TEST CLAIM FORM AND TEST CLAIM AMENDMENT FORM (Pursuant to Government Code section 17500 et seq. and Title 2, California Code of Regulations, section 1181.1 et seq.)

Section 1

Proposed Test Claim Title:

California Regional Water Quality Control Board, Los Angeles Region, Order No. R4-2021-0105

Section 2

Local Government (Local Agency/School District) Name:

County of Los Angeles

Name and Title of Claimant's Authorized Official pursuant to [CCR, tit.2, § 1183.1\(a\)\(1-5\)](#):

Arlene Barrera, Auditor-Controller

Street Address, City, State, and Zip:

500 West Temple Street, Room 525, Los Angeles, CA 90012

Telephone Number

(213) 974-8302

Email Address

abarrera@auditor.lacounty.gov

Section 3 – Claimant designates the following person to act as its sole representative in this test claim. All correspondence and communications regarding this claim shall be sent to this representative. Any change in representation must be authorized by the claimant in writing, and e-filed with the Commission on State Mandates. ([CCR, tit.2, § 1183.1\(b\)\(1-5\)](#))

Name and Title of Claimant Representative:

Howard Gest

Organization: Burhenn & Gest LLP

Street Address, City, State, Zip:

624 South Grand Avenue, Suite 2200, Los Angeles, CA 90017

Telephone Number

(213) 629-8787

Email Address

hgest@burhenngest.com

Section 4 – Identify all code sections (include statutes, chapters, and bill numbers; e.g., Penal Code section 2045, Statutes 2004, Chapter 54 [AB 290]), regulatory sections (include register number and effective date; e.g., California Code of Regulations, title 5, section 60100 (Register 1998, No. 44, effective 10/29/98), and other executive orders (include effective date) that impose the alleged mandate pursuant to [Government Code section 17553](#) and check for amendments to the section or regulations adopted to implement it (refer to completed WORKSHEET on page 5):

Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105 (effective September 11, 2021): (1) Parts IV.A.2 and B and Attachments J through S (except Attachments K, L and N); (2) Part VII and Attachment E; (3) Parts III.A.1, A.3.a, A.3.b, A.5.a, A.5.b, A.5.c, A.6, VIII.I.5, I.6, I.8; (4) Parts VIII.D.1, D.3, D.4; (5) Parts VIII.F.3.c.i, F.3.c.ii, F.3.c.iii; (6) Parts VIII.G.4.a, G.5.a, G.5.b.i, G.5.b.ii; and (7) Parts VIII.H.2 and H.5.b.

- Test Claim is Timely Filed on [Insert Filing Date] [select either A or B]: 7 / 22 / 22
 - A: Which is not later than 12 months (365 days) following [insert effective date] 9 / 11 / 2021, the effective date of the statute(s) or executive order(s) pled; or
 - B: Which is within 12 months (365 days) of [insert the date costs were *first* incurred to implement the alleged mandate] / / , which is the date of first incurring costs as a result of the statute(s) or executive order(s) pled. *This filing includes evidence which would be admissible over an objection in a civil proceeding to support the assertion of fact regarding the date that costs were first incurred.*

([Gov. Code § 17551\(c\)](#); [Cal. Code Regs., tit. 2, §§ 1183.1\(c\)](#) and [1187.5.](#))

Section 5 – Written Narrative:

- Includes a statement that actual or estimated costs exceed one thousand dollars (\$1,000). ([Gov. Code § 17564.](#))
- Includes all of the following elements for each statute or executive order alleged **pursuant to [Government Code section 17553\(b\)\(1\)](#)** (refer to completed WORKSHEET on page 5):
- Identifies all sections of statutes or executive orders and the effective date and register number of regulations alleged to contain a mandate, including a detailed description of the *new* activities and costs that arise from the alleged mandate and the existing activities and costs that are *modified* by the alleged mandate;
- Identifies *actual* increased costs incurred by the claimant during the fiscal year for which the claim was filed to implement the alleged mandate;
- Identifies *actual or estimated* annual costs that will be incurred by the claimant to implement the alleged mandate during the fiscal year immediately following the fiscal year for which the claim was filed;
- Contains a statewide cost estimate of increased costs that all local agencies or school districts will incur to implement the alleged mandate during the fiscal year immediately following the fiscal year for which the claim was filed;

Following FY: 2022 - 2023 Total Costs: App. \$112,844,000 (all permittees)

Identifies all dedicated funding sources for this program;

State: None

Federal: None

Local agency's general purpose funds: No dedicated funding source. (General funds to cover costs are used.)

Other nonlocal agency funds: None

Fee authority to offset costs: None

Identifies prior mandate determinations made by the Board of Control or the Commission on State Mandates that may be related to the alleged mandate:

In re Test Claim on: Los Angeles Regional Quality Control Board Order No. 01-192, Case Nos.: 03-TC-04, 03-TC-19, 03-TC-20, 03-TC-21;

In re Test Claim on: San Diego Regional Water Quality Control Board Order No. R9-2007-0001, Case No. 07-TC-09.

Identifies any legislatively determined mandates that are on, or that may be related to, the same statute or executive order:

None

Section 6 – The Written Narrative Shall be Supported with Declarations Under Penalty of Perjury Pursuant to [Government Code Section 17553\(b\)\(2\)](#) and [California Code of Regulations, title 2, section 1187.5](#), as follows (refer to your completed WORKSHEET on page 5 of this form):

Declarations of actual or estimated increased costs that will be incurred by the claimant to implement the alleged mandate.

Declarations identifying all local, state, or federal funds, and fee authority that may be used to offset the increased costs that will be incurred by the claimant to implement the alleged mandate, including direct and indirect costs.

Declarations describing new activities performed to implement specified provisions of the new statute or executive order alleged to impose a reimbursable state-mandated program (specific references shall be made to chapters, articles, sections, or page numbers alleged to impose a reimbursable state-mandated program).

If applicable, declarations describing the period of reimbursement and payments received for full reimbursement of costs for a legislatively determined mandate pursuant to [Government Code section 17573](#), and the authority to file a test claim pursuant to paragraph (1) of subdivision (c) of [Government Code section 17574](#).

The declarations are signed under penalty of perjury, based on the declarant's personal knowledge, information, or belief, by persons who are authorized and competent to do so.

Section 7 – The Written Narrative Shall be Supported with Copies of the Following Documentation Pursuant to [Government Code section 17553\(b\)\(3\)](#) and [California Code of Regulations, title 2, § 1187.5](#) (refer to your completed WORKSHEET on page 5 of this form):

The test claim statute that includes the bill number, and/or executive order identified by its effective date and register number (if a regulation), alleged to impose or impact a mandate.
Pages 61 to 880.

Relevant portions of state constitutional provisions, federal statutes, and executive orders that may impact the alleged mandate. Pages 1461 to 1569.

- Administrative decisions and court decisions cited in the narrative. (Published court decisions arising from a state mandate determination by the Board of Control or the Commission are exempt from this requirement.) Pages 1570 to 1971.
- Evidence to support any written representation of fact. *Hearsay evidence may be used for the purpose of supplementing or explaining other evidence but shall not be sufficient in itself to support a finding unless it would be admissible over objection in civil actions. (Cal. Code Regs., tit. 2, § 1187.5).* Pages 44 to 1460, 1972-75.

Section 8 – TEST CLAIM CERTIFICATION Pursuant to [Government Code section 17553](#)

- The test claim form is signed and dated at the end of the document, under penalty of perjury by the eligible claimant, with the declaration that the test claim is true and complete to the best of the declarant's personal knowledge, information, or belief.

Read, sign, and date this section. Test claims that are not signed by authorized claimant officials pursuant to [California Code of Regulations, title 2, section 1183.1\(a\)\(1-5\)](#) will be returned as incomplete. In addition, please note that this form also serves to designate a claimant representative for the matter (if desired) and for that reason may only be signed by an authorized local government official as defined in [section 1183.1\(a\)\(1-5\)](#) of the Commission’s regulations, and not by the representative.

This test claim alleges the existence of a reimbursable state-mandated program within the meaning of [article XIII B, section 6 of the California Constitution](#) and [Government Code section 17514](#). I hereby declare, under penalty of perjury under the laws of the State of California, that the information in this test claim is true and complete to the best of my own personal knowledge, information, or belief. All representations of fact are supported by documentary or testimonial evidence and are submitted in accordance with the Commission’s regulations. ([Cal. Code Regs., tit.2, §§ 1183.1 and 1187.5.](#))

INSTRUCTIONS

- **Statute of limitations for filing test claims and test claim amendments.** Local governments may file test claims with the Commission, which shall be filed not later than 12 months (365 days) following the effective date of a statute or executive order, or within 12 months (365 days) of *first* incurring increased costs as a result of a statute or executive order, whichever is later. ([Gov. Code §§ 17551\(c\)](#); [Cal. Code Regs., tit. 2, § 1183.1\(c\)](#), emphasis added.) If the test claim is filed based on the date of first incurring increased costs, evidence of the date of first incurring costs, which would be admissible over an objection in a civil proceeding, must be filed with the test claim or test claim amendment. ([Cal. Code Regs., tit. 2, §§ 1183.1\(c\), 1187.5.](#)) Test claim amendments that add a statute or executive order to an existing test claim shall also be filed within this statute of limitations. ([Cal. Code Regs., tit. 2, §§ 1183.1\(c\).](#))

The statute of limitations for filing a test claim may be tolled when local government and the Department of Finance initiate a joint request for a legislatively determined mandate pursuant to Government Code sections 17573 and 17574. ([See Gov. Code, §§ 17573\(b\), 17574\(c\).](#)) A test claim filed on the same statute or executive order as a legislatively determined mandate pursuant to Government Code section [17574\(c\)](#) shall be filed within six months of the date an event described Government Code section [17574\(c\)\(1\)](#) occurs.

Failure to timely file a test claim will result in the dismissal of the test claim for lack of jurisdiction. ([Gov. Code, § 17551\(c\)](#); [Cal. Code Regs., tit. 2, § 1183.1\(f\),\(g\).](#))

- Complete sections 1 through 8 of the Test Claim Form, including the Worksheet for Sections 4-7, as indicated and note that the first page of the test claim form is the first page of the filing. Do not attach a cover letter, but include all background and arguments in Section 5. Written Narrative. Type all responses. *Failure to complete any of these sections will result in this test claim being returned as incomplete. Pursuant to [Government Code section 17553](#) and [California Code of Regulations, title 2, section 1183.1](#), the Commission will not exercise jurisdiction over statutes and executive orders which are not properly pled. Proper pleading requires that all code sections (including the relevant statute, chapter and bill number), regulations (including the register number and effective date), and executive orders (including the effective date) that impose the alleged mandate are listed in section 4 of the test claim form. Please carefully review your pleading before filing. Test claims may not be amended after the draft proposed decision is issued and the matter is set for hearing, or if the statute of limitations on the statute or executive order being added has expired. ([Gov. Code, § 17557\(e\)](#); [Cal. Code Regs., tit. 2, §§ 1183.1\(c\), 1183.6.](#))*
- Please file the entire test claim, including the Worksheet for Sections 4-7, consistent with the Commission’s regulations ([Cal. Code Regs., tit.2, § 1181.3](#)) by either of the following methods:

E-filing. All new test claim filings and supporting written materials shall be filed via the Commission’s e-filing system, available on the Commission’s website (<http://www.csm.ca.gov>). Documents e-filed with the Commission shall be in a legible and searchable format using a “true PDF” (i.e., documents digitally created in PDF, converted to PDF or printed to PDF) or optical character recognition (OCR) function, as necessary. Test claims shall be filed on this form prescribed by the Commission and shall be digitally signed by the claimant, using the digital signature technology and authentication process contained herein. The completed test claim form shall be e-filed separately from any accompanying documents. Accompanying documents shall be e-filed together in a single file in accordance with section 1181.3(c)(1). The filer is responsible for maintaining the signed original new filing or written

material for the duration of the test claim process, including any period of appeal (this may be an electronic document, depending on how the filer creates and maintains its records). ***No additional copies are required when e-filing the request.***

Hard Copy Filing Cases of Undue Hardship or Significant Prejudice. If e-filing legible and searchable PDF documents, as described in section 1181.3(c)(1) of the Commission’s regulations, would cause the filer undue hardship or significant prejudice, the filer may submit a written request to the executive director to file in hard copy and may file the request by first class mail, overnight delivery, or personal service. Only upon prior approval by the executive director of a written request for a significant hardship or prejudice exception to the e-filing requirement, may a filing be made via hard copy.

Within 10 days of the filing of a test claim, or its amendment, Commission staff will notify the claimant or claimant representative whether the submission is complete or incomplete. Test claims will be considered incomplete if any of the required sections are not included or are illegible. If a completed test claim is not received within thirty 30 calendar days from the date the incomplete test claim was returned, the executive director may disallow the original test claim filing date. A new test claim may then be accepted on the same statute or executive order alleged to impose a mandate. ([Cal. Code Regs., tit.2, § 1183.1.](#))

TEST CLAIM FORM AND TEST CLAIM AMENDMENT FORM (Pursuant to Government Code section 17500 et seq. and Title 2, California Code of Regulations, section 1181.1 et seq.)

Section 1

Proposed Test Claim Title:

California Regional Water Quality Control Board, Los Angeles Region, Order No. R4-2021-0105

Section 2

Local Government (Local Agency/School District) Name:

Los Angeles County Flood Control District

Name and Title of Claimant's Authorized Official pursuant to [CCR, tit.2, § 1183.1\(a\)\(1-5\)](#):

Arlene Barrera, Auditor-Controller

Street Address, City, State, and Zip:

500 West Temple Street, Room 525, Los Angeles, CA 90012

Telephone Number

(213) 974-8302

Email Address

abarrera@auditor.lacounty.gov

Section 3 – Claimant designates the following person to act as its sole representative in this test claim. All correspondence and communications regarding this claim shall be sent to this representative. Any change in representation must be authorized by the claimant in writing, and e-filed with the Commission on State Mandates. ([CCR, tit.2, § 1183.1\(b\)\(1-5\)](#))

Name and Title of Claimant Representative:

Howard Gest

Organization: Burhenn & Gest LLP

Street Address, City, State, Zip:

624 South Grand Avenue, Suite 2200, Los Angeles, CA 90017

Telephone Number

(213) 629-8787

Email Address

hgest@burhenngest.com

Section 4 – Identify all code sections (include statutes, chapters, and bill numbers; e.g., Penal Code section 2045, Statutes 2004, Chapter 54 [AB 290]), regulatory sections (include register number and effective date; e.g., California Code of Regulations, title 5, section 60100 (Register 1998, No. 44, effective 10/29/98), and other executive orders (include effective date) that impose the alleged mandate pursuant to [Government Code section 17553](#) and check for amendments to the section or regulations adopted to implement it (refer to completed WORKSHEET on page 5):

Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105 (effective September 11, 2021): (1) Parts IV.A.2 and B and Attachments J through S (except Attachments K, L and N); (2) Part VII and Attachment E; (3) Parts III.A.1, A.3.a, A3.b, A.5.a, A.5.b, A.5.c, A.6, VIII.I.5; I.6, I.8; (4) Parts VIII.D.1, D.3, D.4; (5) Parts VIII.H.2 and H.5.b.

- Test Claim is Timely Filed on [Insert Filing Date] [select either A or B]: 7 / 22 / 22
 - A: Which is not later than 12 months (365 days) following [insert effective date] 9 / 11 / 2021, the effective date of the statute(s) or executive order(s) pled; or
 - B: Which is within 12 months (365 days) of [insert the date costs were *first* incurred to implement the alleged mandate] / / , which is the date of first incurring costs as a result of the statute(s) or executive order(s) pled. *This filing includes evidence which would be admissible over an objection in a civil proceeding to support the assertion of fact regarding the date that costs were first incurred.*

([Gov. Code § 17551\(c\)](#); [Cal. Code Regs., tit. 2, §§ 1183.1\(c\)](#) and [1187.5.](#))

Section 5 – Written Narrative:

- Includes a statement that actual or estimated costs exceed one thousand dollars (\$1,000). ([Gov. Code § 17564.](#))
- Includes all of the following elements for each statute or executive order alleged **pursuant to [Government Code section 17553\(b\)\(1\)](#) (refer to completed WORKSHEET on page 5):**
- Identifies all sections of statutes or executive orders and the effective date and register number of regulations alleged to contain a mandate, including a detailed description of the *new* activities and costs that arise from the alleged mandate and the existing activities and costs that are *modified* by the alleged mandate;
- Identifies *actual* increased costs incurred by the claimant during the fiscal year for which the claim was filed to implement the alleged mandate;
- Identifies *actual or estimated* annual costs that will be incurred by the claimant to implement the alleged mandate during the fiscal year immediately following the fiscal year for which the claim was filed;
- Contains a statewide cost estimate of increased costs that all local agencies or school districts will incur to implement the alleged mandate during the fiscal year immediately following the fiscal year for which the claim was filed;

Following FY: 2022 - 2023 Total Costs: App. \$112,844,000 (all permittees)

Identifies all dedicated funding sources for this program;

State: None

Federal: None

Local agency's general purpose funds: No dedicated funding source. (General funds to cover costs are used.)

Other nonlocal agency funds: None

Fee authority to offset costs: None

Identifies prior mandate determinations made by the Board of Control or the Commission on State Mandates that may be related to the alleged mandate:

In re Test Claim on: Los Angeles Regional Quality Control Board Order No. 01-192, Case Nos.: 03-TC-04, 03-TC-19, 03-TC-20, 03-TC-21;

In re Test Claim on: San Diego Regional Water Quality Control Board Order No. R9-2007-0001, Case No. 07-TC-09.

Identifies any legislatively determined mandates that are on, or that may be related to, the same statute or executive order:

None

Section 6 – The Written Narrative Shall be Supported with Declarations Under Penalty of Perjury Pursuant to [Government Code Section 17553\(b\)\(2\)](#) and [California Code of Regulations, title 2, section 1187.5](#), as follows (refer to your completed WORKSHEET on page 5 of this form):

Declarations of actual or estimated increased costs that will be incurred by the claimant to implement the alleged mandate.

Declarations identifying all local, state, or federal funds, and fee authority that may be used to offset the increased costs that will be incurred by the claimant to implement the alleged mandate, including direct and indirect costs.

Declarations describing new activities performed to implement specified provisions of the new statute or executive order alleged to impose a reimbursable state-mandated program (specific references shall be made to chapters, articles, sections, or page numbers alleged to impose a reimbursable state-mandated program).

If applicable, declarations describing the period of reimbursement and payments received for full reimbursement of costs for a legislatively determined mandate pursuant to [Government Code section 17573](#), and the authority to file a test claim pursuant to paragraph (1) of subdivision (c) of [Government Code section 17574](#).

The declarations are signed under penalty of perjury, based on the declarant's personal knowledge, information, or belief, by persons who are authorized and competent to do so.

Section 7 – The Written Narrative Shall be Supported with Copies of the Following Documentation Pursuant to [Government Code section 17553\(b\)\(3\)](#) and [California Code of Regulations, title 2, § 1187.5](#) (refer to your completed WORKSHEET on page 5 of this form):

The test claim statute that includes the bill number, and/or executive order identified by its effective date and register number (if a regulation), alleged to impose or impact a mandate.
Pages 61 to 880.

Relevant portions of state constitutional provisions, federal statutes, and executive orders that may impact the alleged mandate. Pages 1461 to 1569.

- Administrative decisions and court decisions cited in the narrative. (Published court decisions arising from a state mandate determination by the Board of Control or the Commission are exempt from this requirement.) Pages 1570 to 1971.
- Evidence to support any written representation of fact. *Hearsay evidence may be used for the purpose of supplementing or explaining other evidence but shall not be sufficient in itself to support a finding unless it would be admissible over objection in civil actions. (Cal. Code Regs., tit. 2, § 1187.5).* Pages 42 to 1460, 1972-75.

Section 8 – TEST CLAIM CERTIFICATION Pursuant to [Government Code section 17553](#)

- The test claim form is signed and dated at the end of the document, under penalty of perjury by the eligible claimant, with the declaration that the test claim is true and complete to the best of the declarant's personal knowledge, information, or belief.

Read, sign, and date this section. Test claims that are not signed by authorized claimant officials pursuant to [California Code of Regulations, title 2, section 1183.1\(a\)\(1-5\)](#) will be returned as incomplete. In addition, please note that this form also serves to designate a claimant representative for the matter (if desired) and for that reason may only be signed by an authorized local government official as defined in [section 1183.1\(a\)\(1-5\)](#) of the Commission’s regulations, and not by the representative.

This test claim alleges the existence of a reimbursable state-mandated program within the meaning of [article XIII B, section 6 of the California Constitution](#) and [Government Code section 17514](#). I hereby declare, under penalty of perjury under the laws of the State of California, that the information in this test claim is true and complete to the best of my own personal knowledge, information, or belief. All representations of fact are supported by documentary or testimonial evidence and are submitted in accordance with the Commission’s regulations. ([Cal. Code Regs., tit.2, §§ 1183.1 and 1187.5.](#))

INSTRUCTIONS

- **Statute of limitations for filing test claims and test claim amendments.** Local governments may file test claims with the Commission, which shall be filed not later than 12 months (365 days) following the effective date of a statute or executive order, or within 12 months (365 days) of *first* incurring increased costs as a result of a statute or executive order, whichever is later. ([Gov. Code §§ 17551\(c\)](#); [Cal. Code Regs., tit. 2, § 1183.1\(c\)](#), emphasis added.) If the test claim is filed based on the date of first incurring increased costs, evidence of the date of first incurring costs, which would be admissible over an objection in a civil proceeding, must be filed with the test claim or test claim amendment. ([Cal. Code Regs., tit. 2, §§ 1183.1\(c\), 1187.5.](#)) Test claim amendments that add a statute or executive order to an existing test claim shall also be filed within this statute of limitations. ([Cal. Code Regs., tit. 2, §§ 1183.1\(c\).](#))

The statute of limitations for filing a test claim may be tolled when local government and the Department of Finance initiate a joint request for a legislatively determined mandate pursuant to Government Code sections 17573 and 17574. ([See Gov. Code, §§ 17573\(b\), 17574\(c\).](#)) A test claim filed on the same statute or executive order as a legislatively determined mandate pursuant to Government Code section [17574\(c\)](#) shall be filed within six months of the date an event described Government Code section [17574\(c\)\(1\)](#) occurs.

Failure to timely file a test claim will result in the dismissal of the test claim for lack of jurisdiction. ([Gov. Code, § 17551\(c\)](#); [Cal. Code Regs., tit. 2, § 1183.1\(f\),\(g\).](#))

- Complete sections 1 through 8 of the Test Claim Form, including the Worksheet for Sections 4-7, as indicated and note that the first page of the test claim form is the first page of the filing. Do not attach a cover letter, but include all background and arguments in Section 5. Written Narrative. Type all responses. *Failure to complete any of these sections will result in this test claim being returned as incomplete. Pursuant to [Government Code section 17553](#) and [California Code of Regulations, title 2, section 1183.1](#), the Commission will not exercise jurisdiction over statutes and executive orders which are not properly pled. Proper pleading requires that all code sections (including the relevant statute, chapter and bill number), regulations (including the register number and effective date), and executive orders (including the effective date) that impose the alleged mandate are listed in section 4 of the test claim form. Please carefully review your pleading before filing. Test claims may not be amended after the draft proposed decision is issued and the matter is set for hearing, or if the statute of limitations on the statute or executive order being added has expired. ([Gov. Code, § 17557\(e\)](#); [Cal. Code Regs., tit. 2, §§ 1183.1\(c\), 1183.6.](#))*
- Please file the entire test claim, including the Worksheet for Sections 4-7, consistent with the Commission’s regulations ([Cal. Code Regs., tit.2, § 1181.3](#)) by either of the following methods:

E-filing. All new test claim filings and supporting written materials shall be filed via the Commission’s e-filing system, available on the Commission’s website (<http://www.csm.ca.gov>). Documents e-filed with the Commission shall be in a legible and searchable format using a “true PDF” (i.e., documents digitally created in PDF, converted to PDF or printed to PDF) or optical character recognition (OCR) function, as necessary. Test claims shall be filed on this form prescribed by the Commission and shall be digitally signed by the claimant, using the digital signature technology and authentication process contained herein. The completed test claim form shall be e-filed separately from any accompanying documents. Accompanying documents shall be e-filed together in a single file in accordance with section 1181.3(c)(1). The filer is responsible for maintaining the signed original new filing or written

material for the duration of the test claim process, including any period of appeal (this may be an electronic document, depending on how the filer creates and maintains its records). ***No additional copies are required when e-filing the request.***

Hard Copy Filing Cases of Undue Hardship or Significant Prejudice. If e-filing legible and searchable PDF documents, as described in section 1181.3(c)(1) of the Commission's regulations, would cause the filer undue hardship or significant prejudice, the filer may submit a written request to the executive director to file in hard copy and may file the request by first class mail, overnight delivery, or personal service. Only upon prior approval by the executive director of a written request for a significant hardship or prejudice exception to the e-filing requirement, may a filing be made via hard copy.

Within 10 days of the filing of a test claim, or its amendment, Commission staff will notify the claimant or claimant representative whether the submission is complete or incomplete. Test claims will be considered incomplete if any of the required sections are not included or are illegible. If a completed test claim is not received within thirty 30 calendar days from the date the incomplete test claim was returned, the executive director may disallow the original test claim filing date. A new test claim may then be accepted on the same statute or executive order alleged to impose a mandate. ([Cal. Code Regs., tit.2, § 1183.1.](#))

WORKSHEETS

In Support of Joint Test Claim of Los Angeles County and the
Los Angeles County Flood Control District Concerning
Los Angeles RWQCB Order No. R4-2021-0105

Test Claim Form Sections 4-7 WORKSHEET

Complete Worksheets for Each New Activity and Modified Existing Activity Alleged to Be Mandated by the State, and Include the Completed Worksheets With Your Filing.

Note: "Permit" refers to Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

Statute, Chapter and Code Section/Executive Order Section, Effective Date, and Register Number: Permit, Parts IV.A.2 and B, and Attachments J through S (except Attachments K, L and N).

Activity: Compliance with water-quality based effluent limitations

Initial FY: 2021-2022 **Cost:** Approximately \$13,994,000

Following FY: 2022-2023 **Cost:** Approximately \$35,859,000 (projected)

Evidence (if required): See Lombos County Declaration, ¶¶ 9(d) and (e), and Test Claim Attachments filed herewith

Dedicated funding sources: **State:** None **Federal:** None

Local agency's general purpose funds: The County uses local funds to implement the mandate. In addition the County receives funds pursuant to the Safe Clean Water Program (Los Angeles County Measure W). Revenues from the Safe, Clean Water Program are generated from a special parcel tax on private properties in the Los Angeles County Flood Control District.

Other nonlocal agency funds: None

Fee authority to offset costs: None available

Test Claim Form Sections 4-7 WORKSHEET

Complete Worksheets for Each New Activity and Modified Existing Activity Alleged to Be Mandated by the State, and Include the Completed Worksheets With Your Filing.

Note: "Permit" refers to Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

Statute, Chapter and Code Section/Executive Order Section, Effective Date, and Register Number: Permit, Parts III A.1; A.3.a; A.3.b; A.5.a; A.5.b, A.5.c; A.6, VIII.I.5; I.6, and I.8

Activity: Regulate "conditionally exempt non-stormwater discharges," including the development of procedures to ensure that non-stormwater dischargers comply with certain conditions and implement designated best management practices (BMPs), and the evaluation of monitoring data to determine if a conditionally exempt non-stormwater discharges are a source of pollutants that are contributing to an exceedance of applicable limitations, including an exceedance of applicable limitations in receiving waters. Address non-stormwater discharges if they are found to be a source of pollutants, have and implement a spill response plan, and publicize and provide a means for public reporting of illicit discharges and other water quality impacts from stormwater and non-stormwater discharges.

Initial FY: 2021-2022 Cost: Approximately \$249,000

Following FY: 2022-2023 Cost: Approximately \$332,000 (projected)

Evidence (if required): See Lombos County Declaration, ¶¶11(k) and (l) and Test Claim Attachments filed herewith.

Dedicated funding sources: State: None Federal: None

Local agency's general purpose funds: The County uses local funds to implement the mandate.

Other nonlocal agency funds: None

Fee authority to offset costs: None available.

SECTION FIVE

NARRATIVE STATEMENT

**In Support of Joint Test Claim of Los Angeles County and the
Los Angeles County Flood Control District Concerning
Los Angeles RWQCB Order No. R4-2021-0105**

**NARRATIVE STATEMENT IN SUPPORT OF JOINT TEST CLAIM OF THE COUNTY
OF LOS ANGELES AND THE LOS ANGELES COUNTY FLOOD CONTROL
DISTRICT**

I. INTRODUCTION

The County of Los Angeles (“County”) and the Los Angeles County Flood Control District (“District”) (collectively, the “Claimants”) bring this Joint Test Claim with respect to various requirements in a stormwater permit issued by the California Regional Water Quality Control Board, Los Angeles Region (“Regional Board”). Such requirements are unfunded State mandates for which a subvention of funds is required.

A. Adoption of Executive Order

On July 23, 2021, the Regional Board adopted a new stormwater permit, Order No. R4-2021-0105 (“Permit” or “2021 Permit”), regulating discharges from the municipal separate storm sewer system (“MS4”) operated by a number of municipal entities in portions of Los Angeles and Ventura Counties.¹

The County and the District are dedicated to fully implementing the Permit requirements. The Regional Board, however, went well beyond what is required by federal law and its prescriptive terms preclude the County and District from designing their own programs. Therefore, as contemplated by article XIII B, section 6, of the California Constitution, Claimants hereby request reimbursement for the numerous new provisions of the Permit that exceed the requirements of federal law, which either were not included in the previous MS4 permit issued by the Regional Board on November 8, 2012, Order No. R4-2012-0175 (“2012 Permit”), and thus constitute a new program or higher level of service, or already have been considered to be State mandates by the Commission on State Mandates (“Commission”).²

This Section 5 of the Test Claim, which is filed on behalf of the County and the District, identifies the activities that are unfunded mandates and sets forth the basis for reimbursement for such activities. The County and the District seek a subvention of funds for the following mandates:

1. Requirements to comply with Water Quality-Based Effluent Limitations (“WQBELs”) set forth in 2021 Permit Part IV.A.2 and Attachments J through S (except Attachments K, L and N);
2. Requirements to comply with monitoring requirements for WQBELs set forth in 2021 Permit Part VII and Attachment E.

¹ A copy of the Permit and all attachments are included as Exhibit A in Section 7, filed herewith.

² A copy of the 2012 Permit is included as Exhibit B in Section 7.

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

3. Requirements relating to the prohibition of non-stormwater discharges through the permittees' MS4s and an Illicit Discharge Detection and Elimination Program, set forth in 2021 Permit Parts III and VIII.I.5, 6, and 8;

4. Requirements relating to public information and participation programs set forth in 2021 Permit Parts VIII.D.1, 3 and 4;

5. Requirements relating to tracking, inspecting, and enforcing post-construction Best Management Practices ("BMPs") as set forth in 2021 Permit Parts VIII.F.3.c.i, ii, and iii;

6. Requirements relating to construction sites set forth in 2021 Permit Parts VIII.G.4.a, 5.a, 5.b.i and ii; and

7. Public Agency requirements, including maintaining an updated database of permittee-owned or operated facilities and an Integrated Pesticide Management Program as set forth in 2021 Permit Parts VIII.H.2 and H.5.

Claimants are committed to achieving clean water and working together with the Regional Board and other stakeholders to achieve the goals set forth in the Permit. Claimants submit this Test Claim solely for the purpose of obtaining the funds necessary to reach those goals.

B. Statement of Interest of Claimants

Claimants file this test claim jointly and, pursuant to 2 Cal. Code Reg. § 1183.1(b), attest to the following:

1. The County and District allege State-mandated costs resulting from the same Executive Order, *i.e.*, the Permit;

2. The County and District agree on all issues of the Joint Test Claim; and

3. The County and District have designated one person to act as the sole representative for all Claimants. That person is Howard Gest of Burhenn & Gest LLP.³

C. Statement of Actual and/or Estimated Costs Exceeding \$1,000

The Claimants further state that, as set forth below and in the attached Section 6 Declarations in support, the actual and/or estimated costs from the State mandates set forth in this Joint Test Claim exceed \$1,000 for each of them. This Narrative Statement sets forth specific and estimated amounts expended by the County and District as determined from the review of pertinent records and as disclosed in the Section 6 Declarations filed herewith. Such amounts reflect, in some cases, costs associated with the development of programs and not their later implementation by the County and District. Claimants respectfully reserve the right to modify such amounts when or if additional information is received and to adduce additional evidence of costs if required in the course of the Joint Test Claim.

³ See Section 6 Declarations of Claimants, filed herewith.

D. The Joint Test Claim is Timely Filed

A test claim must be filed with the Commission “not later than 12 months (365 days) following the effective date of a statute or executive order, or within 12 months (365 days) of first incurring increased costs as a result of a statute or executive order, whichever is later.” 2 Cal. Code. Reg § 1183.1(c).

Here, the Permit became effective on September 11, 2021. Permit, p. 7. Claimants first incurred costs to implement the Permit in or around September 2021, upon the 2021 Permit becoming effective, or shortly thereafter. See Lombos Declarations, ¶ 8. This Test Claim is filed within 12 months thereafter and is, therefore, timely.

II. THE STATUTORY AND REGULATORY FRAMEWORK

The Permit was issued as both a “waste discharge requirement” under the Porter-Cologne Water Quality Control Act, Water Code § 13000 *et seq.*, and as a National Pollutant Discharge Elimination System (“NPDES”) permit under the federal Clean Water Act (“CWA”), 33 U.S.C. § 1342. *See* 2021 Permit Part II.A. In 1969, three years before Congress enacted the CWA, the California Legislature enacted the Porter-Cologne Act, which established the State Board and nine regional control boards as the agencies responsible for the coordination and control of water quality in California. Water Code § 13001.⁴ Under Porter-Cologne, any person who discharges or proposes to discharge “waste” that could affect the quality of the “waters of the state” is required to obtain a waste discharge requirement permit. Water Code §§ 13260 and 13263.

In 1972, Congress adopted what later became known as the CWA. In so doing, Congress expressly preserved the right of any State to adopt or enforce standards or limitations respecting discharges of pollutants or the control or abatement of pollutants, so long as such provisions were not “less stringent” than federal law. 33 U.S.C. § 1370. *See also* 40 C.F.R. § 123.1(i) (“Nothing in this part precludes a State from: (1) Adopting or enforcing requirements which are more stringent or more extensive than those required under this part; (2) Operating a program with a greater scope of coverage than that required under this part.”).

Under the CWA, the discharge of a pollutant to a navigable water of the United States is prohibited unless the discharge is in accordance with one of the statutory provisions of the Act. 33 U.S.C. § 1311(a).⁵ One of those provisions is the NPDES permit program. 33 U.S.C. § 1342. The CWA provides that States may administer their own NPDES permit programs in lieu of the federal program. 33 U.S.C. § 1342(b); 40 C.F.R. § 123.22. A State’s decision to do so is entirely voluntary, and if the State chooses not to administer this program, NPDES permits for that State are issued by the United States Environmental Protection Agency. *See* 33 U.S.C. § 1342(a).

To effectuate California’s issuance of NPDES permits, the Legislature in 1972 added Chapter 5.5 to the Porter-Cologne Act, Water Code §§ 13370-13389. *Building Industry Ass’n of San Diego County v. State Water Resources Control Board* (2004) 124 Cal.App.4th 866, 875.⁶ In

⁴ Copies of relevant California statutes are contained in Section 7, Exhibit D.

⁵ Copies of federal statutes and regulations are contained in Section 7, Exhibit C.

⁶ Copies of cited federal and State cases are contained in Section 7, Exhibit E.

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

so doing, the Legislature ensured that California law would mirror the CWA's savings clause by authorizing the State Board and regional boards to not only issue permits that complied with the CWA's requirements, but also to include in them "any more stringent effluent standards or limitations necessary to implement water quality control plans, or the protection of beneficial uses, or to prevent nuisance." Water Code § 13377.

In California, NPDES permits are issued by the State Board and the nine regional boards. Water Code § 13377. Such permits can include both federal requirements and any other State provisions that are more stringent than the federal requirements. *Id.* As the California Supreme Court held in *City of Burbank v. State Water Resources Control Board* (2005) 35 Cal. 4th 613, 627-28, the latter requirements are State-imposed and subject to the requirements of State law.

The CWA was amended in 1987 to regulate discharges of stormwater from both industrial and municipal sources. 33 U.S.C. § 1342(p). Permits for discharges from municipal separate storm sewer systems:

- (i) may be issued on a system or jurisdiction-wide basis;
- (ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and
- (iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

33 U.S.C. § 1342(p)(3)(B).

The CWA requirements imposed on municipal stormwater dischargers are less stringent than those imposed on industrial dischargers. Industrial dischargers, including industrial stormwater dischargers, must assure that their discharges meet "water quality standards." 33 U.S.C. §§ 1342(a), 1311(b)(1)(C) and 1342(p)(3)(A). The CWA does not impose this requirement on municipal stormwater dischargers. 33 U.S.C. § 1342(p)(3)(B); *Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1164-65. In *Defenders*, the Ninth Circuit specifically held that MS4 permits were not required to include requirements to meet water quality standards. The court found that EPA or a State may have the *discretion* to include such requirements in a MS4 permit, but such inclusion was solely discretionary. It is not required by the CWA. *Id.* at 1166.

Under the CWA, a State administers "*its own permit program* for discharges into navigable waters," which program is established and administered "*under State law.*" 33 U.S.C. § 1342(b) (emphasis added.) *See also* 40 C.F.R. §123.22 ("Any State that seeks to administer a program . . . shall submit a description of the program it proposes to administer in lieu of the Federal program *under State law.* . . .") (emphasis added).

When administering an NPDES program, the State is not acting as an arm of the United States Environmental Protection Agency ("EPA"), but is acting *in lieu* of the federal program. 40 C.F.R. § 123.22; *State of California v. United States Department of the Navy* (9th Cir. 1988) 845

F.2d 222, 225 (CWA legislative history “clearly states that the state permit programs are ‘not a delegation of Federal Authority’ but instead are state programs which ‘function . . . in lieu of the Federal program.’”); *Voices of the Wetlands v. State Water Resources Control Bd.* (2011) 52 Cal.4th 499, 522 (“It is true, as these parties observe, that the Clean Water Act does not directly delegate a state agency the authority to administer the federal clean water program; instead, it allows the EPA director to ‘suspend’ operation of the federal permit program in individual states in favor of EPA-approved permit systems that operate under those state’s own laws in lieu of the federal framework.”).

The Permit is a “Phase I” permit issued to MS4s serving large urban populations. In 1990, EPA issued regulations to implement Phase I of the MS4 permit program. 55 Fed. Reg. 47990 (November 16, 1990). The requirements of those regulations, as they apply to the provisions of the Permit relevant to this Test Claim, are discussed in further depth below.

This Commission previously has found, in a test claim brought regarding the 2001 Los Angeles MS4 permit (“2001 Permit”) and in a test claim brought regarding a 2007 San Diego MS4 permit, that those permits contained requirements that exceeded federal law and constituted unfunded State mandates. *In re Test Claim on: Los Angeles Regional Quality Control Board Order No. 01-192*, Case Nos.: 03-TC-04, 03-TC-19, 03-TC-20, 03-TC-21 (“Los Angeles County Test Claim”); *In re Test Claim on: San Diego Regional Water Quality Control Board Order No. R9-2007-0001*, Case No. 07-TC-09 (“San Diego County Test Claim”). The Supreme Court affirmed the Commission’s findings with respect to the Los Angeles County Test Claim in *Dept. of Finance v. Commission on State Mandates* (2016) 1 Cal. 5th 749 (“*Dept. of Finance*”), a case which is discussed in detail in Section III.B below. Review of the Commission’s decision in the San Diego County Test Claim is currently pending in the California Court of Appeal.

III. STATE MANDATE LAW

A. Introduction

Article XIII B, section 6, of the California Constitution requires that the Legislature provide a subvention of funds to reimburse local agencies any time that the Legislature or a State agency “mandates a new program or higher level of service on any local government.” The purpose of section 6 “is to preclude the State from shifting financial responsibility for carrying out governmental functions to local agencies, which are ‘ill equipped’ to assume increased financial responsibilities because of the taxing and spending limitations that articles XIII A and XIII B impose.” *County of San Diego v. State of California* (1997) 15 Cal.4th 68, 81. The Legislature implemented section 6 by enacting a comprehensive administrative scheme to establish and pay mandate claims. Govt. Code § 17500 *et seq.*; *Kinlaw v. State of California* (1991) 54 Cal. 3d 326, 331, 333 (statute establishes “procedure by which to implement and enforce section 6”).

“Costs mandated by the state” include “any increased costs which a local agency . . . is required to incur after July 1, 1980, as a result of any statute enacted on or after January 1, 1975, or any executive order implementing any statute enacted on or after January 1, 1975, which mandates a new program or higher level of service of an existing program within the meaning of Section 6 of Article XIII B of the California Constitution.” Govt. Code § 17514.

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

Govt. Code § 17516 defines “executive order” to mean “any order, plan, requirement, rule or regulation issued by the Governor, any officer or official serving at the pleasure of the Governor, or any agency, department, board, or commission of state government.”

Govt. Code § 17556 identifies seven exceptions to the reimbursement requirement for State-mandated costs. The exceptions are as follows:

(a) The claim is submitted by a local agency . . . that requested legislative authority for that local agency . . . to implement the program specified in the statute, and that statute imposes costs upon that local agency or school district requesting the legislative authority. . . .

(b) The statute or executive order affirmed for the state a mandate that had been declared existing law or regulation by action of the courts.

(c) The statute or executive order imposes a requirement that is mandated by a federal law or regulation and results in costs mandated by the federal government, unless the statute or executive order mandates costs that exceed the mandate in that federal law or regulation. . . .

(d) The local agency . . . has the authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service.

(e) The statute, executive order, or an appropriation in a Budget Act or other bill provides for offsetting savings to local agencies . . . that result in no net costs to the local agencies or . . . includes additional revenue that was specifically intended to fund the costs of the state mandate in an amount sufficient to fund the cost of the state mandate.

(f) The statute or executive order imposes duties that are necessary to implement, reasonably within the scope of, or expressly included in, a ballot measure approved by the voters in a statewide or local election. . . .

(g) The statute created a new crime or infraction, eliminated a crime or infraction, or changed the penalty for a crime or infraction, but only for that portion of the statute relating directly to the enforcement of the crime or infraction.

B. The Supreme Court’s Holdings in *Dept. of Finance Control this Case*

In *Dept. of Finance*, the Supreme Court addressed a challenge to the Commission’s finding that the inspection and trash receptacle provisions of the 2001 Permit constituted State, as opposed to federal, mandates. Three holdings from that case are pertinent here:

1. The first sets forth the test to determine if a mandate is federal versus State: “If federal law compels the State to impose, or itself imposes, a requirement, that requirement is a federal mandate. On the other hand, if federal law gives the State discretion whether to impose a

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

particular implementing requirement, and the State exercises its discretion to impose the requirement by virtue of a “true choice,” the requirement is not federally mandated.” 1 Cal. 5th at 765.

2. The second pertinent holding addresses the lack of deference to Regional Board findings: In determining whether a mandate is State or federal, the Commission does not defer to the Regional Board. Instead, the Commission makes its own, independent finding. *Id.* at 768-769.

3. The third pertinent holding places on the State the burden of proving that one of Government Code section 17756 exceptions applies, including that a mandate is federal as opposed to State or that the local agency has the authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service. *Id.* at 769.

The manner in which the Supreme Court reached its conclusion that the 2001 Permit mandates were State mandates is also pertinent here. The Supreme Court analyzed (a) federal and State statutory and regulatory authority, (b) evidence from the permit development process, and (c) evidence of other permits issued by the federal and State governments. *Id.* at 770-772. In affirming the Commission’s decision, the Court explicitly rejected the State’s argument that the inspection and trash requirements merely implemented the maximum extent practicable (“MEP”) standard required of stormwater permittees by 33 U.S.C. § 1342(p)(3)(B)(iii), and that the existence of this MEP provision alone was sufficient to establish that federal law compelled these requirements. 1 Cal. 5th at 759-760, 767-768. Instead, the Court undertook an analysis of whether federal law specifically compelled the inspection and trash receptacle requirements at issue. 1 Cal. 5th at 770-772. As noted above, the Court also rejected the State’s argument that the Commission should defer to Regional Board findings that the permit requirements were federal versus State. 1 Cal. 5th at 768-769.

The Supreme Court’s holdings were based on the public policies underlying article XIII B, section 6, and the reasoning in four principal cases: *City of Sacramento v. State of California* (1990) 50 Cal. 3d 51, *County of Los Angeles v. Commission on State Mandates* (1995) 32 Cal. App. 4th 805, *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564, and *Division of Occupational Safety & Health v. State Bd. Of Control* (1987) 189 Cal.App.3^d 794. *See Dept. of Finance*, 1 Cal. 5th at 762-769.

These public policies, the holdings in *Dept. of Finance*, and the holdings in the four cases the Supreme Court relied on, all apply here. As set forth below, the mandates at issue in this Test Claim carry out the governmental function of providing services to the public and impose unique requirements on Claimants. The mandates are new or impose a higher level of service or are a continuation of the new program or higher level of service first imposed by the 2012 Permit. Each requirement is the result of a “true choice” by the Regional Board to impose the conditions at issue or to specify the means of compliance. No requirement is imposed by federal law. And nowhere in the Permit is there any case-specific Regional Board finding that the requirements at issue are the *only* way in which the MEP standard could be achieved. Finally, Claimants do not have the authority to levy service charges, fees, or assessments sufficient to pay for these mandates.

IV. THE MANDATES IN THIS TEST CLAIM ARE STATE MANDATES FOR WHICH CLAIMANTS ARE ENTITLED TO A SUBVENTION OF FUNDS

A. Compliance with Water Quality-Based Effluent Limitations

1. Mandate Requirement in the Permit

2021 Permit Part IV.A.2 requires the permittees, including the Claimants, to “comply with applicable water quality-based effluent limitations (WQBELs) as set forth in Attachments K through S of this Order, pursuant to applicable compliance schedules.”

Attachment J to the 2021 Permit is a matrix that summarizes by watershed management area the water quality-based effluent limitations with which the Claimants must comply.

Attachments M and O through S of the 2021 Permit set forth the specific water quality-based effluent limitations with which the Claimants must comply.

2. The Permit’s Obligation to Comply with Water Quality-Based Effluent Limitations is a State Mandate

The Permit’s imposition of the obligation to comply with water quality-based effluent limitations is a State mandate. The Regional Board was not compelled to include this provision in the Permit, but instead included it as a matter of discretion. As such, the obligation is a State mandate within the meaning of article XIII B, section 6. *Dept. of Finance*, 1 Cal. 5th at 765.

The Supreme Court in *Dept. of Finance* set forth the test for determining whether a mandate is a State or federal mandate. The Supreme Court held:

If federal law compels the state to impose, or itself imposes, a requirement, that requirement is a federal mandate. On the other hand, if federal law gives the state discretion whether to impose a particular implementing requirement, and the state exercises its discretion to impose the requirement by virtue of a “true choice,” the requirement is not federally mandated.

1 Cal. 5th at 765.

Here, there is no question that federal law did not impose a requirement that Claimants comply with water quality-based effluent limitations. This requirement was imposed as a matter of discretion.

The Permit defines water quality-based effluent limitations as “any restriction imposed on quantities, discharge rates, and concentrations of pollutants, which are discharged from point sources to water of the U.S. *necessary to achieve a water quality standard.*” 2021 Permit, Attachment A - Definitions, page A-20 (emphasis added).⁷ Thus, the obligation to comply with

⁷ Water quality standards consist of the designated uses of a navigable water and the water quality criteria required to support such uses. 33 U.S.C. § 1313(c)(2)(A).

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

water quality-based effluent limitations is an obligation to comply with restrictions “on quantities, discharge rates and concentrations of pollutants” in order to “achieve a water quality standard.”

It is well established, however, that the federal Clean Water Act does not require municipal stormwater permittees to comply with water quality standards. While Congress imposed this obligation on industrial stormwater dischargers, it specifically exempted municipal stormwater dischargers. *See Defenders of Wildlife v. Browner* 191 F.3d 1159, 1164-1165 (9th Cir 1999) (“*Defenders*”). As the court said in *Defenders*:

Industrial storm-water discharges shall achieve any more stringent limitation, including those necessary to meet water quality standards . . . Congress chose not to include a similar provision for municipal storm-sewer discharges. Instead, Congress required municipal storm-sewer discharges to ‘reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. 33 U.S.C. § 1342(p)(3)(B)(iii).

See also Building Industry Assn. of San Diego v. State Water Resources Control Board (2004) (“*BIA*”) 124 Cal.App.4th 866, 886.

This does not mean that the Regional Board cannot require municipal stormwater discharges to meet water quality standards through the requirement to comply with water quality-based effluent limitations. *It means, however, that this requirement is not federally required, but instead is imposed as a matter of the Regional Board’s discretion. See BIA*, 124 Cal. App.4th at 883, 886; *Defenders*, 191 F.3d at 1166-1167.

Thus, under the test articulated in *Dept. of Finance*, the requirement to comply with water quality-based effluent limitations is a State, not federal, mandate. It is not imposed or compelled by federal law, but instead is imposed by the Regional Board as a matter of its discretion. As the Supreme Court held, “If federal law compels the state to impose, or itself imposes, a requirement, that requirement is a federal mandate. On the other hand, if federal law gives the state discretion whether to impose a particular implementing requirement, and the state exercises its discretion to impose the requirement by virtue of a ‘true choice,’ the requirement is not federally mandated.” *Dept. of Finance*, 1 Cal. 5th at 765.

As the Supreme Court further held, the issue before the Commission is not whether the Regional Board has the authority to impose the obligation to comply with water quality-based effluent limitations. The question is whether that obligation is a State mandate. *Id.*, 1 Cal.5th at 769. Under *Dept. of Finance*, the Permit’s requirement to comply with water quality-based effluent limitations in the Permit, because it was imposed as a matter of discretion, is a State mandate. *Id.* at 765.

3. Even if the Requirement to Comply with Water Quality-Based Effluent Limitations is a Federal Mandate, the Requirement to Comply with Numeric Effluent Limitations is a State Mandate

Even if the obligation to comply with water quality-based effluent limitations could be considered a federal mandate, the federal CWA does not require permittees comply with numeric effluent limitations. As set forth above, 33 U.S.C. § 1342(p)(3)(B)(iii) provides that municipal stormwater permits “shall require controls to reduce the pollutants to the maximum extent practicable . . . and such other provisions as the Administrator or the state determines appropriate for the control of such pollutants.” The court in *Defenders* specially held that this provision did not require the inclusion of numeric effluent limits to meet water quality standards in MS4 permits, but that EPA or a State had the discretion to include them. 191 F.3d at 1165-66. *See also BIA, supra*, 124 Cal.App.4th at 874 (“With respect to municipal stormwater discharges, Congress clarified that the EPA has the authority to fashion NPDES permit requirements to meet water quality standards without specific numeric effluent limits and instead to impose ‘controls to reduce a discharge of pollutants to the maximum extent practicable.’”)

On November 22, 2002, EPA issued a guidance memorandum on “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements based on Those WLAs.” In this memorandum,⁸ EPA noted that because stormwater discharges are due to storm events that are highly variable in frequency and duration and are not easily characterized, only in rare cases will it be feasible or appropriate to establish numeric limits for municipal stormwater discharges. *Id.* p. 4. EPA concluded that, in light of the language in 33 U.S.C. § 1342(p)(3)(B)(iii), “for NPDES-regulated municipal and small construction discharges effluent limits should be expressed as best management practices (BMPs) or other similar requirements, rather than as numeric effluent limits.” *Id.*

On November 12, 2010, EPA updated its November 22, 2002, memorandum. In its 2010 memorandum, EPA recommended that, “where feasible, the NPDES permitting authority exercise its discretion to include numeric effluent limitations to meet water quality standards.” Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs,” p. 2. In doing so, EPA reiterated that such inclusion would be as a result of the permitting agency, here the Regional Board “*exercis[ing] its discretion.*” *Id.* (emphasis added).

On November 26, 2014, EPA issued a second revision to its November 22, 2002, memorandum, replacing the 2010 memorandum. Again, EPA noted that in including requirements to meet water quality standards, the permitting agency is exercising its discretion. Revisions to the November 22, 2002, Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs,” November 26, 2014, p. 4.

What is noteworthy about these memorandums is not that EPA said that, in some circumstances, the permitting agency can require compliance with numeric effluent limitations.

⁸ See Section 7, Exhibit C.

What is noteworthy is the EPA did not say that in MS4 permits the federal Clean Water Act *requires* numeric effluent limitations. Instead, EPA said that, if they are contained in an MS4 permit, *it would be as a result of the permitting agency exercising its discretion.*

The Regional Board, therefore, was not compelled by the federal CWA to require Claimants to comply with numeric effluent limitations, as the Regional Board did in 2021 Permit Part IV.A.2 and Attachments J and M through S. Instead, the Regional Board did it as a matter of discretion. This requirement is, therefore, a State mandate. *Dept. of Finance*, 1 Cal.5th at 765.

4. The Requirement to Comply with Water Quality-Based Effluent Limitations is a New Program or Higher Level of Service

The requirement to comply with water quality-based effluent limitations is a new program or higher level of service within the meaning of article XIII B, section 6.

First, there is no question these Permit requirements fall within the definition of a program. A “program” within the meaning of article XIII B, section 6, is one that carries out “the governmental function of providing services to the public, or laws which, to implement a state policy, impose unique requirements on local governments and do not apply generally to all residents and entities in the state.” *County of Los Angeles v. State of California* 43 Cal.3d 46, 56. The two parts of this definition are alternatives, meeting either will trigger the subvention requirement unless an exception applies. *Department of Finance v. Commission on State Mandates* (2021) 59 Cal.App.5th 546, 557 (“*Dept. of Finance II*”); *Carmel Valley Fire Protection Dist. v. State of California* (1987) 190 Cal.App.3d 521, 537.

Here the Permit’s requirement that Claimants’ municipal storm sewer system comply with water quality-based effluent limitations meets both prongs of the definition. First, the municipal storm sewer system is a governmental function that provides services to the public. As the Court of Appeal for the Second Appellate District found in reviewing the 2001 Los Angeles County Municipal Storm Water Permit *and the same storm sewer system at issue here*, the provision of stormwater drainage and flood control is a governmental function that provides services to the public and are thus a program. The Regional Board’s requirements are then just added to that program. They do not change its nature. *Dept of Finance II*, 59 Cal.App.5th at 558.

In *Dept. of Finance II*, the court further held that the obligation to reduce trash and other pollutants falls within the definition of a program because the reduction of pollutants itself is a governmental function that provides services to the public. 59 Cal.App.5th at 558-559. That holding also applies here. The obligation to comply with water quality-based effluent limitations is also imposed to reduce the pollutants in Claimants’ stormwater discharge. Like in *Dept. of Finance II*, therefore, the obligation to comply with water quality-based effluent limitations is a governmental function that provides service to the public. *Id.*

The Permit’s requirement for Claimants to comply with water quality-based effluent limitations also meets the second prong of the definition of a program by imposing a unique requirement on local governments. The 2021 Permit, by its terms, applies only to the local

governmental entities identified in the permit. 2021 Permit, pp. 1, 11. *See Dept. of Finance II*, 59 Cal.App.5th at 559-560.

Finally, the requirement is also a new program or higher level of service. “Whether a program is ‘new’ or provides a ‘higher level of service’ is determined by comparing the legal requirements before and after the issuance of the executive order or the change in law.” *Dept. of Finance II*, 59 Cal.App.5th at 557. Preliminarily, the obligation to comply with water quality-based effluent limitations is a partial subject of the test claim the Claimants filed with respect to the 2012 Los Angeles County municipal stormwater permit. *See* Narrative Statement in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District, Section IV.A.1, pages 11-12; 2012 Permit, Part VI.E.1.c. Thus, because this is a continuation of that requirement, through the renewal of that permit, any finding that this obligation is a new program or higher level of service under the 2012 Permit applies equally to the 2021 Permit.

In any event, the imposition of this obligation under the 2021 Permit is a higher level of service. “Higher level of service” refers to “state mandated increases in the services provided by local agencies.” *Dept. of Finance II*, 59 Cal.App.5th at 556. The obligations imposed under the 2012 Permit ceased with the termination of that permit. Thus, under the 2012 Permit, there is no obligation to comply with water quality-based effluent limitations after September 2021, when the 2012 Permit terminated. The 2021 Permit, however, extended that obligation for the life of the 2021 Permit, *i.e.*, it increased the services the Claimants must provide from September 2021 until the end of the 2021 permit, a “state mandated increase in the services provided by the local agencies.” *Id.*

5. Increased Costs of Mandate

In order to comply with this provision permittees, including Claimants, must adopt programs that will reduce the pollutants in stormwater to the limitations set forth in the Permit. A permittee is in compliance with interim WQBELs and receiving water limitations if the permittee is implementing the requirements, including compliance schedules, outlined in Part IV.B and Attachments K through S of the Permit. 2021 Permit Part X.B.1.a. (The permittee can also demonstrate that there are no WQBEL exceedances in its discharges or that the permittee is not responsible for the exceedances. 2021 Permit Part X.B.1.a.ii and 2.a.)

A permittee can also be deemed in compliance with interim WQBELs and receiving water limitations if it is implementing an approved Watershed Management Program, consistent with the actions and schedules contained therein. 2021 Permit Part X.B.1.b.i.

As set forth in the Declarations in Section 6, the County incurred approximately \$13,994,000 in Fiscal Year (FY) 2021-2022 in increased costs with respect to the above requirements. The County is projected to incur approximately \$35,859,000 in increased costs in FY 2022-2023. The District incurred \$481,000 in increased costs in FY 2021-2022. The District is projected to incur approximately \$642,000 in increased costs in FY 2022-2023. *See* County Declaration, ¶ 9(d) and (e); District Declaration ¶ 9(d) and (e).

B. Compliance with Monitoring Requirements for Water Quality-Based Effluent Limitations

1. Mandate Requirement in the Permit

In conjunction with the requirement to comply with water quality-based effluent limitations, the 2021 Permit imposes the obligation to monitor, *i.e.*, sample and analyze the water, to determine compliance with that obligation.

Specifically, 2021 Permit Part VII requires the permittees, including the Claimants, “to comply with the [Monitoring and Reporting Program] and future revisions thereto, in Attachment E of this Order and Standard Provisions relating to monitoring, reporting, and record keeping in Attachment D of this Order.” Permit, p. 40.

2021 Permit Attachment E, Part III.C.2.a, requires this monitoring to “align with the requirements in Attachments K through S of the Order,” which set forth the water quality-based effluent limitations with which the permittees, including the Claimants, must comply. *See* 2021 Permit, Part IV.A.2

To that end, Attachment E, Sections VI.A.3.b and VII.E.2.b specifically require to be monitored “[p]ollutants assigned a [water quality-based effluent limitation] . . . and parameters to determine compliance with water quality-based effluent limitations.”⁹

2. The Permit’s Obligation to Monitor for Compliance with Water Quality-Based Effluent Limitations is a State Mandate

Like the obligation to comply with water quality-based effluent limitations, the obligation to monitor for compliance with that obligation is a State mandate. No federal law or regulation compelled this monitoring.

The federal CWA, in 33 U.S.C. §§ 1318(a) and 1342(a)(2), authorizes the inclusion of monitoring programs into NPDES permits. The CWA regulations, in 40 C.F.R. § 122.26(d)(2)(iii)(D), require the application for a municipal stormwater permit to include a proposed monitoring program “for representative data collection” during the term of the permit. In addition, 40 C.F.R. § 122.44(i) provides that NPDES permits in general should include monitoring requirements to assure compliance with permit limitations.

None of these statutes or regulations, however, specifically require that monitoring for compliance with water quality-based effluent limitations be included in stormwater permits. Instead, the Permit’s obligation to monitor for compliance with water quality-based effluent

⁹ Attachment E to the Permit also requires the monitoring program, whether an Integrated Monitoring Program or a Coordinated Integrated Monitoring Program, to address “all [Total Maximum Daily Load (TMDL)]” monitoring requirements. 2021 Permit, Attachment E, Parts III.A.4 and B.5.

limitations is included pursuant to the Regional Board's discretion to measure compliance with those effluent limitations.

This makes this monitoring a State mandate. Because the obligation to comply with water quality-based effluent limitations is not required by federal law but instead is imposed as a matter of discretion, the monitoring obligation tied to that obligation is also not required by federal law but instead is also imposed as a matter of discretion. If the Regional Board had not exercised its discretion to include compliance with water quality-based effluent limitations, the Permit would not have included a monitoring program to assess that compliance. The monitoring is thus not compelled by federal law or regulation, but is the result of the Regional Board's exercise of its discretion and is, therefore, a State mandate. *Dept. of Finance*, 1 Cal.5th at 765. *See also Id. at 760, 770* (where federal regulations required inspections but did not specifically require the type and extent of inspections at issue, inspections required by permit were imposed as a matter of discretion and thus were State, not federal, mandates).

3. The Requirement to Monitor Compliance with Water Quality-Based Effluent Limitations is a New Program or Higher Level of Service

Just as the obligation to comply with water quality-based effluent limitations is a new program or higher level of service, the monitoring to assess compliance with that obligation is also a new program or higher level of service.

The monitoring is a program in that it is part of the Claimants' stormwater drainage and flood control systems, a governmental function that provides services to the public. *Dept. of Finance II*, 59 Cal.App.5th at 558. The monitoring is also a program in that it supports efforts to reduce pollutants by supporting the obligation to comply with water quality-based effluent limitations, thus providing a service to the public. *Id.* at 559-560. Finally, the 2021 Permit, by its terms, applies only to the local governmental entities identified in the permit. *Id.* at 559. *See also* discussion in Section IV.A.4, above.

The requirement is also a new program or higher level of service. Like compliance with water quality-based effluent limitations, monitoring to support that compliance is a partial subject of the test claim the Claimants filed with respect to the 2012 Permit. *See* Narrative Statement in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District, Section IV.A.1, pages 11-12; 2012 Permit, Attachment E, Parts II.A.2, II.E.2.b, VIII.B.1.c.ii and IX.G.1.b. Because this monitoring is a continuation of that requirement, through the renewal of that permit, any finding that this obligation is a new program or higher level of service under the 2012 Permit applies equally to the 2021 Permit.

It is likewise a higher level of service. Under the 2012 Permit, there is no obligation to monitor compliance with water quality-based effluent limitations after September 2021, when the 2012 Permit terminated. The 2021 Permit, however, extended that obligation for the life of the 2021 Permit, *i.e.*, it increased the services the Claimants must provide from September 2021 until the end of the 2021 permit, a "state mandated increase in the services provided by the local agencies." The extension of this monitoring obligation is thus a higher level of service. *Dept. of Finance II*, 59 Cal.App.5th at 556.

4. Increased Costs of Mandate

Compliance with this requirement requires, *inter alia*, sampling equipment, laboratory analyses and staff time. As set forth in the Declarations in Section 6, the County incurred approximately \$3,758,000 in FY 2021-2022 in increased costs to comply with this requirement. The County is projected to incur approximately \$5,010,000 in increased costs in FY 2022-2023. The District incurred \$2,662,000 in increased costs in FY 2021-2022. The District is projected to incur approximately \$3,549,000 in increased costs in FY 2022-2023. See County Declaration, ¶ 10(e) and (f); District Declaration ¶ 10(e) and (f).

C. Requirements Related to Non-Stormwater Discharge Prohibitions and Illicit Discharge Detection and Elimination Program

1. Mandate Requirements in the Permit

2021 Permit Part III.A.1 prohibits certain non-stormwater discharges through the municipal separate storm sewer system (“MS4”) to receiving waters.

2021 Permit Part III.A.3.a conditionally exempts from this non-stormwater prohibition discharges from essential non-emergency firefighting activities and certain discharges by drinking water suppliers.

2021 Permit Part III.A.3.b conditionally exempts certain non-essential non-stormwater discharges.

2021 Permit Part III.A.5.a requires the Claimants to develop and implement procedures to require conditionally exempt dischargers of non-stormwater to the Claimants’ MS4 to comply with the requirements of Part III.A.5.a.i-vi, and Table 5 of the Permit.

2021 Permit Part III.A.5.b requires the Claimants to keep records of all conditionally exempt non-stormwater discharges greater than 100,000 gallons in an electronic database.

2021 Permit Part III.A.5.c requires the Claimants to evaluate monitoring data collected pursuant to the Permit’s Monitoring and Reporting Program (Permit Attachment E) and other associated data and information to determine, among other things, if authorized or conditionally authorized non-stormwater discharges are a source of pollutants that may be causing or contributing to an exceedance of receiving water limitations and/or water quality based effluent limitations.

2021 Permit Part III.A.6 requires the Claimants to take action to address such non-stormwater discharges if they are found to be such a source of pollutants, through effective prohibition, conditions, diversions or treatment. These tasks involve, among other things, meeting with non-stormwater dischargers, identifying and analyzing the nature of non-stormwater discharges, developing and implementing discharge procedures, conducting public education efforts, and evaluating monitoring data.

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

2021 Permit Part VIII.I.5 requires the Claimants to have a spill response plan that includes procedures that prevent, contain, and respond to all sewage and other spills that may discharge into the storm sewer system.

2021 Permit Part VIII.I.6 requires the Claimants to publicize and provide a means for public reporting of illicit discharges and other water quality impacts from stormwater and non-stormwater discharges into or from the storm sewer system.

2012 Permit Part VIII.I.8 requires the County to document all public reports of illicit discharges, the dates and results of illicit discharge investigations, any corrective actions taken, any follow-up inspections, and the date the investigation was closed.

2. These Non-Stormwater Discharge and Illicit Discharge, Detection and Elimination Programs are State Mandates.

The Permit's non-stormwater discharge and illicit discharge, detection, and elimination requirements set forth above are State, not federal, mandates. No federal law or regulation compelled the Regional Board to include these provisions in the Permit. Instead, the Regional Board did so as a matter of discretion.

The CWA requires MS4 NPDES permits to "include a requirement to effectively prohibit non-stormwater discharges into the storm sewers." 33 U.S.C. § 1342(p)(3)(B)(ii). The implementing federal regulation, 40 CFR 122.26(d)(2)(iv)(B)(1), provides in pertinent part that an MS4 permittee should have (1) a program to prevent illicit discharges (with the exception of certain specified discharges unless they are identified as sources of pollutants); (2) procedures to screen portions of the MS4 during the lifetime of the permit to identify potential illicit discharges; (3), procedures to investigate portions of the MS4 that have a reasonable potential based on that screening to contain illicit discharges; (4) procedures to respond to spills; (5) a program to promote, publicize and facilitate public reporting of illicit discharges; (6) an educational and public information program to facilitate the proper management and disposal of used oil and toxic materials; and (7) controls to limit infiltration of seepage from municipal sanitary sewers.

Here, the non-stormwater Permit requirements go beyond the requirements set forth in the federal CWA regulations, which do not mandate these particular implementing requirements. *Dept. of Finance*, 1 Cal. 5th at 765. Nor do the federal regulations require their scope and detail. *Id.* at 771. Additionally, by specifying the steps to be taken by the Claimants with regard to the evaluation of non-stormwater discharges, including the development and implementation of procedures, the evaluation of monitoring data, reporting to the Regional Board, and coordination with local water purveyors and other requirements, the Regional Board in the Permit has specified the means of compliance with the non-stormwater discharge requirements. *Long Beach Unified School Dist. v State of California* (1990) 225 Cal.App.3d 155, 172-73. Thus, even if these requirements were federal in origin, the Regional Board's specification of compliance, usurping the County and District's ability to design their own program, renders these Permit provisions State mandates. *Id.*; *Dept. of Finance*, 1 Cal. 5th at 771.

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

Specifically:

(1) 2021 Permit Part III.A.5.a requires Claimants to develop procedures to require conditionally exempt non-stormwater dischargers to notify the Claimants, obtain pertinent permits, conduct monitoring, implement BMPs in accordance with Table 5 of the Permit, and maintain records. The federal CWA regulations, however, do not require MS4 dischargers to police exempt or conditionally exempt non-stormwater dischargers. The Regional Board designed and imposed these requirements as a matter of its discretion.

(2) 2021 Permit Part III.A.5.b requires Claimants to maintain records of all conditionally exempt non-stormwater discharges in an electronic database. Nothing in the federal regulations require MS4 operators to create such a database.

(3) 2021 Permit Part III.A.5.c requires Claimants to evaluate monitoring data collected pursuant to the Permit's Monitoring and Reporting Program (Permit Attachment E) and other associated data and information to determine, among other things, if authorized or conditionally authorized non-stormwater discharges are a source of pollutants that may be causing or contributing to an exceedance of receiving water limitations and/or water quality based effluent limitations. Nothing in the federal regulations requires MS4 operators to analyze monitoring data to determine if another entity is causing such exceedances. Moreover, as discussed below, the Regional Board has in fact shifted this responsibility from itself onto the permittees, including the Claimants.

(4) 2021 Permit Part III.A.6 requires Claimants to address non-stormwater discharges if they are found to be such a source of pollutants, through effective prohibition, conditions, diversions, or treatment. These tasks involve, among other things, meeting with non-stormwater dischargers, identifying and analyzing the nature of non-stormwater discharges, the development and implementation of discharge procedures, conducting public education efforts, and evaluating monitoring data. Like the evaluation tasks set forth above, nothing in the federal regulations imposes an obligation on MS4 operators to perform these activities or otherwise police third-party dischargers. This also is a Regional Board responsibility that has been shifted onto the Claimants.

(5) 2012 Permit Part VIII.I.5 requires the County to have a spill response plan and Parts VIII.I.6 and 8 require the County to document all public reports of illicit discharges, the dates and results of illicit discharge investigations, any corrective actions taken, any follow-up inspections, and the date the investigation was closed. These tasks are also not included in the federal regulation. Instead, the Regional Board chose to specify how Claimants are to implement their public reporting program. This requirement is also one that is not compelled by the federal regulation but imposed by the Regional Board as a matter of discretion.

Finally, under the California Water Code, it is the Regional Board's duty, not the Claimants', to regulate discharges from these non-stormwater dischargers. Water Code §§ 13260 and 13263. *Dept. of Finance*, 1 Cal.5th at 770. To the extent that these activities were previously performed by the Regional Board, such as the responsibility to evaluate monitoring data and police non-stormwater dischargers, the Regional Board in the Permit freely chose to impose these

requirements on Claimants rather than perform them itself. As such, a State mandate was imposed. *Id.* at 770-771; *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564, 1593-94.

3. These Permit Requirements are a New Program or Higher Level of Service

The Permit's non-stormwater discharge prohibitions and illicit discharge and detection and elimination program are a new program or higher level of service.

The obligations imposed on permittees, including Claimants, to monitor and police conditionally exempt discharges, to monitor data and take action if non-stormwater discharges are a source of pollutants, and to address illicit discharges are a program in that they are part of the Claimants' stormwater drainage and flood control systems, a governmental function that provides services to the public. *Dept. of Finance II*, 59 Cal.App.5th at 558. These obligations are also a program in that they result in the reduction of pollutants, thus providing a service to the public. *Id.* at 559-560. Finally, the 2021 Permit, by its terms, applies only to the local governmental entities identified in the permit. *Id.* at 559.

These requirements are also a new program or higher level of service. Some of these requirements are the partial subject of the test claim the Claimants filed with respect to the 2012 Permit, such as the requirements for conditionally exempt non-emergency firefighting activities and analysis of non-stormwater discharges. *See* Narrative Statement in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District, Section IV.B.1, page 16; 2012 Permit, Part III.A.2 and 4. Because these activities are a continuation of those requirements, through the renewal of that permit, any finding that these obligations are a new program or higher level of service under the 2012 Permit applies equally to the 2021 Permit. To the extent that these obligations were not present in the 2012 Permit, then they are new programs in their own right.

These requirements are also a higher level of service. To the extent these obligations existed under the 2012 Permit, that permit did not require that they continue after the termination of the 2012 Permit. The 2021 Permit, however, extended those obligations for the life of the 2021 Permit, *i.e.*, it increased the services the Claimants must provide from September 2021 until the end of the 2021 permit. This is a "state mandated increase in the services provided by the local agencies." The 2021 Permit's extension of these obligations is thus a higher level of service. *Dept. of Finance II*, 59 Cal.App.5th at 556. To the extent that these obligations are newly imposed by the 2021 Permit, the obligations are likewise a higher level of service. *Id.*

4. Increased Costs of Mandate

As set forth in the Declarations in Section 6, the County incurred approximately \$249,000 in FY 2021-2022 in increased costs to comply with this requirement. The County is projected to incur approximately \$332,000 in increased costs in FY 2022-2023. The District incurred \$515,000 in increased costs in FY 2021-2022. The District is projected to incur approximately \$687,000 in increased costs in FY 2022-2023. *See* County Declaration, ¶ 11(k) and (l); District Declaration ¶ 11(k) and (l).

D. Compliance with Public Information Program Requirements

1. Mandate Requirements in the Permit

2021 Permit Part VIII.D.1 requires the Claimants to continue its public information and participation program, either collaboratively, in partnership with stormwater member agencies, or individually.

2021 Permit Part VIII.D.3 requires the Claimants to create opportunities for public engagement in stormwater planning and program implementation, and to conduct educational activities and public information focusing on certain wastes and materials identified in that part.

2021 Permit Part VIII.D.4 requires the Claimants to develop metrics for measuring the effectiveness of its program in reaching the general public and the socioeconomic and ethnic groups in the Los Angeles region, increasing the understanding of the importance of stormwater management, increasing support for stormwater management programs, facilitating pollution prevention and educating and involving residents.

2. These Public Information Requirements are State Mandates

The Permit's public information requirements are State mandates. No federal law or regulation compelled the Regional Board to include these specific provisions in the Permit.

The federal stormwater regulations require that a permittee must include in its management program “[a] description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers” and a “description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials.” 40 C.F.R. § 122.26(d)(2)(iv)(B)(5) and 6).

Additionally, 40 C.F.R. § 122.26(d)(2)(iv)(A)(6) requires that the management program include a “description of a program to reduce to the maximum extent practicable, pollutants in discharges from MS4s associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.”

The requirements set forth in Part VIII.D.1, 3 and 4 of the Permit go beyond the requirements of the federal regulations, rendering those requirements a State, not federal, mandate. *Dept. of Finance*, 1 Cal. 5th at 765, 771; *Long Beach Unified School Dist.*, *supra*, 225 Cal.App.3d at 172-73. The Permit requirements exceed the federal requirements in several ways, including the requirements related to public information activities relating to materials other than used oil, toxic materials, pesticides, herbicides and fertilizer, requirements to target educational and public information programs at ethnic communities (2021 Permit Part VIII.d.2.a) and to organize events targeted to residents and population subgroups (2021 Permit Part VIII.d.2.c). These requirements exceed the federal regulatory requirements and were imposed by the Regional Board as a matter of discretion. As such, they are State mandates. *Dept. of Finance*, 1 Cal. 5th at 771.

3. These Permit Requirements are a New Program or Higher Level of Service

The Permit’s public information requirements are a new program or higher level of service.

The public information requirements are a program in that they are part of Claimants’ stormwater drainage and flood control program, provide a service to the public by causing the reduction of pollutants, and are uniquely imposed only on the local governmental entities identified in the permit. *Dept. of Finance II*, 59 Cal.App.5th at 558-560.

These requirements are also a new program or higher level of service. Like some of the other requirements at issue in this test claim, some of these requirements are the partial subject of the test claim the Claimants filed with respect to the 2012 Permit. *See* Narrative Statement in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District, Section IV.E, pages 24-25; 2012 Permit, Part VI.D.5. Because these activities are a continuation of those requirements, through the renewal of that permit, any finding that these obligations are a new program or higher level of service under the 2012 Permit applies equally to the 2021 Permit. To the extent that these obligations were not present in the 2012 Permit, then they are new programs in their own right.

These requirements are also a higher level of service. Again, to the extent these obligations existed under the 2012 Permit, that permit did not require that they continue after the termination of the 2012 Permit. The 2021 Permit, however, extended those obligations for the life of the 2021 Permit, *i.e.*, it increased the services the Claimants must provide from September 2021 until the end of the 2021 permit. This is a “state mandated increase in the services provided by the local agencies.” The 2021 Permit’s extension of these obligations is thus a higher level of service. *Dept. of Finance II*, 59 Cal.App.5th at 556. To the extent that these obligations are newly imposed by the 2021 Permit, the obligations are likewise a higher level of service. *Id.*

4. Increased Costs of Mandate

As set forth in the Declarations in Section 6, the County incurred approximately \$3,795,000 in FY 2021-2022 in increased costs to comply with this requirement. The County is projected to incur approximately \$5,060,000 in increased costs in FY 2022-2023. The District incurred approximately \$1,632,000 in increased costs in FY 2021-2022. The District is projected to incur approximately \$2,177,000 in increased costs in FY 2022-2023. *See* County Declaration, ¶ 12(d) and (e); District Declaration ¶ 12(d) and (e).

E. Requirements Relating to Post-Construction BMPs

1. Mandate Requirements in the Permit

These requirements are applicable to all permittees except the District and the Ventura County Watershed Protection District. 2021 Permit Part VIII.F.

2021 Permit Part VIII.F.3.c.i requires that the County implement a GIS or other electronic system to track projects that are required to have post-construction Best Management Practices

(BMPs), including project identification, acreage, BMP type and description, BMP locations, dates of acceptance and maintenance agreements, inspection dates and summaries, and corrective action.

2021 Permit Part VIII.F.3.c.ii requires the County to inspect all development sites upon completion of construction and before issuance of an occupancy certificate to ensure proper installation of Low Impact Development (“LID”) measures, structural BMPs, treatment control BMPs and hydromodification control BMPs.

2021 Permit Part VI.F.3.c.iii requires the County to develop a post-construction BMP checklist and to inspect at an interval of at least once every two years County-operated post-construction BMPs to assess operations and condition.

2. These Post-Construction Requirements are State Mandates

The above-described requirements are not required by either the CWA or its regulations. Additionally, even were the requirements considered to be required under federal law, the Regional Board’s specification, through these Permit provisions, of how to comply with such requirements itself constitutes a State mandate.

The federal CWA regulations require that MS4 permits include a:

description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant new redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed.

40 CFR § 122.26(d)(2)(iv)(A)(2). Nothing in this regulation requires that permittees develop a tracking system for post-construction BMPs or to inspect construction site BMPs for compliance with stormwater requirements. Similarly, nothing in the regulation requires routine inspections of post-construction BMPs operated by the permittees. Both in the exceedance of federal requirements, and in the specification of compliance set forth in the Permit that goes beyond federal requirements, State mandates have been created. *Dept. of Finance*, 1 Cal. 5th at 765, 771; *Long Beach Unified School Dist., supra*, 225 Cal.App.3d at 172-73.

3. These Permit Requirements are a New Program or Higher Level of Service

The Permit’s requirements relating to post-construction BMPs are a new program or higher level of service.

The requirements are a program in that they provide a service to the public by causing the reduction of pollutants and are uniquely imposed only on the local governmental entities identified in the permit. *Dept. of Finance II*, 59 Cal.App.5th at 558-560.

These requirements are also a new program or higher level of service. Like some of the other requirements at issue in this test claim, these requirements are the partial subject of the test

claim the Claimants filed with respect to the 2012 Permit. *See* Narrative Statement in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District, Section IV.G, pages 29-30; 2012 Permit, Parts VI.D.7(d)(1)(a), (b) and (c). Because these activities are a continuation of those requirements, through the renewal of that permit, any finding that these obligations are a new program or higher level of service under the 2012 Permit applies equally to the 2021 Permit.

These requirements are also a higher level of service. Again, to the extent these obligations existed under the 2012 Permit, that permit did not require that they continue after the termination of the 2012 Permit. The 2021 Permit, however, extended those obligations for the life of the 2021 Permit, *i.e.*, it increased the services the County must provide from September 2021 until the end of the 2021 permit. This is a “state mandated increase in the services provided by the local agencies.” The 2021 Permit’s extension of these obligations is thus a higher level of service. *Dept. of Finance II*, 59 Cal.App.5th at 556.

4. Increased Costs of Mandate

As set forth in the Declarations in Section 6, the County incurred approximately \$1,016,000 in FY 2021-2022 in increased costs to comply with this requirement. The County is projected to incur approximately \$1,355,000 in increased costs in FY 2022-2023. *See* County Declaration, ¶ 13(d) and (e).

F. Construction Site Requirements

1. Mandate Requirements in the Permit

2021 Permit Part VIII.G.4.a requires the County to require the implementation of effective erosion and sediment control BMPs, including a minimum set of BMPs at all construction sites and roadway paving or repair operations (public and private projects). This includes specific BMPs set forth in the Permit’s Tables 7 and 8.

2021 Permit Part VIII.G.5.a requires the County to have a procedure to verify that construction sites one acre or greater have existing coverage under applicable permits, including the State-issued General Construction Activities Stormwater Permit and State or Regional Water Board 401 Water Quality Certification if needed, and has submitted a post-construction plan that complies with the 2021 Permit’s post-construction requirements (2021 Permit Part VIII.F).

2021 Permit Part VIII.G.5.b.i requires the County to have an electronic system to inventory grading, encroachment, demolition, building or construction permits (and any other municipal authorization to move soil and/or conduct construction or destruction that involves land disturbance).

2021 Permit Part VIII.G.5.b.ii requires the County to update the inventory and requires the inventory to contain, among other items, contact information for a project, the latitude and longitude of the project, basic site information, the site’s risk level, current construction phase where feasible, inspection dates, start and anticipated completion dates, whether the project has

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

submitted a Notice of Intent and obtained coverage under the State Board-issued General Construction Activities Stormwater Permit, a description of post-construction BMPs, and a comparison of pre-construction stormwater runoff volume versus post-construction stormwater runoff volume.

The Claimants are not seeking reimbursement for inspection of construction sites to the extent the court in *Dept. of Finance II* found that mandate to be non-reimbursable. *Dept. of Finance II*, 59 Cal.App.5th at 562-563.

2. The Requirements Relating to Construction Sites are State Mandates

The 2021 Permit's requirements relating to construction sites are not required by federal law. With respect to construction sites, 40 CFR 122.26 §122.26(d)(2)(iv)(D) provides that a permittee's stormwater management program should include a description of a program:

[t]o implement and maintain structural best management practices to reduce pollutants in storm water runoff from construction sites . . . which shall include:

- (1) A description of procedures for site planning which incorporate consideration of potential water quality impacts;
- (2) A description of requirements for nonstructural and structural best management practices;
- (3) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and
- (4) A description of appropriate educational and training measures for construction site operators.”

40 C.F.R. §122.26(d)(2)(iv)(D)(1-4).

Nothing in this regulation specifies the requirements set forth in 2021 Permit Parts VIII.G.4.a, 5.a, 5.b.i. and 5.b.ii. Instead, the Regional Board, as a matter of discretion, required these specific, detailed actions by the permittees, the “scope and detail” of which are not compelled by federal regulations. *Dept. of Finance*, 1 Cal. 5th at 771.

Additionally, the Permit requires the development and maintenance of an inventory of construction sites, which is not required by the regulations. As such, the requirements of Parts VIII.G.5.b.i. and ii both exceed the requirements of the federal regulations and specify the means for permittees to comply with those regulations. The requirements, therefore, constitute State mandates. *Dept. of Finance*, 1 Cal. 5th at 771; *Long Beach Unified School Dist.*, *supra*, 225 Cal.App.3d at 172-73.

3. These Permit Requirements are a New Program or Higher Level of Service

The Permit’s requirements relating to construction sites are a new program or higher level of service.

The requirements are a program in that they provide a service to the public by causing the reduction of pollutants and are uniquely imposed only on the local governmental entities identified in the permit. *Dept. of Finance II*, 59 Cal.App.5th at 558-560.

These requirements are also a new program or higher level of service. Similar to other requirements at issue in this test claim, these requirements are the partial subject of the test claim the Claimants filed with respect to the 2012 Permit. *See* Narrative Statement in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District, Section IV.H, page 31; 2012 Permit, Parts VI.D.8(g)(ii) and 8(i). Because these activities are a continuation of those requirements, through the renewal of that permit, any finding that these obligations are a new program or higher level of service under the 2012 Permit applies equally to the 2021 Permit.

These requirements are also a higher level of service. Again, to the extent these obligations existed under the 2012 Permit, that permit did not require that they continue after the termination of the 2012 Permit. The 2021 Permit, however, extended those obligations for the life of the 2021 Permit, *i.e.*, it increased the services the County must provide from September 2021 until the end of the 2021 permit. This is a “state mandated increase in the services provided by the local agencies.” The 2021 Permit’s extension of these obligations is thus a higher level of service. *Dept. of Finance II*, 59 Cal.App.5th at 556.

4. Increased Costs of Mandate

As set forth in the Declarations in Section 6, the County incurred approximately \$81,000 in FY 2021-2022 in increased costs to comply with this requirement. The County is projected to incur approximately \$109,000 in increased costs in FY 2022-2023. *See* County Declaration, ¶ 14(e) and (f).

G. Public Agency Requirements

1. Mandate Requirements in the Permit

2021 Permit Part VIII.H.2 requires the Claimants to maintain an updated inventory or database of all permittee-owned or operated facilities that are potential sources of stormwater pollution, including 27 separate categories of facilities that are required to be in the inventory. The inventory must include the name and address of the facility, contact information, a narrative description of activities performed and potential pollution sources, coverage under any individual or general NPDES permits or waivers, a description of BMPs, and, for trash control devices, an indication of whether it is a partial or certified full capture system. The inventory must be updated at least once during the permit term with information collected through field activities or other readily available informational databases.

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

2021 Permit Part VIII.H.5.b requires the Claimants to implement an Integrated Pesticide Management (“IPM”) program, including restrictions on the use of pesticides, restricting treatments only to remove the target organism, selection of pest controls that minimize risks to human health, beneficial non-target organisms and the environment, partnering with other agencies and organizations to encourage the use of an IPM program, adopt and verifiably implement policies, procedures and/or ordinances requiring the minimization of pesticide use, and encouraging the use of IPM techniques in public agency facilities and activities. Additionally, the County must reduce the use of pesticides that cause impairments of surface waters by preparing and updating annually an inventory of pesticides, quantifying pesticide use by staff and contractors, and implementing IPM alternatives where feasible to reduce pesticide use.

