Control and Site Stabilization.** This includes a description of all sediment and erosion control activities. This may include the planting and maintenance of vegetation, diversion of run-on and runoff, placement of sandbags, silt screens, or other sediment control devices.
9. **Inspections.** Periodic visual inspections of the Facility are necessary to ensure that the SWPPP addresses any significant changes to the Facility's operations or BMP implementation procedures.
  - a. A minimum of four quarterly visual inspections of all areas of industrial activity and associated potential pollutant sources shall be completed each reporting year. The annual comprehensive site compliance evaluation described in section IX of this Attachment may substitute for one of the quarterly inspections.
  - b. Tracking and follow-up procedures shall be described to ensure appropriate corrective actions and/or SWPPP revisions are implemented.

- c. A summary of the corrective actions and SWPPP revisions resulting from quarterly inspections shall be reported in the annual report.
- d. Dischargers shall certify in the annual report that each quarterly visual inspection was completed.
- e. All corrective actions and SWPPP revisions shall be implemented in accordance with sections XII.D and XII.E of this Attachment.

**10. Quality Assurance.** This includes the management procedures to ensure that the appropriate staff adequately implements all elements of the SWPPP and Monitoring Program.

**C. Structural BMPs.** Where non-structural BMPs identified in section VIII.B above are not effective, structural BMPs shall be considered. Structural BMPs typically consist of structural devices that reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. Below is a list of structural BMPs that shall be considered:

- 1. **Overhead Coverage.** This includes structures that protect materials, chemicals, and pollutant sources from contact with storm water and authorized non-storm water discharges.
- 2. **Retention Ponds.** This includes basins, ponds, surface impoundments, bermed areas, etc., that do not allow storm water to discharge from the Facility.
- 3. **Control Devices.** This includes berms or other devices that channel or route run-on and runoff away from pollutant sources.
- 4. **Secondary Containment Structures.** This includes containment structures around storage tanks and other areas that collect any leaks or spills.
- 5. **Treatment.** This includes inlet controls, infiltration devices, oil/water separators, detention ponds, vegetative swales, etc., which reduce the pollutants in storm water discharges and authorized non-storm water discharges.

**D.** The SWPPP shall include a summary identifying each area of industrial activity and associated pollutant sources, pollutants, and BMPs in a table similar to Item A-3 at the end of this Attachment.

## **IX. ANNUAL COMPREHENSIVE SITE COMPLIANCE EVALUATION**

The Discharger shall conduct one comprehensive site compliance evaluation (evaluation) in each reporting period (July 1 – June 30). Evaluations shall be conducted no less than 8 months from each other. The SWPPP shall be revised, as appropriate, and the revisions implemented within 90 days of the evaluation. Evaluations shall include the following:

- A.** A review of all visual observation records, inspection records, and sampling and analysis results.
- B.** A visual inspection of all areas of industrial activity and associated potential pollutant sources for evidence of, or the potential for, pollutants entering the drainage system. A visual inspection of

equipment needed to implement the SWPPP.

- C. A review and evaluation of all BMPs, both structural and non-structural, for each area of industrial activity and associated potential pollutant sources to determine whether the BMPs are properly designed, implemented, and effective in reducing and preventing pollutants in storm water discharges and authorized non-storm water discharges.
- D. An evaluation report that includes:
  1. Identification of personnel performing the evaluation,
  2. Date(s) of the evaluation,
  3. Summary and implementation dates of all significant corrective actions and SWPPP revisions for the reporting year
  4. Schedule for implementing any incomplete corrective actions and SWPPP revisions,
  5. Any incidents of non-compliance and the corrective actions taken, and
  6. A certification that the Discharger has completed the quarterly inspections specified in section VIII.B.9, above and that the Discharger is complying with this Order.
  7. The evaluation report shall be submitted as part of the annual report, retained for at least 5 years, and signed and certified in accordance with Standard Provision V.B of Attachment D of this Order.

**X. NUMERIC ACTION LEVELS (NALs) AND NUMERIC EFFLUENT LIMITATIONS (NELS)**

- A. Numeric Action Levels (NALs) for all storm water discharges are appropriate numeric thresholds that allow a discharger to take corrective action when the Instantaneous Maximum or Annual Average NAL are exceeded. Exceedances of NAL values are not a violation of the Order. Dischargers that exceed one of the NAL values shall take the appropriate corrective action as set forth in section IV.E.3. of the Order.

NALs are specified as follows:

**Table G-1.NALs for Storm Water**

PARAMETER	TEST METHOD <sup>1</sup>	REPORTING UNITS	ANNUAL NAL VALUE	INSTANTANEOUS MAXIMUM NAL
pH	Field test with calibrated portable instrument, or lab sample in accordance with 40 CFR § 136.	pH units	N/A	6.0-9.0
Suspended Solids (TSS), Total	SM2540-D	mg/L	100	400
Oil & Grease (TOG), Total	EPA 1664A	mg/L	15	25

PARAMETER	TEST METHOD <sup>1</sup>	REPORTING UNITS	ANNUAL NAL VALUE	INSTANTANEOUS MAXIMUM NAL
Zinc, Total (H)	EPA 200.8	mg/L	0.26 <sup>2</sup>	-
Copper, Total (H)	EPA 200.8	mg/L	0.0332 <sup>2</sup>	-
Cyanide, Total	SM 4500-CN C, D, or E	mg/L	0.022	-
Lead, Total (H)	EPA 200.8	mg/L	0.262 <sup>2</sup>	-
Chemical Oxygen Demand	SM 5220C	mg/L	120	-
Aluminum, Total (pH 6.5-9.0)	EPA 200.8	mg/L	0.75	-
Iron, Total	EPA200.8	mg/L	1.0	-
Nitrate + Nitrite Nitrogen	SM 4500-NO3- E	mg/L as N	0.68	-
Total Phosphorus	SM 4500-P B+E	mg/L as P	2.0	-
Ammonia	SM 4500-NH3 B+ C or E	mg/L	2.14	-
Magnesium, total	EPA 200.7	mg/L	0.064	-
Arsenic, Total (c)	EPA 200.8	mg/L	0.15	-
Cadmium, Total (H)	EPA 200.8	mg/L	0.0053 <sup>2</sup>	-
Nickel, Total (H)	EPA 200.8	mg/l	1.02 <sup>2</sup>	-
Mercury, Total	EPA 245.1	mg/L	0.0014	-
Selenium, Total	EPA 200.8	mg/L	0.005	-
Silver, Total (H)	EPA 200.8	mg/L	0.0183 <sup>2</sup>	-
Biochemical Oxygen Demand	SM 5210B	mg/L	30	-

SM – Standard Methods for the Examination of Water and Wastewater, 18<sup>th</sup> edition  
 EPA – EPA test methods

<sup>1</sup> Test methods with lower detection limits may be necessary when discharging to impaired water bodies. Alternate test methods may be approved by the San Diego Water Board.

<sup>2</sup> The NAL is based on the highest hardness because the water near the mouth of the creeks is very saline.

**B.** On January 1 of the reporting year following the submittal of the Level 2 ERA Action Plan, a Discharger with Level 2 status shall certify and submit a Level 2 ERA Technical Report that includes one or more of the following demonstrations:

**1. Industrial Activity BMPs Demonstration.** This shall include the following requirements as applicable:

- a. A description of the industrial pollutant sources and corresponding industrial pollutants that are or may be related to the NAL exceedance(s);
- b. An evaluation of all pollutant source(s) associated with industrial activity that are or may be related to the NAL exceedance(s);
- c. Where all of the Discharger’s implemented BMPs, including additional BMPs identified in the Level 2 ERA Action Plan, achieve compliance with the effluent limitations of this

Order and are expected to eliminate future NAL exceedance(s), the Discharger shall provide a description and analysis of all implemented BMPs;

- d. In cases where all of the Discharger's implemented BMPs, including additional BMPs identified in the Level 2 ERA Action Plan, achieve compliance with the effluent limitations of this Order but are not expected to eliminate future NAL exceedance(s), the Discharger shall provide the following, in addition to a description and analysis of all implemented BMPs:
  - i. An evaluation of any additional BMPs that would reduce or prevent NAL exceedances;
  - ii. An estimated costs of the additional BMPs evaluated; and,
  - iii. An analysis describing the basis for the selection of BMPs implemented in lieu of the additional BMPs evaluated but not implemented.
- e. The description and analysis of BMPs required in section d.iii above shall specifically address the drainage areas where the NAL exceedance(s) responsible for the Discharger's Level 2 status occurred, although any additional Level 2 ERA Action Plan BMPs may be implemented for all drainage areas; and,
- f. If an alternative design storm standard for treatment control BMPs in lieu of the design storm standard for treatment control BMPs in section IV.E.4 of the Order will achieve compliance with the effluent limitations of the Order, the Discharger shall provide an analysis describing the basis for the selection of the alternative design storm standard.

**2. Non-Industrial Pollutant Source Demonstration.** This shall include:

- a. A statement that the Discharger has determined that the exceedance of the NAL is attributable solely to the presence of non-industrial pollutant sources. (The pollutant may also be present due to industrial activities, in which case the Discharger must demonstrate that the pollutant contribution from the industrial activities by itself does not result in an NAL exceedance.) The sources shall be identified as either run-on from adjacent properties, aerial deposition from man-made sources, or as generated by on-site non-industrial sources;
- b. A statement that the Discharger has identified and evaluated all potential pollutant sources that may have commingled with storm water associated with the Discharger's industrial activity and may be contributing to the NAL exceedance; and,
- c. A description of any on-site industrial pollutant sources and corresponding industrial pollutants that are contributing to the NAL exceedance that are or may be discharged;
- d. An assessment of the relative contributions of the pollutant from (1) storm water run-on to the facility from adjacent properties or non-industrial portions of the Discharger's property or from aerial deposition and (2) the storm water associated with the Discharger's industrial activity;
- e. A summary of all existing BMPs for that parameter; and,

- f. An evaluation of all on-site/off-site analytical monitoring data demonstrating that the NAL exceedances are caused by pollutants in storm water run-on to the facility from adjacent properties or non-industrial portions of the Discharger's property or from aerial deposition.

**3. Natural Background Pollutant Source Demonstration.** The Natural Background Pollutant Source Demonstration Technical Report shall at a minimum, include the following:

- a. A statement that the Discharger has determined that the NAL exceedance of the NAL is attributable solely to the presence of the pollutant in the natural background that has not been disturbed by industrial activities. (The pollutant may also be present due to industrial activities, in which case the Discharger must demonstrate that the pollutant contribution from the industrial activities by itself does not result in an NAL exceedance);
- b. A summary of all data previously collected by the Discharger, or other identified data collectors, that describes the levels of natural background pollutants in the storm water discharge;
- c. A summary of any research and published literature that relates the pollutants evaluated at the facility as part of the Natural Background Demonstration;
- d. A map showing the reference site location in relation to facility along with available land cover information;
- e. Reference site and test site elevation;
- f. Available geology and soil information for reference and test sites;
- g. Photographs showing site vegetation;
- h. Site reconnaissance survey data regarding presence of roads, outfalls, or other human-made structures; and
- i. Records from relevant state or federal agencies indicating no known mining, forestry, or other human activities upstream of the proposed reference site.

**XI. MONITORING REQUIREMENTS**

Monitoring shall be conducted as specified in the MRP. The SWPPP shall include a description of the following items:

- A.** Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.
- B.** Sampling locations and sample collection procedures. This shall include procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained.
- C.** Identification of the analytical methods and related method detection limits (if applicable) used to detect pollutants in storm water discharges, including a justification that the method detection limits are adequate.

## **XII. SWPPP GENERAL REQUIREMENTS**

- A.** The SWPPP shall be retained at the Facility and made available upon request of a representative of the San Diego Water Board.
- B.** Upon notification by the San Diego Water Board or USEPA that the SWPPP does not meet one or more of the minimum requirements of this Attachment, the Discharger shall revise the SWPPP and implement additional BMPs that are effective in reducing and eliminating pollutants in storm water discharges and authorized non-storm water discharges. As requested, the Discharger shall provide an implementation schedule and/or completion certification to the San Diego Water Board or USEPA.
- C.** The SWPPP shall be revised, as appropriate, and implemented prior to changes in industrial activities, which;
  - 1.** May significantly increase the quantities of pollutants in storm water discharges; or
  - 2.** Cause a new area of industrial activity at the Facility to be exposed to storm water; or
  - 3.** Begin an industrial activity that would introduce a new pollutant source at the Facility.
- D.** The Discharger shall revise the SWPPP and implement the appropriate BMPs in a timely manner and in no case more than 90 days after a Discharger determines that the SWPPP is in violation of any Order requirement.
- E.** When any part of the SWPPP is infeasible to implement by the deadlines specified above due to proposed significant structural changes, the Discharger shall:
  - 1.** Submit a report to the San Diego Water Board that:
    - a.** Identifies the portion of the SWPPP that is infeasible to implement by the deadline;
    - b.** Provides justification for a time extension, and a schedule for completing and implementing that portion of the SWPPP; and
    - c.** Describes the BMPs that will be implemented in the interim period to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.
  - 2.** Comply with any request by the San Diego Water Board to modify the report required in Subsection VII.E.1 above, or provide certification that the SWPPP revisions have been implemented.
- F.** The SWPPP shall be provided, upon request, to the San Diego Water Board, USEPA, local agency, or Compliance Inspection Designees. The San Diego Water Board under section 308(b) of the Clean Water Act considers the SWPPP a report that shall be available to the public.

## **XIII. AUTHORIZED NON-STORM WATER DISCHARGES SPECIAL REQUIREMENTS**

- A.** The SWPPP shall address authorized non-storm water discharges and incorporate the requirements of section IV.F of this Order.

 ASSESSMENT OF POTENTIAL POLLUTION SOURCES AND  
 CORRESPONDING BEST MANAGEMENT PRACTICES SUMMARY**

Area	Activity	Pollutant Source	Pollutant	Best Management Practices
Vehicle & Equipment Fueling	Fueling	Spills and leaks during delivery	fuel oil	- Use spill and overflow protection
		Spills caused by topping off fuel tanks	fuel oil	- Minimize run-on of storm water into the fueling area
		Hosing or washing down fuel area	fuel oil	- Cover fueling area
		Leaking storage tanks	fuel oil	- Use dry cleanup methods rather than hosing down area
		Rainfall running off fuel area, and rainfall running onto and off fueling area	fuel oil	- Implement proper spill prevention control program

## **ATTACHMENT H – BEST MANAGEMENT PRACTICES AND POLLUTION PREVENTION PLAN FOR UTILITY VAULT AND MANHOLE DEWATERING DISCHARGES (UTILITY VAULT PLAN)**

### **I. IMPLEMENTATION**

The Discharger shall develop and implement a Best Management Practices and Pollution Prevention Plan for Utility Vault and Manhole Dewatering Discharges (Utility Vault Plan) which achieves the objectives and the specific requirements listed below. The existing Utility Vault Plan shall continue to be implemented. The revised Utility Vault Plan shall be implemented as soon as possible but no later than 1 year from the effective date of this Order.

### **II. OBJECTIVE**

Through implementation of the Utility Vault Plan, the Discharger shall prevent or minimize the generation and the potential for the release of pollutants from the Facility to the Waters of the United States through normal operations and ancillary activities. The Utility Vault Plan shall be designed to comply with BAT/BCT and to ensure compliance with water quality standards.

III. The Utility Vault Plan shall include, to the extent possible, at least the following items:

#### **A. Utility Vault Plan Administration**

- 1. Pollution Prevention Team.** The Utility Vault Plan shall identify a specific individual or individuals as members of a Pollution Prevention Team that are responsible for developing the Utility Vault Plan and assisting in its implementation, maintenance, and revision. The Utility Vault Plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the Utility Vault Plan.
- 2. Employee Training.** The Discharger shall implement a training program to ensure that all utility personnel that are responsible for implementing the Utility Vault Plan are trained in the proper execution of the procedures and BMPs identified in the Utility Vault Plan to minimize the potential for the release of pollutants in utility vault and underground structure discharges. The training shall address topics such as spill response, good housekeeping, pollution control procedures, and material management practices. In addition, staff who dewater utility vaults or underground structures shall be trained to use a dewatering checklist or dewatering procedures to facilitate evaluation of the quality of the water prior to a planned (non-emergency or non-automated critical) discharge from a utility vault or underground structure. The Utility Vault Plan shall identify who is responsible for the training and how often training will take place. Training shall be held at intervals frequent enough to assure adequate understanding of the Utility Vault Plan goals, objectives, and procedures.

#### **B. Identification of Potential Pollutant Source**

- 1. Description of Potential Pollutant Sources.** The Utility Vault Plan shall provide a description of potential sources that may add pollutants to discharges. The Utility Vault Plan shall identify all activities and significant materials that may potentially be a source of pollutants. The Utility Vault Plan shall include a description of the types of utility materials handled at the site that potentially may be exposed to vault water either within the vault or underground structure or during discharge operations.

- 2. Drainage Map.** Provide a map showing the essential features of the distribution system for the service area boundary and showing the corresponding surface waters to which water may be discharged.

### **3. Pollution Assessment**

- a.** Using the information identified in section III.B and procedures and pollution control measures developed in sections III.C and III.D below, analyze and discuss the pollution sources which have been identified to potentially cause or contribute to an exceedance of water quality objectives. The analysis shall identify potential sources of pollutants and, for each potential source, any corresponding pollutant or pollutant parameter (e.g., oil and grease) of concern. For each pollutant of concern, identify specific control measures which utility company personnel may use to control the discharge of the pollutant.
- b.** If existing discharge data are available, use these data to identify sites or categories of sites which present an increased risk of discharging utility vault water with elevated pollutant levels. Identify potential sources of the elevated pollutant levels and identify specific control measures which will be used to control pollutant levels in the discharges at these sites.

### **C. Procedures for Discharges from Utility Vaults and Underground Structures**

The Discharger shall develop and use a checklist or series of procedures to evaluate the quality of the water prior to a planned (nonemergency or non-automated critical) discharge from a utility vault or underground structure. These procedures shall be included in the Utility Vault Plan. The checklist or series of procedures are intended to allow the Discharger to make a preliminary determination of the quality of water to be disposed and indicate to the Discharger which pollution control measures should be used when discharging the water. The procedures shall include, at a minimum, visual inspection for evidence of, or the potential for, pollutants to be present in the discharge.

The Discharger's Utility Vault Plan shall also include the procedures that will be used for discharges that occur during emergency situations where it is recognized that utility vault or underground structure dewatering may need to occur as soon as possible to avoid endangerment to human health, public safety, or the environment or to reestablish essential public services. Further, the Utility Vault Plan shall address the procedures to be used for automated critical discharges. Automated critical discharges are necessary to protect equipment that is vulnerable to damage by water infiltration or seepage, to minimize outage delays and maintain reliability of essential public services, and for safety purposes. The Discharger shall describe the feasible procedures that may be implemented during emergency situations and for automated critical discharges to minimize the release of pollutants to the environment. The Discharger's staff responsible for dewatering utility vaults or underground structures shall use a checklist or procedures during dewatering activities to facilitate evaluation of the quality of the water prior to a planned (non-emergency or non-automated critical) discharge from a utility vault or underground structure.

### **D. Pollution Control Measures**

The Discharger shall develop a description of BMPs appropriate for their site(s) and operations and implement such BMPs. The appropriateness and priorities of BMPs in a Utility Vault Plan must reflect identified potential sources of pollutants described in section III.B above. In addition, the Discharger should discuss the advantages and limitations of each BMP. If relevant,

include a flow diagram describing the conditions under which specific pollution control measures and/or BMPs will be deployed. The description of pollution control measures and/or BMPs shall address the following minimum components:

1. **Good Housekeeping.** The Discharger shall identify and discuss good housekeeping BMPs which can be adopted to prevent or control the discharge of pollutants. Examples of best practices that should be considered by The Discharger include, but are not limited to, the following:
  - a. Maintain areas surrounding the utility vault and underground structure so that they are kept clean and orderly prior to dewatering activities so as to minimize the presence of pollutants in discharges.
  - b. If applicable, store and contain liquid materials in such a manner that if the container is ruptured, the contents will not discharge, flow, or be washed into the storm drainage system, surface waters, or groundwater.
  - c. Prior to dewatering a utility vault or underground structure, when feasible and safe, maintain the cleanliness and orderliness of all areas that may be impacted by the discharge including the discharge area (e.g., street, roadway, storm drain inlet) which should be clear of debris and sediment prior to discharging.
  - d. Use an absorbent material (e.g., absorbent pads, rags) on the utility vault's or underground structure's water surface prior to dewatering and discharge when an oil sheen has been observed.
2. **Discharge Procedures.** The Utility Vault Plan shall include, at a minimum, provisions and procedures which will be implemented during the discharge from utility vaults and underground structures to minimize the introduction of pollutants and protect receiving water quality. For example, best practices that should be considered to control erosion and minimize the discharge of sediment include, but are not limited to, the following:
  - a. When feasible and safe, sweep/clear the area surrounding the discharge point to prevent washing sediment and debris into storm drains.
  - b. Use straw wattles to reduce erosion.
  - c. Use a filter sock or bag to reduce oil and sediment discharge.
3. **Pollution Control and Waste Disposal Procedures.** Instances may arise where utility personnel determine that a utility vault or underground structure discharge may have a reasonable potential to cause or contribute to an exceedance of water quality objectives for the receiving water and that BMPs and procedures implemented in accordance with sections III.D.1. a and b above will be insufficient to adequately control pollutants in the discharge. In these instances, the Utility Vault Plan shall include provisions and procedures to be implemented to capture, treat, and/or dispose of the discharge in a manner that is protective of receiving water quality (e.g., hauling the utility vault or underground structure water to a wastewater treatment plant or a disposal site). Any potential discharge for which it is determined that the discharge from the utility vault or underground structure will cause or contribute to an exceedance in the receiving water of applicable water quality objectives is not authorized under this Order. The determination of the potential to cause water quality

impacts shall be based on field observations prior to dewatering as well as the results of the Identification of Potential Pollutant Source required in section III.B above.

**E. Annual Plan Evaluation Requirements**

The Discharger shall conduct an overall evaluation of the effectiveness of its Utility Vault Plan in controlling the discharge of pollutants during a discharge event and revise or replace the Utility Vault Plan as necessary to address procedures and BMPs found to not be effective in minimizing the discharge of pollutants.

**1. Plan Evaluation Requirements**

At least once per year, the Discharger shall conduct an evaluation of the effectiveness of their Utility Vault Plan in controlling the discharge of pollutants during a discharge event. At a minimum, the Utility Vault Plan evaluation shall include the following:

- a. Evaluate the Utility Vault Plan measures to reduce pollutant loadings to determine whether they are adequate and properly implemented in accordance with the terms of this Order or whether additional control measures are needed. Ensure that utility source control measures, sediment and erosion control measures, and other structural BMPs identified in the Utility Vault Plan are operating correctly. Perform an evaluation of equipment needed to implement the Utility Vault Plan.
- b. If the results of the monitoring at any of the representative sites required in the MRP (Attachment E) exceed of one or more of the Numeric Action Levels (NALs) listed in Table H-1 below, then a Discharger shall prepare a Discharge Characterization Study to evaluate the potential cause(s) of the NAL exceedance(s). At a minimum, this evaluation shall include an assessment of the potential source(s) of the pollutant and whether the procedures and BMPs contained in the Utility Vault Plan need to be revised to address the identified source(s) in future discharges. Additional NALs may be added in the future based on the results of the Discharge Characterization Study.

**Table H-1. Numeric Action Levels for Utility Vault and Manhole Dewatering**

Parameter	Numeric Action Levels		
	Unit	Minimum Daily	Maximum Daily
Oil and Grease	mg/L	---	25
pH	Standard Units	6.0	9.0
Total Petroleum Hydrocarbons-Diesel Range Organics	mg/L	---	2
Total Petroleum Hydrocarbons-Gasoline Range Organics	µg/L	---	5
Total Suspended Solids	mg/L	---	400

**2. Plan Revisions**

If Utility Vault Plan revisions are necessary based on the Utility Vault Plan evaluation required in section III.E.1 above, the Discharger shall develop a revised Plan with new or revised BMPs to prevent future exceedance(s) of NALs. The Discharger shall implement

such BMPs and document the progress of their implementation and effectiveness in the Annual Report to the Regional Water Board Executive Officer.

If it is determined that the cause(s) of an exceedance of an NAL were beyond the control of the Discharger and not a result of inadequate Utility Vault Plan implementation, procedures, or BMPs, then revisions to the Utility Vault Plan are not required. The Discharger shall provide as part of the Annual Report an explanation detailing when this situation occurs.

The Discharger shall amend the Utility Vault Plan whenever there is a change in construction, operation, or maintenance, when such amendment is necessary to ensure compliance with BAT/BCT and receiving water limitations. The Utility Vault Plan shall also be amended if it is in violation of any conditions of this Order or has not achieved the general objective of controlling pollutants in discharges to surface waters. The Discharger shall submit the amended the Utility Vault Plan to the San Diego Water Board.

### **3. Annual Plan Evaluation and Revision Reporting**

- a.** The Discharger shall provide the results of the annual Utility Vault Plan evaluation and any revisions to the Utility Vault Plan as part of the Annual Report required in section VII.E. of the MRP (Attachment E).
- b.** The Discharger shall retain for five years records summarizing the scope of the annual Utility Vault Plan evaluation, personnel making the evaluation, the date(s) of the evaluation(s), significant observations relating to the implementation of the Utility Vault Plan, and actions taken to revise the Utility Vault Plan.

### **F. Other Special Provisions**

- 1.** The Dischargers shall dispose of solids removed from liquid wastes in accordance with applicable federal, state and local laws, regulations, and ordinances.
- 2.** If the Discharger determines that its utility vault or underground structure is causing or contributing to vector problems, it shall coordinate with a vector control agency to address the vector problems.

## **ATTACHMENT I – BEST MANAGEMENT PRACTICES PLAN FOR APPLICABLE INDUSTRIAL WASTEWATERS**

### **I. Implementation**

The Discharger shall develop and implement a Best Management Practices (BMP) Plan which achieves the objectives and the specific requirements listed below for the activities of pier washing, pier boom cleaning, and boat rinsing activities. Existing BMP Plans for these activities shall continue to be implemented. The revised BMP Plan for these activities shall be implemented as soon as possible but no later than 1 year from the effective date of this Order.

### **II. Purpose**

Through implementation of the BMP Plan, the Discharger shall prevent or minimize the generation and the potential for the release of pollutants from the Facility to the Waters of the United States (U.S.) through normal operations and ancillary activities. The BMP Plan shall address at a minimum pier washing, pier boom cleaning, and boat rinsing activities. Pier boom cleaning and boat rinsing discharges have been eliminated and BMPs are necessary to ensure that there is no discharge from these activities.

### **III. Objectives**

The Discharger shall develop and amend the BMP Plan consistent with the following objectives for the control of pollutants:

- A.** The number and quantity of pollutants and the toxicity of effluent generated, discharged or potentially discharged at the Facility shall be minimized by the Discharger to the extent feasible by managing each waste stream in the most appropriate manner.
- B.** The Discharger shall ensure proper operation and maintenance of the Facility. Standard Operating Procedures (SOPs) may be included in the BMP Plan or referenced.
- C.** The Discharger shall evaluate each component or system for its waste minimization opportunities and its potential for causing a release of significant amounts of pollutants to Waters of the U.S. due to equipment failure, improper operation, and natural phenomena such as rain or snowfall, or other emergency situation. The evaluation shall include all normal operations and ancillary activities at a minimum related to pier washing and any other activities which have the potential to discharge pollutants. The Discharger shall have a plan to address any emergency situation which would result in a significant release of pollutants to Waters of the U.S. including those identified in this evaluation.

### **IV. Requirements**

- A.** The BMP Plan shall be consistent with the objectives in section III above and the general guidance contained in the publication entitled *Guidance Manual for Developing Best Management Practices (BMPs)* (USEPA, 1993) or any subsequent revisions to the guidance document.
- B.** The BMP Plan shall 1) be documented in narrative form, 2) include any necessary plot plans, drawings or maps, and 3) be developed in accordance with good engineering practices.

- C.** The BMP Plan shall be organized and written with the following elements:
1. Purpose and objectives of the BMP Plan
  2. Name and location of the activity with specific BMPs.
  3. Specific management practices and standard operating procedures to achieve the above objectives, including, but not limited to, the following:
    - a. Modification of equipment, facilities, technology, processes, and procedures,
    - b. Reformulation or redesign of products,
    - c. Substitution of materials,
    - d. Improvement in management, inventory control, materials handling or general operational phases of the facility, and
    - e. Materials compatibility.
  4. Good housekeeping.
  5. Preventative maintenance.
  6. Risk identification and assessment.
  7. Reporting of BMP incidents and spills.
  8. Inspections and records.
  9. Employee training.
- D.** The BMP Plan shall establish specific BMPs to meet the objectives identified in section III of this Attachment, addressing each component or system capable of generating or causing a release of significant amounts of pollutants, and identifying specific preventative or remedial measures to be implemented.
- E.** The BMP Plan shall establish specific BMPs or other measures which ensure that the discharge of pollutants including, but not limited to, arsenic, copper, lead, nickel, selenium, zinc, aldrin, alpha-BHC, beta-BHC, 4,4'-DDE (linked to DDT), alpha-endosulfan, beta-endosulfan, heptachlor, and heptachlor epoxide from pier washing is reduced to levels that do not exceed water quality objectives. (RPA)
- F.** The BMP Plan shall include a statement this BMP Plan fulfills the requirements of this Order and shall be signed and certified in accordance with the signatory requirements of Standard Provision V.B. of Attachment D.

## **V. Documentation**

The Discharger shall maintain a copy of the BMP Plan at the Facility and shall make it available to the San Diego Water Board upon request. All offices of the Discharger which are required to maintain a copy of the NPDES permit shall also maintain a copy of the BMP Plan.

## **VI. BMP Plan Modification**

The Discharger shall amend the BMP Plan whenever there is a change in the facility or in the operation of the facility which materially increases the generation of pollutants or their release or potential release to the receiving waters. The Discharger shall also amend the BMP Plan, as appropriate, when operations covered by the BMP Plan change. Any such changes to the BMP Plan shall be consistent with the objectives and specific requirements listed above. All changes in the BMP Plan shall be reported to the San Diego Water Board in writing.

## **VII. Modification for Ineffectiveness**

At any time, if the BMP Plan proves to be ineffective in achieving the general objective of preventing and minimizing the generation of pollutants and their release and potential release to the receiving waters and/or the specific requirements above, the Order and/or the BMP Plan shall be subject to modification to incorporate revised BMP requirements.

## **ATTACHMENT J – DISCHARGE PROHIBITIONS CONTAINED IN THE BASIN PLAN**

### **I. Basin Plan Discharge Prohibitions**

- A.** The discharge of waste to Waters of the State in a manner causing, or threatening to cause a condition of pollution, contamination or nuisance as defined in Water Code section 13050, is prohibited.
- B.** The discharge of waste to land, except as authorized by WDRs of the terms described in Water Code section 13264 is prohibited.
- C.** The discharge of pollutants or dredged or fill material to Waters of the United States except as authorized by an NPDES permit or a dredged or fill material permit (subject to the exemption described in Water Code section 13376) is prohibited.
- D.** Discharges of recycled water to lakes or reservoirs used for municipal water supply or to inland surface water tributaries thereto are prohibited, unless this San Diego Water Board issues an NPDES permit authorizing such a discharge; the proposed discharge has been approved by the State of California Department of Public Health and the operating agency of the impacted reservoir; and the discharger has an approved fail-safe long-term disposal alternative.
- E.** The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited. Allowances for dilution may be made at the discretion of the San Diego Water Board. Consideration would include streamflow data, the degree of treatment provided and safety measures to ensure reliability of facility performance. As an example, discharge of secondary effluent would probably be permitted if streamflow provided 100:1 dilution capability.
- F.** The discharge of waste in a manner causing flow, ponding, or surfacing on lands not owned or under the control of the discharger is prohibited, unless the discharge is authorized by the San Diego Water Board.
- G.** The dumping, deposition, or discharge of waste directly into Waters of the State, or adjacent to such waters in any manner which may permit it being transported into the waters, is prohibited unless authorized by the San Diego Water Board.
- H.** Any discharge to a storm water conveyance system that is not composed entirely of storm water is prohibited unless authorized by the San Diego Water Board. [The federal regulations, 40 CFR section 122.26(b)(13), define storm water as storm water runoff, snow melt runoff, and surface runoff and drainage. 40 CFR section 122.26(b)(2) defines an illicit discharge as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to an NPDES permit and discharges resulting from fire fighting activities.] [section 122.26 amended at 56 FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992].
- I.** The unauthorized discharge of treated or untreated sewage to Waters of the State or to a storm water conveyance system is prohibited.
- J.** The discharge of industrial wastes to conventional septic tank/subsurface disposal systems, except as authorized by the terms described in Water Code section 13264, is prohibited.

- K.** The discharge of radioactive wastes amenable to alternative methods of disposal into the Waters of the State is prohibited.
- L.** The discharge of any radiological, chemical, or biological warfare agent into Waters of the State is prohibited.
- M.** The discharge of waste into a natural or excavated site below historic water levels is prohibited unless the discharge is authorized by the San Diego Water Board.
- N.** The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in Waters of the State or which unreasonably affect, or threaten to affect, beneficial uses of such waters is prohibited.
- O.** The discharge of treated or untreated sewage from vessels to Mission Bay, Oceanside Harbor, Dana Point Harbor, or other small boat harbors is prohibited.
- P.** The discharge of untreated sewage from vessels to San Diego Bay is prohibited.
- Q.** The discharge of treated sewage from vessels to portions of San Diego Bay that are less than 30 feet deep at MLLW is prohibited.
- R.** The discharge of treated sewage from vessels, which do not have a properly functioning USCG certified Type 1 or Type II marine sanitation device, to portions of San Diego Bay that are greater than 30 feet deep at MLLW is prohibited.

## ATTACHMENT K – SEDIMENT CHEMISTRY ANALYTES

All samples shall be tested for the analytes specified in Table K-1. If other toxic pollutants are believed to pose risk to benthic communities, aquatic-dependent wildlife, or human health, those toxic pollutants shall be identified and included by the Discharger. Analytes not on Attachment A of the State Water Board's Sediment Quality Plan cannot be used in the exposure assessment in section V of the State Water Board's Sediment Quality Plan; however the data can be used to conduct more effective stressor identification studies as described in section VII.F of the State Water Board's Sediment Quality Plan.

**Table K-1 Sediment Chemistry Analytes.**

Chemical Name	Chemical Group	Chemical Name	Chemical Group

2,2',3,3',4,5',6,6'-Octachlorobiphenyl	PCB 201 - congener
2,2',3,4,4',5,5',6-Octachlorobiphenyl	PCB 203 - congener

<sup>1</sup> From Attachment A of the State Water Board's Sediment Quality Plan

## **ATTACHMENT L – ELEMENTS FOR SMALL MILITARY BASE MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) – STORM WATER MANAGEMENT PROGRAM (SWMP)**

**I. SIX MINIMUM CONTROL MEASURES.** The SWMP shall describe BMPs, and associated measurable goals, that fulfill the requirements of the following six Minimum Control Measures:

**A. Public Education and Outreach on Storm Water Impacts.** The SWMP shall contain a written plan to distribute educational materials to the target audiences identified below, or conduct equivalent outreach activities about the effects of storm water discharges on water bodies and the steps that the target audiences can take to reduce pollutants in storm water runoff

The SWMP shall contain a list of target audience groups consisting of civilian, contractor, retailers military personnel (including dependents) that are present on the Facility and may be conducting activities that could have potential adverse effect(s) to water quality.

**B. Public Involvement/Participation Program.** The SWMP shall contain a written Public Involvement/Participation Program to:

1. Regularly encourage public participation in the development and implementation of the SWMP;
2. Establish a platform for the public and target audiences to provide input into the development and implementation of the SWMP;
3. Solicit public reporting of suspected illicit discharges via telephone and writing; and
4. Implement procedures for the receipt and consideration of verbal or written public inquires, concerns, and information submitted by the public.

**C. Illicit Discharge Detection and Elimination.** The SWMP shall contain a written Illicit Discharge Detection and Elimination Program containing the following elements:

1. A written program to detect and eliminate illicit discharges (as defined at 40 CFR §122.26(b)(2)) into the storm water drainage systems;
2. A storm sewer system map, showing the location of all storm water drainage systems, outfalls and the names and locations of all Waters of the U.S. that receive discharges from those outfalls;
3. A prohibition against non-storm water discharges into the storm water drainage system except as allowed under Non-Storm Water Specifications IV.F of this Order;
4. A plan to detect and address non-storm water discharges, including illegal dumping, to the MS4 system that are not authorized by a separate NPDES permit;
5. A plan to inform the target audiences of the hazards that are generally associated with illegal discharges and improper disposal of waste; and

6. A plan to address the categories of non-storm water discharges or flows as specified in Non-Storm Water Specification IV.F of this Order (i.e., authorized non-storm water discharges) only where they are identified as significant contributors of pollutants to the storm water collection system.

**D. Construction Site Storm Water Runoff Control.** The SWMP shall contain a written *Construction Site Storm Water Runoff Control* program to reduce pollutants in any storm water runoff to the MS4 from construction activities that result in a land disturbance of greater than or equal to one acre. Reduction of storm water discharges from construction activity disturbing less than one acre must be included in the program if that construction activity is part of a larger common plan of development or sale that would disturb one acre or more. The program must, at a minimum, include the development and implementation of:

1. Mechanisms to require erosion and sediment controls, as well as enforcement mechanisms, to ensure compliance;
2. Requirements for construction site operators to implement appropriate erosion and sediment control BMPs;
3. Requirements for construction site operators to control waste such as discarded building materials, concrete truck washout, chemicals, litter, and sanitary waste at the construction site that may cause adverse impacts to water quality;
4. Procedures for site plan review which incorporate consideration of potential water quality impacts;
5. Procedures for receipt and consideration of information submitted by the public. The Discharger shall demonstrate acknowledgement and consideration of the information submitted, whether submitted verbally or in writing; and
6. Procedures for site inspection and enforcement of control measures.
7. Procedures for verifying that the site has existing coverage under California's statewide General NPDES Permit for Storm Water Discharges Associated with Construction Activities (hereinafter General Construction Permit).

**E. Post-Construction Storm Water Management in New Development and Redevelopment.** The SWMP shall contain a written Post-Construction Storm Water Management Program to:

1. Address storm water runoff from new development and redevelopment projects that disturb greater than or equal to one acre, including projects less than one acre that are part of a larger common plan of development, that discharge into the storm water drainage system by ensuring that controls are in place that would prevent or minimize water quality impacts, and that are designed to maintain pre-project runoff condition
2. Develop and implement water quality strategies, which include a combination of structural and/or non-structural BMPs appropriate for the Facility;

3. Develop or use a mechanism to address post-construction runoff from new development and redevelopment projects.
4. Ensure adequate long-term operation and maintenance of water quality BMPs.
5. Maintain and regularly update an inventory of BMPs installed pursuant to the SWMP. The inventory shall include, at a minimum:
  - a. Exact location of BMP(s);
  - b. Contact information for the individual or entity responsible for long term BMP operation and maintenance;
  - c. A description of the BMP and the year it was installed;
  - d. Maintenance required;
  - e. Actual inspection/maintenance activities that occurred during the reporting year; and
  - f. An assessment by the Discharger if proper operation and maintenance occurred during the year, and if not, what actions the Discharger has taken, or will take, to address the deficiencies.

**F. Pollution Prevention/Good Housekeeping.** The SWMP shall contain a written *Pollution Prevention/Good Housekeeping Program* that is sufficient to minimize pollutant runoff from on-site operations. The Discharger may incorporate by reference, other plans implemented at the Facility (i.e., SWPPP and BMP Plan) that address similar goals. The Discharger shall :

1. Develop *and* implement an operation and maintenance program that includes a training component and has the ultimate goal of preventing or reducing pollutant runoff from Facility operations: and
2. Using training materials that are available from USEPA, the state, or other organizations, include target audience training to prevent and reduce storm water pollution from activities such as park and open space maintenance, fleet building maintenance, new construction and land disturbances, and storm water system maintenance.

**II. MEASUREABLE GOALS.** The SWMP must identify the measurable goals for each of the BMPs, including, as appropriate, the months and years for scheduled actions, including interim milestones and the frequency of the action.

**III. SWMP ANNUAL REVIEW.** The SWMP shall be reviewed annually and revised as necessary. A summary of each annual review, the identified inadequacies, and any planned efforts to address the identified inadequacies shall be maintained as an attachment to the SWMP for a minimum of 5 years.

**ATTACHMENT M – STORM WATER RISK LEVEL DESIGNATION TABLES**

Listing of NBC Municipal Storm Water Discharge Locations					
Discharge Point	Navy ID Number	Latitude	Longitude	Outfall Risk Level	Receiving Water
NBC-001	NASNI-50	32° 42' 31" N	117° 13' 11" W	Municipal	San Diego Bay

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2013-0001**

**GENERAL COMMENTS**

Gnl-1: <i>Implementation of the Tentative Order and its burdensome, untested regulations will be too costly.</i> .....	12
Gnl-2: <i>Allow current permit requirements to remain in effect until Water Quality Improvement Plans are developed.</i> .....	15
Gnl-3: <i>Regional MS4 Permit approach allowing prioritization may result in the neglect of parts of the watershed.</i> .....	16
Gnl-4: <i>Meaningful enforcement of permit requirements is necessary to protect receiving waters.</i> .....	17
Gnl-5: <i>Include requirements to develop maps or charts to track and monitor coastal receiving waters subject to MS4 runoff flows and impacts.</i> .....	18
Gnl-6: <i>Increase use of recycled water to reduce need for imported water and discharges from MS4s.</i> .....	19
Gnl-7: <i>Portions of San Diego County in the Colorado River Region should not be subject to requirements of San Diego Region.</i> .....	20
Gnl-8: <i>Urban runoff is the San Diego Region’s most urgent pollution problem.</i> .....	21
Gnl-9: <i>The term “prohibit” should be changed to “effectively prohibit” throughout Tentative Order when referring to non-storm water discharges.</i> .....	22
Gnl-10: <i>The requirements of the Tentative Order do not allow Copermittees to adaptively manage their programs.</i> .....	23
Gnl-11: <i>Implementation of current permit requirements and accomplishments of Orange and Riverside County Copermittees not being considered.</i> .....	25
Gnl-12: <i>Updating the Basin Plan needs to be a priority of the San Diego Water Board.</i> .....	27
Gnl-13: <i>“Clarify” responsibilities of the Copermittees under the Tentative Order.</i> .....	28
Gnl-14: <i>Request for consistency in MS4 permit requirements for Copermittees under the jurisdiction of multiple Regional Water Boards.</i> .....	30
Gnl-15: <i>Findings and Fact Sheet do not provide adequate justification for new or modified requirements.</i> .....	31
Gnl-16: <i>Recommendation for revising numbering system in the Tentative Order.</i> .....	32
Gnl-17: <i>Requests for changes to schedules and deadlines in the Tentative Order.</i> .....	33
Gnl-18: <i>Requests for additional opportunities to provide comments.</i> .....	34
Gnl-19: <i>The maximum extent practicable (MEP) standard is the floor, not the limit, for MS4 permit requirements.</i> .....	36
Gnl-20: <i>Include graphical representation of areas covered by the Tentative Order.</i> .....	37
Gnl-21: <i>Federal regulations require that the term of the Tentative Order not exceed five years.</i> .....	38
Gnl-22: <i>Identification of grammatical and typographical errors.</i> .....	39

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2013-0001  
(Cont'd)**

**LEGAL COMMENTS**

Lgl-1: *Concerns with strict liability for exceedances of water quality standards and receiving water limitations.* ..... 40

Lgl-2: *Concerns with the Copermittees' legal authority to impose requirements on development projects where a nexus between impact on the receiving water and the project cannot be established.* ..... 43

Lgl-3: *The Tentative Order must address water quality inconsistencies with the California Coastal Act and California Water Code.*..... 46

Lgl-4: *San Diego Water Board has legal authority to not incorporate the Beaches and Creeks Bacteria TMDLs into the Tentative Order.* ..... 47

Lgl-5: *San Diego Water Board does not have the legal authority to issue a regional MS4 permit.* ..... 51

Lgl-6: *The requirements of the Tentative Order are more stringent than Federal law and require a CWC 13241 analysis.* ..... 53

Lgl-7: *The San Diego Water Board cannot determine whether a particular mandate is unfunded.*..... 55

Lgl-8: *"Waters of the state" should be revised to "waters of the U.S" or "receiving waters" throughout the Tentative Order.*..... 57

Lgl-9: *The Tentative Order cannot include requirements to regulate storm water flow.* ..... 58

Lgl-10: *The numeric WQBELs violate requirements of law because they are infeasible.* ..... 61

Lgl-11: *Storm water pollutant control retention requirements of the Tentative Order conflict with Rainwater Capture Act of 2012 (AB 1750).*..... 63

**FINDINGS**

Fnd-1: *Requests for additional findings.* ..... 64

Fnd-2: *Findings 2 and 26: Remove language that states the San Diego Water Board has the authority to issue a regional MS4 permit.* ..... 65

Fnd-3: *Finding 3 and 15 (and elsewhere in permit): Remove "in storm water" from "reduce discharges of pollutants in storm water to the maximum extent practicable".* ..... 66

Fnd-4: *Finding 7: Finding should be modified to support construction of BMPs in receiving waters* ..... 67

Fnd-5: *Findings 8, 16 and 17: Finding should not include presumption that discharges from MS4s always contain waste or pollutants.* ..... 68

Fnd-6: *Finding 10: Finding should be modified to specify linear underground projects (LUPs) should not be subject to permanent post construction BMP requirements*..... 70

Fnd-7: *Finding 11: Finding should not classify natural waters as part of the MS4, and cannot be classified as both an MS4 and receiving water.* ..... 71

Fnd-8: *Finding 12: Finding should not state that Copermittees provide free and open access to MS4s; Copermittees are not responsible for all discharges not prohibited.*..... 73

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2013-0001  
(Cont'd)**

**FINDINGS (Cont'd)**

Fnd-9: *Finding 15: Finding should state that the maximum extent practicable standard applies to both non-storm water and storm water, not just storm water.* . 74

Fnd-10: *Finding 27: Finding should state that implementation of the requirements of the Tentative Order “will” not “may” allow the San Diego Water Board to re-categorize impaired water bodies to Category 4 in the Integrated Report.* ..... 75

Fnd-11: *Finding 28: Finding should state that the requirements of the Tentative Order are more stringent than Federal law and require a CWC 13241 analysis.* . 76

Fnd-12: *Finding 29: San Diego Water Board cannot determine what is a state mandate.* ..... 77

Fnd-13: *Finding 31: Finding should support implementation of the iterative process to comply with prohibitions and limitations.* ..... 78

Fnd-14: *Finding 32: Finding should clarify that NPDES permitted discharges to MS4s that discharge to ASBS are authorized.* ..... 79

**PROVISION A: PROHIBITIONS AND LIMITATIONS**

A-1: *Revise Provision A to clarify how compliance with prohibitions and limitations can be achieved.* ..... 80

A-2: *The maximum extent practicable (MEP) standard applies to both non-storm water and storm water.*..... 84

A-3: *The Copermittees should only be subject to “applicable” prohibitions and water quality standards in the Basin Plan, plans and policies.*..... 85

**PROVISION A.1: Discharge Prohibitions**

A1-1: *MS4 discharges to environmentally sensitive area (ESA) shellfish habitat should be prohibited.* ..... 86

A1-2: *Specify that NPDES permitted discharges to MS4s discharging to ASBS are authorized.* ..... 87

**PROVISION B: WATER QUALITY IMPROVEMENT PLANS**

B-1: *Link compliance with prohibitions and limitations to development and implementation of Water Quality Improvement Plans.*..... 88

B-2: *Support for the Water Quality Improvement Plan approach.*..... 89

B-3: *Ensure adequate public participation in the development and updating of the Water Quality Improvement Plans.* ..... 90

B-4: *Allow current permit requirements to remain in place until Water Quality Improvement Plans are developed.*..... 93

B-5: *Adopt Water Quality Improvement Plans as Orders to implement the permit requirements.* ..... 94

B-6: *Align Water Quality Improvement Plan requirements with the Jurisdictional Runoff Management Program requirements.*..... 95

B-7: *Recommendations for revisions to the introductory paragraph of Provision B.* ..... 96

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2013-0001  
(Cont'd)**

**PROVISION B.1: Watershed Management Areas**

B1-1: *Allow San Diego County to use WURMP for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees are covered under the Tentative Order.* ..... 97

**PROVISION B.2.e: Numeric Goals and Schedules**

B2e-1: *Clearly state that numeric goals are enforceable or not enforceable limitations.* ..... 98  
 B2e-2: *Remove or modify the language for the 10 year limitation of the schedules to achieve numeric goals.*..... 99

**PROVISION B.3: Water Quality Improvement Strategies and Schedules**

B3-1: *Provide a mechanism for compliance with the prohibitions and limitations in Provision A through the Water Quality Improvement Plan.* ..... 100  
 B3-2: *Allow Copermittees to “reduce” instead of “prevent and eliminate” non-storm water discharges through Water Quality Improvement Plan.* ..... 101

**PROVISION B.5: Iterative Approach and Adaptive Management Process**

B5-1: *Recommendations for minor revisions to the language under iterative and adaptive management process requirements.* ..... 102

**PROVISION B.6: Water Quality Improvement Plan Submittal, Updates, and Implementation**

B6-1: *Clarify that the implementation of Water Quality Improvement Plans may demonstrate TMDLs are not required.* ..... 103

**PROVISION C: ACTION LEVELS**

C-1: *Clarify that action levels are enforceable or not enforceable limitations.*..... 104  
 C-2: *Allow the Copermittees to develop action levels instead of prescribing required action levels.* ..... 105  
 C-3: *Notes to Table C-3 should refer to CTR instead of including equations.*..... 108  
 C-4: *Action levels should be included for insecticides.* ..... 109

**PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS**

D-1: *Revise monitoring and assessment requirements as recommended by San Diego County Copermittees.*..... 110  
 D-2: *Include requirements to track and monitor progress toward watershed goals and health of watersheds.* ..... 111  
 D-3: *Requests for changes to schedules for monitoring and monitoring reports.* ..... 114  
 D-4: *Require the Copermittees to utilize monitoring data from third party sources.* ..... 115

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2013-0001  
(Cont'd)**

**PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS (Cont'd)**

D-5: *Include monitoring that will ensure compliance and jurisdictional accountability.* ..... 116

D-6: *Provide the County of San Diego an alternative transitional monitoring and assessment program for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees are covered under the permit.*..... 119

**PROVISION D.1: Receiving Water Monitoring Requirements**

D1-1: *Requests for “clarifications” of receiving water monitoring requirements.* ..... 120

D1-2: *Requests for modifications to receiving water monitoring stations, frequency, and data collection requirements.* ..... 122

D1-3: *Require Test of Significant Toxicity to be consistent with other recent MS4 permits.* ..... 125

**PROVISION D.2: MS4 Outfall Discharge Monitoring Requirements**

D2-1: *Requests for “clarifications” of MS4 outfall discharge monitoring requirements.*..... 126

D2-2: *Requests for modifications to MS4 outfall monitoring stations, frequency, and data collection requirements.*..... 127

**PROVISION D.3: Special Studies**

D3-1: *Request to reduce the number of special studies required.* ..... 129

D3-2: *Allow special studies initiated prior to the term of the Tentative Order to count toward required special studies.*..... 130

**PROVISION D.4: Assessment Requirements**

D4-1: *Requests for “clarifications” of assessment requirements.* ..... 131

D4-2: *Requests for modifications to assessment requirements.* ..... 133

**PROVISION E: JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS**

E-1: *Align the Jurisdictional Runoff Management Program requirements with the Water Quality Improvement Plan requirements.*..... 134

E-2: *Allow San Diego County to use WURMP to guide jurisdictional runoff management program for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees are covered under the permit.*..... 136

**PROVISION E.1: Legal Authority Establishment and Enforcement**

E1-1: *Specify that the legal authority established by Copermittees only applies to the Copermittees’ jurisdictions.* ..... 137

E1-2: *Requests for “clarifications” for legal authority requirements.* ..... 139

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2013-0001  
(Cont'd)**

**PROVISION E.2: Illicit Discharge Detection and Elimination**

E2-1: <i>Non-storm water discharges must be addressed because of the impacts dry weather flows have on receiving waters.</i>	141
E2-2: <i>Requests for “clarifications” of illicit discharge detection and elimination requirements.</i>	142
E2-3: <i>Requests to more clearly define the responsibility of each Copermittee to address sources non-storm water discharges originating outside of a Copermittee’s jurisdiction or control.</i>	143

**PROVISION E.2.a: Non-Storm Water Discharges**

E2a-1: <i>Request to allow the Copermittees to “encourage” instead of “require” air conditioning condensate non-storm water discharges be directed to landscaped areas or other impervious surfaces.</i>	145
E2a-2: <i>Requests for modifications to requirements of fire-fighting non-storm water discharges.</i>	146
E2a-3: <i>Clarify that non-storm water discharges authorized by a separate NPDES permit are authorized to be discharged to the MS4.</i>	148
E2a-4: <i>Objections to addressing non-storm water discharges related to extraction of groundwater as illicit discharges.</i>	149
E2a-5: <i>Request to allow the Copermittees to focus on elimination of “non-storm water discharges that are a source of pollutants” not “non-storm water discharges.”</i>	151
E2a-6: <i>Request to allow the Copermittees to encourage the control of residential car washing non-storm water discharges through public education.</i>	152
E2a-7: <i>Request for modification to requirements for swimming pool non-storm water discharges.</i>	153
E2a-8: <i>Objections to requiring the prohibition of over-irrigation non-storm water discharges.</i>	154
E2a-9: <i>Objection to requirement to reduce or eliminate non-storm water discharges whether or not a non-storm water discharge has been identified as an illicit discharge.</i>	156
E2a-10: <i>Request for modifications to the requirements for water line flushing and water main breaks non-storm water discharges.</i>	157
E2a-11: <i>Request to allow the Copermittees to designate BMPs to be implemented if a category of non-storm water discharges is found to be a source of pollutants instead of requiring a prohibition of the category of non-storm water discharges.</i>	158

**PROVISION E.3: Development Planning**

E3-1: <i>Requests for “clarifications” for development planning requirements.</i>	159
E3-2: <i>Requests for revisions to allow the construction of BMPs in waters of the state.</i>	160
E3-3: <i>Requests for revisions to Priority Development Project inventory requirements</i>	161

# RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Gnl-1	GENERAL
	<p><b>RESPONSE:</b> The San Diego Water Board understands the concerns expressed by the commenters about the potential costs to implement the requirements, but disagrees that the requirements are burdensome and untested.</p> <p>Most of the requirements in the Tentative Order are not new to the San Diego Region. The Tentative Order incorporates many existing requirements from the MS4 permits for Orange and Riverside Counties.</p> <p>The San Diego Water Board has put considerable effort into developing a draft Regional MS4 permit (referred to as the Tentative Order ) that that will jointly cover thirty-nine (39) municipal, county government, and special district entities (Copermittees) in San Diego County , southern Orange County and southwest Riverside County. The Tentative Order significantly modifies the prescriptive action-based regulatory approach of the current municipal storm water permits to an outcome-based approach, with a focus on measuring and achieving improvements in MS4 discharges and receiving water quality. A key feature of the Tentative Order is that it provides an adaptive management pathway for the Copermittees to select and address the highest priority water quality issues through a non-punitive iterative process. The proposed adaptive management permit provisions have great promise and will allow the Copermittees to more flexibly deploy resources to achieve goals that will yield the greatest water quality improvements in the most effective and efficient manner to restore and protect the quality of the San Diego Region's receiving waters. The regional approach of the Tentative Order offers the opportunity to better achieve regulatory consistency as well as maximum efficiency and economy of resources for both the San Diego Water Board and the Copermittees.</p> <p>The San Diego Water Board has carefully considered costs of both the Tentative Order and the TMDLs included in the Tentative Order and found them to be necessary. Consideration of costs is discussed under the Economic Considerations in Section IV of the Fact Sheet. The commenters assert that the Tentative Order is too expensive, but do not consider the costs of not addressing impacts from discharges from the MS4. In addition, the San Diego Water Board has significantly modified the structure and focus of the requirements in the Tentative Order to allow the Copermittees to more efficiently and cost effectively utilize their resources, which is expected to result in the realization of significant cost savings that could not be realized in the existing MS4 permits.</p> <p>The Tentative Order was developed over a two year period beginning in February 2011 through a participatory approach designed to actively engage key stakeholders, The transparent and comprehensive stakeholder participation process has resulted in a Tentative Order designed to be a strategic, cost-effective, and water</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Gnl-1	GENERAL
	<p>quality outcome based permit. Strategic in that it allows for identifying the highest priority water quality conditions to be addressed first. Cost-effective in that the Copermittees are allowed to use their limited resources on the highest priority water quality conditions and can look for efficiencies on a watershed scale. The Tentative Order is water quality outcome based in that it has a clearly defined iterative and adaptive management process that fcuses on measuring and achieving improvements in MS4 discharges and receiving water quality. The Tenaitve Order evaluates success based on water quality monitoring data and assessment, not just completing a minimum number of actions without consideration if these actions are succeeding in improving water quality.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**  
 March 27, 2013

<b>Gnl-2 GENERAL</b>	
<p><b>COMMENT:</b> <i>Allow current permit requirements to remain in effect until Water Quality Improvement Plans are developed.</i></p> <p>Comments were submitted by members of the Building Industry, Engineering/Design Consultants, Societies/Associations/Coalitions, and Other Entities generally requesting that the Copermittees be allowed to continue implementing the current permit requirements until Water Quality Improvement Plans are developed and implemented.</p>	<p><b>Building Industry / Industry</b>                      Associated General Contractors of America                      Otay Land Company</p> <p><b>Engineering/Design Consultants</b>                      Latitude 33 Planning and Engineering</p> <p><b>Societies/Associations/Coalitions</b>                      BIOCUM                      San Diego Association of Realtors</p> <p><b>Other Entities</b>                      Carol Crossman                      Continental Maritime of San Diego                      Gable PR                      Hughes Marino                      Marston+Marston, Inc.                      Nuffer, Smith, Tucker, Inc.                      San Diego Regional Chamber of Commerce                      Sheppard, Mullin, Richter &amp; Hampton LLP                      Southern Cross Property Consultants                      Transition IT</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees that the jurisdictional runoff management program requirements of the current permits should remain in effect until the Water Quality Improvement Plans are developed and accepted.</p> <p>The jurisdictional runoff management program requirements of the existing MS4 permits will remain in effect until the Water Quality Improvement Plans are developed and implemented. The introductory paragraph to Provision E states, <i>“Until the Copermittee has updated its jurisdictional runoff management program document with the requirements of Provision E, the Copermittee must continue implementing its current jurisdictional runoff management program.”</i> This includes the development planning requirements.</p> <p>The Copermittees, however, will be required to comply with the prohibitions and limitations, and implement the transitional monitoring requirements, transitional reporting requirements, and TMDL requirements upon adoption of the Tentative Order.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**  
 March 27, 2013

<b>Gnl-3 GENERAL</b>	
	<p><b>COMMENT:</b> <i>Regional MS4 Permit approach allowing prioritization may result in the neglect of parts of the watershed.</i></p> <p>The Environmental Groups and the South Laguna Civic Association submitted comments expressing support for the Regional MS4 Permit allowing the Copermittees to focus on priorities, but they also expressed concern that the approach may also result in the neglect of parts of the watersheds. The South Laguna Civic Association are particularly concerned that high value habitats and coastal receiving waters of the Aliso Creek watershed will continue to be impacted by runoff from residential developments. The Environmental Groups are concerned that there will be “orphaned” priorities, or one jurisdiction will carry most of the burden of implementing the water quality improvement strategies within the watershed.</p>
	<p><b>Environmental Organizations</b>                  Environmental Groups                  South Laguna Civic Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board understands the concerns, but disagrees that the approach of the Regional MS4 Permit will result in the neglect of parts of the watershed.</p> <p>The San Diego Water Board developed the approach of the Regional MS4 Permit because the Copermittees are no longer focused on achieving outcomes of improved water quality, but compliance with actions that must be implemented. In effect, the current approach is actually resulting in the neglect of the entire watershed because of the “everything, everywhere” approach. When everything is a priority, nothing is a priority.</p> <p>In contrast, the approach of the Regional MS4 Permit is to re-focus the Copermittees’ efforts toward achieving outcomes that will result in improvements in MS4 discharges and receiving water quality. While not all priorities will be addressed immediately, all priorities will be addressed at some point. In allowing the Copermittees to focus on the highest priorities, lower priorities may also be addressed by the strategies being implemented to address the highest priorities. The requirements of the Tentative Order also include several elements that are intended to provide the San Diego Water Board and the public the information necessary to determine if each Copermittee is participating in implementing the Water Quality Improvement Plans.</p> <p>The San Diego Water Board encourages the Environmental Organizations to remain involved during the development and implementation of the Water Quality Improvement Plans to provide recommendations to the Copermittees for the priority water quality conditions that should be addressed. By remaining involved, the environmental organizations can also understand the opportunities and constraints that are identified during the prioritization process.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Gnl-4 GENERAL	
	<p><b>COMMENT:</b> <i>Meaningful enforcement of permit requirements is necessary to protect receiving waters.</i></p> <p>The San Diego Green Building Council, Laguna Bluebelt Association, and South Laguna Civic Association each submitted comments that the Tentative Order must include requirements that result in meaningful enforcement actions. Without requirements for meaningful enforcement actions, the commenters are concerned that discharges from the MS4 and dry weather flows will continue to degrade water quality.</p>
	<p><b>Building Industry / Industry</b> San Diego Green Building Council</p> <p><b>Environmental Organizations</b> Laguna Bluebelt Coalition South Laguna Civic Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that meaningful enforcement actions are necessary to protect receiving waters.</p> <p>The requirements of the Tentative Order are all intended to result in the protection of the quality of receiving waters from MS4 discharges. The Tentative Order also includes requirements for the Copermittees to demonstrate that they are issuing enforcement actions in a timely manner to obtain compliance from sources that are discharging to their MS4s.</p> <p>Enforcement of the requirements of the Tentative Order by the San Diego Water Board may be necessary to compel the Copermittees to properly implement and enforce their legal authorities to adequately protect water quality. By issuing the Regional MS4 Permit, the San Diego Water Board expects to be able to reallocate its resources to better enforce permit requirements instead of developing permits and permit requirements.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Gnl-5 GENERAL	
<p><b>COMMENT:</b> <i>Include requirements to develop maps or charts to track and monitor coastal receiving waters subject to MS4 runoff flows and impacts.</i></p> <p>The Laguna Bluebelt Coalition and South Laguna Civic Association expressed support for the creation of maps to show water quality impacted areas of all creeks and coastal receiving waters within the region. The South Laguna Civic Association would like an interactive map that identifies protected coastal receiving water resources and dominant littoral currents and counter currents to help identify distribution patterns of urban runoff induced algal plumes and thermal plumes.</p>	<p><b>Environmental Organizations</b>                      Laguna Bluebelt Coalition                      South Laguna Civic Association</p>
<p><b>RESPONSE:</b> The San Diego Water Board has considered the concept, but does not agree this requirement is appropriate or necessary to be included in the requirements of the Tentative Order.</p> <p>The San Diego Water Board understands the desire for such spatial and temporal information to be available in a visual format. However, the creation and maintenance of such map would require the collection and processing of data that is beyond the scope of what is required to be measured and reported for the purposes of the Tentative Order.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Gnl-6 GENERAL		
	<p><b>COMMENT:</b> <i>Increase use of recycled water to reduce need for imported water and discharges from MS4s.</i></p> <p>The Laguna Bluebelt Coalition and South Laguna Civic Association expressed support for the increasing the use of recycled water to reduce imported water demand. The commenters contend that increasing recycled water use will reduce discharges to the ocean.</p>	<p><b>Environmental Organizations</b>                      Laguna Bluebelt Coalition                      South Laguna Civic Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board supports and promotes the use of recycled water.</p> <p>The Tentative Order does not prohibit the use of recycled water, but does limit the discharge of recycled water to receiving waters. The requirements of the Tentative Order do not specifically encourage the use of recycled water, nor is it appropriate for the Tentative Order to do so. Recycled water and the discharge of recycled water are regulated by the San Diego Water Board under separate regulatory mechanisms.</p> <p>The San Diego Water Board agrees that the recycling of wastewater, as well as recycling non-storm water discharges and retaining and using storm water runoff has the potential to reduce the need to import water to the San Diego Region. The San Diego Water Board encourages the Environmental Organizations to remain involved during the development and implementation of the Water Quality Improvement Plans to provide recommendations to the Copermittees for identifying opportunities to promote recycled water use and recycling of non-storm water and storm water discharges to and from the MS4.</p>

	<p><b>RESPONSE:</b> The San Diego Water Board agrees that runoff from developed and developing areas pose a significant problem to protecting water quality in the San Diego Region.</p> <p>The San Diego Water Board has developed the Regional MS4 Permit approach to allow the Copermittees to tap into the community and the resources the community is willing to provide to help address the problems associated with runoff from developed and developing areas. The San Diego Water Board encourages the community to remain involved during the development and implementation of the Water Quality Improvement Plans to provide recommendations to the Copermittees for identifying opportunities to the public for addressing problems associated with runoff from developed and developing areas.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Gnl-9 GENERAL	
<p><b>COMMENT:</b> <i>The term "prohibit" should be changed to "effectively prohibit" throughout Tentative Order when referring to non-storm water discharges.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting that the language of the Tentative Order be revised to "effectively prohibit" non-storm water discharges to the MS4 instead of just "prohibit" to be consistent with the language of the Clean Water Act. The Natural Resources Defense Council submitted comments that assert that the Clean Water Act and the Code of Federal Regulation require an absolute prohibition of non-storm water discharges, in any amount, to the MS4.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Natural Resources Defense Council</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees that the language of the Tentative Order should be consistent with the Clean Water Act and Code of Federal Regulations.</p> <p>The Clean Water Act requires MS4 permits to include a requirement that non-storm water discharges are to be "effectively prohibited" to the MS4. The Code of Federal Regulations requires each Copermittee to have the legal authority to "prohibit" non-storm water discharges to the MS4. The Phase I Final Rule clarifies what "effectively prohibit" means (55 FR 47995): <i>"Section 402(p)(3)(B) requires that permits for discharges from municipal separate storm sewers require the municipality to "effectively prohibit" non-storm water discharges from the municipal separate storm sewer...Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit (other than the permit for the discharge from the municipal separate storm sewer.)"</i></p> <p>Where appropriate, the language in the Tentative Order has been revised to be consistent with the language of the Clean Water Act to include the term "effectively prohibit" instead of "prohibit" or "reduce and eliminate." In other cases, the language has been maintained to be consistent with the requirements of the Code of Federal Regulations requiring the Copermittees to establish the legal authority to "prohibit" non-storm water discharges to their MS4s and enforce that legal authority. The establishment and enforcement of the legal authority to "prohibit" non-storm water discharges to their MS4s is how the Copermittees will "effectively prohibit" non-storm water discharges to their MS4s.</p>

<b>Gnl-10 GENERAL</b>	
<p><b>COMMENT:</b> <i>The requirements of the Tentative Order do not allow Copermittees to adaptively manage their programs.</i></p> <p>The Riverside County Copermittees submitted comments contending that the requirements of the Tentative Order will not allow the Copermittees to adaptively manage their programs. In particular, the Riverside County Copermittees cite the prohibitions and limitations of Provision A and the development planning requirements of Provision E.3 as requirements that will limit their ability to adaptively manage.</p>	<p><b>Copermittees</b> Riverside County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the requirements of the Tentative Order will not allow the Copermittees to adaptively manage their programs.</p> <p>The approach used in developing the requirements in the Tentative Order departs significantly from the approach used in developing the requirements of previous and current permits. The current MS4 permits essentially prescribe the programs that must be implemented by each Copermittee, resulting in a focus on complying with the implementation of required actions. The current permits provide the Copermittees little or no ability to adaptively manage the programs to become more focused on achieving outcomes.</p> <p>In contrast, the requirements of the Tentative Order allow the Copermittees to strategically plan by identifying the highest priority pollutants or conditions in a specific watershed, goals and strategies to address those pollutants or conditions, and resources to implement the strategies. Furthermore, the Copermittees are provided the monitoring and assessment information that allows them to determine when those priorities, goals and strategies should be adjusted or are no longer appropriate. The Tentative Order is predicated on a new emphasis on water quality based outcomes (i.e., restoration or protection of water quality and beneficial uses) instead of a prescriptive action based regulatory approach (e.g., implementation of programs).</p> <p>The flexibility that is provided in the Tentative Order should not be mistaken as the San Diego Water Board wishing to grant full autonomy to the Copermittees to implement their jurisdictional runoff management programs. The requirements of the Clean Water Act and the Code of Federal Regulations must still be incorporated into the requirements of the Tentative Order. The Code of Federal Regulations includes several program components that must be implemented by the Copermittees. The USEPA has also provided guidance as to what minimum requirements should be included in those programs.</p> <p>The San Diego Water Board must balance the Copermittees' desire to have more flexibility to adjust their</p>

	<p>programs with the statutory requirements of the Clean Water Act and the California Water Code which hold the Copermitees accountable for compliance with a minimum set of requirements that are enforceable. Given that the Tentative Order already provides the Copermitees great latitude in adjusting their programs to focus their resources on achieving improved water quality, the San Diego Water Board has extended that flexibility further by incorporating additional opportunities into the revised Tentative Order for identifying and implementing more watershed-specific requirements in areas of the Tentative Order where the Copermitees perceive and assert there is little to no flexibility provided. Please see responses to comments A-1 and E3c-2.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Gnl-11 GENERAL	
<p><b>COMMENT:</b> <i>Implementation of current permit requirements and accomplishments of Orange and Riverside County Copermittees not being considered.</i></p> <p>The Orange County and Riverside County Copermittees each submitted comments expressing concern that the Tentative Order has been developed without considering the programs and plans being developed under their current permit requirements, and does not acknowledge the accomplishments achieved by the Copermittees during the previous and current permit terms. In addition, the Orange County and Riverside County Copermittees each submitted comments that they must have an opportunity to propose changes to the requirements of the Tentative Order through the Report of Waste Discharge.</p> <p>The San Diego Green Building Council recommended that the Tentative Order also take into account successes that have been achieved in other jurisdictions outside of the San Diego Region.</p>	<p><b>Building Industry / Industry Copermittees</b>                  San Diego Green Building Council                  Orange County Copermittees                  Riverside County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the Tentative Order does not consider the implementation of current permit requirements, and accomplishments and successes of the Orange County and Riverside County Copermittees and other jurisdictions.</p> <p>Most of the requirements included in the Tentative Order are also in the current permits issued to the Orange County and Riverside Copermittees (Order Nos. R9-2009-0002 and R9-2010-0016). The current permits issued to the Orange County and Riverside County Copermittees include prohibitions and limitations, numeric action levels, and the same jurisdictional runoff management program components. The structural BMP performance standards (i.e. storm water pollutant control retention and hydromodification management) are effectively the same as in the Orange County and Riverside County MS4 permits. The Watershed Workplans of the current permits are very similar to, and are expected to serve as the basis of the Water Quality Improvement Plans. The monitoring program requirements are very similar, with potential reductions of monitoring requirements in several instances. The reporting requirements in the Tentative Order have actually been significantly reduced compared to the current permits.</p> <p>The San Diego Water Board expects the Orange County and Riverside County Copermittees' implementation of their current permit requirements will make the transition from to the Tentative Order much easier than the San Diego County Copermittees because so many of the MS4 permit requirements are similar, and in many cases more prescriptive, than the requirements of the Tentative Order. The flexibility of the requirements of the Tentative Order compared to their current permit requirements will provide the Orange County and Riverside</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

**Gnl-11 GENERAL**

County Copermittees many opportunities to identify more effective and efficient ways to utilize their resources to improve water quality. However, until the Orange County and Riverside County Copermittees obtain coverage under the Tentative Order, they will remain subject to the more prescriptive requirements of their current permits.

Furthermore, the requirements of the Tentative Order were developed with a strong consideration of the current permit requirements being implemented by the Orange County and Riverside County Copermittees, as well the accomplishments of all the Copermittees in the San Diego Region. In fact, the Tentative Order was developed and improved based on comments received from the Orange County and Riverside County Copermittees during the 18 month administrative draft focused meeting and comment process.

The Tentative Order was also developed considering the accomplishments and successes of other jurisdictions outside of the San Diego Region. The basis of incorporating an allowance for implementing a true iterative and adaptive management process is because of the accomplishments, successes, and failures observed by the San Diego Region's Copermittees, as well as those observed in other jurisdictions within California and other states. By allowing a true iterative and adaptive management process to be implemented, the San Diego Water Board expects the Copermittees to not only learn from each other's successes and failures within the San Diego Region, but the successes and failures from other jurisdictions outside the San Diego Region.

The fact of the matter is that the requirements of the Tentative Order are more similar to the current permits issued to the Orange County and Riverside Copermittees than the current permit issued to the San Diego County Copermittees (Order No. R9-2007-0001). This is because most of these elements in the Tentative Order were developed based on the requirements in the current Orange County and Riverside County MS4 permits. The Tentative Order also allows the Orange County and Riverside County Copermittees to provide additional recommendations and propose changes for consideration by the Board based on their experiences and successes when they submit their Report of Waste Discharge for coverage under the Regional MS4 Permit.

March 27, 2013

Gnl-12 GENERAL	
	<p><b>COMMENT:</b> <i>Updating the Basin Plan needs to be a priority of the San Diego Water Board.</i></p> <p>The Riverside County Copermittees commented that the San Diego Water Board should make updating the Basin Plan with water quality objectives based on background conditions, beneficial uses of specific water bodies, and specific conditions that influence the water bodies a priority. The Riverside County Copermittees contend that without the updates, the desired outcomes the Copermittees include in the Water Quality Improvement Plans will be arbitrary and may not achieve desired beneficial use improvements, or be appropriate.</p>
	<p><b>Copermittees</b> Riverside County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that updating the Basin Plan should be a priority. Updating the Basin Plan, however, is not within the scope of developing and issuing the Tentative Order.</p> <p>On many occasions, dischargers have asserted that the water quality standards are not achievable, and because they are not achievable they are not appropriate. The San Diego Water Board disagrees. The water quality standards in the Basin Plan are protective of water quality and are therefore appropriate. The San Diego Water Board maintains that because they are appropriate, they must be achieved to protect water quality.</p> <p>If the Copermittees believe a different water quality objective is appropriate and will protect water quality, the San Diego Water Board recommends that the Copermittees collect the data and develop the evidence to support a different water quality objective to be incorporated into the Basin Plan through an amendment to the Basin Plan. Until then, the water quality standards in the Basin Plan are considered appropriate and must be implemented in MS4 permits.</p>

March 27, 2013

Gnl-13 GENERAL	
<p><b>COMMENT:</b> <i>"Clarify" responsibilities of the Copermitees under the Tentative Order.</i></p> <p>The Orange County, Riverside County and San Diego County Copermitees each submitted comments requesting that the requirements of the Tentative Order "clarify" the responsibilities of the Copermitees, consistent with the requirements of the Clean Water Act. The Copermitees requested revisions throughout the requirements of the Tentative Order to specify that the Copermitees must "effectively prohibit" non-storm water discharges "into the MS4" instead of "into and from the MS4," and control the discharge of "pollutants" not "pollutants in storm water" from the MS4 to the MEP. The Copermitees also requested including several qualifying phrases that the Copermitees could only operate "to the extent allowable" or "as applicable" or other such phrases to "clarify" the Copermitees were only responsible for implementing requirements subject to their legal authority</p> <p>The Natural Resources Defense Council (NRDC) expressed concern that the non-storm water action levels (NALs) may violate the effective prohibition of non-storm water discharges to the MS4. The NRDC requested that the Tentative Order be very clear that the Copermitees are responsible for prohibiting non-storm water discharges to the MS4.</p> <p>The Orange County and Riverside County Copermitees objected to language in the Tentative Order that implied the Copermitees were responsible for "enhancing" and "restoring" water quality in receiving waters, contending that they are only responsible for the discharges from their MS4s. The Orange County Copermitees also objected to the requirements for the Copermitees to evaluate stream channels for restoration, asserting the Copermitees are not responsible for restoring stream channels.</p> <p>The San Diego Unified Port District supported including requirements that result in jurisdictional accountability, recognizing that most of the discharges from the MS4 to San Diego Bay originate from upstream jurisdictions. The San Diego Unified Port District also provided requests for modifications to specify the downstream owners and operators of the MS4 are not responsible and should not be held liable for discharges and pollutants in discharges originating from upstream MS4s. The San Diego Unified Port District requested that the Tentative Order include requirements for the San Diego Water Board to demonstrate a Copermitee caused or contributed to an exceedance of water quality standards. The San Diego Unified Port District also encouraged the San Diego Water Board to include additional monitoring to ensure jurisdictional accountability.</p>	<p><b>Copermitees</b>                  Orange County Copermitees                  Riverside County Copermitees                  San Diego County Copermitees                  San Diego Unified Port District                  San Diego Unified Port District /                  Brown and Winters</p> <p><b>Environmental Organizations</b>                  Natural Resources Defense Council</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

### Gnl-13 GENERAL

**RESPONSE:** The San Diego Water Board reviewed and considered the recommendations and requests.

The San Diego Water Board has revised the language in the Tentative Order to emphasize the Copermittees are responsible for “effectively prohibiting” non-storm water discharges “to the MS4.” The language has not been revised from the control of “pollutants in storm water” to “pollutants” from the MS4 to the MEP. The San Diego Water Board maintains that the Copermittees are required to control “pollutants in storm water” to the MEP. Pollutants in non-storm water discharges are controlled through the effective prohibition of non-storm water discharges to the MS4. Please see the response to comments Gnl-9 and Fnd-3.

The Tentative Order has also been revised to replace any language of “restoring water quality standards in receiving waters” to “protecting water quality standards in receiving waters from MS4 discharges.”

The San Diego Water Board generally did not revise the language with the qualifying phrases requested by the Copermittees. The Copermittees are required to establish the legal authority to implement the requirements of the Tentative Order. The Tentative Order does not require the Copermittees to implement requirements outside of their jurisdictions or outside of their legal authority. Please see response to comments E1-1 and E1-2.

The San Diego Water Board appreciates the support expressed for the requirements that result in jurisdictional accountability. The San Diego Water Board agrees that the requirements of the Tentative Order must provide the San Diego Water Board the information necessary to account for each individual Copermittee’s contribution toward improving or degrading water quality. This information will allow the San Diego Water Board to provide support to improve the Copermittee’s programs, where needed, and the evidence necessary to enforce the requirements of the Tentative Order, when appropriate.

The San Diego Water Board generally disagreed with the modifications to the Tentative Order requested by the San Diego Unified Port District. The San Diego Water Board maintains that the Copermittees are responsible for the discharges from their MS4s to receiving waters. If there are sources that originate from outside a Copermittee’s jurisdiction, it is the Copermittee’s responsibility to demonstrate to the San Diego Water Board that the source is outside of the Copermittee’s legal authority to control.

The San Diego Water Board considered the request by the San Diego Unified Port District for additional monitoring to ensure jurisdictional accountability. The San Diego Water Board included additional monitoring for this purpose. Please see response to comment D-5.

March 27, 2013

Gnl-14 GENERAL	
	<p><b>COMMENT:</b> <i>Request for consistency in MS4 permit requirements for Copermittees under the jurisdiction of multiple Regional Water Boards.</i></p> <p>The Orange County Copermittees submitted comments requesting that the requirements in the Tentative Order be as consistent as possible with requirements in MS4 permits from other Regional Water Boards. The Orange County Copermittees include 5 municipalities that are split between 2 Regional Water Boards. The Orange County Copermittees provided recommended revisions to the Tentative Order aimed at creating greater uniformity and implementability for these 5 municipalities under two MS4 permits.</p>
	<p><b>Copermittees</b> Orange County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board has reviewed and considered the recommended revisions.</p> <p>The San Diego Water Board understands implementing requirements that are not consistent between multiple Regional Water Board permits can present some challenges for a Copermittee. The requirements in the Tentative Order provide significantly more flexibility that will allow a Copermittee to align the implementation of its programs with the requirements of different permit requirements.</p> <p>The San Diego Water Board, however, has not and will not modify any requirements in the Tentative Order to reduce the accountability, enforceability or protectiveness to be more consistent with another Regional Water Board's permit requirements. For those areas of the MS4 permits where there are inconsistent requirements, the solution for the Copermittee would be to develop jurisdictional runoff management programs that implement the most protective elements of both Regional Water Boards' permit requirements and apply them throughout its jurisdiction. In doing so, the Copermittee will be in compliance with the requirements of both MS4 permits and have programs that will be most protective of water quality.</p>

	<p><b>COMMENT:</b> <i>Requests for changes to schedules and deadlines in the Tentative Order.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting changes to the schedules and deadlines for developing, submitting, and implementing several requirements in the Tentative Order. In particular, the requests were focused on additional time for developing the Water Quality Improvement Plans. The San Diego Unified Port District supported the requests. The BIA Regulated Community Coalition and Environmental Groups each submitted comments with recommendations to include more time for public participation during the development of the Water Quality Improvement Plans.</p> <p>The commenters provided several recommendations for modifications to the schedules and deadlines in the Tentative Order that would result in more time to develop and implement the Water Quality Improvement Plans and the monitoring and assessment programs.</p>
	<p><b>Building Industry / Industry</b>                  BIA Regulated Community Coalition</p> <p><b>Copermittees</b>                  Orange County Copermittees                  Riverside County Copermittees                  San Diego County Copermittees                  San Diego Unified Port District</p> <p><b>Environmental Organizations</b>                  Environmental Groups</p>
	<p><b>RESPONSE:</b> The San Diego Water Board reviewed and considered the recommendations to change the schedules and deadlines in the Tentative Order.</p> <p>The San Diego Water Board generally agrees that additional time should be provided to develop the Water Quality Improvement Plans, to allow for a robust public participation process and to provide enough time to implement the optional requirements that have been included in the revised Tentative Order if the Copermittees choose to do so. The San Diego Water Board modified many of the schedules to provide additional flexibility in scheduling the development of several deliverables, as well as including later deadlines for submitting several deliverables. The requirements have also been modified to allow the Copermittees more control in developing the schedules for implementing the monitoring requirements in the Water Quality Improvement Plans.</p> <p>Please see the revisions to Provisions B.3 and F.1 in the revised Tentative Order, as well as the responses to comments B-3 and F1-1.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**  
 March 27, 2013

<b>Gnl-18 GENERAL</b>	
	<p><b>COMMENT:</b> <i>Requests for additional opportunities to provide comments.</i></p> <p>The Riverside County Copermittees, Clean Water Now, and Environmental Groups each submitted comments expressing interest in additional opportunities to provide comments. The Riverside County Copermittees requested an additional public review and comment period after the Tentative Order is revised and the responses to comments are released by the San Diego Water Board. Clean Water Now expressed disappointment with the focused meeting process used in the development of the Tentative Order, and the lack of time available to have protracted discussions. The Environmental Groups requested additional opportunities for the public to participate and provide comments during the development of the Water Quality Improvement Plans.</p>
	<p><b>Copermittees</b>                  Riverside County Copermittees  <b>Environmental Organizations</b>                  Clean Water Now                  Environmental Groups</p>
	<p><b>RESPONSE:</b> The San Diego Water Board considered the requests for additional opportunities to provide comments.</p> <p>The San Diego Water Board disagrees that an additional public review and comment period needs to be provided after the revised Tentative Order and responses to comments are released. Federal regulations only require that the San Diego Water Board provide at least 30 days for public comment on the Tentative Order. The lengthy public review and comment period that was provided for the Tentative Order complies with and exceeds the statutory and regulatory requirements for bringing the Tentative Order before the Board for consideration and adoption. The San Diego Water Board released an administrative draft of the Tentative Order in April 2012, which went through a 5 month review and comment period, with several focused meetings to discuss the requirements. The administrative draft of the Tentative Order was significantly revised based on the comments and information received during the focused meetings and written comments received. The Tentative Order was released in October 2012 and the public comment period was closed in January 2013. The revised Tentative Order will be the third draft of the permit, with a second round of revisions, and revisions reflected in it were made in direct response to written comments received by the San Diego Water Board. The San Diego Water Board has already provided multiple opportunities to comment on the Tentative Order. An additional opportunity to submit written comments is not required or necessary. There will be an opportunity to make oral comments on the revisions to the Tentative Order at the San Diego Water Board hearing.</p> <p>The San Diego Water Board understands that the commenter wished to have more lengthy discussions during the focused meetings that were held during the administrative draft review and comment period. With the exception of the commenter, the San Diego Water Board has received very positive feedback on the focused</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>Gnl-18 GENERAL</b>
<p>meetings that were held. The focused meeting process was above and beyond what is required and the discussions that did take place were more inclusive than previous permit renewal processes. At each focused meeting the San Diego Water Board also extended invitations to everyone present for additional meetings outside the focused meetings. The San Diego Water Board had multiple additional in depth discussions with several groups outside of the focused meeting process on specific topics. If the commenter had contacted the San Diego Water Board for an additional meeting, the San Diego Water Board could have scheduled a meeting with the commenter to have more in depth discussions.</p> <p>The San Diego Water Board agrees that additional opportunities should be provided to the public to participate and comment during the development of the Water Quality Improvement Plans. The San Diego Water Board disagrees that Water Quality Improvement Plans are equivalent in meaning to “water quality control plans” as defined in Water Code section 13050, subdivision (j), requiring a public hearing for the acceptance of the Water Quality Improvement Plans. Please see response to comment B-3.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Gnl-19 GENERAL	
	<p><b>COMMENT:</b> <i>The maximum extent practicable (MEP) standard is the floor, not the limit, for MS4 permit requirements.</i></p> <p>The Natural Resources Defense Council (NRDC) submitted comments asserting that the San Diego Water Board has the authority to include MS4 permit requirements that are more stringent than the MEP standard if necessary to ensure that discharges from the Copermittees' MS4s do not cause or contribute to exceedances of water quality standards in receiving waters. The NRDC cited several court decisions that support their position that the MEP standard is the floor for MS4 permit requirements, and the San Diego Water Board has the authority to impose additional more stringent requirements over and above MEP as determined to be appropriate.</p>
	<p><b>Environmental Organizations</b> Natural Resources Defense Council</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the MEP standard is the floor for permit requirements.</p> <p>In concept, the MEP standard is supposed to evolve and improve and become more stringent over time through an iterative process. In reality, in the current and previous permits issued by the San Diego Water Board, the MEP standard was essentially defined by the requirements of the MS4 permit and the iterative process only occurred when an MS4 permit was renewed by incorporating additional and more stringent requirements. Thus, the MEP standard became static rather than dynamic for each permit term, and only advanced with each permit renewal. This has resulted in multiple MS4 permits by the San Diego Water Board that have different requirements, each a little more stringent than the last one issued.</p> <p>In the Tentative Order the San Diego Water Board has incorporated a new regulatory approach that is expected to result in a more dynamic iterative process to advance the MEP standard during the permit term. Instead of dictating the actions that must be implemented by the Copermittees, and defining the MEP "floor" of requirements that will be utilized to determine compliance, the requirements of the Tentative Order define the iterative process that must be implemented to achieve water quality improvement outcomes through an ever advancing and improving MEP standard.</p> <p>With the exception of the TMDL requirements, the San Diego Water Board disagrees it is necessary to include requirements that are more stringent than the MEP standard. The approach incorporated into the Tentative Order redefines the MEP "floor" from being a "static floor" to a "dynamic floor" that is expected to rise as the Copermittees learn from their failures and successes while working toward achieving tangible improvements in water quality.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>Gnl-20 GENERAL</b>	
	<p><b>COMMENT:</b> <i>Include graphical representation of areas covered by the Tentative Order.</i></p> <p>The San Diego Green Building Council submitted comments recommending that the final permit include a graphic representation of both the political and natural boundaries related to the area under the jurisdiction of the Order.</p>
	<p><b>Building Industry / Industry</b> San Diego Green Building Council</p>
	<p><b>RESPONSE:</b> The San Diego Water Board appreciates the recommendation.</p> <p>Including a graphical representation of the area under the jurisdiction of the Tentative Order is not necessary. The Tentative Order is expected to cover all the Phase I municipalities in the San Diego Region in a phased manner. The Tentative Order will no longer be issued to three separate counties or include requirements separated by political boundaries.</p>

	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the recent Ninth Circuit Court of Appeals decision in NRDC v. County of Los Angeles (<i>Natural Resources Defense Council v. County of Los Angeles, et al.</i> (673 F.3d</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Lgl-1	LEGAL
	<p>1235 (9<sup>th</sup> Cir. 2011) (revd. on other grounds and remanded, <i>Los Angeles County Flood Control District v. Natural Resources Defense Council</i> (133 S.Ct. 710 (2013))), adopted a new interpretation of precedential receiving water limitations language or that it creates any new third party liability risks.</p> <p>Rather the Ninth Circuit's interpretation is consistent with the San Diego Water Board's interpretation of the precedential receiving water limitations language that affords the San Diego Water Board with discretion to take enforcement action for violations of receiving water limitations and discharge prohibitions and also allows for citizen suit enforcement – in other words, engagement in the iterative process does not create a safe harbor from liability for violations of water quality standards. In precedential orders, the State Water Board exercised its discretion to require compliance with water quality standards by directing that MS4 permits contain provision requiring discharges of pollutants in storm water to be controlled so as not to cause or contribute to exceedances of water quality standards in receiving waters. (State Water Board Order WQ-98-01 (<i>Environmental Health Coalition</i>), and WQ 99-05 (<i>Environmental Health Coalition</i>.)</p> <p>Consistent with federal law, the State Water Board also found it appropriate to implement best management practices (BMPs) in lieu of imposing numeric water quality-based effluent limitations to meet water quality standards. (See SWRCB Orders WQ 91-03 (<i>Citizens for a Better Environment</i>), WQ 98-01 (<i>Environmental Health Coalition</i>), WQ 2001-15 (<i>Building Industry Association of San Diego County</i>); See also 40 CFR sec. 122.44(k); Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, USEPA, September 1995.) In these orders and USEPA guidance, the State Water Board and USEPA recognize that the storm water program will evolve over time to incorporate more stringent limitations, including improved BMPs, to meet water quality standards or numeric water quality based effluent limitations.</p> <p>While the State Water Board and San Diego Water Board in its recent MS4 permits have directed MS4 dischargers to achieve compliance with water quality standards through an “iterative process,” using the State Water Board's precedential receiving water limitations language, the Water Boards have never interpreted the iterative process to provide a “safe harbor” for MS4 dischargers. Thus, the Ninth Circuit's recent opinion is consistent with the Water Boards' interpretation and does not create any new uncertainty or third party liability risks that did not previously exist.</p> <p>The San Diego Water Board recognizes and will continue to follow the State Water Board's process (commenced with a public workshop in November 2012) for reconsidering the precedential receiving water limits language and the possibility of creating a “safe harbor” from enforcement for violations of water quality</p>

	<p><b>COMMENT:</b> <i>Concerns with the Copermitees' legal authority to impose requirements on development projects where a nexus between impact on the receiving water and the project cannot be established.</i></p> <p>Comments were submitted by members of the Copermitees, Societies/ Associations/Coalitions, and Other Entities generally expressed concerns with the Copermitees' legal authority to imposed requirements on development projects where a nexus between impact on the receiving water and the project cannot be established. The Copermitees assert that they would be subject to liability under takings clauses of the US and California Constitutions and the Mitigation Fee Act for requiring hydromodification management BMP requirements on new development or redevelopment projects that discharge to hardened channels where a hydromodification impact would be questionable and difficult to establish. Comments from the Societies/ Associations/Coalitions assert that allowing an in lieu fee for improvements to Priority Development Projects that do not cause hydromodification impacts is a direct violation of CEQA.</p> <p>In contrast, the South Laguna Civic Association asserts that the regulatory and legal nexus is clear between MS4 discharges and creek erosion and infrastructure damage, ocean pollution and public health hazards.</p>	<p><b>Copermitees</b>                      City of Dana Point                      City of Imperial Beach                      City of Rancho Santa Margarita                      City of San Diego City Attorney                      County of San Diego Office of County Counsel                      Orange County Copermitees                      Riverside County Copermitees                      San Diego County Copermitees</p> <p><b>Environmental Organizations</b>                      South Laguna Civic Association</p> <p><b>Societies/Associations/Coalitions</b>                      East Otay Mesa Property Owners Association                      Otay Mesa Property Owners Association</p> <p><b>Other Entities</b>                      National Enterprises Inc.</p>
	<p><b>RESPONSE:</b> The San Diego Water Board recognizes the concerns of about the Copermitees' legal authority to impose hydromodification management requirements on development that causes no hydromodification impacts.</p> <p>Federal law mandates that permits issued to MS4s require management practices that will result in reducing pollutants to the maximum extent practicable. The state is required, by law, to select the BMPs. (See <i>NRDC v. USEPA</i> (9<sup>th</sup> Cir. 1992) 966 F.2d 1292; <i>Environmental Defense Center v. USEPA</i> (9<sup>th</sup> Cir. 2002) 344 F.3d 832, 855; <i>Rancho Cucamonga v. Regional Water Quality Control Bd., Santa Ana Region</i> (2006) 135 Cal.App.4<sup>th</sup> 1377, 1389.) The Tentative Order's requirements for Low Impact Development and hydromodification management controls are authorized by federal law. Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(2) provides that Copermitees develop and implement a management program which is to include "A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plans shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed."</p> <p>The Tentative Order does not impose land use regulations, nor does it restrict or control local land-use decision-</p>	

RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Lgl-2	LEGAL
	<p>making authority. Rather, the Tentative Order requires the permittees to fulfill Clean Water Act requirements and protect water quality in their land use decisions. The requirements in the Tentative Order allow for flexibility in compliance options to the extent allowable under the Clean Water Act. The substantive regulatory requirements of the Clean Water Act are a valid exercise of the federal government's enumerated powers and authority over navigable waters. (<i>NRDC v. USEPA</i> (9th Cir. 1998) 863 F.2d 1420, 1436.)</p> <p>Environmental regulation is not land use regulation, and therefore does not infringe upon local authority over land use decisions. (<i>California Coastal Commission v. Granite Rock</i> (1987) 480 U.S. 572. In addition, local land use planning must be consistent with general statewide laws. (<i>County of Los Angeles v. California State Water Resources Control Board</i> (2006) 143 Cal.App.4th 985, 1003.) Article 11, section 7, of the California Constitution states that a county or city may not enact laws that conflict with general laws. The Porter-Cologne Water Quality Control Act contains the California Legislature's finding that water quality is a matter of state-wide concern, requiring a statewide program administered at a regional level. (See, e.g., <i>Wat. Code</i>, § 13000; see also generally <i>Southern California Edison v. State Water Resources Control Board</i> (1981) 116 Cal.App.3d 751, 758.) Section 101 of the CWA has a companion policy statement, where Congress found that water quality is a matter of federal concern.</p> <p>The Tentative Order also does not dictate specific methods of compliance or dictate the manner in which the Copermittees use their land. Where the Tentative Order includes detailed requirements, it is to comply with the Clean Water Act and its regulations. USEPA's regulations mandate that certain requirements be included in MS4 permits in order to achieve the requirements of the Clean Water Act. Thus, federal law mandates that permits issued for MS4s require certain actions that will result in the elimination or reduction of pollutants to receiving waters and the state is required, by federal law, to select the controls necessary to meet this standard. (See <i>NRDC v. USEPA</i> (9th Cir. 1992) 966 F.2d 1292, 1308; <i>City of Rancho Cucamonga v. Regional Water Quality Control Bd., Santa Ana Region</i> (2006) 135 Cal.App.4th 1377, 1389-90.)</p> <p>The requirement that the Copermittees require Priority Development Projects to control post-project runoff flow rates and durations so that they do not exceed pre-development runoff flow rates and durations by more than ten percent is appropriate and necessary to reduce erosion and the discharge of pollutants into receiving waters. It does not require mitigation beyond redevelopment project impacts because the requirement lessens (although does not eliminate) the perpetuating impacts that originated upon initial land alteration (i.e., the project would continue to cause accelerated erosion) absent improved controls of post-project runoff flow rates and durations. The San Diego Water Board maintains that the Copermittees have authority to implement this</p>

Lgl-2	LEGAL
	<p>requirement, and that if implemented it would not rise to the level of a taking of private property. The pre-development condition provision is also consistent with the requirements in both the current Orange County and Riverside County MS4 permits. Please see response to comment E3c2-2.</p> <p>However, to remove the question of the nexus between a project's impact on an already hardened channel, the San Diego Water Board has included a hydromodification management exemption for projects that discharge to conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean. Please see response to comment E3c2-3.</p> <p>The hydromodification management requirements that may be imposed on projects with no hydromodification impacts has been modified, but in any case would not have violated CEQA because the mitigation requirement was not imposed as a result of a CEQA analysis.</p>

	<p><b>COMMENT:</b> <i>San Diego Water Board has legal authority to not incorporate the Beaches and Creeks Bacteria TMDLs into the Tentative Order.</i></p> <p>The County of San Diego and the County of San Diego Office of County Counsel each submitted comments that assert that the San Diego Water Board has the authority to not incorporate the Beaches and Creeks Bacteria TMDLs into the Tentative Order. The comments from the County cite the MEP standard, <i>Defenders of Wildlife v. Browner</i>, and a November 2010 USEPA memorandum as providing the the basis for the legal authority. The City of Lake Forest submitted comments that also cited <i>Defenders of Wildlife v. Browner</i> as providing the the basis for the legal authority to not incorporate TMDLs into the Tentative Order. The comments from the County also assert that the scientific basis of the Beaches and Creeks Bacteria TMDLs is flawed, the requirements of the TMDLs are not achievable, and the costs to implement the requirements of the TMDLs are not worth the benefits that may be achieved. The County requested that the San Diego Water Board elect not to include the Beaches and Creeks Bacteria TMDLs in the Tentative Order and re-evaluate the TMDL.</p> <p>Clean Water Now submitted comments alluded to “recent legal renderings” that called into question the TMDL provisions included in the Tentative Order.</p> <p>Conversely, the USEPA submitted comments in support of the the San Diego Water Board’s approach for incorporating applicable TMDL requirements into the Tentative Order.</p>	<p><b>Copermittees</b>                      City of Lake Forest                      County of San Diego                      County of San Diego Office of County Counsel</p> <p><b>Environmental Organizations</b>                      Clean Water Now</p> <p><b>State/Federal Government</b>                      USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that it has the legal authority to not incorporate the requirements of the Beaches and Creeks Bacteria TMDLs into the Tentative Order.</p> <p>Federal regulations under 40 CFR 122.44(d)(1)(vii)(B) require that NPDES permit requirements incorporate water quality based effluent limitations (WQBELs) that must be consistent with the requirements and assumptions of any available wasteload allocations (WLAs) developed under TMDLs. The federal regulations do not provide the option or discretion to not incorporate these WQBELs into NPDES permits.</p> <p>The San Diego Water Board is required to adopt and implement TMDLs through the MS4 permit, where the Copermittees’ MS4 discharges are a source of the impairment. TMDLs are adopted by the San Diego Water Board pursuant to CWA section 303(d) and CWC sections 13240 and 13242. TMDL implementation programs consist of a description of the nature of actions that are necessary to achieve the WLAs (and LAs), a time schedule for the actions to be taken, and a description of the monitoring and reporting to be undertaken to</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Lgl-4	LEGAL
	<p>determine compliance with the WLAs. Because TMDLs and their programs of implementation are adopted through the Basin Plan amendment process in California, the TMDL implementation program contained in a regional water board's basin plan becomes a regulation upon approval by the State of California Office of Administrative Law. All permits must implement the applicable water quality control plan (i.e. Basin Plan), including any applicable TMDL implementation programs (CWA §§ 303(d), 402(p)(3)(B)(iii); Cal. Water Code §§ 13263, 13377). These Basin Plan provisions thus become the applicable regulations that authorize an MS4 permit to include compliance schedules to achieve effluent limitations derived from TMDL WLAs. It is unclear whether the commenters understand that the TMDL implementation programs are the basis for the compliance schedules and, without the TMDL implementation program, Copermittees would be required to comply with final WQBELs immediately.</p> <p>Further, USEPA has set forth guidance regarding MS4 permits, that such permits must require compliance with applicable TMDLs to meet water quality standards. (See "Revisions to the November 22, 2002 Memorandum 'Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) (for Storm Water Sources and NPDES Requirements Based on Those WLAs.'" (USEPA Office of Water, Nov. 10, 2010.) "<i>Where a TMDL has been established and there is an accompanying implementation plan that provides a schedule for an MS4 to implement the TMDL, the permitting authority [in this case, the Regional Water Board] should consider the schedule as it decides whether and how to establish enforceable interim requirements and interim dates in the permit.</i>" (Id.) The San Diego Water Board is aware that the USEPA memorandum is not legally binding, but finds it very instructive and it is appropriate to consider USEPA guidance, even if that guidance <i>may</i> be modified in some manner in the future.</p> <p>NPDES permits are intended to support the objective of the federal Clean Water Act "<i>to restore and maintain the chemical, physical, and biological integrity of the Nation's waters</i>" (Clean Water Act section 101(a)). Water quality standards, which are the basis for the receiving water limitations in the Tentative Order, are the foundation for achieving this objective. To ensure that discharges do not cause or contribute to exceedances of water quality standards, receiving water limitations provisions are included in all NPDES permits issued pursuant to CWA section 402. Further, Clean Water Act section 402(p)(3)(B)(iii) requires permits for discharges from municipal storm sewers to "require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design, and engineering methods, <i>and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.</i>" [Emphasis added.] In its Phase I Stormwater Regulations, Final Rule, USEPA elaborated on these requirements, stating that, "permits for discharges from municipal separate storm sewer systems must require</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Lgl-4	LEGAL
	<p>controls to reduce the discharge of pollutants to the maximum extent practicable, and where necessary, water quality-based controls.” (See 55 Fed. Reg. 47990, 47994 (Nov. 16, 1990).) USEPA reiterated in its Phase II Stormwater Regulations, Final Rule, that MS4 “permit conditions must provide for attainment of applicable water quality standards (including designated uses), allocations of pollutant loads established by a TMDL, and timing requirements for implementation of a TMDL.”</p> <p>The Clean Water Act provides the San Diego Water Board, to the same extent as the Administrator of USEPA, the discretion to determine what controls are appropriate to protect water quality and achieve the objectives of the Clean Water Act. (See <i>Defenders of Wildlife v. Browner</i> (1999) 191 F.3d 1159, 1166.) As explained in the Tentative Order, compliance with the WLAs established in TMDLs is necessary to achieve compliance with water quality standards. The State Water Board and the San Diego Water Board have previously concluded that discharges from the MS4 contain pollutants that have the reasonable potential to cause or contribute to excursion above water quality standards. As such, receiving water limitations are included in the Tentative Order to ensure that individual and collective discharges from the MS4 do not cause or contribute to exceedances of water quality standards necessary to protect the beneficial uses of the receiving waters. Compliance with the WLAs established in TMDLs is necessary to achieve compliance with water quality standards.</p> <p>In recognition of the purpose of the NPDES program in supporting the objective of the Clean Water Act and utilizing its authority provided by CWA section 402(p)(3)(B)(iii), and considering USEPA’s statements and guidance, the State Water Board has determined that MS4 permits must include compliance with water quality standards. (See State Water Board Order Nos. WQ91-03, WQ 98-01, WQ 99-05 and WQ 2001-15.) Accordingly, the provisions contained in 40 CFR 122.44(d), are applicable to MS4 permits.</p> <p>The San Diego Water Board also disagrees that incorporation of TMDL requirements is based on state law provisions of the Porter Cologne Water Quality Control Act and that consideration of the factors under Water Code section 13241 is required before the requirements may be implemented. TMDLs implement existing water quality objectives that are designed to protect designated beneficial uses. Numeric targets used by TMDLs to implement water quality standards are not designed to re-balance the policy interests underlying those standards. While policy considerations are important in developing water quality standards in the first instance, they are less important in formulating TMDLs that implement them. The statutory directive to adopt TMDLs in the first instance is to “implement the applicable water quality standards with seasonal variations and a margin of safety.” (33 U.S.C. § 1313(c)(2)(A). See also 40 CFR §§ 131.10-13.) While consideration of economic</p>

March 27, 2013

Lgl-4	LEGAL
	<p>factors may be appropriate in adopting TMDLs, a section 13241 economic analysis is not required either in the adoption of TMDLs or in the implementation through an NPDES permit.</p> <p>Additionally, the implementation plan included as part of the Beaches and Creeks Bacteria TMDLs requires the San Diego Water Board to incorporate the requirements of the TMDLs into the appropriate regulatory mechanisms to implement the TMDL requirements. If the requirements of the Beaches and Creeks Bacteria TMDLs are not incorporated into any regulatory mechanisms (e.g. NPDES permits), the TMDL requirements will not be implemented and will not be enforceable. Implementation of the TMDL requirements in regulatory mechanisms must be initiated as soon as possible to achieve the requirements of the TMDL within the compliance schedules of the TMDL.</p> <p>The San Diego Water Board is obligated to incorporate the requirements into the MS4 permit. Otherwise, the San Diego Water Board would be in conflict with its own implementation plan requirements within the Basin Plan as well as the requirements of the Code of Federal Regulations. Please also see response to comment Lgl-10.</p>

	<p><b>COMMENT:</b> <i>San Diego Water Board does not have the legal authority to issue a regional MS4 permit.</i></p> <p>The Orange County and Riverside County Copermittees each submitted comments asserting that the San Diego Water Board does not have the authority to issue a regional MS4 permit under the Clean Water Act. The Orange County Copermittees argue that while it geographically abuts San Diego County, there is extensive federal land separating MS4s within its county from other MS4s and the federal regulations to not allow the issuance of a regional MS4 permit without a “connection.” The commenters also raised concerns over the regulatory requirement to file a Report of Waste Discharge before obtaining coverage under the Tentative Order.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the federal regulations do not authorize the issuance of a region-wide MS4 permit coextensive with the jurisdictional boundaries of the San Diego Region.</p> <p>Despite the geographic separation, the San Diego Water Board has legal authority to issue a regional MS4 permit through its authority in the Clean Water Act. (See Attachment No. 2, September 7, 2012 Letter from San Diego Water Board Counsel on Legal Authority Supporting Issuance of a Regional MS4 Permit) Section 402, subpart (p)(3)(B) of the Clean Water Act states that “Permits for discharges from municipal storm sewers – (i) may be issued on a system- or jurisdiction-wide basis . . . .” The federal storm water regulations in 40 CFR at Part 122.26, subdivision (a)(1)(v) also state that the Director (the San Diego Water Board) may designate dischargers from municipal separate storm sewers on a system-wide or jurisdiction-wide basis, taking into consideration the following factors: (A) location of the the discharge with respect to waters of the United States; (B) the size of the discharge; (C) the quantity and nature of the pollutants discharged to waters of the United States and (D) other relevant factors. Consideration of these factors provides wide discretion to the San Diego Water Board in issuing MS4 permits.</p> <p>More specifically, the regulations permit issuance of system-wide permits covering all MS4s in “adjacent . . . large or medium separate storm sewer systems.” (See 40 CFR sec. 122.26(a)(3)(iv). The regulations also support issuance of MS4 permits on watershed or “other basis” contemplating that such permits may “specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas . . . .” (40 CFR Part 122.26(a)(3)(v).)</p> <p>The USEPA responses to comments for the above regulations also make clear that the permitting authority, in this case, the San Diego Water Board, has flexibility to establish system- or region-wide permits. In the Final</p>

	<p>Rule published in the Federal Register and containing USEPA's responses to comments, USEPA notes that paragraph (iv) of section 122.26(a)(3) would allow an entire system in a geographical region under the purview of a state agency to be designated under a permit. (National Pollutant Discharge Elimination System Permit Application Regulations for Storm Water Discharges, 55 Fed.Reg. 47990, 48030-48042 (Nov. 16, 1990).)</p> <p>It is important to note that a regional MS4 permit does not expand the requirements for each municipality beyond its borders as the federal regulations make clear that MS4 permittees need only comply with permit conditions relating to discharges from the MS4s for which they are operators. (40 CFR Part 122.26(a)(3)(vi).) See also September 7, 2012, memorandum from Jessica Jahr and Catherine Hagan, State Water Board's Office of Chief Counsel, to Ryan Baron and David Huff, counsels for Orange and Riverside Counties, respectively which is incorporated into this response.</p> <p>The other objection commenters raise concerns the regulatory requirement to file a Report of Waste Discharge (ROWD). The Tentative Order does not cover or become effective for either the Orange County or Riverside County Copermittees until the earlier of (1) either or both Counties voluntarily seeks to be covered by the permit, once adopted, or (2) Orange or Riverside County timely submits its respective ROWD proposing changes or other recommendations to the Tentative Order and appropriate changes are made concurrent with permit coverage becoming effective as to one or each County. In other words, the obligation to submit a ROWD and for the San Diego Water Board to consider an ROWD has not been abandoned and the Tentative Order reflects that the San Diego Water Board will rely on the ROWD process to frame prospective revisions to the permit. And while neither county has yet filed its next ROWD, both have been provided with ample and extensive opportunities to participate fully in the development of this Tentative Order.</p>

	<p><b>COMMENT:</b> <i>The requirements of the Tentative Order are more stringent than Federal law and require a CWC 13241 analysis.</i></p> <p>The Orange County and Riverside County Copermitees, City of Lake Forest, and the Building Industry Association of Southern California assert that several requirements of the Tentative Order go beyond the requirements of Federal law, thus an analysis pursuant to California Water code section 13241 is required. The commenters also make several assertions about the deficiencies they perceive with the economic considerations discussed in the Fact Sheet, and assert that a cost-benefit analysis needs to be included in the Fact Sheet discussion.</p>	<p><b>Building Industry / Industry</b>                      Building Industry Association of Southern California  <b>Copermitees</b>                      City of Lake Forest                      Orange County Copermitees                      Riverside County Copermitees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that there are “many requirements in the Draft Permit which exceed the federal MEP standard.”</p> <p>The San Diego Water Board is charged with construction of and administration of the Clean Water Act in the San Diego Region. In issuing MS4 permits, “[t]he permitting agency has discretion to decide what practices, techniques, methods and other provisions are appropriate and necessary to control the discharge of pollutants.” (<i>City of Rancho Cucamonga v. Regional Water Quality Control Board-Santa Ana Region</i> (2006) 135 Cal.App.4th 1377,1389.) However, the “<i>Regional Board must comply with federal law requiring detailed conditions for NPDES permits.</i>” (<i>Ibid.</i>)</p> <p>Further, USEPA expects the permitting authority to develop the specific practices that comply with the Clean Water Act on a permit-by-permit basis. (<i>NRDC v. USEPA</i> (9th Cir. 1992) 966 F.2d 1292, 1308.) To the extent the Board is exercising discretion in including certain permit requirements, the Board is exercising discretion required and/or authorized by federal law, not state law. (See <i>City of Rancho Cucamonga, supra</i>, 135 Cal.App.4th at 1389; <i>Building Industry Association of San Diego County v. State Water Resources Control Bd.</i> (2004) 124 Cal.App.4th 866, 882-883.) Further, the MEP standard is a flexible standard that balances a number of considerations, including technical feasibility, cost, public acceptance, regulatory compliance, and effectiveness. (<i>Id.</i> at pp. 873, 874, 889.) Such considerations change over time with advances in technology and with experience gained in storm water management. (55 Fed. Reg. 47990, 48052 (Nov. 16, 1990).)</p> <p>Accordingly, a determination of whether the conditions contained in Tentative Order exceed the requirements of federal law cannot be based on a point by point comparison of the permit conditions with federal law. The appropriate focus is whether the permit conditions as a whole exceed the MEP standard. The commenters have failed to cite any evidence that demonstrates how requirements in the Tentative Order exceed the MEP</p>	

RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

Lgl-6	LEGAL
	<p>standard or applicable requirements of federal law.</p> <p>The commenters assert that provisions of the Tentative Order are more stringent than the requirements of the Clean Water Act and therefore require an analysis of the factors, including economic considerations, in Water Code section 13241 before the San Diego Water Board can approve such provisions. As indicated above, the San Diego Water Board disagrees that provisions of the Tentative Order are more stringent than requirements of the Clean Water Act. Because the Tentative Order is not more stringent than federal law, its adoption does not require the San Diego Water Board to consider Water Code section 13241 factors. The California Supreme Court in <i>City of Burbank v. State Water Resources Control Board, et al.</i>, ((2005) 35 Cal.4th 613) (<i>Burbank</i>), held: [Water Code s]ection 13377 specifies that wastewater discharge permits must meet the federal standards set by federal law. In effect, section 13377 forbids a regional board’s consideration of any economic hardship on the part of the permit holder if doing so would result in the dilution of the requirements set by Congress in the Clean Water Act. That act prohibits the discharge of pollutants into the navigable waters of the United States unless there is compliance with federal law (33 U.S.C. § 1322(a)), and publicly operated wastewater treatment plants such as those before us here must comply with the act’s clean water standards, regardless of cost [citations]. Because [Water Code] section 13263 cannot authorize what federal law forbids, it cannot authorize a regional board, when issuing a wastewater discharge permit, to use compliance costs to justify pollutant restrictions that do not comply with federal clean water standards.” (<i>Burbank</i>, 35 Cal.4th at 625.)</p> <p>While the <i>Burbank</i> decision does require an analysis of Water Code section 13241 factors when the state adopts permit conditions that are more stringent than federal law (<i>id.</i> at 618) the Tentative Order reflects that all of the challenged provisions are necessary to implement federal law. Thus, the San Diego Water Board is not required to consider economic information to justify a “dilution of the requirements” established in federal law. Even when applicable, consideration of economic information pursuant to section 13241 does not require a cost-benefit analysis, as some commenters suggest. And section 13241 neither specifies how regional water boards must consider its enumerated factors nor does it require that regional water boards may specific findings documenting consideration of the factors. (See <i>California Ass’n of Sanitation Agencies, et al. v. State Water Resources Control Board, et al.</i>, (208 Cal.App.4th 1438, 1464 (2012).) Nonetheless, the Fact Sheet and Response to Comments reflect economic information that has either been developed or gathered by the San Diego Water Board or has been submitted by Copermitttees or others as part of this proceeding. To the extent that economic information in connection with compliance and other costs associated with challenged permit provisions, the San Diego Water Board has fully considered this information. Under these circumstances, <i>Burbank</i> does not require more.</p>

	<p><b>COMMENT:</b> <i>The San Diego Water Board cannot determine whether a particular mandate is unfunded.</i></p> <p>The Orange County, Riverside County and San Diego County Copermitees each submitted comments asserting that the San Diego Water Board does not have the legal authority to determine whether any provisions in the Tentative Order constitute a state mandate, and only the Commission on State Mandates can make the determination.</p>	<p><b>Copermitees</b>                      Orange County Copermitees                      Riverside County Copermitees                      San Diego County Copermitees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board does not dispute that the Commission on State Mandate ultimately has jurisdiction to determine whether the State has imposed a mandate requiring state subvention. However, it is entirely appropriate for the San Diego Water Board to set forth its legal basis to support the provisions in the Tentative Order, finding them to be necessary and appropriate to meet the federal Clean Water Act standards.</p> <p>While the Commission may be expert in state mandates, it has no expertise in the field of water law. As indicated in response to comment Lgl-6, above, the San Diego Water Board does not agree that provisions in the Tentative Order exceed federal requirements of the Clean Water Act. The San Diego Water Board is charged by law with administering and constructing the Clean Water Act's requirements and is entitled to considerable deference in its interpretation of the Act. (See <i>Buidling Industry Ass'n of San Diego, supra</i>, 124 Cal.App.5th at pp. 873, 879 fn.9; <i>County of Los Angeles v. California State Water Resources Control Bd.</i> (2006) 143 Cal.App.4th 985, 997.) In issuing MS4 permits, "[t]he permitting agency has discretion to decide what practices, techniques, methods and other provisions are appropriate and necessary to control the discharge of pollutants." (<i>City of Rancho Cucamonga v. Regional Water Quality Control Board-Santa Ana Region</i> (2006) 135 Cal.App.4th 1377,1389.) However, the "Regional Board must comply with federal law requiring detailed conditions for NPDES permits." (<i>Ibid.</i>) Further, USEPA expects the permitting authority to develop the specific practices that comply with the Clean Water Act on a permit-by-permit basis. (<i>NRDC v. USEPA</i> (9th Cir. 1992) 966 F.2d 1292, 1308.) To the extent the Board is exercising discretion in including certain permit requirements, the Board is exercising discretion required and/or authorized by federal law, not state law. (See <i>City of Rancho Cucamonga, supra</i>, 135 Cal.App.4th at 1389; <i>Building Industry Association of San Diego County v. State Water Resources Control Bd.</i> (2004) 124 Cal.App.4th 866, 882-883.)</p> <p>Further, the MEP standard is a flexible standard that balances a number of considerations, including technical feasibility, cost, public acceptance, regulatory compliance, and effectiveness. (<i>Id.</i> at pp. 873, 874, 889.) Such considerations change over time with advances in technology and with experience gained in storm water management. (55 Fed. Reg. 47990, 48052 (Nov. 16, 1990).) 	<p><b>COMMENT:</b> <i>"Waters of the state" should be revised to "waters of the U.S" or "receiving waters" throughout the Tentative Order.</i></p> <p>The Riverside County and San Diego County Copermittees each submitted comments objecting to applying the requirements of the Tentative Order to "waters of the state" instead of "waters of the U.S." which is consistent with the Clean Water Act, or "receiving waters." The Copermittees are concerned that "waters of the state" may include groundwater, which exceeds federal requirements. The Copermittees requested several revisions throughout the Tentative Order reflecting this comment.</p>	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that certain requirements of the Tentative Order should be revised to "waters of the U.S." or "receiving waters."</p> <p>Where applicable and appropriate, the San Diego Water Board revised "waters of the state" to "waters of the U.S." or "receiving waters" to limit the application of a requirement to surface waters. However, because the Tentative Order also serves as waste discharge requirements and incorporates the water quality standards of the Basin Plan (i.e. discharge prohibition A.1.a), the term "waters of the state" remains appropriate where the phrase exists in the applicable Basin Plan provision, incorporated into the Tentative Order. Because the Tentative Order regulates discharges of pollutants to waters of the United States, the San Diego Water Board does not anticipate there being any MS4 discharges to groundwaters that could violate the prohibition as to waters of the state. Additionally, such provisions are not new to San Diego Region MS4 permits.</p>

	<p><b>COMMENT:</b> <i>The Tentative Order cannot include requirements to regulate storm water flow.</i></p> <p>The Riverside County and San Diego County Copermittees, the City of Lake Forest, and the BIA Regulated Community Coalition each submitted comments that assert the Tentative Order cannot include requirements (i.e. hydromodification management requirements) to regulate storm water flow. The commenters cite a recent court decision from Virginia (<i>Virginia Dept. of Transp. v. U.S. Environmental Protection Agency</i>) as the basis for this assertion.</p> <p>In contrast, the Los Penasquitos Lagoon Foundation requests that the Tentative Order finds discharges (i.e. flow) from the MS4s can generate and/or contribute to discharges of pollutants downstream of the MS4 outfalls (e.g. discharge of sediment due to scouring of the natural channels).</p>	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition</p> <p><b>Copermittees</b>                      City of Lake Forest                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Los Penasquitos Lagoon Foundation</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the Tentative Order cannot include requirements that will result in decreasing the impact of pollutants in storm water runoff discharged from the MS4s on the physical, chemical, and biological integrity of receiving waters to the maximum extent practicable (MEP).</p> <p>The Tentative Order includes requirements to effectively prohibit non-storm water discharges to the MS4, and control the discharge of pollutants from the MS4 to the MEP, consistent with the requirements of the Clean Water Act and Code of Federal Regulations. If non-storm water discharges are effectively prohibited to the MS4s, there should be little to no flow from the MS4s to receiving waters. Thus, the Tentative Order already includes requirements to regulate non-storm water flow to and from the MS4s.</p> <p>In contrast, the MEP standard is a technologically based effluent limitation (TBEL) that applies specifically to storm water discharges from the MS4s. The Tentative Order includes development planning structural BMP requirements that act as BMP-based TBELs to implement the MEP standard for new development and significant redevelopment projects. While the development planning structural BMP requirements are separated into “<i>storm water pollutant control</i>” and “<i>hydromodification management</i>” BMP requirements, they are both for the control of pollutants in storm water discharges from the MS4 to the MEP.</p> <p>The hydromodification management BMP requirements of the Tentative Order do, to a significant extent, regulate flow. However, the primary purpose of the hydromodification management BMP requirements still stems from the requirement that MS4 permits include controls to reduce the discharge of pollutants in storm water from the MS4s to receiving waters. The increases in flows and durations caused by new development</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Lgl-9	LEGAL
	<p>and significant redevelopment also results in increases to pollutants that are discharged in storm water from the MS4s to the receiving waters. The pollutants discharged will always be in excess of what would be generated in a natural environment, even with controls in place.</p> <p>Those increased pollutant loads associated with increased flows and durations of storm water discharging from the MS4s impact the chemical integrity (e.g. salinity, temperature, toxic pollutants), biological integrity (e.g. biological toxicity, supportable flora and fauna, habitat alteration), and physical integrity (e.g. destabilization of stream channels, excessive sediment deposition) of receiving waters. Thus, the hydromodification management BMP requirements of the Tentative Order are necessary to control the discharge of pollutants generated by new development and significant redevelopment projects in storm water discharges from the MS4 to the MEP, even if they do result in the regulation of flow.</p> <p>The recent district court decision from the Eastern District of Virginia (<i>Virginia Dept. of Transportation, et al. v. United States Environmental Protection Agency, et al.</i> (2013 WL 53741 (E.D.Va.) (Virginia Decision)) cited by commenters does not support their argument in the context of the Tentative Order. In the Virginia Decision, USEPA had established a TMDL limiting the flow rate of stormwater into a creek to 681.8 ft/acre-day. USEPA characterized the flow rate as a “surrogate” for sediment, a pollutant. USEPA recognized that flow in and of itself is not a pollutant.</p> <p>As some commenters acknowledge, the Virginia Decision is not precedential and does not bind the San Diego Water Board. More importantly, the decision is inapposite as it concerns section 303(d) of the Clean Water Act concerning total daily maximum loads (TMDLs) which sets forth a very specific requirement that for impaired water bodies, states must establish numeric loads “for those <i>pollutants</i> which the Administrator identifies under section 1314(a)(2) of this title are suitable for such calculation.” Instead of setting a load for a pollutant, USEPA calculated a load for flow as a surrogate for the relevant pollutant.</p> <p>In contrast, as explained above, section 402(p) of the Clean Water Act provides that states issuing MS4 permits shall “require <i>controls</i> to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” (CWA, § 402(p)(3)(B)(iii).) Following the directives of this section of the Clean Water Act, the Tentative Order establishes controls discussed above such as best management practices to remove pollutants in storm water, source control and restrictions on the flow rate and duration of post-construction runoff, the latter of which not only can</p>

	<p>contain pollutants but can affect the discharge of pollutants in the runoff. (See State Water Board Order No. WQ 2000-11 (p. 5) (<i>Cities of Bellflower, et al.</i>) and State Water Board Order WQ 2001-15 (fn.23) (<i>Building Industry Association of San Diego</i>)).</p> <p>One commenter also cites to the Virginia Decision in requesting that the San Diego Water Board conform the TMDL provisions in the Tentative Order to the Virginia Decision. It is unclear how the commenter believes the Virginia Decision applies to the TMDL provisions in the Tentative Order, but as indicated above, the decision is not binding on the San Diego Water Board and any concerns with the loads established in TMDLs should most appropriately be raised in the context of the TMDL approval proceeding.</p>

	<p><b>COMMENT:</b> <i>The numeric WQBELs violate requirements of law because they are infeasible.</i></p> <p>The Orange County Copermitees submitted comments that object to the incorporation of numeric WQBELs for TMDLs, and assert that the inclusion of the numeric WQBELs violate the law because they are infeasible (presumably, to achieve). The Copermitees assert that the WQBELs should be BMP-based and not numeric. The Copermitees cite a 2010 USEPA memorandum, 40 CFR 122.44(k), and the Caltrans MS4 permit as justification for BMP-based instead of numeric WQBELs in the Tentative Order.</p>	<p><b>Copermitees</b> Orange County Copermitees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that including numeric WQBELs for the TMDLs in the Tentative Order violate the requirements of law.</p> <p>The federal regulations under 40 CFR 122.44(d)(1)(vii)(B) require that NPDES permit requirements incorporate WQBELs that must be consistent with the requirements and assumptions of any available wasteload allocations (WLAs) developed under TMDLs. The federal regulations under 40 CFR 122.44(k) do not require WQBELs to be BMP-based if numeric effluent limitations are infeasible, but only that WQBELs that implement WLAs <u>may</u> be expressed in the form of BMPs. BMP-based WQBELs may be allowed if BMPs alone adequately implement WLAs, and additional controls are not necessary. This is consistent with a 2002 USEPA memorandum for “<i>Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs.</i>” WQBELs are required for point source discharges that have the reasonable potential to cause or contribute to an excursion of water quality standards and technology based effluent limitations or standards are not sufficient to achieve water quality standards. Where a WLA has been assigned to a discharge in a TMDL, it is concluded that there is reasonable potential for the discharger to cause or contribute to an excursion of water quality standards.</p> <p>The 2010 USEPA memorandum for “<i>Revisions to the November 22, 2002 Memorandum ‘Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs.’</i>” cited by the Copermitees states, “<i>For the purpose of this memorandum, numeric WQBELs use numeric parameters such as pollutant concentrations, pollutant loads, or numeric parameters acting as surrogates for pollutants [...].</i>” The memorandum goes on to recommend, “<i>Where the NPDES authority determine that MS4 discharges have a reasonable potential to cause or contribute to a water quality standard excursion, EPA recommends that, where feasible, the NPDES permitting authority exercise its discretion to include numeric effluent limitations necessary to meet water quality standards.</i>” The “where feasible” in the memorandum applies to the NPDES permitting authority’s discretion to include numeric effluent</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

Lgl-10	LEGAL
	<p>limitations necessary to meet water quality standards, not to the feasibility of achieving the numeric effluent limitations. The State Water Board, in Order WQ 2006-0012 (Boeing), has made clear that “infeasibility” in the context of numeric effluent limitations refers to “the ability or propriety of establishing” numeric limits, as opposed to the feasibility of compliance. Please also see response to comment Lgl-4.</p> <p>The Caltrans MS4 permit is issued by the State Water Board. Even though the Caltrans MS4 permit may allow for BMP-based WQBELs, this does not require the San Diego Water Board to include BMP-based WQBELs in the Tentative Order regardless of any potential or apparent conflict. The San Diego Water Board will issue additional requirements to Caltrans with numeric WQBELs when and where warranted.</p> <p>The San Diego Water Board considered the feasibility of incorporating numeric WQBELs to implement the requirements of each of the TMDLs and has determined that they are feasible, and necessary, to include to meet water quality standards, consistent with the 2010 USEPA memorandum. Numeric WQBELs are also “additional controls” necessary to implement the WLAs, consistent with the 2002 USEPA memorandum.</p> <p>Each of the TMDLs in the Tentative Order, however, includes BMP-based WQBELs which must be implemented to achieve the numeric WQBELs. The Tentative Order requires the Copermittees to implement the BMP-based WQBELs to achieve the numeric WQBELs. This is consistent with the 40 CFR 122.44(d)(1)(vii)(B) and 40 CFR 122.44(k), and the recommendations of the 2010 USEPA memorandum. The Tentative Order has also been revised to include interim and final TMDL compliance determination options that allow the Copermittees to demonstrate that the BMP-based WQBELs will achieve the numeric WQBELs. The numeric WQBELs are necessary for the Copermittees to quantitatively demonstrate that the BMPs implemented are achieving the WLAs of the TMDLs. Please see response to comments AttE-1 and AttE-3.</p> <p>Thus, the Tentative Order appropriately includes numeric WQBELs and does not violate any requirements of law.</p>

	<p><b>COMMENT:</b> <i>Storm water pollutant control retention requirements of the Tentative Order conflict with Rainwater Capture Act of 2012 (AB 1750).</i></p> <p>The BIA Regulated Community Coalition commented that the Rainwater Capture Act does not provide the authority to collect and retain storm water from impervious surfaces other than rooftops. Thus, the BIA Regulated Community Coalition asserts that the storm water pollutant control retention requirements of the Tentative Order may be in conflict with the Rainwater Capture Act and the retention requirements of the Tentative Order should not be enforced.</p>	<p><b>Building Industry / Industry</b> BIA Regulated Community Coalition</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the storm water pollutant control retention requirements of the Tentative Order are in conflict with the Rainwater Capture Act.</p> <p>The Rainwater Capture Act provides additional clarification that the collection of rainwater from rooftops does not require a water right permit. The Rainwater Capture Act does not address collection of water from other surfaces, nor does it modify or alter existing law pertaining to appropriative water rights. Retention of rainwater or diffuse surface flow before it flows into a watercourse does not require a water right permit. The storm water pollutant control retention requirements of the Tentative Order are not in conflict with the Rainwater Capture Act or existing water rights law.</p>	

FINDINGS

Fnd-1: Requests for additional findings.