2. These Permit Requirements are State Mandates

Nothing in the CWA or the stormwater regulations requires MS4 permittees to maintain an inventory of their public facilities. Similarly, nothing in the CWA or regulations requires the Claimants to develop and implement an IPM program.

The requirements of 2021 Permit Parts VIII.H.2 and H.5.b outlined above exceed the requirements of the CWA and implementing federal regulations, and thus are State mandates. Nothing in federal law or the federal regulations compelled the Regional Board to include these provisions in the Permit. Instead, the Regional Board included them as a matter of discretion. Because the Regional Board exercised “its discretion to impose [the requirements] by virtue of a ‘true choice,’ the [requirements are] not federally mandated.” *Dept. of Finance*, 1 Cal. 5th at 765.

3. These Permit Requirements are a New Program or Higher Level of Service

These public agency requirements are a new program or higher level of service.

The requirements are a program in that they provide a service to the public by causing the reduction of pollutants and are uniquely imposed only on the local governmental entities identified in the permit. *Dept. of Finance II*, 59 Cal.App.5th at 558-560.

These requirements are also a new program or higher level of service. Similar to other requirements at issue in this test claim, these requirements are the partial subject of the test claim the Claimants filed with respect to the 2012 Permit. *See* Narrative Statement in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District, Section IV.C, pages 18-19; 2012 Permit, Parts VI.D.4.c(iii) and (c)(vi) and VI.D.9.c and 9.g(ii). Because these activities are a continuation of those requirements, through the renewal of that permit, any finding that these obligations are a new program or higher level of service under the 2012 Permit applies equally to the 2021 Permit.

These requirements are also a higher level of service. Again, to the extent these obligations existed under the 2012 Permit, that permit did not require that they continue after the termination of the 2012 Permit. The 2021 Permit, however, extended those obligations for the life of the 2021 Permit, *i.e.*, it increased the services the Claimants must provide from September 2021 until the end of the 2021 permit. This is a “state mandated increase in the services provided by the local

agencies.” The 2021 Permit’s extension of these obligations is thus a higher level of service. *Dept. of Finance II*, 59 Cal.App.5th at 556.

4. Increased Costs of Mandate

As set forth in the Declarations in Section 6, the County incurred approximately \$716,000 in FY 2021-2022 in increased costs to comply with this requirement. The County is projected to incur approximately \$955,000 in increased costs in FY 2022-2023. The District incurred \$516,000 in increased costs in FY 2021-2022. The District is projected to incur approximately \$687,000 in increased costs in FY 2022-2023. See County Declaration, ¶ 15(c) and (d); District Declaration, ¶ 13(c) and (d).

V. STATEWIDE COST ESTIMATE

This Joint Test Claim involves a permit issued to Los Angeles County, the Los Angeles County Flood Control District, Ventura County, the Ventura County Watershed Protection District, 85 cities in Los Angeles County, and 10 cities in Ventura County. The Claimants are only two of the permittees and are not in a position to be able to verify costs incurred by other permittees. The Claimants estimate that they incurred costs of approximately \$29,415,000 in FY 2021-2022 and project incurring approximately \$56,422,000 in FY 2022-2023. See Section 6, County Declaration, ¶¶ 9-15 and District Declaration, ¶¶ 9-13. In making a statewide estimate, the costs estimated by the other permittees should be added to the Claimants’ costs estimated here. If the other permittees collectively have incurred costs approximately equal to the costs incurred by Claimants, this would then result in a combined estimate of approximately \$58,830,000 in FY 2021-2022 and approximately \$112,844,000 projected in FY 2022-2023.

VI. FUNDING SOURCES

The Claimants are not aware of any designated State, federal, or non-local agency funds that are or will be available to fund the mandated activities set forth in this Test Claim.

The Claimants are also restricted by the California Constitution with respect to their ability to assess fees or assessments sufficient to pay for the Permit’s mandates.

First, in providing services or conferring benefits, the Claimants cannot assess fees that cover more than the reasonable cost of providing the benefit, privilege, service or product, and the manner in which those costs are allocated to a payor must bear a fair and reasonable relationship to the payor’s burdens or benefits received from the governmental activity. Otherwise, the fee would be considered a tax subject to the requirements of article XIII C of the California Constitution. Cal. Const., Article XIII C § 1(e). See *Jacks v. City of Santa Barbara* (2017) 3 Cal. 5th 248, 261. In this regard, the Claimants bear the burden of proving by a preponderance of the evidence that the amount is no more than necessary to cover the reasonable costs of the governmental activity, and that the manner in which those costs are allocated to a payor bear a fair or reasonable relationship to the payor’s burdens on, or benefits received from, the governmental activity. Cal. Const., Article XIII C § 1(e).

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

The mandates at issue in this test claim are not the types of programs for which the Claimants can assess a fee. Compliance with water quality-based effluent limitations, monitoring associated with compliance with water quality-based effluent limitations, requirements relating to the non-stormwater discharge and the illicit discharge detection and elimination program, public information programs, and public agency requirements, described in Sections IV.A, B, C, D, and G of this Narrative Statement, are all obligations imposed on Claimants themselves. Additionally, these all are programs intended to improve the overall water quality in the basin, which benefits all persons within the jurisdiction. It is not possible to identify benefits that any individual resident, business or property owner within the jurisdiction is receiving that is distinct from benefits that all other persons within the jurisdiction are receiving.

Likewise, no fee can be assessed for the cost of the post-construction inspection of BMPs operated by Claimants themselves, 2021 Permit Part VIII.F.3.c.iii; there is no party involved other than Claimants themselves. As for requirements relating to construction sites and the inventory and post-construction inspection of privately held development sites, there is no way to determine a fee that bears a fair and reasonable relationship to the payor's burdens or benefits received from this inventory or inspections as the private owner is not receiving a benefit; the benefit is to the public in general in the form of reduced pollution.

Second, any assessment would be considered a "special tax" and, as such, could not be imposed without a vote of the electorate. Under the Constitution a tax is defined to be "any levy, charge, or exaction of any kind imposed by a local government . . ." Cal. Const., Article XIII C § 1(e). A "special tax" is defined to be "any tax imposed for specific purposes, including a tax imposed for specific purposes, which is placed into a general fund." *Id.*, Article XIII C § 1(d). Under the Constitution, "No local government may impose, extend, or increase any special tax unless and until that tax is submitted to the electorate and approved by a two-thirds vote." Cal. Const. Article XIII C § 2(d).

Article XIII C, section 1(e), sets forth certain charges that are excepted from the definition of a tax. Those exceptions are:

- (1) A charge imposed for a specific benefit conferred or privilege granted directly to the payor that is not provided to those not charged, and which does not exceed the reasonable costs to the local government of conferring the benefit or granting the privilege.
- (2) A charge imposed for a specific government service or product provided directly to the payor that is not provided to those not charged, and which does not exceed the reasonable costs to the local government of providing the service or product.
- (3) A charge imposed for the reasonable regulatory costs to a local government for issuing licenses and permits, performing investigations, inspections, and audits, enforcing agricultural marketing orders, and the administrative enforcement and adjudication thereof.

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

- (4) A charge imposed for entrance to or use of local government property, or the purchase, rental, or lease of local government property.
- (5) A fine, penalty, or other monetary charge imposed by the judicial branch of government or a local government, as a result of a violation of law.
- (6) A charge imposed as a condition of property development.
- (7) Assessments and property-related fees imposed in accordance with the provisions of Article XIII D.

Cal. Const., Article XIII C § 1(e).

None of these exceptions arguably apply here. As discussed above, any fee or assessment to pay for compliance with water quality-based effluent limitations and monitoring associated therewith, non-stormwater discharge and the illicit discharge detection and elimination program, public information programs, and public agency requirements would be a fee or assessment to pay for the costs of a general program, not one directed towards a specific benefit, privilege, service or product.

Article XIII D of the California Constitution also restricts the County and District's ability to assess property-related fees. Under article XIII D, section 3(a), no tax, assessment, fee, or charge shall be assessed by any agency upon any parcel of property or upon any person as an incident of property ownership, unless it is for "property-related services"¹⁰ or certain other exceptions, except upon a two-thirds vote of the electorate. Under article XIII D, section 6(c), except for fees or charges for sewer, water, and refuse collection services, no property-related fee or charge shall be imposed unless approved by a majority vote of property owners of the property subject to the fee or charge or by two-thirds vote of the electorate residing the affected area. In *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351, 1354, the Court of Appeal held that a general stormwater fee is a property-related fee that is not a charge for water or sewer services, but instead is a property-related fee subject to the two-thirds electoral vote requirement. *Id.* at 1354-1355, 1357-1359.

In November 2018, Los Angeles County voters adopted the Los Angeles Region Safe Clean Water Program. *See* Los Angeles County Flood Control District Code Sections 16.01 et seq. and 18.01 et seq. This program created a special parcel tax of two and one-half (2.5) cents per square foot of impermeable area, except as exempted, to provide funding for programs and projects to increase stormwater and urban runoff capture and reduce stormwater and urban runoff pollution. *Id.*, Sections 16.02 and 16.08. Ten percent of the revenues generated are allocated to the District for implementation and administration of programs and projects, forty percent allocated to municipalities and the unincorporated County area for their projects and programs, and fifty percent for the implementation of regional projects and programs. *Id.*, Section 16.04.

¹⁰ "Property-related services" means "a public service having a direct relationship to property ownership." Article XIII D, § 2(h).

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

The Safe Clean Water Program revenues are not fees or assessments. As set forth in the ordinance, the revenues are generated from a special parcel tax. *Id.*, Section 16.08.

In sum, the Claimants do not have the authority to levy fees or assessments to pay for the mandates that are the subject of this Test Claim. Such fees or assessments can be levied only upon the vote of the electorate.

VII. PRIOR MANDATE DETERMINATIONS

A. Los Angeles County Test Claim

In 2003 and 2007, the County of Los Angeles and 14 cities within the county (“Los Angeles County claimants”) submitted test claims 03-TC-04, 03-TC-19, 03-TC-20 and 03-TC-21. These test claims asserted that provisions of the 2001 Permit, Regional Board Order No. 01-182, constituted unfunded State mandates. The provisions challenged in these test claims concerned the requirement for the Los Angeles County claimants to install and maintain trash receptacles at transit stops and to inspect certain industrial, construction and commercial facilities for compliance with local and/or State stormwater requirements.

The Commission, in a final decision issued on September 3, 2009, determined that the trash receptacle requirement was a reimbursable State mandate. *In re Test Claim on: Los Angeles Regional Quality Control Board Order No. 01-192*, Case Nos.: 03-TC-04, 03-TC-19, 03-TC-20, 03-TC-21. The Commission found that the portion of the test claims relating to the inspection requirement was a State mandate, but that the Los Angeles County claimants had fee authority sufficient to fund such inspections. After a significant amount of litigation, the Commission’s decision was affirmed. *Dept. of Finance, supra*, 1 Cal.5th 749; *Dept. of Finance II, supra*, 59 Cal.App.5th 546.

The Commission approved parameters and guidelines for the trash receptacle mandate, and the State Controller’s Office issued Claiming Instructions to the affected local agencies.

B. San Diego County Test Claim

In 2007, the County of San Diego and 21 cities within the county (the “San Diego County claimants”) submitted test claim 07-TC-09. This test claim asserted that several provisions of San Diego Regional Board Order No. R9-2007-0001 constituted reimbursable State mandates. This order was the renewal of the existing MS4 permit for the San Diego County claimants.

On March 30, 2010, the Commission issued a final decision entitled *In re Test Claim on: San Diego Regional Water Quality Control Board Order No. R9-2007-0001*, Case No. 07-TC-09. In that decision, the Commission found the following requirements to be reimbursable State mandates:

1. A requirement to conduct and report on street sweeping activities;
2. A requirement to conduct and report on storm sewer cleaning;

Section 5: Narrative Statement In Support of Joint Test Claim of Los Angeles County and the Los Angeles County Flood Control District Concerning Los Angeles RWQCB Order No. R4-2021-0105

3. A requirement to conduct public education with respect to specific target communities and on specific topics;
4. A requirement to conduct mandatory watershed activities and collaborate in a Watershed Urban Management Program;
5. A requirement to conduct program effectiveness assessments;
6. A requirement to conduct long-term effectiveness assessments; and
7. A requirement for permittee collaboration.

The Commission also found requirements for hydromodification and low impact development programs to be State mandates, but determined that, because local agencies could charge fees to pay for these programs, they were not reimbursable State mandates.

This case is still the subject of litigation. The most recent court decisions are *Department of Finance v. Commission on State Mandates* (2017) 18 Cal.App.5th 661 and *State of California Department of Finance v. Commission on State Mandates*, Sacramento Superior Court Case No. 34-2010-80000604, Order After Hearing on Cross-Petitions for Writ of Mandate (February 6, 2020), *appeal pending*, *State of California Department of Finance v. Commission on State Mandates*, Case No. C092139 (Ct. Appeal, Third Appellate District).

VIII. LEGISLATIVELY DETERMINED MANDATE

None.

IX. CONCLUSION

As noted in the Introduction, the County and District support the Permit and are working to implement its requirements. Claimants maintain a good working relationship with the Regional Board and its staff and are committed to working together with the Regional Board and other stakeholders to achieve the clean water goals set forth in the Permit.

Nonetheless, important elements of the Permit represent significant mandates. The Claimants submit that the mandates set forth in this Test Claim represent State mandates for which a subvention of funds is required, pursuant to article XIII B, section 6 of the California Constitution. The Claimants respectfully request that the Commission make this finding as to each of the programs and activities set forth herein.

SECTION SIX

DECLARATIONS

In Support of Joint Test Claim of Los Angeles County and the
Los Angeles County Flood Control District Concerning
Los Angeles RWQCB Order No. R4-2021-0105

**DECLARATION OF MARK LOMBOS, P.E.
COUNTY OF LOS ANGELES**

I, Mark Lombos, P.E., hereby declare and state as follows:

1. I am an Assistant Deputy Director for the Los Angeles County Department of Public Works. In that capacity, I share responsibility for the County of Los Angeles' ("County") compliance with the requirements of the Waste Discharge Requirements and National Pollutant Discharge Elimination System (NPDES) Permit for Municipal Separate Storm Sewer System (MS4) Discharges within the Coastal Watershed of Los Angeles and Ventura Counties, Los Angeles Regional Water Quality Control Board ("Regional Board") Order No. R4-2021-0105 (the "2021 Permit").

2. I have reviewed the 2021 Permit and its attachments as set forth herein and am familiar with those provisions. I am also familiar with how the 2021 Permit changed or continued requirements that were previously imposed on the County by the prior Waste Discharge Requirements and NPDES permit for the municipal separate storm sewer system, Regional Board Order No. R4-2012-0175 (the "2012 Permit").

3. I have an understanding of the County's expenditures and sources of funding for programs and activities required to comply with the 2021 Permit.

4. I make this declaration based on my own personal knowledge, except for matters set forth herein based on information and belief and, as to those matters, I believe them to be true. If called upon to testify, I could and would competently testify to the matters set forth herein.

5. Sections 5 and 7 of the Test Claim filed by the County and the Los Angeles County Flood Control District set forth the specific sections of the 2021 Permit at issue in this Test Claim. I hereby incorporate such provisions of Sections 5 and 7 into this declaration as though fully set forth herein.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

6. The County has elected to participate in 12 Watershed Management Programs (WMPs) that are designed to address in whole or in part requirements imposed by the 2021 Permit. (Under the 2012 Permit, the Watershed Management Programs were referred to as “Watershed Management Programs” and “Enhanced Watershed Management Programs”.)

7. Based on my review and understanding of the 2021 Permit, the 2021 Permit requires the County to undertake the following programs, either directly or through the mechanism of a WMP, which programs are new programs and/or higher levels of service, or a continuation of a new program and/or higher level of service first imposed by the 2012 Permit. As to those requirements that were first imposed by the 2012 Permit, because the 2012 Permit has expired, the County would not be required to continue to implement those requirements but for them being imposed again by the 2021 Permit.

8. The County first incurred the Fiscal Year (FY) 2021-2022 costs set forth below in or around September 2021, upon the 2021 Permit becoming effective, or shortly thereafter.

9. **Compliance with Water Quality-Based Effluent Limitations:**

(a) 2021 Permit Part IV.A.2 requires the permittees, including the County, to “comply with applicable water quality-based effluent limitations (WQBELs) as set forth in Attachments K through S of this Order, pursuant to applicable compliance schedules.”

(b) Attachment J to the 2021 Permit is a matrix that summarizes by watershed management area the water quality-based effluent limitations with which the County must comply.

(c) Attachments M and O through S of the 2021 Permit set forth the specific water quality-based effluent limitations with which the County must comply.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

(d) Based on County records, the cost to the County to comply with these water quality-based effluent limitations in FY 2021-2022 was approximately \$13,994,000.

(e) The cost to the County to comply with these water quality-based effluent limitations in FY 2022-2023 is estimated to be \$35,859,000.

10. **Compliance with Monitoring Requirements for Water Quality-Based Effluent Limitations:**

(a) 2021 Permit Part VII requires the permittees, including the County, “to comply with the [Monitoring and Reporting Program] and future revisions thereto, in Attachment E of this Order and Standard Provisions relating to monitoring, reporting, and record keeping in Attachment D of this Order.”

(b) Attachment E to the Permit requires the monitoring program, whether an Integrated Monitoring Program or a Coordinated Integrated Monitoring Program, to address “all [Total Maximum Daily Load (TMDL)]” monitoring requirements. 2021 Permit, Attachment E, Parts III.A.4 and B.5.

(c) As set forth in 2021 Permit Attachment E, Part III.C.2.a, “TMDL compliance monitoring shall be consistent with the recommendations within the TMDL and align with the requirements in Attachments K through S of the Order,” which attachments set forth the water quality-based effluent limitations with which the County must comply.

(d) Attachment E, Sections VI and VII, sets forth the requirements that must be included when monitoring stormwater and non-stormwater for water quality-based effluent limitations.

(e) Based on County records, the cost to the County to comply with these monitoring requirements in FY 2021-2022 was approximately \$3,758,000.

(f) The cost to the County to comply with these monitoring requirements in FY 2022-2023 is estimated to be \$5,010,000.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

11. **Requirements Related to Non-Stormwater Discharge Prohibitions and Illicit Discharge Detection and Elimination Program:**

(a) 2021 Permit Part III.A.1 prohibits certain non-stormwater discharges through the municipal separate storm sewer system (“MS4”) to receiving waters.

(b) 2021 Permit Part III.A.3.a conditionally exempts from this non-stormwater prohibition discharges from essential non-emergency firefighting activities and certain discharges by drinking water suppliers.

(c) 2021 Permit Part III.A.3.b conditionally exempts certain non-essential non-stormwater discharges.

(d) 2021 Permit Part III.A.5.a requires the County to develop and implement procedures to require conditionally exempt dischargers of non-stormwater to the County’s MS4 to comply with the requirements of Part III.A.5.a.i-vi and Table 5 of the Permit.

(e) 2021 Permit Part III.A.5.b requires the County to keep records of all conditionally-exempt non-stormwater discharges greater than 100,000 gallons in an electronic database.

(f) 2021 Permit Part III.A.5.c requires the County to evaluate monitoring data collected pursuant to the Permit’s Monitoring and Reporting Program (Permit Attachment E) and other associated data and information to determine, among other things, if authorized or conditionally authorized non-stormwater discharges are a source of pollutants that may be causing or contributing to an exceedance of receiving water limitations and/or water quality based effluent limitations.

(g) 2021 Permit Part III.A.6 requires the County to take action to address such non-stormwater discharges if they are found to be such a source of pollutants, through effective prohibition, conditions, diversions or treatment. These tasks involve, among other things, meeting with non-stormwater dischargers, identifying and analyzing the nature of non-stormwater discharges, the development and implementation of discharge procedures, conducting public education efforts and evaluating monitoring data.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

(h) 2021 Permit Part VIII.I.5 requires the County to have a spill response plan that includes procedures that prevent, contain, and respond to all sewage and other spills that may discharge into the storm sewer system.

(i) 2021 Permit Part VIII.I.6 requires the County to publicize and provide a means for public reporting of illicit discharges and other water quality impacts from stormwater and non-stormwater discharges into or from the storm sewer system.

(j) 2012 Permit Part VIII.I.8 requires the County to document all public reports of illicit discharges, the dates and results of illicit discharge investigations, any corrective actions taken, any follow-up inspections and the date the investigation was closed.

(k) Based on County records, the cost to the County to comply with these non-stormwater and illicit discharge detection and elimination requirements in FY 2021-2022 was approximately \$249,000.

(l) The cost to the County to comply with these non-stormwater and illicit discharge detection and elimination requirements in FY 2022-2023 is estimated to be \$332,000.

12. **Public Information Program Requirements:**

(a) 2021 Permit Part VIII.D.1 requires the County to continue its public information and participation program, either collaboratively, in partnership with stormwater member agencies, or individually.

(b) 2021 Permit Part VIII.D.3 requires the County to create opportunities for public engagement in stormwater planning and program implementation, and to conduct educational activities and public information focusing on certain wastes and materials identified in that part.

(c) 2021 Permit Part VIII.D.4 requires the County to develop metrics for measuring the effectiveness of its program in reaching the general public and the

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

socioeconomic and ethnic groups in the Los Angeles region, increasing the understanding of the importance of stormwater management, increasing support for stormwater management programs, facilitating pollution prevention, and educating and involving residents.

(d) Based on County records, the cost to the County to comply with these public information program requirements in FY 2021-2022 was approximately \$3,795,000.

(e) Based on County records, the cost to the County to comply with these requirements in FY 2022-2023 will be approximately \$5,060,000.

13. **Post-Construction BMP Requirements:**

(a) 2021 Permit Part VIII.F.3.c.i requires the County to implement a GIS or other electronic system to track projects that are required to have post-construction Best Management Practices (BMPs), including project identification, acreage, BMP type and description, BMP locations, dates of acceptance and maintenance agreements, inspection dates and summaries, and corrective action.

(b) 2021 Permit Part VIII.F.3.c.ii requires the County to inspect all development sites upon completion of construction and before issuance of an occupancy certificate to ensure proper installation of Low Impact Development (“LID”) measures, structural BMPs, treatment control BMPs and hydromodification control BMPs.

(c) 2021 Permit Part VIII.F.3.c.iii requires the County to develop a post-construction BMP checklist and to inspect at an interval of at least once every two years County-operated post-construction BMPs to assess operations and condition.

(d) Based on County records, the cost to the County to comply with these post-construction BMP requirements in FY 2021-2022 was approximately \$1,016,000.

(e) Based on County records, the cost to the County to comply with these post-construction BMP requirements in FY 2022-2023 will be approximately \$1,355,000.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

14. **Construction Site Requirements:**

(a) 2021 Permit Part VIII.G.4.a requires the County to require the implementation of effective erosion and sediment control Best Management Practices (BMPs), including a minimum set of BMPs at all construction sites and roadway paving or repair operations (public and private projects).

(b) 2021 Permit Part VIII.G.5.a requires the County to have a procedure to verify that construction sites one acre or greater have existing coverage under applicable permits including the state-issued General Construction Activities Stormwater Permit and State or Regional Board Water Board 401 Water Quality Certification, if needed, and has submitted a post-construction plan that complies with the 2021 Permit's post-construction requirements (2021 Permit Part VIII.F).

(c) 2021 Permit Part VIII.G.5.b.i requires the County to have an electronic system to inventory grading, encroachment, demolition, building or construction permits (and any other municipal authorization to move soil and/or conduct construction or destruction that involves land disturbance).

(d) 2021 Permit Part VIII.G.5.b.ii requires the County to update the inventory and requires the inventory to contain, among other items, contact information for a project, the latitude and longitude of the project, basic site information, the site's risk level, current construction phase where feasible, inspection dates, start and anticipated completion dates, whether the project has submitted a Notice of Intent and obtained coverage under the State Board-issued General Construction Activities Stormwater Permit, a description of post-construction BMPs, and a comparison of pre-construction stormwater runoff volume versus post-construction stormwater runoff volume.

(e) Based on County records, the cost to the County to comply with these construction site requirements in FY 2021-2022 was approximately \$81,000.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

(f) Based on County records, the cost to the County to comply with these construction site requirements in FY 2022-2023 will be approximately \$109,000.

15. **Public Agency Requirements:**

(a) 2021 Permit Part VIII.H.2 requires the County to maintain an updated inventory or database of all permittee-owned or operated facilities that are potential sources of stormwater pollution, including 27 separate categories of facilities that are required to be in the inventory. The inventory must include the name and address of the facility, contact information, a narrative description of activities performed and potential pollution sources, coverage under any individual or general NPDES permits or waivers, a description of BMPs, and, for trash control devices, an indication of whether it is a partial or certified full-capture system. The inventory must be updated at least once during the permit term with information collected through field activities or other readily available informational databases.

(b) 2021 Permit Part VIII.H.5.b requires the County to implement an Integrated Pesticide Management ("IPM") program, including restrictions on the use of pesticides, restricting treatments only to remove the target organism, selection of pest controls that minimize risks to human health, beneficial non-target organisms and the environment, partnering with other agencies and organizations to encourage the use of an IPM program, adopt and verifiably implement policies, procedures and/or ordinances requiring the minimization of pesticide use, and encouraging the use of IPM techniques in public agency facilities and activities. Additionally, the County must reduce the use of pesticides that cause impairments of surface waters by preparing and updating annually an inventory of pesticides, quantifying pesticide use by staff and contractors, and implementing IPM alternatives where feasible to reduce pesticide use.

(c) Based on County records, the cost to the County to comply with these public agency requirements in FY 2021-2022 was approximately \$716,000.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles County Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

(d) Based on County records, the cost to the County to comply with these requirements in FY 2022-2023 will be approximately \$955,000.

16. I am informed and believe that there are no dedicated State, federal or regional funds that are or will be available to pay for any of the new and/or upgraded programs and activities set forth in this Declaration.

17. The County has filed a joint test claim with the Los Angeles County Flood Control District. The County and District allege state-mandated costs resulting from the same Executive Order, the 2021 Permit [(1) Parts IV.A.2 and B and Attachments J through S (except Attachments K, L, and N); (2) Part VII and Attachment E; (3) Parts III.A.1, A.3.a, A.3.b, A.5.a, A.5.b, A.5.c, A.6, VIII.I.5; I.6, and I.8; (4) Parts VIII.D.1, D.3, D.4; (5) Parts VIII.F.3.c.i, F.3.c.ii, F.3.c.iii; (6) Parts VIII.G.4.a, G.5.a, G.5.b.i, G.5.b.ii, and (7) Parts VIII.H.2 and H.5.b]. The County and the Flood Control District agree on all issues of the test claim, and have designated one person to act as the sole representative, Howard Gest of Burhenn & Gest LLP.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed this 14th day of September, 2022, at Alhambra, California

Mark Lombos, P.E.

DECLARATION OF MARK LOMBOS, P.E.
LOS ANGELES DISTRICT FLOOD CONTROL DISTRICT

I, Mark Lombos, P.E., hereby declare and state as follows:

1. I am an Assistant Deputy Director for the Los Angeles County Department of Public Works. In that capacity, I share responsibility for the Los Angeles County Flood Control District's ("District") compliance with the requirements of the Waste Discharge Requirements and National Pollutant Discharge Elimination System (NPDES) Permit for Municipal Separate Storm Sewer System (MS4) Discharges within the Coastal Watershed of Los Angeles and Ventura Counties, Los Angeles Regional Water Quality Control Board ("Regional Board") Order No. R4-2021-0105 (the "2021 Permit").

2. I have reviewed the 2021 Permit and its attachments as set forth herein and am familiar with those provisions. I am also familiar with how the 2021 Permit changed or continued requirements that were previously imposed on the District by the prior Waste Discharge Requirements and NPDES permit for the municipal separate storm sewer system, Regional Board Order No. R4-2012-0175 (the "2012 Permit").

3. I have an understanding of the District's expenditures and sources of funding for programs and activities required to comply with the 2021 Permit.

4. I make this declaration based on my own personal knowledge, except for matters set forth herein based on information and belief and, as to those matters, I believe them to be true. If called upon to testify, I could and would competently testify to the matters set forth herein.

5. Sections 5 and 7 of the Test Claim filed by the County of Los Angeles and the District set forth the specific sections of the 2021 Permit at issue in this Test Claim. I hereby incorporate such provisions of Sections 5 and 7 into this declaration as though fully set forth herein.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles District Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

6. The District has elected to participate in 18 Watershed Management Programs (WMPs) that are designed to address in whole or in part requirements imposed by the 2021 Permit. (Under the 2012 Permit, the Watershed Management Programs were referred to as “Watershed Management Programs” and “Enhanced Watershed Management Programs”.)

7. Based on my review and understanding of the 2021 Permit, the 2021 Permit requires the District to undertake the following programs, either directly or through the mechanism of a WMP, which programs are new programs and/or higher levels of service, or a continuation of a new program and/or higher level of service first imposed by the 2012 Permit. As to those requirements that were first imposed by the 2012 Permit, because the 2012 Permit has expired, the District would not be required to continue to implement those requirements but for them being imposed again by the 2021 Permit.

8. The District first incurred the Fiscal Year (FY) 2021-2022 costs set forth below in or around September 2021, upon the 2021 Permit becoming effective, or shortly thereafter.

9. **Compliance with Water Quality-Based Effluent Limitations:**

(a) 2021 Permit Part IV.A.2 requires the permittees, including the District, to “comply with applicable water quality-based effluent limitations (WQBELs) as set forth in Attachments K through S of this Order, pursuant to applicable compliance schedules.”

(b) Attachment J to the 2021 Permit is a matrix that summarizes by watershed management area the water quality-based effluent limitations with which the District must comply.

(c) Attachments M and O through S of the 2021 Permit set forth the specific water quality-based effluent limitations with which the District must comply.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles District Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

(d) Based on District records, the cost to the District to comply with these water quality-based effluent limitations in FY 2021-2022 was approximately \$481,000.

(e) The cost to the District to comply with these water quality-based effluent limitations in FY 2022-2023 is estimated to be \$642,000.

10. **Compliance with Monitoring Requirements for Water Quality-Based Effluent Limitations:**

(a) 2021 Permit Part VII requires the permittees, including the District, “to comply with the [Monitoring and Reporting Program] and future revisions thereto, in Attachment E of this Order and Standard Provisions relating to monitoring, reporting, and record keeping in Attachment D of this Order.”

(b) Attachment E to the Permit requires the monitoring program, whether an Integrated Monitoring Program or a Coordinated Integrated Monitoring Program, to address “all [Total Maximum Daily Load (TMDL)]” monitoring requirements. 2021 Permit, Attachment E, Parts III.A.4 and B.5.

(c) As set forth in the 2021 Permit Attachment E, Part III.C.2.a, “TMDL compliance monitoring shall be consistent with the recommendations within the TMDL and align with the requirements in Attachments K through S of the Order,” which attachments set forth the water quality-based effluent limitations with which the District must comply.

(d) Attachment E, Sections VI and VII, sets forth the requirements that must be included when monitoring stormwater and non-stormwater for water quality-based effluent limitations.

(e) Based on District records, the cost to the District to comply with these monitoring requirements in FY 2021-2022 was approximately \$2,662,000.

(f) The cost to the District to comply with these monitoring requirements in FY 2022-2023 is estimated to be \$3,549,000.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles District Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

11. **Requirements Related to Non-Stormwater Discharge Prohibitions and Illicit Discharge Detection and Elimination Program:**

(a) 2021 Permit Part III.A.1 prohibits certain non-stormwater discharges through the municipal separate storm sewer system (“MS4”) to receiving waters.

(b) 2021 Permit Part III.A.3.a conditionally exempts from this non-stormwater prohibition discharges from essential non-emergency firefighting activities and certain discharges by drinking water suppliers.

(c) 2021 Permit Part III.A.3.b conditionally exempts certain non-essential non-stormwater discharges.

(d) 2021 Permit Part III.A.5.a requires the District to develop and implement procedures to require conditionally exempt dischargers of non-stormwater to the District's MS4 to comply with the requirements of Part III.A.5.a.i-vi and Table 5 of the Permit.

(e) 2021 Permit Part III.A.5.b requires the District to keep records of all conditionally exempt non-stormwater discharges greater than 100,000 gallons in an electronic database.

(f) 2021 Permit Part III.A.5.c requires the District to evaluate monitoring data collected pursuant to the Permit's Monitoring and Reporting Program (Permit Attachment E) and other associated data and information to determine, among other things, if authorized or conditionally authorized non-stormwater discharges are a source of pollutants that may be causing or contributing to an exceedance of receiving water limitations and/or water quality based effluent limitations.

(g) 2021 Permit Part III.A.6 requires the District to take action to address such non-stormwater discharges if they are found to be such a source of pollutants, through effective prohibition, conditions, diversions or treatment. These tasks involve, among other things, meeting with non-stormwater dischargers, identifying and analyzing the nature of non-stormwater discharges, the development and implementation of discharge procedures, conducting public education efforts and evaluating monitoring data.

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles District Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

(h) 2021 Permit Part VIII.I.5 requires the District to have a spill response plan that includes procedures that prevent, contain, and respond to all sewage and other spills that may discharge into the storm sewer system.

(i) 2021 Permit Part VIII.I.6 requires the District to publicize and provide a means for public reporting of illicit discharges and other water quality impacts from stormwater and non-stormwater discharges into or from the storm sewer system.

(j) 2012 Permit Part VIII.I.8 requires the District to document all public reports of illicit discharges, the dates and results of illicit discharge investigations, any corrective actions taken, any follow-up inspections, and the date the investigation was closed.

(k) Based on District records, the cost to the District to comply with these non-stormwater and illicit discharge detection and elimination requirements in FY 2021-2022 was approximately \$515,000.

(l) The cost to the District to comply with these non-stormwater and illicit discharge detection and elimination requirements in FY 2022-2023 is estimated to be \$687,000.

12. **Public Information Program Requirements:**

(a) 2021 Permit Part VIII.D.1 requires the District to continue its public information and participation program, either collaboratively, in partnership with stormwater member agencies, or individually.

(b) 2021 Permit Part VIII.D.3 requires the District to create opportunities for public engagement in stormwater planning and program implementation, and to conduct educational activities and public information focusing on certain wastes and materials identified in that part.

(c) 2021 Permit Part VIII.D.4 requires the District to develop metrics for measuring the effectiveness of its program in reaching the general public and the socioeconomic and ethnic groups in the Los Angeles region, increasing the understanding

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles District Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

of the importance of stormwater management, increasing support for stormwater management programs, facilitating pollution prevention, and educating and involving residents.

(d) Based on District records, the cost to the District to comply with these public information program requirements in FY 2021-2022 was approximately \$1,632,000.

(e) Based on District records, the cost to the District to comply with these requirements in FY 2022-2023 will be approximately \$2,177,000.

13. **Public Agency Requirements**

(a) 2021 Permit Part VIII.H.2 requires the District to maintain an updated inventory or database of all permittee-owned or operated facilities that are potential sources of stormwater pollution, including 27 separate categories of facilities that are required to be in the inventory. The inventory must include the name and address of the facility, contact information, a narrative description of activities performed and potential pollution sources, coverage under any individual or general NPDES permits or waivers, a description of BMPs, and, for trash control devices, an indication of whether it is a partial or certified full capture system. The inventory must be updated at least once during the permit term with information collected through field activities or other readily available informational databases.

(b) 2021 Permit Part VIII.H.5.b requires the District to implement an Integrated Pesticide Management (“IPM”) program, including restrictions on the use of pesticides, restricting treatments only to remove the target organism, selection of pest controls that minimize risks to human health, beneficial non-target organisms and the environment, partnering with other agencies and organizations to encourage the use of an IPM program, adopt and verifiably implement policies, procedures and/or ordinances requiring the minimization of pesticide use, and encouraging the use of IPM techniques in public agency facilities and activities. Additionally, the District must reduce the use of pesticides that cause impairments of surface

Section 6: Declarations in Support of Joint Test Claim of the County of Los Angeles and the Los Angeles District Flood Control District Concerning Los Angeles Regional Water Quality Control Board Order No. R4-2021-0105

waters by preparing and updating annually an inventory of pesticides, quantifying pesticide use by staff and contractors, and implementing IPM alternatives where feasible to reduce pesticide use.

(c) Based on District records, the cost to the District to comply with these public agency requirements in FY 2021-2022 was approximately \$516,000.

(d) Based on District records, the cost to the District to comply with these requirements in FY 2022-2023 will be approximately \$687,000.

14. I am informed and believe that there are no dedicated State, federal or regional funds that are or will be available to pay for any of the new and/or upgraded programs and activities set forth in this Declaration.

15. The District has filed a joint test claim with Los Angeles County. The County and District allege state-mandated costs resulting from the same Executive Order, the 2021 Permit [(1) Parts IV.A.2 and B and Attachments J through S (except Attachments K, L and N); (2) Part VII and Attachment E; (3) Parts III.A.1, A.3.a, A3.b, A.5.a, A.5.b, A.5.c, A.6, VIII.I.5, I.6, and I.8; (4) Parts VIII.D.1, D.3, D.4; and (5) Parts VIII.H.2 and H.5.b]. The County and the Flood Control District agree on all issues of the test claim and have designated one person to act as the sole representative, Howard Gest of Burhenn & Gest LLP.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

<http://www.waterboards.ca.gov/losangeles>

REGIONAL PHASE I MS4 NPDES PERMIT

**ORDER NO. R4-2021-0105
NPDES PERMIT NO. CAS004004**

WASTE DISCHARGE REQUIREMENTS AND NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT FOR MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) DISCHARGES WITHIN THE COASTAL WATERSHEDS OF LOS ANGELES AND VENTURA COUNTIES

The Los Angeles County Flood Control District, County of Los Angeles, 85 incorporated cities within the coastal watersheds of Los Angeles County, Ventura County Watershed Protection District, County of Ventura, and 10 incorporated cities within Ventura County (hereinafter referred to separately as Permittees and jointly as Dischargers) are subject to waste discharge requirements (WDRs) for their municipal separate storm sewer system (MS4)¹ discharges originating from within their jurisdictional boundaries composed of stormwater and non-stormwater as set forth in this Order.

Table 1. Discharger Information

| | |
|--|--|
| Dischargers | The Los Angeles County Flood Control District, County of Los Angeles, 85 incorporated cities within the coastal watersheds of Los Angeles County, Ventura County Watershed Protection District, the County of Ventura, and 10 incorporated cities within Ventura County (see Table 2 and Table 3). |
| Name of Facility | Municipal Separate Storm Sewer Systems (MS4s) per 40 CFR § 122.26(b)(8) within the Los Angeles Region |
| Facility Contacts, Titles, Addresses, and Phone Numbers | Available through the Stormwater Multiple Application and Report Tracking System (SMARTS) ² at https://smarts.waterboards.ca.gov/smarts/faces/SwSmartsLogin.xhtml |
| The U.S. Environmental Protection Agency (U.S. EPA) and the California Regional Water Quality Control Board, Los Angeles Region (Los Angeles Water Board) have classified the MS4s located in the Los Angeles Region as a large phase I municipal separate storm sewer system (MS4) pursuant to 40 CFR section 122.26(b)(4) and a major facility pursuant to 40 CFR section 122.2. | |

Table 2. Facility Information for Ventura County Permittees

| Permittee (SMARTS WDID) | Physical Address |
|--|-------------------------|
| Ventura County Watershed Protection District | 800 S. Victoria Ave. |

¹ See Attachment A for definitions of terms, acronyms, and abbreviations used in the Order and all other attachments.

² SMARTS provides a platform where dischargers, regulators, and the public can enter, manage, and view stormwater data including permit applications and compliance and monitoring data associated with NPDES permits for stormwater discharges issued by the State of California. SMARTS is compliant with U.S. EPA’s Cross-Media Electronic Reporting Rule, which sets requirements for electronic reporting of NPDES permit-related submittals.

Table 4. Administrative Information

| | |
|--|---------------------------|
| This Order was adopted on: | July 23, 2021 |
| This Order shall become effective on: | September 11, 2021 |
| This Order shall expire on: | September 11, 2026 |
| In accordance with Title 23, Division 3, Chapter 9 of the California Code of Regulations and to Title 40, Part 122 of the Code of Federal Regulations (CFR), each Discharger shall file a Report of Waste Discharge as an application for reissuance of waste discharge requirements (WDRs) and an application for reissuance of a National Pollutant Discharge Elimination System (NPDES) permit no later than: | March 15, 2026 |
| In accordance with Section 2235.4 of Title 23 of the California Code of Regulations, the terms and conditions of an expired permit are automatically continued pending issuance of a new permit if all requirements of the federal NPDES regulations on continuation of the expired permit are complied with. Accordingly, if a new Order is not adopted by the expiration date above, then the Permittees shall continue to implement the requirements of this Order until a new one is adopted. | |

I, Renee Purdy, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of the Order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on **July 23, 2021**.

Renee Purdy, Executive Officer

I. FACILITY INFORMATION

The 99 entities listed in Table 2 and Table 3 of this Order are the owners and/or operators⁴ of Municipal Separate Storm Sewer Systems within the Los Angeles Region (hereinafter MS4 or Facility). References to the “discharger,” “permittee,” “co-permittee,” or “municipality” in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Dischargers or Permittees herein. Information describing the Permittees’ MS4 within the Los Angeles Region (Facility) is summarized in Table 1, Table 2, and Table 3 of this Order and in the Fact Sheet (Attachment F). The Fact Sheet also includes information regarding the Permittees’ permit applications. Attachment A lists definitions of terms, abbreviations, and acronyms used in this Order and all other attachments.

II. FINDINGS

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter Los Angeles Water Board or Board), finds:

A. Legal Authorities – Federal Clean Water Act and California Water Code.

This Order serves as WDRs pursuant to article 4, chapter 4, division 7 of the California Water Code (commencing with section 13260). This Order is also issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. EPA and chapter 5.5, division 7 of the Water Code (commencing with section 13370). It shall serve as an NPDES permit authorizing the Dischargers to discharge into waters of the U.S. within the Los Angeles Region subject to the WDRs in this Order.

B. Background and Rationale for Requirements

The Los Angeles Water Board developed the requirements in this Order based on information submitted as part of the Permittees’ reapplication packages, through monitoring and reporting programs, and other available information. In accordance with federal regulations at 40 CFR section 124.8, the Fact Sheet (Attachment F), which contains background information and the legal, policy and technical rationale for the requirements in this Order, is hereby incorporated into and constitutes Findings for this Order. Attachments A through E and G through S are also incorporated into this Order.

C. This Order, Regional MS4 Permit

This Order supersedes the previous Orders for the City of Long Beach, 86 Permittees in the coastal watersheds of Los Angeles County, and 12 Permittees in Ventura County to cover 99 Permittees within the coastal watersheds of the Los Angeles Region with one region-wide Phase I MS4 Permit (Regional MS4 Permit). This Order implements the federal Phase I NPDES Stormwater Program requirements. These federal requirements include three fundamental elements: (i) a requirement to effectively prohibit non-stormwater discharges through the MS4, (ii) requirements to implement controls to reduce the discharge of pollutants in stormwater to the maximum extent practicable (MEP), and (iii) other provisions the Los Angeles Water Board has determined appropriate for the control of such pollutants.

D. Delegation of Authority to the Executive Officer

The Los Angeles Water Board by prior resolution has delegated broad authority to its Executive Officer to act on the Los Angeles Water Board’s behalf pursuant to Water Code sections 7 and 13223. Therefore, the Los Angeles Water Board Executive Officer is authorized to act on the Los Angeles Water Board’s behalf on all matters within this Order that have been delegated

⁴ Owner or operator means the owner or operator of any facility or activity subject to regulation under the NPDES program (40 CFR § 122.2).

unless such delegation is unlawful under Water Code section 13223 or this Order explicitly states otherwise.

The Board authorizes the Executive Officer to make non-substantive changes to this Order to correct typographical errors, including correcting misspellings/grammar, ensuring correct cross-references, correcting formatting/numbering, and conforming changes made during the development and adoption of this Order that were inadvertently not carried through the entire Order. The Executive Officer shall provide public notice of any non-substantive changes.

E. Notification of Interested Parties

In accordance with state and federal laws and regulations, the Los Angeles Water Board has notified the Permittees and interested agencies and persons of its intent to prescribe WDRs for the discharges authorized by this Order and has provided them with an opportunity to submit their written and oral comments. Details of the notification, as well as the meetings and workshops held on the working proposal and drafts of the permit, are provided in the Fact Sheet (Attachment F) of this Order.

F. Consideration of Public Comment

The Los Angeles Water Board, in a public meeting, heard and considered all oral and written comments pertaining to the discharges authorized by this Order and the requirements contained herein. The Los Angeles Water Board has prepared written responses to all timely comments on the draft permit, which are included in the Administrative Record for this Order. Details of the public hearing are provided in the Fact Sheet (Attachment F) of this Order.

THEREFORE, IT IS HEREBY ORDERED that this Order supersedes Order No. R4-2010-0108, Order No. R4-2012-0175, and Order No. R4-2014-0024 except for enforcement purposes, and, in order to meet the provisions contained in division 7 of the Water Code (commencing with section 13000) and regulations adopted thereunder, and the provisions of the CWA and regulations and guidelines adopted thereunder, the Dischargers shall comply with the requirements in this Order. This action in no way prevents the Los Angeles Water Board from taking enforcement action for violations of the previous Orders.

In compliance with the judgment and writ of mandate in *Natural Resources Defense Council, Inc. and Los Angeles Waterkeeper v. State Water Resources Control Board and California Regional Water Quality Control Board, Los Angeles Region*, Los Angeles County Superior Court, Case No. BS156962, the issuance of this Order has the effect of setting aside Order No. R4-2012-0175 upon the effective date of this Order. This action to supersede Order No. R4-2012-0175 is not retroactive. Order No. R4-2012-0175 remains valid while it is still in effect, and violations are therefore subject to enforcement. This action also does not impact or affect any prior actions or determinations by the Los Angeles Water Board or its Executive Officer that implemented Order No. R4-2012-0175 including, but not limited to, actions or determinations related to watershed management programs (subject to State Water Board Order WQ 2020-0038), monitoring programs, and alternative biofiltration designs.

III. DISCHARGE PROHIBITIONS

A. Prohibitions – Non-Stormwater Discharges

1. **Prohibition of Non-Stormwater Discharges.** Each Permittee for the portion of the MS4 for which it is an owner or operator shall prohibit non-stormwater discharges through the MS4 to receiving waters.
2. **Exceptions to Prohibition of Non-Stormwater Discharges.** The following authorized and conditionally exempt non-stormwater discharges are not prohibited:
 - a. Authorized non-stormwater discharges separately regulated by an individual or general NPDES permit;
 - b. Authorized non-stormwater discharges separately regulated by a conditional waiver or WDRs for agricultural lands;
 - c. Temporary non-stormwater discharges authorized pursuant to sections 104(a) or 104(b) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) that either: (i) will comply with water quality standards as applicable or relevant and appropriate requirements (“ARARs”) under section 121(d)(2) of CERCLA; or (ii) are subject to either (a) a written waiver of ARARs pursuant to section 121(d)(4) of CERCLA or (b) a written determination that compliance with ARARs is not practicable considering the exigencies of the situation pursuant to 40 CFR. section 300.415(j)⁵;
 - d. Authorized non-stormwater discharges from emergency firefighting activities (i.e., discharges resulting from water use necessary for the protection of life or property from fire)⁶;
 - e. Natural flows including:
 - i. Natural springs;
 - ii. Flows from riparian habitats and wetlands;
 - iii. Diverted stream flows, authorized by the State Water Board or Los Angeles Water Board;
 - iv. Uncontaminated ground water infiltration⁷;
 - v. Rising ground waters, where ground water seepage is not otherwise covered by a NPDES permit⁸;
 - f. Conditionally exempt non-stormwater discharges in accordance with Parts III.A.3 and III.A.4 below.

⁵ These typically include short-term, high volume discharges resulting from the development or redevelopment of groundwater extraction wells, or federal or State-required compliance testing of potable water treatment plants, as part of an authorized groundwater remediation action under CERCLA.

⁶ Discharges from vehicle washing, building fire suppression system maintenance and testing (e.g., sprinkler line flushing), fire hydrant maintenance and testing, and other routine maintenance activities are not considered emergency firefighting activities.

⁷ Uncontaminated ground water infiltration is water other than wastewater that enters the MS4 (including foundation drains) from the ground through such means as defective pipes, pipe joints, connections, or manholes. Infiltration does not include, and is distinguished from, inflow. (See 40 CFR § 35.2005(20).)

⁸ A NPDES permit for discharges associated with ground water dewatering is required within the Los Angeles Region.

- 3. Conditional Exemptions from Non-Stormwater Discharges Prohibition.** The following categories of non-stormwater discharges are exempt from the non-stormwater discharge prohibition, if (1) the Permittee ensures that all required conditions specified below, including in Table 5 of this Order, or other conditions specified and/or approved by the Los Angeles Water Board Executive Officer are met, and (2) the discharge is not a direct discharge into an Area of Special Biological Significance (ASBS) within the Los Angeles Region unless otherwise allowed in Part III.A.4 of this Order.
- a. Conditionally Exempt Essential Non-Stormwater Discharges.** The following non-stormwater discharges are directly or indirectly required by other state or federal statutes and/or regulations, and are exempt from the discharge prohibition in Part III.A.1 of this Order:
- i. Discharges from essential *non-emergency* firefighting activities⁹;
 - ii. Discharges from drinking water systems that are not otherwise regulated by NPDES Permit No. CAG674001, NPDES Permit No. CAG140001, or another separate NPDES permit¹⁰;
- b. Conditionally Exempt Non-Essential Non-Stormwater Discharges.** The following non-stormwater discharges are exempt from the discharge prohibition in Part III.A.1 of this Order, provided that the discharge is not a source of pollutants that will cause or contribute to an exceedance of applicable limitations in Part IV, Part V, and Attachments K through S of this Order:
- i. Dewatering of lakes¹¹;
 - ii. Landscape irrigation;
 - iii. Dechlorinated/debrominated swimming pool/spa discharges¹² not otherwise regulated by a separate NPDES permit;
 - iv. Dewatering of decorative fountains¹³;
 - v. Non-commercial car washing by residents or by non-profit organizations;
 - vi. Street/sidewalk wash water¹⁴;

⁹ This includes firefighting training activities, which simulate emergency responses, and routine maintenance and testing activities necessary for the protection of life and property, including building fire suppression system maintenance and testing (e.g., sprinkler line flushing) and fire hydrant testing and maintenance. Discharges from vehicle washing are not considered essential and as such are not conditionally exempt from the non-stormwater discharge prohibition.

¹⁰ Drinking water system discharges means short-term or seasonal discharges from a drinking water system of water that has been dedicated for drinking water purposes. Discharges from drinking water systems include sources of flows from drinking water storage, supply and distribution systems (including flows from system failures), pressure releases, system maintenance, distribution line testing, and flushing and dewatering of pipes, reservoirs, and vaults, and minor non-invasive well maintenance activities not involving chemical addition(s).

¹¹ Dewatering of lakes does not include dewatering of drinking water reservoirs. Dewatering of drinking water reservoirs is addressed in Part III.A.3.a.ii of this Order.

¹² Conditionally exempt dechlorinated/debrominated swimming pool/spa discharges do not include swimming pool/spa filter backwash or swimming pool/spa water containing bacteria, detergents, wastes, or algaecides, or any other chemicals (including salts from pools commonly referred to as "saltwater pools").

¹³ Conditionally exempt discharges from dewatering of decorative fountains do not include fountain water containing bacteria, detergents wastes, or algaecides, or any other chemicals.

¹⁴ Conditionally exempt non-stormwater discharges of street/sidewalk wash water only include those discharges resulting from use of high pressure, low volume spray washing using only potable water with no cleaning agents

- vii. Short-term releases of potable water with no additives or dyes for filming purposes;
 - viii. Potable wash water used to clean reservoir covers.
- 4. Additional Provisions for Non-Stormwater Discharges to an ASBS.** The following non-stormwater discharges to an MS4 with a direct discharge to an ASBS are allowed pursuant to the California Ocean Plan, provided that:
- a. The non-stormwater discharge falls within any of the following categories:
 - i. One of the conditionally exempt essential non-stormwater discharge categories in Part III.A.3.a of this Order;
 - ii. Essential for emergency response purposes, structural stability, and slope stability, which may include but are not limited to the following discharges:
 - (a) Discharges associated with emergency firefighting operations (i.e., discharges resulting from water use necessary for the protection of life or property from fire)¹⁵;
 - (b) Foundation and footing drains;
 - (c) Water from crawl space or basement pumps;
 - (d) Hillside dewatering.
 - iii. Naturally occurring discharges as follows:
 - (a) Naturally occurring groundwater seepage via a MS4;
 - (b) Non-anthropogenic flows from a naturally occurring stream via a culvert or MS4, as long as there are no contributions of anthropogenic runoff.
 - b. The non-stormwater discharge shall not cause or contribute¹⁶ to an exceedance of applicable limitations in Part IV, Part V, and Attachments K through S of this Order or the water quality objectives in Chapter II of the Ocean Plan, or an undesirable alteration in natural ocean water quality in an ASBS.
- 5. Permittee Requirements.** For conditionally exempt non-stormwater discharges, each Permittee shall:
- a. Develop and implement procedures to ensure that a discharger, if not a named Permittee in this Order, fulfills the following for conditionally exempt non-stormwater discharges to the Permittee's MS4:
 - i. Notifies Permittee of the planned discharge in advance, where required in Table 5 of this Order or consistent with recommendations pursuant to the applicable BMP manual;
 - ii. Obtains any local permits required by the MS4 owner(s) and/or operator(s);

at an average usage of 0.006 gallons per square feet of sidewalk area in accordance with Los Angeles Water Board Resolution No. 98-08. Conditionally exempt non-stormwater discharges of street/sidewalk wash water do not include hosing of any sidewalk or street with a garden hose with a high pressure high volume nozzle.

¹⁵ Discharges from vehicle washing, building fire suppression system maintenance and testing (e.g., sprinkler line flushing), fire hydrant maintenance and testing, and other routine maintenance activities are not considered emergency firefighting activities.

¹⁶ Based on the water quality characteristics of the conditionally exempt non-stormwater discharge itself.

- iii. Provides documentation that it has obtained any other necessary permits or water quality certifications¹⁷ for the discharge;
 - iv. Conducts monitoring of the discharge, if required by the Permittee;
 - v. Implements BMPs and/or control measures as specified in Table 5 of this Order or in the applicable BMP manual(s) as a condition of the approval to discharge into the Permittee's MS4; and
 - vi. Maintains records of its discharge to the MS4, consistent with requirements in Table 5 of this Order or recommendations pursuant to the applicable BMP manual. For lake dewatering, the Permittee shall require that the following information is maintained by the lake owner / operator: name of discharger, date and time of notification, method of notification, location of discharge, discharge pathway, receiving water, date of discharge, time of the beginning and end of the discharge, duration of the discharge, flow rate or velocity, total number of gallons discharged, type(s) of sediment controls used, pH of discharge, type(s) of volumetric and velocity controls used, and field and laboratory monitoring data. These records shall be made available upon request by the Permittee or Los Angeles Water Board.
- b. Maintain records of all conditionally exempt non-stormwater discharges greater than 100,000 gallons in an electronic database consistent with Table 5 of this Order.
 - c. Evaluate monitoring data collected pursuant to the Monitoring and Reporting Program (MRP) of this Order (Attachment E), and any other associated data or information, and determine whether any of the authorized or conditionally exempt non-stormwater discharges identified in Parts III.A.2-4 above are a source of pollutants that may be causing or contributing to an exceedance of applicable limitations in Part IV, Part V, and Attachments K through S of this Order. Based on non-stormwater outfall-based monitoring as implemented through the MRP, if monitoring data show exceedances of applicable limitations at the outfall, the Permittee shall take further action to determine whether the discharge is causing or contributing to exceedances of applicable limitations in the receiving water.
6. If the Permittee determines that any of the conditionally exempt non-essential non-stormwater discharges identified in Part III.A.3.b of this Order is a source of pollutants that causes or contributes to an exceedance of applicable limitations in Part IV, Part V, and Attachments K through S of this Order, the Permittee(s) shall report its findings to the Los Angeles Water Board in its annual report. Based on this determination, the Permittee(s) shall also either:
- a. Effectively prohibit¹⁸ the non-stormwater discharge into the MS4; or
 - b. Impose conditions in addition to those in Table 5 of this Order, subject to approval by the Los Angeles Water Board Executive Officer, on the non-stormwater discharge such that it will not be a source of pollutants; or
 - c. Require diversion of the non-stormwater discharge to the sanitary sewer; or
 - d. Require treatment of the non-stormwater discharge prior to discharge to the receiving water.

¹⁷ Pursuant to the Federal Clean Water Act § 401.

¹⁸ To "effectively prohibit" means to not allow the non-stormwater discharge into the MS4 unless the discharger obtains coverage under a separate NPDES permit prior to discharge into the MS4.

7. If the Permittee effectively prohibits the non-stormwater discharge to the MS4, as per Part III.A.6.a above, then the Permittee shall implement procedures developed under Part VIII.I of this Order (Illicit Discharge Detection and Elimination Program) to eliminate the discharge to the MS4 unless the non-stormwater discharge is regulated by a separate NPDES permit prior to the next discharge.
8. If the Permittee determines that any of the authorized or conditionally exempt essential non-stormwater discharges is a source of pollutants that causes or contributes to an exceedance of applicable limitations in Part IV, Part V, and Attachments K through S of this Order, the Permittee shall notify the Los Angeles Water Board within 30 days of any such determination.
9. Notwithstanding the above, the Los Angeles Water Board, based on an evaluation of monitoring data and other relevant information including TMDLs and antidegradation policies, may require that a discharger obtain coverage under a separate individual or general State Water Board or Los Angeles Water Board NPDES permit for the non-stormwater discharge or may require that the Permittee ensures that the discharger implements additional conditions specified or approved by the Executive Officer to ensure that the discharge is not a source of pollutants.

Table 5. Required Conditions for Conditionally Exempt Non-Stormwater Discharges

| Discharge Category | General Conditions for Exempt MS4 Discharges | Requirements/Required BMPs Prior to Discharge through the MS4 |
|---|--|---|
| All Discharge Categories | See discharge specific conditions below. | <p>Ensure conditionally exempt non-stormwater discharges avoid potential sources of pollutants in the flow path to prevent introduction of pollutants to the MS4 and receiving water.</p> <p>Whenever there is a discharge of 100,000 gallons or more into the MS4, Permittees shall require advance notification by the discharger to the potentially affected MS4 Permittees, including at a minimum either the VCWPD or the LACFCD, and the Permittee with jurisdiction over the land area from which the discharge originates.</p> |
| Discharges from essential <i>non-emergency</i> firefighting activities | Discharges allowed after implementation of specified BMPs. | Implement appropriate BMPs based on the CAL FIRE, Office of the State Fire Marshal’s <i>Water-Based Fire Protection Systems Discharge Best Management Practices Manual</i> (September 2011) for water-based fire protection system discharges, and based on <i>Riverside County’s Best Management Practices Plan for Urban Runoff Management</i> (May 1, 2004), or equivalent BMP manual for fire training activities and post-emergency firefighting activities. |
| Discharges from drinking water systems that are not otherwise regulated by NPDES Permit No. CAG674001, NPDES Permit No. CAG140001, or another | Discharges allowed after implementation of specified BMPs. | <p>Implement appropriate BMPs based on the American Water Works Association (California-Nevada Section) <i>Guidelines for the Development of Your Best Management Practices (BMP) Manual for Drinking Water System Releases</i> (2005) or equivalent industry standard BMP manual.</p> <p>Chlorine residual in the discharge shall not exceed 0.1 mg/L. Additionally, each Permittee shall work with drinking water system owners/operators that may discharge to the Permittee’s MS4 to ensure the following for all discharges greater than 100,000 gallons: (1) notification at least 72 hours prior to a planned discharge and as soon as possible after an unplanned discharge; (2) monitoring of any pollutants of concern¹⁹ in the drinking water system discharge; and (3) record keeping.</p> |

¹⁹ Pollutants of concern in drinking water distribution system discharges may include trash and debris, including organic matter, total suspended solids (TSS), residual chlorine, pH, and any pollutant for which there is a limitation in Parts IV, Part V, and Attachments K through S of this Order applicable to discharges from the MS4 to the receiving water. Determination of the pollutants of concern for a particular discharge shall be based on an evaluation of the potential for the constituent(s) to be present in the discharge at levels that may cause or contribute to exceedances of applicable limitations in Parts IV, Part V, and Attachments K through S of this Order.

| | | |
|---|--|--|
| <p>separate NPDES permit</p> | | <p>Permittees shall ensure that the following information is maintained for all drinking water system discharges to the MS4 (planned and unplanned) greater than 100,000 gallons: name of discharger, date and time of notification (for planned discharges), method of notification, location of discharge, discharge pathway, receiving water, date of discharge, time of the beginning and end of the discharge, duration of the discharge, flow rate or velocity, total number of gallons discharged, type of dechlorination equipment used, type of dechlorination chemicals used, concentration of residual chlorine, type(s) of sediment controls used, pH of discharge, type(s) of volumetric and velocity controls used, and field and laboratory monitoring data.</p> <p>Records shall be retained for five years and made available upon request by the Permittee or Los Angeles Water Board.</p> |
| <p>Potable wash water discharges associated with reservoir cover cleaning</p> | <p>Per the Operations and Maintenance Plan approved by the California Department of Public Health (CDPH)</p> | <p>Create a list of the total number of reservoir covers that must be cleaned to comply with operations and maintenance requirements for reservoir covers; the list should also include the annual cleaning frequency, the address where the reservoirs are located; and the type and size (surface area) of the reservoir covers.</p> <p>The cleaning of the reservoirs shall be done in such a way that minimizes the amount of water used to clean the cover.</p> <p>Wastewater from the cleaning of the reservoir covers shall be discharged to a sanitary sewer or allowed to percolate into the ground; and the discharge shall not cause or contribute to erosion in the area where there will be percolation.</p> <p>If wastewater from the cleaning of the reservoir covers is percolated into the ground, the wash water shall not contain solvents, or other contaminants that might migrate into and contaminate the groundwater supplies.</p> |
| <p>Lake Dewatering</p> | <p>Discharge allowed only if all necessary permits/water quality certifications for dredge and fill activities, including water diversions, are obtained prior to discharge.</p> | <p>Ensure procedures for advanced notification by the lake owner/operator to the Permittee(s) no less than 72 hours prior to the planned discharge.</p> <p>Immediately prior to discharge, visible trash on the shoreline or on the surface of the lake shall be removed and disposed of in a legal manner.</p> <p>Immediately prior to discharge, the discharge pathway and the MS4 inlet to which the discharge is directed, shall be inspected and cleaned out of all pre-existing trash and debris.</p> |

| | | |
|--|--|--|
| | | <p>Discharges shall be volumetrically and velocity controlled to minimize re-suspension of sediments.</p> <p>Measures shall be taken to stabilize lake bottom sediments.</p> <p>Ensure procedures for water quality monitoring for pollutants of concern²⁰ in the lake.</p> <p>Ensure record-keeping of lake dewatering by the lake owner/operator as described in Part III.A.5.a.vi of this Order.</p> |
| Landscape irrigation using potable water | <p>Discharge allowed if runoff due to potable landscape irrigation is minimized through the implementation of an ordinance specifying water efficient landscaping standards, as well as an outreach and education program focusing on water conservation and landscape water use efficiency.</p> | <p>Implement BMPs to minimize runoff and prevent introduction of pollutants to the MS4 and receiving water, including landscape water use efficiency requirements for existing landscaping, use of drought tolerant, native vegetation, and the use of less toxic options for pest control and landscape management.</p> <p>Implement water conservation programs to minimize discharge by using less water.</p> |
| Landscape irrigation using reclaimed or recycled water | <p>Discharge of reclaimed or recycled water runoff from landscape irrigation is allowed if the discharge is in compliance with the producer and distributor operations and management (O&M) plan, and all relevant portions thereof, including the Irrigation Management Plan.</p> | <p>Discharges must comply with applicable O&M Plans, and all relevant portions thereof, including the Irrigation Management Plan.</p> |

²⁰ Pollutants of concern include, at a minimum, trash and debris, including organic matter, TSS, and any pollutant for which there is an limitation in Parts IV, Part V, and Attachments K through S of this Order for the lake and/or receiving water.

| | | |
|--|---|--|
| <p>Dechlorinated / debrominated swimming pool / spa discharges</p> | <p>Discharges allowed after implementation of specified BMPs.</p> <p>Pool or spa water containing copper-based algaecides is not allowed to be discharged to the MS4.</p> <p>Discharges of cleaning wastewater and filter backwash allowed only if authorized by a separate NPDES permit.</p> | <p>Implement BMPs and ensure discharge avoids potential sources of pollutants in the flow path to prevent introduction of pollutants prior to discharge to the MS4 and receiving water.</p> <p>Swimming pool water must be de-chlorinated or de-brominated using holding time, aeration, and/or sodium thiosulfate. Chlorine residual in the discharge shall not exceed 0.1 mg/L.</p> <p>Swimming pool water shall not contain any detergents, wastes, or algaecides, or any other chemicals (including salts from pools commonly referred to as “salt water pools”) in excess of applicable water quality objectives.²¹</p> <p>Swimming pool discharges are to be pH adjusted, if necessary, and be within the range of 6.5 and 8.5 standard units.</p> <p>Swimming pool discharges shall be volumetrically and velocity controlled to promote evaporation and/or infiltration.</p> <p>Ensure procedures for advanced notification by the pool owner to the Permittee(s) at least 72 hours prior to planned discharge for discharges of 100,000 gallons or more.</p> <p>For discharges of 100,000 gallons or more, immediately prior to discharge, inspect and clean out of all pre-existing trash and debris the discharge pathway and the MS4 inlet to which the discharge is directed to.</p> |
| <p>Dewatering of decorative fountains</p> | <p>Discharges allowed after implementation of specified BMPs.</p> <p>Fountain water containing copper-based algaecides may not be discharged to the MS4.</p> <p>Fountain water containing dyes may not be discharged to the MS4.</p> | <p>Implement BMPs and ensure discharge avoids potential sources of pollutants in the flow path to prevent introduction of pollutants prior to discharge to the MS4 and receiving water.</p> <p>Fountain water must be de-chlorinated or de-brominated using holding time, aeration, and/or sodium thiosulfate. Chlorine residual in the discharge shall not exceed 0.1 mg/L.</p> <p>Fountain discharges are to be pH adjusted, if necessary, and be within the range of 6.5 and 8.5 standard units.</p> <p>Fountain discharges shall be volumetrically and velocity controlled to promote evaporation and/or infiltration.</p> |

²¹ Applicable mineral water quality objectives for surface waters are contained in Chapter 3 of the Basin Plan for the Los Angeles Region.

| | | |
|---|---|--|
| | | <p>Ensure procedures for advanced notification by the fountain owner to the Permittee(s) at least 72 hours prior to planned discharge for discharges of 100,000 gallons or more.</p> <p>For discharges of 100,000 gallons or more, immediately prior to discharge, the discharge pathway and the MS4 inlet to which the discharge is directed to shall be inspected and cleaned out of all pre-existing trash and debris.</p> |
| <p>Non-commercial car washing by residents or by non-profit organizations</p> | <p>Discharges allowed after implementation of specified BMPs.</p> | <p>Implement BMPs and ensure discharge avoids potential sources of pollutants in the flow path to prevent introduction of pollutants prior to discharge to the MS4 and receiving water.</p> <p>Minimize the amount of water used by employing water conservation practices such as turning off nozzles or kinking the hose when not spraying a car and using a low volume pressure washer.</p> <p>Encourage use of biodegradable, phosphate free detergents and non-toxic cleaning products.</p> <p>Where possible, wash cars on a permeable surface where wash water can percolate into the ground (e.g. gravel or grassy areas).</p> <p>Empty buckets of soapy or rinse water into the sanitary sewer system (e.g., sinks or toilets).</p> |
| <p>Street/sidewalk wash water</p> | <p>Discharges allowed after implementation of specified BMPs.</p> | <p>Sweeping should be used as an alternate BMP whenever possible and sweepings should be disposed of in the trash.</p> <p>Remove trash, debris, and free standing oil/grease spills/leaks (use absorbent material if necessary) from the area before washing.</p> <p>Use high pressure, low volume spray washing using only potable water with no cleaning agents at an average usage of 0.006 gallons per square feet of sidewalk area.</p> <p>In areas of unsanitary conditions (e.g., areas where the congregation of transient populations can reasonably be expected to result in a significant threat to water quality), whenever practicable, Permittees shall collect and divert street and alley wash water from the Permittee's street and sidewalk cleaning activities to the sanitary sewer.</p> |

| | | |
|--|---|--|
| <p>Potable water discharges for filming activities</p> | <p>Discharges allowed after implementation of specified BMPs.</p> | <p>Prior to discharging the water, the storm drain to the receiving water where the discharge will occur as well as the area in the immediate vicinity of the outlet to the receiving water, and the adjacent downstream portion of the channel that will be influenced by the discharge must be cleaned of all pre-existing trash and debris, and kept free of trash and debris during filming.</p> <p>No trash or debris from the filming activities shall be allowed to remain in the storm drain or channel.</p> <p>Each day, prior to water discharge for the movie scenes, a walk-through of the filming area (including the targeted storm drain and receiving water) shall be conducted by the discharger to ensure that all trash and debris has been removed and no illicit discharges are observed.</p> <p>The source of the water that will be discharged will be de-ionized, chlorine free water.</p> <p>In receiving waters where scour of the channel is a concern, the water must be discharged at a steady, low velocity to minimize scour.</p> <p>Upon the completion of the discharges and associated filming, the discharger shall visually inspect the storm drain and channel downstream of the storm drain outlet to remove any possible trash or debris related to the discharge and filming activities.</p> |
|--|---|--|

B. Prohibitions – Trash

The discharge of trash to surface waters of the State or the deposition of trash where it may be discharged into surface waters of the State is prohibited. Compliance with this prohibition of discharge shall be achieved as follows:

1. **For areas addressed by a trash TMDL.** Each Permittee shall comply with the appropriate trash WQBELs as specified in Part IV.B.3 of this Order.
2. **For areas not addressed by a trash TMDL.** Permittees with regulatory authority over Priority Land Uses (PLUs),²² designated land uses,²³ and equivalent alternate land uses²⁴ shall comply with the following requirements:
 - a. **Compliance Methods**²⁵: The Permittee shall install, operate, and maintain either:
 - i. **Track 1:** A *full capture system (FCS)*²⁶ for all storm drains that capture runoff from the PLUs, designated land uses, and equivalent alternate land uses in the Permittee’s jurisdiction; or
 - ii. **Track 2:** Any combination of *full capture systems, multi-benefit projects,*²⁷ other *treatment controls,* and/or *institutional controls* within either the Permittee’s jurisdiction or within the jurisdiction of the Permittee and contiguous Permittees. The Permittee may determine the locations or land uses within its jurisdiction to implement any combination of controls. The Permittee shall demonstrate that such combination achieves Full Capture System Equivalency (FCSE).²⁸ The Permittee may determine which controls to implement to achieve compliance with Full Capture System Equivalency.

The Permittee may change its compliance method by submitting a written request to the Los Angeles Water Board for approval of a modified Implementation Plan and/or Jurisdictional Map consistent with the requirements specified in subparts b and c below²⁹:

²² Priority Land Uses as defined in Attachment A of this Order.

²³ If the Los Angeles Water Board determines that specific land uses or locations (e.g., parks, stadia, schools, campuses, or roads leading to landfills) generate a substantial amount of trash, a Permittee may be required to comply with Part III.B.2 of this Order. These specific land uses and locations are defined as designated land uses.

²⁴ Equivalent alternate land uses as defined in Attachment A of this Order. A Permittee may request authorization from the Executive Officer to substitute one or more PLUs with equivalent alternate land uses that generate rates of trash equivalent to or greater than the PLU(s) being substituted.

²⁵ Permittees selected a compliance method in response to the Los Angeles Water Board’s August 18, 2017, Water Code Section 13383 Order to Submit Method to Comply With Statewide Trash Provisions; Requirements For Phase I Municipal Separate Storm Sewer System (MS4) Permittees In The Los Angeles Region. Refer to the Fact Sheet (Attachment F) for Permittees’ selected tracks.

²⁶ A list of Full Capture System Trash Treatment Control Devices Certified by the State Water Board is available on the State Water Board’s Stormwater Program - Trash Implementation Program page at https://www.waterboards.ca.gov/water_issues/programs/stormwater/trash_implementation.html

²⁷ Defined as treatment control projects designed to achieve any of the benefits set forth in section 10562, subdivision (d) of the Water Code.

²⁸ Full capture system equivalency as defined in Attachment A of this Order.

²⁹ In no case shall the Permittee receive a time extension to meet final compliance. The Permittee shall meet full compliance per Part III.B.2.d of this Order.

- b. Implementation Plan (For Track 2 Only):** The Permittee shall maintain and implement a Trash Implementation Plan. At a minimum, the Trash Implementation Plan shall include the following:
- i. Locations of proposed and existing certified *full capture systems*, the drainage area served, design specifications and treatment capacity treated by each *full capture system*;
 - ii. In drainage areas without certified *full capture systems*, the combination of controls selected by the Permittee and the rationale for the selection; discussion of how the combination of controls is designed to achieve Full Capture System Equivalency;
 - iii. How Full Capture System Equivalency will be demonstrated, including calculation of baseline trash load using the methodology per the Visual Trash Assessment Approach or other equivalent trash assessment methodology, for all PLUs as well as any designated land uses, and equivalent alternate land uses³⁰;
 - iv. Monitoring of annual trash load using the same methodology that was used to calculate the baseline load for all PLUs as well as any designated land uses, and equivalent alternate land uses to track progress towards achieving Full Capture System Equivalency;
 - v. If using a methodology other than the Visual Trash Assessment Approach to determine trash levels, a description of the methodology used and rationale of how the alternative methodology is equivalent to the Visual Trash Assessment Approach; and
 - vi. If proposing equivalent alternate land uses, a rationale demonstrating that any alternative land uses generate trash at rates that are equivalent to or greater than the PLUs.
- c. Jurisdictional Map:** The Permittee shall maintain and update, at least annually, a Jurisdictional Map identifying the following:
- i. All PLUs, designated land uses and equivalent alternate land uses discharging to the storm drain network;
 - ii. Any drainage areas addressed by existing trash TMDLs;
 - iii. The corresponding storm drain network;
 - iv. Proposed locations of all certified *full capture systems* and where any combination of controls will be implemented that will achieve Full Capture System Equivalency;
- d. Implementation Schedule:** The Permittee shall achieve full compliance as follows:
- i. **Interim Compliance Deadline:** Within 5 years from the effective date of this Order, 50 percent of all PLUs and equivalent alternate land uses must meet Full Capture or Full Capture System Equivalency.
 - ii. **Final Compliance Deadline:** By no later than December 2, 2030, except in designated land uses that have been issued a time schedule by the Los Angeles

³⁰ Refer to the “Recommended Trash Assessment Minimum Level of Effort for Establishing Baseline Trash Generation Levels” document that was included as an enclosure to the Los Angeles Water Board’s August 18, 2017, Water Code Section 13383 Order.

Water Board. In no case may the final compliance date in a time schedule for a designated land use be longer than ten years from the determination by the Los Angeles Water Board to designate a land use or location as a designated land use.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent Limitations

1. **Technology Based Effluent Limitations.** Each Permittee shall reduce pollutants in stormwater discharges from the MS4 to the maximum extent practicable (MEP).
2. **Water Quality-Based Effluent Limitations.** Each Permittee shall comply with applicable water quality-based effluent limitations (WQBELs) as set forth in Attachments K through S of this Order, pursuant to applicable compliance schedules. The WQBELs in this Order are consistent with the assumptions and requirements of the TMDL waste load allocations (WLAs) assigned to discharges from the MS4.³¹

B. Total Maximum Daily Load Provisions

1. General

- a. The provisions of this Part IV.B implement and are consistent with the assumptions and requirements of available WLAs established in TMDLs applicable to the Permittees.
- b. The provisions in this Part IV.B are designed to ensure that Permittees achieve WLAs and meet other requirements of TMDLs covering receiving waters impacted by the Permittees' MS4 discharges. TMDL provisions are grouped by WMA in Attachments K through S of this Order.
- c. Permittees subject to each TMDL are identified in Attachment J of this Order.
- d. Permittees shall comply with the applicable WQBELs and/or receiving water limitations contained in Attachments K through S of this Order, consistent with the assumptions and requirements of the WLAs established in the TMDLs, including programs of implementation and schedules, where provided for in the State adoption of the TMDL (40 CFR §122.44(d)(1)(vii)(B); Cal. Wat. Code §13263(a)).
- e. Permittees may comply with WQBELs and receiving water limitations in Attachments K through S of this Order using any lawful means.

2. U.S. EPA Established TMDLs

- a. For U.S. EPA promulgated TMDLs that have Los Angeles Water Board adopted programs of implementation pursuant to Water Code sections 13240 and 13242, Permittees shall comply with the applicable WQBELs and/or receiving water limitations contained in Attachments K through S of this Order, including the programs of implementation and schedules adopted by the Los Angeles Water Board. These TMDLs are the *TMDLs for Nutrients in the Malibu Creek Watershed; Malibu Creek and Lagoon TMDL for Sedimentation and Nutrients to Address Benthic Community Impairments; TMDLs for Metals and Selenium in the San Gabriel River and Impaired Tributaries; and Los Cerritos Channel TMDLs for Metals.*
- b. For U.S. EPA promulgated TMDLs where the WLAs are equivalent to existing loads or, where Permittees' data reported under the previous MS4 permits indicates they are complying with WLAs; Permittees shall comply with the applicable WQBELs and/or receiving water limitations contained in Attachments K through S as of the effective date of this Order. These TMDLs are the *TMDL for Chloride in the Santa*

³¹ According to 40 CFR § 130.2, waste load allocations constitute a type of water quality-based effluent limitation. Pursuant to 40 CFR § 122.2, effluent limitation means any restriction imposed by the permitting authority on quantities, discharge rates, and concentrations of pollutants that are discharged from point sources.

*Clara River Reach 3; Santa Monica Bay TMDLs for DDTs and PCBs; Ballona Creek Wetlands TMDLs for Sediment and Invasive Exotic Vegetation; Echo Park Lake Nutrient and Trash TMDLs; and Peck Road Park Lake Nutrient and Trash TMDLs.*³²

- c. For U.S. EPA promulgated TMDLs where load reductions are required to meet the WLAs and there is no program of implementation pursuant to Water Code section 13240 and 13242, this Order allows Permittees to propose and implement BMPs that will be effective in achieving compliance with U.S. EPA established WLAs. These TMDLs are the *Pesticides, PCBs, and Sediment Toxicity in Oxnard Drain 3 TMDL; Long Beach City Beaches and Los Angeles River Estuary Indicator Bacteria TMDL; Legg Lake System Nutrient TMDL; Lake Calabasas Nutrient TMDL; Echo Park Lake Chlordane, Dieldrin, and PCBs TMDLs; Peck Road Park Lake Chlordane, Dieldrin, DDTs, and PCBs TMDLs; and Puddingstone Reservoir Nutrient, Mercury, Chlordane, Dieldrin, DDTs, and PCBs TMDLs.*³³
- i. Each Permittee, individually or collaboratively, shall propose BMPs to achieve the applicable numeric WQBELs and/or receiving water limitations contained in Attachments K through S of this Order and a schedule for implementing the BMPs that is as short as possible, in a Watershed Management Program.
- ii. At a minimum, each Permittee shall include the following information in its Watershed Management Program, relevant to each applicable U.S. EPA established TMDL:
- (a) Available data demonstrating the current quality of the Permittee's MS4 discharge(s) in terms of concentration and/or load of the target pollutant(s) to the receiving waters subject to the TMDL.
- (b) A detailed description of BMPs that have been implemented, and/or are currently being implemented by the Permittee to achieve the TMDL WLA(s), if any.
- (c) A detailed time schedule of specific actions the Permittee will take in order to achieve compliance with the applicable TMDL WLA(s).
- (d) A demonstration that the time schedule requested is as short as possible. The time schedule requested should take into account the time since U.S. EPA establishment of the TMDL, and technological, operation, and economic factors that affect the design, development, and implementation of the control measures that are necessary to comply with the applicable numeric WQBELs contained in Attachments K through S of this Order.
- (1) For the *Long Beach City Beaches and Los Angeles River Estuary Indicator Bacteria TMDL* the time schedule to achieve the WQBELs and receiving water limitations shall be as follows:
- (i) During dry weather, for the Long Beach City Beaches no later than the effective date of this Order³⁴;

³² The Echo Park Lake Nutrient and Trash TMDLs and the Peck Road Park Lake Nutrient and Trash TMDLs are part of the *Los Angeles Area Lakes TMDLs for Nitrogen, Phosphorus, Mercury, Trash, Organochlorine Pesticides and PCBs* (Los Angeles Area Lakes TMDLs).

³³ The Legg Lake System Nutrient TMDL; Lake Calabasas Nutrient TMDL; Echo Park Lake Chlordane, Dieldrin, and PCBs TMDLs; Peck Road Park Lake Chlordane, Dieldrin, DDTs, and PCBs TMDLs; and Puddingstone Reservoir Nutrient, Mercury, Chlordane, Dieldrin, DDTs, and PCBs TMDLs are part of the Los Angeles Area Lakes TMDLs.

³⁴ Deadline is established per the City of Long Beach MS4 Permit, Order No. R4-2014-0024, Part VIII.G.1.c.iv.(1).

- (ii) During wet weather, for the Long Beach City Beaches a time schedule as short as possible per Part IV.B.2.c.i of this Order;
 - (iii) During dry weather, for the Los Angeles River Estuary no later than the schedule for Segment A (Rosecrans Avenue to Willow Street) in Table Q – 1 within Attachment Q of this Order;
 - (iv) During wet weather, for the Los Angeles River Estuary no later than March 23, 2037; and
 - (v) For the geometric mean WQBELs and receiving water limitations, no later than the time schedule proposed for wet weather for the Long Beach City Beaches and the Los Angeles River Estuary.
- (e) If the requested time schedule exceeds one year, the proposed schedule shall include interim requirements and the dates for their achievement.
- iii. Each Permittee subject to WQBELs and/or receiving water limitations contained in Attachments K through S of this Order for U.S. EPA established TMDL(s), individually or collaboratively, may submit a Watershed Management Program to the Los Angeles Water Board for approval per the schedule in Parts IX.F and G of this Order.
 - iv. If a Permittee submits a Watershed Management Program that is not approved, then the Permittee shall be required to directly demonstrate compliance with the applicable numeric WQBELs and/or receiving water limitations immediately upon notification of the Los Angeles Water Board’s disapproval.
 - v. If a Permittee does not submit a Watershed Management Program, then the Permittee shall be required to directly demonstrate compliance with the applicable numeric WQBELs and/or receiving water limitations as of the effective date of the Order.

3. Water Quality-Based Effluent Limitations for Trash

Permittees assigned a WQBEL for a trash TMDL shall comply as set forth below.

- a. **Effluent Limitations.** Permittees shall comply with the interim and final WQBELs for the following trash TMDLs:
 - i. Ventura River Estuary Trash TMDL (Attachment K)
 - ii. Lake Elizabeth Trash TMDL (Attachment M)
 - iii. Revolon Slough and Beardsley Wash Trash TMDL (Attachment N)
 - iv. Santa Monica Bay Nearshore and Offshore Debris TMDL (Attachment O)
 - v. Malibu Creek Watershed Trash TMDL (Attachment O)
 - vi. Ballona Creek Watershed Trash TMDL (Attachment O)
 - vii. Machado Lake Trash TMDL (Attachment P)
 - viii. Los Angeles River Watershed Trash TMDL (Attachment Q)
 - ix. Legg Lake Trash TMDL (Attachment Q)
 - x. Echo Park Lake Trash TMDL (Attachment Q)
 - xi. Peck Road Park Lake Trash TMDL (Attachment Q)

- b. Compliance.** Pursuant to California Water Code section 13360(a), Permittees may comply with the trash effluent limitations using any lawful means. Such compliance options are broadly described below. Any combination of these, as allowed by the applicable TMDL, may be employed to achieve compliance:

i. Full Capture Systems (FCS) Compliance Approach

(a) Certified Full Capture Systems. *Full capture systems* are systems that meet the operating and performance requirements described in Attachment A of this Order. The Los Angeles Water Board recognizes the *full capture systems* certified by the State Water Board Executive Director as well as the systems previously certified by the Los Angeles Water Board Executive Officer: nine Los Angeles Water Board Executive Officer-certified *full capture systems*, including Vortex Separation Systems (VSS), specific types or designs of trash nets; two gross solids removal devices (GSRDs); catch basin brush inserts and mesh screens; vertical and horizontal trash capture screen inserts; a connector pipe screen device; and a nutrient separating baffle box.³⁵

(b) Permittees are authorized to comply with their effluent limitations through certified *full capture systems* provided the requirements of subpart (c), immediately below, and any conditions in the certification, continue to be met.

(c) Permittees may comply with their effluent limitations through progressive installation of *full capture systems* throughout their jurisdictional areas until all areas draining to the waterbody associated with the trash TMDL are addressed. For purposes of this Order, attainment of the effluent limitations shall be conclusively presumed for any drainage area to the waterbody associated with the trash TMDL where certified *full capture systems* treat all drainage from the area, provided that the *full capture systems* are adequately sized and maintained, and that maintenance records are up-to-date and available for inspection by the Los Angeles Water Board.

(1) Final Effluent Limitations. A Permittee shall be in compliance with its final effluent limitation if all drainage areas under its jurisdiction and/or authority are serviced by appropriate certified *full capture systems*.

(2) Interim Effluent Limitations. A Permittee shall be in compliance with its interim effluent limitations, where applicable:

(i) By demonstrating that *full capture systems* treat the percentage of drainage areas in the watershed that corresponds to the required trash abatement.

(ii) Alternatively, a Permittee may propose a schedule for installation of *full capture systems* in areas under its jurisdiction and/or authority within a given watershed, targeting first the areas of greatest trash generation, for the Los Angeles Water Board Executive Officer's approval. Any such schedule shall result in timely compliance with the final effluent limitations, consistent with the established TMDL implementation schedule and applicable State policies. A Permittee shall be in compliance with its interim

³⁵ See August 3, 2004 Los Angeles Water Board Memorandum titled "Procedures and Requirements for Certification of a Best Management Practice for Trash Control as a Full Capture System".

effluent limitations provided it is fully in compliance with any such approved schedule.