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Fnd-1	FINDINGS	
	<p><b>COMMENT:</b> <i>Requests for additional findings.</i></p> <p>The Riverside County Copermittees requested several additional findings be included in the Tentative Order associated with water law, flooding, flood control acts, and limitations on legal authority. The County of San Diego and the County of San Diego Department of Environmental Health requested a finding with vector-related language.</p>	<p><b>Copermittees</b>                      County of San Diego                      County of San Diego Department of Environmental Health                      Riverside County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board considered the requests for the additional findings and determined that including the additional findings is not necessary.</p> <p>The requirements of the Tentative Order are consistent with the federal Clean Water Act, Code of Federal Regulations, and the California Water Code. The additional findings requested associated with water law, flooding, flood control acts, limitations on legal authority and vector-related issues are not necessary to establish that the requirements of the Tentative Order are consistent the federal Clean Water Act, Code of Federal Regulations, and the California Water Code.</p> <p>The San Diego Water Board did not include any additional findings as requested by the commenters. The San Diego Water Board did, however, incorporate an additional requirement under the general requirements of all development projects (new Provision E.3.a.(1)(c)) to avoid the creation of nuisance or pollution associated with vectors. Subsequently, additional discussion was also included in the Fact Sheet to encourage the design and implementation of BMPs in consultation with local vector control agencies and the California Department of Public Health.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Fnd-2	FINDINGS	
	<p><b>COMMENT:</b> <i>Findings 2 and 26: Remove language that states the San Diego Water Board has the authority to issue a regional MS4 permit.</i></p> <p>The Orange County and Riverside County Copermitees each submitted comments asserting that Findings 2 and 26 were inaccurate and the San Diego Water Board does not have the authority to issues a regional MS4 permit under the Clean Water Act.</p>	<p><b>Copermitees</b>                      Orange County Copermitees                      Riverside County Copermitees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that it does not have the authority to issue a regional MS4 permit.</p> <p>The San Diego Water Board maintains Findings 2 and 26 are accurate and the San Diego Water Board has the authority to issue a regional MS4 permit. Please see the response to comment Lgl-5.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Fnd-3	FINDINGS	
	<p><b>COMMENT:</b> <i>Finding 3 and 15 (and elsewhere in the Tentative Order): Remove "in storm water" from "reduce discharges of pollutants in storm water to the maximum extent practicable."</i></p> <p>The Riverside County and San Diego County Copermitees each submitted comments that objected to requiring the control of pollutants "in storm water" to the MEP. The Copermitees assert that the Tentative Order is inconsistent with the Clean Water Act and the control of pollutants to the MEP applies to both storm water and non-storm water.</p> <p>The BIA Regulated Community Coalition cited a recent court decision that they assert calls into question several findings, including Findings 3 and 15. Clean Water Now supported the BIA Regulated Community Coalition concerns and also alluded to court decisions that call into question several findings. In both cases, the commenters requested that the Tentative Order be delayed until a definitive interpretation of the legal decisions is made available.</p>	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition</p> <p><b>Copermitees</b>                      Riverside County Copermitees                      San Diego County Copermitees</p> <p><b>Environmental Organizations</b>                      Clean Water Now</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that there is any inconsistency with the requirements of the Clean Water Act, or that the adoption of the Tentative Order should be delayed.</p> <p>Comments received assert that the "plain language" of the Clean Water Act states that the MEP standard applies to all pollutants discharged from the MS4, not just pollutants in storm water. The commenter, however, fails to acknowledge the "plain language" of the Clean Water Act that specifically makes a clear distinction that non-storm water discharges are to be effectively prohibited from entering the MS4.</p> <p>Since the "plain language" of the Clean Water Act states that non-storm water discharges to the MS4 are to be effectively prohibited (CWA section 402(p)(3)(B)(ii)), then no pollutants in non-storm water will enter the MS4 if the discharger is in compliance with this requirement. If no pollutants are entering the MS4 because non-storm water discharges are not entering the MS4, then clearly the very next requirement to control pollutant discharges from the MS4 be reduced to the MEP (CWA section 402(p)(3)(B)(iii)) intends that the discharge of pollutants only apply to storm water.</p> <p>Provisions A.1.b and A.3.a are consistent with CWA section 402(p)(3)(B)(ii) and CWA section 402(p)(3)(B)(iii), respectively, and the Fact Sheet further clarifies this distinction between non-storm water discharges and pollutants in storm water discharges. Findings 3 and 15 are consistent with the Clean Water Act have not be modified. The United States Supreme Court decision, <i>Los Angeles County Flood Control v. Natural Resources Defense Council</i> (2013) 133 S.Ct. 710 does not require any modifications to the Tentative Order.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Fnd-4	FINDINGS	
	<p><b>COMMENT:</b> <i>Finding 7: Finding should be modified to support construction of BMPs in receiving waters.</i></p> <p>The BIA Regulated Community Coalition submitted comments requesting revisions to Finding 7 to support the construction of BMPs in receiving waters. The commenter is concerned that the Tentative Order will not allow the construction of BMPs, or implementation of retrofitting or rehabilitation projects in waters of the U.S. or waters of the state to treat pollutants in storm water from areas of existing development. The commenter also requested a revision to Provision E.3.a.(1)(b) to reflect the requested revision to Finding 7.</p>	<p><b>Building Industry / Industry</b> BIA Regulated Community Coalition</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees revisions to Finding 7 are appropriate or necessary.</p> <p>Finding 7 correctly provides that pursuant to federal regulations under 40 CFR 131.10(a) waste transport or waste assimilation cannot be a designated use for any waters of the U.S. Thus, waters of the U.S. cannot be utilized for the treatment of pollutants in storm water discharges from the MS4s, and treatment control BMPs must not be constructed in waters of the U.S. to treat pollutants in storm water discharges from the MS4s.</p> <p>Finding 7 does not, however, include construction of BMPs for the treatment of pollutants in waters of the state. Thus, the San Diego Water Board has revised Provision E.3.a.(1)(b) to limit the prohibition of constructing structural BMPs in only waters of the U.S. consistent with 40 CFR 131.10(a).</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Fnd-5 FINDINGS	
<p><b>Fnd-5</b></p>	<p><b>COMMENT:</b> <i>Findings 8, 16 and 17: Findings should not include presumption that discharges from MS4s always contain waste or pollutants.</i></p> <p>The Orange County and San Diego County Copermittees objected to Finding 8 stating that discharges from the MS4s contain waste, and does not acknowledge that there may not be pollutants in the discharges from the MS4s. The Copermittees requested revisions to Findings 8, 16 and 17 to reflect this position.</p> <p>The BIA Regulated Community Coalition cited a recent court decision that they assert calls into question several findings, including Finding 8. Clean Water Now supported the BIA Regulated Community Coalition concerns and also alluded to court decisions that call into question several findings. In both cases, the commenters requested that the Tentative Order be delayed until a definitive interpretation of the legal decisions is made available.</p> <p>In contrast, the Los Penasquitos Lagoon Foundation recommended that Finding 8 should also acknowledge pollutant discharges that are caused as a result of discharges from the MS4s (e.g. sediment discharged due to scouring of the receiving waters).</p>
	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition</p> <p><b>Copermittees</b>                      Orange County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Clean Water Now                      Los Penasquitos Lagoon Foundation</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that Findings 8, 16, or 17 are inaccurate, or that the adoption of the Tentative Order should be delayed.</p> <p>The Tentative Order is implementing the requirements of the California Water Code as well as the requirements of the Clean Water Act. Under the California Water Code section 13376, any person discharging waste, or proposing to discharge wastes to waters of the state is not authorized to discharge waste unless issued waste discharge requirements. The requirements of the Clean Water Act, specific to discharges of pollutants to waters of the U.S. are also included in the California Water Code, Chapter 5.5 of Division 7. Thus, under the California Water Code, any person discharging pollutants, or proposing to discharge pollutants to waters of the U.S. is not authorized to discharge pollutants unless issued waste discharge requirements that include NPDES requirements. Waste discharge requirements that include NPDES requirements is also an NPDES permit under the Clean Water Act. The Clean Water Act requires municipalities to obtain NPDES permits to authorize discharges of pollutants from their MS4s.</p> <p>Commenters cite the definition of “waste” in the California Water Code to assert that the definition does not include storm water or any discharge that is not created by human activity. Comments received also assert that</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Fnd-5	FINDINGS
	<p>waste discharge requirements and NPDES permits cannot regulate the discharge of “pure storm water” and that not all discharges from the MS4 contain pollutants.</p> <p>Discharges from the MS4 are not “pure storm water.” Storm water that flows over the surface of any developed area, which includes the MS4 itself, do not enter or discharge from the MS4 without coming into contact with pollutants or constituents that alter the storm water such that it is no longer “pure storm water.” Thus, storm water discharges from the MS4 contains pollutants and contain waste. It is well-known and documented that urban runoff and storm water contains pollutants. (See, e.g., State Water Board Order WQ 2001-015 (“As we stated in Board Order WQ 95-2, the requirement to adopt permits for urban runoff is undisputed, and Regional Water Boards are not required to obtain any information on the impacts of runoff prior to issuing a permit (citation). It is also undisputed that urban runoff contains ‘waste’ within the meaning of Water code section 13050(d), and that the federal regulations define ‘discharge of a pollutant’ to include ‘additions of pollutants into waters of the United States from surface runoff which is collected or channeled by man.’ (40 C.F.R. § 122.2.) But it is the waste or pollutants in the runoff that meet these definitions of ‘waste’ and ‘pollutant.’ And not the runoff itself. [fn]. (p. 5.))</p> <p>The Tentative Order is not regulating “pure storm water” but the discharge of storm water that is being discharged as a waste and contains pollutants. Finding 8 accurately states that discharges from the MS4s contain waste, as defined in the California Water Code. Finding 8 also accurately states that discharges from the MS4s contain pollutants that adversely affect the quality of waters of the state. Findings 16 and 17 also accurately conclude that BMPs and implementation of BMPs are necessary to remove waste and pollutants in storm water discharges from the MS4s.</p> <p>The San Diego Water Board does not understand the comments concerning the recent United States Supreme Court decision in Los Angeles County Flood Control District v. NRDC (133 S.Ct 710 (2013)). The San Diego Water Board has reviewed the opinion and does not believe the opinion necessitates any changes to the Tentative Order.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Fnd-6 FINDINGS		
	<p><b>COMMENT:</b> <i>Finding 10: Finding should be modified to specify linear underground projects (LUPs) should not be subject to permanent post construction BMP requirements.</i></p> <p>San Diego Gas and Electric and the Southern California Gas Company each submitted comments requesting revisions to Finding 10 to specify that linear underground/overhead (utility) projects (LUPs) are not subject to post construction requirements to be consistent with the State Water Board Construction General Permit findings.</p>	<p><b>Building Industry / Industry</b>                      San Diego Gas and Electric                      Southern California Gas Company</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that revisions to Finding 10 are appropriate or necessary.</p> <p>Finding 10 accurately states that pollutants are generated by land development. Finding 10 discusses the generation of pollutants by land development in broad and general terms, and does not specify types of land development activities. Incorporating language into Finding 10 specific to LUPs is inappropriate and not necessary.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Fnd-7 FINDINGS	
<p><b>COMMENT:</b> <i>Finding 11: Finding should not classify natural waters as part of the MS4, and cannot be classified as both an MS4 and receiving water.</i></p> <p>The Orange County, Riverside County, and San Diego County Copermittees each submitted comments asserting that Finding 11 was inaccurate and the San Diego Water Board cannot classify natural waters as part of the MS4.</p> <p>The BIA Regulated Community Coalition cited a recent court decision that they assert calls into question several findings, including Finding 11. Clean Water Now supported the BIA Regulated Community Coalition concerns and also alluded to court decisions that call into question several findings. In both cases, the commenters requested that the Tentative Order be delayed until a definitive interpretation of the legal decisions is made available.</p> <p>In contrast, the Los Penasquitos Lagoon Foundation recommended that the language of Finding 11 should be maintained.</p>	<p><b>Building Industry / Industry</b> BIA Regulated Community Coalition</p> <p><b>Copermittees</b> Orange County Copermittees Riverside County Copermittees San Diego County Copermittees</p> <p><b>Environmental Organizations</b> Clean Water Now Los Penasquitos Lagoon Foundation</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that Finding 11 is inaccurate, or that the adoption of the Tentative Order should be delayed.</p> <p>An MS4 is defined in the federal regulations as a conveyance or system of conveyances owned or operated by a Copermittee, and designed or used for collecting or conveying runoff. Therefore, the San Diego Water Board considers natural drainages that are used by the Copermittees as conveyances of runoff, as both part of the MS4 and as receiving waters.</p> <p>The State Water Board supports this approach. In reviewing a Petition on Order No. R9-2001-0001, the State Water Board stated "<i>We also agree with the Regional Water Board's concern, as stated in its response, that there may be instances where MS4s use 'waters of the United States as part of their sewer system [...]</i>" State Water Resources Control Board Order WQ 2001-15.</p> <p>Furthermore, the U.S. Supreme Court's 2006 <i>Rapanos</i> decision supports the conclusion that natural streams in developed areas can be both receiving waters and MS4s by confirming that ephemeral and intermittent streams can be waters of the U.S. subject to regulation under Clean Water Act section 404 and also be considered point sources of pollution discharges regulated under Clean Water Act section 402. (See <i>Rapanos, et al. v. United</i></p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Fnd-8	FINDINGS
	<p><b>COMMENT:</b> <i>Finding 12: Finding should not state that Copermitees provide free and open access to MS4s; Copermitees are not responsible for all discharges not prohibited.</i></p> <p>The Orange County and Riverside County Copermitees each submitted comments objecting to Finding 12 stating that the Copermitees provide free and open access to MS4s. The Riverside County Copermitees also objected to Finding 12 stating that the Copermitees cannot passively receive and discharge pollutants from third parties. The Copermitees assert that they are not responsible for discharges from their MS4s that are from third parties that are subject to the jurisdiction of the San Diego Water Board.</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that Finding 12 is inaccurate.</p> <p>The Copermitees have the option to request the authority to discharge from their MS4s under an NPDES permit or comply with the complete prohibition against the discharge of pollutants pursuant to Clean Water Act section 301(a) (33 U.S.C. § 1311(a)). These choices are provided by the federal Clean Water Act, not state laws.</p> <p>The Copermitees have opted to discharge from their MS4s under an NPDES permit. In doing so, they are responsible for discharges from the MS4s. Thus, Finding 12 correctly provides that the Copermitees provide free and open access to their MS4s and they are responsible for discharges into the MS4 that they do not prohibit or otherwise control. Finding 12 also correctly provides that the Copermitees cannot passively receive and discharge pollutants from third parties.</p> <p>The Copermitees have the responsibility of identifying the sources of discharges and pollutants from their MS4s. If the Copermitees are not actively identifying sources and cannot identify sources of discharges and pollutants to and from their MS4s, then the Copermitees are the source of the MS4s discharges and pollutants to receiving waters, even if they believe third parties are responsible for the discharges and pollutants.</p> <p>If, however, the Copermitees identify the sources of discharges and pollutants to or from the MS4s as outside of their legal authority to prohibit or otherwise control, then they are not passively receiving and discharging pollutants, even if they are providing free and open access to the MS4s. The data and information that the Copermitees collect to identify the third party sources can provide the evidence that the Copermitees are not responsible for the discharges and pollutants from the MS4s that can be attributed to third parties. Until the data and information are provided to identify those third parties, and demonstrate those parties are not subject to the Copermitees' legal authority, then the Copermitees are responsible for all of the discharges to and from their MS4s unless such discharges are authorized by a separate NPDES permit.</p>

March 27, 2013

Fnd-9	FINDINGS
	<p><b>COMMENT:</b> <i>Finding 15: Finding should state that the maximum extent practicable standard applies to both non-storm water and storm water, not just storm water.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments that assert Finding 15 is inaccurate. The Copermittees assert that the Tentative Order is inconsistent with the Clean Water Act and the MEP standard applies to both non-storm and water storm water, not just storm water.</p> <p>The BIA Regulated Community Coalition cited a recent court decision that they assert calls into question several findings, including Finding 15. Clean Water Now supported the BIA Regulated Community Coalition concerns and also alluded to court decisions that call into question several findings. In both cases, the commenters requested that the Tentative Order be delayed until a definitive interpretation of the legal decisions is made available.</p> <p>San Diego Gas and Electric and the Southern California Gas Company each submitted comments requesting revisions to Finding 15 to clarify that non-storm water discharge authorized by a NPDES permit are authorized to be discharged to the MS4s.</p>
	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition                      San Diego Gas and Electric                      Southern California Gas Company</p> <p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Clean Water Now</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the MEP standard applies to both non-storm water and storm water. The San Diego Water Board also disagrees that Finding 15 should be revised.</p> <p>Finding 15 accurately states the requirements of the Clean Water Act. The San Diego Water Board maintains that MEP standard only applies to pollutants in storm water. The San Diego Water Board also maintains that Finding 15 does not need to be clarified to state that non-storm water discharge authorized by a NPDES permit are authorized to be discharged to the MS4s. Please see the responses to comments Fnd-3 and Fnd-8, and also see Memorandum from San Diego Water Board Counsel to San Diego Water Board dated 5 November 2009, incorporated by reference herein.</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Fnd-10	FINDINGS	
	<p><b>COMMENT:</b> <i>Finding 27: Finding should state that implementation of the requirements of the Tentative Order "will" not "may" allow the San Diego Water Board to re-categorize impaired water bodies to Category 4 in the Integrated Report.</i></p> <p>The San Diego County Copermittees requested that Finding 27 be revised to state that the requirements of the Tentative Order "will" allow the San Diego Water Board to re-categorize impaired water bodies to Category 4 in the Integrated Report, as opposed to only "may" allow the re-categorization.</p>	<p><b>Copermittees</b> San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that revising Finding 27 is appropriate.</p> <p>Finding 27 is accurate to state that the implementation of the Water Quality Improvement Plan "may" allow the San Diego Water Board to re-categorize an impaired water body in Category 4 in the Integrated Report meaning a TMDL is not required. The Integrated Report is ultimately approved by the USEPA. The USEPA may not allow the San Diego Water Board to re-categorize an impaired water body from Category 5 (i.e. TMDL required) to Category 4 (i.e. TMDL not required) if they do not agree that the implementation of the requirements of the Tentative Order will result in attainment of the water quality standards.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Fnd-11	FINDINGS	
	<p><b>COMMENT:</b> <i>Finding 28: Finding should state that the requirements of the Tentative Order are more stringent than Federal law and require a CWC 13241 analysis.</i></p> <p>The Orange County and Riverside County Copermitees each submitted comments objecting to Finding 28. The Copermitees assert that several requirements of the Tentative Order go beyond the requirements of Federal law, thus an analysis pursuant to California Water code section 13241 is required. The Copermitees make several assertions about the deficiencies they perceive with the economic considerations discussed in the Fact Sheet. The Copermitees assert that a cost-benefit analysis needs to be included in the Fact Sheet discussion.</p> <p>The BIA Regulated Community Coalition cited a recent court decision that they assert calls into question several findings, including Finding 28. Clean Water Now supported the BIA Regulated Community Coalition concerns and also alluded to court decisions that call into question several findings. In both cases, the commenters requested that the Tentative Order be delayed until a definitive interpretation of the legal decisions is made available.</p>	<p><b>Building Industry / Industry</b> BIA Regulated Community Coalition</p> <p><b>Copermitees</b> Orange County Copermitees Riverside County Copermitees</p> <p><b>Environmental Organizations</b> Clean Water Now</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that provisions of the Tentative Order go beyond the requirements of the Clean Water Act or Code of Federal Regulations, or that the adoption of the Tentative Order should be delayed.</p> <p>The San Diego Water Board considered economic information in developing the Tentative Order using the best available information, but did not do so in accordance with an analysis pursuant to California Water code section 13241. The provisions of the Tentative Order are based on and fully supported by federal requirements, as demonstrated by the legal authority provided by the Clean Water Act and Code of Federal Regulations sections cited in the Fact Sheet. Thus, the San Diego Water Board maintains that an analysis pursuant to California Water code section 13241 is not required. Federal NPDES regulations do not require that the San Diego Water Board conduct a cost-benefit analysis.</p> <p>Please also see response to comment Lgl-6.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Fnd-12 FINDINGS	
	<p><b>COMMENT:</b> <i>Finding 29: San Diego Water Board cannot determine what is a state mandate.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments objecting to Finding 29 generally asserting that the San Diego Water Board does not have the legal authority to determine whether any provisions in the Tentative Order constitute a state mandate, and only the Commission on State Mandates can make the determination. The County of San Diego also submitted a similar comment.</p>
	<p><b>Copermittees</b>                      County of San Diego                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the Commission on State Mandates ultimately has jurisdiction to determine that a provision in the Tentative Order constitutes a state mandate.</p> <p>Finding 29 is, nonetheless, appropriate and necessary to express and support the San Diego Water Board's position that the Tentative Order is the result of a federal and not a state mandate. Please see the response to comment Lgl-7.</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

Fnd-13	FINDINGS	
	<p><b>COMMENT:</b> <i>Finding 31: Finding should support implementation of the iterative process to comply with prohibitions and limitations.</i></p> <p>The Riverside County Copermittees submitted a comment related to Finding 31 requesting that the Tentative Order be revised to support the iterative process as a means to comply with the discharge prohibitions and receiving water limitations of Provision A. The Copermittees did not request or recommend any revisions to Finding 31, but requested revisions to Provision A to support implementation of the iterative process to comply with the discharge prohibitions and receiving water limitations.</p>	<p><b>Copermittees</b> Riverside County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that implementation of the iterative process is necessary to achieve compliance with the discharge prohibitions and receiving water limitations of Provision A.</p> <p>The San Diego Water Board did not make any revisions to Finding 31 or Provision A as requested by the commenter. The San Diego Water Board did, however, include an option as part of the Water Quality Improvement Plan requirements that each Copermittee may choose to implement to demonstrate compliance with the discharge prohibitions and receiving water limitations of Provision A. Please see response to comment A-1.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

Fnd-14 FINDINGS	
<p><b>COMMENT:</b> <i>Finding 32: Finding should clarify that NPDES permitted discharges to MS4s that discharge to ASBS are authorized.</i></p> <p>San Diego Gas and Electric and Southern California Gas Company requested modifications to Finding 32 to specify that the San Diego Water Board finds that NPDES-permitted discharges to the MS4 that subsequently discharge to ASBS will not alter ocean water quality and the Tentative Order authorizes these NPDES-permitted discharges. The commenters are concerned that the Tentative Order does not clearly state that NPDES permitted discharges to the Copermittees' MS4s that then discharge to ASBS are authorized.</p> <p>The BIA Regulated Community Coalition cited a recent court decision that they assert calls into question several findings, including Finding 32. Clean Water Now supported the BIA Regulated Community Coalition concerns and also alluded to court decisions that call into question several findings. In both cases, the commenters requested that the Tentative Order be delayed until a definitive interpretation of the legal decisions is made available.</p>	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition                      San Diego Gas and Electric                      Southern California Gas Company</p> <p><b>Environmental Organizations</b>                      Clean Water Now</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that revisions to Finding 32 are appropriate or necessary, or that the adoption of the Tentative Order should be delayed.</p> <p>The Tentative Order requires discharges from the Copermittees' MS4 to be consistent with the requirements of Special Protections contained in Attachment B to State Water Board Resolution No. 2012-0012 (Special Protections). The Tentative Order includes provisions that apply to the Copermittees' MS4 discharges to ASBS, thus the Copermittees are subject to the requirements of the Special Protections. Incorporating the requested language into Finding 32 to find that the San Diego Water Board authorizes discharges of other NPDES-permitted discharges to the MS4 is inappropriate and not necessary.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

A-1 PROVISION A: PROHIBITIONS AND LIMITATIONS	
<p><b>COMMENT:</b> <i>Revise Provision A to clarify how compliance with prohibitions and limitations can be achieved.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting that the requirements of Provision A be modified to provide a clear linkage between the prohibitions and limitations of Provisions A.1 to A.3 with the iterative process required under Provision A.4 to be demonstrated through the implementation of the Water Quality Improvement Plans. The Copermittees are concerned that the language of Provision A, if not modified, will be interpreted as requiring strict and immediate compliance with the prohibitions and limitations, and the implementation of the iterative process would not be enough to demonstrate compliance with the prohibitions and limitations. Among the many recommended modifications to the requirements of Provision A, the Copermittees are generally requesting that the discharge prohibitions and receiving water limitations of Provisions A.1.a, A.1.c and A.2.a specifically state that implementation of Provision A.4 constitutes compliance. Furthermore, the Copermittees have requested that Provision A.4 explicitly state that the implementation of the iterative process constitutes compliance with any of the prohibitions and limitations under Provision A.1 to A.3, including compliance with the effective prohibitions of non-storm water discharges to the MS4s, the special protections for ASBS, and the TMDL requirements.</p> <p>Many Copermittees submitted separate comments in support of the requested modifications. One commenter from the Building Industry also requested similar modifications to the requirements of Provision A.</p> <p>In contrast, commenters from Environmental Organizations were strongly in support of maintaining the existing language and asserted that modifications to Provision A that would “weaken” the requirements, or provide “safe harbor” and would violate federal anti-backsliding requirements.</p>	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition</p> <p><b>Copermittees</b>                      City of Del Mar                      City of Imperial Beach                      City of Laguna Hills                      City of Lake Forest                      City of Mission Viejo                      City of Rancho Santa Margarita                      City of San Diego                      City of San Juan Capistrano                      County of San Diego                      County of San Diego Office of County Counsel                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees                      San Diego Unified Port District / Brown and Winters</p> <p><b>Environmental Organizations</b>                      Environmental Groups                      Natural Resources Defense Council</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the comments from the Copermittees and their supporters, as well as the Environmental Organizations.</p> <p>The San Diego Water Board understands the concerns that the Copermittees have expressed regarding the requirements of Provision A and the apparent lack of a linkage between the iterative process under Provision A.4 and the strict compliance with the discharge prohibitions and receiving water limitations of Provisions A.1.a, A.1.c and A.2.a. This language, however, is consistent with the precedential language that was issued under State Water Board Order WQ-1999-05 and has been implemented in all MS4 permits issued by the San Diego Water Board since 2001. The State Water Board has not issued an order or taken other action to supersede the</p>

March 27, 2013

A-1	PROVISION A: PROHIBITIONS AND LIMITATIONS	
	<p>precedential language.</p> <p>Under the Porter-Cologne Water Quality Control Act, waste discharge requirements must implement applicable water quality control plans, including water quality objectives. The discharge prohibitions and receiving water limitations of Provision A.1.a, A.1.c and A.2.a are consistent with this requirement, and are included in all NPDES permits and Waste Discharge Requirements issued by the San Diego Water Board. These are the fundamental requirements that protect water quality by ensuring that discharges comply with applicable water quality standards to ensure protection of receiving water beneficial uses. The San Diego Water Board does recognize an increasing body of monitoring data indicates that water quality standards are in fact not being met by many of the Copermittees' MS4 discharges. The San Diego Water Board has as a matter of practice chosen not to enforce the discharge prohibitions and receiving water limitations of Provision A.1.a, A.1.c or A.2.a if the Copermittees are actively engaged in implementing the other requirements of the MS4 permit. The focus of the previous MS4 permits and the San Diego Water Board has been on compliance with implementation of the actions required by the permit, rather than the water quality outcomes that are expected to be achieved. The San Diego Water Board has initiated enforcement against the Copermittees on several occasions for noncompliance with permit requirements.</p> <p>As noted by the Copermittees, however, the approach of the Tentative Order is a significant departure from the approach of previous MS4 permits. Previous MS4 permits did not provide the Copermittees enough flexibility to truly implement an iterative process to adaptively manage their programs to identify innovative new ways to improve the quality of discharges from their MS4s or in the receiving waters, because the actions required by the permit were relatively fixed and prescriptive. In contrast, the Tentative Order is structured to allow the Copermittees to take advantage of the iterative process and adaptively manage their programs to focus on achieving outcomes.</p> <p>The Tentative Order has been revised to provide an optional pathway for the Copermittees to demonstrate compliance with the discharge prohibitions and receiving water limitations of Provision A.1.a, A.1.c or A.2.a through implementation of technically supported iterative and adaptive management processes applicable to specific pollutant/waterbody combinations. The appropriate location in the Tentative Order for providing this "compliance mechanism," however, is not under Provision A. Instead, the appropriate location is under Provision B. Under the requirements of Provision B for the development of the Water Quality Improvement Plans, the San Diego Water Board has added Provision B.3.c. Provision B.3.c explicitly provides that a Copermittee will be in compliance with the requirements of Provision A.1.a, A.1.c and A.2.a if a specific set of</p>

March 27, 2013

A-1	PROVISION A: PROHIBITIONS AND LIMITATIONS	
	<p>requirements are incorporated and implemented as part of an accepted Water Quality Improvement Plan.</p> <p>Under this option, a Copermittee can demonstrate compliance with the discharge prohibitions and receiving water limitations of Provisions A.1.a, A.1.c and A.2.for specific pollutant/waterbody combinations if the Water Quality Improvement Plan demonstrates through a robust technical analysis that the water quality improvement strategies the Copermittee plans on implementing will achieve applicable water quality stand based numeric goals by a certain date. The implementation must be verified through monitoring and assessments, and the goals, strategies and schedules in the plan can be adjusted accordingly based on those results. The more specific planning, implementation, monitoring and assessment program required under Provision B.3.c, combined with a clear set of numeric goals, strategies, and schedules that the Copermittee demonstrates will achieve compliance through, becomes the iterative and adaptive management process that the San Diego Water Board may accept as being in compliance with Provisions A.1.a, A.1.c and A.2.a, as well as Provision A.4.</p> <p>As recommended by the Environmental Organizations, the San Diego Water Board did not revise Provisions A.1.a, A.1.c, A.2.a and A.4, and the language of Provision A remains consistent with State Water Board Order WQ 1999-05. The addition of Provision B.3.c provides the linkage for compliance with the discharge prohibitions and receiving water limitations through the iterative process that the Copermittees and their supporters requested.</p> <p>The San Diego Water Board did modify Provision A.1.b to clarify how to demonstrate compliance with the effective prohibition of non-storm water discharges to the MS4s. The San Diego Water Board recognizes that the effective prohibition of non-storm water discharges to the MS4 is specifically required by the federal regulations to be achieved through the implementation of an illicit discharge detection and elimination program as specified under 40CFR122.26(d)(2)(iv)(B). Provision A.1.b has been revised to refer to Provision E.2, which is the illicit discharge detection and elimination program requirements that must be implemented by each Copermittee within its jurisdiction to effectively prohibit non-storm water discharges to its MS4.</p> <p>As for the requests to modify the requirements of Provision A to allow the Copermittees to utilize the Water Quality Improvement Plan to demonstrate compliance with the other requirements of Provision A pertaining to the special protections for ASBS and the TMDL requirements, the San Diego Water Board generally did not agree to modify the requirements as requested.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

A-1	<b>PROVISION A: PROHIBITIONS AND LIMITATIONS</b>	
	<p>The linkage for compliance with the ASBS requirements is provided under Provision A.1.d. Provision A.1.d specifies that discharges from MS4s to ASBS are authorized subject to the Special Protections contained in Attachment B to State Water Board Resolution No. 2012-0012. The provisions of the Special Protections are provided in Attachment A to the Order for easy reference, but the Special Protections are actually part of the Ocean Plan. The requirements for the Water Quality Improvement Plan take into account the requirements for the Special Protections. The development and implementation of the Water Quality Improvement Plans should allow the Copermittees that discharge to ASBS to demonstrate that they are in compliance with the Special Protections.</p> <p>As for the linkage for compliance with the TMDL requirements, the linkage is provided under Provision A.3.b. The Copermittees are required to comply with the WQBELs for the TMDLs in Attachment E. The requirements for the Water Quality Improvement Plan take into account the requirements for the TMDLs. The requirements of the TMDLs in Attachment E must be incorporated into the Water Quality Improvement Plan. The development and implementation of the Water Quality Improvement Plans should allow the Copermittees subject to TMDL requirements to demonstrate that they are in compliance with the WQBELs.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

A-2 PROVISION A: PROHIBITIONS AND LIMITATIONS	
A-2	<p><b>COMMENT:</b> <i>The maximum extent practicable (MEP) standard applies to both non-storm water and storm water.</i></p> <p>The Riverside County Copermittees submitted comments asserting that the MEP standard of the Clean Water Act and federal regulations applies to reducing pollutants in non-storm water discharges as well as in storm water discharges. Accordingly, non-storm water discharges are authorized to be discharged if pollutants in non-storm water are reduced to the MEP. The Riverside County Copermittees requested that the language be revised to reflect this concept throughout the Tentative Order.</p> <p>In contrast, the Natural Resources Defense Council (NRDC) submitted comments that the non-storm water action levels (NALs) in the permit may contradict the effective prohibition of non-storm water discharges to the MS4. The NRDC is concerned that stating that the NALs are not considered by the San Diego Water Board to be enforceable limitations could be interpreted as an authorization for discharges of non-storm water, which would be in conflict with the effective prohibition requirements of the Clean Water Act for non-storm water discharges to the MS4.</p>
	<p><b>Copermittees</b> Riverside County Copermittees</p> <p><b>Environmental Organizations</b> Natural Resources Defense Council</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the MEP standard applies to both non-storm water and storm water. Building on the effective prohibition against non-storm water discharges, the Clean Water Act requirement to reduce pollutants discharged from the MS4 to the MEP standard necessarily is limited to storm water discharges. (See Attachment 1 November 5, 2009 Memorandum from San Diego Water Board Counsel, Non-Storm Water Discharges) The San Diego Water Board disagrees that including the NALs in the permit may contradict the effective prohibition of non-storm water discharges to the MS4.</p> <p>Please see the responses to comments Fnd-3 and C-1.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

A-3 PROVISION A: PROHIBITIONS AND LIMITATIONS	
	<p><b>COMMENT:</b> <i>The Copermittees should only be subject to "applicable" prohibitions and water quality standards in the Basin Plan, plans and policies.</i></p> <p>The Riverside County Copermittees are concerned that there are prohibitions and water quality standards included in Provisions A.1.c and A.2.a that do not apply to their jurisdictions. Thus those prohibitions or water quality standards should be deleted or clarified to state that they are only applicable if those discharges or water bodies are within their jurisdictions.</p>
	<p><b>Copermittees</b> Riverside County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board does not agree that it is necessary to delete or clarify any of the requirements under Provisions A.1.c or A.2.a.</p> <p>If there are discharge prohibitions that are not applicable, then there should not be any violations of those discharge prohibitions. Likewise, if there are water quality standards that are not applicable, there should not be any violations of those water quality standards. If, however, any of those prohibitions or water quality standards is applicable, the Copermittees are required to comply or demonstrate compliance with those prohibitions and water quality standards.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

A1-1 PROVISION A.1: Discharge Prohibitions		
	<p><b>COMMENT:</b> <i>MS4 discharges to environmentally sensitive area (ESA) shellfish habitat should be prohibited.</i></p> <p>The South Laguna Civic Association commented that dry weather discharges and elevated storm water flows are incompatible with the protection of ESA shellfish habitat and should be vigorously regulated and prohibited in the Tentative Order.</p>	<p><b>Environmental Organizations</b> South Laguna Civic Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that dry weather discharges and storm water flows should be regulated to protect ESA shellfish habitats.</p> <p>Provision A.1.a prohibits discharges from MS4s in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance in receiving waters of the state. Provision A.2.c requires that discharges from MS4s must not cause or contribute to the violation of water quality standards in any receiving waters. And, specifically for dry weather discharges, Provision A.1.b requires the Copermittees to effectively prohibit non-storm water discharges to the MS4s. Thus, the Tentative Order includes requirements for MS4 discharges that are protective of ESAs.</p>

March 27, 2013

A1-2 PROVISION A.1: Discharge Prohibitions		
	<p><b>COMMENT:</b> <i>Specify that NPDES permitted discharges to MS4s discharging to ASBS are authorized.</i></p> <p>San Diego Gas and Electric and Southern California Gas Company requested modifications to Provision A.1.d to specify that storm water and non-storm water discharges from the Copermittees MS4s from ASBS “made pursuant to NPDES permit” are authorized under the Tentative Order. The commenters are concerned that the Tentative Order does not clearly state that NPDES permitted discharges to the Copermittees’ MS4s that then discharge to ASBS are authorized.</p>	<p><b>Building Industry / Industry</b>                      San Diego Gas and Electric                      Southern California Gas Company</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that it is necessary to revise Provision A.1.d.</p> <p>Provision A.1.d requires discharges from the Copermittees’ MS4 to be consistent with the requirements of Special Protections contained in Attachment B to State Water Board Resolution No. 2012-0012 (Special Protections). Provision A.1.d applies to the Copermittees’ MS4 discharges to ASBS, thus the Copermittees are subject to the requirements of the Special Protections. If storm water and non-storm water discharges are authorized under an NPDES permit and discharged to a Copermittee’s MS4, the Copermittee is responsible for identifying this NPDES permitted discharge to its MS4 that then discharges to ASBS. If the NPDES permitted discharge does not allow the Copermittees to be consistent with the requirements of the Special Protections, the Copermittees should notify the NPDES permitted discharger and/or the San Diego Water Board that the discharge must be brought into compliance with the requirements of the Special Protections.</p> <p>Additionally, please see the response to comment Fnd-14.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

B-1 PROVISION B: WATER QUALITY IMPROVEMENT PLANS	
	<p><b>COMMENT:</b> <i>Link compliance with prohibitions and limitations to development and implementation of Water Quality Improvement Plans.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting that they be allowed to utilize the development and implementation of the Water Quality Improvement Plans as a compliance mechanism for the prohibitions and limitations of Provisions A.1 to A.3. Several Copermittees submitted separate comments in support of the request.</p> <p>Comments submitted by the Environmental Groups were not in support of such an approach, but did support incorporating numeric goals into the Water Quality Improvement Plans that are based on water quality standards and using the Water Quality Improvement Plans to hold the Copermittees accountable for achieving the water quality standards.</p>
	<p><b>Copermittees</b>                      City of Del Mar                      City of Poway                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees                      San Diego Unified Port District</p> <p><b>Environmental Organizations</b>                      Environmental Groups</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the comments from the Copermittees and the Environmental Organizations.</p> <p>The San Diego Water Board has added Provision B.3.c to provide a “pathway” to compliance with the discharge prohibitions and receiving water limitations of Provisions A.1.a, A.1.c and A.2.a. Please see the response to comment A-1.</p> <p>Several commenters indicated that including an analysis to demonstrate that the implementation of the water quality improvement strategies would achieve compliance with the discharge prohibitions and receiving water limitations of Provisions A.1.a, A.1.c and A.2.a is not necessary. The San Diego Water Board disagrees that the analysis is not necessary. Without the analysis, the San Diego Water Board would not be able to make a determination that the implementation of the water quality improvement strategies would result in the achievement of and compliance with Provisions A.1.a, A.1.c and A.2.a for specific pollutant /waterbody combinations. In addition, the required analysis provides another level of transparency that would allow the public to make a determination that the Copermittees are in fact implementing strategies that are making progress toward achieving the requirements of Provisions A.1.a, A.1.c and A.2.a. Thus, the analysis has been incorporated into the requirements of Provision B.3.c.</p>

	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the Tentative Order should ensure adequate public participation during the development and updating of the Water Quality Improvement Plans.</p> <p>The public participation requirements for the development and updates of the Water Quality Improvement Plan</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>B-3 PROVISION B: WATER QUALITY IMPROVEMENT PLANS</b>
<p>are contained in Provisions F.1 and F.2.c. The San Diego Water Board has revised Provisions F.1 and F.2.c to include several of the elements into the public participation requirements as recommended by the commenters, and provide additional time for a robust public participation process to be included in the development of the Water Quality Improvement Plans.</p> <p>Provision F.1.a has been modified to include a set of public participation requirements for the development of the Water Quality Improvement Plan under Provision F.1.a.(1). Included in Provision F.1.a.(1) are requirements to: a) develop a publicly available and noticed schedule of the opportunities for the public to participate and provide comments during the development of the Water Quality Improvement Plan; b) form a Water Quality Improvement Consultation Panel that will consist of at least one San Diego Water Board staff, one representative of the environmental community, and one representative of the development community; and c) coordinate the schedules for the public participation process among the Watershed Management Areas to provide the public as much time and opportunity as possible to participate during the development of the Water Quality Improvement Plans.</p> <p>The role of the Water Quality Improvement Consultation Panel is similar to the requested stakeholder advisory group, which will review the elements that the Copermitees propose to include in the Water Quality Improvement Plan after the public is provided an opportunity to provide data, information and recommendations for each element.</p> <p>The elements of the Water Quality Improvement Plan that require public review and comment remain the same, but have been revised and reorganized under Provisions F.1.a.(2) and F.1.a.(3). The Tentative Order required a public review of the priorities and goals and then a public review of the strategies and schedules. The revised Tentative Order has been modified to first require a public review of the priorities and potential water quality improvement strategies and then a review of the goals, strategies that Copermitees plan on implementing, and the schedules. In each case, the public will be provided an opportunity to provide data, information and recommendations and the Water Quality Improvement Consultation Panel will review the elements required to be developed with the Copermitees to provide recommendations or concurrence prior to submitting to the San Diego Water Board for a public review and comment period.</p> <p>Provisions B.2 and B.3 were also revised and reorganized to be consistent with revisions made to Provisions F.1.a.(2) and F.1.a.(3). Provision B.2.e was revised to require the Copermitees to identify the “potential” water quality improvement strategies that could be implemented to address the highest priority water quality conditions</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>B-3</b>	<b>PROVISION B: WATER QUALITY IMPROVEMENT PLANS</b>	
	<p>identified by the Copermitees. The requirements for identifying numeric goals and schedules for achieving the goals were moved to Provision B.3. Thus the requirements of Provision B.2 will be subject to the public participation and development process requirements of Provision F.1.a.(2), and the requirements of Provision B.3 will be subject to the public participation and development process requirements of Provision F.1.a.(3).</p> <p>Provision F.1.b has also been revised to clarify the completed Water Quality Improvement Plan public review and acceptance process. The San Diego Water Board will make the determination if a public hearing to accept the Water Quality Improvement Plans will be required, or if public input will be limited to written comments. Provision F.1.b has been revised to clarify when the Water Quality Improvement Plans will be considered accepted.</p> <p>Finally, Provision F.2.c has been revised to clarify the requirements for public participation during the updates of the Water Quality Improvement Plans. The public will be provided an opportunity to provide data, information and recommendations and the Water Quality Improvement Consultation Panel will review the elements required to be developed with the Copermitees to provide recommendations or concurrence prior to submitting the requested updates to the San Diego Water Board.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

B-4 PROVISION B: WATER QUALITY IMPROVEMENT PLANS	
<p><b>COMMENT:</b> <i>Allow current permit requirements to remain in place until Water Quality Improvement Plans are developed.</i></p> <p>Comments were submitted by members of the Building Industry, Engineering/Design Consultants, State Government, Societies/Associations/Coalitions, and Other Entities requesting the Tentative Order allow the requirements of the current permits to remain in place until the Water Quality Improvement Plans were developed. There was general concern that enforcement and implementation of the new requirements of the Tentative Order would preempt the Water Quality Improvement Plans before the Water Quality Improvement Plans had a chance to be developed.</p>	<p><b>Building Industry / Industry</b>                      Associated General Contractors of America                      Otay Land Company                      Otay Ranch New Homes</p> <p><b>Engineering/Design Consultants</b>                      Latitude 33 Planning and Engineering</p> <p><b>State/Federal Government</b>                      Senator Mark Wyland</p> <p><b>Societies/Associations/Coalitions</b>                      BIOCUM                      San Diego Association of Realtors</p> <p><b>Other Entities</b>                      Continental Maritime of San Diego                      Carol Crossman                      Gable PR                      Hughes Marino                      Marston+Marston, Inc.                      Nuffer, Smith, Tucker, Inc.                      San Diego Regional Chamber of Commerce                      Sheppard, Mullin, Richter &amp; Hampton                      Southern Cross Property Consultants                      Transition IT</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees that the jurisdictional runoff management program requirements should remain in place until the Water Quality Improvement Plans are developed and accepted by the San Diego Water Board.</p> <p>According to the second paragraph of the opening to Provision E, <i>“Until the Copermittee has updated its jurisdictional runoff management program document with the requirements of Provision E the Copermittee must continue implementing its current jurisdictional runoff management program.”</i> Provision F.2.c does not require the jurisdictional runoff management program documents to be updated until 3 months after the acceptance of the Water Quality Improvement Plan.</p> <p>The Copermittees will be subject to requirements of Provision A (Prohibitions and Limitations), and responsible for implementing the requirements of Provision D (Monitoring and Assessment Program Requirements), Provision F (Reporting), and Attachment E (Specific Provisions for TMDLs) upon the effective date of the Tentative Order.</p>

March 27, 2013

<b>B-5 PROVISION B: WATER QUALITY IMPROVEMENT PLANS</b>		
	<p><b>COMMENT:</b> <i>Adopt Water Quality Improvement Plans as Orders to implement the requirements of the Tentative Order.</i></p> <p>Comments were submitted by Engineering/Design Consultants, Societies/Associations/Coalitions, and Other Entities requesting that the San Diego Water Board adopt the Water Quality Improvement Plans as Orders to implement the requirements of the Tentative Order.</p>	<p><b>Engineering/Design Consultants</b> Latitude 33 Planning and Engineering</p> <p><b>Societies/Associations/Coalitions</b> BIOCOM San Diego Association of Realtors</p> <p><b>Other Entities</b> Continental Maritime of San Diego Carol Crossman Gable PR Hughes Marino Marston+Marston, Inc. Nuffer, Smith, Tucker, Inc. San Diego Regional Chamber of Commerce Sheppard, Mullin, Richter &amp; Hampton Southern Cross Property Consultants Transition IT</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with adopting the Water Quality Improvement Plans as Orders to implement the requirements of the Tentative Order.</p> <p>The Tentative Order, when adopted by the San Diego Water Board, is an Order issued to the Copermittees to implement the requirements of the Clean Water Act and Code of Federal Regulations. The Tentative Order includes specific requirements that must be included in the Water Quality Improvement Plans, which are to be developed by the Copermittees. The Water Quality Improvement Plans themselves, therefore, cannot and should not be adopted as Orders issued by the San Diego Water Board.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>B-6 PROVISION B: WATER QUALITY IMPROVEMENT PLANS</b>		
	<p><b>COMMENT:</b> <i>Align Water Quality Improvement Plan requirements with the Jurisdictional Runoff Management Program requirements.</i></p> <p>The Orange County, Riverside County and San Diego County Copermitees each submitted comments requesting that requirements in Provision E be allowed to be modified based on what is proposed in the Water Quality Improvement Plans. The Copermitees assert that the jurisdictional runoff management program requirements of Provision E are a “one size fits all” set of requirements, and the requirements of the Water Quality Improvement Plan become “additive” rather than “complimentary.” Several Copermitees submitted separate comment letters supporting the concept by requesting the San Diego Water Board align the development and implementation of the Water Quality Improvement Plan better with the jurisdictional runoff management program requirements. The BIA Regulated Community Coalition also submitted comments supporting the concept.</p> <p>The Environmental Groups are concerned with the flexibility of the jurisdictional runoff management program requirements and commented that the Water Quality Improvement Plan should include a detailed list of activities and what activities each Copermitee will implement within its jurisdiction. The Environmental Groups are concerned that without this specificity in the Water Quality Improvement Plans, and the flexibility that is provided in the jurisdictional runoff management program requirements, would result in the burden of achieving water quality improvement within a watershed falling to only one or two Copermitees. The Environmental Groups would like to see a clearer commitment of what will be implemented by each Copermitee either in the Water Quality Improvement Plan or in the jurisdictional runoff management program documents for each Copermitee.</p>	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition</p> <p><b>Copermitees</b>                      City of Dana Point                      City of Laguna Hills                      City of Lake Forest                      City of Mission Viejo                      City of Rancho Santa Margarita                      City of San Juan Capistrano                      Orange County Copermitees                      Riverside County Copermitees                      San Diego County Copermitees</p> <p><b>Environmental Organizations</b>                      Environmental Groups</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the Water Quality Improvement Plans and jurisdictional runoff management program requirements should be better aligned and clearly present the water quality improvement strategies that each Copermitee will implement within its jurisdiction. The San Diego Water Board does not agree that the jurisdictional runoff management program requirements of Provision E should be allowed to be modified by the Water Quality Improvement Plan.</p> <p>The revised Tentative Order requires the Copermitees to clearly present the water quality improvement strategies that each Copermitees will implement within its jurisdiction in the Water Quality Improvement Plan. Each Copermitee must incorporate the strategies that the Copermitee commits to implement, as identified in the Water Quality Improvement Plan, into its jurisdictional runoff management program document.</p> <p>Please see the response to comment E-1.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

B-7 PROVISION B: WATER QUALITY IMPROVEMENT PLANS		
	<p><b>COMMENT:</b> <i>Recommendations for revisions to the introductory paragraph of Provision B.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments recommending revisions to the introductory paragraph under Provision B. The Copermittees recommended revising the goal statement to be focused more on MS4 discharges and not on receiving waters. The Copermittees also recommended adding a statement about the linkage between the Water Quality Improvement Plan and compliance with the prohibitions and limitations of Provision A.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the recommended revisions to the introductory paragraph of Provision B.</p> <p>The recommended revisions by the Copermittees were not necessary and not appropriate for the introductory paragraph to Provision B. After considering the comments and recommendations from the Copermittees, however, the San Diego Water Board did make one minor revision to the introductory paragraph of Provision B. Please see the revised Tentative Order for the revision to the introductory paragraph to Provision B.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

B1-1 PROVISION B.1: Watershed Management Areas	
	<p><b>COMMENT:</b> <i>Allow San Diego County to use Watershed Urban Runoff Management Plan (WURMP) for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees are covered under the Tentative Order.</i></p> <p>The County of San Diego and the San Diego County Copermittees requested that the requirement to develop a Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area be postponed until the Riverside County Copermittees become covered by the Tentative Order. The Riverside County Copermittees supported the request.</p>
	<p><b>Copermittees</b>                  County of San Diego                  Riverside County Copermittees                  San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request.</p> <p>The San Diego Water Board has revised the footnote to Table B-1 to state that the County of San Diego is not required to develop a Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees receive notification of coverage under the Tentative Order. Until then, the County of San Diego will be required to implement their jurisdictional runoff management program in conformance with the requirements of Order No. R9-2007-0001, and implement the transitional monitoring and assessment requirements of Provision D, the transitional reporting requirements of Provisions F.3.b, and the TMDL requirements in Attachment E.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

B2e-1 PROVISION B.2.e: Numeric Goals and Schedules	
	<p><b>COMMENT:</b> <i>Clearly state that numeric goals are enforceable or not enforceable limitations.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting that the Tentative Order specify that numeric goals are not enforceable limitations. In contrast, the USEPA recommended that the Tentative Order or Fact Sheet clarify that the numeric goals (and the schedule for attainment of the goals) would become enforceable requirements once the Water Quality Improvement Plans are accepted by the San Diego Water Board.</p>
	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>State/Federal Government</b>                      USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that additional revisions are necessary to specify the numeric goals are not enforceable limitations. The San Diego Water Board agrees with the USEPA interpretation, but disagrees with the recommendation.</p> <p>The San Diego Water Board did not modify the language of Provision B.2.e (now Provision B.3.a.(1) in the revised Tentative Order) because the San Diego Water Board will utilize the numeric goals to determine if the Copermittees are making progress toward improving water quality.</p> <p>As part of the iterative and adaptive management process, the Copermittees are allowed to modify the numeric goals and the schedules for achieving the goals if the monitoring and assessments provide the rationale to do so. If, however, the Copermittees did not modify the numeric goals or the schedules to achieve the goals, and an interim or final goal was not achieved pursuant to the schedule, the San Diego Water Board would consider the failure to achieve the numeric goal a point of non-compliance. The non-compliance would include the failure to achieve the numeric goal within the schedule, the failure to implement the iterative and adaptive management process, and a demonstration that one or more prohibitions or limitations under Provision A have been violated. Thus, the numeric goals and schedules are enforceable.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>B2e-2 PROVISION B.2.e: Numeric Goals and Schedules</b>	
<p><b>COMMENT:</b> <i>Remove or modify the language for the 10 year limitation of the schedules to achieve numeric goals.</i></p> <p>The Orange County and San Diego County Copermittees each submitted comments requesting modifications to the requirement to achieve the numeric goals within 10 years of the effective date of the Tentative Order. The Orange County Copermittees provided several reasons for removing the 10 year requirement. The San Diego County Copermittees requested that the Tentative Order clarify that the 10 year requirement be limited to achieving a goal that represents progress toward attainment of water quality standards.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request to remove the requirement.</p> <p>The San Diego Water Board has removed the requirement that the Copermittees must include the final dates for achieving the numeric goals that do not initially extend more than 10 years beyond the effective date of the Tentative Order. In its place, the Copermittees must develop a schedule to achieve the numeric goals within a “reasonable period of time” that can be identified during the public participation process required for the development of the Water Quality Improvement Plans. The modifications are provided under Provision B.3.a.(2) of the revised Tentative Order.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

B3-1	<b>PROVISION B.3: Water Quality Improvement Strategies and Schedules</b>	
	<p><b>COMMENT:</b> <i>Provide a mechanism for compliance with the prohibitions and limitations in Provision A through the Water Quality Improvement Plan.</i></p> <p>The San Diego County Copermittees proposed modifications to the requirements of Provision B.3 to include a compliance mechanism that could be included in the Water Quality Improvement Plan to demonstrate compliance with the prohibitions and limitations in Provision A. The San Diego County Copermittees proposed including an option to perform a Reasonable Assurance Analysis to demonstrate that the water quality improvement strategies will attain discharge prohibitions, receiving water limitations, and effluent limitations. The San Diego Unified Port District submitted separate comments that did not support the inclusion of a compliance option utilizing the Water Quality Improvement Plan.</p> <p>The Orange County and Riverside County Copermittees supported the concept of allowing the Copermittees to demonstrate that the water quality improvement strategies in the Water Quality Improvement Plan will attain discharge prohibitions, receiving water limitations, and effluent limitations, but objected to requiring a Reasonable Assurance Analysis.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees                      San Diego Unified Port District</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with including an optional mechanism for compliance with the prohibitions and limitations in Provision A as part of Provision B.3.</p> <p>The San Diego Water Board has added Provision B.3.c as an optional mechanism that the Copermittees may utilize to demonstrate compliance with the discharge prohibitions and receiving water limitations of Provisions A.1.a, A.1.c and A.2.a. Please see the responses to comments A-1 and B-1.</p>

March 27, 2013

B3-2 PROVISION B.3: Water Quality Improvement Strategies and Schedules		
	<p><b>COMMENT:</b> <i>Allow the Copermittees to "reduce" instead of "prevent and eliminate" non-storm water discharges through the Water Quality Improvement Plan.</i></p> <p>Comments from the Building Industry included a recommendation to modify the language of Provision B.3 to allow the Copermittees to "reduce" non-storm water discharges instead of "prevent and eliminate" these discharges to the MS4.</p>	<p><b>Building Industry / Industry</b> BIA Regulated Community Coalition</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the proposed recommendations.</p> <p>The Clean Water Act requires MS4 permits to include a requirement that the MS4 dischargers must "effectively prohibit" non-storm water discharges to the MS4, not just "reduce" non-storm water discharges to the MS4. Provision B.3 included the phrase "prevent and eliminate" to specify what "effectively prohibit" means. To be consistent with the language in the Clean Water Act, the San Diego Water Board has revised "prevent and eliminate" to "effectively prohibit" in Provision B.3.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

B5-1 PROVISION B.5: Iterative Approach and Adaptive Management Process		
	<p><b>COMMENT:</b> <i>Recommendations for minor revisions to the language under iterative and adaptive management process requirements.</i></p> <p>The Riverside County and San Diego County Copermittees each submitted comments recommending minor revisions to the language under Provision B.5 to “clarify” the requirements or to be consistent with their comments regarding non-storm water discharges (see comment Gnl-13).</p>	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the recommended revisions to Provision B.5.</p> <p>The San Diego Water Board did not make any of the minor revisions recommended by the Copermittees as they were not necessary, not appropriate, or changed the intent of the requirement. The San Diego Water Board did, however, make several revisions to Provision B.5 to be consistent with the revisions made to Provisions B.2 and B.3, as discussed in the response to comment B-3.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

B6-1 PROVISION B.6: Water Quality Improvement Plan Submittal, Updates, and Implementation	
	<p><b>COMMENT:</b> <i>Clarify that the implementation of Water Quality Improvement Plans may demonstrate TMDLs are not required.</i></p> <p>The San Diego County Copermittees requested that the Tentative Order, under Finding 27, clarify that the implementation of the requirements “will” not “may” allow the San Diego Water Board to include an impaired water body in Category 4 in the Integrated Report (i.e. TMDL not required). The USEPA recommended including language in the Fact Sheet to clarify that the monitoring and assessments implemented as part of the Water Quality Improvement Plan may demonstrate that TMDLs are not necessary for water bodies listed on the 303(d) List.</p>
	<p><b>Copermittees</b> San Diego County Copermittees <b>State/Federal Government</b> USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request by the Copermittees. The San Diego Water Board agrees with the recommendation from the USEPA.</p> <p>Finding 27 is correct to state that the implementation of the Water Quality Improvement Plan “may” allow the San Diego Water Board to re-categorize an impaired water body in Category 4 in the Integrated Report meaning a TMDL is not required. Please see the response to comment Fnd-8.</p> <p>The San Diego Water Board has modified the Fact Sheet discussion for Provision B.6 as recommended by the USEPA.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

C-1 PROVISION C: ACTION LEVELS	
C-1	<p><b>COMMENT:</b> <i>Clarify that action levels are enforceable or not enforceable limitations.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting that the Tentative Order clarify that the non-storm water action levels (NALs) and storm water action levels (SALs) developed pursuant to Provision C are not enforceable limitations. San Diego Gas and Electric and the Southern California Gas Company requested that the permit clarify that the NALs and SALs are not applicable to non-storm water discharges that have NPDES permits.</p> <p>The Natural Resources Defense Council is concerned that stating that the NALs are not considered by the San Diego Water Board to be enforceable limitations could be interpreted as an authorization for discharges of non-storm water, which would be in conflict with the effective prohibition requirements of the Clean Water Act for non-storm water discharges to the MS4. The USEPA also expressed concern that action levels based on wasteload allocations (WLAs) established as WQBELs in the TMDL requirements of Attachment E may be interpreted as not enforceable.</p>
	<p><b>Building Industry / Industry</b>                  San Diego Gas and Electric                  Southern California Gas Company</p> <p><b>Copermittees</b>                  Orange County Copermittees                  Riverside County Copermittees                  San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                  Natural Resources Defense Council</p> <p><b>State/Federal Government</b>                  USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that additional clarification of the enforceability of the action levels is necessary.</p> <p>The San Diego Water Board did not revise the footnotes as requested by the Copermittees, but did revise the footnotes to clarify that NALs and SALs are not enforceable limitations unless they are based on WQBELs expressed as interim or final effluent limitations for any TMDLs in Attachment E and the interim or final compliance dates have passed.</p> <p>The San Diego Water Board also revised the introductory paragraph under Provision C.1 to specify that the NALs must be incorporated into the Water Quality Improvement Plans to support the development and prioritization of water quality improvement strategies for “effectively prohibiting” not just “addressing” non-storm water discharges to the MS4, consistent with the requirements of the Clean Water Act.</p> <p>Finally, the San Diego Water Board did not revise the requirements of Provision C to clarify that NALs do not apply to non-storm water discharges that have NPDES permits. The requirements of the Tentative Order, including the NALs and SALs, apply to the Copermittees’ MS4 discharges, not to other NPDES permitted discharges, thus it is not necessary or appropriate to specify that the NALs are not applicable to other NPDES permitted discharges.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**  
 March 27, 2013

<b>C-2 PROVISION C: ACTION LEVELS</b>		
	<p><b>COMMENT:</b> <i>Allow the Copermitees to develop action levels instead of prescribing required action levels.</i></p> <p>The Orange County, Riverside County and San Diego County Copermitees each submitted comments requesting that they be allowed to develop or propose non-storm water action levels (NALs) and storm water action levels (SALs) as part of the Water Quality Improvement Plan development process rather than being required to include a prescribed set of NALs and SALs in addition to other NALs and SALs that may be developed as part of the Water Quality Improvement Plan. The Copermitees expressed concern that requiring the prescribed NALs and SALs under Provision C would result in unnecessary analyses for constituents that are not a priority identified in the Water Quality Improvement Plan.</p> <p>The Orange County and San Diego County Copermitees are concerned that the inclusion of the chemically-based prescribed action levels under Provision C may not be the best metric to measure progress toward protection and enhancement of receiving waters if the numeric goals are biologically- or physically-based.</p>	<p><b>Copermitees</b>                  Orange County Copermitees                  Riverside County Copermitees                  San Diego County Copermitees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request to remove the requirements to include the prescribed NALs and SALs in the Water Quality Improvement Plans.</p> <p>The NALs and SALs under Provision C have been included to support the development and prioritization of the water quality strategies that will be implemented based on the highest priority water quality conditions identified by the Copermitees in the Water Quality Improvement Plans.</p> <p>The NALs and SALs have been included as a tool that the Copermitees and the San Diego Water Board can utilize to determine if the Copermitees are implementing the requirements of the Clean Water Act for MS4 permits, which is to <i>effectively prohibit non-storm water discharges to the MS4 and reduce pollutants in storm water discharges from the MS4 to the MEP</i>. The NALs and SALs are not new, and are included in both of the current MS4 permits issued to Orange County (Order No. R9-2009-0002) and Riverside County (Order No. R9-2010-0016).</p> <p>The Copermitees are required to effectively prohibit non-storm water discharges to their MS4s, which in turn should result in little to no discharges from their MS4s to receiving waters. If there are non-storm water discharges from the Copermitees' MS4s to receiving waters, those discharges should only be NPDES permitted discharges. Even if those discharges are NPDES permitted discharges, the Copermitees are responsible for demonstrating that those discharges are not illicit discharges by identifying the sources as</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>C-2</b>	<b>PROVISION C: ACTION LEVELS</b>	
	<p>NPDES permitted discharges.</p> <p>The prescribed NALs in Table C-1 through C-4 are associated with most if not all the pollutants that are known or suspected to be causing or contributing to impairments in water bodies on the 303(d) List for the San Diego Region. The NALs are appropriately based on water quality objectives because non-storm water discharges that do not contain pollutants at levels in exceedance of the NALs are not expected to cause or contribute to exceedances of water quality standards in receiving waters.</p> <p>Thus, the prescribed NALs have been included to allow the Copermittees to prioritize their efforts in effectively prohibiting unpermitted non-storm water discharges to their MS4s, demonstrate that they have effectively prohibited non-storm water discharges to their MS4s that could cause or contribute to exceedances of water quality standards, or identify NPDES permitted sources that are resulting in discharges from their MS4s that are causing or contributing to exceedances of water quality standards in receiving waters. In any case, the prescribed NALs are necessary to allow the San Diego Water Board to determine if the Copermittees are effectively prohibiting non-storm water discharges to the MS4.</p> <p>In contrast, the prescribed SALs are not based on water quality objectives, but set at higher levels because the San Diego Water Board recognizes that reducing pollutants in wet weather discharges from the MS4s to water quality objectives is difficult. The prescribed SALs, however, will allow the Copermittees to prioritize their efforts in reducing pollutants in storm water discharges from their MS4s, and allow the San Diego Water Board to determine if the Copermittees are reducing pollutants in storm water discharges from their MS4s to the MEP.</p> <p>The San Diego Water Board disagrees with the concerns about monitoring for constituents that are not associated with the highest priority water quality conditions. Periodically analyzing non-storm water and storm water discharges from the Copermittees' MS4 for other pollutants other than those associated with the highest priority water quality conditions is necessary if the Copermittees would like to re-prioritize or identify new priority water quality conditions that will be addressed. The San Diego Water Board does recognize that there is a cost associated with analyzing for additional constituents. Thus, the San Diego Water Board has modified the MS4 outfall monitoring requirements to reduce the number of dry weather MS4 outfall monitoring stations that must be analyzed (see Provision D.2.b.(2)(b) of the revised Tentative Order), and provided the Copermittees some flexibility to modify the analytes for the wet weather MS4 outfall monitoring stations (see Provision D.2.c.(5)(f) of the revised Tentative Order).</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

C-2	PROVISION C: ACTION LEVELS
	<p>As for the concerns about the chemically-based NALs and the biologically- or physically-based numeric goals for receiving waters, the San Diego Water Board disagrees that they cannot be linked or may be incompatible. Biologically- or physically-based numeric goals will likely be measured in the receiving waters. The chemically-based NALs apply to the MS4 outfalls. The quality of the MS4 discharges and the improvement of biological or physical measurements can be linked. Both are likely necessary to demonstrate that MS4 discharges are either not causing or contributing to a biological or physical impairment of the receiving water, or an improvement in MS4 discharges is resulting in improvements in the biological or physical conditions of the receiving water.</p> <p>The San Diego Water Board did not revise Provision C as requested by the Copermitees.</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>C-3</b>	<b>PROVISION C: ACTION LEVELS</b>	
	<p><b>COMMENT:</b> <i>Notes to Table C-3 should refer to the California Toxics Rule (CTR) instead of including equations.</i></p> <p>The San Diego County Copermittees recommended removing the equations to calculate the non-storm water action levels (NALs) for the priority pollutants from the notes under Table C-3 and instead refer to the CTR under 40 CFR 131.38(b)(2), where the equations can be found.</p>	<p><b>Copermittees</b> San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the recommendations.</p> <p>The San Diego Water Board has revised the notes under Table C-3 to refer to 40 CFR 131.38(b)(2).</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**  
 March 27, 2013

<b>C-4 PROVISION C: ACTION LEVELS</b>		
	<p><b>COMMENT:</b> <i>Action levels should be included for insecticides.</i></p> <p>The Los Penasquitos Lagoon Foundation recommended specifying action levels for insecticides.</p>	<p><b>Environmental Organizations</b>                      Los Penasquitos Lagoon Foundation</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with this recommendation.</p> <p>Provision C includes numeric actions levels for specific pollutants consistent with Order Nos. R9-2009-0002 and R9-2010-0016. Provisions C.1.b and C.2.b require the Copermittees to develop additional numeric action levels for pollutants or waste constituents that cause or contribute, or are threatening to cause or contribute to a condition of pollution or nuisance associated with the highest water quality priorities related to non-storm water and storm water discharges from the MS4s, respectively.</p> <p>If insecticides cause or contribute to the highest priority water quality conditions identified in the Water Quality Improvement Plan, the Copermittees are required to incorporate numeric action levels into the Water Quality Improvement Plan for insecticides. The San Diego Water Board did not revise Provision C to specify action levels for insecticides.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

D-1 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS		
	<p><b>COMMENT:</b> <i>Revise monitoring and assessment requirements as recommended by San Diego County Copermittees.</i></p> <p>The San Diego County, Orange County, and Riverside County Copermittees designed a question driven monitoring and assessment program that would allow the Copermittees to adaptively manage their storm water programs more effectively and efficiently based on the monitoring data collected and the program assessments. The monitoring and reporting program in Provision D of the Tentative Order largely includes the monitoring and assessment program designed by the Copermittees. The commenters requested further revisions be made to the monitoring and assessment program in Provision D of the Tentative Order.</p> <p>Commenters from Environmental Organizations and Industry support the monitoring and assessment program in Provision D, however stress the importance of the Tentative Order requiring enough monitoring so that the Copermittees are able to track specific short, medium, and long term progress towards detecting and eliminating illicit discharges and improving water quality throughout the San Diego Region. Failing to require enough monitoring puts at risk a Copermittee’s ability to detect increases in pollutant discharges and their effects on receiving water conditions.</p>	<p><b>Building Industry / Industry</b> Industrial Environmental Association</p> <p><b>Copermittees</b> City of San Diego City of Imperial Beach City of National City</p> <p><b>Environmental Organizations</b> Environmental Groups</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the comments from the Copermittees as well as the Environmental Organizations and Industry.</p> <p>Provision D largely includes the question driven monitoring and assessment program collectively designed by the Copermittees. The program requires a sufficient amount of monitoring such that the Copermittees are able to track specific short, medium, and long term progress towards the goals established in the Water Quality Improvement Plan. Through development of the Water Quality Improvement Plans, the monitoring and assessment program required in Provision D can be modified to address specific needs and strategies developed to address the highest priority water quality conditions within each jurisdiction in each Watershed Management Area. The monitoring approach in Provision D has been further refined, based on the specific comments received on the Tentative Order, to allow Copermittees to more efficiently and effectively address the critical questions necessary to adaptively manage their storm water programs and achieve improved water quality within their jurisdiction and each watershed throughout the San Diego Region.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>D-2 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS</b>	
<p><b>COMMENT:</b> <i>Include requirements to track and monitor progress toward watershed goals and health of watersheds.</i></p> <p>The Coastal Environmental Rights Foundation, Environmental Health Coalition, and the San Diego Coastkeeper jointly provided comments expressing concern that the monitoring and assessment requirements of the Tentative Order are not robust enough to: 1) support the Copermittees’ ability to track progress towards achieving the goals and requirements of the Clean Water Act and the San Diego Basin Plan (i.e. effectively prohibiting non-storm water discharges, reducing pollutants in storm water to the maximum extent practicable, supporting the beneficial uses of the receiving waters), 2) enable the San Diego Water Board to determine compliance with the requirements of the Tentative Order, and 3) inform the public of the Copermittees’ compliance with the requirements of the Tentative Order and progress towards achieving its goals.</p> <p>Other commenters from the Environmental Organizations expressed their support to include more monitoring in the Tentative Order, specifically requesting monitoring that provides assurances that Copermittees are able to detect any increase in pollutant discharges from their MS4 systems and be better able to address them sooner rather than later. Commenters from Industry requested the monitoring approach be iterative, strategic, cost-effective and question–driven so that it can provide the Copermittees with cost-effective informed data to guide their future storm water program actions through coordination with the San Diego Water Board staff. Several other commenters provided topic specific comments related to the need for mapping of coastal receiving waters and creeks.</p> <p>The USEPA commented on the need to bring the toxicity sampling requirements up to date with those recently adopted in other general and regional MS4 permits, as well as clarification to the monitoring locations required for determining compliance with TMDLs.</p>	<p><b>Building Industry / Industry</b>                      Industrial Environmental Association</p> <p><b>Environmental Organizations</b>                      South Laguna Civic Association                      CERF, EHC and SDCK                      Environmental Groups                      Laguna Bluebelt Coalition</p> <p><b>State/Federal Government</b>                      USEPA</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with commenters from the Environmental Organizations that the monitoring and assessment requirements of the Tentative Order are not robust enough to support the Copermittees’ ability to track progress towards achieving goals and requirements of the Clean Water Act (CWA), the California Water Code (CWC), and the San Diego Basin Plan (i.e. effectively prohibiting non-storm water discharges, reducing pollutants in storm water to the maximum extent practicable, and supporting the beneficial uses of the receiving waters).</p> <p>Provision D includes a monitoring program structure that is expected to be refined through the Water Quality</p>	

# RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>D-2 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS</b>
<p>Improvement Plan. The Provision D monitoring and assessment program should be customized to achieve the desired outcomes of the Water Quality Improvement Plan and ultimately the CWA and the CWC. The desired outcomes of the CWA and the CWC are about conditions in water bodies (chemical, physical, and biological integrity), and information about conditions in water bodies is essential to help guide the work of protection and restoration. The Tentative Order's monitoring and assessment program requires collection of chemical, physical, and biological data from outfalls and receiving waters designed to inform the Copermittees, the San Diego Water Board, and the public about the condition of the discharge and the conditions of the water bodies in the San Diego Region. The Tentative Order's assessment requirements are designed to take the data collected from the monitoring program and convert it to useful information about the successfulness of the Copermittees' storm water management programs to achieve the desired outcomes of the CWA and the CWC.</p> <p>The San Diego Water Board agrees with comments from Industry that the monitoring program needs to be iterative, strategic, cost-effective and question-driven. As part of the iterative approach and adaptive management requirements of the Tentative Order, Provision D.4 requires the Copermittees to integrate: 1) the data collected pursuant to Provision D.1 through D.3; 2) the assessment findings required pursuant to Provision D.4a-c; and, 3) information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E to assess the effectiveness of, and any necessary modifications to, the Water Quality Improvement Plans. The requirements of the Tentative Order allow the Copermittees to adapt the monitoring based on watershed specific priority conditions within the confines of a robust Water Quality Improvement Plan development and implementation process.</p> <p>The San Diego Water Board agrees that the Tentative Order should be modified to increase clarity of what is required of each Copermittee, thus enabling the San Diego Water Board to better determine compliance. Several commenters provided suggested improvements to Provision D language. Selected modifications to Provision D of the Tentative Order were made to increase clarity of what is expected of the Copermittees throughout the iterative monitoring approach in efforts to increase specificity of what is minimally required and how compliance with the Tentative Order will be determined.</p> <p>The San Diego Water Board also agrees that the Tentative Order should be modified to increase the public's awareness of the Copermittees' compliance and progress towards achieving the goals of the Water Quality Improvement Plans. Provision F.1.a was modified to require the Copermittees implement a robust public participation process with multiple opportunities for public participation throughout the development of each component of the Water Quality Improvement Plan. Provision F.1.b provides the public another opportunity to</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>D-2 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS</b>
<p>submit comments on the Water Quality Improvement Plan during the acceptance process. The Copermitees are also required to include public participation during any updates to the Water Quality Improvement Plan. Finally, the data and information collected from monitoring, and the findings from the assessments will be reported in the Water Quality Improvement Plan Annual Reports.</p> <p>The San Diego Water Board has revised Provision D to be consistent with the toxicity sampling requirements included in the most recently adopted State Water Board and other Regional Water Board MS4 permits. Modifications were also made to Provision D requirements to clarify the monitoring locations for determining compliance with TMDLs.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>D-3 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS</b>		
	<p><b>COMMENT:</b> <i>Requests for changes to schedules for monitoring and monitoring reports.</i></p> <p>The San Diego County Copermittees submitted comments requesting an extension to the duration of the transitional monitoring program to accommodate the acceptance process of the Water Quality Improvement Plan and municipal program budget cycles. The Orange County Copermittees also submitted a comment requesting the commencement of the wet weather transitional outfall monitoring be delayed to year 2 of the transitional period to allow time to inventory and evaluate MS4 outfalls as required by Provision D.2.a.(1).</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the comment that the transitional monitoring program should be continued until such time that the monitoring program within a Water Quality Improvement Plan is accepted by the San Diego Water Board. Provision D.1.a. Receiving Water, D.2.a. MS4 Outfall Discharge Monitoring, D.2.a.(2) Dry Weather MS4 Outfall Discharge Field Screening, and D.2.a.(3) Wet Weather MS4 Outfall Discharge Monitoring have been revised to require the Copermittees to conduct the transitional monitoring program until the Water Quality Improvement Plan is accepted.</p> <p>The San Diego Water Board disagrees with the recommendation to begin wet weather transitional monitoring in year two of the transitional period. Municipalities have already mapped the location of their MS4s for operation and maintenance reasons. Municipalities are also already aware of the majority of information listed in Provision D.2.a.(1), therefore delaying the commencement of the transitional wet weather MS4 outfall monitoring is not appropriate and no change to the Tentative Order was necessary.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>D-4 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS</b>		
<b>D-4</b>	<p><b>COMMENT:</b> <i>Require the Copermittees to utilize monitoring data from third party sources.</i></p> <p>Comments submitted by Environmental Groups support the position that the Tentative Order should require the Copermittees to use third party data that meets particular criteria in their efforts to assess the watersheds and progress towards achieving water quality standards. The particular criteria would require third parties to maintain and make available for review the quality assurance plan, list of methods used, and standard operating procedures for the data. Additionally, the commenters requested the Tentative Order specify that data is “appropriate” if it has been collected using the latest Standard Methods of Water and Wastewater Analysis. The commenters further requested the Tentative Order require the Copermittees to solicit and evaluate third party data that meets the Tentative Order’s criteria for collection, not just the data collected pursuant to Provisions D.1, D.2, and D.3 when evaluating the causes of water quality conditions. Lastly, the commenters support the position that the Copermittees should be allowed to partner with environmental groups or other third parties to complete regional special studies.</p>	<p><b>Environmental Organizations</b> Environmental Groups</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the Copermittees should be required to use appropriately collected data from third parties during their efforts to assess conditions of the watershed.</p> <p>During development of the Water Quality Improvement Plan, the Copermittees are required under Provision B.2.a.(6) and Provision B.2.d.(4)(e) to consider available, relevant, and appropriately collected and analyzed data, information, or studies during their efforts to identify water quality priorities based on impacts of MS4 discharges on receiving waters and pollutant sources and/or stressors that contribute to the highest priority water quality conditions. Provision B.2.a.(6) and Provision B.2.d.(4)(e) allow the Copermittees to consider other data, not just data collected by the Copermittees. Additionally, Provision D.2 allows any data, “<i>not collected specifically for the Order that meet the quality assurance criteria of the Copermittees and the monitoring requirements of the Order</i>” to be used by the Copermittees in their MS4 outfall monitoring program. Lastly, the assessments required under Provision D.4 require evaluation of the data collected pursuant to Provisions D.1, D.2, and D.3, which isn’t restricted to that data which is collected solely by the Copermittees, and which will be heavily influenced by the Water Quality Improvement Plans which are required to use “<i>other available, relevant, and appropriately collected data, information, and studies.</i>”</p> <p>The San Diego Water Board agrees that the Copermittees should be allowed to partner with Environmental Groups or other third parties to complete regional special studies and additional language has been added to Provision D.3.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

D-5 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS	
<p><b>D-5</b></p>	<p><b>COMMENT:</b> <i>Include monitoring that will ensure compliance and jurisdictional accountability.</i></p> <p>The Coastal Environmental Rights Foundation (CERF), Environmental Health Coalition (EHC), and the San Diego Coastkeeper (SDCK) collectively submitted comments in support of increasing the nature, frequency, and amount of monitoring in the Tentative Order. The commenters expressed concern that the “lax approach” to monitoring currently in the Tentative Order is not adequate to assess compliance with the requirements.</p> <p>The USEPA requested the Tentative Order be more specific with regards to required monitoring locations and minimum monitoring frequencies to determine compliance with the TMDLs in Attachment E.</p> <p>The San Diego Unified Port District specifically requested additional jurisdictional outfall monitoring be required to support the San Diego Water Board’s and the Copermitees’ ability to determine the sources of any exceedances(s) of water quality standard(s) in receiving waters.</p>
	<p><b>Copermitees</b> San Diego Unified Port District / Brown and Winters</p> <p><b>Environmental Organizations</b> CERF, EHC and SDCK</p> <p><b>State/Federal Government</b> USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board generally disagrees with the comments from the Environmental Organizations that the monitoring approach in Tentative Order is too “lax.” However, the San Diego Water Board agrees that certain monitoring provisions need additional specificity requiring minimum monitoring frequencies and monitoring at specific locations to track compliance with the TMDLs in Attachment E to the Tentative Order.</p> <p>The monitoring and assessment program in the Tentative Order is a question-driven monitoring approach largely designed to place monitoring resources where they are most needed. In order to answer the questions and accomplish efficiencies, the monitoring approach for non-storm water includes screenings, prioritization, and collection of data through visual observations. The Environmental Organizations call specific attention to the MS4 outfall screening required during the transitional monitoring period and monitoring the 10 highest priority non-storm water persistent flow MS4 outfall locations during the post transitional monitoring period. The San Diego Water Board considers this MS4 outfall screening approach necessary for the Copermitees to identify the highest priority non-storm water persistent flows and eliminate them.</p> <p>Elimination of non-storm water flows is a priority of the Tentative Order because eliminating non-storm water flows is consistent with the Clean Water Act requirement to effectively prohibit non-storm water discharges to the MS4. Elimination of non-storm water flows is the most effective way to prevent 100 percent of the pollutants in the non-storm water discharges from causing or contributing to exceedances in receiving water quality</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

D-5	PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS	
	<p>standards. Therefore, the Tentative Order requires more attention (monitoring, screening, and sampling) at the outfalls to eliminate non-storm water flows. That attention is based on a prioritization to address the outfalls causing or contributing to the very highest priority water quality conditions first.</p> <p>The monitoring and assessment program is designed to be dynamic with collection of data during both wet and dry weather at the MS4 outfalls and in the receiving water. The San Diego Water Board has made revisions in response to comments to ensure the monitoring program in the Tentative Order will be sufficient to inform all stakeholders and the San Diego Water Board on the Copermittees' progress to effectively eliminate non-storm water flows, reduce pollutants in storm water to the maximum extent practicable, and protect conditions in the receiving waters from MS4 discharges. The monitoring and assessment program is adaptable through the Water Quality Improvement Plan to allow the Copermittees to address the highest water quality priorities in a focused manner, directing resources towards those areas or sources within their jurisdiction causing and contributing to the priority water quality conditions.</p> <p>To address the comment on public transparency, the San Diego Water Board has modified the Water Quality Improvement Plan Development process of Provision F.1.a to require the Copermittees to identify the opportunities for public involvement in the development of the Water Quality Improvement Plans. Provision F.4 requires Copermittees to place data and information available to the public on the Regional Clearinghouse. Additional public participation and notification requirements can be found in Provision F that address comments regarding the public access to information concerning the nexus between the health of the receiving waters and the water quality conditions of the discharges from the Copermittees' MS4s.</p> <p>The USEPA requested the Tentative Order to be more specific with regards to the monitoring required to determine compliance with the TMDLs in Attachment E. Provision D.2.c.(2) now requires wet weather outfall monitoring be conducted at least once per year (during the transitional monitoring the Copermittees are still required to sample twice per year), with a requirement that the Copermittees may need to increase the frequency of monitoring to identify pollutants in storm water discharges from the MS4s in order to, among other things, determine compliance with the WQBELs associated with the applicable TMDLs in Attachment E. Additionally, language in Provision D.2.b.(2)(b) has been modified to require the Copermittees to consider, notwithstanding all other priorities, compliance with applicable TMDLs in Attachment E when selecting MS4 outfall monitoring locations.</p> <p>The San Diego Unified Port District specifically requested additional jurisdictional outfall monitoring be required</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>D-5</b>	<b>PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS</b>	
	<p>to support the San Diego Water Board's and the Copermittees' ability to determine the sources of any exceedances(s) of water quality standard(s) in receiving waters. The San Diego Water Board modified Provisions D.2.b.(2)(b) and D.2.c.(1)-(2) in response to USEPA's comments, thereby specifying a minimum frequency for MS4 outfall monitoring during wet weather and requiring both MS4 outfall and receiving water monitoring station locations be suitable to determine compliance with TMDLs in Attachment E, as well as suitable to determine progress towards achieving the goals of the Water Quality Improvement Plans.</p> <p>Provision D.4.b requires the Copermittees to utilize a watershed model to calculate or estimate the total flow volume and pollutant loadings during wet weather and dry weather discharges from the Copermittee's jurisdiction within the Watershed Management Area. These modifications to Provision D, along with the newly revised Water Quality Improvement Plan development process, address the comments on requiring more monitoring to determine compliance. Additionally, the Tentative Order does not preclude a Copermittee from collecting additional monitoring above what is required, if they deem it necessary to demonstrate that the sources are outside of their jurisdictional legal authority to control.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>D-6 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS</b>		
	<p><b>COMMENT:</b> <i>Provide the County of San Diego an alternative transitional monitoring and assessment program for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees are covered under the permit.</i></p> <p>The monitoring and assessment program requirements should account for the phased coverage of the Riverside County Copermittees at a later date than the San Diego County Copermittees with regards to the Santa Margarita River Watershed Management Area.</p>	<p><b>Copermittees</b> County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the commenter.</p> <p>Footnote 3 in Table B-1 of Provision B and Provision D.2.a.(3)(a)(iii), have been revised to allow the County of San Diego to delay development of the Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees have been notified of coverage under the Tentative Order. Footnote 3 in Table B-1 of Provision B clarifies that the County of San Diego is not required to implement the requirements of Provision B until the Riverside County Copermittees have been notified of coverage, but are required to implement the requirements of Provision D and Attachment E for its jurisdiction within the Santa Margarita River Watershed Management Area.</p> <p>Additionally, Provision D.2.a.(3)(a)(iii) was added to specify that the County of San Diego must select at least two (2) wet weather MS4 outfall discharge monitoring stations, reduced from the 5 stations required in Provision D.2.a.(3)(a)(i), for the portion of the Santa Margarita River Watershed Management Area within its jurisdiction until the Riverside Copermittees are notified of coverage. After the Riverside Copermittees are notified of coverage, the County of San Diego in concert with the County of Riverside Copermittees must comply with Provision B requirements and prepare a Water Quality Improvement Plan and implement the monitoring and assessment requirements according to Provision D for the Santa Margarita River Watershed Management Area.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>D1-1 PROVISION D.1: Receiving Water Monitoring Requirements</b>	
<p><b>COMMENT:</b> <i>Requests for "clarifications" of receiving water monitoring requirements.</i></p> <p>The Riverside County Copermitees provided suggested changes to the language in Provision D to clarify that the receiving water monitoring required pursuant to Provision D.1.a.(3) and D.1.e must be conducted as applicable to the Watershed Management Area and the Copermitees' MS4 discharges. The Riverside County Copermitees want a distinction written into the requirements because some of the monitoring requirements only apply to MS4 discharges to certain water bodies and not all Copermitees within a Watershed Management Area will have discharges to that water body.</p> <p>The USEPA requested the Tentative Order be more specific with regards to the transitional and post transitional receiving water monitoring required (frequency and station location) to determine compliance with the TMDLs in Attachment E.</p>	<p><b>Copermitees</b> Riverside County Copermitees <b>State/Federal Government</b> USEPA</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the requested changes to Provisions D.1.a.(3) and D.1.e.</p> <p>The requested changes to Provision D.1.a.(3) were not incorporated because the intent is to require the Copermitees, during the transitional monitoring period, to participate in regional receiving water monitoring programs, as applicable to the Watershed Management Area, including participation in (a) Storm Water Monitoring Coalition Regional Monitoring, (b) Southern California Bight Regional Monitoring, and (c) Sediment Quality Monitoring. Provision D.1.a.(3) correctly conditions the requirement by stating, 'as applicable' to the Watershed Management Area. For example, the expectation is that the Riverside County Flood Control and Water Conservation District, a current member of the Southern California Stormwater Monitoring Coalition (SMC), participate in SMC monitoring within the Watershed Management Area(s), in which their jurisdiction lies.</p> <p>The SMC was formed in 2001 by cooperative agreement of the Phase I municipal storm water NPDES lead Copermitees (including the Riverside County Flood Control and Water Conservation District), the NPDES regulatory agencies in southern California (including the San Diego Water Board) and the Southern California Coastal Water Research Project. It is the goal of the SMC to develop the technical information necessary to better understand storm water mechanisms and impacts, and then develop the tools that will effectively and efficiently improve storm water management decision-making. The SMC develops and funds cooperative projects to improve knowledge of storm water quality management for all throughout the San Diego Region.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

D1-1	PROVISION D.1: Receiving Water Monitoring Requirements	
	<p>The requested changes to Provision D.1.e were not incorporated because the existing language is appropriate.</p> <p>Provision D.2.c.(2) has been revised to require wet weather MS4 outfall monitoring be conducted at least once per year after the Water Quality Improvement Plans are accepted, with a requirement that Copermittees may need to increase the frequency of monitoring in order to identify pollutants in storm water discharges from the MS4s in order to, among other things, determine compliance with the WQBELs associated with the applicable TMDLs in Attachment E. During the transitional monitoring period, the Copermittees are still required to conduct wet weather MS4 outfall monitoring twice per year. Additionally, the language in Provision D.2.b.(2)(b) has been modified to require the Copermittees to consider, notwithstanding all other priorities, compliance with applicable TMDLs in Attachment E when selecting MS4 outfall monitoring locations.</p>

March 27, 2013

<b>D1-2 PROVISION D.1: Receiving Water Monitoring Requirements</b>		
	<p><b>COMMENT:</b> <i>Requests for modifications to receiving water monitoring stations, frequency, and data collection requirements.</i></p> <p>Comments submitted by the Copermitees ranged from a broad request to remove the entire coastal storm drain monitoring program from the receiving water monitoring requirements (San Diego County), adding an alternate compliance option in lieu of the receiving waters monitoring program previously adopted in their current permit (Orange County), to very specific additions to what is recorded during receiving water station field observations (Riverside County).</p> <p>Multiple Environmental Organizations supported the need to increase the amount of monitoring in order to 1) better inform the Copermitees of the nexus between the health of receiving waters and the water quality condition of their discharge, 2) be sufficient to fulfill the San Diego Water Board's need to assess compliance, and 3) be sufficient to fulfill the public's need to stay informed.</p> <p>The USEPA commented on the need for the receiving water requirements to include minimum monitoring frequencies and a minimum number of station locations to measure compliance with the WLAs and associated water quality based effluent limitations of the TMDLs in the Order.</p> <p>The Los Penasquitos Lagoon Foundation requested continuous flow monitoring at the base of tributaries to 303(d) listed water bodies and monitoring of groundwater seepages into 303(d) listed water bodies be added to the monitoring requirements of the Watershed Management Area including the Los Penasquitos Lagoon.</p>	<p><b>Copermitees</b>                      Orange County Copermitees                      Riverside County Copermitees                      San Diego County Copermitees</p> <p><b>Environmental Organizations</b>                      CERF, EHC, SDCK                      Los Penasquitos Lagoon Foundation</p> <p><b>State / Federal Government</b>                      USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request to discontinue the coastal storm drain monitoring program and has replaced it with the receiving water monitoring program of Provision D.1 along with the transitional outfall monitoring screening and post-transitional outfall monitoring program (Provision D.2).</p> <p>The San Diego Water Board disagrees with the requested changes to the field screening observations required in Tables D-1 and D-6. The requests included adding the requirement to record any observed connectivity between MS4 outfall discharges and flowing receiving waters during receiving water and outfall field screening efforts. This was not added to the required observations listed in Tables D-1 or D-6 because the observations are already required as part of the illicit connection and illegal discharge requirements of Provision E.2.</p> <p>Pursuant to Provision D.1.f Alternative Watershed Monitoring Requirements, the San Diego Water Board may</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>D1-2 PROVISION D.1: Receiving Water Monitoring Requirements</b>
<p>direct the Copermitees to participate in an effort to develop alternative watershed monitoring with other regulated entities, other interested parties, and the San Diego Water Board to refine, coordinate, and implement regional monitoring and assessment programs to determine status and trends in receiving waters. This requirement calls attention to the San Diego Water Board's plan to involve the Copermitees in the development of regional monitoring and assessment programs. It further calls attention to the San Diego Waters Board's position that a regional monitoring and assessment program must include other regulated entities in addition to the Phase I Copermitees. The Draft Framework for Monitoring and Assessment in the San Diego Region lays out the San Diego Water Board's framework to develop a regional receiving water monitoring program. Prior to development and required implementation of a regional receiving water monitoring program, and to maintain historical water quality monitoring trends, the requirements of Provision D.1.a-f require Copermitees to continue the receiving water monitoring required by their current storm water permits until coverage under the Tentative Order commences, and the Water Quality Improvement Plans are accepted.</p> <p>The monitoring program in Provision D has been modified to include minimums (removing the language "as appropriate"). Required monitoring minimums also address concerns regarding the Copermitees' and the San Diego Water Board's ability to determine compliance with the requirements of the Tentative Order (including TMDLs). Additionally, the Water Quality Improvement Plan development process has been significantly changed to include more public participation.</p> <p>Furthermore, the Tentative Order recognizes that each Copermitee should evaluate the need to increase its monitoring above what is minimally required to the appropriate level necessary to achieve the goals of the Water Quality Improvement Plan. Within the process for a Copermitee to get a Water Quality Improvement Plan developed and accepted by the San Diego Water Board, the Environmental Organizations and the public at large will have opportunities to contribute their expertise and provide comments on the nature and extent of monitoring needed to measure progress towards achieving the goals of the Water Quality Improvement Plans.</p> <p>Each Copermitee must establish a public participation process to solicit data, information, and recommendations to be utilized in the development of the Water Quality Improvement Plan. The Tentative Order also requires the Copermitees to form a Water Quality Improvement Consultation Panel (Panel) to provide recommendations on the priorities, goals, and strategies of the Water Quality Improvement Plan. The Panel must include a member of the environmental community, a member of the development community, and a member of the San Diego Water Board staff. Any recommendations for monitoring specific to a particular Watershed Management Area, receiving water body, pollutant, or stressor could be provided by the Panel and</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

D1-2	<b>PROVISION D.1: Receiving Water Monitoring Requirements</b>	
	<p>addressed in the Water Quality Improvement Plan.</p> <p>The minimum monitoring required plus the monitoring needed to attain goals established in the Water Quality Improvement Plans will be sufficient to inform the Copermittees, the San Diego Water Board, the environmental groups, and the public on the nexus between the health of receiving waters and the water quality condition of the discharges, compliance with TMDLs, and progress towards achieving the goals of the Clean Water Act.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

D1-3 PROVISION D.1: Receiving Water Monitoring Requirements		
	<p><b>COMMENT:</b> <i>Require Test of Significant Toxicity to be consistent with other recent MS4 permits.</i></p> <p>The USEPA commented that the toxicity monitoring requirements should be modified and to be consistent with the requirements in MS4 permits recently issued by the State Water Resources Control Board (Caltrans MS4 Permit) and the Los Angeles Regional Water Quality Control Board (Los Angeles County MS4 Permit).</p>	<p><b>State/Federal Government</b> USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the toxicity testing and data analysis requirements in the Tentative Orders should be consistent with other recently adopted MS4 Permits.</p> <p>The recently adopted Caltrans and Los Angeles County MS4 Permits include updated toxicity data collection procedures and data analysis methods that are consistent with the Draft State Water Resources Control Board Policy for Toxicity Assessment and Control, June 2012 (Draft State Board Toxicity Policy). Provision D has been updated to remove the acute toxicity test requirements, and only require chronic toxicity test biological endpoint data be analyzed using the Test of Significant Toxicity t-test approach specified in National Pollutant Discharge Elimination System Test of Significant Toxicity Document (USEPA, EPA 833-R-10-003, 2010), and other minor changes to make the Tentative Order consistent with recently adopted MS4 permits.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>D2-1 PROVISION D.2: MS4 Outfall Discharge Monitoring Requirements</b>	
<p><b>COMMENT:</b> <i>Requests for "clarifications" of MS4 outfall discharge monitoring requirements.</i></p> <p>The San Diego County and Riverside County Copermittees requested the dry weather MS4 outfall field screening language in Provision D.2.a.(2) be modified to clarify the number of visual inspections at major outfall locations required per jurisdiction per Watershed Management Area. The Riverside County Copermittees additionally requested that the field screening only apply to those MS4 outfalls in a Copermittee's inventory that are 'accessible,' and clarification to the definition of persistent flow.</p> <p>USEPA supports the Copermittees' comments to improve clarity with respect to identification of MS4 outfall monitoring locations. USEPA further requested language specific enough to assure MS4 outfall monitoring locations are selected to include compliance points for the TMDLs in Attachment E.</p>	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees  <b>State and Federal Government</b>                      USEPA</p>
<p><b>RESPONSE:</b> The San Diego Water Board generally agrees with comments from the Copermittees and USEPA.</p> <p>Additional language has been added to improve the clarity of Provision D.2.a.(2) for those jurisdictions with equal to or greater than 500 major MS4 outfalls within their inventory that are located within multiple Watershed Management Areas. The San Diego Water Board specifically retained language to allow for the Copermittees to conduct more than the minimum amount of visual inspections of their major MS4 outfalls should increased inspections be a part of the strategies specified to meet the goals of any Water Quality Improvement Plan.</p> <p>The San Diego Water Board disagrees with the comments requesting modifications to the persistent flow definition in Footnote 19. The San Diego Water Board maintains that the definition, as written, accomplishes the intent of the requested revision and does not need to be explicitly stated. Existing language in Provision D.2.a.(1)(e) addresses the comment about field screening "accessible" inventoried MS4 outfalls. The Copermittees can field screen an MS4 outfall location by screening a manhole just upgradient of the discharge where access is safe.</p> <p>Provisions D.2.b.(2)(b)(i) and D.2.c.(1) were modified to require additional outfall monitoring locations if the 5 chosen MS4 outfall locations were not sufficient to determine compliance with the TMDLs in the Tentative Order.</p>

March 27, 2013

<b>D2-2 PROVISION D.2: MS4 Outfall Discharge Monitoring Requirements</b>		
<b>D2-2</b>	<p><b>COMMENT:</b> <i>Requests for modifications to MS4 outfall monitoring stations, frequency, and data collection requirements.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each requested modifications to the MS4 outfall monitoring stations, frequency, and data collection requirements.</p> <p>The San Diego County Copermittees requested the MS4 outfall discharge monitoring requirements be changed for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees become covered under the Tentative Order, a reduction to the frequency of outfall sampling during the transitional period from annually to once per 2-year transitional period, a modification to the requirement to sample the 'first flush' during wet weather, a reduction to the number of dry weather outfall monitoring locations from 10 to 5, and an allowance for analytical testing to be reduced if demonstrated by supporting data.</p> <p>The Orange County and Riverside County Copermittees supported most of San Diego County Copermittees' requested revisions. Additionally, the Riverside County Copermittees commented on the disproportionality of the persistent flow MS4 outfall monitoring requirements, and the need to de-emphasize MS outfall monitoring locations if the discharge does not reach a receiving water due to infiltration, evaporation, or treatment.</p> <p>Environmental Organizations supported the need to increase the amount of monitoring in order to better inform the Copermittees of the nexus between the health of receiving waters and the water quality condition of their discharge, be sufficient to fulfill the San Diego Water Board's need to assess compliance, and be sufficient to fulfill the public's need to stay informed.</p> <p>The USEPA commented on the need for the MS4 outfall monitoring requirements to include minimum monitoring frequencies and a minimum number of MS4 outfall locations to measure compliance with the TMDLs.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      CERF, EHC, SDCK</p> <p><b>State / Federal Government</b>                      USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agreed with several of the requested modifications. Revisions to Provision D.2 were made where appropriate.</p> <p>The requirement to monitor at least 10 major outfalls was reduced to monitoring at least 5 major outfalls with persistent flows. To address comments from the USEPA, this requirement was also modified to require additional MS4 outfall monitoring locations, if the 5 chosen outfall locations were not sufficient to determine compliance with the TMDLs. If a smaller jurisdiction has less than 5 major MS4 outfalls with persistent flow,</p>

D3-2 PROVISION D.3: Special Studies	
<p><b>COMMENT:</b> <i>Allow special studies initiated prior to the term of the Tentative Order to count toward the required special studies.</i></p> <p>The San Diego County Copermitees submitted a comment requesting that the special studies initiated prior to the term of the Tentative Order be allowed to count towards the special studies required in Provision D.3, citing that special studies are typically multi-year efforts that require multi-stage planning, funding approval/allocation, and analysis. This comment was supported by the Riverside County Copermitees.</p>	<p><b>Copermitees</b>                      Riverside County Copermitees                      San Diego County Copermitees</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the commenters.</p> <p>Provision D.3 has been modified to allow the use of special studies initiate prior to adoption of the Tentative Order to comply with the requirements of Provision D.3.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

D4-1 PROVISION D.4: Assessment Requirements	
	<p><b>COMMENT:</b> <i>Requests for "clarifications" of assessment requirements.</i></p> <p>The San Diego County and Riverside County Copermittees submitted comments requesting clarifications be made to the assessment requirements of Provisions D.4.b.(1)-(2). The Copermittees concurred that the timing of reporting be compatible with completion of the assessments. The Riverside County Copermittees requested specific revisions to Provision D.4.b.(1)(c)(iv) concerning extrapolation of calculated flow volumes and pollutant loads; and assessment of jurisdictional accountability.</p>
	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the commenters.</p> <p>The San Diego Water Board modified Provision D.4.b.(1)(a) to add an annual assessment of data collected during the transition period and reporting as part of the Transitional Monitoring and Assessment Program Annual Report (Provision F.3.b.2). Provision D.4.b.(2)(a) requires assessment of MS4 outfall data collected after the transitional period and reporting as part of the Water Quality Improvement Plan Annual Report (Provision F.3.b.(3)). Requiring an annual report during the transitional years before the acceptance of the Water Quality Improvement Plan will allow Copermittees to perform 'complete' assessments and report on the progress for that year, whether it be a year within the transitional monitoring period or a year in which monitoring is conducted in accordance with the Water Quality Improvement Plan.</p> <p>Provisions D.4.b.(2)(c)(iv)[a]-[b] were modified to address comments concerning extrapolation of calculated flow volume and pollutant loads to outfalls that were not actually monitored. The assessment now requires the use of a model or other method to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4 outfalls in its jurisdiction identified as having persistent dry weather flows. To address the issue of jurisdictional accountability, the Copermittees are now required to identify and quantify (i.e. volume and pollutant loads) sources of non-storm water not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.</p> <p>The San Diego Water Board generally disagrees with the comment to require calculation of pollutant loads only for those priority water quality constituents identified in the Water Quality Improvement Plan. Calculation of all pollutant loads are required until a Copermittee collects sufficient data or other supporting information pursuant to Provision D.2.b.(2)(e)(iii)[e] to demonstrate analysis of a constituent is not necessary.</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

D4-1	PROVISION D.4: Assessment Requirements
	<p>The San Diego Water Board agrees with the comment that MS4 outfall assessments are to be done for the area covered by each Copermittee and that the data to be used by each Copermittee would include the data collected from any Flood Control District MS4 operated within its jurisdiction. The San Diego Water Board has not modified any language within Provision D.4 to address this comment because the language adequately addresses the comment without further modifications.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

D4-2 PROVISION D.4: Assessment Requirements	
	<p><b>COMMENT:</b> <i>Requests for modifications to assessment requirements.</i></p> <p>The San Diego County Copermittees commented on the need for a longer assessment term (once per permit term rather than annually) to provide meaningful analysis of the annual pollutant load and flow calculations from MS4 outfalls during dry weather. The Copermittees further commented on the need to modify the requirements to calculate jurisdictional loads during wet weather, as well as modifications to clarify assessments necessary to track jurisdictional accountability.</p> <p>The Riverside County Copermittees agreed in large part with the comments provided by the San Diego County Copermittees. The Riverside County Copermittees also expressed a desire to clarify MS4 outfall assessments are to be done by each municipal Copermittee and that the data to be used by each municipal Copermittee include the data collected from any flood control district within its jurisdiction. Additionally, the Riverside County Copermittees expressed concern that the assessment requirements were requiring evaluations beyond their expertise and suggested pollutant loads only be calculated for priority pollutants.</p> <p>The Los Penasquitos Lagoon Foundation requested that the Tentative Order require the Copermittees to work with local land managers to assess the status and trends of receiving water quality conditions.</p>
	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Los Penasquitos Lagoon Foundation</p>
	<p><b>RESPONSE:</b> The San Diego Water Board generally agreed with the need for a longer assessment term (once per permit term rather than annually) to provide meaningful analysis of the annual pollutant load and flow calculations from MS4 outfalls during dry weather and the need to modify the requirements to calculate jurisdictional loads during wet weather to the added area-based jurisdictional computational approach.</p> <p>The San Diego Water Board generally modified the Tentative Order where there was agreement with the comments. The San Diego Water Board, however, disagrees with the requests regarding MS4 outfall assessments for flood control districts, assessment requirements related to critical receiving water beneficial uses, and the suggestion that pollutant loads only be calculated for priority pollutants.</p> <p>The San Diego Water Board agrees with the comments provided by the Los Penasquitos Lagoon Foundation and required increased public participation and formation of a Water Quality Improvement Plan Consultation Panel in Provision F.1.a.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E-1 PROVISION E: JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS</b>		
<b>E-1</b>	<p><b>COMMENT:</b> <i>Align the Jurisdictional Runoff Management Program requirements with the Water Quality Improvement Plan requirements.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting the requirements in Provision E be allowed to be modified based on what is proposed in the Water Quality Improvement Plans. The Copermittees assert that the requirements of Provision E are a “one size fits all” set of requirements, and the requirements of the Water Quality Improvement Plan become “additive” rather than “complimentary.” Several Copermittees submitted separate comment letters supporting the concept by requesting the San Diego Water Board align the development and implementation of the Water Quality Improvement Plan better with the jurisdictional runoff management program requirements. The BIA Regulated Community Coalition also submitted comments supporting the concept.</p> <p>The Environmental Groups submitted comments expressing concern with the flexibility of the jurisdictional runoff management program requirements and requested that the Water Quality Improvement Plan include a detailed list of activities and what activities each Copermittee will implement within its jurisdiction. The Environmental Groups are concerned that without this specificity in the Water Quality Improvement Plans, and the flexibility that is provided in the jurisdictional runoff management program requirements would result in the burden of achieving water quality improvement within a watershed falling to only one or two Copermittees. The Environmental Groups would like to see a clearer commitment of what will be implemented by each Copermittee either in the Water Quality Improvement Plan or in the jurisdictional runoff management program documents for each Copermittee.</p> <p>The USEPA is also concerned with the flexibility that is provided by the requirements of Provision E. The USEPA prefers jurisdictional runoff management program requirements that include specific inspection frequencies.</p>	<p><b>Building Industry / Industry</b> BIA Regulated Community Coalition</p> <p><b>Copermittees</b> City of Dana Point City of Laguna Hills City of Lake Forest City of Mission Viejo City of Rancho Santa Margarita City of San Juan Capistrano Orange County Copermittees Riverside County Copermittees San Diego County Copermittees</p> <p><b>Environmental Organizations</b> Environmental Groups</p> <p><b>State/Federal Government</b> USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the Water Quality Improvement Plans and jurisdictional runoff management program requirements should be better aligned and clearly present the water quality improvement strategies that each Copermittee will implement within its jurisdiction. The San Diego Water Board does not agree that the jurisdictional runoff management program requirements of Provision E should be allowed to be modified by the Water Quality Improvement Plan.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

E-1	PROVISION E: JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS	
	<p>The San Diego Water Board has revised Provision B.3.b in the revised Tentative Order (formerly Provision B.3.a in the Tentative Order) to require the Copermittees to specify which water quality improvement strategies each Copermittee will commit to implementing within its jurisdiction as part of its jurisdictional runoff management program requirements under Provisions E.2-E-7, and the optional water quality improvement strategies that will be implemented by the Copermittee within its jurisdiction when necessary to achieve the numeric goals. The optional water quality improvement strategies are to be implemented by the Copermittee as necessary to contribute toward achieving the numeric goals. Provision B.3.b in the revised Tentative Order also includes requirements for the Copermittees to identify optional Watershed Management Area strategies that the Copermittees will implement when necessary to achieve the numeric goals.</p> <p>Each Copermittee must specify BMPs, education programs, inspection frequencies, incentive and enforcement programs that will be implemented within its jurisdiction as part of its jurisdictional runoff management program requirements under Provisions E.2-E-7. Provisions E.2.e, E.3.g, E.4.f, E.5.e.(1), and E.7.c were removed in the revised Tentative Order, and the introductory paragraphs of Provisions E.2-E.7 were revised to state that each component must be implemented in accordance with the jurisdictional strategies identified in the Water Quality Improvement Plan. These revisions were made to better align the requirements of the Water Quality Improvement Plans and the jurisdictional runoff management programs, and provide an additional layer of transparency to the public for the strategies that the Copermittees will be committing to implement versus those strategies that will be implemented only when necessary to achieve the numeric goals.</p> <p>The San Diego Water Board has not modified the inspection frequency requirements in Provisions E.2-E.7. The inspection frequency requirements provide a sufficient level of guidance and flexibility for allowing the Copermittees to develop appropriate inspection frequencies that will be committed to in the Water Quality Improvement Plans, and a minimum level of effort that is expected for areas associated with the highest priority water quality conditions. The inspection frequencies that the Copermittees commit to implementing as part of the Water Quality Improvement Plans will be utilized by the San Diego Water Board during its audits of the Copermittees' programs to determine compliance with the requirements of the Tentative Order.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E-2 PROVISION E: JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS</b>	
<p><b>COMMENT:</b> <i>Allow San Diego County to use the Watershed Urban Runoff Management Plan (WURMP) to guide its jurisdictional runoff management program for the Santa Margarita River Watershed Management Area until the Riverside County Copermittees are covered under the Tentative Order.</i></p> <p>The County of San Diego and the San Diego County Copermittees requested that the requirement to develop a Water Quality Improvement Plan and implementation of the requirements of Provision E for the Santa Margarita River Watershed Management Area be postponed until the Riverside County Copermittees become covered under the Tentative Order.</p>	<p><b>Copermittees</b> County of San Diego San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request.</p> <p>The second introductory paragraph of Provision E states, “<i>Until the Copermittee has updated its jurisdictional runoff management program document with the requirements of Provision E, the Copermittee must continue implementing its current jurisdictional runoff management program.</i>” The County of San Diego will continue to implement the jurisdictional runoff management program requirements of Order No. R9-2007-0001 until the Riverside County Copermittees are notified of coverage under the Order and a Water Quality Improvement Plan is developed pursuant to the requirements of this Order. The County of San Diego may use its WURMP for the Santa Margarita River Watershed to guide its jurisdictional runoff management program until the Water Quality Improvement Plan is developed and accepted.</p> <p>Please also see the response to comment B1-1.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E1-1 PROVISION E.1: Legal Authority Establishment and Enforcement</b>	
<p><b>COMMENT:</b> <i>Specify that the legal authority established by the Copermittees only applies to the Copermittees' jurisdictions.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting that the requirements of Provision E.1 be modified to specify that the legal authority established by the Copermittees only apply "to the extent allowable by law" and only applies to discharges within their jurisdiction. The Julian Community Planning Group also commented that there are jurisdictions that a Copermittee has no authority to require compliance.</p>	<p><b>Community Planning Groups</b>                      Julian Community Planning Group</p> <p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that it is necessary to specify that the legal authority established by the Copermittees is only applicable to their jurisdictions.</p> <p>The requirements of Provision E.1 are consistent with the requirements under 40CFR122.26(d)(2)(i)(A)-(F) and do not go beyond those requirements. The legal authority that each Copermittee is required to establish for its jurisdiction is logically only expected to apply to its jurisdiction.</p> <p>Provision E.1.a.(2) is consistent with 40CFR122.26(d)(2)(i)(A), which requires the Copermittee to "<i>Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity.</i>" 40CFR122.26(d)(2)(i)(A) does not make a distinction between industrial activity (which includes construction activity according to 40 CFR 122.26(b)(14)(x)) that is regulated by an NPDES permit, such as the Statewide Industrial and Construction General Permits, and those that are not. Even if there are industrial and construction sites regulated by the Statewide Industrial or Construction General Permits, those sites are still subject to the Copermittees ordinances and the Copermittee must have the legal authority to control discharges from those sites.</p> <p>Provisions E.1.a.(4) is consistent with 40CFR122.26(d)(2)(i)(D), which requires the Copermittee to "<i>Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system.</i>" The federal regulations require the Copermittees to enter into interagency agreements to control pollutants from one Copermittee's jurisdiction to another Copermittee's jurisdiction. Provision E.1.a.(4) does not require anything outside of the federal requirements.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E1-1</b>	<b>PROVISION E.1: Legal Authority Establishment and Enforcement</b>	
	<p>Provision E.1.a.(5) is consistent with the requirements in the Order Nos. R9-2007-0001, R9-2009-0002, and R9-2010-0016. The Copermittees should be working with other entities outside of their jurisdiction to reduce or eliminate pollutants being discharged into their jurisdictions and MS4s, especially if those are significant sources of pollutants. The “where possible” qualifier in the requirement gives the Copermittees some flexibility in working with other entities, but Provision E.1.a.(5) does not require the Copermittees to impose their legal authority upon entities outside their jurisdictions.</p> <p>Provision E.1.a.(10) is consistent with 40CFR122.26(d)(2)(i)(F), which requires the Copermittee to “<i>Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.</i>”</p> <p>The San Diego Water Board did not make revisions to the requirements of Provision E.1 requested by the Copermittees.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E1-2 PROVISION E.1: Legal Authority Establishment and Enforcement</b>	
<p><b>COMMENT:</b> Requests for "clarifications" for legal authority requirements.</p> <p>The Orange County, Riverside County and San Diego County Copermitees each submitted comments requesting several "clarification" to requirements of Provision E.1.a to be "consistent" with the requirements under 40CFR122.26(d)(2)(i)(A)-(F).</p>	<p><b>Copermitees</b>                      Orange County Copermitees                      Riverside County Copermitees                      San Diego County Copermitees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the legal authority requirements under Provision E.1.a are not consistent with the requirements under 40CFR122.26(d)(2)(i)(A)-(F).</p> <p>The requirements of Provision E.1.a are consistent with the requirements under 40CFR122.26(d)(2)(i)(A)-(F) and do not go beyond those requirements. The requirements under 40CFR122.26(d)(2)(i)(A)-(F) apply to both non-storm water discharges to the MS4 and pollutants in storm water discharges from the MS4.</p> <p>Provision E.1.a.(1) is consistent with 40CFR122.26(d)(2)(i)(B), which requires the Copermitee to "[operate pursuant to legal authority established...which authorizes or enables the applicant at a minimum to...] Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer." The requirement under 40CFR122.26(d)(2)(i)(B) does not include the term "effectively prohibit" only "prohibit" illicit discharges to the MS4.</p> <p>Provision E.1.a.(2) is consistent with 40CFR122.26(d)(2)(i)(A), which requires the Copermitee to "[operate pursuant to legal authority established...which authorizes or enables the applicant at a minimum to...] Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity." The requirement under 40CFR122.26(d)(2)(i)(A) does not make a distinction between industrial activity (which includes construction activity according to 40 CFR 122.26(b)(14)(x)) that is regulated by an NPDES permit, such as the Statewide Industrial and Construction General Permits, and those that are not.</p> <p>Provision E.1.a.(3) is consistent with 40CFR122.26(d)(2)(i)(C), which requires the Copermitee to "[operate pursuant to legal authority established...which authorizes or enables the applicant at a minimum to...] Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water."</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E1-2</b>	<b>PROVISION E.1: Legal Authority Establishment and Enforcement</b>	
	<p>Provisions E.1.a.(6)-(9) are consistent with 40CFR122.26(d)(2)(i)(E), which requires the Copermitee to “[operate pursuant to legal authority established...which authorizes or enables the applicant at a minimum to...] Require compliance with conditions in ordinances, permits, contracts or orders.” Provisions E.1.a.(6)-(9) provide more specificity about what “compliance with conditions in ordinances, permits, contracts or orders” includes.</p> <p>Provision E.1.a.(10) is consistent with 40CFR122.26(d)(2)(i)(F), which requires the Copermitee to “[operate pursuant to legal authority established...which authorizes or enables the applicant at a minimum to...] Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.”</p> <p>The San Diego Water Board did not make revisions to the requirements of Provision E.1.a requested by the Copermitees.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E2-1 PROVISION E.2: Illicit Discharge Detection and Elimination</b>	
<p><b>COMMENT:</b> <i>Non-storm water discharges must be addressed because of the impacts dry weather flows have on receiving waters.</i></p> <p>The Los Penasquitos Lagoon Foundation and the South Laguna Civic Association each submitted comments expressing concerns about the impacts on receiving water due to dry weather flows. The Los Penasquitos Lagoon Foundation noted that dry weather discharges can create serious impacts to the beneficial uses of receiving waters that support salt marsh habitats. The South Laguna Civic Association noted that elevated creek flows originating from over-irrigation result in the discharge of several pollutants to protected creek, estuary and coastal receiving waters.</p> <p>The Los Penasquitos Lagoon Foundation requested that the Tentative Order provide mechanisms to allow the Copermittees to address dry weather flows regardless of whether or not constituents of concern are present in the flows. The South Laguna Civic Association advocated for effective enforcement measures by the San Diego Water Board to reduce discharges generated by over-irrigation.</p>	<p><b>Environmental Organizations</b>                      Los Penasquitos Lagoon Foundation                      South Laguna Civic Association</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees that non-storm water discharges must be addressed.</p> <p>The approach to regulating non-storm water discharges in the Tentative Order has been modified compared to earlier permits. The Tentative Order focuses on “effectively prohibiting” or preventing and eliminating all non-NPDES-permitted non-storm water discharges to the MS4. The Tentative Order also requires the Copermittees to prohibit non-storm discharges associated with over-irrigation to the MS4. These two changes are expected to result in more actions implemented by the Copermittees to “effectively prohibit” non-storm water discharges to the MS4s and thereby non-storm water and pollutants from the MS4s to receiving waters.</p> <p>The San Diego Water Board agrees that the San Diego Water Board must enforce permit requirements more effectively. By issuing the Tentative Order, the San Diego Water Board expects to be able to reallocate its resources to better enforce permit requirements instead of developing permits and permit requirements. However, the San Diego Water Board also expects the public to provide data, information and evidence that will allow the San Diego Water Board to enforce the requirements of the Tentative Order.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

E2-2	<b>PROVISION E.2: Illicit Discharge Detection and Elimination</b>	
	<p><b>COMMENT:</b> <i>Requests for "clarifications" of illicit discharge detection and elimination requirements.</i></p> <p>The Riverside County and San Diego County Copermittees, the Industrial Environmental Association, the BIA Regulated Community Coalition, and the Los Penasquitos Lagoon Foundation each submitted comment letters recommending minor revisions to the language under Provision E.2 to "clarify" the requirements, or to be consistent the comments regarding non-storm water discharges (see comment Gnl-13).</p>	<p><b>Building Industry / Industry</b>                      Industrial Environmental Association                      BIA Regulated Community Coalition</p> <p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Los Penasquitos Lagoon Foundation</p>
	<p><b>RESPONSE:</b> The San Diego Water Board reviewed and considered the requests for minor revisions to "clarify" the requirements under Provision E.2.</p> <p>Where the San Diego Water Board determined a revision requested by a commenter was appropriate and necessary to clarify a requirement, clarify a linkage to another requirement, or make it consistent with other revisions made in the Tentative Order, the San Diego Water Board made a revision under Provision E.2. In many cases, the requested revision was not appropriate, not necessary, or both. In such cases, the San Diego Water Board did not revise the language as requested.</p> <p>Please see Provision E.2 in the revised Tentative Order to see where revisions were made. Please also see the responses to the comments that follow, associated with Provision E.2, for revisions that were made for specific parts under Provision E.2.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E2-3	<b>PROVISION E.2: Illicit Discharge Detection and Elimination</b>	
	<p><b>COMMENT:</b> <i>Requests to more clearly define the responsibility of each Copermittee to address sources non-storm water discharges originating outside of a Copermittee's jurisdiction or control.</i></p> <p>The Riverside County and San Diego County Copermittees each submitted comments requesting modifications to the language under Provisions E.2.b and E.2.d to better define or more clearly define the responsibilities of each Copermittee to address sources of non-storm water discharges originating outside of a Copermittee's jurisdiction or control.</p> <p>The San Diego County Copermittees requested a minor revision to Provision E.2.b.(6) changing "must" to "shall." The San Diego County Copermittees also requested a minor revision to Provision E.2.d.(1)(d) to include a consideration for natural sources in its prioritization of investigations. The Riverside County Copermittees did not include the comments in their comment letter, but did include similar revisions in a track changes version of the Tentative Order provided with their comments.</p> <p>The Riverside County Copermittees requested additions to Provision E.2.d.(3) to specify that a Copermittee is no longer responsible for eliminating a non-storm water discharge to its jurisdiction if the source is in an upstream jurisdiction, and allowing the Copermittee to charge the San Diego Water Board for identifying non-storm water discharges subject to the regulatory authority of the San Diego Water Board.</p>	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the requests.</p> <p>Revision of Provision E.2.b.(6) to change "must" to "shall" is unnecessary. In either case, the San Diego Water Board would interpret the language as the Copermittee is required to implement Provision E.2.b.(6).</p> <p>Revision of Provision E.2.d.(1)(d) is unnecessary. Provisions E.2.d.(1)(a)-(e) are the criteria that the Copermittee must consider in its prioritization of follow-up investigations. Nothing in Provisions E.2.d.(1)(a)-(e) prohibit the Copermittee from considering natural sources as part of its prioritization of follow-up investigations.</p> <p>The recommended revisions to Provision E.2.d.(3) are not necessary or appropriate. Provision E.2.b.(6) already requires the Copermittee to coordinate with upstream Copermittees to prevent illicit discharges to the MS4 within its jurisdiction. In addition, Provision E.1.a.(4) requires the Copermittee to "<i>Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system.</i>" The federal regulations require the Copermittees to enter into</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E2-3</b>	<b>PROVISION E.2: Illicit Discharge Detection and Elimination</b>	
	<p>interagency agreements to control pollutants from one Copermittee's jurisdiction to another Copermittee's jurisdiction.</p> <p>The request to allow a Copermittee to charge the San Diego Water Board for implementing an investigation of non-storm water discharges to its MS4 is inappropriate. Each Copermittee is required to effectively prohibit non-storm water discharges to their MS4s by enforcing its legal authority, unless a non-storm water discharge is authorized under an NPDES permit. If a non-storm water discharge originates from a source that is subject to the San Diego Water Board's authority and requires an NPDES permit, then the Copermittee is still responsible for identifying the source if it is resulting in a non-storm water discharge into and from the Copermittee's MS4.</p> <p>If the non-storm water discharge is not authorized under an NPDES permit, then it is an illicit discharge. The Copermittee must either eliminate the illicit discharge or require the discharger to obtain authorization from the San Diego Water Board under an NPDES permit. If a non-storm water discharge to the Copermittee's MS4 is an NPDES permitted discharge, then the Copermittee is responsible for demonstrating that the non-storm water discharge is not an illicit discharge by identifying the source as an NPDES permitted discharge. The Copermittee must provide the data and documentation to demonstrate that non-storm water discharges from its MS4 are authorized under separate NPDES requirements. Until the Copermittee demonstrates that a non-storm water discharge is an NPDES-permitted discharge, the Copermittee is responsible for the non-storm water discharge. The non-storm water source investigation and identification are part of the Copermittee's responsibility to demonstrate compliance with the requirements in the Tentative Order.</p> <p>The San Diego Water Board did not revise Provisions E.2.b or E.2.d.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E2a-1	<b>PROVISION E.2.a: Non-Storm Water Discharges</b>	
	<p><b>COMMENT:</b> <i>Request to allow the Copermittees to "encourage" instead of "require" air conditioning condensate non-storm water discharges be directed to landscaped areas or other impervious surfaces.</i></p> <p>The City of National City, the San Diego County Copermittees, the San Diego Unified Port District, and the San Diego Port Tenants Association each submitted comments expressing concerns with requiring air conditioning condensate non-storm water discharges to be directed to landscaped areas or other permeable surfaces, if feasible.</p> <p>The City of National City, the San Diego County Copermittees, and the San Diego Unified Port District requested the language of Provision E.2.a.(4)(a) be revised to encourage instead of require air conditioning condensate non-storm water discharges be directed to landscaped areas or other permeable surfaces. The San Diego County Copermittees also requested the addition of "or to the sanitary sewer" at the end of the requirement. The City of National City opposed this addition.</p> <p>The San Diego Port Tenants Association requested that the requirement be limited to development or re-development projects.</p>	<p><b>Copermittees</b>                      City of National City                      San Diego County Copermittees                      San Diego Unified Port District</p> <p><b>Societies/Associations/Coalitions</b>                      San Diego Port Tenants Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees to revise the requirements to encourage instead of require air conditioning condensate non-storm water discharges be directed to landscaped areas or other permeable surfaces. The San Diego Water Board also agrees to add "to the sanitary sewer" as an additional option.</p> <p>The San Diego Water Board disagrees with limiting the requirement to development or re-development projects. Air conditioning condensate non-storm water discharges originate primarily from existing development, and the Clean Water Act requires the Copermittees to effectively prohibit non-storm water discharges to the MS4.</p> <p>Please see Provision E.2.a.(4)(a) in the revised Tentative Order to see the revisions.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E2a-2 PROVISION E.2.a: Non-Storm Water Discharges	
<p><b>COMMENT:</b> <i>Requests for modifications to requirements of fire-fighting non-storm water discharges.</i></p> <p>The Orange County, Riverside County, and San Diego County Copermittees each submitted comments objecting to the requirement to encourage the implementation of BMPs for emergency firefighting discharges and/or the requirement to address non-emergency firefighting discharges from building fire suppression systems as illicit discharges. The County of San Diego and San Diego County Fire Authority also objected to the requirement to encourage implementation of BMPs for emergency firefighting discharges. San Diego Gas and Electric, the Southern California Gas Company, and the San Diego Port Tenants Association also objected to the requirement to address non-emergency firefighting discharges from building fire suppression systems as illicit discharges.</p> <p>The Orange County and Riverside County Copermittees recommended removing Provision E.2.a.(5)(b) and specifying that emergency firefighting non-storm water discharges do not require BMPs and are not prohibited. The San Diego County Fire Authority recommended maintaining the existing requirements in Order No. R9-2007-0001, which is supported by the County of San Diego.</p> <p>The San Diego County Copermittees recommended revising Provision E.2.a.(5)(a)(i) to require the Copermittees to address non-emergency firefighting discharges from building fire suppression systems as illicit discharges “unless BMPs are implemented to prevent the discharge of pollutants to the MS4.” The Riverside County Copermittees, County of San Diego, San Diego County Fire Authority, San Diego Gas and Electric, Southern California Gas Company, and San Diego Port Tenants Association supported the recommendation. The Orange County Copermittees did not provide a similar comment, but recommended that other non-emergency firefighting discharges be addressed by a program developed and implemented by the Copermittee “in conjunction with the local Fire Authority/District.”</p>	<p><b>Building Industry / Industry</b>                  San Diego Gas and Electric                  Southern California Gas Company</p> <p><b>Copermittees</b>                  County of San Diego                  Orange County Copermittees                  Riverside County Copermittees                  San Diego County Copermittees                  San Diego County Fire Authority</p> <p><b>Societies/Associations/Coalitions</b>                  San Diego Port Tenants Association</p>
<p><b>RESPONSE:</b> The San Diego Water Board has review and considered the recommendations from the commenters.</p> <p>The San Diego Water Board disagrees that the language in Provision E.2.a.(5)(b) requires the implementation of BMPs for emergency fire fighting discharges, or prohibits emergency fire fighting discharges to the MS4. Provision E.2.a.(5)(b) only requires the Copermittees to “encourage” the implementation of BMPs. Provision E.2.a.(5)(b) is a recommendation for the Copermittees to implement, not a requirement for compliance.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

E2a-2	PROVISION E.2.a: Non-Storm Water Discharges
	<p>The San Diego Water Board agrees to the recommended revision to Provision E.2.a.(5)(a)(i). The San Diego Water Board does not agree that the recommended revision to Provision E.2.a.(5)(a)(ii) is necessary. The Copermitees would have to develop and implement the program to address non-emergency fire fighting discharges in conjunction or coordination with the local fire authority or fire district.</p> <p>Please see Provision E.2.a.(5) in the revised Tentative Order to see the revisions.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E2a-3 PROVISION E.2.a: Non-Storm Water Discharges		
	<p><b>COMMENT:</b> Clarify that non-storm water discharges authorized by a separate NPDES permit are authorized to be discharged to the MS4.</p> <p>The San Diego Port Tenants Association, San Diego Gas and Electric, and the Southern California Gas Company each submitted comments requesting language in the Tentative Order to specify that non-storm water discharges authorized by separate NPDES permits are authorized to discharge to the MS4.</p>	<p><b>Building Industry / Industry</b>                      San Diego Gas and Electric                      Southern California Gas Company</p> <p><b>Societies/Associations/Coalitions</b>                      San Diego Port Tenants Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that revision to the language in the Tentative Order are necessary or appropriate.</p> <p>Provision A.1.b has been revised to refer to Provision E.2, which is the illicit discharge detection and elimination program requirements that must be implemented by each Copermittee within its jurisdiction to effectively prohibit non-storm water discharges to its MS4. Provision A.1.b also specifies that the Copermittees are required to effectively prohibit non-storm water discharges to the MS4 <i>unless</i> such discharges are authorized by a separate NPDES permit.</p> <p>The San Diego Water Board did not revise the Tentative Order to include additional language.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E2a-4 PROVISION E.2.a: Non-Storm Water Discharges	
<p><b>COMMENT:</b> <i>Objections to addressing non-storm water discharges related to extraction of groundwater as illicit discharges.</i></p> <p>The Orange County, Riverside County, and San Diego County Copermittees each submitted comments objecting to the requirements to address non-storm water discharges related to extraction of groundwater as illicit discharges if they are not identified as sources of pollutants. The City of National City also submitted a comment with a similar objection. The Copermittees also objected to requiring non-storm water discharges related to extraction of groundwater to be enrolled under the General Groundwater Extraction NPDES Permits issued by the San Diego Water Board.</p> <p>The Copermittees recommended several revisions to Provisions E.2.a.(1) and E.2.a.(3) to modify, remove, and/or reorganize the requirements pertaining to non-storm water discharges related to groundwater extraction.</p>	<p><b>Copermittees</b>                      City of National City                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the recommendations.</p> <p>The Clean Water Act requires NPDES permit for MS4s to effectively prohibit non-storm water discharges to the MS4. As explained in the Fact Sheet, the Phase I Final Rule clarifies that non-storm water discharges through an MS4 are not authorized under the CWA (55 FR 47995): <i>“Today’s rule defines the term “illicit discharge” to describe any discharge through a municipal separate storm sewer system that is not composed entirely of storm water and that is not covered by an NPDES permit. Such illicit discharges are not authorized under the Clean Water Act. Section 402(p)(3)(B) requires that permits for discharges from municipal separate storm sewers require the municipality to “effectively prohibit” non-storm water discharges from the municipal separate storm sewer...Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit.”</i></p> <p>Thus, all non-storm water discharges that do not have authorization under an NPDES permit must ultimately be removed (i.e. prevented or eliminated) from the MS4 or become subject to an NPDES permit.</p> <p>The requirements under Provisions E.2.a.(1) and E.2.a.(3) are consistent with the Clean Water Act, the Code of Federal Regulations and the clarification in the Phase I Final Rule for non-storm water discharges. The non-storm water categories listed under Provision E.2.a.(1) can be authorized by an NPDES permit because they are extracting groundwater for the purpose of dewatering, and the San Diego Water Board has two NPDES permits that can authorize these types of non-storm water discharges. These are not “conditionally exempt”</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E2a-4</b>	<b>PROVISION E.2.a: Non-Storm Water Discharges</b>	
	<p>non-storm water discharges as the Copermittees have asserted. If there are non-storm water discharges that result from groundwater extraction for dewatering and do not have authorization under an NPDES permit, the discharge is an illicit discharge.</p> <p>The non-storm water categories listed under Provision E.2.a.(3) generally are expected to be discharged from natural, uncontrollable, or unanticipated sources. Non-storm water discharges from foundation drains and footing drains designed to be above the groundwater table are not generally expected to occur. If they do occur, the Copermittee is expected to implement its illicit discharge detection and elimination program to determine if the discharge is transient or persistent, a source of pollutants or not, and whether the discharge must be eliminated in accordance with its priorities.</p> <p>In general, the requirements under Provision E.2 are focused on the ultimate removal of unauthorized non-storm water discharges to the MS4 to “effectively prohibit” non-storm water discharges to the MS4, as required by the Clean Water Act. The San Diego Water Board is not requiring the Copermittee to enforce any NPDES permits issued by the San Diego Water Board or State Water Board. The Copermittees are only required to enforce their legal authority to prohibit illicit discharges to their MS4s established pursuant to Provision E.1.a.(1).</p> <p>The San Diego Water Board did not revise Provisions E.2.a.(1) or E.2.a.(3).</p>

E2a-7 PROVISION E.2.a: Non-Storm Water Discharges		
	<p><b>COMMENT:</b> Request for modification to requirements for swimming pool non-storm water discharges.</p> <p>The San Diego County Copermittees requested a minor modification to Provision E.2.a.(4)(c) to add the phrase “should be managed as to:” for the non-storm water discharge requirements related to dechlorinated swimming pool discharges.</p>	<p><b>Copermittees</b> San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board reviewed and considered the requested revision.</p> <p>The revision to Provision E.2.a.(4)(c) does not provide any additional clarify and is not necessary. The San Diego Water Board did not revise Provision E.2.a.(4)(c) as requested.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**  
 March 27, 2013

<b>E2a-8 PROVISION E.2.a: Non-Storm Water Discharges</b>	
<p><b>COMMENT:</b> <i>Objections to requiring the prohibition of over-irrigation non-storm water discharges.</i></p> <p>The Riverside County Copermittees and the County of San Diego each submitted comments objecting to eliminating the non-storm water discharge categories associated with over-irrigation, which results in requiring the Copermittees to prohibit over-irrigation non-storm water discharges to the Copermittees' MS4s. The Copermittees requested that the non-storm water discharge categories associated with over-irrigation be put back into Provision E.2.a.</p> <p>In contrast, the Los Penasquitos Lagoon Foundation and the South Laguna Civic Association each submitted comments expressing concerns about the impacts on receiving water due to dry weather flows associated with over-irrigation. The Los Penasquitos Lagoon Foundation noted that dry weather discharges can create serious impacts to the beneficial uses of receiving waters that support salt marsh habitats. The South Laguna Civic Association noted that elevated creek flows originating from over-irrigation result in the discharge of several pollutants to protected creek, estuary and coastal receiving waters.</p>	<p><b>Copermittees</b>                  County of San Diego                  Riverside County Copermittees</p> <p><b>Environmental Organizations</b>                  Los Penasquitos Lagoon Foundation                  South Laguna Civic Association</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the Copermittees' request.</p> <p>The Riverside County Copermittees assert that the Copermittees must identify the categories that are sources of pollutants that should be prohibited, not the San Diego Water Board. The San Diego Water Board disagrees. This is the responsibility of both the San Diego Water Board and/or the discharger. Either the San Diego Water Board or the discharger may identify categories that should be prohibited. The Phase I Rule (55 FR 48037) specifies that "<i>the Director [i.e. San Diego Water Board] may include permit conditions that either require municipalities to prohibit or otherwise control any of these types of discharges where appropriate.</i>"</p> <p>In this case, the San Diego Water Board has identified non-storm water runoff from landscape irrigation, irrigation water, and lawn watering (collectively, "over-irrigation") as a significant source of pollutants discharging to the MS4. The Fact Sheet cites a number of documents, from the state and all three counties of the San Diego Region, to justify the removal of these categories from the list of categories of non-storm water discharges into the MS4 not required to be prohibited. The San Diego Water Board maintains that the documentation cited in the Fact Sheet supports that removal of these categories. However, the comments from the Los Penasquitos Lagoon Foundation and the South Laguna Civic Association also support this conclusion.</p> <p>In addition, the removal of the non-storm water discharge categories associated with over-irrigation has already</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E2a-8</b>	<b>PROVISION E.2.a: Non-Storm Water Discharges</b>	
	<p>been adopted in the Orange County and Riverside County MS4 Permits (Order Nos. R9-2009-0002 and R9-2016-0016). The Riverside County Copermittees are already subject to the requirement to prohibit non-storm water discharge categories associated with over-irrigation, so the removal of these categories in the Tentative Order is consistent with their current requirements.</p> <p>Furthermore, the removal of the non-storm water discharge categories associated with over-irrigation is consistent with what is already required to be implemented by the Copermittees. The prohibition is consistent with the Water Conservation in Landscaping Act (AB1881), which required cities and counties to adopt landscape water conservation ordinances prohibiting runoff from inefficient landscape irrigation by January 1, 2010. The cities and counties were required to adopt ordinances that prohibit runoff from "the target landscape" to "adjacent property, non-irrigated areas, walks, roadways, parking lots, or structures." The Copermittees should have already adopted these ordinances and are required to enforce these ordinances to prohibit runoff associated with over-irrigation.</p> <p>The San Diego Water Board did not revise Provision E.2.a to include the non-storm water discharge categories associated with over-irrigation.</p>

<b>E2a-9 PROVISION E.2.a: Non-Storm Water Discharges</b>	
<p><b>COMMENT:</b> <i>Objection to requirement to reduce or eliminate non-storm water discharges whether or not a non-storm water discharge has been identified as an illicit discharge.</i></p> <p>The Orange County, Riverside County, and San Diego County Copermittees each submitted comments objecting the requirement under Provision E.2.a.(7) to reduce or eliminate non-storm water discharges whether or not a non-storm water discharge has been identified as an illicit discharge. The San Diego County Copermittees recommended removing the phrase “whether or not the non-storm water discharge has been identified as an illicit discharge” and the Orange County and Riverside County Copermittees recommended removing Provision E.2.a.(7).</p> <p>In contrast, the Los Penasquitos Lagoon Foundation requested that the requirements under Provision E.2 provide the Copermittees a mechanism to address illicit discharges regardless of whether or not constituents of concern are present within the flows. The Los Penasquitos Lagoon Foundation noted that dry weather freshwater flows themselves can create serious impacts to the beneficial uses of receiving waters that support salt marsh habitats, especially when those flows have been changed from ephemeral to perennial.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Los Penasquitos Lagoon Foundation</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request to remove Provision E.2.a.(7), but agrees to modify the language.</p> <p>Provision E.2.a.(7) is consistent with Clean Water Act, the Code of Federal Regulations and the clarification in the Phase I Final Rule for non-storm water discharges. Please see response to comment E2a-4.</p> <p>The San Diego Water Board has revised Provision E.2.a.(7). Please see the revisions in the revised Tentative Order.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E2a-10 PROVISION E.2.a: Non-Storm Water Discharges		
	<p><b>COMMENT:</b> <i>Request for modifications to the requirements for water line flushing and water main breaks non-storm water discharges.</i></p> <p>The Metropolitan Water District of Southern California submitted a request to modify Provision E.2.a.(2) to specify that non-storm water discharges from water purveyors and community water systems are authorized discharges and not illicit discharge if enrolled or regulated under NPDES Permit No. CAG 679001 (Order No. R9-2010-0003).</p>	<p><b>Other Entities</b> Metropolitan Water District of Southern California</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request.</p> <p>Provision E.2.a.(2) is specific to the requirement for the Copermittees to identify whether or not a non-storm water discharge resulting from water line flushing or water main breaks are illicit discharges. These are two non-storm water discharge categories specifically identified in the Code of Federal Regulations that the Copermittees are required to address as illicit discharges if they are identified as a source of pollutants.</p> <p>The introductory paragraph to Provision E.2.a already specifies that non-storm water discharges authorized by a separate NPDES permit is not required to be addressed as an illicit discharge. Provision E.2.a.(2) further specifies that water line flushing and water main breaks covered under NPDES Permit No. CAG 679001 (Order No. R9-2010-0003) are not illicit discharges.</p> <p>The San Diego Water Board did not revise Provision E.2.a.(2).</p>

E3-2 PROVISION E.3: Development Planning		
	<p><b>COMMENT:</b> <i>Requests for revisions to allow the construction of BMPs in waters of the state.</i></p> <p>The San Diego County Copermittees and the BIA Regulated Community Coalition have requested that Provision E.3.a.(1)(b) be revised to allow the implementation of structural BMPs within waters of the state, since the definition of waters of the state is broad and could be interpreted to prohibit storm drain inserts and other common BMPs. The requested revision that “BMPs must not be constructed within a waters of the U.S. unless authorized by the San Diego Water Board Executive Officer” is consistent with the San Diego Water Board’s 401 Certification Program and would protect natural receiving waters from construction and the use of such waters to transport pollutants.</p>	<p><b>Building Industry / Industry Copermittees</b>                      BIA Regulated Community Coalition                      City of Chula Vista                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with this comment and has modified the language in the Tentative Order accordingly.</p>

<b>E3-3 PROVISION E.3: Development Planning</b>	
	<p><b>COMMENT:</b> <i>Requests for revisions to Priority Development Project inventory requirements.</i></p> <p>The San Diego County Copermittees have requested that the Tentative Order be revised such that updates to Priority Development Project databases occur “regularly” instead of “at least annually.” Additionally, the City of Chula Vista requested the start date for Priority Development Project inventory begin December 2002 instead of January 2002, to reflect the start date for the San Diego County Copermittees’ regulatory oversight process pursuant to Order No. 2001-01.</p>
	<p><b>Copermittees</b>                      City of Chula Vista                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the frequency of updates to project inventories should be less frequent than on an annual basis. However, the San Diego Water Board agrees with the request that the start date be changed for San Diego County Copermittees and has revised the language in the Tentative Order appropriately.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3b-1 PROVISION E.3.b: Priority Development Projects</b>	
<p><b>COMMENT:</b> <i>Requests for revisions to development planning requirements to include different requirements for transportation projects.</i></p> <p>The San Diego County and Orange County Copermittees, the Riverside County Transportation Department, and others commented that transportation projects should be exempt from the requirement to implement pollutant control and hydromodification management BMPs set forth in the Tentative Order. Commenters contend that transportation projects should be allotted special consideration because, unlike other types of projects, they must also consider various design constraints having to do with limited right-of-way, utilities, street trees, fire truck access, and general public safety. Commenters recommended that transportation projects be held to USEPA Green Streets guidance as the design requirement.</p>	<p><b>Building Industry / Industry</b>                      San Diego Green Building Council</p> <p><b>Copermittees</b>                      City of Dana Point                      City of Imperial Beach                      Orange County Copermittees                      Riverside County Transportation Department</p>
<p><b>RESPONSE:</b> The San Diego Water Board generally agrees with the commenters regarding the unique constraints associated with existing roadways.</p> <p>The Tentative Order has been revised to provide an exemption from the Priority Development Project designation for projects where retrofitting of existing paved alleys, streets, or roads are designed and constructed in accordance with USEPA Green Street guidance. However, this exemption is only allowed for existing road and not new ones. This is because new roads are not yet spatially constrained and should be able to incorporate the pollutant control and hydromodification management BMPs during the planning stages. The Tentative Order also allows the Copermittees to incorporate alternative compliance options during the planning stages of the new road projects. The San Diego Water Board maintains that controlling pollutants and managing flows coming from roads is critical because roads are significant sources of pollutants and add significant new impervious surfaces.</p> <p>Commenters should also note that routine maintenance activities associated with transportation projects such as maintaining original line and grade, or repairing potholes, is not considered a Priority Development Project and is not subject to any structural BMP requirements.</p>

E3b-2 PROVISION E.3.b: Priority Development Projects		
	<p><b>COMMENT:</b> Request for a clear definition of "directly discharges to" an Environmentally Sensitive Area (ESA).</p> <p>The San Diego County Copermittees and the City of Imperial Beach have requested that Provision B.3.b.(1) be revised to clearly define "directly discharges to" an ESA. The Copermittees are concerned that language in the Tentative Order is confusing and can be misinterpreted.</p>	<p><b>Copermittees</b>                      City of Imperial Beach                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the comment.</p> <p>The San Diego Water Board revised the language in Provision B.3.b.(1) to more clearly define "directly discharges to."</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

E3b-3	PROVISION E.3.b: Priority Development Projects
	<p><b>COMMENT:</b> <i>Requests for modifications to the types of projects defined as Priority Development Projects and subject to the storm water pollutant control and hydromodification management structural BMP requirements.</i></p> <p>The San Diego County, Orange County, and Riverside County Copermittees, several individual Copermittees, members of the Building Industry, Industry, Clean Water Now, and Engineering/Design Consultants submitted comments regarding the types of projects defined as Priority Development Projects. Clean Water Now expressed concern with the types of projects that are considered Priority Development Projects. The Copermittees, Building Industry, and Engineering/Design Consultants provided recommendations for the types of projects that should be defined as Priority Development Projects and therefore subject to the storm water pollutant control and hydromodification management structural BMP requirements, and the types of projects that should be exempt from those requirements.</p> <p>The Copermittees made several comments on this topic, which are summarized below:</p> <ul style="list-style-type: none"> <li>● Single family residences should be exempt because the requirements are complex and difficult for the regular homeowner to understand, and that the potential for pollutant generation is considerably less than an industrial or commercial site;</li> <li>● Driveways should not be included as Priority Development Projects because, unlike roads, driveways experience low daily trips. The Copermittees suggest implementing a lower performance standard for BMPs implemented on driveways than other Priority Development Projects;</li> <li>● The Tentative Order should include qualifiers for parking lots that would trigger Priority Development Project status only if they were uncovered;</li> <li>● Maintenance access roads should be exempt;</li> <li>● The Tentative Order should allow exemptions for parking lots and other projects that are constructed with permeable surfaces;</li> <li>● The Tentative Order should allow exemptions for flood control and emergency projects;</li> <li>● The exemptions allowed for LEED certified single family residences is inappropriate because the program encompasses other environmental considerations, and are outside the scope of storm water permitting;</li> <li>● Triggers for Priority Development status should be simultaneously based on soil type and square footage of impervious surface;</li> <li>● The Tentative Order should allow exemptions for “Watershed Protection Projects” that are undertaken to rehabilitate or prevent environmental, social, and economic damage to the watershed;</li> </ul>
	<p><b>Building Industry / Industry</b>                      American Society of Landscape Architects                      San Diego Green Building Council                      San Diego Gas and Electric Company                      Southern California Gas Company</p> <p><b>Copermittees</b>                      City of Chula Vista                      City of Imperial Beach                      City of Poway                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Clean Water Now</p> <p><b>Engineering/Design Consultants</b>                      Contech Engineered Solutions                      Project Design Consultants</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E3b-3	<b>PROVISION E.3.b: Priority Development Projects</b>	
	<ul style="list-style-type: none"> <li>The hillside development category should be removed because it is not needed.</li> </ul> <p>Some Engineering/Design Consultants suggested that Priority Development Projects be exempt if they are designed and constructed with specific materials or a voluntary certification program. San Diego Gas and Electric and the Southern California Gas Company commented that linear underground/overhead (utility) projects should be exempt from Priority Development Project status due to the nature of their construction.</p>	
	<p><b>RESPONSE:</b> The San Diego Water Board generally disagrees with the requests to remove some project categories from Provision E.3.b, or to exempt certain types of projects from the requirement to implement storm water pollutant control and hydromodification management BMPs. Such BMPs are needed to protect water quality. The list of project categories in Provision E.3.b represents projects that result in the creation of significant areas of impervious surface and/or are pollutant generating in nature, which in turn contributes to pollutants in storm water discharges and altered flow regimes that cause accelerated erosion of channel bed and banks, and consequently degraded stream conditions.</p> <p>With the exception of driveways, the Priority Development Project categories have not changed substantially in San Diego Water MS4 permits. Provision E.3.b of the Tentative Order is consistent with the Fourth Term MS4 permits adopted by the San Diego Water Board for Orange County and Riverside County.</p> <p>Driveways were added as to the Priority Development Project categories because, although they experience much less traffic than roads, they still generate pollutants and create significant impervious surfaces that can impact downstream receiving waters, and must be mitigated. Similarly, even covered parking lots cause impacts for which mitigation is needed because rooftops also add to the impervious surface footprint. Research shows that even incremental increases in impervious surface, as low as 3-5 percent of the watershed area in the semi-arid climate of southern California, can result in degradation of receiving streams (Stein, E. and Zaleski, S., 2005. Technical Report 475, Managing Runoff to Protect Natural Streams: The Latest Development on Investigation and Management of Hydromodification in California. December 30, 2005.).</p> <p>Creation of impervious surface is a concern to the San Diego Water Board and construction with pervious materials that allow infiltration and other natural hydrologic processes are preferred. There is no need to exempt parking lots and other projects constructed with pervious materials from Priority Development Project status because they are not considered Priority Development Projects in the first place. Similarly, maintenance access roads as well as the majority of linear utility projects are not Priority Development Projects because they do not necessarily result in the placement of impervious surfaces above the threshold square footages</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

E3b-3	PROVISION E.3.b: Priority Development Projects	
	<p>associated with Priority Development Projects.</p> <p>Priority Development Project status is based on both the type of project being built and associated pollutants anticipated to be generated, and a threshold for the creation or replacement of impervious surface. Soil type comes into play in terms of meeting the retention requirement, which is discussed in the response to comment E3c1-1. The San Diego Water Board disagrees with the recommendation to define Priority Development Projects by soil type because this is accounted for in the size and type of BMPs as dictated by the retention requirement.</p> <p>The San Diego Water Board disagrees that hillside development projects should be exempt. These projects are susceptible to causing accelerated erosion and therefore must implement structural BMPs. The San Diego Water Board further disagrees that there should be exemptions for emergency projects or flood control projects. Provision E.3 describes requirements that pertain to development planning. Emergency situations, by definition, are not planning exercises and therefore do not involve the design and construction of a building or structure. The San Diego Water Board believes that it may be suitable to relax the structural BMP standards for, or exempt flood control projects, but not before projects are evaluated on a case-by-case basis. In many instances, environmentally friendly practices may be appropriate for implementation in flood control projects, but a variety of options would not be evaluated if the Tentative Order provided a blanket exemption.</p> <p>The San Diego Water Board disagrees that an exemption from the Priority Development Project structural BMP requirements should be provided for all single family residences. The definition of Priority Development Projects in the Tentative Order already excludes a majority of single family residences that may be developed or redeveloped. New single family residences must create 10,000 square feet or more of impervious surface, or 5,000 square feet or more of impervious surface as a Hillside Development, or 2,500 square feet or more of impervious surface if discharging directly to an Environmental Sensitive Area to be defined as a Priority Development Project. Redevelopment single family residence projects must create or replace 5,000 square feet or more of impervious surface, or 2,500 square feet or more of impervious surface if discharging directly to an Environmental Sensitive Area to be defined as a Priority Development Project. Single family residences that are defined as Priority Development Projects can have a significant impact on receiving water quality and it is appropriate for these projects to implement the Priority Development Project structural BMP requirements.</p> <p>The San Diego Water Board removed language pertaining to the option for single family residences to be designed and constructed with LEED certification to qualify as exempt from Priority Development Project status.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3b-3</b>	<b>PROVISION E.3.b: Priority Development Projects</b>	
	<p>This is because several commenters stated that including this requirements was outside the scope of water quality regulation, and that the LEED program was too specific of a certification requirement. To avoid any inconsistency regarding equivalent certification programs and for more streamlined requirements, this option, and hence the exemption allowed for single family residences, was removed. Single family residences large enough to trigger the size thresholds associated with Priority Development Projects are a source of pollutants and altered flow regimes, and therefore must be required to implement structural BMPs. The Copermittees must inspect such BMPs as part of their oversight programs to ensure that homeowners are properly maintaining the BMPs and the BMPs continue to operate as designed in order for the Copermittees to meet the MEP standard of the Clean Water Act.</p> <p>Finally, the San Diego Water Board disagrees that there should be an exemption for “Watershed Protection Projects.” The commenters should note that Priority Development Projects are not only defined by square footage of impervious surface, but also the type of project being constructed. The types of projects described in the comment, such as erosion mitigation, restoration of rivers and ecosystems, or groundwater recharge, do not need to be explicitly provided exemptions because they would not be considered Priority Development Projects in the first place if they do not create or replace impervious surface in exceedance of the thresholds in the Tentative Order.</p> <p>The San Diego Water Board has also revised the Tentative Order to allow the Copermittees to provide exemptions for all types of projects. The Copermittees have the ability to exempt projects from meeting the hydromodification management requirements in areas where they have deemed it appropriate to do so. However, in order to utilize this option, Copermittees must first perform the optional Watershed Management Area Analysis described in Provision B.3.b.(4). Please see the response to Comment E3c-2 for further discussion of this option.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3b-4 PROVISION E.3.b: Priority Development Projects</b>	
<p><b>COMMENT:</b> <i>Redevelopment Priority Development Projects that were subject to previous structural BMP requirements should not be subject to new structural BMP requirements.</i></p> <p>The San Diego County, Orange County, and Riverside County Copermitees each submitted comments requesting that language be added to the Tentative Order that would specify structural BMP requirements are not applicable to Priority Development Projects (or portions thereof) if the project already has implemented structural BMPs pursuant to requirements of prior MS4 permits.</p>	<p><b>Copermitees</b>                      Orange County Copermitees                      Riverside County Copermitees                      San Diego County Copermitees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees in concept with the Copermitees' request.</p> <p>Although some projects may already have structural BMPs onsite, the performance requirements of those BMPs do not necessarily meet the requirements of the Tentative Order. Order No. R9-2007-0001 does not have the numerical storm water pollutant control retention performance standard, therefore redevelopment sites that were subject to Order No. R9-2007-0001 must update their BMPs during the design phase. In some cases, redevelopment projects will already have BMPs that meet the storm water pollutant control and hydromodification management BMP requirements. In these instances, the requirements of the Tentative Order are met and there is no need to change the language.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3c-1 PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements</b>	
<b>E3c-1</b>	<p><b>COMMENT:</b> <i>The Tentative Order ignores regional comprehensive plans developed by municipalities and SANDAG.</i></p> <p>The Jamul Dulzura Community Planning Group and Julian Community Planning Group assert that the requirements in the Tentative Order are contradictory to plans developed by SANDAG and subsequently included in General Plans that include sound principles such as encouraging redevelopment. The Tentative Order's requirements amount to punishing or dis-incentivizing urban infill projects.</p>
	<p><b>Community Planning Groups</b>                  Jamul Dulzura Community Planning Group                  Julian Community Planning Group</p>
	<p><b>RESPONSE:</b> The San Diego Water Board strongly disagrees that the requirements in the Tentative Order are contradictory to principles advocated in regional planning documents. In fact, the Tentative Order is heavily based on planning at the watershed scale, as represented in the Water Quality Improvement Plan requirements. The Tentative Orders increases flexibility for the Copermitees to address urban infill and redevelopment projects by not mandating only on-site BMPs.</p> <p>Redevelopment projects will be required to implement structural BMP requirements that are needed to protect downstream water quality. However, if a Copermitee finds that implementation of the required BMPs fully onsite will not result in meaningful improvements in either pollutant control or hydromodification management, then that Copermitee has the option to allow compliance elsewhere in the watershed where more substantial improvements can take place. There are no additional requirements for redevelopment projects versus new projects, therefore redevelopment projects are not being penalized, as suggested by the commenters.</p> <p>Furthermore, the Tentative Order has been revised to include an exemption from hydromodification management BMP requirements for Priority Development Projects that discharge to conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean. Additionally, more exemptions could be included on a watershed-specific basis if the Copermitees in the Watershed Management Area elect to perform the optional Watershed Management Area Analysis as described in Provision B.3.b.(4). Please see the response to Comment E3c-2 for further discussion of these options.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3c-2 PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements</b>		
<b>E3c-2</b>	<p><b>COMMENT:</b> Request for requirements that allow development of watershed-specific structural BMP performance standards in Water Quality Improvement Plans.</p> <p>The Orange County and San Diego County Copermittees assert that the Tentative Order requires a “one-size-fits-all” approach and request that the Tentative Order allows for watershed-specific performance requirements for structural BMPs. Members of the Building Industry, the City of Imperial Beach, Engineering/Design Consultants, Societies/Associations/Coalitions, and Other Entities requested or expressed support for a similar concept. The Environmental Groups support including alternative compliance options that provide “off-ramps” for the baseline “one size fits all” structural BMP performance requirements.</p>	<p><b>Building Industry / Industry</b> American Society of Landscape Architects</p> <p><b>Copermittees</b> City of Imperial Beach Orange County Copermittees San Diego County Copermittees</p> <p><b>Environmental Organizations</b> Environmental Groups</p> <p><b>Engineering/Design Consultants</b> Latitude 33 Planning and Engineering Project Design Consultants</p> <p><b>Societies/Associations/Coalitions</b> BIOCOM</p> <p><b>Other Entities</b> Carol Crossman Gable PR Hughes Marino Marston+Marston Nuffer, Smith, and Tucker San Diego Regional Chamber of Commerce Sheppard, Mullin, Richter &amp; Hampton LLP Southern Cross Property Consultants Transition IT</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the Tentative Order requires a “one-size-fits-all” approach for the implementation of structural BMPs.</p> <p>For the Priority Development Project structural BMP performance requirements, site specific conditions must be taken into account upon selecting appropriate BMPs. Provision E.3.c.(1)(a), which describes requirements for storm water pollutant control, the Tentative Order states that: “Each Priority Development Project must be required to implement LID BMPs that are designed to retain (i.e. intercept, store, infiltrate, evaporate, and evapotranspire) onsite the volume of storm water runoff produced from a 24-hour 85<sup>th</sup> percentile storm event (design capture volume).” While each Priority Development Project must retain the volume of storm water runoff produced from the 24-hour 85<sup>th</sup> percentile storm, the actual volume retained will vary based on site specific factors, namely soil type and associated infiltration rates. The requirement to retain the volume of water associated with this size storm is appropriate for the reasons stated in the response to comment E3c1-1.</p>

E3c-2 PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements
<p>Similarly, Provision E.3.c.(2)(a), which describes requirements for hydromodification management, states that: <i>“Post-project runoff flow rates and durations must not exceed pre-development runoff flow rates and durations by more than 10 percent (for the range of flows that result in increased potential for erosion, or degraded instream habitat conditions downstream of Priority Development Projects).”</i> This requirement involves implementing BMPs for “the range of flows that result in increased potential for erosion,...” which is necessarily a site-specific requirement. The range of flows that cause downstream erosion from one Priority Development Project may be different than the range of flows that cause erosion from another Priority Development Project located in a different area in the watershed. Therefore, very different BMPs might be required from the two sites.</p> <p>The San Diego Water Board agrees that greater improvements to water quality in the watersheds may be realized if Priority Development Projects were allowed to implement some requirements offsite, as opposed to strictly onsite. For this reason, the Tentative Order allows for “alternative compliance” in instances where the Copermittee determines that offsite measures will have a greater overall water quality benefit for the Watershed Management Area than if the Priority Development Project were to implement structural BMPs onsite. Consequently, watershed-specific structural BMP requirements are present in the Tentative Order in the form of allowable compliance offsite. The “alternative compliance program” has been substantially re-written for simplicity, and also to better align this program with the planning efforts of the Copermittees in the Water Quality Improvement Plans.</p> <p>The alternative compliance program, which is described in Provision E.3.c.(3), is an option for Priority Development Projects where the Copermittee has participated in the development of a Watershed Management Area Analysis as part of the Water Quality Improvement Plan (described in Provision B.3.b.(4)). Such an approach is consistent with the latest findings in hydromodification management by the scientific community. In the Southern California Coastal Water Research Project (SCCWRP) Technical Report No. 667, authors state: <i>“An effective [hydromodification] management program will likely include combinations of on-site measures (e.g., low-impact development techniques, flow-control basins), in-stream measures (e.g., stream habitat restoration), floodplain and riparian zone actions, and off-site measures. Off-site measures may include compensatory mitigation measures at upstream locations that are designed to help restore and manage flow and sediment yield in the watershed.”</i></p> <p>Consistent with the ideas brought forth by the SCCWRP report, in the Watershed Management Area Analysis of Provision B.3.b.(4), which is optional, the Copermittees will develop watershed maps that include as much detail</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

<b>E3c-2 PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements</b>
<p>about factors that affect the hydrology of the watersheds as is available. Such factors included identification of areas suitable for infiltration, coarse sediment supply areas, and locating stream channel structures and constrictions. Once these factors are mapped and studied, the Copermittees can identify areas in the watersheds where “candidate projects” may be implemented that are expected to improve water quality in the watershed by providing more opportunity for infiltration, slowing down storm water flows, or attenuation of pollutants naturally via healthy stream habitat. These projects may be in the form of retrofitting existing development, rehabilitating degraded stream segments, identifying regional BMPs, purchasing land to preserve valuable floodplain functions, and any other projects that the Copermittees identify.</p> <p>Under the alternative compliance program, Priority Development Projects may be allowed to fund, partially fund, or implement a candidate project, in lieu of implementing structural BMPs onsite, if they enter into a voluntary agreement with the Copermittee permitting this arrangement. If compliance involves funding or implementing a project that is outside the jurisdiction of the Copermittee, then that Copermittee may enter into an inter-agency agreement with the appropriate jurisdiction(s).</p> <p>In response to several comments, the Tentative Order has been revised to include an exemption from hydromodification management BMP requirements for Priority Development Projects that discharge to conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean. Provision B.2.b.(4) provides an optional Watershed Management Area Analysis that may allow the Copermittees to identify additional areas within the watershed where it is appropriate to exempt Priority Development Projects from implementing hydromodification management BMPs. Exemptions other than the ones specified in the Tentative Order, then, would be applicable on a watershed basis, and would require supporting rationale.</p> <p>In summary, the Tentative Order includes requirements for site-specific structural BMP requirements and exemptions. In order for them to be realized, the Copermittees must perform up-front analysis to support both the alternative compliance program and watershed-specific hydromodification management BMP exemptions. The San Diego Water Board believes that this approach will allow for meaningful improvement to water quality in the watersheds, as well as the efficient use of resources for innovative projects, as opposed to requiring structural BMPs to be fully implemented on all sites.</p>

March 27, 2013

E3c-3 PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements	
<p><b>COMMENT:</b> Request for modifications to Priority Development Project structural BMP infiltration and groundwater protection pre-treatment requirements.</p> <p>The San Diego County Copermittees and the City of National City commented that pre-treatment for infiltration BMPs on areas of industrial or light industrial activity should only be required if significant pollutant levels are present or if source control BMPs will not provide pre-treatment. Contech Engineer Solutions expressed concern that without clear and specific pre-treatment standards for infiltration BMPs, the Copermittees will accept pre-treatment systems that will require significant maintenance to ensure proper operation. Contech Engineer Solutions recommended very specific design standards for pre-treatment systems.</p>	<p><b>Copermittees</b>                      City of National City                      San Diego County Copermittees</p> <p><b>Engineering/Design Consultants</b>                      Contech Engineered Solutions</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the Copermittees comments. The San Diego Water Board conceptually agrees with Contech Engineered Solutions, but disagrees that including such specific design standards are necessary.</p> <p>The San Diego Water Board has revised Provision E.3.c.(5)(a)(vi) to allow infiltration BMPs on industrial or light industrial areas if source control BMPs will not expose groundwater to activities that are a high threat.</p> <p>The San Diego Water Board did not revise Provision E.3.c.(5)(a)(i). The Copermittees are required to inspect BMPs at Priority Development Projects to confirm they continue to operate as designed. If structural BMPs on Priority Development Projects are not properly maintained, the Copermittees must enforce its ordinances to achieve compliance with its ordinances and the requirements of the Tentative Order.</p>

March 27, 2013

E3c-4	<b>PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements</b>	
	<p><b>COMMENT:</b> <i>General concerns associated with the development planning structural BMP performance requirements.</i></p> <p>Comments from members of the Building Industry, Community Planning Groups, the Copermittees, Environmental Organizations, State Government, Societies/Associations/Coalitions, and Other Entities expressed various concerns about the development planning structural BMP performance requirements for Priority Development Projects.</p> <p>Several commenters expressed concerns with the potential costs associated with enforcing and implementing the changing requirements for development projects, or the uncertainty of the impacts of those new requirements. The South Laguna Civic Association expressed concern that the current development planning requirements are already resulting in the degradation and destruction of creeks, wetlands, and coastal habitats. David Akers, P.E., expressed concern with current practices and supports requirements that will result in sustainable development. The City of Chula Vista questioned what should be done water collected in rain barrels and other retention facilities if there is a lack of demand during the rainy season.</p>	<p><b>Building Industry / Industry</b> Associated General Contractors of America</p> <p><b>Community Planning Groups</b> Julian Community Planning Group Ramona Community Planning Group</p> <p><b>Copermittees</b> City of Chula Vista County of San Diego Orange County Copermittees</p> <p><b>Environmental Organizations</b> Clean Water Now South Laguna Civic Association</p> <p><b>Engineering/Design Consultants</b> David J. Akers, P.E.</p> <p><b>State/Federal Government</b> Senator Mark Wyland</p> <p><b>Societies/Associations/Coalitions</b> San Diego Association of Realtors South County Economic Development Council</p> <p><b>Other Entities</b> Carol Crossman Continental Maritime of San Diego Nuffer, Smith, and Tucker Sheppard, Mullin, Richter &amp; Hampton LLP Southern Cross Property Consultants</p>
	<p><b>RESPONSE:</b> The San Diego Water Board understands the concerns that have been expressed by the commenters.</p> <p>Most of the requirements in the Tentative Order are not new to the San Diego Region. The Tentative Order incorporates many existing requirements from the MS4 permits in Orange and Riverside Counties. However, the Tentative Order also provides the Copermittees with more flexibility to use their limited resources in the most effective and efficient manner to protect the quality of the San Diego Region's receiving waters.</p> <p>The commenters generally are concerned with the costs of implementing the development planning structural BMP performance requirements, but do not consider the costs of not addressing impacts that have been caused by existing development, and may be caused by future development. The San Diego Water Board has significantly modified the structure and focus of the requirements in the Tentative Order to allow the</p>

E3c-4	<b>PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements</b>
	<p>Copermittees to more efficiently and cost effectively utilize their resources, which is expected to result in the realization of significant cost savings that could not be realized in the existing MS4 permits.</p> <p>The development planning structural BMP performance requirements have also evolved significantly since 2001 because of the degradation and destruction of creeks, wetlands, and coastal habitats that have been observed as developed areas have expanded. Thus, the Tentative Order not only includes development planning requirements to protect against impacts to receiving waters that may be caused by future development, but also includes requirements that begin to address impacts that are being caused by existing development. The Tentative Order will allow the Copermittees to address existing development and new develop with a watershed-scale approach that is expected to lead to more sustainable configurations of the watersheds in the San Diego Region over the long term.</p> <p>The question posed regarding the use of retained storm water if there is a lack of demand is not new. The municipalities and several agencies in the San Diego Region have also posed questions about what can be done to address the sustainable water supply concerns that are being expressed as the population grows and demand for water increases. There may be ways to potentially link the two issues to create solutions to address the problems. The Tentative Order was developed to provide the flexibility that will allow the Copermittees to work with other agencies to perhaps identify solutions with mutual benefits.</p>

March 27, 2013

E3c1-1 PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements	
<p><b>COMMENT:</b> <i>Objections with storm water pollutant control retention BMP performance requirements for Priority Development Projects.</i></p> <p>The San Diego County, Orange County, and Riverside County Copermittees and Engineering/Design Consultants contend that the storm water pollutant control retention requirement is infeasible for many Priority Development Projects due to poor soil types and other factors. The Industrial Environmental Association asserts that the Tentative Order does not provide sufficient detail for consistency among Copermittees in evaluating conditions for technical infeasibility. The Copermittees have requested that the term “runoff” be included in the description of “design capture volume.”</p> <p>Other commenters stated that the retention standard will result in runoff “starved” receiving waters. Commenters also stated that the requirement to increase bioretention by 25 percent is arbitrary and without basis.</p> <p>Conversely, Natural Resources Defense Council argues that retention of the 85<sup>th</sup> percentile storm event is an appropriate performance standard and should be required at all sites, regardless of the specific site conditions. David Aker, P.E., also supports the requirement to retain storm water and contends that it is essential for sustainable development.</p>	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition                      Building Industry Association of Southern California, Inc.                      Industrial Environmental Association                      Otay Land Company                      Otay Ranch New Homes                      San Diego Green Building Council</p> <p><b>Copermittees</b>                      City of Chula Vista                      City of Vista                      County of San Diego                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees                      San Diego Unified Port District</p> <p><b>Environmental Organizations</b>                      Natural Resources Defense Council</p> <p><b>Engineering/Design Consultants</b>                      Contech Engineered Solutions                      David J. Akers, P.E.</p> <p><b>State/Federal Government</b>                      USEPA</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the Copermittees that the retention standard, as written in the Tentative Order, is inappropriate.</p> <p>The San Diego Water Board has recognized that the retention of the 85<sup>th</sup> percentile storm event is MEP, and already incorporated the performance standard in both the Orange County and Riverside County MS4 permits. Other MS4 permits in southern California (e.g., Ventura County, Los Angeles County) incorporate similar performance standards, and it is supported by USEPA.</p> <p>Commenters should note that under the Alternative Compliance Program described in Provision E.3.c.(3), Priority Development Projects will have the option to perform mitigation offsite <i>“if the Copermittee determines that the offsite project will have a greater overall water quality benefit for the Watershed Management Area than implementing BMPs onsite.”</i> Theoretically, a Priority Development Project could make the case that retention of the design capture storm is not feasible, or that doing so would result in an unnatural water balance, therefore</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3c1-1 PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements</b>
<p>offsite compliance is preferred. This option is only available to the Priority Development Project if the Copermittee elects to offer it. The San Diego Water Board disagrees that the Tentative Order should provide detail on what constitutes infeasibility because the Copermittees have the experience to make these determinations, and are free to develop consistency standards if the need arises.</p> <p>Language regarding the application of a site specific retention standard was removed because several commenters argued, and the San Diego Water Board agreed, that the analyses could be subjective and introduce uncertainty for the Copermittees in terms of determining compliance. Moreover, comparing the volume of runoff produced from an undeveloped site to that of a Priority Development Project would not be comparing equivalent pollutant levels, because the pollutants expected to be generated from a Priority Development Project would not have been present in runoff from undeveloped land. For simplicity, the language pertaining to site specific retention standards was removed. The word "runoff" was added to the description of "design capture volume" per the Copermittees' requests.</p> <p>Similarly, the language pertaining to biofiltration LID BMPs was removed because the Alternative Compliance Program was restructured to better coincide with the Copermittee's planning efforts in the Water Quality Improvement Plan.</p>

<b>E3c2-1 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>	
<p><b>COMMENT:</b> <i>Allow San Diego Copermittees to continue implementation of current San Diego Hydromodification Management Plan, as approved under Resolution No. R9-2010-0066.</i></p> <p>The San Diego County Copermittees and several other commenters have requested that the <i>Hydromodification Management Plan for San Diego County</i> (HMP), which was approved by the San Diego Water Board in 2010 under Resolution No. R9-2010-0066, be memorialized in the Tentative Order as the standard for hydromodification management.</p>	<p><b>Building Industry / Industry</b>                      Building Industry Association of Southern California, Inc.                      Otay Land Company                      Otay Ranch New Homes</p> <p><b>Community Planning Groups</b>                      Jamul Dulzura Community Planning Group                      Pala Pauma Valley Community Sponsor Group</p> <p><b>Copermittees</b>                      City of Chula Vista                      City of Del Mar                      City of Poway                      City of San Diego                      County of San Diego                      County of San Diego Office of County Counsel                      San Diego County Copermittees</p> <p><b>Societies/Associations/Coalitions</b>                      East Otay Mesa Property Owners Association                      Otay Mesa Property Owners Association</p> <p><b>Other Entities</b>                      National Enterprises Inc.</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with commenters that it is appropriate to reference the San Diego County HMP in the Tentative Order.</p> <p>The San Diego HMP does not include standards that are currently included in the Fourth Term MS4 permits for Orange and Riverside Counties. However, commenters should note that the requirements in the Tentative Order allow the San Diego Copermittees to use the information and analysis that was used to develop the San Diego HMP. In addition, the San Diego HMP will remain in effect until the Water Quality Improvement Plans are accepted by the San Diego Water Board.</p> <p>The San Diego Water Board is aware that the San Diego County Copermittees spent over \$1 million to develop the HMP. This investment is not lost because the Tentative Order allows the Copermittees to build upon the</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

E3c2-1	<b>PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>	
	<p>findings in the HMP; thus, the information developed is not irrelevant. For example, the San Diego HMP used an analysis to determine the range of flows for which Priority Development Projects must implement hydromodification management BMPs. This analysis includes evaluation of site specific conditions, including the level of susceptibility of the downstream receiving water to erosion. Further, the analysis includes a mechanism for Priority Development Projects to determine appropriately sized BMPs, depending on the condition of the downstream receiving water. This analysis is the crux of the San Diego HMP, and the Tentative Order allows its continued use.</p> <p>There are two important changes in the Tentative Order from Order No. R9-2007-0001 that the San Diego County HMP must make adjustments for. Firstly, the Tentative Order includes a requirement that Priority Development Projects use the “predevelopment” condition for evaluating the baseline hydrology for a specific site. The San Diego HMP, as written, can still be used because this requirement only affects the input variables used in the analysis. The San Diego Water Board is requiring the use of the pre-development condition for the reasons discussed in the Response to Comment E3c2-2.</p> <p>Secondly, in response to several comments, the Tentative Order has been revised to include an exemption from hydromodification management requirements for Priority Development Projects that discharge to conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean. Additional exemptions may be allowed on a watershed-basis only if the Copermittees perform a watershed-specific analysis, as part of the Water Quality Improvement Plan that justifies inclusion of exemptions. Much of this work has already been done by the San Diego County Copermittees in the HMP, as the HMP contains many exemptions above and beyond those described in Order No. R9-2007-0001. Again, the investment made in the HMP is not lost; the Copermittees must develop the Watershed Management Area Analysis described in Provision B.3.b.(4) of the Tentative Order and include the exemptions and rationale therein.</p> <p>Finally, the San Diego County Copermittees were notified before completion of the HMP that requirements pertaining to hydromodification management would likely change. As part of the development of the HMP, the Copermittees submitted a first draft on May 1, 2009. In a comment letter dated June 29, 2009, the San Diego Water Board stated that: <i>“Although the Permit (R9-2007-0001) does not specifically interpret “pre-project” conditions to reference pre-development (naturally occurring) conditions, the Copermittees are not restricted from implementing this more conservative standard. Tentative Order No. R9-2009-0002 (the draft Orange County Municipal Permit) dated June 18, 2009 contains this more restrictive language. The San Diego</i></p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>E3c2-1 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>
<p data-bbox="212 266 1478 375"><i>Copermittees should be aware that the next iteration of the Permit may contain similar language. Additionally, the exceptions for hydromodification management measures included in the Permit (provision D.1.g.(3) for discharges into hardened channels will also likely be eliminated.”</i></p> <p data-bbox="212 412 1493 552">Although this quote referred to text in the draft Orange County MS4 Permit, the requirements for using the pre-development baseline hydrology for hydromodification management were eventually included in the final versions of the MS4 permits for both Orange and Riverside Counties. Therefore the San Diego County Copermittees were well aware of the evolving requirements before their HMP was finalized.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3c2-2 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>		
<b>E3c2-2</b>	<p><b>COMMENT:</b> <i>Objections with requiring pre-development versus pre-project hydrology for hydromodification management BMP performance standards.</i></p> <p>Comments submitted by Copermittees, Building Industry, Community Planning Groups, Engineering/Design Consultants, Societies/Associations/Coalitions, and Other Entities objected to the use of pre-development hydrology as a baseline for hydrograph matching (and therefore, BMP design) in the case of redevelopment projects, and that the pre-project design standard is the appropriate standard. Commenters argue that including the pre-development standard would be tantamount to requiring a Priority Development Project to mitigate beyond its impacts.</p>	<p><b>Building Industry / Industry</b> San Diego Green Building Council</p> <p><b>Community Planning Groups</b> Julian Community Planning Group Pala Pauma Valley Community Sponsor Group</p> <p><b>Copermittees</b> City of National City City of Poway City of San Diego City of San Diego City Attorney County of San Diego County of San Diego Office of County Counsel Orange County Copermittees Riverside County Copermittees San Diego County Copermittees San Diego Unified Port District</p> <p><b>Engineering/Design Consultants</b> Project Design Consultants</p> <p><b>Societies/Associations/Coalitions</b> East Otay Mesa Property Owners Association Otay Mesa Property Owners Association</p> <p><b>Other Entities</b> National Enterprises Inc.</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the commenters that pre-project hydrology should be used as the baseline hydrology for redevelopment projects.</p> <p>The “pre-development” language in the Tentative Order has not been removed, but the qualifier “naturally occurring” has been removed from the text because some commenters stated that it caused confusion rather than providing clarity. The definition for “pre-development runoff condition” has been revised in Attachment C and discussion pertaining to this definition and how the San Diego Water Board expects Copermittees to interpret this phrase has been added to the Fact Sheet.</p> <p>Fundamentally, the San Diego Water Board believes that using a hydrology baseline that approximates that of an undeveloped, natural watershed is the only way to facilitate the return of more natural hydrological conditions</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

### E3c2-2 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements

to already built-out watersheds. Using the pre-project hydrology as a baseline for redevelopment projects results in propagating the unnatural hydrology of urbanized areas, which is largely made up of impervious surfaces. Flows from impervious surfaces are highly erosive and consequently have detrimental effects on receiving waters in the San Diego Region. Furthermore, propagating the urbanized flow regime does not support conditions for restoring degraded or channelized stream segments, and would forever sentence such streams to the degraded state. Rehabilitating or restoring degraded stream segments is a critical component of the Tentative Order and is expected to be incorporated into Copermittee's strategies for improving water quality in the watersheds. Finally, the predevelopment standard is not requiring Priority Development Projects to mitigate beyond its impacts because the project would be perpetuating impacts that originated upon initial land alteration (i.e., the project would continue to cause accelerated erosion).

Commenters have stated that it is impracticable to require hydromodification management BMPs to mimic the "pre-Columbian" hydrology because it would be impossible to know the historical conditions with any certainty. However, estimating the conditions of historical conditions is not the intent of this requirement. Rather, using the characteristics of a more natural hydrological condition than that of an urbanized setting is the intent.

In terms of using a pre-development condition for the baseline hydrology, a Priority Development Project has a number of options for estimating this condition when it is not known. For example, a Priority Development Project may consult soil maps, such as those published by the National Resources Conservation Service (NRCS). These readily available maps show the soil types in a given area, regardless of whether or not the land has been developed. This information, along with information regarding existing grade, constitute sufficient data needed to approximate the pre-development condition and intent of the Tentative Order.

Another option is for Priority Development Projects to use characteristics of a nearby open space area as an equivalent baseline. Or, a Priority Development Project may be able to research the geotechnical report associated with a structure upon its development. In any case, the San Diego Water Board asserts that the pre-development hydrology of the area in question can be roughly estimated. However, using the hydrology of a more natural condition, even if not precisely known, will provide significant benefit to receiving waters over using the hydrology associated with pervious (developed) surfaces. Therefore in order to support the basic objectives of the Clean Water Act, which are to restore and maintain the chemical, physical, and biological integrity of the nation's waters [emphasis added], the most appropriate standard to use for hydromodification management is the standard associated with the pre-development runoff condition.

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E3c2-3 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements	
<p><b>COMMENT:</b> <i>Include exemptions from the implementation of hydromodification management BMPs where there is no threat of erosion to downstream receiving waters or there are special circumstances.</i></p> <p>The Copermittees, Building Industry, Engineering/Design Consultants, and others have commented that the Tentative Order should restore exemptions for the implementation of hydromodification management BMPs where there is no threat of erosion to downstream receiving waters, such as concrete-lined or otherwise hardened channels. Commenters also argue that exemptions should be allowed for emergency projects or flood control projects.</p>	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition                      Building Industry Association of Southern California</p> <p><b>Copermittees</b>                      City of Chula Vista                      City of Dana Point                      City of Del Mar                      City of Imperial Beach                      City of Laguna Hills                      City of Lake Forest                      City of Mission Viejo                      City of Rancho Santa Margarita                      City of San Juan Capistrano                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees                      San Diego Unified Port District</p> <p><b>Engineering/Design Consultants</b>                      Contech Engineered Solutions                      Project Design Consultants</p> <p><b>Societies/Associations/Coalitions</b>                      East Otay Mesa Property Owners Association                      Otay Mesa Property Owners Association                      South County Economic Development Council</p> <p><b>Other Entities</b>                      National Enterprises Inc.</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees conceptually that blanket exemptions from hydromodification management BMP requirements should be granted to all redevelopment projects that discharge to hardened channels.</p> <p>Although the San Diego Water Board has not been advocating for the implementation of expensive BMPs to protect stream reaches that are not susceptible to erosion, the idea was to use the resources obtained from these low-threat Priority Development Projects on separate projects located elsewhere in the watershed, where protection from hydromodification is critical. In the most recent findings regarding hydromodification management, found in Southern California Coastal Water Research Project (SCCWRP) Technical Report No. 667, authors state: <i>“The exemption of many small projects from hydromodification controls can result in cumulative impacts to downstream waterbodies...”</i></p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

### E3c2-3 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements

SCCWRP Technical Report No. 667 further states that: “An effective management program will likely include combinations of on-site measures (e.g., low-impact development techniques, flow-control basins), in-stream measures (e.g., stream habitat restoration), floodplain and riparian zone actions, and off-site measures. Off-site measures may include compensatory mitigation measures at upstream locations that are designed to help restore and manage flow and sediment yield in the watershed [Emphasis added].”

The Tentative Order released on October 31, 2012 was written to incorporate these important watershed-based concepts. Nevertheless, several commenters voiced concern over the elimination of exemptions to hardened channels and other non-susceptible receiving waters. After careful consideration, the San Diego Water Board revised the Tentative Order to accommodate the re-introduction of exemptions. Provision E.3.c.(2) has been revised to include an exemption from hydromodification management requirements for Priority Development Projects that discharge to conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean. Additional exemptions may be allowed; however, they would occur on a watershed-specific basis, and must be defined and defended by the Copermittees.

Under the newly created Provision B.3.b.(4), the Copermittees have been provided the option to perform a Watershed Management Area Analysis for the purpose of 1) characterizing the watersheds, 2) identifying alternative compliance projects that Priority Development Projects may use in lieu of implementing structural BMPs onsite, and 3) identifying areas within the watershed where it is appropriate to exempt Priority Development Projects from implementing hydromodification management BMPs. Exemptions, then, would be applicable on a watershed-specific basis, and would require supporting rationale.

One reason why the San Diego Water Board has reservations regarding the idea of blanket exemptions is that allowing them without some sort of analysis is short-sighted. SCCWRP Technical Report 667 discusses the importance of watershed-based planning. The report states: “There is usually also an exemption for projects discharging to hardened channels or waterbodies; however these exemptions may not be supportive of future stream restoration possibilities...”

Although the San Diego Water Board understands that hardened channels may sometimes provide essential flood control, there are situations where stream rehabilitation can take place, and concrete segments can be removed. For this reason, if the Copermittees choose to perform the Watershed Management Area Analysis,

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3c2-3 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>
<p>they may be able to differentiate between hardened stream segments where the concrete will likely never be removed, and other stream segments where there is a possibility for future rehabilitation. Nevertheless, an exemption for concrete-lined channels has been added to the Tentative Order.</p> <p>Finally, the Copermittees commented that there should be exemptions allowed for emergency projects or flood control projects. The San Diego Water Board disagrees with the Copermittees in either case. Provision E.3 describes requirements that pertain to development planning. Emergency situations, by definition, are not planning exercises and therefore do not involve the design, approval, and construction of a building or structure. The San Diego Water Board believes that it may be appropriate to relax the structural BMP standards for, or altogether exempt flood control projects, but not before projects are evaluated on a case-by-case basis. In many instances, environmentally friendly practices may be appropriate for implementation in flood control projects, but a variety of options would not be evaluated by the project proponent if the Tentative Order allowed a blanket exemption.</p>

March 27, 2013

<b>E3c2-4 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>		
	<p><b>COMMENT:</b> <i>Objections with requirements to compensate for sediment supply.</i></p> <p>The Copermittees, Building Industry, and Engineering/Design Consultants have commented that management of sediment supply is a complicated and challenging issue, and more direction regarding the Tentative Order’s intent should be provided. Commenters have also stated that it is inappropriate to require analysis of sediment supply on a site-by-site basis, and that it is better addressed at the regional level.</p>	<p><b>Building Industry / Industry</b>                      BIA Regulated Community Coalition</p> <p><b>Copermittees</b>                      City of Chula Vista                      County of San Diego                      San Diego County Copermittees</p> <p><b>Engineering/Design Consultants</b>                      Contech Engineered Solutions                      Project Design Consultants</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the commenters that addressing the sediment supply issue when a Priority Development Project is under review is complicated and challenging. The intent of the Tentative Order is to protect the coarse sediment supply and ensure that Priority Development Projects will not impact the supply. Therefore, language pertaining to “compensating for” sediment supply has been removed.</p> <p>Instead, where a Copermittee is aware of areas where coarse sediment is naturally discharged to downstream receiving waters, then the San Diego Water Board expects the Copermittee to ensure the protection of this natural process by conditioning the Priority Development Project to either avoid the area, or implement measures that would allow the natural hydrologic process to continue.</p> <p>Please see Provision E.3.c.(2)(b) in the revised Tentative Order for the revisions.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E3c2-5 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements		
	<p><b>COMMENT:</b> <i>Monitoring and assessment program requirements will not provide information necessary to re-define the range of flows causing erosion.</i></p> <p>The City of Chula Vista commented that water quality monitoring as described in Provision D of the Tentative Order will not provide the necessary information to re-define the range of flows thought to cause erosion to receiving waters.</p>	<p><b>Copermittees</b> City of Chula Vista</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the monitoring and assessment program requirements cannot provide information necessary to re-evaluate or re-define the range of flows causing erosion.</p> <p>The water quality monitoring described in Provision D.1.a.(2) represents the minimum level of monitoring needed to comply with the Tentative Order. If the Copermittees elect to re-evaluate the range of flows that are thought to cause erosion to downstream receiving waters, as defined in the San Diego County HMP, then they may design a monitoring program that will provide the necessary information to do so.</p>

March 27, 2013

E3c2-6	<b>PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>	
	<p><b>COMMENT:</b> <i>The low-flow thresholds included in the San Diego County HMP need to be revised.</i></p> <p>Project Design Consultants submitted comments suggesting that the schedule for development of the San Diego County HMP was extremely rushed, and technical expertise was ignored. The HMP should be revised and included in the Tentative Order.</p>	<p><b>Engineering/Design Consultants</b> Project Design Consultants</p>
	<p><b>RESPONSE:</b> The San Diego Water Board does not object to revising the low-flow thresholds included in the San Diego County HMP, provided that revisions are based on data acquired by the Copermittees. However, the process for updating this design standard in the HMP will occur on an ad-hoc basis and need not be referenced in the Tentative Order.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E3c2-7 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements		
	<p><b>COMMENT:</b> <i>The hydromodification management BMP performance standards should allow the use of the erosion potential (Ep) method and in-stream metrics for compliance.</i></p> <p>The Building Industry Association of Southern California requests that the performance standards for hydromodification management allow the use of the Ep method. Requiring project-by-project flow duration control may not be as effective as a regionally-coordinated approach that combines upland control with in-stream remedies.</p>	<p><b>Building Industry / Industry</b> Building Industry Association of Southern California</p>
	<p><b>RESPONSE:</b> The San Diego Water Board considered the request and found that changes are not necessary.</p> <p>Although the language in Provision E.3.c.(2) does not specifically reference the concept of erosion potential, the Copermittees are not prohibited from using such an approach. Provision E.3.c.(2)(a) requires the Copermittees to require implementation of BMPs to ensure that post-project runoff flow rates and durations do not exceed pre-development runoff flow rates and durations by more than 10 percent (for the range of flows that are deemed to cause erosion).</p> <p>However, Provision E.3.c.(2)(c) allows a Priority Development Project to utilize the alternative compliance program in lieu of complying with the requirement to implement structural BMPs onsite. Priority Development Projects are allowed to comply with the hydromodification management requirements by funding, partially funding, or implementing an offsite project, such as stream rehabilitation (which can include stream stabilization). The San Diego Water Board agrees that a regionally-coordinated approach that includes in-stream remedies is more effective than requiring flow duration control BMPs on every Priority Development Project, and for this reason has written the Tentative Order to allow these metrics. However, ultimately, administration of the Alternative Compliance Program is at the discretion of the Copermittees. If the Copermittees find that administering the Alternative Compliance Program is too difficult, costly, or is not in a Copermittee's best interest, than they are not obligated to do so.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3c2-8 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>	
<p><b>COMMENT:</b> <i>There is insufficient data to suggest a need to change the hydromodification management requirements.</i></p> <p>The City of Mission Viejo, Orange County and San Diego County Copermittees have commented that there is no need to include new requirements for hydromodification management, as no new data has emerged suggesting a need for change and the Copermittees have only begun to implement their current HMPs.</p>	<p><b>Copermittees</b>                      City of Mission Viejo                      Orange County Copermittees                      San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that there have been any fundamental changes to the hydromodification management requirements from those included in the Fourth Term storm water permits. The basic premise, which is requiring hydromodification management for erosive flows as defined by the Copermittees, has not changed. The San Diego County Copermittees spent considerable funds and effort to define the range of flows that cause erosive effects, and the Tentative Order does not trump those efforts.</p> <p>The San Diego Water Board disagrees with the notion that no new data has emerged regarding hydromodification management. Several commenters have referenced Southern California Coastal Water Research Project's latest findings in <i>Hydromodification Assessment and Management in California</i> (Technical Report 667). SCCWRP Technical Report 667 clearly states that: <i>"An effective management program will likely include combinations of on-site measures...in-stream measures...and offsite measures...."</i></p> <p>Further, SCCWRP Technical Report 667 states that: <i>"The exemption of many small projects from hydromodification controls can result in cumulative impacts to downstream waterbodies."</i></p> <p>The requirements in the Tentative Order are consistent with the findings in this report and MS4 permits in Orange and Riverside Counties. The San Diego Water Board agrees with the underlying premise advocated in this report, which is that effective hydromodification programs begin with watershed-scale analysis and planning.</p> <p>Although the Copermittees have just recently begun implanting their HMPs, the changes needed to incorporate the requirements of the Tentative Order will not undermine the mechanics of the HMPs and therefore will not require substantial revisions. The incorporation of the pre-development baseline standards and inclusion of only qualified exemptions, resulting from thorough watershed analyses, is essential for protecting receiving streams from erosion caused by altered flow regimes.</p>

March 27, 2013

<b>E3c3-1 PROVISION E.3.c.(3): Alternative Compliance to Onsite Structural BMP Performance Requirements</b>		
	<p><b>COMMENT:</b> <i>Objections to the onsite LID biofiltration treatment control BMP performance standards.</i></p> <p>The San Diego County, Orange County, and Riverside County Copermittees and Engineering/Design Consultants have commented that there is no need to include a 1.5 times multiplier on biofiltration LID BMPs, and that doing so is technically unjustified.</p>	<p><b>Building Industry / Industry</b>                      Building Industry Association of Southern California</p> <p><b>Copermittees</b>                      City of Vista                      Orange County Copermittees                      Riverside County Copermittees</p> <p><b>Engineering/Design Consultants</b>                      Contech Engineered Solutions                      Project Design Consultants</p>
	<p><b>RESPONSE:</b> Provision E.3.c.(3) describing the Alternative Compliance Program has been substantially revised so that it coincides better with the watershed planning efforts of the Copermittees in the Water Quality Improvement Plans. As a result, the requirements related to LID biofiltration BMPs has been removed.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E3c3-2 PROVISION E.3.c.(3): Alternative Compliance to Onsite Structural BMP Performance Requirements</b>		
<b>E3c3-2</b>	<p><b>COMMENT:</b> <i>Modify requirements and process to implement alternative compliance options.</i></p> <p>The San Diego County, Orange County, and Riverside County Copermittees, Engineering/Design Consultants, and Environmental Organizations have expressed concern with the process associated with the Alternative Compliance Program to Onsite Structural BMP Implementation. The Copermittees assert that this program should be administered by the San Diego Water Board, that more time than 4 years should be granted for alternative compliance project completion, and that the administrative costs would be prohibitive. The Environmental Organizations suggest that language be added to the Tentative Order to clearly indicate that the Copermittees are responsible for ensuring that alternative compliance projects are completed within the 4 year timeframe, and also expressed concerns as to whether the alternative compliance project would provide equal water quality benefits as implementing structural BMPs onsite. Engineering/Design Consultants submitted recommendations regarding how administration of the Alternative Compliance Program would work.</p>	<p><b>Building Industry / Industry</b>                      American Society of Landscape Architects                      BIA Regulated Community Coalition                      Building Industry Association of Southern California                      San Diego Green Building Council</p> <p><b>Copermittees</b>                      City of Imperial Beach                      County of San Diego                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Environmental Groups                      Natural Resources Defense Council</p> <p><b>Engineering/Design Consultants</b>                      Project Design Consultants</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the Copermittees that the Alternative Compliance Program should be administered by the San Diego Water Board and not by the Copermittees. The Alternative Compliance Program is provided as an option to the Copermittees. The Copermittees are not required to implement the Alternative Compliance Program. If, however, the Copermittees do implement the Alternative Compliance Program, it is expected to coincide with the Copermittees' watershed planning efforts and assist the Copermittees in reaching their goals of reducing pollutants in storm water runoff leaving their MS4s. This is because the alternative compliance projects consist of projects such as retrofitting existing development, where pollutant treatment can be an added benefit where no treatment currently exists; or stream rehabilitation, where natural attenuation of pollutants can occur as an ancillary benefit to improved stream habitat. Other example projects are regional BMPs that receive runoff from multiple areas, or the preservation or purchase of critical floodplain land.</p> <p>The Tentative Order establishes requirements for the Copermittees and not the San Diego Water Board. Therefore, it would inappropriate for the San Diego Water Board administer this program, but could assist in its implementation by streamlining permits for stream rehabilitation and restoration... The San Diego Water Board understands that the initial costs for administering this program could be significant; however, there are fiscal benefits in that Priority Development Projects could provide the funding for projects that are expected to improve water quality, thereby negating the need for Copermittees to expend their resources on BMPs to accomplish the</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>E3c3-2 PROVISION E.3.c.(3): Alternative Compliance to Onsite Structural BMP Performance Requirements</b>
<p>same thing. Finally, the Copermitees are not required to administer this program and can elect to administer BMPs strictly onsite. Provision E.3.c.(3) has been substantially revised for simplicity and to better coincide with the Copermitees' planning efforts, and all references to LEED certification have been removed.</p> <p>The San Diego Water Board further disagrees that more than 4 years should be granted for alternative compliance project completion. First of all, pollutants from the Priority Development Project are being discharged without treatment and there is not necessarily any equivalent treatment until the alternative compliance project is constructed (although temporal mitigation is required when there is a lag between the two projects). Second of all, the Tentative Order explicitly allows more time for projects where the Executive Officer approves additional time.</p> <p>The San Diego Water Board disagrees with the recommendation that the Tentative Order specify that the Copermitees are responsible for ensuring that the alternative compliance projects are completed within the 4 year time frame. The Tentative Order is issued to the San Diego County, Orange County, and Riverside County Copermitees; therefore all of these entities are responsible for complying with the requirements, and further discussion would be redundant.</p> <p>Finally, the San Diego Water Board agrees that the alternative compliance program presents some uncertainty regarding "greater water quality benefit" expected to come from these projects versus implementation of structural BMPs onsite. If the Copermitees elect to implement an Alternative Compliance Program, they are required to develop a list of potential candidate projects that can be implemented with the Watershed Management Area. The candidate projects will be included in the Water Quality Improvement Plans, which will be reviewed by the public and the San Diego Water Board before implementation takes place. The water quality benefits that can be achieved by implementing those candidate projects will likely be made evident during the public participation process in the development of the Water Quality Improvement Plans.</p>

March 27, 2013

<b>E3c3-3 PROVISION E.3.c.(3): Alternative Compliance to Onsite Structural BMP Performance Requirements</b>		
	<p><b>COMMENT:</b> <i>Request for modifications to the alternative compliance water quality credit system option.</i></p> <p>The Orange County Copermittees have requested that language pertaining to the water quality credit system be revised to remove the no-net impact limitations because certain projects may offer significant environmental benefits that are not necessarily related to water quality.</p> <p>The BIA Regulated Community Coalition recommended that any water quality credit system exercised by the Copermittees be included in the Water Quality Improvement Plans and be approved by the San Diego Water Board and not by its Executive Officer.</p>	<p><b>Building Industry / Industry Copermittees</b>                      BIA Regulated Community Coalition                      Orange County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the Orange County Copermittees that the no-net impact language should be removed from the Tentative Order. The optional credit system described in Provision E.3.c.(3)(d) is based on meeting the structural BMP performance standards as they pertain to protecting and improving water quality. A credit system that would allow other environmental benefits cannot necessarily ensure that water quality would be protected to the MEP standard, for which the performance standards are structured to achieve.</p> <p>The San Diego Water Board disagrees that a water quality credit system requires approval from San Diego Water Board instead of the Executive Officer because the provisions for such a credit system are clearly outlined in the Tentative Order. The Executive Officer will be able to determine whether or not the Copermittee has met the requirements as dictated in the Tentative Order. However, the public may request that any action taken by the Executive Officer be considered by the San Diego Water Board at any time.</p>

March 27, 2013

<b>E3c3-4 PROVISION E.3.c.(3): Alternative Compliance to Onsite Structural BMP Performance Requirements</b>		
	<p><b>COMMENT:</b> <i>Define a list of preferred or "best-in-class" BMPs and include specific guidance regarding evaluation of treatment systems in the Tentative Order.</i></p> <p>The San Diego Green Building Council commented that the Tentative Order should clearly define the best-in-class BMPs and require the creation of a system to catalogue the implementation strategies used by the various Copermittees, and that the database should include the measured water quality impacts from each site. Such information can be used as a resource for future projects and development.</p> <p>Contech Engineered Solutions recommended that the Tentative Order include specific guidance regarding evaluation of proprietary treatment systems, and that the Copermittees need to conduct a performance and feasibility assessment of such systems.</p>	<p><b>Building Industry / Industry</b>                  San Diego Green Building Council  <b>Engineering/Design Consultants</b>                  Contech Engineered Solutions</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with this comments because 1) the San Diego Water Board cannot dictate the manner of compliance with any requirements or regulation for any of the programs it administers, and 2) a "best-in-class" BMP cannot be concretely defined because the MEP standard is dynamic (see Appendix C for the definition of MEP). The Copermittees may choose to share information regarding BMP performance and evaluation of proprietary treatment systems via the Regional Clearinghouse or other mechanism. The Copermittees have the experience and expertise to define what are the appropriate BMPs.</p>

March 27, 2013

E3c3-5 PROVISION E.3.c.(3): Alternative Compliance to Onsite Structural BMP Performance Requirements		
	<p><b>COMMENT:</b> <i>Mitigation should not be required if flow-thru biofiltration LID BMPs are used.</i></p> <p>The Building Industry Association of Southern California submitted comments stating that the Tentative Order should not require mitigation for the portion of the design storm volume that is not retained onsite if this volume is treated by biofiltration LID BMPs prior to discharge. This requirement penalizes and dis-incentivizes the use of these BMPs.</p>	<p><b>Building Industry / Industry</b> Building Industry Association of Southern California</p>
	<p><b>RESPONSE:</b> The San Diego Water Board has included the requirement that mitigation is necessary for the portion of the design storm volume that is not retained onsite because, although this remaining volume of storm water would be treated, the MEP standard as represented by the structural BMP performance requirements would not have been met. The requirement for mitigation is not limited to the use of biofiltration BMPs; mitigation is required no matter what type of flow-thru treatment BMP is utilized by the Priority Development Project. Therefore the San Diego Water Board disagrees that this requirement is penalizing the Priority Development Project for the use of biofiltration LID BMPs, as suggested by the commenter.</p> <p>Retention of the 85<sup>th</sup> percentile storm is clearly the MEP standard for storm water pollutant control, as represented by the Tentative Order and recently adopted MS4 permits in the San Diego Region, other areas of southern California, and elsewhere in the United States. Retention of anything less than the design storm volume must be mitigated because the MEP standard has not been met.</p>

March 27, 2013

E4-1	PROVISION E.4: Construction Management
	discharges from entering the MS4. The San Diego Water Board supports the adaptive management approach in the Tentative Order and has structured the construction inspections to focus on those sites that represent a high priority to maintaining or protecting downstream surface water quality.

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E4-2 PROVISION E.4: Construction Management		
	<p><b>COMMENT:</b> <i>Requests for modifications to construction site inventory, tracking, recordkeeping requirements.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting changes to the construction management requirements that specific construction sites to be inventoried would include only those sites that involve any ground disturbance or soil disturbing activities, include a process for confirming adequate BMP implementation on inventoried sites, specify project 'completion' date not "anticipated completion" date; and 'weather condition during inspection' not 'approximate amount of rainfall since last inspection' on inspection forms, and require construction inventories to be updated quarterly not monthly.</p> <p>The Riverside County Copermittees provided recommended revisions to the construction requirements.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agreed with most of the changes requested by the commenters and modified Provision E.4 accordingly.</p> <p>However, the request to remove the requirement to include 'approximate amount of rainfall since last inspection' on the inspection forms, and the suggestion to include a process for confirming adequate construction BMP implementation for non-inventoried construction site were not incorporated into the revised Tentative Order. The San Diego Water Board is interested in site conditions after a significant rain event(s) therefore documenting the approximate amount of rainfall since the last inspection is required rather than the weather conditions during the inspection. A process for confirming adequate construction BMP implementation for non-inventoried sites can be developed and included in the jurisdictional program, but is not a requirement of the Tentative Order.</p> <p>The San Diego Water Board reviewed all of the recommended revisions provided by the Riverside County Copermittees. See Provision E.4 for those requested revisions that were incorporated into the Tentative Order.</p>

E5-1 PROVISION E.5: Existing Development Management		
	<p><b>COMMENT:</b> <i>Concerns with inspections by volunteers.</i></p> <p>The San Diego County Copermittees expressed concern with exposure to significant liability should a volunteer be injured in the course of an unauthorized inspection, or if private property is damaged during that inspection, or other unforeseen legal issues that result from volunteer groups conducting inspections of inventoried existing developments sites. Similar concerns were expressed by the Industrial Environmental Association and the San Diego Port Tenants Association.</p>	<p><b>Building Industry / Industry</b>            Industrial Environmental Association</p> <p><b>Copermittees</b>            San Diego County Copermittees</p> <p><b>Societies/Associations/Coalitions</b>            San Diego Port Tenants Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board understands the position presented by the commenters and agrees that changes to the language in Provision E.5.c are necessary.</p> <p>Provision E.5.c was modified to restrict the use of Copermittee-trained volunteer monitoring or patrol programs to visual inspections of those inventoried facilities or areas that are publicly accessible. Additionally, the San Diego Water Board incorporated the Industrial Environmental Association's suggested change to the language of Provision E.5.c.(2). The ability of the Copermittee to use volunteer monitoring or patrol programs was included in the Tentative Order to give the Copermittees additional resources to accomplish the inspection requirements of Provision E.5.c. The Copermittees retain sole discretion on using volunteer monitoring or patrol programs to augment their inspection programs. The Copermittees also retain sole discretion to stipulate conditions (insurance, training, etc.) for which a volunteer monitoring or patrol program must comply in order assist them with inspections.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E5-2 PROVISION E.5: Existing Development Management	
	<p><b>COMMENT:</b> <i>Requests for modifications to existing development inventory and tracking requirements.</i></p> <p>The San Diego County Copermittees and City of Santee each requested removal of 'mobile home parks' from the list of residential areas that should be included in its existing development inventory, citing the Mobile Home Park Act preempts a municipality's ability to regulate within the mobile home park. The Copermittees further requested modification to the language of Provision E.5.a to replace the phrase 'may discharge pollutants' with 'has the reasonable potential to discharge pollutants,' claiming that the term 'may' is too broad and limits the Copermittees' ability to focus on those sites in their inventories identified as jurisdictional and watershed priorities. A specific comment was submitted by the City of Chula Vista asking that the Tentative Order allow use of more than one data management system to track the required information.</p>
	<p><b>Copermittees</b>                      City of Chula Vista                      City of Santee                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board understands that a city does not have full access to regulate mobile home parks pursuant to the Mobile Home Park Act, but disagrees that the Copermittees do not have the legal authority to regulate discharges from and require BMPs at mobile home parks to their MS4s.</p> <p>The requirements of the Tentative Order are that each Copermittee maintain an inventory of its existing development that may discharge a pollutant load to and from the MS4. If a Copermittee has mobile home parks in its jurisdiction it must be included in its inventory so that the mobile home park gets considered in the Water Quality Improvement Plan priorities and strategies to address sources of pollutants. The comments included a description of what a city is allowed to regulate via its police powers, at mobile home parks. This list included access 'streets and roads' and parking. These are areas where potentially BMPs could be located if, through the Water Quality Improvement Plan process, it was determined that pollutants discharged from mobile home parks were a high priority water quality condition. Additionally, other scenarios could exist where discharges from mobile home parks are not considered a high priority, and inspections would occur much less often. Therefore, mobile home parks must remain within a Copermittee's existing development inventories, but can be dealt with according to the priorities, schedules and goals of the Water Quality Improvement Plan. Therefore, no change to the Tentative Order was made.</p> <p>The San Diego Water Board disagrees with the comment that the term 'may' should be replaced with 'reasonable potential.' The term 'may' is used to indicate possibility or probability that a pollutant load is discharged from an inventoried existing development facility or area. The term reasonable potential can imply the need to conduct a reasonable potential analysis, which is a far more involved process than a Copermittee making the determination that a facility possibly or probably discharges a pollutant load into its MS4. Nothing in</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

E5-2	PROVISION E.5: Existing Development Management	
	<p>the Tentative Order prevents a Copermittee from conducting a more robust analysis of the potential for pollutant loads to be discharged from its inventoried existing facilities or areas. Therefore, no change to the Tentative Order was made.</p> <p>The use of a GIS database to track inventoried facilities is only “highly recommended” in the Tentative Order, it is not explicitly required. Therefore a Copermittee can use one or more than one data management system to track the required information.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E5-3 PROVISION E.5: Existing Development Management</b>		
	<p><b>COMMENT:</b> <i>Requests for modifications to existing development BMP implementation and maintenance requirements.</i></p> <p>The Riverside County and San Diego County Copermittees submitted comments requesting a modification to the language of Provision E.5.b to specify each Copermittee only be required to designate a minimum set of BMPs for all inventoried existing development with the reasonable potential to discharge pollutant loads to their MS4. Commenters further suggest clarifying language for the required use of pollutant prevention methods (i.e. designated BMPs) in Provision E.5.b.</p> <p>A specific comment was made by the City of Chula Vista to removed 'freeways' from list of existing facilities the Copermittees are required to properly operate and maintain BMPs. The City of Chula Vista notes that freeways are under the jurisdiction of Caltrans, not a city.</p>	<p><b>Copermittees</b>                      City of Chula Vista                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the commenters request to modify the language of Provision E.5.b to specify each Copermittee only be required to designate a minimum set of BMPs for all inventoried existing development with the reasonable potential to discharge pollutant loads to their MS4.</p> <p>Provision E.5.b states that each Copermittee must designate a minimum set of BMPs required for all inventoried existing development, including special event venues. Any existing development that gets inventoried has been identified as a facility that may generate pollutant loads to and from the MS4 under Provision E.5.a. Therefore, if a facility is on the inventory, a Copermittee has already made the determination that the existing development possibly or probably generates a pollutant load. Therefore, no change to the Tentative Order was made.</p> <p>The San Diego Water Board agrees with the requests to clarify the language in Provisions E.5.b.(1)(b) and (d) to specify when a Copermittee must require implementation of BMPs at inventoried existing development not owned by the Copermittee, and when a Copermittee must implement BMPs on their own municipal facilities.</p> <p>The San Diego Water Board also agrees with the City of Chula Vista's request to remove 'freeways' from the list of existing facilities the Copermittees are required to properly operate and maintain BMPs.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E5-4 PROVISION E.5: Existing Development Management</b>		
	<p><b>COMMENT:</b> <i>Requests for modifications to existing development inspection requirements.</i></p> <p>The County of San Diego commented on the need for an exemption from the minimum annual inspection requirement of 20 percent for inventoried linear municipal facilities. Riverside County Copermittees requested the requirement to inspect at least 20 percent of its existing development inventory be deleted.</p> <p>The Tentative Order requires each inventoried existing development be inspected once every five years. Both San Diego County and Riverside County Copermittees commented on this minimum. San Diego County Copermittees want it changed to once per permit term, conversely Riverside County Copermittees support existing language of once per five years. The USEPA does not support relaxation to inspection frequencies because it weakens enforceability and the ability to determine compliance.</p> <p>The San Diego County Copermittees requested clarifying language be added to what must be included in a visual inspection of existing development.</p>	<p><b>Copermittees</b>                  County of San Diego                  Riverside County Copermittees                  San Diego County Copermittees  <b>State and Federal Government</b>                  USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the County of San Diego’s comment concerning the need for exempting linear municipal facilities from the existing development annual inspection requirements due to the number of inspections required if such facilities are considered when calculating 20 percent of the existing development inventory. To address their comments, the language in Provision E.5.c.(1)(a)(iv) includes a footnote, which excludes linear municipal facilities (i.e. MS4 linear channels, sanitary sewer collections systems, streets, roads, and highways). MS4 inlets and basins are not mentioned in this footnote and are still required to be considered when determining 20 percent of inventoried development for the purposes of annual inspections. The San Diego Water Board expects MS4 inlets and basins to be inspected in order to confirm that BMPs are being implemented and maintained to reduce the discharge of pollutants in storm water from the MS4 to the MEP. Comments provided by the USEPA support leaving MS4 inlets and basins in the existing development inventory to strengthen permit enforceability and compliance determinations.</p> <p>The San Diego Water Board kept the existing development minimum inspection requirement of once every five years. This requirement is consistent with comments received by USEPA to include minimum requirements to strengthen permit enforceability and compliance determinations.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E5-5 PROVISION E.5: Existing Development Management		
	<p><b>COMMENT:</b> <i>Requests to limit existing development requirements to existing development with "reasonable potential" to discharge pollutants.</i></p> <p>The San Diego County Copermittees requested the existing development requirements be limited to those existing facilities and areas of development with "reasonable potential" to discharge pollutants.</p>	<p><b>Copermittees</b> San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that replacing the term 'may' with the phrase 'reasonable potential' in Provisions E.5.a-c will give a Copermittee more flexibility to focus on jurisdictional and watershed priorities. The Water Quality Improvement Plan will establish the priority water quality conditions within a Watershed Management Area to which a Copermittee will customize its jurisdictional program (i.e. inspection location and frequencies, pollutant reduction efforts (BMP implementation), retrofit opportunities, etc.).</p> <p>The term 'may' is used to indicate possibility or probability that a pollutant load is discharged from an inventoried existing development facility or area. The term 'reasonable potential' can imply the need to conduct a reasonable potential analysis, which is a far more involved process than a Copermittee making the determination that a facility or developed area possibly or probably discharges a pollutant load into its MS4. Nothing in the Tentative Order prevents a Copermittee from conducting a more robust analysis of the potential for existing development to discharge pollutant loads to and from the MS4. Therefore, no change to the Tentative Order was made.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E5-6 PROVISION E.5: Existing Development Management		
	<p><b>COMMENT:</b> Request to allow the Copermitees to reallocate resources required for monitoring for retrofit and/or rehabilitation projects.</p> <p>The San Diego County Copermitees requested an addition to the requirements of Provision E.5.e to allow the Copermitees to reallocate resources required for monitoring for retrofit and/or rehabilitation projects.</p>	<p><b>Copermitees</b>                      Riverside County Copermitees                      San Diego County Copermitees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request and no change to the Tentative Order was made.</p> <p>Temporarily suspending the monitoring requirements of Provision D to fund a retrofit and/or rehabilitation process is inappropriate. The monitoring requirements in Provision D are the minimum necessary for the Copermitees to demonstrate that the water quality improvement strategies being implemented as part of the Water Quality Improvement Plan are making progress toward achieving the numeric goals.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>E5e2-1 PROVISION E.5.e.(2): Retrofitting Areas of Existing Development</b>	
<p><b>COMMENT:</b> <i>Retrofit existing development to improve water quality.</i></p> <p>The San Diego Green Building Council and South Laguna Civic Association support retrofitting areas of existing development as a means to achieve mandated water quality objectives.</p>	<p><b>Building Industry / Industry</b> San Diego Green Building Council</p> <p><b>Environmental Organizations</b> South Laguna Civic Association</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the commenters and has developed requirements to encourage retrofitting to achieve reductions in pollutants discharged from MS4s and improved water quality conditions in the receiving waters.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E5e2-2 PROVISION E.5.e.(2): Retrofitting Areas of Existing Development	
	<p><b>COMMENT:</b> <i>Requests to remove or modify retrofitting of existing development requirements.</i></p> <p>The Riverside County Copermittees generally requested the removal of the retrofit and stream/channel/habitat rehabilitation project requirements. However, the Riverside County Copermittees also submitted requests for specific retrofit language changes.</p>
	<p><b>Copermittees</b> Riverside County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the requests to remove or modify the retrofitting of existing development requirements.</p> <p>The San Diego Water Board reviewed the requested language changes and did not make any of the revisions recommended as they were not necessary or changed the intent of the requirement.</p> <p>The requirements in the Tentative Order do not require any Copermittee to implement or require the implementation of a retrofitting project. The Tentative Order requires each Copermittee to describe a program that identifies those areas (public, private, or both) as good candidates for retrofitting. In areas where retrofitting projects within certain areas of existing development cannot be implemented by the Copermittee because of ownership (i.e. private property) or permitting, the Copermittee must develop strategies to facilitate the implementation of retrofitting projects if and when the opportunities become available.</p> <p>The San Diego Water Board did not remove or modify the requirements of Provision E.5.e.(2), but the requirements are now under Provision E.5.e.(1) in the revised Tentative Order.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E5e3-1 PROVISION E.5.e.(3): Stream, Channel and/or Habitat Rehabilitation in Areas of Existing Development		
	<p><b>COMMENT:</b> <i>Rehabilitate receiving waters to improve water quality.</i></p> <p>The Laguna Bluebelt Coalition and South Laguna Civic Association expressed support for rehabilitating high value coastal receiving waters to improve water quality.</p>	<p><b>Environmental Organizations</b>                      Laguna Bluebelt Coalition                      South Laguna Civic Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the commenters that rehabilitation of coastal wetlands and estuaries are important to the improvement of water quality within the San Diego Region.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E5e3-2 PROVISION E.5.e.(3): Stream, Channel and/or Habitat Rehabilitation in Areas of Existing Development</b>		
	<p><b>COMMENT:</b> <i>Create map to identify creeks and coastal receiving waters impacted by discharges from storm drains and candidate areas for restoration.</i></p> <p>The Laguna Bluebelt Coalition and South Laguna Civic Association expressed support for the creation of maps to show water quality impacted areas of all creeks and coastal receiving waters within the region. The commenters also supported identifying degraded land elements, offending storm drain outlets and candidate areas for re-forestation and estuarine/coastal restoration.</p>	<p><b>Environmental Organizations</b>                      Laguna Bluebelt Coalition                      South Laguna Civic Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that maps identifying candidate areas for restoration would be useful.</p> <p>The Copermittees have been provided an opportunity to create maps to assist in their efforts to comply with the requirements of the Tentative Order. Specifically, the Copermittees will have the option to generate a map and list of candidate projects, including stream, channel and habitat rehabilitation projects, which could potentially be used as alternative compliance options for Priority Development Projects, to be implemented in lieu of onsite structural BMP performance requirements. The optional Watershed Management Area Analysis is provided in Provision B.3.b.(4).</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E5e3-3 PROVISION E.5.e.(3): Stream, Channel and/or Habitat Rehabilitation in Areas of Existing Development</b>		
	<p><b>COMMENT:</b> Request for modifications to existing development stream, channel and/or habitat rehabilitation requirements.</p> <p>The Orange County Copermittees requested a modification to the requirements of Provision E.5.e.(3) to allow a Copermittee to identify stream, channel, and/or habitat rehabilitation projects downstream of its jurisdiction. The Orange County Copermittees also requested the removal of Provision E.5.e.(3)(a) requiring each Copermittee to identify streams, channels, and/or habitats in areas of existing development as candidates for rehabilitation.</p>	<p><b>Copermittees</b> Orange County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the requests.</p> <p>The requirements of Provision E.5.e.(3) are to be implemented by each Copermittee within its jurisdiction. Allowing a Copermittee to identify stream, channel, and/or habitat rehabilitation projects downstream of its jurisdiction is not appropriate for this requirement. The Copermittee will, however, be able to identify stream, channel, and/or habitat rehabilitation projects downstream of its jurisdiction as potential alternative compliance options for Priority Development Projects if the Copermittees in the Watershed Management Area perform the optional Watershed Management Area Analysis and include it in the Water Quality Improvement Plan.</p> <p>The removal of Provision E.5.e.(3)(a) is not appropriate because without this requirement, the subsequent requirements could not be implemented by the Copermittee.</p> <p>The San Diego Water Board did not modify the requirements of Provision E.5.e.(3), but the requirements are now under Provision E.5.e.(2) in the revised Tentative Order.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E6-1 PROVISION E.6: Enforcement Response Plans</b>	
	<p><b>COMMENT:</b> <i>Specify criminal penalties are limited to intentional or criminally negligent acts.</i></p> <p>The Riverside County and San Diego County Copermittees each submitted comments requesting Provision E.6.b.(5) be modified to specify criminal penalties are limited to intentional or criminally negligent acts.</p>
	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the revision is necessary.</p> <p>Provision E.6.b requires each Copermittee to list the enforcement response approaches that the Copermittee will implement within its jurisdiction to compel compliance with its statutes, ordinances, permits, contracts, order, or similar means, and the requirements of the Order. The Copermittee may specify in its Enforcement Response Plan that criminal penalties are limited to intentional or criminally negligent acts.</p> <p>The San Diego Water Board did not revise Provision E.6.b.(5).</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>E6-2</b>	<b>PROVISION E.6: Enforcement Response Plans</b>	
	<p><b>COMMENT:</b> <i>Notification to San Diego Water Board for "escalated" enforcement should be consistent with Construction General Permit.</i></p> <p>The Riverside County and San Diego County Copermittees each submitted comments requesting Provision E.6.e.(1) be modified to be consistent with the notification requirements of the Construction General Permit.</p>	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request.</p> <p>Provision E.6.e.(1) has been revised as requested.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E6-3 PROVISION E.6: Enforcement Response Plans</b>		
	<p><b>COMMENT:</b> <i>Revise the term "escalated enforcement" to "progressive enforcement."</i></p> <p>The Orange County and Riverside County Copermitees each submitted comments requesting Provision E.6.d be modified to be "Progressive Enforcement" instead of "Escalated Enforcement" because the term is more appropriate.</p>	<p><b>Copermitees</b>                      Orange County Copermitees                      Riverside County Copermitees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request.</p> <p>The Copermitees are expected to implement "progressive enforcement" in all cases of enforcement. For enforcement issues that are associated with the highest priority water quality conditions identified by the Copermitees in the Watershed Management Area, the Copermitees are expected to implement the enforcement more swiftly, meaning escalating its enforcement measures and resources to compel compliance with its statutes, ordinances, permits, contracts, order, or similar means, and the requirements of the Order as soon as possible. The term "escalated enforcement" correctly reflects this added level of urgency and focus to compel compliance.</p> <p>The San Diego Water Board did not revise Provision E.6.d.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>E6-4 PROVISION E.6: Enforcement Response Plans</b>		
	<p><b>COMMENT:</b> <i>Allow the Copermitees to utilize existing guidelines and procedures for enforcement.</i></p> <p>The Orange County and Riverside County Copermitees each submitted comments requesting the introductory paragraph of Provision E.6 be modified to specify that a Copermitee may utilize and implement established, equivalent guidelines and procedures for enforcement.</p>	<p><b>Copermitees</b>                      Orange County Copermitees                      Riverside County Copermitees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request.</p> <p>The Copermitees are allowed to utilize and implement their existing procedures if they meet the requirements of Provision E.6. Provision E.6, however, requires each Copermitee to develop an Enforcement Response Plan, included as part of its jurisdictional runoff management program document, which the San Diego Water Board and the public may utilize to determine if the Copermitee is indeed implementing its enforcement program according to its procedures. The Enforcement Response Plan is expected to be a tool the Copermitee can refer to when issuing enforcement actions to compel compliance with its statutes, ordinances, permits, contracts, order, or similar means, and the requirements of the Order. The Enforcement Response Plan is also expected to result in more consistent enforcement and enforcement actions by the Copermitee within its jurisdiction.</p> <p>The San Diego Water Board did not revise the introductory paragraph to Provision E.6.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E7a-1	<b>PROVISION E.7.a: Public Education</b>	
	<p><b>COMMENT:</b> <i>Requests for modifications to public education requirements.</i></p> <p>The Orange County, Riverside County and San Diego County Copermittees each submitted comments requesting the requirements in Provision E.7.a be modified to allow the Copermittees to focus their public education efforts on the highest priority water quality conditions, and remove or reduce the emphasis in the language that focuses on pesticides, herbicides and fertilizers.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the requested modifications.</p> <p>The public education requirements under Provision E.7.a provide the Copermittees the flexibility to focus their public education efforts on the highest priority water quality conditions, while being consistent with federal regulations.</p> <p>Provision E.7.a.(1) is consistent with 40CFR122.26(d)(2)(iv)(A)(6), which requires each Copermittee to provide “A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include...educational activities...” Provision E.7.a.(1) has been expanded to include “other pollutants of concern...as determined and prioritized by the Copermittee(s) by jurisdiction and/or watershed to address the highest priority water quality conditions...” To be consistent with 40CFR122.26(d)(2)(iv)(A)(6), however, each Copermittee must have a program of educational activities to reduce pollutants associated with pesticides, herbicides and fertilizers to the MEP.</p> <p>The San Diego Water Board did not modify Provision E.7.a.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