(d) Full Capture System Technical Infeasibility. In drainage areas where the vast majority of catch basins are retrofitted with *full capture systems*; the *full capture systems* are properly sized, operated, and maintained; and retrofit of remaining catch basins is technically infeasible; a Permittee may submit a written request that the Los Angeles Water Board Executive Officer make a determination that the Permittee is in full compliance with its final effluent limitation if all of the following criteria are met:

- (1)** 98% of all catch basins within the Permittee's jurisdictional land area in the watershed are retrofitted with *full capture systems* (or, alternatively, 98% of the jurisdiction's drainage area is addressed by *full capture systems*) and at least 97% of the catch basins (or, alternatively, drainage area) within the Permittee's jurisdiction in the subwatershed (the smaller of the HUC-12 equivalent area or tributary subwatershed) are retrofitted with *full capture systems*; and
- (2)** The Permittee submits to the Los Angeles Water Board a report for Executive Officer concurrence, detailing the technical infeasibility of *full capture system* retrofits in the remaining catch basins and evaluating the feasibility of *partial capture devices*, and the potential to install *full capture systems* or *partial capture devices* along the storm drain or at the MS4 outfall downgradient from the catch basin; and
- (3)** The Permittee submits to the Los Angeles Water Board a report for Executive Officer approval, detailing the *partial capture devices and institutional controls* that are currently and will continue to be implemented in the affected subwatershed(s), including an assessment of the effectiveness of the *partial capture devices and institutional controls* using existing data and representative studies.

In addition, if significant land use changes occur in the affected subwatershed (based on permits for new development and significant re-development) or if there is a significant change in the suite of implemented *partial capture devices and/or institutional controls* (e.g., reduced frequency of implementation, reduced spatial coverage of implementation, change in technology employed), the Permittee shall re-evaluate the effectiveness of *institutional controls* and *partial capture devices* and report the findings to the Los Angeles Water Board for confirmation or change to the determination. Such re-evaluation shall occur within one year of the identification of the significant changes.

(e) Exceptions for Malibu Creek Watershed and Revolon Slough and Beardsley Wash Trash TMDLs. Permittees subject to the Malibu Creek Watershed and Revolon Slough and Beardsley Wash Trash TMDLs, in Attachments O and N of this Order respectively, may comply with trash WQBELs through the installation of *full capture systems*, or any lawful manner to achieve Full Capture System Equivalency, in Priority Land Uses (PLUs) consistent with implementation of Part III.B.2.a of this Order.

ii. **Mass Balance Compliance Approach.** Permittees may comply with their interim and final effluent limitations through a combination of *full capture*

systems, *partial capture devices*, and the application of *institutional controls*.³⁶ In this approach, a Permittee shall demonstrate compliance by calculating its annual trash discharge and comparing this estimate to applicable interim and/or final effluent limitations. To calculate the annual trash discharge, the Permittee shall conduct a study to determine how much trash is accumulating within its jurisdiction between storm events to calculate a Daily Generation Rate (DGR).

(a) Intermediate Calculations

- (1) Daily Generation Rate (DGR).** The DGR is the average amount of litter deposited to land or surface water during a 24-hour period, as measured in a specified drainage area. Permittees shall conduct a study to estimate the DGR for the applicable trash TMDL area. The DGR will be used in the mass balance calculation to determine the trash discharged during storm events.
 - (i) Study Area:** The DGR study area(s) shall be representative of the land uses and activities within the Permittee’s authority. The DGR for the applicable area under the Permittee’s jurisdiction and/or authority shall be extrapolated from the representative drainage area(s) analyzed during the study.
 - (ii) Study Time Period:** The DGR shall be determined from direct measurement of trash deposited in the drainage study area during any 30-day period between June 22nd and September 22nd exclusive of rain events.³⁷
 - (iii) Recalculation Frequency:** The DGR shall be re-calculated every year unless a less frequent period for recalculation is approved by the Los Angeles Water Board Executive Officer. Upon achieving compliance with final water quality-based effluent limitations, Permittees may reduce the frequency of DGR recalculation to every five years (no Executive Officer approval necessary).

Daily Generation Rate

$$DGR = \sum \left(\frac{A_i}{A_i^{study}} \right) \left(\frac{m_i}{t_i} \right)$$

where:

- A_i = total area within jurisdiction represented by land use i
- A_i^{study} = representative area used in DGR study for land use i
- m_i = amount of trash collected during the DGR study collection period for land use i [gal or lbs]
- t_i = number of days of DGR study collection period for land use i (should be at least 30 days) [days]

- (2) Partial Capture Devices.** Trash discharges from areas serviced solely by *partial capture devices* may be estimated based on demonstrated

³⁶ While interim effluent limitations may be complied with using *partial capture devices*, compliance with final effluent limitations cannot be achieved with the exclusive use of *partial capture devices*.

³⁷ Provided no special events are scheduled that may affect the representative nature of that collection period.

performance of the device(s) in the implementing area. Performance shall be demonstrated under different conditions (e.g. low to high trash loading). That is, trash reduction is equivalent to the *partial capture devices'* trash removal efficiency multiplied by the percentage of drainage area serviced by the devices. For automatic retractable screens (ARS), Permittees may use an 86% removal efficiency.³⁸

- (3) **Certified Full Capture Systems.** Areas serviced by properly sized, operated, and maintained *full capture systems* are considered to have no trash discharge.
- (b) **Mass Balance Calculation.** A mass balance equation shall be used to estimate the amount of trash discharged during a storm event.³⁹
 - (1) **Storm Event Trash Discharge.** The *Storm Event Trash Discharge* for a given rain event in the Permittee's drainage area shall be calculated by multiplying the number of days since the last street sweeping⁴⁰ by the DGR and subtracting the amount of any trash recovered in the catch basins. For each day of a storm event that generates greater than 0.25 inch of rain, the Permittee shall calculate a *Storm Event Trash Discharge*. In cases where the calculated *Storm Event Trash Discharge* is negative, the *Storm Event Trash Discharge* will be equivalent to zero gallons or pounds of trash.

Storm Event Trash Discharge

$$\text{Storm Event Trash Discharge} = (t * DGR) - m_{\text{recovered}}$$

where:

- t = days since last street sweeping [days]
- DGR = Daily Generation Rate [gal/day or lbs/day]
- $m_{\text{recovered}}$ = trash recovered from catch basins [gal or lbs]

- (2) **Total Storm Year Trash Discharge.** The sum of the *Storm Event Trash Discharges* for the storm year shall be the Permittee's calculated annual trash discharge.

³⁸ City of Los Angeles Technical Report: Assessment of Catch Basin Opening Screen Covers. June 2016.

³⁹ Amount of trash shall refer to the uncompressed volume (in gallons) or drip-dry weight (in pounds) of trash collected.

⁴⁰ If the Permittee's jurisdiction is not swept all in one day but on multiple days of the week, the weighted average of days since the last street sweeping shall be used, using the "Weighted Average of Days Since Last Street Sweeping" spreadsheet in Attachment I of this Order.

Total Storm Year Trash Discharge

$$\text{Total Storm Year Trash Discharge} = \sum_i^n D_i$$

where:

D_i = the *Storm Event Trash Discharge* for storm event day i

n = the number of storm event days with precipitation greater than 0.25 inch

- (c) **Interim Effluent Limitations.** Permittees employing a mass balance compliance approach shall be in compliance with interim effluent limitations if the calculated Total Storm Year Trash Discharge is less than the applicable interim water quality-based effluent limitation. This can also be expressed as an equivalent percent reduction relative to the Permittee's baseline load in the applicable TMDL.
- (d) **Final Effluent Limitations.**
- (1) Permittees using a *mass balance compliance approach* shall be in compliance with the final effluent limitations when the reduction of trash from the jurisdiction's baseline load is 99% or greater as calculated using the approach, and *partial capture devices* are properly sized, operated, and maintained; or
 - (2) **Mass Balance Equivalency.** A Permittee may request that the Los Angeles Water Board Executive Officer make a determination that a 97% to 98% reduction of the baseline load, as calculated using a mass balance approach, constitutes full compliance with the final effluent limitation if the Permittee submits a report to the Los Angeles Water Board for Executive Officer approval including:
 - (i) Two or more consecutive years of data showing that the Permittee's compliance was at or above a 97% reduction in its baseline trash load; and
 - (ii) An evaluation of *institutional controls* in the jurisdiction demonstrating continued effectiveness and any potential enhancements; and
 - (iii) Demonstration that opportunities to implement *partial capture devices* have been fully exploited.
- iii. **Scientifically Based Alternative Compliance Approach.** A Permittee may comply with their interim and final effluent limitations using a scientifically based alternative compliance approach wherein the Permittee conducts effectiveness studies of *institutional controls* and *partial capture devices* for their particular subwatershed(s) and/or demonstrates that existing studies are representative and transferable to their implementing area. Permittees must request approval from the Los Angeles Water Board Executive Officer prior to conducting any studies and/or reporting compliance using this approach. In any such request to use an scientifically based alternative compliance approach, the Permittee shall provide a schedule for periodic compliance effectiveness demonstration and evaluation.

- iv. Minimum Frequency of Assessment and Collection Compliance Approach.** If allowed in a trash TMDL⁴¹ and approved by the Executive Officer, a Permittee may alternatively comply with its final effluent limitations by implementing a program for *minimum frequency of assessment and collection* (MFAC) in conjunction with BMPs. To the satisfaction of the Executive Officer, the MFAC/BMP program must meet the following criteria:
- (a)** The MFAC/BMP Program includes an initial minimum frequency of trash assessment and collection and suite of structural and/or nonstructural BMPs. The MFAC/BMP program shall include collection and disposal of all trash found in the receiving water and shoreline. Permittees shall implement an initial suite of BMPs based on current trash management practices in land areas that are found to be sources of trash to the water body.
 - (b)** The MFAC/BMP Program includes reasonable assurances that it will be implemented by the responsible Permittees.
 - (c)** MFAC protocols may be based on Surface Water Ambient Monitoring Program (SWAMP) protocols for rapid trash assessment, or alternative protocols proposed by Permittees and approved by the Los Angeles Water Board Executive Officer.
 - (d)** Implementation of the MFAC/BMP program should include a Health and Safety Program to protect personnel. The MFAC/BMP program shall not require Permittees to access and collect trash from areas where personnel are prohibited.
 - (e)** The Los Angeles Water Board Executive Officer may approve or require a revised assessment and collection frequency and definition of the critical conditions under the MFAC:
 - (1)** To prevent trash from accumulating in deleterious amounts that cause nuisance or adversely affect beneficial uses between collections;
 - (2)** To reflect the results of trash assessment and collection;
 - (3)** If the amount of trash collected does not show a decreasing trend, where necessary, such that a shorter interval between collections is warranted; or
 - (4)** If the amount of trash collected is decreasing such that a longer interval between collections is warranted.
 - (f)** At the end of the implementation period, a revised MFAC/BMP program may be required if the Los Angeles Water Board Executive Officer determines that the amount of trash accumulating between collections is causing nuisance or otherwise adversely affecting beneficial uses.
 - (g)** With regard to subparts (iv)(e)(1), (iv)(e)(2), or (iv)(e)(3) above, the Los Angeles Water Board Executive Officer is authorized to allow responsible Permittees to implement additional structural or non-structural BMPs in lieu of modifying the monitoring frequency.

⁴¹ The Lake Elizabeth Trash TMDL (Attachment M), Legg Lake Trash TMDL (Attachment Q), Machado Lake Trash TMDL (Attachment P), Ventura River Estuary Trash TMDL (Attachment K), and Revolon Slough and Beardsley Wash Trash TMDL (Attachment N) allow Permittees to comply with WQBELs by implementing an MFAC program in conjunction with BMPs.

- c. Los Angeles County Flood Control District and Ventura County Watershed Protection District Compliance for Trash TMDLs.** For all trash TMDLs where the LACFCD and VCWPD are named as a responsible Permittee per Attachment J of this Order, the following shall apply:
- i.** The LACFCD and VCWPD are responsible for performing storm drain operation and maintenance, including but not limited to: catch basin labeling, catch basin label inspections, and open channel signage; open channel maintenance that includes removal of trash and debris; and implementation of activity specific BMPs, including those related to litter/debris/graffiti in compliance with this Order.
 - ii.** The LACFCD and VCWPD may be held responsible with a Permittee for non-compliance with water quality-based effluent limitations where it has either:
 - (a)** Without good cause denied entitlements or other necessary authority to a responsible jurisdiction or agency for the timely installation and/or maintenance of *full and/or partial capture trash control devices* for purposes of TMDL compliance in parts of the MS4 physical infrastructure that are under its authority, or
 - (b)** Not fulfilled its obligations regarding proper BMP installation, operation, and maintenance for purposes of TMDL compliance within the MS4 physical infrastructure under its authority, thereby causing or contributing to a responsible jurisdiction and/or agency to be out of compliance with its interim or final water quality-based effluent limitation.
 - iii.** Under these circumstances, the LACFCD and VCWPD's responsibility shall be limited to non-compliance related to the drainage area(s) within the jurisdiction where the LACFCD and VCWPD has authority over the relevant portions of the MS4 physical infrastructure.

V. RECEIVING WATER LIMITATIONS

- A. Discharges from the MS4 that cause or contribute to the violation of receiving water limitations are prohibited.
- B. Discharges from the MS4 of stormwater, or non-stormwater, for which a Permittee is responsible,⁴² shall not cause or contribute to a condition of nuisance.
- C. The Permittee shall comply with Parts V.A and V.B through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with their stormwater management program and its components and other requirements of this Order including any modifications. The Permittees' stormwater management program and its components shall be designed to achieve compliance with receiving water limitations. If exceedances of receiving water limitations persist, notwithstanding implementation of the Permittees' stormwater management program and its components and other requirements of this Order, the Permittee shall ensure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:
 - 1. Upon a determination by either the Permittee or the Los Angeles Water Board that discharges from the MS4 are causing or contributing to an exceedance of an applicable Receiving Water Limitation, the Permittee shall promptly notify the Los Angeles Water Board and thereafter submit a Receiving Water Limitations Compliance Report (as described in the Reporting Requirements, Part XIV.C of the Monitoring and Reporting Program, Attachment E) to the Los Angeles Water Board for approval. The Receiving Water Limitations Compliance Report shall describe the BMPs that are currently being implemented by the Permittee and additional BMPs, including modifications to current BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of receiving water limitations. The Receiving Water Limitations Compliance Report shall include an implementation schedule. This Receiving Water Limitations Compliance Report shall be submitted per Attachment E Part XIV.C unless the Los Angeles Water Board directs an earlier submittal. The Los Angeles Water Board may require modifications to the Receiving Water Limitations Compliance Report.
 - 2. The Permittee shall submit any modifications to the Receiving Water Limitations Compliance Report required by the Los Angeles Water Board within 30 days of notification.
 - 3. Within 30 days following the Los Angeles Water Board Executive Officer's approval of the Receiving Water Limitations Compliance Report, the Permittee shall revise its stormwater management program and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, an implementation schedule, and any additional monitoring required.
 - 4. The Permittee shall implement its revised stormwater management program and its components and monitoring program according to the approved implementation schedule in the Receiving Water Limitations Compliance Report.
- D. So long as the Permittee has complied with the procedures set forth in Part V.C above and is implementing its revised stormwater management program and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Los Angeles Water Board to modify current BMPs or develop additional BMPs.

⁴² Pursuant to 40 CFR § 122.26(a)(3)(vi), a Permittee is only responsible for discharges of stormwater and non-stormwater from the MS4 for which it is an owner or operator. MS4 is defined in Attachment A of this Order and 40 CFR § 122.26(b)(8).

VI. STANDARD PROVISIONS

Permittees shall comply with the following provisions. If there is any conflict, duplication, or overlap between provisions specified by this Order, the more stringent provision shall apply:

A. Federal Standard Provisions

Each Permittee shall comply with all Standard Provisions included in Attachment D of this Order, in accordance with 40 CFR sections 122.41 and 122.42.

B. Legal Authority

1. Each Permittee must establish and maintain adequate legal authority, within its respective jurisdiction, to control pollutant discharges into and from its MS4 through ordinance, statute, permit, contract or similar means. This legal authority must, at a minimum, authorize or enable the Permittee to:
 - a. Control the contribution of pollutants to its MS4 from stormwater discharges associated with industrial and construction activity and control the quality of stormwater discharged from industrial and construction sites. This requirement applies both to industrial and construction sites with coverage under an NPDES permit, as well as to those sites that do not have coverage under an NPDES permit.
 - b. Prohibit all non-stormwater discharges into the MS4 to receiving waters not otherwise authorized or conditionally exempt pursuant to Part III.A of this Order;
 - c. Prohibit and eliminate illicit discharges and illicit connections to the MS4;
 - d. Control the discharge of spills, dumping, or disposal of materials other than stormwater to its MS4;
 - e. Require compliance with conditions in Permittee ordinances, permits, contracts or orders (i.e., hold dischargers to its MS4 accountable for their contributions of pollutants and flows);
 - f. Utilize enforcement mechanisms to require compliance with applicable ordinances, permits, contracts, or orders;
 - g. Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Permittees;
 - h. Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements with other owners of the MS4 such as the State of California Department of Transportation;
 - i. Carry out all inspections, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with applicable municipal ordinances, permits, contracts and orders, and with the provisions of this Order, including the prohibition of non-stormwater discharges into the MS4 and receiving waters. This means the Permittee must have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from entities discharging into its MS4;
 - j. Require the use of control measures to prevent or reduce the discharge of pollutants to achieve water quality standards/receiving water limitations;
 - k. Require that structural BMPs are properly operated and maintained; and
 - l. Require documentation on the operation and maintenance of structural BMPs and their effectiveness in reducing the discharge of pollutants to the MS4.

2. Each Permittee must submit a statement certified by its chief legal counsel that the Permittee has the legal authority within its jurisdiction to implement and enforce each of the requirements contained in 40 CFR § 122.26(d)(2)(i)(A-F) and this Order. Each Permittee shall submit this certification annually as part of its Annual Report beginning with the first Annual Report required under this Order. These statements must include:
 - a. Citation of applicable municipal ordinances or other appropriate legal authorities and their relationship to the requirements of 40 CFR § 122.26(d)(2)(i)(A)-(F) and of this Order; and
 - b. Identification of the local administrative and legal procedures available to mandate compliance with applicable municipal ordinances identified in subpart a above and therefore with the conditions of this Order, and a statement as to whether enforcement actions can be completed administratively or whether they must be commenced and completed in the judicial system.

C. Fiscal Resources

1. Each Permittee shall conduct a fiscal analysis of the annual capital and operation and maintenance expenditures necessary to implement the requirements of this Order. The analysis shall include the following: costs incurred to comply with this Order and an estimate of the costs for the upcoming permit year. See Attachment E for Annual Report requirements.
2. Each Permittee shall also enumerate and describe in its Annual Report the source(s) of funds used in the past year, and proposed for the coming year, to meet necessary expenditures to implement the requirements of this Order.

D. Responsibilities of the Permittees

Each Permittee is required to comply with the requirements of this Order applicable to its discharges. Permittees are not responsible for the implementation of the provisions applicable to other Permittees. Each Permittee shall:

1. Comply with the requirements of this Order including attachments and any modifications thereto.
2. Inform the Los Angeles Water Board of instances of non-compliance pursuant to the MRP (Attachment E).
3. Submit complete and timely reports including but not limited to non-compliance reporting, annual reports, monitoring reports, and the report of waste discharge.
4. Consider facilitating coordination among internal departments and agencies, as necessary, to achieve the implementation of the requirements of this Order applicable to such Permittees in an efficient and cost-effective manner.
5. Consider participating in intra-agency coordination (e.g., Planning Department, Fire Department, Building and Safety, Code Enforcement, Public Health, Parks and Recreation, and others) and inter-agency coordination (e.g., other Permittees under this Order, other NPDES permittees) necessary to successfully implement the provisions of this Order.

E. Public Review

1. All documents submitted by the Permittee to the Los Angeles Water Board in compliance with the terms and conditions of this Order shall be made available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. § 552 (as amended)) and the Public Records Act (Cal. Government Code § 6250 et seq.).

2. All documents submitted by the Permittee to the Los Angeles Water Board Executive Officer for approval shall be made available by the Permittee to the public for a 30-day period to allow for public comment, unless otherwise specified.

F. Los Angeles Water Board Review

1. An approval of a document by the Los Angeles Water Board or the Executive Officer per their delegated authority, may include conditions that must be met by the Permittee. If the conditions are not met, the approval may be revoked.
2. Any formal determination or approval made by the Los Angeles Water Board Executive Officer pursuant to the provisions of this Order may be reviewed by the Los Angeles Water Board. A Permittee(s) or a member of the public may request such review upon petition within 30 days of the effective date of the notification of such decision to the Permittee(s) and interested persons on file at the Los Angeles Water Board.

G. Reopener and Modification

1. This Order may be modified, revoked, reissued, or terminated in accordance with the provisions of 40 CFR sections 122.44, 122.62, 122.63, 122.64, 124.5, 125.62, and 125.64. Causes for taking such actions include, but are not limited to:
 - a. Endangerment to human health or the environment resulting from the permitted activity, including information that the discharge(s) regulated by this Order may have the potential to cause or contribute to adverse impacts on water quality and/or beneficial uses;
 - b. Acquisition of newly obtained information that would have justified the application of different conditions if known at the time of Order adoption;
 - c. To address changed conditions identified in required reports or other sources deemed significant by the Los Angeles Water Board;
 - d. To incorporate provisions as a result of future amendments to the Basin Plan, such as a new or revised water quality objective or the adoption or reconsideration of a TMDL, including the program of implementation and time schedule for implementation. As soon as possible after the effective date of a revised TMDL, where the revisions warrant a change to the provisions of this Order, the Los Angeles Water Board may modify this Order consistent with the assumptions and requirements of the revised WLA(s), including the program of implementation;
 - e. To incorporate provisions as a result of new or amended statewide water quality control plans or policies adopted by the State Water Board;
 - f. To incorporate provisions as a result of the promulgation of new or amended federal or state laws or regulations, U.S. EPA guidance concerning regulated activities, or judicial decisions that becomes effective after adoption of this Order.
 - g. To incorporate effluent limitations for toxic constituents determined to be present in significant amount in the discharge through a more comprehensive monitoring program included as part of this Order;
 - h. To include new Reporting Levels (RLs), in accordance with the provisions set forth in 40 CFR Parts 122 and 124; and/or
 - i. To include provisions or modifications to WQBELs in Part IV and Attachments K through S of this Order prior to the final compliance deadlines, if practicable, that would allow an action-based, BMP compliance demonstration approach with regard to final WQBELs for stormwater discharges. Such modifications shall be based on the

Los Angeles Water Board's evaluation of whether Watershed Management Programs in Part IX of this Order have resulted in attainment of interim WQBELs for stormwater and review of relevant research, including but not limited to data and information provided by Permittees and other stakeholders, on stormwater quality and the efficacy and reliability of stormwater control technologies. Provisions or modifications to WQBELs in Part IV and Attachments K through S of this Order shall only be included in this Order where there is evidence that stormwater control technologies can reliably achieve final WQBELs.

2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:
 - a. Violation of any term or condition contained in this Order;
 - b. Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; or
 - c. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.
 3. The filing of a request by a Permittee for a modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.
 4. Upon the consent of the Permittee(s), this Order may be modified to make corrections or allowances for changes in the permitted activity, following the procedures at 40 CFR section 122.63, if processed as a minor modification.⁴³ Minor modifications may only:
 - a. Correct typographical errors;
 - b. Require more frequent monitoring or reporting by a Permittee; or
 - c. Change an interim compliance date in a schedule of compliance, provided the new date is not more than 120 days after the date specified in the existing permit and does not interfere with attainment of the final compliance date requirement.
- H. Any discharge of waste to any point(s) other than specifically described in this Order is prohibited and constitutes a violation of this Order.
- I. A copy of this Order shall be maintained by each Permittee so as to be available during normal business hours to Permittee employees responsible for implementation of the provisions of this Order and members of the public.
- J. This Order does not exempt any Permittee from compliance with any other laws, regulations, or ordinances that may be applicable.
- K. The provisions of this Order are severable. If any provision of this Order or the application of any provision of this Order to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this Order shall not be affected thereby.

VII. MONITORING AND REPORTING PROGRAM (MRP) REQUIREMENTS

Permittees shall comply with the MRP, and future revisions thereto, in Attachment E of this Order and Standard Provisions relating to monitoring, reporting, and record keeping in Attachment D of this Order.

⁴³ This provision does not apply to Watershed Management Programs, Integrated Monitoring Programs, or Coordinated Integrated Monitoring Programs.

VIII. STORMWATER MANAGEMENT PROGRAM MINIMUM CONTROL MEASURES

A. General

1. Each Permittee shall implement the requirements in Parts VIII.D through VIII.I below or may in lieu of the requirements in Parts VIII.D through VIII.I, implement customized actions within each of these general categories of control measures as set forth in an approved Watershed Management Program per Part IX of this Order. Implementation shall be consistent with the requirements of 40 CFR § 122.26(d)(2)(iv).
2. **Timelines for Implementation.** Unless otherwise noted in this Part VIII, each Permittee that does not elect to develop or continue to implement a Watershed Management Program per Part IX shall implement the requirements contained in this Part VIII as of the effective date of this Order unless it is a new or modified requirement as compared to the Permittee's prior permit. Permittees shall have up to 6 months from the effective date of this Order to incorporate new or modified requirements into their existing stormwater management program unless otherwise specified below.
3. **Municipal Employee and Contractor Training**
 - a. Each Permittee shall ensure all employees in targeted positions (whose interactions, jobs, and activities affect stormwater quality) are trained on an annual basis on the requirements of the overall stormwater management program in this Order, and shall ensure contractors performing privatized/contracted municipal services are appropriately trained to:
 - i. Promote a clear understanding of the potential for activities to pollute stormwater.
 - ii. Identify opportunities to require, implement, and maintain appropriate BMPs in their line of work.
 - b. Each Permittee shall ensure all employees and contractors who use or have the potential to use pesticides and/or fertilizers (whether or not they normally apply these as part of their work) are trained on an annual basis. Training programs shall address:
 - i. The potential for pesticide-related surface water toxicity;
 - ii. Proper use, handling, and disposal of pesticides;
 - iii. The least toxic methods of pest prevention and control, including Integrated Pest Management (IPM); and
 - iv. Reduction of pesticide use.
 - c. Outside contractors can self-certify, providing they certify they have received all applicable training to implement the requirements in this Order and have documentation to that effect.
 - d. New Permittee staff members must be provided with stormwater training applicable to their position within 180 days of starting employment. Each Permittee must create and maintain a list of applicable positions and contractors which require specific MS4 Permit compliance training.
 - e. Each Permittee must continue to annually implement a training program regarding the identification of illicit discharges through an illicit discharges detection and elimination (IDDE) program for all municipal field staff, who, as part of their normal job responsibilities (including but not limited to street sweeping, storm drain maintenance, solid waste management, sanitary sewer collection system maintenance, road maintenance), may come into contact with or otherwise observe an illicit discharge or

illicit connection to the MS4. The IDDE training program should address, at a minimum, the following:

- i. Illicit connection and discharge identification, including definitions and examples,
 - ii. investigation,
 - iii. elimination,
 - iv. cleanup,
 - v. reporting, and
 - vi. documentation.
- f. Each Permittee shall ensure that all staff whose primary job duties are related to implementing the construction stormwater program in Part VIII.G of this Order are adequately trained on an annual basis. Training shall be provided to pertinent staff to ensure appropriate knowledge of:
- i. The General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), including its SWPPP, monitoring and reporting program, and BMP requirements.
 - ii. Local requirements, including any applicable ordinances and BMP standards.
 - iii. Appropriate structural and non-structural BMPs.
 - iv. Post-construction and runoff reduction requirements.
- g. Each Permittee shall ensure that all staff whose primary job duties are related to implementing the industrial and commercial facilities program in Part VIII.E of this Order are adequately trained on an annual basis. Training shall be provided to pertinent staff to ensure appropriate general knowledge of:
- i. The General Permit for Storm Water Discharges Associated with Industrial Activities (Industrial General Permit), including its SWPPP, monitoring and reporting program, and BMP requirements.
 - ii. Local requirements, including any applicable ordinances and BMP standards.
 - iii. Appropriate structural and non-structural BMPs.
- h. Each Permittee shall maintain documentation of municipal employee and contractor training activities.

B. Progressive Enforcement and Interagency Coordination

1. Each Permittee shall develop and implement a Progressive Enforcement Policy to ensure that (1) regulated Industrial/Commercial facilities, (2) construction sites, (3) new development and redevelopment sites with post-construction controls, and (4) illicit discharges are each brought into compliance with all stormwater and non-stormwater requirements within a reasonable time period as specified below.
 - a. **Follow-up Inspections.** In the event that a Permittee determines, based on an inspection or illicit discharge investigation, that a facility or site operator has failed to adequately implement all necessary BMPs, that Permittee shall take progressive enforcement actions which, at a minimum, shall include a follow-up inspection within 4 weeks from the date of the initial inspection and/or investigation.
 - b. **Enforcement Action.** In the event that a Permittee determines that a facility or site operator has failed to adequately implement BMPs after a follow-up inspection, that

Permittee shall take enforcement action as established through authority in its municipal code and ordinances, through the judicial system, or refer the case to the Los Angeles Water Board, per the Interagency Coordination provisions below.

- c. **Records Retention.** Each Permittee shall maintain records, per their existing record retention policies, and make them available on request to the Los Angeles Water Board, including inspection reports, warning letters, notices of violations, and other enforcement records, demonstrating a good faith effort to bring facilities into compliance.
- d. **Referral of Violations of Municipal Ordinances and California Water Code § 13260.** A Permittee may refer a violation(s) of its municipal stormwater ordinances and/or California Water Code section 13260 by industrial and commercial facilities and construction site operators not subject to the Industrial and/or Construction General Permits to the Los Angeles Water Board (via telephone or electronically⁴⁴) provided that the Permittee has made a good faith effort of applying its Progressive Enforcement Policy to achieve compliance with its own ordinances. At a minimum, a Permittee's good faith effort must be documented with:
 - i. Two follow-up inspections; and
 - ii. Two warning letters or notices of violation.
- e. **Referral of Violations of the Industrial and Construction General Permits, including Requirements to File a Notice of Intent or No Exposure Certification.** For those facilities or site operators in violation of municipal stormwater ordinances and subject to the Industrial and/or Construction General Permits, Permittees may escalate referral of such violations to the Los Angeles Water Board (promptly via telephone or electronically⁴⁵) after one inspection and one written notice of violation (copied to the Los Angeles Water Board) to the facility or site operator regarding the violation. In making such referrals, Permittees shall include, at a minimum, the following documentation:
 - i. Name of the facility or site,
 - ii. Facility or site physical address (or GPS coordinates if a physical address is not available),
 - iii. Contact information of the Owner and Operator of the facility or site (i.e., name, address, phone number, email),
 - iv. WDID Number (if applicable),
 - v. Records of communication with the facility/site operator regarding the violation, which shall include at least one inspection report,
 - vi. The written notice of violation (copied to the Los Angeles Water Board),
 - vii. For industrial sites, the industrial activity being conducted at the facility that is subject to the Industrial General Permit and the corresponding SIC code (if available), and
 - viii. For construction sites, site acreage and site risk level.

⁴⁴ Email to MS4stormwaterRB4@waterboards.ca.gov.

⁴⁵ Ibid.

- 2. Investigation of Complaints Transmitted by the Los Angeles Water Board Staff.** Each Permittee shall initiate, within one business day,⁴⁶ investigation of complaints from facilities within its jurisdiction. The initial investigation shall include, at a minimum, a limited inspection of the facility to confirm validity of the complaint and to determine if the facility is in compliance with municipal stormwater ordinances and, if necessary, to oversee corrective action. Each Permittee shall report their findings of their investigation to the Los Angeles Water Board within 3 weeks of receiving the complaint.
- 3. Assistance with Los Angeles Water Board Enforcement Actions.** As directed by the Los Angeles Water Board Executive Officer, Permittees shall assist Los Angeles Water Board enforcement actions by:
 - a. Assisting in identification of current owners, operators, and lessees of properties and sites.
 - b. Providing staff, when available, for joint inspections with Los Angeles Water Board inspectors.
 - c. Appearing to testify as witnesses in Los Angeles Water Board enforcement hearings.
 - d. Providing copies of inspection reports and documentation demonstrating application of its Progressive Enforcement Policy.

C. Modifications/Revisions

Each Permittee shall modify its stormwater management programs, protocols, practices, and municipal codes to make them consistent with the requirements in this Order.

D. Public Information and Participation Program

1. General Provisions

- a. Each Permittee shall continue to include public participation in their stormwater management program consistent with the requirements of 40 C.F.R. section 122.26(d)(2)(iv).
- b. Each Permittee shall develop and implement the requirements listed in Part VIII.D.3 and Part VIII.D.4 below using one or more of the following approaches:
 - i. Collaboratively (i.e., multiple Permittees, County-wide or Region-wide, or one or more Watershed Groups)
 - ii. State or national partnerships with stormwater member agencies (e.g., CASQA)
 - iii. Individually within its jurisdiction.
- c. Each Permittee shall adapt its Public Information and Participation Program (PIPP) over time to address new information, water quality priorities, and stormwater management program priorities as they arise.

2. Objectives

- a. Reach the general population and involve the range of socioeconomic groups and ethnic communities that make up the Los Angeles Region in Permittees' stormwater management programs to facilitate:

⁴⁶ Permittees may comply with the Permit by taking initial steps (such as logging, prioritizing, and tasking) to "initiate" the investigation within that one business day. However, the Los Angeles Water Board would expect that the initial investigation, including a site visit, to occur within four business days.

- i. Increased understanding about the importance of stormwater management to public health/community health, environmental quality and local water resiliency; and
- ii. Increased support for stormwater management programs and stormwater projects among residents in the region.
- b. Facilitate pollution prevention through the proper management and disposal of used oil, toxic materials, and targeted pollutants as potential sources of water quality impacts associated with discharges into the MS4.
- c. Use effective strategies to educate and involve residents and population subgroups through culturally effective methods.⁴⁷

3. Program Requirements

- a. Permittee(s) shall create opportunities for public engagement in stormwater planning and program implementation and shall raise public awareness of stormwater program benefits and needs. The Permittee may build upon programs/activities such as Caltrans' *Protect Every Drop* campaign and the Measure W campaign, which featured many educational events conducted by multiple stakeholders and MS4 Permittees.
- b. Permittee(s) shall conduct educational activities and public information activities to facilitate stormwater and non-stormwater pollution prevention and mitigation. Activities should be focused on priority water quality issues as identified by the Permittee(s).
 - i. The Permittee(s) shall identify and select targeted pollutants for public information/education topics and materials. In selecting targets, the Permittee(s) shall consider the proper management and disposal of:
 - (a) Vehicle wastes (e.g., used oil, used tires);
 - (b) Household waste materials (i.e., trash and household hazardous waste, including personal care products, pharmaceuticals, and household cleaners);
 - (c) Pesticides, herbicides, and fertilizers;
 - (d) Green waste;
 - (e) Animal wastes; and/or
 - (f) Other materials as determined by the Permittee(s).
 - ii. Public informational/educational materials shall be distributed using the method(s) that the Permittee(s) chooses to most effectively reach the public and promote behavioral change and achieve the objectives in Part VIII.D.2 above. Such methods may include, but are not limited to the following:
 - (a) Internet-based platforms (e.g., stormwater websites, social media websites and applications);
 - (b) Commercial points-of-purchase (e.g., automotive parts stores, home improvement centers / hardware stores / paint stores, landscape / gardening centers, pet shops);

⁴⁷ Culturally effective methods require Permittees to identify audiences based on demographics, language and/or cultural attributes and behaviors and then identify and select outreach activities that will best align with the identified audiences.

- (c) Schools;
- (d) Radio/television; and/or
- (e) Community events.

4. Documentation and Tracking

- a. Permittee(s) shall develop metrics for measuring the effectiveness in achieving each objective listed in Part VIII.D.2 above.
- b. Each Permittee shall, at a minimum, document and track the following information on Public Information and Participation activities implemented:
 - i. Activity;
 - ii. Date(s) of activity;
 - iii. Method of Dissemination;
 - iv. Targeted Behavior;
 - v. Targeted Pollutant;
 - vi. Targeted Audience;
 - vii. Culturally Effective Method(s); and
 - viii. Other information necessary for the metrics identified in Part VIII.D.4.a above
 - ix. Metric for measuring effectiveness.

E. Industrial/Commercial Facilities Program

This Part VIII.E is applicable to all Permittees except LACFCD and VCWPD.

- 1. **General.** Each Permittee except LACFCD and VCWPD shall implement an Industrial / Commercial Facilities Program that meets the requirements of this Part VIII.E. Through policies, procedures, and/or ordinances, the Industrial / Commercial Facilities Program shall be designed to prevent illicit discharges to the MS4 and receiving waters, reduce industrial / commercial discharges of stormwater to the maximum extent practicable, and prevent industrial / commercial discharges from the MS4 from causing or contributing to a violation of receiving water limitations. Minimum program components shall include the following:
 - a. Inventory and track Critical Industrial/Commercial Sources;
 - b. Educate, assist, and inspect Critical Industrial/Commercial Sources; and
 - c. Ensure compliance with municipal policies, procedures, and/or ordinances at industrial and commercial facilities that are critical sources of pollutants in stormwater.
- 2. **Industrial/Commercial Sources Inventory / Electronic Tracking System**
 - a. Each Permittee shall maintain an updated watershed-based inventory or database of all industrial and commercial facilities within its jurisdiction that are critical sources of stormwater pollution. The inventory or database shall be maintained in electronic format and incorporation of facility information into a Geographical Information System (GIS) is recommended. Critical Sources to be tracked are summarized below:
 - i. U.S. EPA “Phase I” Facilities [as specified in 40 CFR §122.26(b)(14)(i)-(xi)]
 - ii. Other federally mandated facilities [as specified in 40 CFR §122.26(d)(2)(iv)(C)]:
 - (a) Municipal landfills;

- (b) Hazardous waste treatment, disposal, and recovery facilities; and
 - (c) Industrial facilities subject to section 313 “Toxic Release Inventory” reporting requirements of the Emergency Planning and Community Right-to-Know Act of 1986 (EPCRA) [42 U.S.C. § 11023].
- iii. Commercial Facilities may include, but are not limited to:
 - (a) Restaurants;
 - (b) Automotive service facilities (including those located at automotive dealerships);
 - (c) Retail Gasoline Outlets; and
 - (d) Nurseries and Nursery Centers (Merchant Wholesalers, Nondurable Goods, and Retail Trade).
 - iv. All other facilities that the Permittee determines may contribute significant amounts of pollutants to the MS4.
- b. Each Permittee shall include the following minimum fields of information for each critical source industrial and commercial facility identified in its watershed-based inventory or database:
 - i. Name of facility;
 - ii. Name of owner/operator and contact information;
 - iii. Address of facility (physical and mailing);
 - iv. The latitude / longitude coordinates;
 - v. Standard Industrial Classification (SIC) code;
 - vi. North American Industry Classification System (NAICS) code (optional);
 - vii. A narrative description of the activities performed and/or principal products produced;
 - viii. Identification of facilities that have active coverage under the State Water Board’s General NPDES Permit for the Discharge of Storm Water Associated with Industrial Activities (Industrial General Permit) or other individual or general NPDES permits. For facilities with active coverage under the Industrial General Permit, the type of coverage (i.e. Notice of Intent or No Exposure Certification) and the Waste Discharge Identification (WDID) number shall be included;
 - ix. Identification of facilities that have filed a Notice of Non-Applicability (NONA) or any applicable waiver issued by the Los Angeles Water Board or State Water Board pertaining to stormwater discharges;
 - x. Date and description of outreach; and
 - xi. Date(s) of inspection(s).
 - c. Each Permittee shall update its inventory of critical sources at least once every two years. The update shall be accomplished through collection of new information obtained through field activities or through other readily available inter- and intra-agency informational databases (e.g., business licenses, pretreatment permits, sanitary sewer connection permits, and similar information).
- 3. Requirements for Commercial Sources.** The provisions contained in this Part VIII.E.3 apply to all facilities listed in Parts VIII.E.2.a.ii through iv above.

- a. **Outreach.** At least once during the five-year period of this Order, each Permittee shall notify the owner/operator of each of its inventoried sites of the BMP requirements applicable to the site/source.
 - b. **Business Assistance Program.** Each Permittee shall implement a Business Assistance Program to provide technical information to businesses to facilitate their efforts to reduce the discharge of pollutants in stormwater. Assistance shall be targeted to select business sectors or small businesses upon a determination that their activities may be contributing substantial amounts of pollutants to the MS4 or receiving water. Assistance may include technical guidance and provision of educational materials. The Program may include:
 - i. On-site technical assistance, telephone, or e-mail consultation regarding the responsibilities of business to reduce the discharge of pollutants, procedural requirements, and available guidance documents.
 - ii. Distribution of stormwater pollution prevention educational materials to operators of auto repair shops; car wash facilities; restaurants and mobile sources including automobile/equipment repair, washing, or detailing; power washing services; mobile carpet, drape, or upholstery cleaning services; swimming pool, water softener, and spa services; portable sanitary services; and commercial applicators and distributors of pesticides, herbicides and fertilizers, if present.
 - c. **Inspection.** Each Permittee shall inspect all facilities identified in Parts VIII.E.2.a.ii through iv of this Order in accordance with the frequency and scope stated below:
 - i. **Frequency of Inspections.** Each Permittee shall inspect the facilities every two years, ensuring that the first mandatory compliance inspection occurs no later than 2 years after the effective date of this Order. A minimum interval of 6 months between the compliance inspections is required.
 - ii. **Scope of Inspections.** Each Permittee shall inspect these facilities to confirm that stormwater and non-stormwater BMPs are being effectively implemented in compliance with municipal ordinances. At each facility, inspectors shall verify that the operator is implementing effective source control BMPs for the pollutants generated by the commercial activity. Likewise, for those BMPs that are not adequately protective of water quality, a Permittee may require additional site-specific controls. Each inspection shall be documented by an inspection report that includes a summary of the inspection, conclusion, and photos.
- 4. Requirements for Industrial Sources.** The provisions contained in this Part VIII.E.4 apply to all facilities listed in Part VIII.E.2.a.i of this Order. The Industrial General Permit is the primary regulating permit for these facilities. Requirements for Permittees are as follows:
- a. **Business Assistance Program.** Each Permittee shall implement a Business Assistance Program to provide technical information to businesses to facilitate their efforts to comply with the requirements of the Industrial General Permit.⁴⁸ Assistance shall be targeted to select business sectors or small businesses upon a determination that their activities may be contributing substantial amounts of pollutants to the MS4 or receiving water. Assistance may include technical guidance and provision of educational materials. The Program may include on-site technical assistance, telephone, or e-mail consultation regarding the responsibilities of business and

⁴⁸ Permittees may use information and tools available at the Los Angeles Water Board and State Water Board websites respectively at www.waterboards.ca.gov/losangeles/water_issues/programs/stormwater/sw_index.html and www.waterboards.ca.gov/water_issues/programs/stormwater/industrial.html.

techniques to reduce the discharge of pollutants, procedural requirements, and available guidance documents. Permittees may also refer businesses to the Los Angeles Water Board or State Water Board to provide further technical assistance.

- b. Inspection.** Each Permittee shall inspect all facilities identified in Part VIII.E.2.a.i of this Order in accordance with the frequency and scope stated below:
 - i. Frequency of Inspections.** Each Permittee shall inspect the facilities every two years for facilities that have exposure to stormwater and every five years for facilities that do not have exposure to stormwater. Permittees shall ensure that the first mandatory compliance inspection occurs no later than 2 years after the effective date of this Order. A minimum interval of 6 months between the compliance inspections is required.
 - ii. Scope of Inspections.** Each Permittee shall inspect these facilities to confirm that:
 - (a)** The facility is either enrolled in the Industrial General Permit (i.e. has an active WDID number) or has submitted a NONA application to the Los Angeles Water Board.
 - (b)** A Storm Water Pollution Prevention Plan (SWPPP) is developed and available at the facility.
 - (c)** BMPs are being effectively implemented at the facility for all pollutants of concern.
 - (d)** Each inspection shall be documented by an inspection report that includes a summary of the inspection, conclusion, and if possible, photos.
 - iii. Exclusion of Industrial Facility Inspection.** The Permittee is exempt from performing the inspection requirements listed in Parts VIII.E.4.b.i and ii above if the facility has been inspected by the Los Angeles Water Board within the past 2 years.⁴⁹
- 5. Source Control BMPs for All Facilities Listed Under Part VIII.E.2.a.i – iv.** Effective source control BMPs for the activities listed in Table 6 of this Order shall be implemented at all facilities listed under Part VIII.E.2.a.i – iv of this Order unless the pollutant generating activity does not occur or occurs in areas where there is no exposure to stormwater discharges:

⁴⁹ History of inspections may be verified by contacting the Los Angeles Water Board or through SMARTS at <https://smarts.waterboards.ca.gov>.

Table 6. Source Control BMPs for Industrial and Commercial Facilities

| Pollutant-Generating Activity | BMP Narrative Description |
|--|---|
| Unauthorized Non-Stormwater Discharges | Effective elimination of unauthorized non-stormwater discharges |
| Accidental Spills/Leaks | Implementation of effective spills/leaks prevention and response procedures |
| Vehicle/Equipment Fueling | Implementation of effective fueling source control devices and practices |
| Vehicle/Equipment Cleaning | Implementation of effective equipment/vehicle cleaning practices and appropriate wash water management practices |
| Vehicle/Equipment Repair | Implementation of effective vehicle/equipment repair practices and source control devices |
| Outdoor Liquid Storage | Implementation of effective outdoor liquid storage source controls and practices |
| Outdoor Equipment Operations | Implementation of effective outdoor equipment source control devices and practices |
| Outdoor Storage of Raw Materials | Implementation of effective source control practices and structural devices |
| Storage and Handling of Solid Waste | Implementation of effective solid waste storage/handling practices and appropriate control measures |
| Building and Grounds Maintenance | Implementation of effective facility maintenance practices |
| Parking/Storage Area Maintenance | Implementation of effective parking/storage area designs and housekeeping/maintenance practices |
| Stormwater Conveyance System Maintenance Practices | Implementation of proper conveyance system operation and maintenance protocols |
| Pollutant-Generating Activity | BMP Narrative Description from Los Angeles Water Board Resolution No. 98-08 |
| Sidewalk Washing | <ol style="list-style-type: none"> 1. Remove trash, debris, and free-standing oil/grease spills/leaks (use absorbent material, if necessary) from the area before washing; and 2. Use high pressure, low volume spray washing using only potable water with no cleaning agents at an average usage of 0.006 gallons per square feet of sidewalk area. |
| Street Washing | Collect and divert wash water to the sanitary sewer. Note: Approval from the applicable sanitary sewer collection agency may be needed. |

6. Progressive Enforcement. Each Permittee shall implement its Progressive Enforcement Policy to ensure that Industrial / Commercial facilities are brought into compliance with all stormwater requirements within a reasonable time period. See Part VIII.B for requirements for the development and implementation of a Progressive Enforcement Policy.

F. Planning and Land Development Program

This Part VIII.F is applicable to all Permittees except LACFCD and VCWPD. Each Permittee except LACFCD and VCWPD must use their land use and planning authorities to implement a Planning and Land Development Program.

1. **Priority Development Projects.** Priority Development Projects are land development projects that fall under the Permittee’s planning and building authority for which the Permittee must impose specific requirements, including the implementation of structural BMPs to meet the performance requirements described in Part VIII.F.4 of this Order.
 - a. **Definition of Priority Development Projects.** Priority Development Projects include the following:
 - i. New development projects that are in any of the following categories:
 - (a) Projects equal to 1 acre or greater of disturbed area and adding more than 10,000 square feet or more of impervious surface area (collectively over the entire project site)
 - (b) Industrial parks of 10,000 square feet or more of surface area
 - (c) Commercial malls of 10,000 square feet or more of surface area
 - ii. Redevelopment projects that create and/or replace 5,000 square feet or more of impervious surface (collectively over the entire project site) on any of the following:
 - (a) Existing sites of 10,000 square feet or more of impervious surface area
 - (b) Industrial parks 10,000 square feet or more of surface area
 - (c) Commercial malls 10,000 square feet or more of surface area
 - iii. New development and redevelopment projects that create and/or replace 5,000 square feet or more of impervious surface (collectively over the entire project site) and support one or more of the following uses:
 - (a) Restaurants (SIC 5812)
 - (b) Parking lots
 - (c) Automotive service facilities (SIC 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539)
 - (d) Retail gasoline outlets
 - iv. New development and redevelopment projects that create and/or replace 2,500 square feet or more of impervious area; discharge stormwater that is likely to impact a sensitive biological species or habitat; and are located in or directly adjacent to or are discharging directly to an ASBS, “Sensitive Ecological Area” in Los Angeles County,⁵⁰ or “Environmentally Sensitive Area” in Ventura County.⁵¹
 - v. Street and road construction of 10,000 square feet or more of impervious surface area shall follow U.S. EPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets (December 2008 EPA-833-F-08-009) to the maximum extent practicable. Street and road construction applies to standalone streets, roads, highways, and freeway projects. Temporary access roads are not subject to this requirement. Projects under this category are exempt from the

⁵⁰ As identified by the County of Los Angeles’ Significant Ecological Areas Program. (<http://planning.lacounty.gov/site/sea/home/>)

⁵¹ As identified by Ventura County Permittees using the definition of an “Environmentally Sensitive Area” in Order No. R4-2010-0108.

Priority Development Structural BMP Performance Requirements in Part VIII.F.4 of this Order.

b. Considerations for Redevelopment Projects

- i. The structural BMP performance requirements of Part VIII.F.4 of this Order are applicable to redevelopment Priority Development Projects, as defined in Part VIII.F.1.a of this Order, as follows:
 - (a) Where redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development the entire project must be mitigated.
 - (b) Where redevelopment results in an alteration of less than fifty percent of impervious surfaces of a previously existing development only the alteration must be mitigated, and not the entire development.
- ii. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

c. Exemptions. Permittees can exempt themselves from the Priority Development Project Structural BMP Performance Requirements in Part VIII.F.4 of this Order if they implement one of the following:

- i. **Local Ordinance Equivalence.** A Permittee that has adopted a local LID ordinance prior to the adoption of this Order, and which includes a retention requirement numerically equal to the 0.75-inch, 24-hour rain event or the 85th percentile, 24-hour rain event, whichever is greater, may submit documentation to the Los Angeles Water Board that the alternative requirements in the local ordinance will provide equal or greater reduction in stormwater discharge pollutant loading and volume as would have been obtained through strict conformance with Part VIII.F.4 of this Order and, if applicable, Part VIII.F.2 of this Order.
 - (a) The Los Angeles Water Board shall provide public notice of the proposed equivalency determination and a minimum 30-day period for public comment. After review and consideration of public comments, the Los Angeles Water Board Executive Officer will determine whether implementation of the local ordinance provides equivalent pollutant control to the applicable provisions of this Order. Local ordinances that do not strictly conform to the provisions of this Order must be approved by the Los Angeles Water Board Executive Officer as being “equivalent” in effect to the applicable provisions of this Order in order to substitute for the requirements in Part VIII.F.4 of this Order and, where applicable, Part VIII.F.2 of this Order.
 - (b) Where the Los Angeles Water Board Executive Officer determines that a Permittee’s local LID ordinance does not provide equivalent pollutant control, the Permittee shall either:

- (1) Require conformance with Part VIII.F.4 of this Order and, where applicable, Part VIII.F.2 of this Order, or
 - (2) Update its local ordinance to conform to the requirements herein and resubmit to the Los Angeles Water Board Executive Officer for approval.
 - ii. **Regional Stormwater Mitigation Program.** Permittees may apply for approval of a regional or sub-regional stormwater mitigation program to substitute in part or wholly for new development and redevelopment requirements for proposed areas. Upon review and a determination by the Los Angeles Water Board Executive Officer that the proposal is technically valid and appropriate, the Los Angeles Water Board may consider for approval such a program if its implementation meets all of the following requirements:
 - (a) Retains the runoff from the 85th percentile, 24-hour rain event or the 0.75 inch, 24-hour rain event, whichever is greater;
 - (b) Results in improved stormwater quality;
 - (c) Meets the hydromodification management requirements in Part VIII.F.2 of this Order if applicable;
 - (d) Is fiscally sustainable and has secure funding; and
 - (e) Is completed in five years including the construction and start-up of treatment facilities.
 - (f) Nothing in this provision shall be construed as to delay the implementation of requirements for new development and redevelopment, as approved in this Order.
 - iii. **Specific LID Performance Standards attached to Waste Discharge Requirements (Order No. R4-2012-0139) for Newhall Ranch Project Phases I and II.** The Newhall Ranch Project Phases I and II (a.k.a. the Landmark and Mission Village projects) are deemed to be an existing development that will at a minimum be designed to comply with the Specific LID Performance Standards attached to the Waste Discharge Requirements in Order No. R4-2012-0139. All subsequent phases of the Newhall Ranch Project constructed during the term of this Order shall be subject to the requirements of this Order.
 - d. **Priority Development Project Structural BMP Performance Requirements.** Each Permittee shall require all Priority Development Projects identified in Part VIII.F.1.a of this Order to meet the Structural BMP Performance Requirements contained in Part VIII.F.4 of this Order in the following order of preference:
 - i. On-site infiltration, bioretention and/or rainfall harvest and use,
 - ii. If subpart i above is infeasible, on-site biofiltration, off-site groundwater replenishment, and/or off-site retrofit, or
 - iii. If subpart ii above is infeasible, on-site treatment, where all the above options are infeasible.
2. **Hydromodification Management Requirements.** Permittees must require (i) Priority Development Projects within natural drainage systems in Los Angeles County and (ii) Priority Development Projects disturbing land areas of 50 acres or greater in Ventura County to implement hydrological control measures to prevent accelerated downstream erosion and protect stream habitat.

- a. Definition of Natural Drainage Systems.** Natural drainage systems that are subject to the hydromodification assessments and control include all drainages that have not been modified using engineering controls or drainages that are tributary to a natural drainage system. Examples of engineering modifications to a drainage include channelization, armoring with concrete, and application of rip-rap. The clearing or dredging of a natural drainage system does not constitute a “modification” for purposes of these provisions.
- b. Exemptions to Hydromodification Controls.** Permittees may exempt the following New Development and Redevelopment projects from implementation of hydromodification controls where assessments of downstream channel conditions and proposed discharge hydrology indicate that adverse hydromodification effects to beneficial uses of Natural Drainage Systems are unlikely:

 - i. Projects that are replacement, maintenance or repair of a Permittee’s existing flood control facility, storm drain, or transportation network.
 - ii. Redevelopment Projects in the Urban Core that do not increase the effective impervious area or decrease the infiltration capacity of pervious areas compared to the pre-project conditions.
 - iii. Projects that have any increased discharge directly or via a storm drain to a sump, lake, area under tidal influence, into a waterway that has a 100-year peak flow (Q100) of 25,000 cfs or more, or other receiving water that is not susceptible to hydromodification impacts.
 - iv. Projects that discharge directly or via a storm drain into concrete or otherwise engineered (not natural) channels (e.g., channelized or armored with rip rap, shotcrete, etc.), which, in turn, discharge into receiving water that is not susceptible to hydromodification impacts (as in Parts VIII.F.2.b.i-iii above).
 - v. LID BMPs implemented on single family homes are sufficient to comply with Hydromodification criteria.
- c. Hydromodification Management Control Criteria**

 - i. Projects disturbing an area less than or equal to 1 acre must implement controls meeting applicable performance requirements in Part VIII.F.4 of this Order.
 - ii. Projects disturbing an area greater than 1 acre, but less than 50 acres will be presumed to meet pre-development hydrology if one of the following demonstrations are made:

 - (a) The project is designed to retain onsite the runoff of the 95th percentile, 24-hour storm; or
 - (b) The runoff flow rate, volume, velocity, and duration for the post-development condition do not exceed the pre-development condition for the 2-year, 24-hour storm event. This condition may be substantiated by simple screening models, including those described in Hydromodification Effects on Flow Peaks and Durations in Southern California Urbanizing Watersheds or other models acceptable to the Executive Officer of the Los Angeles Water Board; or
 - (c) The Erosion Potential (Ep) in the receiving water is approximately 1. Ep is determined as follows: The total *effective work* done on the channel boundary is derived and used as a metric to predict the likelihood of channel adjustment given watershed and stream hydrologic and geomorphic

variables. The index under urbanized conditions is compared to the index under pre-urban conditions expressed as a ratio (E_p). The effective work index (W) can be computed in several different ways including simplistic work equations, material specific sediment transport equations, or more complex functions based on site calibrated sediment rating curves. One such work equation, which represents the total work done on the channel boundary, includes the following:

$$\text{Equation 1: } W = \sum_{i=1}^n (\tau_i - \tau_c)^{1.5} \cdot V \cdot \Delta t_i$$

Where: W = effective work, τ_c = critical shear stress that initiates bed mobility or erodes the weakest bank layer, τ_i = applied hydraulic shear stress, Δt = duration of flows (in hours), V = mid-channel flow velocity, and n = length of flow record. The effective work index for presumed stable stream channels under pre-urban conditions (W_{post}) is compared to stable and unstable channels under current urbanized conditions (W_{pre}). The comparison, expressed as a ratio, is defined as the Erosion Potential (E_p)⁵² (McRae (1992, 1996)).

$$\text{Equation 2: } E_p = \frac{W_{post}}{W_{pre}}$$

where:

W_{post} = work index estimated for the post-urban condition

W_{pre} = work index estimated for the pre-urban condition

Alternatively, Permittees can demonstrate that an E_p of approximately 1 has been achieved in the receiving water as determined by a Hydromodification Analysis Study or opt to use other work equations to demonstrate that an E_p of approximately 1 has been achieved for Los Angeles Water Board Executive Officer approval. Additionally, Permittees can use a sediment transport function such as the Brownlie equation or the Meyer-Peter and Muller equation (*US Department of Agriculture, Natural Resources Conservation Service, 2007. Part 654 Stream Restoration Design, National Engineering Handbook, August 2007*) to demonstrate appropriate Hydromodification control.

- iii. Projects disturbing 50 acres or more will be presumed to meet pre-development hydrology based on the successful demonstration of one of the following conditions:
 - (a) The site infiltrates onsite the runoff from a 2-year, 24-hour storm event; or
 - (b) The runoff flow rate, volume, velocity, and duration for the post-development condition does not exceed the pre-development condition for the 2-year,

⁵² MacRae, C.R. 1992. The Role of Moderate Flow Events and Bank Structure in the Determination of Channel Response to Urbanization. Resolving conflicts and uncertainty in water management: Proceedings of the 45th Annual Conference of the Canadian Water Resources Association. Shrubsole, D, ed. 1992, pg. 12.1-12.21; MacRae, C.R. 1996. Experience from Morphological Research on Canadian Streams: Is Control of the Two-Year Frequency Runoff Event the Best Basis for Stream Channel Protection. Effects of Watershed Development and Management on Aquatic Ecosystems, ASCE Engineering Foundation Conference, Snowbird, Utah, pg. 144-162.

24-hour storm event. These conditions must be substantiated by hydrologic modeling acceptable to the Los Angeles Water Board Executive Officer; or

(c) The Erosion Potential (Ep) in the receiving water is approximately 1.

d. Alternative Criteria

i. **Low Impact Development Manual.** Permittees may satisfy hydromodification requirements by implementing the hydromodification requirements in the current County of Los Angeles Low Impact Development Manual and/or Ventura County Hydromodification Control Plan for all projects disturbing an area greater than 1 acre within natural drainage systems.

ii. **Hydromodification Control Plans.** Permittees may alternatively develop and implement watershed specific Hydromodification Control Plans (HCPs). Such plans shall be developed no later than one year after the effective date of this Order for Los Angeles Water Board Executive Officer approval. The HCP shall be deemed in effect upon approval.

(a) An HCP shall identify:

- (1) Stream classifications
- (2) Flow rate and duration control methods
- (3) Sub-watershed mitigation strategies
- (4) Stream and/or riparian buffer restoration measures, which will maintain the stream and tributary Erosion Potential at 1 unless an alternative value can be shown to be protective of the natural drainage systems from erosion, incision, and sedimentation that can occur as the result of flow increases from impervious surfaces and prevent damage to stream habitat in natural drainage system tributaries.

(b) An HCP shall contain the following elements:

- (1) Hydromodification Management Standards
- (2) Natural Drainage Areas and Hydromodification Management Controls
- (3) Hydromodification Management Control Design Criteria
- (4) For flow duration control methods, the range of flows to control for, and goodness of fit criteria
- (5) Allowable low critical flow (Q_c) which initiates sediment transport
- (6) Description of the approved Hydromodification Model
- (7) Any alternate Hydromodification Management Model and Design
- (8) Stream Restoration Measures Design Criteria
- (9) Monitoring and Effectiveness Assessment
- (10) Record Keeping

3. Implementation Requirements

a. **Project Coordination.** Each Permittee shall facilitate a process for effective approval of post-construction stormwater control measures. The process shall include:

i. Detailed LID site design and BMP review including BMP sizing calculations, BMP pollutant removal performance, and municipal approval; and

- ii. An established structure for communication and delineated authority between and among municipal departments that have jurisdiction over project review, plan approval, and project construction through memoranda of understanding or an equivalent agreement.
- b. **Maintenance Agreement and Transfer.** Prior to issuing approval for final occupancy, each Permittee shall require that all new development and redevelopment projects subject to post-construction BMP requirements, with the exception of simple LID BMPs implemented on single family residences, provide an operation and maintenance plan, monitoring plan, where required, and verification of ongoing maintenance provisions for LID practices, Treatment Control BMPs, and Hydromodification Control BMPs including but not limited to: final map conditions, legal agreements, covenants, conditions or restrictions, CEQA mitigation requirements, conditional use permits, and/or other legally binding maintenance agreements. Permittees shall require maintenance records be kept on site for treatment BMPs implemented on single family residences.
 - i. Verification at a minimum shall include the developer's signed statement accepting responsibility for maintenance until the responsibility is legally transferred; and either:
 - (a) A signed statement from the public entity assuming responsibility for BMP maintenance; or
 - (b) Written conditions in the sales or lease agreement, which require the property owner or tenant to assume responsibility for BMP maintenance and conduct a maintenance inspection at least once a year; or
 - (c) Written text in project covenants, conditions, and restrictions for residential properties assigning BMP maintenance responsibilities to the Homeowners Association; or
 - (d) Any other legally enforceable agreement or mechanism that assigns responsibility for the maintenance of BMPs.
 - ii. Each Permittee shall require all development projects subject to post-construction BMP requirements to provide a plan for the operation and maintenance of all structural and treatment controls. The plan shall be submitted for examination of relevance to keeping the BMPs in proper working order. Where BMPs are transferred to Permittee for ownership and maintenance, the plan shall also include all relevant costs for upkeep of BMPs in the transfer. Operation and Maintenance plans for private BMPs shall be kept on-site for periodic review by Permittee inspectors.
- c. **Tracking, Inspection, and Enforcement of Post-Construction BMPs.** Each Permittee shall implement a tracking system and an inspection and enforcement program for new development and redevelopment post-construction stormwater no later than 60 days after Order adoption date.
 - i. Implement a GIS or other electronic system for tracking projects that have been conditioned for post-construction BMPs. The electronic system, at a minimum, should contain the following information:
 - (a) Municipal Project ID
 - (b) Project Acreage
 - (c) BMP Type and Description

- (d) BMP Location (coordinates)
 - (e) Date of Acceptance
 - (f) Date of Maintenance Agreement
 - (g) Maintenance Records
 - (h) Inspection Date and Summary
 - (i) Corrective Action
 - (j) Date Certificate of Occupancy Issued
 - (k) Replacement or Repair Date
- ii. Inspect all development sites upon completion of construction and prior to the issuance of occupancy certificates to ensure proper installation of LID measures, structural BMPs, treatment control BMPs and hydromodification control BMPs. The inspection may be combined with other inspections provided it is conducted by trained personnel.
 - iii. Verify proper maintenance and operation of post-construction BMPs previously approved for new development and redevelopment and operated by the Permittee. The post-construction BMP maintenance inspection program shall incorporate the following elements:
 - (a) The development of a Post-construction BMP Maintenance Inspection checklist; and
 - (b) Inspection at least once every 2 years after project completion, of post-construction BMPs to assess operation conditions with particular attention to criteria and procedures for post-construction treatment control and hydromodification control BMP repair, replacement, or re-vegetation.
 - iv. For post-construction BMPs operated and maintained by parties other than the Permittee, the Permittee shall require the other parties to document proper maintenance and operations.
 - v. Undertake enforcement action per the established Progressive Enforcement Policy as appropriate based on the results of the inspection. See Part VIII.B of this Order for requirements for the development and implementation of a Progressive Enforcement Policy.

4. Priority Development Project Structural BMP Performance Requirements

a. Water Quality / Flow Reduction / Resources Management Criteria

- i. Except as provided in Part VIII.F.1.c, Part VIII.F.2, or Part VIII.F.4.b of this Order, each Permittee shall require Priority Development Projects to retain on-site the Storm Water Quality Design Volume (SWQDV). The SWQDV is defined the greater of the following:
 - (a) The runoff from the 0.75-inch, 24-hour rain event; or
 - (b) The runoff from the 85th percentile, 24-hour rain event.
- ii. When evaluating the potential for on-site retention, each Permittee shall consider the maximum potential for evapotranspiration from green roofs and rainfall harvest and use.

b. Alternative Compliance

- i.** In instances of technical infeasibility or where a project has been determined to provide an opportunity to replenish regional ground water supplies at an offsite location within the same sub-watershed (HUC-12) as the new development or redevelopment project, each Permittee may allow projects to comply with this Order through the alternative compliance measures as described in Part VIII.F.4.c of this Order.
- ii. Technical Infeasibility Demonstration.** Technical infeasibility may be determined by the Permittee or demonstrated to the Permittee by the project applicant. If a project applicant is demonstrating technical infeasibility, the project applicant must demonstrate that the project cannot reliably retain 100 percent of the SWQDV on-site, even with the maximum application of green roofs and/or rainwater harvest and use, and that compliance with the applicable postconstruction requirements would be technically infeasible by submitting a site-specific hydrologic and/or design analysis conducted and endorsed by a registered professional engineer, geologist, architect, and/or landscape architect. Technical infeasibility may result from conditions including the following:

 - (a)** The infiltration rate of saturated in-situ soils is less than 0.3 inch per hour and it is not technically feasible to amend the in-situ soils to attain an infiltration rate necessary to achieve reliable performance of infiltration or bioretention BMPs in retaining the SWQDV on-site.
 - (b)** Locations where seasonal high ground water is within 5 to 10 feet of the surface.
 - (c)** Locations within 100 feet of a ground water well used for drinking water.
 - (d)** Brownfield development sites where infiltration poses a risk of causing pollutant mobilization.
 - (e)** Other locations where pollutant mobilization is a documented concern.⁵³
 - (f)** Locations with potential geotechnical hazards.
 - (g)** Smart growth and infill or redevelopment locations where the density and/or nature of the project would create significant difficulty for compliance with the on-site volume retention requirement.
- iii. Alternative Compliance for Groundwater Replenishment Opportunities.** To utilize alternative compliance measures to replenish groundwater at an offsite location, the project applicant shall demonstrate:

 - (a)** Why it is not advantageous to replenish groundwater at the project site,
 - (b)** That the offsite location is in the same subwatershed (HUC-12) as the Priority Development Project,
 - (c)** That groundwater can be used for beneficial purposes at the offsite location, and

⁵³ Pollutant mobilization is considered a documented concern at or near properties that are contaminated or store hazardous substances underground.

- (d) That the alternative measures shall also provide equal or greater water quality benefits to the receiving surface water than the Water Quality/Flow Reduction/Resource Management Criteria in Part VIII.F.4.a of this Order.

c. Alternative Compliance Measures

- i. **Onsite Biofiltration:** Projects can use biofiltration for 1.5 times the portion of the SWQDV that is not reliably retained onsite where R_v = volume reliably retained onsite and B_v is the biofiltration volume.

$$\text{Equation 3: } B_v = 1.5(SWQDV - R_v)$$

- (a) Biofiltration systems shall, at a minimum, meet design specifications consistent with those provided in the Los Angeles County LID Manual, Ventura County Technical Guidance Manual for Storm Water Quality Control Measures (July 2002 and its revisions), or equivalent LID Manual.
- (b) Biofiltration systems discharging to a receiving water that is included on the Clean Water Act section 303(d) list of water quality-limited (i.e., impaired) water bodies due to nitrogen compounds or related effects shall be designed and maintained to achieve enhanced nitrogen removal capacity.

- ii. **Onsite Flow-based BMPs:** If a Permittee determines that onsite biofiltration and offsite alternative compliance measures are not technically feasible, the Permittee may request the Executive Officer allow the use of onsite flow-based BMPs. In the request, Permittees must outline why none of the other alternative compliance measures are feasible. Approval will only be granted to areas where other alternative compliance measures are not feasible due to significant technical issues.

If approved, the Permittee may allow the Priority Development Project to utilize flow-through treatment control BMPs to treat runoff leaving the site, and mitigate for the design capture volume not reliably retained onsite pursuant to Part VIII.F.4.a of this Order. Flow-through treatment control BMPs must be sized and designed to:

- (a) Filter or treat either:
 - (1) The maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour, for each hour of a storm event; or
 - (2) The maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity (for each hour of a storm event), as determined from the local historical rainfall record, multiplied by a factor of two;
- (b) Be certified for “Enhanced Treatment” under the Washington State Department of Ecology’s TAPE Program; or an appropriate future BMP certification developed by the State of California.

- iii. **Off-site Infiltration:** Projects may use infiltration or bioretention BMPs to intercept a volume of stormwater runoff equal to the SWQDV, less the volume of stormwater runoff reliably retained onsite, at an approved offsite project located within the same subwatershed (HUC-12) as the Priority Development Project, and provide pollutant reduction (treatment) of the stormwater runoff discharged from the project site in accordance with the Water Quality Mitigation Criteria provided in Part VIII.F.4.d of this Order. The required offsite mitigation volume (M_v) shall be calculated by the equation below:

Equation 4: $M_v = SWQDV - R_v$

- iv. **Groundwater Replenishment Projects:** Permittees may propose regional projects to replenish regional groundwater supplies at offsite location, provided the groundwater supply has a designated beneficial use in the Basin Plan.
 - (a) Regional groundwater replenishment projects must use infiltration, groundwater replenishment, or bioretention BMPs to intercept a volume of stormwater runoff equal to the SWQDV for Priority Development Projects, within the approved project area, and
 - (b) Provide pollutant reduction (treatment) of the stormwater runoff discharged from Priority Development Projects, within the project area to mitigate stormwater pollution in accordance with the Water Quality Mitigation Criteria provided in Part VIII.F.4.d of this Order.
 - (c) Permittees implementing a regional groundwater replenishment project in lieu of onsite controls shall ensure the volume of runoff captured by the project shall be equal to the mitigation volume calculated using Equation 4 in Part VIII.F.4.c.iii of this Order.
 - (d) Regional groundwater replenishment projects must be located in the same sub-watershed (HUC-12) as the Priority Development Project(s) that did not fully retain the SWQDV. Permittees may consider locations outside of the HUC-12 but within the HUC-10 subwatershed area if there are no opportunities within the HUC-12 subwatershed or if greater pollutant reductions and/or groundwater replenishment can be achieved at a location within the larger HUC-10 subwatershed. The use of a mitigation, groundwater replenishment, or retrofit project outside of the HUC-12 subwatershed is subject to the approval of the Executive Officer of the Los Angeles Water Board.
 - v. **Off-site Project – Retrofit Existing Development:** Project proponents may use infiltration, bioretention, rainfall harvest and use and/or biofiltration BMPs to retrofit an existing development, with similar land uses or land uses associated with comparable or higher stormwater runoff event mean concentrations (EMCs) than the as the project which did not fully retain the SWQDV. Comparison of EMCs for different land uses shall be based on published data from studies performed in southern California.
 - (a) The retrofit land shall be designed and constructed to intercept a volume of stormwater runoff equal to the mitigation volume as described above in Equation 4, except biofiltration BMPs shall be designed to meet the biofiltration volume as described in Equation 3 and
 - (b) Provide pollutant reduction (treatment) of the stormwater runoff from the project site as described in the Water Quality Mitigation Criteria provided in Part VIII.F.4.d of this Order.
- d. **Water Quality Mitigation Criteria**
- i. Each Permittee shall require all Priority Development Projects that have been approved for offsite mitigation or ground water replenishment projects as defined in Part VIII.F.4.b through Part VIII.F.4.c of this Order to also provide treatment of stormwater runoff from the project site. Each Permittee shall require these projects to design and implement post-construction stormwater BMPs and

control measures to reduce pollutant loading as necessary to ensure that the controls implemented on the site are designed so that the discharge does not cause or contribute to an exceedance of receiving water limitations at the Permittee's downstream MS4 outfall.

- ii. Each Permittee may allow the project proponent to install flow-through modular treatment systems including sand filters, or other proprietary BMP treatment systems that are certified for "Basic Treatment" under the Washington State Department of Ecology's TAPE Program; or an appropriate future BMP certification developed by the State of California. The sizing of the flow through treatment device shall be based on a rainfall intensity of:
 - (a) 0.2 inch per hour, or
 - (b) The one year, one-hour rainfall intensity as determined from the most recent Los Angeles County or Ventura County isohyetal map, whichever is greater.
- iii. In addition to the requirements for controlling pollutant discharges as described in Part VIII.F.4.c of this Order and the treatment benchmarks described above, each Permittee shall ensure that the new development or redevelopment will not cause or contribute to an exceedance of applicable limitations at the outfall established in Part IV.B and Attachments K through S of this Order.

G. Construction Program

1. **Construction Program Applicability.** The requirements contained in this part apply to all activities involving land disturbance with the exception of agricultural activities. Activities covered by this permit include construction or demolition activity, including, but not limited to clearing, grading, grubbing, soil compaction, excavation, paving or re-paving, linear underground/overhead projects (LUPs), or any other activity that results in a land disturbance.
2. Each Permittee shall develop, implement, and enforce a construction program that:
 - a. Prevents illicit construction-related discharges of pollutants into the MS4 and receiving waters.
 - b. Implements and maintains structural and non-structural BMPs to reduce pollutants in stormwater runoff from construction sites.
 - c. Reduces construction site discharges of pollutants to the MS4 to the maximum extent possible.
 - d. Prevents construction site discharges to the MS4 from causing or contributing to a violation of receiving water limitations.
 - e. Ensures that the pertinent provisions contained in Part VIII.F (Planning and Land Development Program) of this Order are incorporated in applicable construction projects.
3. Each Permittee shall establish for its jurisdiction an enforceable erosion and sediment control ordinance, or equivalent municipal code language, for all construction sites that disturb land.
4. **Construction Sites Less than One Acre.** The provisions contained in this Part VIII.G.4 apply exclusively to construction sites less than 1 acre that are not part of a common plan of development.
 - a. **BMP Implementation.** Through the use of the Permittee's erosion and sediment control ordinance and/or building permit, the Permittee shall require the

implementation of an effective combination of erosion and sediment control BMPs from Table 7 and/or Table 8 of this Order (where applicable) to prevent erosion and sediment loss, and the discharge of construction wastes.

Table 7. Minimum Set of BMPs for All Construction Sites

| | |
|----------------------------------|--|
| Site Management | Housekeeping |
| | Scheduling |
| Erosion Controls | Preservation of Existing Vegetation |
| | Wind erosion controls |
| Sediment Controls | Perimeter controls (e.g. Silt Fence, Sandbag Barriers, etc.) |
| | Stabilized Construction Site Entrance/Exit |
| Non-Stormwater Management | Water Conservation Practices |
| | Dewatering Operations |
| Waste Management | Material Delivery and Storage |
| | Stockpile Management |
| | Spill Prevention and Control |
| | Solid Waste Management |
| | Concrete Waste Management |
| | Sanitary/Septic Waste Management |

Table 8. Minimum Required BMPs for Roadway Paving or Repair Operation (For Private or Public Projects)

| | |
|-----------|--|
| 1 | Restrict paving and repaving activity to exclude periods of rainfall or predicted rainfall unless required by emergency conditions. |
| 2 | Install gravel bags and filter fabric or other equivalent inlet protection at all susceptible storm drain inlets and at manholes to prevent spills of paving products and tack coat. |
| 3 | Prevent the discharge of release agents including soybean oil, other oils, or diesel to the stormwater drainage system or receiving waters. |
| 4 | Minimize non stormwater runoff from water use for the roller and for evaporative cooling of the asphalt. |
| 5 | Clean equipment over absorbent pads, drip pans, plastic sheeting or other material to capture all spillage and dispose of properly. |
| 6 | Collect liquid waste in a container, with a secure lid, for transport to a maintenance facility to be reused, recycled or disposed of properly. |
| 7 | Collect solid waste by vacuuming or sweeping and securing in an appropriate container for transport to a maintenance facility to be reused, recycled or disposed of properly. |
| 8 | Cover the "cold-mix" asphalt (i.e., pre-mixed aggregate and asphalt binder) with protective sheeting during a rainstorm. |
| 9 | Cover loads with tarp before haul-off to a storage site, and do not overload trucks. |
| 10 | Minimize airborne dust by using water spray or other approved dust suppressant during grinding. |
| 11 | Avoid stockpiling soil, sand, sediment, asphalt material and asphalt grindings materials or rubble in or near stormwater drainage system or receiving waters. |
| 12 | Protect stockpiles with a cover or sediment barriers during a rain. |

b. Construction Site Inspection. Inspect construction sites as needed based on the evaluation of the factors that are a threat to water quality. In evaluating the threat to

water quality, the following factors shall be considered: project start and estimated completion date; soil erosion potential; site slope; project size and type; sensitivity of receiving water bodies; proximity to receiving water bodies; non-stormwater discharges; past record of non-compliance by the operators of the construction site; and any water quality issues relevant to the watershed where the construction site is located.

- 5. Construction Sites One Acre or Greater.** The provisions contained in this Part VIII.G.5 apply exclusively to construction sites 1 acre or greater and construction sites less than 1 acre that are part of a common plan of development totaling 1 acre or greater. The Construction General Permit is the primary regulating permit for these sites. Requirements for Permittees are as follows:

a. Construction Plan Review and Approval

- i. Prior to the Permittee issuing a grading or building permit (or any pertinent permits), each Permittee shall verify that the construction site operators have existing coverage under applicable permits, including, but not limited to the Construction General Permit, and State Water Board 401 Water Quality Certification.
- ii. Prior to the Permittee issuing a grading or building permit (or any pertinent permits), each Permittee shall require each operator of a construction activity within its jurisdiction to prepare and submit a post-construction plan prior to the disturbance of land for the Permittee's review and written approval. Prior to approval, each Permittee shall verify that the post-construction plans comply with the applicable provisions listed in Part VIII.F (Planning and Land Development Program) of this Order.

b. Construction Site Inventory / Electronic Tracking System

- i. Each Permittee shall use an electronic system to inventory grading permits, encroachment permits, demolition permits, building permits, or construction permits (and any other municipal authorization to move soil and/ or conduct construction or destruction that involves land disturbance) issued by the Permittee. To satisfy this requirement, the use of a database or GIS is recommended.
- ii. Each Permittee shall continuously update the inventory as new sites are permitted and sites are completed. The inventory / tracking system shall contain, at a minimum:
 - (a) Relevant contact information for each project (e.g., name, address, phone, email, etc. for the owner and contractor);
 - (b) The latitude / longitude coordinates of the project;
 - (c) The basic site information including status, size of the project and area of disturbance;
 - (d) Site Risk Level (or Type for Linear Underground/Overhead projects);
 - (e) The current construction phase where feasible;
 - (f) Inspection date(s);
 - (g) The project start date and anticipated completion date;

- (h) Whether the project has submitted a Notice of Intent and obtained coverage under the Construction General Permit, and if so, the project's Waste Discharge Identification (WDID) number; and
 - (i) A brief description of the project's post-construction BMPs and a comparison of pre-construction stormwater runoff volume versus post-construction stormwater runoff volume.
- c. **Construction Site Inspection.** Each Permittee shall inspect all construction sites 1 acre or greater and construction sites less than 1 acre that are part of a common plan of development totaling 1 acre or greater in accordance with the frequency and scope stated below:
 - i. **Frequency of Inspections**
 - (a) For construction sites that are determined to be a significant threat to water quality⁵⁴ and construction sites that discharge to a 303(d)-listed waterbody impaired for sediment or turbidity, the Permittee shall conduct an inspection:
 - (1) At least once every two weeks,
 - (2) When two or more consecutive days with greater than 50% chance of rainfall are predicted by National Oceanic and Atmospheric Administration (NOAA)⁵⁵,
 - (3) And within 48 hours of a 0.5-inch rain event.
 - (b) For all other construction sites, the Permittee shall conduct monthly inspections.
 - (c) If following a site inspection, the Permittee deems the site in compliance with the requirements listed in Part VIII.G.5.c.ii below, the Permittee may reduce the inspection frequency as necessary to a minimum of once during wet weather and once during dry weather.
 - (d) Once the project is completed and prior to issuing a certificate of occupancy, the Permittee shall conduct a post-construction inspection.
 - ii. **Scope of Inspections.** Each Permittee shall inspect these sites to confirm that:
 - (a) The project is enrolled in the Construction General Permit (i.e. has an active WDID number).
 - (b) A SWPPP is developed and available at the site.
 - (c) An effective combination of erosion and sediment control BMPs from Table 7 or Table 8 of this Order (where applicable) are implemented to prevent erosion and sediment loss, and the discharge of construction wastes.
 - (d) During the Certificate of Occupancy inspection, or any type of post-construction inspection, each Permittee shall ensure post-construction BMPs have been implemented in accordance with the project's post-construction plans approved per Part VIII.G.5.a.ii above.

⁵⁴ In evaluating the threat to water quality, the following factors shall be considered: soil erosion potential; site slope; project size and type; sensitivity of receiving water bodies; proximity to receiving water bodies; non-stormwater discharges; past record of non-compliance by the operators of the construction site; and any water quality issues relevant to the particular MS4.

⁵⁵ <https://www.nws.noaa.gov>

- iii. The requirements under Part VIII.G.5.c of this Order can be satisfied by inspections conducted by the project proponent's Qualified SWPPP Developer (QSD), Qualified SWPPP Practitioner (QSP), or other personnel/consultants who are Certified Professionals in Erosion and Sediment Control (CPESC), provided that the Permittee:
 - (a) Ensures all requirements under Part VIII.G.5.c are satisfied by the inspection,
 - (b) Verifies the inspection findings,
 - (c) Takes responsibility for the validity of the inspections, and
 - (d) Takes any follow-up or Progressive Enforcement Actions, if applicable.
- 6. **Progressive Enforcement.** Each Permittee shall implement its Progressive Enforcement Policy to ensure that construction sites are brought into compliance with all stormwater requirements within a reasonable time period. See Part VIII.B of this Order for requirements for the development and implementation of a Progressive Enforcement Policy.

H. Public Agency Activities Program

- 1. **General Provisions.** Each Permittee shall implement a Public Agency Activities Program consistent with the requirements specified in this Part VIII.H. The purpose of the program is to prevent or minimize impacts from MS4 discharges from Permittee-owned or operated facilities and activities. Requirements for Public Agency Facilities and Activities consist of the following components:
 - a. Public Facility and Activity Inventory;
 - b. Public Facility and Activity Management;
 - c. Vehicle and Equipment Wash Areas;
 - d. Landscape, Park, and Recreational Facilities Management;
 - e. Storm Drain Operation and Maintenance;
 - f. Road Reconstruction;
 - g. Streets and Road Pollutant Management;
 - h. Parking Facilities Maintenance; and
 - i. Emergency Procedures.
- 2. **Public Agency Facility and Activity Inventory.**
 - a. Each Permittee shall maintain an updated inventory or database of all Permittee-owned or operated (i.e., public) facilities and activities within its jurisdiction that the Permittee determines are potential sources of pollutants to the MS4. The inventory or database shall be maintained in electronic format and incorporation of facility information into a GIS is recommended. The Permittee shall consider the following facilities when determining sources to be inventoried:
 - i. Animal control facilities
 - ii. Chemical storage facilities
 - iii. Composting facilities

- iv.** Equipment storage and maintenance facilities (including landscape maintenance-related operations)
 - v.** Fueling or fuel storage facilities (including municipal airports)
 - vi.** Hazardous waste disposal facilities
 - vii.** Hazardous waste handling and transfer facilities
 - viii.** Incinerators
 - ix.** Landfills
 - x.** Materials storage yards
 - xi.** Pesticide storage facilities
 - xii.** Fire stations
 - xiii.** Public restrooms
 - xiv.** Public parking lots
 - xv.** Public golf courses
 - xvi.** Public swimming pools
 - xvii.** Public parks
 - xviii.** Public works yards
 - xix.** Public marinas
 - xx.** Recycling facilities
 - xxi.** Solid waste handling and transfer facilities
 - xxii.** Vehicle storage and maintenance yards
 - xxiii.** Stormwater management facilities (e.g., detention basins)
 - xxiv.** Streets and roads
 - xxv.** Catch basins
 - xxvi.** Stormwater capture, control, and treatment devices
 - xxvii.** All other Permittee-owned or operated facilities or activities that each Permittee determines may contribute a substantial amount of pollutants to the MS4.
- b.** Each Permittee shall include the following minimum fields of information for each Permittee-owned or operated facility in its inventory.
- i.** Name of facility;
 - ii.** Name of facility manager and contact information;
 - iii.** Address of facility (physical and mailing, or description if no address available or applicable);
 - iv.** A narrative description of activities performed and potential pollution sources;
 - v.** If applicable, coverage under the Industrial General Permit or other individual or general NPDES permits or any applicable waiver issued by the Los Angeles or State Water Board pertaining to stormwater discharges;

- vi. Activities listed in Table 9 of this Order that occur at the facility and a description of BMPs implemented for the activity. Treatment control BMPs⁵⁶ (i.e., BMPs that remove pollutants) and/or BMPs that involve stormwater capture (including infiltration or use) must also be noted; and
 - vii. For trash treatment control devices, indication of whether it is a *partial capture system* or a certified *full capture system*.
- c. Each Permittee shall verify the accuracy of their inventory once during the permit term. The update shall be accomplished through collection of new information obtained through field activities or through other readily available inter- and intra-agency informational databases (e.g., property management, land-use approvals, accounting and depreciation ledger account, and similar information).
- 3. Public Agency Facility and Activity Management**
- a. Where activities listed in Table 9 of this Order occur at Permittee-owned/leased facilities, including streets and roads, each Permittee must implement BMPs to control the discharge of pollutants to the MS4. The Permittee shall select BMPs that will reduce pollutants in discharges from the MS4 to the MEP and prevent discharges from public agency facilities and activities to the MS4 from causing or contributing to a violation of receiving water limitations.