E8-1 PROVISION E.8: Fiscal Analysis	
	<p><b>COMMENT:</b> <i>Request to remove requirement to secure resources to meet requirements of the Tentative Order.</i></p> <p>The Riverside County Copermittees requested that Provision E.8.a, requiring each Copermittee to secure the resources necessary to meet all the requirements of the Order, be removed. The Riverside County Copermittees assert this requirement exceeds the requirements of the Clean Water Act.</p>
	<p><b>Copermittees</b> Riverside County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request.</p> <p>The Copermittees are responsible for securing the resources necessary to meet the requirements of the Tentative Order. Without securing the resources necessary to meet all requirements of the Tentative Order, the Copermittee would be unable to meet the requirements of the Tentative Order.</p> <p>Additionally, CWA section 402(p)(3)(B)(iii) requires that NPDES permits for storm water discharges from MS4s to “<i>require controls to reduce the discharge of pollutants [in storm water] to the maximum extent practicable [MEP], including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.</i>” The requirement for each Copermittee to secure the resources necessary to meet all the requirements of the Order is considered “<i>such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.</i>”</p> <p>The San Diego Water Board did not remove the requirement.</p>

March 27, 2013

<b>F1-1 PROVISION F.1: Water Quality Improvement Plans</b>	
<p><b>COMMENT:</b> <i>Requests for modifications to Water Quality Improvement Plan development process and schedule.</i></p> <p>Comments from the Building Industry and the Copermitees requested modifications to the schedules for developing and updating the Water Quality Improvement Plans. Generally, the requests were for more time because of several different factors. The San Diego County Copermitees also requested several modifications to the content of the submittal required for each element of the Water Quality Improvement Plan.</p> <p>Comments from the Environmental Groups and USEPA were primarily concerned with the public participation process during the development of the Water Quality Improvement Plans. The concern was that the requirements of the Tentative Order did not allow for enough public participation, and they requested that additional opportunities be provided during the Water Quality Improvement Plan development and updates. The Environmental Groups also requested that the Water Quality Improvement Plans be required to be developed consecutively instead of concurrently.</p>	<p><b>Building Industry / Industry</b> BIA Regulated Community Coalition</p> <p><b>Copermitees</b> Orange County Copermitees Riverside County Copermitees San Diego County Copermitees San Diego Unified Port District</p> <p><b>Environmental Organizations</b> Environmental Groups</p> <p><b>State/Federal Government</b> USEPA</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request to provide additional time to develop the Water Quality Improvement Plans, but disagrees with requiring the Water Quality Improvement Plans to be developed consecutively instead of concurrently. The San Diego Water Board also agrees with including additional opportunities for public participation during the Water Quality Improvement Plan development and update processes.</p> <p>The San Diego Water Board has modified the requirements of Provision F.1 to provide the Copermitees up to 24 months, instead of 18 months, to develop the Water Quality Improvement Plans. The schedules for developing and submitting the elements of the Water Quality Improvement Plan have also been modified to provide additional time, and additional flexibility to stagger the development of the Water Quality Improvement Plans to provide the public sufficient opportunity to provide data, information and recommendations.</p> <p>Please also see the response to comment B-3.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

F3b-1	PROVISION F.3.b: Annual Reports	
	<p><b>COMMENT:</b> <i>Recommendations for modifications to Annual Report requirements.</i></p> <p>Several commenters provided recommendations for modifications to the Annual Report requirements to clarify the requirements, include different requirements, or remove requirements.</p> <p>Ecolayers and the San Diego County Copermittees are concerned with the requirements related to uploading data to the California Environmental Data Exchange Network (CEDEN). Uploading data to CEDEN is not necessary according to Ecolayers. The Copermittees would like to limit the data uploads only to data generated by the Copermittees and not third parties.</p> <p>The Orange County, Riverside County, and San Diego County Copermittees all expressed concern about the transitional reporting period between the time the Tentative Order becomes effective and the date that the first Water Quality Improvement Plan Annual Reports are required. The Orange County Copermittees also expressed concern with the use of the Jurisdictional Runoff Management Program Annual Report Form (Form) in Attachment D to the Tentative Order. The Orange County Copermittees requested continuing the use of the current jurisdictional runoff management program annual reporting format instead of the Form.</p> <p>The Environmental Groups also expressed concern with the Form. The Environmental Groups are concerned that the Form would not adequately reflect the activities that each Copermittee was implementing within its jurisdiction and allow the public to understand how the Copermittees were implementing effective water quality improvement strategies.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      Riverside County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Environmental Groups</p> <p><b>Other Entities</b>                      Ecolayers</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that modifying the Annual Report requirements is necessary to clarify transitional reporting requirements and Water Quality Improvement Plan reporting requirements. The San Diego Water Board does not agree that uploading data to CEDEN is unnecessary. Finally, the San Diego Water Board disagrees with replacing the Form with the current jurisdictional runoff management program annual reporting format.</p> <p>The San Diego Water Board has revised the Annual Report requirements under Provision F.3.b to include (1) Transitional Jurisdictional Runoff Management Program Annual Reports, (2) Transitional Monitoring and Assessment Program Annual Reports, and (3) Water Quality Improvement Plan Annual Reports. The Transitional Jurisdictional Runoff Management Program Annual Reports and Transitional Monitoring and</p>

March 27, 2013

F3b-1	<b>PROVISION F.3.b: Annual Reports</b>	
	<p>Assessment Program Annual Reports will be submitted by the Copermittees until the first Water Quality Improvement Plan Annual Reports are required.</p> <p>The Form is required for each Copermittee within each Watershed Management Area during the transitional reporting permit. Each Copermittee has the option to continue utilizing the current jurisdictional runoff management program annual reporting format in addition to the Form until the Water Quality Improvement Plan Annual Reports are required. The Form will continue to be required as part of the Water Quality Improvement Plan Annual Reports, but they are expected to be included as an appendix or attachment to the report.</p> <p>The San Diego Water Board will review the Forms to ensure that the Copermittees have certified that they are implementing their jurisdictional runoff management programs in compliance with the requirements. The San Diego Water Board will also utilize the Forms during audits of the Copermittees' jurisdictional runoff management programs and their records.</p> <p>The Water Quality Improvement Plan Annual Reports will provide the information that the Environmental Groups are interested in seeing as part of the annual reporting requirements. Provision F.3.b.(3)(d) requires each Copermittee to report the water quality improvement strategies that were implemented and/or no longer implemented by each of the Copermittees during the reporting period and previous reporting periods, and are planned to be implemented during the next reporting period.</p> <p>Finally, the San Diego Water Board has not removed the requirements to upload data to CEDEN, but has limited the data that is required to be uploaded to CEDEN to just data generated by the Copermittees.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

F3c-1 PROVISION F.3.c: Regional Monitoring and Assessment Report		
	<p><b>COMMENT:</b> <i>Requests for modifications to Regional Monitoring and Assessment Report requirements.</i></p> <p>The Riverside County and San Diego County Copermittees each submitted requests for modifications to the Regional Monitoring and Assessment Report requirements.</p> <p>The Riverside County Copermittees recommended aligning the requirements with the Integrated Assessment of the Water Quality Improvement Plans. The San Diego County Copermittees recommended removing the requirement for the Regional Monitoring and Assessment Report as it appears to be duplicative with the Integrated Assessment of the Water Quality Improvement Plans. The San Diego County Copermittees also requested, if the Regional Monitoring and Assessment Report requirements remain, that data uploaded to the Regional Clearinghouse be limited only to data generated by the Copermittees and not third parties.</p>	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the requests to modify the Regional Monitoring and Assessment Report requirements. The San Diego Water Board agrees with limiting the data uploaded to the Regional Clearinghouse only to data generated by the Copermittees.</p> <p>The Regional Monitoring and Assessment Report is for the entire San Diego Region, not specific to each Watershed Management Area. The Regional Monitoring and Assessment Report may utilize the findings from the Integrated Assessments of the Water Quality Improvement Plans, but the Regional Monitoring and Assessment Report is intended to provide a “snapshot” of the conditions of the entire San Diego Region.</p> <p>The San Diego Water Board did not remove Provision F.3.c from the requirements. The San Diego Water Board did, however, revise Provision F.3.c.(3) to limit the data that is required to be uploaded to the Regional Clearinghouse to just data generated by the Copermittees.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

F4-1 PROVISION F.4: Regional Clearinghouse		
	<p><b>COMMENT:</b> <i>Request to allow the Copermittees to utilize existing mechanisms and linkages as part of the Regional Clearinghouse.</i></p> <p>The Orange County and San Diego County Copermittees each submitted comments requesting the requirements in Provision F.4 be modified to allow the Copermittees to utilize their existing web-based systems. The Orange County and San Diego County Copermittees requested that language be added to Provision F.4 that specifies a Copermittee may elect to develop and maintain clearinghouses provided by other Copermittees or agencies.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the Copermittees should be allowed to utilize their existing web-based systems.</p> <p>Provision F.4.a allows the Copermittees to link the Regional Clearinghouse “<i>to other internet-based data portals and databases where the original documents are stored.</i>” The Regional Clearinghouse, however, must be a single website that is linked to the other web-based systems. Provision G.2.d requires the Principal Watershed Copermittees to coordinate and develop the Regional Clearinghouse.</p> <p>The San Diego Water Board has added a footnote to the opening paragraph of Provision F.4 as requested by the San Diego County Copermittees, which is consistent with the language requested by the Orange County Copermittees.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

G-1 PROVISION G: PRINCIPAL WATERSHED COPERMITTEE RESPONSIBILITIES	
<b>G-1</b>	<p><b>COMMENT:</b> <i>Request for "clarifications" of Copermittee responsibilities.</i></p> <p>The San Diego County Copermittees requested that Provision G "clarifies" that all Copermittees have some responsibilities to implement the requirements of the permit, not just the Principal Watershed Copermittees. The San Diego County Copermittees also requested removal of the language recommending that an individual Copermittee should not be designated a Principal Watershed Copermittee for more than two Watershed Management Areas.</p>
	<p style="text-align: right;"><b>Copermittees</b> San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees to clarify that all Copermittees are responsible for implementing the requirements. The San Diego Water Board disagrees that it is necessary to remove the recommendation that an individual Copermittee should not be designated a Principal Watershed Copermittee for more than two Watershed Management Areas.</p> <p>Provision G states that an individual Copermittee "should not" be designated a Principal Watershed Copermittee for more than two Watershed Management Areas. "Should not" indicates that it is a recommendation, not a requirement. The recommendation has been included to express the San Diego Water Board's desire for, as well as encourage, more Copermittees to assume leadership positions in developing Water Quality Improvement Plans and coordinating water quality improvement strategies among Copermittees in a Watershed Management Area and in the San Diego Region. The recommendation is not a requirement. Removal of a recommendation is not necessary.</p> <p>The San Diego Water Board has added Provision G.3 to specify that the Principal Watershed Copermittees are not responsible for ensuring that the other Copermittees in the Watershed Management Area are in compliance with the requirements, and that each Copermittee is responsible for implementing the requirements of the Tentative Order.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

H-1 PROVISION H: MODIFICATION OF PROGRAMS		
	<p><b>COMMENT:</b> <i>Request for an explicit re-opener provision in permit for TMDLs.</i></p> <p>The Orange County and San Diego County Copermittees and several individual Copermittees requested an explicit re-opener provision be included in the Tentative Order for when TMDLs may be amended.</p>	<p><b>Copermittees</b>                      City of Dana Point                      City of Imperial Beach                      City of Laguna Niguel                      City of Mission Viejo                      City of Poway                      City of Rancho Santa Margarita                      City of San Diego                      Orange County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request.</p> <p>The San Diego Water Board has revised Provision H.4 to explicitly state when the San Diego Water Board will re-open the Order for modifications. Provision H.4.c explicitly states that the San Diego Water Board will re-open the Order if any of the TMDLs in Attachment E are amended in the Basin Plan by the San Diego Water Board, and the amendment is approved by the State Water Board, Office of Administrative Law, and the USEPA.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

H-2 PROVISION H: MODIFICATION OF PROGRAMS	
<p><b>COMMENT:</b> <i>Request to include language that the permit may be amended outside of the Water Quality Improvement Plan process.</i></p> <p>The San Diego County Copermittees have requested the San Diego Water Board include language in Provision H.3 that explicitly states the Tentative Order may be modified outside of the Water Quality Improvement Plan development and implementation process. The San Diego County Copermittees indicated that there may be frequent modifications to the permit requirements based on the Water Quality Improvement Plan development and implementation process.</p>	<p><b>Copermittees</b> San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request.</p> <p>The Tentative Order has been structured to allow the iterative and adaptive management process to occur within the Water Quality Improvement Plan development and implementation process. The San Diego Water Board does not anticipate any need to modify the Order's requirements as a result of the implementation of the Water Quality Improvement Plans.</p> <p>In the event that the Order's requirements do need to be modified, the language currently in Provision H.3 is adequate for this purpose. Thus, the San Diego Water Board did not revise Provision H.3 as requested by the San Diego County Copermittees.</p>

AttA-1 ATTACHMENT A: Discharge Prohibitions and Special Protections		
	<p><b>COMMENT:</b> <i>Requests for modifications to Areas of Special Biological Significance (ASBS) Special Protections requirements.</i></p> <p>San Diego Gas and Electric and Southern California Gas Company requested modifications to Provision I.A.1.e.(2)(ii) of the Special Protections for Areas of Special Biological Significance, Governing Point Source Discharges of Storm Water and Nonpoint Source Waste Discharges (Special Protections) in Attachment A to the Order. San Diego Gas and Electric and Southern California Gas Company requested Provision I.A.1.e.(2)(ii) be revised to include a reference to Finding 32 of the Order to be consistent with their comments regarding authorized non-storm water discharges to MS4s that discharge to ASBS (see comment Fnd-14).</p>	<p><b>Building Industry / Industry</b>                      San Diego Gas and Electric                      Southern California Gas Company</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request.</p> <p>The Special Protections in Attachment A to the Tentative Order were adopted under Resolution No. 2012-0012 by the State Water Board, and are provided verbatim as a reference. Revising the provisions of the Special Protections, which are part of a resolution issued by the State Water Board, is not appropriate or necessary.</p> <p>The San Diego Water Board did not revise the Special Protections in Attachment A.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>AttB-1 ATTACHMENT B: Standard Permit Provisions and General Provisions</b>	
<p><b>COMMENT:</b> <i>Requests for modifications to Standard Permit Provisions.</i></p> <p>The Riverside County and San Diego County Copermitees each submitted comments requesting Standard Permit Provision 1.m be removed from the Standard Permit Provisions in Attachment B. The Copermitees are concerned that the bypass provisions of Standard Permit Provision 1.m would require the Copermitees to notify the San Diego Water Board whenever there is an anticipated or unanticipated bypass of storm water treatment BMPs.</p>	<p><b>Copermitees</b>            Riverside County Copermitees            San Diego County Copermitees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request.</p> <p>The Standard Permit Provisions in Attachment B are required to be included in all NPDES permits. Thus, it is inappropriate to remove any of the Standard Permit Provisions.</p> <p>Standard Permit Provision 1.m(1)(a) defines a bypass as the intentional diversion of waste streams from any portion of a treatment facility. As most storm water treatment BMPs are not expected to be attended and expected to operate without oversight, there are unlikely to be “intentional” diversions of waste streams. If, however, one or more Copermitees operate a storm water treatment control BMP that requires an “intentional” diversion of the waste stream, the San Diego Water Board expects the Copermitee(s) to comply with the requirements of Standard Permit Provision 1.m.</p> <p>The San Diego Water Board did not revise the Standard Permit Provisions in Attachment B.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>AttB-2 ATTACHMENT B (Standard Permit Provisions and General Provisions)</b>	
	<p><b>COMMENT:</b> <i>Requests for "clarifications" to the General Provisions.</i></p> <p>The Riverside County and San Diego County Copermittees each submitted comments requesting "clarifications" to the General Provisions in Attachment B. The Copermittees requested that General Provision 2.h include language that specifies the Copermittees are not responsible for pollutants in its MS4 discharges originating from an NPDES-permitted non-storm water discharge. The Copermittees also requested that recordkeeping requirements of General Provision 2.i.(2) be deleted or revised to be consistent with Standard Permit Provision 1.j.(2).</p>
	<p><b>Copermittees</b>                      Riverside County Copermittees                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the requests.</p> <p>Discharges to the Copermittees' MS4s authorized by a separate NPDES permit do not have to be prohibited, as specified in the requirements of Provisions A.1.b and E.2. The Copermittees, however, are responsible for identifying the sources of the discharges from its MS4 if it causes or contributes to exceedances of water quality standards in receiving waters. Please see the response to comment E2-3.</p> <p>The recordkeeping requirements of General Provision 2.i.(2) are not inconsistent with Standard Permit Provision 1.j.(2). Standard Permit Provision 1.j.2 requires records to be kept for a minimum of 3 years unless the San Diego Water Board extends this period, consistent with the Code of Federal Regulations requirement. The San Diego Water Board has extended the recordkeeping requirements of Standard Permit Provision 1.j.(2) with General Provision 2.i.(2) to a period of 5 years. Thus, there is no conflict or inconsistency.</p> <p>The San Diego Water Board did not revise the General Provisions in Attachment B.</p>

March 27, 2013

<b>AttC-1 ATTACHMENT C: Acronyms, Abbreviations, and Definitions</b>	
<p><b>COMMENT:</b> <i>Requests for additional or modified definitions.</i></p> <p>Several comments were submitted by the Copermittees and Building Industry / Industry requesting modifications to existing definitions and/or the addition of new definitions to Attachment C to the Tentative Order.</p>	<p><b>Building Industry / Industry</b>            BIA Regulated Community Coalition            San Diego Gas and Electric            Southern California Gas Company</p> <p><b>Copermittees</b>            City of Chula Vista            Orange County Copermittees            Riverside County Copermittees            San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board reviewed and considered the requested modifications to existing definitions and additional definitions.</p> <p>Where the San Diego Water Board determined a modification to a definition requested by a commenter was appropriate and necessary to clarify a definition or make it consistent with other revisions made in the Tentative Order, the San Diego Water Board made a revision. Where the San Diego Water Board determined the addition of a definition requested by a commenter was appropriate and necessary, the San Diego Water Board added the definition. In several cases, the requested modification or addition was not appropriate, not necessary, or both. In such cases, the San Diego Water Board did not modify or add the definition as requested.</p> <p>Please see Attachment C in the revised Tentative Order to see the revisions that were made.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

AttE-1 ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads	
<p><b>COMMENT:</b> <i>Link compliance with TMDL requirements to development and implementation of Water Quality Improvement Plans.</i></p> <p>The San Diego County Copermittees submitted comments requesting that the development and implementation of the Water Quality Improvement Plans be a compliance mechanism for the TMDL requirements of Attachment E. The San Diego Unified Port District submitted separate comments in support of the request. The Orange County Copermittees submitted comments requesting that Provision A.1 and A.2 include language that specifies that compliance with the discharge prohibitions and receiving water limitations will be achieved through implementing the requirements of Attachment E.</p> <p>Comments from Environmental Groups were not in support of allowing compliance with the TMDL requirements through a “reasonable assurance analysis” included in the Water Quality Improvement Plan.</p>	<p><b>Copermittees</b>                      City of San Diego                      Orange County Copermittees                      San Diego County Copermittees                      San Diego Unified Port District</p> <p><b>Environmental Organizations</b>                      Environmental Groups</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the comments from the Copermittees. The San Diego Water Board disagrees with the comments from the Environmental Groups.</p> <p>The San Diego Water Board acknowledges that monitoring all MS4 outfalls or all receiving waters at all times to demonstrate compliance with the final WQBELs is difficult, likely to be cost prohibitive, and likely to be infeasible. Thus, the San Diego Water Board has included an option to the Compliance Determination requirements allowing the utilization of the Water Quality Improvement Plan to demonstrate compliance with the interim and final TMDL requirements. The compliance determination option provides the Copermittees a mechanism through an analysis to demonstrate that there is “reasonable assurance” that the interim and final numeric WQBELs are being achieved through the implementation of BMPs. Because the Water Quality Improvement Plans will undergo a public participation and review process, the San Diego Water Board is confident that a Water Quality Improvement Plan that includes such an analysis will allow the Copermittees to demonstrate that the final TMDL requirements are being achieved and will be acceptable to the public and the San Diego Water Board.</p> <p>For the interim TMDL compliance determination requirements, the Copermittees are allowed to demonstrate compliance by implementing a Water Quality Improvement Plan that has been accepted by the San Diego Water Board, with a “reasonable assurance” that the implementation of the BMPs will achieve the interim TMDL WQBELs within the interim compliance dates. The Copermittees will be provided considerable flexibility for</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>AttE-1 ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads</b>
<p>demonstrating compliance with achieving the interim WQBELs.</p> <p>For the final TMDL compliance determination requirements, the Copermittees are allowed to demonstrate compliance with the final WQBELs by implementing a Water Quality Improvement Plan that includes an analysis to demonstrate that the implementation of the BMPs required by the TMDL achieves compliance with one or more of the final numeric WQBELs. The Water Quality Improvement Plan must include monitoring and assessments to confirm that the Water Quality Improvement Plan is achieving the final TMDL requirement. The San Diego Water Board must accept and continue to accept the Water Quality Improvement Plan and analysis, and the Copermittees must continue to implement the BMPs and demonstrate through the analysis that the final numeric WQBELs are being achieved.</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>AttE-2 ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads</b>	
<p><b>COMMENT:</b> <i>Requests for including TMDL requirements consistent with the TMDLs as developed or "as originally intended."</i></p> <p>Several Copermitees submitted comments that the TMDLs have not been incorporated "as originally written and intended" or somehow inconsistent with the TMDLs as they were developed. The Orange County Copermitees specifically referred to the Baby Beach Bacteria TMDLs and the Beaches and Creeks Bacteria TMDLs, noting examples that they identified as "inconsistent" with the TMDLs in the Basin Plan.</p> <p>A comment from Clean Water Now seemed to imply that there was some inconsistencies present in the TMDL requirements "in light of recent legal renderings" though no specific legal interpretations or decisions were provided.</p> <p>The USEPA noted that the Beaches and Creeks Bacteria TMDLs included additional WLAs and compliance endpoints that were not included in Attachment E.</p>	<p><b>Copermitees</b>                      City of Dana Point                      City of Imperial Beach                      City of Laguna Hills                      City of Lake Forest                      City of Mission Viejo                      City of Rancho Santa Margarita                      City of San Juan Capistrano                      Orange County Copermitees                      San Diego Unified Port District</p> <p><b>Environmental Organizations</b>                      Clean Water Now</p> <p><b>State/Federal Government</b>                      USEPA</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the TMDL requirements in Attachment E are inconsistent with the TMDLs as developed or "as originally intended."</p> <p>The comments from the Copermitees and USEPA noted that several aspects of the TMDLs as they are in the Basin Plan are not included in the Tentative Order. The omission of those aspects of the TMDLs, however, does not mean that the TMDL requirements in Attachment E are inconsistent with the TMDLs as developed or "as originally intended." The TMDLs as developed are all intended to restore the water quality standards in receiving waters impaired by specific pollutants. The WLAs and LAs as developed are all intended to ensure that discharges from point and nonpoint sources to receiving waters will not cause or contribute to exceedances of water quality standards in receiving waters. The TMDL requirements in Attachment E are consistent with the intent of the TMDLs, and the WLAs for MS4s. In other words, the TMDL requirements in Attachment E are intended to ensure that discharges from the Responsible Copermitees' MS4s will not cause or contribute, and will continue to not cause or contribute to exceedances of water quality standards in receiving waters. According to each TMDL, when all point sources and nonpoint sources achieve their WLAs and LAs, including the WLAs for MS4s, the water quality standards in receiving waters will be restored.</p> <p>The San Diego Water Board included TMDL requirements in Attachment E that are entirely consistent with the requirements of the TMDLs as adopted and incorporated into the Basin Plan. The implementation plans of the</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>AttE-2 ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads</b>	
	<p>TMDLs in the Basin Plan are essentially “instructions” for the San Diego Water Board to incorporate the requirements into the regulatory mechanisms that will implement the requirements of the TMDL to attain the water quality standards that are being impaired by a pollutant in a water body. In each case, the “instructions” provide the permit writer considerable flexibility in how to express the WLAs as WQBELs in the permit, but not as much flexibility in the compliance schedules for achieving the WLAs.</p> <p>Nonetheless, the San Diego Water Board has revised the TMDL requirements in Attachment E to include some of the additional aspects of the TMDLs as developed and included in the Basin Plan. Please see the following responses to comments pertaining to Attachment E.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>AttE-3 ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads</b>	
<p><b>COMMENT:</b> <i>Objections with how the Water Quality Based Effluent Limitations are included or expressed in the Tentative Order.</i></p> <p>The Orange County and San Diego County Copermittees each submitted comments that objected to how the WQBELs for the TMDLs in Attachment E are included or expressed.</p> <p>The San Diego County Copermittees object to including receiving water limitations as a component of the WQBELs, and requested a clearer linkage between receiving water limitations and effluent limitations. The Orange County Copermittees had a similar objection. The San Diego County Copermittees also requested that the WQBELs expressed as effluent limitations specify that the concentration-based effluent limitations be applied on a watershed basis and not outfall by outfall.</p> <p>The Orange County Copermittees questioned the feasibility of the numeric WQBELs, and asserted that compliance with WQBELs should be based on implementation of BMPs. The Orange County Copermittees assert that a Reasonable Potential Analysis (RPA) is required before including WQBELs into the permit. The Orange County Copermittees also assert that the WQBELs for the Baby Beach Bacteria TMDLs and Beaches and Creeks Bacteria TMDLs are not consistent with the assumptions and requirements of the WLAs.</p> <p>In contrast, the USEPA generally supported the San Diego Water Board's approach for incorporating the TMDL requirements into the Tentative Order.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      San Diego County Copermittees</p> <p><b>State/Federal Government</b>                      USEPA</p>
<p><b>RESPONSE:</b> The San Diego Water Board has included WQBELs that are consistent with the requirements and assumptions of the TMDLs.</p> <p>WQBELs can be expressed as (1) conditions in receiving waters that are to be attained to restore or protect water quality standards in receiving waters, (2) conditions in discharges that will not cause or contribute to exceedances of water quality standards in receiving waters, (3) BMPs that will ensure discharges will not cause or contribute to exceedances of water quality standards in receiving waters, or (4) a combination of one or more of (1)-(3).</p> <p>The San Diego Water Board has incorporated (1)-(3) under the WQBEL requirements for each of the TMDLs in Attachment E. In most cases, if the WQBEL expressed as a receiving water limitation is achieved, the discharges from the MS4s are assumed to be in compliance with the TMDL requirements. If not, then the</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>AttE-3 ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads</b>
<p>Copermittees must demonstrate that discharges from the MS4s are not causing or contributing to the exceedances in the receiving waters by achieving the WQBELs expressed as effluent limitations. In every case, the Copermittees are required to implement BMPs to ensure that discharges from their MS4s do not cause or contribute to exceedances of water quality standards in receiving waters.</p> <p>Because there are TMDLs in the Basin Plan that have identified the MS4s as causing or contributing to exceedances of water quality standards, an RPA is not necessary to establish WQBELs. RPAs are only necessary if the San Diego Water Board decides to develop and incorporate WQBELs into an NPDES permit absent a TMDL.</p> <p>The WQBELs are also consistent with the assumptions and requirements of the WLAs. In each case, the WLAs are calculated based on numeric targets that are assumed to be able to restore or protect water quality standards in receiving waters and/or ensure discharges from the Responsible Copermittees' MS4s will not cause or contribute to exceedances of water quality standards in receiving waters. The numeric targets are required to be based on water quality objectives in the Basin Plan. Discharges from the MS4s are required to achieve the numeric targets for their discharges to protect water quality standards in receiving waters to meet the WLAs. The WQBELs for the TMDLs in Attachment E are consistent with the numeric targets, and thus consistent with the underlying assumptions and requirements of the numeric targets that are the basis of the WLAs.</p> <p>For the Baby Beach Bacteria TMDLs and Beaches and Creeks Bacteria TMDLs, the San Diego Water Board has not revised the concentration-based WQBELs, but has included WQBELs expressed as load-based effluent limitations. The Copermittees may utilize the load-based effluent limitations to demonstrate that the BMPs they are implementing are achieving their effluent limitations and not causing or contributing to exceedances of water quality standards in receiving waters. Please see the response to comment AttE-1.</p>

March 27, 2013

<b>AttE6-1 ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads</b>		
	<p><b>COMMENT:</b> Recommendation to add a provision to address TMDLs approved during the term of the Tentative Order.</p> <p>The USEPA recommended adding a provision to the requirements of the Tentative Order to address TMDLs approved during the term of the permit to expedite implementation of the TMDLs by the Copermittees.</p>	<p><b>State/Federal Government</b> USEPA</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the recommendation.</p> <p>The San Diego Water Board has revised Provision F.2.c to include a requirement for the Copermittees to initiate an update to the applicable Water Quality Improvement Plans to incorporate the requirements of any TMDL Basin Plan amendments, applicable to the Copermittees, approved by the Office of Administrative Law and USEPA within the term of the Tentative Order.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

AttE1-1 ATTACHMENT E 1: Chollas Creek Diazinon TMDL	
<p><b>COMMENT:</b> <i>Request to revise WQBELs for Chollas Creek Diazinon TMDL based on recalculated criteria.</i></p> <p>The San Diego County Copermittees assert that the Chollas Creek Diazinon TMDL is based on erroneous numeric targets due to an error discovered in the criteria used to develop the TMDL. The San Diego County Copermittees requested that the WQBELs for the Chollas Creek Diazinon TMDL be revised based on recalculated criteria, or remove the TMDL until the WQBELs can be “corrected.”</p>	<p><b>Copermittees</b> San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request.</p> <p>The Chollas Creek Diazinon TMDL was incorporated into the Basin Plan in September 2003. Until the Basin Plan is revised to include the “corrected” criteria as part of the numeric targets, the San Diego Water Board is required to include the TMDL requirements in the Tentative Order consistent with the requirements of the TMDL in the Basin Plan.</p> <p>The criteria utilized in the development of the Chollas Creek Diazinon TMDL are more protective than the “corrected” criteria cited by the commenter. Implementation of the Chollas Creek Diazinon TMDL with the WQBELs consistent with the numeric targets in the TMDL in the Basin Plan is protective of the water quality standards in receiving waters.</p> <p>According to the commenter, the “corrected” criteria were discovered in 2004. The commenter has had almost 9 years to approach the San Diego Water Board to request a revision to the TMDL in the Basin Plan. If the commenter would like to revise the numeric targets of the TMDL in the Basin Plan, the commenter must approach the TMDL and Basin Planning staff of the San Diego Water Board to request the change. Requesting the change through the MS4 permit development process is not the appropriate forum.</p> <p>The WQBELs for the Chollas Creek Diazinon TMDL were not revised.</p>

March 27, 2013

AttE2-1 ATTACHMENT E 2: Shelter Island Yacht Basin Dissolved Copper TMDLs	
<p><b>COMMENT:</b> <i>Request to include San Diego Unified Port District as MS4 operator in SIYB Dissolved Copper TMDL.</i></p> <p>The City of San Diego requested that the San Diego Unified Port District be listed as a Responsible Copermitttee under the dissolved copper TMDL for Shelter Island Yacht Basin.</p>	<p><b>Copermitttees</b> City of San Diego</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the San Diego Unified Port District should be listed as a Responsible Copermitttee under the Shelter Island Yacht Basin dissolved copper TMDL.</p> <p>The Shelter Island Yacht Basin dissolved copper TMDL adopted under Resolution No. R9-2005-0019 only listed the City of San Diego as an owner or operator of an MS4 that discharges to Shelter Island Yacht Basin. The TMDL provides a wasteload allocation (WLA) of 30 kg/yr for MS4 discharges by the City of San Diego only.</p> <p>This means that if the San Diego Unified Port District does in fact have MS4 discharges to Shelter Island Yacht Basin, the TMDL currently has assigned MS4 discharges from the San Diego Unified Port District a WLA of 0 kg/yr. Any discharge of dissolved copper from MS4s owned or operated by the San Diego Unified Port District to Shelter Island Yacht Basin would be in violation of its WLA and WQBELs expressed as effluent limitations.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

AttE2-2 ATTACHMENT E 2: Shelter Island Yacht Basin Dissolved Copper TMDLs	
<p><b>COMMENT:</b> <i>Request to revise WQBELs expressed as receiving water limitations for the Shelter Island Yacht Basin Dissolved Copper TMDL to include Water Effects Ratio.</i></p> <p>The San Diego County Copermittees noted that the Water Effects Ratio (WER) term was incorporated into the Chollas Creek Dissolved Metals TMDLs and requested that the WQBELs expressed as receiving water limitations for the Shelter Island Yacht Basin Dissolved Copper TMDL include the WER term.</p>	<p><b>Copermittees</b> San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request.</p> <p>The San Diego Water Board has included a WER multiplier to the WQBELs expressed as receiving water limitations for the Shelter Island Yacht Basin Dissolved Copper TMDL. The WER is assumed to be 1.0 unless there is a site-specific and chemical-specific WER. The WER must be incorporated into the Basin Plan before it can be utilized in the calculation for the WQBELs expressed as receiving water limitations. The footnote includes this clarification.</p> <p>The San Diego Water Board also revised the footnotes for the WER term in the Chollas Creek Dissolved Metals TMDLs to clarify that the WER is assumed to be 1.0 unless a site-specific and chemical-specific WER is provided in the Basin Plan.</p>

March 27, 2013

AttE3-1 ATTACHMENT E 3: Rainbow Creek Total Nitrogen and Total Phosphorus TMDLs	
<p><b>COMMENT:</b> <i>Request to remove the Rainbow Creek Total Nitrogen and Total Phosphorus TMDLs from the Tentative Order.</i></p> <p>The County of San Diego and San Diego County Copermittees requested the Rainbow Creek Total Nitrogen and Total Phosphorus TMDLs be removed from Attachment E to the Tentative Order. The Copermittees noted that the TMDL, as it is incorporated in the Basin Plan, only identified a wasteload allocation (WLA) for Caltrans. The TMDL only assigns load allocation (LAs) for land uses to the County of San Diego. The Copermittees assert that only requirements for WLAs can be incorporated into an NPDES permit.</p> <p>The San Diego County Copermittees also requested, if the Rainbow Creek Total Nitrogen and Total Phosphorus TMDLs are not removed from Attachment E, that one of the compliance determination options allow the Responsible Copermittee to demonstrate compliance by “using its legal authority to reduce nutrient discharges from the land uses identified...to the maximum extent practicable.”</p>	<p><b>Copermittees</b>                      County of San Diego                      San Diego County Copermittees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request to remove the Rainbow Creek Total Nitrogen and Total Phosphorus TMDLs from Attachment E. The San Diego Water Board also disagrees with allowing compliance by only achieving MEP.</p> <p>The Basin Plan states in the Rainbow Creek Total Nitrogen and Total Phosphorus TMDLs, “<i>In the event that a nonpoint source becomes a permitted discharge, the portion of the load allocation that is associated with the source can become a wasteload allocation</i>” (page 7-17 of the Basin Plan). The Rainbow Creek Total Nitrogen and Total Phosphorus TMDLs include several LAs that have been assigned to land uses that fall within the jurisdiction of the County of San Diego and discharge non-storm water and storm water to and from its MS4. Because these “nonpoint sources” are discharges subject to the requirements of an NPDES permit, they are permitted discharges. Thus they are effectively and appropriately considered WLAs that must be incorporated into the Tentative Order.</p> <p>The San Diego Water Board has revised and reorganized the format of the TMDL requirements in Attachment E, as requested by the Copermittees (see response to comment AttE-4). The reformatting and reorganization also resulted in the removal of the WLA term from the TMDL requirements. The introductory paragraph has been revised to specify that the TMDLs in Attachment E incorporate provisions that implement the LAs and WLAs applicable to discharges regulated under the Tentative Order.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

**AttE3-1 ATTACHMENT E 3: Rainbow Creek Total Nitrogen and Total Phosphorus TMDLs**

The request by the Copermittees to include a compliance determination option of allowing compliance only by achieving MEP is not appropriate for a TMDL. TMDLs require the achievement of WQBELs when technology-based effluent limitations (TBELs) cannot achieve the attainment of water quality standards in receiving waters. The MEP standard is a TBEL. The Responsible Copermittee must achieve the WQBELs to either restore or protect water quality standards in receiving waters, or ensure discharges from the MS4 do not cause or contribute to exceedances of water quality standards in receiving waters.

The San Diego Water Board did not remove the Rainbow Creek Total Nitrogen and Total Phosphorus TMDLs from Attachment E. The San Diego Water Board did not include a compliance determination option that allows compliance only by achieving MEP.

AttE5-1 ATTACHMENT E 5: Baby Beach and Shelter Island Shoreline Park Bacteria TMDLs	
<p><b>COMMENT:</b> <i>Request to revise the WQBELs of the Baby Beach and Shelter Island Shoreline Park Bacteria TMDL requirements to allow for load-based compliance.</i></p> <p>The Orange County and San Diego County Copermittees, Environmental Groups, and the USEPA each commented that the bacteria TMDLs included load-based WLAs, expressed as mass loads, percent load reductions, or both, and recommended including load-based WQBELs. The Orange County and San Diego County Copermittees requested the WQBELs include load-based effluent limitations and allow compliance to be demonstrated with load-based effluent limitations instead of concentration-based effluent limitations. The Environmental Groups did not support allowing compliance determination solely through mass-loading numbers.</p>	<p><b>Copermittees</b>                      Orange County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Environmental Groups</p> <p><b>State/Federal Government</b>                      USEPA</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request to include requirements that allow for load-based compliance with the Baby Beach and Shelter Island Shoreline Park Bacteria TMDLs.</p> <p>Please see the responses to comment AttE-1 and AttE-3.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

AttE6-1 ATTACHMENT E 6: Beaches and Creeks Bacteria TMDLs	
<p><b>COMMENT:</b> <i>Water bodies no longer listed on the 303(d) List should not be required to implement or comply with the requirements of the Beaches and Creeks Bacteria TMDLs.</i></p> <p>The Orange County and San Diego County Copermitees and the Cities of Carlsbad, Del Mar and Encinitas submitted comments noting that the Beaches and Creeks Bacteria TMDLs included language that beach segments that were delisted from the 303(d) list are not subject to further action and not required to submit Bacteria Load Reduction Plans (BLRPs) or Comprehensive Load Reduction Plans (CLRPs) as long as monitoring continues to support compliance with REC-1 water quality standards. The Copermitees requested that the Beaches and Creeks Bacteria TMDLs be modified so the beach segments that are not included on the 303(d) list are not required to implement or comply with the Beaches and Creek Bacteria TMDLs requirements.</p>	<p><b>Copermitees</b>                      City of Carlsbad                      City of Del Mar                      City of Encinitas                      Orange County Copermitees                      San Diego County Copermitees</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that beach segments that are not on the 303(d) List should not be required to implement or comply with the Beaches and Creek Bacteria TMDLs requirements.</p> <p>The Beaches and Creeks Bacteria TMDLs have been incorporated into the Basin Plan and apply to all the water bodies listed in the TMDL. The Copermitees cite the following from the introduction to the Beaches and Creeks TMDLs: <i>“Specific beach segments from some of the Pacific Ocean shorelines listed in the above table have been delisted from the 2008 303(d) list that was approved by the San Diego Board on December 16, 2009, and therefore are not subject to any further action as long as monitoring data continues to support compliance with water quality standards”</i> (Basin Plan page 7-60). This does not mean that the TMDLs do not apply to these segments, only that the current BMPs are working and additional actions (i.e. additional BMPs) are not necessary at this time.</p> <p>Under the TMDL Compliance Schedule for the Beaches and Creeks Bacteria TMDLs, the Basin Plan states: <i>“The TMDLs that address the Pacific Ocean shorelines identified in the 2002 303(d) List are assumed to be applicable to all the beaches located on the shorelines of the hydrologic subareas (HSAs), hydrologic areas (HAs), and hydrologic units (HUs) listed above, or as listed individually in the 2008 and future 303(d) Lists”</i> (Basin Plan page 7-106). This means that the TMDLs apply to the entire Pacific Ocean Shorelines identified in the TMDL and is not only where there are beach segments that are listed on the 303(d) List. Thus, it does not matter if a particular segment has been delisted, the TMDLs still apply to the entire Pacific Ocean Shoreline identified in the TMDL.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

### AttE6-1 ATTACHMENT E 6: Beaches and Creeks Bacteria TMDLs

The TMDL Compliance Schedule also states, *“In some cases, receiving water limitations are already being met, resulting in the delisting of those segments or areas from the 2006 and/or 2008 303(d) Lists. The protection of the REC-1 beneficial use of those delisted segments or areas, however, must also be maintained, and those segments or areas must remain off future iterations of the 303(d) List... If receiving water limitations are exceeded in the future in those locations, the BLRPs or CLRPs must include the implementation of a BMP program that will ensure that the TMDLs will be achieved by the end of the TMDL compliance schedules.”* (Basin Plan page 7-106). The Basin Plan continues, *“For watersheds in Table 7-52 where there are no longer any impairments listed on the 2008 303(d) List, the Phase I MS4s and Caltrans are not required to submit a BLRP or CLRP within 18 months of the effective date of these TMDLs. If, however, any segment of a waterbody for the watershed (Pacific Ocean shoreline, creek, or mouth as shown in Table 7-36) is re-listed on a future 303(d) List for any type of indicator bacteria, the Phase I MS4s and Caltrans will be required to submit a BLRP or CLRP within 6 months of the adoption of the 303(d) List by the San Diego Regional Board”* (page 7-107). This means that a BLRP or CLRP is not required by the Basin Plan to be submitted within 18 months of the effective date of the TMDLs, but it also does not mean that the San Diego Water Board cannot require a BLRP or CLRP to be submitted.

The Beaches and Creeks Bacteria TMDLs were developed when it was unknown when the Orange County and San Diego County MS4 Permits would be renewed to incorporate the requirements of the TMDLs. At the time the TMDLs were adopted, the Orange County MS4 Permit had just been renewed in 2009, and the San Diego County MS4 Permit was unlikely to be renewed before 2012. The San Diego Water Board wanted the implementation of the TMDLs to begin with the submittal of BLRPs or CLRPs, before the Orange County and San Diego County MS4 permits were expected to be renewed. Thus, the TMDL included the 18 month period of time for the Copermittees to develop the BLRPs or CLRPs to be required by the San Diego Water Board through an appropriate regulatory mechanism. The regulatory mechanism to compel the submittal of the BLRPs or CLRPs from the Copermittees could have been in the form of an investigative order, enforcement action, or a modification to the existing MS4 permits.

The San Diego Water Board removed the 18 month BLRP or CLRP submittal requirement only for the watersheds where there were no bacteria impairments on the 2008 303(d) List because there was not the same level of urgency to begin implementation of the TMDL requirements as for those watersheds where there continue to be bacteria impairments. The removal of the 18 month BLRP or CLRP submittal requirement did not mean that a BLRP or CLRP would not be required to be developed as part of the TMDL requirements in the MS4 permit.

# RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

## AttE6-1 ATTACHMENT E 6: Beaches and Creeks Bacteria TMDLs

The fact that the Beaches and Creeks Bacteria TMDLs are now part of the Basin Plan means that the TMDLs and the requirements of the TMDLs must be implemented through a regulatory mechanism to restore water quality standards in receiving waters and/or ensure discharges are not causing or contributing to exceedances of water quality standards in receiving waters. In this case, the Tentative Order is the regulatory mechanism that is implementing the requirements of the Beaches and Creeks Bacteria TMDLs to ensure that discharges from the Copermittees' MS4s will comply with the WLAs in the TMDL and not cause or contribute to exceedances of water quality standards in receiving waters.

For segments or areas where there is no bacteria impairment identified on the 303(d) List, implementation of the Beaches and Creeks Bacteria TMDL requirements in the Tentative Order will ensure that discharges from the Copermittees' MS4s will continue to not cause or contribute to exceedances of water quality standards in receiving waters and remain off the 303(d) List. The Copermittees will be required to include the monitoring and assessments that are necessary to demonstrate that discharges from the Copermittees MS4s continue to not cause or contribute to exceedances of water quality standards in receiving waters and remain off the 303(d) List. The Copermittees will not be required to include additional BMPs in the Water Quality Improvement Plans if the existing BMPs are allowing the Copermittees to achieve the bacteria TMDL requirements. If, however, bacteria impairments result in the re-listing of any of these beach segments on the 303(d) List, the incorporation of the TMDL requirements in the Water Quality Improvement Plan will fulfill the CLRP requirements, and the Copermittees will be required to update the Water Quality Improvement Plan to ensure that discharges from the Copermittees' MS4s will not cause or contribute to exceedances of water quality standards in receiving waters by the final TMDL compliance date.

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>AttE6-2 ATTACHMENT E 6: Beaches and Creeks Bacteria TMDLs</b>	
<p><b>COMMENT:</b> <i>Estimated costs to implement Beaches and Creeks Bacteria TMDLs are very high, and TMDLs may not be attainable.</i></p> <p>Several community planning groups, the County of San Diego and the San Diego Taxpayers Association expressed concerns with the estimated costs of implementing the Beaches and Creeks Bacteria TMDLs. There were also concerns expressed about the feasibility of attaining the TMDLs. The commenters generally objected to including the Beaches and Creeks Bacteria TMDLs in the Tentative Order until there was some certainty that the expenses associated with implementing the TMDLs will result in the achievement of the TMDLs.</p>	<p><b>Community Planning Groups</b>                      Pala Pauma Valley Community Sponsor Group                      Jamul Dulzura Community Planning Group                      Ramona Community Planning Group                      Julian Community Planning Group</p> <p><b>Copermittees</b>                      County of San Diego                      County of San Diego Office of County Counsel</p> <p><b>Societies/Associations/Coalitions</b>                      San Diego Taxpayers Association</p>
<p><b>RESPONSE:</b> The San Diego Water Board understands the concerns with the potential costs of implementing the requirements of the TMDLs, as well as the concerns with the feasibility of attaining the TMDLs.</p> <p>The costs associated with achieving the requirements of the Beaches and Creeks Bacteria TMDLs were considered during Basin Plan amendment process. The Beaches and Creeks Bacteria TMDL Basin Plan amendment was made available for public review and comment on several occasions. The San Diego Water Board adopted the Beaches and Creeks Bacteria TMDLs after considering the potential costs. The State Water Board, Office of Administrative Law, and the USEPA also approved the Beaches and Creeks Bacteria TMDLs.</p> <p>At this time it is difficult to predict the actual costs of complying with the Beaches and Creeks Bacteria TMDL requirements. Even the estimates that have been provided by the County of San Diego and the City of San Diego in their Comprehensive Load Reduction Plans acknowledge there is significant uncertainty in their cost estimates. While the cost estimates do provide some idea of the magnitudes of the potential costs for implementing BMPs and programs to achieve the TMDLs, the cost estimates fail to include or consider the potential cost savings or cost benefits that may be achieved or realized by implementing the Beaches and Creeks Bacteria TMDLs.</p> <p>The Beaches and Creeks Bacteria TMDL requirements provide the Copermittees a compliance schedule of up to 20 years. The Copermittees have not truly begun implementing the requirements of the TMDLs and have only questioned and raised concerns over the potential costs and feasibility of attaining the TMDLs before developing any information to demonstrate the TMDLs cannot, in fact, be attained or that the costs exceed the benefits of implementing the TMDLs.</p>	

# RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001

March 27, 2013

<b>AttE6-2 ATTACHMENT E 6: Beaches and Creeks Bacteria TMDLs</b>	
	<p>The San Diego Water Board is implementing the requirements of the federal Clean Water Act. The incorporation of the requirements of the Beaches and Creeks Bacteria TMDLs in the Tentative Order is required to implement the WLAs that have been assigned to the MS4s, which is supported by the USEPA. The San Diego Water Board has not removed the Beaches and Creeks Bacteria TMDLs from Attachment E to the Order.</p>

	<p><b>COMMENT:</b> <i>Request to revise the Beaches and Creeks Bacteria TMDL requirements to allow for BMP-based compliance.</i></p> <p>The Orange County and San Diego County Copermittees requested that the Beaches and Creeks Bacteria TMDL requirements be revised to allow for BMP-based compliance. Several Copermittees submitted separate comments supporting the concept.</p> <p>Comments from Environmental Groups were not in support of allowing BMP-based compliance with the TMDL requirements through a “reasonable assurance analysis.”</p>	<p><b>Copermittees</b>                      City of Imperial Beach                      City of Poway                      City of San Diego                      Orange County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Environmental Groups</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the Copermittees’ request. The San Diego Water Board disagrees with the Environmental Groups that BMP-based compliance option should not be provided.</p> <p>Please see the response to comment AttE-1.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

AttE6-5 ATTACHMENT E 6: Beaches and Creeks Bacteria TMDLs	
<p><b>COMMENT:</b> <i>Request to revise the Beaches and Creeks Bacteria TMDL requirements to allow for adjustment of interim TMDL compliance dates.</i></p> <p>The Orange County and San Diego County Copermittees and the City of San Diego submitted comments noting that the Beaches and Creeks Bacteria TMDL included a provision that allows for the Copermittees to propose interim compliance dates if they develop a Comprehensive Load Reduction Plan, and requested the TMDL requirements be modified to allow for the interim TMDL compliance dates to be adjusted. The City of Imperial Beach supported the concept. The Environmental Groups requested that there be an assessment of progress toward achieving the interim goals within the term of the permit.</p>	<p><b>Copermittees</b>                      City of Imperial Beach                      City of San Diego                      Orange County Copermittees                      San Diego County Copermittees</p> <p><b>Environmental Organizations</b>                      Environmental Groups</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees with the Copermittees to allow for the interim TMDL compliance dates to be adjusted. The San Diego Water Board also agrees that there should be an assessment or progress toward achieving interim goals within the term of the permit.</p> <p>The Water Quality Improvement Plan is essentially the same as a CLRP. Including language allowing the Copermittees to adjust the interim TMDL compliance dates in the Water Quality Improvement Plan would not be inconsistent with the requirements of the Beaches and Creeks Bacteria TMDLs in the Basin Plan. Thus, the San Diego Water Board has included language in Specific Provision 6.c.(1) of the revised Tentative Order that allows the Copermittees to propose alternative interim TMDL compliance dates in the Water Quality Improvement Plan.</p> <p>The requirements of Provision B.3.a.(2)(b) in the revised Tentative Order also require the Copermittees to establish an interim goal that the Copermittees will work toward achieving within the term of the permit.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

<b>AttE6-6 ATTACHMENT E 6: Beaches and Creeks Bacteria TMDLs</b>		
	<p><b>COMMENT:</b> <i>Requests to revise the WQBELs of the Beaches and Creeks Bacteria TMDLs requirements.</i></p> <p>The City of Laguna Niguel submitted comments with information from a study being conducted by the Southern California Coastal Waters Research Project (SCCWRP) in cooperation with the Copermittees regarding bacteria loads that can be attributed to natural sources. The information provided by the City of Laguna Niguel was provided to support a request to include load-based WQBELs based on load reductions. The City of Laguna Niguel also requested that the load reductions be calculated using a baseline of 1996-2002 data instead of 2002-2011 data.</p> <p>The San Diego County Copermittees submitted comments noting that the total coliform water quality objectives only apply to ocean waters and should not be applied to creeks. The San Diego County Copermittees requested that the WQBELs expressed as receiving water limitations specify that the total coliform receiving water limitations only apply to beaches and not creeks.</p>	<p><b>Copermittees</b>                      City of Laguna Niguel                      San Diego County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the requests from the City of Laguna Niguel and the San Diego County Copermittees.</p> <p>The San Diego Water Board has incorporated WQBELs expressed as load-based effluent limitations based on percent load reductions. Please see the response to comments AttE-1 and AttE-3.</p> <p>The San Diego Water Board revised the tables with the WQBELs expressed as receiving water limitations to be consistent with the tables in the Beaches and Creeks Bacteria TMDLs.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2013-0001**

March 27, 2013

AttE6-7 ATTACHMENT E 6: Beaches and Creeks Bacteria TMDLs		
	<p><b>COMMENT:</b> <i>Request to revise the Beaches and Creeks Bacteria TMDLs monitoring and assessment requirements to be consistent with TMDL Basin Plan amendment.</i></p> <p>The San Diego County Copermitees submitted comments requesting that the Beaches and Creeks Bacteria TMDLs monitoring and assessment requirements in the Order include the procedures to calculate wet weather exceedance frequencies as provided in the TMDL Basin Plan amendment.</p>	<p><b>Copermitees</b> San Diego County Copermitees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the request.</p> <p>Specific Provisions 6.d.(1)(c) and 6.d.(2)(c) have been modified to include the procedures for calculating the dry weather and wet weather exceedance frequencies for beaches and creeks.</p>

# Response to Comments on Tentative Order No. R9-2015-0001

## January 21, 2015

### Introduction

This report contains responses to written comments timely received on Tentative Order No. R9-2015-0001, *An Order Amending Order No. R9-2013-0001, NPDES No. CAS010266, National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region*. The Tentative Order and its attachments were available for public review and comment for 60 days, with the comment period ending on November 19, 2014. Specifically, the San Diego Water Board requested comments on the following three documents:

- Tentative Order No. R9-2015-0001;
- Attachment No. 1 – Revised Order No. R9-2013-0001; and
- Attachment No. 2 – Revised Fact Sheet to Order No. R9-2013-0001.

The phrases “Tentative Order” and “Tentative Order as it amends Order No. R9-2013-0001” in the following response to comments table refers to both Tentative Order No. R9-2015-0001 and the two attachments. Comments and responses are organized by the section of either Attachment 1 or Attachment 2 that is being referenced. Wherever possible, comments are grouped based on content and summarized by the San Diego Water Board. The actual comment letters can be accessed on the San Diego Water Board website at:

[http://www.waterboards.ca.gov/sandiego/water\\_issues/programs/stormwater/oc\\_stormwater.r.shtml](http://www.waterboards.ca.gov/sandiego/water_issues/programs/stormwater/oc_stormwater.r.shtml).

### List of Commenters:

Comments were submitted by the following organizations, public agencies, or individuals:

1. City of Aliso Viejo
2. City of Del Mar
3. City of Lake Forest
4. City of San Diego
5. Coalition (San Diego Building Industry Association, Building Industry Association of Southern California, Associated General Contractors, Associated Builders and Contractors, San Diego Regional Chamber of Commerce, Business Leadership Alliance, San Diego Association of Realtors, San Diego Apartment Association, National Association of Industrial & Office Properties, Building Office & Management Association, San Diego Chapter of the American Society of Landscape Architects)
6. Coastal Environmental Rights Foundation
7. Construction Industry Coalition on Water Quality (The Associated General Contractors of California, Building Industry Association of Southern California,

Engineering Contractors Association, Southern California Contractors Association, and the United Contractors located in San Ramon in Northern California)

8. County of Orange
9. County of San Diego
10. County of Riverside
11. Industrial Environmental Association
12. San Diego Coastkeeper
13. San Diego Unified Port District
14. Tory R. Walker Engineering, Inc.

## **Acronyms and Abbreviations**

The following acronyms and abbreviations are used in the response to comments table.

ASBS	Area(s) of Special Biological Significance
BMP	Best Management Practice
Basin Plan	Water Quality Control Plan for the San Diego Basin
CEQA	California Environmental Quality Act
CFR	Code of Federal Regulations
CWA	Clean Water Act
CWC	California Water Code
LID	Low Impact Development
MEP	Maximum Extent Practicable
MS4	Municipal Separate Storm Sewer System
NAL	Non-Storm Water Action Level
NPDES	National Pollutant Discharge Elimination System
ROWD	Report of Waste Discharge (application for NPDES reissuance)
SAL	Storm Water Action Level
San Diego Water Board	California Regional Water Quality Control Board, San Diego Region
State Water Board	State Water Resources Control Board
TMDL	Total Maximum Daily Load
USEPA	United States Environmental Protection Agency
WLA	Waste Load Allocation
WQBEL	Water Quality Based Effluent Limitation

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0001**

**PREVIOUSLY SUBMITTED COMMENT LETTERS**

PR-1: Written comments submitted during adoption proceedings of Order No. R9-2013-0001 are applicable to Tentative Order No. R9-2015-0001 and should be considered ..... 8

PR-2: Construction Industry Coalition on Water Quality resubmits its comment letters pertaining to hydromodification management ..... 9

**GENERAL COMMENTS**

Gnl-1: Remove City of Lake Forest from Table 1b and the associated footnote..... 10

Gnl-2: Tentative Order toxicity requirements do not take into account information presented in the Orange County Copermittees ROWD..... 11

Gnl-3: Numbering in Tentative Order should explicitly identify the major sections to help the reader..... 13

Gnl-4: Tentative Order provides an overly broad interpretation of the stormwater regulations by requiring MS4s to “enhance” and “restore” beneficial uses. .... 14

Gnl-5: Tent Order includes language that provides an overly broad use of the term “prohibit”. .... 15

Gnl-6: Tentative Order’s WQBELs were improperly formulated..... 16

Gnl-7: WQBELs should only be defined as effluent limitation ..... 17

**LEGAL COMMENTS**

Lgl-1: Land Development requirements expose Copermittees to significant litigation risk and will be largely unenforceable. .... 18

Lgl-2: Tentative Order numeric WQBELs violate the requirements of law because they are infeasible..... 21

Lgl-3: San Diego Water Board does not have the legal authority to issue a regional MS4 permit..... 23

Lgl-4: The Requirements in the Tentative Order No. R9-2015-0001 are more stringent than federal law, requiring an economic analysis..... 25

Lgl-5: The San Diego Water Board cannot determine whether a particular mandate is unfunded..... 27

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0001  
(Cont'd)**

**FINDINGS**

Fnd-1: Modify Findings and/or Fact Sheet to include additional key findings. .... 29

Fnd-2: Modify Finding 7 - In-Stream Treatment Control Systems to allow for the implementation of regional BMPs. .... 30

Fnd-3: Modify Finding 8, 16, and 17 to remove presumption that discharges from MS4s always contain waste. .... 32

Fnd-4: Delete Finding 11 Natural waters cannot legally be classified as part of the MS4, and a part of both the MS4 and receiving water. .... 34

Fnd-5: Modify Finding 12 to remove sentence that discusses "free and open access to an MS4". .... 35

Fnd-6: Modify Finding 15 to recognize that the discharge of all pollutants from the MS4 is subject to the MEP standard. .... 37

Fnd-7: Revise Finding 29 to clarify single water board regulations of Cities of Lake Forest, Laguna Woods, Laguna Hills. .... 38

Fnd-8: Modify Finding 31 to state the Tentative Order is more stringent than Federal Law, requiring an analysis of the factors pursuant to Water Code Section 13241..... 39

Fnd-9: Delete Finding 32 The San Diego Water Board has no legal ability to determine whether a particular mandate is unfunded. .... 40

**PROVISION A: PROHIBITIONS AND LIMITATIONS**

A-1: Include path to compliance with prohibitions, receiving water limitations, and effluent limitations in the Tentative Order. .... 41

**PROVISION B: WATER QUALITY IMPROVEMENT PLANS**

B-1: Water Quality Improvement Plans should be the foundation for a BMP-based compliance approach. .... 44

B-2: Water Quality Improvement Plans need to be based on regionally appropriate water quality standards that reflect sustainable conditions for beneficial uses. .... 45

**PROVISION B.1: Watershed Management Areas**

B1-1: Revise footnote 2 to Table B-1 to clarify single water regulation of City of Lake Forest. .... 46

B1-2: Revise language in Tentative Order to clarify NPDES permit is applicable to discharges from Copermittees MS4s. .... 47

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0001  
(Cont'd)**

**PROVISION B.3: Water Quality Improvement Goals, Strategies and Schedules**

B3-1: Provision B.3.a should explicitly state that the action levels, interim goals and final goals are not enforceable limitations..... 48

**PROVISION C: ACTION LEVELS**

C-1: Tentative Order should enable the Copermittees to apply NALs/SALs based on the priorities of the Water Quality Improvement Plan and/or the IDDE program..... 49

**PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS**

D-1: Copermittees need to have the flexibility to use analytical monitoring in the water quality improvement plans..... 52

D-2: Modify Tentative Order requirements to be consistent with language in the South Orange County Wastewater Authority permit language ..... 54

**PROVISION E: JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS**

E-1: Water Quality Improvement Plans and related Jurisdictional Runoff Management Programs should be streamlined and focus on the watershed's highest priorities..... 55

**PROVISION E.1: Legal Authority Establishment and Enforcement**

E1-1: Copermittees are only responsible for administering and enforcing the codes and ordinances applicable to their jurisdictions. .... 57

E1-2: The requirement for third party BMP effectiveness documentation is duplicative ..... 58

**PROVISION E.2: Illicit Discharge Detection and Elimination**

E2-1: Modify the Illicit Discharge Detection and Elimination Program Provisions so as not to negate the very intent and purpose of the watershed approach..... 59

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0001  
(Cont'd)**

**PROVISION E.2.a: Non-Storm Water Discharges**

E2a-1: Copermitees should be given flexibility to prioritize their IDDE program to focus on non-storm water discharges likely to be a source of pollutants..... 60

E2a-2: Modify Provision E.2.a.(5) to reflect the language previously adopted by the Regional Board in Order No. R9-2009-0002 regarding emergency firefighting discharges..... 62

E2a-3: Tentative Order Should Not Require the Elimination of Non-Storm Water Discharges as a Part of the IDDE Program..... 63

**PROVISION E.3: Development Planning**

E3-1: Development Planning Provisions must be modified so as not to negate the very intent and purpose of the watershed approach..... 64

**PROVISION E.3.b: Priority Development Projects**

E3b-1: Portions of redevelopment projects that already have water quality treatment BMPS should not be subject to the new PDP requirements ..... 65

E3b-2: Tentative Order should include a priority development project exemption for flood control and stream restoration projects ..... 66

E3b-3: Tentative Order should include a priority development project exemption for emergency public safety projects ..... 67

**PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements**

E3c-1: Modify Tentative Order to allow flexibility in structural BMP performance standards if watershed-specific performance standards are developed in the WQIP ..... 68

**PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements**

E3c1-1: Terminology is inconsistent with the use of “Low Impact Development” BMPs..... 70

E3c1-2: San Diego Water Board is requiring increasingly stringent onsite storm water retention requirements..... 71

E3c1-2: Tentative Order and Fact Sheet ignore the findings of the Copermitee’s Report of Waste Discharge ..... 73

E3c1-4: If priority development projects use alternative compliance, onsite conventional BMPs should not also be required. .... 75

E3c1-5: Biofiltration BMPs Should Be Sized for the Design Capture Volume ..... 77

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0001  
(Cont'd)**

**PROVISION E.3.c.(2): Hydromodification Management BMP Requirements**

E3c2-1: Hydromodification requirements are based on faulty foundational assumptions..... 79

E3c2-2: Hydromodification management requirements should be based on a watershed management approach, be consistent with the WQIPs, and consider the current Copermittee HMPs. .... 81

E3c2-3: San Diego Water Board is eliminating exemptions for hydromodification control when stormwater runoff is conveyed to significantly hardened or engineered channels..... 84

E3c2-4: Hydromodification Control Requirements to avoid critical sediment yield areas are unnecessarily restrictive.. .... 86

E3c2-5: Modify Tentative Order to clarify that the interim hydromodification exemptions are in place until the San Diego Water Board approves the BMP Design Manual ..... 88

**PROVISION E.3.c.(3): Alternative Compliance to Onsite Structural BMP Implementation**

E3c3-1: Requests for the Water Quality Equivalency calculations be included as an optional Copermittee deliverable. .... 89

E3c3-2: Copermittees Should Be Allowed Flexibility to Develop a Trading and Water Quality Credit System ..... 90

**PROVISION E.3.e: Priority Development Project BMP Implementation and Oversight**

E3e-1: Include the date the BMP manual will be implemented to provide clarity..... 91

E3e-2: Define Prior Lawful Approval in the Tentative Order. .... 92

**PROVISION E.4: Construction Management**

E4-1: Modify Construction Management Program provisions so as not to negate the very intent and purpose of the watershed approach ..... 95

**PROVISION E.5: Existing Development Management**

E5-1: Modify Existing Development Program provisions so as not to negate the very intent and purpose of the watershed approach ..... 96

E5-2: Delete the requirement to evaluate retrofit of stream channels..... 97

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0001  
(Cont'd)**

**PROVISION E.6: Enforcement Response Plans**

E6-1: Copermitees Should be Allowed to Utilize Existing Guidelines and Procedures for Enforcement..... 98  
E6-2: Redefine "Escalated Enforcement" ..... 99

**PROVISION E.7: Public Education and Participation**

E7-1: The Public Education Program provisions must be modified so as not to negate the very intent and purpose of the watershed approach..  
..... 100

**PROVISION F: REPORTING**

F-1: Modify Tentative Order to better align reporting requirements with the process for development and updates of the various plans. .... 101

**PROVISION H: MODIFICATION OF PROGRAMS**

H-1: Modify Tentative Order to include an explicit re-opener provision..... 103

**ATTACHMENT A: Discharge Prohibitions and Special Protections**

AttA-1: The City supports the proposed changes to the Areas of Special Biological Significance ..... 104

**ATTACHMENT C: Acronyms, Abbreviations, and Definitions**

AttC-1: Request for additional or modified definitions ..... 105

**ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads**

AttE-1: Compliance determination for final WQBELs should be based on implementation of BMPs and not numeric effluent limitations. .... 106  
AttE-2: Modify Tentative Order to include a compliance mechanism prior to approval of the WQIP. .... 108

**ATTACHMENT E 5: Baby Beach and Shelter Island Shoreline Park Bacteria TMDL**

AttE5-1: Correct discrepancies between adopted TMDL Basin Plan and provision in Tentative Order..... 109  
AttE5-2: WQBELs for Baby Beach TMDL inappropriately include TMDL numeric targets. .... 110

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0001  
(Cont'd)**

**ATTACHMENT E 6: Beaches and Creeks Bacteria TMDL**

AttE6-1: Correct discrepancies between adopted TMDL Basin Plan and provision in Tentative Order..... 112  
AttE6-2: WQBELs for Beaches and Creeks TMDL inappropriately include TMDL numeric targets. .... 113

**ATTACHMENT E 7: Los Peñasquitos Lagoon Sediment TMDL**

AttE7-1: Modify the Tentative Order to allow individual jurisdictional compliance with TMDLs. .... 115  
AttE7-2: Clarify that waste load allocations include discharges from other responsible parties in addition to Responsible Copermitees ..... 116  
AttE7-3: Revise the Final TMDL Compliance Determination to be Consistent with the Basin Plan Amendment and Other TMDLs. .... 117  
AttE7-4: Revise the Final TMDL Compliance Determination to be Consistent with the Basin Plan Amendment and Other TMDLs. .... 119  
AttE7-5: Revise interim TMDL compliance options in Tentative Order to be consistent with the basin plan amendment. .... 120  
AttE7-6: Revise the heading on column 2 of Table 7.2 from tons/year to tons/wet season to be consistent with the basin plan amendment. .... 121  
AttE7-7: Revise monitoring and assessment requirements to require monitoring start the first full wet season after WQIP is accepted by the Regional Board. .... 122

**ATTACHMENT F: Fact Sheet / Technical Report**

AttF-1: Based on the successes of the Orange County Stormwater Program, there is little justification for much of the Tentative Order. .... 123  
AttF-2: Modify Fact Sheet to include language explaining the iterative approach and TMDLs. .... 125  
AttF-3: Modify Fact Sheet to include language explaining the incorporation of New TMDLs into the WQIPs. .... 126

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>PR- 1 PREVIOUSLY SUBMITTED COMMENT LETTERS</b>	
<p><b>COMMENT:</b> <i>All prior comments, evidence, and objections made during adoption of Order No. R9-2013-0001 are applicable to Tentative Order No. R9-2015-0001 are requested to be incorporated during consideration of Tentative Order No. R9-2015-0001.</i></p> <p>Because of the uncertainty of the legal impact the anticipated adoption of Tentative Order No. R9-2015-0001 might have upon pending appeals with the State Water Resources Control Board (State Board) of the Order being amended (Order No. R9-2013-0001), the commenters wish to renew all objections to various aspects of the Tentative Order as described in any petition already before the State Board and further wish to incorporate all evidence pertaining to those objections.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> <li>• <b>County of San Diego</b> Concurring Cities: Petitioners in proceeding A-2254</li> <li>• <b>San Diego Unified Port District</b></li> <li>• <b>Riverside County Copermittees</b></li> <li>• <b>City of San Diego</b></li> </ul>
<p><b>RESPONSE:</b> The San Diego Water Board understands the concerns expressed by the commenters.</p> <p>The San Diego Water Board reviewed Tentative Order No. R9-2015-0001 and its Attachments and has determined that the March 27, 2013 responses to comments document prepared during the 2013 adoption process of Order No. R9-2013-0001 and the oral responses to comments during the workshop and hearings during that process address the renewed comments. The San Diego Water Board incorporates its written responses to comments and oral responses to comments raised during the workshops and hearing on Order No. R9-2013-0001 into these responses. To the extent commenters incorporate issues and objections raised in petitions for review of Order No. R9-2013-0001 filed with the State Board in SWRCB/OCC File A-2254(a)-(p), the San Diego Water Board notes that it has not yet had an opportunity to submit written responses to those petitions for review and is not specifically addressing those petitions for review in these responses to comments. The San Diego Water Board will submit written responses to the petitions for review at the appropriate time in the State Board's petition proceeding. No changes to the Tentative Order or its Attachments were made based on the renewed comments.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

PR-2	PREVIOUSLY SUBMITTED COMMENT LETTERS	
	<p><b>COMMENT:</b> <i>The Construction Industry Coalition on Water Quality resubmits its comment letters on hydromodification management cited in letters dated September 14, 2012 and January 11, 2013, which were submitted as part of the May 2013 adoption process of Order No. R9-2013-0001.</i></p>	<p><b>Construction Industry Coalition on Water Quality</b></p> <ul style="list-style-type: none"> <li>• San Diego Building Industry Association</li> <li>• Building Industry Association of Southern CA</li> <li>• Associated General Contractors</li> <li>• Associated Builders and Contractors</li> <li>• San Diego Regional Chamber of Commerce</li> <li>• Business Leadership Alliance</li> <li>• San Diego Association of Realtors</li> <li>• San Diego Apartment Association</li> <li>• National Association of Industrial &amp; Office Properties</li> <li>• Building Office &amp; Management Association</li> <li>• San Diego Chapter of American Society of Landscape Architects</li> </ul>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>Gnl-1 GENERAL COMMENTS</b>		
	<p><b><u>COMMENT:</u></b> <i>Remove City of Lake Forest from Table 1b and the associated footnote.</i></p> <p>The City of Lake Forest requests changes to the Tentative Order to clarify regulation of the City of Lake Forest by a single water board as described in the agreement between the Santa Ana Water Board and the San Diego Water Board.</p>	City of Lake Forest
	<p><b><u>RESPONSE:</u></b> The San Diego Water Board generally agrees with the City's comment.</p> <p>The City of Lake Forest was removed from the list of Copermittees in Table 1b and a footnote to the Table was added to identify the requirements of the Order that apply to the City of Lake Forest.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>Gnl-2 GENERAL COMMENTS</b>	
	<p><b>COMMENT:</b> <i>The Tentative Order toxicity requirements do not take into account information presented in the Orange County Copermittees ROWD.</i></p> <p>The County of Orange and Concurring Cities, and Orange County Flood Control District comment that toxicity occurs sporadically in streams and creeks in south Orange County and toxicity is encountered in open (undeveloped) areas at levels equivalent to those in urban areas. They also comment that there is a greater prevalence of toxicity in wet weather and pesticides are implicated as the principal source of this toxicity. This pattern suggests that dry weather toxicity is not caused by urban sources of pollutants. Moreover pesticide use, presents a moving target for MS4 management efforts due to the continuous introduction of new products. Regulation of pesticide use is exclusively within the jurisdiction of state and federal agencies and not the role of MS4s.</p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the comment. The San Diego Water Board reviewed and considered the information pertaining to toxicity within the Copermittees' ROWD.</p> <p>Generally speaking, numerous sources of potential pollutants in storm water runoff exist, including contributions from urban activities such as industry, transportation, and residential development or from agricultural activities. Runoff from pervious and impervious areas (i.e., streets, parking lots, lawns, golf courses and agricultural land) carries accumulated contaminants (i.e., atmospheric dust, trace metals, street dirt, hydrocarbons, fertilizers and pesticides) into receiving waters. This problem is exacerbated in Southern California, where urbanization dominates most watersheds. In southern California, the runoff from urbanized watersheds contributes substantial loadings of a variety of constituents to receiving water environments. For example, the Southern California Coastal Water Research Project (SCCWRP) has estimated the cumulative loads of lead and zinc from all of the urbanized watersheds in the Southern California Bight to the coastal oceans represent over half of the combined mass emissions from all sources, which include traditional point sources such as publicly owned treatment works, industrial facilities, and power generating stations.</p> <p>Because of the additive and antagonistic interactions of the many chemical constituents found in storm water runoff, there is a strong potential for receiving water quality impacts related to toxicity. Moreover, the varied structural BMPs in use to reduce pollutant levels in urban runoff are not capable of reducing the most toxic fraction of runoff, the dissolved phase. Metals typically associated with fine particles in storm water runoff also have the potential to accumulate in the sediments of downstream receiving waters where they may contribute to the risk of toxicity. Therefore, even when BMPs have been shown to reduce the larger particulates found in runoff, it cannot be assumed that treatment processes are also reducing toxicity. Consequently, direct</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Gnl-2	GENERAL COMMENTS
	<p>measurement of toxicity in storm water runoff and receiving water sediments is needed.</p> <p>The requirements for toxicity sampling were updated during the adoption of Order No. R9-2013-0001 in response to comments provided by USEPA to make the toxicity requirements more consistent with recently adopted MS4 permits (i.e. Caltrans and Los Angeles County MS4 Permits). The recently adopted Caltrans and Los Angeles County MS4 Permits include updated toxicity data collection procedures and data analysis methods that are consistent with the Draft State Water Resources Control Board Policy for Toxicity Assessment and Control, June 2012 (Draft State Board Toxicity Policy). See also response to comment D-1. Sediment monitoring requirements were also updated in Water Quality Control Plan for Enclosed Bays and Estuaries, Part 1 Sediment Quality (State Plan).</p> <p>Based on these considerations, no revisions to the Tentative Order are needed.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

Gnl-3	GENERAL COMMENTS	
	<p><b>COMMENT:</b> <i>Numbering in Tentative Order should explicitly identify the major sections to help the reader.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the Tentative Order should explicitly identify the major permit sections to increase readability.</p> <p>Footers throughout the Tentative Order indicate the subsections, e.g. A.1, A.2, to orient the reader. Additionally, the electronic PDF version of the Tentative Order has bookmarks for the major provisions to assist in navigating the requirements. Therefore, the San Diego Water Board did not make the requested revisions because existing footers and navigation capabilities address the comment.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Gnl-4	GENERAL COMMENTS	
	<p><b>COMMENT:</b> <i>The Tentative Order provides an overly broad interpretation of the storm water regulations by requiring MS4s to “enhance” and “restore” beneficial uses as the CWA only requires that Copermittees protect beneficial uses and prevent nuisance.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the Tentative Order provides an overly broad interpretation of the storm water regulations.</p> <p>The San Diego Water Board reviewed and considered this comment during the adoption process of Order No. R9-2013-0001 (Regional MS4 Permit), making changes that replaced language which referred to “restoring water quality standards in receiving water” to language that required protection of water quality standards in receiving water from MS4 discharges. The Fact Sheet, pages 114-115 to Tentative Order No. R9-2015-0001 clearly states that Provisions E.5.e.(1)-(2) do not require the implementation of channel, streams, and/or habitat rehabilitation projects, but do require the Copermittees to develop a program with strategies to facilitate the implementation of these types of projects in areas of existing development. The strategies are expected to include allowing and encouraging Priority Development Projects to implement retrofitting types of projects as a means of compliance with the structural BMP performance criteria requirements of Provisions E.3.c.(1) and E.3.c.(2). Therefore, no revisions were made to Tentative Order No. R9-2015-0001 or its Attachments.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>Gnl-5 GENERAL COMMENTS</b>	
	<p><b>COMMENT:</b> <i>The Tentative Order includes language that provides an overly broad use of the term “prohibit.”</i></p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the Tentative Order provides an overly board use of the term prohibit.</p> <p>The Clean Water Act requires MS4 permits to include a requirement that non-storm water discharges are to be “effectively prohibited” to the MS4. The Code of Federal Regulations requires each Copermittee to have the legal authority to “prohibit” non-storm water discharges to the MS4. The Phase I Final Rule clarifies what “effectively prohibit” means (55 FR 47995): “Section 402(p)(3)(B) requires that permits for discharges from municipal separate storm sewers require the municipality to “effectively prohibit” non-storm water discharges from the municipal separate storm sewer...Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit (other than the permit for the discharge from the municipal separate storm sewer.)”</p> <p>During the 2013 adoption process for Order No. R9-2013-0001, where appropriate, the language in Order No. R9-2013-0001 was revised to be consistent with the language of the Clean Water Act to include the term “effectively prohibit” instead of “prohibit” or “reduce and eliminate.” In other cases, the language was maintained to be consistent with the requirements of the Code of Federal Regulations requiring the Copermittees to establish the legal authority to “prohibit” non-storm water discharges to their MS4s and enforce that legal authority. The establishment and enforcement of the legal authority to “prohibit” non-storm water discharges to their MS4s is how the Copermittees will “effectively prohibit” non-storm water discharges to their MS4s.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Gnl-6 GENERAL COMMENTS		
	<p><b>COMMENT:</b> <i>The Tentative Order's WQBELs were improperly formulated.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> There are TMDLs in the Basin Plan that established wasteload allocations for MS4 discharges causing or contributing to exceedances of water quality standards in specified impaired water bodies. The San Diego Water Board has included WQBELs that are consistent with the requirements and assumptions and requirements of the TMDLs wasteload allocations (WLAs) in accordance with applicable federal regulations at 40 CFR 122.44(d)(1) (vii)(B) and 40 CFR 122.44(k)(2)-(4). TMDLs included in Attachment 1 to the Tentative Order have been approved by USEPA during the TMDL development process and again reviewed by USEPA as part of the Regional MS4 2013 Permit adoption process.</p> <p>NPDES permits must limit and control all pollutants that are or may be discharged at a level that "will cause, have the reasonable potential to cause, or contribute to an excursion above any State water quality standard including narrative criteria." (See 40 CFR 122.44(d)(1)(i)). The analysis that is performed to determine what pollutants require WQBELs is commonly referred to as the "reasonable potential analysis." NPDES permits must include WQBELs for all pollutants with "reasonable potential." (see 40 CFR 122.44(d)(1)(i))</p> <p>Where a WLA has been assigned to a discharge in a TMDL, it is concluded that there is reasonable potential for the discharger to cause or contribute to an excursion of water quality standards. Because there are TMDLs in the Basin Plan that have identified the established WLAs for MS4s as discharges causing or contributing to exceedances of water quality standards, demonstration of reasonable potential is presumed for the purposes of establishing a WQBEL based on an applicable WLA. (see 40 CFR 122.44(d)(1)(ii))</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Gnl-7	GENERAL COMMENTS	
	<p><b>COMMENT:</b> <i>WQBELs should only be defined as effluent limitations.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board has included WQBELs that are consistent with the assumptions and requirements of TMDL wasteload allocations in accordance with applicable federal regulations at 40 CFR 122.44(d)(1)(vii)(B).</p> <p>WQBELs can be expressed as (1) conditions in receiving waters that are to be attained to restore or protect water quality standards in receiving waters, (2) conditions in discharges that will not cause or contribute to exceedances of water quality standards in receiving waters, (3) BMPs that will ensure discharges will not cause or contribute to exceedances of water quality standards in receiving waters, or (4) a combination of one or more of (1)-(3). This is consistent with 40 CFR 122.44(d)(1)(vii)(B) and 122.44(k)(2)-(4).</p> <p>The San Diego Water Board has incorporated options (1)-(3) under the WQBEL requirements for each of the TMDLs in Attachment E. In most cases, if the WQBEL expressed as a receiving water limitation is achieved, the discharges from the MS4s are assumed to be in compliance with the TMDL requirements. If not, then the Copermittees must demonstrate that discharges from the MS4s are not causing or contributing to the exceedances in the receiving waters by achieving the WQBELs expressed as effluent limitations. In every case, the Copermittees are required to implement BMPs to ensure that discharges from their MS4s do not cause or contribute to exceedances of water quality standards in receiving waters.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

Lgl-1	<b>LEGAL COMMENTS</b>	
	<p><b>COMMENT:</b> <i>Land Development requirements expose Copermittees to significant litigation risk and will be largely unenforceable. Therefore, predevelopment runoff reference conditions and stream, channel and habitat restoration requirements should be eliminated in their entirety.</i></p> <p>Commenters generally expressed concerns with the Copermittees' legal authority to imposed requirements on development projects where a nexus between impact on the receiving water and the project cannot be established. The Copermittees assert that they would be subject to liability under takings clauses of the US and California Constitutions and the Mitigation Fee Act for requiring hydromodification management BMP requirements on new development or redevelopment projects that discharge to hardened channels where a hydromodification impact would be questionable and difficult to establish.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board recognizes the concerns of the Copermittees' legal authority to impose hydromodification management requirements on development that causes no hydromodification impacts and responded to nearly identical comments during the adoption process for Order No. R9-2013-0001. As stated in response to comment Gnl-1, the San Diego Water Board incorporates those responses into this response to comments document. As stated in the 2013 responses to comments document:</p> <p>Federal law mandates that permits issued to MS4s require management practices that will result in reducing pollutants to the maximum extent practicable. The state is required, by law, to select the BMPs. (See NRDC v. USEPA (9th Cir. 1992) 966 F.2d 1292; Environmental Defense Center v. USEPA (9th Cir. 2002) 344 F.3d 832, 855; Rancho Cucamonga v. Regional Water Quality Control Bd., Santa Ana Region (2006) 135 Cal.App.4th 1377, 1389.) The Tentative Order's requirements for Low Impact Development and hydromodification management controls are authorized by federal law. Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(2) provides that Copermittees develop and implement a management program which is to include "A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plans shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed."</p> <p>The Tentative Order does not impose land use regulations, nor does it restrict or control local land-use decision-making authority. Rather, the Tentative Order requires the permittees to fulfill Clean Water Act requirements and protect water quality in their land use decisions. The requirements in the Tentative Order</p>	

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Lgl-1	LEGAL COMMENTS
	<p>allow for flexibility in compliance options to the extent allowable under the Clean Water Act. The substantive regulatory requirements of the Clean Water Act are a valid exercise of the federal government's enumerated powers and authority over navigable waters. (NRDC v. USEPA (9th Cir. 1998) 863 F.2d 1420, 1436.)</p> <p>Environmental regulation is not land use regulation, and therefore does not infringe upon local authority over land use decisions. (California Coastal Commission v. Granite Rock (1987) 480 U.S. 572. In addition, local land use planning must be consistent with general statewide laws. (County of Los Angeles v. California State Water Resources Control Board (2006) 143 Cal.App.4th 985, 1003.) Article 11, section 7, of the California Constitution states that a county or city may not enact laws that conflict with general laws. The Porter-Cologne Water Quality Control Act contains the California Legislature's finding that water quality is a matter of statewide concern, requiring a statewide program administered at a regional level. (See, e.g., Wat. Code, § 13000; see also generally Southern California Edison v. State Water Resources Control Board (1981) 116 Cal.App.3d 751, 758.) Section 101 of the CWA has a companion policy statement, where Congress found that water quality is a matter of federal concern.</p> <p>The Tentative Order also does not dictate specific methods of compliance or dictate the manner in which the Copermittees use their land. Where the Tentative Order includes detailed requirements, it is to comply with the Clean Water Act and its regulations. USEPA's regulations mandate that certain requirements be included in MS4 permits in order to achieve the requirements of the Clean Water Act. Thus, federal law mandates that permits issued for MS4s require certain actions that will result in the elimination or reduction of pollutants to receiving waters and the state is required, by federal law, to select the controls necessary to meet this standard. (See NRDC v. USEPA (9th Cir. 1992) 966 F.2d 1292, 1308; City of Rancho Cucamonga v. Regional Water Quality Control Bd., Santa Ana Region (2006) 135 Cal.App.4th 1377, 1389-90.)</p> <p>The requirement that the Copermittees require Priority Development Projects to control post-project runoff flow rates and durations so that they do not exceed pre-development runoff flow rates and durations by more than ten percent is appropriate and necessary to reduce erosion and the discharge of pollutants into receiving waters. It does not require mitigation beyond redevelopment project impacts because the requirement lessens (although does not eliminate) the perpetuating impacts that originated upon initial land alteration (i.e., the project would continue to cause accelerated erosion) absent improved controls of post-project runoff flow rates and durations. The San Diego Water Board maintains that the Copermittees have authority to implement this requirement, and that if implemented it would not rise to the level of a taking of private property. The pre-development condition provision is also consistent with the requirements in both the current Orange County and Riverside County MS4 permits.</p>

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Lgl-1	LEGAL COMMENTS
	<p>To remove the question of the nexus between a project's impacts on an already hardened channel, the Tentative Order includes a hydromodification management exemption for projects that discharge to conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Lgl-2 LEGAL COMMENTS	
	<p><b>COMMENT:</b> <i>Tentative Order numeric WQBELs violate the requirements of law because they are infeasible.</i></p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that including numeric WQBELs for the TMDLs in the Tentative Order violate the requirements of law.</p> <p>The federal regulations under 40 CFR 122.44(d)(1)(vii)(B) require that NPDES permit requirements incorporate WQBELs that must be consistent with the requirements and assumptions of any available wasteload allocations (WLAs) developed under TMDLs. The federal regulations under 40 CFR 122.44(k) do not require WQBELs to be BMP-based if numeric effluent limitations are infeasible, but only that WQBELs that implement WLAs <u>may</u> be expressed in the form of BMPs. BMP-based WQBELs may be allowed if BMPs alone adequately implement WLAs, and additional controls are not necessary. This is consistent with a 2002 USEPA memorandum for “<i>Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs.</i>” WQBELs are required for point source discharges that have the reasonable potential to cause or contribute to an excursion of water quality standards and technology based effluent limitations or standards are not sufficient to achieve water quality standards. Where a WLA has been assigned to a discharge in a TMDL, it is concluded that there is reasonable potential for the discharger to cause or contribute to an excursion of water quality standards.</p> <p>The memorandum “<i>Revisions to the November 22, 2002 Memorandum ‘Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs)’ issued by USEPA on November 26, 2014 states, “Where the NPDES authority determine that MS4 discharges have a reasonable potential to cause or contribute to a water quality standard excursion, EPA recommends that, where feasible, the NPDES permitting authority exercise its discretion to include numeric effluent limitations necessary to meet water quality standards.”</i> The “where feasible” in the memorandum applies to the NPDES permitting authority’s discretion to include numeric effluent limitations necessary to meet water quality standards, not to the feasibility of achieving the numeric effluent limitations. The State Water Board, in Order WQ 2006-0012 (Boeing), has made clear that “infeasibility” in the context of numeric effluent limitations refers to “the ability or propriety of establishing” numeric limits, as</p>

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Lgl-2	LEGAL COMMENTS
	<p>opposed to the feasibility of compliance.</p> <p>The Caltrans MS4 permit is issued by the State Water Board. Even though the Caltrans MS4 permit may allow for BMP-based WQBELs, this does not require the San Diego Water Board to include BMP-based WQBELs in the Tentative Order regardless of any potential or apparent conflict. The San Diego Water Board will issue additional requirements to Caltrans with numeric WQBELs when and where warranted.</p> <p>The San Diego Water Board considered the feasibility of incorporating numeric WQBELs to implement the requirements of each of the TMDLs and has determined that they are feasible, and necessary, to include to meet water quality standards, consistent with the 2014 USEPA memorandum. Numeric WQBELs are also "additional controls" necessary to implement the WLAs, consistent with the 2002 USEPA memorandum.</p> <p>Each of the TMDLs in the Tentative Order, however, includes BMP-based WQBELs which must be implemented to achieve the numeric WQBELs. The Tentative Order requires the Copermittees to implement the BMP-based WQBELs to achieve the numeric WQBELs. This is consistent with the 40 CFR 122.44(d)(1)(vii)(B) and 40 CFR 122.44(k), and the recommendations of the 2014 USEPA memorandum. The Tentative Order has also been revised to include interim and final TMDL compliance determination options that allow the Copermittees to demonstrate that the BMP-based WQBELs will achieve the numeric WQBELs. The numeric WQBELs are necessary for the Copermittees to quantitatively demonstrate that the BMPs implemented are achieving the WLAs of the TMDLs.</p> <p>Thus, the Tentative Order appropriately includes numeric WQBELs and does not violate any requirements of law.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>Lgl-3 LEGAL COMMENTS</b>	
<p><b>COMMENT:</b> <i>San Diego Water Board does not have the legal authority to issue a regional MS4 permit.</i></p> <p>The County of Orange and Concurring Cities and Orange County Flood Control District request that they be issued an individual permit. The Commenters claim the San Diego Water Board does not have the legal authority to include Orange County in a Regional Permit because there is no system-wide, jurisdiction-wide, or common watershed basis to do so.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
<p><b>RESPONSE:</b> The San Diego Water Board incorporates its responses to comments for the adoption of Order No. R9-2013-0001 and other documents in the record including the September 7, 2012, legal memorandum prepared by San Diego Water Board counsel. The San Diego Water Board disagrees with the commenters that the federal regulations do not authorize the issuance of a region-wide MS4 permit coextensive with the jurisdictional boundaries of the San Diego Region.</p> <p>The San Diego Water Board reviewed and considered this comment during the adoption process of Order No. R9-2013-0001 (Regional MS4 Permit) and reaffirms its position that despite the geographic separation, the San Diego Water Board has legal authority to issue a regional MS4 permit through its authority in the Clean Water Act. (September 7, 2012 Letter from San Diego Water Board Counsel on Legal Authority Supporting Issuance of a Regional MS4 Permit) Section 402, subpart (p)(3)(B) of the Clean Water Act states that "Permits for discharges from municipal storm sewers – (i) may be issued on a system- or jurisdiction-wide basis . . . ."</p> <p>The federal storm water regulations in 40 CFR at Part 122.26, subdivision (a)(1)(v) also state that the Director (the San Diego Water Board) may designate dischargers from municipal separate storm sewers on a system-wide or jurisdiction-wide basis, taking into consideration the following factors: (A) location of the discharge with respect to waters of the United States; (B) the size of the discharge; (C) the quantity and nature of the pollutants discharged to waters of the United States and (D) other relevant factors. Consideration of these factors provides wide discretion to the San Diego Water Board in issuing MS4 permits.</p> <p>More specifically, the regulations permit issuance of system-wide permits covering all MS4s in "adjacent . . . large or medium separate storm sewer systems." (See 40 CFR sec. 122.26(a)(3)(iv). The regulations also support issuance of MS4 permits on watershed or "other basis" contemplating that such permits may "specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas . . . ." (40 CFR Part 122.26(a)(3)(v).)</p> <p>The USEPA responses to comments for the above regulations also make clear that the permitting authority, in</p>	

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Lgl-3	LEGAL COMMENTS
	<p>this case, the San Diego Water Board, has flexibility to establish system- or region-wide permits. In the Final Rule published in the Federal Register and containing USEPA's responses to comments, USEPA notes that paragraph (iv) of section 122.26(a)(3) would allow an entire system in a geographical region under the purview of a state agency to be designated under a permit. (National Pollutant Discharge Elimination System Permit Application Regulations for Storm Water Discharges, 55 Fed. Reg. 47990, 48030-48042 (Nov. 16, 1990).)</p> <p>It is important to note that a regional MS4 permit does not expand the requirements for each municipality beyond its borders as the federal regulations make clear that MS4 permittees need only comply with permit conditions relating to discharges from the MS4s for which they are operators. (40 CFR Part 122.26(a)(3)(vi).) See also September 7, 2012, memorandum from Jessica Jahr and Catherine Hagan, State Water Board's Office of Chief Counsel, to Ryan Baron and David Huff, counsels for Orange and Riverside Counties, respectively.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>Lgl-4 LEGAL COMMENTS</b>	
	<p><b>COMMENT:</b> <i>The Requirements in the Tentative Order are more stringent than federal law, requiring an economic analysis.</i></p> <p>The County of Orange and Concurring Cities and Orange County Flood Control District assert that several requirements of Tentative Order go beyond the requirements of Federal law, thus an analysis pursuant to California Water code section 13241 is required. The commenters also make several assertions about deficiencies in the economic considerations discussed in the Fact Sheet, and assert that a cost-benefit analysis needs to be included in the Fact Sheet discussion.</p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that "several requirements of Tentative Order go beyond the requirements of Federal law."</p> <p>The San Diego Water Board is charged with construction of and administration of the Clean Water Act in the San Diego Region. In issuing MS4 permits, "[t]he permitting agency has discretion to decide what practices, techniques, methods and other provisions are appropriate and necessary to control the discharge of pollutants." (City of Rancho Cucamonga v. Regional Water Quality Control Board-Santa Ana Region (2006) 135 Cal.App.4th 1377,1389.) However, the "Regional Board must comply with federal law requiring detailed conditions for NPDES permits." (Ibid.)</p> <p>Further, USEPA expects the permitting authority to develop the specific practices that comply with the Clean Water Act on a permit-by-permit basis. (NRDC v. USEPA (9th Cir. 1992) 966 F.2d 1292, 1308.) To the extent the Board is exercising discretion in including certain permit requirements, the Board is exercising discretion required and/or authorized by federal law, not state law. (See City of Rancho Cucamonga, supra, 135 Cal.App.4th at 1389; Building Industry Association of San Diego County v. State Water Resources Control Bd. (2004) 124 Cal.App.4th 866, 882-883.) Further, the MEP standard is a flexible standard that balances a number of considerations, including technical feasibility, cost, public acceptance, regulatory compliance, and effectiveness. (Id. at pp. 873, 874, 889.) Such considerations change over time with advances in technology and with experience gained in storm water management. (55 Fed. Reg. 47990, 48052 (Nov. 16, 1990).)</p> <p>Accordingly, a determination of whether the conditions contained in Tentative Order exceed the requirements of federal law cannot be based on a point by point comparison of the permit conditions with federal law. The appropriate focus is whether the permit conditions as a whole exceed the MEP standard. The commenters assert that provisions of the Tentative Order are more stringent than the requirements of the Clean Water Act and therefore require an analysis of the factors, including economic considerations, in Water Code section</p>

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Lgl-4	LEGAL COMMENTS
	<p>13241 before the San Diego Water Board can approve such provisions. As indicated above, the San Diego Water Board disagrees that provisions of the Tentative Order are more stringent than requirements of the Clean Water Act. Because the Tentative Order is not more stringent than federal law, its adoption does not require the San Diego Water Board to consider Water Code section 13241 factors. The California Supreme Court in <i>City of Burbank v. State Water Resources Control Board, et al.</i>, ((2005) 35 Cal.4<sup>th</sup> 613) (<i>Burbank</i>), held: [Water Code] section 13377 specifies that wastewater discharge permits must meet the federal standards set by federal law. In effect, section 13377 forbids a regional board's consideration of any economic hardship on the part of the permit holder if doing so would result in the dilution of the requirements set by Congress in the Clean Water Act. That act prohibits the discharge of pollutants into the navigable waters of the United States unless there is compliance with federal law (33 U.S.C. § 1322(a)), and publicly operated wastewater treatment plants such as those before us here must comply with the act's clean water standards, regardless of cost [citations]. Because [Water Code] section 13263 cannot authorize what federal law forbids, it cannot authorize a regional board, when issuing a wastewater discharge permit, to use compliance costs to justify pollutant restrictions that do not comply with federal clean water standards." (<i>Burbank</i>, 35 Cal.4<sup>th</sup> at 625.)</p> <p>While the <i>Burbank</i> decision does require an analysis of Water Code section 13241 factors when the state adopts permit conditions that are more stringent than federal law (<i>id.</i> at 618) Tentative Order No. R9-2015-0001 reflects that all of the challenged provisions are necessary to implement federal law. Thus, the San Diego Water Board is not required to consider economic information to justify a "dilution of the requirements" established in federal law. Even when applicable, consideration of economic information pursuant to section 13241 does not require a cost-benefit analysis, as some commenters suggest. And section 13241 neither specifies how regional water boards must consider its enumerated factors nor does it require that regional water boards may specific findings documenting consideration of the factors. (See <i>California Ass'n of Sanitation Agencies, et al. v. State Water Resources Control Board, et al.</i>, (208 Cal.App.4<sup>th</sup> 1438, 1464 (2012).) Nonetheless, the Fact Sheet and Response to Comments reflect economic information that has either been developed or gathered by the San Diego Water Board or has been submitted by Copermittees. To the extent that economic information in connection with compliance and other costs associated with challenged permit provisions, the San Diego Water Board has fully considered this information. Under these circumstances, <i>Burbank</i> does not require more.</p> <p>See also comment response Fnd-8.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>Lgl-5    LEGAL COMMENTS</b>	
	<p><b>COMMENT:</b> <i>The San Diego Water Board cannot determine whether a particular mandate is unfunded.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District assert that the San Diego Water Board does not have the legal authority to determine whether any provisions in the Tentative Order constitute a state mandate, and only the Commission on State Mandates can make the determination.</p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> In proposing Tentative Order No. R9-2015-0001, the San Diego Water Board proposes amendments to Order No. R9-2013-0001 which includes Finding 31 and corresponding discussion in the Fact Sheet setting forth the San Diego Water Board's conclusion and supporting reasoning that Order No. R9-2013-0001 does not constitute an unfunded state mandate requiring subvention. The San Diego Water Board incorporates its responses to comments on the adoption of Order No. R9-2013-0001 into this response. The San Diego Water Board does not dispute that the Commission on State Mandate ultimately has jurisdiction to determine whether the State has imposed a mandate requiring state subvention. However, it remains entirely appropriate for the San Diego Water Board to set forth its legal basis to support its conclusion Order No. R9-2013-0001, as amended by Tentative Order No. R9-2015-0001, contains provisions the Board finds to be necessary and appropriate to meet the federal Clean Water Act standards.</p> <p>While the Commission may be expert in state mandates, it has no expertise in the field of water law. As indicated in response to comment Lgl-5, above, the San Diego Water Board does not agree that Order No. R9-2013-0001 as amended by Tentative Order No. R9-2015-0001 exceed federal requirements of the Clean Water Act. The San Diego Water Board is charged by law with administering and constructing the Clean Water Act's requirements and is entitled to considerable deference in its interpretation of the Act. (See Building Industry Association of San Diego, supra, 124 Cal.App.5th at pp. 873, 879 fn.9; County of Los Angeles v. California State Water Resources Control Bd. (2006) 143 Cal.App.4th 985, 997.) In issuing MS4 permits, "[t]he permitting agency has discretion to decide what practices, techniques, methods and other provisions are appropriate and necessary to control the discharge of pollutants." (City of Rancho Cucamonga v. Regional Water Quality Control Board-Santa Ana Region (2006) 135 Cal.App.4th 1377,1389.) However, the "Regional Board must comply with federal law requiring detailed conditions for NPDES permits." (Ibid.) Further, USEPA expects the permitting authority to develop the specific practices that comply with the Clean Water Act on a permit-by-permit basis. (NRDC v. USEPA (9th Cir. 1992) 966 F.2d 1292, 1308.) To the extent the Board is exercising discretion in including certain permit requirements, the Board is exercising discretion required and/or authorized by federal law, not state law. (See City of Rancho Cucamonga, supra, 135 Cal.App.4th at 1389;</p>

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Lgl-5	LEGAL COMMENTS
	<p>Building Industry Association of San Diego County v. State Water Resources Control Bd. (2004) 124 Cal.App.4th 866, 882-883.)</p> <p>Further, the MEP standard is a flexible standard that balances a number of considerations, including technical feasibility, cost, public acceptance, regulatory compliance, and effectiveness. (Id. at pp. 873, 874, 889.) Such considerations change over time with advances in technology and with experience gained in storm water management. (55 Fed. Reg. 47990, 48052 (Nov. 16, 1990).) The San Diego Water Board's findings are the expert conclusions of the principal state agency charged with implementing the NPDES program in California. (Cal. Wat. Code §§ 13001, 13370.) The San Diego Water Board is not precluded from including provisions in Tentative Order No. R9-2015-0001 which commenters may contend are state mandates and it is well within the San Diego Water Board's authority to conclude, based on its expertise in administering the Clean Water Act, Tentative Order No. R9-2015-0001 does not exceed federal law and is therefore not a state mandate subject to subvention.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Fnd-1	FINDINGS	
	<p><b>COMMENT:</b> <i>Modify findings and/or Fact Sheet to include additional key findings from the Report of Waste Discharge (including the State of the Environment) and use this information as the basis for the Draft Order's requirements.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District are concerned that the San Diego Water Board did not review and consider the "State of the Environment" discussion in their ROWD based on the Findings and Fact Sheet amendments presented in the Tentative Order and its Attachments.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the comment.</p> <p>The San Diego Water Board reviewed and considered all information in the Copermittees ROWD, as is documented in the Findings of Tentative Order No. R9-2015-0001 (i.e. Findings 1 through 4). Based on the ROWD review newly proposed requirements specific to southern Orange County Copermittees (i.e. interim hydromodification exemptions for large rivers and engineered channels) are presented in Attachment No. 1 to the Tentative Order (i.e. Order No. R9-2013-0001 as Amended by Order No. R9-2015-0001). San Diego Water Board reviewed the ROWD, including the "State of the Environment" discussion and the San Diego Water Board concluded that many of the ROWD recommendations could be accommodated by the requirements in Order No. R9-2013-0001 with only a limited number of changes required. The new flexible regulatory approach (described in the Fact Sheet for Order No. 2013-0001) and proposed requirements, puts more control in the hands of the Copermittees to develop a watershed-based planning approach. As described in Finding 2 of the Tentative Order, development of a watershed-based planning approach is portrayed in the ROWD as the most important next step to take in the development of the storm water programs in Orange County. The Tentative Order also provides the Copermittees with the flexibility to continue taking advantage of opportunities to reduce dry weather flows (a repeated recommendation throughout the ROWD).</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>Fnd-2 FINDINGS</b>	
	<p><b>COMMENT:</b> <i>Modify Finding 7 - In-Stream Treatment Control Systems to allow for the implementation of stream restoration or stream rehabilitation projects and constructed wetlands, or maintenance or reconstruction of existing stream restoration or rehabilitation projects, constructed wetlands, and regional BMPs.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District suggest modify the language in Finding 7 to allow for full flexibility to identify creative solutions that meet the Tentative Order's alternative compliance goals through implementation of stream restoration or rehabilitation.</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the language in Finding 7 of Order No. R9-2013-0001 stifles Copermittee ability to meet the Tentative Order's alternative compliance goals through creative solutions such as implementation of stream restoration or stream rehabilitation projects and constructed wetlands, or prevents maintenance or reconstruction of existing stream restoration or rehabilitation projects, constructed wetlands, and regional BMPs.</p> <p>Finding 7 states that pursuant to federal regulations (40CFR 131.10(a)) states cannot adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Authorizing the construction of a runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Finding 7 concludes that treatment control best management practices (BMPs) must not be constructed in waters of the U.S. The language of Finding 7 does not impinge upon a Copermittees ability to take full advantage of the flexibility provided in the Tentative Order's alternative compliance option.</p> <p>Permit Provision II.E.3.c.(3) of Order No. R9-2013-0001 enables each Copermittee, at its own discretion, to allow Priority Development Projects (POPs) to participate in an alternative compliance program in lieu of implementing the onsite structural BMP performance requirements of Provisions II.E.3.c.(1) and II.E.3.c.(2). Alternative compliance is only allowed if the Copermittee determines that implementation of an alternative compliance project will result in a greater overall water quality benefit for the Watershed Management Area than fully complying with the onsite performance requirements.</p> <p>This alternative compliance option establishes a mechanism for Copermittees to provide alternative candidate projects for those land development projects that are unable to fully implement controls onsite. Copermittees can develop and make available a variety of candidate alternative compliance projects, including stream restoration and rehabilitation projects within a water body, as long as such projects do not entail placement of a treatment facility or treatment control BMPs within the water body. A vast variety of candidate projects could</p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Fnd-2	FINDINGS
	<p>be proposed under Permit Provision II.E.3.c.(3) and it is expected that candidate projects will not include projects that entail construction, operation, and maintenance of a pollution treatment control facilities or BMPs in a water body. The placement of structures of this type in a water body is contrary to the intent of 40CFR 131.10(a) and; therefore the Tentative Order does not propose any modifications to Finding 7. Many candidate project options exist that could a) achieve the greater overall water quality benefit envisioned by the alternative noncompliance permit provision, and b) support the physical, chemical, and biological integrity, as well as the beneficial uses of a particular water body, and c) not entail constructing treatment facilities or BMPs within a water body.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Fnd-3	FINDINGS	
	<p><b>COMMENT:</b> <i>Modify Finding 8, 16, and 17 to remove presumption that discharges from MS4s always contain waste.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District object to Finding 8 of Order No. R9-2013-0001 stating that discharges from the MS4s contain waste, and that Finding 8 does not acknowledge that there may not be pollutants in the discharges from the MS4s. The commenters requested revisions to Findings 8, 16 and 17 to reflect this position.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the commenters that Findings 8, 16, or 17 need revision.</p> <p>The Tentative Order implements the requirements of the California Water Code as well as the requirements of the Clean Water Act. Under California Water Code section 13376, any person discharging waste, or proposing to discharge wastes to waters of the State is not authorized to discharge waste unless issued waste discharge requirements. The requirements of the Clean Water Act, specific to discharges of pollutants to waters of the U.S. are also included in the California Water Code, Chapter 5.5 of Division 7. Thus, under the California Water Code, any person discharging pollutants, or proposing to discharge pollutants to waters of the U.S. is not authorized to discharge pollutants unless issued waste discharge requirements that include NPDES requirements. Waste discharge requirements that include NPDES requirements is also an NPDES permit under the Clean Water Act. The Clean Water Act and the California Water Code requires municipalities to obtain and comply with NPDES permits for authorized discharges of pollutants to waters of the U.S. from their MS4s. Municipalities proposing to discharge pollutants from an MS4 must obtain an NPDES permit before they can lawfully discharge.</p> <p>Comments received assert that the definition of “waste” in California Water Code section 13050 does not include storm water or any discharge that is not created by human activity. Comments received also assert that waste discharge requirements and NPDES permits cannot regulate the discharge of “pure storm water” and that not all discharges from the MS4 contain pollutants.</p> <p>Discharges from the MS4 are not “pure storm water.” Storm water that flows over the surface of any developed area, which includes the MS4 itself, do not enter or discharge from the MS4 without coming into contact with pollutants or constituents that alter the storm water such that it is no longer “pure storm water.” Thus, storm water discharges from the MS4 contains pollutants and contain waste. It is well-known and documented that urban runoff and storm water contains pollutants. (See, e.g., State Water Board Order WQ</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Fnd-3	FINDINGS
	<p>2001-015 ("As we stated in Board Order WQ 95-2, the requirement to adopt permits for urban runoff is undisputed, and Regional Water Boards are not required to obtain any information on the impacts of runoff prior to issuing a permit (citation). It is also undisputed that urban runoff contains 'waste' within the meaning of Water Code section 13050(d), and that the federal regulations define 'discharge of a pollutant' to include 'additions of pollutants into waters of the United States from surface runoff which is collected or channeled by man.' (40 C.F.R. § 122.2.) But it is the waste or pollutants in the runoff that meet these definitions of 'waste' and 'pollutant.' And not the runoff itself. [fn]. (p. 5.))</p> <p>Tentative Order No. R9-2015-0001 (like the current adopted version of Order No. R9-2013-0001) does not regulate "pure storm water." The Tentative Order regulates the discharge of storm water that is being discharged as a waste and contains pollutants. Finding 8 of Order No. R9-2013-0001 accurately states that discharges from the MS4s contain waste, as defined in the California Water Code. Finding 8 also accurately states that discharges from MS4s contain pollutants that adversely affect the quality of waters of the state. Findings 16 and 17 also accurately conclude that BMPs and implementation of BMPs are necessary to remove waste and pollutants in storm water discharges from MS4s.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Fnd-4 FINDINGS	
	<p><b>COMMENT:</b> <i>Delete Finding 11. Natural waters cannot legally be classified as part of the MS4, and a part of both MS4 and receiving water.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District assert that Finding 11 is inaccurate and the San Diego Water Board cannot classify natural waters as part of the MS4.</p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with this comment.</p> <p>An MS4 is defined in the federal regulations as a conveyance or system of conveyances owned or operated by a Copermittee, and designed or used for collecting or conveying runoff. Therefore, the San Diego Water Board considers natural drainages that are used by the Copermittees as conveyances of runoff, as both part of the MS4 and as receiving waters.</p> <p>The State Water Board supports this approach. In reviewing a Petition on Order No. R9-2001-0001, the State Water Board stated "<i>We also agree with the Regional Water Board's concern, as stated in its response, that there may be instances where MS4s use 'waters of the United States as part of their sewer system [...]</i>" State Water Resources Control Board Order WQ 2001-15.</p> <p>Furthermore, the U.S. Supreme Court's 2006 <i>Rapanos</i> decision supports the conclusion that natural streams in developed areas can be both receiving waters and MS4s by confirming that ephemeral and intermittent streams can be waters of the U.S. subject to regulation under Clean Water Act section 404 and also be considered point sources of pollution discharges regulated under Clean Water Act section 402. (See <i>Rapanos, et al. v. United States and Carabell et al. v. United States Army Corps of Engineers, et al. (2006) 547 U.S. 715, 743-744.</i>)</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Fnd-5	FINDINGS	
	<p><b>COMMENT:</b> <i>Modify Finding 12 to more accurately describe that Copermittees do not accept free and open access to MS4s, and are not responsible for all discharges not prohibited.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District object to Finding 12 stating that the Copermittees provide free and open access to MS4s. The Copermittees assert that they are not responsible for discharges from their MS4s that are from third parties that are subject to the jurisdiction of the San Diego Water Board</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that Finding 12 is inaccurate.</p> <p>The Copermittees have the option to request the authority to discharge from their MS4s under an NPDES permit or comply with the complete prohibition against the discharge of pollutants pursuant to Clean Water Act section 301(a) (33 U.S.C. § 1311(a)). These choices are provided by the federal Clean Water Act, not state laws.</p> <p>The Copermittees have opted to discharge from their MS4s under an NPDES permit. In doing so, they are responsible for discharges from the MS4s. Thus, Finding 12 correctly establishes that the Copermittees provide free and open access for third party discharges to their MS4s and that in doing so the Copermittees are responsible for discharges into the MS4 that they do not prohibit or otherwise control. Finding 12 also correctly concludes that the Copermittees cannot passively receive and discharge pollutants from third parties.</p> <p>The Copermittees have the responsibility of identifying the sources of discharges and pollutants from their MS4s. If the Copermittees are not actively identifying sources and cannot identify sources of discharges and pollutants to and from their MS4s, then the Copermittees are the source of the MS4s discharges and pollutants to receiving waters, even if they believe third parties are responsible for the discharges and pollutants.</p> <p>If, however, the Copermittees identify the sources of discharges and pollutants to or from the MS4s as outside of their legal authority to prohibit or otherwise control, then they are not passively receiving and discharging pollutants, even if they are providing free and open access to the MS4s. The data and information that the Copermittees collect to identify the third party sources can provide the evidence that the Copermittees are not responsible for the discharges and pollutants from the MS4s that can be attributed to third parties. Until the data and information are provided to identify those third parties, and demonstrate those parties are not subject to the Copermittees' legal authority, then the Copermittees are responsible for all of the discharges to and from their MS4s unless such discharges are authorized by a separate NPDES permit.</p>	

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Fnd-5	FINDINGS
	Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Fnd-6 FINDINGS	
	<p><b>COMMENT:</b> <i>Modify Finding 15 to recognize that the discharge of all pollutants from the MS4 is subject to the MEP standard.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District assert Finding 15 is inaccurate. The Copermittees assert that the Tentative Order is inconsistent with the Clean Water Act and the MEP standard applies to both non-storm and water storm water, not just storm water.</p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the comment and incorporates its responses to comments on this topic from the San Diego Water Board's adoption proceedings on Order No. R9-2013-0001.</p> <p>The San Diego Water Board disagrees that the MEP standard applies to both non-storm water and storm water. The San Diego Water Board also disagrees that Finding 15 of Order No. R9-2013-0001 should be revised. Finding 15 accurately states the requirements of the Clean Water Act. The San Diego Water Board maintains that MEP standard only applies to pollutants in storm water. See also, Memorandum from San Diego Water Board Counsel to San Diego Water Board dated 5 November 2009, incorporated by reference herein.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

Fnd-7	<b>FINDINGS</b>	
	<p><b>COMMENT:</b> <i>Modify Finding 29 to clarify single water board regulations of Cities of Lake Forest, Laguna Woods, Laguna Hills.</i></p> <p>The City of Lake Forest provided suggested language changes to Finding 29 of the Tentative Order to clarify single water board regulation of the Cities of Lake Forest, Laguna Woods, and Laguna Hills.</p> <p>Suggested language changes were for the most part accepted by the San Diego Water Board.</p>	City of Lake Forest
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with most of the suggested language changes proposed by the City of Lake Forest.</p> <p>The City of Lake Forest provided suggested language changes to Finding 29 of the Tentative Order to clarify single water board regulation of the Cities of Lake Forest, Laguna Woods, and Laguna Hills.</p> <p>The Tentative Order was modified to reflect, for the most part, the City's recommended changes. The word "wholly" was not added as requested by City of Lake Forest because it is unnecessary to clarify the terms of the Water Code section 13228 agreement. The permit language and the Water Code section 13228 designation agreement specify in detail how the Santa Ana Water Board and the San Diego Water Board will, respectively, regulate the City of Lake Forest as well as the Cities of Laguna Hills and Laguna Woods under each Region's respective MS4 permits. The San Diego Water Board notes that the current Riverside County MS4 permit (Order No. R9-2010-0016) includes the term "wholly" but the San Diego Water Board will consider removing that term when it considers the County of Riverside and Riverside Copermittees' Report of Waste Discharge for the reason set forth above.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

Fnd-8 FINDINGS	
	<p><b>COMMENT:</b> <i>Modify Finding 31 to state the Tentative Order is more stringent than Federal Law, requiring an analysis of the factors pursuant to Water Code Section 13241.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District assert that several requirements of the Tentative Order go beyond the requirements of Federal law, thus an analysis pursuant to California Water code section 13241 is required. The commenters also make several assertions about the deficiencies they perceive with the economic considerations discussed in the Fact Sheet, and assert that a cost-benefit analysis needs to be included in the Fact Sheet discussion.</p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with this comment and incorporates its responses to comments on this topic from the San Diego Water Board's adoption proceedings on Order No. R9-2013-0001.</p> <p>The provisions of the Tentative Order do not go beyond the requirements of the Clean Water Act or Code of Federal Regulations. The San Diego Water Board again considered economic information in developing the Tentative Order No. R9-2015-0001 using the best available information, but did not do so in accordance with an analysis pursuant to California Water code section 13241. The provisions of the Tentative Order No. R9-2015-0001 are based on and fully supported by federal requirements, as demonstrated by the legal authority provided by the Clean Water Act and Code of Federal Regulations sections cited in the Fact Sheet. Thus, the San Diego Water Board maintains that an analysis pursuant to California Water Code section 13241 is not required. Federal NPDES regulations do not require that the San Diego Water Board conduct a cost-benefit analysis.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p> <p>Please also see response to comment Lgl-4 and Lgl-5.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

Fnd-9	FINDINGS	
	<p><b><u>COMMENT:</u></b> <i>Delete Finding 32. The San Diego Water Board has no legal ability to determine whether a particular mandate is unfunded.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District assert that the San Diego Water Board does not have the legal authority to determine whether any provisions in the Tentative Order constitute a state mandate, and only the Commission on State Mandates can make the determination.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

A-1	PROVISION A: PROHIBITIONS AND LIMITATIONS	
	<p><b>COMMENT:</b> <i>Tentative Order needs to include language that shows a clear pathway to compliance with the discharge prohibitions, receiving water limitations, and effluent limitations in Provision A. 1.</i></p> <p>Orange County and Concurring Cities, the Orange County Flood Control District, Riverside County Copermittees and the City of San Diego each submitted comments requesting that the requirements of Provision A be modified to provide a clear linkage between the prohibitions and limitations of Provisions A.1 to A.3 with the iterative process required under Provision A.4 to be demonstrated through the implementation of the Water Quality Improvement Plans. The commenters are concerned that the language of Provision A, if not modified, will be interpreted as requiring strict and immediate compliance with the prohibitions and limitations, and the implementation of the iterative process would not be enough to demonstrate compliance with the prohibitions and limitations. Among the many recommended modifications to the requirements of Provision A, the commenters are generally requesting that the discharge prohibitions and receiving water limitations of Provisions A.1.a, A.1.c and A.2.a specifically state that implementation of Provision A.4 constitutes compliance. Furthermore, the Copermittees have requested that Provision A.4 explicitly state that the implementation of the iterative process constitutes compliance with any of the prohibitions and limitations under Provision A.1 to A.3, including compliance with the effective prohibitions of non-storm water discharges to the MS4s, and the TMDL requirements.</p> <p>During adoption of Order No. R9-2013-0001, commenters from environmental organizations were strongly in support of maintaining the existing language and asserted that modifications to Provision A would “weaken” the requirements, or provide “safe harbor” and would violate federal anti-backsliding requirements.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> <li>• <b>Riverside County Copermittees</b></li> <li>• <b>City of San Diego</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board understands the concerns that the Copermittees have expressed regarding the requirements of Provision A and the apparent lack of a linkage between the iterative process under Provision A.4 and the strict compliance with the discharge prohibitions and receiving water limitations of Provisions A.1.a, A.1.c and A.2.a. This language, however, is consistent with the precedential language that was issued under State Water Board Order WQ-1999-05 and has been implemented in all MS4 permits issued by the San Diego Water Board since 2001. The State Water Board has not yet issued an order or taken other action to supersede this precedential language. Recently, the State Water Board issued a Draft Order on November 21, 2014 in response to petitions challenging the 2012 Los Angeles MS4 Permit in which compliance with receiving water limitations is a major focus. Although the State Water Board's Draft Order generally upholds the Los Angeles Water Board Order, no final decision has been made. The State Water Board held a December 16, 2014 public workshop to receive comments and discuss the Draft Order with</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

A-1	PROVISION A: PROHIBITIONS AND LIMITATIONS
	<p>Copermittees and interested persons. No decision was made at the workshop. The State Water Board did not indicate when a final Order might be issued.</p> <p>Under the Porter-Cologne Water Quality Control Act, waste discharge requirements must implement applicable water quality control plans, including water quality objectives. The discharge prohibitions and receiving water limitations of Provision A.1.a, A.1.c and A.2.a are consistent with this requirement, and are included in all NPDES permits and Waste Discharge Requirements issued by the San Diego Water Board. These are the fundamental requirements that protect water quality by ensuring that discharges comply with applicable water quality standards to ensure protection of receiving water beneficial uses. The San Diego Water Board does recognize an increasing body of monitoring data indicates that water quality standards are in fact not being met by many of the Copermittees' MS4 discharges. The San Diego Water Board has as a matter of practice not sought to enforce the discharge prohibitions and receiving water limitations of Provision A.1.a, A.1.c or A.2.a where the Copermittees are actively engaged in implementing the other requirements of the MS4 permit. The focus of the previous MS4 permits and the San Diego Water Board has been on compliance with implementation of the actions required by the permit, rather than the water quality outcomes that are expected to be achieved.</p> <p>As noted by the Copermittees, however, the approach of the Tentative Order is a significant departure from the approach of previous MS4 permits. Previous MS4 permits did not provide the Copermittees enough flexibility to truly implement an iterative process to adaptively manage their programs to identify innovative new ways to improve the quality of discharges from their MS4s or in the receiving waters, because the actions required by the permit were relatively fixed and prescriptive. In contrast, the Tentative Order is structured to allow the Copermittees to take advantage of the iterative process and adaptively manage their programs to focus on achieving outcomes.</p> <p>Since the State Water Board has yet to issue a final decision response to the petitions challenging the 2012 Los Angeles Water Board MS4 Permit, the San Diego Water Board did not revise Provisions A.1.a, A.1.c, A.2.a and A.4, and the language of Provision A remains consistent with the language in precedential State Water Board Order No. WQ 1999-05. However, the San Diego Water Board supports the concept of an alternative compliance option and considered it during the adoption of the Regional MS4 Permit in 2013.</p> <p>The San Diego Water Board will consider incorporation of the Riverside County Copermittees into the Regional MS4 Permit in late 2015 or early 2016. As part of this process, the San Diego Water Board will also consider the incorporation of a well-defined, transparent, and finite alternative compliance option similar to the option</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

A-1	PROVISION A: PROHIBITIONS AND LIMITATIONS
	<p>proposed in 2013, but also consistent with any decisions/guidance from the State Water Board. A rigorous alternative compliance option would allow the Copermittees that are willing to pursue significant receiving water quality improvements beyond the iterative process to be deemed in compliance with the receiving water limitations. Inclusion of the alternative compliance option during the extensive public process for the Riverside County Copermittees will provide the stakeholders the necessary opportunity to discuss, comment, and suggest changes to any proposed language.</p> <p>An administrative finding documenting the San Diego Water Board's intent to consider incorporation of an alternative compliance option during the MS4 NPDES permit reissuance proceedings for the Riverside County Copermittees has been added to the Tentative Order.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>B-1 PROVISION B: WATER QUALITY IMPROVEMENT PLANS</b>		
	<p><b>COMMENT:</b> <i>Water Quality Improvement Plans should be the foundation for a BMP-based compliance approach.</i></p> <p>Orange County and Concurring Cities, the Orange County Flood Control District, Riverside County Copermittees and the City of San Diego request that Copermittees be allowed to utilize the development and implementation of the Water Quality Improvement Plans as a compliance mechanism for the prohibitions and limitations of Provisions A.1 to A.3.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> <li>• <b>Riverside County Copermittees</b></li> <li>• <b>City of San Diego</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board understands the concerns raised by the comments from the Copermittees.</p> <p>The Tentative Order includes the State Water Board precedential language. At this time the San Diego Water Board has chosen to keep the State Water Board precedential language in Attachment 1 to the Tentative Order until the State Water Board takes action with regards to this issue. Should the State Water Board decide to issue revised precedential language regarding mechanisms for compliance with Provision A.1 to A.3, the San Diego Water Board will then update the Regional MS4 Permit as necessary.</p> <p>Additionally, the discussion in the Fact Sheet under Provision B6 describes the San Diego Water Boards intentions to use the Water Quality Improvement Plans as functionally equivalent documents to TMDL Load Reduction Plans.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p> <p>See also response to comment A-1.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

B-2	PROVISION B: WATER QUALITY IMPROVEMENT PLANS	
	<p><b>COMMENT:</b> <i>Water Quality Improvement Plans need to be based on regionally appropriate water quality standards that reflect sustainable conditions for beneficial uses.</i></p>	Riverside County Copermittees
	<p><b>RESPONSE:</b> The San Diego Water Board understands the concerns raised by the Riverside County Copermittees, however the proceedings on the Tentative Order are not the proper forum for addressing proposals to modify Basin Plan water quality standards.</p> <p>Water quality standards and beneficial uses are established in the San Diego Water Board's Basin Plan and not the Tentative Order /. The San Diego Water Board suggests the Riverside County Copermittees bring the comment forth during the San Diego Water Boards process for conducting the Triennial Review of Basin Plan water quality standards which is currently underway. . It is within the Triennial Review process that the San Diego Water Board reviews the Basin Plan water quality standards and beneficial uses. Information on the Triennial Review process can be accessed on the San Diego Water Board website at:  <a href="http://www.waterboards.ca.gov/sandiego/water_issues/programs/basin_plan/tri_review.shtml">http://www.waterboards.ca.gov/sandiego/water_issues/programs/basin_plan/tri_review.shtml</a></p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>B1-1</b>	<b>PROVISION B.1: Watershed Management Areas</b>	
	<p><b><u>COMMENT:</u></b> <i>Revise footnote 2 to Table B-1 to clarify single water regulation of City of Lake Forest.</i></p> <p>The City of Lake forest suggests revision to footnote 2 to Table B-1 to clarify single board regulation.</p>	City of Lake Forest
	<p><b><u>RESPONSE:</u></b> The San Diego Water Board understands the City's comment and has modified the footnote language to be consistent with the language in Finding 29. Please see response to Comment Fnd-7.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>B1-2 PROVISION B.1: Watershed Management Areas</b>		
<b>B1-2</b>	<p><b>COMMENT:</b> <i>Revise language in Tentative Order to clarify NPDES permit is applicable to discharges from Copermittees MS4s.</i></p> <p>The City of San Diego requests that the requirements of the Tentative Order “clarify” the responsibilities of the Copermittees to develop a Water Quality Improvement Plan “for their MS4 discharges within” each of the Watershed Management Areas.</p>	City of San Diego
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the comment that clarification is necessary.</p> <p>The San Diego Water Board did not revise the language with the qualifying phrases requested by the Copermittees. The Copermittees are required to establish the legal authority to implement the requirements of the Tentative Order. The Tentative Order does not require the Copermittees to implement requirements outside of their jurisdictions or outside of their legal authority.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>B3-1</b>	<b>PROVISION B.3: Water Quality Improvement Goals, Strategies and Schedules</b>	
	<p><b>COMMENT:</b> <i>Provision B.3.a should explicitly state that the action levels, interim goals and final goals are not enforceable limitations.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the comment.</p> <p>After further clarification with the commenters on their references to footnotes in Provision B and C, Footnote 8 to Provision C.1 for Non-Storm Water Action Levels (NALs) and Footnote 10 to Provision C.2 Storm Water Action Levels (SALs) clearly state NALs and SALs incorporated in the Water Quality Improvement Plans are not considered by the San Diego Water Board to be enforceable effluent limitations, unless the NAL or SAL is based on a WQBEL expressed as an interim or final effluent limitation for a TMDL in Attachment E and the interim or final compliance date has passed.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>C-1 PROVISION C: ACTION LEVELS</b>		
<b>C-1</b>	<p><b>COMMENT:</b> <i>The Tentative Order should enable the Copermittees to apply NALs/SALs based on the priorities of the Water Quality Improvement Plan and/or the IDDE program.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District are concerned that the Tentative Order contradicts itself by stating Copermittees must develop and incorporate numeric NALs and SALs into the Water Quality Improvement Plan and/or IDDE program, then mandates Copermittees include all of the numeric action levels identified in tables C-1 to C-5. The Copermittees expressed concern that requiring the prescribed NALs and SALs under Provision C would result in unnecessary analyses for constituents that are not a priority identified in the Water Quality Improvement Plan.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the request to modify the requirements as suggested.</p> <p>The NALs and SALs under Provision C have been included to support the development and prioritization of the water quality strategies that will be implemented based on the highest priority water quality conditions identified by the Copermittees in the Water Quality Improvement Plans.</p> <p>The NALs and SALs have been included as a tool that the Copermittees and the San Diego Water Board can utilize to determine if the Copermittees are implementing the requirements of the Clean Water Act for MS4 permits to <i>effectively prohibit non-storm water discharges to the MS4 and reduce pollutants in storm water discharges from the MS4 to the MEP.</i> The NALs and SALs are not new, and are included in both of the current MS4 permits issued to Orange County (Order No. R9-2009-0002) and Riverside County (Order No. R9-2010-0016).</p> <p>The Copermittees are required to effectively prohibit non-storm water discharges to their MS4s, which in turn should result in little to no discharges from their MS4s to receiving waters. If there are non-storm water discharges from the Copermittees' MS4s to receiving waters, those discharges should only be NPDES permitted discharges. Even if those discharges are NPDES permitted discharges, the Copermittees are responsible for demonstrating that those discharges are not illicit discharges by identifying the sources as NPDES permitted discharges.</p> <p>The prescribed NALs in Table C-1 through C-4 are associated with most if not all the pollutants that are known</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

C-1	PROVISION C: ACTION LEVELS
	<p>or suspected to be causing or contributing to impairments in water bodies on the 303(d) List for the San Diego Region. The NALs are appropriately based on water quality objectives because non-storm water discharges that do not contain pollutants at levels in exceedance of the NALs are not expected to cause or contribute to exceedances of water quality standards in receiving waters.</p> <p>Thus, the prescribed NALs have been included to allow the Copermittees to prioritize their efforts in effectively prohibiting unpermitted non-storm water discharges to their MS4s, demonstrate that they have effectively prohibited non-storm water discharges to their MS4s that could cause or contribute to exceedances of water quality standards, or identify NPDES permitted sources that are resulting in discharges from their MS4s that are causing or contributing to exceedances of water quality standards in receiving waters. In any case, the prescribed NALs are necessary to allow the San Diego Water Board to determine if the Copermittees are effectively prohibiting non-storm water discharges to the MS4. The Tentative Order also allows Copermittees the flexibility to develop and include NALs, for which values are not already included provision C-1, for those pollutants that are causing or contributing, or threatening to cause or contribute to a condition of pollution or nuisance in receiving waters associated with the highest priority water quality conditions related to non-storm water discharges from the MS4s into the Water Quality Improvement Plans and IDDE Program. The Tentative Order does not prohibit the Copermittees from using any “previously established NALs” in addition to those listed in C-1 to C-4.</p> <p>In contrast, the prescribed SALs are not based on water quality objectives, but set at higher levels because the San Diego Water Board recognizes that reducing pollutants in wet weather discharges from the MS4s to water quality objectives is challenging. The prescribed SALs, however, will allow the Copermittees to prioritize their efforts in reducing pollutants in storm water discharges from their MS4s, and allow the San Diego Water Board to determine if the Copermittees are reducing pollutants in storm water discharges from their MS4s to the MEP.</p> <p>The San Diego Water Board disagrees with the concerns about monitoring for constituents that are not associated with the highest priority water quality conditions. Periodically analyzing non-storm water and storm water discharges from the Copermittees’ MS4 for pollutants other than those associated with the highest priority water quality conditions is necessary if the Copermittees would like to re-prioritize or identify new priority water quality conditions that will be addressed. The San Diego Water Board does recognize that there is a cost associated with analyzing for additional constituents. Thus, the San Diego Water Board has modified the MS4 outfall monitoring requirements to reduce the number of dry weather MS4 outfall monitoring stations that must be analyzed (see Provision D.2.b.(2)(b) of Order No. R9-2013-0001) and provided the Copermittees some flexibility to modify the analytes for the wet weather MS4 outfall monitoring stations (see Provision</p>

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

C-1	PROVISION C: ACTION LEVELS
	<p>D.2.c.(5)(f).</p> <p>As for the concerns about the chemically-based NALs and the biologically- or physically-based numeric goals for receiving waters, the San Diego Water Board disagrees that they cannot be linked or may be incompatible. Biologically- or physically-based numeric goals will likely be measured in the receiving waters. The chemically-based NALs apply to the MS4 outfalls. The quality of the MS4 discharges and the improvement of biological or physical measurements can be linked. Both are likely necessary to demonstrate that MS4 discharges are either not causing or contributing to a biological or physical impairment of the receiving water, or an improvement in MS4 discharges is resulting in improvements in the biological or physical conditions of the receiving water.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

D-1 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS		
	<p><b>COMMENT:</b> <i>Copermittees need to have the flexibility to adjust analytical monitoring in the water quality improvement plans based on assessments of current sources that may contribute to the section 303(d) water body impairments.</i></p> <p>The County of Orange and Concurring Cities and Orange County Flood Control District requested relief of analytical monitoring requirements if supporting information can be provided to document the current pollutant concentrations or may provide historic information to support the absence of usage of these constituents in the MS4 drainage area.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the suggested revisions to the Tentative Order.</p> <p>Monitoring required in Provision D of Attachment No. 1 to the Tentative Order describes the minimum monitoring required to inform the Copermittees, San Diego Water Board, and the public on the progress the Copermittees make within their Phase 1 storm water programs to: 1) effectively prohibit non-storm water discharges to the MS4 and reduce pollutants in storm water from the MS4 to the maximum extent practicable; and 2) implement strategies to control the discharge of pollutants in MS4 discharges and improve receiving water quality. These minimum monitoring requirements do not prohibit the Copermittees from conducting monitoring for which it considers necessary to identify constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan.</p> <p>Each Copermittee is required to achieve compliance with the Basin Plan prohibitions and receiving water limitations (Provision A.1.a, A.1.c, and A.2.a, in Attachment 1 to the Tentative Order) through implementation of control measures and other actions as specified in the Tentative Order. The monitoring and assessment information collected and reported is expected to be key to the iterative approach and adaptive management process required by the Tentative Order (Provision A.4 of Attachment 1). Under the adaptive management provision, Copermittees are expected to change their monitoring programs to collect the necessary data for them to be able to demonstrate that their jurisdictional storm water management programs are making measurable progress towards achieving compliance with Basin Plan prohibitions and receiving water limitations. Changes to the monitoring programs would be presented during the development of or subsequent updates to the Water Quality Improvement Plan. All Copermittees are required to conduct the minimum monitoring described in Provision D, however through the adaptive management approach in Provision A of Attachment 1 to the Tentative Order, Copermittees are allocated sufficient flexibility to make changes to their monitoring program to collect the data most necessary to that their control strategies and other actions are</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

D-1	PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS
	<p>making measurable progress towards effectively eliminating non-storm water discharges, and reducing pollutants in storm water to the maximum extent practicable to ultimately achieve compliance with the Basin Plan prohibitions and receiving water limitations (Provision A in Attachment 1 to the Tentative Order).</p> <p>Based on this consideration no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p> <p>See also response to comment Gnl-2.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>D-2 PROVISION D: MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS</b>		
	<p><b><u>COMMENT:</u></b> <i>Modify Tentative Order requirements to be consistent with language in the South Orange County Wastewater Authority permit language.</i></p> <p>The San Diego Water Board Monitoring and Assessment staff requests the Tentative Order be modified to update the Unified Beach Water Quality Monitoring language.</p>	<p style="text-align: center;">San Diego Water Board Staff of the Monitoring and Assessment Group</p>
	<p><b><u>RESPONSE:</u></b> The San Diego Water Board agrees with the comment and has made the suggested language changes to the Tentative Order</p> <p>The Tentative Order language was revised to be consistent with the December 5, 2014 Executive Officer's letter directive, issued pursuant to California Water Code section 13383, requiring Copermittee participation in and shared responsibility for implementation of the Unified Beach Water Quality Program. Effective April 1, 2015, the requirements established through issuance of this Water Code section 13383 letter directive will become an enforceable component of the monitoring and reporting requirements in the Tentative Order.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E-1 PROVISION E: JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS</b>		
<b>E-1</b>	<p><b>COMMENT:</b> <i>Water Quality Improvement Plans and related Jurisdictional Runoff Management Programs should be streamlined and focus on the watershed's highest priorities.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District commented that the Tentative Order, Attachment 1 at Provision E deviates from the strategic and adaptive approach of the Water Quality Improvement Plan concept, and is instead a "one-size-fits-all" approach. The commenters recommend modifying the Tentative Order so that the Water Quality Improvement Plans and jurisdictional runoff management programs can be streamlined and focus on the highest priorities within the watersheds.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the Water Quality Improvement Plan framework allows for the identification and development of a storm water management program built around the highest priority water quality conditions within a specific watershed. The Tentative Order is structured so that the Water Quality Improvement Plan identifies the highest priority conditions of concern for a particular watershed, and also strategies, numeric goals, and schedules for making improvements for those conditions of concern. The jurisdictional runoff management programs are meant to be the implementing mechanism for the Water Quality Improvement Plans, i.e. they must incorporate the strategies identified in the Water Quality Improvement Plans.</p> <p>The San Diego Water Board disagrees that the requirements of Provision E deviate from the strategic and adaptive approach of the Water Quality Improvement Plan concept and that modifications are needed. The commenters should note that the requirements of the Provision E of the Tentative Order are substantially less prescriptive than those of the previous Fourth Term MS4 permits. Whereas the requirements of the Fourth Term MS4 permits were very specific, detailed, and prescriptive, the requirements of the Tentative Order include only basic program elements that meet the minimum requirements of 40 CFR 122.26(d)(2)(iv), but include much more flexibility in how the Copermittees implement their programs. The Copermittees can emphasize or de-emphasize different aspects of their programs to accomplish the overarching goals of the Water Quality Improvement Plans. For example, a Copermittee may choose to emphasize a certain program element by increasing the frequency of BMP inspections for discharges that are likely to contribute to the priority conditions of concern, while maintaining other program elements at the minimum required levels. Unlike the Fourth Term MS4 permits, the Tentative Order allows each Copermittee to specify, for example, the minimum inspection frequency for each specific program element. In this way, Copermittees are allowed to run their programs at minimum baseline levels, but also direct their resources where needed to achieve improvements in water quality and to address the highest priority conditions of concern.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E-1	PROVISION E: JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS
	Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E1-1 PROVISION E.1: Legal Authority Establishment and Enforcement</b>		
	<p><b>COMMENT:</b> <i>The Copermittees are only responsible for administering and enforcing the codes and ordinances applicable to their jurisdictions.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request that the requirements of Provision E.1 be modified to specify that the legal authority established by the Copermittees applies only to discharges within their jurisdictions, and that it is unnecessary to include language pertaining to discharges regulated by the Statewide Industrial and Construction General Permits.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that it is necessary to specify that the legal authority established by the Copermittees is only applicable to their jurisdictions.</p> <p>The requirements of Provision E.1 are consistent with the requirements under 40 CFR 122.26(d)(2)(i)(A)-(F) and do not go beyond those requirements. The legal authority that each Copermittee is required to establish for its jurisdiction is logically only expected to apply to its jurisdiction.</p> <p>Provision E.1.a.(2) is consistent with 40 CFR 122.26(d)(2)(i)(A), which requires the Copermittee to <i>“Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity.”</i> 40 CFR 122.26(d)(2)(i)(A) does not make a distinction between industrial activity (which includes construction activity according to 40 CFR 122.26(b)(14)(x) that is regulated by an NPDES permit, such as the Statewide Industrial and Construction General Permits, and those that are not. Even if there are industrial and construction sites regulated by the Statewide Industrial or Construction General Permits, those sites are still subject to the Copermittees ordinances and the Copermittee must have the legal authority to control discharges from those sites.</p> <p>Provision E.1.a.(10) is consistent with 40 CFR 122.26(d)(2)(i)(F), which requires the Copermittee to <i>“Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.”</i> Therefore no modifications are warranted, and the San Diego Water Board did not make revisions to the requirements of Provision E.1 requested by the Commenters.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E1-2	<b>PROVISION E.1: Legal Authority Establishment and Enforcement</b>	
	<p><b>COMMENT:</b> <i>The requirement for third party BMP effectiveness documentation is duplicative.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District state that Provision E.1.a.(8) of the Tentative Order requires the Copermittees to obtain legal authority to require documentation of the effectiveness of BMPs, and that this requirement sets up a process for the establishment of multiple third party monitoring programs and expenditure of public funds to monitor the effectiveness of BMPs. The commenters state that this requirement ignores the fact that Copermittees have already established legal authority for their development standards, and is therefore redundant.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that Provision E.1.a.(8) sets up a process for the establishment of multiple third party monitoring programs and expenditure of significant public funds to monitor the effectiveness of BMPs. The Provision simply states that each Copermittee must establish legal authority that authorizes the Copermittee to require documentation on the effectiveness of BMPs from any of its dischargers. The Copermittee is not required to exercise this legal authority, but the legal authority must be established and available to the Copermittees in the event that the Copermittee could benefit from obtaining this type of information. The requirement is not duplicative because the legal authority to impose development standards is separate from the legal authority to require documentation on BMP effectiveness.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

January 21, 2015

<b>E2-1</b>	<b>PROVISION E.2: Illicit Discharge Detection and Elimination</b>	
	<p><b>COMMENT:</b> <i>Modify the Illicit Discharge Detection and Elimination Program provisions so as not to negate the very intent and purpose of the watershed approach and the focus on the highest priorities within each watershed management area.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request modification to the introductory paragraph of the Illicit Discharge Detection and Elimination Provisions to better reflect the watershed approach and program focus on highest priority conditions of concern.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that modifications to the Illicit Discharge Detection and Elimination Program Provisions are needed for the reasons stated in the Response to Comment E1-1.</p> <p>Copermittees are afforded flexibility in meeting the requirements of Provision E.2. They are required to meet a minimum baseline program (with limited prescriptiveness compared to previous Fourth Term MS4 permits) as stated in the Tentative Order, and within that framework may focus on the highest priority conditions of concern as described in the Water Quality Improvement Plans. All illicit discharges are to be actively detected and eliminated in a prioritized manner.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E2a-1 PROVISION E.2.a: Non-Storm Water Discharges</b>		
	<p><b>COMMENT:</b> <i>Copermittees should be given flexibility to prioritize their IDDE program to focus on non-storm water discharges likely to be a source of pollutants.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request that the requirements under Provision E.2.a be revised to allow the Copermittees to focus on eliminating non-storm water discharges that are a source of pollutants and not require the elimination of all non-storm water discharges.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the commenter's request. Provision E.2 does provide the Copermittees with a mechanism to address illicit discharges regardless of whether or not constituents of concern are present within the flows. The Copermittees are required to prioritize the non-storm water discharges that they will address, and eliminate the highest priority non-storm water discharges first.</p> <p>The Clean Water Act requires NPDES permit for MS4s to effectively prohibit non-storm water discharges to the MS4. As explained in the Fact Sheet, the Phase I Final Rule clarifies that non-storm water discharges through an MS4 are not authorized under the CWA (55 FR 47995): <i>"Today's rule defines the term "illicit discharge" to describe any discharge through a municipal separate storm sewer system that is not composed entirely of storm water and that is not covered by an NPDES permit. Such illicit discharges are not authorized under the Clean Water Act. Section 402(p)(3)(B) requires that permits for discharges from municipal separate storm sewers require the municipality to "effectively prohibit" non-storm water discharges from the municipal separate storm sewer... Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit."</i></p> <p>Thus, all non-storm water discharges that do not have authorization under an NPDES permit or are a category of non-storm water discharges that have been identified as a source of pollutants must ultimately be removed (i.e. prevented or eliminated) from the MS4 or become subject to an NPDES permit. The requirements under Provisions E.2.a.(1) and E.2.a.(3) are consistent with the Clean Water Act, the Code of Federal Regulations and the clarification in the Phase I Final Rule for non-storm water discharges.</p> <p>The non-storm water categories listed under Provision E.2.a.(3) generally are expected to be discharged from natural, uncontrollable, or unanticipated sources. Non-storm water discharges from foundation drains and footing drains designed to be above the groundwater table are not generally expected to occur. If they do occur, the Copermittee is expected to implement its illicit discharge detection and elimination program to</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E2a-1	PROVISION E.2.a: Non-Storm Water Discharges
	<p>determine if the discharge is transient or persistent, a source of pollutants or not, and whether the discharge must be eliminated in accordance with its priorities.</p> <p>In general, the requirements under Provision E.2 are focused on the ultimate removal of unauthorized non-storm water discharges to the MS4 to "effectively prohibit" non-storm water discharges to the MS4, as required by the Clean Water Act. The San Diego Water Board is not requiring the Copermittee to enforce any NPDES permits issued by the San Diego Water Board or State Water Board. The Copermittees are only required to use their legal authority to prohibit illicit discharges to their MS4s established pursuant to Provision E.1.a.(1).</p> <p>The San Diego Water Board did not revise Provision E.2 as recommended by the commenters.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E2a-2 PROVISION E.2.a: Non-Storm Water Discharges</b>		
	<p><b>COMMENT:</b> <i>Modify Provision E.2.a.(5) to reflect the language previously adopted by the Regional Board in Order No. R9-2009-0002 regarding emergency firefighting discharges.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request that the Tentative Order be modified to clarify that there should not be a circumstance in which the Copermittees or the San Diego Water Board would identify emergency firefighting discharges as illicit discharges or a significant source of pollutants, and therefore in no instance would require BMP implementation.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the language in Provision E.2.a.(5) requires revision. This Provision does not require the implementation of BMPs for emergency firefighting discharges, nor does it prohibit emergency firefighting discharges to the MS4. Provision E.2.a.(5)(b) only requires the Copermittees to “encourage” the implementation of BMPs in emergency situations. Provision E.2.a.(5)(b) is a recommendation for the Copermittees to implement, not a requirement for compliance.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E2a-3 PROVISION E.2.a: Non-Storm Water Discharges		
	<p><b>COMMENT:</b> <i>The Tentative Order should not require the elimination of non-storm water discharges as a part of the IDDE Program.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District state that Provision E.2.a.(7) misapplies the federal regulations that require the Copermittees to identify non-storm water discharges as illicit discharges prior to having an obligation to effectively prohibit it, and therefore the Provision should be removed.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that it is appropriate to remove Provision E.2.a.(7) because it is consistent with Clean Water Act, the Code of Federal Regulations and the clarification in the Phase I Final Rule for non-storm water discharges. Please see the response to comment E2a-1 for further discussion.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E3-1 PROVISION E.3: Development Planning</b>		
	<p><b>COMMENT:</b> <i>The Development Planning Provisions must be modified so as not to negate the very intent and purpose of the watershed approach and the focus on the highest priorities within each Watershed Management Area.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request modification to the introductory paragraph of the Development Planning Provisions to better reflect the watershed approach and program focus on highest priority conditions of concern.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that modifications to the Development Planning Program Provisions are needed for the reasons stated in the Response to Comment E1-1.</p> <p>Copermittees are afforded flexibility in meeting the requirements of Provision E.3. They are required to meet a minimum baseline program (with limited prescriptiveness compared to Fourth Term MS4 permits) as stated in the Tentative Order, and within that framework may focus on the highest priority conditions of concern as described in the Water Quality Improvement Plans.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E3b-1 PROVISION E.3.b: Priority Development Projects</b>		
	<p><b>COMMENT:</b> <i>Portions of redevelopment projects that already have water quality treatment BMPS should not be subject to the new PDP requirements.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request that language be added to the Tentative Order that would specify structural BMP requirements are not applicable to Priority Development Projects (or portions thereof) if the project already has implemented structural BMPs pursuant to requirements of prior MS4 permits.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees in concept with the Copermittees' request.</p> <p>Although some projects may already have structural BMPs onsite, the performance requirements of those BMPs do not necessarily meet the MEP requirements of the Tentative Order. Priority Development Projects subject to the requirements of older MS4 permits may not have BMPs that meet the numerical storm water pollutant control retention performance standard, or the flow control hydromodification performance standard. Therefore, when redevelopment sites, that were subject to older MS4 permit requirements, want to create and/or replace 5,000 square feet or more of impervious surface on the project site (collectively over the entire project site on an existing site with 10,000 square feet or more of impervious surfaces), the redevelopment site must update the BMPs during the design phase.</p> <p>Furthermore, the commenter should note that the pollutant control and hydromodification management BMP requirements of the Tentative Order are the same as the previous South Orange County MS4 permit, Order No. R9-2009-0002. Therefore Priority Development Projects that were subject to these requirements developed in 2009 should already be in compliance with the requirements of the Tentative Order.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3b-2	PROVISION E.3.b: Priority Development Projects	
	<p><b>COMMENT:</b> <i>Tentative Order should include a priority development project exemption for flood control and stream restoration projects.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request that the Tentative Order should include exemptions for flood control and stream restoration projects from the requirement to implement structural BMPs since they are not a source of pollutants.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board believes that it may be suitable to relax the structural BMP standards for, or exempt flood control projects, but not before projects are evaluated on a case-by-case basis. In many instances, water quality protective measures may be appropriate for implementation in flood control projects, but such options would not be evaluated if the Tentative Order provided a blanket exemption. Furthermore, 40 CFR 122.26(d)(2)(iv)(A)(4) requires Copermittees to include in their applications mechanisms “to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible.” Such evaluations would not occur if flood control projects were provided blanket exemption from Priority Development Project status, therefore a blanket exemption is not appropriate.</p> <p>Stream restoration projects do not fit any of the Priority Development Project categories, therefore no exemptions are needed.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3b-3	<b>PROVISION E.3.b: Priority Development Projects</b>	
	<p><b>COMMENT:</b> <i>Tentative Order should include a priority development project exemption for emergency public safety projects.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request the Tentative Order include exemptions for emergency public safety projects from the requirement to implement structural BMPs because <i>a delay due to the development and approval of a Standard Stormwater Mitigation Plan (SSMP) would compromise public safety, public health and/or the environment.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that modifications to the Tentative Order to exempt emergency public safety projects from the requirement to implement structural BMPs is necessary.</p> <p>The Commenters state that emergency projects will be implemented immediately where public safety, public health, and/or the environment is threatened, and that there will be no time for the development, processing, and plan check for these projects. The San Diego Water Board agrees. Provision E.3 describes requirements that pertain to development <i>planning</i>. Emergency situations, by definition, are not planned projects and therefore do not involve the design, approval, and construction of a building or structure. Therefore an explicit exemption is not needed. Regardless of the conditions (i.e. emergency conditions) under which a public safety project requires installation, if a public safety project meets the Priority Development Project criteria of Provision E.3.b, then the public safety project needs to include the structural BMP controls of Provision E.3.c.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E3c-1 PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements</b>		
	<p><b>COMMENT:</b> <i>Modify the Tentative Order to allow flexibility in the structural BMP performance standards if watershed-specific performance standards are developed in the water quality improvement plans.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District submitted comments stating that the Copermittees should be given the opportunity to develop alternative BMP performance standards consistent with the goals of the Water Quality Improvement Plans.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that greater improvements to water quality in the watersheds may be realized if Priority Development Projects were allowed to implement some requirements offsite, as opposed to strictly onsite. For this reason, the Attachment No. 1 of the Tentative Order allows for “alternative compliance” in instances where the Copermittee determines that offsite measures will have a greater overall water quality benefit for the Watershed Management Area than if the Priority Development Project were to implement structural BMPs onsite. Consequently, watershed-specific structural BMP requirements are present in Attachment No. 1 to the Tentative Order that provide for allowable compliance offsite. Therefore no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p> <p>The alternative compliance program, which is described in Provision E.3.c.(3), is an option for Priority Development Projects where the Copermittee has participated in the development of a Watershed Management Area Analysis as part of the Water Quality Improvement Plan (described in Provision B.3.b.(4)). Such an approach is consistent with the latest findings in hydromodification management by the scientific community. In the Southern California Coastal Water Research Project (SCCWRP) Technical Report No. 667, the authors state: <i>“An effective [hydromodification] management program will likely include combinations of on-site measures (e.g., low-impact development techniques, flow-control basins), in-stream measures (e.g., stream habitat restoration), floodplain and riparian zone actions, and off-site measures. Off-site measures may include compensatory mitigation measures at upstream locations that are designed to help restore and manage flow and sediment yield in the watershed.”</i></p> <p>Consistent with the ideas brought forth by the SCCWRP report, in the optional Watershed Management Area Analysis of Provision B.3.b.(4), the Copermittees must develop watershed maps that include as much detail about factors that affect the hydrology of the watersheds as is available. Such factors included identification of areas suitable for infiltration, coarse sediment supply areas, and locating stream channel structures and constrictions. Once these factors are mapped and studied, the Copermittees can identify areas in the</p>	

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3c-1	PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements
	<p>watersheds where “candidate projects” may be implemented that are expected to improve water quality in the watershed by providing more opportunity for infiltration, slowing down storm water flows, or attenuation of pollutants naturally via healthy stream habitat. These projects may be in the form of retrofitting existing development, rehabilitating degraded stream segments, identifying regional BMPs, purchasing land to preserve valuable floodplain functions, and any other projects that the Copermittees identify.</p> <p>Under the alternative compliance program, Priority Development Project applicants may be allowed to fund, partially fund, or implement a candidate project, in lieu of implementing structural BMPs onsite, if they enter into a voluntary agreement with the Copermittee permitting this arrangement. If compliance involves funding or implementing a project that is outside the jurisdiction of the Copermittee, then that Copermittee may enter into an inter-agency agreement with the appropriate jurisdiction(s).</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

January 21, 2015

<b>E3c1-1</b>	<b>PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements</b>	
	<p><b>COMMENT:</b> <i>Terminology is inconsistent with the use of "Low Impact Development" BMPs.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request modification to the Provision E.3 to provide consistency with the use of "Low Impact Development" terminology.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board has reviewed the suggested edits to Provision E.3 and did not find any suggestions pertaining to Low Impact Development terminology.</p> <p>Based on this consideration no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 20, 2015

E3c1-2	<b>PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements</b>	
	<p><b>COMMENT:</b> <i>The San Diego Water Board is requiring increasingly stringent onsite storm water retention requirements.</i></p> <p>The Construction Industry Coalition on Water Quality (CICWQ) submitted comments stating that the San Diego Water Board is requiring increasingly stringent onsite storm water retention requirements without evidence that existing requirements under Order No. R9-2009-0002 are not working to protect water quality and beneficial uses. The commenter asserts that the San Diego Water Board is proposing to enact the most stringent onsite requirements for storm water runoff anywhere in California, and that the requirements are less flexible than earlier MS4 permits.</p>	<p><b>Construction Industry Coalition on Water Quality</b></p> <ul style="list-style-type: none"> <li>• San Diego Building Industry Association</li> <li>• Building Industry Association of Southern CA</li> <li>• Associated General Contractors</li> <li>• Associated Builders and Contractors</li> <li>• San Diego Regional Chamber of Commerce</li> <li>• Business Leadership Alliance</li> <li>• San Diego Association of Realtors</li> <li>• San Diego Apartment Association</li> <li>• National Association of Industrial &amp; Office Properties</li> <li>• Building Office &amp; Management Association</li> <li>• San Diego Chapter of American Society of Landscape Architects</li> </ul>
	<p><b>RESPONSE:</b> The commenter incorrectly asserts that Attachment No. 1 to Tentative Order requires increasingly stringent onsite storm water retention requirements over and above the requirements of Order No. R9-2009-0002, the Fourth Term MS4 permit for Orange County Copermittees. The purpose of the onsite retention requirement in both the Tentative Order and Order No. R9-2009-0002 is to retain onsite the pollutants contained in the volume of storm water runoff produced from a 24-hour 85th percentile storm event. This requirement has not changed from Order No. R9-2009-0002, and therefore the commenter is incorrect in stating that the San Diego Water Board is requiring additional prescriptive performance measures for retaining storm water runoff. This is the MEP standard recognized by the San Diego Water Board and is consistent with the Fourth Term Permits for Orange County and Riverside County (Order Nos. R9-2009-0002 and R9-2010-0016, respectively), as well as Santa Ana Water Board Order Nos. R8-2009-0030 and R8-2010-0033 (Orange County and Riverside County MS4 Permits, respectively), Los Angeles Water Board Order No. R4-2010-0108 (Ventura County MS4 Permit), and Los Angeles Water Board Order No. R4-2012-0175 (Los Angeles County MS4 Permit).</p> <p>Additionally, the San Diego Water Board disagrees with the commenter's assertion that the retention standard</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 20, 2015

E3c1-2	<b>PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements</b>
	<p>is less flexible in the Tentative Order than in Order No. R9-2009-0002. In fact, the pollutant control and hydromodification management BMP requirements are more flexible in the Tentative Order than in the Fourth Term MS4 permits because the Tentative Order allows Priority Development Projects to comply by mitigating offsite, if doing so would provide greater water quality benefit for the watershed.</p> <p>Please see the response to Comment No. E3c1-2 for a discussion of the Watershed Management Analysis and the ability to perform offsite mitigation.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>E3c1-3 PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements</b>	
<p><b>COMMENT:</b> <i>The Tentative Order and Fact Sheet ignore the findings of the Copermittee's Report of Waste Discharge.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District submitted comments stating that there is little justification for the requirements of the Tentative Order based on the successes of the Copermittee's storm water programs, as reported in the Report of Waste Discharge (ROWD). The Copermittees report successes in reducing bacterial contamination in coastal waters during dry weather, and also assert that exceedances of total dissolved solids (TDS) and nutrients are unlikely due to urban sources. The commenters also state that the Tentative Order should recognize this uncertainty and not mandate on-site retention of runoff in the first instance where it may exacerbate the exfiltration of shallow groundwater with elevated TDS and nutrients.</p> <p>Finally, the commenters state that toxicity occurs sporadically in receiving waters in Orange County, indicating that the causes are not urban in nature, and that pesticide regulation is not within the Copermittees' jurisdictions.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
<p><b>RESPONSE:</b> The San Diego Water Board recognizes that the Copermittees have made great strides in improvements in water quality and attainment of beneficial uses through rigorous implementation of their storm water management programs, but disagrees that the requirements of Attachment No. 1 to the Tentative Order should be removed.</p> <p>The Copermittees note that bacterial contamination is low during dry weather, but concede that achieving reductions in bacteria concentrations in wet weather is challenging. The San Diego Water Board is charged with protecting the beneficial uses of receiving waters at all times, regardless of season or weather conditions. The fact that there are still impairments with bacterial contamination in the receiving waters during the rainy season is exactly why the requirements in the Tentative Order are necessary.</p> <p>The San Diego Water Board agrees that it is worthwhile to understand the environmental significance TDS and nutrients and their relationship, or lack thereof, to urban sources. The San Diego Water Board disagrees, however, that the Tentative Order does not recognize the need to protect shallow groundwater from exfiltration of TDS and nutrients. Although the Tentative Order at Provision E.3.c.(1)(a) requires onsite retention of the design capture volume, this can be accomplished via several physical mechanisms such as interception, storage, evaporation, and evapotranspiration, in addition to infiltration. Therefore the Tentative Order does not automatically mandate on-site retention of runoff in the form of infiltration in every instance, as the commenter</p>

E3c1-3	PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements
	<p>asserts.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p> <p>See also response to comment Gnl-2.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>E3c1-4 PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements</b>		
	<p><b>COMMENT:</b> <i>If priority development projects use alternative compliance, onsite conventional BMPs should not also be required.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District state that there is not adequate technical justification for requiring onsite conventional BMPs when a Priority Development Project is allowed alternative compliance offsite. The commenters state that requiring both is double mitigation that goes well beyond the MEP standard.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with this comment.</p> <p>Onsite pollutant treatment using conventional BMPs is a minimum general requirement to remove pollutants from runoff prior to its discharge to any receiving water. The storm water pollutant control BMP requirement for Priority Development Projects is to retain, onsite, the pollutants contained in the volume of storm water runoff produced from a 24-hour 85<sup>th</sup> percentile storm event (design capture volume). If it is not technically feasible to retain pollutants within the design capture volume, onsite, then the Tentative Order provides for an alternative means of compliance. If the Priority Development Project proponent is allowed to implement BMPs offsite, then the portion of the design capture volume that is not reliably retained onsite must be treated prior to discharging pollutants into the receiving water. 40 CFR 131.10(a) prohibits use of the receiving water as a treatment system and therefore, requires treatment of runoff to occur prior to the discharge of runoff to receiving waters (See Finding 7 in Attachment 1 of the Tentative Order). If Priority Development Projects are allowed to forgo onsite conventional treatment of runoff, then the Priority Development Projects would discharge untreated runoff from their site into receiving waters which is prohibited under 40 CFR.</p> <p>Retention of the 85th percentile storm is clearly the MEP standard for storm water pollutant control, as represented by the Tentative Order and its Attachments, recently adopted MS4 permits in the state (R8-2009-0030 and R8-2010-0033; North Orange and Riverside County MS4 permits, R4-2010-0108 and R4-2012-0175; Ventura County and Los Angeles County MS4 permits, and San Diego Water Board Order Nos. R9-2009-0030 and R9-2010-0016; South Orange County and Riverside County MS4 permits), and elsewhere in the United States. Retention of anything less than the design storm volume must be mitigated because the MEP standard has not been met. Therefore, Attachment 1 to the Tentative Order includes a requirement that mitigation is necessary for the portion of the design storm volume that is not retained onsite because, although this remaining volume of storm water would be treated to some level, the MEP standard as represented by the structural BMP performance requirements would not have been met.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3c-5	<b>PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements</b>	
	<p><b>COMMENT:</b> <i>Biofiltration BMPs should be sized for the design capture volume.</i></p> <p>The County of Orange and Concurring Cities and Orange County Flood Control District assert that the requirement to oversize biofiltration BMPs to treat 1.5 times the design capture volume, if used to meet the pollutant control BMP requirements, is an increase over the prior Orange County MS4 permit. The commenters state that the Fact Sheet provides no technical justification for the sizing factor, and that biofiltration should be considered equivalent to onsite retention.</p> <p>The commenters also assert that Priority Development Projects that use biofiltration BMPs must also implement conventional BMPs, effectively requiring double mitigation when it is not needed.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The commenter incorrectly states that the requirement to size biofiltration BMPs to treat 1.5 times the design capture volume not reliably retained onsite is an increase from the prior Orange County MS4 permit (Order No. R9-2009-0002). This methodology of sizing the BMP was included in the Tentative Order <i>in addition to</i>, and not <i>in replacement of</i>, the methodology of sizing the BMP in Order No. R9-2009-0002. As a result, Priority Development Projects have two options for sizing biofiltration BMPs: 1.5 times the design capture volume not reliably retained onsite, OR a flow-thru design that has a total volume, including pore spaces and pre-filter detention volume, sized to hold at least 0.75 times the portion of the design capture volume not reliably retained onsite. The 1.5 sizing factor was included in the Tentative Order to offer more than one method of complying with the requirement. As described in the Fact Sheet, the 1.5 multiplier is based on the finding in the Ventura County Technical Guidance Manual that biofiltration of 1.5 times the design capture volume not retained onsite will provide approximately the same pollutant removal as retention of the design capture volume on an annual basis. This standard is consistent with the Los Angeles Water Board's Los Angeles County and Ventura County municipal storm water permits (Order Nos. R4-2012-0175 and R4-2010-0108, respectively).</p> <p>The commenter argues that biofiltration should be considered equivalent to other retention BMPs and therefore the 1.5 sizing factor is not needed. However, biofiltration is a flow-thru system, and therefore is not capable of retaining pollutants onsite (and preventing discharges of pollutants to receiving waters) in the equivalent manner as retention BMPs. The commenter compares the performance of harvest and use BMPs to biofiltration BMPs for the removal of total suspended solids, but fails to evaluate the performance of a range of retention BMPs, such as infiltration or evapotranspiration, which are widely accepted as effective pollutant control strategies.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3c-5	PROVISION E.3.c: Priority Development Project Structural BMP Performance Requirements
	<p>The commenter incorrectly asserts that Priority Development Projects that use biofiltration as an alternative compliance option must also implement conventional BMPs, and in effect requires double mitigation. Provision E.3.c.(1)(a)(i) of the Tentative Order allows for the use of biofiltration BMPs where retention of the full design capture volume is not technically feasible, but does not also require the use of conventional treat-and-release BMPs.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 20, 2015

E3c2-1	<b>PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>	
	<p><b>COMMENT:</b> <i>Hydromodification requirements are based on faulty foundational assumptions.</i></p> <p>Tory Walker, PE, submitted comments stating that the hydromodification requirements of the Tentative Order are based on faulty foundational assumptions. The commenter states that 1) the requirements cannot be based on a category of stream being either stable or highly dynamic, 2) flow rate reductions caused by dams reduces channel degradation, and runoff from Priority Development Projects may compensate for this and promote a more natural condition, and 3) as a result, the Tentative Order needs to accommodate more site-specific flexibility.</p>	Tory Walker Engineering
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the hydromodification management requirements in the Tentative Order are based on faulty assumptions that preclude the accommodation of site-specific conditions. In fact, the Tentative Order incorporates the ability to accommodate site-specific conditions much more so than previous Fourth Term MS4 permits.</p> <p>The requirements in the Tentative Order provide that post-project runoff conditions must not exceed pre-development runoff conditions by more than 10 percent (for the range of flows that result in increased potential for erosion or degraded instream habitat downstream of the Priority Development Project). Note that the requirement is not to control <i>all</i> flows, but only those flows that are expected to cause erosion downstream. Because the downstream receiving water may or may not be susceptible to erosion, then the BMPs needed upstream, on the Priority Development Project will necessarily vary. In essence, when configuring BMPs for a particular Priority Development Project, the project proponent must evaluate both site-specific conditions and runoff conditions expected from the project, as well as the receiving water's susceptibility to erosion. The requirements in the Tentative Order do not specify that channels are to be treated as either stable or highly dynamic.</p> <p>The commenter states that hydromodification impacts caused by dams could actually be offset by runoff from Priority Development Projects. The San Diego Water Board recognizes this possibility, therefore the Tentative Order allows for offsite compliance in lieu of implementing hydromodification management BMPs onsite, where the Copermittee finds offsite compliance to provide a greater water quality benefit to the watershed. In this example, if the Copermittees in the watershed complete the optional Watershed Management Area Analysis described in Provision B.3.b(4) and find that flows generated from Priority Development Projects would actually help offset the runoff impounded by upstream dams, then the Copermittees could allow the Priority Development Projects located downstream of the dams the ability to comply offsite. For these reasons, the</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 20, 2015

E3c2-1	PROVISION E.3.c.(2): Hydromodification Management BMP Requirements
	<p>San Diego Water Board disagrees that the hydromodification management requirements of the Tentative Order should be modified.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted</p>

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>E3c2-2 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>		
	<p><b>COMMENT:</b> <i>Hydromodification management requirements should be based on a watershed management approach, be consistent with the WQIPs, and consider the current Copermittee HMPs.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District state that hydromodification management should be based on the conditions of receiving waters and on the impacts and potential impacts from development projects, and the basis for management should be an understanding of the watershed and specific receiving waters. The commenters state that hydromodification management objectives should be watershed specific and developed through a stakeholder process. The commenters assert that the hydromodification management requirements in the Tentative Order are a one-size-fits-all approach that does not allow consideration of watershed analysis or receiving water information.</p> <p>The commenters state that requirement to use the pre-development runoff conditions as the performance standard goes beyond federal law by taking the Clean Water Act's purpose to restore waters out of context of section 402(p). The requirement does not reflect the developed urban environment and negates the engineering efforts to date to protect life and property from floods.</p> <p>The commenters also state that identifying "naturally occurring" conditions for redevelopment sites is difficult; raising the technical question as to how far back a Copermittee goes historically in determining the proper predevelopment timeframe. The commenters conclude by suggesting an approach to hydromodification management that is consistent with the intent of the Water Quality Improvement Plan approach, and considers the Copermittee's current Hydromodification Management Plans.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the hydromodification management requirements in the Tentative Order are a one-size-fits all approach and that the requirements do not allow consideration of watershed analysis or receiving water information.</p> <p>The requirements of the Tentative Order provide that post-project runoff conditions must not exceed pre-development runoff conditions by more than 10 percent (for the range of flows that result in increased potential for erosion, or degraded instream habitat downstream of Priority Development Projects). Note that the requirement is not to control <i>all</i> post-project flows, but only those that are expected to <i>cause erosion or degraded habitat</i> downstream of the Priority Development Project. The performance standards of the Tentative Order are the same as those of the Commenters existing Order No. R9-2009-0002.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3c2-2	PROVISION E.3.c.(2): Hydromodification Management BMP Requirements	
	<p>Since each Priority Development Project is expected to result in a specific post-project runoff condition, and the susceptibility of the receiving water to erosion could vary substantially based on location within a watershed, then the range of flows to control, and hence the specific BMPs required, will necessarily vary and is not a one-size-fits all requirement. In this way, the requirements in the Tentative Order specifically address both watershed and receiving water information.</p> <p>The Tentative Order allows for hydromodification management BMP implementation, and also exemptions, specific to the San Juan Watershed Management Area based on Copermittee's analysis of the watershed. See the response to Comment No. E3c1-1 regarding the Watershed Management Area Analysis as part of Water Quality Improvement Plan development, and how the Copermittees can use the results of the analysis to allow watershed-specific offsite mitigation in lieu of structural BMP implementation onsite, and also allow exemptions from the requirements.</p> <p>The Commenters incorrectly assert that the requirements in the Tentative Order attempt to restore waters to pre-Columbian conditions because of the requirement to use pre-development runoff conditions rather than pre-project runoff conditions in evaluating the need for hydromodification management BMPs. The Tentative Order requires the use of pre-development runoff conditions as a means of restoring a more natural hydrology to allow for stream rehabilitation, but there is no requirement to return the landscape to pre-Columbian conditions, nor is there a need to speculate how far back a Copermittee must go in determining the appropriate timeframe. Because pre-development runoff conditions cannot be precisely known for a redevelopment project, the Tentative Order allows the use of any readily available information to estimate pre-development runoff conditions. Pre-development runoff conditions for redevelopment projects are defined in Attachment C to the Tentative Order as "runoff conditions from the project footprint assuming infiltration characteristic of the underlying soil, and existing grade." A Priority Development Project must use available information to estimate these parameters, and there is no need to perform extensive historical assessments, as the commenter asserts.</p> <p>The requirement to use pre-development runoff conditions as the performance standard is needed because using a hydrology baseline that approximates that of an undeveloped, natural watershed is the only way to facilitate the return of more natural hydrological conditions to already built-out watersheds. Using the pre-project hydrology as a baseline for redevelopment projects results in propagating the unnatural hydrology of urbanized areas, which is largely made up of impervious surfaces. Flows from impervious surfaces are highly erosive and consequently have detrimental effects on receiving waters in the San Diego Region. Furthermore, propagating the urbanized flow regime does not support conditions for restoring degraded or channelized</p>

January 21, 2015

E3c2-2	PROVISION E.3.c.(2): Hydromodification Management BMP Requirements	
	<p>stream segments, and would forever sentence such streams to the degraded state. Identification of areas suitable for rehabilitating degraded stream segments is a critical component of the Tentative Order and is expected to be incorporated into Copermittee's strategies for improving water quality in the watersheds.</p> <p>Finally, the Copermittees will be allowed to use the Hydromodification Management Plan developed under Order No. R9-2009-0002. The performance standards of the Tentative Order are the same as those of Order No. R9-2009-0002, therefore there is no need for the Copermittees to develop new requirements or methodologies, or otherwise update their Hydromodification Management Plan.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>E3c2-3 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>		
	<p><b>COMMENT:</b> <i>The San Diego Water Board is eliminating exemptions for hydromodification control when storm water runoff is conveyed to significantly hardened or engineered channels.</i></p> <p>The Construction Industry Coalition on Water Quality (CICWQ) assert that regulations are tending to require hydromodification controls for Priority Development Projects, regardless of receiving water susceptibility. CICWQ states that this direction is driven by environmental advocacy for removal of all concrete lined channels regardless of existing land uses and feasibility, and that such efforts ignore the vital role that flood control facilities play in urban infrastructure and the protection of life and property. The alignment, grade, and cross section of many urban streams have been irrevocably altered, and a regulatory requirement to return flows to pre-development conditions will not allow stream restoration to occur.</p> <p>CICWQ and the Riverside County Copermittees both submitted comments stating that the interim exemptions from hydromodification controls allowed for engineered channels should be granted outright without further study from the Copermittees.</p>	<p><b>Construction Industry Coalition on Water Quality</b></p> <ul style="list-style-type: none"> <li>• San Diego Building Industry Association</li> <li>• Building Industry Association of Southern CA</li> <li>• Associated General Contractors</li> <li>• Associated Builders and Contractors</li> <li>• San Diego Regional Chamber of Commerce</li> <li>• Business Leadership Alliance</li> <li>• San Diego Association of Realtors</li> <li>• San Diego Apartment Association</li> <li>• National Association of Industrial &amp; Office Properties</li> <li>• Building Office &amp; Management Association</li> <li>• San Diego Chapter of American Society of Landscape Architects</li> </ul> <p><b>Riverside County Copermittees</b></p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the hydromodification management requirements in the Tentative Order mandate controls on Priority Development Projects, regardless of receiving water susceptibility.</p> <p>The requirements of the Tentative Order provide that post-project runoff conditions must not exceed pre-development runoff conditions by more than 10 percent (for the range of flows that result in increased potential for erosion, or degraded instream habitat downstream of Priority Development Projects). Note that the requirement is not to control <i>all</i> post-project flows, but only those that are expected to <i>cause erosion or degraded habitat</i> downstream of the Priority Development Project. Since each Priority Development Project is expected to result in a specific post-project runoff condition, and the susceptibility of the receiving water to erosion could vary substantially based on location within a watershed, then the range of flows to control, and hence the specific BMPs required, will necessarily vary and is not a one-size-fits all requirement. In this way, the requirements in the Tentative Order specifically address the susceptibility of the receiving water.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3c2-3	PROVISION E.3.c.(2): Hydromodification Management BMP Requirements	
	<p>The commenter correctly asserts that the driver behind the requirement to use the pre-development performance standard is the sustainability of geomorphically stable channels and the ability to return urbanized streams to a more natural state. As explained in the response to Comment No. E.3.c2-2, the requirement to use pre-development runoff conditions as the performance standard is needed because using a hydrology baseline that approximates that of an undeveloped, natural watershed is the only way to facilitate the return of more natural hydrological conditions to already built-out watersheds, which in turn supports conditions for rehabilitating degraded or channelized stream segments.</p> <p>Contrary to what the commenter asserts, the Tentative Order does not require Copermittees to remove concrete from channels that are engineered to relieve flooding and protect life and property. The Tentative Order provides exemptions for Priority Development Projects that discharge to receiving waters where there is little threat of erosion, and subsequently implementing BMPs onsite would do little to protect the beneficial uses of such receiving waters. The commenter correctly states that the exemption for engineered channels is temporary. However, the commenter should note that there is a high likelihood that exemptions for engineered channels will become permanent. The Tentative Order allows for the Copermittees to recommend permanent exemptions based on completion of an optional Watershed Management Area Analysis pursuant to Provision B.3.b.(4). As part of this effort, the Copermittees would identify, for example, areas in the watershed suitable for urban retrofitting, and areas suitable for stream rehabilitation. The Copermittees would also identify areas suitable for exemptions for hydromodification management, such as engineered channels that are needed for the protection of life and property. The interim exemption for engineered channels is not granted outright as permanent exemptions because the areas have not yet been analyzed in the context of stream rehabilitation opportunities. The San Diego Water Board does not anticipate the Watershed Management Area Analysis to be burdensome on the Copermittees because they have already completed a Watershed Management Planning Tool, with similar goals as the Watershed Management Area Analysis, as part of their storm water management programs.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 20, 2015

<b>E3c2-4 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>		
	<p><b>COMMENT:</b> <i>Hydromodification control requirements to avoid critical sediment yield areas are unnecessarily restrictive.</i></p> <p>The Construction Industry Coalition on Water Quality (CICWQ) assert that the hydromodification management requirements of the Tentative Order to “avoid critical sediment yield areas” are unnecessarily restrictive. The commenters state that several Priority Development Projects have been significantly delayed or stopped because of the inability to comply with this requirement.</p>	<p><b>Construction Industry Coalition on Water Quality</b></p> <ul style="list-style-type: none"> <li>• San Diego Building Industry Association</li> <li>• Building Industry Association of Southern CA</li> <li>• Associated General Contractors</li> <li>• Associated Builders and Contractors</li> <li>• San Diego Regional Chamber of Commerce</li> <li>• Business Leadership Alliance</li> <li>• San Diego Association of Realtors</li> <li>• San Diego Apartment Association</li> <li>• National Association of Industrial &amp; Office Properties</li> <li>• Building Office &amp; Management Association</li> <li>• San Diego Chapter of American Society of Landscape Architects</li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the requirements to avoid critical sediment yield areas are unnecessarily restrictive. The requirements are necessary to protect receiving waters from erosive flows caused by land development. As explained in the Fact Sheet to the Tentative Order, hydromodification, which is caused by both altered storm water flow and altered sediment flow regimes, is largely responsible for degradation of creeks, streams, and associated habitats in the San Diego Region. In an ongoing study by the Stormwater Monitoring Coalition to assess the health of streams throughout Southern California, researchers found that three of the four highest risk stressors to creeks (percent sands and fines present, channel alteration, and riparian disturbance) were related to physical habitat (Assessing the Health of Southern California Streams, Stormwater Monitoring Coalition, Fact Sheet). Researchers studying flood frequencies in Riverside County have found that increases in watershed imperviousness of only 9-22 percent can result in increases in peak flow rates for the two-year storm event of up to 100 percent (Schueler and Holland, 2000. Storm Water Strategies for Arid and Semi-Arid Watersheds, (Article 66). The Practice of Watershed Protection). Such changes in runoff have significant impacts on channel morphology.</p> <p>Placement of impervious surfaces as a result of urbanization is largely responsible for erosional impacts to</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 20, 2015

E3c2-4	PROVISION E.3.c.(2): Hydromodification Management BMP Requirements
	<p>streams because placement of impervious surfaces encapsulates "good" sediment (such as sand, gravel, rocks and cobbles) that would normally replenish creek beds and banks to help stabilize them. For this reason, the Tentative Order requires Priority Development Projects to avoid critical sediment yield areas, as defined by the Copermittees, or implement measures to allow coarse sediment to be discharged to receiving waters. Such measures are designed to protect receiving waters and avoid impacts experienced by past land development practices.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3c2-5	<b>PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>	
	<p><b>COMMENT:</b> <i>Modify Tentative Order to clarify that the interim hydromodification exemptions are in place until the San Diego Water Board approves the BMP Design Manual.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District recommend that the interim timeframe exemptions for engineered channels and large rivers from hydromodification management remain in place until the BMP Design Manual is approved by the San Diego Water Board, as opposed to when the BMP Design Manual has been updated. The commenters have made this request so that there is no timing gap in coverage for the exemptions.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that any changes are needed to the language in Provision E.3.c.(2)e. The Tentative Order requires the Copermittees to update their BMP Design Manuals in accordance with Provision F.2.b. The Copermittees are required to update their BMP Design Manual, but there is no requirement to seek San Diego Water Board approval before the BMP Design Manual goes into effect 180 days after completing the update. If there is a discrepancy in approving the Water Quality Improvement Plan with recommended exemptions before the BMP Design Manual goes into effect, then the San Diego Water Board could direct the Copermittees to delay implementation of the BMP Design Manual.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E3c3-1</b>	<b>PROVISION E.3.c.(3): Alternative Compliance to Onsite Structural BMP Implementation</b>	
	<p><b><u>COMMENT:</u></b> <i>Requests for the Water Quality Equivalency calculations be included as an optional Copermittee deliverable.</i></p> <p>The County of San Diego requests that the Water Quality Equivalency calculations and methodologies currently under development by the Copermittees in support of the Alternative Compliance Program be included in the Tentative Order as an optional deliverable for review and acceptance by the San Diego Water Board's Executive Officer.</p>	County of San Diego
	<p><b><u>RESPONSE:</u></b> The San Diego Water Board agrees with this comment and has modified the Tentative Order at Provision E.3.c.(3) to incorporate the recommendation.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3c3-2	<b>PROVISION E.3.c.(3): Alternative Compliance to Onsite Structural BMP Implementation</b>	
	<p><b>COMMENT:</b> <i>Copermittees should be allowed flexibility to develop a trading and water quality credit system.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District requests that language pertaining to the water quality credit system be revised to remove the no-net impact limitations because certain projects may offer significant environmental benefits that are not necessarily related to water quality, and that any water quality trading system should be implemented in accordance with EPA's 2003 Final Water Quality Trading Policy.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the commenters that the no-net impact language should be removed from the Tentative Order. The optional credit system described in Provision E.3.c.(3)(d) is based on meeting the structural BMP performance standards as they pertain to protecting and improving water quality. A credit system that would allow other environmental benefits cannot necessarily ensure that water quality would be protected to the MEP standard, for which the performance standards are structured to achieve.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

E3e-1	<b>PROVISION E.3.e: Priority Development Project BMP Implementation and Oversight</b>	
	<p><b><u>COMMENT:</u></b> <i>Include the date the BMP manual will be implemented to provide clarity.</i></p> <p>The City of San Diego requests that the date that the BMP Manual will go into effect for the San Diego County Copermittees (December 24, 2015) be explicitly expressed in the Tentative Order.</p>	City of San Diego
	<p><b><u>RESPONSE:</u></b> The San Diego Water Board disagrees that including the date when the BMP Manual will go into effect is appropriate, because this date will be different for the various Copermittees covered under the Tentative Order (i.e. San Diego County Copermittees, South Orange County Copermittees, and eventually Riverside County Copermittees).</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E3e-2 PROVISION E.3.e: Priority Development Project BMP Implementation and Oversight</b>		
	<p><b>COMMENT:</b> <i>Revise the Tentative Order to define when a priority development project has prior lawful approval.</i></p> <p>The City of San Diego requests a definition of prior lawful approval be added to the Tentative Order to clarify when it is appropriate to allow Priority Development Projects to comply with BMP standards of previous MS4 permits. The City of San Diego recommends including a definition that can 1) provide a clear, bright line; 2) provide a backstop to ensure that older projects with approvals comply with new requirements unless those approvals confer vested rights; 3) protect vested rights; and 4) preserve Copermittee's land use authority. Similarly, the Coalition provided comments requesting that the Tentative Order be modified to include a definition of prior lawful approval, stating that clarifying the intent of the San Diego Water Board will assist all interested parties in understanding the factors that the Copermittees need to balance in applying their discretion with Provision E.3.e.(1)(a) of the Tentative Order.</p> <p>In contrast, the Coastal Environmental Rights Foundation and San Diego Coastkeeper submitted comments that it is not necessary to take any action to define prior lawful approval, stating that doing so could allow for vested rights that run counter to widely accepted law.</p>	<p><b>Construction Industry Coalition on Water Quality</b></p> <ul style="list-style-type: none"> <li>• San Diego Building Industry Association</li> <li>• Building Industry Association of Southern CA</li> <li>• Associated General Contractors</li> <li>• Associated Builders and Contractors</li> <li>• San Diego Regional Chamber of Commerce</li> <li>• Business Leadership Alliance</li> <li>• San Diego Association of Realtors</li> <li>• San Diego Apartment Association</li> <li>• National Association of Industrial &amp; Office Properties</li> <li>• Building Office &amp; Management Association</li> <li>• San Diego Chapter of American Society of Landscape Architects</li> </ul> <p><b>San Diego Coastkeeper Coastal Environmental Rights Foundation</b></p> <p><b>City of San Diego</b></p>
	<p><b>RESPONSE:</b> The San Diego Water Board has carefully considered the comments received regarding prior lawful approval, and whether or not it is appropriate to define this term in the Tentative Order.</p> <p>The San Diego Water Board understands the concerns regarding the difficulty the Copermittees face in applying their discretion to the concept of prior lawful approval in a consistent manner that complies with the intent of Provision E.3.e.(1)(a). Therefore, for the reasons presented by the commenters, the San Diego Water Board agrees that clarification regarding the intent of the Provision and the San Diego Water Board's expectation in how the Copermittees use their discretion, would be helpful to all parties.</p> <p>The Tentative Order has been modified to include a definition for prior lawful approval for both private and public Priority Development Projects that is intended to provide guidance and clarification to Copermittees in</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3e-2	PROVISION E.3.e: Priority Development Project BMP Implementation and Oversight
	<p>exercising their discretion in this matter. For private development projects, prior lawful approval is a development approval or construction permit that complies with the Priority Development Project requirements of the Fourth Term MS4 permits (Order Nos. R9-2007-0001 for San Diego County, R9-2009-0002 for south Orange County, or R9-2010-0016 for Riverside County) and includes the design of the storm water drainage system for the project in its entirety as accepted by the Copermittee. Alternatively, prior lawful approval is a development approval or construction permit that confers a vested right to Priority Development Projects to proceed under storm water structural BMP requirements of prior MS4 permits. If a Copermittee grants prior lawful approval to a Priority Development Project based on one of the two aforementioned conditions, then the Copermittee must ensure that 1) any subsequent project approvals must be issued within 5 years of the effective date of the BMP Design Manual, and 2) BMP installation under subsequent approvals must remain in substantial conformity with the design of the storm water drainage system included in the initial approval.</p> <p>For public projects, prior approval allowing implementation of Fourth Term MS4 Permit structural BMP requirements in lieu of the requirements of the Tentative Order is acceptable if the storm water drainage system for the project, in its entirety, has been stamped by the City or County Engineer by the time the BMP Design Manual goes into effect.</p> <p>The San Diego Water Board recognizes that the Copermittees will need to determine whether or not a project has prior lawful approval under the Order based on the circumstances of each project. Nevertheless, the San Diego Water Board expects each Copermittee to require the implementation of Provision E.3 of the Tentative Order wherever it can lawfully do so. Some projects will have received prior lawful approval by the effective date of the BMP Design Manual and hence the requirements of the Fourth Term MS4 permits will govern. The San Diego Water Board expects that very few Priority Development Projects, if any, will be allowed to implement BMP requirements from prior MS4 permits. In cases where BMP requirements from the Fourth Term (or earlier) MS4 permits govern the structural BMP design requirements of a Priority Development Project, the San Diego Water Board expects the Copermittees to be able to demonstrate, in a programmatic audit or other means, that the project has prior lawful approval within the meaning of Provision E.3 of this Order. The San Diego Water Board has conducted and will continue to conduct programmatic audits of the Copermittee's land development programs to evaluate MS4 permit compliance. In all cases the San Diego Water Board expects the Copermittees to only approve projects with adequate post construction BMPs that are protective of water quality.</p> <p>In summary, Attachment 1 of the Tentative Order has been modified at Provision E.3.e.(1) to include a definition of the term "prior lawful approval." This language is intended to provide clarity on how the term</p>

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E3e-2	PROVISION E.3.e: Priority Development Project BMP Implementation and Oversight
	should be interpreted in determining structural BMP requirements for Priority Development Projects, and will also assist the San Diego Water Board in assessing Copermittee compliance with implementing the structural BMP requirements for Priority Development Projects to the maximum extent practicable (MEP) standard.

January 21, 2015

<b>E4-1 PROVISION E.4: Construction Management</b>		
	<p><b>COMMENT:</b> <i>Modify Construction Management Program provisions so as not to negate the very intent and purpose of the watershed approach and the focus on the highest priorities within each watershed management area.</i></p> <p>The County of Orange and Concurring Cities and Orange County Flood Control District requests the introductory paragraph of the Construction Management Provisions be modified to better reflect the watershed approach and program focus on highest priority conditions of concern.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that modifications to the Construction Management Program Provisions are needed for the reasons stated in the Response to Comment E1-1.</p> <p>Copermittees are afforded flexibility in meeting the requirements of Provision E.4. They are required to meet a minimum baseline program (with limited prescriptiveness compared to Fourth Term MS4 permits) as stated in the Tentative Order, and within that framework focus on the highest priority conditions of concern as described in the Water Quality Improvement Plans.</p> <p>Based on this consideration no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E5-1 PROVISION E.5: Existing Development Management</b>		
	<p><b>COMMENT:</b> <i>Modify Existing Development Program provisions so as not to negate the very intent and purpose of the watershed approach and the focus on the highest priorities within each watershed management area.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request modification to the introductory paragraph of the Existing Development Provisions to better reflect the watershed approach and program focus on highest priority conditions of concern.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that modifications to the Existing Development Management Program Provisions are needed for the reasons stated in the Response to Comment E1-1.</p> <p>Copermittees are afforded flexibility in meeting the requirements of Provision E.5. They are required to meet a minimum baseline program (with limited prescriptiveness compared to Fourth Term MS4 permits) as stated in the Tentative Order, and within that framework focus on the highest priority conditions of concern as described in the Water Quality Improvement Plans.</p> <p>Based on this consideration no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E5-2	<b>PROVISION E.5: Existing Development Management</b>	
	<p><b><u>COMMENT:</u></b> <i>Delete the requirement to evaluate retrofit of stream channels.</i></p> <p>The County of Orange and Concurring Cities and Orange County Flood Control District requested removal of the requirement to evaluate retrofit of stream channels from the Tentative Order because it is not the Copermittee's responsibility to restore receiving waters.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b><u>RESPONSE:</u></b> The San Diego Water Board agrees that it is not the responsibility of the Copermittees to restore receiving waters. None of the provisions in the Tentative Order requires the Copermittees to perform stream restorations.</p> <p>The Tentative Order at Provision E.5.e.(2) requires the Copermittees to describe a program to rehabilitate streams, channels, and habitats in existing developed areas by first identifying viable candidates, then developing a strategy to facilitate the implementation of the rehabilitations. Rehabilitation of streams, channels, and habitats may also serve as candidates for alternative compliance (to implementation of structural BMPs; see Tentative Order at Provision E.3.c.(3)), and is an important element of the Tentative Order in achieving improvements in water quality and watershed functions.</p> <p>Based on this consideration no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E6-1 PROVISION E.6: Enforcement Response Plans</b>		
	<p><b>COMMENT:</b> <i>Copermittees should be allowed to utilize existing guidelines and procedures for enforcement.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request Provision E.6 be modified to specify that a Copermittee may utilize and implement established, equivalent guidelines and procedures for enforcement.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that any changes to the Tentative Order are needed. A Copermittee will be able to continue using and implementing existing enforcement guidelines and procedures if the Copermittee demonstrates the procedures and guidelines comply with the requirements of Provision E.6. Provision E.6 requires each Copermittee to document enforcement processes and procedures in an Enforcement Response Plan, as part of its jurisdictional runoff management program document and specifically describes what must be included in the Plan. The Enforcement Response Plan will promote transparency and accountability by ensuring that Copermittee enforcement programs and procedures are clear and accessible to the San Diego Water Board and the public, and can be used to evaluate the adequacy of Copermittee enforcement programs and progress towards meeting enforcement goals. Because the Copermittees already have procedures in place for enforcement, there will likely only be minor modifications needed to the programs to meet the requirements of Provision E.6.</p> <p>The Enforcement Response Plan is expected to be a tool the Copermittee can refer to when issuing enforcement actions to compel compliance with its statutes, ordinances, permits, contracts, order, or similar means, and the requirements of the Tentative Order. The Enforcement Response Plan is also expected to result in more consistent enforcement and enforcement actions by the Copermittee within its jurisdiction.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

E6-2	PROVISION E.6: Enforcement Response Plans	
	<p><b>COMMENT:</b> <i>The definition for "Escalated Enforcement" should be redefined.</i></p> <p>The County of Orange and Concurring Cities, and the Orange County Flood Control District request Provision E.6.d be modified to be "Progressive Enforcement" instead of "Escalated Enforcement" because the process should reflect a standard progressive approach.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the recommendation to modify the language in Provision E.6.d from "escalated enforcement" to "progressive enforcement".</p> <p>The Copermittees are expected to implement "progressive enforcement" in all cases of enforcement. For enforcement issues that are associated with the highest priority water quality conditions identified by the Copermittees in the Watershed Management Area, the Copermittees are expected to implement enforcement swiftly. "Escalated enforcement" refers to the Copermittee escalating its enforcement measures and resources to a) ensure compliance with local statutes, ordinances, permits, contracts, order, or similar means, and the requirements of the Tentative Order, b) compel prompt correction of violations and the conditions that led to the violations, and c) deter future violations. The term "escalated enforcement" correctly reflects this added level of urgency and focus to compel compliance.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>E7-1</b>	<b>PROVISION E.7: Public Education and Participation</b>	
	<p><b>COMMENT:</b> <i>The Public Education Program provisions must be modified so as not to negate the very intent and purpose of the watershed approach and the focus on the highest priorities within each watershed management area.</i></p> <p>The County of Orange and Concurring Cities and the Orange County Flood Control District request modification to the introductory paragraph of the Public Education Program Provisions to better reflect the watershed approach and program focus on highest priority conditions of concern.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that modifications to the Public Education Program Provisions are needed for the reasons stated in the Response to Comment E1-1.</p> <p>Copermittees are afforded flexibility in meeting the requirements of Provision E.7. The Copermittees are required to meet a minimum baseline program (with limited prescriptiveness compared to Fourth Term MS4 permits) as stated in the Tentative Order, and within that framework focus on the highest priority conditions of concern as described in the Water Quality Improvement Plans.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

F-1 PROVISION F: REPORTING	
	<p><b>COMMENT:</b> <i>Modify Tentative Order to better align reporting requirements with the process for development and updates of the various plans to allow for the time necessary to complete the work and to submit the ROWD.</i></p> <p>The County of Orange and Concurring Cities and Orange County Flood Control District suggest the due dates for development of each component of the Water Quality Improvement Plan be linked to the development step that precedes it and not to the commencement of coverage under the Order. The commenters also suggest the timeframe for development of the Water Quality Improvement Plan incorporate adequate time for the Copermittees to review and respond to comments received on the current action before moving on to the next step of development. The Copermittees are also concerned that the schedule proposed in the Tentative Order would impart an overly burdensome schedule on members of the public participating in the Consultation Panels and reviewing documents during the public review periods and do not allow for adequate time to conduct CEQA.</p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The Tentative Order accommodates the commenters concerns with the amount of time needed to develop the Water Quality Improvement Plan and submit the deliverables by providing a flexible range within which the Copermittees may submit each component of the Water Quality Improvement Plan. Copermittees may submit the requirements of Provision B.2 (i.e. priority water quality conditions, source of conditions, and potential water quality improvement strategies) as early as 6 months and no later than 12 months after commencement of coverage and Provision B.3 (i.e. goals, strategies, and schedules) as early as 9 months, and no later than 18 months after commencement of coverage. By including this range within which the deliverable can be submitted, the San Diego Water Board is allowing adequate time and adequate flexibility for the Copermittees to a) create the deliverable, b) accept and review comments received on the deliverable during development of the Water Quality Improvement Plan, and c) complete any CEQA compliance as the Copermittee determines to be necessary. The San Diego Water Board expects each partial deliverable to be well thought out and complete but also realizes that additional time exists in the process to further incorporate comments and input received during the public comment period and San Diego Water Board staff review. As such the Tentative Order requires the final version of the Water Quality Improvement Plan to be submitted within 24 months after commencement of coverage under the Tentative Order as it amends Order No. R9-2013-0001.</p> <p>By requiring submittal of individual components of the Water Quality Improvement Plan, members of the Consultation Panel, the public, and the San Diego Water Board will be able to provide input early on in the Plan</p>

RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

F-1	PROVISION F: REPORTING
	<p>development. The San Diego Water Board expects that any deficiencies in the Water Quality Improvement Plan will be identified early on either during the public review and comment period or during the review by the San Diego Water Board. The Orange County Copermittees may wish to consult with San Diego County Copermittees to benefit from their experience in developing the Water Quality Improvement Plans.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>H-1 PROVISION H: MODIFICATION OF PROGRAMS</b>		
	<p><b>COMMENT:</b> <i>Modify Tentative Order to include an explicit re-opener provision.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that additional revisions to the explicit re-opener provisions in the Tentative Order are necessary.</p> <p>Provision H.4.c of the Tentative Order already explicitly states that the San Diego Water Board will re-open the Order if any of the TMDLs in Attachment E are amended in the Basin Plan by the San Diego Water Board, and the amendment is approved by the State Water Board, Office of Administrative Law, and the USEPA.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

January 21, 2015

<b>AttC-1 ATTACHMENT C: Acronyms, Abbreviations, and Definitions</b>		
	<p><b>COMMENT:</b> <i>Request for additional or modified definitions.</i></p> <p>Several comments were submitted requesting modifications to existing definitions and/or the addition of new definitions to Attachment C to the Tentative Order.</p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board reviewed and considered the requested modifications to existing definitions and additional definitions.</p> <p>All of the requested additions or modifications were submitted during the 2013 adoption process for Order No. R9-2013-0001. The San Diego Water Board reconsidered the requested additions or modifications and determined, in all cases, that the requested modifications or additions were still not appropriate, not necessary, or both.</p> <p>Therefore, no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>AttE-1 ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads</b>		
	<p><b>COMMENT:</b> <i>Compliance determination for final WQBELs should be based on implementation of BMPs and not numeric effluent limitations.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board has already included a compliance determination option for final WQBELs based on implementation of BMPs in the Tentative Order.</p> <p>WQBELs can be expressed as (1) conditions in receiving waters that are to be attained to restore or protect water quality standards in receiving waters, (2) conditions in discharges that will not cause or contribute to exceedances of water quality standards in receiving waters, (3) BMPs that will ensure discharges will not cause or contribute to exceedances of water quality standards in receiving waters, or (4) a combination of one or more of (1)-(3). This is consistent with 40 CFR 122.44(d)(1)(vii)(B) and 122.44(k)(2)-(4).</p> <p>The San Diego Water Board has incorporated options (1)-(3) under the WQBEL requirements for each of the TMDLs in Attachment E. In most cases, if the WQBEL expressed as a receiving water limitation is achieved, the discharges from the MS4s are assumed to be in compliance with the TMDL requirements. If not, then the Copermittees must demonstrate that discharges from the MS4s are not causing or contributing to the exceedances in the receiving waters by achieving the WQBELs expressed as effluent limitations. In every case, the Copermittees are required to implement BMPs to ensure that discharges from their MS4s do not cause or contribute to exceedances of water quality standards in receiving waters.</p> <p>For the interim TMDL compliance determination requirements, the Copermittees are allowed to demonstrate compliance by implementing a Water Quality Improvement Plan that has been accepted by the San Diego Water Board, with a "reasonable assurance" that the implementation of the BMPs will achieve the interim TMDL WQBELs within the interim compliance dates. The Copermittees will be provided considerable flexibility for demonstrating compliance with achieving the interim WQBELs.</p> <p>For the final TMDL compliance determination requirements, the Copermittees are allowed to demonstrate compliance with the final WQBELs by implementing a Water Quality Improvement Plan that includes an</p>

January 21, 2015

AttE-1	ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads
	<p>analysis to demonstrate that the implementation of the BMPs required by the TMDL achieves compliance with one or more of the final numeric WQBELs. The Water Quality Improvement Plan must include monitoring and assessments to confirm that the Water Quality Improvement Plan is achieving the final TMDL requirement. The San Diego Water Board must accept and continue to accept the Water Quality Improvement Plan and analysis, and the Copermittees must continue to implement the BMPs and demonstrate through the analysis that the final numeric WQBELs are being achieved.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

AttE-2	<b>ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads</b>	
	<p><b>COMMENT:</b> <i>Modify Tentative Order to include a compliance mechanism prior to approval of the Water Quality Improvement Plans.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that it is necessary to include a compliance mechanism prior to approval of the Water Quality Improvement Plan.</p> <p>If a TMDL in Attachment E includes interim or final compliance dates that have passed, the Copermittees are expected to have data to demonstrate that one or more of the compliance determination options have already been met. If interim or final TMDL compliance dates have not passed, compliance with the interim or final TMDL compliance requirements do not have to be demonstrated yet, thus a compliance determination mechanism is not yet required.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>AttE5-1 ATTACHMENT E 5: Baby Beach and Shelter Island Shoreline Park Bacteria TMDL</b>		
	<p><b>COMMENT:</b> <i>Correct discrepancies between adopted TMDLs in the Basin Plan and provisions in the Tentative Order.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that there are discrepancies between the TMDLs in the Basin Plan and the provisions in the Tentative Order.</p> <p>The TMDLs as developed are all intended to restore the water quality standards in receiving waters impaired by specific pollutants. The WLAs and LAs as developed are all intended to ensure that discharges from point and nonpoint sources to receiving waters will not cause or contribute to exceedances of water quality standards in receiving waters. The TMDL requirements in Attachment E are consistent with the intent of the TMDLs, and the WLAs for MS4s. In other words, the TMDL requirements in Attachment E are intended to ensure that discharges from the Responsible Copermittees' MS4s will not cause or contribute, and will continue to not cause or contribute to exceedances of water quality standards in receiving waters. According to each TMDL, when all point sources and nonpoint sources achieve their WLAs and LAs, including the WLAs for MS4s, the water quality standards in receiving waters will be restored.</p> <p>The San Diego Water Board included TMDL requirements in Attachment E that are entirely consistent with the requirements of the TMDLs as adopted and incorporated into the Basin Plan. The implementation plans of the TMDLs in the Basin Plan are essentially "instructions" for the San Diego Water Board to incorporate the requirements into the regulatory mechanisms that will implement the requirements of the TMDL to attain the water quality standards that are being impaired by a pollutant in a water body. In each case, the "instructions" provide the permit writer considerable flexibility in how to express the WLAs as WQBELs in the permit, but not as much flexibility in the compliance schedules for achieving the WLAs.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>AttE6-2 ATTACHMENT E 6: Beaches and Creeks Bacteria TMDL</b>	
	<p><b>COMMENT:</b> <i>Modify Attachment E.5, WQBELs for Beaches and Creeks TMDL inappropriately include TMDL numeric targets.</i></p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board has included WQBELs that are consistent with the requirements and assumptions of the TMDLs.</p> <p>The federal regulations under 40 CFR 122.44(d)(1)(vii)(B) require that NPDES permit requirements incorporate WQBELs that must be consistent with the requirements and assumptions of any available WLAs developed under TMDLs.</p> <p>WQBELs can be expressed as (1) conditions in receiving waters that are to be attained to restore or protect water quality standards in receiving waters, (2) conditions in discharges that will not cause or contribute to exceedances of water quality standards in receiving waters, (3) BMPs that will ensure discharges will not cause or contribute to exceedances of water quality standards in receiving waters, or (4) a combination of one or more of (1)-(3). This is consistent with 40 CFR 122.44(d)(1)(vii)(B) and 122.44(k)(2)-(4).</p> <p>The San Diego Water Board has incorporated options (1)-(3) under the WQBEL requirements for each of the TMDLs in Attachment E. In most cases, if the WQBEL expressed as a receiving water limitation is achieved, the discharges from the MS4s are assumed to be in compliance with the TMDL requirements. If not, then the Copermittees must demonstrate that discharges from the MS4s are not causing or contributing to the exceedances in the receiving waters by achieving the WQBELs expressed as effluent limitations. In every case, the Copermittees are required to implement BMPs to ensure that discharges from their MS4s do not cause or contribute to exceedances of water quality standards in receiving waters.</p> <p>The WQBELs are also consistent with the assumptions and requirements of the WLAs. In each case, the WLAs are calculated based on numeric targets that are assumed to be able to restore or protect water quality standards in receiving waters and/or ensure discharges from the Responsible Copermittees' MS4s will not cause or contribute to exceedances of water quality standards in receiving waters. The numeric targets are required to be based on water quality objectives in the Basin Plan. Discharges from the MS4s are required to</p>

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

	<p>achieve the numeric targets for their discharges to protect water quality standards in receiving waters to meet the WLAs. The WQBELs for the TMDLs in Attachment E are consistent with the numeric targets, and thus consistent with the underlying assumptions and requirements of the numeric targets that are the basis of the WLAs.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

AttE7-1 ATTACHMENT E 7: Los Peñasquitos Lagoon Sediment TMDL		
	<p><b><u>COMMENT:</u></b> <i>Modify the Tentative Order to allow individual jurisdictional compliance with TMDLs.</i></p> <p>The City of San Diego requests the Tentative Order be modified so that Final TMDL Compliance Determination using the Water Quality Improvement Plan pathway is based on individual jurisdictional compliance instead of all Copermittees collectively.</p>	City of San Diego
	<p><b><u>RESPONSE:</u></b> The San Diego Water Board disagrees that modifications are needed to the language pertaining to TMDL compliance determination. The commenter correctly asserts that the intent of the language, and in fact, the intent of the Water Quality Improvement Plan concept, is that the Copermittees develop the Water Quality Improvement Plans collectively and evaluate water quality improvement strategies on a watershed basis. The San Diego Water Board recognizes that the Copermittees have no authority over other Copermittees to compel TMDL compliance; therefore, the Tentative Order has multiple compliance pathways available to each Copermittee to achieve compliance. These pathways are presented in each of the 7 Specific (TMDL) Provisions at X.b.(3). These alternative compliance pathways do not rely on actions or inactions of other Copermittees.</p>	

## RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001

January 21, 2015

<b>AttE7-2 ATTACHMENT E 7: Los Peñasquitos Lagoon Sediment TMDL</b>		
	<p><b>COMMENT:</b> <i>Clarify that waste load allocations include discharges from other responsible parties in addition to Responsible Copermitees.</i></p> <p>The City of San Diego, City of Del Mar, and Industrial Environmental Association submitted comments requesting the final effluent limitations expressed in Table 7.1, which were derived from waste load allocations, recognize the contribution of sediment loading to the Los Penasquitos Watershed from dischargers other than the Copermitees. Without this recognition, the other dischargers would have a zero sediment loading allocation, contrary to the intent of the TMDL.</p>	<p>Industrial Environmental Association City of San Diego City of Del Mar</p>
	<p><b>RESPONSE:</b> Although the Tentative Order is an NPDES permit specifically issued to the Phase I MS4 Copermitees, the San Diego Water Board has nonetheless modified Table 7.1 to state that the effluent limitation of 2,580 tons/year is shared amongst all dischargers identified in Resolution No. R9-2012-0033. Provision 7.b.(2)(c)(ii) has likewise been modified to clarify that the Responsible Copermitees must implement BMPs to achieve only their portion of the effluent limitations, as opposed to other discharger's contributions.</p> <p>The City of San Diego suggested dividing up the collective load in proportion to land area occupied by each discharger, but the San Diego Water Board cannot impose a TMDL distribution methodology through the permitting process that has not been peer reviewed and vetted through the TMDL development stakeholder process. Assigning a waste load allocation and subsequent effluent limitation applicable to all dischargers within a watershed collectively, is consistent with the San Diego Water Board's approach to TMDL expression for other waterbodies and constituents.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>AttE7-3 ATTACHMENT E 7: Los Peñasquitos Lagoon Sediment TMDL</b>		
	<p><b>COMMENT:</b> <i>Revise the Final TMDL compliance determination to be consistent with the Basin Plan Amendment and other TMDLs.</i></p> <p>The City of Del Mar and the City of San Diego submitted comments requesting the language pertaining to final TMDL compliance determination be modified to be consistent with the Basin Plan Amendment adopted by the San Diego Water Board under Resolution No. R9-2012-0033, and offer multiple compliance pathways similar to other TMDLs.</p>	<p>City of Del Mar City of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees to modify the language of Provision 7.b.(3)(a) to match the language of the Basin Plan Amendment (page A-16). However, the San Diego Water Board disagrees that the suggested revisions to add additional language to incorporate a compliance pathway related to “implementation actions” is necessary. Specifically, both the City of San Diego and City of Del Mar requested the following language to be added:</p> <p>“Demonstrate that implementation actions are active on and/or affecting 346 acres with continued monitoring to ensure 80 percent target achievement”</p> <p>This language is not needed because Provision 7.b.(3)(b) regarding the development of the Water Quality Improvement Plan as a compliance pathway serves the same purpose as the suggested language. The phrase “implementation actions” has been added to Provision 7.b.(3)(b)(ii) to incorporate all ideas from the Basin Plan Amendment language into the Water Quality Improvement Plan concept.</p> <p>The San Diego Water Board considered the request to add two additional compliance pathways similar to those included in other TMDLs. As this sediment TMDL is different than other adopted TMDLs because the primary focus is lagoon saltmarsh restoration, as opposed to the quality of the MS4 discharges, the San Diego Water Board did not incorporate the suggested modifications. The intent of the TMDL efforts was to facilitate successful restoration of 346 acres of saltmarsh vegetation, and the Tentative Order appropriately uses this metric as the primary compliance pathway.</p> <p>The schedule to achieve compliance is 20 years, as established by the TMDL. In contrast, the NPDES permit as represented by the Tentative Order is on a 5-year cycle. Revisions to the compliance pathways available to the Responsible Parties can be revisited upon reissuance of the NPDES permit at a later date. The San Diego Water Board believes it is more appropriate to offer multiple compliance pathways after data have been collected showing the effects of sediment reduction efforts on lagoon restoration. If a positive linkage can be</p>

January 20, 2015

AttE7-4 ATTACHMENT E 7: Los Peñasquitos Lagoon Sediment TMDL		
	<p><b>COMMENT:</b> <i>Correct references in the Los Penasquitos final TMDL compliance determination.</i></p> <p>The City of San Diego requested modifications to Specific Provision 7.b(3)(b) to correct errors.</p>	City of San Diego
	<p><b>RESPONSE:</b> The San Diego Water Board has reviewed the recommendation to change the text to reference 7.b.(2)(a) and has not made changes because the references to Specific Provision 7.b.(3)(a) are correct. The incorrect reference to Specific Provision 2 has been changed to Specific Provision 7</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>AttE7-5 ATTACHMENT E 7: Los Peñasquitos Lagoon Sediment TMDL</b>		
	<p><b>COMMENT:</b> <i>Revise the interim TMDL compliance determination to be consistent with the Basin Plan Amendment and other TMDLs.</i></p> <p>The City of Del Mar and the City of San Diego submitted comments requesting that the language pertaining to interim TMDL compliance determination be modified to be consistent with the Basin Plan Amendment adopted by the San Diego Water Board under Resolution No. R9-2012-0033, and offer multiple compliance pathways similar to other TMDLs.</p>	<p>City of Del Mar City of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees with the recommendation and has added multiple compliance options for interim TMDL compliance at Specific Provision 7.c.(2), as suggested by the commenters.</p> <p>Interim TMDL compliance, on or after the interim compliance dates shown in Table 7.2, may be demonstrated via one of the following methods:</p> <ul style="list-style-type: none"> <li>(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water; OR</li> <li>(b) The final receiving water limitation under Specific Provision 7.b.(2)(a) is met; OR</li> <li>(c) There are no exceedances of the Copermittee's portion of interim effluent limitations under Table 7.2 at the Responsible Copermittee's MS4 outfalls; OR</li> <li>(d) The Responsible Copermittees have submitted and is fully implementing a Water Quality Improvement Plan, accepted by the San Diego Water Board, which provides reasonable assurance that the Copermittee's portion of the interim TMDL compliance requirements will be achieved by the interim compliance date.</li> </ul>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>AttE7-6 ATTACHMENT E 7: Los Peñasquitos Lagoon Sediment TMDL</b>		
	<p><b>COMMENT:</b> <i>Revise Tables 7.1 and 7.2 in Specific Provision 7 to Reflect the Basin Plan Amendment.</i></p> <p>The City of San Diego and the City of Del Mar submitted comments requesting modifications to Tables 7.1 and 7.2 to 1) change the heading from interim effluent limitations in tons/year to tons/wet season, and 2) add a footnote acknowledging that the effluent limitation is shared by all Responsible Parties identified in Resolution R9-2012-0033.</p>	<p>City of Del Mar City of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board reviewed the wasteload allocations in the Basin Plan Amendment and notes that they are reported in tons/year on both page A-6 and the Table on page A-17. Nevertheless, Table 7.2 has been modified to report the effluent limitations in tons per wet season, as the commenters requested. A footnote was also added to acknowledge the other Responsible Parties identified in Resolution R9-2012-0033.</p> <p>The San Diego Water Board agrees that the third column of Table 7.2 is misleading and not useful, therefore it was deleted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>AttE7-1 ATTACHMENT E 7: Los Peñasquitos Lagoon Sediment TMDL</b>		
	<p><b>COMMENT:</b> <i>Revise monitoring start date to be the first full wet season after the Water Quality Improvement Plan is accepted.</i></p> <p>The City of San Diego and the City of Del Mar submitted comments requesting that the Assessment and Reporting Requirements in Specific Provision 7.d.(3) be revised so that the first data collection occurs after the San Diego Water Board acceptance of the Water Quality Improvement Plan.</p>	<p>City of Del Mar City of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the start date for the monitoring requirements should be delayed, but disagrees that acceptance of the Water Quality Improvement Plan is needed first. The language has been changed so that the start date occurs in the 2015-2016 wet season.</p> <p>The monitoring requirements were developed as part of the TMDL Basin Plan Amendment that was adopted by the San Diego Water Board in 2012. The TMDL became effective, and the compliance timeline started, when it was approved by the Office of Administrative Law in July, 2014. The Responsible Parties need not wait for acceptance of the Water Quality Improvement Plan to begin implementing their required monitoring program under the TMDL.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>AttF-1 ATTACHMENT F: Fact Sheet / Technical Report</b>	
	<p><b>COMMENT:</b> <i>Based on the successes of the Orange County Storm Water Program, there is little justification for much of the Tentative Order.</i></p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> Attachment F to the Tentative Order includes the Fact Sheet. The Fact Sheet sets forth a brief summary of the basis for the draft permit conditions, the principal facts and the significant factual, legal, methodological, and policy questions the San Diego Water Board considered in preparing the Tentative Order. The Fact Sheet. In accordance with the Code of Federal Regulations (CFR) Title 40 Parts 124.8 and 124.56 (40 CFR 124.8 and 40 CFR 124.56), this Fact Sheet includes, but is not limited to, the following information:</p> <ol style="list-style-type: none"> <li>1. Contact information</li> <li>2. Public process and notification procedures</li> <li>3. Background of municipal storm water permits</li> <li>4. Regional MS4 Permit approach</li> <li>5. Economic considerations</li> <li>6. Applicable statutes, regulations, plans and policies</li> <li>7. Discussion of the provisions in the Order</li> </ol> <p>The Fact Sheet also references the Permit Reissuance Process specific to Orange County Copermittees, and references the San Diego Water Board receipt and consideration of the Report of Waste Discharge during development of the Tentative Order. Based on San Diego Water Board review of the Report of Waste Discharge and consideration of the State of Environment discussion, very few changes to Order No. R9-2013-0001 (Regional MS4 Permit) were necessary in the Tentative Order to accommodate the recommendations made in the Report of Waste Discharge. The Fact Sheet was modified to include a brief summary of the basis for any change made in the Tentative Order either related to the State of the Environment discussion in the Report of Waste Discharge or the comments included herein. The Tentative Order requirements reflect the progress made by the Orange County Copermittees' programs and provides them with considerably more flexibility to further improve water quality.</p> <p>See also comment E3c-1 and Gnl-2.</p>

	Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>AttF-2 ATTACHMENT F: Fact Sheet / Technical Report</b>		
	<p><b>COMMENT:</b> <i>Modify Fact Sheet to include language explaining the iterative approach and TMDLs.</i></p>	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that additional language is necessary to explain the iterative approach and TMDLs.</p> <p>The iterative approach is for NPDES storm water discharges that are not subject to requirements set forth in TMDLs and are causing or contributing to exceedances of water quality standards in receiving waters. Attachment E to the Tentative Order includes requirements that must be met to be in compliance with the TMDLs. For most of the TMDLs in Attachment E, the requirements also include provisions that provide additional flexibility for determining and achieving compliance with the interim TMDL requirements. The Fact Sheet accurately describes the difference between the iterative approach of the MS4 Permit and compliance with TMDL requirements.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>	

**RESPONSE TO COMMENTS ON TENTATIVE ORDER NO. R9-2015-0001**

January 21, 2015

<b>AttF-3 ATTACHMENT F: Fact Sheet / Technical Report</b>	
	<p><b>COMMENT:</b> <i>Modify Fact Sheet to include language explaining the incorporation of new TMDLs into the Water Quality Improvement Plans.</i></p>
	<ul style="list-style-type: none"> <li>• <b>County of Orange</b> Concurring Cities: Cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Lake Forest, and Mission Viejo</li> <li>• <b>Orange County Flood Control District</b></li> </ul>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that additional language is necessary to explain the incorporation of new TMDLs into the Water Quality Improvement Plans.</p> <p>Going forward, the San Diego Water Board is assuming that the Copermittees will be involved as a stakeholder in the development of any new TMDLs that may include the MS4 as a source of pollutants contributing to impairment. As a stakeholder, the Copermittees are expected to work with the San Diego Water Board TMDL development staff to identify appropriate WLAs and implementation measures to address MS4 discharges.</p> <p>Because of this knowledge, the Copermittees will have the background and information that will be useful during the re-opening of the MS4 Permit to include the new TMDL requirements. Provision F.2.c.(2) requires the Copermittees to “initiate” an update to the Water Quality Improvement Plans after Office of Administrative Law (OAL) and USEPA approval. The Copermittees may “initiate” the update by working with San Diego Water Board MS4 permitting staff to re-open the Regional MS4 Permit and concurrently begin the process of incorporating any new water quality improvement strategies that may be necessary to include into the Water Quality Improvement Plan. In addition, the expectation is that the Water Quality Improvement Plans will reduce the need for new TMDLs in the future.</p> <p>Based on these considerations no changes to the Tentative Order as it amends Order No. R9-2013-0001 are needed or warranted.</p>

**Responses to Comments on  
Tentative Order No. R9-2015-0100**  
November 4, 2015  
**Revised November 10, 2015**

**Introduction**

This report contains responses to written comments timely received on Tentative Order No. R9-2015-0100, *An Order Amending Order No. R9-2013-0001, NPDES No. CAS010266, as Amended by Order No. R9-2015-0001, National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region* (Tentative Order). The Tentative Order and its attachments were available for public review and comment for 46 days, with the comment period ending on September 14, 2015. Specifically, the San Diego Water Board requested comments on the following three documents:

- Tentative Order No. R9-2015-0100;
- Attachment No. 1 – Revised Order No. R9-2013-0001; and
- Attachment No. 2 – Revised Fact Sheet to Order No. R9-2013-0001.