Table 9. Activities Requiring BMP Implementation

| General Category | Specific Activity |
|--------------------------------|---|
| Flexible Pavement | Asphalt Cement Crack and Joint Grinding/Sealing |
| | Asphalt Paving |
| | Structural Pavement Failure (Digouts) Pavement Grinding and Paving |
| | Emergency Pothole Repairs |
| | Sealing Operations |
| Rigid Pavement | Portland Cement Crack and Joint Sealing |
| | Mudjacking and Drilling |
| | Concrete Slab and Spall Repair |
| Slope/Drains/Vegetation | Shoulder Grading |
| | Non-landscaped Chemical Vegetation Control |
| | Non-landscaped Mechanical Vegetation Control/Mowing |
| | Non-landscaped Tree and Shrub Pruning, Brush Chipping, Tree and Shrub Removal |
| | Fence Repair |
| | Drainage Ditch and Channel Maintenance |
| | Drain and Culvert Maintenance |
| | Curb and Sidewalk Repair |
| Litter/Debris/Graffiti | Sweeping Operations |
| | Litter and Debris Removal |
| | Emergency Response and Cleanup Practices |
| | Graffiti Removal |

⁵⁶ Treatment control BMPs are defined as any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

| General Category | Specific Activity |
|-------------------------------|---|
| Landscaping | Chemical Vegetation Control |
| | Manual Vegetation Control |
| | Landscaped Mechanical Vegetation Control/ Mowing |
| | Landscaped Tree and Shrub Pruning, Brush Chipping, Tree and Shrub Removal |
| | Irrigation Line Repairs |
| | Irrigation (Watering), Potable and Non-potable |
| Environmental | Storm Drain Stenciling |
| | Roadside Slope Inspection |
| | Roadside Stabilization |
| | Stormwater Treatment Devices |
| | Traction Sand Trap Devices |
| Bridges | Welding and Grinding |
| | Sandblasting, Wet Blast with Sand Injection and Hydroblasting |
| | Painting |
| | Bridge Repairs |
| Other Structures | Pump Station Cleaning |
| | Tube and Tunnel Maintenance and Repair |
| | Tow Truck Operations |
| | Toll Booth Lane Scrubbing Operations |
| Electrical | Sawcutting for Loop Installation |
| Traffic Guidance | Thermoplastic Striping and Marking |
| | Paint Striping and Marking |
| | Raised/Recessed Pavement Marker Application and Removal |
| | Sign Repair and Maintenance |
| | Median Barrier and Guard Rail Repair |
| | Emergency Vehicle Energy Attenuation Repair |
| Storm Maintenance | Minor Slides and Slipouts Cleanup / Repair |
| Management and Support | Building and Grounds Maintenance |
| | Storage of Hazardous Materials (Working Stock) |
| | Material Storage Control (Hazardous Waste) |
| | Outdoor Storage of Raw Materials |
| | Vehicle and Equipment Fueling |
| | Vehicle and Equipment Cleaning |
| | Vehicle and Equipment Maintenance and Repair |
| | Aboveground and Underground Tank Leak and Spill Control |

- b. Each Permittee shall ensure proper operation of all treatment control BMPs and maintain them as necessary for proper operation, including all post-construction treatment control BMPs.

- c. Any residual water⁵⁷ produced by a treatment control BMP and not being internal to the BMP performance when being maintained shall be:
 - i. Hauled away and legally disposed of,
 - ii. Applied to the land without runoff, or
 - iii. Discharged to the sanitary sewer system (with permits or authorization).
- d. Any contractors hired by the Permittee to conduct Public Agency Activities listed in Table 9 of this Order shall be contractually required to implement and maintain the activity specific BMPs as required by Part VIII.H.3.a and b of this Order. Each Permittee shall conduct oversight of contractor activities to ensure these BMPs are implemented and maintained.
- e. Each Permittee shall implement an inspection and maintenance program for all Permittee-owned treatment control BMPs, including post-construction treatment control BMPs. The inspection shall document whether the BMPs identified in the inventory are implemented in compliance with municipal ordinances. The Permittee shall use inspection results to target future inspection sites.
- f. If there is any storage of hazardous or toxic materials or hydrocarbons at a facility owned and/or operated by a Permittee and if the facility is not manned at all times, a 24-hour emergency response telephone number shall be prominently posted where it can easily be read from the outside.
- g. Permittee-owned or operated facilities that have obtained coverage under the Industrial General Permit shall implement and maintain BMPs consistent with the associated SWPPP in areas of industrial activity at the facility. The activity specific BMPs listed in Table 9 of this Order shall be implemented in the areas of non-industrial activity at the facility.

4. Vehicle and Equipment Washing

- a. Each Permittee shall implement and maintain appropriate activity specific BMPs as required by Part VIII.H.3.a of this Order for all fixed vehicle and equipment washing; including firefighting and emergency response vehicles.
- b. Each Permittee shall prevent discharges of wash waters from vehicle and equipment washing to the MS4 by implementing any of the following measures at existing facilities with vehicle or equipment wash areas:
 - i. Self-contain, and haul off for disposal;
 - ii. Equip with a clarifier or an alternative pre-treatment device and plumb to the sanitary sewer in accordance with applicable wastewater provider regulations;
or
 - iii. Infiltrate with no discharge off-site.
- c. Each Permittee shall ensure that any municipal facilities constructed, redeveloped, or replaced shall not discharge wastewater from vehicle and equipment wash areas to the MS4 by plumbing all areas to the sanitary sewer in accordance with applicable wastewater provider regulations, or self-containing all wastewater / wash water and hauling to a point of legal disposal.

⁵⁷ In the context of this Order, residual water is defined as water remaining in a structural BMP subsequent to the drawdown or drainage period. The residual water typically contains high concentration(s) of pollutants.

5. Landscape, Park, and Recreational Facilities Management

- a. Each Permittee shall implement and maintain appropriate activity specific BMPs as required by Part VIII.H.3.a of this Order for all Landscape, Park, and Recreational Facilities Management facilities.
- b. Each Permittee shall comply with pesticide regulations pertaining to the use, application, and disposal of Pesticides in California Code of Regulations (CCR), Chapter 4, Subchapters 3, 4, and 5 and shall implement an Integrated Pesticide Management (IPM) program that includes the following:
 - i. Pesticides are used only if monitoring indicates they are needed, and pesticides are applied according to applicable permits and established guidelines.
 - ii. Treatments are made with the goal of removing only the target organism.
 - iii. Pest controls are selected and applied in a manner that minimizes risks to human health, beneficial non-target organisms, and the environment.
 - iv. The use of pesticides, including organophosphates and pyrethroids, that does not threaten water quality.
 - v. Partner with other agencies and organizations to encourage the use of IPM.
 - vi. Adopt and verifiably implement policies, procedures, and/ or ordinances requiring the minimization of pesticide use and encouraging the use of IPM techniques (including beneficial insects) for Public Agency Facilities and Activities.
 - vii. Policies, procedures, and ordinances shall include commitments and a schedule to reduce the use of pesticides that cause impairment of surface waters by implementing the following procedures:
 - (a) Prepare and annually update an inventory of pesticides used by all internal departments, divisions, and other operational units.
 - (b) Quantify pesticide use by staff and hired contractors.
 - (c) Demonstrate implementation of IPM alternatives where feasible to reduce pesticide use.
- c. Each Permittee shall implement the following requirements:
 - i. Use a standardized protocol for the routine and non-routine application of pesticides (including pre-emergent), and fertilizers.
 - ii. Ensure there is no application of pesticides or fertilizers (1) when two or more consecutive days with greater than 50% chance of rainfall are predicted by NOAA,⁵⁸ (2) within 48 hours of a ½-inch rain event, or (3) when water is flowing off the area where the application is to occur. This requirement does not apply to the application of aquatic pesticides or pesticides which require water for activation.
 - iii. Ensure that no banned or unregistered pesticides are stored or applied.
 - iv. Ensure that all staff applying pesticides are certified in the appropriate category by the California Department of Pesticide Regulation or are under the direct supervision of a pesticide applicator certified in the appropriate category.

⁵⁸ <https://www.nws.noaa.gov>

- v. Implement procedures to encourage the retention and planting of native vegetation to reduce water, pesticide and fertilizer needs; and
- vi. Store pesticides and fertilizers indoors or under cover on paved surfaces or use secondary containment.
- vii. Reduce the use, storage, and handling of hazardous materials to reduce the potential for spills.
- viii. Regularly inspect storage areas.

6. Storm Drain Operation and Maintenance

- a. Each Permittee shall implement and maintain activity specific BMPs as required in Part VIII.H.3.a of this Order.
- b. Each Permittee shall ensure that all material removed from the MS4 does not reenter the system. Solid material shall be dewatered in a contained area and liquid material shall be disposed in accordance with any of the following measures:
 - i. Self-contain, and haul off for legal disposal; or
 - ii. Applied to the land without runoff; or
 - iii. Equip with a clarifier or an alternative pre-treatment device; and plumb to the sanitary sewer in accordance with applicable wastewater provider regulations.
- c. **Catch Basin Labels and Open Signage**
 - i. Each Permittee shall label all storm drain inlets that they own with a legible “no dumping” message.
 - ii. Each Permittee shall inspect the legibility of the stencil or label nearest each inlet prior to the wet season every year.
 - iii. Each Permittee shall record all catch basins with illegible stencils and labels and re-stencil or re-label within 180 days of inspection.
 - iv. Each Permittee shall post signs, referencing local code(s) that prohibit littering and illegal dumping, at designated public access points to open channels, creeks, urban lakes, and other relevant water bodies.
- d. **MS4 Maintenance.** Each Permittee shall continue to implement a program for MS4 maintenance that includes the following:
 - i. Visual monitoring of Permittee-owned open channels⁵⁹ and other drainage structures for trash and debris at least annually.
 - ii. Removal of trash and debris from open channels⁶⁰ a minimum of once per year before the wet season.
 - iii. Reduce or eliminate of the discharge of contaminants during MS4 maintenance and clean outs.
 - iv. Proper disposal of debris and trash removed during MS4 maintenance.

⁵⁹ Open channel excludes curbs, trenches in parking lots that lead to catch basins, etc.

⁶⁰ Ibid.

7. Road Reconstruction

- a. Each Permittee shall require that for any project that includes roadbed or street paving, repaving, patching, digouts, or resurfacing roadbed surfaces, that the following BMPs be implemented for each project.
- b. Restrict paving and repaving activity to exclude periods of rainfall or predicted rainfall⁶¹ unless required by emergency conditions.
- c. Install sandbags or gravel bags and filter fabric at all susceptible storm drain inlets and at manholes to prevent spills of paving products and tack coat.
- d. Prevent the discharge of release agents including soybean oil, other oils, or diesel into the MS4 or receiving waters.
- e. Prevent non-stormwater runoff from water use for the roller and for evaporative cooling of the asphalt.
- f. Clean equipment over absorbent pads, drip pans, plastic sheeting or other material to capture all spillage and dispose of properly.
- g. Collect liquid waste in a container, with a secure lid, for transport to a maintenance facility to be reused, recycled or disposed of properly.
- h. Collect solid waste by vacuuming or sweeping and securing in an appropriate container for transport to a maintenance facility, or other appropriate facility, to be reused, recycled or disposed of properly.
- i. Cover the “cold-mix” asphalt (i.e., pre-mixed aggregate and asphalt binder) with protective sheeting during a rainstorm.
- j. Cover loads with tarp before haul-off to a storage site, and do not overload trucks.
- k. Minimize airborne dust by using water spray during grinding.
- l. Avoid stockpiling soil, sand, sediment, asphalt material and asphalt grindings materials or rubble in or near MS4 or receiving waters.
- m. Protect stockpiles with a cover or sediment barriers during a rain.

8. Streets and Road Pollutant Management

- a. Each Permittee shall designate streets and/or street segments within its jurisdiction as one of the following:
 - i. Priority A: Streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or debris.
 - ii. Priority B: Streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or debris.
 - iii. Priority C: Streets and/or street segments that are designated as generating low volumes of trash and/or debris.
- b. Each Permittee shall perform street sweeping of curbed streets according to the following schedule:
 - i. Priority A: Streets and/or street segments that are designated as Priority A shall be swept at least two times per month.

⁶¹ A probability of precipitation (POP) of 50% or more is required.

- ii. Priority B: Streets and/or street segments that are designated as Priority B shall be swept at least once per month.
 - iii. Priority C: Streets and/or street segments that are designated as Priority C shall be swept as necessary but in no case less than once per year.
- 9. Parking Facilities Maintenance.** Permittee-owned parking lots exposed to stormwater and meeting either criteria listed below, shall be inspected at least twice per month. If debris and/or oil is observed during the inspection, the parking lot shall be cleaned. At a minimum, parking lots must be cleaned once per month. For parking lots with a gravel/sediment base, Permittees shall also implement and maintain BMPs to prevent the discharge of gravel and sediment to the MS4.
- a. Facility parking lots greater than 1 acre; or
 - b. Facility parking lots used for heavy vehicle storage such as, construction vehicles, buses, refuse trucks, etc.
- 10. Emergency Procedures.** Each Permittee may conduct activities to restore essential public service systems and infrastructure in emergency situations with a self-waiver of the provisions of this Order as follows:
- a. The Permittee shall abide by all other regulatory requirements, including notification to other agencies as appropriate.
 - b. Where the self-waiver has been invoked, the Permittee shall submit to the Los Angeles Water Board Executive Officer a statement of the occurrence of the emergency, an explanation of the circumstances, and the measures that were implemented to reduce the threat to water quality, no later than 30 business days after the situation of emergency has passed.
 - c. Minor restorations of essential public service systems and infrastructure in emergency situations (that can be completed in less than 1 week) are not subject to the notification provisions. Appropriate BMPs to reduce the threat to water quality shall be implemented.

I. Illicit Discharge Detection and Elimination Program

1. General

- a. Each Permittee shall continue to implement a program to detect and remove or require the dischargers to the MS4 to obtain a separate NPDES permit for, illicit discharges and improper disposal into the storm sewer as required by 40 C.F.R. section 122.26(d)(2)(iv)(B).
- b. Each Permittee shall maintain a written description, including a schedule and procedures, for its IDDE program⁶² that addresses the required program elements in 40 C.F.R. section 122.26(d)(2)(iv)(B)(1-7).
- c. Once each permit term, each Permittee shall review, and update as necessary, all written program descriptions including procedures, that pertain to its IDDE program.
- d. Oil or oily material, chemicals, refuse, or other pollution causing materials shall not be stored or deposited in areas where they may be picked up by rainfall and carried off of the property and/or discharged to surface waters. Any such spill of such materials shall be contained and removed immediately.

⁶² Referred to as Illicit Connection and Illicit Discharge Elimination Program in previous Orders.

2. Illicit Discharge Source Investigation

- a.** Each Permittee shall conduct an investigation to identify the location and source of all reported illicit discharges. For non-stormwater discharges from outfalls, the Permittee shall follow procedures in Part VII of the MRP (Non-Stormwater Outfall-Based Screening and Monitoring Requirements).
- b.** At a minimum, each Permittee shall initiate an investigation to identify and locate the source within 72 hours of becoming aware of the illicit discharges.

3. Illicit Discharge Elimination

- a.** Once the source of the illicit discharge is identified, the Permittee shall notify the responsible party and require the responsible party to conduct all necessary corrective actions to eliminate the illicit discharge or obtain a separate NPDES permit for the discharge.
- b.** The Permittee shall conduct follow-up inspections as necessary until the illicit discharge is eliminated or permitted.
- c.** If the Permittee determines that the source of the illicit discharge originates within an upstream jurisdiction, the Permittee shall notify the upstream jurisdiction and the Los Angeles Water Board within 30 days of such determination and provide all information collected regarding efforts to identify its source.
- d.** In the event the Permittee is unable to eliminate an ongoing illicit discharge following full execution of its legal authority and in accordance with its Progressive Enforcement Policy, or other circumstances prevent the full elimination of an ongoing illicit discharge, including the inability to find the responsible party(ies), the Permittee shall provide for elimination of the illicit discharge through diversion to the sanitary sewer or, alternatively, provide treatment at the location of the identified discharge. In either instance, the Permittee shall notify the Los Angeles Water Board in writing within 30 days of such determination and shall provide a written description of the efforts that have been undertaken to eliminate the illicit discharge, the proposed action(s) to be undertaken, anticipated costs, and a schedule for completion.

4. Infiltration from Sanitary Sewer to MS4 – Preventive Maintenance

- a.** Each Permittee shall implement controls and measures to prevent and eliminate infiltration of seepage from sanitary sewers to MS4s through thorough, routine preventive maintenance of the MS4.
- b.** Each Permittee that operates both a municipal sanitary sewer system and an MS4 must implement controls and measures to prevent and eliminate infiltration of seepage from the sanitary sewers to the MS4s that must include overall sanitary sewer and MS4 surveys and thorough, routine preventive maintenance of both. Implementation of a Sewer System Management Plan in accordance with the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems may be used to fulfill this requirement.
- c.** Each Permittee shall implement controls to prevent infiltration of seepage from sanitary sewers to the MS4 where necessary. Such controls must include:
 - i.** Adequate plan checking for construction and new development;
 - ii.** Incident response training for its municipal employees that identify sanitary sewer spills;
 - iii.** Code enforcement inspections;

- iv. MS4 maintenance and inspections;
- v. Interagency coordination with sewer agencies; and
- vi. Proper education of its municipal staff and contractors conducting field operations on the MS4 or its municipal sanitary sewer (if applicable).

5. Spill Response

- a. Each Permittee shall continue to implement a spill response plan that includes procedures to prevent, contain, and respond to all sewage and other spills that may discharge into the MS4.
- b. Each Permittee shall report spills that may endanger health or the environment in accordance with California Water Code § 13271.

6. Public Reporting

- a. Permittee(s) shall publicize and provide a means for public reporting of illicit discharges and other water quality impacts from stormwater and non-stormwater discharges into or from MS4s.
 - i. Permittee(s) may elect to use either an existing county-wide telephone hotline for Los Angeles County or Ventura County as the public reporting contact, or may establish its own hotline, if preferred.
 - ii. In lieu of a telephone hotline, the Permittee(s) may facilitate public reporting by providing an email address, Web-based form/reporting portal, or other Internet-based application.
- b. Permittee(s) shall maintain current contact information for staff assigned to the IDDE public reporting program.

7. Progressive Enforcement. Each Permittee shall implement its Progressive Enforcement Policy to ensure that illicit discharges are brought into compliance with all stormwater requirements within a reasonable time period. See Part VIII.B of this Order for requirements for the development and implementation of a Progressive Enforcement Policy.

8. Documentation and Tracking

- a. Public reports of illicit discharges shall be documented.
- b. Each Permittee shall track investigations of illicit discharges to document, at a minimum, the date(s) the illicit discharge was observed; the results of the investigation, including the corrective actions taken to eliminate the discharge; any follow-up inspections; and the date the investigation was closed.

IX. WATERSHED MANAGEMENT PROGRAMS

A. General

- 1.** The purpose of this Part IX is to allow Permittees the flexibility to individually or collaboratively develop Watershed Management Programs to implement the requirements of this Order on a watershed scale through customized strategies, control measures, and BMPs.
- 2.** Participation in a Watershed Management Program is voluntary and allows a Permittee to address its highest watershed priorities, including complying with the requirements of Part V (Receiving Water Limitations), Part IV and Attachments K through S (Total Maximum Daily Load Provisions), Part III (Discharge Prohibitions), and Part VIII (Minimum Control Measures) of this Order. This Part IX and other requirements in this Order pertaining to Watershed Management Programs do not apply to Permittees not participating in an approved Watershed Management Program.
- 3.** A Permittee's implementation of an approved Watershed Management Program does not constitute compliance with the non-stormwater discharge prohibition in Part III.A of this Order. However, a Permittee may use an approved Watershed Management Program to implement program elements and control measures to effectively eliminate prohibited non-stormwater discharges consistent with Part III.A and Part VIII.I (Illicit Discharge Detection and Elimination Program) of this Order as appropriate.
- 4.** The Permittee(s) may elect to develop a Watershed Management Program (WMP) using the Los Angeles Water Board's WMAs. Where appropriate, WMAs may be separated into subwatersheds to focus water quality prioritization and implementation efforts by receiving water. Each WMP shall:
 - a.** Be consistent with the provisions in Parts IX.B through IX.E of this Order,
 - b.** Identify and implement strategies, control measures, and BMPs for Water Body-Pollutant Combinations (WBPCs) addressed in the WMP to ensure that: (i) discharges from the Permittee's MS4 achieve any applicable WQBELs in Part IV and Attachments K through S of this Order pursuant to the corresponding compliance schedules, (ii) discharges from the Permittee's MS4 do not cause or contribute to exceedances of receiving water limitations in Part V, Part IV.B, and Attachments K through S of this Order, and (iii) non-stormwater discharges that are a source of pollutants are prohibited pursuant to Part III.A of this Order. The program shall also ensure that controls are implemented to reduce the discharge of pollutants to the MEP pursuant to Part IV.A.1 of this Order,
 - c.** Execute a monitoring and reporting program pursuant to Attachment E (MRP) of this Order to determine progress towards achieving applicable limitations,
 - d.** Modify strategies, control measures, and BMPs as necessary based on analysis of monitoring data collected pursuant to the MRP and other applicable information to ensure that applicable WQBELs, receiving water limitations, TMDL compliance schedules, and other milestones set forth in the WMP are achieved in the required timeframes.
 - e.** Provide appropriate opportunity for meaningful stakeholder and community input into the development or revision of the WMP.
 - f.** Maximize the effectiveness of available funds by leveraging the funds through partnerships and creative funding models that utilize multiple funding sources and through analysis of alternatives and the selection and sequencing of actions needed

to comply with WQBELs and receiving water limitations according to compliance schedules and, thus, to address human health and water quality related challenges;

- g.** Incorporate effective innovative technologies, approaches and practices, such as green infrastructure;
- h.** Ensure that actions to address existing requirements in this Order to comply with technology-based effluent limitations and core requirements (e.g., including elimination of non-stormwater discharges of pollutants through the MS4, and controls to reduce the discharge of pollutants in stormwater to the maximum extent practicable) are not interrupted or delayed;
- i.** Include an estimate of the capital and operation and maintenance costs of implementing the WMP and a financial strategy to fund those costs. Discuss which program costs have secured funding and the corresponding funding sources. If funding is not available for near-term watershed control measures (within 5 years from the effective date of this Order), discuss how Permittee(s) plan to obtain funding and what the anticipated funding sources are.
- j.** Implement structural watershed control measures such as multi-benefit regional projects. Permittees and other partners are encouraged to collaborate on multi-benefit regional projects.
- k.** Demonstrate that strategies, control measures, and BMPs cumulatively retain the runoff volume of the 85th percentile, 24-hour storm event for the drainage area tributary to the applicable receiving water. For drainage areas not addressed by retaining the runoff volume of the 85th percentile, 24-hour storm event, the WMP shall include a Reasonable Assurance Analysis (RAA) to demonstrate that applicable WQBELs and receiving water limitations shall be achieved through implementation of other watershed control measures.
- l.** Identify the group lead, if the WMP includes multiple Permittees, and provide names of all Permittees participating in the WMP. If the group lead or participants change, the group shall promptly notify the Los Angeles Water Board.

B. Program Development

- 1. Water Quality Characterization.** The WMP shall include an evaluation of existing water quality conditions, including characterization of stormwater and non-stormwater discharges from the MS4 and receiving water quality, to support development of the source assessment, identification of water quality priorities and sequencing of management actions. The evaluation shall include, at a minimum, the routine water quality data collected over the last five years pursuant to the Permittee(s) monitoring and reporting program(s) and approved TMDL monitoring programs. The WMP should include an explanation of the process used to determine what available data was relevant, how information considered was used, and why any relevant available data was disregarded.
- 2. Source Assessment.** In identifying WBPCs in Categories 1 – 3 in subpart 3 below, Permittees shall identify known and suspected stormwater and non-stormwater pollutant sources in discharges to the MS4 and from the MS4 to receiving waters and any other stressors related to MS4 discharges causing or contributing to the water quality priorities.
 - a.** The identification of known and suspected pollutant sources shall consider the following information:
 - i.** All relevant, available water quality data;

- ii. Special studies conducted pursuant the Permittee(s) monitoring and reporting program or TMDLs; and
 - iii. Locations of the Permittees' MS4s, including, at a minimum, all MS4 major outfalls and major structural controls for stormwater and non-stormwater that discharge to receiving waters.
 - b. The source assessment shall include the following:
 - i. An explanation of how any information considered as part of the Source Assessment was ultimately used to inform development of the WMP (e.g., directly or via citations to the appropriate WMP or RAA section); and
 - ii. An explanation of why any relevant available data was disregarded.
- 3. **Water Body-Pollutant Combinations (WBPCs).** On the basis of the evaluation of existing water quality conditions, WBPCs addressed in the WMP shall be classified into one of the following three categories:
 - a. **Category 1 (Highest Priority):** Pollutants for which WQBELs and receiving water limitations are established in Part IV and Attachments K through S of this Order to implement TMDLs.
 - b. **Category 2 (High Priority):** Pollutants for which data indicate water quality impairment in the receiving water according to the State's Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (State Listing Policy) and for which MS4 discharges may be causing or contributing to the impairment.
 - c. **Category 3 (Medium Priority):** Pollutants for which there are insufficient data to indicate water quality impairment in the receiving water according to the State's Listing Policy, but which exceed applicable receiving water limitations contained in this Order and for which MS4 discharges may be causing or contributing to the exceedance within the last five years.
- 4. **Sequencing of Water Quality Priorities.** Permittees shall identify the water quality priorities within each WMA that will be addressed by the WMP. Permittees shall sequence management actions to address water quality priorities based on the water quality characterization, source assessment, WBPC prioritization, and compliance schedules. The following categories of WBPCs should be considered when determining the appropriate sequencing of management actions:
 - a. **TMDLs**
 - i. Controlling pollutants for which there are WQBELs and/or receiving water limitations with final compliance deadlines within the permit term, or TMDL compliance deadlines that have already passed, and limitations have not been achieved.
 - ii. Controlling pollutants for which there are WQBELs and/or receiving water limitations with interim deadlines within the term of this Order.
 - iii. Progress toward controlling pollutants for which there are WQBELs and/or receiving water limitations with interim and/or final compliance deadlines beyond the term of this Order.

b. Other Receiving Water Considerations

- i. Controlling pollutants for which data indicate impairment pursuant to the State’s Listing Policy and the findings from the source assessment implicates discharges from the MS4.
- ii. Controlling pollutants for which data indicate exceedances of receiving water limitations in the receiving water within the last five years and the findings from the source assessment implicates discharges from the MS4.

5. Selection of Watershed Control Measures. Permittees shall identify strategies, control measures, and BMPs for WBPCs addressed in the WMP to implement through their jurisdiction-specific stormwater management programs, and collectively on a watershed or subwatershed scale, with the goal of creating a cost-effective program to focus individual and collective resources on water quality priorities.

a. The objectives of the Watershed Control Measures shall include:

- i. Prevent or eliminate non-stormwater discharges through the MS4 that are a source of pollutants to receiving waters.
- ii. Implement pollutant controls necessary to achieve applicable interim and final WQBELs and/or receiving water limitations pursuant to corresponding compliance schedules in Part IV.B and Attachments K through S of this Order.
- iii. Ensure that discharges from the MS4 do not cause or contribute to exceedances of receiving water limitations.

b. Watershed Control Measures may include but are not limited to:

i. Structural controls such as:

- (a)** Vegetated nature-based solutions (e.g., bioretention, green roofs, constructed storm water wetlands, wet and dry detention basins);
- (b)** Multi-benefit regional projects;
- (c)** Stormwater retention basins/subsurface stormwater infiltration galleries or dry wells;
- (d)** Other green infrastructure;
- (e)** Low Impact Development (LID) design features such as cisterns and rooftop/impervious area disconnection; and
- (f)** Diversions to sanitary sewer collection, treatment, and reclamation systems.

ii. Non-structural controls such as:

- (a)** Operation and maintenance procedures; and
- (b)** Source control, including but not limited to market-based solutions such as product replacement/substitution initiatives; human source management programs; and local ordinances prohibiting sources of pollutants (e.g., plastic bags, straws, Styrofoam containers)

c. Each Permittee shall ensure that all employees and contractors whose primary job duties are related to implementation of structural and non-structural BMPs are adequately trained to effectively implement, operate, and maintain such BMPs and are versed in factors affecting BMP effectiveness.

- 6. Watershed Management Program Provisions.** The following provisions of this Order shall be incorporated as part of the WMP:
- a. Stormwater Management Program Minimum Control Measures**
 - i. Permittees shall assess the minimum control measures (MCMs) as defined in Parts VIII.D to VIII.I of this Order to identify opportunities for focusing resources on the water quality priorities in each watershed. For each of the following minimum control measures, Permittees shall propose modifications, if appropriate, that will address water quality priorities:
 - (a) Public Information and Participation Program (PIPP)
 - (b) Industrial/Commercial Facilities Program
 - (c) Planning and Land Development Program
 - (d) Development Construction Program
 - (e) Public Agency Activities Program
 - (f) Illicit Discharge Detection and Elimination Program (IDDE)
 - ii. At a minimum, the WMP shall include management programs consistent with 40 CFR section 122.26(d)(2)(iv)(A)-(D).
 - iii. If the Permittee(s) proposes to eliminate in their WMP a control measure identified in Parts VIII.D through VIII.I of this Order because that specific control measure is not applicable to the Permittee(s), the Permittee(s) shall provide a rationale and appropriate documentation for its elimination.
 - iv. Such modifications, once approved as part of the WMP, shall replace in part or in whole the requirements in Parts VIII.D through VIII.I of this Order for participating Permittees.
 - b. Non-Stormwater Discharge Measures.** Where Permittees identify non-stormwater discharges from the MS4 as a source of pollutants that cause or contribute to exceedance of receiving water limitations and/or WQBELs addressed in the WMP, the Watershed Control Measures shall include strategies, control measures, and/or BMPs to effectively prohibit the source of pollutants consistent with Parts III.A (Prohibitions – Non-Stormwater Discharges) and VIII.I (IDDE) of this Order. Requirements in Part III.A of this Order apply to all Permittees regardless of whether a Permittee is implementing a Watershed Management Program or not.
- 7. Each program shall include the following components:**
- a.** Documentation that Permittees have the necessary legal authority to independently or collaboratively implement the Watershed Control Measures identified in the program, or that other legal authority exists to compel implementation of the Watershed Control Measures.
 - b.** Identification of watershed control measures to achieve WQBELs and receiving water limitations contained in this Part IV, V, and Attachments K through S of this Order to which the Permittee(s) is subject. The WMP shall clearly identify which watershed control measures are addressing which WQBELs and receiving water limitations;
 - c.** For structural controls, the number, type, and locations of projects and/or the volume capture or target load reduction for a drainage area that will be met by structural controls;
 - d.** For each non-structural control, the nature and scope of implementation;

- e. Interim milestones and dates for achievement to ensure that any applicable TMDL compliance deadlines will be met;
 - f. The program shall clearly identify the responsibilities of each participating Permittee for implementation of watershed control measures;
 - g. Identification of any unavailable but necessary information needed to support any analysis in the WMP, including but not limited to the Water Quality Characterization in Part IX.B.1 of this Order, the Source Assessment in Part IX.B.2 of this Order, and the Reasonable Assurance Analysis in Part IX.B.8 of this Order. The discussion of the missing information must include the assumptions made to substitute that information, and milestones for acquiring and incorporating that information into the WMP or RAA as appropriate; and
 - h. Expected volume capture, load reductions, or other compliance metric at regular milestones, and the methods by which these reductions will be measured and demonstrated for each WBPC. Interim milestones shall be no more than 5 years apart.
- 8. Reasonable Assurance Analysis.** Per Part IX.A.4.k of this Order, for drainage areas not addressed by retaining the runoff volume of the 85th percentile, 24-hour storm event, Permittees shall conduct a Reasonable Assurance Analysis (RAA) to demonstrate that implementation of the watershed control measures in the WMP will reasonably ensure that the Permittee's MS4 discharges achieve any applicable WQBELs and do not cause or contribute to exceedances of receiving water limitations. Permittees shall address all WBPCs addressed in the WMP in its RAA, except for those WBPCs in drainage areas addressed by retaining the runoff volume defined above.
- a. The RAA may be based on any available guidance documents to conduct an RAA such as: the Los Angeles Water Board's *Guidelines for Conducting Reasonable Assurance Analysis in a Watershed Management Program, Including an Enhanced Watershed Management Program* dated March 25, 2014 and any updates thereto;⁶³ and *Developing Reasonable Assurance: A Guide to Performing Model-Based Analysis to Support Municipal Stormwater Program Planning* dated February 2017 prepared by Paradigm Environmental for U.S. EPA Region 9.
 - b. The RAA shall be a quantitative analysis that is performed using a peer-reviewed model in the public domain where available. Examples of models that may be considered for use for the RAA include the Watershed Management Modeling System (WMMS) and the Structural BMP Prioritization and Analysis Tool (SBPAT). Where modeling is unavailable or inappropriate, a Permittee may consider alternative numeric analyses or other quantitative methods, including a non-modeling-based analysis (e.g., empirical data analysis) for its RAA. The quantitative reasoning for non-modeling based analysis may use one or more metrics such as magnitude of loading, frequency of exceedance, required percent reduction, or similar metric as compared to the modeled WBPCs and associated watershed control measures.
 - c. Permittees may rely on modeling in TMDL Implementation Plans approved by the Los Angeles Water Board to fulfill the requirements for the RAA for the WBPCs addressed by the TMDL Implementation Plan(s). If the Los Angeles Water Board, in its comments on the TMDL Implementation Plan(s), indicates that more information

⁶³ The Los Angeles Water Board expressly delegates authority to its Executive Officer to revise, as necessary, the 2014 RAA Guidelines after an appropriate public notice and comment period. If any of the proposed revisions to the RAA Guidelines are significant or generate significant public controversy, then a quorum of the Los Angeles Water Board shall consider whether to approve the proposed revisions at publicly noticed meeting.

would be required to use the modeling as a basis for permit compliance, the additional information specified by the Board must be provided when the draft/revised WMP is submitted or in advance of submittal of the draft/revised WMP. If the Permittees identify a pollutant in a TMDL Implementation Plan to use as a limiting pollutant in the RAA, the Permittees must include justification for the limiting pollutant per Part IX.B.8.f of the Order.

- d.** Models utilized in the RAA shall be calibrated using available data that are relevant to the WMP's environmental setting and conditions. The WMP shall explain how the models were calibrated or explain why no further calibration was required (e.g., relied on WMMS default hydrology calibration).
- e.** Models utilized in the RAA shall be validated with relevant data that are independent of the data used for model calibration.
- f.** Where appropriate, Permittees may identify the "limiting" pollutant(s) in the RAA, which if controlled to achieve the applicable WQBEL and/or receiving water limitation will ensure that the applicable limitations for other pollutants are also achieved. If a limiting pollutant(s) is used in the RAA, the WMP must include a justification for the limiting pollutant(s). At a minimum, this justification must include:
 - i.** Identification of each limiting pollutant grouping and the waterbodies addressed (e.g., a table);
 - ii.** An explanation of why the limiting pollutant groupings can be addressed via similar control measures and schedules. This explanation should discuss (1) the similarities in fate and transport mechanisms or explain why any differences in fate and transport mechanisms are irrelevant, (2) the ability of the proposed control measures to address all pollutants in the limited pollutant grouping, and (3) how addressing the limiting pollutant will result in attainment of WQBELs and receiving water limitations for all WBPCs in the RAA within applicable compliance schedules, considering, where relevant, the sources of the different pollutants to be addressed; and
 - iii.** For WBPCs that are addressed by the limiting pollutant approach but not modeled, the RAA shall provide an alternative quantitative analysis for how control of the limiting pollutant(s) will address the identified non-modeled WBPCs and their applicable WQBELs and receiving water limitations consistent with the requirements in Part IX.B.8.a above.
- g.** The RAA shall involve the assembly of relevant data, including land use, hydrological, and pollutant loading data. Permittees shall review quality assurance/quality control (QA/QC) criteria for data and identify datasets that meet QA/QC criteria. A Permittee's use of WMMS shall satisfy this requirement.
- h.** Parameters or data relating to the performance of watershed control measures represented in a model utilized in the RAA shall be based on impartial, well accepted studies and sources. These data shall have been statistically analyzed to determine appropriate estimates of control measure performance.
- i.** Permittees shall demonstrate using the RAA that the activities and watershed control measures identified in the WMP will achieve applicable WQBELs and/or receiving water limitations in Part IV, Part V, and Attachments K through S of this Order for each water body-pollutant combination or limiting pollutant group.
- j.** Permittees may include other regulated point and nonpoint sources within the drainage area in the RAA. The RAA shall demonstrate, for the drainage area to the

compliance point, that the activities and watershed control measures identified in the WMP in conjunction with those identified to address other regulated point and nonpoint sources will, in combination, result in a total pollutant load equal to or less than the sum of the individual allowable pollutant loads established in the applicable TMDL and incorporated into the respective permit(s) and Board order(s).

- 9. Compliance Schedules.** Permittees shall incorporate any applicable compliance schedules in Part IV.B and Attachments K through S of this Order, or approved Time Schedule Order (TSO), for WBPCs addressed in the WMP and, where necessary develop interim requirements and dates for their achievement. Compliance schedules and interim requirements and dates for their achievement shall be used to measure progress towards addressing the highest water quality priorities and achieving applicable WQBELs and/or receiving water limitations.
- a. Schedules must be adequate for measuring progress on a watershed or subwatershed scale throughout the term of this Order.
 - b. Schedules must be developed for both the strategies, control measures and BMPs implemented by each Permittee within its jurisdiction and for those that will be implemented by multiple Permittees on a watershed scale.
 - c. Schedules shall incorporate the following:
 - i. Final compliance deadlines occurring within the permit term for any applicable WQBELs and/or receiving water limitations in Part IV.B and Attachments K through S of this Order, or approved TSO;
 - ii. Where WQBELs and/or receiving water limitations in Part IV.B and Attachments K through S of this Order have final compliance deadlines or time schedules in an approved TSO beyond the permit term, Permittees shall identify interim requirements and dates for their achievement that are within the permit term to ensure adequate progress toward achieving final compliance deadlines or time schedules in an approved TSO. Interim milestones shall be no more than 5 years apart.
 - iii. For water quality priorities related to addressing exceedances of receiving water limitations in Part V and not otherwise addressed by TMDLs in Part IV.B and Attachments K through S of this Order:
 - (a) Requirements based on measurable criteria or indicators, to be achieved in the receiving waters and/or MS4 discharges,
 - (b) A schedule with dates for achieving the requirements, and
 - (c) A final date for achieving the receiving water limitations as soon as possible,
 - (d) If the schedule extends beyond the permit term, interim milestones shall be no more than 5 years apart.
 - iv. Incorporation of the requirements and implementation schedule in subpart B.9 above into an approved WMP fulfills the requirements in Part V.C.1 of this Order to prepare an Receiving Water Limitations Compliance Report.

C. Watershed Management Program Implementation

1. Each Permittee shall begin implementing the WMP immediately upon approval of the program by the Los Angeles Water Board.
2. Notwithstanding Part IX.E (Adaptive Management) of this Order, Permittees may propose WMP modifications at any time during the term of this Order, as necessary. Permittees

shall provide written requests explaining the nature of the proposed modification and justification for consideration by the Los Angeles Water Board. Such justification may include the need to align the timing of implementation for a specific project with a project partner that is not regulated by the Regional MS4 Permit.

3. Through the process in Part IX.C.2, above, Permittees may request an extension of deadlines for achievement of interim requirements and final compliance deadlines established pursuant to Part IX.B.9 of this Order, with the exception of those final compliance deadlines established in a TMDL. Permittees shall provide requests in writing and shall include in the request the justification for the extension. Extensions are subject to approval by the Los Angeles Water Board.

D. Integrated Watershed Monitoring and Assessment

Permittees shall conduct monitoring as set forth in the MRP (Attachment E). The monitoring program shall assess progress toward achieving the WQBELs and/or receiving water limitations addressed in the WMP. The monitoring program shall assess progress toward addressing water quality priorities, per any applicable compliance schedules and approved TSOs as set forth in Part IX.B.9 of this Order.

E. Adaptive Management Process

1. Permittees shall implement an adaptive management process for each approved WMP. The purpose of the adaptive management process is to adapt the WMP so that the watershed control measures in the WMP become more effective, based on, but not limited to a consideration of the following:
 - a. Progress toward achieving interim and/or final WQBELs and/or receiving water limitations in Part IV and Attachments K through S of this Order, according to established compliance schedules set forth in Part IX.B.9 of this Order;
 - b. Progress toward achieving improved water quality in MS4 discharges and achieving receiving water limitations through implementation of the watershed control measures based on an evaluation of outfall-based monitoring data and receiving water monitoring data;
 - c. Re-evaluation of watershed control measures for the achievement of interim and final milestones for stormwater volume addressed (via capture, infiltration, diversion, etc.), load reduction, or other compliance metric;
 - d. Multi-year efforts that were not completed in the current permit term and will continue over the next 5 year(s);
 - e. Re-evaluation of the water quality priorities identified for the WMA based on more recent water quality data for discharges from the MS4 and the receiving water(s) and a reassessment of sources of pollutants in MS4 discharges;
 - f. Availability of new information and data from sources other than the Permittees' monitoring program(s) within the WMA that informs the effectiveness of the actions implemented by the Permittees;
 - g. Costs and available funding;
 - h. Los Angeles Water Board recommendations; and
 - i. Recommendations for modifications to the WMP solicited through a public participation process.
2. Based on the results of the adaptive management process, the Permittee(s) may propose WMP modifications necessary to improve the effectiveness of the WMP, including but not

limited to new compliance deadlines and interim requirements, with the exception of those final compliance deadlines established in a TMDL, and new or substitute watershed control measures. The Permittee(s) shall clearly identify any WMP modification proposals in their submittal.

3. The adaptive management process fulfills the requirements in Part V.D of this Order to address continuing exceedances of receiving water limitations.
4. **Reporting on the adaptive management process results.** The results of the adaptive management process shall be submitted with the Permittees' ROWD. Permittees shall report the following information to the Los Angeles Water Board concurrently with the submittal of the ROWD (180 days before Order expiration date) required pursuant to Part II.B of Attachment D (Standard Provisions):
 - a. On-the-ground structural control measures completed since approval of the WMP;
 - b. Non-structural control measures completed since approval of the WMP;
 - c. Monitoring data that evaluates the effectiveness of implemented control measures in improving water quality;
 - d. Comparison of the effectiveness of the control measures to the results projected by the RAA;
 - e. Assessment of the appropriateness of the assumptions used in the RAA (e.g. non-structural BMP implementation and corresponding reductions, rates of redevelopment, etc.);
 - f. Comparison of control measures completed to date with control measures projected to be completed to date pursuant to the WMP using equivalent metrics;
 - g. Control measures proposed to be completed in the next five years pursuant to the WMP and the schedule for completion of those control measures using metrics consistent with those in the approved WMP;
 - h. Status of funding and implementation for control measures proposed to be completed in the next five years; and
 - i. Identification of the most effective and least effective control measures and explain why those control measures were effective or least effective and how control measures will be optimized, modified, or terminated accordingly for WMP implementation in the next 5 years.
5. Subsequent to the first adaptive management submittal, the Los Angeles Water Board Executive Officer may require additional implementation of an adaptive management process and submittal of results at any time but no earlier than two years after the submittal of the ROWD.

F. Ventura County Permittees

1. Ventura County Permittees that opt to develop a Watershed Management Program shall implement requirements per the schedule specified in Table 10 below:

Table 10. Ventura County WMP Implementation Schedule

| Part | Provision | Due Date |
|--------|--|---|
| IX.F.2 | Submit NOI to the Los Angeles Water Board electing to develop a WMP and/or stating its intent to join an existing WMP | 3 months after Order effective date |
| IX.F.3 | For Ventura County Permittees that elect to develop a WMP or join an existing WMP, submit the new or updated WMP to Los Angeles Water Board | 24 months after Order effective date |
| IX.F.3 | For Ventura County Permittees that elect to develop a WMP or join an existing WMP, submit the final WMP in response to comments from the Los Angeles Water Board | Within 3 months of receipt of comments from the Los Angeles Water Board or as otherwise directed by the Executive Officer |
| IX.F.5 | Begin implementation of the WMP | Immediately upon Los Angeles Water Board approval of final program |
| IX.E | Submit results of WMP adaptive management process | With submittal of ROWD |

2. Ventura County Permittees that elect to develop a WMP or join an existing WMP shall submit a Notice of Intent (NOI) to the Los Angeles Water Board no later than 3 months after the effective date of this Order. The NOI shall:
 - a. Identify all participating Ventura County Permittees and provide the program concept and geographical scope (county-wide and/or watershed/subwatershed scale).
 - b. Provide a letter of intent from each participating Permittee that is signed per the signatory requirements in Part V.B in Attachment D of this Order.
 - c. Identify which Water-Body Pollutant Combinations as defined in Part IX.B.3 of this Order will be addressed in the WMP.
3. A Ventura County Permittee(s) that elects to develop a WMP or join an existing WMP shall submit the new or updated WMP to the Los Angeles Water Board Executive Officer no later than 24 months after the effective date of this Order. Within 3 months of receipt of comments from the Los Angeles Water Board or as otherwise directed by the Executive Officer, Ventura County Permittee(s) shall submit the final WMP in response to comments.
4. Until the WMP is approved by the Los Angeles Water Board, Ventura County Permittees that elect to develop a WMP shall:
 - a. Continue to implement their existing stormwater management programs, including actions within each of the six categories of minimum control measures consistent with 40 CFR section 122.26(d)(2)(iv) in lieu of Part VIII.D through Part VIII.I in this Order;
 - b. Comply with all other Parts of this Order, including Parts III, IV, VI, VII, VIII.A and B and Attachments K through S; and
 - c. Comply with Part V of this Order for Water-Body Pollutant Combinations not identified in the NOI.
5. The Ventura County Permittee(s) shall implement their WMP immediately upon approval by the Los Angeles Water Board.

6. Ventura County Permittees that do not elect to develop a WMP shall be subject to all requirements in this Order except those requirements pertaining to Watershed Management Programs immediately upon the effective date of this Order.
7. Ventura County Permittees that do not have an approvable WMP shall be subject to all requirements in this Order except those requirements pertaining to Watershed Management Programs upon disapproval by the Los Angeles Water Board.
8. Ventura County Permittees may request an extension of the deadlines to submit an NOI to develop a WMP, submit a draft program, and submit a final program. The extension is subject to approval by the Executive Officer of the Los Angeles Water Board. If the extension is approved, Ventura County Permittees shall comply with Part VIII (Stormwater Management Program Minimum Control Measures) of this Order and shall demonstrate compliance with all receiving water limitations pursuant to Part V of this Order during any extension period.
9. For those Ventura County Permittees opting to discontinue participation in an approved Watershed Management Program, the Ventura County Permittee, immediately upon submittal of their notice shall be subject to all requirements of this Order except those requirements pertaining to Watershed Management Programs.

G. Los Angeles County Permittees

1. Los Angeles County Permittees with an approved Watershed Management Program⁶⁴ shall implement requirements per the schedule specified in Table 11 below:

Table 11. Los Angeles County WMP Implementation Schedule

| Part | Provision | Due Date |
|-------------|---|---|
| IX.G.3.a | Submit revised RAA and WMP in response to comments from the Los Angeles Water Board | Within 3 months of receipt of comments from the Los Angeles Water Board or as otherwise directed by the Executive Officer |
| IX.G.3.c | Implement revised WMP | Upon Los Angeles Water Board approval of revised program |
| IX.E | Submit results of WMP Adaptive Management process | With submittal of ROWD |

2. Notifications Regarding WMP Participation

- a. Within 30 days of withdrawing from participation in a WMP, a Los Angeles County Permittee currently participating in the implementation of an approved Watershed Management Program shall notify the Los Angeles Water Board that it is discontinuing its participation in the implementation of the Watershed Management Program.
- b. Los Angeles County Permittees that currently do not have an approved Watershed Management Program may opt to join an approved Watershed Management Program. In such case, the Los Angeles County Permittee seeking to join an already

⁶⁴ Reference to the term “approved Watershed Management Program or approved WMP” in this section includes Watershed Management Programs (WMPs) and Enhanced Watershed Management Programs (EWMPs) that were developed pursuant to the previous MS4 permits (Order Number R4-2012-0175 and Order Number R4-2014-0024).

approved program shall notify the Los Angeles Water Board as soon as possible. This Permittee remains subject to all requirements of this Order (except those requirements pertaining to Watershed Management Programs) until the Watershed Management Program has been modified and approved by the Los Angeles Water Board to add the Permittee to the Watershed Management Program and to update schedules and milestones accordingly.

- c. For those Los Angeles County Permittees opting to discontinue participation in an approved Watershed Management Program, the Los Angeles County Permittee, immediately upon submittal of their notice shall be subject to all requirements of this Order except those requirements pertaining to Watershed Management Programs.

3. Revised WMP and RAA

- a. Los Angeles County Permittee(s) that opt to continue implementing a Watershed Management Program shall update their Watershed Management Program and RAA to be consistent with the requirements of this Order as directed by the Executive Officer. In response to the Los Angeles Water Board’s comments on any WMP and RAA, Los Angeles County Permittee(s) shall submit a revised RAA and WMP within three months of receipt of comments or as otherwise directed by the Executive Officer.
- b. The Los Angeles Water Board, or the Executive Officer pursuant to their delegated authority, will approve or disapprove the updated WMP. The Executive Officer may waive the requirement for approval of the updated WMP, following the 60-day public review and comment period, if the Executive Officer determines that a Los Angeles County Permittee has adequately demonstrated using water quality monitoring data that the WMP as currently approved is meeting appropriate water quality targets in accordance with established deadlines.
- c. The Los Angeles County Permittee(s) shall implement revisions to their WMP immediately upon approval by the Los Angeles Water Board.
- d. Until the updated WMP is approved by the Los Angeles Water Board, the Los Angeles County Permittee(s) shall continue to implement the currently approved version of their Watershed Management Program as identified in Table 12 below:

Table 12. Watershed Management Programs

| Los Angeles County Permittee / Group Name | Initial Approval Date |
|--|-----------------------|
| Upper Santa Clara River Watershed Group (Los Angeles County, LACFCD, and city of Santa Clarita) | 4/7/2016 |
| Upper Los Angeles River Watershed Group (Los Angeles County, LACFCD, and cities of Alhambra, Burbank, Calabasas, Glendale, Hidden Hills, La Cañada Flintridge, Los Angeles, Montebello, Monterey Park, Pasadena, Rosemead, San Fernando, San Gabriel, San Marino, South El Monte, South Pasadena, and Temple City) | 4/20/2016 |
| Los Angeles River Upper Reach 2 Sub Watershed Group (LACFCD and cities of Bell, Bell Gardens, Commerce, Cudahy, Maywood, and Huntington Park, and Vernon) | 4/28/2015 |
| Lower Los Angeles River Watershed Group (LACFCD and cities of Downey, Lakewood, Long Beach, Lynwood, Paramount, Pico Rivera, Signal Hill, and South Gate) | 4/28/2015 |

| Los Angeles County Permittee / Group Name | Initial Approval Date |
|---|--|
| Rio Hondo/San Gabriel River Water Quality Group (Los Angeles County, LACFCD, and cities of Arcadia, Bradbury, Duarte, Monrovia, and Sierra Madre) | 4/21/2016 (Revised WMP approved 4/2/2019) |
| Upper San Gabriel River Group (Los Angeles County, LACFCD, and cities of Baldwin Park, Covina, Glendora, Industry, and La Puente, West Covina) | 4/11/2016 |
| East San Gabriel Valley Watershed Management Area Group (cities of Claremont, La Verne, Pomona, and San Dimas) | 4/28/2015 |
| Lower San Gabriel River Group (LACFCD, and cities of Artesia, Bellflower, Cerritos, Diamond Bar, Downey, Hawaiian Gardens, La Mirada, Lakewood, Long Beach, Norwalk, Pico Rivera, Santa Fe Springs, and Whittier) | 4/28/2015 |
| Los Cerritos Channel Watershed Group (LACFCD, and cities of Bellflower, Cerritos, Downey, Lakewood, Long Beach, Paramount, and Signal Hill) | 4/28/2015 |
| Malibu Creek Watershed Group (Los Angeles County, LACFCD, and Agoura Hills, Calabasas, Hidden Hills, and Westlake Village) | 4/27/2016 |
| Marina del Rey Group (Los Angeles County, LACFCD, and cities of Culver City and Los Angeles) | 4/27/2016 |
| North Santa Monica Bay Coastal Watersheds Group (Los Angeles County, LACFCD, and City of Malibu) | 4/19/2016 |
| Santa Monica Bay Watershed Jurisdictions 2 & 3 Group (Los Angeles County, LACFCD, and cities of El Segundo, Los Angeles, and Santa Monica) | 4/21/2016 |
| Beach Cities Watershed Management Group (LACFCD and cities of Hermosa Beach, Manhattan Beach, Redondo Beach, and Torrance) / Machado Lake Subwatershed Supplement (City of Torrance) | 4/18/2016; 12/9/2016 |
| Palos Verdes Peninsula Watershed Management Group (Los Angeles County, LACFCD, and cities of Palos Verdes Estates, Rancho Palos Verdes, and Rolling Hills Estates) | 4/19/2016 |
| Ballona Creek Group (Los Angeles County, LACFCD, Beverly Hills, Culver City, Inglewood, Los Angeles, Santa Monica, and West Hollywood) | 4/20/2016 |
| Dominguez Channel Watershed Management Area Group (Los Angeles County, LACFCD, and cities of Carson, El Segundo, Hawthorne, Inglewood, Lawndale, Lomita, and Los Angeles) | 4/21/2016 |
| Alamitos Bay/Los Cerritos Channel Group (Los Angeles County and LACFCD) | 4/28/2015 |
| Santa Monica Bay Watershed Jurisdiction 7 Group (LACFCD and City of Los Angeles) | 4/28/2015 |
| Nearshore Watersheds (City of Long Beach) | 1/28/2016 |
| City of El Monte | 4/28/2015 |
| City of La Habra Heights | 12/12/2014 |
| City of Walnut | 4/28/2015 |

- Los Angeles County Permittees that do not have an approvable updated WMP shall be subject to all requirements in this Order except those requirements pertaining to Watershed Management Programs upon disapproval by the Los Angeles Water Board.

5. Los Angeles County Permittees may request an extension of the deadlines in Table 11. The extension is subject to approval by the Executive Officer of the Los Angeles Water Board. Part IX.G.3.d above applies until the Los Angeles County Permittee(s) has an approved revised WMP in place.

X. Compliance Determination for WQBELs and Receiving Water Limitations

A. General

1. Compliance Points

A Permittee shall demonstrate compliance with WQBELs and receiving water limitations in Part IV, Part V, and Attachments K through S of this Order, at the compliance monitoring locations identified in monitoring programs per Attachment E of this Order unless a Permittee is implementing a Watershed Management Program per Part IX of this Order. Compliance points may include outfalls and/or alternative access points, such as manholes or in channels at the Permittee's jurisdictional boundary, or locations in the receiving water.

2. Compliance with Receiving Water Limitations

Compliance with the procedure described in Part V.C of this Order does not constitute compliance with the receiving water limitation provisions of Part V.A and Part V.B of this Order.

3. Compliance with Bacteriological Limitations During High Flow Suspension (HFS) Conditions

WQBELs and receiving water limitations for protection of water contact recreation (REC-1) and non-contact recreation (REC-2) do not apply during a high flow suspension as defined in Attachment A of this Order.

B. WQBELs and Receiving Water Limitations for Pollutants other than Trash

1. Interim WQBELs and Receiving Water Limitations⁶⁵

a. Direct Demonstration of Compliance with TMDL-Specific Requirements

- i. A Permittee is in compliance with interim WQBELs and receiving water limitations associated with a TMDL, if the Permittee is implementing the requirements, including compliance schedules, outlined in Part IV.B and Attachments K through S of this Order applicable to the waterbody-pollutant combination(s) addressed by that TMDL.
- ii. A Permittee demonstrates compliance with interim WQBELs and receiving water limitations associated with a TMDL in the same manner as described in Part X.B.2 of this Order

b. Alternative Demonstration of Compliance

- i. A Permittee shall be deemed in compliance with interim WQBELs and receiving water limitations if it is implementing an approved Watershed Management Program, consistent with the actions and schedules therein, to address the applicable waterbody-pollutant combination pursuant to Part IX of this Order. For milestones proposed to be met entirely by implementation of strategies, control measures, or BMPs for which there is no quantitative analysis that satisfies the requirements in Part IX.B.8.b of this Order, Permittees may only be deemed in compliance with the interim WQBELs and receiving water limitations if the

⁶⁵ In this Order all interim WQBELs are associated with TMDLs. Interim receiving water limitations are generally associated with TMDLs (i.e. an interim WLA expressed as a standard to be met in the receiving water), but may also include interim requirements incorporated into an approved Watershed Management Program to achieve compliance with final receiving water limitations in Part V of this Order for waterbody-pollutant combinations that are not addressed by a TMDL.

- Permittee demonstrates actual attainment of the associated water quality milestone.
- ii. Minor deviations from interim actions, requirements, and schedules in an approved Watershed Management Program are permitted under the following circumstances:
 - (a) Notification is provided to the Los Angeles Water Board in the Annual Report, including a clear description of the interim action or requirement in the Watershed Management Program, an explanation for the deviation, and the revised schedule, requirement, and/or action.
 - (b) The final deadline for project completion or program implementation will still be met.
 - (c) Any revised action or substituted action(s) will provide equivalent water quality improvement.
 - iii. A Permittee that fails to implement the actions and schedules in an approved Watershed Management Program for any waterbody-pollutant combination must either:
 - (a) Revise its Watershed Management Program per Parts IX.E.2, IX.F.3 or Part IX.G.3.a of this Order to maintain deemed compliance status unless the deviation is minor per Part X.B.1.b.ii of this Order; or
 - (b) Comply directly with the WQBELs and receiving water limitations in Part IV.B and Attachments K through S of this Order, or
 - (c) If there is no applicable TMDL, comply directly with the final receiving water limitations in Part V of this Order.

2. Final WQBELs and Receiving Water Limitations

- a. **Direct Demonstration of Compliance.** A Permittee is in compliance with final WQBELs and receiving water limitations in Part IV.B and Attachments K through S of this Order and/or in Part V of this Order, if the Permittee demonstrates any of the following:
 - i. There are no exceedances of the WQBEL for the specific pollutant in the discharge at the Permittee's compliance point(s), including an outfall to the receiving water that collects discharges from multiple Permittees' jurisdictions;
 - ii. There are no exceedances of the receiving water limitation for the specific pollutant in the receiving water(s) at, or downstream of, the Permittees' compliance point(s);
 - iii. There is no direct or indirect discharge from the Permittee's MS4 to the receiving water during the relevant time period; or
 - iv. The exceedance is the result of an authorized or exempt non-stormwater discharge specified in Part III.A.2 of this Order during a specific sampling event. The water quality characteristics must be based on the source specific water quality monitoring data from the authorized or conditionally exempt essential non-stormwater discharge or other relevant information documenting the characteristics of the specific non-stormwater discharge.

b. Alternative Demonstration of Compliance

- i. A Permittee shall be deemed in compliance with the receiving water limitations in Part V of the Order if it is implementing the applicable TMDL requirement(s) in Part IV.B and Attachments K through S of this Order; or
- ii. A Permittee shall be deemed in compliance with the WQBELs and receiving water limitations for the U.S. EPA TMDLs identified in Part IV.B.2.c of this Order and/or the receiving water limitations in Part V of the Order if it is implementing an approved Watershed Management Program, consistent with the actions and schedules therein, to address the applicable waterbody-pollutant combination pursuant to Part IX of this Order. A Permittee may only rely on this compliance path up until the final deadline for achievement of the relevant WQBEL and/or receiving water limitation; or
- iii. A Permittee shall be deemed in compliance with final WQBELs and receiving water limitations in Part IV.B and Attachments K through S of this Order if it has retained all conditionally exempt, non-essential non-stormwater as defined in Part III.A (Prohibitions – Non-Stormwater Discharges) of this Order and all stormwater runoff up to and including the volume equivalent to the 85th percentile, 24-hour event for the drainage area tributary to the applicable receiving water for that waterbody provided the Permittee is implementing all actions and schedules in an approved Watershed Management Program including, but not limited to the ongoing monitoring and adaptive management requirements in Parts IX.D and IX.E of this Order; or
- iv. Upon notification of a Ventura County Permittee’s intent to develop a WMP or join an existing WMP and prior to approval of the new or updated WMP, a Permittee’s full compliance with all requirements in Part IX.F of this Order shall constitute a Permittee’s compliance with the receiving water limitations provisions in Part V.A of this Order. A Permittee will only be deemed in compliance for receiving water limitations for those pollutants that are listed in the NOI.

C. WQBELs and Receiving Water Limitations for Trash

1. General

- a. A Permittee may rely on another permittee or entity to implement trash controls or systems to achieve compliance with WQBELs or receiving water limitations for trash; however, a Permittee remains ultimately responsible for compliance with any WQBEL or receiving water limitation for trash applicable to its jurisdictional area.
- b. If a Permittee’s compliance strategy includes the installation of full capture systems and/or partial capture devices and institutional controls in the area serviced by another public entity, then the Permittee is responsible for obtaining all necessary authorizations, including any permits, to do so.
- c. If a Permittee is unable to obtain the necessary authorizations to install a full capture system or partial capture device within another Permittee’s MS4 infrastructure, either Permittee may request a dispute resolution conference with the Los Angeles Water Board. Nothing in this subsection shall be construed as relieving a Permittee of any liability that the Permittee would otherwise have under this Order.

2. Areas not addressed by a Trash TMDL

- a. A Permittee is in compliance with the receiving water limitation for trash in Part V of this Order if the Permittee demonstrates any one of the following:
 - i. There are no exceedances of the trash receiving water limitation in the receiving water(s) at, or downstream of, the Permittees' outfall(s); or
 - ii. There is no direct or indirect discharge from the Permittee's MS4 to the receiving water during the relevant time period.
- b. Compliance with the Discharge Prohibition in Part III.B of this Order will be considered as evidence of whether a Permittee is causing or contributing to a violation of the receiving water limitation for trash in Part V of this Order in drainage areas within PLUs, equivalent alternative land uses, or designated land uses.

3. Areas Addressed by a Trash TMDL

a. Full Capture System Compliance Option

- i. A Permittee is in compliance with the interim and final WQBELs for trash outlined in Part IV.B and Attachments K through S of this Order, as specified in Part IV.B.3.b.i of this Order.
- ii. A Permittee violates its interim or final WQBELs for trash, if any of the following are true:
 - (a) The Permittee fails to demonstrate that it has addressed all drainage areas within its jurisdiction with full capture systems,
 - (b) The full capture systems for any drainage area(s) are not adequately sized and maintained,
 - (c) Maintenance records are not up-to-date and available for inspection by the Los Angeles Water Board, or
 - (d) It is not in compliance with any of the conditions of the certification of the specific full capture device.
- iii. A Permittee that violates its interim or final WQBELs for trash is presumed to have discharged trash in an amount equal to the percentage of the baseline waste load allocation⁶⁶ represented by the drainage area within its jurisdiction not addressed with full capture systems. A Permittee may overcome this presumption by demonstrating that the actual or calculated discharge for that drainage area is fully or partially in compliance with the applicable interim or final effluent limitation.

b. Other Compliance Options

- i. A Permittee is in compliance with the interim or final WQBELs for trash outlined in Part IV.B and Attachments K through S of this Order, as specified in Part IV.B.3.b.ii-iv of this Order (Mass Balance, Scientifically Based Alternative, and Minimum Frequency of Assessment and Collection).
- ii. A Permittee that violates its interim and/or final WQBEL is presumed to have violated the applicable limitation for each day of each storm event that generated precipitation greater than 0.25 inch during the applicable water year, except

⁶⁶ Baseline Waste Load Allocation as defined in Attachment A of this Order.

those storm days on which it establishes that its trash discharges have not exceeded the applicable effluent limitation.

D. Commingled Discharges

1. Permittees that have commingled MS4 discharges are jointly responsible for meeting the requirements of this Order. However, Permittees are only responsible for discharges from the MS4 for which they are owners and/or operators.
2. Where Permittees have commingled MS4 discharges to the receiving water, compliance at the outfall discharging to the receiving water or compliance in the receiving water shall be determined for the group of Permittees as a whole unless an individual Permittee demonstrates that its discharge did not cause or contribute to the exceedance.
3. Permittees are responsible for demonstrating that their discharge did not cause or contribute to an exceedance of an applicable WQBEL or receiving water limitation.
4. A Permittee may demonstrate that its discharge did not cause or contribute to an exceedance of an applicable WQBEL or receiving water limitation in the manner described in Part X.B.2 of this Order.
5. A Permittee may also demonstrate that its discharge did not cause or contribute to an exceedance of an applicable receiving water limitation by demonstrating that there was an alternative source of a pollutant that is not typically associated with MS4 discharges that caused the exceedance, and that pollutant was not discharged from the Permittee's MS4. For any such demonstration, the Permittee shall use the most current source identification methodology(ies) for the applicable pollutant.

E. Time Schedule Orders

1. Unless a Permittee has selected, and is in compliance, with one of the alternative compliance options set forth in Part X.B of this Order, the Permittee must comply with any applicable interim and final WQBELs and receiving water limitations in accordance with the corresponding compliance schedule deadlines.
2. Where a Permittee believes that it needs additional time to comply with these WQBELs and/or receiving water limitations, a Permittee may request a TSO pursuant to California Water Code sections 13300 and/or 13385(j)(3) for the Los Angeles Water Board's consideration. A Permittee seeking an extension of a compliance deadline, other than a final TMDL deadline, in an approved Watershed Management Program does not need a TSO and may request the extension in accordance with the modification provisions in Part IX.C of this Order.
3. If a TSO is issued and the Permittee is in compliance with that TSO, the Los Angeles Water Board will not pursue further enforcement of violations involving the specific waterbody-pollutant combination(s) addressed in the TSO, including the mandatory minimum penalty provisions of section 13385(h) and (i) for violations of WQBELs in Part IV.B and Attachments K through S of this Order.
4. Permittees may either individually request a TSO or may jointly request a TSO with Permittees subject to the WQBELs and/or receiving water limitations.
5. At a minimum, a written request for a time schedule order must include the following:
 - a. Data demonstrating the current quality of the MS4 discharge(s) in terms of concentration and/or load of the target pollutant(s) to the receiving waters subject to the TMDL;

- b. A detailed description and chronology of structural controls and source control efforts, since the effective date of the TMDL, to reduce the discharge of the pollutant(s) from the MS4 to the receiving waters subject to the TMDL;
- c. Justification of the need for additional time to achieve the WQBELs and/or receiving water limitations which may include time to collaborate with other entities not regulated by the Regional MS4 Permit on a specific project(s) that will reduce discharges of the pollutant(s) from multiple sources;
- d. A detailed time schedule of specific actions the Permittee will take in order to achieve the water WQBELs and/or receiving water limitations;
- e. A demonstration that the time schedule requested is as short as possible, considering the technological, operation, and economic factors that affect the design, development, and implementation of the control measures that are necessary to comply with the WQBELs and/or receiving water limitation(s); and
- f. If the requested time schedule exceeds one year, the proposed schedule must include interim requirements and the date(s) for their achievement.

XI. ENFORCEMENT

A. General

- 1. With the caveat that only one kind of penalty may be applied for each kind of violation, violation of any of the provisions of this Order may subject the violator to any of the penalties described herein or in Attachment D of this Order, or any combination thereof, at the discretion of the prosecuting authority.
- 2. Failure to comply with provisions or requirements of this Order, or violation of other applicable laws or regulations governing discharges through the MS4 to receiving waters, may subject a Permittee to administrative or civil liabilities, criminal penalties, and/or other enforcement remedies to ensure compliance. Additionally, certain violations may subject a Permittee to civil or criminal enforcement from appropriate local, state, or federal law enforcement entities.
- 3. Section 13385 of the California Water Code provides that any person who violates a waste discharge requirement or a provision of the California Water Code is subject to civil penalties of up to \$5,000 per day, \$10,000 per day, or \$25,000 per day of violation, or when the violation involves the discharge of pollutants, is subject to civil penalties of up to \$10 per gallon per day or \$25 per gallon per day of violation; or some combination thereof, depending on the violation, or upon the combination of violations.
- 4. California Water Code section 13385(h)(1) requires the Los Angeles Water Board to assess a mandatory minimum penalty of three-thousand dollars (\$3,000) for each serious violation. Pursuant to California Water Code section 13385(h)(2), a “serious violation” is defined as any waste discharge that violates the effluent limitations contained in the applicable waste discharge requirements for a Group II pollutant by 20 percent or more, or for a Group I pollutant by 40 percent or more. Appendix A of 40 CFR section 123.45 specifies the Group I and II pollutants. Pursuant to California Water Code section 13385.1(a)(1), a “serious violation” is also defined as “a failure to file a discharge monitoring report required pursuant to Section 13383 for each complete period of 30 days following the deadline for submitting the report, if the report is designed to ensure compliance with limitations contained in waste discharge requirements that contain effluent limitations.”

5. California Water Code section 13385(i) requires the Los Angeles Water Board to assess a mandatory minimum penalty of three-thousand dollars (\$3,000) for each violation whenever a person violates a waste discharge requirement effluent limitation in any period of six consecutive months, except that the requirement to assess the mandatory minimum penalty shall not be applicable to the first three violations within that time period.
6. Pursuant to California Water Code section 13385.1(d), for the purposes of section 13385.1 and subdivisions (h), (i), and (j) of section 13385, “effluent limitation” means a numeric restriction or a numerically expressed narrative restriction, on the quantity, discharge rate, concentration, or toxicity units of a pollutant or pollutants that may be discharged from an authorized location. An effluent limitation may be final or interim and may be expressed as a prohibition. An effluent limitation, for these purposes, does not include a receiving water limitation, a compliance schedule, or a best management practice.
7. Unlike subdivision (c) of California Water Code section 13385, where violations of effluent limitations may be assessed administrative civil liability on a per day basis, the mandatory minimum penalties provisions identified above require the Los Angeles Water Board to assess mandatory minimum penalties for “each violation” of an effluent limitation. Some water quality-based effluent limitations in Attachments K through S of this Order (e.g., trash, as described immediately below) are expressed as annual effluent limitations. Therefore, for such limitations, there can be no more than one mandatory minimum penalty for each interim or final effluent limitation per year.

B. Trash TMDLs

For the purposes of discretionary enforcement under California Water Code section 13385, subdivisions (a), (b), and (c), not every storm event may result in trash discharges. In trash TMDLs adopted by the Los Angeles Water Board, the Los Angeles Water Board states that improperly deposited trash is mobilized during storm events of greater than 0.25 inch of precipitation. Therefore, violations of the effluent limitations are limited to the days of a storm event of greater than 0.25 inch. When a Permittee has violated the annual effluent limitation, any subsequent discharges of trash during any day of a storm event of greater than 0.25 inch during the same water year constitutes an additional day in which the violation of the effluent limitation occurs, unless the Permittee has established that its discharge has not exceeded the applicable effluent limitation for trash on the relevant storm days consistent with Part X.C.3.b.ii of this Order.

ATTACHMENT A – DEFINITIONS

85th Percentile, 24-Hour Storm Event

The 85th percentile, 24-hour storm event is a statistical design storm defined through a hydrologic analysis of long-term rainfall records for a particular geographic area. At the most basic level, the design storm represents the 85th percentile, 24-hour rainfall depth (typically measured in inches of rain) among all 24-hour rainfall depths evaluated in the historical record. Analyses that define this storm event often express the 85th percentile, 24-hour storm event as an “isohyetal” or “isopluvial” map with contour lines connecting areas with the same 85th percentile, 24-hour rainfall depth. In some situations (e.g. in storm hydrographs), the temporal distribution of rainfall during the 85th percentile, 24-hour storm event may be assumed.

Adverse Impact

A detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants.

Anti-degradation Policies

State and federal laws, regulations and policies established to protect waters from degradation. In particular, these laws, regulations and policies protect waters where existing quality is higher than necessary for the protection of beneficial uses. These requirements are set forth in *Statement of Policy with Respect to Maintaining High Quality of Waters in California*, State Water Board Resolution No. 68-16 and 40 C.F.R. section 131.12.

Applicable Standards and Limitations

All State, interstate, and federal standards and limitations to which a “discharge” or a related activity is subject under the CWA, including effluent limitations, water quality standards, standards of performance, toxic effluent standards or prohibitions, and pretreatment standards under sections 301, 302, 303, 304, 306, 307, 308, 403 and 404 of the CWA.

Areas of Special Biological Significance (ASBS)

As defined in the Water Quality Control Plan for Ocean Waters of California (California Ocean Plan), ASBS are all those areas designated by the State Water Board as ocean areas requiring protection of species or biological communities to the extent that maintenance of natural water quality is assured. All Areas of Special Biological Significance are also classified as a subset of State Water Quality Protection Areas. ASBS are also referred to as State Water Quality Protection Areas – Areas of Special Biological Significance (SWQPA-ASBS). These areas include the Mugu Lagoon to Latigo Point ASBS (also known as ASBS 24) located along the coastline of Ventura and Los Angeles counties.

Arithmetic Sample Mean (μ)

Also called the average, is the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic sample mean is calculated as follows:

Arithmetic sample mean = $\mu = \Sigma \bar{x} / n$ where:

$\Sigma \bar{x}$ is the sum of the measured ambient water concentrations, and n is the number of samples.

Authorized Discharge

Any discharge that is authorized pursuant to an NPDES permit, waste discharge requirements, a conditional waiver of waste discharge requirements, or other appropriate order issued by the State or Regional Water Board or complies with the requirements set forth in the Order.

Authorized Non-Stormwater Discharge

Authorized non-stormwater discharges are discharges that are not composed entirely of stormwater and that are either: (1) separately regulated by an individual or general NPDES permit and allowed to discharge into the MS4 when in compliance with all NPDES permit conditions; (2) separately regulated by a conditional waiver of waste discharge requirements (WDRs) or WDRs for agricultural lands; (2) authorized by U.S. EPA¹ pursuant to sections 104(a) or 104(b) of CERCLA that either (i) will comply with water quality standards as applicable or relevant and appropriate requirements (“ARARs”) under section 121(d)(2) of CERCLA or (ii) are subject to (a) a written waiver of ARARs by U.S. EPA pursuant to section 121(d)(4) of CERCLA or (b) a written determination by U.S. EPA that compliance with ARARs is not practicable considering the exigencies of the situation, pursuant to 40 CFR section 300.415(j); or (3) necessary for emergency responses purposes, including discharges from emergency firefighting activities.

Automotive Service Facilities

A facility that is categorized in any one of the following Standard Industrial Classification (SIC) and North American Industry Classification System (NAICS) codes. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5511, and 5541, provided that these facilities have no outside activities or materials that may be exposed to stormwater.

| SIC Code | Corresponding NAICS Code |
|----------|------------------------------------|
| 5013 | 425120, 441310, 425110, and 423120 |
| 5014 | 425120, 425110, 423130, and 441320 |
| 5511 | 441110 |
| 5541 | 447110 and 447190 |
| 7532 | 811121 |
| 7533 | 811112 |
| 7534 | 326212 and 811198 |
| 7536 | 811122 |
| 7537 | 811113 |
| 7538 | 811111 |
| 7539 | 811198 and 811118 |

Average Monthly Effluent Limitation (AMEL)

The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Baseline Waste Load Allocation

The initial pollutant load ascribed to a Permittee as part of a TMDL. Typically Baseline Waste Load Allocations are used to implement trash TMDLs, in which progressive reductions in the Waste Load Allocations are based on a percentage of the Baseline Waste Load Allocation. Several trash TMDLs applicable to the Permittees require that Permittees establish Baseline Waste Load Allocations through an approved Trash Monitoring and Reporting Plan.

¹ These typically include short-term, high volume discharges resulting from the development or redevelopment of groundwater extraction wells, or U.S. EPA or State-required compliance testing of potable water treatment plants, as part of a U.S. EPA authorized groundwater remediation action under CERCLA.

Basin Plan

The Water Quality Control Plan, Los Angeles Region, otherwise known as the Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties.

Beneficial Uses

The existing or potential uses of receiving waters as designated by the Los Angeles Water Board in the Basin Plan.

Best Management Practices (BMPs)

BMPs are practices or physical devices or systems designed to prevent or reduce pollutant loading from stormwater or non-stormwater discharges to receiving waters.

Bioaccumulative

Those substances taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Biofiltration

A Low Impact Development (LID) BMP that reduces stormwater pollutant discharges by intercepting rainfall on vegetative canopy, and through incidental infiltration and/or evapotranspiration, and filtration. Planning level analyses described in the *Ventura County Technical Guidance Manual* estimate that biofiltration of 1.5 times the stormwater quality design volume (SWQDv) provides approximately equivalent or greater reductions in pollutant loading when compared to bioretention or infiltration of the SWQDv.² Incidental infiltration is an important factor in achieving the required pollutant load reduction. Therefore, the term “biofiltration” as used in the Order is defined to include only systems designed to facilitate incidental infiltration or achieve the equivalent pollutant reduction as biofiltration BMPs with an underdrain. Biofiltration BMPs include bioretention systems with an underdrain and bioswales.

Bioretention

A LID BMP that reduces stormwater runoff by intercepting rainfall on vegetative canopy, and through evapotranspiration and infiltration. The bioretention system typically includes a minimum 2-foot top layer of a specified soil and compost mixture underlain by a gravel-filled temporary storage pit dug into the *in-situ* soil. As defined in the Order, a bioretention BMP may be designed with an overflow drain but may not include an underdrain. When a bioretention BMP is designed or constructed with an underdrain it is regulated in the Order as a biofiltration BMP.

Bioswale

A LID BMP consisting of a shallow channel lined with grass or other dense, low-growing vegetation. Bioswales are designed to collect stormwater runoff and to achieve a uniform sheet flow through the dense vegetation for a period of several minutes.

Carcinogenic

Pollutants that are known to cause cancer in living organisms.

Chronic Toxicity

A measurement of a sublethal effect (e.g., reduced growth, reproduction) to experimental test organisms exposed to effluent or ambient waters compared to that of the control organisms.

² Geosyntec Consultants and Larry Walker Associates. 2015. *Ventura County Technical Guidance Manual for Stormwater Quality and Control Measures, Manual Update 2011, Errata Update 2015. Appendix D.* Prepared for the Ventura Countywide Stormwater Quality Management Program. May 29, 2015. pp. D-4 – D-15.

Co-Permittee

Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators (40 CFR 122.26(a)(3)(vi)).

Coefficient of Variation (CV)

CV is a measure of data variability and is calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

Commercial Malls

Any development on private land comprised of one or more buildings forming a complex of stores which sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with a parking area(s). A commercial mall includes, but is not limited to: mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers.

Conditionally Exempt Essential Non-Stormwater Discharge

Conditionally exempt essential non-stormwater discharges are certain categories of discharges that are not composed entirely of stormwater and that are allowed by the Los Angeles Water Board to discharge into the MS4, if the discharge is in compliance with all specified requirements; are not otherwise regulated by an individual or general NPDES permit; and are essential public services that are directly or indirectly required by other State or federal statute and/or regulation. These include non-stormwater discharges such as from drinking water supplier distribution system releases. Conditionally exempt essential non-stormwater discharges may contain minimal amounts of pollutants, however, when in compliance with industry standard BMPs and control measures, do not result in significant environmental effects. (See 55 Fed. Reg. 47990, 47995 (Nov. 16, 1990)).

Conditionally Exempt Non-Stormwater Discharge

Conditionally exempt non-stormwater discharges are certain categories of discharges that are not composed entirely of stormwater and that are either not sources of pollutants or may contain only minimal amounts of pollutants and when in compliance with specified BMPs do not result in significant environmental impacts. (See 55 Fed. Reg. 47990, 47995 (Nov. 16, 1990)).

Construction Activity

Construction activity includes any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that results in land disturbance. Construction does not include emergency construction activities required to immediately protect public health and safety or routine maintenance activities required to maintain the integrity of structures by performing minor repair and restoration work, maintain the original line and grade, hydraulic capacity, or original purposes of the facility. See "Routine Maintenance" definition for further explanation. Where clearing, grading or excavating of underlying soil takes place during a repaving operation, the Statewide General Construction Permit coverage is required if more than one acre is disturbed or the activities are part of a larger plan.

Construction General Permit

General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities. General NPDES permit issued by the State Water Board, which authorizes the discharge of stormwater from construction activities under certain conditions.

Control

To minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

Daily Discharge

Daily Discharge is defined as “discharge of a pollutant” measured during a calendar day or any 24-hour period that reasonably represents the calendar day for purposes of sampling. For pollutants with limitations expressed in units of mass, the “daily discharge” is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the “daily discharge” is calculated as the average measurement of the pollutant over the day. (40 CFR § 122.2).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

Daily Generation Rate (DGR)

The estimated amount of trash deposited within a representative drainage area during a 24-hour period, calculated from the amount of trash collected from streets and catch basins in the area over a 30-day period between June 22 and September 22.

Dechlorinated / Debrominated Swimming Pool Discharge

Swimming pool discharges which do not contain measurable quantities of chlorine or bromine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term does not include swimming pool filter backwash.

Detected, but Not Quantified (DNQ)

DNQ are those sample results less than the Reporting Level (RL), but greater than or equal to the laboratory’s Method Detection Limit (MDL). Sample results reported as DNQ are estimated concentrations.

Development

Any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

Directly Adjacent

For priority development projects as set forth in the “Planning and Land Development” provisions, projects situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of an environmentally sensitive area.

Director

The Director of a municipality and Person(s) designated by and under the Director’s instruction and supervision.

Discharge

When used without qualification the release of a pollutant or pollutants from the MS4.

Direct Discharge

Outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

Discharge of a Pollutant

Any addition of any “pollutant” or combination of pollutants to “waters of the United States” from any “point source” or, any addition of any pollutant or combination of pollutants to the waters of the “contiguous zone” or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by a State, municipality, or other person which do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

Disturbed Area

An area that is altered as a result of clearing, grading, and/or excavation.

Drinking Water Distribution System Discharges

Sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, distribution line testing, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and minor non-invasive well maintenance activities not involving chemical addition(s). It does not include wastewater discharges from activities that occur at wellheads, such as well construction, well development (i.e., aquifer pumping tests, well purging, etc.), or major well maintenance. For the purposes of the Order, drinking water distribution system discharges include treated and raw water (from raw water pipelines, reservoirs, storage tanks, etc.) that are dedicated for drinking water supply.

Effective Impervious Area (EIA)

EIA is the portion of the surface area that is hydrologically connected to a drainage system via a hardened conveyance or impervious surface without any intervening pervious area to mitigate the runoff volume.

Effluent Limitation

Any restriction imposed on quantities, discharge rates, and concentrations of pollutants, which are discharged from point sources to waters of the U.S. (40 CFR § 122.2).

Emergency Situation

Any incident, whether natural, technological, or human-caused, that requires responsive action to protect life or property.³ The responsive action should implement measures, to the fullest extent possible, to reduce the threat to water quality.

Enclosed Bays

Enclosed Bays means indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake’s Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower

³ As defined by the Federal Emergency Management Agency (FEMA).

Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

Equivalent Alternate Land Uses

Per the *Water Quality Control Plan for Ocean Waters of California* (Ocean Plan) and the *Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (ISWEBE Plan), hereafter collectively referred to as the Statewide Trash Provisions, an MS4 permittee with regulatory authority over priority land uses may request to substitute one or more priority land uses with alternate land use(s) within the MS4 permittee's jurisdiction that generates rates of trash that are equivalent to or greater than the priority land use(s) being substituted. The substitution request need not be an acre-for-acre substitution but may involve one or more priority land uses, or a fraction of a priority land use, or both. However, the total trash generated in the equivalent alternate land use must be equivalent to or greater than the total trash generated from the priority land use(s) for which substitution is requested. Comparative trash generation rates shall be established through the reporting of quantification measures such as street sweeping and catch basin cleanup records; mapping; visual trash assessment; or other information as required by the Los Angeles Water Board.

Estimated Chemical Concentration

The estimated chemical concentration that results from the confirmed detection of the substance by an analytical method which results in a value below the Minimum Level (ML).

Estuaries

Estuaries means waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater. Estuaries do not include inland surface waters or ocean waters.

Existing Discharger

Any discharger that is not a new discharger. An existing discharger includes an "increasing discharger" (i.e., any existing facility with treatment systems in place for its current discharge that is or will be expanding, upgrading, or modifying its permitted discharge after the effective date of the Order).

Flow-through treatment BMPs

Flow-through treatment BMPs include modular, vault type "high flow biotreatment" devices contained within an impervious vault with an underdrain or designed with an impervious liner and an underdrain.

Freshwater

All waters where the salinity is equal to or less than 1 ppt (one part per thousand) 95 percent or more of the time during the water year.

Full Capture System (FCS)

A treatment control, or series of treatment controls, including but not limited to, a multi-benefit project or a low impact development control that traps all particles that are 5 mm or greater, and has a design treatment capacity that is either: a) of not less than the peak flow rate, Q, resulting from a one-year, one-hour, storm in the subdrainage area, or b) appropriately sized to, and designed to carry at least the same flows as, the corresponding storm drain.