The phrases “Tentative Order” and “Regional MS4 Permit” in the following response to comments table refers to both Tentative Order No. R9-2015-0100 and the two attachments. Comments and responses are organized by the section of either Attachment 1 or Attachment 2 that is being referenced. Wherever possible, comments are grouped based on content and summarized by the San Diego Water Board. The actual comment letters can be accessed on the San Diego Water Board website at:

[http://www.waterboards.ca.gov/sandiego/water\\_issues/programs/stormwater/index.shtml](http://www.waterboards.ca.gov/sandiego/water_issues/programs/stormwater/index.shtml)

**List of Commenters:**

Comments were submitted by the following organizations, public agencies, or individuals (listed alphabetically):

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0100**

**GENERAL COMMENTS**

Gnl-1: *Request to incorporate previous written comments and testimony in the record for this Tentative Order.*..... 11

Gnl-2: *Request for clarification of implementation requirements for the Riverside County Copermittees as a result of late entry into the Regional MS4 Permit.* 12

Gnl-3: *Request to remove the City of Menifee from Water Quality Improvement Plan development and implementation.*..... 13

Gnl-4: *Stakeholder workshops haven been effective.*..... 14

Gnl-5: *Requests for the Regional MS4 Permit to acknowledge the potential benefit of developing site specific water quality objectives in concert with development of the Water Quality Improvement Plan.*..... 15

Gnl-6: *Request for clarification that location of a MS4 within the Port’s jurisdictional boundaries does not render the Port an owner or operator of the MS4.*..... 16

Gnl-7: *Compliance with all the discharge prohibitions in the Regional MS4 Permit under all circumstances is likely impossible.* ..... 17

Gnl-8: *Request for clarification by City of Lake Forest for applicability of the Water Quality Improvement Plan development requirements.* ..... 18

Gnl-9: *Recommendations for actions that can be implemented to improve water quality.*..... 19

Gnl-10: *The Regional MS4 Permit illegally authorizes compliance schedules for California Toxics Rule (CTR) based TMDLs beyond May 18, 2010.*..... 20

**PROVISION A: PROHIBITIONS AND LIMITATIONS**

A-1: *Requests to include language in the prohibitions and limitations of Provision A that is linked to the alternative compliance pathway under Provision B.3.c.*..... 21

**PROVISION A.1: Discharge Prohibitions**

A1-1: *Request to correct State Water Board Resolution No. 2012-0012 reference in Provision A.1.d to Resolution No. 2012-0031.* ..... 22

**PROVISION A.2: Receiving Water Limitations**

A2-1: *Request for removal of receiving water limitations from Regional MS4 Permit.*..... 23

**PROVISION B: WATER QUALITY IMPROVEMENT PLANS**

B-1 *Request to revise the language in Provision B.1 to limit the Water Quality Improvement Plan to addressing discharges from the MS4.*..... 24

**PROVISION B.2: Priority Water Quality Conditions**

B2-1 *Request for revisions to the requirements for identifying priority water quality conditions under Provision B.2.* ..... 25

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0100  
(Cont'd)**

**PROVISION B.3.c: Prohibitions and Limitations Compliance Option**

B3c-1: *Support for the inclusion of the receiving water limitations alternative compliance pathway in the Regional MS4 Permit. .... 26*

B3c-2: *Requests for revisions to the requirement for developing and incorporating annual milestones into the schedules for the alternative compliance pathway. .... 27*

B3c-3: *Requests for revisions to provide additional clarifying language for when a Copermittee is deemed in compliance with receiving water limitations. .... 29*

B3c-4: *Requests to include compliance with receiving water limitations during the Water Quality Improvement Plan planning and development process. .... 30*

B3c-5: *Request to include receiving water limitations for ASBS under Provision A.2.b as part of alternative compliance pathway. .... 32*

B3c-6: *Requests for revisions to alternative compliance pathway numeric goal requirements proposed under Provision B.3.c.(1)(a)(iii). .... 33*

B3c-7: *The alternative compliance pathway would result in safe harbor protection and should be removed from the Regional MS4 Permit. .... 34*

B3c-8: *The alternative compliance pathway is inconsistent with the State Water Board’s Order. .... 35*

B3c-9: *The Tentative Order violates anti-backsliding requirements and the rationale provided does not support an anti-backsliding exception. .... 38*

B3c-10: *The Tentative Order violates anti-degradation requirements and the anti-degradation findings are unsupported by evidence. .... 41*

**PROVISION B.5: Iterative Approach and Adaptive Management Process**

B5-1: *Request for clarification of timing and conditions for alternative compliance pathway analysis updates. .... 44*

**PROVISION D.4.a: Receiving Water Assessments**

D4a-1: *Recommended revisions to transitional assessment requirements under Provision D.4.a.(1)(a). .... 45*

**PROVISION E.2: Illicit Discharge Detection and Elimination**

E2-1: *Requests for revisions to clarify implementation of the illicit discharge and detection program under Provision E.2 is compliance with the requirement to effectively prohibit non-storm water discharges to the MS4. .... 46*

E2-2: *Request for clarification of discharges of potable water sources under Provision E.2.a.(3)(f). .... 47*

**PROVISION E.3.b.(1): Definition of Priority Development Project**

E3b1-1: *Request for revisions to the definition of Priority Development Projects under Provision E.3.b.(1). .... 48*

**PROVISION E.3.b.(3): Priority Development Project Exemptions**

E3b3-1: *Request for Priority Development Project exemption for “self-remediating” projects.*

**INDEX OF COMMENT SUMMARIES AND RESPONSES  
ON TENTATIVE ORDER NO. R9-2015-0100  
(Cont'd)**

**PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements**

E3c1-1: *Request for revisions to clarify the biofiltration storm water pollutant control BMP performance criteria.*..... 50

E3c1-2: *The San Diego Water Board is requiring increasing stringent on-site storm water retention without evidence that the 2010 Southwest Riverside MS4 Permit requirements are not working.* ..... 51

**PROVISION E.3.c.(2): Hydromodification Management BMP Requirements**

E3c2-1: *Request for revisions to requirements to manage critical coarse sediment yield areas.* ..... 52

E3c2-2: *Request for interim timeframe exemptions for hydromodification management BMP requirements to be granted outright without any additional study or consideration.* ..... 54

**E3c2-3: *The requirement in the Regional MS4 Permit for Priority Development Projects to avoid coarse sediment yield areas results in a potential "taking" of private property.*..... 56**

**PROVISION E.3.d: BMP Design Manual Update**

E3d-1: *Request for additional time for San Diego County Copermittees to update and implement their BMP Design Manuals* ..... 57

E3d-2: *Request for revisions to clarify effective date of the BMP Design Manual is the same as the implementation date.* ..... 58

**PROVISION E.3.e.(1): Structural BMP Approval and Verification Process**

November 4, 2015 / Revised November 10, 2015

<b>Gnl-1 GENERAL COMMENTS</b>	
<p><b>COMMENT:</b> <i>Request to incorporate previous written comments and testimony in the record for this Tentative Order.</i></p> <p>The Copermitees and other stakeholders requested that previous written comments and testimony be incorporated into the record for this Tentative Order. The comment letters also included copies of the written comments previously submitted during the proceedings to adopt Order No. R9-2013-0001, and the proceedings to adopt Order No. R9-2015-0001 to amend Order No. R9-2013-0001.</p>	<p>Riverside County Copermitees                      Orange County Copermitees                      City of Dana Point                      City of San Diego                      San Diego Unified Port District                      South Laguna Civic Association                      Construction Industry Coalition on Water Quality</p>
<p><b>RESPONSE:</b> The San Diego Water Board is incorporating the previous written comments and testimony provided during the proceedings to adopt Order No. R9-2013-0001, and the proceedings to adopt Order No. R9-2015-0001 to amend Order No. R9-2013-0001 into the record for this Tentative Order.</p> <p>The San Diego Water Board reviewed Tentative Order No. R9-2015-0100 and its Attachments and has determined that the March 27, 2013 responses to comments document prepared during the 2013 adoption process of Order No. R9-2013-0001, the January 21, 2015 responses to comments document prepared during the adoption process of Order No. R9-2015-0001, and the oral responses to comments during the workshops and hearings during those proceedings address the previously submitted comments and testimony. The San Diego Water Board is incorporating by this reference as if set forth in full herein its written responses to comments and oral responses to comments raised during the workshops and hearings on Order Nos. R9-2013-0001 and R9-2015-0001 into these responses.</p> <p>To the extent commenters incorporate issues and objections raised in petitions for review of Order No. R9-2013-0001 filed with the State Water Board in SWRCB/OCC File A-2254(a)-(p), or in petitions for review of Order No. R9-2015-0001, amending Order No. R9-2013-0001 (SWRCB/OCC File A-2367(a)-(i)), the San Diego Water Board notes that it has not yet had an opportunity to submit written responses to those petitions for review and is not specifically addressing those petitions for review in these responses to comments. The San Diego Water Board will submit written responses to the petitions for review at the appropriate time in the State Water Board's petition proceeding.</p> <p>No changes to the Tentative Order or its Attachments were made based on the renewed comments.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100

November 4, 2015 / Revised November 10, 2015

Gnl-2	GENERAL COMMENTS	
	<p><b>COMMENT:</b> <i>Request for clarification of implementation requirements for the Riverside County Copermittees as a result of late entry into the Regional MS4 Permit.</i></p> <p>The Riverside County Copermittees noted that several provisions of the Regional MS4 Permit, including requirements to submit certification of legal authority, assessment and subsequent Water Quality Improvement Plan revision requirements, and requirements to submit a regional monitoring and assessment report, which either require data gathered under a Water Quality Improvement Plan that has been accepted by the San Diego Water Board, or are due for submittal outside of the Regional MS4 Permit's term. The Riverside County Copermittees wanted clarification that: 1) the certification of legal authority which was submitted by the Riverside County Copermittees under Order No. R9-2010-0016 will remain effective until a new certification is submitted with the first Water Quality Improvement Plan Annual Report (after the current Regional MS4 Permit term has ended), 2) any provisions regarding assessments or requiring data gathered under an accepted Water Quality Improvement Plan will not be due until such time that the necessary data are gathered and the assessments made under time periods described in the Regional MS4 Permit, and 3) the regional monitoring and assessment report for the current Regional MS4 Permit term should be completed utilizing data gathered during the transitional monitoring period, as these will be the only data that will be available at that time.</p>	Riverside County Copermittees
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that: 1) the certification of legal authority which was submitted by the Riverside County Copermittees under Order No. R9-2010-0016 will remain effective until a new certification is submitted with the first Water Quality Improvement Plan Annual Report (after the current Regional MS4 Permit term has ended), 2) any provisions regarding assessments or requiring data gathered under an accepted Water Quality Improvement Plan will not be due until such time that the necessary data are gathered and the assessments made under time periods described in the Regional MS4 Permit, and 3) the regional monitoring and assessment report for the current Regional MS4 Permit term should be completed utilizing data gathered during the transitional monitoring period, as these will be the only data that will be available at that time.</p>

November 4, 2015 / Revised November 10, 2015

<b>Gnl-3 GENERAL COMMENTS</b>		
	<p><b>COMMENT:</b> <i>Request to remove the City of Menifee from Water Quality Improvement Plan development and implementation.</i></p> <p>The Riverside County Copermittees and the City of Menifee requested several modifications to the Regional MS4 Permit that would remove the City of Menifee from the requirement to develop and implement the Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area. The Riverside County Copermittees and the City of Menifee assert that the City of Menifee does not own or operate any MS4 within the Santa Margarita River Watershed Management Area, and provided a map showing the City’s jurisdictional boundary and MS4.</p>	<p>Riverside County Copermittees City of Menifee</p>
	<p><b>RESPONSE:</b> The San Diego Water Board reviewed the information provided by the commenters and disagrees that the City of Menifee does not own or operate any MS4 within the Santa Margarita Watershed Management Area.</p> <p>The maps provided by the commenters show a portion of MS4 along Scott Road within the Santa Margarita Watershed Management Area that is indicated to be owned by the City of Menifee. In addition, the maps provided by the commenters show that there is a residential area within the City of Menifee and within the Santa Margarita River Watershed Management Area with streets, curb, and gutter that drain to MS4 owned by the Riverside County Flood Control and Water Conservation District, which discharges to a tributary of Warm Springs Creek. Warm Springs Creek is an impaired water body in the Santa Margarita River Watershed Management Area and may become subject to the requirements of a TMDL in the future. The streets, curb, and gutter in the residential area are also considered part of the City of Menifee’s MS4. The maps provided confirm that it is appropriate for the City of Menifee to be required to participate in the development and implementation of the Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>Gnl-4 GENERAL COMMENTS</b>		
	<p><b>COMMENT:</b> <i>Stakeholder workshops have been effective.</i></p> <p>The Orange County Copermittees expressed appreciation for the efforts of the San Diego Water Board staff to collaboratively engage the Copermittees and other stakeholders through the use of mediated workshops. The workshop format allowed all viewpoints to be expressed with sufficient time provided for discussion of issues regarding the Regional MS4 Permit.</p>	<p>Orange County Copermittees City of Dana Point City of Laguna Beach</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the collaborative approach utilized during the Regional MS4 Permit development and amendment processes has been beneficial for the San Diego Water Board staff to better understand the issues of concern to the stakeholders.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100

November 4, 2015 / Revised November 10, 2015

Gnl-5 GENERAL COMMENTS	
	<p><b>COMMENT:</b> <i>Requests for the Regional MS4 Permit to acknowledge the potential benefit of developing site specific water quality objectives in concert with development of the Water Quality Improvement Plan.</i></p> <p>The Cities of Dana Point and Laguna Beach requested that the Regional MS4 Permit and Fact Sheet specifically acknowledge the benefit of developing site specific objectives in concert with the development of the Water Quality Improvement Plans, even if development of the site specific objectives may extend the period to complete development of the Water Quality Improvement Plans.</p>
	<p>City of Dana Point City of Laguna Beach</p>
	<p><b>RESPONSE:</b> The San Diego Water Board acknowledges that developing site specific water quality objectives (site specific objectives) may be appropriate where there are data that are available to support site specific objectives. The San Diego Water Board, however, disagrees that it is appropriate to delay development and implementation of any Water Quality Improvement Plans with an expectation that site specific objectives will be developed.</p> <p>Any action taken by the San Diego Water Board to establish site specific objectives would require amendment of the Basin Plan to incorporate the site specific objectives before they could be implemented in any NPDES permits or waste discharge requirements issued by the San Diego Water Board. The Basin Planning process requires separate proceedings that need to include the public, the San Diego Water Board, the State Water Board, the Office of Administrative Law, and the USEPA. This process will take much longer to complete than developing the Water Quality Improvement Plan.</p> <p>However, the San Diego Water Board encourages the Copermitees to utilize the Water Quality Improvement Plan development process to identify areas within the Watershed Management Area where developing site specific objectives may be appropriate and include special studies to collect data that can be used to support development of site specific objectives.</p>

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>Gnl-6 GENERAL COMMENTS</b>	
<p><b>COMMENT:</b> <i>Request for clarification that location of a MS4 within the Port's jurisdictional boundaries does not render the Port an owner or operator of the MS4.</i></p> <p>The San Diego Unified Port District (Port) asserts that just because a MS4 facility falls within its jurisdictional boundaries, which overlap with the Cities of San Diego, National City, Chula Vista, Imperial Beach, and Coronado (Member Cities), that does not mean the Port owns or operates the MS4 facility, and thus the Port would not be responsible for discharges from those MS4 facilities. Therefore, the Port requested revisions to the Tentative Order that clarify this distinction.</p>	<p>San Diego Unified Port District</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the Tentative Order should be revised to include additional clarification. The Port owns and operates MS4 facilities (streets, curbs and gutters, catch basins, etc.) and lands within the tidelands that either convey or discharge storm water runoff into MS4 facilities owned or operated by Member Cities, or directly to receiving waters. The Port is responsible for complying with permit conditions pertaining to discharges from MS4 facilities and lands the Port owns or operates that discharge into MS4 facilities of Member Cities or directly to receiving waters. The Port must provide the evidence to demonstrate that it does not own or operate MS4 facilities or lands that discharge storm water runoff directly or indirectly into the MS4 facilities owned by the Member Cities.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>Gnl-7 GENERAL COMMENTS</b>		
	<p><b>COMMENT:</b> <i>Compliance with all the discharge prohibitions in the Regional MS4 Permit under all circumstances is likely impossible.</i></p> <p>The Cities of Dana Point and Laguna Beach asserts that compliance with all the discharge prohibitions in the Regional MS4 Permit under all circumstances is not practicable and likely impossible. The Cities go on to assert that the Cities are in a position of being required to comply with the discharge prohibitions under all circumstances, or are being required to meet a “zero discharge standard,” both of which are impossible to achieve.</p>	<p>City of Dana Point City of Laguna Beach</p>
	<p><b>RESPONSE:</b> The San Diego Water Board does not disagree with the assertion that the Copermittees are not in compliance with all the discharge prohibitions in the Regional MS4 Permit under all circumstances. The San Diego Water Board disagrees that it is not practicable and likely impossible to comply with all of the discharge prohibitions under all circumstances. The cases cited in support of the commenters’ argument are inapposite and factually distinguishable from Order No. R9-2013-0001 (as amended) and the discharge prohibitions and receiving water limitations provisions therein.</p> <p>To date, the Copermittees have not implemented programs that are capable of complying with all of the discharge prohibitions under all circumstances, but that does not mean it is not practicable nor impossible. The assertion that complying with all the discharge prohibitions in the Regional MS4 Permit under all circumstances is not practicable and impossible cannot be supported without first demonstrating that the Copermittees have implemented all of their programs to effectively prohibit non-storm water discharges to the MS4 and reduce pollutants in storm water discharges to the maximum extent practicable (MEP). Moreover, several audits conducted recently by the San Diego Water Board indicate that the Copermittees may not be adequately implementing their basic jurisdictional runoff management program (JRMP) requirements to reduce pollutants in storm water discharges to the MEP standard. Even if the Copermittees implemented the basic JRMP requirements to the MEP standard, the Copermittees can also implement additional practicable actions or programs to comply with all of the discharge prohibitions in the Regional MS4 Permit.</p>

November 4, 2015 / Revised November 10, 2015

<b>Gnl-8 GENERAL COMMENTS</b>		
	<p><b>COMMENT:</b> <i>Request for clarification by City of Lake Forest for applicability of the Water Quality Improvement Plan development requirements.</i></p> <p>The City of Lake Forest requested clarification on its participation in development of the Water Quality Improvement Plan, based on the agreement that discharges from its MS4 in the San Diego Region will be regulated by the Santa Ana Water Board.</p>	City of Lake Forest
	<p><b>RESPONSE:</b> The San Diego Water Board expects the City of Lake Forest to contribute to development of the Water Quality Improvement Plan and describe the water quality improvement strategies that will be implemented by the City to comply with TMDL requirements. The strategies implemented by the City of Lake Forest are only expected to implement the requirements of the Phase I MS4 Permit issued by the Santa Ana Water Board, except when and where additional strategies (known as optional jurisdictional strategies or Watershed Management Area strategies in the Regional MS4 Permit) may be necessary to achieve TMDL requirements.</p> <p>Likewise, if the Water Quality Improvement Plan includes final numeric goals that are not based on TMDL requirements, the City of Lake Forest is expected to include descriptions of the water quality improvement strategies that the City may implement to contribute toward achieving those final numeric goals.</p>

<b>Gnl-8 GENERAL COMMENTS</b>		
	<p><b>COMMENT:</b> <i>Recommendations for actions that can be implemented to improve water quality.</i></p> <p>The South Laguna Civic Association provided several recommended actions that may result in improvements to water quality.</p>	<p>South Laguna Civic Association</p>
	<p><b>RESPONSE:</b> The San Diego Water Board appreciates the recommendations. The recommendations, however, appear to be actions that could be implemented as part of water quality improvement strategies by the Copermittees, and not necessarily appropriate to include into the requirements of the Tentative Order. The recommended actions provided by the commenter can be brought to the attention of the south Orange County Copermittees during the development of the Water Quality Improvement Plan.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100

November 4, 2015 / Revised November 10, 2015

<b>Gnl-10 GENERAL COMMENTS</b>		
	<p><b>COMMENT:</b> <i>The Regional MS4 Permit illegally authorizes compliance schedules for CTR-based TMDLs beyond May 18, 2010.</i></p> <p>The Environmental Groups assert the Tentative Order and the Regional MS4 Permit illegally authorize compliance schedules for TMDLs to achieve compliance with the CTR as required by the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP).</p>	Environmental Groups
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the Tentative Order or the Regional MS4 Permit are in conflict with the SIP. The Tentative Order and Regional MS4 Permit are consistent with the TMDLs and the SIP. The Regional MS4 Permit establishes requirements for the regulation of storm water discharges, and the compliance schedule requirements of the SIP do not apply to storm water discharges.</p> <p>Please refer to footnote 1 on page 3 of the <a href="#">SIP</a> which states, <i>“This Policy does not apply to regulation of storm water discharges. The SWRCB has adopted precedential decisions addressing regulation of municipal storm water discharges in Orders WQ 91-03, 91-04, 96-13, 98-01, 99-05, and 2001-15.”</i></p>

<b>B-1 PROVISION B: WATER QUALITY IMPROVEMENT PLANS</b>		
	<p><b>COMMENT:</b> <i>Request to revise the language in Provision B.1 to specify the Water Quality Improvement Plans are to address discharges from the MS4.</i></p> <p>The City of San Diego requested Provision B.1 be revised to state that the Copermittees must develop a Water Quality Improvement Plan <u>for their MS4 discharges</u> within each of the Watershed Management Areas in Table B-1.</p>	City of San Diego
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the Water Quality Improvement Plans should be specific to just addressing discharges from the MS4.</p> <p>The Regional MS4 Permit is for the regulation of the Copermittees' MS4 discharges, but the Water Quality Improvement Plan is a planning document that requires the Copermittees to evaluate and identify all water quality conditions of concern within a Watershed Management Area. The Copermittees then determine what conditions of concern are the priorities that should be addressed by their individual jurisdictional strategies and/or through watershed-wide strategies. The Water Quality Improvement Plan development process provides the Copermittees flexibility in determining how to address priority issues through establishment of goals that directly improve receiving water quality impacted by MS4 discharges, instead of only limiting goals to MS4 discharges.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>

<b>B3c-1 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>		
	<p><b>COMMENT:</b> <i>Support for the inclusion of the receiving water limitations alternative compliance pathway in the Regional MS4 Permit.</i></p> <p>The Riverside County, Orange County, and San Diego County Copermittees, as well as several individual Copermittees submitted comments that support the inclusion of the receiving water limitations alternative compliance pathway proposed to be incorporated into the Regional MS4 Permit as Provision B.3.c.</p>	<p>Riverside County Copermittees                      Orange County Copermittees                      City of Lake Forest                      City of San Clemente                      City of San Juan Capistrano                      City of San Diego                      City of Santee                      County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board appreciates the support to include the receiving water limitations alternative compliance pathway into the Regional MS4 Permit.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>B3c-2 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>		
	<p><b>COMMENT:</b> <i>Requests for revisions to the requirement for developing and incorporating annual milestones into the schedules for the alternative compliance pathway.</i></p> <p>The Riverside County, Orange County, and San Diego County Copermittees, as well as several individual Copermittees requested revisions to the requirement to develop and incorporate annual milestones into the schedules for the alternative compliance pathway under Provision B.3.c. The Copermittees assert that annual milestones are burdensome, unworkable, and not meaningful. The Copermittees requested that milestones be limited to one or two milestones per permit term.</p>	<p>Riverside County Copermittees                      Orange County Copermittees                      City of Lake Forest                      City of San Clemente                      City of San Juan Capistrano                      San Diego County Copermittees                      City of San Diego                      City of Santee</p>
	<p><b>RESPONSE:</b> The San Diego Water Board considered the proposed revisions and rationale provided and determined that revisions to the requirement for developing and incorporating annual milestones are appropriate. However, the San Diego Water Board does not agree that milestones should be limited to just one or two per permit term.</p> <p>The development and incorporation of annual milestones into the alternative compliance pathway is necessary for a Copermittee to be able to demonstrate to the San Diego Water Board and the public that there is a commitment to implementing a credible, rigorous, ambitious, and transparent plan to improve the quality of its MS4 discharges and/or receiving waters within its jurisdiction. The San Diego Water Board agrees, however, that annual milestones may become less meaningful after 5 or 10 years. Therefore, Provision B.3.c.(1)(a)(vii) and footnote 9 have been revised as follows:</p> <p><u>Provision B.3.c.(1)(a)(vii)</u>                      For each final numeric goal developed pursuant to Provisions B.3.a and B.3.c.(1)(a)(i)-(v), <del>at least one</del> annual milestones<sup>9</sup> and <del>the dates for its</del> <u>their</u> achievement must be included within each <u>of the next five (5) Water Quality Improvement Plan Annual Report reporting periods, or until the final numeric goal is achieved. Annual milestones and the dates for their achievement for the 5 Water Quality Improvement Plan Annual Report reporting periods of the next permit term, or until the final numeric goal is achieved, must be provided as part of the Report of Waste Discharge required pursuant to Provision F.5.</u></p> <p><u>Footnote 9</u>                      Annual milestones for each final numeric goal must <del>build upon previous milestones and lead to be clearly and directly linked to, or demonstrate progress is being made toward,</del> the achievement of the final numeric</p>

November 4, 2015 / Revised November 10, 2015

<b>B3c-3 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>		
	<p><b>COMMENT:</b> <i>Requests for revisions to provide additional clarifying language for when a Copermittee is deemed in compliance with receiving water limitations.</i></p> <p>The Riverside County Copermittees requested revisions to the alternative compliance pathway requirements under Provision B.3.c.(2) and the iterative process requirements under Provision A.4 to clarify when a Copermittee is deemed in compliance with receiving water limitations, especially relative to other Copermittees if updates are needed. The Environmental Groups requested revisions to Provision B.3.c.(2) to strictly require achievement of annual milestones and remove the potential for updates as a clearer way of determining when a Copermittee is no longer deemed in compliance.</p>	<p>Riverside County Copermittees Environmental Groups</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that revisions to Provision B.3.c.(2) are necessary to clarify when a Copermittee is deemed in compliance. The requirements under Provision B.3.c.(2) are clear criteria that the San Diego Water Board will use to determine if a Copermittee can be deemed in compliance with Provisions A.1.a, A.1.c, A.1.d, A.2, and A.3.b.</p> <p>The commenters did, however, identify a scenario during the period of time a Copermittee has submitted “acceptable rationale and recommends appropriate modifications” and the San Diego Water Board accepts the rationale and recommended modifications where it may not be clear if a Copermittee is or is not in compliance. The intent was to continue deeming the Copermittee in compliance with Provisions A.1.a, A.1.c, A.1.d, A.2, and A.3.b during this period of time. To clarify this intent, the following has been added to the last paragraph of the discussion of Provision B.3.c on page F-62 in the Fact Sheet:</p> <p style="margin-left: 40px;"><u>The Copermittee continues to be deemed in compliance with the requirements of Provisions A.1.a, A.1.c, A.1.d, A.2, and A.3.b during the time the San Diego Water Board reviews the rationale and recommended modifications to the interim numeric goals, and/or water quality improvement strategies, and/or schedules. If and when the San Diego Water Board determines that it does not accept the rationale or recommendations, the Copermittee will be notified they are no longer deemed in compliance with Provisions A.1.a, A.1.c, A.1.d, A.2, and A.3.b.</u></p>

November 4, 2015 / Revised November 10, 2015

<b>B3c-4 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>		
	<p><b>COMMENT:</b> <i>Requests to include compliance with receiving water limitations during the Water Quality Improvement Plan planning and development process.</i></p> <p>The Riverside County and Orange County Copermittees, several Orange County cities, as well as the County of San Diego requested that the requirements under Provision B.3.c be revised to include compliance with the prohibitions and limitations of Provision A during the development of the Water Quality Improvement Plans. Several of the comments also assert that including compliance during development of the Water Quality Improvement Plan is consistent with State Water Board Order WQ 2015-0075.</p>	<p>Riverside County Copermittees                      Orange County Copermittees                      City of Dana Point                      City of Laguna Beach                      City of Lake Forest                      City of San Clemente                      City of San Juan Capistrano                      County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that it is appropriate to deem a Copermittee in compliance with any of the prohibitions and limitations under Provision A before a Water Quality Improvement Plan has been submitted and accepted by the San Diego Water Board. The San Diego Water Board also disagrees that State Water Board Order WQ 2015-0075 communicates that the State Water Board expects or requires in any way that Regional Water Boards allow for compliance with receiving water limitations during development of watershed management plans.</p> <p>The San Diego Water Board is concerned that allowing for compliance during the development of the Water Quality Improvement Plan would remove the motivation or incentive for Copermittees to develop a credible, rigorous, ambitious, and transparent plan. Before the San Diego Water Board can make a determination that a Copermittee has a credible, rigorous, ambitious, and transparent plan that can demonstrate discharges from a Copermittee’s MS4 will not cause or contribute to exceedances of water quality standards in receiving waters, or that receiving waters will be protected from MS4 discharges, the San Diego Water Board must first have an opportunity to review the proposed plan.</p> <p>In response to the assertion that State Water Board Order WQ 2015-0075 encourages or mandates alternative compliance pathways to include compliance during development of the Water Quality Improvement Plan, the commenters failed to provide a clear citation of this direction. There is nothing within the State Water Board Order that explicitly requires the inclusion of an alternative compliance pathway in Phase I MS4 Permit, let alone compliance during development of the plan for alternative compliance. State Water Board Order WQ 2015-0075 only requires the San Diego Water Board to <u>consider</u> inclusion of an alternative compliance pathway, and include findings in the permit if the San Diego Water Board chooses not to include the alternative compliance pathway. In this case, the San Diego Water Board has chosen to incorporate an alternative compliance</p>

<b>B3c-6 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>		
	<p><b>COMMENT:</b> <i>Requests for revisions to alternative compliance pathway numeric goal requirements proposed under Provision B.3.c.(1)(a)(iii).</i></p> <p>The City of San Diego requested a revision to combine Provisions B.3.c.(1)(a)(iii) and B.3.c.(1)(a)(iv) to reduce confusion regarding whether the categories of numeric goals are mandatory or optional. The County of San Diego requested additional language to be added to Provision B.3.c.(1)(a)(iii) to limit the numeric goals for MS4 discharges only to pollutants or conditions where MS4 discharges are causing or contributing to the impairment.</p>	<p>City of San Diego County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the revisions requested are appropriate or necessary.</p> <p>The City of San Diego’s requested revision does not provide more clarity, and actually reduces the available options for numeric goals. Provisions B.3.c.(1)(a)(iii) and B.3.c.(1)(a)(iv) allow a Copermittee to choose interim and final numeric goals applicable to the Copermittee’s MS4 outfalls, OR interim and final numeric goals applicable to the receiving waters, OR a combination of both. The City’s proposed revisions would only allow a Copermittee to choose interim and final numeric goals applicable to the Copermittee’s MS4 outfalls, OR interim and final numeric goals applicable to the receiving waters, but NOT a combination of both.</p> <p>The San Diego Water Board disagrees that the County’s proposed revision is necessary because if a Copermittee’s MS4 discharges do not contain pollutants that are causing or contributing to an impairment listed on the Clean Water Act Section 303(d) List of Water Quality Impaired Segments, the Copermittee should not have difficulty developing and including final numeric goals that can demonstrate their discharges are not causing or contributing to the impairment. The Copermittee will also have to collect data to demonstrate that the final numeric goals have been achieved and continue to be achieved. The data collected, assessed, and reported will demonstrate that the Copermittee is not causing or contributing to the impairment listed on the Clean Water Action Section 303(d) List.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>

<b>B3c-7 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>		
	<p><b>COMMENT:</b> <i>The alternative compliance pathway would result in safe harbor protection and should be removed from the Regional MS4 Permit.</i></p> <p>The Environmental Groups assert that providing the alternative compliance pathway provides the Copermittees with safe harbor protection, and requested the alternative compliance pathway be removed from the Regional MS4 Permit.</p>	Environmental Groups
	<p><b>RESPONSE:</b> The San Diego Water Board does not agree that the alternative compliance pathway provides the Copermittees with safe harbor protection that “simply mimics the failed iterative approach.” Compliance with the alternative compliance pathway means, for compliance determination purposes, that the San Diego Water Board would deem a Copermittee that has fulfilled the requirements of the alternative compliance pathway as in compliance with the receiving water limitations. As long as the Copermittee is in compliance with the requirements under Provision B.3.c, the San Diego Water Board can consider the Copermittee in compliance with the prohibitions and limitations. Complying with the requirements of Provision B.3.c, however, will require a significant commitment, level of effort, and resources from any Copermittee that chooses to implement it. Any Copermittee that can comply with the requirements of Provision B.3.c will also be demonstrating a well defined and transparent commitment to improve water quality.</p> <p>Please also see responses to comments <b>Gnl-10 and</b> B3c-8.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>

<b>B3c-8 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>		
	<p><b>COMMENT:</b> <i>The alternative compliance pathway is inconsistent with the State Water Board's Order.</i></p> <p>The Environmental Groups assert that the alternative compliance pathway in the Tentative Order is inconsistent with State Water Board Order WQ 2015-0075. The Environmental Groups assert that the alternative compliance pathway proposed in the Tentative Order is inconsistent because a) it does not contain specific guidance or protocols for a “well defined” and “transparent” analysis, b) it does not require a “finite” period of time to achieve receiving water limitations, and c) it does not include requirements for multi-benefit or storm water resource projects.</p>	Environmental Groups
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the alternative compliance pathway proposed in the Tentative Order is inconsistent with the State Water Board Order. The alternative compliance pathway in the Tentative Order is consistent with the State Water Board Order for the following reasons:</p> <p>a) In response to the assertion that the alternative compliance pathway in the Tentative Order does not include specific guidance or protocols for a “well defined” and “transparent analysis, the approach of the alternative compliance pathway in the Tentative Order is actually more “well defined” and “transparent” than the example provided by the commenter. The commenter provides permit language from the Los Angeles MS4 Permit as an example of specific guidance and protocols for a reasonable assurance analysis. While there is more description as to what components the reasonable assurance analysis must include, fundamentally the analysis is based on a computer model consisting of equations with assumptions which utilize data that are entered into and processed by a computer. Many of the variables in the equations will be based on assumptions, and members of the public may not know or understand how those variables may impact the results. The Los Angeles MS4 Permit does not include provisions that allows for or requires public participation or review of the model, its assumptions, and inputs.</p> <p>In contrast, the alternative compliance pathway in the Tentative Order does require an analysis with “clearly stated assumptions” which must go through a public participation process that allows the public to review and provide comments on the analysis methodology and the assumptions included in the analysis. The main difference in the approaches is that the Copermittee has more flexibility with how to do the analysis, and as long as there is understanding and support from the public and the San Diego Water Board. The Copermittee is not just limited to one or two “acceptable” models, but also is not precluded from the use of those models. The Tentative Order alternative compliance pathway is a truly transparent process for the public and provides for the public to participate in how the analysis is defined. Based on these</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100

November 4, 2015 / Revised November 10, 2015

### B3c-8 PROVISION B.3.c: Prohibitions and Limitations Compliance Option

considerations, the analysis requirement is “well defined” and “transparent” consistent with the State Water Board Order.

- b) In response to the assertion that the alternative compliance pathway in the Tentative Order does not require a “finite” period of time to achieve compliance with receiving water limitations, the alternative compliance pathway requires a Copermittee to provide a schedule for when receiving water limitations are expected to be achieved. Any schedule with an expected end date is “finite.” However, “finite” should not mean there is not room for making adjustments to the schedule if conditions warrant it.

Absent the alternative compliance pathway, no assessments would necessarily be conducted to determine if or when receiving water limitations have been fully achieved. The San Diego Water Board prefers a permit that will provide support, incentive, and motivation for the Copermittees to achieve compliance with receiving water limitations within a foreseeable future rather than a permit that only has the threat of enforcement in the present and the foreseeable future. However, while the alternative compliance pathway removes the immediate threat of enforcement for violations of receiving water limitations, it also includes additional requirements that can be used to hold the Copermittee more accountable for implementing strategies to achieve compliance with receiving water limitations. In the end, the San Diego Water Board believes that the alternative compliance pathway provides a path to compliance with receiving water limitations that is “finite” compared to the “iterative process” that was previously required, consistent with the State Water Board Order.

- c) In response to the assertion that the alternative compliance pathway in the Tentative Order does not include requirements for multi-benefit or storm water resource projects, the San Diego Water Board acknowledges there is no text in Provision B.3.c that includes the term “multi-benefit.” However, the Tentative Order does include several provisions that encourage multi-benefit and regional storm water resource projects without using the term “multi-benefit.”

The commenter should first review Provisions B.3.b.(1)(b) and B.3.b.(2). While these provisions are not specifically mentioned under Provision B.3.c, they are required to be included in the Water Quality Improvement Plan, which is where the alternative compliance pathway requirements of Provision B.3.c must be included. Provision B.3.b.(1)(b) requires each Copermittee to identify strategies to retrofit areas of existing development and rehabilitate conditions of channels or habitats within its jurisdiction, which are considered multi-benefit strategies. Provision B.3.b.(2) also requires the Copermittees in the Watershed Management Area to identify strategies to retrofit areas of existing development and rehabilitate conditions of

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>B3c-8 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>
<p>channels or habitats that are regional or multi-jurisdictional.</p> <p>Tied to Provisions B.3.b.(1)(b) and B.3.b.(2) are also the jurisdictional runoff management program (JRMP) requirements under Provisions E.3.c.(3) and E.5.e. Provision E.5.e requires each Copermittee to identify areas of existing development within its jurisdiction for retrofit and rehabilitation projects, and to identify strategies to facilitate implementation of those projects. Provision E.3.c.(3) provides each Copermittee the option to allow development projects to implement candidate projects identified as part of the optional Watershed Management Area Analysis allowed pursuant to Provision B.3.b.(4), also included in the Water Quality Improvement Plan. The candidate projects include several types of multi-benefit and storm water resource type projects, including but not limited to stream or riparian area rehabilitation, retrofitting existing infrastructure to incorporate storm water retention or treatment, regional BMPs, groundwater recharge projects, water supply augmentation, and land purchases to preserve floodplain functions. Therefore, while the alternative compliance pathway requirements under Provision B.3.c do not include the term “multi-benefit” in the text, the Tentative Order includes several provisions that require or encourage the implementation of multi-benefit and storm water resource projects consistent with the State Water Board Order.</p>

November 4, 2015 / Revised November 10, 2015

<b>B3c-9 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>		
	<p><b>COMMENT:</b> <i>The Tentative Order violates anti-backsliding requirements and the rationale provided does not support an anti-backsliding exception.</i></p> <p>The Environmental Groups assert that the Tentative Order violates the anti-backsliding provisions of the Clean Water Act and its implementing regulations because the San Diego Water Board's findings related to the alternative compliance pathway fail to support the use of anti-backsliding exceptions.</p>	Environmental Groups
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the Tentative Order violates anti-backsliding provisions of the Clean Water Act and the federal regulations. The Clean Water Act generally prohibits the relaxation of effluent limitations in a reissued permit. However, as discussed in the Fact Sheet, it remains unresolved whether anti-backsliding provisions are applicable to the incorporation of an alternative compliance pathway into a regional MS4 permit. (please see page F-32 of the Fact Sheet; <i>please also see State Board Order WQ 2015-0075 at pp 18-21, stating "it is unnecessary, however, to resolve the ultimate applicability of the regulatory anti-backsliding provisions"</i>).</p> <p>Even if the anti-backsliding provisions do apply, the alternative pathway provisions fit squarely within an exception. There are numerous exceptions to the Clean Water Act's backsliding provisions based on new information. See, e.g., 33 U.S.C. § 1342(o)(2)(B)(i), 40 C.F.R. § 122.44(l)(i)(B)(1). Additionally, Under 40 C.F.R. section 122.44(l), anti-backsliding provision do not apply if the circumstances on which the previous permit was based have materially and substantially changed since the time the previous permit was issued and would constitute cause for permit modification or revocation or reissuance under 40 C.F.R. section 122.62. Section 122.62 in turn states that new information not available at the time the previous permit was issued is cause for modification. 40 C.F.R. § 122.62(a)(2).</p> <p>Furthermore, the San Diego Water Board disagrees with the assertion that the new information from the lessons learned and experiences of the Los Angeles Water Board are somehow "unique" to the Los Angeles Region. To the extent that the permitting history in Los Angeles may be considered "unique" in any way, it is still consistent with the San Diego Water Board's experience with storm water permitting over the last decade. The transition to a Regional MS4 Permit in the Fifth Term Permit was driven, in part, by a growing recognition that a watershed management approach required regional action. In the Regional MS4 permit, the San Diego Water Board seeks to provide a consistent set of permit requirements for all of the Copermitttees and to promote the efficiencies gained from collective action in jurisdictional runoff management.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100

November 4, 2015 / Revised November 10, 2015

### B3c-9 PROVISION B.3.c: Prohibitions and Limitations Compliance Option

The San Diego Water Board structured the Regional MS4 Permit to incorporate new information because there has been a statewide paradigm shift with respect to stormwater management. In June 2015, the State Water Board issued a precedential water quality order, Order WQ 2015-0075. This Order directed all of the Regional Water Boards to consider the Los Angeles Water Board's alternative compliance path to receiving water limits in all Phase I MS4 permits going forward (State Water Board Order WQ 2015-0075 at p 51). Moreover, the State Water Board made it clear that all regional water boards had been informed by the lessons learned in Los Angeles, stating "[f]urther, we [the State Water Board] find that all regional water boards are informed by the information gained in the Los Angeles Region, so that any regional water board that adopts an alternative compliance path in a subsequent Phase I permit would not be in violation of anti-backsliding requirements, regardless of the particular storm water permitting history of that region." *Id.* at p. 22 fn. 74. Thus, while the State Water Board Order relies heavily on the information and evidence related to the Los Angeles County MS4 Permit and its version of an alternative compliance pathway, the information and evidence are also applicable to and are expected to be utilized in the San Diego Region if an alternative compliance pathway is incorporated into the San Diego Regional MS4 Permit.

For all of the reasons stated above, the alternative compliance path provisions do not violate federal anti-backsliding provisions. To clarify, however, the discussion on Anti-Backsliding Requirements on page F-32 in the Fact Sheet has been revised as follows:

CWA sections 402(o) and 303(d)(4) and federal regulations at 40 CFR 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations or conditions may be relaxed. While this Order allows implementation of an alternative compliance pathway option in Provision B.3.c to constitute compliance with receiving water limitations under certain circumstances, the availability of that alternative and the corresponding availability of additional time to come into compliance with receiving water limitations does not violate the antbacksliding provisions. The receiving water limitations provisions of this Order are imposed under section 402(p)(3)(B) of the Clean Water Act rather than based on best professional judgment, or based on section 301(b)(1)(C) or sections 303(d) or (e), and are accordingly not subject to the anti-backsliding requirements of section 402(o). Although the non-applicability is less clear with respect to the regulatory anti-backsliding provisions in 40 CFR 122.44(l), the regulatory history suggests that USEPA's intent was to establish the anti-backsliding regulations with respect to evolving technology standards for traditional point sources. (See, e.g., 44 Fed.Reg. 32854, 32864 (Jun. 7, 1979)). It

RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100

November 4, 2015 / Revised November 10, 2015

**B3c-9 PROVISION B.3.c: Prohibitions and Limitations Compliance Option**

is unnecessary, however, to resolve the ultimate applicability of the regulatory anti-backsliding provisions, because the alternative compliance pathway option in Provision B.3.c qualifies for an exception to backsliding as based on new information.

The alternative compliance pathway option in Provision B.3.c of this Order was informed by new information available to the Board from experience and knowledge gained through storm water permitting at the Regional Water Boards in the last ten years. There has been a statewide paradigm shift in storm water management. State Water Board Order WQ 2015-0075 directed all of the Regional Water Boards to consider the Los Angeles Water Board's alternative compliance path to receiving water limitations in all Phase I MS4 permits going forward (State Water Board Order WQ 2015-0075 at page 51) ~~It~~, and the Los Angeles Water Board's process of developing over 30 watershed-based TMDLs and implementing several TMDLs since the adoption of the previous permits. In particular, the Los Angeles Water Board recognized the significance of allowing time to plan, design, fund, operate and maintain watershed-based BMPs necessary to attain water quality improvements and additionally recognized the potential for municipal storm water to benefit water supply. Similarly, the San Diego Water Board's experience developing and implementing the Fourth Term MS4 Permits and TMDLs that apply on a regionwide scale (i.e. TMDLs for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region) has resulted in a similar recognition of the need for a watershed-based approach that allows time to plan, design, fund, operate and maintain BMPs to address impaired waters that have been impacted by MS4 discharges. Thus, even if the receiving water limitations are subject to anti-backsliding requirements, they were revised based on new information that would support an exception to the anti-backsliding provisions. (33 U.S.C. § 1342(o)(2)(B)(i); 40 C.F.R. § 122.44(l)(1); 40 C.F.R. §122.44(l)(2)(i)(B)(1)).

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>B3c-10 PROVISION B.3.c: Prohibitions and Limitations Compliance Option</b>		
	<p><b>COMMENT:</b> <i>The Tentative Order violates anti-degradation requirements and the anti-degradation findings are unsupported by evidence.</i></p> <p>The Environmental Groups assert that the Tentative Order violates anti-degradation requirements and there is no evidence to support the anti-degradation findings. The Environmental Groups generally assert that anti-degradation findings from State Water Board Order WQ 2015-0075 are not applicable to the Tentative Order and the findings in the Tentative Order are unsupported by evidence.</p>	Environmental Groups
	<p><b>RESPONSE:</b> Consistent with the direction of the State Water Board Order WQ 2015-0075 adopted in June 2015, the San Diego Water Board considered the inclusion of an alternative compliance pathway into the Regional MS4 Permit. With the inclusion of this new permit component, the federal and state antidegradation policies were considered in light of the evidence in the record and information about the nature of municipal storm water discharges, evolving municipal storm water permits and the State Water Board’s precedential order. The Regional MS4 Permit and Fact Sheet were revised to be consistent with all of these considerations.</p> <p>The San Diego Water Board disagrees that the antidegradation findings in the Tentative Order are inadequate and unsupported by evidence in the record. The San Diego Water Board considered relevant information unique to the San Diego Region such as its own storm water permitting history and TMDL adoption and implementation through municipal storm water permits. The San Diego Water Board has adopted seven TMDL Basin Plan amendments that cover at least 30 waterbody-pollutant combinations, similar to the Los Angeles Region. The implementation of these 7 TMDLs through the Regional MS4 Permit is essential for achieving water quality standards in the region. Moreover, the State Water Board’s discussion of appropriate antidegradation considerations for the Los Angeles MS4 Permit is equally applicable in the context of the San Diego Water Board’s Tentative Order that incorporates an alternative compliance pathway. In its consideration of antidegradation, the State Water Board acknowledges that the Los Angeles MS4 permit “improves on past practices that have been inadequate to protect water quality, and includes a monitoring and assessment program that will identify any changes in water quality. [fn.] In general, under the Los Angeles MS4 Order, we expect to see a trajectory away from any past degradation, even if there may be some continued short-term degradation.” (Order WQ 2015-0075, p. 26.) Likewise, the Regional MS4 Permit now requires Copermitees to design watershed based monitoring and assessment programs that promote and track progress towards meeting the relevant water quality objectives. As such, were the State Water Board considering the Tentative Order, it likely would reach the same conclusion about the San Diego Regional MS4 Permit.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100

November 4, 2015 / Revised November 10, 2015

### B3c-10 PROVISION B.3.c: Prohibitions and Limitations Compliance Option

The commenters incorrectly assert that the San Diego Water Board is required, but has failed, to follow procedures and requirements set forth in a USEPA document titled “*Interim Economic Guidance for Water Quality Standards Workbook*” (March 1995) (Workbook). USEPA’s Workbook provides guidance that states may choose, but are not required, to follow. Although the Workbook does provide some information that states *may* use to consider whether degradation of high-quality waters is warranted from an economic impacts perspective, the guidance was not crafted to be used in the context of permitting of MS4 discharges. (See USEPA Workbook, cover memo, pp. 1-2 and Workbook, p. 1-1.) Instead, the San Diego Water Board has considered available guidance provided by the State Water Board in the Administrative Procedures Update (APU) 90-004 in conjunction with, among other things, available evidence about the quality of the receiving waters for discharges of storm water in finding that the Tentative Order complies with federal and state anti-degradation policies<sup>1</sup>. The antidegradation findings in the Tentative Order, like those adopted in the State Water Board Order for the final Los Angeles MS4 Permit, are supported by substantial evidence in the record for the Regional MS4 Permit.

In the stormwater context, a generalized antidegradation analysis is appropriate. As the State Water Board acknowledges, guidance provided in the APU 90-004 “may be construed to exempt [a regional water board] from conducting an extensive pollutant by pollutant analysis for each water body in the region” where, as here, there is insufficient data available to carry out a complete antidegradation analysis for each water body-pollutant combination.” (See Order WQ 2015-0075, p. 25.) The State Water Board notes the APU-90-004 “contemplates the appropriate antidegradation analysis for a discrete discharge or facility. It has limited value when considering anti-degradation in the context of storm water discharges from diffuse sources, conveyed through multiple outfalls, with multiple pollutants impacting multiple water bodies within a municipality, or in this case, a region, especially given that reliable data on the baseline water quality from 1968 is not available.” (Id., p. 27; see also id., p. 27, n. 90 [“We note that USEPA did not conduct a detailed antidegradation analysis in issuing NPDES Permit No. DC00000221 for MS4 discharges to the District of Columbia, presumably for similar reasons. The court in *Asociacion de Gente Unida* also relied on APU 90-004 in part in rejecting an antidegradation analysis conducted by the Central Valley Regional Water Quality Control Board for discharges of pollutants to groundwater from dairy facilities region-wide, but the court’s objection was to the regional water board’s reliance on an illusory prohibition of discharge to groundwater in finding that no antidegradation analysis

<sup>1</sup> See, e.g., 1996, 1998, 2002, 2006, 2010 Clean Water Action section 303(d) Lists for the San Diego Region, and monitoring reports from the San Diego County, Orange County, and Riverside County Copermittees since the First Term MS4 Permits issued in 1990.

<b>D4a-1 PROVISION D.4.a: Receiving Waters Assessments</b>		
	<p><b>COMMENT:</b> <i>Recommended revisions to transitional assessment requirements under Provision D.4.a.(1)(a).</i></p> <p>The Riverside County Copermittees noted that Provision D.4.a.(1)(a) prescribes that assessments required to be made under Provision D.4.a.(2) must be included in each Copermittees' transitional monitoring and assessment reports; however, Provision D.4.a.(2)(e) requires determination of whether strategies identified in the Copermittees' Water Quality Improvement Plan are progressing towards achieving interim and final numeric goals described in the Water Quality Improvement Plan. The Riverside County Copermittees provided their understanding that transitional monitoring and assessment applies to the time period when the Copermittees' Water Quality Improvement Plan is being developed, and therefore assessments made during this time period cannot provide information on the progress of the Water Quality Improvement Plan. Based on their observations, the Riverside County Copermittees recommended revisions to Provision D.4.a.(1)(a).</p>	Riverside County Copermittees
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the revisions to Provision D.4.a.(1)(a) are necessary.</p> <p>It is true that the transitional monitoring and assessment applies to the time period when the Water Quality Improvement Plan is being developed. The commenters can fulfill the assessment requirement of Provision D.4.a.(2)(e) by either stating that they cannot make a determination until the Water Quality Improvement Plan is accepted and implemented, or assess the strategies that are currently being implemented at the time of the assessment and are expected to be included in the Water Quality Improvement Plan. The San Diego Water Board expects the assessments reported during the transitional period to serve as a baseline for improvements in water quality as the Water Quality Improvement Plans are implemented over time.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>

<b>E2-1 PROVISION E.2: Illicit Discharge Detection and Elimination</b>		
	<p><b>COMMENT:</b> <i>Requests for revisions to clarify implementation of the illicit discharge and detection program under Provision E.2 is compliance with the requirement to effectively prohibit non-storm water discharges to the MS4.</i></p> <p>The Orange County Copermittees, as well as the Cities of Dana Point and Laguna Beach, requested revisions to Provision E.2 to explicitly state that implementation of the illicit discharge detection and elimination requirements under Provision E.2 constitutes compliance with effective prohibition of non-storm water discharges to the MS4 required under Provision A.1.b.</p>	<p>Orange County Copermittees City of Dana Point City of Laguna Beach</p>
	<p><b>RESPONSE:</b> The San Diego Water disagrees that revisions to Provision E.2 are necessary. Provision A.1.b explicitly states that Copermittees are required to effectively prohibit non-storm water discharges to the MS4 “through the implementation of Provision E.2.” The Copermittees are already expected to demonstrate compliance with Provision A.1.b through the implementation of Provision E.2. If a Copermittee has not adequately implemented Provision E.2, then the Copermittee is not only, not in compliance with the requirements of Provision E.2, but by default will also not be in compliance with Provision A.1.b.</p> <p>The San Diego Water Board, however, recognizes that additional clarification may be helpful in understanding that implementing the requirements of Provision E.2 is how the San Diego Water Board will assess a Copermittee’s compliance with the requirement to effectively prohibit non-storm water discharges to the MS4 under Provision A.1.b. Therefore, the San Diego Water Board has revised the opening paragraph of the discussion for Provision E.2 in the Fact Sheet (page F-81) to the following:</p> <p style="padding-left: 40px;">Provision E.2.(Illicit Discharge Detection and Elimination) requires each Copermittee to implement an illicit discharge detection and elimination program to effectively prohibit non-storm water discharges to the MS4 by actively detecting and eliminating illicit discharges and disposal into its MS4. <u>If the San Diego Water Board finds that a Copermittee is fully implementing the requirements of Provision E.2, then the Copermittee is deemed in compliance with the effective prohibition of non-storm water discharges to the MS4 required under Provision A.1.b.</u></p>

<b>E3c1-1 PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements</b>		
	<p><b>COMMENT:</b> <i>Request for revisions to clarify the biofiltration storm water pollutant control BMP performance criteria.</i></p> <p>The County of San Diego requested a revision to Provision E.3.c.(1)(a)(i)[b] to clarify the intent and applicability of the biofiltration BMP design criteria.</p>	<p>County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the proposed change is necessary. The wording describing the design requirements adequately describe the intent and applicability of the biofiltration BMP design criteria. Any proposed change incorporated during the adoption proceedings of the Tentative Order could be interpreted as a change in the requirement, when in fact there is no change.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>	

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100

November 4, 2015 / Revised November 10, 2015

<b>E3c1-2 PROVISION E.3.c.(1): Storm Water Pollutant Control BMP Requirements</b>		
	<p><b>COMMENT:</b> <i>The San Diego Water Board is requiring increasingly stringent on-site storm water retention without evidence that the 2010 Southwest Riverside MS4 Permit requirements are not working.</i></p> <p>CICWQ asserts that the Tentative Order has more stringent on-site storm water retention requirements than the 2010 Southwest Riverside County MS4 Permit (Order No. R9-2010-0016) requirements without any evidence that the requirements of Order No. R9-2010-0016 are not working to protect water quality and maintain beneficial uses.</p>	<p>Construction Industry Coalition on Water Quality (CICWQ)</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees with the assertion that the Tentative Order has more stringent on-site storm water retention requirements over and above the requirements of Order No. R9-2010-0016.</p> <p>The purpose of the on-site retention requirement in both the Tentative Order and Order No. R9-2010-0016 is to retain on-site the pollutants contained in the volume of storm water runoff produced from a 24-hour 85th percentile storm event. This requirement has not changed from Order No. R9-2010-0016, and therefore the commenter is incorrect in stating that the San Diego Water Board is requiring additional prescriptive performance measures for retaining storm water runoff. This is the maximum extent practicable (MEP) standard recognized by the San Diego Water Board and is consistent with the Fourth Term MS4 Permits for Orange County and Riverside County (Order Nos. R9-2009-0002 and R9-2010-0016, respectively), as well as Santa Ana Water Board Order Nos. R8-2009-0030 and R8-2010-0033 (Orange County and Riverside County MS4 Permits, respectively), Los Angeles Water Board Order Nos. R4-2010-0108 and R4-2012-0175 (Ventura County and Los Angeles County MS4 Permits, respectively).</p> <p>Additionally, the storm water pollutant control and hydromodification management BMP requirements in the Tentative Order are more flexible than in Order No. R9-2010-0016 by providing an optional Alternative Compliance Program under Provision E.3.c.(3) of the Regional MS4 Permit. The Alternative Compliance Program, if developed by a Copermittee, would allow Priority Development Projects to fully comply with storm water pollutant control and hydromodification management BMP requirements either on-site, offsite, or a combination of both, if doing so would provide greater water quality benefit to the watershed.</p>

November 4, 2015 / Revised November 10, 2015

<b>E3c2-1 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>		
	<p><b>COMMENT:</b> <i>Request for revisions to requirements to manage critical coarse sediment yield areas.</i></p> <p>CICWQ asserts that the Tentative Order requirements for Priority Development Projects to “avoid critical sediment yield areas” are unnecessarily restrictive. The County of San Diego requested that the requirement to manage critical course sediment yield areas be moved from the hydromodification management BMP performance standard requirements under Provision E.3.c.(2)(b) to Provision E.3.d as part of the BMP Design Manual update to be addressed regionally.</p>	<p>County of San Diego Construction Industry Coalition on Water Quality (CICWQ)</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the requirements to avoid critical sediment yield areas are unnecessarily restrictive or that they should be moved from under Provision E.3.c.(2)(b) to Provision E.3.d. The requirements are necessary to protect receiving waters from erosive flows caused by land development.</p> <p>As explained in the Fact Sheet to the Tentative Order, hydromodification, which is caused by both altered storm water flow and altered sediment flow regimes, is largely responsible for degradation of creeks, streams, and associated habitats in the San Diego Region. In an ongoing study by the Stormwater Monitoring Coalition to assess the health of streams throughout Southern California, researchers found that three of the four highest risk stressors to creeks (percent sands and fines present, channel alteration, and riparian disturbance) were related to physical habitat (<i>Assessing the Health of Southern California Streams, Stormwater Monitoring Coalition, Fact Sheet</i>). Researchers studying flood frequencies in Riverside County have found that increases in watershed imperviousness of only 9-22 percent can result in increases in peak flow rates for the two-year storm event of up to 100 percent (Schueler and Holland, 2000. <i>Storm Water Strategies for Arid and Semi-Arid Watersheds</i>, (Article 66). <i>The Practice of Watershed Protection</i>). Such changes in runoff have significant impacts on channel morphology, and given the current state of science the San Diego Water Board has included these requirements to reduce these potential impacts to receiving waters that may be caused by development projects.</p> <p>Placement of impervious surfaces as a result of urbanization is largely responsible for erosional impacts to streams because placement of impervious surfaces encapsulates “good” sediment (such as sand, gravel, rocks and cobbles) that would normally replenish creek beds and banks to help stabilize them. For this reason, the Tentative Order requires Priority Development Projects to avoid critical sediment yield areas, as defined by the</p>

<b>E3c2-1 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>	
	<p>Copermittees, or implement measures to allow coarse sediment to be discharged to receiving waters, such that there is no net impact to the receiving water. Such measures are designed to protect receiving waters and avoid impacts experienced as a result of past land development practices.</p> <p>The San Diego Water Board recognizes that implementation of new requirements is challenging, and is supportive of the Copermittees' efforts to develop guidance for land developers in meeting this requirement. Until this guidance is widely available, Copermittees and land developers should recognize that strict avoidance of critical sediment yield areas is not mandated and that compliance may be achieved by other methods, provided that the stream experiences "no net impact."</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>

November 4, 2015 / Revised November 10, 2015

<b>E3c2-2 PROVISION E.3.c.(2): Hydromodification Management BMP Requirements</b>		
	<p><b>COMMENT:</b> <i>Request for interim timeframe exemptions for hydromodification management BMP requirements to be granted outright without any additional study or consideration.</i></p> <p>CICWQ asserts that the Tentative Order is eliminating exemptions for hydromodification control, even when stormwater runoff is conveyed in the MS4 system to significantly hardened or engineered channels. CICWQ requested that the San Diego Water Board revise the Tentative Order to make the interim timeframe exemptions under Provision E.3.c.(2)(e) part of the exemptions under Provision E.3.c.(2)(d) without any additional study or consideration.</p>	<p>Construction Industry Coalition on Water Quality (CICWQ)</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the interim timeframe exemptions for hydromodification management BMP requirements should be granted outright without any additional study or consideration.</p> <p>The commenter correctly deduced that the driver behind the requirement to use the pre-development performance standard is the sustainability of geomorphically stable channels and the ability to return urbanized streams to a more natural state. The requirement to use pre-development runoff conditions as the performance standard is needed because using a hydrology baseline that approximates that of an undeveloped, natural watershed is the only way to facilitate the return of more natural hydrological conditions to already built-out watersheds, which in turn supports conditions for rehabilitating degraded or channelized stream segments.</p> <p>Contrary to what the commenter asserts, the Tentative Order does not require Copermittees to remove concrete from channels that are engineered to relieve flooding and protect life and property. The Tentative Order provides exemptions for Priority Development Projects that discharge to receiving waters where there is little threat of erosion, and subsequently implementing BMPs on-site would do little to protect the beneficial uses of such receiving waters. The commenter correctly states that the exemption for engineered channels is temporary. However, the commenter should note that there is a high likelihood that exemptions for engineered channels can become accepted as applicable for a Watershed Management Area. The Tentative Order allows for the Copermittees to recommend exemptions based on completion of an optional Watershed Management Area Analysis pursuant to Provision B.3.b.(4). As part of this effort, the Copermittees would identify, for example, areas of existing development in the watershed suitable for retrofitting, and areas suitable for stream rehabilitation. The Copermittees would also identify areas suitable for exemptions for hydromodification management, such as engineered channels that are needed for the protection of life and property. The interim</p>

<b>E3d-1 PROVISION E.3.d: BMP Design Manual Update</b>		
	<p><b>COMMENT:</b> <i>Request for additional time for San Diego County Copermittees to update and implement their BMP Design Manuals.</i></p> <p>The San Diego County Copermittees and the County of San Diego requested revisions to Provision E.3.d which would grant Copermittees up to 180 days to incorporate corrections to the definition of Priority Development Projects under Provision E.3.b.(1) and begin implementing their BMP Design Manuals.</p>	<p>San Diego County Copermittees County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that more time is needed to update and implement the BMP Design Manuals. In a letter dated May 29, 2015, the San Diego Water Board forewarned the San Diego County Copermittees that changes to the Priority Development Project categories were necessary in order to clearly reflect the intended definitions. At that time, the San Diego Water Board provided the language that is now proposed in the Tentative Order.</p> <p>The Copermittees have had ample opportunity to initiate and complete their local adoption processes in order to meet the BMP Design Manual implementation date. For this reason, more time is not necessary and a delay in BMP Design Manual implementation is not warranted. However, the San Diego Water Board will use Provision F.2.b.(4) to grant the Copermittees an extra 90 days beyond the original BMP Design Manual implementation date of December 24, 2015 to complete the update and begin implementation of the BMP Design Manual. Please also see response to comment F2b-1.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>E3d-2 PROVISION E.3.d: BMP Design Manual Update</b>		
	<p><b>COMMENT:</b> <i>Request for revisions to clarify the effective date of the BMP Design Manual is the same as the implementation date.</i></p> <p>The San Diego County Copermittees, the City of San Diego, and the County of San Diego requested revisions to Provision E.3.d to include language that clarifies the effective date of the BMP Design Manual is the same as when the BMP Design Manual begins implementation.</p>	<p>San Diego County Copermittees City of San Diego County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the proposed modification would clarify the San Diego Water Board's intention. Provision E.3.d has been modified as follows:</p> <ul style="list-style-type: none"> <li>a. Each Copermittee must update its BMP Design Manual pursuant to Provision F.2.b. Until the Copermittee has updated its BMP Design Manual pursuant to Provision F.2.b.(1), the Copermittee must continue implementing its current BMP Design Manual. The Copermittee must implement the updated BMP Design Manual within 180 days following completion of the update pursuant to Provision F.2.b.(1), unless directed otherwise by the San Diego Water Board Executive Officer. <u>The date the BMP Design Manual is implemented is the "effective date" of the BMP Design Manual.</u></li> </ul>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>E3e1-1 PROVISION E.3.e.(1): Structural BMP Approval and Verification Process</b>	
<p><b>COMMENT:</b> <i>Requests for revisions to the proposed language to define projects with prior lawful approval under Provision E.3.e.(1)(a).</i></p> <p>The City of San Diego requested a revision to the proposed language to define projects with prior lawful approval to also include projects that have received development approvals.</p> <p>San Diego Coastkeeper and Coastal Environmental Rights Foundation requested revisions that would allow a Priority Development Project to proceed under previous land development requirements only if the Copermittee demonstrates that, among other required conditions, construction activities on the Priority Development Project commenced prior to the effective date of the new BMP Design Manual and that all approvals and permits necessary to complete the implementation of the initially approved design also be obtained prior to the effective date of the new BMP Design Manual.</p>	<p>City of San Diego San Diego Coastkeeper and Coastal Environmental Rights Foundation</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that any changes are needed to the proposed language in Provision E.3.e.(1)(a). Specifically, reliance on issuance of a development approval alone is not consistent with the San Diego Water Board’s goal of requiring most new Priority Development Projects to be subject to the requirements in the new BMP Design Manual unless limited conditions are met. Nor is it consistent with the <i>Avco</i> line of cases, which requires commencement of construction and substantial reliance on the permit as the determining factors for grandfathering projects under previous development requirements. Reliance on issuance of a development approval alone may also result in many fewer Priority Development Projects implementing projects based on the new BMP Design Manual required in Order No. R9-2013-0001 as amended.</p> <p>With regard to the Environmental Groups’ comment, the San Diego Water Board believes it is appropriate for the Copermittees to have the ability to allow a Priority Development Project meeting all other required conditions in Provision E.3.e.(1)(a) to proceed under previous land use development requirements if the Copermittee demonstrates that construction activities have commenced before, or within 180 days after, the effective date of the new BMP Design Manual. The Board believes it is appropriate to include a grace period of 180 days after the effective date of the BMP Design Manual in order to provide certainty of requirements for projects in process, and allow for scheduling of construction activities under optimal conditions, such as outside of nesting season, or during the dry season, when impacts from storm water runoff are minimized. And, as long as development projects complete construction of all phases in substantial conformity with the approved design, which includes storm water pollutant control and hydromodification management BMPs approved by the</p>

E5c-1	<b>PROVISION E.5.c: Existing Development Inspections</b>	
	<p><b>COMMENT:</b> <i>Request to include an optional third-party certification program into the existing development inspection provisions.</i></p> <p>Section F.3.b.(4)(c) of Order No. R9-2010-0016 allowed the Riverside County Copermittees the option to propose a third-party certification program for commercial and industrial inspection programs, subject to San Diego Water Board Executive Officer acceptance. The Riverside County Copermittees noted that a similar provision does not exist in the Tentative Order, and requested inclusion of this option in the Regional MS4 Permit.</p>	Riverside County Copermittees
	<p><b>RESPONSE:</b> At this time the San Diego Water Board does not support the inclusion of a third-party certification program as part of the existing development inspection provisions.</p> <p>The San Diego Water Board has conducted audits of several Copermittees' existing development and post construction BMP inspection programs in the San Diego Region that utilize self certifications or third-party certifications to verify the proper operation and maintenance of post construction BMPs. These audits have found such programs have not adequately confirmed that BMPs are being properly operated and maintained so they are effective at removing pollutants in storm water discharges from commercial and industrial sites to the MEP.</p> <p>However, the Regional MS4 Permit provides the Copermittees significant flexibility in the implementation of their existing development inspection programs, and does not preclude the use of third-party certification programs during years where inspections are not necessarily required. If the Copermittees can develop a third-party certification program that can demonstrate such a program can be implemented in a way that will ensure BMPs are being properly operated and maintained so they are effective at removing pollutants in storm water discharges from commercial and industrial sites to the MEP, the San Diego Water Board may reconsider including such an option into the Regional MS4 Permit during the renewal process anticipated to begin in early 2018.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>

<b>F2b-1 PROVISION F.2.b: BMP Design Manual Updates</b>		
	<p><b>COMMENT:</b> <i>Request for revisions to clarify the effective date of the BMP Design Manual.</i></p> <p>The San Diego County Copermittees, the City of San Diego, and the County of San Diego requested revisions to Provision F.2.b.(4) to include language that clarifies the effective date of the BMP Design Manual if an update to the BMP Design Manual is required.</p>	<p>San Diego County Copermittees City of San Diego County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that the proposed modification to the text in Provision F.2.b.(4) would clarify that the BMP Design Manual effective date is no later than 90 days after the San Diego Water Board adopts amendments to Provisions E.3.a-d. Provision F.2.b.(4) will be modified as follows:</p> <p style="margin-left: 40px;">(4) If the San Diego Water Board amends Provisions E.3.a-d during the permit term but after the Copermittee has completed the update pursuant to Provision F.2.b.(1), the Copermittee must revise its BMP Design Manual to incorporate the amended Provision E.3.a-d requirements as soon as possible but not later than 90 days after the date the San Diego Water Board adopts the amendments to Provisions E.3.a-d, unless otherwise directed by the San Diego Water Board Executive Officer. <u>Under these circumstances, the effective date of the BMP Design Manual is not later than 90 days after the date the San Diego Water Board adopts the amendments to Provisions E.3.a-d, unless otherwise directed by the San Diego Water Board Executive Officer.</u></p>

<b>AttC-1 ATTACHMENT C: Acronyms, Abbreviations, and Definitions</b>	
<p><b>COMMENT:</b> <i>Request for revisions to definition of Construction Activities.</i></p> <p>The City of Escondido requested revisions to the definition of Construction Activities in Attachment C to the Regional MS4 Permit. The commenter requested the removal of the term “phase” from the definition because the term introduces artificial phases during a construction project that cannot be readily tracked.</p>	<p>City of Escondido</p>
<p><b>RESPONSE:</b> The San Diego Water Board agrees that the revisions are appropriate.</p> <p>The definition of Construction Activities in Attachment C has been revised as follows:</p> <p><b>Construction Activities</b> – Actions implemented during construction of development or redevelopment projects during the Preliminary <u>Tasks Phase</u> (including rough grading and/or disking, clearing and grubbing operations, or any soil disturbance prior to mass grading), Grading or Land Development <u>Phase</u> (including topography and slope reconfiguration, alluvium removals, canyon cleanouts, rock undercuts, keyway excavations, land form grading, and stockpiling of select material for capping operations), Streets and Utility <u>Installation Phase</u> (including excavation and street paving, lot grading, curbs, gutters and sidewalks, public utilities, public water facilities including fire hydrants, public sanitary sewer systems, storm sewer systems and/or other drainage improvements), or Vertical Construction <u>Phase</u> (including the build out of structures from foundations to roofing, including rough landscaping).</p>

November 4, 2015 / Revised November 10, 2015

AttC-2 ATTACHMENT C: Acronyms, Abbreviations, and Definitions	
	<p><b>COMMENT:</b> <i>Request for revisions to definition of Redevelopment.</i></p> <p>The City of San Diego requested revisions to the definition of Redevelopment in Attachment C to the Regional MS4 Permit to improve the clarity of the definition.</p>
	<p align="right">City of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board agrees that revisions would provide additional clarity in the definition of Redevelopment.</p> <p>The definition of Redevelopment in Attachment C has been revised as follows:</p> <p><b>Redevelopment</b> – The creation and/or replacement of impervious surface on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, <del>and creation or addition of impervious surfaces.</del> Replacement of impervious surfaces includes any activity <del>that is not part of a routine maintenance activity</del> where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include <u>routine maintenance activities, such as</u> trenching and resurfacing associated with utility work; <u>pavement grinding</u>; resurfacing existing roadways; <del>new sidewalks construction</del>, pedestrian ramps, or bike lanes on existing roads; and routine replacement of damaged pavement, such as pothole repair.</p>

November 4, 2015 / Revised November 10, 2015

<b>AttE-1 ATTACHMENT E: Specific Provisions for Total Maximum Daily Loads</b>	
	<p><b>COMMENT:</b> <i>Request for revisions to TMDL requirements in Attachment E to the Regional MS4 Permit to allow independent jurisdictional compliance with TMDLs.</i></p> <p>The City of San Diego requested revisions to the TMDL requirements in Attachment E to the Regional MS4 Permit that would allow independent jurisdictional compliance instead of requiring all the Copermittees named as responsible to comply with the TMDL requirements.</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that modifications are needed to the language pertaining to TMDL compliance determination. The commenter correctly asserts that the intent of the language, and in fact, the intent of the Water Quality Improvement Plan concept, is that the Copermittees develop the Water Quality Improvement Plans collectively and evaluate water quality improvement strategies on a watershed basis. The San Diego Water Board recognizes that the Copermittees have no authority over other Copermittees to compel TMDL compliance; therefore, the Tentative Order has multiple compliance determination pathways available to each Copermittee to achieve compliance. The final compliance determination pathways are presented in Attachment E Specific (TMDL) Provisions 1.b.(3), 2.b.(3), 3.b.(3), 4.b.(3), 5.b.(3), 6.b.(3), and 7.b.(3). There are several compliance determination pathways that allow a Copermittee to demonstrate independent jurisdictional compliance with water quality based effluent limitations (WQBELs).</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>

November 4, 2015 / Revised November 10, 2015

<b>AttE6-1 ATTACHMENT E.6: Beaches and Creeks Bacteria TMDLs</b>		
	<p><b>COMMENT:</b> <i>Requests for revisions to clarify that water bodies de-listed from the 303(d) List are not subject to the Beaches and Creeks TMDL requirements.</i></p> <p>The Orange County Copermittees requested revisions to the Beaches and Creeks Bacteria TMDLs requirements in Attachment E to state that specific water bodies or beach segments included in Table 6.0 that have been delisted from the 2008 Clean Water Act Section 303(d) List of Water Quality Impaired Segments are not subject to any further action as long as monitoring data continues to support compliance with water quality standards.</p>	<p>Orange County Copermittees</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that any revisions are necessary or appropriate. The Orange County Copermittees correctly state that the water bodies listed in Table 6.0 must be in compliance with the final TMDL compliance requirements (and WQBELs). If a water body or beach segment has been de-listed, then the MS4 discharge WQBELs and/or receiving water WQBELs should already be achieved, but the BMP WQBELs and the monitoring and assessment requirements are still required to be implemented to maintain the achievement of the MS4 discharge WQBELs and/or receiving water WQBELs in the de-listed water body or beach segment.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>

November 4, 2015 / Revised November 10, 2015

<b>AttE6-2 ATTACHMENT E.6: Beaches and Creeks Bacteria TMDLs</b>	
	<p><b>COMMENT:</b> <i>Request for revisions to compliance dates for the Beaches and Creeks Bacteria TMDLs.</i></p> <p>The San Diego County Copermittees, the City of San Diego, and the County of San Diego requested that the compliance dates proposed to be added to Tables 6.1 and 6.4 be removed. The commenters assert that the compliance dates proposed to be added are inconsistent with the requirements of the Beaches and Creeks Bacteria TMDLs. The commenters also assert that the Beaches and Creeks Bacteria TMDLs do not require the development of a Bacteria Load Reduction Plan (BLRP) or Comprehensive Load Reduction Plan (CLRP) for segments of beaches or creeks de-listed from the Clean Water Act Section 303(d) List of Water Quality Limited Segments.</p>
	<p>San Diego County Copermittees City of San Diego County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the addition of the compliance dates is inconsistent with the Beaches and Creeks Bacteria TMDLs requirements. The San Diego Water Board also disagrees that segments of beaches or creeks de-listed from the Clean Water Act Section 303(d) List of Water Quality Limited Segments are not required to develop a BLRP or CLRP.</p> <p>The compliance date for the Beaches and Creeks Bacteria TMDLs is specified on page 7-107 of the Basin Plan as follows:</p> <p><i>“Full implementation of the TMDLs for indicator bacteria shall be completed as soon as possible, but no later than 10 years from the effective date for both the dry weather and wet weather TMDLs, unless an alternative compliance schedule is approved as part of a Comprehensive Load Reduction Plan, as described in the following section. The effective date of these TMDLs is April 4, 2011.</i></p> <p><i>The San Diego Water Board will require the Phase I MS4s to submit Bacteria Load Reduction Plan (BLRPs) outlining the proposed BMP program that will be capable of achieving the necessary load reduction required to attain the bacteria TMDLs in the receiving water, acceptable to the Regional Board within 18 months after the effective date of these TMDLs....”</i></p> <p>Tables 7-53 and 7-54 on page 7-108 in Chapter 7 of the Basin Plan present the compliance schedules that apply if the Copermittees develop a BLRP. Page 7-109 of the Basin Plan describes the potential for the Copermittees to develop CLRPs. If the Copermittees choose to develop a CLRP, the compliance date and schedule for the Beaches and Creeks Bacteria TMDLs is specified on page 7-109 of the Basin Plan in Table 7-55 and as follows:</p>

## RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100

November 4, 2015 / Revised November 10, 2015

### AttE6-2 ATTACHMENT E.6: Beaches and Creeks Bacteria TMDLs

*“...the dischargers may develop and submit a CLRP for all constituents of concern in lieu of the BLRP, and to propose an appropriately tailored alternative compliance schedule. Proposed alternative compliance schedules tailored under this provision may not extend beyond 10 years for the dry weather bacteria TMDLs and 20 years for the wet weather bacteria TMDLs from the effective date ....”*

Tables 6.1 and 6.4 were revised in the Tentative Order to be consistent with the compliance schedules of Tables 7-53, 7-54, and 7-55 of the Beaches and Creeks Bacteria TMDLs in the Basin Plan. Therefore, the addition of the compliance dates proposed to be added to Tables 6.1 and 6.4 are consistent with the requirements of the Beaches and Creeks Bacteria TMDLs.

As for the assertion that the Beaches and Creeks Bacteria TMDLs do not require BLRPs or CLRPs for segments of beaches or creeks de-listed from the Clean Water Act Section 303(d) List of Water Quality Limited Segments, the commenters appear to be citing text from the TMDL Compliance Schedule section instead of the TMDL Implementation Plan section of the Beaches and Creeks Bacteria TMDLs. It is true that on page 7-107 of the Basin Plan, includes a statement that:

*“For watersheds in Table 7-52 where there are no longer any impairments listed on the 2008 303(d) List, the Phase I MS4s and Caltrans are not required to submit a BLRP or CLRP within 18 months of the effective date of the TMDLs.”*

However, this statement is under the TMDL Compliance Schedule requirements and was only included to indicate that the San Diego Water Board would not require a BLRP or CLRP to be submitted within 18 months of the effective date. It was not intended to mean that a BLRP or CLRP would never be required. If the commenters look under the TMDL Implementation Plan requirements for Phase I MS4s, which begins on page 7-85 of the Basin Plan, there is no statement that a BLRP or CLRP will not be required for “watersheds ... where there are no longer any impairments listed on the 2008 303(d) List.” The TMDL Implementation Plan for Phase I MS4 does, however, state the following on page 7-86 of the Basin Plan:

*“The WQBELs will likely consist of receiving water limitations (based on the numeric targets) and require the implementation of a BMP program to achieve the TMDLs in receiving waters. The Phase I MS4s will be required to submit Bacteria Load Reduction Plans (BLRPs) or Comprehensive Load Reduction Plans (CLRPs) outlining a proposed BMP program capable of achieving the necessary load reductions required to attain the TMDLs in receiving waters, acceptable to the San Diego Water, within 18 months after the effective date of these TMDLs. The San Diego Water Board will require the BLRPs or CLRPs to be developed on a watershed or region wide scale. The BLRPs or CLRPs should be developed and*

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

**AttE6-2 ATTACHMENT E.6: Beaches and Creeks Bacteria TMDLs**

*incorporated as part of the Watershed Runoff Management Programs required under the Phase I MS4 NPDES requirements....”*

The TMDL Implementation Plan requirements clearly state the BLRPs or CLRPs are required and do not have any exceptions. The TMDL Compliance Schedule requirements do allow an exception from submitting a BLRP or CLRP within 18 months of the effective date, but do not state that a BLRP or CLRP will never be required. Specific Provision 6.b.(2)(c)(i) is consistent with the TMDL Implementation Plan requirements in the Basin Plan by requiring a CLRP to be on a watershed scale and incorporated into the Water Quality Improvement Plans (i.e. Watershed Runoff Management Program), which includes a BMP implementation program capable of achieving the necessary load reductions required to attain the TMDLs in receiving waters for all the applicable Watershed Management Areas in Table 6.0. Table 6.0 lists all the beaches and areas included in the Beaches and Creeks Bacteria TMDLs from the Basin Plan. Please also see the response to comment AttE6-1.

However, the San Diego Water Board recognizes that Specific Provision 6.b.(2)(c)(i) only allows for the Copermitees to incorporate CLRPs into the Water Quality Improvement Plans. Therefore, to be consistent with the Beaches and Creeks Bacteria TMDLs, which allows for BLRPs to be developed and submitted, Specific Provision 6.b.(2)(c)(i) has been revised as follows:

- (i) The Water Quality Improvement Plans for the applicable Watershed Management Areas in Table 6.0 must incorporate the Bacteria Load Reduction Plans (BLRPs) or Comprehensive Load Reduction Plans (CLRPs) required to be developed pursuant to Resolution No. R9-2010-0001.

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>AttE6-3 ATTACHMENT E.6: Beaches and Creeks Bacteria TMDLs</b>	
<p><b>COMMENT:</b> <i>Request for revisions to clarify that compliance with receiving water limitations in the Beaches and Creek Bacteria TMDLs will be assessed at the compliance points identified in the TMDL Monitoring Plan.</i></p> <p>The County of San Diego requested revisions to the Beaches and Creeks Bacteria TMDLs requirements to specify that compliance with receiving water limitations can be determined at the compliance points identified in the TMDL Monitoring Plans that are included in the Water Quality Improvement Plans.</p>	<p>County of San Diego</p>
<p><b>RESPONSE:</b> The San Diego Water Board disagrees that the revision is necessary. The Beaches and Creeks Bacteria TMDLs interim and final compliance determination requirements includes a pathway that allows the Copermittees to demonstrate that there are no exceedances of the final (or interim) receiving water limitations in the receiving water <i>“at, or downstream of the Responsible Copermittee’s MS4 outfalls.”</i></p> <p>The Specific Monitoring and Assessment Requirements of the Beaches and Creeks Bacteria TMDLs specifies the locations where monitoring is required to determine compliance. For beaches, the required monitoring locations are <i>“at, or downstream of the Responsible Copermittee’s MS4 outfalls.”</i> For creeks, the monitoring locations are required to be at or near the mouth and one or more locations upstream of the mouth, both of which should be <i>“at, or downstream of the Responsible Copermittee’s MS4 outfalls.”</i> If the receiving waters are not exceeding the final (or interim) receiving water limitations expressed as exceedance frequencies at the required receiving water monitoring locations, then the Copermittees have demonstrated compliance with the receiving water WQBELs <i>“at, or downstream of the Responsible Copermittee’s MS4 outfalls.”</i> If, however, there are exceedances at a receiving water monitoring location, then the upstream Copermittees will need to demonstrate compliance with another compliance determination pathway.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>	

**RESPONSES TO COMMENTS RECEIVED ON TENTATIVE ORDER NO. R9-2015-0100**

November 4, 2015 / Revised November 10, 2015

<b>AttE7-1 ATTACHMENT E.7: Los Penasquitos Lagoon Sediment TMDL</b>		
	<p><b>COMMENT:</b> <i>Request for revisions to incorporate a land use-based compliance pathway into the Los Penasquitos Lagoon Sediment TMDL.</i></p> <p>The County of San Diego requested revisions to the Total Maximum Daily Load for Sediment in Los Penasquitos Lagoon (Los Penasquitos Sediment TMDL) in Attachment E to incorporate a land use-based compliance pathway.</p>	<p>County of San Diego</p>
	<p><b>RESPONSE:</b> The San Diego Water Board disagrees that changes are needed to accommodate a land use-based compliance pathway for the Los Penasquitos Lagoon Sediment TMDL.</p> <p>The commenter states that if the land use has not changed significantly from the 1970s baseline, the timeframe at which water quality standards in the lagoon were met, then the sediment loads from the Copermittee’s MS4s are expected to be approximately the same as the baseline levels and within the amount allowed in the wasteload allocation. The San Diego Water Board agrees that under this scenario in which land use has not changed significantly, the sediment levels would be approximately the same as baseline levels. If this is confirmed through water quality monitoring, then the Copermittee has likely met its portion of the final effluent limit described in Provision 7.b.(2)(b) and has achieved compliance. For this reason, changes to the TMDL compliance pathways are not needed or warranted.</p> <p>No changes were made to the Tentative Order as a result of this comment.</p>

## Executive Summary

The Orange County Stormwater Program (the Program) is a cooperative municipal regulatory compliance initiative focused on the management of urban and stormwater runoff for the protection and enhancement of Orange County's creeks, rivers, streams, and coastal waters. The primary objective of the Program is to fulfill the commitment of the County of Orange, the Orange County Flood Control District and the cities of Orange County (collectively, the "Permittees"), to develop and implement a program that satisfies the requirements of area-wide Municipal Separate Storm Sewer System (MS4) National Pollutant Discharge Elimination System (NPDES) Permits.

The purpose of this document is to comply with the requirement for submittal of a "Report of Waste Discharge" (ROWD). This report discusses the Permittees' Fourth Term MS4 Permit compliance activities and accomplishments over the period June, 2009 to June, 2013. It identifies all of the activities, research and pilot studies the Permittees propose to undertake during the next permit term based upon a consideration of the effectiveness of the Program and need for additional pollutant control initiatives. The report requests coverage under a Fifth Term Permit that is specific to south Orange County.

The Permittees also consider a series of performance metrics to further enable the effectiveness of the Program's elements to be evaluated. This assessment of program effectiveness, comprising consideration of both the state of the aquatic environment and program performance metrics, is the basis for identifying the specific program activities and pilot studies the Permittees propose to undertake during the next permit

term. These activities, which are identified as recommendations for program continuation, program enhancements, or program modifications, together with the Fifth Term MS4 Permit compliance milestones, are noted in each section of the report and are summarized in Section 7.0. The deliberate emphasis on program enhancement, rather than policy and programmatic change, is emblematic of a mature municipal stormwater program that is protective of water quality and is achieving meaningful environmental outcomes.

### *State of the Environment – Key Findings*

This report includes an analysis of the state of water quality in Orange County and explores trends for four primary water quality issues on which the Permittees intend to focus during the Fifth Term. Key findings and trends are discussed for bacteria, total dissolved solids, nutrients and toxicity.

#### Bacteria

- The County's beaches support concentrated recreational activities for both residents and visitors and are important contributors to the local and regional economy.
- Concern about swimming safety is consistently high and epidemiology studies in dry weather show that some illness (for example, gastroenteritis) is associated with full immersion swimming in contaminated water.
- Contamination is very low during dry weather and has dropped steadily over time; beach report card grades are consistently high.

- Sources of contamination have been reduced through targeted actions; remaining issues during dry weather are localized and may have natural components.
- Contamination is more widespread during wet weather; wet weather flows are larger and qualitatively different.
- Health risks associated with wet weather flows are uncertain, but ongoing research and development focuses on improved monitoring tools and wet weather epidemiology studies.
- Progress on managing dry weather contamination demonstrates the efficacy of targeted BMPs appropriate to specific situations that may include natural sources (e.g., birds).

#### Dissolved Solids

- Persistent and widespread exceedances of total dissolved solids occur in channels and at discharge outfalls.
- Dissolved solids are a challenging to address because a large portion of these elevated levels derive from natural sources in regional groundwater.
- Understanding local geology is key to understanding sources of dissolved solids and the pathways they travel in the watershed.
- While the flood control system provides one pathway for dissolved solids in groundwater to reach the surface, other natural pathways (such as artesian springs) exist and there is evidence of historically elevated dissolved solids levels in surface water in the region.

#### Nutrients

- Nutrient levels in South Orange County streams and channels are frequently above commonly used thresholds that suggest increased likelihood of nutrient impacts. In contrast, there are much less frequent occurrences of impacts, such as macroalgal overgrowth, due to excessive nutrient levels.
- Nutrient issues are not limited to the urban portion of the County; regional monitoring data show nutrient enrichment and impacts such as increased macroalgal cover and/or lower dissolved oxygen in streams and estuaries in undeveloped regions.
- The major point sources of nutrients have been controlled. Therefore, nonpoint and diffuse sources such as leaching from upland soils and intrusions from shallow groundwater are increasingly important.
- Nutrients can be readily transported in and out of various reservoirs (e.g., sediments, groundwater) and undergo complex biological transformation and cycling. This makes traditional pollutant control strategies less effective for nutrients.

Improved management strategies may contribute to further progress, particularly in streams and channels, by accounting for site-specific conditions, promoting Low Impact Development, and accounting for broader regional sources.

#### Toxicity

- Toxicity in freshwater channels in all conditions (aquatic, sediment, wet and dry weather) occurs at low levels and is

sporadic, occurring at different locations at different times and varying unpredictably across test species.

- Aquatic toxicity in dry weather occurs in open (undeveloped) areas at levels equivalent to those in urban areas; suggesting that dry weather toxicity is not driven predominantly by urban pollutants.
- There are no apparent trends in toxicity over time.
- Metals, except for some instances of elevated copper, are at low levels and do not appear to contribute to aquatic toxicity in freshwater.
- The primary source of toxicity appears to be pesticides, with evidence that pyrethroids contribute to sediment toxicity.
- Use of organophosphate pesticides has declined virtually to zero but use of pyrethroid pesticides has increased and exceedances of thresholds for pyrethroid pesticides are high.
- Reported pesticide use in the County has declined from just over 2 million pounds a year in 1998 to just under 1 million pounds in 2011, due primarily to reduced use of indoor fumigants.
- There is a large data gap in our knowledge of retail pesticide sales and use.
- Pesticide use (which is regulated directly at the state and federal levels) presents a moving target for management because of the continued introduction of new products; the most effective management strategies are to continue to reduce dry weather runoff/flows and support education and outreach efforts to reduce pesticide use and runoff.

### *Controlling Pollutant Sources - Countywide/Jurisdictional Programs: Accomplishments*

The management of sources of pollution from diffuse urban areas involves the strategic application of Best Management Practices (BMPs) to activities and drainage systems within the urban environment. The purpose of BMPs is to protect water quality by reducing pollutant loads and concentrations and by reducing discharges (volumetric flows and flow rates) causing stream channel erosion. Municipal efforts to prioritize, inspect and manage existing and new development, educate the public to encourage adoption of behaviors protective of water quality and to respond to illegal discharges or illicit connections are discussed in this section.

- The Model Municipal Activities Program ensures that BMPs are implemented and maintained at over 1,700 municipal facilities.
- The Model Integrated Pest Management Program ensures municipal conformance with an Integrated Pest Management Policy developed in partnership with University of California Cooperative Extension. Implementation of the policy is resulting in reductions in municipal fertilizer and pesticide use.
- Public awareness surveys conducted approximately every three years demonstrate increased levels of awareness regarding stormwater concerns and several positive behavior changes regarding car washing, use of landscape management products, and pet waste.

- The Program achieved over 155 million impressions through various forms of paid media, and over 5.5 million impressions at outreach events from 2008 to 2013.
- The Permittees initiated a strategic behavior-specific outreach program in 2012.
- Reductions in outdoor water use, retrofitting the residential environment to reduce outdoor water demand and elimination of runoff from irrigation are the foci of action-based outreach efforts initiated in 2013.
- The Permittees developed a significantly revised Model Water Quality Management Plan (WQMP) and Technical Guidance Document (TGD) to implement new requirements for the implementation of Low Impact Development (LID) BMPs.
- The Permittees implemented the new Model WQMP and TGD for all priority projects in north Orange County starting on August 17, 2011, and in south Orange County starting on December 20, 2013.
- During the permit term (through the FY2012-13 reporting period) 1,369 WQMPs for public and private projects were approved across all of Orange County for a total of 18,749 acres of development now that are now subject to Project WQMPs.
- South Orange County was mapped and a geodatabase was developed that includes conveyance systems, infiltration constraints, land use, and soil types. The County is using the geodatabase to evaluate channel susceptibility to hydromodification, and opportunities and constraints for infiltration and treatment BMP implementation at various scales.
- The Construction Program maintained an inventory of up to 12,060 construction sites, prioritized these sites regarding their threat to water quality, and inspected them at the frequency specified by the permit. Non-compliant sites were educated and required to implement BMPs as required.
- The Industrial/Commercial Program inventoried 14,000 sites and conducted inspections of these sites at frequencies specified by the permit.
- A new Mobile Business Pilot Model Program was developed and implemented.
- Residential sources of pollutants were addressed through the Model Residential Program, which included development of new outreach materials and continued outreach to Common Interest Areas and Homeowner's Associations.
- The Permittees continued to aggressively detect and eliminate Illicit Discharges and Illegal Connections (ID/IC) through discharge monitoring, source investigation, and enforcement.
- A spill reporting hotline (1-877-89-SPILL) provides a resource for public spill and water pollution reporting, and an iPhone reporting application was developed. All reports were responded to and resolved.

- The *Model Investigative Guidance for Orange County Illegal Discharges and Illicit Connections Program* was updated for the Non-stormwater Action Levels (NALs) based monitoring program by inclusion of a new *San Diego Region Dry Weather Numeric Action Level (NAL) Source Identification Guide*.
- Essential elements of the Countywide Area Spill Control Program were completed and implemented.
- The NALs monitoring program was fully implemented.

*Controlling Pollutant Sources - Watershed Programs: Accomplishments*

In addition to countywide and jurisdictional programs, the Permittees participated in water quality planning on the watershed scale. These efforts have led to multi-jurisdictional solutions to problems that cut across programs and jurisdictional boundaries. While the focus of watershed planning in south Orange County is on specific pollutants of concern associated with urban stormwater, particularly TMDLs, this management approach is also supportive of broader objectives such as watershed habitat restoration, consistent with the Practical Vision, and integrated water resource management.

- Extensive watershed mapping of hydromodification susceptibility, infiltration feasibility and regional BMP opportunity sites for the entire south Orange County area has been completed.
- Watershed Workplans for all six San Diego Region

Watersheds were developed and implemented. These workplans describe the Watershed Permittees' collective watershed strategies to assess, prioritize and address water quality challenges within each watershed.

- Comprehensive Load Reduction Plans (CLRPs) were developed for Aliso Creek, San Juan Creek and San Clemente Coastal Streams Watersheds. These watershed CLRPs were developed to address bacteria pollutants and other watershed 303(d) listed constituents.
- Dana Point harbor was delisted for Indicator Bacteria and 17 shoreline stations were delisted for Enterococcus, Fecal Coliform and Total Coliform.
- Baby Beach TMDL dry weather load reductions have been achieved for total coliform and the 50% load reduction milestones for fecal coliform and Enterococcus have also been achieved. Wet weather data also supports the conclusion that TMDL load reductions have been achieved for total coliform and fecal coliform. Further reductions are needed for Enterococcus.

*Plan Development*

The Permittees have developed a strategic approach to stormwater management that is a cyclical process of measurement, analysis and program improvement.

- The Permittees have been implementing a strategic management approach that includes model programs specified in the permit and the DAMP, and watershed programs focused on specific water bodies and pollutants.

- The Program employs an iterative, adaptive management approach that includes monitoring, evaluation, program revision, BMP implementation adjustment/enhancement, and continued monitoring.
- The Program conducts annual and permit term (i.e. ROWD) using the guidance from CASQA approach.
- The ROWD recommends an evolution to a more holistic watershed management approach to support integrated water resource management and the optimization of watershed ecosystem services.

*Program Management and Financing: Accomplishments*

Program management includes maintaining a committee structure, participation in regional and statewide groups and tracking costs for compliance.

- The Program continued to operate with the County of Orange as the Principal Permittee during the permit term.
- The Program operated under a four-tier committee structure with participation at all levels by Permittee staff and management.
- An Implementation Agreement establishes responsibilities and provides a funding mechanism for cooperative activities. Funding has been sufficient to complete common program activities.
- The Program benefitted strongly from cooperation and representation among several regional and statewide

groups including the California Stormwater Quality Association and the Southern California Coastal Water Research Project.

- Coordination with Orange County Transportation Authority (OCTA) on development of a Structural BMP Prioritization and Analysis Tool (SBPAT) to support disbursement of Measure M2 funding for water quality projects. SBPAT is a GIS-based decision support tool that is being used to identify and prioritize potential structural BMP retrofit projects throughout Orange County. To date Tier 1 funding of \$8.6 million has been awarded to 85 projects and Tier 2 funding of \$12.7 million has been awarded to 8 projects.

## 1.0 Introduction

### *The Story: Introduction*

- Established in 1990, the Orange County Stormwater Program (the Program) is a cooperative regulatory partnership among the cities of Orange County, the County of Orange and the Orange County Flood Control District (collectively the Permittees) who operate an interconnected municipal storm drain system. Discharges of stormwater and urban runoff from this system are authorized by National Pollutant Discharge Elimination System (NPDES) Municipal Stormwater Permits.
- The Program is focused on maintaining regulatory compliance of the Permittees with Clean Water Act mandates and mitigating the water quality impacts to streams, creeks and coastal waters that can arise from the imprint of urban development on the landscape.
- This Report of Waste Discharge (ROWD) constitutes the Permittees' application for a Fifth Term of NPDES Municipal Stormwater Permit that is specific to South Orange County and presents specific recommendations for the continuation and future development of the Program.

## 1.1 Overview

The Program is a cooperative regulatory partnership among the cities of Aliso Viejo, Dana Point, Laguna Beach, Laguna Hills, Laguna Niguel, Laguna Woods, Lake Forest, Mission Viejo, Rancho Santa Margarita, San Clemente, San Juan Capistrano, the County of Orange and the Orange County Flood Control District (collectively the Permittees - See **Attachment 1.1 - Primary Permittee Contacts**) who operate an interconnected municipal storm drain system which

discharges stormwater and urban runoff pursuant to National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System Permit (MS4 Permit). Clean Water Act Section 402(p) stipulates that MS4 permits must require the Permittees to:

- Effectively prohibit non-stormwater discharges to the storm drain system, and
- Implement controls to reduce the discharge of pollutants in stormwater to the Maximum Extent Practicable (MEP).

In anticipation of the expiration of the South Orange County MS4 Permit on December 16, 2014, this Report of Waste Discharge (ROWD):

- Describes the regulatory basis and environmental rationale for the Program and requests issuance of a Fifth Term Permit that is specific to south Orange County (see - "Introduction");
- Presents an assessment of the state of the environment for South Orange County with specific reference to swimming safety and aquatic ecosystem health and makes recommendations for the future allocation of monitoring resources (see - "State of the Environment");
- Evaluates jurisdictional pollutant control program effectiveness and makes recommendations for enhancing future program implementation (see - "Controlling Pollutant Sources: Jurisdictional Management Programs");
- Describes watershed-based planning in Orange County and makes recommendations for integrating Total Maximum Daily Load requirements into the Fifth Term Permit (see - "Controlling Pollutant Sources: Watershed Programs");
- Reviews the Program's jurisdictional and watershed planning processes and makes recommendations for a shift toward a "watershed management approach"

supportive of the restorative goals of the Clean Water Act (see – “Plan Development”);

- Reviews the Program’s management structure and describes current program financing including recommendations for future cost studies (see – “Program Management and Financing”); and
- Summarizes recommendations for the future direction of the Program with recommendations (see – “Summary and Conclusions”).

In combination these discussions are intended to fulfill the requirements for the content of the Report of Waste Discharge (see R9-2009-0002 – Section K.2.b), which must include:

- Proposed changes to the Permittees’ runoff management programs;
- Proposed changes to monitoring programs;
- Justification for proposed changes;
- Permittee and primary contact information; and
- Any other information for the reissuance of the Order.

## 1.2 Background

### Urban Runoff and Water Quality

The Program is focused on mitigating the adverse impacts to creeks, streams, estuaries and coastal waters that can arise from the imprint of urban development on the landscape. Urbanization creates rooftops, driveways, roads and parking lots (Schueler and Holland, 2000) use the term *imperviousness* as the unifying theme for understanding the adverse hydrologic impacts of urbanization), which (1) increase the flow rate and volume of rainfall runoff (compared to pre-development conditions) and (2) provide a source of pollutants that are flushed or leached by rainfall runoff into surface water systems. These pollutants can include

pathogens (disease causing bacteria, viruses and protozoan cysts from fecal sources), nutrients (bio-stimulatory substances such as nitrogen and phosphorus from fertilizers and organic wastes), sediments (sands and silts eroded from construction sites) and toxic organic and inorganic constituents (metals from automotive wear surfaces and pesticides applied to structures and landscapes).

*There are four interrelated but separable effects of land-use changes on the hydrology of an area: changes in peak flow characteristics, changes in total runoff, changes in quality of water, and changes in the hydrologic amenities*

Luna Leopold, 1968

For streams, creeks and coastal waters, urban runoff can result in:

- Water quality degradation from increased loadings of sediment, nutrients, metals, hydrocarbons, pesticides, and bacteria;
- Stream channel modification and habitat loss due to erosion or channel realignment for flood protection;
- Increased water temperatures resulting from solar energy absorption by urban surfaces and elimination of riparian shading; and
- Loss of groundwater recharge.

Water quality can be defined by both a set of concentrations, speciations, and physical partitions of organic and inorganic substances, and the composition and state of aquatic biota found in a waterbody (Meybeck and Helmer, 1992). Understanding these alternate definitions is highly significant to the ongoing development of the Program, the regulatory framework that impels it and the San Diego RWQCB’s “Practical Vision (SDRWQCB 2013).”

**Section 2.0** presents a comprehensive assessment of the “state of the environment” for South Orange County based on the results of long-term water quality monitoring and related special studies. However, from a regulatory compliance perspective the 303(d) has particular significance in setting the Program’s specific pollutant priorities.

### Regulatory History

The Program was initiated in 1990 as a cooperative local government response to a 1987 amendment to the federal Clean Water Act (CWA) that established National Pollutant Discharge System (NPDES) permit requirements for municipal operators of storm drain systems. This amendment was intended to specifically address the adverse water quality impacts of urban runoff. Permit application requirements were promulgated by US Environmental Protection Agency (EPA) in 1990 (40 CFR 122) and form the basis of the current program. There are two fundamental requirements:

- Effectively prohibit non-stormwater discharges to the storm drain system; and
- Implement controls to reduce the discharge of pollutants in stormwater to the Maximum Extent Practicable (MEP).

Orange County’s first NPDES Permits were issued in 1990 with renewals in 1996, 2002 and 2009. The Permits require that surface water quality protection be a key consideration in local governments’ oversight of construction and development, its regulation of industry and commerce, and in its construction, operation and maintenance of the public urban infrastructure.

There are separate NPDES Permits administered by the Santa Ana and San Diego Regional Water Quality Control Boards (RWQCBs). City and county jurisdictional boundaries rarely

coincide with watershed boundaries and in Orange County five jurisdictions within the Program (County of Orange, Orange County Flood Control District and the cities of Lake Forest, Laguna Hills and Laguna Woods) are subject to both permits. For these jurisdictions, the designation provision in Water Code Section 13228 is an option for seeking a single set of permit requirements in instances, such as Orange County, where there is a trend of increasing divergence in permitting approaches between the Regional Boards. The adoption of the Fifth Term Permit will be an opportunity for the two of the split jurisdictions (Cities of Lake Forest and Laguna Hills) who have requested coverage under a single permit to have resolution of this issue.

*"Maximum extent practicable (MEP) means to the maximum extent possible, taking into account equitable considerations of synergistic, additive, and competing factors, including but not limited to, gravity of the problem, fiscal feasibility, public health risks, societal concern, and social benefits."*

Elizabeth Miller Jennings, 1993

### Management Approach

The management of water pollution arising from landscapes involves the strategic application of Best Management Practices (BMPs). The purpose of BMPs is to protect the beneficial uses of water resources principally through the reduction of pollutant loads and concentrations.

The Program’s management approach is a process that involves:

1. Selecting and implementing BMPs to address site specific water quality problems based upon a consideration of

regulatory requirements and technical, institutional and economic feasibility;

2. Conducting comprehensive program effectiveness assessments to ensure that the BMPs are correctly implemented and to determine the effectiveness of BMPs in achieving water quality standards; and
3. Revising and/or enhancing BMPs if water quality standards are not being achieved.

This management approach is applied at two distinct scales: (1) activities conducted by the Permittees implementing jurisdictional programs based on the model programs in the Drainage Area Management Plan (DAMP); and (2) activities conducted by the Permittees and others participating in watershed programs addressing specific waterbody-pollutant combinations including the restorative goals of the Clean Water Act.

### Drainage Area Management Plan

The **Drainage Area Management Plan (DAMP)** is the principal policy and program guidance document for the *Program*. The DAMP describes the agreements, structures and programs that:

- Identify urban impacts on receiving waters; produce environmental quality information to direct management activities, including prioritization of pollutants to support the development of specific controls to address these problems; and determine if aquatic resources are being protected;
- Improve existing municipal pollution prevention and removal best management practices (BMPs) to further reduce the amount of pollutants entering the storm drain system;
- Educate the public about the issues of urban stormwater

and non-stormwater pollution and obtain their support in implementing pollution prevention BMPs;

- Ensure that all new development and significant redevelopment incorporates appropriate Site Design, Source Control, Treatment Control and LID BMPs to address specific water quality issues;
- Ensure that construction sites implement control practices that address control of construction related pollutants discharges including an effective combination of erosion and sediment controls and on-site hazardous materials and waste management;
- Ensure that existing development addresses discharges from industrial facilities, selected commercial businesses, residential development and common interest areas/homeowner associations.
- Detect and eliminate illegal discharges/illicit connections to the municipal storm drain system;
- Assess constituents of concern and manage urban runoff on a watershed basis with an emphasis on Total Maximum Daily Load (TMDL) obligations and the restorative goals of the Clean Water Act;
- Provide the framework for the program management activities and plan development, and
- Provide the legal authority for prohibiting unpermitted discharges into the storm drain system and for requiring

### **Best Management Practices**

BMPs are defined as "schedules of activities, prohibitions of practices, maintenance procedures, and structural and/or managerial practices, that when used singly or in combination, prevent or reduce the release of pollutants to receiving waters." The types of BMPs are source control, runoff treatment, and flow control.

BMPs in new development and significant redevelopment;

The model programs in the DAMP are implemented individually by each of the Permittees according to jurisdictional DAMP/Local Implementation Plans (LIPs). The ongoing development of the DAMP is informed by annual and five year (i.e. ROWD) program effectiveness assessments.

### Orange County - Physical Landscape

Orange County comprises 790 square miles of land area, beginning on a coastal plain and rising to an elevation of over 5,000 feet in the Puente Hills and Santa Ana Mountains to the north and east. The northwestern part of the county lies on the coastal plain of the Los Angeles Basin, while the southeastern end rises into the foothills of the Santa Ana Mountains. The landscape of Orange County presents urbanized watersheds encompassing 34 cities and a total population of 3.1 million people.

Most of Orange County's population resides in one of two shallow coastal valleys either the Santa Ana Valley or the Saddleback Valley. The County has a history of large planned communities, the most notable being the City of Irvine, City of Mission Viejo, City of Aliso Viejo, Coto de Caza, Anaheim Hills, Tustin Ranch, Tustin Legacy, Ladera Ranch, Talega and City of Rancho Santa Margarita. Population growth has slowed as the County has become largely built out (**Figures 1.1 - 1.5**).

Before urbanization, Orange County was drained by ephemeral streams and agricultural drainage ditches which were dry most of the year and carried measurable flow primarily during short duration flash floods and longer duration general winter storms. As urbanization progressed, man-made agricultural drainage ditches were enlarged to

flood control channels and the few natural streams such as Santa Ana River, San Diego Creek and San Juan Creek were constrained within levees to provide flood protection (**Figures 1.6 -1.10**). Ephemeral flows in some of the man-made and natural channels have been replaced with continuous low flows created from urban and agricultural irrigation and shallow groundwater.

South Orange County comprises five principal watersheds (Laguna Coastal Streams, Aliso Creek, Dana Point Coastal Streams, San Juan Creek and San Clemente Coastal Streams). In addition, small areas of largely undeveloped land in the City of San Clemente and unincorporated Orange County extend into the San Mateo Creek Watershed. These watersheds are hydrologically separate from North Orange County and physically, hydrologically and jurisdictionally isolated from the adjacent counties of Riverside and San Diego by mountain ranges and/or large swaths of federal land.

Across south Orange County, residential land uses, spread across characteristically modified topography, predominate. Beneath the urbanized landscapes, mostly clay-rich soils overlie marine sediments such as the Monterey and Capistrano Formations. Shallow groundwater from these formations is likely the major determinant of dry weather stream water chemistry and the cause of phosphorus, chloride, sulfates and total dissolved solids (TDS) being identified as the cause of water quality impairments.

### Fifth Term Permit

The complexion of the south Orange County landscape is distinct both within Orange County and across the region. For the Program, this landscape presents a number of unique water quality challenges. For example, to enable the Program to effectively prohibit non-stormwater discharges, efforts to

abate dry weather discharges must be allowed to distinguish and prioritize between shallow groundwater influences and genuinely aberrant urban conditions.

In the absence of large areas of industrial and commercial enterprise and little residential redevelopment, addressing pollutant wash-off from impervious surfaces in predominantly residential landscapes requires an emphasis on public infrastructure solutions complemented with education and outreach. This approach ensures that both modifications to drainage infrastructure and public support for the Program will be sustained over the long term.

The history and nature of South Orange County's development also has implications for stormwater regulation and permitting if the broader ecological outcomes contemplated in the Practical Vision and recent imperatives for integrated water resource management are to be achieved. For example, the highly modified stream systems that have been reconstructed to protect historic floodplain development and high land values mean that opportunities for alternate channel configurations will need to be identified through a watershed analysis and cannot be assumed to be presented by every modified channel segment.

For reasons identified above and which are discussed in greater detail in the subsequent sections of this report, this ROWD constitutes the request by the Permittees for a Fifth Term Permit that is unique to South Orange County.

## Orange County - Public Interest

A public that is informed and motivated to adopt practices protective of water quality can be a significant form of pollution source control. However, continually increasing public knowledge of and willingness to prevent water pollution at home and work is an ever-evolving process and significant challenge. In spite of this, public opinion surveys conducted in 2003, 2005, 2009 and 2012 indicate that Orange County residents have already become both more knowledgeable of environmental quality and are increasingly engaged in environmentally protective behaviors.

Preservation of the environment out of concern for future generations is the number one environmental concern reported by respondents in the most recent opinion survey. A notable eighty-eight percent of respondents reported being concerned about preserving the environment for their children. As a powerful motivator, the connection to future generations can help communicate *why* a particular issue is important and supplement *how* the individual can personally help prevent pollution. Perhaps not surprisingly, parents of children who brought home water quality information were also substantially more likely to perform a greater number of "stormwater safe" behaviors. Of the seven behaviors measured, parents of informed students were more than three times as likely to perform all seven behaviors (22 percent compared to only seven percent).

Orange County residents are clearly concerned about the environment and can be motivated to adopt practices that protect water quality. The Permittees intend to respond to this interest by supplementing continued investment in mass-media education campaigns with targeted outreach that zeroes

in on key pollutants and addresses behaviors that most regularly contribute to that source of pollution. This supplemental approach will use Community Based Social Marketing (CBSM) to encourage target audiences to adopt specific BMPs; the process of CBSM is explained further in **Section 3.3.4**. This two pronged approach provides the Permittees the ability to foster long-term engagement while continuing to provide mass media communication that reaches the entire Orange County population.

### **1.3 Approach to Preparing Report of Waste Discharge**

The ROWD assesses the current Program and identifies revisions to the management program in response to the information learned. Indeed, it is a basic requirement of the Permits' receiving water limitations provisions that the Program continue to adapt and evolve when urban runoff is determined to be causing or contributing to impairments of beneficial uses.

The development of the DAMP is informed by two discrete, yet related water quality planning processes: "countywide/jurisdictional," and "watershed-based" water quality management (see - "Plan Development"). Each process incorporates findings from annual assessments focused on determining whether desired programmatic outcomes are being achieved. Specifically:

- Are program elements being implemented effectively?
- Are environmental improvements being realized?

In this ROWD, the assessment of the Program has produced three types of "Recommendations":

1. **Program Continuation** – Requires no changes in implementation approach, policy or permitting
2. **Program Enhancements** – Requires shift in implementation approach
3. **Program Modifications** – Requires adjustments in policy and permitting

The “Recommendations” are presented throughout the ROWD and are summarized in “Recommendations for Fifth Term Permit.”

## 2.0 State of the Environment

### 2.1 Overview

The Program's monitoring, assessment, and environmental research efforts are intended to track progress toward solving existing issues, identify emerging issues that could become issues in the future, and support research and development that improves our understanding of key processes and advances the efficiency and effectiveness of monitoring methods.

Monitoring is most often seen as a response to regulatory requirements, which it is, but it also provides information that guides the use of important resources and answers a set of fundamental questions of keen interest to both managers and the public. The State Water Resources Control Board has articulated the following four questions (based on the intent of the federal Clean Water Act) that provide a broad context for water quality monitoring in the state:

- Is our water safe to drink?
- Is it safe to swim in our waters?
- Is it safe to eat fish and shellfish from our waters?
- Are our aquatic ecosystems healthy?

This current assessment of the state of the environment for south Orange County (**Figure 2.1.1**) summarizes the results of long-term monitoring and related special studies that address the second and fourth of these questions (related to swimming safety and aquatic ecosystem health). These two issues are directly related to stormwater management priorities. The safety of drinking water is addressed by other agencies and

programs that produce independent reports on drinking water quality. The safety of consuming local fish and shellfish is directly managed by the California Office of Environmental Health Hazard Assessment (OEHHA), supported by data and assessments conducted by the California Surface Water Ambient Monitoring Program (SWAMP) and others (the Beaches and Creeks TMDL for bacteria did not address the shellfish recreational use standard). In addition, the State Water Resources Control Board is in the process of conducting a statewide assessment of the potential contribution of contaminated sediments in enclosed bays and estuaries to the levels of contaminants in seafood tissue as well as shell beneficial use (SWRCB 2011).

**Figure 2.1.1: The portion of South Orange County that is under the jurisdiction of the San Diego Regional Water Quality Control Board and is the focus of this Report. Blue lines represent watershed boundaries.**

This Report therefore focuses on the two core management questions that are within the Stormwater Program’s area of responsibility and that are not currently being assessed by other agencies. For each major question (e.g., Is it safe to swim in our waters?), monitoring and assessment should, over time, answer the following assessment questions:

- Is there a problem?
- If so, what is its magnitude and extent?
- What are the sources of the problem?
- Are conditions getting better or worse?
- Are management actions working as intended?

Monitoring, assessment, and research efforts should be tightly focused on one or more of these questions and be managed to ensure that resources are reallocated when questions are answered and new ones arise (**Figure 2.1.2**). Monitoring, assessment, and research should therefore be managed as a portfolio of resources invested in creating the information needed to meet the Program’s goals, with the allocation of resources adjusted as needed. Assessment and research are included as a package with monitoring for two reasons. First, the information produced by ongoing monitoring programs is most useful when it is carefully analyzed, evaluated in the context of other related information, and applied to the basic questions motivating monitoring (i.e., assessed). Second, not all questions can be answered by routine monitoring and targeted special studies (i.e., research) are often needed to fill critical data gaps, develop more effective monitoring tools, and/or lay the groundwork for new management approaches. This approach follows the guidance contained in the Regional Board’s recently adopted *Framework for Monitoring and Assessment* (RWQCB 2012), which emphasizes the importance

of a sequential, question-driven approach supported by appropriate monitoring and assessment efforts that are adapted over time as knowledge improves and priorities shift.

**Figure 2.1.2: Monitoring, assessment, and research provide the data and information required to answer the five key assessment questions.** Attention should shift among questions as information improves and priorities change, and the mix of monitoring, assessment, and research activities should be adjusted to correspond.

The Program has identified three themes that help structure the assessment of the status and trends of environmental conditions in south Orange County and the accompanying recommendations for restructuring current monitoring programs:

- Theme 1: Focus on priority areas and constituents rather than trying to monitor all constituents, potential issues, and locations.

- Theme 2: Increase the integration of data from a wider range of sources in order to leverage the value and impact of the Program's efforts to address the five assessment questions.
- Theme 3: Continue evolving from a strictly discharge-specific approach to a risk prioritization approach that can highlight problem areas and support more flexible monitoring designs that include data driven adaptive triggers.

These three Report themes inform the following the section of progress toward meeting management goals for the four critical areas of concern (bacteria, dissolved solids, nutrients and toxicity). In these areas, there is a substantial amount of data available to support conclusions about progress, highlight remaining problem areas, and reexamine current monitoring designs to improve efficiency and effectiveness.

This Report begins with an evaluation of available data from the past ten years of monitoring in the region's water bodies in order to identify constituents whose concentrations and impacts have been successfully reduced, as well as those that remain of concern. This initial prioritization is then expanded and examined in greater detail in subsequent sections of this Report.

Subsequent sections examine these constituents in greater depth, the progress made and factors that contribute to continuing issues. Each section ends with recommendations for improving monitoring's effectiveness. A final section evaluates the study designs for the Dry Weather and the Coastal Ambient monitoring efforts, to assess whether their goals could be better met with different approaches.

## 2.2 Prioritization

### *The Story: Prioritization*

- Prioritization is a valuable tool for the Program to use its resources wisely to focus on the most important issues.
- Initial prioritization is based on the overall frequency and magnitude of exceedances of compliance standards and other measures of problem severity.
- In inland channels, bacteria, dissolved solids, and nutrients are persistent issues over time, particularly in wet weather.
- For coastal discharges, there are no persistent issues in wet weather, while bacteria and nutrients are issues in dry weather.
- Some elevated toxicity is present in inland channels during wet weather, but overall toxicity is not different from that described for background conditions by the Stormwater Monitoring Coalition (SMC).
- There are no persistent issues in the coastal surfzone due to discharges, other than localized bacteria contamination at a handful of problem beaches and localized and moderate nutrient exceedances in wet weather.

The Program has measured a broad suite of contaminants and other measures of condition (i.e., toxicity, bioassessment) and the accumulated data from many years of monitoring provides a valuable opportunity to compare the severity of impacts and adjust their relative priority. In order to provide a consistent basis of comparison across indicators (with the exceptions of toxicity and bioassessment), an overall index of the extent to which indicators meet regulatory standards is used.

The index, developed by the Canadian Council of Ministers of the Environment (CCME) was used in the Report of Waste Discharge (ROWD) for the northern portion of the County and such frequency-based indices are widely used in water quality assessment (e.g., by the Central Coast Regional Water Quality Control Board and the Ventura Countywide Stormwater Quality Management Program). It provides a measure, scored from 0 – 100, of the frequency and magnitude of exceedances that can be tracked over time, with lower scores representing worse conditions and higher scores better conditions. This index which is a more effective means of communicating water quality results accounts for the number of indicators within each category (e.g., bacteria, metals) that exceed standards in each year, the percentage of individual samples that exceed standards, and the average magnitude of any such exceedances (CCME 2001).

**Table 2.2.1: Overall summary of results of prioritization analysis.** Red represents persistent and widespread exceedances of regulatory thresholds, yellow occasional exceedances, and green few if any exceedances. Measures of exceedance used in this analysis accounted for both the frequency and the magnitude of exceedance. Note: Bacteria, dissolved solids, and nutrients may be problem constituents in channels, and bioassessment scores in urban areas are generally low.

	Bacteria	Dissolved solids	Nutrients	Toxicity	Pesticides	Metals	Bioassessment
<i>Channels</i>							
Dry	Red	Red	Red	Green	Green	Green	Red
Wet	Red	Red	Red	Yellow	Green	Green	NA
<i>Coastal</i>							
Dry	Green	NA	Green	Green	Green	Green	NA
Wet	Yellow	NA	Yellow	Green	Green	Green	NA

### 2.2.1 Inland Channels

For inland channels, bacteria, dissolved solids, and nutrients are persistent issues over time. Toxicity is somewhat higher in wet than in dry weather, but is not substantially above background conditions described in SMC studies. Biological condition (i.e., bioassessment) is generally poor and is in the lower 50% of the distribution compared to other urban areas in southern California. The following figures present results of

the prioritization analysis for these core constituents, beginning with **Figure 2.2.1**'s overall summary ranking of constituents based on monitoring data from receiving waters in inland channels.

**Figure 2.2.2** presents a slightly different perspective with data collected from stormwater discharge points into inland channels prior to mixing with receiving water. No constituents in wet weather exceeded Stormwater Action Levels (SALs) (**Figure 2.2.2a**) which are higher than the Water Quality Objectives (WQO) that apply to dry weather discharges (**Figure 2.2.2b**) and receiving waters in channels (**Figure 2.2.1**). Nutrients and bacteria are persistent issues for dry weather discharges.

While toxicity is present in urban channels (**Table 2.2.2**), it is not higher, overall, in dry weather than the toxicity documented in the open (undeveloped) landuse by the SMC's regional monitoring program. Wet weather toxicity in the County's channels is higher in wet than in dry weather, and is somewhat higher in wet weather for *Americamysis bahia* than seen in the northern portion of the County, patterns discussed further in the subsequent section on toxicity.

**Figure 2.2.1: Overall exceedance index for core monitoring constituents in inland channels, summarized over the 2003 – 2013 monitoring period.** The bar charts rank constituents based on their respective CCME exceedance indices in both dry and wet weather, with higher values indicating fewer and smaller exceedances. Note: pesticides and metals had considerably lower exceedance rates and magnitudes of exceedance than bacteria, dissolved solids, and nutrients.

**Figure 2.2.2: Comparison of individual constituent concentrations with a) stormwater action levels (SALs) for wet weather and b) water quality objectives (WQOs) for dry weather.** In the box and whiskers plot, the horizontal bar represents the median, with the upper and lower edge of the box the 75<sup>th</sup> and 25<sup>th</sup> percentiles of the distribution, respectively, and the whiskers the maximum and minimum values. Note: All constituents are below SALs in wet weather and only nutrients and bacteria are above NALs in dry weather.

a)

b)

**Table 2.2.2: Summary of the Program’s toxicity testing in South Orange County from 2003 – 2012, an effort that includes 2548 tests on multiple species from a range of times, locations, and conditions.** *Note: Toxicity levels are generally low except for one organism in wet weather that is susceptible to pesticides.*

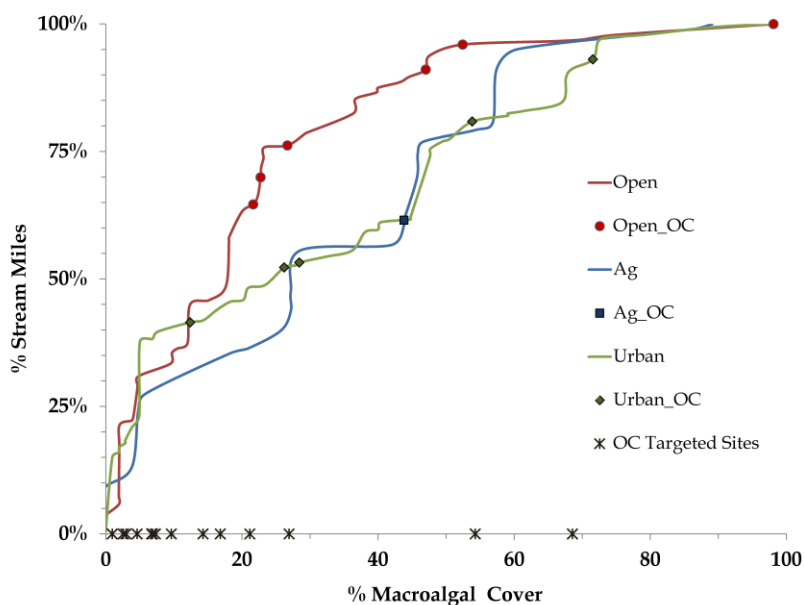

Test Species	Dry Weather			Wet Weather			Sediment		
	n	Toxic	Nontoxic	n	Toxic	Nontoxic	n	Toxic	Nontoxic
<i>Americamysis bahia</i>	391	34%	66%	573	45%	55%			
<i>Strongylocentrotus purpuratus</i>	179	5%	95%	293	24%	76%			
<i>Ceriodaphnia dubia</i>	569	20%	80%	51	12%	88%			
<i>Pimephales promelas</i>	64	9%	91%	1	0%	100%			
<i>Hyalella azteca</i>	224	11%	89%	17	53%	47%	9	0%	100%
<b>Overall</b>	1593	18%	82%	946	36%	64%	9	0%	100%

Biological condition, as measured by macroinvertebrate bioassessment results, is uniformly poor at targeted monitoring sites in South Orange County channels (**Figure 2.2.3**). Studies conducted as part of the State Water Resources Control Board’s effort to develop a statewide Biological Integrity policy indicate that alterations to physical habitat are a major cause of degraded biological conditions. The somewhat elevated toxicity in wet weather (**Table 2.2.3**) might be another contributing factor. Because the Biological Integrity policy, with its new scoring protocol, is still under development, and its technical background studies have not been completed and released, the Program will defer a more detailed consideration of biological condition for now. At that point, however, a causal assessment, using the approach recommended by the State Water Board, would be appropriate and informative.

**Table 2.2.3: Summary of aquatic toxicity results from the past five years of Stormwater Monitoring Coalition (SMC) samples from random sites across the southern California region.** *Sites were located in both open (i.e., undeveloped) and urban landuse types. The large majority of stream miles were nontoxic for acute toxicity (i.e., survival), with an equivalent amount of sporadic background toxicity, in both open and urban landuses. The majority of stream miles were toxic for chronic toxicity (i.e., reproduction) in the open landuse, a strikingly different pattern than seen in the urban landuse. Note: Toxicity patterns in open undeveloped areas are not substantially from those in urban areas.*

	% Stream Miles	
	Open	Urban
<b>Ceriodaphnia Survival</b>		
Toxic	2.1	2.4
Nontoxic	97.9	97.6
<b>Ceriodaphnia Reproduction</b>		
Toxic	63.0	37.4
Nontoxic	37.0	62.6

**Figure 2.2.3: Cumulative frequency distribution of SMC bioassessment monitoring results across southern California in three distinct landuses.** The random sites within Orange County sampled as part of the SMC program are indicated on the curves for urban and open landuses. Targeted channel sites are shown along the X axis and Index of Biotic Integrity (IBI) scores for these sites, with one exception, fall in the lower 50% of the distribution compared to all urban landuse sites sampled as part of the SMC regional study. Note: Bioassessment IBI scores in urban areas are in the lower half of scores for urban areas in southern California.

## 2.2.2 Coastal Surfzone

For the coastal surfzone, nutrients and bacteria are mild to moderate issues in wet weather, with most bacteria issues due to a small number of persistent problem beaches (Figure 2.2.4). Elevated nutrient concentrations in wet weather are a concern because they may contribute to regional eutrophication in coastal estuaries and to harmful algal blooms along the coast.

**Figure 2.2.4: Overall exceedance index for core monitoring constituents in the coastal surfzone, summarized over the 2003 - 2013 monitoring period.** Note: Constituents measured at coastal discharge points rarely exceed standards, except occasionally for bacteria and nutrients in wet weather.

While **Figure 2.2.4** suggests that bacteria contamination is a moderate problem, particularly in wet weather, two other datasets present a different perspective. The data in **Figure 2.2.4** are drawn from the Program’s monitoring at large coastal discharges, all of which are more likely to have elevated bacteria levels and thus represent a worst case estimate. In contrast, Heal the Bay beach report grades for a much larger set of South Orange County swimming beaches (**Figure 2.2.5**) show that the large majority of grades are in the A condition, even in wet weather and a more detailed examination of individual beaches (**Figure 2.2.6**) shows that bacteria shows continued improvement at some beaches over the past five years. However, **Figure 2.2.6** does not reflect recent dramatic improvements at these beaches because it summarizes data over the entire 2005 – 2013 period (see **Section 2.3** which reflects on the recent changes and provides a perspective of trends over time). The issues that do exist are localized to a few persistent problem beaches. For example, Heal the Bay has recently removed both Poche and Doheny beaches from its Beach Bummer list of the top 10 problem beaches in southern California. Thus, the data summarized for **Figure 2.2.4** do not provide the entire context for evaluating bacterial contamination at coastal beaches.

**Figure 2.2.4** shows that nutrients may be a moderate issue in wet weather. However, unlike bacteria which cause relatively localized issues because they die off in seawater, nutrients can be a more regional concern due to their potential to contribute to plankton blooms and eutrophication both in local estuaries and the larger coastal ocean. A fuller assessment of potential nutrient impacts will depend on the developing state policy on Nutrient Numeric Endpoints (NNE) for coastal estuaries and Bight Program assessments of nutrients’ potential contribution to plankton blooms in the coastal ocean.