The rational equation is used to compute the peak flow rate: $Q = C \times I \times A$, where Q = design flow rate (cubic feet per second, cfs); C = runoff coefficient (dimensionless); I = design rainfall intensity (inches per

hour, as determined per the rainfall isohyetal map specific to each region, and A = subdrainage area (acres).

Prior to installation, full capture systems must be certified by the Executive Director, or designee, of the State Water Board. Uncertified full capture systems will not satisfy the requirements in the Order pertaining to trash. Full capture systems certified by the Los Angeles Water Board prior to the effective date of the Trash Amendments shall satisfy the requirements pertaining to trash, unless the Executive Director, or designee, of the State Water Board determines otherwise.

Full Capture System Equivalency (FCSE)

The trash load that would be reduced if full capture systems were installed, operated, and maintained for all storm drains that capture runoff from the relevant areas of land (priority land uses, significant trash generating areas, facilities or sites regulated by NPDES permits for discharges of stormwater associated with industrial activity, or specific land uses or areas that generate substantial amounts of trash, as applicable). The full capture system equivalency is a trash load reduction target that the permittee quantifies by using an approach, and technically acceptable and defensible assumptions and methods for applying the approach, subject to the approval of the Los Angeles Water Board.

Geometric Mean

A type of mean or average that indicates the central tendency or typical value of a set of numbers by using the product of their values (as opposed to the arithmetic mean which uses their sum). The geometric mean is defined as the n th root of the product of n numbers. The formula is expressed as: $GM = \sqrt[n]{(x_1)(x_2)(x_3) \dots (x_n)}$, where x_n is the sample value and n is the number of samples collected.

Green Infrastructure

The range of measures that use plant or soil systems, permeable pavement or other permeable surfaces or substrates, stormwater harvest and reuse, or landscaping to store, infiltrate, or evapotranspire stormwater and reduce flows to sewer systems or to surface waters (CWA § 502(27), 33 U.S.C. 1362(27)).

Green Roof

A LID BMP using planter boxes and vegetation to intercept rainfall on a roof surface. Rainfall is intercepted by vegetation leaves and through evapotranspiration. Green roofs may be designed as either a bioretention BMP or as a biofiltration BMP. To receive credit as a bioretention BMP, the green roof system planting medium shall be of sufficient depth to provide capacity within the pore space volume to contain the design storm depth and may not be designed or constructed with an underdrain.

High Flow Suspension (HFS)

The High Flow Suspension shall apply to waters where the (av) footnote appears in Table 2-1a of the Basin Plan on days with rainfall equal to or greater than ½ inch and the 24 hours following the end of the ½-inch or greater rain event, as measured at the nearest local rain gauge, using local Doppler radar, or using widely accepted rainfall estimation methods. The HFS only applies to water contact recreational activities associated with the swimmable goal as expressed in the federal Clean Water Act section 101(a)(2) and regulated under the REC-1 use, non-contact water recreation involving incidental water contact regulated under the REC-2 use, and the associated bacteriological objectives set to protect those activities. Water quality objectives set to protect (1) other recreational uses associated with the fishable goal as expressed in the federal Clean Water Act section 101(a)(2) and regulated under the REC-1 use and (2) other REC-2 uses (e.g., uses involving the aesthetic aspects of water) shall remain in effect at all times for waters subject to the HFS.

Hydrologic Unit Code (HUC)

A standardized watershed classification system in which each hydrologic unit is identified by a unique hydrologic unit code (HUC). The HUC may consist of an eight (8) to twelve (12) digit number. The 8-digit HUC identifies an area based on four levels of classification: region, sub-region, hydrologic basin, and hydrologic sub-basin. The Watershed Boundary Dataset includes the 12-digit HUC delineation, which further divides each hydrologic unit into watersheds and sub-watersheds based on scientific information and not administrative boundaries. The Watershed Boundary Dataset is the highest resolution and the most detailed delineation of the watershed boundaries. The mapping precision has been improved to a scale of 1:24,000.

Hydromodification

The alteration away from a natural state of stream flows or the beds or banks of rivers, streams, or creeks, including ephemeral washes, which results in hydrogeomorphic changes.

Illicit Connection

Any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

Illicit Discharge

Any discharge into the MS4 that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes any non-stormwater discharge, except authorized non-stormwater discharges; conditionally exempt non-stormwater discharges; and non-stormwater discharges resulting from natural flows specifically identified in the Order.

Illicit Disposal

Any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute stormwater or authorized or conditionally exempt non-stormwater.

Industrial General Permit

General Permit for Storm Water Discharges Associated with Industrial Activities. General NPDES permit issued by the State Water Board, which authorizes the discharge of stormwater from certain industrial activities under certain conditions.

Industrial/Commercial Facility

Any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by either the Standard Industrial Classifications (SIC) or the North American Industry Classification System (NAICS). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

Industrial Park

A land development that is set aside for industrial development. Industrial parks are typically located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It also includes office parks, which have offices and light industry.

Infiltration BMP

A LID BMP that reduces stormwater runoff by capturing and infiltrating the runoff into in-situ soils or amended on-site soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement.⁴

Inland Surface Waters

All surface waters of the state that do not include the ocean, enclosed bays, or estuaries.

Inspection

An on-site review of a facility and its operations, at reasonable times, to determine compliance with specific municipal or other legal requirements. The steps involved in performing an inspection, include, but are not limited to:

1. Pre-inspection documentation research;
2. Request for entry;
3. Interview of facility personnel;
4. Facility walk-through;
5. Visual observation of the condition of facility premises;
6. Examination and copying of records as required;
7. Sample collection (if necessary or required);
8. Exit conference (to discuss preliminary evaluation); and,
9. Report preparation, and if appropriate, recommendations for coming into compliance.

Instantaneous Maximum Effluent Limitation

The highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation

The lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Institutional Controls

Programmatic measures that do not require construction or structural modifications to the MS4. Examples include street sweeping, public education, and clean out of catch basins that discharge to storm drains.

Integrated Pest Management (IPM)

An ecosystem-based strategy that focuses on long-term prevention of pests or their damage through a combination of techniques such as biological control, habitat manipulation, modification of cultural practices, and use of resistant varieties.

Large Municipal Separate Storm Sewer System (MS4)

As defined in 40 CFR 122.26 (b)(4), all MS4s that are either:

- (i) Located in an incorporated place with a population of 250,000 or more as determined by the 1990 Decennial Census by the Bureau of the Census;

⁴ Some types of infiltration BMPs such as dry wells, may meet the definition of a Class V, deep well injection facility and may be subject to permitting under U.S. EPA requirements.

- (ii) Located in the counties listed in appendix H [of 40 CFR Part 122], except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or
- (iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:
 - (A) Physical interconnections between the municipal separate storm sewers;
 - (B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(4)(i) of this section;
 - (C) The quantity and nature of pollutants discharged to waters of the United States;
 - (D) The nature of the receiving waters; and
 - (E) Other relevant factors; or
- (iv) The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraph (b)(4) (i), (ii), (iii) of this section.”

Limiting Pollutant

The limiting pollutant is defined as a pollutant, demonstrated through an RAA, that requires a higher level of stormwater management relative to other pollutants, such that implementation of actions or controls to address the limiting pollutant are reasonably expected to achieve receiving water and/or water quality based effluent limitation(s) for other pollutants within the same schedule.

Linear Underground/Overhead Project (LUP)

LUPs including, but are not limited to, those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/borrow locations.

Linear Underground / Overhead Project Type

Based on the location and complexity of a Linear Underground/Overhead Project, these projects are separated into LUP Types. The possible LUP Types are Type 1, Type 2, and Type 3 with Type 1 sites imposing the lowest risk to water quality and Type 3 sites imposing the highest. The Construction General Permit provides an LUP Type determination worksheet.

Low Impact Development (LID)

The implementation of systems and practices that use or mimic natural processes to: 1) infiltrate and recharge, 2) evapotranspire and/or 3) harvest and use precipitation near to where it falls to earth.

Los Angeles Region

Los Angeles Region comprises all basins draining into the Pacific Ocean between the southeasterly boundary, located in the westerly part of Ventura County, of the watershed of Rincon Creek and a line which coincides with the southeasterly boundary of Los Angeles County from the ocean to San Antonio Peak and follows thence the divide between San Gabriel River and Lytle Creek drainages to the divide between Sheep Creek and San Gabriel River drainages. (California Water Code section 13200(d).) The Los Angeles Region does not include the cities of Lancaster and Palmdale, which are within the jurisdiction of the Lahontan Region (also known as Region 6).

Major Outfall

Major municipal separate storm sewer outfall (or “major outfall”) means a municipal separate storm sewer outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more). (40 CFR § 122.26(b)(5))

Marine Waters

All waters where the salinity is greater than 1 ppt (one part per thousand) more than 5 percent of the time during the water year. Marine waters include ocean waters and saline non-ocean waters such as enclosed bay, estuarine, and coastal lagoon waters.

Maximum Daily Effluent Limitation (MDEL)

The highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median

The middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between the $n/2$ and $n/2+1$).

Medium Municipal Separate Storm Sewer System (MS4)

All MS4s that serve a population greater than 100,000 or more but less than 250,000 (1990 Census) as defined in 40 CFR 122.26 (b)(7).

Method Detection Limit (MDL)

MDL is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is distinguishable from method blank results, as defined in 40 C.F.R. part 136, Appendix B.

Minimum Level (ML)

ML is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Municipal Separate Storm Sewer System (MS4)

A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) (40 CFR § 122.26(b)(8)):

1. Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;
2. Designed or used for collecting or conveying storm water;
3. Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR § 122.2.

National Pollutant Discharge Elimination System (NPDES)

The national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA §307, 402, 318, and 405. The term includes an “approved program.”

Natural Drainage System

A natural drainage system is a drainage system that has not been modified using engineering controls (e.g., channelized or armored). The clearing or dredging of a natural drainage system does not cause the system to be classified as modified for purposes of the “Hydromodification Management Requirements” in the Order.

Nature-Based Solution

A project that utilizes natural processes that slow, detain, infiltrate or filter stormwater or urban runoff. These methods may include relying predominantly on soils and vegetation; increasing the permeability of impermeable areas; protecting undeveloped mountains and floodplains; creating and restoring riparian habitat and wetlands; creating rain gardens, bioswales, and parkway basins; and enhancing soil through composting, mulching, and planting trees and vegetation, with preference for native species. Nature-based solutions include projects that mimic natural processes, such as green streets, spreading grounds and planted areas with water storage capacity.

New Development

Land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

Non-Stormwater Discharge

Any discharge into the MS4 that is not composed entirely of stormwater.

Not Detected (ND)

Sample results which are less than the laboratory's MDL.

Nuisance

Anything that meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal.; (3) occurs during, or as a result of, the treatment or disposal of wastes.

Nursery

Nursery operations that are generally classified under 4 broad NAICS classification sectors: (1) 111xxx – Crop Production – Agriculture; (b) 424xxx – Merchant Wholesalers, Nondurable Goods; (c) 44xxxx – Retail Trade; and (d) 454xxx – Non-store retailers. Retail nursery operations shall be covered by the Order. The Order does not cover wholesale nursery stock operations or agricultural nursery operations, unless such operations are not covered by another Order.

Ocean Waters

The territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Water Board's California Ocean Plan.

Outfall

A point source as defined by 40 CFR § 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States. (40 CFR § 122.26(b)(9))

Parking Lot

Land area or facility for the parking or storage of motor vehicles used for businesses, commerce, industry, or personal use.

Partial Capture Device

Any structural trash control device that has not been certified by the Executive Officer of the Los Angeles Water Board, or the Executive Director of the State Water Board, as meeting the "full capture" performance requirements.

Persistent Pollutants

Persistent pollutants are substances for which degradation or decomposition in the environment is nonexistent or prolonged.

Point Source

Any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural stormwater runoff. (40 CFR § 122.2)

Pollutants

Those "pollutants" defined in CWA § 502(6) (33 U.S.C. § 1362(6)) and incorporated by reference into California Water Code §13373.

Pollution Prevention

Pollution Prevention means any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code § 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State Water Board or the Los Angeles Water Board.

Potable Water

Water that meets the drinking water standards of the U.S. Environmental Protection Agency.

Priority Land Uses (PLUs)

Per the *Water Quality Control Plan for Ocean Waters of California* (Ocean Plan) and the *Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (ISWEBE Plan), hereafter collectively referred to as the Statewide Trash Provisions, PLUs are those developed sites, facilities, or land uses (i.e., not simply zoned land uses) within the MS4 permittee's jurisdiction from which discharges of trash are regulated as follows:

1. **High-density residential:** all land uses with at least ten (10) developed dwelling units/acre.
2. **Industrial:** land uses where the primary activities on the developed parcels involve product manufacture, storage, or distribution (e.g., manufacturing businesses, warehouses, equipment storage lots, junkyards, wholesale businesses, distribution centers, or building material sales yards).
3. **Commercial:** land uses where the primary activities on the developed parcels involve the sale or transfer of goods or services to consumers (e.g., business or professional buildings, shops, restaurants, theaters, vehicle repair shops, etc.)
4. **Mixed urban:** land uses where high-density residential, industrial, and/or commercial land uses predominate collectively (i.e., are intermixed).
5. **Public transportation stations:** facilities or sites where public transit agencies' vehicles load or unload passengers or goods (e.g., bus stations and stops).

Project

All development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Pub. Resources Code §21065).

Rain Event

Any rain event greater than 0.1 inch in 24 hours except where specifically stated otherwise.

Rainfall Harvest and Use

Rainfall harvest and use is an LID BMP system designed to capture runoff, typically from a roof but it can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department.

Rare, Threatened, or Endangered Species (RARE)

A beneficial use for waterbodies in the Los Angeles Region, as designated for specific waterbodies in the Basin Plan, that supports habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

Raw Water

Water that is taken from the environment by drinking water suppliers with the intent to subsequently treat or purify it to produce potable water. Raw water does not include wastewater discharges from activities that occur at wellheads, such as well construction, well development (i.e., aquifer pumping tests, well purging, etc.), or major well maintenance.

Receiving Water

A “water of the United States” into which waste and/or pollutants are, or may be, discharged.

Receiving Water Limitation

Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38.

Redevelopment

Redevelopment includes but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

Regional Administrator

The Regional Administrator of the Regional Office of the U.S. EPA or the authorized representative of the Regional Administrator.

Reporting Level (RL)

The RL is the Minimum Level (ML) (and its associated analytical method) chosen by the Discharger for reporting and compliance determination. MLs correspond to the approved analytical methods for reporting a sample result either from Appendix 4 of the SIP in accordance with section 2.4.2 of the SIP or established in accordance with section 2.4.3 of the SIP. The ML represents the lowest quantifiable concentration in a sample based on the proper application of method-based analytical procedures and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied in the computation of the Reporting Level (RL).

Residual Water

In the context of the Order, water remaining in a structural BMP subsequent to the drawdown or drainage period. The residual water typically contains high concentration(s) of pollutants.

Restaurant

Establishments primarily engaged in the retail sale of prepared food and drinks for on-premise or immediate consumption. Caterers and industrial and institutional food service establishments are also included in this industry. (SIC Code 5812).

Retail Gasoline Outlet

Any facility engaged in selling gasoline and lubricating oils – SIC 5541 and NAICS 447110 and 447190.

Routine Maintenance

Routine maintenance projects include, but are not limited to projects conducted to:

1. Maintain the original line and grade, hydraulic capacity, or original purpose of the facility.
2. Perform as needed restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities.
3. Includes road shoulder work, regrading dirt or gravel roadways and shoulders and performing ditch cleanouts.
4. Update existing lines⁵ and facilities to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.
5. Repair leaks.
6. Routine maintenance does not include construction of new⁶ lines or facilities resulting from compliance with applicable codes, standards and regulations.

Runoff

Any runoff including stormwater and non-stormwater from a drainage area that reaches a receiving water body.

Screening

Using proactive methods to identify illicit discharges and/or illicit connections through a continually narrowing process. The methods may include: performing baseline monitoring of open channels, conducting special investigations using a prioritization approach, analyzing maintenance records for catch basin and storm drain cleaning and operation, and verifying all permitted connections into the storm drains. Special investigation techniques may include: dye testing, visual inspection, smoke testing, flow monitoring, infrared, aerial and thermal photography, and remote control camera operation.

Sidewalk Rinsing

Means low-volume pressure washing of paved pedestrian walkways with average water usage of 0.006 gallons per square foot, with no cleaning agents, and proper disposal of all debris collected.

Site

The land or water area where any “facility or activity” is physically located or conducted, including adjacent land used in connection with the facility or activity.

Site Risk Level

The Construction General Permit establishes three levels of risk possible for a construction site. The possible risk levels are level 1, level 2, and level 3 with risk level 1 sites imposing the lowest risk to water quality and risk level 3 sites imposing the highest. Risk levels are assessed by calculating the sediment

⁵ Update existing lines includes replacing existing lines with new materials or pipes.

⁶ New lines are those that are not associated with existing facilities and are not part of a project to update or replace existing lines.

transport risk using the RUSLE formula and determining the receiving water risk. The Construction General Permit provides a Risk Level determination worksheet.

Source Control BMP

Any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent stormwater pollution by reducing the potential for contamination at the source of pollution.

Source of Drinking Water

Any water designated as municipal or domestic supply (MUN) in the Los Angeles Region Basin Plan.

Southern California Stormwater Monitoring Coalition or Stormwater Monitoring Coalition (SMC)

A collaborative research/monitoring partnership of the Southern California Water Boards, Municipal Storm Water Agencies, and municipalities to develop the methodologies and assessment tools to more effectively understand urban stormwater and non-stormwater (anthropogenic) impacts to receiving waters and to conduct research/monitoring through Subsequent Research Implementation Agreements. The first original cooperative agreement was entered into on February 8, 2001.

Standard Deviation (σ)

Standard Deviation is a measure of variability that is calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;

μ is the arithmetic mean of the observed values; and

n is the number of samples.

State Water Quality Protection Areas (SWQPAs)

As defined in the California Ocean Plan, State Water Quality Protection Areas (SWQPAs) are non-terrestrial marine or estuarine areas designated to protect marine species or biological communities from an undesirable alteration in natural water quality. All Areas of Special Biological Significance (ASBS) that were previously designated by the State Water Board in Resolutions 74-28, 74-32, and 75-61 are now also classified as a subset of State Water Quality Protection Areas and require special protections afforded by the California Ocean Plan.

Stormwater Management Program

A Permittees' stormwater management program includes all actions, activities and projects that it implements individually or in conjunction with other Permittees or partners in fulfillment of the requirements of the Order, including those pursuant to an approved Watershed Management Program in which the Permittee is participating.

Storm Water Pollution Prevention Plan (SWPPP)

A plan, as required by a state general permit for discharges of stormwater (e.g., Construction General Permit or Industrial General Permit), identifying potential pollutant sources and describing the design, placement and implementation of BMPs, to effectively prevent non-stormwater discharges and reduce pollutants in stormwater discharges from activities covered by the general permit.

Storm Water (or Stormwater)

Storm water runoff, snow melt runoff, and surface runoff and drainage related to precipitation events (pursuant to 40 CFR § 122.26(b)(13); 55 Fed. Reg. 47990, 47995 (Nov. 16, 1990)).

Storm Water Discharge Associated with Industrial Activity

Industrial discharge as defined in 40 CFR § 122.26(b)(14).

Structural BMP

Any structural facility designed and constructed to mitigate the adverse impacts of stormwater and non-stormwater pollution (e.g. Treatment Control BMPs).

Total Chlordane

The sum of alpha Chlordane, gamma Chlordane, cis-Nonachlor, trans-Nonachlor, and Oxychlordane.

Total DDTs

The sum of isomers *p,p'*-DDT, *p,p'*-DDE, *p,p'*-DDD, *o,p'*-DDT, *o,p'*-DDE and *o,p'*-DDD. Alternatively, the sum of 4,4'-DDT, 4,4'-DDE, 4,4'-DDD, 2,4'-DDT, 2,4'-DDE, and 2,4'-DDD.

Total Maximum Daily Load (TMDL)

The sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background such that the cumulative pollutant load from all sources does not exceed the loading (assimilative) capacity of the waterbody.

Total Nitrogen

The sum of Total Kjeldahl Nitrogen (TKN), Nitrate as Nitrogen and Nitrite as Nitrogen.

Total Polychlorinated Biphenyls (PCBs)

Sum of all 55 PCB congeners listed in Table A-7 of the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality Provisions.

Toxicity Identification Evaluation (TIE)

A set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

Toxicity Reduction Evaluation (TRE)

TRE is a study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate.

Trash

All improperly discarded solid material from any production, manufacturing, or processing operation including, but not limited to, products, product packaging, or containers constructed of plastic, steel, aluminum, glass, paper, or other synthetic or natural materials.

Trash Discharge

Any trash that passes through the trash capture devices and/or uncovered catch basins and enters the storm drain system.

Trash Excluders

Any structural trash control device that prevents the discharge of trash to the storm drain system or to receiving waters. A trash excluder may or may not be certified by the Executive Officer of the Los Angeles

Water Board or the Executive Director of the State Water Board as meeting the “full capture” performance requirements.

Treatment

The application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

Treatment Control BMP

Any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

Uncontaminated Ground Water Infiltration

Water other than waste water that enters the MS4 (including foundation drains) from the ground through such means as defective pipes, pipe joints, connections, or manholes. Infiltration does not include, and is distinguished from, inflow. (See 40 CFR § 35.2005(20).)

U.S. EPA Phase I Facilities

Facilities in specified industrial categories that are required to obtain a NPDES permit for stormwater discharges, as required by 40 CFR § 122.26(c). These categories include:

1. facilities subject to stormwater effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR Subchapter N)
2. manufacturing facilities
3. oil and gas/mining facilities
4. hazardous waste treatment, storage, or disposal facilities
5. landfills, land application sites, and open dumps
6. recycling facilities
7. steam electric power generating facilities
8. transportation facilities
9. sewage of wastewater treatment works
10. light manufacturing facilities

Vehicle Maintenance/Material Storage Facilities/Corporation Yards

Any Permittee owned or operated facility or portion thereof that:

1. Conducts industrial activity, operates equipment, handles materials, and provides services similar to Federal Phase I facilities;
2. Performs fleet vehicle service/maintenance on ten or more vehicles per day including repair, maintenance, washing, and fueling;
3. Performs maintenance and/or repair of heavy industrial machinery/equipment;
4. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control, and Counter-measures (SPCC) plan.

Water Quality-based Effluent Limitation

Any restriction imposed on quantities, discharge rates, and concentrations of pollutants, which are discharged from point sources to waters of the U.S. necessary to achieve a water quality standard.

Waters of the State

Any surface water or groundwater, including saline waters, within the boundaries of the state.

Watershed Management Program (WMP)

A voluntary, alternative compliance pathway where a Permittee or group of Permittees develops a comprehensive program on a watershed or subwatershed scale to achieve compliance with the requirements of the Order, including complying with Receiving Water Limitations, Total Maximum Daily Load Provisions, Discharge Prohibitions, and Minimum Control Measures in a collaborative and holistic manner. Through a WMP, Permittees can identify and implement customized, cost effective strategies and BMPs based on the unique characteristics and water quality priorities of the watershed.

Water Year

Unless otherwise defined in specific permit provisions, the 12-month period beginning October 1, for any given year through September 30, of the following year. The water year is designated by the calendar year in which it ends.

Waters of the United States or Waters of the U.S.⁷

1. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
2. All interstate waters, including interstate "wetlands";
3. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
 - a. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
 - b. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
 - c. Which are used or could be used for industrial purposes by industries in interstate commerce;
4. All impoundments of waters otherwise defined as waters of the United States under this definition;
5. Tributaries of waters identified in paragraphs 1 through 4 of this definition;
6. The territorial sea; and
7. "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraph 1 through 6 of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR section 423.22(m), which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with U.S. EPA.

Wet Season

The calendar period beginning October 1 through April 15 unless otherwise stated.

⁷ Waters of the U.S. definition shall be defined per U.S. EPA's The Navigable Waters Protection Rule (85 Federal Register 22250 (April 21, 2020)) effective on June 22, 2020.

ATTACHMENT D – STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the terms, requirements, and conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action; permit termination, revocation and reissuance, or modification; denial of a permit renewal application; or a combination thereof. (40 C.F.R. § 122.41(a); California Water Code, §§ 13261, 13263, 13265, 13268, 13000, 13001, 13304, 13350, 13385.)
2. The Discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)
2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Los Angeles Water Board, State Water Board, U.S. EPA, and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i); California Water Code, §§ 13267, 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(i); 40 C.F.R. § 122.41(i)(1); California Water Code, §§ 13267, 13383);
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(2); California Water Code, §§ 13267, 13383);
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(3); California Water Code, §§ 13267, 13383); and
4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i)(4); California Water Code, §§ 13267, 13383.)

G. Bypass

1. Definitions

- a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)
 - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)
2. **Bypass not exceeding limitations.** The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance Parts I.G.3, I.G.4, and I.G.5 of this Attachment D. (40 C.F.R. § 122.41(m)(2).)
 3. **Prohibition of bypass.** Bypass is prohibited, and the Los Angeles Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):
 - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));
 - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and
 - c. The Discharger submitted notice to the Los Angeles Water Board as required under Standard Provisions – Permit Compliance Part I.G.5 of this Attachment D. (40 C.F.R. § 122.41(m)(4)(i)(C).)
 4. The Los Angeles Water Board may approve an anticipated bypass, after considering its adverse effects, if the Los Angeles Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance Part I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)

5. Notice

- a. **Anticipated bypass.** If the Discharger knows in advance of the need for a bypass, it shall submit prior notice, if possible at least 10 days before the date of the bypass. The notice shall be sent to the Los Angeles Water Board. As of December 21, 2020, all notices must be submitted electronically to the initial recipient defined in Standard Provisions – Reporting Part V.J of this Attachment D. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(i).)”
- b. **Unanticipated bypass.** The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting Part V.E of this Attachment D (24-hour notice). The notice shall be sent to the Los Angeles Water Board. As of December 21, 2020, all notices must be submitted electronically to the initial recipient defined in Standard Provisions – Reporting Part V.J of this Attachment D. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(ii).)”

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. **Effect of an upset.** An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance Part I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).)
2. **Conditions necessary for a demonstration of upset.** A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):
 - a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));
 - b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));
 - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and
 - d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)
3. **Burden of proof.** In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS – PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Los Angeles Water Board. The Los Angeles Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. §§ 122.41(l)(3), 122.61.)

III. STANDARD PROVISIONS – MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)

B. Monitoring must be conducted according to test procedures approved under 40 C.F.R. part 136 for the analyses of pollutants unless another method is required under 40 C.F.R. chapter 1, subchapter N. Monitoring must be conducted according to sufficiently sensitive test methods approved under 40 C.F.R. part 136 for the analysis of pollutants or pollutant parameters or as required under 40 C.F.R. chapter 1, subchapter N. For the purposes of this paragraph, a method is sufficiently sensitive when:

1. The method minimum level (ML) is at or below the level of the most stringent effluent limitation established in the permit for the measured pollutant or pollutant parameter, and either the method ML is at or below the level of the most stringent applicable water quality criterion for the measured pollutant or pollutant parameter or the method ML is above the applicable water quality criterion but the amount of the pollutant or pollutant parameter in the facility's discharge is high enough that the method detects and quantifies the level of the pollutant or pollutant parameter in the discharge; or
2. The method has the lowest ML of the analytical methods approved under 40 C.F.R. part 136 or required under 40 C.F.R. chapter 1, subchapter N for the measured pollutant or pollutant parameter.

In the case of pollutants or pollutant parameters for which there are no approved methods under 40 C.F.R. part 136 or otherwise required under 40 C.F.R. chapter 1, subchapter N, monitoring must be conducted according to a test procedure specified in this Order for such pollutants or pollutant parameters. (40 C.F.R. §§ 122.21(e)(3), 122.41(j)(4), 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS – RECORDS

A. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Los Angeles Water Board Executive Officer or U.S. EPA at any time. (40 C.F.R. § 122.41(j)(2); California Water Code § 13383(a))

- B.** Records of monitoring information shall include:
1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));
 2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));
 3. The date(s) analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));
 4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));
 5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and
 6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)
- C.** Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):
1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and
 2. Permit applications and attachments, permits and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Los Angeles Water Board, State Water Board, or U.S. EPA within a reasonable time, any information which the Los Angeles Water Board, State Water Board, or U.S. EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Los Angeles Water Board, State Water Board, or U.S. EPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); California Water Code, §13383.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Los Angeles Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Standard Provisions – Reporting Parts V.B.2, V.B.3, V.B.4, V.B.5, and V.B.6 below. (40 C.F.R. § 122.41(k).)
2. All permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA). (40 C.F.R. § 122.22(a)(3)).
3. All reports required by this Order and other information requested by the Los Angeles Water Board, State Water Board, or U.S. EPA shall be signed by a person described in Standard Provisions – Reporting Part V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
 - e. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));
 - f. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus

be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

- g.** The written authorization is submitted to the Los Angeles Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)
- 4.** If an authorization under Standard Provisions – Reporting Part V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting Part V.B.3 above must be submitted to the Los Angeles Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)
- 5.** Any person signing a document under Standard Provisions – Reporting Parts V.B.2 or V.B.3 above shall make the following certification:

“I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.” (40 C.F.R. § 122.22(d).)
- 6.** Any person providing the electronic signature for documents described in Standard Provisions – Parts V.B.1, V.B.2, or V.B.3 above that are submitted electronically shall meet all relevant requirements of this Standard Provisions – Reporting Part V.B, and shall ensure that all relevant requirements of 40 C.F.R. part 3 (Cross-Media Electronic Reporting) and 40 C.F.R. part 127 (NPDES Electronic Reporting Requirements) are met for that submission. (40 C.F.R. § 122.22(e).)

C. Monitoring Reports

- 1.** Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order. (40 C.F.R. § 122.41(l)(4).)
- 2.** Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Los Angeles Water Board or State Water Board. As of December 21, 2016, all reports and forms must be submitted electronically to the initial recipient defined in Standard Provisions – Reporting Part V.J of this Attachment D and comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(l)(4)(i).)
- 3.** If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 C.F.R. part 136, or another method required for an industry-specific waste stream under 40 C.F.R. subchapter N, the results of such monitoring shall be included in the calculation and reporting of the data submitted in the DMR or reporting form specified by the Los Angeles Water Board or State Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)
- 4.** Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written report shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written report shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 C.F.R. § 122.41(l)(6)(i).)

For noncompliance events related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports must include the data described above (with the exception of time of discovery) as well as the type of event (i.e., combined sewer overflow, sanitary sewer overflow, or bypass event), type of overflow structure (e.g., manhole, combined sewer overflow outfall), discharge volume untreated by the treatment works treating domestic sewage, types of human health and environmental impacts of the event, and whether the noncompliance was related to wet weather.

As of December 21, 2020, all reports related to combined sewer overflows, sanitary sewer overflows, or bypass events must be submitted to the Los Angeles Water Board and must be submitted electronically to the initial recipient defined in Standard Provisions – Reporting Part V.J of this Attachment D. The reports shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. The Los Angeles Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 C.F.R. § 122.41(l)(6)(ii)):
 - a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)
 - b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)
 - c. Violation of a maximum daily discharge limitation for any of the pollutants listed by the Los Angeles Water Board in this Order [40 CFR Section (l)(6)(ii)(C) and 122.44(g)].
3. The Los Angeles Water Board may waive the above-required written report under this provision on a case by case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

F. Planned Changes

The Discharger shall give notice to the Los Angeles Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or
2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are not subject to effluent limitations in this Order. (40 C.F.R. § 122.41(l)(1)(ii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Los Angeles Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order's requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting Parts V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above. For noncompliance events related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports shall contain the information described in Standard Provision – Reporting Part V.E above and the applicable required data in appendix A to 40 C.F.R. part 127. The Los Angeles Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Los Angeles Water Board, State Water Board, or U.S. EPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

J. Initial Recipient for Electronic Reporting Data

The owner, operator, or the duly authorized representative is required to electronically submit NPDES information specified in appendix A to 40 C.F.R. part 127 to the initial recipient defined in 40 C.F.R. section 127.2(b). U.S. EPA will identify and publish the list of initial recipients on its website and in the Federal Register, by state and by NPDES data group [see 40 C.F.R. section 127.2(c)]. U.S. EPA will update and maintain this listing. (40 C.F.R. § 122.41(l)(9).)

VI. STANDARD PROVISIONS – ENFORCEMENT

- A. The Los Angeles Water Board is authorized to enforce the terms of this permit under several provisions of the Water Code, including, but not limited to, sections 13268, 13385, 13386, and 13387.
- B. The CWA provides that any person who violates Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any such Sections in a permit issued under Section 402, or any requirement imposed in a pretreatment program approved under Sections 402(a)(3) or 402(b)(8) of the CWA is subject to a civil penalty not to exceed \$25,000 per day for each violation. The CWA provides that any person who negligently violates Sections 301, 302, 306, 307, 308, 318, or 405 of the CWA, or any condition or limitation implementing any of such Sections in a permit issued under Section 402 of the CWA, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to criminal penalties of \$2,500 to \$25,000 per day of violation, or imprisonment of not more than one (1) year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more

than \$50,000 per day of violation, or by imprisonment of not more than two (2) years, or both. Any person who knowingly violates such Sections, or such conditions or limitations is subject to criminal penalties of \$5,000 to \$50,000 per day of violation, or imprisonment for not more than three (3) years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than \$100,000 per day of violation, or imprisonment of not more than six (6) years, or both. Any person who knowingly violates Section 301, 302, 303, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such Sections in a permit issued under Section 402 of the CWA, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than \$250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than \$500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in Section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than \$1,000,000 and can be fined up to \$2,000,000 for second or subsequent convictions [40 CFR Section 122.41(a)(2)] [California Water Code Sections 13385 and 13387].

- C. Any person may be assessed an administrative penalty by the Los Angeles Water Board for violating Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such Sections in a permit issued under Section 402 of the CWA. Administrative penalties for Class I violations are not to exceed \$10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed \$25,000. Penalties for Class II violations are not to exceed \$10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed \$125,000 [40 CFR Section 122.41(a)(3)].
- D. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than two (2) years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than four (4) years, or both [40 CFR Section 122.41(j)(5)].
- E. The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this Order, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than \$10,000 per violation, or by imprisonment for not more than six months per violation, or by both [40 CFR Section 122.41(k)(2)].

VII. ADDITIONAL STANDARD CONDITIONS APPLICABLE TO SPECIFIC CATEGORIES OF NPDES PERMITS [40 CFR SECTION 122.42]

- A. *Municipal separate storm sewer systems.* The operator of a large or medium MS4 or a municipal separate storm sewer that has been designated by the Los Angeles Water Board or U. S. EPA under 40 CFR section 122.26(a)(1)(v) shall submit an annual report by the anniversary of the date of the issuance of the permit for such MS4. All reports submitted in compliance with 40 CFR section 122.42(c) shall be submitted electronically by the owner, operator, or the duly authorized representative of the MS4 to the initial recipient, as defined in defined in Standard Provisions – Reporting Part V.J of this Attachment D, in compliance with 40 CFR section 122.42 and 40 CFR part 3 (including, in all cases, subpart D to part 3), section 122.22, and 40 CFR part 127. The report shall include [40 CFR section 122.42(c)]:

1. The status of implementing the components of the storm water management program that are established as permit conditions [40 CFR Section 122.42(c)(1)];
2. Proposed changes to the storm water management programs that are established as permit conditions. Such proposed changes shall be consistent with 40 CFR Section 122.26(d)(2)(iii) [40 CFR Section 122.42(c)(2)]; and
3. Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under 40 CFR Section 122.26(d)(2)(iv) and (d)(2)(v) [40 CFR Section 122.42(c)(3)];
4. A summary of data, including monitoring data, that is accumulated throughout the reporting year [40 CFR Section 122.42(c)(4)];
5. Annual expenditures and budget for year following each annual report [40 CFR Section 122.42(c)(5)];
6. A summary describing the number and nature of enforcement actions, inspections, and public education programs [40 CFR Section 122.42(c)(6)]; and
7. Identification of water quality improvements or degradation [40 CFR Section 122.42(c)(7)].

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)

Section 308 of the federal Clean Water Act (CWA) and sections 122.41(h), (j)-(l), 122.44(i), and 122.48 of title 40 of the Code of Federal Regulations (40 C.F.R.) require that all NPDES permits specify monitoring and reporting requirements. Federal regulations applicable to large and medium MS4s also specify additional monitoring and reporting requirements. (40 C.F.R. §§ 122.26(d)(2)(i)(F) & (d)(2)(iii)(D), 122.42(c).) California Water Code section 13383 also authorizes the Los Angeles Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements.¹ This MRP establishes monitoring, reporting, and recordkeeping requirements that implement the federal and California laws and/or regulations.

I. PURPOSE AND SCOPE

A. General Objectives

The general objectives of the Monitoring Program are to:

1. Assess the chemical, physical, and biological impacts of discharges from the municipal separate storm sewer system (MS4) on receiving waters.
2. Assess compliance with receiving water limitations and water quality-based effluent limitations (WQBELs) established to implement Total Maximum Daily Loads (TMDLs) during wet weather and dry weather.
3. Characterize pollutant loads in MS4 discharges.
4. Identify sources of pollutants in MS4 discharges.
5. Assess the overall health and evaluate long-term trends in receiving water quality.
6. Measure and improve the effectiveness of pollutant controls implemented under the Order.

B. Purpose

The results of the monitoring requirements outlined below shall be used to refine control measures for the reduction of pollutant loading and the protection and enhancement of the beneficial uses of the receiving waters in the Region. Furthermore, the monitoring program allows Permittees to coordinate monitoring efforts on a watershed or subwatershed basis to leverage monitoring resources in an effort to increase cost-efficiency and effectiveness and to closely align monitoring with TMDL monitoring requirements, and if Permittee(s) are participating, closely align monitoring with Watershed Management Programs.

C. Monitoring Program Elements

The Monitoring Program shall include the following elements:

1. **Receiving water monitoring** shall be performed at previously designated mass emission stations, TMDL receiving water compliance points (as designated in the most recently approved Monitoring Plans as identified in Table E-1 and Table E-2 of this MRP), and additional receiving water locations representative of the impacts from MS4 discharges. The objectives of the receiving water monitoring include the following:

¹ *In the Matter of the Petitions of The City of Oceanside, Fallbrook Public Utilities District, and the Southern California Alliance of Publicly Owned Treatment Works, For Review of WDR Order Nos. R9-2019-0166 [NPDES No. CA0107433] and R9-2019-0169 [NPDES No. CA0108031] (“Fallbrook”), State Water Resource Control Board Order WQ 2021-0005 at pp. 12-13 & n.31 (the plain language of section 13383 alone provides the Board the authority to establish monitoring and reporting requirements for MS4 discharges, and is consistent with the Clean Water Act).*

- a. Determine whether the receiving water limitations are being achieved including receiving water limitations derived from TMDL WLAs that apply in-stream,
 - b. Assess trends in pollutant concentrations over time, or during specified conditions,
 - c. Determine whether the designated beneficial uses are fully supported as determined by water chemistry, as well as aquatic toxicity and bioassessment monitoring.
2. **Stormwater outfall-based monitoring** shall be performed at outfall monitoring locations that are representative of the land uses within the Permittees' jurisdiction, and at TMDL outfall monitoring locations (as designated in the most recently approved Monitoring Plans as identified in Table E-1 and Table E-2 of this MRP). The objectives of the stormwater outfall-based monitoring program include the following:
- a. Determine whether a Permittee's discharge is in compliance with applicable stormwater WQBELs derived from TMDL WLAs that apply at the outfall,
 - b. Determine whether a Permittee's discharge causes or contributes to an exceedance of receiving water limitations that apply in-stream.
3. **Non-stormwater outfall-based monitoring** shall be performed at TMDL outfall monitoring locations (as designated in the most recently approved Monitoring Plans as identified in Table E-1 and Table E-2 of this MRP) and additional outfalls with significant non-stormwater (NSW) discharges that remain unaddressed after source identification. The objectives of the non-stormwater outfall-based monitoring program include the following:
- a. Determine whether a Permittee's discharge is in compliance with applicable non-stormwater WQBELs derived from TMDL WLAs that apply at the outfall,
 - b. Determine whether a Permittee's discharge contributes to or causes an exceedance of receiving water limitations that apply in-stream,
 - c. Assist a Permittee in identifying illicit discharges as described in Part VIII.I of the Order.
4. **Regional studies** are encouraged to further characterize the impact of the MS4 discharges on the beneficial uses of the receiving waters. Appropriate regional studies include the Southern California Stormwater Monitoring Coalition (SMC) Regional Watershed Monitoring Program, Southern California Bight Project, and special studies as specified in this MRP Parts X and XI, and approved TMDLs (see Part XV TMDL Reporting).

II. GENERAL MONITORING PROVISIONS

- A. Monitoring shall be conducted in accordance with the requirements specified in Attachment D of the Order (Part III, Standard Provisions – Monitoring).
- B. Records of monitoring information shall include information required under Attachment D of the Order (Part IV, Standard Provisions – Records).
- C. All applications, reports, plans, or other information submitted to the Los Angeles Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Attachment D of the Order (Part V.B, Standard Provisions - Reporting, Signatory and Certification Requirements).
- D. Monitoring results shall be reported in accordance with the requirements specified in Attachment D of the Order (Part V.C, Standard Provisions - Reporting, Monitoring Reports).
- E. All monitoring and reporting shall be conducted in accordance with the Standard Monitoring Provisions specified in Part XIII of this MRP.

- F.** Unless otherwise indicated in this MRP, if the Permittee(s) wishes to modify any monitoring requirements specified in this MRP including an approved Monitoring Program (e.g., reduce or eliminate monitoring of specified pollutants, reduce monitoring frequencies, change monitoring locations), then the Permittee(s) shall submit a written request to the Executive Officer of the Los Angeles Water Board for approval prior to making any modifications. This provision may be waived if the Los Angeles Water Board determines that the modification is (a) minor and (b) does not otherwise violate any applicable provision of law.

G. Sampling Methods

1. Sampling methods shall be implemented as per the Standard Provisions for Monitoring described in Attachment D of the Order and Part XIII of this MRP.
2. Grab samples shall be taken for constituents that are required to be collected as such (e.g., pathogen indicator bacteria, oil and grease, cyanides, and volatile organics); in instances where grab samples are generally expected to be sufficient to characterize water quality conditions (primarily dry weather); and where the sample location limits Permittees' ability to install an automated sampler.
3. At a minimum, a sufficient volume of sample must be collected to perform all the required biological and chemical tests, including TIEs where aquatic toxicity is observed during the sample event.
4. Monitoring methods for trash shall be conducted in accordance with the applicable requirements specified in Part III.B and Part IV.B.3 of the Order.
5. Flow may be estimated using U.S. EPA methods at receiving water monitoring locations, where flow measuring equipment is not in place.
6. Flow may be estimated for stormwater outfall monitoring based on drainage area, impervious cover, and precipitation data.

H. Analytical Procedures

1. All monitoring, sampling, sample preservation, and analyses must be conducted according to sufficiently sensitive test procedures approved under 40 CFR Part 136 for the analysis of pollutants, unless another test procedure is required under 40 CFR subchapter N or is otherwise specified in the Order for such pollutants. (40 CFR section 122.41(j)(4); 40 CFR § 122.21(e)(3); 79 Fed. Reg. 49001 (Aug. 19, 2014).)
2. Suspended-Sediment Concentration (SSC) shall be analyzed per American Society for Testing and Materials (ASTM) Standard Test Method D-3977-97.
3. For polychlorinated biphenyls (PCBs) in aqueous samples, Permittees are encouraged to conduct their analysis using a high-resolution EPA-approved method with recommended Reporting Levels of at least 20 pg/L for ocean waters and 170 pg/L for non-ocean marine waters and freshwater for each congener². At a minimum, PCBs shall be analyzed for all 55 PCB congeners listed in Table A-7 of the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality Provisions.
4. Trash shall be analyzed in accordance with the applicable requirements specified in Part III.B and Part IV.B.3 of the Order.
5. Aquatic toxicity shall be monitored in accordance with Part IX of this MRP.
6. All parameters shall be analyzed according to the Standard Provisions for Monitoring described in Attachment D of the Order and Part XIII of this MRP.

² Non-ocean marine waters include enclosed bay, estuarine, and coastal lagoon waters.

7. Permittees shall use sufficiently sensitive analytical test methods that are consistent with 40 CFR Parts 122 and 136, and 40 CFR chapter I, subchapters N. While attainment of recommended Reporting Levels in Table E-6 of this MRP are not required, Permittees are encouraged to attain these recommended Reporting Levels to ensure that analytical test methods are capable of detecting and measuring constituents at, or below the applicable receiving water limitations and/or WQBELs.
- I. **Laboratory Certification.** Laboratories analyzing monitoring samples shall be certified by the State Water Board's Division of Drinking Water, Environmental Laboratory Accreditation Program (ELAP), and must include quality assurance/quality control (QA/QC) data with their reports. The Permittee shall provide a copy of the laboratory certification to the Los Angeles Water Board with their submittal of the Monitoring Report each time a new certification and/or renewal of the certification is obtained from ELAP.
- J. **Standard Operating Procedures (SOPs).** For any monitoring conducted under this MRP, Permittees shall continue to develop and maintain Standard Operation Procedures (SOP or SOPs). An SOP consists of five elements: Title page, Table of Contents, Procedures, Quality Assurance/Quality Control (QA/QC), and References. The SOP shall:
 1. Briefly describe the purpose of the work or process, including any regulatory information or standards that are appropriate to the process, and the scope to indicate what is covered.
 2. Denote what sequential procedures should be followed, divided into significant sections; e.g., possible interferences, equipment needed, equipment/instrument maintenance and calibration, personnel qualifications, and safety considerations.
 3. Describe QA/QC activities and list any cited or significant references.
 4. Include copies of field form templates.

III. MONITORING PROGRAMS

Los Angeles County Permittees shall continue to implement the most recent version of the monitoring programs specified in Table E-1 of this MRP until those monitoring programs are revised per this MRP. Ventura County Permittees shall develop an Integrated Monitoring Program (IMP) or Coordinated Integrated Monitoring Program (CIMP). Required elements of an IMP and CIMP and a schedule to revise or develop an IMP/CIMP are described below in this Part III.

A. Integrated Monitoring Program (IMP)

1. An Integrated Monitoring Program (IMP) provides flexibility to allow each Permittee to satisfy the monitoring requirements in this MRP. The IMP may leverage monitoring resources by selecting monitoring locations, parameters, or monitoring techniques that will satisfy multiple monitoring requirements.
2. The requirements of an approved TMDL Monitoring Plan may be modified by an IMP that is subsequently approved by the Executive Officer of the Los Angeles Water Board.
3. Where appropriate, the IMP may utilize alternative approaches to meet the General Objectives (Part I.A of this MRP). Sufficient justification shall be provided in the IMP for the alternative approach(es). Such alternative approaches shall be subject to public review and final approval by the Los Angeles Water Board Executive Officer.
4. At a minimum, the IMP must address all TMDL and non-TMDL monitoring requirements in this MRP, including receiving water monitoring, stormwater outfall-based monitoring, non-stormwater outfall-based monitoring, unless otherwise addressed by a separate Monitoring Plan(s).

B. Coordinated Integrated Monitoring Program (CIMP)

1. A Coordinated Integrated Monitoring Program (CIMP) provides flexibility to allow multiple Permittees to collaborate on a watershed or subwatershed basis to satisfy the monitoring requirements in the Order. Permittees are encouraged to coordinate their monitoring programs with other Permittees to develop and implement a CIMP. The CIMP may be county-wide or limited to a single watershed, or sub-watershed.
2. **Benefits of the CIMP Approach**
 - a. The CIMP may leverage monitoring resources by selecting monitoring locations, parameters, or monitoring techniques that will satisfy multiple monitoring requirements.
 - b. The CIMP provides Permittees opportunities to increase the cost efficiency and effectiveness of the monitoring program. The greatest efficiency may be achieved when a CIMP is designed and implemented on a watershed basis.
 - c. If Permittees opt to participate in regional studies, a CIMP may be employed to implement regional studies, where a single Permittee takes the lead in directing the study, and the other Permittees provide funding or in lieu services.
3. The requirements of an approved TMDL Monitoring Plan may be modified by a CIMP that is subsequently approved by the Executive Officer of the Los Angeles Water Board.
4. Where appropriate, the CIMP may utilize alternative approaches to meet the General Objectives (Part I.A of this MRP). Sufficient justification shall be provided in the CIMP for the alternative approach(es). Such alternative approaches shall be subject to public review and final approval by the Los Angeles Water Board Executive Officer.
5. A CIMP shall address all TMDL and non-TMDL monitoring requirements in this MRP, including receiving water monitoring, stormwater outfall-based monitoring, non-stormwater outfall-based monitoring.

C. Monitoring Requirements for IMP and/or CIMP

The IMP and/or CIMP must contain the following information:

1. **General**
 - a. A list of the participating Permittee(s).
 - b. A map (preferably GIS) delineating the geographic boundaries of the monitoring program including the receiving waters, the MS4 catchment drainages and outfalls, subwatershed boundaries (i.e., HUC 12), political boundaries, land use, and the proposed monitoring locations for both dry weather/non-stormwater and wet weather/stormwater monitoring.
 - c. Proposed monitoring locations and an explanation of how and why monitoring at the proposed locations will provide representative measurement of the effects of the MS4 discharges on the receiving water.
 - d. Alternative monitoring proposal(s) for any of the monitoring requirements in this MRP and a rationale for the alternative proposal(s) (e.g., monitoring location, monitoring frequency, wet/dry weather criteria, constituents to monitor).
 - e. A description of how the Permittee(s) is implementing monitoring requirements in this MRP (i.e., TMDL compliance monitoring, receiving water monitoring, stormwater outfall based monitoring, non-stormwater outfall-based screening and monitoring, and aquatic toxicity monitoring).

- f. If monitoring will occur at new locations not previously monitored and a Permittee(s) opts to install new monitoring infrastructure, the Permittee(s) shall propose a time schedule specifying when monitoring will commence at these stations.
- g. Test species sensitivity screening results for aquatic toxicity per Part IX.H.3 of this MRP.

2. TMDLs

- a. A description of how the Permittee(s) is fulfilling its obligations for TMDL compliance monitoring under an IMP, CIMP, or other monitoring plan(s). TMDL compliance monitoring shall be consistent with the recommendations within the TMDL and align with the requirements in Attachments K through S of the Order.
- b. A list of applicable TMDLs and TMDL compliance points, based on approved TMDL Monitoring Plans and/or as identified in the Basin Plan or U.S. EPA established TMDL.
- c. Identification of the proposed monitoring locations that fulfill the TMDL Monitoring Plan(s) requirements.
- d. Shoreline Monitoring Locations shall be monitored for bacterial indicators (e.g., total coliform, fecal coliform (or *E. coli*), and enterococcus) consistent with the applicable bacteria TMDL per the frequency proposed in a Monitoring Plan.

3. Mass Emission/Receiving Water Monitoring

- a. Location and description of receiving water locations,
- b. A description of how the Permittee(s) is contributing to the monitoring of mass emission stations or a discussion of why monitoring at mass emission stations is not being supported.

4. Stormwater Outfall-Based Monitoring

- a. Stormwater discharges from the MS4 shall be monitored at outfalls and/or alternative access points such as manholes or in channels at the Permittee's jurisdictional boundary.
- b. The Permittee(s) shall consider the following criteria when selecting outfalls for stormwater discharge monitoring:
 - i. The stormwater outfall-based monitoring program should ensure representative data by monitoring at least one major outfall per subwatershed (HUC 12) drainage area, within the Permittee's jurisdiction, or alternate approaches as approved in an IMP and/or CIMP.
 - ii. The drainage(s) to the selected outfall(s) shall be representative of the land uses within the Permittee's jurisdiction.
 - iii. If a Permittee is implementing an IMP, to the extent possible, the selected outfalls shall not receive drainage from another jurisdiction. If this is not possible, the Permittee shall conduct "upstream" and "downstream" monitoring as the system enters and exits the Permittee's jurisdiction.
 - iv. The Permittee(s) shall select outfalls with configurations that facilitate accurate flow measurement and in consideration of safety of monitoring personnel.
 - v. The specific location of sample collection may be within the MS4 upstream of the actual outfall to the receiving water if field safety or accurate flow measurement require it.

5. Other Monitoring Requirements

A description of how the Permittee(s) is implementing other monitoring requirements in this MRP (i.e., non-stormwater outfall-based screening and monitoring, aquatic toxicity monitoring, and if applicable, regional studies, and special studies).

D. Schedule for Submitting New/Revised Monitoring Programs

1. Los Angeles County Permittees

- a. Within 18 months of the effective date of the Order, Los Angeles County Permittee(s) with an existing Monitoring Program(s), as listed in Table E-1 of this MRP below, shall submit an updated monitoring program(s) for approval by the Executive Officer of the Los Angeles Water Board. Updates shall be consistent with applicable requirements in this MRP, monitoring provisions in applicable TMDLs, and specifically, with Attachments K through S of the Order.
- b. The cities of Compton and Gardena, which have a Board Directive for monitoring per Table E-1 of this MRP below, shall develop an IMP or join a CIMP. If developing an IMP, the cities shall submit it to the Los Angeles Water Board for Executive Officer approval no later than 18 months after the effective date of the Order. If joining a CIMP, the cities of Compton and Gardena shall notify the Los Angeles Water Board by the effective date of the Order.
- c. Los Angeles County Permittee(s) shall implement the revisions to their monitoring program(s) immediately upon approval, unless otherwise indicated in the approved monitoring program or directed by the Executive Officer of the Los Angeles Water Board.
- d. After adoption of the Order, if there is any change in which Permittees are participating in a CIMP, that Permittee shall notify the Los Angeles Water Board promptly. The Permittee(s) shall then revise/develop their monitoring program as directed by the Los Angeles Water Board.
- e. Monitoring requirements pursuant to Order No. R4-2012-0175 including MRP No. CI-6948 and Order No. R4-2014-0024 including MRP No. CI-8052 and pursuant to the most recently approved version of the Monitoring Programs in Table E-1 of this MRP shall remain in effect until the Executive Officer of the Los Angeles Water Board approves the respective updated Monitoring Program.

Table E-1. Approved Monitoring Programs by WMAs for Los Angeles County Permittees

| Los Angeles County Permittee / Group Name | Monitoring Program | Initial Approval Date |
|--|---------------------------|------------------------------|
| Upper Santa Clara River Watershed Group (Los Angeles County, LACFCD, and city of Santa Clarita) | CIMP | 09/02/2015 |
| Upper Los Angeles River Watershed Group (Los Angeles County, LACFCD, and cities of Alhambra, Burbank, Calabasas, Glendale, Hidden Hills, La Cañada Flintridge, Los Angeles, Montebello, Monterey Park, Pasadena, Rosemead, San Fernando, San Gabriel, San Marino, South El Monte, South Pasadena, and Temple City) | CIMP | 11/03/2015 |
| Los Angeles River Upper Reach 2 Sub Watershed Group (LACFCD and cities of Bell, Bell Gardens, Commerce, Cudahy, Maywood, and Huntington Park, and Vernon) | CIMP | 03/22/2016 |

| Los Angeles County Permittee / Group Name | Monitoring Program | Initial Approval Date |
|---|---------------------------|------------------------------|
| Lower Los Angeles River Watershed Group (LACFCD and cities of Downey, Lakewood, Long Beach, Lynwood, Paramount, Pico Rivera, Signal Hill, and South Gate) | CIMP | 09/16/2015 |
| Rio Hondo/San Gabriel River Water Quality Group (Los Angeles County, LACFCD, and cities of Arcadia, Azusa, Bradbury, Duarte, Monrovia, and Sierra Madre) | CIMP | 09/27/2015 |
| Upper San Gabriel River Group (Los Angeles County, LACFCD, and cities of Baldwin Park, Covina, Glendora, Industry, La Puente, West Covina, and South El Monte) | CIMP | 09/17/2015 |
| East San Gabriel Valley Watershed Management Area Group (cities of Claremont, La Verne, Pomona, and San Dimas) | CIMP | 09/23/2015 |
| Lower San Gabriel River Group (LACFCD, and cities of Artesia, Bellflower, Cerritos, Diamond Bar, Downey, Hawaiian Gardens, La Mirada, Lakewood, Long Beach, Norwalk, Pico Rivera, Santa Fe Springs, and Whittier) | CIMP | 09/16/2015 |
| Los Cerritos Channel Watershed Group (LACFCD, and cities of Bellflower, Cerritos, Downey, Lakewood, Long Beach, Paramount, and Signal Hill) | CIMP | 09/16/2015 |
| Malibu Creek Watershed Group (Los Angeles County, LACFCD, and Agoura Hills, Calabasas, Hidden Hills, and Westlake Village) | CIMP | 04/20/2016 |
| Marina del Rey Group (Los Angeles County, LACFCD, and cities of Culver City and Los Angeles) | CIMP | 08/21/2016 |
| North Santa Monica Bay Coastal Watersheds Group (Los Angeles County, LACFCD, and city of Malibu) | CIMP | 11/03/2015 |
| Santa Monica Bay Watershed Jurisdictions 2 & 3 Group (Los Angeles County, LACFCD, and cities of El Segundo, Los Angeles, and Santa Monica) | CIMP | 10/08/2015 |
| Beach Cities Watershed Management Group (LACFCD and cities of Hermosa Beach, Manhattan Beach, Redondo Beach, and Torrance) | CIMP | 11/23/2015 |
| Palos Verdes Peninsula Watershed Management Group (Los Angeles County, LACFCD, and cities of Palos Verdes Estates, Rancho Palos Verdes, Rolling Hills Estates, and Rolling Hills) | CIMP | 04/20/2016 |
| Ballona Creek Group (Los Angeles County, LACFCD, Beverly Hills, Culver City, Inglewood, Los Angeles, Santa Monica, and West Hollywood) | CIMP | 11/05/2015 |
| Dominguez Channel Watershed Management Area Group (Los Angeles County, LACFCD, and cities of Carson, El Segundo, Hawthorne, Inglewood, Lawndale, Lomita, and Los Angeles) | CIMP | 12/21/2015 |
| Alamitos Bay/Los Cerritos Channel Group (Los Angeles County and LACFCD) | CIMP | 09/22/2015 |

| Los Angeles County Permittee / Group Name | Monitoring Program | Initial Approval Date |
|--|------------------------------------|-----------------------|
| Santa Monica Bay Watershed Jurisdiction 7 Group (LACFCD and city of Los Angeles) | CIMP | 02/20/2017 |
| City of Compton | Board Directive | 09/05/2016 |
| City of El Monte | IMP | 01/20/2016 |
| City of Gardena | Board Directive | 11/21/2016 |
| City of Irwindale | IMP | 02/18/2016 |
| City of La Habra Heights | IMP | 11/02/2015 |
| City of Rolling Hills | NSW Screening & Monitoring Program | 12/08/2014 |
| City of Walnut | IMP | 09/04/2015 |
| City of Long Beach: Nearshore Watersheds (Port) | IMP | 07/06/2016 |
| City of Long Beach: Nearshore Watersheds (Non-Port) | IMP | 12/03/2016 |

2. Ventura County Permittees

- a. Ventura County Permittee(s) shall develop an IMP or CIMP or join an existing CIMP designed to satisfy the monitoring requirements in this MRP. Within 3 months of the effective date of the Order, Ventura County Permittee(s) shall submit a NOI to the Executive Officer of the Los Angeles Water Board describing whether it intends to develop in an IMP or CIMP or join an existing CIMP.
- b. Ventura County Permittee(s) shall submit the new or updated IMP or CIMP to the Executive Officer of the Los Angeles Water Board for approval within 24 months after the effective date of the Order.
- c. Ventura County Permittee(s) shall commence monitoring within 30 days after approval of the IMP, or within 90 days after approval of the CIMP unless otherwise directed by the Executive Officer of the Los Angeles Water Board.
- d. Monitoring requirements pursuant to Order No. 2010-0108 including MRP No. CI-7388 and pursuant to the most recently approved version of the Monitoring Plans in Table E-2 shall remain in effect until the Executive Officer of the Los Angeles Water Board approves the IMP(s) or CIMP(s).

IV. MONITORING LOCATIONS FOR VENTURA COUNTY PERMITTEES

A. Receiving Water Monitoring Locations

1. Inland Receiving Water Monitoring Locations

- a. Ventura County Permittee(s) shall include the following receiving water monitoring³ locations listed below in Table E-3 of this MRP in their IMP or CIMP and continue to monitor at these locations:

³ These receiving water monitoring locations were known as mass emissions stations in the previous Ventura County MS4 Permit Order No. R4-2010-0108.

Table E-3. Receiving Water Monitoring Locations

| Receiving Water | Monitoring Location Name | Monitoring Location Description |
|-------------------|--------------------------|---|
| Ventura River | ME-VR2 | Ventura River at Ojai Valley Sanitation District Latitude: 34.34305° Longitude: - 119.29888° |
| Santa Clara River | ME-SCR | Santa Clara River at Freeman Diversion Latitude: 34.29917° Longitude: -119.10722° |
| Calleguas Creek | ME-CC | Calleguas Creek at Camarillo Street Latitude: 34.17917° Longitude: -119.03889° |

- b. Notwithstanding subpart a above, Ventura County Permittees may propose additional or alternative monitoring locations in their IMP or CIMP as necessary to satisfy the requirements of this MRP.
- c. In the IMP or CIMP, Ventura County Permittee(s) shall propose a receiving water monitoring location in the Malibu Creek subwatershed within Ventura County. This monitoring location shall be representative of the impacts from MS4 discharges.

2. Shoreline Monitoring Locations

Ventura County Permittees shall continue to monitor for indicator bacteria (i.e., fecal coliform (or E. coli) and enterococcus) at the following shoreline monitoring locations listed below in Table E-4 of this MRP and, shall include these monitoring locations in their IMP or CIMP. Sampling for indicator bacteria at shoreline monitoring locations shall be conducted once a week, at a minimum.

Table E-4. Shoreline Monitoring Locations

| Site ID | Site Description | Monitoring Location Latitude (North) | Monitoring Location Longitude (West) | Receiving Water |
|---------|---|--------------------------------------|--------------------------------------|-----------------|
| 2500 | La Conchita Beach | 34.36420° | -119.45010° | Pacific Ocean |
| 13000 | Surfer's Point at Seaside Park – end of the access path via wooden gate | 34.27301° | -119.30503° | Pacific Ocean |
| 14000 | Promenade Park Beach – Figueroa Street | 34.27441° | -119.29764° | Pacific Ocean |
| 15000 | Promenade Park Beach – Redwood Apts | 34.27534° | -119.29548° | Pacific Ocean |
| 17000 | Promenade Park Beach – Calif. Street | 34.27566° | -119.29303° | Pacific Ocean |
| 18000 | San Buenaventura State Beach - Kalorama Street | 34.27362° | -119.28883° | Pacific Ocean |

| Site ID | Site Description | Monitoring Location Latitude (North) | Monitoring Location Longitude (West) | Receiving Water |
|---------|---|--------------------------------------|--------------------------------------|-----------------|
| 19000 | San Buenaventura State Beach – south of drain at San Jon Road | 34.27223° | -119.28518° | Pacific Ocean |
| 20000 | San Buenaventura State Beach – Dover Lane | 34.26587° | -119.27786° | Pacific Ocean |
| 21000 | San Buenaventura State Beach – Waymouth Lane | 34.25690° | -119.27153° | Pacific Ocean |
| 29000 | Oxnard Beach – 5th Street | 34.19789° | -119.24869° | Pacific Ocean |
| 30000 | Oxnard Beach – Outrigger Way | 34.19035° | -119.24458° | Pacific Ocean |
| 32000 | Oxnard Beach Park – Falkrik Avenue | 34.17873° | -119.23846° | Pacific Ocean |
| 33000 | Oxnard Beach Park – Starfish Drive | 34.17652° | -119.23708° | Pacific Ocean |
| 39000 | Silverstrand Beach – S. Paula | 34.15244° | -119.22010° | Pacific Ocean |
| 40000 | Silverstrand Beach - Sawtelle | 34.14739° | -119.21683° | Pacific Ocean |

B. Stormwater Outfall-Based Monitoring Locations

In lieu of monitoring at least one major outfall per subwatershed (HUC 12) drainage area, within the Permittee’s jurisdiction, Ventura County Permittee(s) shall continue to monitor the following monitoring locations in Table E-5 of this MRP and shall include these monitoring locations in their IMP or CIMP. The drainage(s) to the selected stormwater outfall(s) shall be representative of the land uses within the Ventura County Permittee’s jurisdiction:

Table E-5. Stormwater Outfall Monitoring Locations

| Permittee | Major Outfalls / Locations | Monitoring Location Latitude (North) | Monitoring Location Longitude (West) | Receiving Water / Watershed |
|-----------|--------------------------------|--------------------------------------|--------------------------------------|--|
| Camarillo | MO-CAM / Camarillo Hills Drain | 34.219517° | - 119.066053° | Tributary to Revolon Slough / Calleguas Creek Watershed |
| Ojai | MO-OJA / Fox Canyon Drain | 34.444744° | - 119.241219° | Tributary to San Antonio Creek / Ventura River Watershed |

| Permittee | Major Outfalls / Locations | Monitoring Location Latitude (North) | Monitoring Location Longitude (West) | Receiving Water / Watershed |
|-------------------------------|--|--------------------------------------|--------------------------------------|---|
| Unincorporated Ventura County | MO-MEI / Happy Valley Drain | 34.445539° | - 119.290319° | Tributary to Ventura River / Ventura River Watershed |
| Ventura | MO-VEN / Moon Ditch | 34.243561° | - 119.194986° | Tributary to Santa Clara River / Santa Clara River Watershed |
| Fillmore | MO-FIL / North Fillmore Drain | 34.404586° | -118.930686° | Tributary to Sespe Creek / Santa Clara River Watershed |
| Moorpark | MO-MPK / Walnut Canyon Drain | 34.279053° | - 118.905425° | Tributary to Arroyo Las Posas / Calleguas Creek Watershed |
| Oxnard | MO-OXN / El Rio Drain | 34.236139° | - 119.184425° | Tributary to Santa Clara River / Santa Clara River Watershed |
| Port Hueneme | MO-HUE / Hueneme Drain | 34.140808° | - 119.188217° | Tributary to Tsumas Creek ⁴ at the Pacific Ocean / Miscellaneous Ventura County Coastal Watersheds |
| Santa Paula | MO-SPA / 11th Street Drain (Santa Paula Airport) | 34.348608° | - 119.055506° | Tributary to Santa Clara River / Santa Clara River Watershed |
| Simi Valley | MO-SIM / Bus Canyon Drain | 34.272097° | - 118.783736° | Tributary to Arroyo Simi / Calleguas Creek Watershed |
| Thousand Oaks | MO-THO / North Fork Arroyo Conejo | 34.213311° | - 118.921397° | Tributary to Conejo Creek / Calleguas Creek Watershed |

1. Notwithstanding Part IV.B above, Ventura County Permittees may propose additional or alternative monitoring locations in their IMP or CIMP as necessary to satisfy the requirements of this MRP.
2. Ventura County Permittee(s) shall propose an outfall monitoring location in Malibu Creek subwatershed within Ventura County in their IMP or CIMP.

⁴ Tsumas Creek was formerly known as J Street Drain.

V. RECEIVING WATER MONITORING REQUIREMENTS

A. Minimum Wet Weather Receiving Water Monitoring Requirements

All Permittees shall incorporate in their monitoring program the following minimum requirements for monitoring the receiving water during wet weather conditions:

1. Unless required more frequently by an applicable TMDL, the receiving water shall be monitored a minimum of three times per water year during wet weather for all parameters, except aquatic toxicity which must be monitored at least once per water year during wet weather.
2. Monitoring shall be performed in the receiving water during wet weather conditions, defined for the purposes of this monitoring program as follows:
 - a. Monitoring shall occur during wet weather conditions, including targeting the first significant storm event of the water year following the criteria below, and at least two additional wet weather events within the same wet season.
 - i. **First Significant Storm Event.** Permittees shall target the first storm event of the water year with a predicted rainfall of at least 0.25 inch at a seventy percent probability of rainfall at least 24 hours prior to the event start time.
 - ii. **Subsequent Wet Weather Events.** Permittees shall target subsequent storm events that forecast sufficient rainfall and runoff to meet program objectives and site-specific study needs. Wet weather is defined as greater than or equal to 0.1 inch of precipitation, as measured from the nearest Los Angeles County or Ventura County Watershed Protection District controlled rain gauge within the watershed.
 - b. As an alternative to subpart a above, Permittees may propose:
 - i. An alternative precipitation threshold in a Monitoring Program for Los Angeles Water Board Executive Officer approval and/or,
 - ii. A precipitation threshold as defined by applicable TMDLs within the watershed.
 - c. Sampling events shall be separated by a minimum of three days of dry conditions (less than 0.1 inch of rain each day).
3. Receiving water monitoring during wet weather shall be conducted as soon as possible (within 6 hours)⁵ of starting stormwater outfall-based monitoring, to be reflective of potential impacts from MS4 discharges.
4. At a minimum, the following parameters shall be monitored during wet weather unless a surrogate pollutant has been approved by the Executive Officer of the Los Angeles Water Board.
 - a. Flow,
 - b. Pollutants assigned a wet weather receiving water limitation derived from TMDL WLAs (see Attachments K through S of the Order) and parameters to determine compliance with receiving water limitations,

⁵ Marine waters receiving water monitoring where a boat is used to collect samples during wet weather shall be conducted as soon as conditions are safe for small crafts (as defined by the National Oceanic and Atmospheric Administration's) to be reflective of potential impacts from MS4 discharges.

- c. Other pollutants identified on the CWA section 303(d) List for the receiving water or downstream receiving waters. Permittees may propose in a Monitoring Program not to monitor for specific 303(d) listed pollutant(s), if one or more of the following applies:
 - i. If the Permittee(s) demonstrates, using recent monitoring data, that the waterbody is no longer impaired; and/or
 - ii. If the Permittees(s) demonstrates, using relevant information, that there is no MS4 source causing or contributing to the impairment in the receiving water.
 - d. Total Suspended Solids (TSS) and hardness, when metals are monitored,
 - e. Suspended-Sediment Concentration (SSC) if the receiving water is listed on the CWA section 303(d) list for sedimentation, siltation or turbidity,⁶
 - f. Field measurements applicable to inland freshwater bodies only: pH, dissolved oxygen, temperature, and specific conductivity,
 - g. Aquatic Toxicity (once per water year, during first storm event of the water year).
5. Additionally, the screening parameters in Table E-6 of this MRP shall be monitored during wet weather in the first water year during the first significant rain event. If a parameter is at or below the Reporting Level (RL) per Part II.H.7 of this MRP, or the result is below the lowest applicable water quality objective, and is not otherwise identified in subparts 4.a-4.g above, it need not be further analyzed. Otherwise, the parameter shall be analyzed for the remainder of the Order during wet weather at the receiving water monitoring location where the exceedance was found. The Permittee(s) may propose in a Monitoring Program not to monitor for specific constituents in Table E-6 of this MRP if it is not a constituent listed above in subparts 4.a-4.g and the Permittee(s) demonstrates with relevant information that there is no MS4 source causing or contributing to exceedances in the receiving water and/or recent data shows that the result is at or below the RL per Part II.H.7 of this MRP, or below the lowest applicable water quality objective.

B. Minimum Dry Weather Receiving Water Monitoring Requirements

All Permittees shall incorporate the following minimum requirements for monitoring the receiving water during dry weather conditions:

1. Unless required more frequently by an applicable TMDL, the receiving water shall be monitored a minimum of two times per water year during dry weather for all parameters, except aquatic toxicity which must be monitored at least once per water year during dry weather.
 - a. **Historically Driest Month.** One of the dry weather monitoring events shall be during the month with the historically lowest instream flows. Where instream flow data are not available, monitoring shall occur during the historically driest month. Dry weather occurs on days with less than 0.1 inch of rain as measured from the nearest Los Angeles County or Ventura County Watershed Protection District controlled rain gauge within the watershed.
 - b. **Additional Dry Weather Event.** The additional dry weather monitoring event shall occur on days with less than 0.1 inch of rain as measured from the nearest Los Angeles County or Ventura County Watershed Protection District controlled rain gauge within the watershed.

⁶ Gray, John, R., G. Douglas Glysson, Lisa M. Turcios, and Gregory E. Schwarz. 2000. *Comparability of Suspended-Sediment Concentration and Total Suspended Solids Data*. United States Geological Survey. Water Resources Investigations Report 00-4191. August 2000.

- 2.** As an alternative to subpart 1 above, Permittees may propose:
 - a.** An alternative criterion in a Monitoring Program for Los Angeles Water Board Executive Officer approval and/or,
 - b.** A criterion as defined by applicable TMDLs within the watershed.
- 3.** Dry weather sampling shall occur at least three days after a rain event of 0.1 inch or greater.
- 4.** At a minimum the following parameters shall be monitored during dry weather, unless a surrogate pollutant has been approved by the Executive Officer of the Los Angeles Water Board:
 - a.** Flow,
 - b.** Pollutants assigned a dry weather receiving water limitation derived from TMDL WLAs (see Attachments K through S of the Order) and parameters to determine compliance with receiving water limitations,
 - c.** Other pollutants identified on the CWA section 303(d) List for the receiving water or downstream receiving waters. Permittees may propose in a Monitoring Program not to monitor for 303(d) listed pollutant(s) if one or more of the following applies:
 - i.** If the Permittee(s) demonstrates, using recent monitoring data, that the receiving water is no longer impaired by the 303(d) listed pollutant(s); and/or
 - ii.** If the Permittees(s) demonstrates, using relevant information, that there is no MS4 source causing or contributing to the impairment in the 303(d) listed receiving water.
 - d.** TSS and hardness, when metals are monitored,
 - e.** Suspended-Sediment Concentration (SSC) if the receiving water is listed on the CWA section 303(d) list for sedimentation, siltation or turbidity,
 - f.** Field measurements for monitoring of inland freshwater bodies: dissolved oxygen, pH, temperature, and specific conductivity,
 - g.** Aquatic Toxicity (once per water year, during the historically driest month).
- 5.** Additionally, the parameters in Table E-6 shall be monitored during dry weather in the first water year during the historically driest weather event. If a parameter is at or below the Reporting Level (RL) per Part II.H.7 of this MRP, or the result is below the lowest applicable water quality objective, and is not otherwise identified in subparts 4.a-4.g above, it need not be further analyzed. Otherwise, the parameter shall be analyzed for the remainder of the Order during dry weather at the receiving water monitoring location where the exceedance was found. The Permittee(s) may propose in a Monitoring Program not to monitor for specific constituents in Table E-6 of this MRP if it is not a constituent listed above in subparts 4.a-4.g and the Permittee(s) demonstrates with relevant information that there is no MS4 source causing or contributing to exceedances in the receiving water and/or recent data shows that the result is at or below the RL per Part II.H.7 of this MRP, or below the lowest applicable water quality objective.

VI. STORMWATER OUTFALL-BASED MONITORING REQUIREMENTS

A. Minimum Wet Weather Stormwater Outfall-based Monitoring Requirements

All Permittees shall incorporate in their monitoring program the following minimum requirements for monitoring stormwater at outfalls:

1. Unless required more frequently by an applicable TMDL, stormwater discharges shall be monitored a minimum of three times per water year for all parameters except aquatic toxicity.
2. Monitoring shall be performed at the outfalls during wet weather conditions, defined for the purposes of this monitoring program as follows:
 - a. Monitoring shall occur during wet weather conditions, including targeting the first significant rain event of the water year following the criteria below, and at least two additional wet weather events within the same wet season.

¹¹ Non-ocean marine waters include enclosed bay, estuarine, and coastal lagoon waters.

- i. **First Significant Rain Event.** Permittees shall target the first storm event of the water year with a predicted rainfall of at least 0.25 inch at a seventy percent probability of rainfall at least 24 hours prior to the event start time.
 - ii. **Subsequent Wet Weather Events.** Permittees shall target subsequent storm events that forecast sufficient rainfall and runoff to meet program objectives and site-specific study needs. Wet weather is defined as greater than or equal to 0.1 inch of precipitation, as determined by the closest rain gauge to the catchment area draining to the outfall.
 - b. As an alternative to subpart a above, Permittees may propose:
 - i. An alternative precipitation threshold in a Monitoring Program for Los Angeles Water Board Executive Officer approval and/or,
 - ii. A precipitation threshold as defined by applicable TMDLs within the watershed.
 - c. Sampling events shall be separated by a minimum of three days of dry conditions (less than 0.1 inch of rain each day).
3. At a minimum, the following parameters shall be monitored unless a surrogate pollutant has been approved by the Executive Officer of the Los Angeles Water Board:
 - a. Flow,
 - b. Pollutants assigned a WQBEL derived from TMDL WLAs (see Attachments K through S of the Order) and parameters to determine compliance with WQBELs,
 - c. Other pollutants identified on the CWA section 303(d) List for the receiving water or downstream receiving waters the outfall discharges to consistent with Part V.A.4.c of this MRP,
 - d. TSS and hardness, when metals are monitored,
 - e. Suspended Sediment Concentration (SSC) if the receiving water the outfall is discharging to is listed on the CWA Section 303(d) list for sedimentation, siltation or turbidity,
 - f. Field measurements applicable to inland freshwater bodies only: pH, dissolved oxygen, temperature, and specific conductivity,
 - g. A toxicant or class of toxicants that is identified through a TIE conducted during wet weather at a receiving water monitoring location. Permittees shall analyze for the toxicant(s) during the next scheduled sampling event in the discharge from the outfall(s) upstream of the receiving water location.
4. Other parameters in Table E-6 of this MRP identified as exceeding the lowest applicable water quality objective in the nearest downstream receiving water monitoring location per Part V.A.5 of this MRP.
5. **Sampling Methods**
 - a. Grab samples may be collected in specific situations as allowed by Part II.G.2 of this MRP.
 - b. For all other constituents, flow-weighted composite samples must be collected such that samples are representative of changes in pollutant concentrations and runoff flows during the stormwater discharge. Permittees shall use the following methods or propose an alternative protocol in their IMP or CIMP:

- i. Flow-weighted composite samples shall be collected during the first 24 hours of the stormwater discharge, or during the entire stormwater discharge if the discharge is less than 24 hours;
- ii. Flow-weighted composite samples shall be collected using a minimum of 3 sample aliquots taken in each hour of the stormwater discharge for the entire stormwater discharge or for the first three hours of the stormwater discharge, with each aliquot collection being separated by a minimum of 15 minutes.
- iii. If Permittees propose an alternative sample aliquot collection frequency, the pacing at which aliquots are collected during the sampling period should be representative of the changes in pollutant concentration and runoff flows during the stormwater discharge.

VII. NON-STORMWATER OUTFALL-BASED SCREENING AND MONITORING REQUIREMENTS

Permittees shall include in their monitoring program a non-stormwater outfall-based screening and monitoring program that documents, with written procedures on how requirements in Part VII of this MRP will be implemented.

A. Objectives of the Non-Stormwater Outfall-Based Screening and Monitoring Program

The Permittee(s) shall implement an outfall-based screening and monitoring program to meet the following objectives:

1. Develop criteria or other means to ensure that all outfalls with significant non-stormwater discharges are identified and assessed during the term of the Order.
2. For outfalls determined to have significant non-stormwater flow, determine whether flows are the result of illicit discharges, authorized or conditionally exempt non-stormwater flows, natural flows, or from unknown sources.
3. Address illicit discharges in accordance with the IDDE Program (Part VIII.I of the Order) for appropriate action.
4. Prioritize monitoring of outfalls considering the potential threat to the receiving water and applicable TMDL compliance schedules.
5. Based on existing screening or monitoring data or other institutional knowledge, assess the impact of non-stormwater discharges (other than identified illicit discharges) on the receiving water.
6. Conduct monitoring and assess the monitoring data to determine the impact of non-stormwater discharges on the receiving water.
7. Conduct monitoring or other investigations to identify the source of pollutants in non-stormwater discharges, consistent with the IDDE Program.
8. Use results of the screening process to evaluate the conditionally exempt non-stormwater discharges identified in Parts III.A.2 and III.A.3 of the Order and take appropriate actions pursuant to Part III.A.5.c of the Order for those discharges that have been found to be a source of pollutants.
9. Maximize the use of Permittee resources by integrating the screening and monitoring process into existing monitoring and/or screening efforts.

B. Screening of Outfalls with Significant Non-Stormwater Discharge

Based on the inventory of outfalls required under Part VIII of this MRP, all Permittee(s) shall develop and implement written procedures explaining the screening criteria to identify outfalls

with significant non-stormwater discharges. Significant non-stormwater discharges may be determined by one or more of the following characteristics:

1. Discharges from major outfalls subject to dry weather TMDLs.
2. Discharges that have caused or have the potential to cause overtopping of downstream diversions.
3. Discharges exceeding a threshold discharge rate as proposed by the Permittee.
4. Discharges from areas where there is evidence of ongoing potential illegal dumping or illicit connections. This shall include evidence gathered from field observations and/or monitoring data.
5. Other characteristics as determined by the Permittee(s) and incorporated within their screening program. If other characteristics are used, the Permittee shall provide a definition or a criterion for how a significant non-stormwater discharge will be determined. If the criterion is field measurements and/or water quality data, thresholds shall be specified in the written procedures.

C. Source Investigation for Outfalls with Significant Non-Stormwater Discharge

Each Permittee shall conduct source investigation for outfalls identified to have significant non-stormwater discharge. The Permittee shall prioritize source investigation with consideration of dry weather TMDL compliance schedules, 303(d) listed waterbodies for dry weather constituents, dry weather receiving water monitoring data with recurring exceedances, geographic location, and other necessary factors. The source investigation shall be conducted as follows:

1. If the source of a significant non-stormwater discharge is determined to be an illicit discharge, then each Permittee shall implement procedures to eliminate the discharge consistent with IDDE requirements.
2. If the source of a significant non-stormwater discharge is determined to be an NPDES permitted discharge, a discharge subject to a Record of Decision approved by U.S. EPA pursuant to section 121 of CERCLA, a conditionally exempt essential non-stormwater discharge, or entirely comprised of natural flows as defined at Part III.A.2 of the Order, then the Permittee shall document the source.
3. If the source of a significant non-stormwater discharge is either unknown or a conditionally exempt, but non-essential, non-stormwater discharge, then each Permittee shall conduct monitoring required in Part VII.E of this MRP.
4. If the significant non-stormwater discharge is comprised of more than one source, then the Permittee shall attempt to quantify the relative contribution from each individual source or group of similar sources (e.g., irrigation overspray) and classify the contributions as authorized, conditionally exempt essential, natural, illicit discharge, conditionally exempt non-essential, or unknown.
5. If the source of a significant non-stormwater discharge is unknown, then the Permittee shall describe the efforts undertaken to identify the source. Methods for identifying the source of non-stormwater discharge may include inspection and/or surveillance, discharge monitoring and data loggers, video or physical inspection, monitoring for indicator parameters (e.g., surfactants, chlorine, pyrethroids), or other means.
6. If a source of a significant non-stormwater discharge originates within an upstream jurisdiction, then the Permittee shall inform in writing both the upstream jurisdiction and the Los Angeles Water Board within 30 days of determination of the presence of the discharge,

all available characterization data, contribution determination efforts, and efforts taken to identify its source.

D. Schedule for Screening and Source Investigation

1. Schedule for Ventura County Permittees

- a. Ventura County Permittees shall screen outfalls for significant non-stormwater discharges and conduct source investigation for no less than 50 percent of the outfalls with significant non-stormwater discharges within 3 years of the effective date of the Order, and 100 percent of the outfalls with significant non-stormwater discharges within 5 years of the effective date of the Order.
- b. Notwithstanding subpart a above, Ventura County Permittees may propose in their IMP or CIMP an alternative source investigation schedule if it can demonstrate an equivalent level of source investigation and abatement.

2. Schedule for Los Angeles County Permittees

- a. Los Angeles County Permittees shall continue monitoring outfalls with significant non-stormwater discharges that were identified in previously approved monitoring programs in Table E-1 of this MRP.
- b. Additionally, Los Angeles County Permittees shall consider dry weather receiving water monitoring data downstream of the outfalls and other relevant information to determine if re-screening is necessary for any of the previously screened outfalls that did not have significant non-stormwater discharge. Where re-screening is needed, the Permittee(s) shall make the necessary changes in its written program documents, re-screen the necessary outfalls for significant non-stormwater discharges, and conduct source investigation for those outfalls within 3 years of the effective date of the Order.
- c. Notwithstanding subpart b above, Los Angeles County Permittees may propose in their IMP or CIMP an alternative source investigation schedule if it can demonstrate an equivalent level of source investigation and abatement.

E. Non-Stormwater Outfall-Based Monitoring

1. For the purposes of this monitoring program, non-stormwater discharges shall be monitored during dry weather when precipitation is less than 0.1 inch and those days not less than 72 hours after a wet day. A wet day is defined as days with 0.1 inch of rain or more.
2. Within 90 days after completing the outfall screening and source investigation for significant non-stormwater discharges or after the Executive Officer of the Los Angeles Water Board approves the IMP or CIMP, whichever is later, each Permittee shall monitor outfalls during dry weather that are 1) comprised of conditionally exempt non-stormwater discharges, 2) continuing discharges attributed to illicit discharges, or 3) from unknown sources. The following parameters shall be monitored:
 - a. Flow,
 - b. Pollutants assigned a WQBEL derived from TMDL WLAs for the respective receiving water, as identified in Attachments K through S of the Order and parameters to determine compliance with WQBELs,
 - c. Other pollutants identified on the CWA section 303(d) List for the receiving water or downstream receiving waters consistent with Part V.B.4.c of this MRP.

- d. A toxicant or class of toxicants that is identified through a TIE conducted during dry weather at a receiving water monitoring location. Permittees shall analyze for the toxicant(s) during the next scheduled sampling event in the discharge from the outfall(s) upstream of the receiving water location.
 - e. Other parameters in Table E-6 of this MRP identified as exceeding the lowest applicable water quality objective in the nearest downstream receiving water monitoring location per Part V.B.5 of this MRP.
3. For outfalls subject to a dry weather TMDL, monitoring frequency shall be as specified in the TMDL or as specified in a monitoring program approved by the Executive Officer of the Los Angeles Water Board.
4. For outfalls not subject to dry weather TMDLs, monitoring frequency shall be four times during the first water year of monitoring, distributed approximately quarterly, during dry weather conditions or as specified in a monitoring program approved by the Executive Officer of the Los Angeles Water Board.
5. If outfall monitoring results during the first water year of monitoring do not exceed a water quality standard, the Permittee may conduct field observations (as described below) for that outfall instead of monitoring per Part VII.E.2 of this MRP.
 - a. When conducting field observations, the Permittee must identify flow estimation (i.e., width of water surface, approximate depth of water, approximate flow velocity, flow rate), odor, color, clarity, floatables, deposits/stains, vegetation condition, structural condition, and biology.
 - b. If there are changes in field observations, the permittee must resume monitoring as described in Parts VII.E.2 and VII.E.5 of this MRP and must implement illicit discharge elimination procedures in Part VIII.I of the Order. Field observations (in lieu of sampling) may resume if the non-stormwater is identified as an illicit discharge and is eliminated or if monitoring results under Part VII.E.2 of this MRP do not exceed water quality standards for one water year.
6. If outfall monitoring results during the first water year of monitoring exceed a water quality standard, the Permittee shall continue to monitor those outfalls for the exceeded parameters two times a year.
7. For all non-stormwater outfall-based monitoring, the Permittee must record general information including conveyance type, dominant watershed land uses, flow estimation, and sensory observations as described in Part VII.E.5.a of this MRP.

VIII. OUTFALL-BASED DATABASE

- A. **Storm Drains, Channels and Outfalls Map(s) and/or Database.** All Permittee(s) shall maintain a map(s) and/or database (GIS preferred) of its MS4 to include the following information:
 1. Surface water bodies within the Permittee(s) jurisdiction
 2. Sub-watershed (HUC 12) boundaries
 3. Land use overlay
 4. Jurisdictional boundaries
 5. The location and length of all open channel and underground storm drain pipes 18 inches in diameter or greater (with the exception of catch basin connector pipes)
 6. The location of all dry weather diversions (e.g., Low Flow Diversions (LFDs))

7. The location of all major MS4 outfalls within the Permittee's jurisdictional boundary. Each major outfall shall be assigned an alphanumeric identifier, which must be noted on the map.
8. Storm drain outfall catchment areas for each major outfall within the Permittee(s) jurisdiction
9. Each mapped MS4 outfall shall be linked to a database to include the following:
 - a. Ownership
 - b. Latitude / Longitude Coordinates
 - c. Physical description of outfall structure including size (e.g., diameter and shape).
 - d. Photographs of the outfall, where possible, to provide baseline information to track operation and maintenance needs over time
 - e. Stormwater and non-stormwater monitoring data
 - f. Notation of outfalls with significant non-stormwater discharges
 - g. If the outfall conveys no significant non-stormwater discharges, include the basis for this determination.
 - h. For outfalls conveying significant non-stormwater discharges:
 - i. Date and time of last visual observation or inspection.
 - ii. Description of receiving water at the point of discharge (e.g., natural, soft-bottom with armored sides, trapezoidal, concrete channel).
 - iii. Parking, access, and safety considerations.
 - iv. Photographs of outfall condition.
 - v. Photographs of significant non-stormwater discharge (or indicators of discharge) unless safety considerations preclude obtaining photographs.
 - vi. Estimation of discharge rate.
 - vii. All diversions either upstream or downstream of the outfall.
 - viii. Observations regarding discharge characteristics such as turbidity, odor, color, presence of debris, floatables, or characteristics that could aid in pollutant source identification.

IX. AQUATIC TOXICITY MONITORING METHODS

- A. Aquatic Toxicity Monitoring shall be conducted according to the procedures described in this Part IX. When the State Water Board's Policy for Toxicity Assessment and Control is fully approved and in effect, the Los Angeles Water Board Executive Officer may direct the Permittee(s) to replace current toxicity program elements with standardized procedures in the policy.
- B. The Permittee(s) shall collect and analyze samples taken from receiving water monitoring locations to evaluate the extent and causes of toxicity in receiving waters.
- C. Toxicity samples may be flow-weighted composite samples, or grab samples, for wet and dry event sampling.
- D. The total sample volume shall be determined both by the specific toxicity test method used and the additional volume necessary for TIE studies. Sufficient sample volume shall be collected to perform both the required toxicity tests and TIE studies.

- E. Holding Times.** All toxicity tests shall be conducted as soon as possible following sample collection. The 36-hour sample holding time for test initiation shall be targeted. However, no more than 72 hours shall elapse before the conclusion of sample collection and test initiation.
- F. Definition of Acute Toxicity.** Acute toxicity measures a lethal effect to experimental test organisms exposed to an effluent or receiving waters compared to that of the control organisms.
- G. Definition of Chronic Toxicity.** Chronic toxicity measures a sublethal effect (e.g., reduced growth, reproduction) to experimental test organisms exposed to an effluent or receiving waters compared to that of the control organisms.
- H. Toxicity Monitoring Program**

- 1. Freshwater Test Species and Methods.** If samples are collected in receiving waters with salinity <1 ppt, or from outfalls discharging to receiving waters with salinity <1 ppt, then the Permittee(s) shall conduct the following critical life stage chronic and acute toxicity tests in Table E-7 of this MRP on undiluted samples in accordance with species and short-term test methods in *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms* (EPA/821/R-02/013, 2002; Table IA, 40 CFR Part 136) and *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms* (EPA/821/R-02/012, 2002; Table IA, 40 CFR Part 136). In no case shall the following test species be substituted with another organism unless written authorization from the Los Angeles Water Board Executive Officer is received:

Table E-7. Freshwater Aquatic Toxicity Species and Analytical Procedures

| Test Species | Test Endpoint(s) | U.S. EPA Method |
|--|----------------------------|------------------------|
| <i>Pimephales promelas</i> (Fathead Minnow) | Larval Survival and Growth | EPA-821-R-02-013 |
| <i>Ceriodaphnia dubia</i> (Freshwater Crustacean) | Survival and Reproduction | EPA-821-R-02-013 |
| <i>Hyalella azteca</i> (Freshwater Amphipod) | Survival | EPA-821-R-02-012 |
| <i>Chironomus dilutus</i> (Midge) | Survival | EPA-821-R-02-012 |

- 2. Non-Ocean Marine Waters¹² Test Species and Methods.** If samples are collected in receiving waters with salinity ≥1 ppt, or from outfalls discharging to receiving waters with salinity ≥1 ppt, then the Permittee(s) shall conduct the following critical life stage chronic toxicity tests in Table E-8 of this MRP on undiluted samples in accordance with species and short-term test methods in *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms* (EPA/600/R-95/136, 1995) or *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms*, Third Edition, October 2002, (EPA/821-R-02-014). Artificial sea salts shall be used to increase sample salinity. In no case shall the following test species be substituted with another organism unless written authorization from the Los Angeles Water Board Executive Officer is received:

¹² Non-ocean marine waters include enclosed bay, estuarine, and coastal lagoon waters.

Table E-8. Non-Ocean Marine Waters Aquatic Toxicity Species and Analytical Procedures

| Test Species | Test Endpoint(s) | U.S. EPA Method |
|---|----------------------------|-----------------|
| <i>Atherinops affinis</i> ¹³ (Topsmelt) | Larval Survival and Growth | 1006.01 |
| <i>Strongylocentrotus purpuratus</i> (Purple Sea Urchin) | Fertilization | 1008.0 |
| <i>Macrocystis pyrifera</i> (Giant Kelp) | Germination and Growth | 1009.0 |

3. **Test Species Sensitivity Screening.** During the first year of the permit term, Permittees shall conduct a sensitivity screening to determine the most sensitive test species. The Permittees' IMP or CIMP shall include the results of the test species sensitivity screening and identify the most sensitive test species that will be used for aquatic toxicity monitoring. To determine the most sensitive test species, the Permittee(s) shall conduct two wet weather and two dry weather toxicity tests with the species listed for freshwater and non-ocean marine waters, as appropriate. Sensitive species determinations may result in one most sensitive test species for wet weather and a different most sensitive test species for dry weather or the same most sensitive test species for both dry and wet weather. Sensitive test species determinations shall also consider the most sensitive test species used for proximal receiving water monitoring. After this screening period, subsequent aquatic toxicity monitoring required per Parts V.A.4.g and V.B.4.g of this MRP shall be conducted using the most sensitive test species (i.e., 1 chronic and/or acute freshwater species and/or 1 chronic marine and ocean waters species, as appropriate).
4. Toxicity test biological endpoint data shall be analyzed using the Test of Significant Toxicity t-test approach specified in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (U.S. Environmental Protection Agency, Office of Wastewater Management, Washington, D.C. EPA 833-R-10-003, 2010). For this monitoring program, the critical acute and chronic in-stream waste concentration (IWC) is set at 100% receiving water for receiving water samples and 100% effluent for wet and dry weather outfall samples. A 100% receiving water/outfall effluent sample and a control shall be tested. For *Hyaella* and *Chironomus* acute toxicity test methods, the test result will be considered a "pass," regardless of a TST determination of "fail" if the percent survival in the receiving water is equal to or greater than 90 percent.

I. Quality Assurance

1. If the receiving water or outfall effluent test does not meet all test acceptability criteria (TAC) specified in the test methods manuals (*Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms* (EPA/821/R-02/013, 2002), *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms* (EPA/821/R-02/012, 2002; Table IA, 40 CFR Part 136), and *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms* (EPA/600/R-95/136, 1995)), then the Permittee(s) must re-sample and re-test at the earliest time possible.
2. Control water, including brine controls, shall be laboratory water prepared and used as specified in the test methods manuals.

¹³ If laboratory-held cultures of the topsmelt, *Atherinops affinis*, are not available for testing, then the Permittee(s) shall conduct a static renewal toxicity test with the inland silverside, *Menidia beryllina* (Larval Survival and Growth Test Method 1006.01), found in the third edition of *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms* (EPA-821-R-02-014, 2002; Table IA, 40 CFR part 136).

3. If organisms are not cultured in-house, then concurrent testing with a reference toxicant shall be conducted. If organisms are cultured in-house, then monthly reference toxicant testing is sufficient. Reference toxicant tests and effluent toxicity tests shall be conducted using the same test conditions (e.g., same test duration, etc.).

J. Toxicity Identification Evaluation (TIE)

1. A toxicity test sample is immediately subject to TIE procedures to identify the toxic chemical(s), if either the survival or sublethal endpoint demonstrates a Percent Effect value equal to or greater than 50% at the IWC. Percent Effect is defined as the effect value—denoted as the difference between the mean control response and the mean IWC response, divided by the mean control response—multiplied by 100.
2. A TIE shall be performed to identify the causes of toxicity using the same species and test method and, as guidance, U.S. EPA manuals: *Toxicity Identification Evaluation: Characterization of Chronically Toxic Effluents, Phase I* (EPA/600/6-91/005F, 1992); *Methods for Aquatic Toxicity Identification Evaluations, Phase II Toxicity Identification Procedures for Samples Exhibiting Acute and Chronic Toxicity* (EPA/600/R-92/080, 1993); *Methods for Aquatic Toxicity Identification Evaluations, Phase III Toxicity Confirmation Procedures for Samples Exhibiting Acute and Chronic Toxicity* (EPA/600/R-92/081, 1993); and *Marine Toxicity Identification Evaluation (TIE): Phase I Guidance Document* (EPA/600/R-96-054, 1996).
3. The TIE should be conducted on the test species demonstrating the most sensitive toxicity response at a sampling location. A TIE may be conducted on a different test species demonstrating a toxicity response with the caveat that once the toxicant(s) are identified, the most sensitive test species triggering the TIE shall be further tested to verify that the toxicant has been identified and addressed.
4. A TIE Prioritization Metric (see Appendix 5 in SMC Model Monitoring Program) may be utilized to rank sites for TIEs.
5. Clarification regarding follow-up monitoring requirements in response to observed toxicity in receiving waters can be found in Attachment G of the Order (Aquatic Toxicity: TIE and TRE Requirements).

K. Toxicity Reduction Evaluation (TRE)

1. When a toxicant or class of toxicants is identified through a TIE conducted at a receiving water monitoring location, Permittees shall analyze for the toxicant(s) during the next scheduled sampling event in the discharge from the outfall(s) upstream of the receiving water location.
2. If the toxicant is present in the discharge from the outfall at levels above the applicable limitation, a TRE shall be performed for that toxicant.
3. The TRE shall include all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate the causes of toxicity. No later than 30 days after the source of toxicity and appropriate BMPs are identified, the Permittee(s) shall submit a TRE Corrective Action Plan to the Los Angeles Water Board Executive Officer for approval. At minimum, the plan shall include a discussion of the following:
 - a. The potential sources of pollutant(s) causing toxicity.
 - b. A list of municipalities and agencies that may have jurisdiction over sources of pollutant(s) causing toxicity.
 - c. Recommended BMPs to reduce the pollutant(s) causing toxicity.

- d. Proposed post-construction control measures to reduce the pollutant(s) causing toxicity.
 - e. Follow-up monitoring to demonstrate that the toxicants have been reduced or eliminated.
4. Participation in a Watershed Management Program that addresses the aquatic toxicity waterbody-pollutant combination shall satisfy the requirement in subpart 3 above to submit a TRE Corrective Action Plan.
 5. The TRE process shall be coordinated with TMDL monitoring and implementation (i.e., if a TMDL for 4,4'-DDD is being implemented when a TRE for 4,4'-DDD is required, then efforts shall be coordinated to avoid overlap).
 6. Clarification regarding follow-up monitoring requirements in response to observed toxicity in receiving waters can be found in Attachment G of the Order (Aquatic Toxicity: TIE and TRE Requirements).

X. REGIONAL STUDIES

A. Southern California Stormwater Monitoring Coalition Watershed Monitoring Program

Each Permittee is encouraged to continue participation in the Southern California Stormwater Monitoring Coalition (SMC) Regional Watershed Monitoring Program's current study design, by supporting the monitoring at the sites within the watershed management area(s) that overlap with the Permittee's jurisdictional area.

B. Southern California Bight Project

Each Permittee is encouraged to continue participation in the Southern California Bight Project (SCBP) monitoring within the watershed management area(s) that overlap with the Permittee's jurisdictional area.

XI. SPECIAL STUDIES

Each Permittee is encouraged to conduct special studies recommended in a TMDL. Optional special studies include:

A. Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters Toxic Pollutants TMDL

Permittees may opt to conduct special studies to further refine the site-specific link between sediment pollutant concentrations, depth of bed sediment contamination and fish tissue concentrations; foraging ranges of targeted fish; additional data to refine watershed and hydrodynamic models, additional data on contaminant contributions of the Los Angeles River or San Gabriel River to Greater Harbor waters; stressor identifications; additional diazinon data; and further characterization of direct air deposition loadings for heavy metals and legacy pesticides. If opting to conduct this special study, Permittees shall propose a schedule for monitoring and reporting.

B. Los Angeles Area Lakes TMDL: Legg Lake, Lake Calabasas, Echo Park Lake, Puddingstone Reservoir, and Peck Road Park Lake TMDLs (*U.S. EPA established*)

Permittees may opt to conduct a special study based on the recommendations in the TMDL and propose a schedule for monitoring and reporting.

C. Biotic Ligand Model (BLM) to Establish Site-Specific Objectives for Copper

A Permittee(s) may opt to conduct monitoring at a specific waterbody(ies) and gather monitoring data necessary to establish a site-specific objective for copper using the BLM. If opting to

conduct this monitoring, Permittees shall submit a monitoring and reporting plan in accordance with Los Angeles Water Board recommendations.

XII. REPORTING REQUIREMENT OBJECTIVES

The reporting process is intended to meet the following objectives:

- A.** Present summary information that allows the Los Angeles Water Board to assess:
 - 1. Each Permittee's appropriate participation in one or more Watershed Management Programs if applicable.
 - 2. The impact of each Permittee(s) stormwater and non-stormwater discharges on the receiving water.
 - 3. Each Permittee's compliance with receiving water limitations and numeric water quality-based effluent limitations.
 - 4. The effectiveness of each Permittee(s) control measures in reducing discharges of pollutants from the MS4 to receiving waters.
 - 5. Whether the quality of MS4 discharges and the health of receiving waters is improving, staying the same, or declining as a result of watershed management program efforts, and/or TMDL implementation measures, and implementation of Minimum Control Measures.
 - 6. Whether changes in water quality can be attributed to pollutant controls imposed on new development, re-development, or retrofit projects.
- B.** Present detailed data and information in an accessible format to allow the Los Angeles Water Board to verify conclusions presented in a Permittee's summary information.
- C.** Provide the Permittee(s) a forum to discuss the effectiveness of its past and ongoing control measure efforts and to convey its plans for future control measures.
- D.** Present data and conclusions in a transparent manner to facilitate the review and understanding by the general public.
- E.** Focus each Permittee's reporting efforts on watershed condition, water quality assessment, and an evaluation of the effectiveness of control measures.

XIII. STANDARD MONITORING AND REPORTING PROVISIONS

- A.** All monitoring, reporting, and recordkeeping activities shall be conducted in accordance with requirements specified in Attachments D, E, H and I of the Order.
- B.** In addition to requirements specified in Part IV.B of Attachment D of the Order, the Permittee shall also retain records of monitoring information to include weather conditions, rainfall amount, and data sheets showing toxicity test results.
- C.** Reporting requirements related to the monitoring of trash shall be conducted in accordance with Parts IV.B.3 and III.B of the Order and reported per Attachment H and I of the Order.
- D.** The monitoring data submitted to the Los Angeles Water Board shall specify, for each pollutant, the analytical method used, the applicable Reporting Level (RL), and the current Method Detection Limit (MDL) as determined by the procedure in 40 C.F.R. part 136. For the purpose of reporting compliance with numerical limitations and performance goals, the results of analytical determinations for the presence of chemical constituents in a sample shall be reported using the following reporting protocols:
 - 1. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

2. Sample results less than the RL, but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.
 3. For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ. The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be listed as percent accuracy (\pm a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.
 4. Sample results less than the laboratory's MDL shall be reported as "Not Detected," or ND.
 5. The Permittee(s) are to instruct laboratories to establish calibration standards so that the RL value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Permittee to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.
- E.** Exceedances of applicable limitations in the Order shall be determined using sample reporting protocols defined in Part XIII.D above and Attachment A (refer to definition for reporting level) of the Order. For purposes of reporting and administrative enforcement by the Los Angeles Water Board and State Water Board, the Permittee(s) shall be out of compliance with applicable limitations if the concentration of the pollutant in the monitoring sample is greater than the applicable limitation and greater than or equal to the Reporting Level (RL) unless otherwise stated in Part X (Compliance Determination) of the Order.
- F.** If no flow occurred during the sampling event, then the Monitoring Report shall so state.
- G.** All monitoring data submitted to the Los Angeles Water Board shall be reported in units consistent to Table E-6 in this MRP or if reporting TMDL monitoring data, consistent to units in Attachments K through S of the Order.
- H.** The Los Angeles Water Board or its Executive Officer, consistent with 40 CFR section 122.41, may approve changes to the Monitoring and Reporting Program, after providing the opportunity for public comment, either:
1. By request of a Permittee or by an interested person after submittal of the Monitoring Report. Such request shall be in writing and filed not later than 60 days after the Monitoring Report submittal date, or
 2. As deemed necessary by the Los Angeles Water Board Executive Officer, following notice to the Permittees.
- I.** Permittees must provide a copy of the Standard Operation Procedures (SOP or SOPs) for any monitoring conducted under this MRP to the Los Angeles Water Board upon request.
- J.** When monitoring cannot be performed to comply with the requirements of the Order due to circumstances beyond a Permittee's control, then within two working days, the following shall be submitted to the Los Angeles Water Board Executive Officer:
1. Statement of situation.
 2. Explanation of circumstance(s) with documentation.
 3. Statement of corrective action for the future.

XIV. REPORTING REQUIREMENTS

Permittees shall comply with all reporting requirements in this Part XIV unless otherwise specified by the Los Angeles Water Board. Furthermore, all items within Attachment H and Attachment I shall serve as reporting requirements for the Order.

A. Program Reports

Permittees shall use the forms provided in Attachments H and I of the Order starting June 15, 2022 or December 15, 2022, per the schedule below. For the 2020-21 fiscal year reporting, Permittees shall continue their annual reporting per the previous permits.

- 1. Annual Report Form.** Each Permittee shall complete and submit an Annual Report using the Annual Report Form (contained in Attachment H) no later than December 15 of each year for the preceding July 1 to June 30 reporting period¹⁴. Unless otherwise specified by the Los Angeles Water Board, each Permittee shall submit its Annual Report to the Los Angeles Water Board in pdf file format via an electronic method (e.g., CD, USB drive, attachment/link in email¹⁵, etc.).
- 2. Watershed Management Program Progress Report Form.** Each Permittee or group of Permittees participating in a Watershed Management Program shall complete and submit a Watershed Management Program Progress Report using the Watershed Management Program Progress Report Form (contained in Attachment H) semi-annually no later than December 15 and June 15 of each year for the preceding January 1 to June 30 and July 1 to December 31 reporting period, respectively. Unless otherwise specified by the Los Angeles Water Board, each Permittee shall submit its Watershed Management Program Report to the Los Angeles Water Board in pdf file format via an electronic method (e.g., CD, USB drive, attachment/link in email¹⁶, etc.). Each Permittee participating in a Watershed Management Program shall make the Watershed Management Program Progress Report readily available to the public through multiple avenues, including direct outreach and posting to its website or a website specifically dedicated for the watershed management group semi-annually. The posting to the website shall be prominent, immediately identifiable, and readily available to visitors to the website. The Watershed Management Program Progress Report shall be easily understandable to the general public. For the web-posting, each Permittee participating in a Watershed Management Program shall extract the progress summary included in Section 1.1 of Attachment H and post it on the website with a link to the full Watershed Management Program Progress Report. The extracted progress summary shall be translated, in a culturally relevant manner, into languages other than English based on community demographics and considering information on linguistic isolation (e.g., Cal EnviroScreen).
- 3. Trash Reporting Forms.** Permittees shall annually report on compliance with Trash TMDLs and Trash Discharge Prohibitions using the Trash TMDL Reporting Form and/or Trash Discharge Prohibition Reporting Form (contained in Attachment I or a revised form approved by the Los Angeles Water Board) and submit completed forms as attachments to the Annual Report Form.
- 4.** In the Annual Report Form, each Permittee is required to report on implementation of the Order including not limited to expenditures, funding sources, and progress on implementing the following programs: Non-Stormwater Discharge Prohibitions, Minimum Control Measures, the Non-Stormwater Outfall-Based Screening and Monitoring Program, Trash TMDLs, and Trash Discharge Prohibitions. The Watershed Management Program Progress Report shall be used to report on progress in implementing the WMP.

¹⁴ e.g., the Annual Report due on December 15, 2022 must cover the activities from July 1, 2021 to June 30, 2022.

¹⁵ Email to MS4stormwaterRB4@waterboards.ca.gov.

¹⁶ Ibid.

B. Monitoring Report

1. Each Permittee or group of Permittees shall submit a Monitoring Report per the schedule indicated in Table E-9 below (e.g., the Monitoring Report due on December 15, 2021 must cover the monitoring period from January 1, 2021 to June 30, 2021).

Table E-9. Monitoring Results Reporting Schedule

| Items to Submit | Reporting Frequency | Preceding Monitoring Period | Monitoring Report Due Date |
|---|---------------------|-----------------------------|----------------------------|
| Monitoring Results (Part XIV.B.2.a) and Certification (Part XIV.B.2.b) | Semi – Annual | January 1 through June 30 | December 15 |
| Monitoring Results (Part XIV.B.2.a) and Certification (Part XIV.B.2.b) | Semi – Annual | July 1 through December 31 | June 15 |
| Certification (Part XIV.B.2.b), Summary of Sampling Events (Part XIV.B.2.c), QA/QC (Part XIV.B.2.d), Summary of Exceedances (Part XIV.B.2.e), and Summary of Aquatic Toxicity Monitoring (Part XIV.B.2.f) | Annual | July 1 through June 30 | December 15 |

2. **Monitoring Report Content:** Unless otherwise specified by the Los Angeles Water Board, each Permittee or group of Permittees shall submit Monitoring Reports to the Los Angeles Water Board via an electronic method (e.g., CD, USB drive, attachment/link in email¹⁷, etc.). The Monitoring Report shall include the following items per Table E-9 above:
 - a. **Monitoring Results.** An electronic copy of all receiving water and outfall monitoring results in Excel or CSV file format and in the California Environmental Data Exchange Network (CEDEN) data entry template format,¹⁸ or in a format specified by the Los Angeles Water Board. Data files shall use CEDEN controlled vocabulary terms and the SWAMP standard list of analyte, matrix and unit combinations (available at https://www.waterboards.ca.gov/water_issues/programs/swamp/swamp_iq/). Any data that is not CEDEN compatible (e.g., photographic evidence, rain data, qualitative data, and narrative data) shall be provided in a format deemed appropriate by the Permittee(s) or as specified by the Los Angeles Water Board.
 - b. **Certification.** Certification and signature per Part V.B of Attachment D of the Order.
 - c. **Summary of Sampling Events.** For each sampling event, provide the following information:
 - i. Date
 - ii. Site ID (i.e., station ID or monitoring location ID)
 - iii. Monitoring Location Type (i.e., outfall or receiving water)
 - iv. Sample Media (e.g., water column, bed sediment, fish tissue, storm-borne sediment)
 - v. For receiving water monitoring locations, indicate the Site ID of the upstream outfall.

¹⁷ Ibid.

¹⁸ CEDEN data entry templates are available on the website: <http://ceden.org/>.

- vi. For outfall monitoring locations, indicate the receiving water the outfall discharges to and if being monitored, the Site ID of the receiving water monitoring location.
 - vii. Missed monitoring events and justification (e.g., no discharge, unsafe conditions, holding time exceeded due to lab business hours).
 - viii. Weather Condition (i.e., wet or dry). If there are applicable TMDLs with a specific definition, indicate so and indicate the weather condition per the TMDL.
 - ix. Station ID of rain gage station(s) and/or flow gage station(s) used to determine the weather condition.
 - x. For each wet weather sampling event, provide the following information:
 - (a) Date
 - (b) Storm start time
 - (c) Storm duration (hours)
 - (d) Highest storm intensity – 15 minutes (inches/hour)
 - (e) Total storm volume (inches)
 - (f) Did the sample event occur during the first significant storm?
 - (g) Was the sampling event preceded by at least three days of dry weather (less than 0.1 inches of rain each day)?
 - xi. For each dry weather sampling event, provide the following information:
 - (a) Date
 - (b) Did the sample event occur during the historically driest month?
 - (c) Did the sampling event occur at least three days after a rain event of 0.1 inches or greater?
 - xii. Information in (i)-(xi) above for additional monitoring events (e.g., accelerated monitoring for bacteria)
- d. **Quality Assurance/Quality Control (QA/QC).** Summarize QA/QC results and actions to address any QA/QC issues that arose (e.g., holding time, contamination, precision). This may include a summary of qualified data if necessary.
- e. **Summary of Exceedances.** Summarize exceedances of applicable WQBELs, receiving water limitations, and aquatic toxicity thresholds for all test results, with corresponding sampling dates, monitoring site IDs, and weather conditions (i.e., dry weather or wet weather). Quantitatively describe trends¹⁹ in water quality (e.g., improving, staying the same, declining) in the receiving water and outfalls, using statistical analysis and/or graphical presentation of data, for wet and dry weather conditions. Where the Permittee determines that outfall discharges are causing or contributing to receiving water exceedances, provide a summary of efforts taken to address these exceedances.

¹⁹ Use available monitoring data since July 8, 2010 for Ventura County Permittees, since March 28, 2014 for the City of Long Beach, and since December 28, 2012 for other Los Angeles County Permittees.

- f. Summary of Aquatic Toxicity Monitoring.** Provide the following:
- i.** If aquatic toxicity was confirmed and a TIE was conducted, identify the toxic chemicals as determined by the TIE. Include all relevant data to allow the Los Angeles Water Board to review the adequacy and findings of the TIE. This shall include, but not be limited to, the sample(s) date, sample(s) start and end time, sample type(s) (flow-weighted composite, grab, or field measurement), sample location(s), the parameters, the analytical results, and the applicable limitation.
 - ii.** A full laboratory report for each toxicity test prepared according to the appropriate test methods manual chapter on Report Preparation, including:
 - (a)** The toxicity test results for the t-test, reported as “Pass” or “Fail”, and the “Percent Effect”,
 - (b)** The dates of sample collection and initiation of each toxicity test,
 - (c)** Test species with biological endpoint values for each concentration tested,
 - (d)** Reference toxicant test results,
 - (e)** Water quality measurements for each toxicity test (e.g., pH, dissolved oxygen, temperature, conductivity, hardness, salinity, chlorine, ammonia),
 - (f)** TRE/TIE testing results, and
 - (g)** A printout of CETIS (Comprehensive Environmental Toxicity Information System) program results.
 - iii.** TIEs (Phases I, II, and III) that have been completed or are being conducted, by monitoring location.
 - iv.** The development, implementation, and results for each TRE Corrective Action Plan, beginning the water year following the identification of each pollutant or pollutant class causing toxicity.

C. Receiving Water Limitations Compliance Report

- 1.** If a Permittee is not addressing receiving water limitations per Part V.C (Receiving Water Limitations) of the Order, or if it is determined by the Permittee or the Los Angeles Water Board that discharges from the MS4 are causing or contributing to an exceedance of an applicable receiving water limitation, then the Permittee shall submit a Receiving Water Limitations Compliance Report that:
 - a.** Describes the BMPs that are currently being implemented by the Permittee and additional BMPs, including modifications to current BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of receiving water limitations; and
 - b.** Includes an implementation schedule for implementing the BMPs that is as short as possible.
- 2.** The Permittee shall submit the Receiving Water Limitations Compliance Report concurrently with their Annual Report per the schedule and submittal method indicated in Part XIV.A.1 of this MRP for approval by the Los Angeles Water Board Executive Officer.
- 3.** Consistent with Part V.D of the Order, so long as the Permittee has complied with the procedures set forth in Part V.C of the Order and is implementing its approved Receiving Water Limitations Compliance Report, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations

unless directed by the Los Angeles Water Board to modify current BMPs or develop additional BMPs.

4. **Watershed Management Program Exemption.** Per Part IX.B.9.c.(iv) of the Order, implementation of actions to address water quality priorities in a Watershed Management Program related to addressing exceedances of receiving water limitations in Part V (Receiving Water Limitations) of the Order which is not otherwise addressed by TMDLs in Part IV of the Order and Attachments K through S, fulfills the requirements in Part V.C of the Order to prepare a Receiving Water Limitations Compliance Report.

XV. TMDL REPORTING

Permittees shall report on compliance with all TMDLs in Attachments K through S in their Program Reports and Monitoring Reports per Part XIV.A-C of this MRP. Notable TMDL-specific reporting requirements are as follows:

A. Santa Monica Bay Nearshore and Offshore Debris TMDL

Permittees shall notify the Los Angeles Water Board promptly if there is future development of MS4 infrastructure in the Santa Monica Bay WMA within Ventura County but outside of the Malibu Creek subwatershed. After notification, the Los Angeles Water Board may require an updated Trash Monitoring and Reporting Plan (TMRP) and Plastic Pellet Monitoring and Reporting Plan (PMRP) to be submitted.

B. Upper Santa Clara River Chloride TMDL and Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL

Ventura County Permittees shall notify the Los Angeles Water Board promptly if there is future development of MS4 infrastructure within Ventura County that discharges to Santa Clara River Reaches 4B and 5. After notification, the Los Angeles Water Board may require an updated TMDL monitoring and implementation plan to be submitted.

C. Metals and Selenium in the Calleguas Creek, its Tributaries, and Mugu Lagoon TMDL

Board Briefing: By March 27, 2023 and every 2 years thereafter, Permittees shall provide a verbal update to the Los Angeles Water Board, including progress toward meeting the TMDL, water quality data, and a summary of implementation activities completed to date.

D. Boron, Chloride, Sulfate, and TDS (Salts) in the Calleguas Creek Watershed TMDL

Optional Special Studies Results: If participating in an optional special study, Permittees shall submit the results of the special studies 2 years after special study workplan approval by the Los Angeles Water Board Executive Officer.

E. Implementation Plan for the U.S. EPA-Established Malibu Creek Nutrients TMDL and the U.S. EPA-Established Malibu Creek and Lagoon Sedimentation and Nutrients TMDL to Address Benthic Community Impairments

1. **Nutrient Implementation Plan:** If Los Angeles County Permittees have not already submitted a nutrient implementation plan, they shall update their existing Watershed Management Program per the schedule in Part IX.G of the Order, if participating in a Watershed Management Program.
2. **Sediment Implementation Plan:** If Los Angeles County Permittees below Malibu Lake have not already submitted a sediment implementation plan, they shall update their existing Watershed Management Program per the schedule in Part IX.G of the Order, if participating in a Watershed Management Program.
3. **Nutrient Implementation Plan:** If Ventura County Permittees have not already submitted a nutrient implementation plan, they shall address this requirement as part of their

Watershed Management Program per the schedule in Part IX.F of the Order, if participating in a Watershed Management Program.

F. Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters Toxic Pollutants TMDL

1. **Phase II Implementation Report:** Permittees shall report in writing on the status of implementation and scope, and schedule of remaining Phase II implementation actions to the Los Angeles Water Board by March 23, 2022.
2. Los Angeles County Permittees responsible for the Los Angeles River Metals TMDLs are responsible for conducting and reporting water and sediment monitoring above the Los Angeles River Estuary to determine the Los Angeles River’s contribution to the impairments in the Greater Los Angeles and Long Beach Harbor waters.
3. Los Angeles County Permittees responsible for the San Gabriel River Metals TMDLs are responsible for conducting and reporting water and sediment monitoring at the mouth of the San Gabriel River to determine the San Gabriel River’s contribution to the impairments in the Greater Los Angeles and Long Beach Harbor waters.

G. Los Angeles River Watershed Bacteria TMDL

1. **Load Reduction Strategy (LRS):** For dry weather, Permittees opting to implement an LRS may submit a stand-alone LRS for Los Angeles Water Board Executive Officer approval or may opt to submit the LRS as part of a Watershed Management Program per the deadlines indicated in Attachment Q (Los Angeles River Watershed TMDL Provisions), Table Q-1 of the Order. Table E-10 is a list of LRS submittals received to date.
2. **Implementation Plan:** By March 23, 2022, Permittees shall submit an Implementation Plan for wet weather with interim milestones for Los Angeles Water Board Executive Officer approval or may opt to address this requirement as part of a Watershed Management Program.

Table E-10. LRS Submittals

| Load Reduction Strategy | Submitted By | Document Date | Approval Date |
|--|--|----------------------|---------------------------|
| Arroyo Seco Load Reduction Strategy | Upper Los Angeles River Watershed Group | March 2016 | Has not been approved yet |
| Compton Creek Load Reduction Strategy | Upper Los Angeles River Watershed Group | March 2018 | Has not been approved yet |
| Compton Creek Load Reduction Strategy | Lower Los Angeles River Watershed Group | March 2018 | Has not been approved yet |
| Rio Hondo Load Reduction Strategy | Upper Los Angeles River Watershed Group, Los Angeles River Upper Reach 2 Sub Watershed Group, Lower Los Angeles River Watershed Group, City of El Monte, City of Irwindale | March 2016 | Has not been approved yet |
| Rio Hondo Load Reduction Strategy Addendum | Upper Los Angeles River Watershed Group, Los Angeles River Upper Reach 2 Sub Watershed Group, Lower Los Angeles River Watershed Group, City of El Monte, City of Irwindale | September 2017 | Has not been approved yet |
| Segment A Load Reduction Strategy | Lower Los Angeles River Watershed Group | September 2016 | Has not been approved yet |

| Load Reduction Strategy | Submitted By | Document Date | Approval Date |
|-----------------------------------|---|----------------------|---------------------------|
| Segment B Load Reduction Strategy | Lower Los Angeles River Watershed Group | September 2014 | Has not been approved yet |
| Segment B Load Reduction Strategy | Upper Los Angeles River Watershed Group as part of the EWMP | June 2015 | April 20, 2016 |
| Segment B Load Reduction Strategy | Los Angeles River Upper Reach 2 Sub Watershed Group | December 2014 | Has not been approved yet |
| Segment E Load Reduction Strategy | Upper Los Angeles River Watershed Group | September 2017 | Has not been approved yet |

H. Los Angeles River and Tributaries Metals TMDL

Permittees shall conduct and report additional receiving water monitoring to verify that water quality conditions are similar to those of the 2008 and 2014 copper WER study periods. The copper WER evaluation monitoring will consist of receiving water monitoring for key chemical parameters needed for estimates of WERs utilizing the Biotic Ligand Model (BLM). Monitoring shall be conducted at the locations sampled in the 2008 and 2014 copper WER studies, as well as additional locations in upstream portions of tributaries. The upstream tributary monitoring may be discontinued or reduced if it is shown that downstream tributary monitoring locations are representative of the entire tributary. Monitoring of sediment chemistry shall be conducted at one site immediately above the Los Angeles River Estuary and one site within the Estuary annually for analysis of general sediment quality constituents and metals.

Permittees will include criteria in their monitoring plan for determining what constitutes a significant change in BLM-predicted WERs. If BLM-predicted WERs significantly change, then Permittees shall submit a plan for Executive Officer approval to conduct WER toxicity testing in the applicable reaches or tributaries to reassess WERs.

ATTACHMENT F – FACT SHEET

As described in Part II of the Order, the Los Angeles Water Board incorporates this Fact Sheet as findings of the Los Angeles Water Board supporting the issuance of the Order. This Fact Sheet sets forth the principal facts and the significant factual, legal, methodological, and policy and technical rationale that serve as the basis for the requirements of the Order.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the facility and the Dischargers.

Table F-1. Facility Information

| | |
|--|--|
| WDID No.¹ | Various (see Table 2 and Table 3 of the Order) |
| Dischargers | The Los Angeles County Flood Control District (LACFCD), the County of Los Angeles, the 85 incorporated cities within the coastal watersheds of Los Angeles County, the Ventura County Watershed Protection District (VCWPD), the County of Ventura, and the 10 incorporated cities within Ventura County (see Table 2 and Table 3 of the Order) ² |
| Name of Facility | Municipal Separate Storm Sewer Systems (MS4s) ³ within the coastal watersheds of Los Angeles and Ventura counties |
| Facility Contacts, Titles, Addresses, and Phone Numbers | Available through the Stormwater Multiple Application and Report Tracking System (SMARTS) ⁴ at https://smarts.waterboards.ca.gov/smarts/faces/SwSmartsLogin.xhtml |
| Mailing Addresses | Refer to SMARTS |
| Billing Addresses | Refer to SMARTS |
| Type of Facility | Large Municipal Separate Storm Sewer System (MS4) |
| Major or Minor Facility | Major |
| Discharge Points | Locations throughout the Los Angeles Region |
| Discharge Description | Stormwater and Non-Stormwater Discharges |
| Receiving Waters | Various (see Part II.A of this Fact Sheet) |

¹ WDID No. stands for “Waste Discharge Identification” Number, which is a unique identifier given to a specific facility and regulatory measure (e.g., NPDES permit). In the case of the Order, each Discharger has a unique WDID number associated with its coverage under the Order.

² Note that the cities of Palmdale and Lancaster, though in Los Angeles County, are not within the coastal watersheds of Los Angeles County and, therefore, are not under the jurisdiction of the Los Angeles Water Board. These two cities are under the jurisdiction of the Lahontan Water Board.

³ See Attachment A of the Order for definitions of terms, acronyms, and abbreviations used in the Order, including this Fact Sheet and all other attachments.

⁴ SMARTS provides a platform where dischargers, regulators, and the public can enter, manage, and view stormwater data including permit applications and compliance and monitoring data associated with NPDES permits for stormwater discharges issued by the State of California. SMARTS is compliant with U.S. EPA’s Cross-Media Electronic Reporting Rule, which sets requirements for electronic reporting of NPDES permit-related submittals.

| | |
|-----------------------------|--|
| Receiving Water Type | Inland surface waters, estuarine waters, and marine waters, including but not limited to, lakes, rivers, estuaries, lagoons, harbors, bays, beaches, and the Pacific Ocean |
|-----------------------------|--|

A. Dischargers

The 99 municipalities listed in Table 2 and Table 3 of the Order are the owners and/or operators⁵ of Municipal Separate Storm Sewer Systems within the Los Angeles Region (hereinafter Facility or MS4). For the purposes of the Order, the entities listed in Table 2 and Table 3 of the Order are hereinafter referred to separately as “Permittees” and jointly as the “Dischargers.” References to “discharger” or “permittee” or “co-permittee” or “municipality” in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Dischargers or Permittees herein.

References to “Los Angeles County MS4 Permittees” or “Los Angeles County Permittees” refer to LACFCD, the County of Los Angeles, and the 85 incorporated cities within Los Angeles County, excluding Lancaster and Palmdale which are not within the Los Angeles Water Board’s jurisdiction. References to “Ventura County MS4 Permittees” or “Ventura County Permittees” refers to VCWPD, the County of Ventura, and the 10 incorporated cities within Ventura County. Furthermore, reference to “Los Angeles Region” is defined per California Water Code section 13200(d) as follows: “Los Angeles region, which comprises all basins draining into the Pacific Ocean between the southeasterly boundary, located in the westerly part of Ventura County, of the watershed of Rincon Creek and a line which coincides with the southeasterly boundary of Los Angeles County from the ocean to San Antonio Peak and follows thence the divide between San Gabriel River and Lytle Creek drainages to the divide between Sheep Creek and San Gabriel River drainages.”

B. Discharges

Information about the Facility’s stormwater and non-stormwater discharges to waters of the United States is summarized in Table F-1 above. Permittees were previously regulated by (1) Order No. R4-2010-0108 and National Pollutant Discharge Elimination System (NPDES) Permit No. CAS004002, effective on July 8, 2010, (2) Order No. R4-2012-0175 and NPDES No. CAS004001, effective on December 28, 2012, and (3) Order No. R4-2014-0024 and NPDES No. CAS004003, effective on March 28, 2014. Attachment A of the Order lists definitions, abbreviations, and acronyms of terms used in the Order and all other attachments. Attachment B of the Order provides a map depicting each major Watershed Management Area (WMA), its subwatersheds, and the major receiving waters therein to which the Facility discharges. Attachment C of the Order depicts the major MS4-related infrastructure within the Los Angeles Region and monitoring locations for Ventura County Permittees.

C. Permit Scope

The Order regulates discharges of stormwater and non-stormwater from the Permittees’ MS4s. Section 122.26(b)(8) of title 40 of the Code of Federal Regulations (CFR)⁶ defines an MS4 as “a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade

⁵ Owner or operator means the owner or operator of any facility or activity subject to regulation under the NPDES program (40 CFR § 122.2).

⁶ All further statutory references are to title 40 of the Code of Federal Regulations unless otherwise indicated.

channels, or storm drains): (i) [o]wned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States; (ii) [d]esigned or used for collecting or conveying storm water; (iii) [w]hich is not a combined sewer; and (iv) [w]hich is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.”

Stormwater discharges consist of those discharges that originate from precipitation events. Federal regulations define “storm water” as “storm water runoff, snow melt runoff, and surface runoff and drainage.” (40 CFR § 122.26(b)(13)). While “surface runoff and drainage” is not defined in federal law, U.S. EPA’s preamble to its final stormwater regulations demonstrates that the term is related to precipitation events such as rain and/or snowmelt. (*55 Fed. Reg. 47990, 47995-96* (Nov. 16, 1990)).

Non-stormwater discharges consist of all discharges through an MS4 that do not originate from precipitation events. Non-stormwater discharges through an MS4 are prohibited unless authorized under a separate NPDES permit; authorized by U.S. EPA pursuant to Sections 104(a) or 104(b) of CERCLA; composed of natural flows; the result of emergency firefighting activities; or conditionally exempted in the Order.

A permit issued to more than one Permittee for MS4 discharges may contain separate stormwater management programs for particular Permittees or groups of Permittees. (40 CFR § 122.26(d)(2)(iv)). Given LACFCD’s and VCWPD’s limited land use authorities, they are not subject to the Industrial/Commercial Facilities Program and the Planning and Land Development Program. However, as owners and operators of a MS4, LACFCD and VCWPD remain subject to the Public Information and Participation Program, Illicit Discharge Detection and Elimination Program, Public Agency Activities Program, and Construction Program. LACFCD and VCWPD are also subject to all other requirements of the Order, including but not limited to the discharge prohibitions, receiving water limitation provisions, TMDL provisions, monitoring and reporting provisions, and standard provisions.

D. Rationale for Issuance of a Regional Phase I MS4 Permit

The Los Angeles Water Board retains the discretion as the permitting authority to determine whether to issue permits for discharges from MS4s on a system-wide or jurisdiction-wide basis. Clean Water Act section 402(p)(3)(B)(i) and implementing regulations at 40 CFR section 122.26, subdivisions (a)(1)(v), (a)(3)(ii), and (a)(3)(iv) allow the permitting authority to issue permits for MS4 discharges on a system-wide or jurisdiction-wide basis taking into consideration a variety of factors. Such factors include the location of the discharge with respect to waters of the United States, the size of the discharge, the quantity and nature of the pollutants discharged to waters of the United States, and other relevant factors. Federal regulations at 40 CFR section 122.26(a)(3)(ii) identify a variety of possible permitting structures, including one system-wide permit covering all MS4 discharges or distinct permits for appropriate categories of MS4 discharges including, but not limited to, all discharges owned or operated by the same municipality, located within the same jurisdiction, all discharges within a system that discharge to the same watershed, discharges within a MS4 that are similar in nature, or

for individual discharges from MS4s. Consistent with CWA 402(p)(3)(B)(i), the Los Angeles Water Board is issuing the Order for its entire Los Angeles Region.

Additionally, the Los Angeles Water Board is issuing the Order to implement the State Water Board's guiding principles for MS4 permit development by all regional water boards, which is provided in Order WQ 2015-0075.⁷ Specifically, the State Water Board declared:

“Phase I MS4 permits should (1) continue to require compliance with water quality standards in accordance with our Order WQ 99-05; (2) allow compliance with TMDL requirements to constitute compliance with receiving water limitations; (3) provide for a compliance alternative that allows permittees to achieve compliance with receiving water limitations over a period of time as described above; (4) encourage watershed-based approaches, address multiple contaminants, and incorporate TMDL requirements; (5) encourage the use of green infrastructure and the adoption of low impact development principles; (6) encourage the use of multi-benefit regional projects that capture, infiltrate, and reuse storm water; and (7) require rigor, accountability, and transparency in identification and prioritization of issues in the watershed, in proposal and implementation of control measures, in monitoring of water quality, and in adaptive management of the program.”

The application of these principles on a region-wide basis results in improved consistency and uniformity, where warranted, in Phase I MS4 permit requirements, while providing Permittees the flexibility to tailor their implementation through watershed management programs in consideration of socio-economic, land use, and geographic characteristics.

Two of the three Phase I MS4 permits issued by the Los Angeles Water Board, including Los Angeles County and the City of Long Beach, already incorporate these principles. With regard to Ventura County MS4 Permittees, the previous Order, No. R4-2010-0108, was structured as a single permit whereby all 12 Permittees were assigned uniform requirements, with additional requirements for the Principal Permittee. With the issuance of the Los Angeles County MS4 Permit (Order No. R4-2012-0175) as amended by State Water Board Order WQ 2015-0075, the Los Angeles Water Board created a new permitting framework based on Watershed Management Areas to address MS4 discharges and water quality protection in the region. This framework

⁷ On April 21, 2021, the Los Angeles County Superior Court issued a final judgment in the case of Natural Resources Defense Council, Inc. and Los Angeles Waterkeeper v. State Water Resources Control Board and California Regional Water Quality Control Board, Los Angeles Region (Super. Ct. Los Angeles County, No. BS156962 (NRDC)). At issue was plaintiffs' challenge to the adequacy of the Water Boards' antidegradation analysis in the 2012 Los Angeles County MS4 Order. The trial court ruled that the Water Boards' antidegradation analysis for any high quality waters was not supported by adequate findings. In furtherance of the judgment, the court will issue a writ ordering the State Water Board to set aside Order WQ 2015-0075. As of June 1, 2021, the court has not issued the writ and the State Water Board has taken no action to set aside Order WQ 2015-0075. As such, Order WQ 2015-0075 remains in effect and relevant to the analysis of many of the matters discussed herein. Even if Order WQ 2015-0075 is ultimately set aside, the trial court's ruling was based solely on the antidegradation analysis for high quality waters and did not call into question the propriety of the State Water Board's other holdings on the 2012 Los Angeles County MS4 Permit. Because these holdings have not been disturbed by the NRDC case, and because these holdings address matters relevant to the Regional MS4 Order, this Fact Sheet continues to cite and discuss Order WQ 2015-0075, as appropriate, for matters other than antidegradation concerning high quality waters.

intended to provide a comprehensive and integrated strategy toward water resource protection, enhancement, and restoration within a hydrologically defined drainage basin or watershed while considering watershed specific characteristics in order to develop and implement a cost-effective program to achieve compliance. The Ventura County Permittees' reapplication package supported the inclusion of the Watershed Management Program as an optional alternative compliance pathway in Ventura County. Additionally, the reapplication package assumed that the future permit would follow the structure of the Los Angeles County MS4 Permit in Order No. R4-2012-0175 and therefore, the Permittees framed their proposals for changes to the permit accordingly. As a result, the Los Angeles Water Board finds that the framework and principal elements of a MS4 permit need not differ between counties and/or Permittees in the Los Angeles Region. A Regional Phase I MS4 Permit, which incorporates a watershed-based approach, provides regional consistency, while allowing Permittees the opportunity to customize their stormwater management programs considering unique watershed characteristics.

The Los Angeles Water Board also considered the nature of most Permittees' MS4s, which comprise a large interconnected system particularly in Los Angeles County where the discharges from these entities frequently commingle in the MS4 prior to discharge to receiving waters. Additionally, the City of Long Beach, which was previously regulated under its own permit, is geographically located at the base of 4 out of 10 of the watersheds within Los Angeles County and therefore has frequent commingling of its MS4 discharges with MS4 discharges of upstream Permittees in these watersheds.

The Los Angeles Water Board also considered the location of discharges and the nature of the receiving waters (see 40 CFR 122.26(b)(4)(iii) and (b)(7)(iii)). For example, while the MS4s in Los Angeles and Ventura County do not interconnect, they do discharge to some shared receiving waters (e.g., Malibu Creek, Santa Monica Bay, Santa Clara River). The City of Thousand Oaks (within Ventura County) and the City of Agoura Hills (within Los Angeles County) both discharge to Malibu Creek. Likewise, the cities of Ventura (within Ventura County) and Santa Clarita (within Los Angeles County) both discharge to Santa Clara River. The same is true within Ventura County where for example, the City of Ojai and the City of Ventura, both discharge to receiving waters in the Ventura River Watershed. Having one permit for MS4 discharges to the same receiving waters across Los Angeles and Ventura Counties allows to the Board to address water quality in a consistent manner.

Further necessitating a watershed framework is the requirement to implement 45 largely watershed-based TMDLs in the Order. Most Permittees have already established jurisdictional groups on a watershed or subwatershed basis for TMDL implementation. (See Attachment J of the Order for a matrix of these TMDLs and Permittees by WMA.) Some of the TMDLs apply to both Los Angeles County and Ventura County Permittees for the reason discussed above. These TMDLs also address multiple watersheds and the jurisdictional areas of multiple Permittees. Having separate permits makes implementation of the TMDLs more cumbersome.

Based on an evaluation of these factors, the Los Angeles Water Board determined that, because of the complexity and networking of the MS4 within the Los Angeles Region, that one system-wide permit is appropriate. In order to provide individual Permittees with specific requirements, the Order regulates the MS4 discharges of all 99 Permittees with some sections devoted to universal requirements for all Permittees. Some sections are devoted to distinct requirements for Los Angeles County Permittees and Ventura County Permittees and other sections devoted to requirements specific to each WMA,

including TMDL implementation provisions. This structure is supported by section 402(p) of the Clean Water Act and 40 CFR sections 122.26, subdivisions (a)(1)(v), (a)(3)(ii), and (a)(3)(iv). A single permit will ensure consistency and equitability in regulatory requirements within the Los Angeles Region, while watershed-based requirements within the single permit will provide flexibility to tailor permit provisions to address distinct watershed characteristics and water quality issues. Additionally, an internal watershed-based structure comports with the Los Angeles Water Board's Watershed Management Initiative and its watershed-based TMDL requirements. Watershed-based requirements will help promote watershed-wide solutions to address water quality problems, which in many cases are the most efficient and cost-effective means to address stormwater and urban runoff pollution. Further, watershed-based requirements may encourage collaboration among permittees to implement regional integrated water resources approaches such as stormwater capture and re-use to achieve multiple benefits.

II. FACILITY DESCRIPTION

A. Description of Receiving Waters and Watershed Management Areas

The area under the jurisdiction of the Los Angeles Water Board (Los Angeles Region) is 4,447 square miles in size. It contains 120 miles of coastline, 18,839 acres of lakes, and 1,704 miles of rivers and streams. Major Watershed Management Areas in the Los Angeles Region are shown on Figure B-1 of Attachment B of the Order and described below.

B. Geographic Coverage and Watershed Management Areas

The municipal stormwater and non-stormwater discharges from the MS4 enter receiving waters in the major Watershed Management Areas of the Ventura River Watershed; Miscellaneous Ventura County Coastal Watersheds; Santa Clara River Watershed; Calleguas Creek Watershed; Santa Monica Bay Watershed, including Malibu Creek Subwatershed, Ballona Creek Subwatershed, and Marina del Rey Subwatershed; Dominguez Channel and Greater Los Angeles and Long Beach Harbors Watershed, including Machado Lake Subwatershed; Los Angeles River Watershed; San Gabriel River Watershed; and Los Cerritos Channel and Alamitos Bay Watershed. The receiving waters within these WMAs include those identified in Tables 2-1, 2-1a, 2-3, 2-3a, 2-4, 2-4a, and Appendix 1 Table 1, Table A2-1, Table A2-3 and Table A2-4 of the *Water Quality Control Plan – Los Angeles Region (Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties)*, and other unidentified tributaries to these surface waters.

The Order defines WMAs consistent with the delineations used by the Los Angeles Water Board. Permittees included in each of the major WMAs are listed in Attachment J of the Order. Maps depicting each WMA, its subwatersheds, and the major receiving waters therein are included in Attachment B of the Order.

Ventura River Watershed Management Area. The Ventura River and its tributaries drain a coastal watershed in western Ventura County. The watershed covers a fan-shaped area of 235 square miles (150,400 acres), which is located within the western Transverse Ranges (the only major east-west mountain ranges in the continental U.S.) (Attachment B Figure B-2). From the upper slopes of the Transverse Ranges, the surface water system in the Ventura River watershed generally flows in a southerly direction to an estuary, located at the mouth of the Ventura River. Groundwater basins are highly interconnected with the surface water system and are recharged or depleted

according to surface flow conditions. The surface waters that drain the watershed have very steep gradients, ranging from 40 feet per mile at the mouth to 150 feet per mile at the headwaters. Precipitation in the watershed varies widely and mostly occurs as rainfall during a few storms between November and March. Summer and fall months are typically dry. Although snow occurs at higher elevations, melting snowpack does not sustain significant runoff in warmer months. The unpredictable weather pattern, coupled with the steep gradients throughout most of the watershed, result in high flow velocities with most runoff reaching the ocean.

Land use in the watershed is predominantly open space with a mix of residential, agriculture, commercial and industrial uses along the mainstem of the river. The MS4s of the incorporated cities of Ojai and Ventura along with unincorporated areas of Ventura County discharge to the Ventura River system. Residents and agricultural interests in this watershed are entirely dependent on local surface water and groundwater and there is no connection to the State Water Project to deliver imported water.

Migratory steelhead trout ascend upstream in the Ventura River and into San Antonio Creek and may utilize areas above the Robles Diversion Dam via a fish passageway. A limited resident population of rainbow trout occurs above Robles Diversion Dam and in San Antonio Creek and the lower Ventura River. Multiple interested agencies, including Ventura County and other entities, have recognized the potential for the restoration and enhancement of steelhead populations in the Ventura River through the removal of Matilija Dam, which is in the upper watershed and blocks access to a large area of prime spawning habitat.

Wetlands are found at the Ventura River estuary as well as along the river and bordering lakes. The wetland at the mouth of the Ventura River is considered a significant biological resource by Ventura County due to its ability to provide habitat for thousands of biota that include endangered, rare, or threatened species. The mainstem of the river as well as San Antonio Creek are also listed as significant biological resources due to their use by steelhead trout. "Critical" condor habitat exists in three areas in Ventura County, including Matilija Creek.

Water quality in the upper reaches is good but quality in the lower reaches is influenced by a combination of municipal wastewater discharges, agricultural activities, livestock, MS4 discharges, and oil industry discharges among other sources of pollutants. Excessive algae occurs at many locations and most water quality problems involve eutrophication. Total Maximum Daily Loads (TMDLs) have been established (as required by the federal Clean Water Act) to address water quality impairments due to trash, nutrients, eutrophic conditions and algae in the watershed.

Stakeholders in the watershed have formed several long-range water planning groups and have developed Integrated Regional Water Management (IRWM) Plans under Propositions 50 and 84. These Plans address the future water needs of each IRWM Region in terms of reliability of the water supply, improvement to water quality (including implementing TMDLs), increases in habitat and open space (additionally serving as areas for recharge of stormwater), and replacement of water-related infrastructure as needed. The stakeholders also propose projects to help implement the Plan's goals; applicants may pursue funding through a variety of sources including grant funding available through bond programs. Ventura County Permittees within this watershed also participated in the development of a Storm Water Resource Plan pursuant to Water Code section 10563 et seq. in order to be eligible to apply for state funding for stormwater and dry weather runoff projects to improve water quality.

Miscellaneous Ventura County Coastal Watershed Management Area. The Miscellaneous Ventura County Coastal WMA is composed of four separate coastal drainage areas located between the Los Angeles Water Board's boundary with the Central Coast Water Board and the Ventura River, Santa Clara River, Calleguas Creek, and Santa Monica Bay WMAs (Attachment B Figure B-3). The drainage areas are typified by beaches, small coastal streams, coastal lakes, and harbors such as Ventura Harbor, Channel Islands Harbor, and Port Hueneme. The WMA encompasses an area that historically consisted of extensive coastal wetlands that were connected to the Pacific Ocean. Many unique habitats, including coastal wetlands and lagoons, such as McGrath Lake and Ormond Beach Wetlands, and the nearby coastal dunes remain in the WMA. They are identified as significant biological resources by Ventura County. These areas provide habitats for many fish, birds, invertebrates, sea lions, and other marine and estuarine species

Land use in this WMA trends heavily to either open space or urban uses. The MS4s of the incorporated cities of Port Hueneme, Oxnard, and Ventura along with unincorporated areas of Ventura County discharge to these miscellaneous Ventura County Coastal Watersheds. Some of these waterbodies receive runoff from urban areas through sizable drains and pollutants associated with MS4 discharges will be found. The water quality problems found in the harbors in the WMA generally involve elevated bacteria, metals, and legacy pesticides. While residents and commercial/agricultural interests in this WMA utilize some local groundwater, they are highly dependent on imported water.

Channel Islands Harbor: Channel Islands Harbor is located south of the Santa Clara River and is in the immediate vicinity of considerable residential development and some agricultural land. Kiddie Beach and Hobie Beach, near the mouth of the harbor, are on the 2014/2016 Clean Water Act section 303(d) list due to impairment by indicator bacteria.

Port Hueneme Harbor: Port Hueneme Harbor is a medium-sized deep-water harbor located in Ventura County, north of Mugu Lagoon. The construction of most of the harbor was completed in 1975. A U.S. Navy Construction Battalion historically operated part of it. The rest of the harbor serves as a commercial port operated by the Oxnard Harbor District. Two endangered bird species may use the harbor, the California Brown Pelican, and the California Least Tern. The harbor is on the 2014/2016 Clean Water Act section 303(d) list for DDT and PCBs in fish/shellfish tissue. The DDT and PCB impairments in fish/shellfish tissue are being addressed through an action other than a TMDL (i.e., dredging).

Ventura Marina: Ventura Marina is a small craft harbor located between the mouths of the Ventura and Santa Clara Rivers. It is home to numerous small boats and two boatyards. The "Ventura Keys" area of the marina is a residential area situated along three canals. The marina is surrounded by agricultural land and a large unlined ditch drains into the Keys area. The marina and Ventura Keys area are on the 2014/2016 Clean Water Act section 303(d) list for indicator bacteria. In 2018, the Los Angeles Water Board re-evaluated the 303(d) listing for Ventura Keys and concluded that the waterbody should remain on the 303(d) list. The area around the jetties is listed as impaired for DDT and PCBs. The nearby Arundell Barranca is an open drain carrying mostly agricultural, commercial, and residential runoff, which flows into the marina.

McGrath Lake: McGrath Lake is a small brackish waterbody located just south of the Santa Clara River. The lake is located partially on State Parks land and partially on privately-owned oilfields in current production. A number of agricultural ditches drain into the lake. The MS4 does not discharge into McGrath Lake. A state beach is located off the coastal side of the lake. The habitat around the lake is quite unique and it is utilized by a large number of overwintering migratory birds. The lake is on the 2014/2016 Clean Water Act section 303(d) list for several legacy pesticides.

Open Coastline: A major feature of the coastline north of Mugu Lagoon is Ormond Beach and Ormond Beach Wetlands. The ocean immediately off the coast was part of the Bight '03, Bight '98, and the 1994 Southern California Bight Regional Monitoring Program. The Ormond Beach Wetlands has been extensively characterized as part of a wetlands restoration planning process being led by the Coastal Conservancy. The Ormond Beach Task Force was formed in 1993 and meets as needed to address issues and projects that may affect the beach and wetlands. Major ongoing activities include work by U.S. EPA to characterize and clean up the Halaco Superfund site adjacent to Ormond Beach Wetlands and wetlands restoration planning being undertaken by the State Coastal Conservancy. Additionally, the open coastline has numerous beaches. Several of these were historically listed on the 303(d) list as impaired due to bacteria. The Los Angeles Water Board re-evaluated these listings in 2019 and, based on the data analysis, recommended removing Ormond Beach, Peninsula Beach, Point Mugu Beach, Port Hueneme Beach Park, Rincon Parkway Beach, San Buenaventura Beach and Surfer's Point at Seaside (also known as Seaside Park Beach) from the 303(d) list. The Los Angeles Water Board recommended keeping Rincon Beach on the 303(d) list due to an ongoing bacteria impairment.

TMDLs have been developed for many of the impairments in the Miscellaneous Ventura County Coastal Watersheds. TMDLs in effect include those for bacteria at Kiddie Beach and Hobie Beach, bacteria at McGrath Beach, and PCBs, pesticides, and sediment toxicity at McGrath Lake.

Santa Clara River Watershed Management Area. The Santa Clara River and its tributaries drain a watershed area of 1,620 square miles (1,036,800 acres) (Attachment B Figure B-4). At approximately 100 miles (161 kilometers) in length, the Santa Clara River is the largest river system in southern California that remains in a relatively natural state. The river originates on the northern slope of the San Gabriel Mountains in Los Angeles County, traverses Ventura County, and flows into the Pacific Ocean between the cities of Ventura and Oxnard. Santa Clara River Reaches 1, 2, 3, 4A, 4B and major tributaries Santa Paula, Sespe and Piru Creeks are in Ventura County. Santa Clara River Reach 5 lies between Ventura County and Los Angeles County. Santa Clara River Reaches 6, 7, 8 and major tributaries Castaic, San Francisquito, and Bouquet Canyon Creeks are in Los Angeles County. About 40% of the watershed, the Upper Santa Clara River, is in Los Angeles County and about 60% of the watershed, the Lower Santa Clara River, is in Ventura County.

Land use in the watershed is predominately open space, most of which is National Forest or condor sanctuary. Residential, agriculture, and some industrial land uses occur along the mainstem. Portions of the MS4s of the incorporated cities of Santa Clarita, Fillmore, Santa Paula, Ventura and Oxnard and unincorporated areas of both counties discharge to the Santa Clara River system.

Significant biological resources described in Ventura County's General Plan include the extensive patches of high-quality riparian habitat that are present along the length of the river and its tributaries. Also considered significant are areas such as the wetlands found at the Santa Clara River estuary, along the river, and bordering lakes. One of the largest of Santa Clara River's tributaries, Sespe Creek, contains most of the Santa Clara River's remnant run of the steelhead trout. Piru and Santa Paula Creeks, two other tributaries of the Santa Clara River, also support good habitat for steelhead, although both contain barriers to migration. Additionally, the Santa Clara River has populations of unarmored three-spined stickleback (endangered), Santa Ana sucker, arroyo toad, and California least Bell's vireo. San Francisquito Canyon, Placerita Canyon, Soledad Canyon, Castaic, and Elizabeth Canyon Creeks are smaller tributaries that all provide valuable habitat. The Santa Clara River also serves as an important wildlife corridor. A lagoon exists at the mouth of the river and supports a large variety of wildlife.

Various reaches of the Santa Clara River are on the 2014/2016 Clean Water Act section 303(d) list of impaired water bodies for pesticides, metals, indicator bacteria, salts, and trash, among other pollutants. The elevated bacterial indicator densities are causing impairment of the REC-1 and REC-2 designated beneficial uses for the Santa Clara River Estuary and Reaches 3, 5, 6, and 7. The Estuary is also listed for toxaphene and residual amounts of other legacy pesticides (ChemA) in fish tissue. The excessive levels of chloride are impairing the AGR and GWR designated beneficial uses of Santa Clara River Reaches 3, 4A, 4B, 5 and 6. The trash in Lake Elizabeth is causing impairments to the WARM, WILD, RARE, REC-1 and REC-2 designated beneficial uses. TMDLs have been developed for these impairments in the watershed.

Stakeholders within the area under the jurisdiction of the Los Angeles Water Board have formed several long-range water planning groups and have developed IRWM Plans under Propositions 50 and 84. Stakeholders in the Los Angeles County portion of the Santa Clara River Watershed joined together to develop the IRWM Plan for the Upper Santa Clara River. They work closely with the IRWM group in the lower watershed, led by the Watersheds Coalition for Ventura County, which has a Santa Clara River Watershed Committee for IRWM Plan implementation in that watershed. Permittees within this watershed also participated in the development of a Storm Water Resource Plan pursuant to Water Code section 10563 et seq. in order to be eligible to apply for state funding for stormwater and dry weather runoff projects to improve water quality.

Calleguas Creek Watershed Management Area. Calleguas Creek and its major tributaries: Revolon Slough, Conjeo Creek, Arroyo Conejo, Arroyo Santa Rosa, and Arroyo Simi, drain a watershed area of 343 square miles (219,520 acres) in southern Ventura County and a small portion of western Los Angeles County (Attachment B Figure B-5). The northern boundary is formed by the Santa Susana Mountains, South Mountain, and Oak Ridge; the southern boundary is formed by the Simi Hills and Santa Monica Mountains. Land uses vary throughout the watershed. Urban development is generally restricted to the city limits of Simi Valley, Moorpark, Thousand Oaks, and Camarillo. Although some residential development has occurred along the slopes of the watershed, most upland areas are still open space. Agricultural activities, primarily cultivation of orchards and row crops, are spread out along valleys and on the Oxnard Plain.

Mugu Lagoon, located at the mouth of the watershed, is one of the few remaining significant saltwater wetland habitats in southern California. The Point Mugu Naval Air Base is located in the immediate area. The surrounding Oxnard Plain supports a large variety of agricultural crops. The lagoon borders on an Area of Special Biological

Significance (ASBS) and supports a great diversity of wildlife including several endangered birds and one endangered plant species. Except for the military base, the lagoon area is relatively undeveloped.

Various reaches of the Calleguas Creek Watershed are on the 2014/2016 Clean Water Act section 303(d) list of impaired water bodies for ammonia, chlordane, chloride, legacy pesticides, metals, bacteria, nutrients, and trash, among other pollutants.

Stakeholders within the area under the jurisdiction of the Los Angeles Water Board have formed several long-range water planning groups and have developed IRWM Plans under Propositions 50 and 84. Permittees within this watershed also participated in the development of a Storm Water Resource Plan pursuant to Water Code section 10563 et seq. in order to be eligible to apply for state funding for stormwater and dry weather runoff projects to improve water quality.

Santa Monica Bay Watershed Management Area. The Santa Monica Bay Watershed Management Area encompasses an area of 414 square miles (264,960 acres) (Attachment B Figure B-6). Its borders reach from the crest of the Santa Monica Mountains on the north and from the Ventura-Los Angeles County line to downtown Los Angeles. From there it extends south and west across the Los Angeles plain to include the area east of Ballona Creek and north of the Baldwin Hills. A narrow strip of land between Playa del Rey and Palos Verdes drains to the Bay south of Ballona Creek. The WMA includes several subwatersheds, the two largest being Malibu Creek to the northwest and Ballona Creek to the south. The Malibu Creek area contains mostly undeveloped mountain areas, large acreage residential properties, and many natural stream reaches, while Ballona Creek is predominantly channelized and drains a highly developed watershed.

Many of the Santa Monica Bay beaches are identified on the 2014/2016 Clean Water Act section 303(d) list of impaired water bodies for indicator bacteria. Santa Monica Bay offshore and nearshore is on the 2014/2016 Clean Water Act section 303(d) list of impaired water bodies for trash, DDTs, PCBs, arsenic, and mercury. The elevated bacterial indicator densities during both dry and wet weather are causing impairments of the REC-1 and REC-2 designated beneficial uses of the Santa Monica Bay beaches. The debris and elevated concentrations of DDT and PCBs are causing impairments to the IND, NAV, REC-1, REC-2, COMM, EST, MAR, BIOL, MIGR, WILD, RARE, SPWN, SHELL, and WET designated beneficial uses of the Santa Monica Bay. One of the impacts in marine habitats is sediment contamination and damage to marine life that the contaminants cause when they are released from the sediment (through natural fluctuations or through disturbance of the sediment) into the food chain. Bioaccumulation of DDT in white croaker, Dover sole, and California brown pelicans are well-known examples of the impacts caused by sediment contamination.

Malibu Creek subwatershed: The Malibu Creek subwatershed drains an area of about 109 square miles (69,760 acres) (Attachment B Figure B-6a). Approximately two-thirds of this subwatershed lies in Los Angeles County and the remaining third lies in Ventura County. Much of the land is part of the Santa Monica Mountains National Recreation Area and is under the purview of the National Parks Service. The watershed borders the eastern portion of Ventura County to the northwest and the Los Angeles River watershed to the east. Major tributaries include Cold Creek, Lindero Creek, Las Virgenes Creek, Medea Creek, and Triunfo Creek. The Malibu Creek watershed also includes lakes such as Lake Sherwood, Westlake Lake, Malibou Lake, and Lake Lindero. Located at the end of and receiving flows from

Malibu Creek is the 40-acre Malibu Lagoon. The Malibu Creek subwatershed land uses are 88% open space, 3% commercial/light industry, 9% residential, and less than 1% public.

Malibu Lagoon supports two important plant communities, the coastal salt marsh and coastal strand, and is an important refuge for migrating birds (over 200 species of birds have been observed). Perennial streams in Malibu Canyon support oak and riparian woodlands. Malibu Creek is also the southernmost watercourse in California where steelhead trout continue to spawn in relatively large numbers.

The Malibu Creek Watershed is on the 2014/16 Clean Water Act section 303(d) list of impaired water bodies for bacteria, nutrients, selenium, sulfates, sediment/siltation, and trash. Elevated bacterial indicator densities are causing impairment of the REC-1 and REC-2 designated beneficial uses of Malibu Creek, Malibu Lagoon, and the adjacent beaches. Excess nutrients and sedimentation/siltation are causing impairments to the REC-1, REC-2, WARM, COLD, EST, MAR, WILD, RARE, MIGR, and SPWN designated beneficial uses of waterbodies in the Malibu Creek Watershed. Selenium is causing impairments to the WARM designated beneficial uses of waterbodies in the Malibu Creek Watershed. Trash is causing impairments to the REC-1, REC-2, WARM, COLD, MIGR, WILD, RARE, SPWN, and WET designated beneficial uses of the waterbodies in the Malibu Creek Watershed.

Marina del Rey subwatershed: The Marina del Rey subwatershed is approximately 2.7 square miles (1,728 acres) located adjacent to the mouth of Ballona Creek (Attachment B, Figure B-6b). The Marina del Rey subwatershed is highly developed at 80%; the remaining 20% is split between water and open/recreation land uses.

Marina del Rey is on the 2014/2016 Clean Water Act section 303(d) list for bacteria and sediment concentrations of copper, lead, zinc, DDT, PCBs, chlordane, and sediment toxicity. The elevated bacterial indicator densities are causing impairment of the REC-1 and REC-2 designated beneficial uses at Marina del Rey Harbor Mothers' Beach and back basins. The toxic pollutants are causing impairments to the REC-1, MAR, WILD, COMM, and SHELL designated beneficial uses of the Marina del Rey Harbor.

Ballona Creek subwatershed: Ballona Creek and its tributaries drain a subwatershed of about 128 square miles (81,920 acres) (Attachment B, Figure B-6c). Ballona Creek is the largest drainage tributary to Santa Monica Bay and discharges to the ocean adjacent to the entrance of the Marina del Rey Harbor. The watershed boundary extends in the east from the crest of the Santa Monica Mountains southward and westward to the vicinity of central Los Angeles and thence to Baldwin Hills. Tributaries of Ballona Creek include Centinela Creek, Sepulveda Canyon Channel, Benedict Canyon Channel, and numerous other storm drains. Ballona Creek is concrete lined upstream of Centinela Boulevard. All of its tributaries are either concrete channels or covered culverts. The channel downstream of Centinela Boulevard is trapezoidal composed of grouted rip-rap side slopes and an earth bottom. The urbanized areas of Ballona Creek account for 80% of the watershed; the partially developed foothill and mountains make up the other 20%.

The watershed encompasses an area that historically consisted of extensive wetlands. The current-day Ballona Wetlands are located near the mouth of the

creek and represents one of the few remaining regionally significant coastal wetlands along Santa Monica Bay. The complex of wetlands is a mixture of habitats dominated by coastal salt marsh; several special status species are supported there including Belding's Savannah Sparrow. In 2004, the State of California acquired ownership of this remaining wetland area (600 acres (243 hectares) in total).

Ballona Creek and Ballona Creek Estuary are on the 2014/2016 Clean Water Act section 303(d) list for trash, toxicity, bacteria, historic pesticides, PCBs, PAHs, and metals. The Ballona Creek Wetlands is on the 2014/2016 Clean Water Act section 303(d) list for trash, exotic vegetation, habitat alterations, and reduced tidal flushing. Trash is causing impairments to the REC-1, REC-2, WARM, WILD, EST, MAR, RARE, MIGR, SPWN, COMM, WET, and COLD designated beneficial uses of Ballona Creek. The metals, pesticides, PCBs, and PAHs in sediments and dissolved copper, dissolved lead, and dissolved zinc, are causing impairments to the REC-1, REC-2, EST, MAR, WILD, RARE, MIGR, SPWN, COMM, and SHELL designated beneficial uses of Ballona Creek Estuary, Ballona Creek, and Sepulveda Channel. The elevated bacterial indicator densities are causing impairment of the REC-1, LREC-1, and REC-2 designated beneficial uses of Ballona Creek, Sepulveda Channel, and Ballona Estuary. The excess sediment and invasive non-native vegetation are causing impairments to the EST, MIGR, RARE, REC-1, REC-2, SPWN, WET, and WILD designated beneficial uses of the Ballona Creek Wetlands.

Dominguez Channel and Greater Harbor Waters Watershed Management Area.

The Dominguez Channel and Los Angeles/Long Beach Harbors Watershed Management Area (Dominguez WMA) is in the southern portion of the Los Angeles Basin (Attachment B Figure B-7). It covers an area of approximately 121 square miles (77,440 acres). Los Angeles Harbor is 7,500 acres and the Long Beach Harbor is 7,600 acres; together they have an open water area of approximately 8,128 acres. Along the northern portion of San Pedro Bay is a natural embayment formed by a westerly extension of the coastline which contains both harbors, with the Palos Verdes Hills the dominant onshore feature. The 15-mile-long Dominguez Channel drains a densely urbanized area to Inner Los Angeles Harbor. Despite its industrial nature, contaminant sources, disrupted wetlands habitat, and low flushing ability, the inner harbor area supports diverse fish and benthic populations and provides a protected nursery area for juvenile fish. The California least tern, an endangered species, nests in one part of the harbor complex. Some wetlands persist in the Machado Lake area. The outer part of both harbors (the greater San Pedro Bay within the breakwaters) has been less disrupted and supports a great diversity of marine life and a large population of fish. It is also open to the ocean at its eastern end and receives much greater flushing than the inner harbors.

Various reaches of the Dominguez WMA are on the 2014/2016 Clean Water Act section 303(d) list of impaired water bodies for metals, DDT, PCBs, PAHs, historic pesticides, coliform, and sediment toxicity. The elevated bacteria indicator densities are causing impairments to the SHELL, REC-1, and REC-2 designated beneficial uses of Los Angeles Harbor. The elevated levels of metals and organics are causing impairments to beneficial uses designated in these waters to protect aquatic life, including MAR and RARE. In addition, the elevated levels are causing impairments in the estuaries, which are designated with SPWN, MIGR, and WILD beneficial uses. Dominguez Channel also has an existing designated use of WARM and the Los Angeles River Estuary has the

designated use of WET. Beneficial uses associated with human use of these waters that are impaired due to the elevated concentrations of metals and organics include REC-1, REC-2, IND, NAV, COMM, and SHELL.

Machado Lake subwatershed: Machado Lake is a subwatershed of the Dominguez Channel Watershed (Attachment B, Figure B-7a). Wilmington Drain discharges into Machado Lake from the north; the channel is concrete lined from its origin south of Sepulveda Boulevard (between Normandie and Vermont Avenues) to where it crosses under the Harbor Freeway north of Lomita Boulevard. South of this point it changes to a soft bottom with natural side banks to where it empties into Machado Lake. Habitat in this part of the drain includes mature riparian woodland, riparian scrub, freshwater marsh, and weedy vegetation. The area is well-utilized by birds

Machado Lake is listed on the 2014/2016 Clean Water Act section 303(d) list for trash, nutrients, PCBs and historic pesticides. Trash, nutrients and toxic pollutants are causing impairments to the WARM, WET, RARE, WILD, REC-1 and REC-2 designated beneficial uses of Machado Lake. TMDLs have been adopted by the Los Angeles Water Board for trash, nutrients, PCBs and pesticides for Machado Lake. The point sources of trash and nutrients into Machado Lake are stormwater and non-stormwater discharges from the MS4. Stormwater discharges occur through the following sub-drainage systems: Drain 553, Wilmington Drain, Project 77/510, and Waleria Lake Retention Basin.

Los Angeles River Watershed Management Area. The Los Angeles River Watershed Management Area drains a watershed of 824 square miles (527,360 acres) (Attachment B Figure B-8) in Los Angeles County and a small portion of south eastern Ventura County. Approximately 1.2 acres of Simi Valley, which is in Ventura County, drains to the Los Angeles River Watershed and is mainly undeveloped. The Los Angeles River WMA is one of the largest in the Los Angeles Region and is also one of the most diverse in terms of land use patterns. Approximately 324 square miles of the watershed are covered by forest or open space land including the area near the headwaters, which originate in the Santa Monica, Santa Susana, and San Gabriel Mountains. The remainder of the watershed is highly developed. There are approximately 205 miles of engineered channels within the Los Angeles River Watershed. A 6.8-mile (11-kilometer) long reach in the narrows area (in the middle portion of the river system), where ground water rises into the streambed, is mostly unlined along the stream bottom and provides natural habitat for fish and other wildlife in an otherwise concrete conveyance. The river flows through the San Fernando Valley past heavily developed residential and commercial areas. Major tributaries to the river in the San Fernando Valley are the Pacoima Wash, Tujunga Wash (both drain portions of the Angeles National Forest in the San Gabriel Mountains), Burbank Western Channel, and Verdugo Wash (both drain the Verdugo Mountains). From the Arroyo Seco, north of downtown Los Angeles, to the confluence with the Rio Hondo, the river flows through industrial and commercial areas and is bordered by rail yards, freeways, and major commercial and government buildings. The river is hydraulically connected to the San Gabriel River Watershed by the Rio Hondo through the Whittier Narrows Reservoir. Flows from the San Gabriel River and Rio Hondo merge at this reservoir during larger flood events and thus flows from the San Gabriel River Watershed may impact the Los Angeles River. From the Rio Hondo to the Pacific Ocean, the river flows through industrial, residential, and commercial areas. The Los Angeles River tidal prism/estuary begins in Long Beach at

Willow Street and runs approximately three miles before joining with Queensway Bay. The channel has a soft bottom in this reach with concrete-lined sides.

A number of lakes are also part of the Los Angeles River WMA, including Legg Lake, Peck Road Park, Belvedere Park, Hollenbeck Park, Lincoln Park, and Echo Park Lakes as well as Lake Calabasas. These lakes are heavily used for recreational purposes.

Various reaches and lakes within the Los Angeles River WMA are on the 2014/2016 Clean Water Act section 303(d) list of impaired water bodies for trash, nitrogen compounds and related effects (ammonia, nitrate, nitrite, algae, pH, odor, and scum), metals (copper, cadmium, lead, zinc, aluminum and selenium), bacteria, and historic pesticides. Beneficial uses impaired by trash are REC-1, REC-2, WARM, WILD, EST, MAR, RARE, MIGR, SPWN, COMM, WET and COLD. The excess nitrogen compounds are causing impairments to the REC-1, REC-2, WARM, COLD, and WILD beneficial uses. Excess metals and historic pesticides are causing impairments to the WILD, RARE, WARM, WET, and GWR beneficial uses. Elevated indicator bacteria densities are causing impairments to the REC-1 and REC-2 beneficial uses.

San Gabriel River Watershed Management Area. The San Gabriel River Watershed (SGR WMA) receives drainage from a 689-square mile (440,960 acre) area of eastern Los Angeles County (Attachment B, Figure B-9). The main channel of the San Gabriel River is approximately 58 miles long. Its headwaters originate in the San Gabriel Mountains with the East, West, and North Forks. The river empties to the Pacific Ocean at the Los Angeles and Orange Counties boundary in Long Beach. The main tributaries of the river are Big Dalton Wash and Little Dalton Wash, San Dimas Wash, Walnut Creek, San Jose Creek, Fullerton Creek, and Coyote Creek. Part of the Coyote Creek subwatershed is in Orange County and is under the authority of the Santa Ana Water Board.⁸ A number of lakes and reservoirs are also part of the SGR WMA, including Puddingstone Reservoir. Land use in the watershed is diverse and ranges from

⁸ The Orange County portion of the Coyote Creek subwatershed comprises 86 square miles. MS4 discharges within the Orange County portion of the Coyote Creek subwatershed are within the jurisdiction of the Santa Ana Water Board and are not covered by the Order. These MS4 discharges, which drain into Coyote Creek, eventually reach the San Gabriel River within the boundaries of the Los Angeles Water Board's jurisdiction. Sources of MS4 discharges from Orange County to the San Gabriel River include the following. The Orange County Flood Control District (OCFCD) owns and operates the Los Alamitos Retarding Basin and Pumping Station (Los Alamitos Retarding Basin). The Los Alamitos Retarding Basin is within the San Gabriel River Watershed and is located adjacent to the Los Angeles and Orange County boundary. The majority of the 30-acre Los Alamitos Retarding Basin is in Orange County; however, the northwest corner of the facility is in Los Angeles County. Stormwater and non-stormwater discharges, which drain to the Los Alamitos Retarding Basin, are pumped to the San Gabriel River Estuary (SGR Estuary) through pumps and subterranean piping. The pumps and discharge point are in Los Angeles County. The OCFCD pumps the water within the Los Alamitos Retarding Basin to the SGR Estuary through four discharge pipes, which are covered by tide gates. The discharge point is located approximately 700 feet downstream from the 2nd Street Bridge in Long Beach. The total pumping capacity of the four pumps is 800 cubic feet per second (cfs). There is also a 5 cfs sump pump that discharges nuisance flow continuously to the SGR Estuary through a smaller diameter uncovered pipe. The discharge from the Los Alamitos Retarding Basin is covered under the Orange County Municipal NPDES Storm Water Permit (NPDES Permit No. CAS618030, Santa Ana Regional Water Quality Control Board Order No. R8-2009-0030), which was issued to the County of Orange, Orange County Flood Control District and Incorporated Cities on May 22, 2009. The Orange County MS4 Permit references the San Gabriel River Metals and Selenium TMDL (Metals TMDL). The waste load allocations listed in the Metals TMDL for Coyote Creek are included in the Orange County MS4 Permit. However, the Orange County MS4 Permit does not contain the dry weather copper waste load allocations assigned to the Estuary.

predominantly open space in the upper watershed to urban land uses in the middle and lower parts of the watershed.

The watershed consists of extensive areas of undisturbed riparian and woodland habitats in its upper reaches. Much of the watershed of the West Fork and East Fork of the river is set aside as a wilderness area; other areas in the upper watershed are subject to heavy recreational use. The upper watershed also contains a series of flood control dams. The watershed is hydraulically connected to the Los Angeles River through the Whittier Narrows Reservoir (normally only during high storm flows). The lower part of the river flows through a concrete-lined channel in a heavily urbanized portion of the Los Angeles Coastal Plain, before becoming a soft bottom channel once again near the ocean in the City of Long Beach. Flow in these lower reaches is dominated by effluent from several municipal wastewater treatment facilities and MS4 discharges.

Various reaches and lakes of the SGR WMA are on the 2014/2016 Clean Water Act section 303(d) list of impaired water bodies due to bacteria, trash, nitrogen, phosphorus, historic pesticides, PCBs, and metals (copper, lead, selenium, and zinc). Beneficial uses impaired by trash are REC-1, REC-2, WARM, COLD, and WILD. Metals and historic pesticides loadings are causing impairments of the WILD, WARM, COLD, RARE, EST, MAR, MIGR, SPWN, WET, MUN, IND, AGR, GWR, and PROC beneficial uses. The excess nitrogen and phosphorus are causing impairments to the REC-1, REC-2, WARM, COLD, and WILD beneficial uses. Elevated indicator bacteria densities are causing impairments to the REC-1 and REC-2 beneficial uses.