**Figure 2.2.5: Percentage of the time that swimming beaches are in each Heal the Bay report card category, averaged across all monitored beaches. During dry weather beaches are in the A grade between 80 and 90% of the time. During wet weather the percentage of A grades drops, but has remained at about 80% for the past two years.**

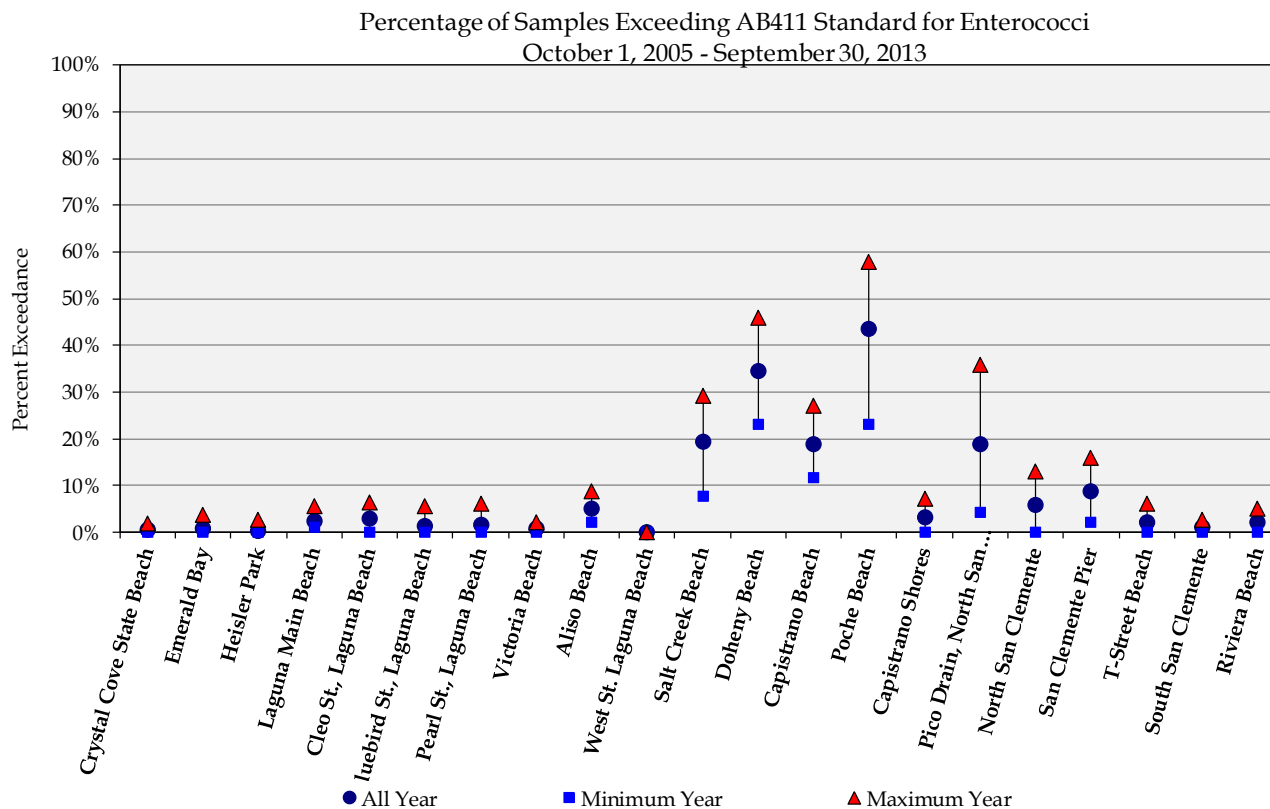

a)

b)

**Figure 2.2.6: The overall percent exceedance of the AB411 *Enterococcus* standard over the time period 2005 - 2013.** *Poche and Doheny, and to a lesser extent Pico, are the only persistent problem beaches and this summary figure overstates the problem because it does not clearly reflect significant recent improvements. This figure focuses on Enterococcus because it is the only one of the three AB411 indicators with any meaningful level of exceedance. Note: Exceedances of the Enterococcus standard occur at only a few problem beaches, which have improved dramatically in recent years.*

## 2.3 Bacteria

### *The Story: Bacteria*

- The County's beaches support concentrated recreational activities for both residents and visitors and are important contributors to the local and regional economy.
- Concern about swimming safety is consistently high and epidemiology studies in dry weather show that some illness (for example, gastroenteritis) is associated with full immersion swimming in contaminated water.
- Contamination is very low during dry weather and has dropped steadily over time; beach report card grades are consistently high.
- Sources of contamination have been reduced through targeted actions; remaining issues during dry weather are localized and may have natural components.
- Contamination is more widespread during wet weather; wet weather flows are larger and qualitatively different.
- Health risks associated with wet weather flows are uncertain, but ongoing research and development focuses on improved monitoring tools and wet weather epidemiology studies.
- Progress on managing dry weather contamination demonstrates the efficacy of targeted BMPs appropriate to specific situations that may include natural sources (e.g., birds).

### 2.3.1 A Valued Resource

South Orange County's beaches (**Figure 2.3.1**) have been used for recreation at least as far back as the early 20th Century, and the local population as well as visitors from outside the region have enjoyed the opportunities they provide for sightseeing, picnicking, sunbathing, swimming, and surfing. The acceleration of urbanization and population growth in the last century increased beach usage at the same time as growing environmental awareness intensified concerns about contamination and its potential health impacts. The nexus of these two trends was illustrated dramatically in 1999 when persistent closures of Huntington State Beach due to contamination resulted in substantial economic impacts, anxiety about potential health effects, and concerted efforts to find and control the sources of contamination. While this event occurred in the north County, it affected perceptions among managers and the public throughout southern California. With over 100 million visits annually to southern California's beaches (nearly 40 million of which occur in Orange County) (Dwight et al. 2007) that contribute billions of dollars to the regional economy, the stakes related to contamination and public health are higher than ever.

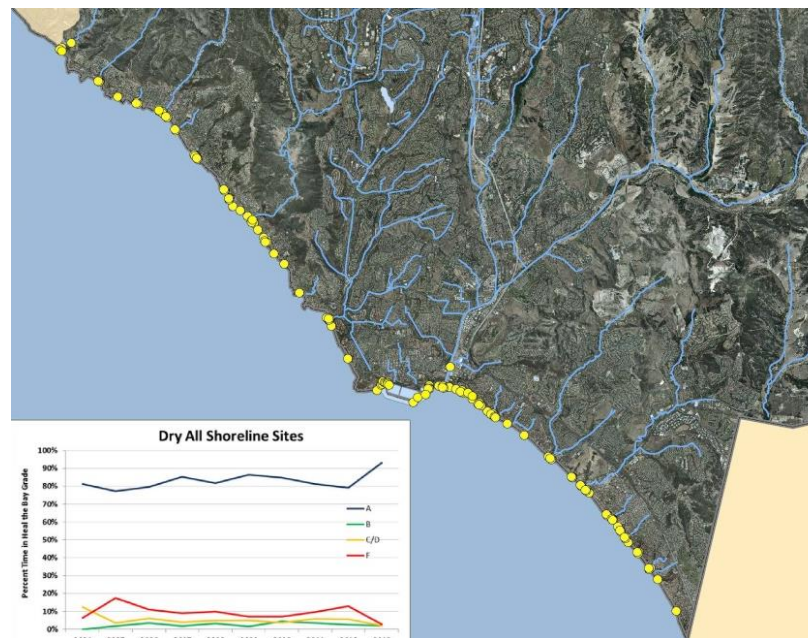

The intensity of recreational use at beaches has stimulated a large amount of research, monitoring, and regulation at the federal, state, and local levels. These efforts have identified bacterial, protozoan, and viral pathogens that could be present when contaminated runoff and untreated sewage are released into the ocean (HCA 2012). Epidemiology studies in Santa Monica Bay (1995 & 2007/08) and at Doheny Beach (Colford et al. 2012) documented higher illness rates (e.g., gastroenteritis) among swimmers, especially near flowing stormdrains.

Figure 2.3.1: The beach is a popular recreational destination across the region.

These illnesses are not life threatening. However, the past history of beach contamination due to untreated sewage discharges (prior to passage of the federal Clean Water Act), along with current concerns about sewage spills and untreated storm-drain discharges, has led to constant vigilance and one of the preeminent beach water quality monitoring and improvement programs in the state (**Figure 2.3.2**). A unified monitoring program that improves coordination among monitoring efforts conducted by the Program and the water treatment agencies has been approved by the Regional Water Board and will be implemented shortly.

Figure 2.3.2: A Coordinated beach monitoring program conducted by the County Health Care Agency, the Program, and wastewater treatment agencies regularly monitors a large number of swimming sites. Heal the Bay prepares weekly beach report card grades (inset figure and expanded **Figure 2.2.5**) that are made available on their website ([www.healthebay.org](http://www.healthebay.org)).

### 2.3.2 Progress during Dry Weather

Beach use and body contact recreation occur predominantly during the summer and in dry weather, although there is some use, mainly by surfers, during wet weather in the winter storm season. As a result, most regulation and monitoring focuses on dry weather conditions, using three bacterial indicators that indicate the presence of fecal pollution. These indicators are only indirect indicators of illness risk and not themselves pathogens, or disease agents. Thus, they do not provide a direct measure of potential health risk. However, they have been correlated with illness rates in dry weather when sewage contamination is present. They are more easily sampled and analyzed than the larger number of pathogens themselves. Long-term monitoring based on these indicators shows that exceedances of regulatory standards are also low and have been dropping over time and that the percentage of Heal the Bay report card grades of A has been at or above 80% in dry weather since 2004 (Figure 2.3.2).

This improvement in conditions during dry weather has been mirrored by a decrease over the past several years in beach closures due to contamination, as measured by Beach Mile Days (Figure 2.3.3). This metric is calculated by multiplying the length in days of each closure by the length (in miles) of beach affected and is a more accurate measure of the impact on beach users than the simple number of closures.

The improvement over time in these several measures of beach condition has resulted from a better understanding of contamination sources and targeted efforts to address the most severe of these sources. These efforts (Figure 2.3.4) initially focused on wastewater treatment plant improvements and treatment upgrades and have more recently expanded to

include a wide range of localized BMPs (Figure 2.3.5) that have dramatically reduced the level of contamination at beaches and in the streams that discharges to the coastline. For example, the percent of *Enterococcus* exceedances at Salt Creek in Dana Point and the Pico stormdrain in San Clemente have dropped from 23 to 10% and from 22 to 4%, respectively, since 2005.

**Figure 2.3.3: The total number of Beach Mile Days (the product of the length of beach posted times the length of beach posted) posted due to exceedances of standards during the April 1 – October 31 summer swimming season. Beach Mile Days have declined substantially since 2000 and reached an all-time low in 2013. Adapted from HCA (2012).**

Figure 2.3.4: Timeline of significant actions in several categories that have contributed significantly to improved beach water quality.

Figure 2.3.5: Coastal flow diversions that reroute dry weather flow to treatment plants that affect flow and/or bacterial loads.

Beginning around 2000, County agencies and individual cities began improving their spill response and prevention capability, supported by a number of state laws and policies targeted at the discharge of FOG (fats, oils and grease, which can clog sewer lines), with the result that the numbers of spills and beach closures due to spills have declined dramatically (Figure 2.3.6).

Attention also focused on urban runoff from rivers, creeks, and stormdrains, which can contain high levels of bacterial indicators. A notable regional example is the long-term effort to document and reduce levels of bacterial contamination in Aliso Creek which has been ongoing since the late 1990s.

**Figure 2.3.6: Two key metrics track the decreasing impact of sewage spills on beach condition in South Orange County over time. a) The number of reported sewage spills from 1999 through 2013. The number of spills peaked in 2000 and has declined steadily since then (regression significant at  $p = 0.001$ ), reflecting increased attention to the causes of spills (primarily line blockages); b) the number of beach closures from 1999 through 2011 resulting from sewage spills. After peaking in 2000, the number of closures has declined steadily (regression significant at  $p < 0.001$ ), reflecting the reduction in the number of sewage spills and in the percentage of spills reaching the beach. Peaks in 2005 and 2010 are due to an unusual number of larger spills over 1000 gallons. Adapted from HCA (2012).**

a)

b)

### 2.3.3 Problem Beaches and Creeks

In response to persistent bacterial contamination issues at a number of creeks and beaches in the San Diego region, the San Diego Regional Water Board in 2007 adopted a Total Maximum Daily Loads for Indicator Bacteria, Project I - Beaches and Creeks in the San Diego Region, commonly referred to as the Beaches and Creeks TMDL. In the southern portion of the County, the primary focus of the TMDL was on a handful of persistent problem beaches (**Figure 2.2.6**). The TMDL was preceded by other individual actions, such as the Aliso Creek Directive issued by the Regional Water Board in 2001, also in response to elevated bacteria concentrations in the Aliso Creek watershed. These regulatory actions, combined with increased public and management attention to bacterial contamination (e.g., reduced sewage spills (**Figure 2.3.6**), have resulted in significant improvements to beach water quality. For example, both Poche and Doheny Beaches were recently removed from Heal the Bay's Beach Bummer list of the ten worst beaches in the region.

While actions to reduce bacterial inputs and improve water quality span the region (**Figure 2.3.5**), Aliso Creek and Poche and Doheny Beaches provide representative examples of the diversity of monitoring, assessment, prevention, and treatment efforts that combine to produce improvements over the past several years.

In addition to water conservation efforts that include the entire urbanized portion of the Aliso Creek watershed, four specific types of Best Management Practices (BMPs) have been implemented, including:

- **Treatment systems** such as sand filters, cartridge media filters, disinfection (ozone or Ultraviolet (UV) light, and dry weather diversions that send stormdrain flow to the sanitary sewer for treatment
- **Wetlands/channel restoration** that enhances a stream's natural capacity to absorb pollutant loads and restores riparian habitat
- **Landscape retrofits** such as weather-based irrigation controllers, edgescaping that replaces irrigated lawn area along the edge of a sidewalk, street curb, driveway, etc. with lower impact landscaping and permeable ground covering, and other irrigation improvements to improve water efficiency and reduce runoff
- **Catch basin retrofits** such as debris gates and in line baskets or filters that reduce the potential for bacterial growth by keeping trash out of catch basins

These actions have had noticeable effects, reducing fecal coliform levels below the regulatory standard at a key monitoring station in the lower watershed and reducing *Enterococcus* levels to near the standard (**Figure 2.3.7**).

**Figure 2.3.7: Fecal indicator bacteria concentrations at Aliso Creek monitoring site CTPJ01 have significantly declined and now meet recreational water quality objectives (WQOs) for fecal coliform.**

Bacterial indicator levels in the Aliso Creek watershed have declined over the past several years in concert with a decline in the average flowrate from urban discharges to the creek (Figure 2.3.8). While correlation of course does not necessarily equal causality, in this instance there is a strong case that the reduced flow of water contaminated with urban pollutants (including bacteria) has contributed to the reduced levels seen in the creek monitoring program.

The story of success at Poche and Doheny Beaches is equally dramatic but involves a different set of studies and BMPs. In concert with the epidemiology study at Doheny Beach in 2008-08, a source identification pilot project (or SIPP) identified leaking sanitary sewer infrastructure as a source of human fecal markers seen in the surfzone. Targeted repair efforts essentially removed this source. A parallel program at Poche Beach, the Poche Clean Beach Project, used state grant funds to construct a filtration and UV treatment system that reduced

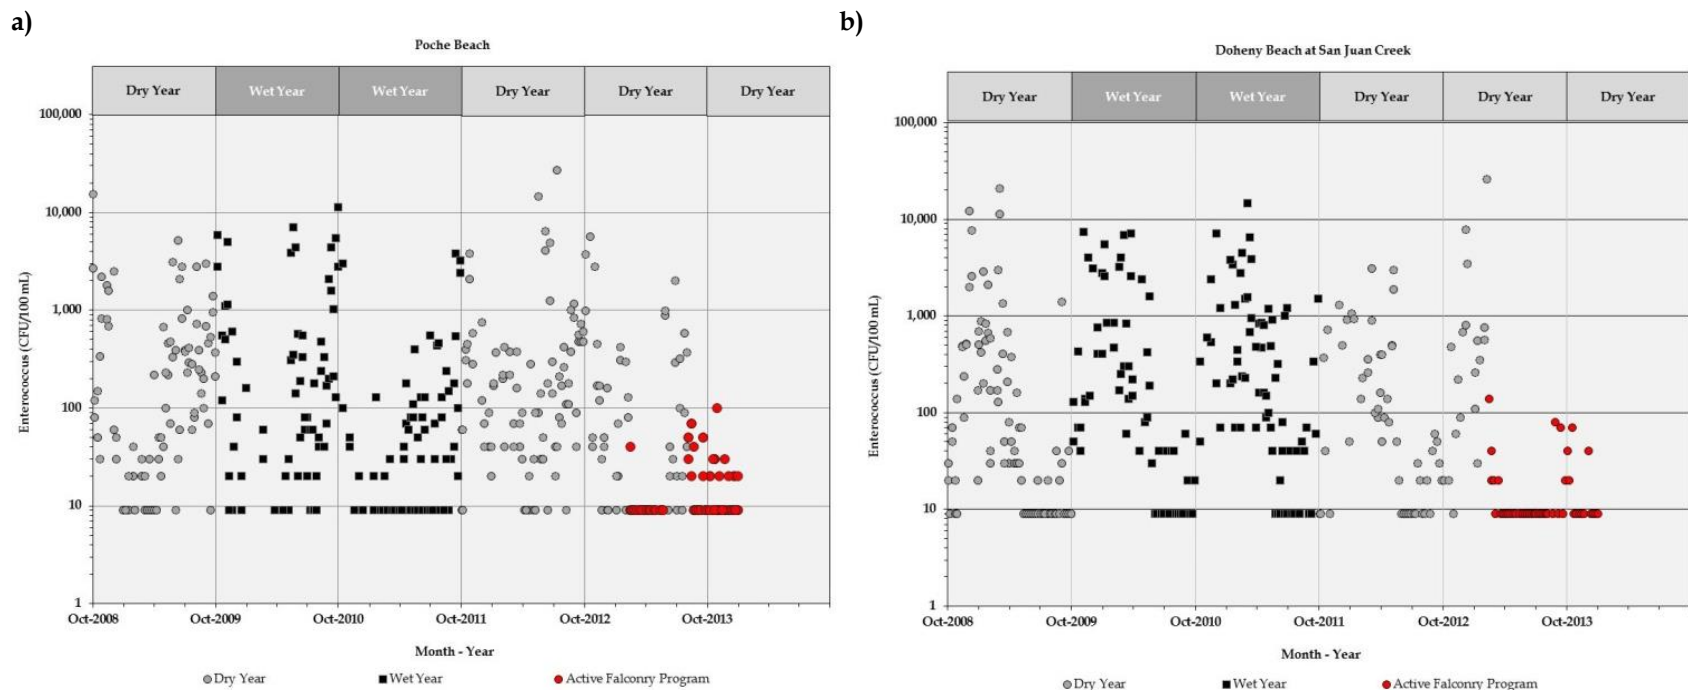

input of bacterial contamination from the the channel discharging to the beach.

**Figure 2.3.8: The fecal coliform seasonal geomean in the Aliso Creek watershed plotted in comparison to the average dry weather flow rate in the creek. Note: Fecal coliforms have declined in concert with reductions in flow of urban runoff to Aliso Creek.**

Additional studies identified another source of human fecal makers, this one airborne. Projects that involved genetic characterization as well as behavioral studies of seagulls found that seagulls feeding at the Prima Deshecha landfill in the upper watershed constituted a separate pathway for contamination. Better landfill maintenance, combined with falconry programs at both the landfill and the beach significantly reduce this source of contaminant input (Figure 2.3.9). Thus, the combination of modern genetics methods and the ancient practice of falconry provided an effective solution at Poche and Doheny Beaches.

**Figure 2.3.9: The presence of an active falconry program to deter seagulls is associated with significant declines in bacterial contamination levels at both Poche (a) and Doheny (b) beaches. Note: Falconry programs help reduce contaminant inputs from seagulls.**

Ongoing efforts by cities and their stormwater programs to improve water conservation and reduce nuisance runoff have begun to ameliorate this problem. While concentrations of indicator bacteria in channels in both wet and dry weather combined continue to be elevated, the diversion of dry weather stormdrain and stream flows to treatment plants and other actions (**Figure 2.3.5**) has significantly reduced the volume of contaminated flows to beaches. Such efforts, along with the targeted identification and removal of specific

problem sources, have also helped the County and watershed permittees make substantial progress toward improving conditions at the few problem beaches in the region. As a result of the effectiveness of these complementary actions, Orange County's beaches meet regulatory standards for the large majority of the time in dry weather and the health risks of swimming during dry weather conditions are very low, well understood, and well managed.

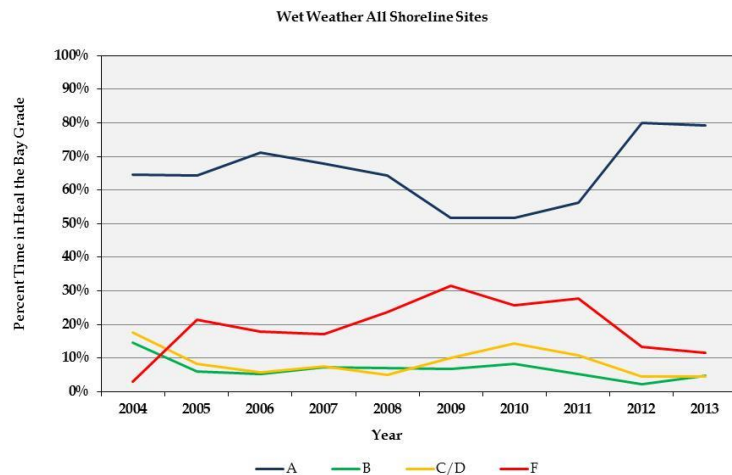

### 2.3.4 Continued Challenges in Wet Weather

In contrast to the progress achieved in maintaining clean beaches during dry weather conditions, significant challenges remain during wet weather. Channel flows during and immediately after wet weather storms are substantially higher than during dry weather (**Figure 2.3.11a vs. 2.3.11b**) which makes it infeasible to apply the management practices (e.g., diversion to treatment plants) that have been so successful in dry weather. In addition, these flows reach the beach more frequently (**Figure 2.3.10c**), which means that their loads of bacteria and other pathogens are delivered directly to the coastal ocean, with the result that beach grades worsen and exceedances of standards increase during wet weather (**Figure 2.3.11**). Nevertheless, the annual percentage of A grades for wet weather on the Heal the Bay report card has reached 70% in recent years (**Figure 2.3.11**). As a result of these characteristics of wet weather flow, the Orange County Health Care Agency issues routine health advisories recommending that the public stay out of the ocean during and for 72 hours after storms in order to avoid contact with potentially contaminated discharge. Despite this, there is significant recreational use during storms (**Figure 2.3.10d**), primarily by surfers taking advantage of the larger surf that often accompanies winter storms.

**Figure 2.3.10: Photographs showing examples of the changes in flows during dry and wet weather and the subsequent changes in ocean water quality.** a) Dry weather flows are much smaller than b) wet weather flows; c) wet weather flows from stormdrains and channels typically reach the ocean in wet weather, in contrast to dry weather flows which rarely reach the ocean; d) surfers often take advantage of the large waves caused by winter storms, despite the increased exposure to contamination this may involve.

**Figure 2.3.11: The percentage of poor Heal the Bay report card grades at swimming beaches is much higher in wet weather than in dry weather (see insert in Figure 2.10), although the annual percentage of A grades has increased gradually in recent years to 80% and the percentage of F grades has dropped to 10% in the most recent monitoring year (2013). Note: Heal the Bay beach grades in wet weather have improved recently and are mostly A.**

In addition to the higher flows in wet weather, there are two other aspects of this issue that complicate efforts to reduce wet weather contamination and its resultant potential health risks:

- Bacterial contamination in wet weather flows stems from a much wider range of sources than in dry weather
- Limitations in existing monitoring tools make it difficult to know when there is actually human fecal contamination and a resultant health problem

Rainfall and the resulting runoff from land surfaces mobilizes indicator bacteria from a wide range of sources, including

humans and animals, soils, vegetation debris, and persistent bacterial films in gutters and stormdrains. These loads stem from sources in both urban and open areas, as documented in a number of studies that have correlated bacterial loading with rainfall and measured loading from both urban and natural landscapes. Controlling this large range of sources and the very large volumes of wet weather flow would present a daunting engineering problem. For example, the long-term (1986 – 2013) mean monthly flow of San Juan Creek in January, February, and March is approximately 6175, 9201, and 5095 acre feet, respectively. Because treating these runoff volumes is infeasible, approaches such as Low Impact Development (which reduces runoff) and amendments to the Basin Plan that include changing bacteria objectives, delisting of some concrete channels, and suspending objectives in highly modified flood control channels during periods of high flow may be called for.

Because of the different nature of wet weather flows and the indirect nature of monitoring indicators, it is impossible to draw firm conclusions about health risk in wet weather. Wet weather flows may actually include a large proportion of true pathogens or they may simply be mobilizing non-pathogenic indicator bacteria from multiple sources across the landscape and diluting a stable pool of human fecal pathogens. Epidemiological studies in dry weather, including in Santa Monica Bay in 1995 and 2007 - 08, and at Doheny Beach (Colford et al. (2012) have established a relationship between levels of indicator bacteria and health risk, as well as documenting that full immersion swimming closer to flowing stormdrains increases risk. In contrast, there are no epidemiological studies in wet weather that can help resolve the fundamental uncertainties that have so far precluded significant management actions.

New studies planned and underway should, over the next few years, provide significant insight into the nature and magnitude of health risks in wet weather as well as more powerful and targeted monitoring tools to support improved regulation and decision making.

### 2.3.5 Monitoring Methods

Current indicators do not measure pathogens directly and do not separate human vs. animal and other sources. This is problematic, especially in wet weather when higher flows mobilize indicator bacteria from a multitude of sources distributed widely across the landscape. The current bacterial indicators are present in soils, leaf litter, other forms of rotting biomass, biofilms in gutters and stormdrains, as well as in both domesticated animals and wildlife, and often recover and grow in the environment even after disinfection. In contrast, the pathogens responsible for human illness (about 90% of which are viruses) all derive from human fecal contamination. These shortcomings of traditional indicators make it difficult to reliably separate human from nonhuman sources, estimate health risk, and accurately track the sources of actual pathogens.

Recent research has led to new tools that resolve some of these handicaps, although further development remains to be done over the next few years. Ongoing research falls into three categories:

- Development of genetic markers that more reliably identify the presence of human fecal material
- Monitoring methods that directly measure the presence and abundance of pathogens, particularly viruses

- Wet weather epidemiology studies that will improve estimates of health risk from exposure to ocean waters during wet weather conditions

We now have the technology to reliably determine if there is a human fecal component to bacterial contamination, using the HF183 genetic marker from a *Bacteriodes* species that is present in large quantities in humans but not in other species. This marker is not itself a pathogen but does enable relatively accurate estimates of the percentage of time human fecal material is present. At present, it is most useful as a means of confirming / eliminating the presence of human sources, a key first step in microbial source tracking studies. However, it is not yet a suitable basis for revised regulatory standards because its persistence in the environment and its behavior compared to that of actual pathogens is poorly understood. A component of Bight '13 aims to improve our understanding of HF183's utility by measuring it, along with traditional indicators, in a number of coastal drainages across southern California in both wet and dry weather.

New monitoring methods that utilize digital polymerase chain reaction (dPCR) technology enable quantification of pathogenic viruses at very low detection limits. Researchers can now test for the presence of adenoviruses, noroviruses, and rotaviruses in environmental samples, although substantial further development is needed before these methods are available for routine application. Rotaviruses are related predominantly to gastrointestinal illness and some adenoviruses affect a broader range of membranes, including those in the nose and bronchia. Some noroviruses cause intense but shortlived (24 - 48 hour) illnesses that are not life threatening but are extremely unpleasant. With funding from the state of CA, the Southern California Coastal Water

Research Project is working with the Monterey Bay Aquarium Research Institute (MBARI) and researchers at Arizona State University to develop mobile digital PCR equipment that could enable new approaches to beach water quality monitoring, such as in situ sensors that provide a stream of real-time data. There are technical complications related to sample processing but once these are resolved, the digital PCR methods could provide the basis for updated standards.

The third area of research is the investigation of health effects associated with swimming and surfing in the ocean during wet weather conditions. SCCWRP is cooperating with the City and County of San Diego and USEPA this winter on a pilot wet weather epidemiology study that will follow a large sample of surfers to estimate the relationship between illness rates and the levels in ocean water of a number of indicator bacteria and pathogens. Plans are in place for a full epidemiology study at more locations during the winter of 2014/15. The results of these studies, in combination with quantitative risk assessment methods, could show that health risk is either lower or higher than the assumptions built into current regulations. In either case, the epidemiology studies, in combination with new monitoring methods, will provide the basis for improved regulations and more informed management decisions.

### 2.3.6 Recommendations

Past progress in identifying and controlling sources of contamination, the availability of a long time series of monitoring data, and the development of new monitoring and assessment tools provide the basis for this review of existing bacteria monitoring programs with the goal of improving their utility and efficiency. The following recommendations stem

from a data-driven, risk prioritization approach that views monitoring, assessment, research, and management actions as a portfolio of related actions.

- Continue targeted data analyses of monitoring data to prioritize problem areas. Conduct additional source tracking studies as needed, using new monitoring methods based on genetic markers to identify potential sources of these issues such as infiltration into the MS4 from sewage lines. This effort should build on results of the Bight '13 Microbiology Study.
- Continue identifying opportunities to reduce and prevent flows in dry weather, where monitoring and source tracking data suggest the presence of human fecal contamination.
- Conduct statistical power analysis and optimization studies to improve existing monitoring program designs to improve efficiency and take advantage of available information about patterns and trends of contamination. **Figure 2.3.12** illustrates how statistical power analysis can provide information that can reduce and/or better target monitoring resources.
- Shift resources from routine monitoring to targeted source tracking and adaptive response, using new tools such as genetic markers of human fecal contamination as these become available.
- Continue supporting regional and collaborative research into better monitoring and source tracking tools.
- Improve understanding of health risk related to high wet weather flows, for example, through the Bight '13 Microbiology Study; follow results of the pilot wet weather epidemiology study planned for San Diego and consider

supporting the larger, follow-on study planned for 2014/2015.

- Conduct pilot mass balance studies to determine their utility for improving the prioritization of management actions.

**Figure 2.3.12: Example analysis run with pesticide data to demonstrate statistical power analysis for a trend monitoring program.** *The number of years of data required to detect varying amounts of change with different numbers of samples per year (5, 10, 20, 40) next to respective curves). This figure illustrates that increased sampling intensity often produces diminishing returns and that such analyses can inform tradeoffs among different types of sampling effort and the amount of change managers wish to detect and/or the amount of time they can wait to detect a change. The figure also shows that the inherent variability in a system may make it impossible to detect small amounts of change with even large amounts of sampling effort.*

## 2.4 Dissolved Solids

### *The Story: Dissolved Solids*

- Persistent and widespread exceedances of total dissolved solids occur in channels and at discharge outfalls.
- Dissolved solids are a challenging to address because a large portion of these elevated levels derive from natural sources in regional groundwater.
- Understanding local geology is key to understanding sources of dissolved solids and the pathways they travel in the watershed.
- While the flood control system provides one pathway for dissolved solids in groundwater to reach the surface, other natural pathways (such as artesian springs) exist and there is evidence of historically elevated dissolved solids levels in surface water in the region.

### 2.4.1 Natural Geology is Key

Dissolved solids refers to the amount of salt in water and can be a difficult water quality problem to address when concentrations are elevated. They can be toxic to fish and plants and require expensive processing in water reclamation systems to make the water drinkable or usable for irrigation. Dissolved solids, as general description of the amount of salt in water, consists of several other constituents including

chloride, sulfate, nitrate, phosphate, calcium, magnesium, sodium, potassium, and sometimes a few trace metals such as cadmium, nickel, selenium, and zinc.

Total dissolved solids (TDS) consistently exceed the Basin Plan Objective (**Figure 2.4.1**) and these levels create the potential for detrimental impacts on the aquatic ecosystem; for example, TDS has been suspected as a causal factor in poor benthic macroinvertebrate community condition.

The key issue in deciding whether elevated dissolved solids represent a water quality problem, and thus a priority for management, depends directly on the source of these solids and the appropriate benchmark for comparison (**Figure 2.4.2**). Many creeks in South Orange County have elevated levels of dissolved solids that do not appear to be related to the urban sources. For example, the dissolved solids from common urban potable sources such as imported water from the Colorado River or northern California, or locally generated drinking water from deep groundwater supplies or from recycled water, are often at levels much lower than those measured in South Orange County creeks. Similarly, the shallow groundwater tables that provide most of the water to these streams are often much higher in dissolved solids than water from urban sources.

Figure 2.4.1: An overall exceedance index of the extent to which total dissolved solids meet regulatory standards in both a) wet and b) wet conditions is low (which means poor conditions) and has remained fairly steady since 2004.

a)

b)

Local geology is the primary reason South Orange County creeks have dissolved solids higher than those in common urban sources of water. The coastal areas of South Orange County have salt-rich native soils, commonly referred to as marine sedimentary geology, with the result that creeks have elevated dissolved solids. Further, the creeks with elevated dissolved solids are not limited only to water bodies within urbanized areas. Natural reference creeks in coastal areas with this type of unique geology and little to no urban influence have levels of dissolved solids substantially above those in urban water sources (**Figure 2.4.2a**).

In contrast, the parts of South Orange County with geology more closely related to bedrock (i.e., igneous geology) and those soils found in the upland higher elevations closer to the Santa Ana mountains are much less related to marine sediments and thus have lower levels of dissolved solids (**Figure 2.4.2b**).

The Program has conducted several special studies to improve understanding of the relationships between natural and urban sources of dissolved solids in creeks. Studies in Oso Creek, which has elevated dissolved solids levels showed that dissolved solids concentrations in this Creek were comparable to those in three reference streams (**Figure 2.4.3a**), although loads of dissolved solids to Oso Creek were higher than those in natural streams (**Figure 2.4.3b**).

The Program has also conducted collaborative studies with researchers in the Geochemistry Group at University of Southern California's Department of Earth Sciences, using specialized testing of stable isotopes of hydrogen and oxygen. Physiographic conditions under which rain falls in the Sierra Nevada or Colorado River watersheds are very different from

those in the County's low elevation coastal watersheds. These differences impart unique isotopic signatures that can help to uniquely identify the contribution from various sources. This study compared the isotopic signatures of groundwater emerging from weeps and springs in the urbanized areas of South Orange County to those from a range of potential sources including rain, natural groundwater, and urban sources (e.g., potable or recycled water). The stable isotopic signature for shallow groundwater from weeps and springs in urban areas is more similar to that of local rain water and natural reference streams and much less similar to the imported water that is the primary source of potable water in south Orange County.

**Figure 2.4.2: Means and ranges of dissolved solids concentration in a) various water sources including rainwater, local potable, Colorado River potable, recycled, groundwater, and b) streams. Data from these sources provide context as to which water source(s) most closely resemble surface waters with elevated dissolved solids.**

a)

b)

**Figure 2.4.3: Ranges of dissolved solid concentrations (a) and loads (b) in Oso Creek in comparison to three reference streams of similar geology.**

This study also compared shallow groundwater to the global meteoric water line, which describes the mean relationship between hydrogen and oxygen isotopes in water which has not been exposed to evaporation (Figure 2.4.4). The shallow groundwater in urban areas reflects conditions more similar to rainwater and reference streams than to an imported source of water.

**Figure 2.4.4: Hydrogen and oxygen stable isotope compositions of shallow groundwater in urban creeks across south Orange County in comparison to rain, water from reference streams in undeveloped watersheds, and imported municipal water from Colorado River and the Sierra Nevada mountains.**

These three pieces of information have important implications for the Program's efforts to identify sources of dry weather flow, understand the underlying natural conditions in streams in the urbanized portions of South Orange County, and to then determine whether elevated dissolved solids in a particular watershed are an important management priority for the future.

#### **2.4.2 Recommendations**

- Conduct a mass balance study, even if at a crude level, to determine the extent to which the MS4 contributes to dissolved solid levels in the creeks
- Prepare a summary report on historic and contemporary conditions of dissolved solids across south Orange County
- Invest effort into understanding whether dissolved solids are important stressor on macroinvertebrate communities in the creeks to evaluate the environmental significance of elevated dissolved solid concentrations
- Continue evaluating changes in dissolved solids at key locations such as Oso Creek in concert with water conservation efforts to track changes in dissolved solids over time.

## 2.5 Nutrients

### *The Story: Nutrients*

- Nutrient levels in South Orange County streams and channels are frequently above commonly used thresholds that suggest increased likelihood of nutrient impacts. In contrast, there are much less frequent occurrences of impacts, such as macroalgal overgrowth, due to excessive nutrient levels.
- Nutrient issues are not limited to the urban portion of the County; regional monitoring data show nutrient enrichment and impacts such as increased macroalgal cover and/or lower dissolved oxygen in streams and estuaries in undeveloped regions.
- The major point sources of nutrients have been controlled. Therefore, nonpoint and diffuse sources such as leaching from upland soils and intrusions from shallow groundwater are increasingly important.
- Nutrients can be readily transported in and out of various reservoirs (e.g., sediments, groundwater) and undergo complex biological transformation and cycling. This makes traditional pollutant control strategies less effective for nutrients.
- Improved management strategies may contribute to further progress, particularly in streams and channels, by accounting for site-specific conditions, promoting Low Impact Development, and accounting for broader regional sources.

### 2.5.1 A Complex Regional Problem

Elevated levels of nutrients have become an increasing national and regional concern in recent years because of their impacts on lakes, streams and estuaries. Nutrient enrichment leads to the overgrowth of algae in streams, (**Figure 2.5.1**) and estuaries (**Figure 2.5.2**) that can reduce dissolved oxygen, sometimes to the point of causing mortality to fish and other aquatic organisms. Dense algal mats can also cause aesthetic (visual and odor) impacts and impair beneficial uses such as boating and swimming. There is also concern that nutrient runoff has contributed to the observed increased incidence and severity of harmful algal blooms (HABs) in California and their toxic effects in the coastal ocean (**Figure 2.5.3**). For example, the Bight '08 Program found that anthropogenic nutrient inputs are co-located with algal bloom hotspots at subregional and seasonal / daily scales and ongoing regional studies are further investigating this potential connection. Finally, nutrients are involved in geochemical processes that can amplify ocean acidification impacts in estuaries.

Unlike most other pollutants, nutrients are involved in complex biological transformation and cycling processes (**Figure 2.5.4**) and storage in a variety of reservoirs. This complicates nutrient assessment and management in two important ways. First, nutrient impacts can persist even after inputs have been reduced or ended because nutrients stored in sediments, groundwater, and plants can move in and out of these reservoirs on a range of time scales. For example, studies conducted by the Southern California Coastal Water Research Project and others have shown that nutrients cycle in and out of the sediments in bays and estuaries on a seasonal basis and (Fenn et al. 2010) showed that large portions of several vegetation types in California (e.g., chaparral, oak woodlands,

coastal sage scrub, annual grassland) exceed the “critical load” for nitrogen deposition. Excess loading of nitrogen from aerial deposition can cause shifts in the plant community by, for example, changing conditions to favor invasive grasses and other nutrient sensitive species. Where loadings exceed the amount that can be assimilated by plants, rainfall can more easily wash excess nutrients out of soils and into streams.

**Figure 2.5.1: Nutrient enrichment causes overgrowth of algae in streams, particularly in warmer, low flow conditions. a) algal mats in a slow moving stream. Urban and natural watershed areas can supply excessive nutrients, so algal overgrowth and its secondary impacts (e.g., low dissolved oxygen) occur in both urban channels (b) and streams in undeveloped open space (c).**

a)

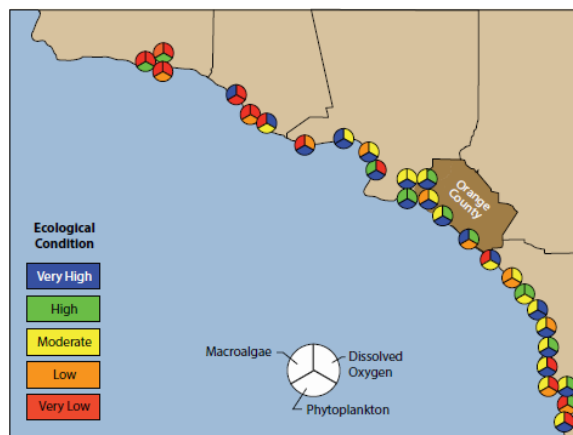

b)

c)

**Figure 2.5.2:** Almost all estuarine segments in the Southern California Bight show some degradation on at least one of the three response indicators of eutrophication: macroalgal cover, phytoplankton, and dissolved oxygen concentration. *Adapted from Bight '08 program data.*

**Figure 2.5.3:** Bloom of the alga *Lingulodinium polyhedrum* in the coastal ocean off southern California. *This alga can be toxic to marine organisms.*

**Figure 2.5.4: A graphical conceptual model of nutrient dynamics in a generalized estuarine system.** *Nutrients derive from multiple sources, both natural and anthropogenic, spread across the watershed. Atmospheric deposition can exceed the carrying capacity of upland soils, leading to nutrient loading to streams during storm events. Nutrient loadings are higher in wet weather and they can be stored in and move through sediments, groundwater, and riparian and aquatic plants on different timescales. Because of these reservoirs, nutrients can require a lengthy period to move through the system and their impacts can continue long after inputs have been shut off. Note: Nutrients enter coastal systems through a variety of sources and pathways.*

The second way in which nutrients differ from most other pollutants is that complex bio- and geochemical dynamics can cause very different effects at different locations or times in response to the same nutrient concentration or load. As a result, there is no consistent functional relationship between the exceedance of a single, numeric regulatory standard for nitrogen or phosphorus and the presence or severity of impacts from nutrient overenrichment.

## 2.5.2 Nutrient Patterns in South Orange County

The Program collects three types of data that help document the extent, severity, and changes over time in nutrient issues:

- Concentrations of nutrients and comparison of these data to commonly used thresholds (1 mg/l for total Nitrogen; 0.1 mg/L for total Phosphorus) that indicate likelihood of impacts
- The percent cover of algae, a measure of nutrient impacts on biological conditions in waterbodies
- Mass loads of nutrients at key mass emission stations

**Figure 2.5.5a** and **2.5.5b** shows that nutrients (total nitrogen and total phosphorus) commonly exceed thresholds in channels and that a frequency-based water quality index widely used in a number of monitoring and assessment programs has improved only slightly since 2000. While conditions are slightly better in dry weather in most years, the index values are consistently low (i.e., poor condition) in all years in both dry and wet weather.

However, this is not strictly an urban problem (see **Figures 2.5.1c** and **2.5.6**). The Stormwater Monitoring Coalition (SMC) has for the past five years collected data from sites across southern California in urban, agricultural, and open

(undeveloped) natural areas. The locations of SMC sites are selected randomly each year so that they can provide a statistically valid picture of regional conditions, which forms a valuable context for interpreting data from north County. **Figure 2.5.6** shows that targeted monitoring sites in South Orange County channels clustered in the lower end of the distribution (less than about 30% macroalgal cover) for the urban landuse. In other words, about half of the stream miles in southern California in the urban land use had a greater degree of macroalgal cover than did sites in channels in South Orange County. **Figure 2.5.6** also shows about half of the stream miles in southern California in the open (undeveloped) landuse had up to 20% macroalgal cover. Thus, while macroalgal cover is greater in the urban landuse, this problem also occurs in undeveloped streams in the region.

**Figure 2.5.5** shows that elevated nutrient levels are pervasive in south County channels but **Figure 2.5.6** documents that the primary nutrient impact monitored in these channels, percent macroalgal cover, is at the lower end of the cumulative frequency distribution for the urban landuse in the region. Thus, nuisance algal growth is not always evident in streams when nutrients are above thresholds, which reflects the lack of a one-to-one correspondence between nutrient levels and impacts such as macroalgal cover and dissolved oxygen. Recognition of this issue is at the heart of the State Water Resources Control Board's attempt to develop a new approach to setting nutrient thresholds (see **Section 2.5.4** *New Management Approaches* below).

**Figure 2.5.5: An overall index of the extent to which nutrients (total nitrogen and total phosphorus) meet thresholds in channels and outfalls, in both dry (a) and wet (b) weather is low (which means poor conditions) and has remained low over the monitoring period. The index integrates the number of indicators and the percentage of samples higher than thresholds in each year, and the average magnitude of such excursions (CCME 2001). It provides a score, scaled from 0 - 100, that can readily be tracked over time. Note: Nutrients regularly exceed standards in channels in both wet and dry weather.**

**Figure 2.5.6: The cumulative frequency distribution function of macroalgal cover in the three landuse types sampled by the Stormwater Monitoring Coalition’s (SMC) regional program.** Fifty percent of the stream miles in the open landuse had about 20% or less macroalgal cover, while about 50% of the stream miles in the urban landuse had about 30% or less macroalgal cover. The majority of the County’s targeted sites (situated along the X axis) had less than 30% macroalgal cover.

### 2.5.3 Nutrient Sources

As with many pollutants, the focus on sources of nutrient inputs has gradually shifted from distinct point sources to more widespread and diffuse sources as point sources have been identified, targeted for management action, and removed or reduced. Natural areas such as chaparral, oak woodlands, coastal sage scrub, and annual grassland can also be important sources of nutrient loading, particularly in wet weather. These areas have accumulated excess nutrients from aerial deposition (e.g., nitrogen oxides in smog) which can leach from soils during rain events. **Figure 2.5.7** shows that concentrations of nutrients in wet weather runoff from undeveloped open space are similar to those in runoff from urban sites. As a result, a narrow focus on urban sources of nutrients will miss an important category of inputs.

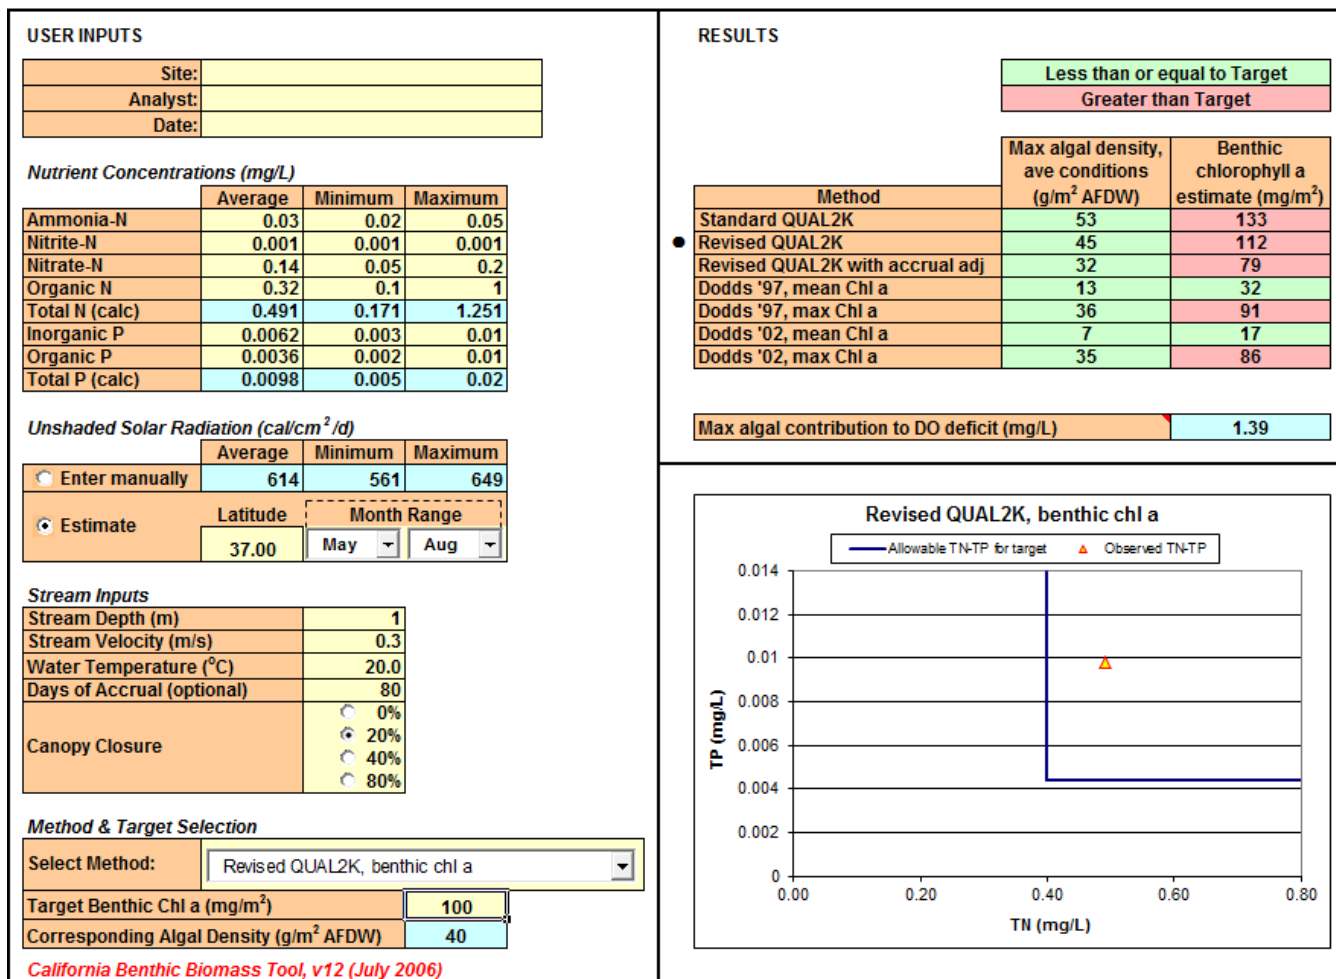

**Figure 2.5.7: Wet weather flow-weighted mean concentrations of several forms of nutrients at urban (shaded boxes) and undeveloped open space (clear boxes) sites, as measured in the SCCWRP Natural Loadings Study.** *These data document that natural areas are sources of nutrients at concentrations that are similar in some cases to those in runoff from urban sites. Boxes indicate the 25th and 75th percentiles and error bars indicate the 10th and 89th percentiles. From Stein and Yoon (2007).*

### 2.5.4 New Management Approaches

Improved knowledge about the lack of a tight correlation between nutrient levels and nutrient impacts, and about the importance of diffuse sources in open areas and in groundwater, has prompted the development of new management approaches at both the statewide and regional / local levels that more accurately measure and address the risk of impairment. For example, the State Water Resources Control Board's Nutrient Numeric Endpoint (NNE) project is developing methods (**Figure 2.5.8**) to derive a maximum allowable nutrient concentration in a particular stream reach, reservoir, or estuary based on local factors such as temperature, irradiance, and flow. The NNE's goal is to ensure that the key ecological indicators of macroalgae and dissolved oxygen remain within acceptable bounds.

Figure 2.5.8: The main user interface for the current version of the freshwater Nutrient Numeric Endpoint (NNE) biomass estimation spreadsheet tool. In this figure, data fields are loaded with example data for illustrative purposes.

## 2.5.5 Recommendations

Past progress in identifying and controlling sources of contamination, the availability of a long time series of monitoring data, and the development of new monitoring and assessment tools provide the basis for this review of existing nutrient programs with the goal of improving their utility and efficiency. The following recommendations stem from a data-driven, risk prioritization approach that views monitoring, assessment, research, and management actions as a portfolio of related actions.

- Conduct an assessment of sources and practices that input to the MS4, to assess the significance of each to downstream issues.
- Continue identifying opportunities to reduce and prevent flows in dry weather.
- Pilot a regional mass balance nutrient model, even if elementary, to help prioritize monitoring and management attention; the Newport Bay watershed and SCCWRP coastal ocean nutrient mass balance models provide useful examples.
- Use available time series of data to streamline monitoring to improve its statistical and economic efficiency. Sampling effort could be reduced by identifying stations that essentially mimic each other and/or by reducing the spatial and/or temporal intensity of sampling. Monitoring could shift to a sentinel program with a lower frequency of monitoring intended to ensure conditions do not worsen.

## 2.6 Toxicity

### *The Story: Toxicity*

- Toxicity in freshwater channels in all conditions (aquatic, sediment, wet and dry weather) occurs at low levels and is sporadic, occurring at different locations at different times and varying unpredictably across test species.
- Aquatic toxicity in dry weather occurs in open (undeveloped) areas at levels equivalent to those in urban areas; suggesting that dry weather toxicity is not driven predominantly by urban pollutants.
- There are no apparent trends in toxicity over time.
- Metals, except for some instances of elevated copper, are at low levels and do not appear to contribute to aquatic toxicity in freshwater.
- The primary source of toxicity appears to be pesticides, with evidence that pyrethroids contribute to sediment toxicity.
- Use of organophosphate pesticides has declined virtually to zero but use of pyrethroid pesticides has increased and exceedances of thresholds for pyrethroid pesticides are high.
- Reported pesticide use in the County has declined from just over 2 million pounds a year in 1998 to just under 1 million pounds in 2011, due primarily to reduced use of indoor fumigants.
- There is a large data gap in our knowledge of retail pesticide sales and use.
- Pesticide use (which is regulated directly at the state and federal levels) presents a moving target for management

because of the continued introduction of new products; the most effective management strategies are to continue to reduce dry weather runoff/flows and support education and outreach efforts to reduce pesticide use and runoff.

### 2.6.1 Low but Puzzling Patterns in Toxicity

Since the publication of Rachel Carson's *Silent Spring* in 1962, concerns about the potentially destructive impacts of chemicals released into the environment have expanded, supported by an increasingly sophisticated understanding of their impacts and modes of action. Environmental monitoring now provides a range of tools, including sensitive sampling for specific chemicals at very low levels and toxicity tests (Figure 2.6.1) that integrate the effects on organisms of multiple chemicals in ambient water and sediments. These tools can indicate the potential for toxic effects before they become major events and provide the means for tracking and managing the distribution and impacts of anthropogenic chemicals.

**Figure 2.6.1: The water flea *Ceriodaphnia* which is commonly used as a laboratory test organism in both acute and chronic aquatic toxicity tests**

The Program’s monitoring efforts to assess aquatic ecosystem health include a range of toxicity tests (**Table 2.2.2**) including aquatic tests in both dry and wet weather as well as toxicity tests on sediment collected from streams and channels. These tests use a variety of test organisms sensitive to different types of chemicals include and assess both acute (i.e., survival / death) and chronic (i.e., reproduction / growth) endpoints to document a range of potential toxic effects. **Table 2.2.2** summarizes the results of 2548 separate toxicity tests performed since 2003. The overall level of toxicity is low but is highest in wet weather. Winter storms wash accumulated contaminants off land surfaces and the first flush of storms is

**Table 2.2.2 (Repeated): Summary of the Program’s toxicity testing in South Orange County since from 2003 - 2012, an effort that includes 2548 tests on multiple species from a range of times, locations, and conditions.** *Note: Toxicity levels are generally low except for one organism in wet weather that is susceptible to pesticides.*

Test Species	Dry Weather		
	n	Toxic	Nontoxic
<i>Americamysis bahia</i>	391	34%	66%
<i>Strongylocentrotus purpuratus</i>	179	5%	95%
<i>Ceriodaphnia dubia</i>	569	20%	80%
<i>Pimephales promelas</i>	64	9%	91%
<i>Hyalella azteca</i>	224	11%	89%
<b>Overall</b>	1593	18%	82%

The Program also has the benefit of comparing data from its sites in South Orange County to a collection of sites from across southern California sampled by the regional Stormwater Monitoring Coalition (SMC). The locations of SMC sites are selected randomly each year so that they can provide a statistically valid picture of regional background

known to have higher levels of contamination. In addition, some contaminants, particularly synthetic pyrethroids, which are an increasingly common pesticide, bind to sediments where, depending on their solubility, they may be a primary cause of aquatic and/or sediment toxicity in urban streams (Holmes et al. 2008). However, the occurrence of toxicity is highly variable, shifting from site to site at different sampling times; a careful examination of the Program’s data shows no consistent spatial patterns or trends over time. The relatively low level of toxicity, combined with the fact it appears sporadically, makes it difficult to control.

conditions, which forms a valuable context for interpreting data from South Orange County.

A summary of the past five years of SMC aquatic toxicity testing data (**Table 2.2.3**, repeated below for convenience) shows puzzling patterns. Acute toxicity (i.e., mortality) occurs in only a small fraction of stream miles in both open and urban landuses. In contrast, chronic toxicity (i.e., reduced reproduction) is more prevalent in the open landuse than the urban landuse. There is chronic toxicity present in the urban landuse, but in a much smaller portion of stream miles than in undeveloped open space. These results suggest that there are sources of toxicity that are more widely spread throughout the region and may not necessarily be directly associated with urban runoff. Speculation has focused on aerial deposition of airborne contaminants or natural factors such as high conductivity or turbidity. For example, a special study conducted by the Program in the Oso Creek watershed found that high levels of dissolved solids (see **Section 2.4** on dissolved solids, above), which can be toxic to aquatic species, derived from natural geologic formations and had increased in recent decades as development patterns caused the

groundwater table to rise. However, no regionwide followup studies on the SMC's findings have to date been planned or conducted.

In addition to the generally low toxicity found in inland channels, the Program's toxicity testing in the surfzone up- and downcoast of stormwater discharge points has found virtually no toxicity in the nearshore marine environment.

**Table 2.2.3: Summary of aquatic toxicity results from the past five years of Stormwater Monitoring Coalition (SMC) samples from random sites across the southern California region.** Sites were located in both open (i.e., undeveloped) and urban landuse types. The large majority of stream miles were nontoxic for acute toxicity (i.e., survival) in both landuse categories, with an equivalent amount of sporadic background toxicity in both open and urban landuses. The majority of stream miles were toxic for chronic toxicity (i.e., reproduction) in the open landuse, a strikingly different pattern than seen in the urban landuse.

	% Stream Miles	
	Open	Urban
<b>Ceriodaphnia Survival</b>		
Toxic	2.1	2.4
Nontoxic	97.9	97.6
<b>Ceriodaphnia Reproduction</b>		
Toxic	63.0	37.4
Nontoxic	37.0	62.6

## 2.6.2 Metals not a Source of Toxicity

Toxicity is a useful indicator of ecological impacts but toxicity test results by themselves do not identify the specific pollutants or other stressors responsible for toxicity. Instead they can indicate the general category of pollutants, such as metals or organic pesticides, contributing to toxicity. The

Program therefore combines three complementary lines of evidence to attempt to isolate the cause(s) of toxicity:

- Correlation between toxicity test results and chemical concentrations in the waters and sediments collected for toxicity tests
- Comparison of these chemical concentrations to regulatory standards in the California Toxics Rule (CTR) which are based on laboratory studies of test organisms' sensitivity to specific chemicals
- More detailed analyses of ambient water and sediments, called Toxicity Investigation Evaluations (TIEs), that sequentially remove classes of chemicals to determine whether toxicity drops in concert

Unfortunately, these studies have not succeeded in clearly identifying the sources of toxicity in the County's streams and channels. The sporadic nature of the toxicity signal makes it difficult to follow up on, correlations are inconsistent, and TIE methods have technical limitations that make their results less specific than desired. However, these methods have succeeded in ruling out metals as a source of toxicity and suggesting that the observed persistent toxicity patterns in the test species evaluated in urban streams and channels is due to organic compounds, likely pesticides.

Exceedances of CTR standards for metals are consistently low in both dry and wet weather (**Figure 2.6.2**) and there is no apparent trend over time. While copper and cadmium account for the large majority of these limited exceedances, neither metal is correlated with the occurrence of toxicity in streams and channels and has not been identified as a cause of freshwater toxicity in TIEs. This conclusion matches findings from the SMC's regional program (see **Table 2.2.3**), a regional

**Figure 2.6.2: An overall index of the extent to which metals meet regulatory standards in channels and embayments is high (meaning few exceedances) and has remained steady since 2003, in all samples for both dry (a) and wet (b) weather. This index accounts for the number of metals that exceed standards in each year, the percentage of individual samples that exceed standards, and the average magnitude of any such exceedances (CCME 2001). It provides a score, scaled from 0 - 100, that can readily be tracked over time.**

a)

b)

study of loadings from natural areas (Figure 2.6.3), as well as from watershed monitoring programs in the San Gabriel River and Los Angeles River watersheds.

While copper is a concern in harbors, the 2002 TMDL for Toxic Pollutants in San Diego Creek and Newport Bay estimated that antifouling paint on boat hulls represents nearly 90% of the loading of copper to the Bay. In addition, a Bight '08 study of discharges to Areas of Special Biological Significance (ASBS) (Schiff et al. 2011) found no significant differences between post storm metals concentration at ASBS discharge sites and at reference drainages. There was some evidence for a slight increase in copper at ASBS discharge sites but this may be due to particular coastal sources such as harbors and coastal developments with copper architectural features.

### 2.6.3 A Localized Source of Copper

A history of persistent exceedances of regulatory thresholds for copper in the Irvine Cove community triggered a detailed, two-year special study to identify and prioritize sources of copper for future source control efforts. This cooperative effort between the County and the City of Laguna Beach included additional sampling of stormwater runoff at multiple locations along with field reconnaissance to identify potential sources of copper. This information helped focus targeted sampling at specific potential sources to rule them in or out and characterize their contribution to copper levels in runoff. The study showed that copper was concentrated in runoff from Irvine Cove below the Pacific Coast Highway, a spatial pattern that ruled out brake pad dust as a major source. Further reconnaissance focused attention on residential architectural copper uses such as roofs, rain gutters, and flashing (Figure

2.6.4). Sampling during a storm event of runoff from homes with and without architectural copper features showed that the average level of copper in runoff from homes with copper features was nearly ten times higher than copper in runoff

**Figure 2.6.3: Wet weather flow-weighted mean concentrations of metals at urban (shaded boxes) and undeveloped open space (clear boxes) sites, as measured in the regional study of runoff characteristics from natural drainages.** These data document that natural areas are sources of metals, although concentrations in runoff from natural drainages are somewhat lower than those at urban sites. Boxes indicate the 25th and 75th percentiles and error bars indicate the 10th and 89th percentiles. Dots represent extreme values.

from homes without copper, and nearly six times the regulatory action level. Maximum levels of copper were more than 1000 times higher. This information is useful in ruling out other sources and highlights the difficulty of controlling all sources of contaminants from urbanized watersheds.

Figure 2.6.4: Aerial photograph of a portion of the Irvine Cove drainage area identifying various types of structural architectural copper uses.

## 2.6.4 Trends in Pesticide Use

While pesticides have been implicated as a cause of both aquatic and sediment toxicity, it has been extremely difficult to confirm their role largely because of technical challenges associated with TIEs. There are hundreds of pesticides in current use, neither certified laboratory methods nor toxic thresholds exist for many of these, and legacy pesticides such as DDT are still present in the environment. In addition, the population of pesticides in use changes continually over time in response to new regulatory requirements and increasing knowledge of their targets' physiology (**Figure 2.6.5**).

Organochlorine pesticides (e.g., DDT, chlordane) were banned and replaced by organophosphate pesticides (e.g., diazinon and chlorpyrifos), whose use was tightly restricted and were in turn replaced by the synthetic pyrethroids (e.g., permethrin). Most recently, policies have tightened the use of pyrethroids, opening a door for increased use of fipronil. Newer pesticides are often toxic at much lower levels than older pesticides (e.g., pyrethroids exhibit toxic effects at the parts per trillion level), requiring the development of increasingly sensitive methods with lower detection limits. In addition, new pesticides often change the nature of toxicity and the types of organisms affected. This illustrates a core problem in pesticide monitoring, assessment, and management – the ever-changing cast of characters that pose a constant challenge to monitoring methods and the understanding of toxic processes.

**Figure 2.6.5** shows that the use of organophosphate pesticides (chlorpyrifos and diazinon) has declined substantially since the early 1990s, even before their use in residential applications was banned in 2001 and 2004, respectively. Available data from the Program's monitoring efforts shows that, as a result, the exceedance index for organophosphate pesticides has increased (i.e., improved conditions) significantly in dry weather and to a lesser degree in wet weather (**Figure 2.6.6**). The slower rate of improvement in wet weather suggests that there may be reservoirs of these pesticides still present. Because agricultural uses must be reported and the reported use of these pesticides has declined to virtually zero (**Figure 2.6.5**), it is unlikely that still-permitted uses of these two pesticides are the source of the remaining wet weather exceedances. In contrast, the exceedance index for pyrethroid pesticides in wet weather is quite low (i.e., poor conditions), reflecting their increased use.

**Figure 2.6.5: Trends in the use of the two most widely used organophosphate pesticides, diazinon and chlorpyrifos, and permethrin, the most widely used of the newer synthetic pyrethroids.** *The organophosphates have virtually disappeared from the County after their residential use was banned by the USEPA, in 2001 for chlorpyrifos and 2004 for diazinon. Trends for all three pesticides are significant at the  $p < 0.001$  level.*

**Figure 2.6.6: Trends over time in the exceedance index for a) organophosphate pesticides in dry weather and b) both organophosphate and pyrethroid pesticides in wet weather.** Higher values of the index indicate better conditions. Organophosphate pesticides reach an index value of 100 (no exceedances) in dry weather (a) and remain there, a trend significant at the  $p < 0.001$  level; pyrethroid exceedances appear in 2010 and increase quickly. While there are remaining exceedances for organophosphate pesticides in wet weather (b), the overall relationship between trends in the two types of pesticides reflects that in dry weather.

Despite the challenges of assessing pesticides' impacts in waterbodies, we do know that total reported pesticide use in Orange County has declined dramatically since 1998 (**Figure 2.6.7**). Inspection of detailed annual reports on the California Department of Pesticide Regulation's (CDPR) website shows this is due to declines in the use of glyphosate (i.e., Roundup) and a set of indoor fumigants used, for example, in termite treatment of homes and other structures. Glyphosate is an herbicide that is applied in the environment and there are some concerns about its potential water quality impacts. Indoor fumigants, in contrast, are not applied outdoors, degrade relatively quickly, and vent to the atmosphere. Because it has extended over nearly 15 years, this decline is likely due to a combination of causes, including changes in the real estate market (fumigation is required as a condition of sale), growing concern about health effects of toxic compounds, the greater use of spot applications of pesticides, and the increased availability of alternative non-pesticide treatments for indoor and structural pests.

The CDPR data show that large declines in pesticide use are possible, and provide promise that continued education and improved policy can contribute to environmental improvement. However, the chemicals that contributed most to the decline shown in **Figure 2.6.7** are not those (e.g., pyrethroids, fipronil) most often implicated in environmental toxicity. Further examination of the CDPR database would be needed to determine whether the aggregate amount of reported environmentally toxic pesticide applications has also declined in recent years. More importantly, there is a large and significant data gap related to retail purchases at hardware, gardening, and home improvement stores. Sales at these outlets are not reported to the CDPR and methods to reliably

**Figure 2.6.7: Total reported pesticide use in Orange County, drawn from the California Department of Pesticide Regulation's website ([www.cdpr.ca.gov](http://www.cdpr.ca.gov)).** *The amount applied annually has declined by over 50% since 1998 (regression significant at  $p < 0.001$ ). Note: Overall pesticide use appears to be declining.*

capture these data have not yet been developed. Continued efforts to expand the scope of pesticide sales / use reporting and to improve education on proper application and the use of effective alternatives (e.g., botanical oils) could reduce the loading of pesticides to the County's water bodies. For example, CDPR has developed new regulations for pyrethroid application that should substantially reduce pyrethroids in urban runoff. Such efforts will be amplified by the continuing focus on water conservation to reduce dry weather runoff (e.g., through Low Impact Development practices) and on reducing overuse to minimize or prevent toxicity in wet weather runoff, which are the two delivery

pathways for moving pesticides from the landscape to water bodies.

### 2.6.5 Recommendations

Past progress in identifying and controlling sources of contamination, the availability of a long time series of monitoring data, and the development of new monitoring and assessment tools provide the basis for this review of existing toxicity monitoring programs with the goal of improving their utility and efficiency. The following recommendations stem from a data-driven, risk prioritization approach that views monitoring, assessment, research, and management actions as a portfolio of related actions.

- Reassess management concerns and priorities about metals impacts in freshwater channels, bays and estuaries, and the nearshore coastal zone.
- To the extent that metals, particularly copper, remain a concern because of potential impacts in bays and harbors, recognize that inputs from antifouling paint, which are not an urban runoff issue, are likely a more important source than watershed input.
- Improve information on the use of pesticides in the County, particularly by the largest applicators
- Work with other interested parties to fill the data gap related to retail sales of pesticides.
- Examine the CDPR database to develop a more thorough picture of trends in reported pesticide use.
- Use this information to expand and focus cooperate outreach efforts about proper pesticide application and the

use of alternatives such as botanical oils that are effective, but nonlethal, insect deterrents.

- Use available data to streamline monitoring and improve its statistical and economic efficiency. Consider reducing the current focus on metals monitoring and targeting pesticide monitoring on less expensive representative constituents or surrogates. Consider reducing the frequency of sampling for sediment associated constituents to the Bight Program's sampling frequency.
- Given the overall low level of observed toxicity, consider increasing the use of adaptive responses (e.g., TIEs and other types of causal assessment) in place of intensive routine monitoring.
- Continue taking advantage of opportunities to reduce dry weather runoff to channels.
- Continue the productive relationship the University of California's South Coast Research and Extension Center and take advantage of opportunities for its Director to communicate the stormwater management perspective to CDPR.

## 2.7 Reconsideration of Monitoring Program Elements

### *The Story: Revisiting Program Designs*

- The designs of two program elements deserve reconsideration because of increased knowledge, improved monitoring and assessment tools, and shifting management priorities.
- Such reconsideration and adaptation is fully in the spirit of the Regional Board's recently adopted Framework for Monitoring and Assessment.
- The Coastal Ambient Program has served its purpose and documented that coastal stormwater discharges are not causing any meaningful exceedances or impacts in the very nearshore coastal zone.
- The Bight Program's regional assessment of the effects of stormwater discharges on protected areas at larger spatial scales is a more effective approach to answering questions about the potential impacts of stormwater discharges.
- Efforts to reduce dry weather flow, in part through water conservation and reclamation efforts have produced substantial declines in the amount of dry weather stormwater discharge.
- These reductions have resulted in concomitant reductions in the loads of a range of problematic constituents and represent an effective means of controlling pollution from urban runoff.

### 2.7.1 Coastal Ambient Monitoring has Served Its Purpose

The potential impacts of coastal stormwater discharges on the marine ecosystem have long been a concern because of the pollutants they carry to the ocean. Impacts could occur at the point of initial discharge where they are most concentrated and/or at larger distances as discharge plumes mix into the coastal ocean.

The Program's Coastal Ambient monitoring effort samples directly in front of and at a short distance up- and downcoast of key discharge points. It is designed to determine whether stormwater pollutants are reaching the surfzone in concentrations that exceed water quality objectives and are causing measurable toxicity. However, the prioritization analysis shows that this is not the case, with only minor exceedances and virtually no toxicity detected. The length of time this monitoring has continued and its consistent results in both wet and dry years suggests these findings are robust and reliable.

While the Coastal Ambient monitoring has confirmed that nearfield effects in the immediate vicinity of coastal discharges are not occurring, questions about the possibility of farfield effects, particularly on protected areas (ASBSs and MPAs), have not yet been resolved. This requires a more substantial effort and is being addressed by a Bight Program study that integrated several types of information on a regional scale. The Bight study included three main parts:

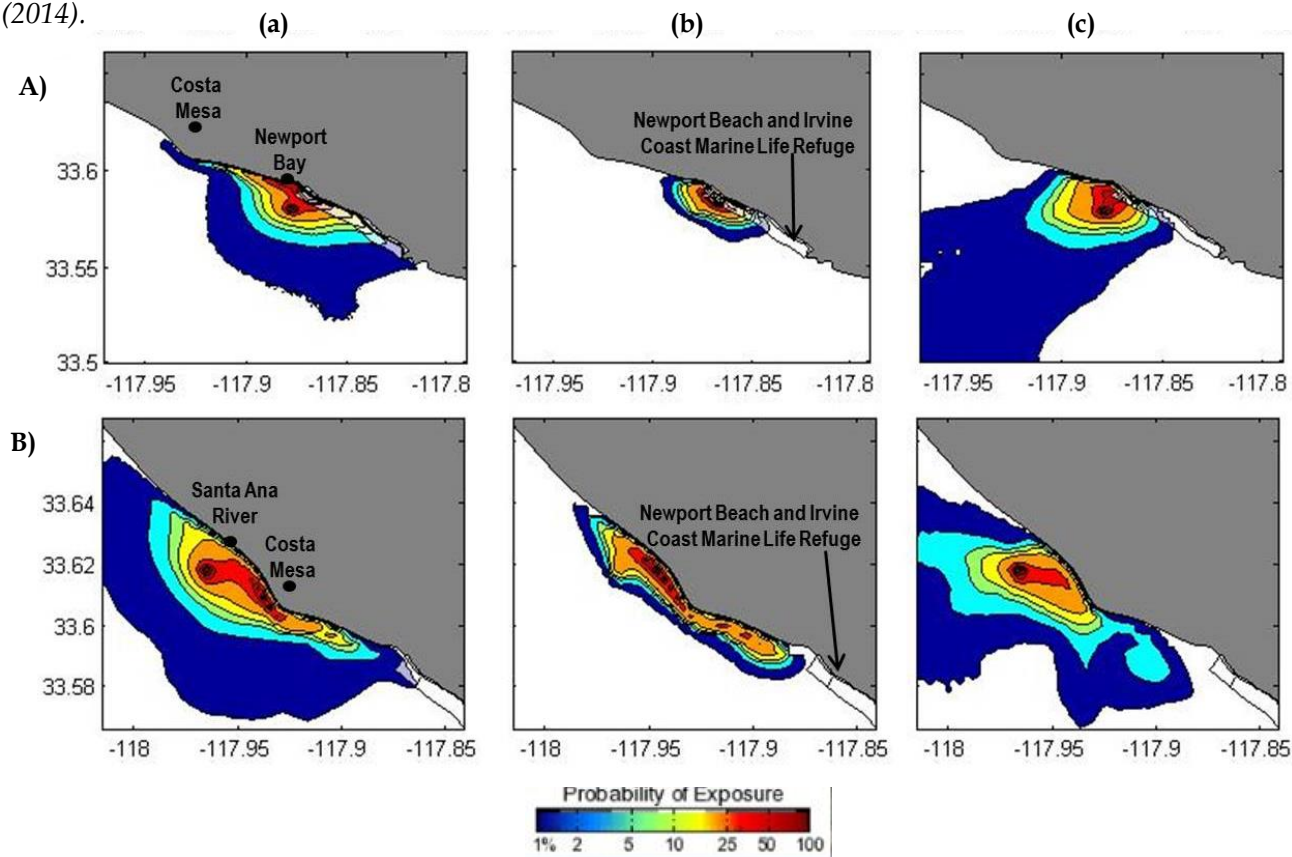

- A pollution index of the likely intensity of stormwater pollution at specific protected areas
- A fishing pressure index of the effects of commercial and recreational fishing on key species

- A new assessment tool for measuring the condition of biological communities on rocky reefs

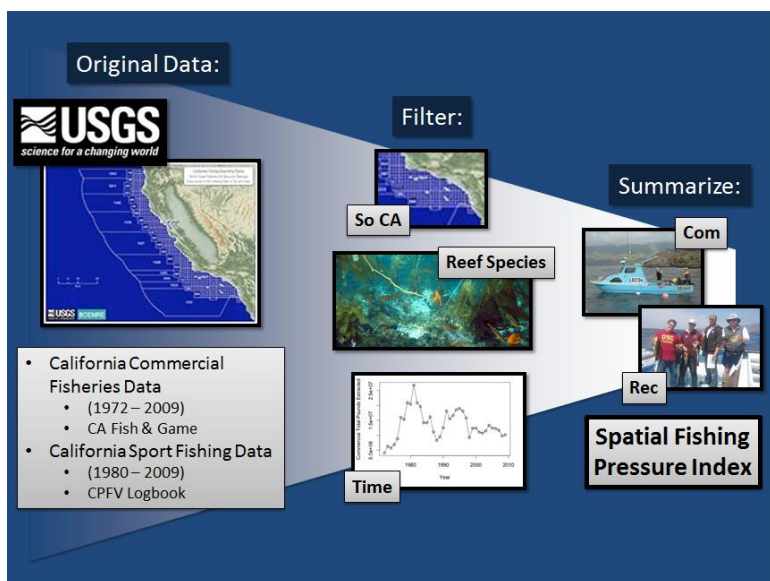

The pollution index was based on a plume dispersion model (**Figure 2.7.1**) (Rogowski et al. 2014) that estimated the probability that stormwater discharge plumes would overlap with specific protected areas. This was combined with a measure of pollutant loads to develop an estimated index of pollution intensity. The regional assessment will then compare the relative effects of fishing pressure (**Figure 2.7.2**) and pollution on the status of biological communities.

**Figure 2.7.1: Illustration of the use of coastal discharge flow and coastal current data to produce probability exposure maps for a series of discharges and nearby protected areas in southern California.** The figure is organized by rows for (A) Newport Bay, and (B) Santa Ana River. Additionally, each column represents a different temporal model run including (a) annual, (b) the February 22, 2008 storm event, and (c) the December 15, 2008 storm event. Local ASBS are also displayed in all figures and defined in column (b). The X-axis is longitude and the Y-axis latitude. Colors represent probability of plume exposure as indicated at the bottom of the the figure. These probability exposure maps are then combined with estimates of pollutant loads for each discharge to derive a pollutant index for each protected area. From Figure 3, Rogowski et al. (2014).

**Figure 2.7.2: Schematic of the data integration and synthesis steps involved in producing an index of fishing pressure on protected areas in southern California.** *From Update on Fishing Pressure Index presentation by SCCWRP, Ocean Science Trust, and Occidental College Vantuna Research Group, March 2, 2014.*

## 2.7.2 Runoff Reduction, a Powerful All-Around Tool

Evidence from a number of the Program’s monitoring efforts documents the value of water conservation and reduced urban runoff (i.e., discharge flow into streams and channels) in reducing pollutant inputs and their impacts. Water conservation and related efforts to reduce urban runoff therefore represent a potentially powerful all-around tool for addressing impacts of urban runoff. While water conservation efforts motivated by state and local policies provide the underlying impetus, pollutant control could add another important rationale for pursuing such policies as part of a larger, coordinated strategy. The effectiveness of such programs is dramatically illustrated by the declining trend of dry weather discharge flow to channels and streams from urban outfall (Figure 2.7.3).

The integrated regional approach includes a more much more powerful and relevant set of questions and methods to address the potential impacts of coastal stormwater discharges on marine ecosystems. The Program’s future efforts to assess the potential impacts of coastal discharges should therefore focus on contributing to this regional effort rather than continuing to monitor at extremely local scales in the vicinity of each discharge point.

**Figure 2.7.3: Discharge of dry weather flow to channels and creeks from urban outfalls has declined dramatically despite an increase in regional population. The decline spans both wet and dry years and is therefore not simply a result of drought conditions.**

### 3.0 Controlling Pollutant Sources: Jurisdictional Programs

#### 3.1 Overview

The management of sources of pollution from diffuse urban areas involves the strategic application of Best Management Practices (BMPs) to activities and drainage systems within the urban environment. The purpose of BMPs is to protect water quality by reducing pollutant loads and concentrations and by reducing discharges (volumetric flows and flow rates) causing stream channel erosion.

The DAMP is the principal policy and program guidance document for the *Program*. At its core is a series of Model Programs that are individually implemented by the Permittees in accordance with DAMP/Local Implementation Plans (LIPs). These Model Programs are intended to enable the Permittees to:

- Improve existing municipal pollution prevention and removal BMPs to further reduce the amount of pollutants entering the storm drain system (**Model Municipal Activities and Model IPM Program**);
- Educate the public about the issues of urban stormwater and non-stormwater pollution and obtain their support in implementing pollution prevention BMPs (**Model Education and Outreach Program**);
- Ensure that all new development and significant redevelopment incorporates appropriate Site Design, Source Control and Treatment Control BMPs to address specific water quality issues (**Model Land Development Program**);
- Ensure that construction sites implement an effective

combination of erosion and sediment controls and on-site hazardous materials and waste management (**Model Construction Program**);

- Ensure that existing development addresses discharges from industrial facilities, selected commercial businesses, residential development and common interest areas/homeowner associations (**Model Existing Development**), and
- Detect and eliminate illegal discharges/illicit connections to the municipal storm drain system (**Model ID/IC Program**).

## 3.2 Municipal Infrastructure and Integrated Pest Management

### *The Story: Municipal*

- The Model Municipal Activities Program ensures that BMPs are implemented and maintained at over 1,700 municipal facilities.
- Municipal services, including trash and debris removal, solid waste collection, household hazardous waste disposal and street sweeping were established prior to the First Term MS4 Permits but are monitored and contribute to water quality protection.
- The Model Integrated Pest Management Program ensures municipal conformance with an Integrated Pest Management Policy developed in partnership with University of California Cooperative Extension. Implementation of the policy is resulting in reductions in municipal fertilizer and pesticide use.

### 3.2.1 Overview

The Permittees own and operate facilities and build and maintain much of the transportation, drainage and recreational infrastructure of the urban environment. To ensure that BMPs are incorporated into municipal areas and infrastructure maintenance programs, the Permittees have followed a systematic process of BMP evaluation of municipal areas, activities and drainage facilities since the First Term Permits. The Permittees also implement Integrated Pest Management (IPM) approaches at municipal sites to address sources of toxicity from municipal activities.

## 3.2.2 Municipal Activities Program Implementation and Assessment

The Model Municipal Activities Program has been implemented since 2002-03. It requires the Permittees to:

- Inventory municipal sites
- Prioritize municipal areas and maintenance activities based upon water quality threat
- Prepare BMP guidance
- Conduct inspections of municipal areas/facilities
- Implement Model Maintenance Procedures
- Conduct training
- Implement an IPM Policy
- Examine retrofit opportunities for municipal facilities

### Site Inventories

Annually, the Permittees inspect over 1,700 municipal facilities comprising 27% high priority sites, 11% medium priority sites and 62% low priority sites.

### BMP Guidance

The Permittees have produced BMP factsheets for the Model Municipal Program that are available at [www.ocwatersheds.com](http://www.ocwatersheds.com). In addition to training, these BMP factsheets serve as the primary guidance for Permittee municipal maintenance procedures. The Permittees will complete a review of the municipal BMP factsheets in late 2014 or early 2015.

## Training

Municipal training materials for “Municipal 101” were available for Permittee use as a “train the trainer” tool covering the minimum required BMPs discussed in the fact sheets. The focus of municipal training during the permit term was on development and implementation of jurisdictional IPM programs (**Table 3.2.1**).

In the Fifth Term MS4 Permit, the Permittees will examine opportunities to enhance training formats with “flip the classroom” approaches that emphasize in-classroom discussion and hands-on application of concepts.

**Table 3.2.1: Municipal Training**

Date	Subject Matter/Title	Target Audience	Permittee Staff in Attendance
September 15, 2010	Integrated Pest Management (IPM) Training	Stormwater Program Managers	23
May 17, 2012	Implementing Integrated Pest Management Policy Within Local Jurisdictions: The Impacts of Pesticide Formulations and Exotic Pests	Municipal Training Instructors and Field Staff	52
May 15, 2013	Implementing Integrated Pest Management Policy Within Local Jurisdiction: The Who, What, Where and Why	Stormwater Program Managers and Field Staff	32

## Inspection and BMP Implementation

### *Municipal Facilities*

Inspectors implement the Model Municipal Program by ensuring implementation of the Model Maintenance Procedures. For each facility, inspectors categorize the degree of BMP implementation on site as “fully implemented,” “partially implemented” or “not implemented.”

Since 2008, more than 90% of facilities have consistently implemented all required BMPs. In addition, the number of facilities with no BMP implementation has decreased since 2009 from 2.4% to 0.28% of facilities (**Figure 3.2.1**).

**Figure 3.2.1: Municipal Area Inspections and BMP Implementation from 2008-09 to 2012-13**

Between 2008 and 2013, a majority of Permittees reported inspecting an average of more than 90% of catch basins on an annual basis and 100% of catch basins on a bi-annual basis (Figure 3.2.2). The percentage of drainage facilities requiring cleaning as a result of inspections has remained approximately 80% (Figure 3.2.2).

**Figure 3.2.2: Catch Basin Inspections Performed from 2008-09 to 2012-13**

### Municipal Services (Baseline BMPs)

Permittees collect data on a number of municipal activities that pre-date the adoption of MS4 permits for Orange County, but nonetheless contribute significantly to water quality protection. These “baseline BMPs” include storm drain

cleaning, street sweeping, solid waste and household hazardous waste collection, used oil grant participation and trash and debris control.

### Storm Drain Maintenance

The Permittees inspected and cleaned an average of 210 miles of storm drain and removed an average of 6,279 tons of material on an annual basis (Figure 3.2.3).

**Figure 3.2.3: Drainage Facility Maintenance and Material Removed from 2008-09 to 2012-13**

### Household Hazardous Waste (HHW) Collection

OC Public Works finalized a memorandum of understanding

with OC Waste and Recycling on June 23, 2010 to ensure that household hazardous waste collection, transfer and disposal practices do not cause or contribute to water quality problems. The County, on behalf of the Permittees has collected an annual average of almost 3,600 tons of household hazardous waste since 2008 (Figure 3.2.4).

**Figure 3.2.4: Tons of Household Hazardous Waste Collected from 2008-09 to 2012-13**

*Used Oil Grant Participation*

Nearly all of the Permittees and the County’s Health Care Agency participated in the Used Oil Grant program during the past five years. Through these programs, hundreds of thousands of gallons of used oil and tens of thousands of used oil filters have been collected and disposed of properly,

preventing these contaminants from entering the environment (Figure 3.2.5).

**Figure 3.2.5: Used Oil and Filters Collected from 2008-09 to 2012-13**

*Trash & Debris Control*

Trash can degrade surface water quality and negatively impact aquatic habitat. The Permittees utilize a combination of trash and debris controls to address this issue. Controls include structural BMPs such as debris booms, catch basin inserts and continuous deflection separation (CDS) units and source control BMPs such as public education and street sweeping. The Orange County Stormwater Program GIS Cloud layer includes locations of all trash and debris booms

(<http://oc.giscloud.com/map/242085/orange-county-stormwater-program-san-diego-region>).

The Permittees also engage the public in cleanup events throughout the year when requested and annually every September for Inner-Coastal & Watershed and Coastal Cleanup Day, resulting in the removal of thousands of pounds of trash and debris. The County also initiated a pilot Adopt A Channel program in 2012 whereby Disneyland Resort adopted a 2-mile segment of Anaheim Barber City Channel and a debris boom. Though the pilot adoption was within the Santa Ana Region, the County is in the process of expanding the program county-wide to promote community involvement in keeping trash out of local waterways and to supplement jurisdictional resources.

Additionally, ongoing efforts to characterize the flux of trash and debris through the County's urban watersheds may ultimately produce recommendations for enabling management and maintenance approaches to be more effectively prioritized. These efforts include the Newport Bay Trash Management Plan and South Orange County Trash and Litter Special Study described in Section 3.2.4 of the 2012-13 Unified Annual Report. Also, the Permittees collaborated on the Stormwater Monitoring Coalition's (SMC) Regional Bioassessment Study to incorporate trash and debris data from multiple sampling sites throughout southern California in 2012 and 2013. As a result of ongoing watershed and regional trash monitoring efforts, the Permittees would like to see the opportunity retained for jurisdictions to leverage the information arising from these studies to prioritize control efforts consistent with the MEP standard established by the statute.

### Model Integrated Pest Management Program

Since pesticide-related water column toxicity is a priority issue of countywide concern, Integrated Pest Management (IPM) will continue to be a focus of the Program. A key component of an effective Integrated Pest Management (IPM) Program is an emphasis on maintaining plant health through proper fertilizer and pest management. Reducing unnecessary fertilizer and pesticide applications reduces the opportunity for these chemicals to inadvertently enter local waters through irrigation and rain events.

The Permittees formally adopted individual IPM Policies during the 2010-2011 reporting period based on an IPM Policy template developed with assistance from University of California Cooperative Extension (UCCE). The result has been the adoption of a set of basic IPM guidelines implemented by each public agency.

#### *Fertilizer*

Fertilizer usage is tracked and reported by total nitrogen, phosphorus and potassium applied per acre. Since 2010, the amount of all three nutrients applied per acre has decreased; nitrogen per acre decreased 49%, phosphorus per acre decreased 60% and potassium decreased by 55% (**Figure 3.2.6**).

Figure 3.2.6: Fertilizer Applied per Acre 2008-09 to 2012-13

Figure 3.2.7: Active Ingredient Herbicide Applied 2008-09 to 2012-13

### Pesticides

Permittees have utilized fewer pounds of insecticides on an annual basis since 2010, especially those recognized by research as having the greatest potential for causing aquatic toxicity. For the 2012-13 reporting year, Permittees reduced application of the herbicide glyphosate by 62% (**Figure 3.2.7**). Additionally, Permittees reduced overall application of pyrethroid, organophosphate and phenylpyrazole pesticides by 47% collectively between 2012 and 2013 (**Figure 3.2.8**).

**Figure 3.2.8: Active Ingredient Pesticide Applied 2008-09 to 2012-13**

### 3.2.3 Municipal Retrofit Opportunities & the Practical Vision for Sustainable Water Supply

#### Municipal Retrofitting

Municipal stormwater retrofits and specifically regional stormwater retrofits are potentially an important tool in the municipal stormwater tool box. Municipal stormwater retrofits provide an opportunity to implement BMPs to provide treatment for existing urban areas, assist with achieving TMDL compliance, serve as offset mitigation for land development and contribute toward integrated water resource management.

Through the Orange County BMP Retrofit Opportunities

Study numerous potential stormwater BMP retrofit sites were identified in various municipal right-of-ways. Water quality models have also been developed for some of the watersheds in Orange County that can help identify the water quality benefits of the proposed BMP sites. The Permittees will continue to identify public land suitable for stormwater retrofitting and projects supportive of the “*Practical Vision – A Vision for Achieving a Sustainable Local Water Supply* (SDRWQCB 2013).”

#### *OCTA Environmental Cleanup Grant Program*

The Permittees have also implemented trash and debris controls and regional retrofit projects through the Orange County Transportation Authority (OCTA) Measure M Environmental Cleanup Program. The structure of the Environmental Cleanup Program, its management and coordination with the Permittees was discussed in Section C-3.2.6.1 of the 2012-13 Unified Annual Report. **Section 6.0** of this report summarizes the two-tier grant process which provides funding for BMPs, including catchbasin screens and regional multi-jurisdictional projects.

#### Green Infrastructure

Green infrastructure is also an important tool in the municipal stormwater tool box. Green infrastructure incorporates LID concepts to help achieve stormwater management goals of improving water quality and reducing volume of stormwater runoff while also meeting infrastructure needs of municipalities in a sustainable manner. Opportunities exist for implementation of green infrastructure either as a part of municipal capital improvement projects (CIP) or as part of Green Street retrofit projects. Evaluation of how green

infrastructure can be incorporated into CIP or as part of green street retrofit projects will be undertaken.

### 3.2.4 Recommendations

Based upon consideration of the water quality priorities of the Program (bacteria, nutrients and pesticide related toxicity) and the evaluation of program implementation, the recommendations are:

1. **Enhance municipal training** to address common issues encountered through municipal related complaints and to utilize innovative education formats to encourage effective discussion-based learning. The four most common issues that occur are: trash/debris, pathogen/bacteria, hydrocarbons and exempt discharges (County of Orange PNIR data, n=205 municipal related complaints, 2008-2012). Training will focus on in-classroom engagement of concepts learned prior to the training session and focus on reducing issues and pollutants of concern through specific actions (e.g. runoff reduction to reduce bacteria loading).
2. **Develop a municipal green infrastructure program** that could include evaluation of opportunities for pilot green street projects of different land use/density configurations and development of a green street guidance manual.
3. **Examine public land retrofit opportunities** for regional BMPs and propose a program to evaluate previously identified regional retrofit opportunities in jurisdictionally owned areas for use in TMDL compliance and LID and/or hydromodification management alternative compliance. This effort will involve the development of watershed models and evaluation of the previously identified
- potential BMP retrofit sites. Previous reviews (e.g. 2005 RBF retrofit study) will be integrated with current mapping.
4. **Develop and initiate the implementation of individualized IPM Guidelines for each Permittee** with the goal of demonstrating significant and consistent reductions in fertilizer and pesticide applications based on the mission and goals outlined in jurisdictional IPM Policies.
5. **Conduct pilot soil and/or leaf tissue analysis to guide fertilizer use** to ensure nitrogen is not applied at annual rates above those recommended by UCCE research. The Permittees would identify the most fertilizer-intensive area by type (e.g. sports fields) and select one site for analysis. The analysis would assist Permittees in fine-tuning nitrogen application based on the needs of plants at the highest use areas.
6. **Improve methods for documenting usage of fertilizer and active ingredient of pesticide on an annual basis** to allow for more reliable data on the acreage receiving fertilizer applications. In collaboration with the UCCE, a standardized reporting method would be developed, improving reporting accuracy on both the amount of nitrogen and pesticides applied by Permittees on an annual basis. The objective would be to minimize fertilizer applications where annual rates exceed those recommended by UC research (174 -261 lbs. N/acre) while more accurately capturing the acreage to which fertilizer is applied.
7. **Expand training to include peer-reviewed online training**

**courses offered by University of California IPM (UC IPM) and UCCE** to ensure the IPM and water quality message reaches as many field staff as possible. Possible options include the UC IPM Urban Pesticide Runoff and Mitigation online training series developed by UC academics across the state to provide a more suitable method to reach field staff unable to attend in-person training. The online training consists of a series of courses directly addressing the impacts of pesticides on water quality as well as practices to mitigate these impacts (<http://www.ipm.ucdavis.edu/training/upr-mitigation.html>).

2. X = Performance Standard will be completed during this fiscal year. Gray shaded cells indicate ongoing implementation.

### 3.3 Public Outreach

#### *The Story: Public Outreach*

- Public awareness surveys conducted approximately every three years demonstrate increased levels of awareness regarding stormwater concerns and several positive behavior changes regarding car washing, use of landscape management products, and pet waste.
- The Program achieved over 155 million impressions through various forms of paid media, and over 5.5 million impressions at outreach events from 2008 to 2013.
- Outreach to school-age children provided water pollution prevention education to over 125,000 students and the Permittees helped support several targeted academic programs throughout the Fourth MS4 Permit term.
- The Permittees initiated a strategic behavior-specific outreach program in 2012.
- The Program enhanced partnerships with the Municipal Water District of Orange County, Chapman University and the University of California Cooperative Extension (UCCE) during the Fourth MS4 Permit term.
- Reductions in outdoor water use, retrofitting the residential environment to reduce outdoor water demand and elimination of runoff from irrigation are the foci of action-based outreach efforts initiated in 2013.

### 3.3.1 Overview

Ongoing education of the public about environmentally protective behaviors is essential foundational to improving water quality. The goal of the Education Program is to build engagement with residents, encourage and document the adoption of BMPs and increase the overall knowledge of Orange County residents and businesses regarding water quality protection. The Education Program was strategically re-branded from “Project Pollution Prevention” to “H<sub>2</sub>OC” in 2012 to stress the importance to Orange County residents of water resource stewardship.

### 3.3.2 Public Outreach Program Accomplishments and Assessment

For the past decade, H<sub>2</sub>OC (previously Project Pollution Prevention) has used public awareness surveys to assess awareness of and behavior change regarding stormwater issues. Survey results indicate small but significant increases in awareness around causes and prevention of stormwater pollution and increased levels of participation in BMPs. Most notably, survey results indicate several positive behavior changes among Orange County residents since 2003 including:

- Willingness to use a commercial car wash facility in lieu of home car washing (five percent increase);
- Proper use of lawn and garden fertilizers and pesticides (five percent increase); and
- Picking up waste and droppings from their pet (nine percent increase).

The Permittees will continue to conduct public awareness surveys to measure and assess awareness of Orange County

residents on water quality issues. These surveys will seek to measure water quality knowledge, current participation in stormwater safe behaviors, and willingness to participate in the same. Additional tracking of specific behavior campaigns, as discussed below, will be measured with pre-initiation and post-completion surveys to better evaluate effectiveness. Finally, the Permittees will continue to measure impressions garnered from the mass media campaigns. Collectively, these measures will help evaluate the success of the various public outreach efforts.

### Media Outreach and Impressions

The Permittees have consistently improved the reach of paid advertising since the program began in 2003 and exceeded goals for achievement of impressions through media. The Permittees achieved the following from 2008 through 2013:

- 155 million total paid media impressions including traditional print (e.g. newspaper) ads, bus shelter and bus side posters, billboards, internet banner ads, radio, movie theater and television public service announcements, and gas pump banners; and
- More than 5.5 million grassroots impressions including outreach events like environmental fairs, beach and channel clean-up days, newsletters and workshops.

During the 2012-13 reporting year, the Permittees garnered a total of 40,218,892 impressions through various forms of media (**Figure 3.3.1**).

### Earned Media

Earned media includes any unpaid publicity through sources like television (e.g. news reports), newspaper articles, social media (e.g. Facebook, Twitter, or blogs), or other media platform (e.g. podcasts, YouTube, etc). The inclusion of earned media into the total impression count provides a more accurate assessment of the true number of impressions earned, and helps increase public trust in the program overall. The Permittees garnered a total of 18,405,509 impressions from earned media during the 2012-13 reporting year (**Figure 3.3.1**).

The Permittees will examine methods for increasing program presence on social media in the Fifth Term Permit to encourage residential adoption of specific BMPs associated with *action campaigns*. Development and implementation of these campaigns is described in **Section 3.3.4**.

**Figure 3.3.1: Media Impressions by Region 2012-13**

### 3.3.3 Youth Outreach

Children are crucial to the dissemination of water quality information as key messengers and influencers of parents' behavior. The 2012 Public Awareness Survey indicated that forty-six percent (46%) of adults with school-aged children at home received information about water pollution prevention, an increase of 20% over the 2009 Survey. Additionally, parents of students who brought home information were three times more likely to engage in 7 out of 7 identified "stormwater safe" behaviors (22% to 7%).

The Permittees have maintained and enhanced a robust school outreach program since 2008, including:

- Direct outreach to more than 125,000 students through provision of workbooks, support and assistance designing watershed education programs and funding of programming focused on addressing water quality issues;
- Achieved more than 400,000 total impressions through programs to educate teachers (i.e. Project WET) and the general public at the Discovery Science Center; and
- Development and support of targeted academic programs through partnerships with educational institutions in the community to ensure a consistent message and increase breadth of outreach (e.g. Municipal Water District of Orange County, Chapman University).

### 3.3.4. Behavior Specific Campaigns

There are a variety of actions an Orange County resident can take to help protect water quality, ranging from picking up

after their dog to reporting illegal dumping. However, studies have shown that people can become easily overwhelmed when presented with multiple options, leading to inaction.

Through behavior-specific campaigns the Permittees will target narrow behaviors most likely to have a positive impact on water quality. Target behaviors will be selected by assessing public awareness survey data, water quality monitoring results and the needs of the Permittees.

Behavior-specific campaigns began in 2012; assessment of these efforts will serve as a robust foundation from which future campaigns are determined. Specific achievements include:

- Development of a comprehensive strategic plan in 2012 (2012 Strategic Plan) including extensive analysis of Orange County residents, ongoing biennial surveys, and independent research; and
- Prioritization of target behaviors based on public awareness surveys and water quality monitoring data.

The Permittees intend to employ best practices to implement behavior-specific campaigns using the Community Based Social Marketing (CBSM) model. CBSM steps include:

- Identifying barriers and motivators to an activity;
- Developing a strategy that utilizes tools to leverage those barriers and motivators in order to affect behavior change;
- Pilot the strategy; and
- Evaluate the strategy and refine it for broader implementation.

The Permittees will use these principles in tandem with mass media outreach efforts to continue fostering general public awareness of stormwater issues.

### *Targeted Outreach Campaigns*

The 2012 Strategic Plan concluded that existing outreach efforts should be supplemented by targeted outreach to small, community-based groups in *action campaigns*. Evaluation of each *action campaign* includes setting baseline measures and conducting follow-up assessments using the CBSM model to create long term engagement and to track success.

Each *action campaign* focus is determined by assessing the following variables:

- *Identification of key pollutants* – the Permittees will examine and prioritize key pollutants based on level of harm they pose to the environment and prevalence in water quality data. Once identified, constituents of concern will be further prioritized by likelihood of education impacting the presence of these pollutants;
- *Determine return on investment (ROI)* – the Permittees will assess which behaviors would produce the largest ROI, predicted by assessing the number of people performing that action (i.e. prevalence) and the likelihood that those people would change that action. This step balances ease of performing a behavior and the potential environmental impact; and
- *Consideration of external opportunities and needs* – the final step considers opportunities to leverage campaign messages and tactics with existing programs and/or messaging elsewhere in the Orange County Stormwater Program or by other agencies or groups.

### **3.3.5 Runoff Reduction and Water Use Efficiency**

Runoff reduction stresses onsite retention of runoff by utilizing BMPs to intercept, capture, and infiltrate rainwater to reduce runoff and pollutant loading. The Permittees will continue to build upon partnerships with water purveyors to marry water use efficiency and runoff reduction messaging, increasing message consistency and breadth. Since 2008, the Permittees have nurtured relationships with other agencies and community groups to accomplish the following:

- Collaborated with water utility providers on water use efficiency messaging by participating in stakeholder meetings and providing presentations on key stormwater pollution issues (e.g. Municipal Water District of Orange County).
- Utilized partnerships with the University of California Cooperative Extension (UCCE) to outreach to plant nursery owners and operators and other landscape representatives.

The Permittees will continue to foster these relationships to promote reductions in runoff and overall water use. Investment in coordination of programs and specific action campaigns will continue with campaigns such as the [“Overwatering is Out”](#) initiative launched in 2013.

### 3.3.6 Website Content and Usability

Public awareness surveys indicate that the number of residents seeking information about watersheds and water pollution prevention from the internet continues to increase. In order to ensure water quality data, watershed information and public education materials are available to the public in an easily accessible online format is important to the success of the program.

Building off of the San Diego Regional Water Quality Control Board *Practical Vision for Proactive Public Outreach and Communication* (SDRWQCB 2013), the Principal Permittee will review the [ocwatersheds.com](http://ocwatersheds.com) website to assess usability and with the goal of increasing access to mapping tools, water quality data and BMPs to prevent water pollution and urban runoff.

### 3.3.7 Recommendations

The Permittees intend to focus on the following:

1. **Emphasize outreach to school-age children** to continue building upon existing partnerships and increasing knowledge of the Orange County community as a whole through increasing knowledge of youth.
2. **Incorporate current strategic approach of using public awareness survey results to prioritize outreach efforts** based on behaviors of concern in tandem with water quality results to document small-scale behavior change over time.
3. **Coordinate with water supply agencies** to incorporate water use efficiency and runoff reduction messaging to maximize program reach and ensure requested behavior changes align with water use efficiency techniques supported by other agencies. Coordinate to encourage behaviors and develop programs supportive of building a sustainable local water supply as identified in the Practical Vision; including building social norms around water use efficiency and elimination of irrigation runoff.
4. **Develop focused outreach campaigns based on water quality and survey results** utilizing CBSM techniques to document changes in targeted behaviors. The Permittees will develop focused campaigns supportive of a singular message with the goal of reducing competing messaging that may lead to inaction. CBSM tactics will be utilized to target behaviors associated with water quality priorities identified by the Permittees.
5. **Encourage greater public participation in stormwater pollution prevention and elimination of non-stormwater discharges** through the use of CBSM and increased availability to online resources. *Action campaigns* would encourage residents to take an identified action and to share efforts with others.
6. **Social media calendars will synchronize outreach efforts and encourage direct participation in and sharing of program messaging.** Social media forms of earned media will complement *action campaign* elements by encouraging direct residential participation in programs. Activity on social media significantly increases with boosted posts and paid advertising; these unpaid and paid tools will support CBSM programs.
7. **Review website for usability and revise structure as needed to meet goals of increasing public use of web content.** The goal of the review will be to increase access to mapping tools, water quality data and BMPs to prevent water pollution

Gray shaded cells indicate ongoing implementation.

### 3.4 New Development/Significant Redevelopment

#### *The Story: New Development/Significant Redevelopment*

- The Permittees developed a significantly revised Model Water Quality Management Plan (WQMP) and Technical Guidance Document (TGD) to implement new requirements for the implementation of Low Impact Development (LID) BMPs.
- The Permittees implemented the new Model WQMP and TGD for all priority projects in north Orange County starting on August 17, 2011, and in south Orange County starting on December 20, 2013.
- The Permittees are implementing region-specific approaches to hydromodification management.
- During the permit term (through the 2012-13 reporting period) 1,369 WQMPs for public and private projects were approved across all of Orange County for a total of 18,749 acres of development now that are now subject to Project WQMPs.
- South Orange County was mapped and a geodatabase was developed that includes conveyance systems, infiltration constraints, land use, and soil types. The County is using the geodatabase to evaluate channel susceptibility to hydromodification, and opportunities and constraints for infiltration and treatment BMP implementation at various scales.

#### 3.4.1 Overview

Development creates rooftops, driveways, roads and parking

lots which increase the timing and volume of rainfall runoff (compared to pre-development conditions) and provide a source of pollutants that are flushed or leached by rainfall runoff or dry weather runoff into surface water systems. Since the inception of the Program, it has been recognized that the incorporation of BMPs into a development project in its planning stages offers the most effective opportunity to limit increases in pollutant loads and preserve natural hydrologic processes. Consequently, the Program links new development and significant redevelopment BMP design, construction and site operation to the earliest phases of new development project planning, encompassed by the jurisdictional General Plans, environmental review and development permit approval processes.

The New Development/Significant Redevelopment Program has evolved over successive MS4 Permit terms from a narrow focus on discharge water quality to a broader consideration of the hydrologic impacts of land use change. Routine structural and non-structural BMPs implemented during the first two permit terms aimed to minimize the introduction of pollutants into the drainage system. In the third MS4 Permit term, the Permittees continued to implement routine structural and non-structural BMPs, but they also worked with project proponents to improve site design. The current Fourth Term Permits emphasize use of site design BMPs and bring the concepts of LID and hydromodification control to the forefront.

The Model WQMP describes the process that Permittees employ for developing a Project WQMP for individual new development and significant redevelopment projects, which, minimizes the effects of urbanization on site hydrology, runoff flow rates or velocities and pollutant loads. Following approval of the final project WQMP and construction of the

project, the Project WQMP will also serve to maintain the terms, conditions and requirements with the project proponent and their successors over the entire life of the project. The effects of urbanization will be minimized through implementation of practicable and enforceable project-based controls or stormwater BMPs, or through a combination of project-based and regional BMPs.

### **3.4.2 New Development/Significant Redevelopment Program Implementation and Assessment**

#### Model Water Quality Management Plan (WQMP)

A new Model WQMP and TGD were developed during an eighteen month stakeholder process. Implementation of the new Model WQMP and TGD commenced on August 17, 2011, in north Orange County and on December 20, 2013, in south Orange County. This Model WQMP identifies appropriate LID practices and BMPs and alternative compliance programs for new development and significant redevelopment projects. LID BMPs must be selected based on a hierarchy of control types and sized to capture the maximum feasible portion of the design capture volume using the highest priority control type (e.g., retention). The next lower priority control type (biotreatment) can only be used for any portion of the design capture volume that cannot be feasibly captured by retention BMPs.

In accordance with the Model WQMP, new development and significant redevelopment projects meeting threshold criteria, are required to develop and implement a Project WQMP that includes LID and hydromodification control BMPs, where necessary, at the earliest conceptual planning stages of a project for early review. Depending upon the project size and characteristics, these may include:

- BMP site design measures;
- Implementing LID BMPs on-site;
- Constructing or participating in sub-regional/regional LID systems;
- Implementing hydromodification control BMPs; and
- Using alternative programs or treatment control BMPs.

In addition, the Model WQMP includes more rigorous requirements regarding assessing and abating hydromodification impacts. The effects of hydromodification can be mitigated with the use of LID strategies, site design and hydrologic source controls.

In south Orange County an interim hydromodification performance standard was applied to development and redevelopment projects starting in December 2010. This performance standard has been superseded by the requirements of the Hydromodification Management Plan (HMP).

Project WQMPs are required for private new development and significant redevelopment projects within Permittees' jurisdictions, and equivalent public agency capital projects undertaken by the Permittees that are either:

- "Priority Projects" meeting one of the criteria identified in the Permit, regardless of project size.
- "Non-Priority Projects" that do not qualify as one of the Priority Project Categories but meet one of the following:
  - Require discretionary action that will include a precise plan of development, except for those

projects exempted by the Water Quality Ordinance (as applicable), or

- Require issuance of a non-residential plumbing permit.

### BMP Implementation

Since 2002, a total of 4,152 Project WQMPs have been approved, covering 40,461 acres which represents 9.3% of the area within Orange County subject to subject to the regulatory provisions of the Third and Fourth Term MS4 Permits (681.4 square miles). During the current Fourth Term MS4 permit term 1,369 WQMPs for public and private projects were approved for a total of 18,749 acres of development (**Figure 3.4.2**).

**Figure 3.4.2: Historical WQMPs and Acreage Covered**

The Project WQMP for a Priority Project must include:

- Routine structural and non-structural Source Control BMPs;
- Site Design BMPs (as appropriate);
- Runoff retention BMPs, also referred to as LID BMPs – requirements may be met through either project specific (on-site) controls or, in cases of on-site infeasibility, regional or watershed management controls that provide equivalent or better treatment performance, subject to certain conditions described in the Model WQMP; and
- The mechanism(s) by which long-term operation and maintenance of all structural BMPs will be provided.

The Project WQMP for a Non-Priority Project must include:

- Routine structural and non-structural Source Control BMPs;
- Site Design BMPs (as appropriate); and
- The mechanism(s) by which long-term operation and maintenance of all structural BMPs will be provided.

Following approval of the Model WQMP in 2011, 9,764 acres of development in north Orange County have incorporated LID BMPs. Progress with implementation of the LID-based Model WQMP in south Orange County will be discussed in the FY2013-14 Annual Report.

Since each site with an approved Project WQMP may incorporate multiple BMPs, there is now in Orange County a growing inventory across the urban landscape of many thousands of BMPs. The emergence of Geographical Information System (GIS)-based software allows (1) strategically managing an inspection program to ensure the continued effectiveness of these BMPs and (2) evaluation of

the impact of constructing features in the urban landscape intended to be protective of water quality.

### Training

To provide land developers, project proponents, and associated consultants and organizations with an overview of the new land development requirements, training for NPDES Program Managers, planners, plan checkers and the development community was provided in July and September 2011 for north Orange County and was repeated for south Orange County in October, 2013. The training provided an overview of the level of detail that must be included at each phase of the WQMP preparation process, site and watershed assessment methods, LID BMP selection and prioritization methods, LID BMP design standards and performance criteria, regional LID BMP options, watershed-based plans and LID alternative compliance options. All of the training modules have been posted to the OC Watersheds website ([http://www.ocwatersheds.com/WQMP\\_FAQs.aspx](http://www.ocwatersheds.com/WQMP_FAQs.aspx)) and YouTube.

### General Plan Assessment and Development Standards Review

In October 2009, the Principal Permittee hosted a workshop for the Permittees to provide guidance on assessing their General Plans and development standards review to ensure the following LID principles are considered in their review, and considered for inclusion in some fashion as appropriate, in the General Plan and Local Coastal Plan (if applicable):

- Limit disturbance of natural water bodies and drainage systems; conserve natural areas; minimize soil compaction to landscaped areas; protect slopes and channels; and minimize impacts from stormwater and

urban runoff on the biological integrity of natural drainage systems and water bodies;

- Minimize changes in hydrology and pollutant loading; ensure that post-development runoff rates and velocities from a site have no significant adverse impact on downstream erosion and stream habitat;
- Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground; construct streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided that public safety is not compromised;
- Preserve wetlands, riparian corridors, and buffer zones and establish reasonable limits on the clearing of vegetation from the project site;
- Encourage the use of water quality wetlands, biofiltration swales, watershed-scale retrofits, etc., where such measures are likely to be effective and technically and economically feasible;
- Provide for appropriate permanent measures to reduce storm water pollutant loads in storm water from the development site; and
- Establish development guidelines for areas particularly susceptible to erosion and sediment loss.

### Enhancements in Methodologies

The County of Orange as Principal Permittee participates in a number of collaborative studies and initiatives on behalf of the Permittees that are aimed at the further development of

assessment techniques and methodologies to support more informed and consistent decision making across Southern California. Examples of current studies and initiatives affecting New Development/Significant Development include:

#### *SMC – Phase 1 Hydromodification Study*

The primary objective of this study was to find relationships between stream channel type and resistance that would allow prediction of channel response under changed conditions associated with increased impervious cover. Ultimately this effort will contribute to the establishment of stormwater management criteria to help minimize the impacts to stream channels from the conversion of undeveloped (or less developed) areas to residential, commercial, or other intensive land uses.

#### *SMC – Low Impact Development Study*

SMC developed a manual of practice for LID that provides:

- Details on how to use LID Principles and LID BMPs to reduce the impacts of land development or re-development on water resources at the project level;
- Guidance for municipalities, land use planners, land developers, consultants, design professionals who prepare stormwater engineering plans and specifications, and others in private industry and public service;
- A site planning and design reference that will facilitate the implementation of LID for projects in Southern California. It is designed to complement the

Stormwater BMP Manual(s) that have been developed and are maintained by CASQA;

- A tool that can be applied at the site level for the development of integrated water and stormwater management regulatory compliance and resource protection programs; and
- The SMC LID Manual is available online at the California LID Portal ([californialid.org](http://californialid.org)).

#### *SMC – Barriers to Low Impact Development Study*

The purpose of this study was to dig deeper into potential barriers to LID by investigating the complex web of codes, processes and perceptions surrounding LID implementation.

#### Hydromodification

Hydrograph modification, or “hydromodification,” refers to the changes in the magnitude and frequency of stream flows and its associated sediment load that can be the consequence of watershed urbanization due to increasing landscape imperviousness. In urban watersheds, hydromodification can become evident as channel erosion and sedimentation resulting in degradation of in-stream habitat. Another consequence of hydromodification can be channel realignment and modification which can similarly lead to degraded ecology.

Concern for the significance to stream ecology of the hydrologic impacts of urban runoff was the rationale for the inclusion of hydromodification control requirements in the Fourth Term Permits. These requirements also align with the Practical Vision’s intention of focusing the State’s regulatory

tools, in the San Diego region, on realizing the restorative goals of the Clean Water Act. The planning required of the Permittees for pollution prevention, pollution control and MS4 permit compliance, is thus evolving into a more holistic approach that integrates flood control, erosion control and water quality management.

In Orange County, BMP planning occurs on both a watershed scale and a site scale. However, the watershed in most cases is the appropriate scale for developing plans that consider both multiple stream system influences and effects and the setting of ecological objectives and restorative goals. In the absence of a holistic evaluation of the watershed, the benefit of unilaterally applying hydromodification control requirements to all development projects is not clear because it is harder to understand the relationship of a specific project to the surrounding landscape. It is also difficult to effectively evaluate the cumulative influences and effects that are involved<sup>1</sup>.

The adverse environmental impacts that can arise from land development must, however, be understood for the lawful requirement of mitigation. Based on the takings clause of the U.S. and California constitutions and the Mitigation Fee Act, hydromodification control requirements applied to development projects must bear a reasonable relationship to the impacts of the project. Requiring hydrologic controls on projects draining to receiving waters not susceptible to hydromodification is contrary to these legal requirements. Such requirements may also be beyond the scope of a mandate intended to control the discharge of pollutants from a point source. The need for all hydromodification control

---

<sup>1</sup> Urban Runoff Quality Management, WEF Manual of Practice No.23/ASCE Manual and Report on Engineering Practice No. 87.

requirements to be informed by a holistic and rigorous watershed analysis is considered in greater detail in **Attachment 3.4.1**.

#### Integrated Water Resource Management and Regional BMPs

The use of “Regional BMPs,” in the Model WQMP is required to be a subordinate choice to on-site mitigation. This LID hierarchy is increasingly being viewed as obstructive, as California adapts to increasing uncertainty regarding the resilience of its water supply infrastructure by seeking to better retain stormwater in the landscape for local water supply augmentation. Regional BMPs are seen to be a key part of this adaptive effort (See Southern California Water Committee [www.socalwater.org/](http://www.socalwater.org/) ).

Following two prior years of scant rainfall, calendar year 2013 closed as the driest year in recorded history for many areas of California. Early in 2014, on January 17, Gov. Edmund G. Brown Jr. declared a drought state of emergency and directed state officials to take all necessary actions in response. The policy framework for these actions is the California Water Action Plan (CWAP) (State of California, 2014).

One of the CWAP’s key action items is a shift toward Integrated Water Resource Management approaches (IWRM). IWRM has long been practiced in other areas of the world and is now being championed by USEPA and California water leaders as the preferred management approach for solving the challenges of increasingly stringent water quality regulations and the water supply demands of a growing population.

The America Water Resources Association defines IWRM as:

*The coordinated planning, development, protection, and management of water, land, and related resources in a*

*manner that fosters sustainable economic activity, improves or sustains environmental quality, ensures public health and safety, and provides for the sustainability of communities and ecosystems.*

IWRM is a management approach that requires collaboration among key water resources areas such as drinking water supply, wastewater treatment, flood management, and water quality protection to leverage resources and create multi-benefit projects. In the field of stormwater management, the term “multi-benefit projects” is often synonymous with the term “Regional BMPs.” Such BMPs are typically conceived as constructed basins, under the management of a special district, where basin design is optimized for local groundwater augmentation, flood control and runoff treatment and where the basin is receiving runoff from sub-watershed areas often in excess of 50 acres.

Since the use of “Regional BMPs,” in the Model WQMP is required to be a subordinate choice to on-site mitigation, the CWAP’s mandate for a policy shift toward IRWM in California has clear implications for future MS4 permitting. Indeed, in his observations on the future contribution of stormwater management to IRWM, the Executive Officer of the Santa Ana RWQCB observed (CASQA, 2013<sup>2</sup>) that while Regional BMP solutions potentially offered an opportunity to realize multiple benefits, consistent with IRWM, the “LID Hierarchy” of the Fourth Term Permits presents an impediment to constructing Regional BMPs.