Los Cerritos Channel and Alamitos Bay Watershed Management Area. The Los Cerritos Channel is concrete-lined above the tidal prism and drains a small but densely urbanized area of east Long Beach (Attachment B, Figure B-10). The watershed covers an area of approximately 37 square miles (23,680 acres) out of which 5 square miles (3,200 acres) is Alamitos Bay. The Los Cerritos WMA is located between the Los Angeles and San Gabriel Rivers and drains to the same general area as the San Gabriel River. There is also a minor hydraulic connection between the lower San Gabriel River and Los Cerritos Channel due to the location of a power plant intake within the Long Beach Marina; the discharge from this facility is into the San Gabriel River estuary. The Los Cerritos Channel's tidal prism starts at Anaheim Road and connects with Alamitos Bay through the Marine Stadium; the wetlands connect to the Channel a short distance from the lower end of the Channel. The wetland, and portion of the channel near the wetland, is an overwintering site for a great diversity of birds despite its small size. An endangered bird species, the Belding's Savannah Sparrow, may nest there and an area adjacent to the wetlands is a historic least tern colony site. A small marina is located in the channel, which is also used by rowing teams and is a popular fishing area. Alamitos Bay is composed of the Marine Stadium, a recreation facility built in 1932; Long Beach Marina; a variety of public and private berths; and the Bay proper. A small bathing lagoon, Colorado Lagoon located entirely in Long Beach, has a tidal connection with the Bay and is used by overwintering migratory birds. The majority of land use in this WMA is high density residential.

Los Cerritos Channel is on the 2014/2016 Clean Water Act section 303(d) List of impaired water bodies for metals (copper, zinc, and lead), trash, ammonia, pH, chlordane, and bacteria. Alamitos Bay is on the 2014/2016 Clean Water Act section 303(d) List of impaired water bodies for bacteria and dissolved oxygen. Beneficial uses impaired by these constituents in the Los Cerritos Channel include WILD, REC2 and WARM.

Middle Santa Ana River Watershed Management Area. The Middle Santa Ana River Watershed Management Area (MSAR WMA) covers approximately 488 square miles (312,320 acres) and lies mostly in San Bernardino and Riverside counties; however, a small part of Los Angeles County is also included. The area of Los Angeles County, which lays in the MSAR WMA, includes portions of the cities of Pomona (12.3 square miles), Claremont (8.4 square miles), and Diamond Bar (0.7 square miles) and unincorporated Los Angeles County (12.3 square miles). The MSAR WMA is comprised of three subwatersheds. The subwatershed that includes portions of Pomona and Claremont is the Chino Basin Subwatershed. Surface drainage from Pomona and Claremont is generally southward toward San Antonio Creek, which is tributary to Chino Creek, which feeds into the Prado Flood Control Basin.

Various reaches of the MSAR WMA, including Chino Creek, are listed on the 2014/16 Clean Water Act section 303(d) list for bacteria. Elevated bacterial indicator densities are causing impairments of the REC-1 and REC-2 beneficial uses for the Santa Ana River Reach 3, Chino Creek Reaches 1 and 2, Mill Creek (Prado Area), Cucamonga Creek Reach 1, and Prado Park Lake.

The Santa Ana River Watershed is a major WMA within the Santa Ana Water Board jurisdiction. However, 30.5 square miles of the Santa Ana River Watershed falls within the Los Angeles Water Board's jurisdiction and therefore will be addressed in the Order except as follows. Per an agreement between the Los Angeles Water Board and the Santa Ana Water Board dated May 31, 2013, the Santa Ana Water Board is designated as the regulator of discharges of bacteria by the cities of Claremont and Pomona through their MS4s to receiving waters within the Santa Ana River Watershed addressed by the Middle Santa Ana River Watershed Bacterial TMDL.⁹ Per this agreement, both the Santa Ana Water Board and Los Angeles Water Board have the authority to enforce the terms of any MS4 permit issued to the cities of Claremont and Pomona if the MS4 discharges occur with the Los Angeles Water Board's geographic jurisdiction.

C. Description of the Permittees' MS4s

The Permittees' MS4s, like many MS4s in the nation, are based on regional floodwater management systems that use both natural and altered water bodies to achieve flood management goals. Most Permittees' MS4s comprise a large interconnected system used by multiple municipalities. This extensive system conveys stormwater and non-stormwater across municipal boundaries where it is commingled within the MS4 and then discharged to receiving water bodies.

The area covered under the Order contains an extensive drainage network that serves incorporated and unincorporated areas in every Watershed Management Area within the Los Angeles Region. The Los Angeles Region comprises all basins draining into the Pacific Ocean between the southeasterly boundary, located in the westerly part of Ventura County, of the watershed of Rincon Creek and a line which coincides with the southeasterly boundary of Los Angeles County from the ocean to San Antonio Peak and follows thence the divide between San Gabriel River and Lytle Creek drainages to the divide between Sheep Creek and San Gabriel River drainages. (California Water Code § 13200(d)). Maps depicting the major drainage infrastructure within the area covered under the Order are included in Attachment C. Rough estimates based on GIS data and other information from Permittees indicate that the Los Angeles Region has

⁹ Attachment D to Order No. R8-2013-0043.

an over 7,300-mile subsurface network of MS4 infrastructure (including main storm drain lines, lateral lines, and culverts). Table F-2 below provides approximated information on the extent of select Permittees' MS4-related infrastructure based on available information carried over from the previous permits, information provided by Ventura County Permittees upon request, GIS data, and annual reports.

Table F-2. Select Permittees' MS4-Related Infrastructure¹⁰

| Permittee | Area (Square Miles) | Catch Basins | Storm Drain Length (miles) | Open Channel Length (miles) |
|--|------------------------------------|-------------------------|---|--|
| Ventura County Watershed Protection District | 8.9 | 0 | 59.5 | 219 |
| Ventura County | 32.4 | 1421 | 35.6 | 0.01 |
| Camarillo | 19.86 | 1521 | 60 | 5.78 |
| Fillmore | 3.2 | 208 | 18.2 | 5 |
| Moorpark | 12.5 | 737 | 57.0 | 0 |
| Ojai | 4.4 | 172 | 4.1 | 6 |
| Oxnard | 27.1 | 3644 | 167.3 | 10.62 |
| Port Hueneme | 4.5 | 234 | 6.4 | 3 |
| Santa Paula | 5.5 | 520 | 18.5 | 1 |
| Simi Valley | 42.3 | 1783 | 107.5 | 3 |
| Thousand Oaks | 55.4 | 3293 | 205.4 | 2 |
| Ventura | 22.2 | 1847 | 139.6 | 9 |
| Long Beach | 47.7 | 3800 | 180 | 49 |
| LACFCD / Los Angeles County | 3100 | 88000 | 3500 | 500 |
| City of Los Angeles | 469 | 30000 | 1600 | 31 |
| El Monte | 10 | 316 | 11 | 0.4 |
| Glendale | 30.6 | 1045 | 136.7 | 14.4 |
| Inglewood | 9 | 1157 | 12 | 0 |
| Pasadena | 26 | 1050 | 30 | 7.3 |

¹⁰ All numbers in this table are the Permittees' best estimates based on knowledge of their storm drainage system; these estimates do not include all conveyances subject to the definition of an MS4 under federal regulations. Estimates can vary due to definition of terms, and GIS categorization and mapping accuracy. These are subject to change as data is field verified and new infrastructure is constructed or decommissioned by Permittees.

| Permittee | Area (Square Miles) | Catch Basins | Storm Drain Length (miles) | Open Channel Length (miles) |
|------------------|------------------------------------|-------------------------|---|--|
| Santa Monica | 8.3 | 850 | 68.3 | 0.5 |
| Torrance | 20 | 2000 | 20 | 3 |

Additionally, there are numerous stormwater treatment facilities, including stormwater retention basins and stormwater detention basins, within the region. Some examples of existing stormwater treatment facilities include the Santa Monica Urban Runoff Recycling Facility (SMURRF) (City of Santa Monica), Marie Canyon (City of Malibu), and Paradise Cove (City of Malibu). Some examples of existing stormwater retention/detention basins include Oxford Basin (County of Los Angeles), Amie Retention Basin (Torrance), and Louie Pompei Park (Glendora).

Stormwater and non-stormwater are conveyed through the MS4s and ultimately discharge into receiving waters of the Los Angeles Region. MS4s subject to the Order receive stormwater and non-stormwater flows from various sources, including conveyances owned by the Permittees covered by the Order and other public agencies, NPDES permitted discharges, discharges authorized by the U.S. EPA (including discharges subject to a decision document approved pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)), rising ground water, and natural flows.

The volume of stormwater and non-stormwater conveyed through the MS4s can be estimated by looking at impervious area data. Detailed data on impervious area is unavailable for Ventura County Permittees at the time of this permit development. However, per the permit reapplication package (or Report of Waste Discharge, also known as the ROWD), Ventura County has 200,000 acres of developed land. Specific data for Los Angeles County, however, is available through the Safe, Clean Water Program (Measure W) information provided by Los Angeles County and LACFCD and is presented in Table F-3 below.

Table F-3. Los Angeles County Impervious Area

| Permittee | Impervious Area (ac) |
|------------------|-----------------------------|
| Agoura Hills | 840 |
| Alhambra | 2,066 |
| Arcadia | 2,361 |
| Artesia | 491 |
| Azusa | 1,526 |
| Baldwin Park | 1,717 |
| Bell | 755 |
| Bell Gardens | 757 |
| Bellflower | 1,936 |
| Beverly Hills | 1,290 |
| Bradbury | 143 |
| Burbank | 3,407 |

| Permittee | Impervious Area (ac) |
|-----------------------|-----------------------------|
| Calabasas | 1,089 |
| Carson | 6,432 |
| Cerritos | 2,363 |

The Order applies to all 99 Permittees within the nine major coastal WMAs under the jurisdiction of the Los Angeles Water Board. These 99 Permittees include 95 cities, two counties, and two flood control districts. The two flood control districts are described in more detail, below, as the nature and scope of their authorities is different from the other 97 Permittees.

D. Description of Flood Control District Permittees

In 1915, the California Legislature enacted the Los Angeles County Flood Control Act, establishing the Los Angeles County Flood Control District (LACFCD). The objectives and purposes of the Act are to provide for the control and conservation of flood, storm and other waste waters within the flood control district. Among its other powers, LACFCD also has the power to preserve, enhance, and add recreational features to lands or interests in lands contiguous to its properties for the protection, preservation, and use of the scenic beauty and natural environment for the properties or the lands. LACFCD is governed, as a separate entity, by the County of Los Angeles Board of Supervisors.

LACFCD's system includes the majority of drainage infrastructure within incorporated and unincorporated areas of Los Angeles County in every watershed, including approximately 500 miles of open channel, 3,500 miles of underground drains, and an estimated 88,000 catch basins. Portions of LACFCD's current system were originally unmodified natural rivers and water courses. LACFCD's system conveys both storm and non-stormwater throughout Los Angeles County. Other Permittees' MS4s within Los Angeles County connect and discharge to LACFCD's system.

The Ventura County Watershed Protection District (VCWPD) was formed, in part, to provide for the control and conservation of flood and stormwaters, and for the protection and maintenance of watercourses, watersheds, and life and property within the VCWPD from damage or destruction from storm flows or flooding. The VCWPD was originally established on September 12, 1944 as the "Ventura County Flood Control District." On January 1, 2003, per California Water Code Appendix, Chapter 46, the name was changed to the Ventura County Watershed Protection District to reflect changes in community values, regulatory requirements, and funding opportunities. The change in name also reflected VCWPD's desire to emphasize integrated watershed management and to solve flood control problems with environmentally sound approaches.

VCWPD's system includes infrastructure within incorporated and unincorporated areas of Ventura County in every watershed. VCWPD owns/operates approximately 219 miles of open channel and 60 miles of storm drains.

Unlike other Permittees, including the counties of Los Angeles and Ventura, LACFCD and VCWPD do not own or operate any municipal sanitary sewer systems, public streets, roads, or highways. LACFCD and VCWPD also have no planning, zoning, development permitting or other land use authority over industrial or commercial facilities, or new developments or re-development projects located in any incorporated or unincorporated areas within their service area. Nonetheless, as owners and operators of MS4s, LACFCD and VCWPD are required by federal law to control pollutant discharges into and from their MS4s, including but not limited to the ability to control through interagency agreements among co-Permittees and other owners of MS4s the contribution of pollutants from one portion of the MS4 to another portion of the MS4.

Under Order No. R4-2010-0108, VCWPD was designated the Principal Permittee. However, in the Order, the role of Principal Permittee has been eliminated, since the Order applies to Permittees in both Los Angeles and Ventura Counties. Furthermore, under Order No. R4-2012-0175, LACFCD was prescribed separate requirements for minimum control measures. The Order generally does not include separate requirements for LACFCD or VCWPD; however, it notes where certain provisions do not apply (e.g., provisions relating to the industrial and commercial facilities inspection

programs, planning and land development programs, and new development and re-development projects within their jurisdictional boundaries).

E. Nature of MS4 Discharges as a Source of Pollutants to Receiving Waters and Need for Regulation

Stormwater and non-stormwater discharges consist of surface runoff generated from various land uses, which is conveyed via the MS4 and ultimately discharge to surface waters throughout the region. Discharges of stormwater and non-stormwater through the MS4s within the Los Angeles Region convey pollutants to surface waters.

The quality of stormwater and non-stormwater discharges from MS4s is fundamentally important to public health, the health of the environment, and the quality of life in Southern California. Polluted stormwater and non-stormwater discharges from MS4s are a leading cause of water quality impairment in the Los Angeles Region. Stormwater and non-stormwater discharges are often contaminated with pesticides, fertilizers, fecal indicator bacteria and associated pathogens, trash, oil and other automotive byproducts, and many other toxic substances generated by activities in the urban environment. Water that flows over streets, parking lots, construction sites, and industrial, commercial, residential, and municipal areas convey these pollutants through the MS4 directly into receiving waters of the Region.

The water quality impacts and resulting ecosystem impacts and increased public health risks from MS4 discharges that affect receiving waters nationwide and throughout the jurisdiction of the Los Angeles Water Board, including its coastline, are well documented. One of the seminal studies on stormwater impacts was the National Urban Runoff Program (NURP) Study (U.S. EPA 1983), which showed that MS4 discharges from residential, commercial, and light industrial areas contain significant loadings of total suspended solids and other pollutants. The NURP Study also found that pollutant levels from illicit discharges were high enough to significantly degrade receiving water quality, and threaten aquatic life, wildlife, and human health. Many studies since continue to support the conclusions of the NURP Study. The general findings and conclusions of the NURP Study are reiterated in the more recent 2008 National Research Council report "Urban Runoff Management in the United States" as well as in a regional study, "Sources, Patterns and Mechanisms of Storm Water Pollutant Loading from Watersheds and Land Uses of the Greater Los Angeles Area, California," SCCWRP Technical Report 510 (2007), funded in large part by the Los Angeles Water Board.

Some of the conclusions of the 2007 regional study, which largely remain true today (as demonstrated by an analysis of monitoring data collected under the three previous permit terms), were as follows:

- *Storm water runoff from watershed and land use-based sources is a significant contributor of pollutant loading and often exceeds water quality standards.* High pollutant concentrations were observed throughout the study at both mass emission (ME) and land use (LU) sites. Pollutant concentrations frequently exceeded water quality standards.
- *Storm water Event Mean Concentrations (EMCs), fluxes and loads were substantially lower from undeveloped open space areas when compared to developed urbanized watersheds.* Storms sampled from less developed watersheds produced pollutant EMCs and fluxes that were one to two orders of magnitude lower than comparably sized storms in urbanized watersheds.

Furthermore, the higher fluxes from developed watersheds were generated by substantially less rainfall than the lower fluxes from the undeveloped watersheds, presumably due to increased impervious surface area in developed watersheds.

- *The Los Angeles region contributed a similar range of storm water runoff pollutant loads as that of other regions of the United States.* Comparison of constituent concentrations in storm water runoff from land use sites from this study reveal median EMCs that are comparable to U.S. averages reported in the National Stormwater Quality Database (NSQD; Pitt et al., 2003). Comparison to the NSQD data set provides insight to spatial and temporal patterns in constituent concentrations in urban systems. Similarities between levels reported in the NSQD and this study suggest that land-based concentrations in southern California storm water are generally comparable to those in other parts of the country.
- *Peak concentrations for all constituents were observed during the early part of the storm.* Constituent concentrations varied with time over the course of storm events. For all storms sampled, the highest constituent concentrations occurred during the early phases of storm water runoff with peak concentrations usually preceding peak flow. Although the pattern of an early peak in concentration was comparable in both large and small developed watersheds, the peak concentration tended to occur later in the storm and persist for a longer duration in the smaller developed watersheds. Therefore, monitoring programs must capture the early portion of storms and account for intra-storm variability in concentration in order to generate accurate estimates of EMC and contaminant loading. Programs that do not initiate sampling until a flow threshold has been surpassed may severely underestimate storm EMCs.
- *Highest constituent loading was observed early in the storm season with intra-annual variability driven more by antecedent dry period than amount of rainfall.* Seasonal differences in constituent EMCs and loads were consistently observed at both ME and LU sites. In general, early season storms (October - December) produce significantly higher constituent EMCs and loads than late season storms (April - May), even when rainfall quantity was similar. This suggests that the magnitude of constituent load associated with storm water runoff depends, at least in part, on the amount of time available for pollutant build-up on land surfaces. The extended dry period that typically occurs in arid climates such as southern California maximizes the time for constituents to build-up on land surfaces, resulting in proportionally higher concentrations and loads during initial storms of the season.

The Natural Resources Defense Council (NRDC) 1999 Report, "Stormwater Strategies, Community Responses to Runoff Pollution" identifies two main causes of the storm water pollution problem in urban areas. Both causes are directly related to development in urban and urbanizing areas:

- *Increased volume and velocity of surface runoff.* There are three types of human-made impervious covers that increase the volume and velocity of runoff: (i) rooftop, (ii) transportation imperviousness, and (iii) non-porous (impervious) surfaces. As these impervious surfaces increase, infiltration will decrease, forcing more water to run off the surface, picking up speed and pollutants.

- *The concentration of pollutants in the runoff.* Certain activities, such as those from industrial sites, are large contributors of pollutant concentrations to the MS4.

The report also identified several activities causing stormwater pollution from urban areas, including practices of homeowners, businesses, and government agencies.

Studies conducted by the United States Geological Survey (USGS) through its National Water Quality Assessment (NAWQA) program confirm the link between urbanization and water quality impairments in urban watersheds due to contaminated stormwater runoff (USGS, 2001).

Furthermore, the water quality impacts of urbanization and urban stormwater discharges have been examined and described by many researchers and summarized by U.S. EPA in a 1997 publication titled "Urbanization and Streams: Studies of Hydrologic Impacts". Urbanization causes changes in hydrology and increases pollutant loads which adversely impact water quality and impair the beneficial uses of receiving waters. Increases in population density and imperviousness result in changes to stream hydrology including:

- increased peak discharges compared to predevelopment levels;
- increased volume of storm water runoff with each storm compared to pre-development levels;
- decreased travel time to reach receiving water;
- increased frequency and severity of floods;
- reduced stream flow during prolonged periods of dry weather due to reduced levels of infiltration;
- increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from channelization; and
- decreased infiltration and diminished ground water recharge.

The 2016 National Water Quality Inventory (CWA Section 305(b) Report) showed that urban runoff/storm water discharges contribute to the impairment of 49,330 miles of streams, to the impairment of 759,483 acres of lakes, to the impairment of 316 miles of coastal shoreline, and to the impairment of 16,773 square miles of estuaries in the United States.

Permittees in Ventura County and Los Angeles County have conducted monitoring to, among other objectives:

- assess the overall health and trends in receiving water quality;
- assess impacts of MS4 discharges on receiving waters;
- identify sources of pollutants;
- assess compliance with receiving water limitations and water quality-based effluent limitations derived from TMDL waste load allocations; and
- measure and improve the effectiveness of measures implemented to comply with their MS4 permits.

Monitoring by Permittees in the Los Angeles Region indicates that concentrations of pathogen indicators (fecal coliform, total coliform, and enterococcus), heavy metals (such as Pb, Cu, Zn, Cd, As, Ni, Ag) and pesticides (such as diazinon, malathion, lindane, total chlordane) among others exceed water quality standards in receiving waters. Receiving water impacts studies found that stormwater discharges from urban watersheds exhibit toxicity attributable to heavy metals. Bioassessments of the benthic communities showed bioaccumulation of toxicants. Sediment analysis showed higher concentrations of pollutants, such as Pb and PAHs, in urban watersheds than in rural watersheds (2 to 4 times higher). In addition, toxicity of dry weather, non-stormwater flows was observed with the cause of toxicity undetermined. Other studies have documented concentrations of pollutants that exceed water quality standards in storm drains flowing to the ocean during dry weather, and adverse health impacts from swimming near flowing storm drains (LARWQCB, 2020; Haile et al., 1999).

Trash is also a serious and pervasive water quality problem in the Los Angeles Region and statewide. In 2015, during development of the Amendment to the Water Quality Control Plan for Ocean Waters of California (Ocean Plan) for Trash Provisions and Part 1 Trash Provisions of the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries (collectively referred to as “the Trash Amendments”), the State Water Board conducted a comprehensive assessment of the impacts of trash on beneficial uses of surface waters throughout the state, including impacts to aquatic habitat and aquatic life, public health, contact and non-contact water recreation, commercial and sport fishing, navigation, and Native American culture.¹¹ Trash in waterways causes significant water quality problems. Small and large floatables inhibit the growth of aquatic vegetation, decreasing habitat and spawning areas for fish and other living organisms. Wildlife living in rivers and in riparian areas can be harmed by ingesting or becoming entangled in floating trash. Except for large items, settleables are not always obvious to the eye. They include glass, cigarette butts, rubber, and construction debris, among other things. Settleables can be a problem for bottom feeders and can contribute to sediment contamination. Some debris (e.g., diapers, medical and household waste, and chemicals) are a source of bacteria and toxic substances. Floating debris that is not trapped and removed will eventually end up on the beaches or in the open ocean, keeping visitors away from our beaches and degrading coastal waters. Through periodic surface water quality assessments pursuant to Clean Water Act section 305(b) and identification of impaired waters pursuant to Clean Water Act section 303(d), the Los Angeles Water Board has determined that current levels of trash exceed the existing water quality objectives contained in the Basin Plan that are necessary to protect the beneficial uses of many surface waters. Los Angeles Water Board staff regularly observes trash in surface waters throughout the Los Angeles Region. Non-profit organizations such as Heal the Bay, Friends of the Los Angeles River (FoLAR) and others organize volunteer clean-ups periodically and document the amount of trash collected. Significant strides have been made by a number of Permittees in addressing this problem through the implementation of control measures to achieve waste load allocations established in trash TMDLs.

As discussed above, pollutants in stormwater and non-stormwater have damaging effects on both human health and aquatic ecosystems. Water quality assessments

¹¹ State Water Resources Control Board. Amendment to the Water Quality Control Plan for the Ocean Waters of California to Control Trash and Part 1 Trash Provisions of the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California: Final Staff Report Appendix A “Trash Background.”

conducted by the Los Angeles Water Board have identified impairment of beneficial uses of water bodies in the Los Angeles Region caused or contributed by pollutants in MS4 discharges. As a result of these impairments, there are beach postings, fish consumption advisories, ecosystem and recreational impacts from trash and debris, and toxic conditions for aquatic life, among others. Forty-five TMDLs established by the Los Angeles Water Board and U.S. EPA identify MS4 discharges as one of the pollutant sources causing or contributing to the water quality impairments of the myriad waterbodies addressed by the TMDLs.

The Ventura County Permittees' January 2015 Report of Waste Discharge identifies a number of pollutants of concern in Table 3-25, including indicator bacteria, trash, sedimentation/siltation, pesticides (diazinon, chlorpyrifos, dieldrin, chlordane, DDT compounds, toxaphene, and bifenthrin), minerals (boron, chloride, sulfate, TDS), PCBs, metals (copper, nickel, mercury, aluminum), selenium, nutrients and nutrient related effects (total nitrogen, total phosphorus, algal biomass, algal percent cover, dissolved oxygen), toxicity, and temperature among others. Ventura County Permittees' Annual Reports (2009/2010 – 2018/2019) confirm these pollutants of concern, reporting *E. coli*, chloride, total dissolved solids (TDS), selenium and metals, including dissolved copper and total aluminum as some of the pollutants in MS4 discharges. Additionally, the Los Angeles Water Board has also identified nutrients, pesticides, heavy metals, and trash as pollutants of concern in various areas of Ventura County and, through TMDL development, has identified MS4 discharges as one of the sources of these pollutants. An analysis of monitoring data relative to TMDL implementation in Ventura County is summarized below.

The Los Angeles Water Board, based on monitoring data collected during the term of Order No. R4-2012-0175 (2012/2013 – 2016/2017) has identified bacteria, nutrients, pesticides, metals, and trash among others as pollutants of concern in various areas of Los Angeles County and, through TMDL development, has identified MS4 discharges as one of the sources of these pollutants. An analysis of monitoring data analysis relative to TMDL implementation in Los Angeles County is also summarized below.

1. Mass Emission Stations

Permittees have historically monitored receiving waters throughout the Los Angeles Region at a set of receiving water monitoring stations referred to as “mass emission stations.” These stations were established to assess compliance with the Los Angeles County MS4 Permit and the Ventura County MS4 Permit. The mass emission stations are generally located at the base of watersheds and are intended to monitor the quality of water discharged from large mixed land use areas. Results from the mass emission monitoring are also used to estimate pollutant loads and to analyze long term water quality trends. Monitoring at these stations provides a high-level look at the impacts of MS4 discharges on receiving waters during storm events and during dry weather conditions.

a. Wet Weather Mass Emission Station Monitoring

The table below highlights the frequency that select constituents exceeded wet weather TMDL targets and/or Basin Plan water quality objectives at each mass emission station during the period of the permit terms for Order No. R4-2010-0108 and Order No. R4-2012-0175 from 2009 to 2017. This table shows that bacteria and metals are not achieving objectives during storm events throughout the Los Angeles Region. *E. coli* exceeded TMDL targets and/or Basin Plan objectives in more than 25% of wet weather samples. Additionally,

eight of ten stations had metals that exceeded TMDL targets and/or Basin Plan objectives in more than 25% of wet weather samples. Nutrients had exceedances in two of the ten stations.

Table F-4. Summary of Major Constituents Exceeding TMDL Targets and/or Basin Plan Water Quality Objectives at Mass Emission Stations During Wet Weather Conditions (2009-2017)

| Mass Emission Station | Condition | 1% - 10% of Samples Exceeded TMDL Target/Basin Plan Objective | 11% - 25% of Samples Exceeded TMDL Target/Basin Plan Objective | > 25% of Samples Exceeded TMDL Target/Basin Plan Objective |
|---------------------------|-----------|---|--|--|
| Ballona Creek | Wet | - | Total Lead | <i>E. coli</i> , Total Copper, Total Zinc |
| Calleguas Creek | Wet | - | - | <i>E. coli</i> |
| Coyote Creek | Wet | - | - | <i>E. coli</i> , Total Copper, Total Zinc |
| Dominguez Channel | Wet | - | Total Lead | <i>E. coli</i> , Total Copper, Total Zinc |
| Los Angeles River | Wet | - | Total Lead | <i>E. coli</i> , Total Copper, Total Zinc |
| Malibu Creek | Wet | - | - | <i>E. coli</i> , Total Nitrogen, Total Phosphorus |
| San Gabriel River | Wet | - | Total Zinc | <i>E. coli</i> , Total Copper |
| Santa Clara River (Lower) | Wet | Nitrate + Nitrite | - | <i>E. coli</i> , Total Copper, Total Zinc |
| Santa Clara River (Upper) | Wet | Total Lead | Total Zinc | <i>E. coli</i> , Total Copper |
| Ventura River | Wet | - | - | <i>E. coli</i> |

b. Dry Weather Mass Emission Station Monitoring

The table below similarly shows the frequency that the same set of constituents exceeded dry weather TMDL targets and/or Basin Plan water quality objectives at each mass emissions station. *E. coli* exceeded TMDL targets and/or Basin Plan objectives in six of ten stations. Metals exceeded targets and limitations in two of ten stations. Nutrients exceeded targets and limitations in two of ten stations.

Table F-5. Summary of Major Constituents Exceeding TMDL Targets and/or Basin Plan Water Quality Objectives at Mass Emission Stations During Dry Weather Conditions (2009-2017)

| Mass Emission Station | Condition | 1% - 10% of Samples Exceeded TMDL Target/Basin Plan Objective | 11% - 25% of Samples Exceeded TMDL Target/Basin Plan Objective | > 25% of Samples Exceeded TMDL Target/Basin Plan Objective |
|---------------------------|-----------|---|--|--|
| Ballona Creek | Dry | Total Copper, Total Zinc | <i>E. coli</i> | - |
| Calleguas Creek | Dry | - | <i>E. coli</i> | - |
| Coyote Creek | Dry | - | - | <i>E. coli</i> |
| Dominguez Channel | Dry | - | Total Copper | <i>E. coli</i> |
| Los Angeles River | Dry | - | - | <i>E. coli</i> |
| Malibu Creek | Dry | - | - | Total Nitrogen, Total Phosphorus |
| San Gabriel River | Dry | - | Nitrate + Nitrite | - |
| Santa Clara River (Lower) | Dry | - | - | - |
| Santa Clara River (Upper) | Dry | - | - | - |
| Ventura River | Dry | - | <i>E. coli</i> | - |

2. Bacteria

Indicator bacteria (e.g., *E. coli*, total coliform, fecal coliform, and *Enterococcus*) are monitored to indicate the likelihood of pathogens in surface waters. The Los Angeles Water Board’s Basin Plan establishes water quality objectives for indicator bacteria to protect water contact recreation (REC-1) and non-contact water recreation (REC-2) beneficial uses. Permittees have monitored bacteria to implement bacteria TMDLs in the Los Angeles Region and to implement beach water quality monitoring requirements under Health and Safety Code sections 115880, 115885, and 115915.

a. Wet Weather Bacteria Monitoring

The tables below summarize wet weather bacteria monitoring at receiving water and outfall monitoring stations. Data from 2012 to 2017 was analyzed for Los Angeles County. Data from 2009 through 2017 was analyzed for Ventura County. Indicator bacteria consistently exceeded water quality objectives at receiving water monitoring stations. In several watersheds, the frequency of samples exceeding objectives was more than 50%. Outfalls have also consistently exceeded applicable *E. coli* effluent limitations. In some watersheds, all outfalls samples exceeded effluent limitations.

Table F-6. Summary of Wet Weather Bacteria Monitoring at Receiving Water Stations

| Watershed | TMDL | # of Stations | # of Exceedances | # of Samples | % Exceed |
|----------------------------------|--|----------------------|-------------------------|---------------------|-----------------|
| Ballona Creek | Ballona Creek Bacteria TMDL | 8 | 155 | 203 | 76% |
| Dominguez Channel | Los Angeles Harbor Bacteria TMDL | 3 | 164 | 385 | 43% |
| Los Angeles River | Los Angeles River Bacteria TMDL | 7 | 26 | 45 | 58% |
| Los Angeles River | Long Beach City Beaches and Los Angeles River Estuary Bacteria TMDL | 12 | 175 | 330 | 53% |
| Malibu Creek | Malibu Creek and Lagoon Bacteria TMDL | 14 | 127 | 198 | 64% |
| Marina del Rey | Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL | 13 | 367 | 733 | 50% |
| Misc. Ventura Coastal Watersheds | Harbor Beaches of Ventura County Bacteria TMDL | 2 | 43 | 135 | 32% |
| San Gabriel River | San Gabriel River Bacteria TMDL | 10 | 48 | 51 | 94% |
| Santa Clara River | Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL | 4 | 30 | 37 | 81% |
| Santa Monica Bay | Santa Monica Bay Beaches Bacteria TMDL | 68 | 1174 | 3770 | 31% |
| Alamitos Bay | (non-TMDL areas) | 4 | 82 | 149 | 55% |
| Calleguas Creek | (non-TMDL areas) | 1 | 21 | 22 | 95% |
| Colorado Lagoon | (non-TMDL areas) | 2 | 27 | 70 | 39% |
| Dominguez Channel | (non-TMDL areas) | 2 | 19 | 19 | 100% |
| Los Cerritos Channel | (non-TMDL areas) | 3 | 18 | 18 | 100% |
| Ventura River | (non-TMDL areas) | 1 | 23 | 26 | 88% |

Table F-7. Summary of Wet Weather Bacteria Monitoring at Outfall Stations

| Watershed | TMDL | # of Stations | # of Exceedances | # of Samples | % Exceed |
|----------------------|--|----------------------|-------------------------|---------------------|-----------------|
| Ballona Creek | Ballona Creek Bacteria TMDL | 2 | 9 | 9 | 100% |
| Los Angeles River | Los Angeles River Bacteria TMDL | 12 | 17 | 37 | 46% |
| Malibu Creek | Malibu Creek and Lagoon Bacteria TMDL | 3 | 6 | 6 | 100% |
| Marina del Rey | Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL | 1 | 3 | 3 | 100% |
| San Gabriel River | San Gabriel River Bacteria TMDL | 12 | 53 | 58 | 91% |
| Santa Clara River | Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL | 11 | 91 | 103 | 88% |
| Alamitos Bay | (non-TMDL areas) | 1 | 3 | 3 | 100% |
| Dominguez Channel | (non-TMDL areas) | 4 | 9 | 9 | 100% |
| Los Cerritos Channel | (non-TMDL areas) | 1 | 3 | 3 | 100% |

b. Dry Weather Bacteria Monitoring

The tables below summarize dry weather bacteria monitoring at receiving water and outfall monitoring stations. Data from 2012 to 2017 was analyzed for Los Angeles County. Data from 2009 through 2017 was analyzed for Ventura County. Compared to wet weather, there were fewer exceedances of water quality objectives at receiving water stations. Outfalls consistently exceeded applicable *E. coli* effluent limitations.

Table F-8. Summary of Dry Weather Bacteria Monitoring at Receiving Water Stations

| Watershed | Associated TMDL | Weather Condition | # of Stations | # of Exceedances | # of Samples | % Exceed |
|-------------------|----------------------------------|--------------------------|----------------------|-------------------------|---------------------|-----------------|
| Ballona Creek | Ballona Creek Bacteria TMDL | Dry | 8 | 950 | 1763 | 54% |
| Dominguez Channel | Los Angeles Harbor Bacteria TMDL | Dry (Winter) | 3 | 159 | 899 | 18% |
| Dominguez Channel | Los Angeles Harbor Bacteria TMDL | Dry (Summer) | 3 | 269 | 1618 | 17% |
| Los Angeles River | Los Angeles River Bacteria TMDL | Dry | 25 | 293 | 513 | 57% |

| Watershed | Associated TMDL | Weather Condition | # of Stations | # of Exceedances | # of Samples | % Exceed |
|----------------------------------|--|--------------------------|----------------------|-------------------------|---------------------|-----------------|
| Los Angeles River | Long Beach City Beaches and Los Angeles River Estuary Bacteria TMDL | Dry (Winter) | 12 | 59 | 796 | 7% |
| Los Angeles River | Long Beach City Beaches and Los Angeles River Estuary Bacteria TMDL | Dry (Summer) | 12 | 170 | 1507 | 11% |
| Malibu Creek | Malibu Creek and Lagoon Bacteria TMDL | Dry | 15 | 346 | 1447 | 24% |
| Marina del Rey | Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL | Dry (Winter) | 13 | 353 | 1479 | 24% |
| Marina del Rey | Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL | Dry (Summer) | 13 | 338 | 2722 | 12% |
| Misc. Ventura Coastal Watersheds | Harbor Beaches of Ventura County Bacteria TMDL | Dry (Winter) | 2 | 21 | 219 | 10% |
| Misc. Ventura Coastal Watersheds | Harbor Beaches of Ventura County Bacteria TMDL | Dry (Summer) | 2 | 26 | 469 | 6% |
| San Gabriel River | San Gabriel River Bacteria TMDL | Dry | 10 | 17 | 38 | 45% |
| Santa Clara River | Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL | Dry | 3 | 0 | 15 | 0% |
| Santa Monica Bay | Santa Monica Bay Beaches Bacteria TMDL | Dry (Winter) | 68 | 938 | 7839 | 12% |
| Santa Monica Bay | Santa Monica Bay Beaches Bacteria TMDL | Dry (Summer) | 68 | 746 | 14094 | 5% |
| Alamitos Bay | (non-TMDL areas) | Dry | 4 | 57 | 980 | 6% |

| Watershed | Associated TMDL | Weather Condition | # of Stations | # of Exceedances | # of Samples | % Exceed |
|----------------------|------------------------|--------------------------|----------------------|-------------------------|---------------------|-----------------|
| Calleguas Creek | (non-TMDL areas) | Dry | 1 | 1 | 9 | 11% |
| Colorado Lagoon | (non-TMDL areas) | Dry | 2 | 14 | 475 | 3% |
| Dominguez Channel | (non-TMDL areas) | Dry | 2 | 7 | 12 | 58% |
| Los Cerritos Channel | (non-TMDL areas) | Dry | 1 | 2 | 3 | 67% |
| Ventura River | (non-TMDL areas) | Dry | 1 | 1 | 9 | 11% |

Table F-9. Summary of Dry Weather Bacteria Monitoring at Outfall Stations

| Watershed | Associated TMDL | # of Stations | # of Exceedances | # of Samples | % Exceed |
|----------------------|--|----------------------|-------------------------|---------------------|-----------------|
| Malibu Creek | Malibu Creek and Lagoon Bacteria TMDL | 1 | 1 | 1 | 100% |
| San Gabriel River | San Gabriel River Bacteria TMDL | 3 | 6 | 17 | 35% |
| Santa Clara River | Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL | 9 | 37 | 60 | 62% |
| Los Cerritos Channel | (non-TMDL areas) | 1 | 1 | 1 | 100% |

3. Metals

Permittees have monitored metals at several receiving water and outfall monitoring stations. This reflects the number of metals TMDLs and metals impairments throughout the Los Angeles Region. Copper, lead, and zinc are the primary metals of concern in the region as concentrations of these metals have exceeded water quality objectives for protection of aquatic life, which are established in the California Toxics Rule (CTR). Zinc and copper have often been identified as “limiting pollutants” in Watershed Management Programs established under the Los Angeles County and City of Long Beach MS4 Permits.

a. Wet Weather Metals Monitoring

The tables below summarize Permittees’ wet weather metals monitoring in select watersheds during the previous permit term (2009-2017 in Ventura County and 2012-2017 in Los Angeles County). Copper and/or zinc exceedances were observed at many receiving water stations when monitoring results were compared to CTR acute criteria for both total metals and dissolved metals.

Where outfall monitoring was conducted, many outfalls exceeded applicable effluent limitations for copper and zinc during wet-weather monitoring. Exceedances for these two constituents were observed at outfall stations in Calleguas Creek, Santa Clara River, Los Angeles River, Ballona Creek, San Gabriel River, and Los Cerritos Channel. Lead exceedances were also observed; however, these occurred at a far lower frequency.

**Table F-10. Summary of Wet Weather Metals Receiving Water Monitoring Exceeding Criteria by Watershed
(Exceedances / Samples)**

| Parameter | Ballona Creek | Calleguas Creek | Dominguez Channel | Los Angeles River | Los Cerritos Channel | San Gabriel River | Santa Clara River | Ventura River |
|---------------------|---------------|-----------------|-------------------|-------------------|----------------------|-------------------|-------------------|---------------|
| Cadmium (Total) | -- | -- | -- | 3/48 | -- | -- | -- | -- |
| Cadmium (Dissolved) | -- | -- | -- | 0/42 | -- | -- | -- | -- |
| Copper (Total) | 104/109 | 5/24 | 21/21 | 64/100 | 30/30 | 82/91 | 17/37 | 0/26 |
| Copper (Dissolved) | 84/109 | 0/25 | -- | 19/94 | 30/30 | 34/91 | -- | -- |
| Lead (Total) | 41/109 | 0/22 | 4/21 | 13/104 | 16/19 | 9/91 | 2/32 | 0/26 |

| Nickel (Total) | -- | 0/43 | -- | -- | -- | -- | -- | -- |
| Selenium | 0/2 | -- | -- | -- | -- | -- | -- | -- |
| Zinc (Total) | 8/9 | -- | 0/6 | 39/62 | -- | 3/7 | -- | -- |

b. Dry Weather Metals Monitoring

The tables below summarize Permittees' dry weather metals monitoring in select watersheds during the previous permit term (2009-2017 in Ventura County and 2012-2017 in Los Angeles County). Compared to wet weather, there were fewer exceedances of dry weather effluent limitations at outfalls and receiving water limitations at receiving water stations. For several constituent and waterbodies, no exceedances were observed.

**Table F-12. Summary of Dry Weather Metals Receiving Water Monitoring Exceeding Criteria by Watershed
(Exceedances / Samples)**

| Parameter | Ballona Creek | Calleguas Creek | Dominguez Channel | Los Angeles River | Los Cerritos Channel | San Gabriel River | Santa Clara River | Ventura River |
|------------------------|------------------|--------------------|----------------------|-------------------------|----------------------------|-------------------------|-------------------------|------------------|
| Cadmium (Total) | -- | -- | -- | 0/18 | -- | -- | -- | -- |
| Cadmium (Dissolved) | -- | -- | -- | 0/14 | -- | -- | -- | -- |
| Copper (Total) | 8/150 | 0/10 | 2/10 | 5/255 | 4/8 | 1/34 | 0/19 | 0/9 |
| Copper (Dissolved) | 1/150 | 0/10 | -- | 2/251 | 4/8 | 0/34 | -- | -- |
| Lead (Total) | 0/150 | 0/9 | 0/10 | 3/164 | -- | 0/31 | 0/16 | 0/9 |
| Lead (Dissolved) | 0/150 | -- | -- | 0/160 | -- | 0/31 | -- | -- |

| Zinc (Dissolved) | 0/150 | -- | -- | 0/221 | -- | 0/35 | -- | -- |

**Table F-13. Summary of Dry Weather Metals Outfall Monitoring Exceeding Criteria by Watershed
(Exceedances / Samples)**

| Parameter | Ballona Creek | Calleguas Creek | Dominguez Channel | Los Angeles River | Los Cerritos Channel | San Gabriel River | Santa Clara River | Ventura River |
|--------------------|--------------------------|----------------------------|------------------------------|----------------------------------|-------------------------------------|----------------------------------|----------------------------------|--------------------------|
| Cadmium (Total) | -- | -- | -- | -- | -- | -- | -- | -- |
| Copper (Total) | 1/8 | 9/17 | -- | 0/2 | -- | -- | -- | -- |
| Lead (Total) | 0/8 | -- | -- | 0/2 | -- | -- | -- | -- |
| Mercury (Total) | -- | 0/9 | -- | -- | -- | -- | -- | -- |
| Nickel (Total) | -- | 0/15 | -- | -- | -- | -- | -- | -- |
| Selenium | -- | 0/8 | -- | -- | -- | 0/4 | -- | -- |
| Zinc (Total) | 0/8 | -- | -- | -- | -- | -- | -- | -- |

4. Nutrients

Permittees have monitored nutrients at several receiving water and outfall monitoring stations in waterbodies with nutrient and nutrient-related impairments. Data from 2012 to 2017 was analyzed for Los Angeles County. Data from 2009 through 2017 was analyzed for Ventura County. Although discharges from municipal wastewater treatment plants (also known as publicly owned treatment works or POTWs) have often been identified as major sources of impairments in some TMDLs, MS4 discharges have been identified as a source of impairment during wet weather and dry weather in several TMDLs. The tables below summarize nutrient monitoring at some select river systems with nutrient TMDLs. Permittees also monitor nutrients in lake systems as there are several lakes in the Los Angeles Region that have nutrient TMDLs.

Table F-14. Summary of Nutrients Receiving Water Monitoring Exceeding Criteria by Watershed (Exceedances / Samples)

| Limitation | Calleguas Creek | Los Angeles River | Malibu Creek (Summer) | Malibu Creek (Winter) | Santa Clara River |
|----------------------|-----------------|-------------------|-----------------------|-----------------------|-------------------|
| Ammonia (1 Hr Avg) | 0/546 | 0/57 | -- | -- | 1/41 |
| Ammonia (30 Day Avg) | 0/511 | 0/57 | -- | -- | 1/35 |
| Nitrate | 176/546 | 1/65 | -- | -- | 1/35 |
| Nitrite | 1/516 | 2/57 | -- | -- | -- |
| Nitrate + Nitrite | 179/542 | 5/65 | 5/13 | 1/43 | -- |
| Total Phosphorus | -- | -- | 12/14 | -- | -- |

Table F-15. Summary of Nutrients Outfall Monitoring Exceeding Criteria by Watershed (Exceedances / Samples)

| Limitation | Calleguas Creek | Los Angeles River | Malibu Creek (Summer) | Malibu Creek (Winter) | Santa Clara River |
|----------------------|-----------------|-------------------|-----------------------|-----------------------|-------------------|
| Ammonia (1 Hr Avg) | 0/108 | 0/28 | -- | -- | 2/38 |
| Ammonia (30 Day Avg) | 1/100 | 0/28 | -- | -- | 2/28 |
| Nitrate | 0/1 | 0/21 | -- | -- | -- |
| Nitrite | -- | 2/21 | -- | -- | -- |
| Nitrate + Nitrite | 1/109 | 1/28 | 2/2 | 0/6 | 0/28 |
| Total Phosphorus | -- | -- | 2/2 | -- | -- |

5. Salts

Permittees have monitored for salts at receiving water and outfall monitoring stations in waterbodies with salt impairments. Data from 2012 to 2017 was analyzed for Los Angeles County. Data from 2009 through 2017 was analyzed for Ventura County. The tables below summarize monitoring conducted for the Calleguas Creek Watershed Salts TMDL and Santa Clara River Chloride TMDL.

Both watersheds show continued exceedances of TMDL targets and/or receiving water limitations. The monitoring results for Santa Clara River is separated by the

weather condition at sample collection. Dry weather receiving water and outfall samples exceeded more frequently than wet weather samples. For example, 12 of 19 (63%) dry weather outfall samples exceeded applicable limitations compared to 1 of 60 (2%) wet weather outfall samples.

Table F-16. Summary of Salts Monitoring at Receiving Water Stations

| Watershed | Constituent | Weather Condition | # of Stations | # of Exceedances | # of Samples | % Exceed |
|-------------------|-------------|-------------------|---------------|------------------|--------------|----------|
| Calleguas Creek | Boron | -- | 6 | 8 | 34 | 24% |
| Calleguas Creek | Chloride | -- | 6 | 4 | 44 | 9% |
| Calleguas Creek | Sulfate | -- | 6 | 8 | 36 | 22% |
| Calleguas Creek | TDS | -- | 6 | 8 | 44 | 18% |
| Santa Clara River | Chloride | Wet | 3 | 9 | 44 | 20% |
| Santa Clara River | Chloride | Dry | 3 | 12 | 20 | 60% |

Table F-17. Summary of Salts Monitoring at Outfall Stations

| Watershed | Constituent | Weather Condition | # of Stations | # of Exceedances | # of Samples | % Exceed |
|-------------------|-------------|-------------------|---------------|------------------|--------------|----------|
| Calleguas Creek | Chloride | -- | 4 | 10 | 24 | 42% |
| Calleguas Creek | Sulfate | -- | 4 | 1 | 7 | 14% |
| Calleguas Creek | TDS | -- | 4 | 7 | 24 | 29% |
| Santa Clara River | Chloride | Wet | 8 | 1 | 60 | 2% |
| Santa Clara River | Chloride | Dry | * | 12 | 19 | 63% |

6. Toxic Pollutants

Toxic pollutants include pesticides, PCBs, PAHs, and metals. Toxic pollutants can bioaccumulate in fish and other aquatic organisms, which is harmful for both the organisms as well as organisms that consume these species (including humans). The Los Angeles Water Board's Basin Plan establishes a narrative water quality objective to address bioaccumulation, which states "Toxic pollutants shall not be present at levels that will bioaccumulate in aquatic life to levels which are harmful to aquatic life or human health." The State Water Board has established Sediment Quality Objectives for enclosed bays and estuaries, which state:

- Pollutants in sediments shall not be present in quantities that, alone or in combination are toxic to benthic communities in bays and estuaries of California;
- Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health in bays and estuaries of California; and

- Pollutants shall not be present in sediment at levels that alone or in combination are toxic to wildlife and resident finfish by direct exposure or bioaccumulate in aquatic life at levels that are harmful to wildlife or resident finfish by indirect exposure in bays and estuaries of California.

There are several TMDLs addressing impairments due to toxic pollutants in the Los Angeles Region. These TMDLs address impairments in estuaries, harbors, lakes, and other waterbodies where toxic pollutants can accumulate in the sediment. Permittees have been monitoring toxic pollutants in several waterbodies throughout the Los Angeles Region. This monitoring includes sediment monitoring at estuaries, lakes, and bays; stormborne sediment during rain events; and fish tissue monitoring at receiving waters. Data from 2012 to 2017 was analyzed for Los Angeles County. Data from 2009 through 2017 was analyzed for Ventura County. The table below summarizes some of the toxic pollutant monitoring conducted by Permittees. Due to the complexity of toxics TMDLs, which often include interim limitations and the analysis of multiple lines of evidence, it should be noted that the information in the table is a simplification of receiving water conditions.

Table F-18. Summary of Toxic Pollutants Receiving Water Monitoring Exceeding Criteria by Watershed (Exceedances / Samples)

| Parameter | Sample Type | Ballona Estuary | Calleguas Creek and Mugu Lagoon | Colorado Lagoon | Dominguez Channel Estuary | Santa Monica Bay |
|-----------|---------------------|-----------------|---------------------------------|-----------------|---------------------------|------------------|
| 4,4-DDD | Sediment | -- | 0/66 | -- | -- | -- |
| 4,4-DDE | Sediment | -- | 0/66 | -- | -- | -- |
| 4,4-DDT | Sediment | -- | 1/66 | -- | -- | -- |
| Cadmium | Stormborne Sediment | 2/13 | -- | -- | -- | -- |

| Zinc | Sediment | -- | -- | 8/12 | 3/22 | -- |
| Zinc | Stormborne Sediment | 2/13 | -- | -- | -- | -- |

F. History of the Previous Permits

Prior to the issuance of the Order, the Los Angeles Water Board issued Permittees in Ventura County, Permittees within the coastal watersheds of Los Angeles County (with the exception of the City of Long Beach), and the City of Long Beach their own respective Phase I MS4 Permits.

Ventura County MS4 Permit

The first MS4 Permit for Ventura County and the incorporated areas therein was Order No. 94-082, issued by the Los Angeles Water Board on August 22, 1994. Between 1994 and 2010, several iterations of this permit were issued. Order No. 94-082 was superseded by Order No. 00-108, issued by the Los Angeles Water Board on July 27, 2000. On May 7, 2009, the Los Angeles Water Board issued Order No. 09-0057, which superseded Order No. 00-108. On July 8, 2010, the Los Angeles Water Board issued Order No. R4-2010-0108, which superseded Order No. 09-0057, to address perceived procedural issues raised by the Building Industry Legal Defense Foundation and others in a petition to the State Water Board.

Prior to the issuance of the Order, Order No. R4-2010-0108 served as the NPDES permit for MS4 stormwater and non-stormwater discharges within the watersheds of Ventura County. The requirements of Order No. R4-2010-0108 applied to the Ventura County Watershed Protection District, County of Ventura, and the cities of Camarillo, Fillmore, Moorpark, Ojai, Oxnard, Port Hueneme, San Buenaventura (Ventura), Santa Paula, Simi Valley, and Thousand Oaks.

Working together under the Ventura County MS4 Permit, the VCWPD joined together with the County of Ventura and 10 incorporated cities to form the Ventura Countywide Stormwater Quality Management Program. VCWPD was designated as the Principal Permittee. The Principal Permittee coordinated and facilitated activities necessary to comply with the requirements of Order No. R4-2010-0108 but was not responsible for ensuring compliance of any of the other Permittees. As noted earlier, the designation of

a Principal Permittee has not been carried over from Order No. R4-2010-0108 to the Order.

Los Angeles County MS4 Permit

The first MS4 permit for Los Angeles County and the incorporated areas therein was Order No. 90-079, issued by the Los Angeles Water Board on June 18, 1990. Order No. 96-054 was issued by the Los Angeles Water Board on July 15, 1996, which superseded Order No. 90-079. Order No. 96-054 was superseded by Order No. 01-182, which was issued by the Los Angeles Water Board on December 13, 2001. Order No. 01-182 was amended on September 14, 2006 by Order No. R4-2006-0074, on August 9, 2007 by Order No. R4-2007-0042, on December 10, 2009 by Order No. R4-2009-0130, and on October 19, 2010 and April 14, 2011 pursuant to a peremptory writ of mandate in Los Angeles County Superior Court Case No. BS122724. As discussed below, Order No. 01-182 did not regulate MS4 discharges originating from the City of Long Beach.

On November 8, 2012, the Los Angeles Water Board issued Order No. R4-2012-0175, which superseded Order No. 01-182, as amended. Thereafter, several Los Angeles County MS4 Permittees and environmental organizations filed 37 petitions with the State Water Board challenging various provisions of Order No. R4-2012-0175. On June 16, 2015, the State Water Board adopted Order WQ 2015-0075, which generally upheld Order No. R4-2012-0175 but with a number of revisions to the findings and provisions. Two cities and two environmental organizations subsequently filed three lawsuits (petitions for writ of mandate) against the Los Angeles Water Board and State Water Board challenging various aspects of Los Angeles Water Board Order No. R4-2012-0175 and State Water Board Order WQ 2015-0075. These lawsuits have the following brief background and status:

- Natural Resources Defense Council (NRDC) and Los Angeles Waterkeeper's primary contention is that allowing permittees to implement approved watershed management programs (WMPs) in lieu of strictly complying with receiving water limitations violates federal NPDES anti-backsliding requirements and state and federal anti-degradation requirements. In January 2017, the Los Angeles County Superior Court denied the petition for writ of mandate and upheld Order No. R4-2012-0175. Upon appeal by NRDC and Los Angeles Waterkeeper, on December 24, 2018, the Second District Court of Appeal issued an unpublished, mixed decision.¹² On the anti-backsliding claim, the Court of Appeal affirmed the conclusions of the State Water Board and the trial court that the anti-backsliding provisions did not apply when the 2012 permit authorized WMPs as an alternative means of compliance with receiving water limitations. As for the anti-degradation claim, the Court of Appeal reversed and remanded the trial court's anti-degradation ruling on procedural grounds. The Court of Appeal held that the trial court applied the wrong standard of review, but did affirm that a simple anti-degradation analysis applied to the permit. On remand, the Superior Court ruled that the Water Boards' anti-degradation analysis in Order No. R4-2012-0175 pertaining to high quality waters only was not supported by adequate findings and issued a judgment on April 21, 2021, stating that the court will issue a writ of mandate ordering the Water Boards to set aside Order No. R4-2012-0175. Following issuance of the writ, the Los Angeles Water Board will have 180 days to comply with the court's writ. Alternatively, if the Water Boards file a notice of appeal, they may also file a petition

¹² *Natural Res. Defense Council Inc. et al. v. State Water Res. Control Board et al.* (Dec. 24, 2018) Cal. Court of Appeal, Second Appellate District, Div. Five, Case No. B282016 [nonpub. opn.].

for writ of supersedeas with the Court of Appeal to seek to keep the 2012 permit in effect pending appeal. Unless and until the Los Angeles Water Board supersedes the 2012 permit through issuance of this Order or otherwise acts to set aside the 2012 permit, the 2012 permit remains in effect.¹³

- In two separate but related cases, the cities of Duarte and Gardena challenged various aspects of Order No. R4-2012-0175, including alleging that the Los Angeles Water Board failed to properly consider economic considerations under Water Code section 13241 before imposing numeric effluent limitations (NELs). In September 2019, the Orange County Superior Court issued writs of mandate in both cases requiring the Los Angeles Water Board to set aside all NELs in the 2012 permit and to reconsider the permit in light of the court's ruling. The court ruled that the Water Boards were required to consider costs under Water Code section 13241, as it had determined that incorporation of NELs in the 2012 permit exceeded federal Clean Water Act requirements, and that the Water Boards failed to adequately do so. The court declined to address the cities' other contentions as it found the NEL issue dispositive. The Water Boards disagreed with the court's ruling and appealed the decision. On January 28, 2021, the Court of Appeal issued a unanimous, published decision in the *City of Duarte* case and a companion unpublished decision in the *City of Gardena* case reversing the trial court's rulings in both cases. The Court of Appeal did not decide whether NELs were more stringent than required by federal law. Assuming without deciding that they were more stringent and required considering of the Water Code section 13241 factors, the Court of Appeal concluded that "The Regional Board developed an economic analysis of the Permit's requirements, consistent with Water Code section 13241." (*City of Duarte v. State Water Resources Control Board et al.* (2021) 60 Cal.App.5th 258, as modified on denial of rehearing (Feb. 19, 2021); *City of Gardena v. State Water Resources Control Board et al.* (2021) Cal. Court of Appeal, Fourth Appellate Dist., Div. Three, Case No. G058540, as modified on denial of rehearing (Feb 19, 2021) [nonpub. opn.].) On April 28, 2021, the California Supreme Court denied the cities' Petitions for Review, leaving the appellate court's rulings in place. The Court of Appeal has directed the trial court to deny the cities' petitions for writ of mandate and to enter judgments in favor of the Water Boards.

The Los Angeles Water Board further amended Order No. R4-2012-0175 on September 8, 2016 (Order No. R4-2012-0175-A01) incorporating provisions consistent with the revised Ballona Creek Watershed Trash TMDL and the revised Los Angeles River Watershed Trash TMDL. Additionally, on July 9, 2018, the Los Angeles Water Board Executive Officer modified Table E-2 of Attachment E (Monitoring and Reporting Program) to Order No. R4-2012-0175 to remove fecal coliform from the freshwater monitoring requirements.

Prior to the issuance of the Order, Order No. R4-2012-0175, as amended, served as the NPDES permit for MS4 stormwater and non-stormwater discharges within the coastal watersheds of Los Angeles County. The requirements of Order No. R4-2012-0175 applied to the Los Angeles County Flood Control District, the unincorporated areas of Los Angeles County under Los Angeles County's jurisdiction, and 84 cities within the coastal watersheds of Los Angeles County except for the City of Long Beach.

¹³ *Natural Res. Defense Council, Inc. et al. v. State Wat. Res. Control Bd. et al.*, Los Angeles County Superior Court, Case No. BS156962 (March 29, 2021). Judge Beckloff's ruling did not change the Court of Appeals' anti-backsliding analysis.

City of Long Beach MS4 Permit

The Los Angeles Water Board regulated discharges from the City of Long Beach's MS4 from 1990 through 1999 under the Los Angeles countywide MS4 requirements contained in Order No. 90-079 and Order No. 96-054 issued on June 18, 1990 and July 15, 1996, respectively.

In 1999, the Los Angeles Water Board issued a separate MS4 Permit, Order No. 99-060, to the City of Long Beach for discharges originating from its MS4. Order No. 99-060 was superseded by Order No. R4-2014-0024, which was issued by the Los Angeles Water Board on February 6, 2014. The Los Angeles Water Board amended Order No. R4-2014-0024 on September 8, 2016 (Order No. R4-2014-0024-A01) incorporating provisions consistent with the revised Los Angeles River Watershed Trash TMDL. Additionally, on July 9, 2018, the Los Angeles Water Board Executive Officer modified Table E-2 of Attachment E (Monitoring and Reporting Program) to Order No. R4-2014-0024 to remove fecal coliform from freshwater monitoring requirements.

Order No. R4-2014-0024, as amended, served as the NPDES permit for MS4 stormwater and non-stormwater discharges for the City of Long Beach prior to the issuance of the Order.

Regional MS4 Permit

Except for enforcement purposes, the Order supersedes the previous orders for Permittees in Ventura County, Permittees within the coastal watersheds of Los Angeles County (excepting the City of Long Beach), and the City of Long Beach to cover all Phase I MS4 Permittees within the coastal watersheds of the Los Angeles Region with one regionwide Phase I MS4 Permit (Regional MS4 Permit).

G. Summary of Requirements in Previous Permits

Ventura County

The Ventura County MS4 Permit was last reissued in 2010 as Order No. R4-2010-0108. Order No. R4-2010-0108 expired on July 8, 2015, but was administratively continued pursuant to federal and state regulations. Order No. R4-2010-0108 was organized under the following seven parts and included several attachments. The description below briefly summarizes key permit parts and attachments in Order No. R4-2010-0108.

Part 1 – Discharge Prohibitions

As required by section 402(p)(3)(B)(ii) of the Clean Water Act, Part 1 requires permittees to effectively prohibit non-stormwater discharges into the MS4 and receiving waters, except where such discharges: originate from a State, Federal, or other source for which they are pre-empted from regulating by State or federal law; are covered by a separate NPDES permit or conditional waiver of waste discharge requirements (WDRs) for irrigated lands; are flows from firefighting activities; or fall within one of thirteen categories of flows that are conditionally exempted from the discharge prohibition. These exempted flows fall under certain categories of natural flows and flows incidental to urban activities (i.e., landscape irrigation, sidewalk rinsing). These non-stormwater flows may be exempted so long as they are not a source of pollutants that exceed water quality standards and permittees meet all conditions where specified.

Part 2 – Receiving Water Limitations

Pursuant to State Water Board Order WQ 99-05, Part 2 prohibits discharges from the MS4 that cause or contribute to a violation of water quality standards. In addition, discharges from the MS4 of stormwater or non-stormwater, for which a Permittee is responsible, may not cause or contribute to a condition of nuisance. Part 2.3 requires permittees to comply with receiving water limitations through timely implementation of control measures and other actions to reduce pollutants in the stormwater discharges. If exceedances persist, the Permittee shall ensure compliance with receiving water limitations by following a list of procedures such as submitting a report to the Los Angeles Water Board Executive Officer that describes what additional BMPs are being implemented to address the exceedances. Part 2.4 requires Permittees to annually report the effectiveness of BMPs in reducing exceedances of receiving water limitations.

Part 3 – Stormwater Quality Management Program (SQMP) Implementation

Under Part 3, each Permittee shall, at a minimum, adopt and implement applicable terms of the permit within its jurisdictional boundary. As Principal Permittee, VCWPD shall be responsible for program coordination as described in the permit, as well as compliance with applicable portions of the permit within its jurisdiction. Each Permittee shall also comply with the requirements of 40 CFR section 122.26(d)(2) and implement programs and control measures so as to reduce the discharges of pollutants in stormwater to the maximum extent practicable (MEP) and achieve water quality standards. Part 3 also requires each Permittee to achieve treatment BMP performance standards identified in Attachment C for an 85th percentile 24-hour runoff event.

With regards to TMDLs, Part 3 requires each Permittee to implement programs and measures to comply with TMDL WLAs assigned to MS4 discharges as specified in Part 5. The WLAs are expressed numerically in Part 5 as water quality-based effluent limitations and Permittees are expected to attain the WLAs by implementing BMPs. Additionally, permittees are required to submit an Annual Budget Summary that provides the estimated expenditures to implement the permit for the upcoming report year.

Part 3 also sets forth specific responsibilities of the Principal Permittee and other Permittees such as participation in committee meetings and intra-agency coordination and requirements regarding each Permittee's legal authority.

Part 4 – Special Provisions

Part 4 sets forth provisions for watershed initiative participation, public information and participation program, industrial/commercial facilities control program, planning and land development program, development construction program, public agency activities program, and illicit connections and illicit discharges elimination program. These programs are termed "minimum control measures" and have been in place since the inception of the MS4 NPDES permitting program, as required by federal regulations.

As part of general requirements, Part 4 allows Permittees to propose site-specific Best Management Practice (BMP) Substitution for Los Angeles Water Board Executive Officer approval. Part 4 also sets forth requirements for the Reporting Program in Attachment I.

Part 5 – Total Maximum Daily Load (TMDL) Provisions

As required by 40 CFR section 122.44(d)(1)(vii)(B), the permit incorporated TMDL WLAs, expressed numerically in a manner consistent with the assumptions and requirements of the TMDL from which they were derived. In permit terms, these TMDL WLAs are water quality-based effluent limits. Part 5 requires permittees to comply with applicable WLAs and lists 13 TMDLs applicable to MS4 discharges within Ventura County with the WLAs assigned to MS4 discharges and compliance options.

Part 6 – Definitions

Part 6 includes definitions for terms used within the permit.

Part 7 – Standard Provisions

Part 7 includes standard provisions relating to implementation of the programs required by the permit. Such provisions include, but are not limited to, the duty to comply, the duty to mitigate, inspection and entry requirements, proper operation and maintenance requirements, monitoring and reporting requirements, and the duty to provide information. Most of these provisions are required by 40 CFR sections 122.41 or 122.42 and apply to all NPDES permits.

Attachment A – Watershed Management Areas

Attachment A includes a table that lists the Watershed Management Areas and their respective major surface waterbodies, hydrologic units, Clean Water Act section 303(d) listed pollutants, and permittees.

Attachment B – Pollutants of Concern for Calleguas Creek, Santa Clara River, and Ventura River Watersheds

Attachment B includes pollutants of concern for Calleguas Creek, Santa Clara River, and Ventura River Watershed based on 2003-2007 data from mass emissions stations, receiving water sites, and land use monitoring sites.

Attachment C – Treatment BMP Performance Standards and Effluent Concentrations as Median Values

Attachment C provides treatment BMP performance standards which includes a table of parameters and their respective effluent concentrations for various categories of BMPs.

Attachment D – Critical Sources Categories

Attachment D lists facilities and their Standard Industrial Classification (SIC) codes for critical sources.

Attachment E – Determination of Erosion Potential

Attachment E includes formulas to determine erosion potential.

Attachment F – Monitoring Program

Attachment F has self-monitoring requirements, which include: (1) monitoring of “mass emissions” at three mass emission monitoring stations; (2) monitoring of major outfalls specified in Attachment I; (3) Dry Weather Analytical Monitoring; (4) Aquatic Toxicity Monitoring; (5) Beach Water Quality Monitoring; (6) TMDL Monitoring; (7) Bioassessment; and (8) Special Studies.

Attachment G – Storm Water Monitoring Program’s Constituents and Associated Minimum Levels

Attachment G includes a table listing the required stormwater monitoring program constituents and their associated minimum levels.

Attachment H – Storm Water Monitoring Program’s Major Outfall Stations

Attachment H includes a table listing the required major outfall monitoring sites and the responsible permittees.

Attachment I – Reporting Program Requirements

Attachment I has reporting requirements where an annual report includes: (1) monitoring of “mass emissions” at three mass emission monitoring stations; (2) monitoring of major outfalls specified in Attachment H; (3) Dry Weather Analytical Monitoring; (4) Aquatic Toxicity Monitoring; (5) Beach Water Quality Monitoring; (6) TMDL Monitoring; (7) Bioassessment; and (8) Special Studies. Permittees are also required to submit an Annual Monitoring Program Report, which answers a set of questions on discharge prohibitions and receiving water limitations. Additionally, Permittees are required to include in their Annual Report answers to a set of questions on the SQMP and special provisions of the Order.

Fact Sheet/Staff Report

The Fact Sheet/Staff Report provides an overview of the Ventura County MS4 Permit and explains the significant factual, legal, methodological, technical, and policy rationale that serve as the basis for the permit requirements.

Los Angeles County

The Los Angeles County MS4 Permit was last reissued in 2012 as Order No. R4-2012-0175 and was amended as described above. Order No. R4-2012-0175 expired on December 28, 2017 but was administratively continued pursuant to federal and state regulations. Order No. R4-2012-0175 is organized under six parts and includes several attachments. The description below summarizes key permit parts and attachments in Order No. R4-2012-0175.

Part III. Discharge Prohibitions

As required by section 402(p)(3)(B)(ii) of the Clean Water Act, Part III requires Permittees to prohibit non-stormwater discharges through the MS4 to receiving waters except for non-stormwater discharges regulated under a separate NPDES permit, temporary non-stormwater discharges authorized by U.S. EPA, authorized non-stormwater discharges from emergency firefighting activities, natural flows, and certain conditionally exempt discharges.

Part IV. Effluent Limitations and Discharge Specifications

Part IV requires each Permittee to comply with technology based effluent limitations by reducing pollutants in stormwater discharges from the MS4 to the maximum extent practicable (MEP). Part IV also requires Permittees to comply with applicable water quality-based effluent limitations (WQBELs) as set forth in Part VI.E of the permit.

Part V. Receiving Water Limitations

Pursuant to State Water Board Order WQ 99-05, Part V prohibits discharges from the MS4 that cause or contribute to a violation of receiving water limitations. In

addition, discharges from the MS4 of stormwater or non-stormwater, for which a Permittee is responsible, shall not cause or contribute to a condition of nuisance. Part V.3 requires permittees to comply with receiving water limitations through timely implementation of control measures and other actions to reduce pollutants in the discharges. If exceedances persist, the Permittee shall ensure compliance with receiving water limitations by following a list of procedures, such as submitting an Integrated Monitoring Compliance Report to the Los Angeles Water Board Executive Officer that describes what additional BMPs are being implemented to address the exceedances.

Part VI. Provisions

Part VI includes requirements for standard provisions, monitoring and reporting, watershed management programs, stormwater management program minimum control measures (MCMs), and Total Maximum Daily Loads (TMDLs).

Standard provisions include requirements to comply with Attachment D, ensure each Permittee has the necessary legal authority to prohibit non-stormwater discharges through the MS4 to receiving waters, as well as possess adequate legal authority to develop and enforce stormwater and non-stormwater ordinances for its jurisdiction. It also lists responsibilities of Permittees and requires Permittees to conduct a fiscal analysis and report it in their annual report. There are also provisions for public review and Los Angeles Water Board review, permit reopener and modification provisions, and enforcement provisions including enforcement of water quality-based effluent limitations for trash.

The monitoring and reporting provisions require compliance with Attachment E (Monitoring and Reporting Program) and also describe compliance determination for commingled discharges.

The watershed management program provisions in Part VI.C describe a voluntary alternative compliance pathway allowing permittees to individually or collaboratively develop a Watershed Management Program (WMP) or an Enhanced Watershed Management Program (EWMP). The WMP or EWMP allows Permittee(s) the flexibility to customize strategies, control measures, and BMPs to meet the requirements of the permit. Part VI.C describes compliance determination for participation in a WMP or EWMP, timelines for WMP or EWMP development and implementation, requirements to conduct a Reasonable Assurance Analysis (RAA), and provisions for an adaptive management process.

Part VI.D includes general requirements, progressive enforcement and interagency coordination provisions, and six MCMs that are the Public Information and Participation Program (PIPP), Industrial/Commercial Facilities Program, Planning and Land Development Program, Development Construction Program, Public Agency Activities Program, and Illicit Connections and Illicit Discharges Elimination Program (IC/IDE). Part VI.D.4 lists MCM provisions applicable to LACFCD.

Part VI.E includes TMDL provisions including compliance with applicable WQBELs and/or receiving water limitations contained in Attachments L through R, compliance determination for TMDLs, timelines for compliance with U.S. EPA TMDLs, and provisions for compliance with trash TMDLs.

Attachment A – Definitions

Attachment A includes acronyms, abbreviations, and definitions for terms used within the permit.

Attachment B – Watershed Management Area Maps

Attachment B depicts each Watershed Management Area, its subwatersheds, and the major receiving waters.

Attachment C – MS4 Maps by Watershed Management Area

Attachment C depicts the major drainage infrastructure with the area covered under the permit by WMAs.

Attachment D – Standard Provisions

Attachment D includes standard provisions relating to implementation of the programs required by the permit. Such provisions include, but are not limited to, the duty to comply, the duty to mitigate, inspection and entry requirements, proper operation and maintenance requirements, monitoring and reporting requirements, and the duty to provide information. Most of these provisions are required by 40 CFR section 122.41, which applies to all NPDES permits, or section 122.42, which sets forth additional conditions applicable to specified categories of NPDES permits, including MS4 permits.

Attachment E – Monitoring and Reporting Program

Attachment E establishes monitoring, reporting, and recordkeeping requirements. Attachment E allows for an integrated monitoring approach where a Permittee can submit an Integrated Monitoring Program (IMP) or a group of Permittees can coordinate monitoring efforts on a watershed or subwatershed basis to submit a Coordinated Integrated Monitoring Program (CIMP) for Los Angeles Water Board Executive Officer approval. The IMP or CIMP must contain the following elements: (1) receiving water monitoring; (2) stormwater outfall-based monitoring; (3) non-stormwater outfall-based monitoring; (4) new-development/re-development effectiveness tracking; and (5) regional studies. Furthermore, Attachment E specifies monitoring data and annual report submittal timelines and describes key elements to report on.

Attachment F – Fact Sheet

The Fact Sheet provides an overview of the Los Angeles County MS4 Permit and explains the significant factual, legal, methodological, technical, and policy rationale that serve as the basis for the requirements of the permit.

Attachment G – Non-Storm Water Action Levels and Municipal Action Levels

Corresponding to Part III (Discharge Prohibitions) of the permit and non-stormwater outfall monitoring per Attachment E, Attachment G lists non-stormwater action levels for waterbodies. Additionally, Attachment G lists hardness-based action levels for metals. Municipal Action Levels listed in Attachment G apply to stormwater outfall monitoring conducted per Attachment E.

Attachment H – Bioretention/Biofiltration Design Criteria

Corresponding to the Planning and Land Development MCM in the permit, Attachment H describes design specification requirements for bioretention and biofiltration systems.

Attachment I – Developer Technical Information and Guidelines

Attachment I requires Permittees to make available certain reference information and recommended guidelines to the development community. This information may include but is not limited to hydromodification control criteria, low impact development (LID) principles and specifications, and construction BMPs.

Attachment J – Determination of Erosion Potential

Corresponding to the Planning and Land Development MCM in the permit, Attachment J defines erosion potential and provides equations to calculate erosion potential.

Attachment K – Permittees and TMDLs Matrix

Attachment K provides a comprehensive list of TMDLs by Watershed Management Area and the Permittees subject to each TMDL.

Attachment L – TMDL Provisions for the Santa Clara River Watershed Management Area

Attachment L specifies four TMDLs incorporated in the permit with their WQBELs and/or receiving water limitations and compliance options.

Attachment M – TMDL Provisions for Santa Monica Bay Watershed Management Area (including Malibu Creek, Ballona Creek, and Marina del Rey Subwatersheds)

Attachment M specifies 13 TMDLs incorporated in the permit with their WQBELs and/or receiving water limitations and compliance options.

Attachment N – TMDL Provisions for Dominguez Channel and Greater Harbor Waters Watershed Management Area (including Machado Lake Subwatershed)

Attachment N specifies five TMDLs incorporated in the permit with their WQBELs and/or receiving water limitations and compliance options.

Attachment O – TMDL Provisions for Los Angeles River Watershed Management Area

Attachment O specifies seven TMDLs incorporated in the permit with their WQBELs and/or receiving water limitations and compliance options.

Attachment P – TMDL Provisions for the San Gabriel River Watershed Management Area

Attachment P specifies two TMDLs incorporated in the permit with their WQBELs and/or receiving water limitations and compliance options.

Attachment Q – TMDL Provisions for Los Cerritos Channel and Alamitos Bay Watershed Management Area

Attachment Q specifies two TMDLs incorporated in the permit with their WQBELs and/or receiving water limitations and compliance options.

Attachment R – TMDL Provisions for Middle Santa Ana River Watershed Management Area

Attachment R specifies one TMDL incorporated in the permit with its WQBELs and/or receiving water limitations and compliance options.

City of Long Beach

The City of Long Beach MS4 Permit was last reissued in 2014 as Order No. R4-2014-0024 and was amended as described above. Order No. R4-2014-0024 expired on March 28, 2019 but was administratively continued pursuant to federal and state regulations. Order No. R4-2014-0024 is organized under the following eight parts and includes several attachments. The description below summarizes key permit parts and attachments in Order No. R4-2014-0024.

Part III. Discharger Responsibilities

Part III requires the City of Long Beach to comply with provisions in the permit including attachments. It also requires the City of Long Beach to submit complete and timely reports and participate in intra-agency coordination.

Part IV. Discharge Prohibitions

Part IV requires the City of Long Beach to prohibit any discharge of toxic substances from the MS4 into surface waters in concentrations acutely or chronically toxic to animal or plant life. As required by section 402(p)(3)(B)(ii) of the Clean Water Act, Part IV also prohibits non-stormwater discharges through the MS4 to receiving waters except for non-stormwater discharges regulated under an NPDES permit, temporary non-stormwater discharges authorized by U.S. EPA, authorized non-stormwater discharges from emergency firefighting activities, natural flows, and certain conditionally exempt discharges.

Part V. Effluent Limitations and Discharge Specifications

Part V requires the City of Long Beach to comply with technology based effluent limitations by reducing pollutants in stormwater discharges from the MS4 to the maximum extent practicable (MEP). Part V also requires the City of Long Beach to comply with WQBELs as set forth in Part VIII of the permit.

Part VI. Receiving Water Limitations

Pursuant to State Water Board Order WQ 99-05, Part VI prohibits discharges from the MS4 that cause or contribute to a violation of receiving water limitations. In addition, discharges from the MS4 of stormwater or non-stormwater, for which the City of Long Beach is responsible, shall not cause or contribute to a condition of nuisance. Part VI.3 requires the City of Long Beach to comply with receiving water limitations through timely implementation of control measures and other actions to reduce pollutants in the discharges. If exceedances persist, the City of Long Beach shall ensure compliance with receiving water limitations by following a list of procedures such as submitting an Integrated Monitoring Compliance Report to the Los Angeles Water Board Executive Officer that describes what additional BMPs are being implemented to address the exceedances.

Part VII. Provisions

Part VII includes standard provisions, monitoring and reporting requirements, provisions for watershed management programs, and stormwater management program MCMs such as PIPP, Industrial/Commercial Facilities Program, Planning and Land Development Program, Construction Program, Public Agency Activities Program, and IC/IDE Program. Monitoring and reporting provisions require compliance with Attachment E.

Standard provisions include requirements to comply with Attachment D to ensure that the City of Long Beach has the necessary legal authority to prohibit non-stormwater discharges through the MS4, as well as possess adequate legal authority to develop and enforce stormwater and non-stormwater ordinances for its jurisdiction. It also requires the City of Long Beach to conduct a fiscal analysis and discuss it in their annual report. Other provisions include public review and Los Angeles Water Board review provisions, permit reopener and modification provisions, and enforcement provisions including enforcement of trash water quality-based effluent limitations.

The watershed management program provisions in Part VII.C describe a voluntary alternative compliance pathway allowing the City of Long Beach to individually or collaboratively with other MS4 Permittees develop a Watershed Management Program (WMP) or an Enhanced Watershed Management Program (EWMP). The WMP or EWMP allows the City of Long Beach flexibility to customize strategies, control measures, and BMPs to meet the requirements of the permit. It describes compliance determination for participation in a WMP or EWMP, timelines for WMP or EWMP development and implementation, requirements to conduct a Reasonable Assurance Analysis (RAA), and provisions for an adaptive management process.

Part VIII. Total Maximum Daily Loads

Part VIII lists TMDL provisions including compliance determination for TMDLs, timelines for compliance with U.S. EPA TMDLs, and provisions for compliance with trash TMDLs. It also requires the City of Long Beach to comply with applicable WQBELs to implement 9 TMDLs.

Attachment A – Definitions

Attachment A includes acronyms, abbreviations, and definitions for terms used within the permit.

Attachment B – Watershed Management Areas within the City of Long Beach

Attachment B depicts the four WMAs within the City of Long Beach.

Attachment C – City of Long Beach MS4

Attachment C depicts the MS4 within the City of Long Beach.

Attachment D – Standard Provisions

Attachment D includes standard provisions relating to implementation of the programs required by the permit. Such provisions include, but are not limited to, the duty to comply, the duty to mitigate, inspection and entry requirements, proper operation and maintenance requirements, monitoring and reporting requirements, and the duty to provide information. Most of these provisions are required by 40 CFR section 122.41, which applies to all NPDES permits, and section 122.42, which sets forth additional conditions applicable to specified categories of NPDES permits, including MS4 permits.

Attachment F – Fact Sheet

The Fact Sheet provides an overview of the City of Long Beach MS4 Permit and explains the significant factual, legal, methodological, technical, and policy rationale that serve as the basis for the requirements of the permit.

Attachment E – Monitoring and Reporting Program

Attachment E establishes monitoring, reporting, and recordkeeping requirements. Attachment E allows for an integrated monitoring approach where the City of Long Beach can submit an Integrated Monitoring Program (IMP) or the City of Long Beach with other MS4 Permittees can coordinate monitoring efforts on a watershed or subwatershed basis to submit a Coordinated Integrated Monitoring Program (CIMP) for Los Angeles Water Board Executive Officer approval. The IMP or CIMP must contain the following elements: (1) receiving water monitoring; (2) stormwater outfall-based monitoring; (3) non-stormwater outfall-based monitoring; (4) new-development/re-development effectiveness tracking; and (5) regional studies. Furthermore, Attachment E specifies monitoring data and annual report submittal timelines and describes key elements to report on.

Attachment G – Non-Storm Water Action Levels and Municipal Action Levels

Corresponding to Part IV (Discharge Prohibitions) of the permit and non-stormwater outfall monitoring per Attachment E, Attachment G lists non-stormwater action levels for waterbodies. Additionally, Attachment G lists hardness-based action levels for metals. Municipal Action Levels listed in Attachment G apply to stormwater outfall monitoring conducted per Attachment E.

Attachment H – Bioretention / Biofiltration Design Criteria

Corresponding to the Planning and Land Development MCM in the permit, Attachment H describes design specification requirements for bioretention and biofiltration systems.

Attachment I – Developer Technical Information and Guidelines

Attachment I requires the City of Long Beach to make available certain reference information and recommended guidelines to the development community. This information may include but not limited to hydromodification control criteria, LID principles and specifications, and construction BMPs.

Notably, all three previous MS4 permits required outfall and receiving water monitoring for a suite of constituents commonly found in stormwater and non-stormwater discharges and addressed by applicable TMDLs. Therefore, Part II.E of this Fact Sheet summarizes water quality in the Los Angeles Region based on existing monitoring for TMDLs and other categories of pollutants.

H. Permit Applications

1. Ventura County Permittees

On January 9, 2015, 180 days prior to the expiration of Order No. R4-2010-0108, all 12 Ventura County Permittees filed a joint reapplication package also known as a Report of Waste Discharge (ROWD) to apply for renewal of their waste discharge requirements that serve as an NPDES permit to discharge stormwater and authorized and conditionally exempt non-stormwater through their MS4 to surface waters. Specifically, the reapplication package was submitted on behalf of the Ventura Countywide Stormwater Quality Management Program, which consists of the Ventura County Watershed Protection District, the County of Ventura, and the incorporated cities of Camarillo, Fillmore, Moorpark, Ojai, Oxnard, Port Hueneme, Ventura, Santa Paula, Simi Valley, and Thousand Oaks.

The Los Angeles Water Board evaluated the Ventura County Permittees' reapplication package and deemed it complete per federal stormwater regulations contained in the U.S. EPA Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems; Final Rule, August 9, 1996 (*61 Fed Reg. 41697*).

2. Los Angeles County Permittees

By July 3, 2017, 180 days prior to the expiration of Order No. R4-2012-0175 as amended by State Water Board Order WQ 2015-0075 and Los Angeles Water Board Order No. R4-2012-0175-A01, the 86 Los Angeles County Permittees submitted a total of 29 reapplication packages to discharge stormwater and authorized and conditionally exempt non-stormwater through their MS4 to surface waters. Out of the 29 reapplication packages, 19 were submitted by groups of Permittees and 10 were submitted individually.

The Los Angeles Water Board evaluated these 29 reapplication packages and deemed them complete per federal stormwater regulations contained in the U.S. EPA Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems; Final Rule, August 9, 1996 (*61 Fed Reg. 41697*).

3. City of Long Beach

On October 1, 2018, 180 days prior to the expiration of Order No. R4-2014-0024 as amended by Los Angeles Water Board Order No. R4-2014-0024-A01, the City of Long Beach submitted a reapplication package to discharge stormwater and authorized and conditionally exempt non-stormwater through its MS4 to surface waters.

The Los Angeles Water Board evaluated the City of Long Beach's reapplication package and deemed it complete per federal stormwater regulations contained in the U.S. EPA Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems; Final Rule, August 9, 1996 (*61 Fed Reg. 41697*).

III. APPLICABLE FEDERAL AND STATE LAWS, REGULATIONS, PLANS, AND POLICIES

The provisions contained in the Order are based on the requirements and authorities described in the Order's Findings and below. These include the federal Clean Water Act and implementing regulations, the California Water Code, and applicable statewide and regional water quality control plans and policies.

A. Municipal Separate Storm Sewer System Requirements

The 1972 Clean Water Act (CWA)¹⁴ established the NPDES Program to regulate the discharge of pollutants from point sources to waters of the United States. However, pollution from stormwater and dry-weather urban runoff was largely unabated for over a decade. In response to the 1987 Amendments to the Clean Water Act, U.S. EPA developed Phase I of the NPDES Storm Water Permitting Program in 1990, which established a framework for regulating municipal, industrial, and construction discharges of stormwater and non-stormwater. The Phase I program addressed sources of stormwater and dry-weather urban runoff that had the greatest potential to

¹⁴ Federal Water Pollution Control Act; 33 U.S.C. § 1251 et seq., which, as amended in 1977, is commonly known as the Clean Water Act.

negatively impact water quality. In particular, under Phase I U.S. EPA required NPDES permit coverage for discharges from medium and large MS4s with populations of 100,000 or more. Operators of MS4s regulated under the Phase I NPDES Storm Water Program were required to obtain permit coverage for discharges of stormwater and non-stormwater from their MS4s to waters of the United States.

In 1990, pursuant to 40 CFR section 122.26(b)(4), the Los Angeles Water Board designated the MS4s owned and/or operated by the incorporated cities and Ventura County within the watersheds of Ventura County, and by the incorporated cities and Los Angeles County within the coastal watersheds of Los Angeles County as a large MS4 due to the total populations of Los Angeles County and Ventura County and the interconnected nature of the Permittees' MS4s. The total population of the cities and unincorporated areas in Ventura County covered by the Order was approximately 823,318 in 2010 and has increased by approximately 3.3% to 850,967 in 2018 according to the United States Census. The total population of the cities and unincorporated areas in Los Angeles County covered by the Order was approximately 9,505,484 in 2010 and has increased by approximately 2.9% to 9,786,075 in 2018, according to the United States Census.

B. Water Quality Control Plans

The CWA requires the Los Angeles Water Board to establish water quality standards for each water body in its region. Water quality standards include beneficial uses, water quality objectives that are established at levels sufficient to protect those beneficial uses, and an antidegradation policy to prevent degrading high-quality waters unless specific circumstances apply.

1. Water Quality Control Plan - Los Angeles Region

The Los Angeles Water Board's *Water Quality Control Plan - Los Angeles Region* (hereinafter Basin Plan) designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters in the Los Angeles Region. Pursuant to CWC Section 13263(a), the requirements of the Order implement the Basin Plan. The beneficial uses applicable to the surface water bodies that receive discharges from the Permittees' MS4 are identified in Chapter 2 of the Basin Plan and generally include Municipal and Domestic Supply (MUN); Agricultural Supply (AGR); Industrial Service Supply (IND); Industrial Process Supply (PROC); Ground Water Recharge (GWR); Freshwater Replenishment (FRSH); Navigation (NAV); Hydropower Generation (POW); Water Contact Recreation (REC-1); Limited Contact Recreation (LREC-1); Non-Contact Water Recreation (REC-2); Commercial and Sport Fishing (COMM); Warm Freshwater Habitat (WARM); Cold Freshwater Habitat (COLD); Estuarine Habitat (EST); Preservation of Areas of Special Biological Significance (BIOL); Wildlife Habitat (WILD); Preservation of Rare and Endangered Species (RARE); Marine Habitat (MAR); Wetland Habitat (WET); Migration of Aquatic Organisms (MIGR); Spawning, Reproduction, and/or Early Development (SPWN); and Shellfish Harvesting (SHELL).

2. Ocean Plan

In 1972, the State Water Board adopted the Water Quality Control Plan for Ocean Waters of California (Ocean Plan). Since the adoption of Order No. R4-2010-0108, Order No. R4-2012-0175, and Order No. R4-2014-0024, the State Water Board adopted various amendments to the Ocean Plan. One of the most recent

amendments that has become effective was adopted on August 7, 2018 to incorporate bacteria provisions and a water quality standards variance policy. OAL approved it on February 4, 2019 and U.S. EPA approved it on March 22, 2019. Additionally, on April 2, 2019, the State Water Board further revised the Ocean Plan through Resolution No. 2019-0015 (incorporating state wetland definition and procedures for discharges of dredged or fill material to waters of the state). OAL approved it on August 28, 2019 and it became effective on May 28, 2020. The Ocean Plan is applicable, in its entirety, to the ocean waters of the State. To protect beneficial uses, the Ocean Plan establishes water quality objectives and a program of implementation. Pursuant to California Water Code section 13263(a), the requirements of the Order implement the Ocean Plan. The Ocean Plan identifies beneficial uses of ocean waters of the State to be protected, which include Industrial Water Supply (IND); Water Contact (REC-1) and Non-Contact Recreation (REC-2), including aesthetic enjoyment; Navigation (NAV); Commercial and Sport Fishing (COMM); Mariculture; Preservation and Enhancement of Designated Areas of Special Biological Significance (ASBS); Rare and Endangered Species (RARE); Marine Habitat (MAR); Fish Migration (MIGR); Fish Spawning (SPWN); and Shellfish Harvesting (SHELL). All MS4 discharges into the Pacific Ocean must protect the existing and designated uses identified in the Ocean Plan and Basin Plan.

3. Inland Surface Waters, Enclosed Bays, and Estuaries Plan (ISWEBE)

Since the adoption of Order No. R4-2010-0108, Order No. R4-2012-0175, and Order No. R4-2014-0024, the State Water Board adopted various provisions, which make up, collectively, the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries (ISWEBE) of California. Part 1 Trash Provisions was adopted by the State Water Board on April 7, 2015 through Resolution No. 2015-0019. OAL approved it on December 2, 2015 and U.S. EPA approved it on January 12, 2016. Part 2 Tribal Subsistence Beneficial Uses and Mercury Provisions was adopted by State Board on May 2, 2017 through Resolution No. 2017-0027. OAL approved it on June 28, 2017 and U.S. EPA approved it on July 14, 2017. Part 3 Bacteria Provisions and Variance Policy was adopted by State Board on August 7, 2018 through Resolution No. 2018-0038. OAL approved it on February 4, 2019 and U.S. EPA approved it on March 22, 2019. The State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State was adopted by State Board on April 2, 2019 through Resolution No. 2019-0015. OAL approved it on August 28, 2019 and it became effective on May 28, 2020. The Toxicity Provisions were adopted by the State Water Board on December 1, 2020. The Toxicity Provisions are not yet in effect. The Toxicity Provisions will take effect upon approval by the California Office of Administrative Law for purposes of state law and upon approval by the U.S. Environmental Protection Agency for purposes of federal law. The ISWEBE is applicable to various discharges in the Order.

4. Statewide Trash Provisions

To control trash, the State Water Board on April 7, 2015, adopted an Amendment to the Water Quality Control Plan for Ocean Waters of California (Ocean Plan) for Trash Provisions and Part 1 Trash Provisions of the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries. Together, they are collectively referred to as “the Trash Amendments.” The Trash Amendments do the following: (1) establish a narrative water quality objective for trash, (2) establish corresponding applicability, including an exception for those waters within the

jurisdiction of the Los Angeles Water Board for which trash TMDLs are in effect prior to the effective date of the Trash Amendments,¹⁵ (3) establish a prohibition on the discharge of trash, (4) provide implementation requirements for permitted storm water and other discharges, (5) set a time schedule for compliance, and (6) provide a framework for monitoring and reporting requirements. The Los Angeles Water Board is required to implement the new Trash Provisions through NPDES permits issued pursuant to Federal Clean Water Act section 402(p), including MS4 permits. The water quality objective established by the Trash Provisions serves as a water quality standard federally mandated under Clean Water Act section 303(c) and the federal regulations. (33 United States Code section 1312, 40 Code of Federal Regulations section 131.) This water quality standard was specifically approved by U.S. EPA following adoption by the State Water Board and approval by the Office of Administrative Law. Further, the water quality standard expected to be achieved pursuant to the Trash Provisions may allow each waterbody subsequently determined to be impaired by trash to not be placed on the Clean Water Act section 303(d) list, obviating the need for the development of a TMDL for trash for each of those waterbodies. (33 United States Code section 1313(c); 40 Code of Federal Regulations section 130.7.). In those cases, the specific actions that will be carried out by the Permittee substitute for some or all the actions that would otherwise be required consistent with a waste load allocation in a trash TMDL. (40 Code of Federal Regulations section 122.44, subdivision (d)(1)(vii)(B).) The Trash Amendments are applicable to various discharges in the Order and the Order implements the Trash Amendments.

5. Sediment Quality

In 2008, the State Water Board adopted the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality Provisions. It is was most recently amended on June 5, 2018 and became effective on March 11, 2019. This plan supersedes other narrative sediment quality objectives and establishes new sediment quality objectives and related implementation provisions for specifically defined sediments in most bays and estuaries. Requirements of the Order implement sediment quality objectives of this plan.

C. National Toxics Rule (NTR) and California Toxics Rule (CTR)

U.S. EPA adopted the National Toxics Rule (NTR)¹⁶ on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, U.S. EPA adopted the California Toxics Rule (CTR).¹⁷ The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. The CTR was most recently amended on November 15, 2018 to withdraw the freshwater criteria for lead applicable to certain waters of California because the State of California adopted, and the U.S. EPA approved a site-specific objective for lead for the Los Angeles River and its tributaries.

¹⁵ The exception includes the following watersheds and waterbodies: Los Angeles River Watershed, Ballona Creek, Malibu Creek Watershed, Santa Monica Bay Nearshore and Offshore, San Gabriel River East Fork, Revolon Slough and Beardsley Wash, Ventura River Estuary, Machado Lake, Lake Elizabeth, Lake Hughes, Munz Lake, Peck Road Park Lake, Echo Park Lake, Lincoln Park Lake and Legg Lake.

¹⁶ 40 CFR § 131.36.

¹⁷ Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, (65 Federal Register 31682-31719 (May 18, 2000)), adding 40 CFR § 131.38.

(83 *Fed. Reg.* 52163-52168 (Oct. 16, 2018)). These rules contain federal water quality criteria for priority pollutants. The requirements of the Order are consistent with the NTR (40 CFR section 131.36) and CTR (40 CFR section 131.38).

D. Endangered Species Acts

The Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (CESA, Fish and Game Code, §§ 2050 to 2089.25) or the federal Endangered Species Act (ESA, 16 U.S.C.A., §§ 1531 to 1544). The requirements of the Order are designed to maintain water quality and prevent a condition of pollution, contamination, or nuisance in waters of the United States. Permittees remain independently responsible for meeting all applicable requirements under CESA and ESA.

E. NPDES Electronic Reporting Rule (e-Rule)

40 Code of Federal Regulations part 127 requires NPDES permittees to electronically report information and also requires authorized states implementing the NPDES program to ensure that the required minimum set of data in part 127, Appendix A, is electronically transferred to U.S. EPA in a “timely, accurate, complete and nationally consistent manner fully compatible with U.S. EPA’s national NPDES data system.” The rule does not add new reporting requirements on NPDES regulated entities; rather it substitutes paper-based filings with electronic transmission. The State’s existing electronic reporting system for stormwater discharges (Stormwater Multiple Application and Report Tracking System (SMARTS)), which is compliant with U.S. EPA’s Cross-Media Electronic Reporting Rule (40 Code of Federal Regulations part 3), does not currently accommodate the collection from MS4 dischargers and reporting to U.S. EPA of all applicable Appendix A data in a “nationally consistent manner fully compatible with U.S. EPA’s national NPDES data system.” Electronic reporting requirements for those data will be implemented when the State develops an approved system. On April 30, 2019, U.S. EPA proposed changes to the NPDES e-Rule, in Appendix A, to update data elements applicable to regulated MS4s to be consistent with existing MS4 regulations. On February 28, 2020, U.S. EPA proposed the “Phase 2 Extension Rule,” extending the December 21, 2020 deadline to December 21, 2025 for electronic submittal of annual reports.¹⁸

F. Monitoring and Reporting

Section 308(a) of the federal CWA, and 40 CFR sections 122.41(h), (j)-(l), 122.41(i), and 122.48, require that all NPDES permits specify monitoring and reporting requirements. Federal regulations applicable to large and medium MS4s also specify additional monitoring and reporting requirements. These monitoring requirements for MS4 discharges are prescriptive and require the permitting agency to include requirements for both stormwater and non-stormwater effluent sampling at representative outfalls, representative receiving water monitoring, sampling of specific pollutants, monitoring at specified intervals (e.g., at least three storm events per year), use of analytical methods specified in 40 CFR Part 136, and use of field collection methods. (40 CFR §§ 122.26(d)(2)(i)(F) & (d)(2)(iii)(D), 122.42(c).) California Water Code Section 13383 authorizes the Los Angeles Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. The Monitoring and

¹⁸ 80 Federal Register pp. 64064-64158; 84 Federal Register pp. 18200-182-5; 85 Federal Register pp. 11909-11927.

Reporting Program in the Order requires monitoring, reporting, and recordkeeping requirements that implement the federal and state laws and/or regulations. This Monitoring and Reporting Program is provided in Attachment E of the Order.

G. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR section 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR section 122.42, are provided in Attachment D of the Order. Permittees must comply with all standard provisions and with those additional conditions that are applicable under 40 CFR section 122.42 provided in Attachment D of the Order. Part VI of the Order also includes various provisions applicable to the Permittees. The rationale for the provisions contained in Part VI of the Order is provided in Part VIII of this Fact Sheet.

H. Antidegradation Policy

Federal regulations at 40 CFR section 131.12 require that state water quality standards include an antidegradation policy consistent with federal requirements. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16 ("Statement of Policy with Respect to Maintaining High Quality of Waters in California"). Where the federal antidegradation policy is applicable, the State Water Board has interpreted Resolution No. 68-16 to incorporate the federal antidegradation policy.¹⁹ The Los Angeles Water Board's Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. The permitted discharge must be consistent with the antidegradation provision of 40 CFR section 131.12 and State Water Board Resolution No. 68-16. Resolution No. 68-16 and 40 CFR section 131.12 require that high quality waters be maintained unless degradation is justified based on specific findings. The Los Angeles Water Board finds that the permitted discharges authorized by this Order are consistent with the antidegradation provision of 40 CFR section 131.12 and State Water Board Resolution No. 68-16, as set forth herein.

In the context of the Order, a federal NPDES permit, compliance with the federal antidegradation policy requires consideration of the following. First, the Los Angeles Water Board must ensure that "existing instream uses and the level of water quality necessary to protect the existing uses" are maintained and protected.²⁰ Second, if the baseline quality of a waterbody for a given constituent "exceeds levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water, that quality shall be maintained and protected" through the requirements of the Order unless the Los Angeles Water Board makes findings that: (1) any lowering of the water quality is "necessary to accommodate important economic or social development in the area in which the waters are located"; (2) "water quality adequate to protect existing uses fully" is assured; and (3) "the highest statutory and regulatory requirements for all new and existing point sources and all cost-effective and reasonable best management practices for nonpoint source control" are achieved.²¹ Under this second tier review, the Board may identify the waters for protection through the public process of a permitting action, as it is here. Before allowing any lowering of high quality water, the Board must

¹⁹ State Water Board Order WQ 86-17 (*Fay*), pp. 16-19.

²⁰ 40 CFR § 131.12(a)(1). This provision has been interpreted to mean that, "[i]f baseline water quality is equal to or less than the quality as defined by the water quality objective, water quality shall be maintained or improved to a level that achieves the objectives." (State Water Board, Administrative Procedures Update, Antidegradation Policy Implementation for NPDES Permitting, 90-004 (APU 90-004), p. 4.)

²¹ 40 CFR § 131.12(a)(2).

conduct an analysis of alternatives that evaluates practicable alternatives that would prevent or lessen the degradation associated with the discharges permitted. In the context of 40 CFR § 131.12(a)(2)(ii), practicable means “technologically possible, able to be put into practice, and economically viable.”²²

The Order must also comply with any requirements of State Water Board Resolution No. 68-16 beyond those imposed through incorporation of the federal antidegradation policy.²³ Resolution No. 68-16 requires findings that any lowering of water quality is “consistent with the maximum benefit to the people of the State” and “will not unreasonably affect present and anticipated beneficial use of such water and will not result in water quality less than that prescribed in the policies” and further that the discharge is subject to “waste discharge requirements which will result in the best practicable treatment or control of the discharge.”²⁴ The baseline quality considered in making the appropriate findings is the best quality of the water since 1968, the year of adoption of Resolution No. 68-16, or a lower level if that lower level was allowed through a permitting or other regulatory action, such as establishing a water quality objective, that was consistent with the federal and state antidegradation policies.²⁵ The following analysis assumes, without deciding, that the baseline for antidegradation analysis is 1968.²⁶

²² 40 CFR § 131.3(n).

²³ See State Water Board Order WQ 86-17 (*Fay*), p. 23, fn. 11.

²⁴ State Water Board Resolution No. 68-16, Resolve 2. Best practicable treatment or control is not defined in Resolution No. 68-16; however, the State Water Board has evaluated what level of treatment or control is technically achievable using “best efforts.” (See State Water Board Orders WQ 81-5 (*City of Lompoc*), WQ 82-5 (*Chino Basin Municipal Water District*), WQ 90-6 (*Environmental Resources Protection Council*).) A Questions and Answers document on Resolution No. 68-16 by the State Water Board states as follows: “To evaluate the best practicable treatment or control method, the discharger should compare the proposed method to existing proven technology; evaluate performance data, e.g. through treatability studies; compare alternative methods of treatment or control; and/or consider the method currently used by the discharger or similarly situated dischargers . . . The costs of the treatment or control should also be considered . . .” (Questions and Answers, Resolution No. 68-16, State Water Board (Feb. 16, 1995), pp. 5-6.)

²⁵ APU 90-004, p.4. The baseline for application of the federal antidegradation policy is 1975, which is the date used in 40 CFR § 131.3(e) to define existing uses of a waterbody. For state antidegradation requirements, see also *Asociacion de Gente Unida por el Agua (AGUA) v. Central Valley Water Board* (2012) 210 Cal.App.4th 1255,1270. The baseline for the application of the state antidegradation policy is generally the highest water quality achieved since 1968, the year the policy was adopted.

²⁶ The baseline may be later than 1968 for two reasons. First, the appropriate baseline is determined by the date on which a policy establishing the level of water quality to protect was effective. (Resolution 68-16, Resolve 1.) The Region’s Basin Plan has been updated and amended several times since 1971, when it was first adopted, to include new or revised water quality objectives. Second, a permitting action with appropriate antidegradation findings allowing degradation may establish a new baseline consistent with the level of water quality achieved under that permit. The Los Angeles Water Board has regulated the Permittees’ MS4 discharges in the past through permits issued in 1990, 1996, 2001, and 2012 for Los Angeles County; 1999 and 2014 for City of Long Beach; and 1994, 2000, 2009, and 2010 for Ventura County. APU 90-004 acknowledges that no antidegradation analysis is required where the regional water board has no expectation that water quality will be reduced by the permitting action; here, if the water quality achieved under the prior permits had been used as the baseline, arguably, no antidegradation analysis would have been required. (APU 90-004, p. 2.) Nevertheless, this is a new regional permit for Permittees in *both* Los Angeles and Ventura Counties, and for ease of analysis, 1968 is used herein as the baseline.

The Board Is Not Required to Make Waterbody by Waterbody and Pollutant by Pollutant Antidegradation Findings:

The Los Angeles Water Board finds that it is not required to conduct a waterbody by waterbody and pollutant by pollutant antidegradation analysis for this Order. The Los Angeles Water Board makes this finding for two reasons. First, the Administrative Procedures Update, Antidegradation Policy Implementation for NPDES Permitting, 90-004 (APU 90-004), which specifies a waterbody by waterbody and pollutant by pollutant analysis for some permitting actions, does not address permitting for diffuse MS4 discharges. Second, APU 90-004 itself indicates that a waterbody by waterbody and pollutant by pollutant analysis is only required when conducting a “complete” antidegradation analysis; a complete analysis, in turn, is not required where any reduction in water quality is temporally limited and would not result in any long-term deleterious effects on water quality.”²⁷ Here, the Order requires compliance with the non-stormwater discharge prohibition, Receiving Water Limitations and Numeric Effluent Limitations derived from TMDLs designed to bring MS4 discharges and receiving waters into compliance with water quality objectives. The discussion below elaborates on these two reasons.

APU 90-004 is a State Water Board internal guidance document establishing methods for implementing the federal and state antidegradation policies in NPDES permits. APU 90-004 suggests that an antidegradation analysis requires a pollutant by pollutant and waterbody by waterbody analysis in certain contexts, specifically where the discharge at issue is a discrete discharge from a singular facility. However, APU 90-004 has limited value when considering antidegradation in the context of MS4 discharges from diffuse sources, conveyed through multiple outfalls, with multiple pollutants impacting multiple water bodies within region.²⁸ This interpretation is sensible for this Order, given that reliable data on the baseline water quality is not readily available since 1968 for a region that spans 4,447 square miles and includes 120 miles of coastline, 18,839 acres of lakes, and 1,704 miles of rivers and streams. The Los Angeles Water Board estimates that, there are over 850,000 combinations of waterbodies and pollutants that could potentially require individual consideration in the Region.²⁹ The antidegradation analysis for this Order instead relies on a general assessment of the existing water quality data that is reasonably available to the Los Angeles Water Board and makes findings regarding the social and economic benefits and costs of permitting stormwater and non-stormwater MS4 discharges in accordance with the Order terms.

The Los Angeles Water Board additionally finds that, even if APU 90-004 applies to the issuance of this Order, it requires at most a “simple” antidegradation analysis. APU 90-

²⁷ APU 90-004, p. 2.

²⁸ The State Water Board held so in Order WQ 2015-0075. In *Natural Resources Defense Council v. State Water Resources Control Board*, the superior court did not invalidate this particular conclusion. (Super. Ct. Los Angeles County, No. BS156962, Order, March 29, 2021). The State Water Board’s interpretation of its own guidance is entitled to deference. See also State Water Board Order WQ 2018-0002, p. 77 (reaching the same conclusion for agricultural discharges).

²⁹ See, https://www.waterboards.ca.gov/water_issues/programs/water_quality_goals/; the tributary table [MasterTribTable.xls \(ca.gov\)](#); and the Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties (Basin Plan), Ch. 2, Tables 2-1 through 2-4a and Beneficial Uses Figures; and Chapter 3. The number could easily be higher if the Los Angeles Water Board incorporated CEDEN data and other information to determine the exact number of waterbodies and waterbody pollutant combinations. If it could be done at all, a pollutant by pollutant, waterbody by waterbody antidegradation analysis would be extremely time consuming and take years to complete.

004 contemplates that a “simple” antidegradation analysis is appropriate under specified circumstances. In particular, as stated above, APU 90-004 states that a simple antidegradation analysis is allowed when a “Regional Board determines the reduction in water quality is temporally limited and will not result in any long-term deleterious effects on water quality” or where a “Regional Board determines the proposed action will produce minor effects which will not result in a significant reduction of water quality.”³⁰ Here, the Order continues the requirements of the previous permits or imposes equivalent or more protective requirements such that the water quality established under the prior permits is expected to be maintained and improved. Generally, the prior permits instituted controls such as a prohibition on non-stormwater discharges that are a source of pollutants through the MS4s, receiving water limitations, WQBELs based on TMDLs, and monitoring programs to help ensure that water quality will be maintained at the level it is now, or improve it, and this new Order institutes further controls such as additional TMDL-based WQBELs and receiving water limitations. Therefore, any degradation permitted while controls are continuing to be developed will be temporally limited and will not result in any long-term deleterious effects on water quality.³¹ Such a finding would not be appropriate if, for example, the Order declined to require long-term compliance with water quality objectives, but that is not the case here.

APU 90-004 does not provide guidance on the scope and content of a simple antidegradation analysis. Nor does it define the terms “temporally limited” or “long term.” Those terms must therefore be interpreted in the context of the types of discharges being permitted and with deference to the best professional judgment of the Los Angeles Water Board.³² The Los Angeles Water Board determines that the findings made below

³⁰ APU 90-004, p. 2. In an unpublished decision, the Second District Court of Appeal affirmed that a simple antidegradation analysis applied to the 2012 Los Angeles County MS4 permit. (*Natural Resources Defense Council v. State Water Resources Control Board* (2018) 2018 WL 6735201, at *6).

³¹ See, Order, Part IX.A.4.b, k; B.8; E; G.3

³² During the hearing to consider adoption of this Order on July 16, 2021, NRDC, Heal the Bay, and Los Angeles Waterkeeper (together, the “Environmental Groups”) asserted that if the Los Angeles Water Board adopted the Order with the alternative compliance path outlined in Part X.B.1.b of the Order (referred to in the antidegradation analysis, *infra*, as “Alternative 5,”), then a simple antidegradation analysis is not appropriate. They asserted that a complete antidegradation analysis is necessary because, since the WMPs were first approved (2015), there is no evidence that there has been any significant improvement in water quality. The Los Angeles Water Board disagrees and finds that water quality effects during a period of multiple years, spanning more than one permit term, are still “temporally limited” and not “long term” in the context of the regulation of MS4 discharges.

MS4 discharges are fundamentally different from those specifically discussed in the APU, such as discharges from discrete point sources like publicly owned treatment works, or POTWs. MS4 discharges are diffuse discharges conveyed through multiple outfalls, with multiple pollutants impacting multiple water bodies within the region. To effectively control and abate pollution to surface waters from MS4 discharges, permittees testified during the hearing on this Order that they need time to plan and implement solutions that are projected to bring impaired waters into attainment. This kind of pollution control and abatement would take time even if WMPs with deemed in compliance provisions were not part of the proposed solutions. The Board, and permittees, understand and expect that more than one permit term may be necessary to adequately plan and construct BMPs or implement other solutions to ensure that impaired waters will be restored.

Furthermore, it is not surprising that, after only one permit term, water quality data do not show marked improvement, because as many permittees testified, the first generation of projects in approved WMPs are only being completed just now. For example, Paul Alva, Principal Engineer at the Los Angeles County

meet the requirements of a simple antidegradation analysis and are also consistent with an antidegradation analysis done at a generalized level, as appropriate for this Order. With these findings, based on the information available to it and using its best professional judgment, the Los Angeles Water Board concludes that the discharge will not be adverse to the intent and purpose of the State and federal antidegradation policies. Regardless of APU 90-004's application, however, the below analysis is consistent with the generalized antidegradation analysis appropriate for this Order and complies with both the federal antidegradation regulations, and with the State antidegradation policy.

The Los Angeles Water Board Makes the Following Antidegradation Findings:

The discharges permitted in the Order are consistent with the antidegradation provisions of 40 CFR section 131.12 and Resolution No. 68-16. The Los Angeles Water Board's conclusion that the terms and conditions of the Order are consistent with the antidegradation policies is based on the following analysis.

1. Water bodies that do not meet water quality objectives (water bodies that are not high quality):

Most of the receiving waters within the area covered by the Order are not meeting water quality objectives for multiple pollutants associated with MS4s, meaning that they are not attaining water quality objectives necessary to protect beneficial uses.³³ This is evidenced in part by the fact that many of these waterbodies are listed on the State's Clean Water Act section 303(d) List of impaired waters and, additionally, either the Los Angeles Water Board or the U.S. EPA has established numerous TMDLs to address many of the impairments.³⁴ The source assessment for these TMDLs identify MS4 discharges as a source of the impairments. Under both federal and state antidegradation policies, these receiving waters are not considered "high quality" waters for these pollutants. To the extent that data are

Department of Public Works, testified on July 16, 2021 that multi-benefit WMP projects such as Magic Johnson Park, Ladera Park, Carriage Crest Park, and Gates Park have either just been completed or will be completed soon. Once those projects are fully operational, and once other, similar projects are built, the Board expects to see measurable improvements in receiving water quality. Indeed, the evidence already indicates WMPs with deemed in compliance are achieving results. As illustrated in Mr. Alva's presentation to the Board on July 16, 2021, the landscape of water quality has and will continue to vastly improve all over the County, and not just in certain communities, due to WMP construction and implementation.

In summary, the time to plan, construct, and see results from the projects built is a temporal limitation that is as short as practicable and it is appropriate given the nature of the discharges at issue. This is especially true since most of the deemed in compliance provisions have an end point and will expire. (See Order, Part X.B.)

³³ This is certainly true of the receiving waters in the more urbanized watersheds throughout the Region during wet weather. See, staff presentations at MS4 Workshops regarding monitoring data, dated 9/13/2018 (Ventura County data); and 7/12/2018 and 5/10/2018 (Los Angeles County data).

³⁴ It should be noted that impaired waters, or waters that are not high quality, are not confined to those listed only on the 303(d) List. There are several reasons for this, including (but not limited to) the fact that the most recent 303(d) List for the Los Angeles Region is based on available data through August 2010. Accordingly, the 303(d) List itself does not reflect all of the waterbodies in the Region that are impaired or fail to meet water quality standards.

available from 1968, there were few high quality receiving waters in the more urbanized watersheds in the Los Angeles Region even at that time.³⁵

For receiving waters that are not high quality waters, the federal antidegradation policy requires that regulatory actions ensure that existing instream uses and the level of water quality necessary to protect the existing uses is maintained and protected. (40 CFR § 131.12(a)(1).) The Order ensures that existing instream (beneficial) uses and the level of water quality necessary to protect the existing uses is maintained and protected through requirements to not cause or contribute to exceedances of water quality objectives in the receiving water and to restore impaired water bodies.³⁶ This is achieved through the following provisions:

- a. The Order requires compliance with receiving water limitations to meet water quality standards in the receiving water either by demonstrating compliance pursuant to Part V of the Order and the Permittee's monitoring and reporting program pursuant to Part VII of the Order or by implementing an approved Watershed Management Program (WMP) pursuant to Part IX of the Order. Watershed Management Programs must specify structural and non-structural stormwater and non-stormwater controls that are demonstrated to have a reasonable assurance of achieving compliance with receiving water limitations and that must be implemented in accordance with an approved compliance schedule. The reasonable assurance analysis, or RAA, is

³⁵ See e.g., Water Resources Control Board, State of California, Toxic Substances Monitoring Program, Ten Year Summary Report 1978-1987 (August 1990) (Administrative Record, Order No. 01-082, R0044666 - 44669); The Santa Monica Bay Restoration Project, An Assessment of Inputs of Fecal Indicator Organisms and Human Enteric Viruses from Two Santa Monica Storm Drains (June 1990) (Administrative Record, Order No. 01-082, R0047130 - 47174); Santa Monica Bay Restoration Project, Pathogens and Indicators in Storm Drains Within the Santa Monica Bay Watershed (June 1992) (Administrative Record, Order No. 01-082, R0047688 - 47748); Santa Monica Bay Restoration Project, Storm Drains as a Source of Surf Zone Bacterial Indicators and Human Enteric Viruses to Santa Monica Bay (August 1991) (Administrative Record, Order No. 01-082, R004779 - 47780); James M. Danza, Water Quality and Beneficial Use Investigation of the Los Angeles River: Prospects for Restored Beneficial Use (1994) (Administrative Record, Order No. 01-082, R0048073 - 48204); Southern California Coastal Water Research Project, Annual Report (1987) (Administrative Record, Order No. 01-082, R0048205 - 48304); National Research Council, Monitoring Southern California's Coastal Waters (1990) (Administrative Record, Order No. 01-082, R0048306 - 48473); Southern California Coastal Water Research Project, Annual Report (1988-89) (Administrative Record, Order No. 01-082, R0048476 - 48482); City of Los Angeles, Wastewater Program Management Division, Santa Monica Bay Stormwater Pollutant Reduction Study (December 1987) (Administrative Record, Order No. 01-082, R0048485 - 48561); Santa Monica Bay Restoration Project, Santa Monica Bay Characterization Study Chapter 7, Urban Runoff (1993) (Administrative Record, Order No. 01-082, R0048714 - 48733); To California Regional Water Quality Control Board, Stormwater Runoff in Los Angeles and Ventura Counties (June 1988) (Administrative Record, Order No. 01-082, R0050795 - 50888); Heal the Bay's State of the Marina Report, Marina del Rey (July 9, 1993) (Administrative Record, Order No. 01-082, R0050999 - 0051022); County of Los Angeles, Department of Beaches and Harbors, The Marine Environment of Marina del Rey (October 1991 - June 1992) (Administrative Record, Order No. 01-082, R0051023 - 51344); Prepared for American Oceans Campaign, Chemical Contaminant Release into the Santa Monica Bay, A Pilot Study (June 12, 1993) (Administrative Record, Order No. 01-082, R0051345 - 51557); Report to the Department of Beaches and Harbors, County of Los Angeles, The Marine Environment of Marina del Rey, October 1989 to September 1990 (March 1991) (Administrative Record, Order No. 01-082, R0052394 - 52721).

³⁶ These actions also ensure that discharges will not unreasonably affect present and anticipated beneficial uses and will not result in water quality less than water quality objectives, as required by Resolution No. 68-16.

quantitative and generally conducted using industry accepted computer modeling to show that proposed WMPs will achieve applicable WQBELs and will not cause or contribute to exceedances of receiving water limitations. This Order requires objective technical demonstrations that any proposed controls, and those controls already in the process of being developed, will address pollutants in MS4 discharges sufficient to meet water quality standards. Additionally, the Order requires a comprehensive evaluation and update, through the required adaptive management process, of the WMP during the permit term to ensure progress toward achieving WQBELs and receiving water limitations.

- b.** The Order requires Permittees to comply with WQBELs and/or receiving water limitations consistent with the assumptions and requirements of TMDL WLAs assigned to MS4 discharges established in 45 TMDLs applicable to water bodies within the Los Angeles Region to restore water quality sufficient to protect the beneficial uses of the impaired water bodies.
- c.** The Order requires Permittees to develop and implement stormwater management programs consisting of six major program elements (MCMs), and effectively prohibit non-stormwater discharges that are a source of pollutants through the MS4 to receiving waters.
- d.** The Order includes requirements for extensive monitoring and reporting designed to identify changes in water quality at hundreds of outfall monitoring sites.

These provisions are collectively designed to halt any further degradation of impaired water bodies and improve the quality of such waters to a level protective of existing uses over a time schedule that is as short as possible. The antidegradation policies do not explicitly or implicitly override the authority and discretion the Clean Water Act and the Water Code grant to the Los Angeles Water Board as to how it structures a permit to ensure water quality necessary to protect beneficial uses. The law does not require immediate restoration of impaired water bodies nor does it require an immediate prohibition of discharges that contribute to an exceedance in the waterbody. Rather, federal regulations at 40 CFR section 122.47 allow NPDES permits, including MS4 permits, to have compliance schedules. Similarly, Water Code section 13263, subdivision (c), authorizes the Los Angeles Water Board to include a time schedule for achieving water quality objectives in waste discharge requirements. Where a TMDL has been established, Water Code section 13242 states that the TMDL implementation plan, as incorporated into the water quality control plan, shall include a time schedule for actions to be taken. When issuing waste discharge requirements, Water Code section 13263 requires regional boards to implement any relevant water quality control plans that have been adopted. Certainly, water quality objectives must be achieved; but the law, as cited above, recognizes and allows for the fact that it can take time to restore or achieve the objectives.³⁷ In this regard, some impaired

³⁷ Additionally, and as discussed elsewhere in this Fact Sheet, while MS4 permits must include a technology-based standard of effectively prohibiting non-storm water discharges through the MS4 and reducing pollutants in the discharge to the MEP, requiring strict compliance with water quality standards (e.g., by requiring immediate compliance with receiving water limitations or water quality based effluent limitations) is at the discretion of the permitting agency (33 U.S.C. § 1342(p)(3)(B); *Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1166-67). This Order imposes numeric water quality based

water bodies may stagnate or, rarely, continue to degrade³⁸ for a period of time before showing improvement. This period of time may be as long as multiple years. This is not contrary to the authorities for compliance schedules stated above and is not contrary to the antidegradation policies.³⁹

2. High quality water bodies:

Some of the waterbodies within the area covered by the Order may be high quality waters with regard to some pollutants. Some of these waterbodies may be currently high quality as compared to currently applicable objectives.⁴⁰ Others of these waterbodies may be currently impaired but may be classified as high quality waters because they were historically high quality for certain pollutants. MS4 discharges of stormwater and non-stormwater into such water bodies may have resulted in lowering of the quality of the water bodies since 1968 with regard to the pollutants in the discharge.

For high quality water bodies,⁴¹ the Los Angeles Water Board finds as follows:

- a. Practicable Alternatives: The Los Angeles Water Board has evaluated a range of practicable alternatives that would prevent or lessen any degradation

effluent limitations to implement TMDL WLAs and requires compliance with receiving water limitations for all constituents in the MS4 discharges. The fact that the Board also allows reasonable time schedules to achieve compliance with the numeric effluent limitations and receiving water limitations is not contrary to the law for this additional reason.

³⁸ Certain commenters have argued that any further degradation of water bodies not meeting objectives violates the antidegradation policies and that such further degradation has occurred under the 2012 Los Angeles County MS4 Order. As a matter of fact and science, the Los Angeles Water Board generally disagrees with assertions made that water bodies not meeting water quality objectives have continued to degrade (or that they are accelerating) under the 2012 Los Angeles County MS4 Order or will continue to degrade under this Order. However, even if these assertions were true, the law does not preclude limited and temporary further degradation while a permittee works to implement measures in compliance with a compliance schedule, as set forth above.

³⁹ With regard to waterbodies that are not high quality, the antidegradation policies do not require socioeconomic findings justifying any continued degradation of such waterbodies that may occur while the Permittees implement requirements in accordance with a compliance schedule. Even if such findings were required, the Los Angeles Water Board finds that this potential, limited, and temporary further lowering of water quality is justified for the same reasons articulated in the Section titled, "High Quality Water Bodies," Part III.H.2 of this Fact Sheet, *infra*.

⁴⁰ See, staff presentations at MS4 Workshops regarding monitoring data (dated 9/13/2018 (Ventura County data); and 7/12/2018 and 5/10/2018 (Los Angeles County data)), which summarize and evaluate data collected under the three prior MS4 permits. For example, at the mass emissions stations in the Ventura River, Calleguas Creek, and Malibu Creek watersheds, concentrations of copper, lead and zinc in wet weather are below water quality objectives, or TMDL numeric targets where applicable.

⁴¹ The quality of some currently high quality waters that are close to or at objectives may degrade below water quality objectives temporarily while Permittees plan for, develop, and implement appropriate controls in accordance with the compliance schedules in the Order and some historically high quality waters may stagnate or continue to degrade below water quality objectives during the same period. The Los Angeles Water Board finds that the potential, limited, and temporary lowering of water quality below the objectives is authorized by 40 CFR § 122.47 and the time schedule provisions of the Water Code set out in the Section titled, "Water bodies that do not meet the water quality objectives (water bodies that are not high quality)" Part III.H.1 of this Fact Sheet, *supra*, and, to the extent any findings are required under the antidegradation policies, is justified for the same reasons articulated in this Part III.H.2 of this Fact Sheet, "High quality water bodies."

associated with permitted MS4 discharges to high quality waters. These alternatives are discussed below.

- i. Alternative 1 - Complete prohibition on some or all pollutants in MS4 non-stormwater discharges to high quality waters: This alternative would prohibit MS4 discharges of some or all pollutants in non-stormwater to high quality receiving waters. By eliminating these discharges, pollutants from non-stormwater discharges would not reach high quality receiving waters during dry weather and thus not cause any degradation. In high quality water areas, this alternative could require the permittees to either divert all non-stormwater to a facility for treatment, or retain all non-stormwater through retention basins, infiltration galleries, and other controls that would prevent non-stormwater from reaching surface waters through storage, infiltration, or reuse. Alternatively, Permittees could install specific pollutant control measures that prevent specific pollutants from being discharged through the MS4.
- ii. Alternative 2 - Complete prohibition on some or all pollutants in MS4 stormwater discharges to high quality waters: This alternative would prohibit MS4 discharges of some or all pollutants in stormwater to high quality receiving waters. By eliminating these discharges, pollutants from stormwater would not reach high quality receiving waters during wet weather and not cause any degradation. As wet weather will always occur, this alternative could require the permittees to either divert all stormwater in the MS4 to a facility for treatment, or retain all stormwater through retention basins, infiltration galleries, and other controls that would prevent stormwater from reaching surface waters through storage, infiltration, or reuse. Permittees could also install pollutant control measures that are specific to preventing specific pollutants from being discharged through the MS4.
- iii. Alternative 3 - Stricter Pollutant Controls for New Development and Redevelopment in areas with high quality waters: This alternative would subject new development and redevelopment projects to more stringent water quality and runoff reduction criteria, such as retention of the 95th percentile, 24-hour storm volume instead of the 85th percentile, 24-hour storm volume. This alternative would hold new developments and redevelopments to more stringent performance criteria that would eliminate stormwater discharges from most storms.
- iv. Alternative 4 - Watershed Management Program alternative compliance option without deemed compliance with Receiving Water Limitations for any high quality waters: This alternative would allow the permittees to implement approved WMPs, with customized control measures, to achieve Receiving Water Limitations, WQBELs, and other requirements. With this alternative, a permittee would not be deemed in compliance with Receiving Water Limitations for high quality waters while they are fully and timely implementing an approved WMP.
- v. Alternative 5 - Watershed Management Program alternative compliance option with deemed compliance with Receiving Water Limitations for some high quality waters: This alternative would allow the permittees to implement approved WMPs, with customized control measures, to

achieve Receiving Water Limitations, WQBELs, and other requirements. With this alternative, a permittee would be deemed in compliance with Receiving Water Limitations for some high quality waters, primarily those waters that may have been high quality historically but are not currently high quality,⁴² while they are fully and timely implementing an approved WMP.⁴³ This alternative was incorporated as a set of terms in the 2012 Los Angeles MS4 permit and the 2014 City of Long Beach MS4 permit.

- vi. Alternative 6 - Establishment of WQBELs for MS4 discharges to high quality waters: This alternative includes the Board establishing WQBELs for MS4 discharges of certain pollutants to high quality waters. These WQBELs would apply to both stormwater and non-stormwater discharges. The 2010 Ventura County, 2012 Los Angeles County, and 2014 City of Long Beach MS4 permits only include WQBELs where they are based on TMDL wasteload allocations applicable to MS4 discharges (i.e., for impaired waters and not high quality waters). This alternative would require the Board to establish WQBELs where no TMDLs have been established.

- b. Economic and Social Development Considerations and Consistency with Maximum Benefit to the People of the State: The Board incorporated Alternative 5 and aspects of Alternatives 1 and 2 into the Order. These alternatives may allow limited degradation of high quality water bodies by MS4 discharges, but these alternatives ultimately require MS4 discharges to meet and not fall below water quality standards.

Such degradation of high quality waters is necessary to accommodate important economic or social development in the area and is consistent with the maximum benefit to the people of the state for the following reasons:

- i. Alternatives 1 and 2, if implemented as full prohibitions, would hamper important social and economic development.
 - (a) The MS4 discharges of stormwater and non-stormwater in certain circumstances are to the maximum benefit to the people of the state because they may be necessary for flood control and public safety.⁴⁴ MS4 discharges also can assist with maintaining instream flows that support beneficial uses.⁴⁵ In addition, complete diversion or

⁴² See, discussion *infra* at Parts III.H.1.d and III.H.2.b of this Fact Sheet.

⁴³ Under this alternative, and in accordance with WQ-2020-0038, Permittees must develop compliance schedules for WMPs that (among other things) include a final date for achieving receiving water limitations as soon as possible. (State Board Order WQ-2020-0038 at p. 77; see, also, Order, Part IX.B.9.c.iii.c; Part X, generally.)

⁴⁴ SCCWRP Technical Report 520, Concept Development: Design Storm for Water Quality in the Los Angeles Region, October 2007; LASGRWC. Storm Water: Asset not Liability. [n.d.] [Noting at p. 1 the potential trade-offs between water quality and ensuring public safety, including protecting property from flood damage and maintaining passable roadways.]

⁴⁵ For instance, the [Los Angeles River Flows Project](#) studied the impacts of reduced flows on beneficial uses in the Los Angeles River as a pilot application of the [California Environmental Flows Framework](#). At the beginning of this project, Los Angeles Water Board staff presented on the importance of minimum flows for recreation and wildlife in both concrete and soft-bottom channels of the river (https://www.waterboards.ca.gov/water_issues/programs/docs/lar/002_r4_la_river_info_item_20171103rev.pdf). Wading shorebirds, for example, rest and feed in the shallow waters of the concrete lined portion of the lower Los Angeles River. The final report for the project, "[Process and Decision Support](#)

retention of MS4 discharges that would reach the MS4 and receiving water would require extensive structural controls that are not technologically feasible in many locations.⁴⁶

- (b) The vast majority of the Permittees are cities and counties that provide essential and valuable public services. Part XIII of this Fact Sheet considers economics, including Permittees' compliance costs associated with meeting the requirements of the Order. Controlling stormwater discharges to the point that there is no potential degradation of any potentially high quality waters by requiring complete diversion or retention would be an enormous opportunity cost that could preclude MS4 permittees from spending substantial funds on other important social and economic needs. This may manifest itself in the reduction of some public services or prevent other public services from being provided in the first place. Permittees have previously provided public comments (on the Tentative Order and during consideration of the 2012 Los Angeles County MS4 Permit) that spending limited municipal resources on immediately addressing all pollutants in MS4 discharges (all stormwater and non-stormwater discharges) will adversely impact municipal budgets, such as fire and police protection, as well as other social services.⁴⁷
- (c) As another example, and specifically in response to comments received, the Los Angeles Water Board conducted an analysis (based on cited sources in footnote no. below), that estimates the equivalent public benefit that may be provided through affordable housing and services if full retention and diversion is not required. The results of the analysis support the finding that the social and economic benefits of a society where there would be significantly fewer unhoused residents would be far greater than the additional benefits created by taking water quality from the point where water quality standards are achieved to a level of higher quality that may only be achieved with full retention.⁴⁸ The same funds that would

[Tools for Evaluating Flow Management Targets to Support Aquatic Life and Recreational Beneficial Uses of the Los Angeles River.](#)" quantified the flow ranges associated with different species, habitats, and recreational uses in the river and evaluated the impacts of various combinations of reductions in wastewater, stormwater, and non-stormwater discharges. In general, if all discharges were eliminated, there would not be enough flow to protect beneficial uses including habitat for local plant and animal species.

⁴⁶ Southern California Coastal Water Research Project. *Concept Development: Design Storm for Water Quality in the Los Angeles Region, Technical Report 520*. October 1, 2007.

⁴⁷ See, e.g., City of South El Monte comment letter on 2012 Los Angeles MS4 Permit, July 23, 2012 (prior to the time the deemed in compliance pathway was included in the permit) ("The City is dedicated to the protection and enhancement of water quality. The City, however, has other functions that require funding as well. If this Permit is adopted as proposed, even in the best case scenario, spending cuts to other crucial services such as police, fire, and public works are certain. The permittee dwindling general funds simply cannot take the financial hit the Permit is poised to impose on them.").

⁴⁸ In 2012, Los Angeles County projected that it would cost \$120B, or \$134.8B in 2019 dollars, for complete diversion or retention of MS4 discharges, whereas the cost of implementing EWMPs, which require addressing the 85th percentile, 24-hour storm event or otherwise reducing or treating stormwater discharges to attain water quality standards, was estimated by Board staff to be \$21.0B-\$21.3B (see Section XIII, Economic Considerations). Instead of using this cost differential of \$113.5B-\$113.8B to further improve

have to be used to prevent all MS4 discharges (as opposed to only 85% of those discharges) could be invested instead in addressing homelessness, and could support affordable housing and several decades of supportive services for a significant number of residents at-risk of being unhoused.⁴⁹

- (d) The significantly higher cost of complete stormwater diversion or retention could lead to increased fees for residents with little benefit

waters that would already have achieved water quality standards, thereby already being able to support designated beneficial uses, this money could be better spent addressing the homeless problem in the region. In 2020, there were an estimated 66,436 unhoused residents in Los Angeles County. (Los Angeles Homeless Services Authority. 2021. 2020 Greater Los Angeles Homeless Count – Total Point-In-Time Homeless Population by Geographic Areas. <https://www.lahsa.org/documents?id=4692-2020-greater-los-angeles-homeless-count-total-point-in-time-homeless-population-by-geographic-areas.pdf>.) The median cost in Los Angeles County of constructing a permanent housing unit for the homeless is about \$531,000. (Galperin, Ron. 2019. The High Cost of Homeless Housing: Review of Proposition HHH. Ron Galperin LA Controller. <https://lacontroller.org/audits-and-reports/high-cost-of-homeless-housing-hhh/>.) Supportive services to address the homeless housing gap were estimated in 2016 to be \$428.8M per year, or \$455.3M in 2019 dollars. (Los Angeles Homeless Services Authority. 2016. Report on Homeless Housing Gaps in the County of Los Angeles. <https://homeless.lacounty.gov/wp-content/uploads/2019/02/Report-on-Homeless-Housing-Gaps-in-the-County-of-Los-Angeles-1-2016-1....pdf>) Adjusting for the increase in the homeless population since then yields an estimated annual cost in supportive services of \$1.2B in 2019 dollars. (Assuming the same supportive services cost per person estimated in 2016, multiplied by the number of homeless residents in LA County in 2020.) The stormwater capture cost differential could build enough units to house every homeless person in Los Angeles County and pay for supportive services for the next 67 years, even with the conservative assumption of one person per housing unit. Housing a homeless person in Los Angeles County results in average cost savings of about \$2,731 per person per month in 2019 dollars in terms of reduced need for public services, such as medical and policing expenses. (Economic Roundtable. 2008. Where We Sleep: Costs when Homeless and Housed in Los Angeles. https://economicrt.org/wp-content/uploads/2009/11/Where_We_Sleep_2009.pdf) This means that there would be annual cost savings of about \$2.2B from housing all homeless residents in Los Angeles County, and over 67 years the cost savings would be about \$145.1B-\$145.8B, greater than the stormwater capture cost differential of \$113.5B-\$113.8B. An analysis of Ventura County finds similar results where each of its 1,743 unhoused residents could be provided permanent housing for at least 55 years with its stormwater capture cost differential, assuming that Ventura County's cost of full capture would be their estimated MS4 compliance costs multiplied by the same ratios of Los Angeles County's E/WMP costs to cost of full stormwater capture, yielding cost differentials ranging from \$2.5B-\$23.4B (<https://www.vcstar.com/story/news/2020/12/12/covid-ventura-county-continuum-of-care-2021-homeless-count/3868785001/>). This analysis was also based on an average cost per unit of \$480,000 for housing the homeless in Ventura County in 2019 and the same supportive services cost per person as in LA County (<https://humanimpact.org/wp-content/uploads/2020/10/HIP-Ventura-County-Lets-Invest-Sources-2020.pdf>). Detailed calculations can be found in the administrative record. It can be expected that there would be substantial additional benefits for these housed residents and for the local economy from being more fully able to engage in society.

⁴⁹ Contrary to what the Environmental Groups asserted during their closing statement to the Board on July 16, 2021, this discussion is only an example used to show how different permit requirements could affect municipal spending, and it is not a finding that the funds not expended on MS4 controls would in fact be spent on ending homelessness or that in deciding whether to approve the permit with deemed compliance provisions that the board is presented with a zero sum choice—housing or water quality. Municipalities' budgets are not unlimited, so when one slice of the budget pie gets bigger, another slice may get smaller. Permittees who testified during the hearings on July 8, 9, and 16, 2021, and those who testified during the 2012 Los Angeles County MS4 hearings, have identified certain services that would be cut, such as police and fire, if they were required to immediately comply with all receiving water limitations.

in return after water quality standards have been met, or beyond the requirement to address the 85th percentile, 24-hour storm event. The literature is sparse on the impact of MS4 project costs on user fees, but Kea et al. (2016) found higher rates of user fee establishment in the years directly before and after MS4 permit deadlines,⁵⁰ indicating that utilities often rely on user fees to meet permit requirements.

It is also possible that higher costs could be passed down to residents through increased housing prices driven by higher impact fees, which cities often charge developers to help fund public services, or higher construction costs. The literature finds that overall impact fees lead to higher home prices.⁵¹ Requiring complete stormwater diversion or retention from properties could also lead to higher construction costs for housing, which is one of the drivers of higher home prices.⁵² There is extensive literature showing that higher housing prices are associated with proximity to cleaner waterbodies,⁵³ which provide benefits to society. However, higher housing prices driven by higher impact fees or construction costs that do not contribute toward discernible improvements in water quality would likely provide lower marginal benefits compared to a scenario where residents could avoid additional housing costs by not having to pay higher impact fees or construction costs in a region where housing costs are already high, or a scenario where this cost could be spent on more pressing public services or societal problems (see, for example, footnote , *supra*.)

- ii. However, aspects of Alternatives 1 and 2 are practicable and have been incorporated into this Order. The Order generally implements a prohibition on trash discharges through the installation of full capture systems or controls to achieve full capture equivalency, or alternative

⁵³ See e.g. Guignet, Dennis, Matthew T. Heberling, Michael Papenfus, Olivia Griot, and Ben Holland. 2020. Property values, water quality, and benefit transfer: A nationwide meta-analysis. Working Papers 20-04, Department of Economics, Appalachian State University. <https://ideas.repec.org/p/apl/wpaper/20-04.html>

compliance option, e.g., the mass-balance approach.⁵⁴ The Order also largely prohibits the discharge of non-stormwater into and through the MS4 to receiving waters. While there are some limited exceptions where the non-stormwater discharge is expected not to be a source of pollutants, where the discharge is determined to be a source of pollutants it must be prohibited. The Order also supports efforts to maximize the capture of stormwater through retention basins, infiltration galleries, and other controls.

- iii. Alternative 3, if implemented, would create heightened water quality related performance requirements for new developments and redevelopments that discharge to high quality water. Holding new developments and redevelopments to more stringent criteria may be practicable for some projects; however, the benefit to water quality is expected to be marginal as compared to the requirements already imposed on projects designated as “Priority Development Projects” in the Order. (See Part VIII.F.1.a of the Order.) Whenever feasible, these projects must implement structural BMPs to remove, reduce, beneficially reuse, and/or retain stormwater on-site. These structural BMPs must be designed to address the 85th percentile, 24-hour runoff volume. When on-site measures are technically infeasible (e.g., infill development), the projects are required to mitigate off-site. These requirements apply whether or not the receiving water is considered high-quality and are expected to improve water quality for a greater number of people. Further, because waterbodies may be high quality for some pollutants and not others it is difficult, if not impossible, to designate specific areas as high quality waters.
- iv. Both Alternatives 4 and 5, if implemented, could result in limited degradation of high quality water bodies. Any degradation that would occur under either alternative is consistent with the maximum benefit to the people of the state because the structural controls built through these programs will ultimately be more effective at maintaining and restoring water quality protective of beneficial uses than ongoing programmatic controls. The WMP permit terms of Alternatives 4 and 5 require implementation of objective technical solutions that have been demonstrated to be designed to meet water quality standards. Such controls necessarily take time to design and construct, but it is to the maximum benefit of the people of the state that such controls be designed and implemented properly so as to be protective of water quality in the long run. These measures that control impacts from stormwater and non-stormwater discharges in the Order are typically effective across multiple pollutants. The alternatives would concurrently address other constituents of concern that may not be causing impairment but may still be leading to degradation, resulting in improvements in levels of all pollutants, including those for which the receiving water may be high quality.

⁵⁴ Where there are no applicable trash TMDLs, the Order requires compliance with the Statewide Trash Amendments in Priority Land Uses (PLU), alternative land use areas, and designated land use areas. See, Part III.B (Trash Discharge Prohibitions), Order; and Part IV.B.3 (WQBELs for Trash), Order.

- v. Alternatives 4 and 5 avoid the high economic and social costs associated with decreased public services analyzed above in Parts III.H.2.b.i.(b)-(d) of this antidegradation analysis.⁵⁵ At the same time, Alternatives 4 and 5 provide additional economic and social benefits to the people of the state by incentivizing and incorporating multi-benefit projects that include benefits beyond water quality protection such as increased local water supplies, beautified streets, plazas, and parking areas, and facilities that support habitat and recreation. For example, the MacArthur Lake Rehabilitation Project in the City of Los Angeles is projected to capture about 130 acre-feet of stormwater per year while improving the habitat and recreational value of the park by improving lake water quality and adding bioswales and wetlands. The master plan for the project was completed in 2017, and it is estimated that the project will be completed between 2024 to 2026.⁵⁶
- vi. Multi-benefit projects – that is, projects that fund stormwater capture that provide multiple benefits like those emphasized in WMPs – are actively encouraged by the State of California, which administers Proposition 1 funds (\$200 million in grant funds) for such multi-benefit projects. For example, the Piru Stormwater Capture for Groundwater Recharge Project in Ventura County, which is estimated to capture about 17 acre-feet per year while also augmenting local water supply through groundwater recharge.⁵⁷ Table F-19 provides further examples of multi-benefit projects funded by Proposition 1, many of which were funded to build WMP projects in Los Angeles County. While Prop 1 funding has been expended, construction of multi-benefit projects from approved WMPs will likely qualify for these types of grant monies in the future. Additionally, the construction of these projects also creates good-paying jobs that do not require advanced degrees, accessible to those in disadvantaged communities.⁵⁸

⁵⁵ See footnote nos. - and sources cited therein.

⁵⁶ Deets, Deborah, Gilbert A. Cedillo, Enrique C. Zaldivar, and Shahram Kharaghani. 2020. MacArthur Lake Rehabilitation Project. PowerPoint presentation. https://drive.google.com/file/d/1wOoTBkZE4amsEoOtwKOxxa_gAzSQISUu/view

⁵⁷ Ventura County Public Works. 2020. In the News: Completed Project for Groundwater Recharge Captures Stormwater amid dry months of January and February. Ventura County Public Works. <https://www.vcpublicworks.org/2020/08/25/piru-stormwater/> While Ventura County's current 2010 MS4 Permit does not have provisions to implement WMPs as a compliance alternative, this project is included in the Ventura Countywide Municipal Stormwater Resource Plan prepared for the Ventura Countywide Stormwater Quality Management Program, dated September 20, 2016. This plan identifies projects that are expected to contribute towards meeting MS4 permit requirements, including TMDL-related provisions, in addition to achieving other benefits, including augmenting local water supplies. In this way, it has many similarities to WMPs. It is expected that these types of multi-benefit projects will be incentivized further by this Order, as they were in Los Angeles County following the issuance of the 2012 Los Angeles County MS4 Permit.

⁵⁸ Building on the findings by Economic Roundtable, Los Angeles Alliance for a New Economy estimated that over 30 years, the Safe, Clean Water Program (Measure W) will create about 6,530 construction jobs and 1,347 O&M jobs, as well as about 1,559 annual indirect and induced jobs. This would yield about \$14B in overall regional economic benefits from \$9B in investment. Furthermore, many of these jobs created would be good-paying jobs that do not require an advanced degree, accessible to those in disadvantaged communities. (Los Angeles Alliance for a New Economy (LAANE). [Liquid Assets. How Stormwater Infrastructure Builds Resilience, Health, Jobs, and Equity](#). March 2018.)

Table F-19. Multi-benefit projects funded through Proposition 1 To Date

| Project Name | Project Proponent | Water supply benefit | Water quality benefit | Flood management benefit | Environmental benefit | Community benefit | Benefit to DAC |
|--|--|--|--|--|-----------------------|--|---|
| South Gate Urban Orchard Demonstration Project | City of South Gate | Increased water supply reliability | Nonpoint source pollution control | -- | -- | Enhanced and/or created recreational and public use areas | Y - City of South Gate and Thunderbird Villa Mobile Home Park |

vii. Alternative 4 is nevertheless not to the maximum benefit of the people of the state because it is less likely than Alternative 5 to result in the anticipated economic and social development described in Part III.H.2.b, subsection v, immediately above. As many of the permittees testified during the hearing on this Order, WMPs with the broader deemed compliance option (Alternative 5) better incentivize building and investing in long-term structural and non-structural controls that will improve water quality in the long run for multiple constituents and with multiple benefits.⁵⁹ There are several reasons for this. Deeming Permittees in compliance with receiving water limitations while they are building and investing in these multi-benefit projects is necessary to accommodate the public bidding process (which many municipalities must go through to initiate construction) and the construction process, which takes approximately 5-7 years.⁶⁰ Deeming Permittees in compliance while they are implementing their WMP projects allows Permittees to focus on constructing multi-benefit projects and long-term water sustainability planning, instead of focusing immediately (and spending money) on fixing violations or defending litigation related to those violations that might occur *before* their projects are completed. Having determined that water quality is most effectively protected by requiring Permittees to take a thoughtful proactive watershed management approach to discharges, which also encourages water supply augmentation and has environmental benefits, the Los Angeles Water Board finds that fairness and good public policy also advises against requiring them to comply with all effluent and receiving water limitations immediately (and potentially penalizing them for not doing so). The Order is designed to facilitate cooperation and coordination between the State and Permittees, local government entities. For example, Paul Alva, Principal Engineer for the Los Angeles County Department of Public Works, testified on July 16, 2021, that the 2012 Los Angeles County MS4 Permit structure, with deemed in compliance, has enabled the County to form new partnerships with entities like Caltrans and Los Angeles Department of Water and Power, and that it has fostered collaboration with other permittees as well. Allowing local governments to be deemed in compliance while implementing and constructing WMP projects strengthens this important public policy goal. Without the deemed compliance approach, Permittees are expected to shift at least some of their limited resources budgeted for planned, comprehensive, long-term, multi-benefit projects, to measures that are reactive, short-term, and ultimately less effective or protective of water quality in the long run.⁶¹ Importantly, the deemed compliance approach does not mean that the Los Angeles Water Board cannot take

⁵⁹ See, Table F-20. Testimony from Los Angeles County Department of Public Works staff, and representatives from the Lower Los Angeles River Watershed and Lower San Gabriel River Watershed E/WMP groups on July 16, 2021 also supports this.

⁶⁰ Testimony provided by Los Angeles County Public Works staff and other permittees at Board meetings and workshops in 2020 states that TMDL implementation projects (incorporated into WMPs) can take from five to seven years per project from design to completion (January 7, 2020 workshop and May 14, 2020 Board meeting).

⁶¹ See, footnote nos. - and citations therein.

enforcement to ensure implementation of the Order requirements. Of course, Permittees are required to be pursuing and implementing their WMP controls as expeditiously as possible according to approved time schedules, and they can be separately subject to enforcement if they are not. Similarly, they may be subject to third-party citizen suits for violations of these terms.

- viii. Alternative 5 is necessary to accommodate important economic and social development and to the maximum benefit of the people of the state because coupling the WMP framework with deemed compliance also incentivizes collaboration to implement the most cost-effective controls. For example, Permittees in the County of Los Angeles were able to leverage the water supply and water quality benefits of the WMPs with deemed in compliance benefits to pass funding measures such as Measure W and Measure CW. Table F-20 documents the Measure W projects funded in 2020 and 2021,⁶² the majority of which were also proposed in an E/WMP. Table F-20 also documents another important fact that also demonstrates that Alternative 5 results in social and economic development that would not be achieved under Alternative 4. The kinds of projects built under the WMP framework with deemed in compliance has facilitated investment and construction of multi-benefit projects that include parks, infiltration, and low impact development (among other things) in communities that might not have seen that investment without the Board's adoption of the Los Angeles County MS4 Permit in 2012 incorporating the alternative compliance pathway of WMPs with deemed in compliance. This is not speculation. Mr. Alva from the County of Los Angeles explained to the Board on July 16, 2021, that the landscape of water quality has and will continue to vastly improve all over the County, and not just in certain communities, due to WMP construction and implementation. Under the 2001 Permit, which did not include deemed in compliance provisions for RWLs, only about two dozen coastal projects for low flow diversions were built to achieve water quality objectives. The 2012 Permit facilitated a shift in the building of projects from the limited number of coastal projects under the 2001 permit, to the planning, approval and beginning construction of many multi-benefit projects all over the County, including in disadvantaged, inland communities. All of Los Angeles County benefits from the multi-benefit projects now – which include multi-benefit projects and nature-based solutions that take into account current pressing challenges of drought and climate change and allow change to occur in an equitable fashion, in communities where they would not have occurred otherwise. Mr. Alva testified that this paradigm shift, towards building multi-benefit projects across the region and not just at the coast, would not have happened without the current compliance pathway, WMPs with deemed in compliance. Alternative 5, compared to Alternative 4, has thus already resulted in and is expected to continue to result in important economic and social development and are to the maximum benefit to the people of the state.

* This specific project was not identified in the E/WMP, but this type of project was identified.

Similarly, Permittees in both Los Angeles and Ventura Counties have been able to utilize Proposition 1 funding to develop multi-benefit stormwater management projects such as those set forth in Table F-20, *supra*, which are exactly the type of projects that WMPs contemplate.⁶³ And, as discussed immediately above, this alternative provides important socioeconomic benefits such as creation of new jobs, increased local water supplies, beautified streets, plazas, and parking areas, and facilities that support habitat and recreation, while allowing the local governments to maintain important public services. This alternative therefore has the greatest chance of success, within the shortest time frame, and furthers the goal of maintaining and achieving water quality standards.

- ix. Further, Alternative 5 does not create a framework where there is a deemed in compliance pathway for all receiving water limitations. Alternative 5 does not relieve Permittees of the requirement to effectively prohibit non-stormwater discharges. The non-stormwater discharge prohibitions are not afforded deemed compliance status through the WMP provisions. Rather, the WMPs provide alternative compliance pathways only for particular waterbody-pollutant combinations: Those addressed by TMDLs (highest priority); those that are listed on the Clean Water Act Section 303(d) List as impaired and for which MS4 discharges may be causing or contributing to the impairment (high priority); or for which there are insufficient data to indicate water quality impairment in the receiving water according to the State's Listing Policy, but which exceed applicable receiving water limitations contained in this Order and for which MS4 discharges may be causing or contributing to the exceedance within the last five years (medium priority).⁶⁴ None of these water bodies are high quality waters currently. As explained in State Water Board Order WQ 2020-0038, Permittees must be clear about which waterbody-pollutant combinations and receiving water limitations they will address in their WMPs.⁶⁵ "Deemed compliance is not a right; it is an accommodation based on the time and effort required to undertake the complex planning and implementation efforts needed to improve water quality. It is meant to encourage significant investment in collaborative regional - and watershed-based BMP implementation, leading eventually to all receiving waters meeting final receiving water limitations."⁶⁶

⁶³ See, Table F-21, *supra*.

⁶⁴ As such, many of the waters to which the deemed in compliance allowance provisions will be applied are not high quality waters in the first place (see Order, Part IX.A.4; IX.B.1-3) and subject instead to the antidegradation analysis under Part III.H.1 of this Fact Sheet. The findings above are made only to the extent these waterbodies are considered high quality based on a historic baseline. To the extent that the WMP alternative compliance pathways do allow for pollutants to be discharged into otherwise high quality waters, the period to achieve receiving water limitations where there are exceedances must be as short as possible.

⁶⁵ See, e.g., WQ 2020-0038 at p. 11.

⁶⁶ WQ 2020-0038 at p. 10.

- x. Alternative 5 may result in limited degradation of high quality waters, in particular currently impaired waters that may nevertheless be considered high quality waters based on a historic baseline.⁶⁷ The federal antidegradation policy does not require consideration of economic and social costs associated with degradation; it only requires findings that “allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located.” The state antidegradation policy does not define the exact factors that must be considered in determining “maximum benefit to the people of the state.” APU 90-004 states that factors to be considered in a complete antidegradation analysis include economic and social costs of the discharge compared to its benefits, but this Order is subject only to a simple antidegradation analysis.⁶⁸ The Los Angeles Water Board has nevertheless considered the costs associated with water quality degradation that may occur under Alternative 5, but has done so necessarily at a generalized level. Specifically, in choosing Alternative 5 over Alternative 4, the Los Angeles Water Board finds as follows:
- (a) There are significant environmental, public health, and economic costs associated with exceedances of water quality objectives. Southern California’s local economy thrives on a healthy environment, as does the health of its population. By way of example, the failure to control stormwater runoff (which would result in exceedances of water quality objectives) would, among other things, negatively impact ocean water quality, which would negatively impact the coastal economy, including tourism and the fishing industry. Similarly, the failure to meet water quality objectives in ocean waters would negatively impact recreation and public health of beachgoers. These costs are discussed in detail in Part XIII.D.4 of this Fact Sheet and are incorporated into these findings by reference.
 - (b) The considered costs are associated with exceedances of water quality objectives rather than limited degradation of high quality waters to a level that remains better than objectives. This is because the objectives are set to protect beneficial uses in the first place.
 - (c) Where Alternative 5 may allow a currently high quality waterbody to degrade below water quality objectives, or where it will allow a currently impaired, but historically high quality waterbody to stagnate or worsen in quality, even for multiple years, this allowance is for a finite period of time defined by the compliance schedule specified in the permit. The Los Angeles Water Board finds that the temporary degradation is justified based on the social and economic benefits discussed in findings Part III.H.2.b of this Fact Sheet.

⁶⁷ The WMPs are designed to provide deemed in compliance only for pollutants for which the waterbody is impaired or there are exceedances of receiving water limitations and the Order is not written to allow currently high quality waterbodies to be degraded for those pollutants for which deemed compliance is not provided.

⁶⁸ Outside of the complete antidegradation analysis context, APU 90-004 states only that the “findings should indicate . . . [t]he socioeconomic and public benefits that result from lowered water quality.” (APU 90-004, p. 1.)

associated with Alternative 5, notwithstanding the potential costs of degradation. In particular, the Los Angeles Water Board anticipates that the structural controls that are designed and built over a longer timeframe are more likely to lead to water quality improvements than other measures.

- (d) Alternative 4 could potentially avoid some of the costs discussed in subsection (a), above, because some Permittees may correct some exceedances earlier if required to comply immediately with receiving water limitations. From a practical perspective, however, the Los Angeles Water Board finds that immediate compliance, particularly for those waters that may have been high quality historically but are not high quality currently, is unrealistic even if required, given the technical and financial constraints faced by Permittees. Since Permittees will not be able to afford to comply immediately, any costs avoided would be minimal.⁶⁹
- xi. Regarding Alternative 6, WQBELs are for the most part set to be protective of beneficial uses, which is the floor of the level of protection required under the antidegradation policies and may not be protective of water quality higher than necessary to protect beneficial uses. Therefore, this alternative is not more protective of high quality water bodies than requiring compliance with receiving water limitations, which already require permittees' MS4 discharges to not cause or contribute to exceedances of water quality objectives. This alternative would impose a significant analytical hurdle on development and adoption of a permit by requiring the Los Angeles Water Board to spend extensive efforts to analyze hundreds of thousands of waterbody-pollutant combinations and then further conduct an infeasible set of reasonable potential analyses to determine whether the permittees' discharges are impacting high quality waters and for what pollutants. Ultimately, the alternative would divert staff resources from oversight of the implementation of potentially more effective and practical permit requirements, as well diverting staff from the Board's other programs.
- xii. For all of the reasons set forth above, the Los Angeles Water Board finds that any lowering of high quality waters under this Order's structure, which is consistent with Alternative 5 and components of Alternatives 1 and 2, is necessary to accommodate important economic or social development in the Region and is to the maximum benefit of the people of the State.
- c. Requirement for Highest Statutory and Regulatory Requirements and Best Practicable Treatment and Control: The Order requires the highest statutory

⁶⁹ See, e.g., Testimony from Arne Anselm, Ventura County, Transcript, October 15, 2020 Board Workshop, at p. 55:12-14 ("And certainly funding plays a big part of that, and getting a funding plan together, and developing that source of money. It's hard to do everything without that money. If we're limited to just the funds we have, not much will get done."); Chris Minton, Larry Walker and Associates, on behalf of the Malibu Creek Watershed EWMP Group, Transcript, February 11, 2021 Board Meeting, at p. 83:8-14 ("One reason we asked for more time is that it does take money to build projects. Under no cashflow scenario is it possible for us to receive or borrow enough money in the next five years to cover the cost of all of our projects. Even if our EWMP cost estimates are off by 50-percent, we still won't receive enough funds."). See, also, references cited in footnote , *supra*.

and regulatory requirements and requires that the Permittees meet best practicable treatment or control.

- i. The Order prohibits all non-stormwater discharges, with a few enumerated exceptions, through the MS4 to all receiving waters.
- ii. As required by 40 CFR section 122.44(a), the Permittees must comply with the “maximum extent practicable” technology-based standard set forth in CWA section 402(p)(3)(B)(iii) and implement control measures under six program elements of a stormwater management program.
- iii. As required by CWA section 402(p)(3)(B)(iii) and 40 CFR section 122.44(d)(1)(vii)(B), the Permittees must comply with applicable WQBELs based on TMDL WLAs established for waters in the Los Angeles Region.
- iv. The Order also contains provisions to encourage, wherever feasible, retention of stormwater from the 85th percentile, 24-hour storm event. This stormwater retention design standard is based on robust engineering and technical evaluations to determine state-of-the-art design standards for post-construction site scale BMPs and catchment scale regional BMPs.⁷⁰
- v. The measures that control impacts from stormwater and non-stormwater discharges in the Order are typically effective across multiple pollutants. For example, retention basins, low-impact development controls, and low flow diversions avert stormwater and non-stormwater from reaching the receiving water at all—preventing degradation to the receiving water from all types of constituents. The Watershed Management Program provisions contained in the Order are designed to achieve water quality standards for those constituents that are impairing the receiving water, as well as to address other constituents of concern that may not be causing impairment as defined in CWA section 303(d) and State policy. The Watershed Management Programs developed pursuant to these provisions will likely result in improvements in levels of all pollutants, including those for which the receiving water may be high quality.

As a final backstop against degradation, the Order includes an extensive monitoring and reporting program, including concurrent monitoring of MS4 discharges at representative outfalls and in receiving waters for all pollutants of concern in the particular receiving water; monitoring during both wet weather and dry weather conditions; and analysis of toxicity in receiving waters and, if toxicity is observed, follow-up monitoring of MS4 discharges among other monitoring requirements. Monitoring data must be submitted semi-annually, and the Order also includes reopener provisions to allow modification of the Order as necessary to add preventative provisions if a threat of degradation is suspected. The monitoring and reporting requirements are sufficient to identify and address changes in water quality.⁷¹

⁷⁰ See, for example, State Water Board Order WQ 2000-11, the “LA SUSMP Order” and Concept Development: Design Storm For Water Quality in the Los Angeles Region (SCCWRP, Technical Report 520, October 2007).

⁷¹ In *AGUA*, 210 Cal.App.4th 1255, the Court of Appeal held that a dairy general non-NPDES permit violated the State antidegradation policy in part because the permit relied on a prohibition of degradation to assert that the antidegradation policy was not implicated by the discharges without incorporating any additional

I. Anti-Backsliding Requirements

Sections 402(o) and 303(d)(4) of the CWA and federal regulations at 40 C.F.R. section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permits, with some exceptions where limitations may be relaxed. In general, the effluent limitations in the Order are at least as stringent as the effluent limitations in Order No. R4-2010-0108 (Ventura County), Order No. R4-2012-0175 (Los Angeles County), and Order No. R4-2014-0024 (Long Beach). However, certain of the effluent limitations in the Order are not identical to the effluent limitations in the previous MS4 permits because the Order implements revisions to TMDLs that occurred after these permits were adopted. Table F-21 lists changes to effluent limitations that increase allowable pollutant loadings or remove the effluent limitations entirely due to revised WLAs. While not all of the changes to these effluent limitations constitute backsliding, the rationale for each change is discussed below.

Table F-21. Changes to Effluent Limitations in Previous MS4 Permits

| TMDL | Constituent | Waterbody | Existing Limitation | New Limitation |
|--|-------------------------------|--|---------------------------------------|--|
| Revolon Slough and Beardsley Wash Trash TMDL | Trash | Revolon Slough and Beardsley Wash | 0 Trash discharged from all land uses | 0 Trash discharged from priority land uses |
| Malibu Creek Watershed Trash TMDL | Trash | Malibu Creek Watershed | 0 Trash discharged from all land uses | 0 Trash discharged from priority land uses |
| Ballona Creek Metals TMDL | Selenium | Ballona Creek | 169 g/day | None |
| | | Sepulveda Channel | 76 g/day | |
| | | Ballona Creek and tributaries | 5 µg/L | |
| | Ballona Creek and tributaries | 4.73 x 10 ⁻⁶ x daily storm volume (L) g/day | | |
| | Copper | Ballona Creek | 807.7 g/day | 1,457.6 g/day |

technical controls, or in lieu of such controls sufficient or appropriate monitoring to verify that in fact there was no ongoing degradation. The Order acknowledges that there may be some limited degradation of high quality waters due to stormwater and non-stormwater discharges, but imposes appropriate controls (e.g., through compliance with receiving water limitation provisions, discharge prohibitions, and WQBELs) to minimize any such degradation and further imposes extensive monitoring and reporting as described above to detect any degradation that may be inconsistent with the findings of the Order.

| TMDL | Constituent | Waterbody | Existing Limitation | New Limitation |
|---|-----------------|-------------------------------|--|---|
| | | Sepulveda Channel | 365.6 g/day | 540.6 g/day |

What follows is a discussion of (1) the general law pertaining to anti-backsliding and (2) why the anti-backsliding provisions in the CWA and federal regulations do not bar the changes in the effluent limitations appearing in the Order.

1. General Principles of Law Governing Anti-Backsliding Analysis for Effluent Limitations Established Pursuant to TMDLs

As noted above, the CWA contains both statutory anti-backsliding provisions in section 402(o) and regulatory anti-backsliding provisions in 40 C.F.R. section 122.44(l). The CWA’s statutory prohibition against backsliding applies under a narrow set of criteria specified in section 402(o).⁷² Section 402(o)(1) prohibits relaxing technology based effluent limitations originally established based on best professional judgment, when there is a newly revised effluent limitation guideline. This section is inapplicable here since none of the WQBELs in the Order are TBELs based on BPJ. Section 402(o)(1) also prohibits relaxing of WQBELs imposed pursuant to CWA sections 301(b)(1)(C) or 303(d) or (e). However, backsliding may be allowed for WQBELs such as the ones at issue here pursuant to one of six exceptions in CWA section 402(o)(2).⁷³ Two are relevant here:

⁷² See SWRCB Order WQ 2015-0075 at pp. 19-23; NPDES Permit Writers’ Handbook at §7.2.1.1 (U.S. EPA 2010).

⁷³ NPDES Permit Writers’ Manual, § 7.2.1.3 (U.S. EPA 2010); CWA section 402(o). Relaxation of limits based on state water quality standards may not be based on section 402(o)(B)(ii), which allows TBELs based on BPJ to be relaxed if technical mistakes or mistaken interpretations of the law were made in issuing the permit under CWA section 402(a)(1)(B).

- material and substantial alterations or additions to the permitted facility occurred after permit issuance which justify the application of a less stringent effluent limitation (CWA section 402(o)(A));
- information is available which was not available at the time of permit issuance (other than revised regulations, guidance, or test methods) and which would have justified the application of a less stringent effluent limitation at the time of permit issuance (the “New Information Exception”) (402(o)(2)(B)(i));

Relaxation of WQBELs may also be allowed if such backsliding is consistent with the provisions in CWA section 303(d)(4). CWA section 303(d)(4) allows backsliding in the following circumstances. First, “CWA section 303(d)(4)(A) allows the establishment of a less stringent effluent limitation when the receiving water has been identified as not meeting applicable water quality standards (i.e., a *nonattainment water*)” if two conditions are met: (a), “the existing effluent limitation must have been based on a ...TMDL or other ...WLA established under CWA section 303;” and (b) “relaxation of the effluent limitation is only allowed if attainment of water quality standards will be ensured or the designated use not being attained is removed in accordance with the water quality standards regulations.”⁷⁴

Second, section 303(d)(4)(B), applies to “waters where the water quality equals or exceeds levels necessary to protect the designated use, or to otherwise meet applicable water quality standards (i.e., an *attainment water*). Under CWA section 303(d)(4)(B), a limitation based on a TMDL, WLA, other water quality standard, or any other permitting standard may only be relaxed where the action is consistent with state’s antidegradation policy.”⁷⁵

Here, the WQBELs are imposed pursuant to section 303(d). For purposes of the following analysis, both sections 303(d)(4) and the exceptions in section 402(o)(2) are relevant because “U.S. EPA has consistently interpreted CWA section 402(o)(1) to allow relaxation of WQBELs and effluent limitations based on state standards if the relaxation is consistent with the provisions of CWA section 303(d)(4) or if ... [certain] of the exceptions in CWA section 402(o)(2)... [apply]. The two provisions [303(d)(4) and 402(o)(2)] constitute independent exceptions to the prohibition against relaxation of effluent limitations. If either is met, relaxation is permissible.”⁷⁶ As set forth below, the changes to numeric WQBELs in the Order either do not constitute backsliding or satisfy one or more of the foregoing exceptions to anti-backsliding as described below.

2. WQBEL Revisions That Do Not Constitute Backsliding

a. Marina del Rey Harbor Toxic Pollutants TMDL

The 2012 Permit for the County of Los Angeles incorporated the Marina del Rey Harbor Toxic Pollutants TMDL and included numeric WQBELs consistent with the assumptions and requirements of the WLAs in the TMDL as adopted in 2005. (Resolution No. 2005-012. (2005 TMDL.)). The TMDL was reconsidered in 2014 (Resolution R14-004 (2014 TMDL)). The Order updates the WQBELs for copper, lead, zinc, total chlordane, and total PCBs in Marina

⁷⁴ NPDES Permit Writers’ Manual, § 7.2.1.3 (U.S. EPA 2010); CWA section 303(d)(4)(A).

⁷⁵ NPDES Permit Writers’ Manual, § 7.2.1.3 (U.S. EPA 2010); CWA section 303(d)(4)(B).

⁷⁶ NPDES Permit Writers’ Manual, § 7.2.1.3 (U.S. EPA 2010); CWA sections 303(d)(4) and 402(o)(2).

del Rey Harbor consistent with the assumptions and requirements in the 2014 TMDL.

In the 2005 TMDL, the geographical area in which the toxic impairments were found were confined to the back basins of the Marina del Rey Harbor. During the 2014 reconsideration, the Los Angeles Water Board evaluated data collected since adoption of the TMDL and found that the toxic impairments were also present in several of the front basins.⁷⁷ Therefore, the 2014 TMDL revised the geographic area addressed by the TMDL to include the whole harbor and updated the percentage of land area covered by the MS4 permittees to account for areas draining into the front basins.⁷⁸ The 2014 TMDL adjusted the loading capacity and waste load allocations based on the revised geographic area.

The WQBELs in the Order are equal to the adjusted waste load allocations for copper, lead, zinc, total chlordane, and total PCBs in the 2014 TMDL. Because the increased geographic area resulted in an increased loading capacity of sediment bound pollutants discharged to Marina del Rey Harbor through stormwater, the WQBELs assigned to responsible MS4 permittees in the Order allow increased loadings of these constituents.

However, even though increased loadings are allowed, the WQBELs are not less stringent than before. In the 2014 TMDL analysis, the Los Angeles Water Board relied on the same the linkage analysis as the 2005 TMDL.⁷⁹ Similarly, the numeric sediment targets used to calculate the loading capacity and waste load allocations remained the same as the 2005 TMDL. The increased allowable loading is a result of adding the expanded geographic area to the analysis and its associated TSS loading. The increased allowable loading is spread out over the expanded geographic area. Therefore, while the WQBELs for copper, lead, zinc, total chlordane and total PCBs have increased, they are still as protective as the WQBELs in the 2012 Los Angeles County Permit. Even if anti-backsliding applies, the imposition of new WQBELs for copper, lead, zinc, total chlordane and total PCBs satisfies the anti-backsliding exception in CWA section 303(d)(4)(A) because the revisions in the 2014 TMDL will assure attainment of water quality standards. Indeed, TMDLs are developed for the purpose of specifying requirements for the achievement of water quality standards in impaired water bodies.⁸⁰ The additional loading of sediment-bound pollutants was solely to account for the expanded scope of the TMDL and no changes were made to the implementation schedule for the back basins.

b. Ballona Creek Metals TMDL

The 2012 Los Angeles County Permit incorporated numeric WQBELs consistent with the assumptions and requirements of the Ballona Creek Metals TMDL (Resolution No. R07-015), which became effective in 2008. In 2013, the Los Angeles Water Board reconsidered and revised this TMDL (Resolution No. R13-010). The revised TMDL became effective in 2015. The

⁷⁷ (Staff Report p. 6).

⁷⁸ (Staff Report p. 6 and 24)

⁷⁹ (Staff Report p. 8).

⁸⁰ (33 U.S.C. 1313(d); 40 C.F.R. §130.7.)

Order updates the WQBELs consistent with the assumptions and requirements of the revised Ballona Creek TMDL. Specifically:

- the final mass-based and concentration-based WQBELs for copper, lead and zinc allow increased loadings during dry weather; and
- the final mass-based WQBEL for lead allows increased loading during wet weather.

Although these revisions to the WQBELs allow increased loadings of copper, lead, and zinc, these changes do not constitute backsliding because the revised TMDL on which they are based used site-specific information to recalculate the WLAs, which did not change the intended level of protection. During the 2013 reconsideration, the Los Angeles Water Board evaluated additional, more recent flow data, hardness data, and dissolved to total metals ratios. These robust data sets resulted in adjustments to flow rates, hardness and conversion factors that compelled revisions to the dry- and wet-weather numeric targets. The dry-weather numeric targets for copper, lead and zinc increased, which in turn increased the dry-weather WLAs for copper, lead and zinc. Likewise, the wet-weather numeric target for lead increased, which increased the wet-weather WLA for lead.⁸¹ The WQBELs in the Order are equal to the revised WLAs.

Even if anti-backsliding applies, each of these changes meets the anti-backsliding exception set forth in CWA section 303(d)(4)(A). Section 303(d)(4)(A) of the CWA allows relaxation of effluent limits in non-attainment waters if “the cumulative effect of all such revised effluent limitations based on such total maximum daily load or waste load allocation will assure the attainment of such water quality standard, or (ii) the designated use which is not being attained is removed in accordance with regulations” established under the CWA. These revisions were made in accordance with the revised WLAs in the revised TMDL, which will assure the attainment of water quality standards for copper, lead and zinc in dry weather, and for lead in wet weather. Attainment of these water quality standards will occur within a reasonable time frame, set forth in the implementation schedule.

c. Los Angeles River Nitrogen Compounds and Related Effects TMDL

The 2012 Permit for the County of Los Angeles incorporated WQBELs consistent with the assumptions and requirements of the Los Angeles River (LAR) Nitrogen Compounds and Related Effects TMDL (LAR Nitrogen TMDL) (Resolution NO. R03-009).⁸² In 2012, the Los Angeles Water Board reconsidered and revised the LAR Nitrogen TMDL to incorporate site-specific, seasonal objectives for ammonia, expressed as temperature- and pH-dependent equations for Reaches 3-5 of the river and Rio Hondo Reach 3. (Resolution No. 12-010). These revisions became effective on August 7, 2014. The Order therefore updates the numeric WQBELs consistent with the assumption and requirements of the 2012 revisions of the LAR Nitrogen

⁸¹ The wet-weather numeric targets for copper and zinc decreased which resulted in a decrease of the wet-weather WLAs for copper and zinc. (Section 3.1.5.1, pp. 15-16 of the Staff Report.)

⁸² The implementation plan for LAR Nitrogen TMDL was amended by Resolution No. 03-016 to align certain interim ammonia WLAs with planned construction projects. The TMDL remained unchanged in all other respects.

TMDL. The updated WQBELs were calculated using three years of site-specific temperature and pH data (1/1/2018 - 12/31/2020) consistent with the WLA equations and implementation provisions in the 2012 revised TMDL.

The original LAR Nitrogen TMDL included numeric targets and WLAs for ammonia based on U.S. EPA's "1999 Update of Ambient Water Quality Criteria" for