These observations cause the recurring debate about the merits of centralized versus de-centralized approaches, or on-site versus regional controls, to creating a stormwater management infrastructure to be re-visited. While the Fourth

---

<sup>2</sup> CASQA Quarterly Meeting, November, 2013

Term Permits have required on-site BMPs to be constructed unless they can be determined to be infeasible, the Santa Ana Third Term Permit encouraged examination of regional approaches. The regional BMP emphasis was supported by technical guidance (see WEF/ASCE, 1998<sup>3</sup>) that contemplated stormwater quality being managed across the landscape in a drainage system retrofitted with basins and under the direct management of a special district. This guidance had concluded that constructing fewer regional controls would ultimately be both less expensive than a large number of on-site controls and more effective in the longer term since control outlets are larger and therefore easier to design, build, operate and maintain. Moreover, they could additionally capture the street runoff that would be missed by on-site controls and be large enough to offer opportunities for compatible uses such as recreation and ecological habitat. With the new imperative to have IWRM inform approaches to stormwater management, the permitting framework clearly needs to allow for on-site and off-site BMP “equivalency” to enable IRWM and water quality and restorative goals to be realized and optimized at the watershed level.

#### Mitigation for Restoration Projects

Rehabilitating highly modified streams, to improve ecological, recreational or water supply augmentation amenities, may require the use of impervious materials to the extent that Project WQMP criteria are met. Requiring mitigation for restoration projects in such instances may threaten project viability. Moreover, such projects would already be subject to regulation by the United States Army Corps of Engineers (USACOE) under CWA Section 404, by the State and Regional Boards under CWA Section 401, and by the Federal

---

<sup>3</sup> Urban Runoff Quality Management, WEF Manual of Practice No.23/ASCE Manual and Report on Engineering Practice No. 87.

USFW and California DFG. Any environmental impacts of these projects will be mitigated as required by these agencies and therefore should be explicitly exempted from Project WQMP requirements.

### Public Safety Projects

In specific instances, channel re-construction may need to be undertaken on an emergency basis when there is an imminent threat to public safety. Such projects may involve like-for-like replacement of hardened channels and there will be no time for the development, processing and plan check, and revisions of a Project WQMP for these projects. Emergency projects are provided exempt status in many other MS4 permits including the Santa Ana Region Permit (Order No. R8-2009-0030) and the Los Angeles County MS4 Permit (Order R4-2012-0175).

#### 3.4.3 Recommendations:

1. **Implement an approach to hydromodification management that is informed by a watershed analysis and channel-specific protection and restoration goals.** The Permittees understand that, consistent with current published research, a “one-size-fits-all” approach for hydromodification management is not appropriate for highly modified urban stream systems. Pending a comprehensive watershed analysis, land development projects discharging runoff to engineered channels, should not be required to implement hydromodification management controls.
2. **Incorporate an IRWM element into the land planning/land development process.** The Permittees understand that an IRWM approach is needed to

optimize attainment of water quality protection, water conservation, flood control, and stream protection goals. The Permittees therefore intend to incorporate an IRWM element into their land planning and land development processes so that as development projects begin entitlement this approach and opportunities to achieve this approach are evaluated. This recommendation will require a modified LID Hierarchy that establishes the equivalency of “On-site BMP” and “Off-Site /Regional BMP” solutions.

3. **Create an exemption from Project WQMP requirements for stream and watershed restoration projects.**
4. **Create an exemption for emergency public safety projects where delay would compromise public safety, public health and/or the environment.**
5. **Develop an internet based regional geodatabase.** To effectively implement an IRWM and watershed management approach, access to information that describes all of the key hydrologic process and landscape characteristics will be critical. The Permittees are developing and starting to use an internet-based regional geodatabase to give developers and municipal staff access to the geotechnical and hydrologic information necessary for evaluating the application of the LID hierarchy to sites.
6. **Pilot the use of technology to better track Project WQMP inspections and follow up actions needed.** To fully utilize the WQMP Submittal Tool and Database WQMP inspections could be performed with tablets or other devices where GIS information and other

information can immediately be uploaded to the database. The Permittees propose piloting the use of tablets or other devices linked to the Database for Project WQMP inspections by a select number of cities.

7. **Enhance the data collected for WQMPs to have a better understanding of water quality benefits on an annual basis.** The Permittees desire to perform a better assessment of the New Development/Significant Redevelopment Program. In order to better understand the effectiveness of the program, the Permittees propose to collect new critical data elements, and enhance data quality by integrating information into the WQMP Submittal Tool and Database. New data would include volumes of water treated, land area treated, and other relevant information needed to evaluate TMDL compliance, to identify developed/redeveloped areas that meet LID and/or hydromodification requirements, and to track BMP maintenance as a measure of effectiveness.

### Implementation Schedule - Land Development

### 3.5 Construction

#### *The Story: Construction*

- The Construction Program maintained an inventory of up to 12,060 construction sites, prioritized these sites regarding their threat to water quality, and inspected them at the frequency specified by the permit. Non-compliant sites were educated and required to implement BMPs as required.
- BMP Guidance was updated to address the renewed Statewide General Construction Storm Water Permit, and Permittee construction inspection staff were trained accordingly.
- Three Qualified SWPPP Developer (QSD)/Qualified SWPPP Practitioner (QSP) training sessions were offered during the Permit term. Approximately 150 people attended this training.

#### 3.5.1 Overview

The Permittees regulate construction activities and have responsibility for the construction and reconstruction of municipal facilities and infrastructure within their jurisdictions. Construction sites and activities are a significant potential source of sediment and other pollutants and have been a priority for the Program since the First Term MS4 Permits.

The Program requires effective BMP implementation by construction site owners, developers, contractors, and other responsible parties. All construction projects, regardless of size, must implement an effective combination of erosion and sediment controls and waste and materials management BMPs. To ensure that effective BMPs are implemented, each jurisdiction conducts inspections to verify the appropriateness and implementation of BMPs and takes enforcement action as necessary. Training is provided annually to support consistent countywide implementation.

#### 3.5.2 Construction Program Implementation and Assessment

The Model Construction Program has been implemented since 2002-03. It requires the Permittees to:

- Inventory construction sites;
- Prioritize construction sites based upon water quality threat;
- Prepare BMP guidance;
- Conduct inspections of construction sites;
- Undertake enforcement; and
- Conduct training.

##### Site Inventories

Between 2008 and 2013, the Permittees reported annual construction site inventories ranging from 7,123 (2012-13) to 12,059 (2008-2009). Order R9-2009-002 does not designate construction sites as high, medium or low priority; rather, prioritization is based on site size and proximity to sediment-impaired receiving waters. However, for the ease of differentiation and reporting, sites will be categorized as

“high” “medium” and “low” priority based on the following factors:

**HIGH:** Any site 30 acres or larger; any site 1 acre or larger and tributary to a CWA section 303(d) water body segment impaired for sediment or within or directly adjacent to, or discharging directly to, the ocean or a receiving water within an ESA; or other sites determined by the Copermittees or the Regional Board as a significant threat to water quality.

**MEDIUM:** Construction sites with one acre or more of soil disturbance not meeting the criteria specified for ‘high’ priority sites.

**LOW:** Construction sites that are less than one acre in size.

The numbers of construction sites and relative proportions of low, medium, and high priority sites for the past five years are shown in **Figure 3.5.1**.

**Figure 3.5.1: Construction Site Inspections & Prioritizations, 2008-09 to 2012-13**

## BMP Guidance

The Permittees have produced a *Construction Runoff Guidance Manual* and it is available at

<http://ocwatersheds.com/documents/bmp/constructionactivities>.

The manual was updated in late 2012 to ensure consistency with the renewed Construction General Permit (Order 2009-0009-DWQ) (CGP), to incorporate findings from an Erosion Control BMP Field Evaluation, and to provide guidance on dewatering activities and BMPs appropriate for small construction sites. The manual is the basis for the pre-wet season construction training held each September. CASQA updated their California Stormwater BMP Handbook for Construction in November 2009 as on online portal and the updated BMP Factsheets provide additional, up-to-date guidance for the Permittees.

## Inspection and Enforcement

Inspectors implement their jurisdictional program, which is based on the Model Construction Program, by enforcing compliance with grading or building permits, sediment and erosion control plans, and the Water Quality Ordinance(s). Enforcement actions taken by inspectors include, but are not limited to, education, verbal warnings and administrative actions under the Water Quality Ordinance (notice of violation, administrative compliance order, etc.), and written actions under Building/Grading Ordinances (corrective action notice, stop work order, etc.).

As a result of the inspections, between 2008-2013 the Permittees reported issuing 2,297 educational letters, 1,454 notices of non-compliance, 186 administrative compliance orders, 19 cease and desist orders, and 9 misdemeanor/infractions for a total of 3,965 enforcement actions (**Figure 3.5.2**).

**Figure 3.5.2: Enforcement Actions Taken, 2008-09 to 2012-13**

**Figure 3.5.3: Construction Sites Out of Compliance, 2008-09 to 2012-13**

The number and type of enforcement activities vary greatly from year to year; however, the percentage of construction sites out of

compliance is consistently under 10% (Figure 3.5.3). This is a consistently high (i.e. >90%) level of compliance from year to year within the regulated community, which may be attributable to the long term impact of inspection programs, new guidance published by CASQA, and the implementation of the new Construction General Permit requirements, including new requirements for a *Qualified Stormwater Pollution Prevention Plan (SWPPP) Developer* to prepare a construction site's SWPPP, and a *Qualified SWPPP Practitioner* to ensure that the SWPPP is being correctly implemented.

The Fourth Term MS4 Permit requires significant inspection resources for both high priority and medium priority construction sites. Based on Figure 3.5.2 and Figure 3.5.3, enforcement actions per capita and the proportion of construction sites out of compliance have decreased over the permit term. Therefore, it is appropriate to consider revising the inspection requirements and inspection frequency for the Fifth-Term MS4 Permit.

### Training

Pre-wet season construction inspection training has been provided to inspectors each September during the permit term. A new module for Construction Inspectors, with a focus on interactive exercises for trainees, was developed and provided in September 2012. Qualified SWPPP Developer (QSD) and Qualified SWPPP Practitioner (QSP) training was provided three times in the permit term to NPDES Program staff and construction inspectors. The first QSD/QSP Training was provided on June 9, 13, and 14, 2011. The second QSD/QSP Training was provided on May 24, 29 and June 5, 2012. The third QSD/QSP Training was provided on April 2, 9 and 16, 2014. Approximately 50 staff attended each round of training.

### 3.5.3 Recommendations

The recommendations are:

1. **Reduce the frequency of inspection for “high” priority sites** from bi-weekly to twice during the wet season and reduce the frequency of inspection for “medium” priority sites from monthly to once during the wet season.
2. **Pilot a GIS and internet-based database to track construction sites.** In order to provide easier tracking of construction sites on a countywide basis, the Permittees will develop a GIS and internet-based database where information regarding each construction site can be entered. The Permittees would examine the benefits of such a database by piloting implementation with a select number of cities.
3. **Conduct pilot field-testing of personal electronic devices to document inspections onsite.** Use of tablets or other electronic devices during inspections will allow inspectors to immediately upload construction site information to the GIS based database. The Permittees would pilot the use of these technologies with a select number of cities.
4. **Conduct QSD/QSP Training.** The QSD/QSP Training developed by the State Board and CASQA provides a detailed understanding of the Construction General Permit. The Permittees propose providing this training to municipal staff every other year to ensure that inspectors and other municipal staff understand the CGP requirements that are to be implemented for construction projects in their jurisdiction. It is anticipated that with potential changes to the CGP being adopted in 2014 that municipal staff should be aware of these changes and any new or modified requirements for CGP compliance.

### Implementation Schedule - Construction

Proposed Model Construction Program Actions	Recommendation <sup>1</sup>	Implementation Schedule <sup>2</sup>				
		2013-2014	2014-2015	2015-2016	2016-2017	2017-2018
<b>Inventory Construction Sites</b>

## 3.6 Existing Development

### *The Story: Industrial/Commercial*

- The Industrial/Commercial Program inventoried 14,000 sites and conducted inspections of these sites at frequencies specified by the permit.
- The Program trained Authorized Inspectors and provided education and enforcement to address facilities lacking effective BMPs.
- A new Mobile Business Pilot Model Program was developed and implemented.
- Residential sources of pollutants were addressed through the Model Residential Program, which included development of new outreach materials and continued outreach to Common Interest Areas and Homeowner's Associations.

### 3.6.1 Overview

Stormwater discharges from commercial and industrial facilities can become contaminated when material management practices allow exposure of pollutant sources to stormwater and/or there is commingling of runoff with wastes. The Existing Development Model Program provides a programmatic framework to guide Permittees in the regulatory oversight of activities in commercial and industrial areas. Through inspections, outreach and requiring compliance with water quality ordinances, the Permittees are able to effect protection of the quality of urban and stormwater runoff from industrial and commercial facilities.

The Model Program also provides a framework, emphasizing education and outreach approaches, for addressing activities in residential and common interest areas that can threaten water quality.

### 3.6.2 Model Industrial/Commercial Program Implementation and Assessment

The Model Industrial/Commercial Program requires the Permittees to address the following:

- Identify and inventory commercial and industrial facilities;
- Establish model maintenance procedures;
- Develop and implement a program to address mobile businesses;
- Conduct inspections of food service establishments (FSEs);
- Conduct inspections and undertake enforcement
- Conduct training; and
- Conduct education and outreach.

#### Facility Inventory and Inspection

The Permittees maintain a database of industrial and commercial facilities that have a potential impact to water quality. This database documents all information related to the facility such as outreach, inspection, and any follow up actions required. Industrial and commercial facilities have been identified and inventoried per permit requirements for over ten years.

Following clarification of reporting practices in 2008, the total number of industrial facilities has remained relatively stable.

The significant drop in number of commercial facilities on the inventory between FY 2009-10 and FY 2010-11 is attributable to the removal of the food service establishments (FSEs) from the commercial inventory that year. The gradual decline in the number of both industrial and commercial facilities over the permit term is likely due to the economic downturn.

The Fourth-Term MS4 Permit specifies that a minimum of 20% of the total combined industrial and commercial facility inventories be inspected each year. Since permit adoption in 2009, the annual inspection average for the total combined industrial and commercial inventory has been between 40-46%. **Figure 3.6.1** and **Figure 3.6.2** show the total annual inventory and inspections of industrial and commercial facilities, respectively. This data excludes inspections at Food Service Establishments (FSEs), as these are inspected by the HCA and are tracked separately.

On April 1, 2014, the State Water Resources Control Board adopted a new Industrial General Permit which expands the list of facilities that are required to obtain coverage. The Orange County Stormwater Program will evaluate how this expansion and other changes to the statewide industrial program will impact the Permittees' Existing Development Model Program.

**Figure 3.6.1: Industrial Facility Inventory and Inspections from 2008-09 to 2012-13**

\* Low number of industrial facilities in 2008-09 was due to a reporting issue that was subsequently clarified in 2009-10.

**Figure 3.6.2: Commercial Facility Inventory and Inspections from 2008-09 to 2012-13**

### BMP Implementation

Twenty-four (24) model BMP fact sheets have been prepared (available at <http://www.ocwatershed.com/IndustrialCommercialBusinessActivities.aspx>) which include a description of specific minimum source control BMPs for common industrial and commercial activities that may discharge pollutants. The California Stormwater Quality Association (CASQA) is currently updating the Industrial BMP Handbook and converting it to a web portal. The Orange County Stormwater Program will be giving consideration to incorporating the updated CASQA BMP fact sheets into the program.

Permittees gauge implementation of the required BMPs through the inspection program. Facilities fall into one of three categories; they have fully implemented, partially implemented, or not implemented any of the required BMPs. As illustrated in **Figure 3.6.3**, the majority (>80%) of industrial and commercial facilities were fully implementing BMPs as required upon inspection.

**Figure 3.6.3: Industrial and Commercial Site Compliance Rates (excluding FSEs) from 2008-09 to 2012-13**

### Enforcement Activities

Permittees are required to use a progressive enforcement approach and initiate enforcement actions where commercial and industrial facilities are found to be out of compliance. Enforcement for the industrial and commercial component of the Existing Development Program is the responsibility of

individual Permittees. Each Permittee has several different levels of enforcement to choose from for different types of situations. This includes – from least severe to most severe – issuance of an educational letter, a notice of non-compliance, an administrative compliance order, a cease and desist order, or a misdemeanor/infraction. Over the past five years, the Permittees conducted enforcement as necessary based on the results of the industrial and commercial inspections (Figure 3.6.4).

**Figure 3.6.4: Industrial and Commercial Enforcement Actions (excluding FSEs) from 2008-09 to 2012-13**

Where non-compliance is evident during inspections, inspection frequency and enforcement actions are increased until compliance is achieved. Increased follow-up and enforcement appear to be resulting in increased rates of compliance. Figure 3.6.5 illustrates the number and type of

enforcement actions taken at industrial and commercial facilities over the past five years. It appears that lower level enforcement actions such as educational letters and notices of non-compliance are typically successful in gaining compliance, although nearly every year, there are over 100 higher level enforcement actions taken against industrial and commercial facilities.

**Figure 3.6.5: Industrial and Commercial Enforcement Actions by Enforcement Types (Excluding FSEs) from 2008-09 to 2012-13**

### Food Facility Inspection Program

Orange County Health Care Agency (OCHCA) annually conducts up to three inspections of each food service establishment for compliance with the California Uniform Retail Food Facilities Law. The OCHCA inspectors identify NPDES issues during one of these three inspections and they

are forwarded to the respective Permittees for follow up. In **Figure 3.6.6**, a sharp decrease in the number of inspections per year is evident between FY 2008-09 and FY 2009-10, due to a clarification in reporting practices.

**Figure 3.6.6: HCA Annual Inspections at Food Service Establishments from 2008-09 to 2012-13**

\* High number of inspections in 2008-09, and low numbers of inspections in 2009-10 and 2010-11 due to reporting issues that were subsequently clarified in 2009-10 and 2011-12, respectively.

The numbers of inspections resulting in the detection of NPDES issues at FSEs is illustrated in **Figure 3.6.7**. Where these issues were found, Permittees followed up with the necessary enforcement actions. It appears that the numbers of inspections detecting issues has been slowly declining since 2009, from 34% to 24%.

**Figure 3.6.7: NPDES Issues Discovered During Food Service Establishment Inspections Performed by HCA from 2008-09 to 2012-13**

\* High number of inspections in 2008-09 due to reporting issues that was subsequently clarified in 2009-10.

### Mobile Business Model Pilot Program

Due to their transitory and regional nature, mobile businesses are a challenging component of the Model Existing Development Program. The Mobile Business Model Pilot Program, which was developed in 2009-2010 and commenced in 2010-2011, is a countywide approach to inventorying and regulating mobile businesses. There are five key elements to the Model Program:

1. Develop an inventory of mobile businesses operating within the County;
2. Identify and require implementation of minimum BMPs for mobile businesses;

3. Provide outreach to the mobile businesses;
4. Perform inspections or provide a self-certification process for the businesses; and
5. Conduct enforcement as necessary to ensure compliance.

In 2011, a web-based Mobile Business Database was developed to serve as a countywide inventory and repository for the information for each business pertaining to inspections and/or self-certification, outreach, and enforcement actions. The database allows Permittees to update the inventory with mobile businesses found to operate within their jurisdiction, as well as enter and track enforcement actions in their jurisdiction and countywide. The database tracks over 1,500 mobile businesses and includes information related to the business type, outreach, and enforcement information.

In order to assist surface cleaners in selecting and implementing the appropriate types of BMPs, a Model Surface Cleaner BMP Fact Sheet was developed in 2011. This BMP Fact Sheet provides the minimum control measures required of the mobile businesses.

A mass-mailing notification was distributed in June 2012 to all mobile detailing businesses in the countywide inventory in conjunction with an outreach workshop held on June 27, 2012. The notification included a workshop flier and mobile detailing brochure.

The Permittees implemented appropriate enforcement actions where necessary to ensure that Mobile Businesses were implementing the required BMPs (**Figure 3.6.9**). The increase in enforcement actions in 2010-11 may be due to improved inventorying countywide after development of the Mobile

Business Database (**Figure 3.6.8**).

**Figure 3.6.8: Enforcement Actions Issued to Mobile Businesses in Orange County from 2008-09 to 2012-13**

**Figure 3.6.9: Types of Enforcement Actions Issued to Mobile Businesses from 2008-09 to 2012-13**

### Training

Over the permit term the County developed the *Training Program Framework Core Competencies Document*. The *Training Program Framework Core Competencies* document defines the core competencies (knowledge, level of experience, and skills) necessary to ensure the capabilities of individuals carrying out specialized municipal stormwater program compliance responsibilities. It is expected that an individual or group of individuals who has/have developed these competencies will be able to affect jurisdictional conformance with the DAMP/LIP and the compliance of their jurisdiction.

The Permittees developed and implemented the training program pursuant to Permit requirements and the DAMP. A

region-wide training session was held specific to industrial and commercial inspections on April 7, 2009. The NPDES Inspection Sub-Committee also provided training on various subjects relevant to the Existing Development and ID/IC programs. This sub-committee meets quarterly to provide training to inspectors and others on issues related to spill response, inspection and enforcement.

### **3.6.3 Model Residential Program Implementation and Assessment**

Residential areas comprise a significant portion of the land area of each Permittee's jurisdiction. The Model Residential Program was developed to further reduce pollutants potentially released into the environment from residential activities, including efforts to reduce over-watering. It encourages use of pollution prevention practices as the most effective method to protect receiving water quality and comprises:

- Best Management Practice (BMP) Requirements
- Source identification and prioritization
- Facilitation of hazardous waste collection
- Program Implementation
- Enforcement

During the 2012-13 reporting period, the LIP/PEA Sub-committee updated the eight (8) model BMP fact sheets which include a description of specific pollution-prevention activities for residential areas. The BMP fact sheets are available at <http://ocwatersheds.com/documents/bmp/residentialactivities>. Each fact sheet contains the following sections: targeted pollutants, required activities, and recommended activities.

BMP factsheets have been prepared for the following activities:

- Automobile Repair & Maintenance
- Automobile Washing
- Automobile Parking
- Home & Garden Care Activities
- Disposal of Pet Waste
- Disposal of Green Waste
- Household Hazardous Wastes
- Water Conservation

Four (4) Household Hazardous Waste Collection Centers, operated by the County of Orange Waste and Recycling Agency, are located at the following sites throughout the county:

- 1071 N. Blue Gum Street, Anaheim, CA 92806
- 17121 Nichols Street - Gate 6, Huntington Beach, CA 92647
- 6411 Oak Canyon, Irvine, CA 92618
- 32250 La Pata Avenue, San Juan Capistrano, CA 92675

The implementation of the residential program relies on education and outreach to notify and urge residents to observe the designated sets of BMPs for each of the high threat activities. Permittees encourage the implementation of the designated BMPs for each residence within its jurisdiction principally through the overall public education element of the Program. The Permittees have also developed a source identification procedure and prioritize residential areas based on proximity to Environmentally Sensitive Areas (ESAs). Over the last five years, the County (as manager of the

reporting system) has responded to, or forwarded to Permittees, a total of 260 residential complaints (Figure 3.6.11).

**Figure 3.6.10: Residential Complaints, County of Orange, from 2008-09 to 2012-13**

Enforcement in residential areas begins with outreach and education and most often compliance is achieved without formal enforcement remedies. However, where necessary, the Permittees have the legal authority to increase the level of enforcement to gain compliance. Where necessary, enforcement actions were taken to achieve compliance. Indeed, between 2008-09 and 2011-12, the County has relied on formal enforcement actions to gain compliance in residential areas in only seven cases. These included two citations, three criminal cases, and two notices of non-compliance. However, many of the residential cases tracked by the County were referred to other agencies for follow-up and enforcement. The analysis of residential enforcement data performed only includes those actions taken by the County.

### 3.6.4 Common Interest Areas (CIAs) and Homeowner's Associations (HOAs) Program Implementation and Assessment

Orange County is home to over 3,000 CIAs/HOAs and common interest developments account for 80% of all new housing in the County. Within Orange County, approximately 90% of incorporated residential areas lie within the purview of the maintenance associations that govern CIAs/HOAs. Permittees in the San Diego Region have implemented individual CIA/HOA programs since the Third-Term permits.

Nineteen (19) model BMP fact sheets were developed which include a description of specific pollution-prevention activities for CIAs/HOAs. The BMP Fact Sheets are available at <http://ocwatersheds.com/documents/bmp/commoninterestactivities>.

Enforcement of BMPs in common interest developments relies on the following mechanisms: public reporting hotline, analysis of dry weather/illicit discharge monitoring results, and municipal employee observations. During the permit term, the County responded to, or forwarded to Permittees, 37 complaints related to CIA/HOA issues. When necessary, enforcement may be accomplished in two ways: through enforcement of conditions and restrictions (CC&Rs) enacted by the associations or through the Permittees' enforcement processes.

### 3.6.5 Recommendations

1. Consider incorporating the updated CASQA BMP fact sheets into the Existing Development Model Program.

**Implementation Schedule - Industrial, Commercial, Mobile Program**

Industrial, Commercial, and Mobile Program Actions	Recommendation <sup>1</sup>	Implementation Schedule <sup>2</sup>				
		2013-2014	2014-2015	2015-2016	2016-2017	2017-2018
<b>Source Identification and Facility Inventory</b>						
Maintain inventory of required industrial sites	C					
Maintain inventory of required commercial facilities	C					
Maintain inventory of required residential sites	N					
<b>Facility Inspection Activities</b>						
Annually inspect 20% of the industrial and commercial inventory, with 100% of the industrial and commercial inventory inspected over the permit term.	C					
<b>Best Management Practice (BMP) Implementation</b>						
Update BMP Fact Sheets for existing development as necessary	C					
Provide outreach to all industrial commercial facilities during the Permit term	C					
<b>Enforcement Activities</b>						
Conduct follow-up inspections and enforcement as necessary to ensure compliance	C					
Track types of enforcement actions by facility type	E					
<b>Food Facility Inspection Program</b>						
Maintain and update inventory of FSEs	C

<b>Evaluate Opportunities for Retrofit</b>						
Evaluate opportunities for retrofitting existing development to address constituents identified as the highest priorities in the Water Quality Implementation Plan	E					

1. C = Continue; E = Enhance; N = New

2. X = Performance Standard will be completed during this fiscal year. Gray shaded cells indicate ongoing implementation.

## 3.7 Illegal Discharges/Illicit Connections

### *The Story: ID/IC*

- The requirement to effectively prohibit non-stormwater discharges into the MS4 is one of two fundamental requirements of the Clean Water Act stormwater mandate.
- The Permittees continued to aggressively detect and eliminate Illicit Discharges and Illegal Connections (ID/IC) through discharge monitoring, source investigation, and enforcement.
- A spill reporting hotline (1-877-89-SPILL) provides a resource for public spill and water pollution reporting, and a smartphone reporting application was developed. All reports were responded to and resolved.
- The *Model Investigative Guidance for Orange County Illegal Discharges and Illicit Connections Program* was updated for the Non-stormwater Action Levels (NALs) based monitoring program by inclusion of a new *San Diego Region Dry Weather Numeric Action Level (NAL) Source Identification Guide*.
- Essential elements of the Countywide Area Spill Control Program were completed and implemented.
- The NALs monitoring program was fully implemented.

## 3.7.1 Overview

It is a specific requirement of the Federal Clean Water Act that non-stormwater discharges, arising from illegal discharges and illicit connections (ID/IC) to the municipal storm drain system, must be effectively prohibited. Since the first term MS4 permit, a programmatic framework for detecting and quickly responding to non-stormwater discharges has been a key integral element of the Program.

## 3.7.2 Illegal Discharges/Illicit Connections Program Implementation and Assessment

The Model ID/IC Program provides guidance for Permittees when identifying, responding to, and mitigating the effects of non-stormwater discharges. The Model Program requires the Permittees to address the following:

- Detect illegal discharges and illicit connections;
- Enable public reporting;
- Investigate illegal discharges and illicit connections;
- Undertake enforcement; and
- Conduct Training.

### Detection of Illegal Discharges and Illicit Connections

The Permittees implemented the NALs monitoring program during the Fourth Term MS4 Permit in south Orange County. The NALs monitoring program is outlined in the Fourth Term MS4 Permit and includes numeric action levels derived from Basin Plan objectives that, when exceeded, trigger the need for a source investigation. The NALs monitoring program uses a suite of water quality analyses conducted in the field and through contract laboratories. Field data is entered into the County's CBI MS4 on-line database system to which

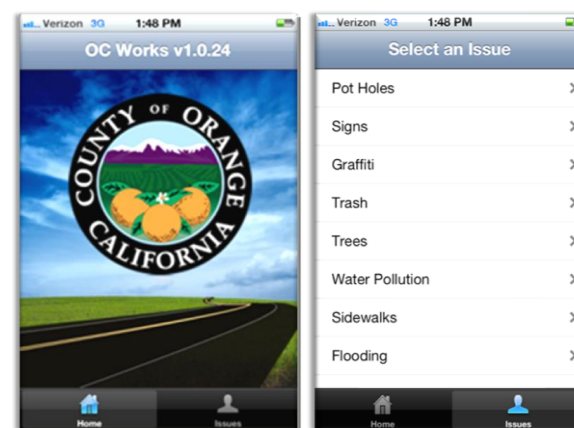

Permittees have been provided with login information and have immediate access to all field data once it is entered into the system.

As part of the NALs monitoring program, outfall sites are visited and sampled twice annually; once in the dry season and once in the wet seasons (preceded by an absence of rain for 72 hours). Over the past four years, the Permittees have conducted a total of 175 site visits at 25 sites.

### Reporting

The Permittees continue to field complaints stemming from numerous sources, including the water pollution telephone hotlines. Telephone and web-based reporting systems (both countywide and in individual cities) for the general public have been established and are advertised in the Program's public education materials, Orange County "White Pages" telephone directories, and Permittee websites.

The Permittees' field inspectors are trained to detect illegal discharges as part of their daily activities and, indeed, the majority of illegal discharges continue to be detected by Permittee staff. In addition, the Permittees promote hotline numbers, principally 1-877-89-SPILL, to receive water pollution complaints and incident information from the public and use database software to document the reported incidents which assists with the tracking of water pollution complaints by source. The Permittees also developed a [smartphone application](#) to provide another tool for the general public to use when reporting water pollution issues

Over the past five years there has been a decrease in the total number of complaints received (**Figure 3.7.1**).

**Figure 3.7.1: Source of Complaints from 2008-09 to 2012-13**

## Investigate Illegal Discharges and Illicit Connections

Each Permittee has designated Authorized Inspectors to investigate compliance with, detect violations of, and take actions pursuant to their Water Quality Ordinance.

Authorized Inspectors follow specific procedures documented in the *Model Investigative Guidance for Orange County Illegal Discharges and Illicit Connections Program (Investigative Guidance Manual)*. The *Investigative Guidance Manual* was updated by the Permittees during the permit term. The revision included adding resources and tools as appendices and updating key resources, including an attachment specific to South County Permittees, the *San Diego Region Dry Weather Numeric Action Level (NAL) Source Identification Guide*.

The Permittees maintain records of information from a complaint, notification, or response request. To ensure that the necessary information is collected, the Permittees use pre-established forms to collect information. After the initial entry of the information on the Pollution Notification/Investigation Request (PNIR) or related form, the information is generally entered into a database. The data from the Permittees' databases is analyzed to increase the Permittees' awareness regarding the most problematic waste categories and facility activity types.

**Figure 3.7.2** and **Figure 3.7.3** display results from the County-maintained PNIR database covering the 2008-09 to 2011-12 reporting periods. **Figure 3.7.2** provides a breakdown of the waste category under which each ID/IC discharge investigation was classified. The frequency of incident appears to be equally distributed all waste categories. **Figure 3.7.3** displays a breakdown of the facility activity type under which each ID/IC discharge investigation was classified.

Similarly there is no facility type or single land use that is predominantly the subject of investigations.

The data used in the analysis includes information from the mobile business database which is a shared incident reporting database created specifically to ensure effective application of the Enforcement Consistency Guide to businesses operating from mobile premises across multiple jurisdictions. The experience with this database encourages consideration being given to creating a single countywide ID/IC database with the potential to streamline reporting and enable more detailed analyses to better identify priority activities and facility types of concern.

**Figure 3.7.2: Waste Categories Encountered during ID/IC or Mobile Business Discharge Investigations**

**Figure 3.7.3: Facility Activity Types Encountered during ID/IC Discharge Investigations**

### Enforcement

Enforcement actions are undertaken according to the adopted Water Quality Ordinances and accompanying Enforcement Consistency Guide. In instances of noncompliance, the Permittees adopted one of four types of remedies, including educational letters, administrative remedies, criminal remedies, or other civil or criminal remedies, as appropriate. **Figure 3.7.4** displays the number and type of enforcement actions undertaken during the past five reporting periods. The five year trend largely represents a decrease in the total

number of enforcement actions. Given the correlating decrease in the total number of complaints received over the same time period, the decrease in the total number of enforcement actions indicates a change in behavior which is causing a decrease in the total number of ID/IC incidents occurring.

**Figure 3.7.4: Enforcement Actions 2008-09 to 2012-13**

### Training

During the permit term, the Permittees developed a training program, including curriculum content. The training program defined expertise and competency for each key area of jurisdictional stormwater program responsibility, including Authorized Inspectors. Illegal Discharges/Illicit Connections (ID/IC) Training Sessions for Authorized Inspectors and spill responders were conducted on May 18, 2010 (66 attendees) and April 16, 2013 (69 attendees). In addition, the NPDES

Inspection Sub-Committee also provided training on various subjects relevant to the ID/IC program. This sub-committee meets quarterly to provide training to Authorized Inspectors and others on issues related to spill response, inspection and enforcement. It also serves as a forum for the coordination and discussion of ongoing difficult or new enforcement, investigation, or enforcement issues and to profile cases or incidents.

### Model Sewage Spill Response Procedures

Starting in 2000, the County and OCS D began development and implementation of a coordinated sewage spill prevention and response demonstration project (i.e. the “Countywide Area Spill Control (CASC) Program”).

During the permit term, the CASC Program was activated three times in the San Diego Region: (1) March 23, 2010, to respond to a 1.4 million gallon sewage spill; (2) on June 25, 2010, to respond to a 2,400 gallon sewage spill; and, (3) on April 28, 2014, to respond to a 4,600 gallon biosolids spill. The March 23, 2010 incident was the largest CASC response to date, and the response was a major success – a berm was placed in Tijeras Creek to contain the spill and 2.5 million gallons were pumped from the containment and returned from the Santa Margarita Water District sewer system, minimizing both the beach closure area and the total number of beach closure days. For these reasons, the San Diego Regional Board reduced the *Potential Harm for Discharge Violations* score when assessing the Administrative Civil Liability (ACL) for this spill event.

CASC Response on March 23, 2010, Tijeras Creek

### Actions Levels

In 2003, the Permittees began implementing the seasonal *Dry Weather Reconnaissance Program* on a countywide basis to monitor storm drain outfalls for the presence of illegal connections and illicit discharges (ID/IC). This Program’s hybrid reconnaissance monitoring design combines probabilistic and targeted sampling and the use of formal statistical tools (tolerance intervals and control charts). This design enables the program to systematically prioritize problematic sites, compare conditions to the regional urban background, and track trends over time.

- A *tolerance interval* bound is the upper or lower confidence-interval bound of a quartile of the background data distribution. Tolerance intervals are

derived from the probabilistic site data and are used to quantify the key aspects of the regional background.

- *Control charts* are used to establish an upper or lower bound on a data distribution, based on previous monitoring data. They are created for each site and provide a means of tracking data at individual sites and identifying when new data values deviate substantially (either upward or downward) from previous experience.
- Used together, tolerance intervals and control charts provide a consistent and quantitative means of identifying sites that exhibit clearly aberrant values.

In its Fourth Term Permit for south Orange County the San Diego Regional Board has modified the dry weather reconnaissance-based monitoring to include NALs), based on Basin Plan objectives. Comparison of the approaches shows that the NALs-based program triggers investigative responses at a much higher frequency for many constituents (e.g. enterococci and reactive orthophosphate as P; **Figure 3.7.6** and **Figure 3.7.7** respectively).

Based upon historical data (**Figure 3.7.6**), for example, the probability that a sample does not exceed the NAL for enterococci is approximately 3%. As a result, 32 out of 33 sampling events would be required to be investigated. In contrast, the probability that a sample does not exceed the enterococci tolerance interval is 90%, which ensures that investigative resources are applied to the most aberrant prioritized discharges.

**Figure 3.7.5: Enterococci Exceedance Frequencies Associated with Dry Weather Reconnaissance Tolerance Intervals Compared with Exceedance Frequencies Associated with NALs.**

**Figure 3.7.6: Reactive Orthophosphate as P Exceedance Frequencies Associated with Dry Weather Reconnaissance Tolerance Intervals Compared with Exceedance Frequencies Associated with NALs**

The impact of the switch from “action levels” to “NALs” is demonstrated in **Table 3.7.1**. Under the Dry Weather Reconnaissance Program protocol the Permittees conducted 274 site visits; whereas for the NAL-based program the

Permittees conducted 45 site visits. Although the Permittees collected data and information for six times more stations as a part of the Dry Weather Reconnaissance Program, the NALs-based program identified more than six times the number of exceedances, thereby confounding the ability of the Permittees to prioritize investigative efforts.

The South Orange County Permittees have found strong positive linear relationships between phosphorus and metals associated with seepage and exfiltration of shallow groundwater from the Monterey and Capistrano marine sedimentary formations. Both formations are known to be enriched in trace metals and phosphorus and are prevalent across southern Orange County. This evidence suggests that many exceedances are due to non-ID/IC factors (i.e. local geology - Ni, Cd). These findings underscore the concern of the Permittees that the NALs preclude the Permittees from discriminating between instances of ID/IC and non-ID/IC conditions and is therefore inconsistent with a mandate that requires the effective prohibition through ordinance of non-stormwater discharges arising from ID/IC. See additional discussion of this issue in **Attachment 3.7.1**.

**Table 3.7.1: Comparison of the 2011-12 NALs Data Collected in the San Diego Region with the Data from the Dry Weather Hybrid Reconnaissance Monitoring Program for the 2009-10 Reporting Period**

Constituent	# of NAL Exceedances	% of NAL Exceedances	# of Reconnaissance Action Level Exceedances	% of Reconnaissance Action Level Exceedances
			2011-2012	
pH	1	2	0	0
TDS	42	93	0	0
Dissolved Oxygen	2	4	0	0
Turbidity	3	7	3	1
Surfactants	3	7	14	5
Total Coliforms	24	53	0	0
Fecal Coliforms	19	42	0	0
Enterococcus	42	93	0	0
Unionized Ammonia	3	7	8	3
Total Nitrogen	41	91	0	0
Total Phosphate	38	84	11	4
Cadmium	13	28	0	0
Copper	1	2	0	0
Nickel	7	15	0	0
Zinc	1	2	0	0
<b>Total # of Site Visits</b>	<b>45</b>		<b>274</b>	

### 3.7.3 Recommendations

The major elements of the program (e.g. the facilitation of public reporting of complaints, and the designation and training of Authorized Inspectors) continue to be vital and successful pieces of the Program. However, the NALs Program has proven to be less effective than the Dry Weather Reconnaissance Program. The recommendation is:

1. **Reinstate an approach, such as the Dry Weather Reconnaissance Program, that allows investigative resources to be directed toward abating priority aberrant discharges.**
2. **Continue implementation of CASC.**
3. **Consider development of a standardized reporting database potentially accessible by all Permittees.**

### Implementation Schedule - ID/IC

Proposed ID/IC Program Actions	Recommendation <sup>1</sup>	Implementation Schedule <sup>2</sup>				
		2013-2014	2014-2015	2015-2016	2016-2017	2017-2018
<b>Detect Illegal Discharges and Illicit Connections</b>						
Implement Dry Weather Reconnaissance Program monitoring approach to prioritize investigations on non-stormwater discharges arising from ID/IC.	N					
<b>Facilitate Reporting</b>						
Advertise telephone, web-based, and applications-based reporting systems	C					
<b>Investigate Illegal Discharges and Illicit Connections</b>						
Investigate compliance with, detect violations of, and take actions pursuant to each Permittee's respective Water Quality Ordinance and the <i>Investigative Guidance Manual</i>	C					
Maintain records of information from monitoring, a complaint, notification, or response request in an ID/IC database	C					
Evaluate using a standardized ID/IC record-keeping system and/or database amongst all Permittees	N		X			
<b>Enforce upon Illegal Discharges and Illicit Connections</b>						
Take enforcement actions according to each Permittee's respective Water Quality Ordinances and accompanying Enforcement Consistency Guide	C					

Proposed ID/IC Program Actions	Recommendation <sup>1</sup>	Implementation Schedule <sup>2</sup>				
		2013-2014	2014-2015	2015-2016	2016-2017	2017-2018
Track enforcement actions	C					
<b>Conduct Training</b>						
Develop additional training modules as needed	E	X				
Conduct training of Authorized Inspectors	C					
<b>Model Sewage Spill Response Procedures</b>						
Implement CASC Program countywide	C					

1. C = Continue; E = Enhance; N = New

2. X = Recommendation will be completed during this fiscal year. Gray shaded cells indicate ongoing implementation.

## 4.0 Controlling Pollutant Sources: Watershed Programs

### *The Story: Watershed Programs*

- Extensive watershed mapping of hydromodification susceptibility, infiltration feasibility and regional BMP opportunity sites for the entire south Orange County area has been completed.
- Watershed Workplans for all six San Diego Region Watersheds were developed and implemented. These workplans describe the Watershed Permittees' collective watershed strategies to assess, prioritize and address water quality challenges within each watershed.
- Comprehensive Load Reduction Plans (CLRPs) were developed for Aliso Creek, San Juan Creek and San Clemente Coastal Streams Watersheds. These watershed CLRPs were developed to address bacteria pollutants and other watershed 303(d) listed constituents.
- Dana Point harbor was delisted for Indicator Bacteria and 17 shoreline stations were delisted for *Enterococcus*, Fecal Coliform and Total Coliform.
- Baby Beach TMDL dry weather load reductions have been achieved for total coliform and the 50% load reduction milestones for fecal coliform and *Enterococcus* have also been achieved. Wet weather data also supports the conclusion that TMDL load reductions have been achieved for total coliform and fecal coliform. Further reductions are needed for *Enterococcus*.

## 4.1 Overview

Watershed management is the term used for the approach to water quality planning that places an emphasis on the watershed (the area draining into a river system, ocean or other body of water through a single outlet) as the planning area and looks to multi-jurisdictional solutions to problems that cut across programs and jurisdictional boundaries.

While the focus of watershed planning in south Orange County is on specific pollutants of concern associated with urban stormwater, particularly TMDLs, this management approach is also supportive of broader objectives such as watershed habitat restoration, consistent with the Practical Vision, and integrated water resource management.

There are six distinct watersheds within the San Diego Regional Board area which are identified in **Table 4.1** and shown in **Figure 4.1**

**Table 4.1: San Diego Region Watersheds**

Watershed Planning Area	Major Watercourses
Laguna Coastal Streams	Laguna Canyon Creek
Aliso Creek	Aliso Creek
Dana Point Coastal Streams	Salt Creek
San Juan Creek	San Juan Creek, Oso Creek, Trabuco Creek, Bell Canyon, Verdugo Canyon
San Clemente Coastal Streams	Prima Deshecha, Segunda Deshecha
San Mateo Creek	San Mateo Creek

**Figure 4.1: Orange County Watershed Boundaries**

## 4.2 Non-TMDL Watershed Accomplishments

During the Fourth Term Permit, non-TMDL watershed management efforts – supportive of integrated water resource management – have included mapping of the landscape characteristics that are significant for hydrologic processes, adoption of an Integrated Regional Watershed Management Plan for south Orange County, preparation of Watershed Workplans for each of the six San Diego Region Watersheds, and engaging the public regarding local watershed issues.

## Watershed Mapping Tool

A key element of watershed planning is identification of opportunities for regional and subregional stormwater management facilities. These facilities can play a critical role in more quickly realizing water quality, hydromodification, water supply and/or habitat goals compared to approaches that are exclusively reliant upon on-site mitigation.

Initial extensive watershed mapping of hydromodification susceptibility, infiltration feasibility and regional BMP opportunity sites for the entire south Orange County area has been completed and is available through the County’s land records web-based portal, known as the Land Records 2.0 mapping tool: <http://landrecords.ocpublicworks.com/ocsl/>.

## Integrated Regional Watershed Management Plan

Although it is not a permit requirement, the preparation of an Integrated Regional Watershed Management Plan (IRWMP) provides for a coordinated approach to resource management and capital improvement planning. This coordinated approach also leverages partnerships with regional stakeholders and existing programs and plans, such as TMDLs, and consolidated grants.

The State of California has been promoting integrated regional water management planning, as a means of achieving more sustainable water use. IRWMPs are a more efficient and effective way to manage water resources. It allows for regional prioritization of important watershed issues and for consensus to be reached on how to address those issues. Whereas watershed planning for stormwater management is focused on enhanced BMP implementation targeting specific

constituents of concern within a watershed, an IRWMP is an integrated plan for all water resources projects, including water supply, wastewater, flood management, stormwater and urban runoff, aquatic habitat, and recreation.

Governance for water quality programs is organized around three geographic sub-areas, or watershed management areas (WMAs)--North Orange County, Central Orange County, and South Orange County. Aliso Creek, San Juan Creek, Laguna Coastal Streams, Dana Point Coastal Streams, San Clemente Coastal Streams and San Mateo Creek (within Orange County) watersheds comprise the South Orange County WMA which falls wholly under the jurisdiction of the San Diego Regional Board.

The County of Orange, cities, and water and wastewater agencies of south Orange County formed the South Orange County Integrated Regional Water Management (IRWM) Group in 2004 and subsequently developed and adopted the South Orange County IRWMP in 2005.

In January 2007, the South Orange County IRWMP was one of seven statewide proposals recommended for funding. In July 2007, the South Orange County IRWM Group executed a Prop 50 IRWM Implementation Grant Agreement with the State Water Resources Control Board to receive grant funds in an amount of \$25,000,000 for the seven highest ranking projects included in the IRWMP. One of the completed projects for which the water management strategy was water quality was the City of Laguna Beach's Heisler Park Marine Habitat Protection Project. This project was designed to reduce runoff to the ecological reserve. The park improvements include: a controlled and efficient irrigation system; bluff-top landscape grading; surface drain and pathway improvements; storm

drain improvements; installation of three (3) urban runoff diversion automation systems in existing Continuous Deflection Separation (CDS) units; and coastal bluff stabilization.

An IRWMP update was initiated in 2012 to meet Prop 84 State guidelines and included a call for projects. 57 project forms were received. These projects were added to previous projects for a total of 139 projects now included in the IRWMP. Five of the top ten projects on the priority project list directly address water quality.

The updated plan was finalized in 2013 and adopted by the South Orange County WMA Executive Committee. The Final and Approved 2013 IRWMP is available at the following link: [http://ocwatersheds.com/programs/ourws/wmaareas/wma\\_southoc/soc\\_wma\\_irwmp](http://ocwatersheds.com/programs/ourws/wmaareas/wma_southoc/soc_wma_irwmp)

### *Watershed Workplans*

Pursuant to Directive G of Order No. R9-2009-0002, Watershed Workplans were developed for each of the six watersheds in south Orange County. These Workplans describe the Watershed Permittees' development and implementation of a collective watershed strategy to assess and prioritize the water quality challenges within the watershed's receiving waters, identify and model sources of the highest priority water quality challenges, develop a watershed-wide BMP implementation strategy to abate highest priority water quality challenges, and a monitoring strategy to evaluate BMP effectiveness and changing water quality prioritization in each watershed.

The 2012-13 reporting period marked the tenth year of implementation of Watershed Action Plans/Watershed Workplans. The Watershed Workplans build on the considerable work and studies that have been completed collaboratively over a multi-year period. These include the following initiatives:

- Development and implementation of the *Drainage Area Management Plan (DAMP)/Jurisdictional Runoff Management Plans (JRMPs)*.
- *2005 Draft Identification of Retrofitting Opportunities Study* – this study identifies potential retrofit sites adjacent to or near existing flood control infrastructure under public ownership.
- *South Orange County IRWMP* – integrated regional watershed planning fosters development of holistic solutions to problems; addresses problems at the source; and integrates projects and programs throughout the region that have logical overlaps.
- *Southern California Coastal Water Research Project (SCCWRP) epidemiology and microbial source tracking study* – this study examined several new techniques for measuring traditional fecal indicator bacteria, new species of bacteria, and viruses to determine whether they yield a better relationship to human health outcomes than the indicators presently used in California.
- *Hydromodification controls* – these controls seek ways to mitigate erosion impacts by establishing requirements for controlling runoff from new development and significant redevelopment. These plans typically include decentralized storm water management systems and protection of natural drainage features, such as wetlands and stream corridors. Runoff is

typically directed toward infiltration-based storm water BMPs, such as those included in the Watershed Workplans, that slow and treat runoff.

The Watershed Workplans consider the findings of the Receiving Waters and MS4 Discharge Monitoring Program in addition to other characterizations of receiving water quality. This data is used to inform management decisions in each of the watersheds, which includes guiding the type and location of BMPs to employ.

Water quality is assessed through a review of water quality standards and objectives, NPDES wet weather and non-stormwater monitoring data, indicator bacteria data for coastal waters collected from the Orange County Health Care Agency (OCHCA) and South Orange County Wastewater Authority (SOCWA), special studies conducted within the region, watershed management plans, and through informal data exchange and discussions with watershed residents, local conservation agents, and government officials.

Indicator bacteria exceedances (as determined by fecal indicator bacteria) at south county beaches and creeks, and the resulting potential for human health impacts, is currently the most significant concern for the region based upon MS4 permit and bacteria TMDL requirements. Consequently, indicator bacteria has been the primary focus of existing watershed water quality monitoring programs. As new data is collected through the Orange County Stormwater Program's regional monitoring efforts, future watershed specific TMDL monitoring and assessment efforts, and pollution source identification monitoring special studies, the characterization of receiving water quality will be expanded to include additional pollutants as priorities.

Changes in receiving water indicator bacteria levels concentrations have seen some positive improvements over the past few years. In general, the number of beach monitoring sites affected by the more stringent *Enterococcus* standard is showing a decreasing trend in the number of sites affected. These changes are attributed partially to 1) the cumulative effects of increasing attention on water conservation and 2) continued education of the public on the pollution prevention, but substantially to 3) implementation of structural BMPs at problematic sites.

Heal the Bay, a nonprofit environmental organization, reports the results of routine monitoring of beaches conducted by local health agencies and dischargers annually in their Beach Report Card. In the 2013 Beach Report Card, water quality in Orange County was reported as excellent with 93% A or B grades. Beach water quality during the winter dry weather was also very good with 86% A or B grades. Wet weather A and B grades (73%) were up four percent from last year and bested the five-year average by 17%.

Examples of special studies on pollutant source tracking for pollutants of concern in addition to and including indicator bacteria include:

*Fecal Indicator Bacteria Special Study at Doheny Beach and Poche Beach*

The San Juan Creek and San Clemente Coastal Streams Watershed Permittees have invested in source investigation studies and made long term capital investments in additional control measures to reduce runoff impacts on beach water quality at Doheny Beach and Poche Beach. The efforts undertaken during the Fourth Term Permit include:

- Completing the Prima Deschecha watershed study to identify sources and develop plans for additional BMPs to mitigate indicator bacteria levels at Poche Beach;
- Continuing operation of the Poche Beach ultraviolet treatment system to reduce indicator bacteria levels in watershed runoff;
- Conducting a pilot scale falconry project to discourage gulls from congregating at Poche Beach;
- Providing support for the scientific development of new microbial source tracking host-specific fecal source markers through contributions of in-kind services to the Source; and
- Providing support of scientific advancements to identify beaches affected by potential human sources through contributions of in-kind services to the Southern California Bight-13 Regional Monitoring Program Shoreline Microbiology Study.

The goal of the source investigations at Poche Beach and Doheny Beach, which are ongoing, are intended to develop a prioritization effort to identify and ultimately reduce the most important sources that represent a potential health risk for beach visitors.

*Origin of Fecal Indicator Bacteria Impairments at Doheny State Beach*

This study was designed to answer questions about the origin of bacteria impairments along Doheny State Beach from San Juan Creek. The study found that the native bird population accounts for the single largest percentage of fecal indicator bacteria variability and mass contribution in dry weather flows to the Pacific Ocean Shoreline at the beach.

Additionally, the main sources of fecal indicator bacteria in San Juan Creek appears to be concentrated at the pond at the mouth of San Juan Creek and not from the lower watershed.

#### *Trace Metals*

This is an ongoing study in the region, which includes monitoring for trace metals to better understand the nature of sources in runoff. In recent years, efforts lead by the County to characterize natural sources from ambient geology demonstrated that native soil attributes in specific areas are the primary contributor for many constituents of concern such as cadmium, nickel, chloride, sulfate, and selenium. Understanding the true source of naturally derived pollutants is important from not only a scientific basis but also from a management perspective.

#### *Trash & Debris*

This special study is ongoing and relates to trash monitoring in San Diego Region watersheds. The goals of the trash monitoring efforts are to help determine the extent of the issue and improve our understanding of managing trash in the environment using multiple efforts on both regional and local scales.

#### *Oso Creek Dissolved Solids Study*

This study was conducted to compile information on the impairments and assessed three aspects of water quality in Oso Creek, a subwatershed to San Juan Creek:

1. An evaluation of the current water quality condition of Oso Creek in comparison with three reference streams of similar geological characteristics;
2. Use of stable isotope measurements to assess whether current sulfate levels may be originating from sulfur based fertilizers; and,
3. A review of historic information to examine critical points in the development of the watershed over time that may have contributed to the impairments and may continue as potential barriers to corrective actions.

Three general and somewhat contrary water quality findings from this study are the key points of consideration for future efforts:

1. The dissolved solids are consistent with the geology and reference streams in terms of the concentrations,
2. The process of urbanization appears to have increased dissolved solid levels over the time period of the developed watershed history by increasing groundwater loadings, and
3. Successful efforts to decrease the domestic water runoff appear to have contributed to increases in dissolved solids concentration.

#### *L01S03 Drainage Area Nitrogen and Phosphorus Source Investigation*

Water quality data for the L01S03 drainage system in the San Juan Creek watershed has shown that the drainage area has elevated levels of nitrate-nitrogen and phosphorus. This study was conducted to investigate and identify the source of the elevated nutrients. The results of this drainage area source identification and investigation support that the source of

elevated nitrate-nitrogen and phosphorus source in the L01S03 drainage system originates from natural groundwater seepage in contact with the Capistrano Formation geology.

The watershed Permittees use the water quality monitoring data and findings from the special studies to develop BMP action plans. These action plans contribute to attaining receiving water quality objectives. Copies of the BMP action plans are included with each of the Watershed Workplans, which are available at the following links:

Aliso Creek:

<http://ocwatersheds.com/programs/ourws/alisocreek/reportsstudies>

Dana Point Coastal Streams:

<http://ocwatersheds.com/programs/ourws/dpcoastalstreams/reportsstudies>

### *Public Outreach and Participation*

The governance structure for the WMAs, which was developed at the request of the Orange County Board of Supervisors, includes a variety of methods to engage the general public. The process provides balanced access and opportunity for participation in the IRWM process. It includes participating in stakeholder workshops, inclusion in the IRWM process, communication via email and information sharing via the County's website [www.ocwatersheds.com](http://www.ocwatersheds.com).

Additionally, directive G of Order No. R9-2009-0002 includes a provision for public participation. The first drafts of the Watershed Workplans were posted on the [www.ocwatersheds.com](http://www.ocwatersheds.com) website in November 2010 for public review and comment prior to submittal to the San Diego Regional Water Quality Control Board. No comments specific to the plans were received. The south Orange County Permittees held the inaugural annual public stakeholder meeting the following year in December 2012 to identify issues of concern among residents in the watershed. Attendance for the meeting was low. Given the well-established stakeholder structure of the IRWM process, high level of public stakeholder involvement, and in the interest of a truly integrated approach to water resources, all of the south Orange County watershed permittees elected to integrate the annual public update of the Watershed Workplans into the IRWM stakeholder process. This approach also gives the south Orange County watershed Permittees the ability to reach the same stakeholders, as well as a broader audience, including water and sewer agencies and elected officials.

### 4.3 TMDL Watershed Accomplishments

Through the Fourth Term Permit term, the Permittees have made significant progress addressing the Beaches and Creeks TMDL and the Baby Beach TMDL. Accomplishments include:

#### *Beaches and Creeks Bacteria TMDL*

On February 10, 2010, the San Diego Regional Water Quality Control Board adopted indicator bacteria TMDLs for impaired beaches and creeks in the San Diego Region (Beaches and Creeks TMDLs). This TMDL includes over nine and a half miles of County beaches, the entire length of Aliso Creek and the lower mile of San Juan Creek.

As a first step to TMDL compliance, watershed Comprehensive Load Reduction Plans (CLRPs) were developed outlining the BMPs needed to meet TMDL Waste Load Allocations (WLAs) and special studies to identify sources of indicator bacteria and other listed pollutants in the watershed. In October 2012, Aliso and San Juan Creek Watershed Permittees submitted draft CLRPs to the San Diego Regional Water Quality Control Board for review. Subsequently, a draft CLRP for the San Clemente Coastal Streams Watershed was submitted in December 2012.

The CLRPs describe the approach taken by the Watershed Permittees in response to San Diego Regional Water Quality Control Board Resolution No. R9-2010-0001 (Amending the Water Quality Control Plan for the San Diego Basin [9] to Incorporate Revised Total Maximum Daily Loads for Indicator Bacteria, Project I - Beaches and Creeks in the San Diego Region [Including Tecolote Creek]). As described in the resolution, development of a watershed pollutant load

reduction plan is a required step in the bacteria TMDL. To fulfill this requirement watershed CLRPs were developed to address bacteria pollutants and other watershed 303(d) listed constituents. Key CLRP elements include: assessing watershed conditions and setting priorities including development of a Watershed Monitoring and Assessment Program; assessing BMP effectiveness and developing a CLRP Implementation Strategy; developing individual Watershed Permittee BMP Action Plans; and, preparing a schedule for loading reductions to be achieved.

The 2010 Clean Water Act Section 303(d) list identifies the following pollutants/stressors for segments in the Aliso Creek Watershed: indicator bacteria, selenium, total nitrogen, total phosphorus, toxicity, Benzo[b]fluoranthene, Dieldrin, and sediment toxicity. San Juan Creek is listed for: indicator bacteria, chloride, sulfates, total dissolved solids, total nitrogen, total phosphorus, toxicity, DDE, Diazinon, and selenium. San Clemente Coastal Streams are listed for: indicator bacteria, phosphorus, turbidity, toxicity, cadmium and nickel. With the exception of indicator bacteria where TMDLs have been developed, current monitoring provides limited data on these other constituents at a watershed scale. Additional monitoring and data analysis is needed to calculate pollutant loads, identify hotspots, better define human health risks, habitat impacts, and in the case of toxicity determine the specific pollutants causing impairment. As a result initial CLRP efforts focus on bacteria TMDLs and a series of additional studies to collect the data necessary to understand the extent of impairment for other watershed pollutants.

The BMP Action Plans contained in the CLRPs detail current and proposed structural and non-structural BMP efforts. Projected watershed bacterial load reductions were calculated

based upon these plans to determine overall progress within the watershed and an expected reduction schedule.

By using an adaptive management approach, it is anticipated that the continual refinement of watershed BMP Action Plans and data gathered through CLRP Monitoring and Assessment Program will result in reductions consistent with bacteria TMDL WLAs and an improved understanding of watershed water quality impairments and the measures needed to address them.

Examples of BMPs in the action plans include two new wetlands constructed during the Fourth Term Permit, the Glenwood Wetland in Aliso Viejo which will treat runoff from 230 acres of golf course, residential and HOA common area and public parks; and the Oso Parkway Southside Wetland in Laguna Hills which treats 30 acres. Wetlands have proven to have high bacteria removal efficiency during dry weather. For example, the Wood Canyon Emergent Wetland at J02P08 in Aliso Viejo has reduced the concentration of indicator bacteria significantly--over 95% or 1 to 2-logs. The level of fecal coliform bacteria dropped to an average of 58 CFU/100 mL, which is lower than REC-1 water quality objective of 200 CFU/100mL. Both the Glenwood Wetland and the Oso Parkway Southside Wetland is expected to achieve similar bacteria removal efficiency.

Another BMP effective at bacterial removal are debris gates. The cities of Laguna Hills, Laguna Niguel and Lake Forest have installed debris gates at a number of catch basins to prevent gross pollutants from entering the MS4. Based on previous projects and studies, the debris gates are anticipated to provide an 85% reduction in debris in basins at pre-wet-season cleanout, and 68% reduction in number of basins

containing any pollutant-laden debris that would contaminate influent water during dry weather. During wet weather an average of 85% decrease in debris quantity in catch basins yielding 85% decrease of first-flush pollutant constituents released to MS4 at start of each storm of rainy season has been observed.

The efforts to date to reduce bacteria impairments have proven successful. On October 11, 2011, USEPA issued its final decision regarding the water bodies and pollutants USEPA added to California's 2010 303(d) List, which also included State Water Board staff recommendations for additions, deletions or changes. The following list of segments were recommended for deletion in the 2010 Integrated report and were included in the final approved 2010 303(d) list: Dana Point harbor was delisted for Indicator Bacteria (Note: 0.03 mile was included on the 2010 303(d) list for *Enterococcus* and Total Coliform, and the listing for Total Coliform relates to the SHELL standard and not REC-1); 17 shoreline stations were delisted for *Enterococcus*, Fecal Coliform and Total Coliform; 2 shoreline stations were delisted for *Enterococcus* and Fecal Coliform; 2 shoreline stations were delisted for Fecal Coliform and Total Coliform; and 2 shoreline stations delisted for Fecal Coliform. Note that the 2006 303(d) list included whole segments that were later broken down to stations on the 2010 303(d) list. Several segments/stations were also changed from the all-encompassing Indicator Bacteria on the 2006 303(d) list to Total Coliform, Fecal Coliform, and/or *Enterococcus* on the 2010 303(d) list.

### **Baby Beach TMDL**

In June 2008, the San Diego Regional Water Quality Control Board adopted indicator bacteria Total Maximum Daily Loads

(TMDLs) for Baby Beach in Dana Point Harbor. The TMDLs require 82.7-96.2% (dependent upon specific indicator bacteria) waste load reductions from the stormdrain system. Total Coliform, Fecal Coliform and *Enterococcus* wet weather reductions have to occur by December 31, 2019. Dry weather reductions for Total Coliform, Fecal Coliform and *Enterococcus* must occur by September 15, 2014.

Through implementation of BMPs to address several suspected bacteria sources, including measures such as manually removing bird feces from the beach, Baby Beach water quality has improved significantly. Data analysis for the 2012-13 reporting period indicates that dry weather TMDL load reductions have been achieved for total coliform and the 50% load reduction milestones for fecal coliform and *Enterococcus* have also been achieved. Wet weather data also supports the conclusion that TMDL load reductions have been achieved for total coliform and fecal coliform while further reductions are needed for *Enterococcus*. A recent microbial source tracking special study suggested that a portion of the remaining bacterial exceedances at Baby Beach may be of canine origin, prompting the County to increase enforcement of its policy banning dogs from the beach.

#### 4.4 Recommendations

##### *Aliso Creek Bacteria Investigations*

There has been a dramatic reduction in bacteria concentrations in Aliso Creek since 2003 correlating with an increase in watershed Permittee BMP implementation and watershed wide water conservation efforts. This current Aliso Creek Monitoring Program was designed to track Creek bacteria concentrations over a ten year period. 2015 marks the tenth

year of implementation of this program, and the following recommendations are made:

- 1) Reduce current Permittee quarterly progress reporting to an annual basis. Observed watershed bacteria reductions have shifted efforts away from new BMP projects to ongoing BMP maintenance decreasing the benefit of quarterly reporting. This change is consistent with R9-2009-0002 which specifies only an annual assessment of water quality data and municipality programs implemented within high-priority storm drain locations. Permittees will continue to meet quarterly to discuss efforts to reduce bacteria in the Aliso Creek watershed.
- 2) Continue implementation of monitoring and reporting described in the Revised Aliso Creek Program through December 2015 with 2015 annual reporting to include a reevaluation of the program relative to watershed bacteria TMDLs, the watershed Comprehensive Load Reduction Plan (CLRP), and related NPDES programs. Implementation of the program through 2015 will allow for an evaluation of the data relative to the initial ten year program design and developing fifth term permit NPDES programs.

## 5.0 Plan Development

### 5.1 Overview

#### *The Story: Plan Development*

- The Permittees have been implementing a strategic management approach that includes model programs specified in the permit and the DAMP, and watershed programs focused on specific water bodies and pollutants.
- The Program employs an iterative, adaptive management approach that includes monitoring, evaluation, program revision, BMP implementation adjustment/enhancement, and continued monitoring.
- The Program conducts annual and permit term (i.e. ROWD) using the guidance from CASQA approach.
- The ROWD recommends an evolution to a more holistic watershed management approach to support integrated water resource management and the optimization of watershed ecosystem services.

The Permittees have developed a strategic approach to stormwater management that is a cyclical process of measurement, analysis and program improvement. This approach is applied at two distinct scales: (1) regionally by the Permittees implementing jurisdictional programs based on the model programs in the DAMP; and (2) in specific watersheds by the Permittees and others participating in watershed programs addressing specific waterbody-pollutant combinations and the restorative goals of the Clean Water Act.

Two basic categories of assessment measure have been used related to (1) the shorter term confirmation of BMP implementation (Implementation or Process Measures, also termed Programmatic Indicators) and (2) the longer term verification of environmental improvement (Validation or Results Measures, including indicators of environmental change). This categorization of measures is intended to reflect two basic assessment questions: (1) are program elements being implemented correctly and effectively? And (2) are environmental improvements being realized?

*... Upon determination by either the permittees of the Regional Water Board that discharges are causing or contributing to an exceedance of an applicable Water Quality Standard, the permittees shall promptly notify and thereafter submit a report to the Regional Water Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of Water Quality Standards. The report may be incorporated in the annual update to the Stormwater Management Plan unless the Regional Water Board directs an earlier submittal. WQO-99-05*

The planning process has been given particular regulatory significance by the approach to MS4 permitting in California. Indeed, the approach was developed as a model for fulfilling the Receiving Water Limitations and Discharges Prohibitions of the Permits. These provisions are based on State Water Resources Control Board Water Quality order 99-05 which creates an iterative management approach as the basis for compliance.

## 5.2 Plan Development and Effectiveness Assessment

### Strategic Management Approach

The Permittees' strategic approach to stormwater management is defined by a cyclical (iterative) process, or *Quality Loop*, of measurement, analysis, and improvement of the program (Figure 5.1). An analogue for this approach is the formal environmental management system for which ISO 14001 establishes standards. It

provides a structure that enables the Permittees to *think* about new ways of working, *measure* existing policies and procedures and/or just *implement* existing

activities in different ways. The key is the continual search for improvement in the way that regulatory compliance is maintained and the surface water environment protected and enhanced through implementation of BMPs until protection of beneficial uses is achieved.

Due to the episodic and highly variable nature of stormwater, strict compliance with regulatory water quality standards is problematic, especially for wet weather runoff discharges. In recognition of the nature of wet weather discharges, WQO 99-05 requires application of an iterative management process as the basis of compliance with the MS4 permit Receiving Water Limitations provisions. The

Figure 5.1: The Quality Loop  
(Gilbert & Gould, 1998)

Permits have required this process be conducted a minimum of once each year. This process is outlined in Figure 5.3.

Plan development occurs at two distinct scales: (1) activities conducted by the Permittees implementing BMPs in their DAMP/LIPs based on the model programs in the DAMP; and (2) activities conducted by the Permittees and others participating in watershed programs addressing specific waterbody-pollutant combinations.

*Countywide/Jurisdictional BMPs* are specified in the Permits, are applicable on a countywide basis and are proven and cost-effective. They include BMP requirements for municipal maintenance activities, public and business education and outreach, BMP requirements for land development and redevelopment, structural and non-structural BMP requirements for construction projects), BMPs for existing development and identification and elimination of illegal discharges/illicit connections.

For the watershed-based programs, the planning process has been focused principally on specific water quality problems in receiving waters, with impaired waters or TMDLs having a higher priority, and implementation of additional *Watershed BMPs* on an individual and/or collaborative basis. However, watershed-based planning has also led to a number restoration projects.

At both scales the approach uses information obtained from program effectiveness assessment, the countywide baseline water quality monitoring program, and from the additional water quality planning initiatives that have been or are currently being conducted in a number of the watersheds to determine those with beneficial use impairments potentially attributable to urban stormwater. New candidate BMPs can be prevention or removal oriented and can be considered either for updating *Countywide/Jurisdictional BMPs* or for incorporation as *Watershed BMPs*. New BMPs are generally identified from one or more of the following:

- A review of technical literature (such as the ASCE/EPA database);
- A review of existing control programs;
- Demonstration or research projects;
- Input from consulting firms and municipalities already involved in new BMP implementation; or
- Other sources.

New BMPs, chosen for broad implementation, are selected from candidate BMPs that have been field-tested and evaluated as to their pollutant removal efficiency and cost effectiveness.

Methodologies for assessing Program and BMP effectiveness include conventional monitoring (such as water quality monitoring) and non-conventional monitoring. Conventional monitoring can provide a more direct indication of actual BMP performance, but is very challenging for a number of reasons. Water quality monitoring is costly, particularly given the highly variable nature of stormwater runoff, and targeted on a limited number of BMPs. Furthermore, not all BMPs are readily evaluated through water quality monitoring. Therefore, an accurate, quantifiable assessment of the cumulative effectiveness of current BMPs is difficult for a variety of reasons, including:

- A number of BMPs predate the Program which means that there is no “baseline” monitoring data representative of “pre-BMP” conditions;
- Since, to date, no watershed has been uniquely subject to a single BMP, the influence of an individual BMP upon the overall surface water quality cannot yet be readily determined;
- The temporal and spatial variability in water quality, particularly in wet weather, complicates any statistical correlation of the data with storm frequency, storm length and intensity, land use, or land management practices. This confounding factor in statistical analyses has been

exacerbated by storm seasons in recent years that have varied much in their intensity, duration and volume;

- Many of the BMPs are implemented to address the issues associated with a specific land use. However, since the land uses are extremely varied within the watersheds, it has not proven possible to characterize the effects of those specific BMPs; and
- Factors other than chemical water quality may be more directly responsible for impairment of beneficial uses, yet all these factors combine in their effects and are difficult to separate one from another.

A method for evaluating overall stormwater program effectiveness on both a programmatic and individual BMP level has been documented by the California Stormwater Quality Association (**Figure 5.1**). The approach presents a hierarchy of potential outcomes that can be evaluated ranging from programmatic permit compliance assessment to demonstrated changes in receiving water quality. Tiers 1-3 are assessment measures that support the shorter term confirmation of BMP implementation (Implementation or Process Measures, also termed Programmatic Indicators). Tiers 4-6 are assessment measures that reflect the longer term verification of environmental improvement (Validation or Results Measures, including indicators of environmental change).

**Figure 5.1: CASQA Assessment Pyramid**

In addition, a number of important initiatives are being supported by the Permittees aimed at the further development of assessment techniques and methodologies to support more informed and consistent decision making across Southern California. Notable amongst these initiatives is the Regional Bioassessment Monitoring Program of the Stormwater Monitoring Coalition.

### 5.3 Watershed Approach

Managing water quality on a watershed basis, rather than jurisdictional basis (see **Table 5.1** for comparison), is generally recognized as offering a more holistic and thereby more effective basis for ultimately achieving meaningful environmental outcomes. Consequently, the ROWD recommends a watershed-based approach as a fundamental structure for the future of the Program.

#### Watershed

*..that area of land, a bounded hydrologic system, within which all living things are inextricably linked by their common water course and where, as humans settled, simple logic demanded that they become part of a community.*

John Wesley Powell, Scientist-Geographer

The development of a Watershed Plan would generally include the following steps:

- Conduct a watershed assessment to identify the watershed issues and establish desired beneficial use and ecosystem service outcomes;
- Establish watershed-specific implementation strategies to address the highest priority issues and concerns; and
- Submit to the Regional Board Executive Officer for review and approval.

A Watershed Plan is consistent with federal regulations regarding the development of NPDES permit conditions, as well as the implementation of storm water management programs, at a watershed scale (40 CFR §§ 122.26(a)(3)(ii), 122.26(a)(3)(v), and 122.26(d)(2)(iv)). This approach is also consistent with USEPA's Watershed-Based NPDES Permitting Policy Statement<sup>1</sup> which explains that, "[t]he utility of this tool relies heavily on a detailed, integrated, and inclusive watershed planning process." USEPA identifies a number of important benefits of watershed permitting, including more environmentally effective results; the ability to emphasize measuring the effectiveness of targeted actions on improvements in water quality; reduced cost of improving the quality of the nation's waters; and more effective implementation of watershed plans, including TMDLs, among others.

The watershed approach requires development and implementation of a comprehensive, collaborative, and prioritized Watershed Plan. A Watershed Plan will allow for the more effective linking of existing stormwater program elements to create an implementation strategy tailored to the needs of the watershed(s). In Orange County, such an approach would also present an opportunity to bring greater cogency to ongoing sub-regional and watershed initiatives, address the current impetus for integrated water resource management, and provide a framework for identifying projects that align with the restorative goals of the Practical Vision.

### 5.4 Recommendations

The recommendations are:

1. **Continue to implement the Strategic Countywide/Jurisdictional Management approach.**

<sup>1</sup> Memorandum from G. Tracy Meehan, III, Assistant Administrator to Water Division Directors, Regions I-IX, titled "Watershed-Based National Pollutant Discharge Elimination System (NPDES) Permitting Policy Statement," USEPA, December 3, 2002.

2. **Develop a comprehensive Watershed Plan** to evaluate the watershed and to prioritize implementation efforts and associated resource allocation.
3. **Develop pilot program(s) for regional water quality** or groundwater recharge BMPs
4. **Develop model program(s) for water retention credit trading** to facilitate off-site BMP implementation where appropriate and to address existing developed areas.

## Implementation Schedule - Plan Development

Proposed Plan Development Actions	Recommendations <sup>1</sup>	Implementation Schedule <sup>2</sup>				
		2013-2014	2014-2015	2015-2016	2016-2017	2017-2018
<b>Strategic Management Approach</b>						
Countywide/Jurisdictional Management approach	C					
Complete model program for a water quality/quantity trading	E		X			
Complete identification of regional runoff retention BMPs opportunity sites	E		X			
Complete model watershed management plan	N		X			

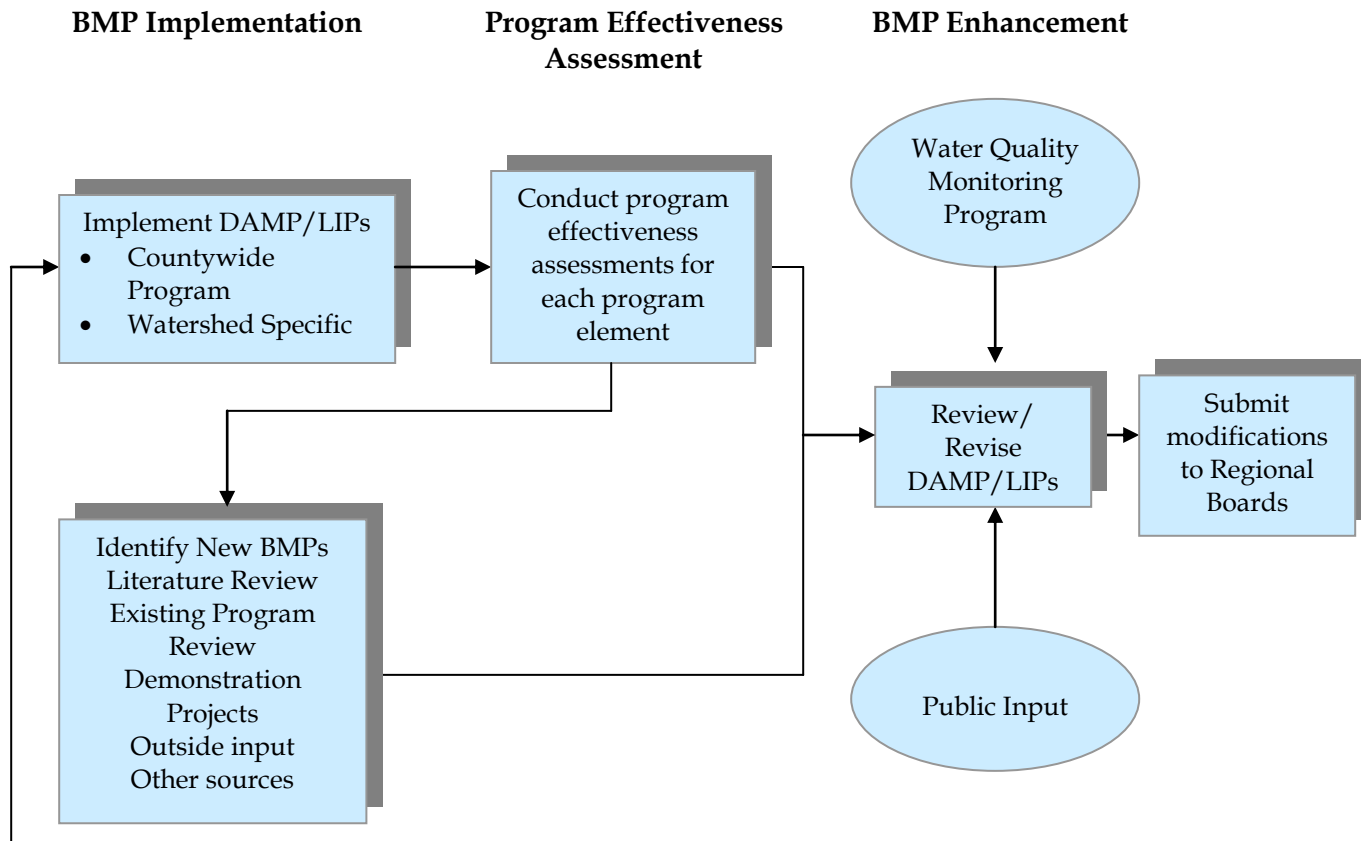

1. C = Continue; E = Enhance; N = New

2. X = Recommendations will be completed during this fiscal year. Gray shaded cells indicate ongoing implementation

<b>Table 5.1 Comparison of Planning Processes</b>		
	<b>Local Implementation Plan</b>	<b>Watershed Plans</b>
Area Covered by Plan	Defined by political (city/county) boundaries	Defined by hydrologic boundaries
Planning Process	Focused on reducing discharges of pollutants in urban runoff and stormwater pollution on a uniform countywide basis. Directed by DAMP/LIP in conformance with NPDES permits requirements.	Focused on improving local receiving water quality where it is adversely impacted by urban runoff and stormwater pollution (or other stressors). Directed by NPDES permit requirements and 303(d) list/TMDLs. Should optimize all watershed attributes and functions (water supply, energy, habitat, economic development, housing, trans...)
Framework	Directed by Orange County Stormwater Program committee structure and Regional Board review. Public consultation principally through California Environmental Quality Act (CEQA) process/Regional Board review.	Directed by broad participation among municipal and public agency stakeholders. Characterized by public participation.
Assessment	Based on information from countywide municipal and regional cooperative investigations of stormwater and receiving water quality	Based on information from watershed-specific investigations and are undertaken on an annual basis, or timescale appropriate

<b>Table 5.1 Comparison of Planning Processes</b>		
	and are undertaken on an annual and 5 year basis.	to the process, impact, or management strategy.
Planning	Broad based approach with emphasis on well established pollution prevention and source control measures.	Includes both pollutant specific approach, with emphasis on treatment controls and consideration of innovative regional solutions, and projects addressing restorative goals of the Clean Water Act.
Implementation	Individually by the Permittees.	Individually and collaboratively by Watershed Permittees and other agencies.
Monitoring	Considers pollutant load reduction.	Considers beneficial use attainment.

Figure 5.2: Strategic management flow diagram

## 6.0 Program Management and Financing

### *The Story: Program Management/Financing*

- The Program continued to operate with the County of Orange as the Principal Permittee during the permit term.
- The Program operated under a four-tier committee structure with participation at all levels by Permittee staff and management.
- An Implementation Agreement establishes responsibilities and provides a funding mechanism for cooperative activities. Funding has been sufficient to complete common program activities.
- The Program benefitted strongly from cooperation and representation among several regional and statewide groups including the California Stormwater Quality Association and the Southern California Coastal Water Research Project.
- Coordination with Orange County Transportation Authority (OCTA) on development of a Structural BMP Prioritization and Analysis Tool (SBPAT) to support disbursement of Measure M2 funding for water quality projects. SBPAT is a GIS-based decision support tool that is being used to identify and prioritize potential structural BMP retrofit projects throughout Orange County. To date Tier 1 funding of \$8.6 million has been awarded to 85 projects and Tier 2 funding of \$12.7 million has been awarded to 8 projects.

## 6.1 Overview

The Program is a cooperative regulatory compliance initiative comprised of 36 separate municipal entities. It addresses Clean Water Act mandates and is focused on the management of urban and stormwater runoff for the protection and enhancement of Orange County's creeks, streams, rivers and coastal waters. The County of Orange is the Principal Permittee and the cities and the Orange County Flood Control District are Co-Permittees on the permits. Principal Permittee and Permittee responsibilities are specified in the permit. Permittee collaboration and cooperation is enabled by an Implementation Agreement. The designation of a Principal Permittee has provided for cost effective management of the overall stormwater program by combining resources to complete those activities which benefit all of the Permittees.

To enable the development and implementation of the Program a program management framework has been established. This management framework comprises a four tier committee structure (Permittees, City Managers' Water Quality Committee, Technical Advisory Committee (TAC)/Planning Advisory Committee (PAC) and Program Committees/Task Forces/Ad Hoc Groups).

## 6.2 Program Implementation and Assessment

### Implementation Agreement

A formal agreement enabling Permittee cooperation is the NPDES Stormwater Permit Implementation Agreement (the "Implementation Agreement") which establishes the responsibilities of the Permittees with respect to compliance with the Permits. The Implementation Agreement also

establishes a funding mechanism for the shared costs of the Program, based on each municipality's area and resident population, and formally recognizes the role of the TAC.

The Implementation Agreement, originally entered into in December of 1990, was amended in October of 1993 to include two additional Permittees (the cities of Laguna Hills and Lake Forest) and formally established the TAC. The Implementation Agreement was amended again, effective June 25, 2002, to include three additional Permittees (the cities of Aliso Viejo, Laguna Woods and Rancho Santa Margarita) and to incorporate modifications to the management structure and cost-sharing formulas.

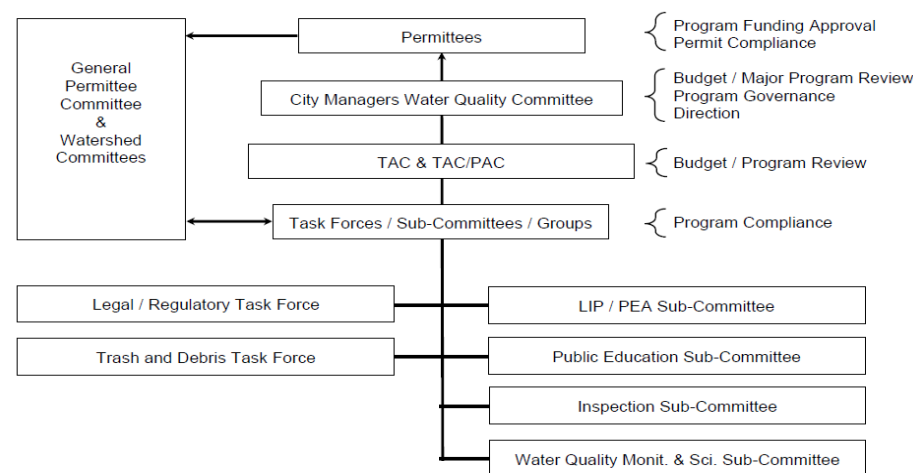

The structure of the Agreement has accommodated the expansion of the Program and the significant escalation of shared costs with the adoption and implementation of the Third- and Fourth-Term MS4 Permits. It has also served as a model for cost sharing collaboration related to the Newport Bay TMDL compliance effort (including the related Nitrogen Selenium Management Program), Aliso Creek TMDL, San Juan Creek TMDL, Coyote Creek TMDL and Regional Harbor Monitoring Program.

### Management Framework

The USEPA defines a management framework as “a lasting process for partners working together. It’s a support structure making it easier to coordinate efforts – a structure made of agreed upon standard operating procedures, timelines and forums for communicating with each other” (USEPA, 2002). The four tier management framework was established in early 2002 to support the development and implementation of the Program.

The Permittee committees, subcommittees, task forces and ad-hoc working groups are shown in **Figure 6.1**.

**Figure 6.1: Orange County Municipal NPDES Management Framework**

### *City Manager’s Water Quality Committee*

The City Manager’s Water Quality Committee meets annually and as otherwise needed and provides budget and overall program review and governance direction. The Committee is comprised of several City Managers and is supported by County staff.

### *City Engineer’s Technical Advisory Committee (TAC)/ Planning Advisory Committee (PAC)*

The TAC acts in an advisory role to the Permittees and implements policy previously established by the Permittees. The TAC is comprised of one City Engineer, or selected

representative from each of the County Supervisorial Districts and a representative from the County of Orange. The TAC is expanded to the TAC/PAC when matters relating to land development are considered. It meets 4-6 times annually. Meetings of the TAC and the TAC/PAC are subject to the Brown Act.

### *General Permittee Committee*

The General Permittee Committee is the principal forum for disseminating information for program coordinators. The Committee meets monthly (except November). The Committee periodically evaluates the need for creating standing sub-committees and ad hoc committees as needed in order to accomplish the objectives of the Orange County NPDES Stormwater Program.

### *Sub-Committees/Task Forces*

The task forces, sub-committees and ad-hoc working groups provide for the continued development of the Program in specialized areas. The management framework is reviewed annually to ensure it meets program needs. All of the task forces, sub-committees and ad-hoc working groups have brought forward initiatives to meet the requirements of the Fourth Term Permits and to address Program needs under a consensus building process. The frequency (i.e. number of meetings) of meetings is undergoing re-evaluation with respect to the upcoming Fifth Term MS4 Permit as programs attain maturity and require less oversight.

### Program Funding

Over the last 10 years the countywide cost of compliance with the permits has almost doubled from approximately \$55m in FY2000-01 to \$95m in FY2011-12. These costs are anticipated to continue to increase as the Program shifts toward a greater emphasis on watershed management approaches to address burgeoning TMDL requirements.

In FY2011-12, the funding sources used by the Permittees to meet these costs included: General Fund, Utility Tax, Separate Utility, Gas Tax, and Special District Fund, Others (Sanitation Fee, Fleet Maintenance, Community Services District, Water Fund, Sewer & Storm Drain Fee, Grants, and Used Oil Recycling Grants) (See Figure 6.2). While increasingly more stringent regulatory obligations prompt consideration being given to creation of dedicated stormwater funding, there are significant obstacles to overcome.

**Figure 6.2: FY2011-12 Funding Sources**

In November 1996, California voters approved Proposition 218 which requires that any new or increased property-related fee be subject to voter approval. Proposition 218 has created a significant hurdle for municipalities seeking to levy charges for storm water management programs that, with successive permits are becoming increasingly complex. The Proposition did create an exemption to the voter approval requirement for water, sewer and trash collection fees, and some municipalities adopted the position that stormwater fees were akin to water or sewer fees, and thus exempt from the voter approval requirement. However, the 2002 court decision in *Howard Jarvis Taxpayers Association v. City of Salinas* established definitively that storm water or storm drainage fees are property-related fees subject to Proposition 218, and are not exempt from voter approval requirements. Based on this ruling, any new or increased stormwater fee must be approved by 66% of voters (Office of the Independent Budget Analyst Report, City of San Diego, 2009).

The uncertainty regarding future compliance costs is a concern to the Permittees. Consequently, a costs study, including a

review of funding options, will be completed in the next permit term.

### 6.3 Program Representation and Coordination with Other Agencies

#### *Orange County Transportation Authority (OCTA)*

The Principal Permittee co-chairs the OCTA’s Environmental Cleanup Allocation Committee which oversees the Environmental Cleanup Program (ECP). The ECP is intended to support improvements in overall water quality by providing funding for projects addressing transportation-generated pollution. The Committee has been meeting on a monthly basis since November 2007.

The Tier 1 Grant Program is designed to mitigate the more visible form of pollutants, such as litter and debris that collects on roadways and in storm drains prior to being deposited in waterways and the ocean. Tier 1 consists of funding for equipment purchases and upgrades to existing catch basins and related best management practices (BMPs) such as screens, filters, inserts and other streetscale low-flow diversion projects. A total of up to \$19.5 million is available for the Tier 1 program over a seven-year window from 2011-12 through 2017-18.

The first Tier 1 call for projects was issued in February 2011. In August 2011, the Board approved the funding of 34 projects to 23 cities and the County of Orange, totaling more than \$2.8 million. In August 2012, the Board approved a second round of funding with a total of \$2.8 million awarded to 33 projects from 24 cities and the County.

The Tier 2 Grant Program consists of funding regional, potentially multi-jurisdictional, capital-intensive projects. Examples include constructed wetlands, detention/infiltration basins and bioswales, which mitigate pollutants including litter and debris, but also heavy metals, organic chemicals, sediment and nutrients. The Tier 2 program is funded with bond financing revenues with up to \$38 million from the EAP allocated through fiscal year 2015-16. Beyond 2015-16, funding will be based on a pay-as-you-go basis.

To date Tier 1 funding of \$8.6 million has been awarded to 85 projects and Tier 2 funding of \$12.7 million has been awarded to 8 projects.

### *California Stormwater Quality Association*

Since 1989, CASQA has assisted the State of California, USEPA, municipalities, special districts and businesses in developing and implementing effective water quality management programs in California. CASQA is a leader in helping California comply with the municipal and industrial NPDES stormwater mandates of the federal Clean Water Act. The Principal Permittee is active on the Board of Directors, Executive, Program Committee, Policy and Permitting Subcommittee and Public Information – Public Participation Subcommittee.

### *Stormwater Monitoring Coalition*

The SMC was formed in 2001 and revised in 2008 by cooperative agreement of the Phase I municipal stormwater NPDES lead Permittees, Caltrans, the NPDES regulatory agencies in southern California, SCCWRP and USEPA Office of Research. The SMC seeks to improve the effectiveness of

existing programs, particularly monitoring, by promoting standardization and coordination, and reducing duplication of effort across individual programs.

### *Southern California Coastal Water Research Project*

The SCCWRP is a joint powers agency research institute focusing on the coastal ecosystems of Southern California from watersheds to the ocean. It was formed in 1969 to enhance the scientific understanding of linkages among human activities, natural events, and the health of the Southern California coastal environment; to communicate this understanding to decision makers and other stakeholders; and to suggest strategies for protecting the coastal environment. Current SCCWRP studies of particular significance to the Program include Bight '13, investigations into toxicity, trash and debris and microbiology, and the effort to better coordinate environmental monitoring in the Newport Bay watershed.

The Principal Permittee participated as a Commissioner on SCCWRP's governing board and as the Program's representative on the Commission Technical Advisory Group (CTAG).

## **6.4 Recommendations**

The recommendations are:

- 1. Retain the NPDES Stormwater Permit Implementation Agreement.**
- 2. Continue the program management framework, albeit with a reduction in meeting frequencies.**

3. **Complete study of future stormwater compliance costs and funding alternatives.**
4. **Continue collaborative regional studies.**

**Implementation Schedule - Program Management and Financing**

Proposed Program Management and Financing Actions	Recommendations <sup>1</sup>	Implementation Schedule <sup>2</sup>				
		2013-2014	2014-2015	2015-2016	2016-2017	2017-2018
<b>Implementation Agreement</b>

2. X = Recommendation will be completed during this fiscal year. Gray shaded cells indicate ongoing implementation

## 7.0 Recommendations for Fifth Term Permit

### 7.1 Overview

Established in 1990, the Program is a cooperative regulatory partnership of the Permittees who operate an interconnected municipal storm drain system which discharges stormwater and urban runoff and at the same time provides flood protection to the United States' sixth most populous county. In Orange County, the impact of urbanization on hydrologic systems and the adverse consequences of both changed hydrology and pollutant source creation are evident today in Orange County's principal drainage systems. However, at the same time, there are very significant water quality successes, such as coastal water quality along the entire length of the Orange County coastline and sources of bacteria contamination having been reduced through targeted actions that can unequivocally be attributed to the impact of the Program and the Permittees.

### 7.2 Future Program Development and Implementation

During the Fourth Term Permit period there has continued to be a significant allocation of resources the integration of LID and hydromodification control practices into local land development regulation. Going forward, this element of the Program will continue to be a major focus of activity as the Permittees look to create off-site and in-lieu fee options for alternative compliance pathways for land development and re-development. This focus also aligns with broader State Board integrated water resource management goals centered on better use of stormwater for local water supply augmentation, increasing interest in "green infrastructure" solutions and realization of the restorative goals of the Clean

Water Act.

Development of a watershed-based planning approach is viewed as the most important next step to take in the development of the Program. Such an approach offers the opportunity for more comprehensively identifying the meaningful environmental and recreational amenities that can be realized in each watershed and the management strategies that will most effectively ensure their realization. These plans will also provide an opportunity, through linkage and integration, for cogency to be brought to a number of related restoration projects and sub-regional water management efforts such as the Integrated Regional Water Management Plans.

With respect to specific water quality constituents of concern, there will be additional effort directed toward pollutant control and research into the environmental significance of pesticide related toxicity, bacteria, and nutrients.

#### Pesticides

Synthetic pyrethroids have been identified as a significant urban runoff water quality issue on a statewide basis. Directly as a consequence of the efforts of CASQA, the Department of Pesticide Regulation enacted regulations that became effective in July, 2012, specifically intended to limit where structural pest control businesses can apply pesticides in an effort to protect water quality in urban areas. The rules restrict the use of 17 pyrethroid insecticides applied by businesses and significantly limit the amount of pesticides that can be applied outdoors, especially to concrete and other hard surfaces more susceptible to runoff. The regulations also prohibit outdoor pest control applicators and maintenance gardeners from

spraying when it rains or to standing water due to rainfall or watering. An evaluation of the regulations by UC Davis suggested that they could affect an 80% reduction in pyrethroid concentrations in runoff. Nonetheless, the Program will continue to seek to make additional progress with IPM policy implementation and general public education and outreach.

### Bacteria

There is significant progress to be reported in Orange County regarding trends in bacterial contamination. Indeed, long-term monitoring of bacterial indicators of contamination shows that exceedances of regulatory standards are low and have been dropping over time and that the annual percentage of Heal the Bay report card grades of A has been between 93% and 97% since 2005. This very significant progress with respect to shoreline water quality underscores the impetus for action that comes from broad societal recognition of a problem, an unequivocally favorable cost-benefit analysis and the ability to implement pragmatic cost effective solutions.

In inland surface waters the issue of systemic elevated concentrations of bacteria persists. However, intensive monitoring of the Aliso Creek watershed appears to show that reductions in dry weather flow have produced significant reductions in bacterial concentrations. This finding points to the value of efforts to curtail outdoor water usage. Consequently, collaboration with water districts on water conservation themed education and outreach will continue to be the focus of efforts to engage the general public and sustain the ongoing reductions in bacteria concentrations being observed in inland surface waters.

### Nutrients

Eutrophication of estuaries and coastal waters has been linked to anthropogenic changes in watersheds and is of concern because of the potential for harmful algal blooms, hypoxia, and impacts on aquatic food webs. Across Orange County's watersheds nutrients continue to present a regulatory concern although the environmental significance of nutrients and the specific contribution of urban sources is less understood in these other areas. Nutrient thresholds are frequently exceeded in the County's streams and channels. However, there are many less frequent occurrences of impacts, such as macroalgal overgrowth, due to these exceedances. Moreover nutrient problems are not limited to the urban portion of the County; regional monitoring data show nutrient enrichment and impacts such as increased macroalgal cover and/or lower dissolved oxygen in streams and estuaries in undeveloped regions. Pending further research, the Program will continue to effect reductions in municipal fertilizer use through implementation of the Program's IPM policy and encourage water quality-sensitive landscape maintenance practices in the general population through education and outreach.

### **7.3 Proposed Management Program**

Based upon the prior discussion and in response to the findings of the environmental quality monitoring program, the Program proposes the following management program for the period of the Fifth Term MS4 Permit:

#### *State of the Environment: Bacteria*

- Continue targeted data analyses of monitoring data to prioritize problem areas. Conduct additional source

tracking studies as needed, using new monitoring methods based on genetic markers to identify potential sources of these problems such as infiltration into the MS4 from sewage lines. This effort should build on results of the Bight '13 Microbiology Study (see **Section 2.3.6**);

- Continue identifying opportunities to reduce and prevent flows in dry weather, where monitoring and source tracking data suggest the presence of human fecal contamination (see **Section 2.3.6**);
- Conduct statistical power analysis and optimization studies to improve existing monitoring program designs to improve efficiency and take advantage of available information about patterns and trends of contamination (see **Section 2.3.6**);
- Shift resources from routine monitoring to targeted source tracking and adaptive response, using new tools such as genetic markers of human fecal contamination as these become available (see **Section 2.3.6**);
- Continue supporting regional and collaborative research into better monitoring and source tracking tools (see **Section 2.3.6**);
- Improve understanding of health risk related to high wet weather flows, for example, through the Bight '13 Microbiology Study; follow results of the pilot wet weather epidemiology study planned for San Diego and consider supporting the larger, follow-on study planned for 2014-15 (see **Section 2.3.6**); and

- Conduct pilot mass balance studies to determine their utility for improving the prioritization of management actions (see **Section 2.3.6**).

#### *State of the Environment: Dissolved Solids*

- Conduct a mass balance study, even if at a crude level, to determine the extent to which the MS4 contributes to dissolved solid levels in the creek (see **Section 2.4.2**);
- Prepare a summary report on historic and contemporary conditions of dissolved solids across south Orange County (see **Section 2.4.2**);
- Invest effort into understanding whether dissolved solids are important stressor on macroinvertebrate communities in the creeks to evaluate the environmental significance of elevated dissolved solid concentrations (see **Section 2.4.2**); and
- Continue evaluating changes in dissolved solids at key locations such as Oso Creek in concert with water conservation efforts to track changes in dissolved solids over time (see **Section 2.4.2**).

#### *State of the Environment: Nutrients*

- Conduct an assessment of sources and practices that input to the MS4 to assess the significance of each to downstream issues (see **Section 2.5.5**);
- Continue identifying opportunities to reduce and prevent flows in dry weather (see **Section 2.5.5**);

- Pilot a regional mass balance nutrient model, even if elementary, to help prioritize monitoring and management attention; the Newport Bay watershed and SCCWRP coastal ocean nutrient mass balance models provide useful examples (see **Section 2.5.5**); and
- Use available time series of data to streamline monitoring to improve its statistical and economic efficiency. Sampling effort could be reduced by identifying stations that essentially mimic each other and/or by reducing the spatial and/or temporal intensity of sampling. Monitoring could shift to a sentinel program with a lower frequency of monitoring intended to ensure conditions do not worsen (see **Section 2.5.5**).

*State of the Environment: Toxicity*

- Reassess management concerns and priorities about metals impacts in freshwater channels, bays and estuaries, and the nearshore coastal zone (see **Section 2.6.5**);
- To the extent that metals, particularly copper, remain a concern because of potential impacts in bays and harbors, recognize that inputs from antifouling paint, which are not an urban runoff issue, are likely a more important source than watershed input (see **Section 2.6.5**);
- Improve information on the use of pesticides in the County, particularly by the largest applicators (see **Section 2.6.5**);

- Work with other interested parties to fill the data gap related to retail sales of pesticides (see **Section 2.6.5**);
- Examine the CDPH database to develop a more thorough picture of trends in reported pesticide use (see **Section 2.6.5**);
- Use this information to expand and focus cooperative outreach efforts about proper pesticide application and the use of alternatives such as botanical oils that are effective, but nonlethal, insect deterrents (see **Section 2.6.5**);
- Use available data to streamline monitoring and improve its statistical and economic efficiency. Consider reducing the current focus on metals monitoring and targeting pesticide monitoring on less expensive representative constituents or surrogates. Consider reducing the frequency of sampling for sediment associated constituents to the Bight Program’s sampling frequency (see **Section 2.6.5**);
- Given the overall low level of observed toxicity, consider increasing the use of adaptive responses (e.g., TIEs and other types of causal assessment) in place of intensive routine monitoring (see **Section 2.6.5**);
- Continue taking advantage of opportunities to reduce dry weather runoff to channels (see **Section 2.6.5**); and
- Continue the productive relationship the University of California’s South Coast Research and Extension

Center and take advantage of opportunities for its Director to communicate the stormwater management perspective to C DPR (see Section 2.6.5).

#### *Controlling Pollutant Sources: Watershed Programs – Aliso Creek*

- Reduce current Permittee quarterly progress reporting to an annual basis. Observed watershed bacteria reductions have shifted efforts away from new BMP projects to ongoing BMP maintenance decreasing the benefit of quarterly reporting. (see Section 4.4); and
- Continue implementation of monitoring and reporting described in the Revised Aliso Creek Program through December 2015 with 2015 annual reporting to include a reevaluation of the program relative to watershed bacteria TMDLs, the watershed Comprehensive Load Reduction Plan (CLRP), and related NPDES programs. (see Section 4.4).

#### *Municipal Infrastructure and Integrated Pest Management*

Continue current model programs and:

- Enhance municipal training to address common issues encountered through municipal related complaints and to utilize innovative education formats to encourage effective discussion-based learning. The four most common issues that occur are: trash/debris, pathogen/bacteria, hydrocarbons and exempt discharges. Training will focus on in-classroom engagement of concepts learned prior to the training session and focus on reducing issues and pollutants of concern through specific actions (e.g. runoff reduction

to reduce bacteria loading) (see Section 3.2.3);

- Develop a municipal green infrastructure program that could include evaluation of opportunities for pilot green street projects of different land use/density configurations and development of a green street guidance manual (see Section 3.2.3);
- Examine public land retrofit opportunities for regional BMPs and propose a program to evaluate previously identified regional retrofit opportunities in jurisdictionally owned areas for use in TMDL compliance and LID and/or hydromodification management alternative compliance. This effort will involve the development of watershed models and evaluation of the previously identified potential BMP retrofit sites. Previous reviews (e.g. 2005 RBF retrofit study) will be integrated with current mapping (see Section 3.2.3);
- Develop and initiate the implementation of individualized IPM Guidelines for each Permittee with the goal of demonstrating significant and consistent reductions in fertilizer and pesticide applications based on the mission and goals outlined in jurisdictional IPM Policies (see Section 3.2.3);
- Conduct pilot soil and/or leaf tissue analysis to guide fertilizer use to ensure nitrogen is not applied at annual rates above those recommended by UCCE research. The Permittees would identify the most fertilizer-intensive area by type (e.g. sports fields) and select one site for analysis. The analysis would assist Permittees in fine-tuning nitrogen application based on

the needs of plants at the highest use areas (see Section 3.2.3)

- Improve methods for documenting usage of fertilizer and active ingredient of pesticide on an annual basis to allow for more reliable data on the acreage receiving fertilizer applications. In collaboration with the UCCE, a standardized reporting method would be developed, improving reporting accuracy on both the amount of nitrogen and pesticides applied by Permittees on an annual basis. The objective would be to minimize fertilizer applications where annual rates exceed those recommended by UC research (174 -261 lbs. N/acre) while more accurately capturing the acreage to which fertilizer is applied (see Section 3.2.3); and
- Expand training to include peer-reviewed online training courses offered by University of California IPM (UC IPM) and UCCE to ensure the IPM and water quality message reaches as many field staff as possible. Possible options include the UC IPM Urban Pesticide Runoff and Mitigation online training series developed by UC academics across the state to provide a more suitable method to reach field staff unable to attend in-person training. The online training consists of a series of courses directly addressing the impacts of pesticides on water quality as well as practices to mitigate these impacts (<http://www.ipm.ucdavis.edu/training/upr-mitigation.html>) (see Section 3.2.3).

#### Public Outreach

Continue current model program and:

- Emphasize outreach to school-age children to continue building upon existing partnerships and increasing knowledge of the Orange County community as a whole through increasing knowledge of youth (see Section 3.3.7);
- Incorporate current strategic approach of using public awareness survey results to prioritize outreach efforts based on behaviors of concern in tandem with water quality results to document small-scale behavior change over time (see Section 3.3.7);
- Coordinate with water supply agencies to incorporate water use efficiency and runoff reduction messaging to maximize program reach and ensure requested behavior changes align with water use efficiency techniques supported by other agencies. Coordinate to encourage behaviors and develop programs supportive of building a sustainable local water supply as identified in the Water Quality Implementation Plan; including building social norms around water use efficiency and elimination of irrigation runoff (see Section 3.3.7);
- Develop focused outreach campaigns based on water quality and survey results utilizing CBSM techniques to document changes in targeted behaviors. The Permittees will develop focused campaigns supportive of a singular message with the goal of reducing competing messaging that may lead to inaction. CBSM tactics will be utilized to target behaviors associated with water quality priorities identified in the Water Quality Implementation Plan (see Section 3.3.7);

- Encourage greater public participation in stormwater pollution prevention and elimination of non-stormwater discharges through the use of CBSM and increased availability to online resources. Action campaigns would encourage residents to take an identified action and to share efforts with others (see **Section 3.3.7**);
- Social media calendars will synchronize outreach efforts and encourage direct participation in and sharing of program messaging. Social media forms of earned media will complement action campaign elements by encouraging direct residential participation in programs. Activity on social media significantly increases with boosted posts and paid advertising; these unpaid and paid tools will support CBSM programs (see **Section 3.3.7**); and
- Review website for usability and revise structure as needed to meet goals of increasing public use of web content. The goal of the review will be to increase access to mapping tools, water quality data and BMPs to prevent water pollution (see **Section 3.3.7**).

*New Development / Significant Redevelopment*

- Implement an approach to hydromodification management that is informed by a watershed analysis and channel-specific protection and restoration goals. The Permittees understand that, consistent with current published research, a “one-size-fits-all” for hydromodification management is not appropriate for highly modified urban stream systems. Pending a watershed analysis, land development projects

discharging runoff to engineered channels, should not be required to implement hydromodification management controls (see **Section 3.4.3**);

- Incorporate an IRWM element into the land planning/land development process. The Permittees understand that an integrated water resources management approach is needed to optimize attainment of water quality protection, water conservation, flood control, and stream protection goals. The Permittees therefore intend to incorporate an integrated water resources management element into their land planning and land development processes so that as development projects begin entitlement this approach and opportunities to achieve this approach are evaluated. This recommendation will require a modified LID Hierarchy that establishes the equivalency of “On-site BMP” and “Off-Site /Regional BMP” solutions (see **Section 3.4.3**);
- Create an exemption from Project WQMP requirements for stream and watershed restoration projects (see **Section 3.4.3**);
- Create an exemption for emergency public safety projects where delay would compromise public safety, public health and/or the environment (see **Section 3.4.3**);
- Develop an internet based regional geodatabase. To effectively implement an IRWM and watershed management approach, access to information that describes all of the key hydrologic process and landscape characteristics will be critical. The

Permittees are developing and starting to use an internet-based regional geodatabase to give developers and municipal staff access to the geotechnical and hydrologic information necessary for evaluating the application of the LID hierarchy to sites (see **Section 3.4.3**);

- Develop an internet based Project WQMP Submittal Tool and Database potentially in collaboration with Riverside and San Bernardino. The Permittees spend a significant amount of time plan checking and tracking Project WQMPs and so the permittees propose development of an internet based Project WQMP review tool to streamline the submittal and review of WQMPs, allow for enhanced tracking of WQMPs and WQMP inspections, and help with effectiveness assessments and annual reporting (see **Section 3.4.3**);
- Pilot the use of technology to better track Project WQMP inspections and follow up actions needed. To fully utilize the WQMP Submittal Tool and Database WQMP inspections could be performed with tablets or other devices where GIS information and other information can immediately be uploaded to the database. The Permittees propose piloting the use of tablets or other devices linked to the Database for Project WQMP inspections by a select number of cities (see **Section 3.4.3**); and
- Enhance the data collected for WQMPs to have a better understanding of water quality benefits on an annual basis. The Permittees desire to perform a better assessment of the New Development/Significant Redevelopment Program. In order to better

understand the effectiveness of the program, the Permittees propose to collect new critical data elements, and enhance data quality by integrating information into the WQMP Submittal Tool and Database. New data would include volumes of water treated, land area treated, and other relevant information needed to evaluate TMDL compliance, to identify developed/redeveloped areas that meet LID and/or hydromodification requirements, and to track BMP maintenance as a measure of effectiveness (see **Section 3.4.3**).

#### *Construction*

Continue current model program and

- Reduce the frequency of inspection for “high” priority sites from bi-weekly to twice during the wet season and reduce the frequency of inspection for “medium” priority sites from monthly to once during the wet season (see **Section 3.5.3**);
- Pilot a GIS and internet-based database to track construction sites. In order to provide easier tracking of construction sites on a countywide basis, the Permittees will develop a GIS and internet-based database where information regarding each construction site can be entered. The Permittees would examine the benefits of such a database by piloting implementation with a select number of cities (see **Section 3.5.3**);
- Conduct pilot field-testing of personal electronic devices to document inspections onsite. Use of tablets

or other electronic devices during inspections will allow inspectors to immediately upload construction site information to the GIS based database. The Permittees would pilot the use of these technologies with a select number of cities (see **Section 3.5.3**); and

- Conduct QSD/QSP Training. The QSD/QSP Training developed by the State Board and CASQA provides a detailed understanding of the Construction General Permit. The Permittees propose providing this training to municipal staff every other year to ensure that inspectors and other municipal staff understand the CGP requirements that are to be implemented for construction projects in their jurisdiction. It is anticipated that with potential changes to the CGP being adopted in 2014 that municipal staff should be aware of these changes and any new or modified requirements for CGP compliance (see **Section 3.5.3**).

#### *Existing Development*

Continue current model program and

- Consider incorporating the updated CASQA BMP fact sheets into the Existing Development Model Program (see **Section 3.6.6**).

#### *Illegal Discharges/Illicit Connections*

- The major elements of the program (e.g. the facilitation of public reporting of complaints, and the designation and training of Authorized Inspectors) continue to be vital and successful pieces of the Program. However, the NALs Program has proven to be less effective than

the Dry Weather Reconnaissance Program. The recommendation is (see **Section 3.7.3**):

- Reinstate an approach, such as the Dry Weather Reconnaissance Program, that allows investigative resources to be directed toward abating priority aberrant discharges;
- Continue implementation of CASC; and
- Consider development of a standardized reporting database potentially accessible by all Permittees.

#### *Plan Development*

- Continue to implement the Strategic Countywide/Jurisdictional Management approach (see **Section 5.4**);
- Develop a comprehensive Watershed Plan to evaluate the watershed and to prioritize implementation efforts and associated resource allocation (see **Section 5.4**);
- Develop pilot program(s) for regional water quality or groundwater recharge BMPs (see **Section 5.4**); and
- Develop model program(s) for water retention credit trading to facilitate off-site BMP implementation where appropriate and to address existing developed areas (see **Section 5.4**).

#### *Program Management and Financing*

- Retain the NPDES Stormwater Permit Implementation Agreement (see **Section 6.4**);

- Continue the program management framework, albeit with a reduction in meeting frequencies (**see Section 6.4**);
- Complete study of future stormwater compliance costs and funding alternatives (**see Section 6.4**); and
- Continue collaborative regional studies (**see Section 6.4**).

Hydromodification

## Recommendations for Fifth term Permit: Hydromodification

**The Fifth Term Permit should include an initial or time limited exemption for conveyance channels that are engineered and regularly maintained for the capacity to convey peak flows from the 10-year or greater storm for ultimate build out condition from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean. The proposed exemption is necessary to provide adequate time to develop a prioritized approach informed by a holistic watershed analysis**

### Discussion

The Program has expended significant resources to map and characterize the County's drainage systems and create a geodatabase that includes significant information regarding channel attributes. The geodatabase identifies the susceptibility of channel and stream systems to hydromodification from increased flow rates and durations. These efforts have categorized three basic channel conditions;

1. Natural condition or minimally modified;
2. Large river channels that are highly engineered and modified; and
3. Channels with substantial modification for flood control, most of which are engineered and maintained.

The Program proposes to prioritize the hydromodification management approach to identify and fully protect near-natural condition channels. Engineered channels with substantial modification and flood control function will have a lower priority for hydromodification management. A holistic watershed analysis will evaluate and prioritize channel reaches or basins regarding their potential for rehabilitation or

potentially improving their ecological functions. An initial limited time exemption will provide the time to determine which modified channels have potential for rehabilitation to a more natural state, as well as channels with more constraints that reduces their potential for rehabilitation. Highly modified channels require further evaluation for several reasons:

- Engineered channels were installed for the purpose of flood control and protection of public safety and property. Alterations to these channels may conflict with their primary function in the built environment. Additionally, engineered flood control channels generally have limited options for modification as they must provide their mandated service of flood control within a right-of-way constrained by adjacent development. In virtually all cases, it is likely to be cost prohibitive to purchase additional right of way so that flood control channels could be modified to approximate a natural state.
- Studies<sup>1</sup> have shown that hydromodification is caused by storms up to the 10 year event. Engineered channels designed to convey the 10-year ultimate build out condition will therefore not experience hydromodification impacts. and if impacts or damage does occur, the Flood Control District is legally obligated to repair the channel and restore the design function.
- The pre-development stream channel pathways were dynamic and changed through time. These natural washes were modified to provide flood protection for developed areas, fundamentally changing the slope and composition of the bed material. This modification is evident in south Orange County as identified for both Prima Deshecha identified in **Figure**

1 and Segunda Deshecha identified in **Figure 2** below. In both cases the historic paths of these streams were straightened, and development in the area was built as close to the modified channel right-of-way as possible. There are few opportunities to change the condition of these streams as most changes would require additional right-of-way acquired through condemning existing development.

The adverse hydrologic impacts to stream systems that can arise from land development must, be understood as a basis for the lawful requirement of mitigation. Based on the takings clause of the U.S. and California constitutions and the Mitigation Fee Act, hydromodification control requirements applied to development projects must bear a reasonable relationship to the impacts of the project. Requiring hydrologic controls on projects draining to receiving waters not susceptible to hydromodification is contrary to these legal requirements. An initial exemption for engineered channels is consistent with this mitigation concept of relationship and nexus to impacts.

In addition to legal concerns regarding the overly broad application of hydromodification management controls, significant fiscal constraints confront restorative goals. The Prima Deshecha and Segunda Deshecha watersheds (**Figures 1 & 2**), for example, demonstrate the quite profound changes to these channel systems that have attended development of the landscape. Moreover, it is evident in **Figures 1 and 2** that a re-configuration of these channels toward more natural channel alignments will require more land. Because of the costs identified in **Table 1** it will be fiscally infeasible to restore in many instances. The watershed analysis is needed to identify modified channels that genuinely present opportunities for

restoration or rehabilitation in south Orange County and which will benefit from hydromodification management.

**Table 1 Average Property Costs in Orange County**

Property Type	Cost (per square foot)	Cost (per acre)
Retail	\$355.52	\$15,486,451.20
Office	\$249.47	\$10,866,913.20
Industrial	\$179.39	\$7,814,228.40

A final consideration is another aspect of state law. The Orange County Flood Control District has been delegated authority by the Legislature to construct channels and infrastructure for flood control purposes. These engineered channels are intended for the protection of public safety and property and are mandated by the Orange County Flood Control Act of 1927. Engineered channels serve the public health and safety through flood control protection. A significant portion of Orange County lies in a flood plain and the public needs the benefits of these flood control channels for protection of public safety and property.

Based on the above information a time limited (i.e. pending completion of a watershed analysis) exemption for engineered channels is warranted and should be provided in the Fifth Term Permit for all engineered channels in South Orange County. Provided below are **Figures 3-14** that identify the engineered channels and associated drainage areas in South Orange County, including specific jurisdictions, that would be exempt for discharges to an engineered channel conveyance system with the capacity to convey the 10-year ultimate condition that extends from the point of discharge to water

storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean.

The approach to hydromodification management should be to protect the highest quality streams from future impacts of increased volume and velocity of runoff that will cause hydromodification impacts. A secondary goal of hydromodification management can be restoration or rehabilitation of stream channels where it is feasible, however the watershed analysis needs to be completed first, to identify which streams restoration or rehabilitation is practical.
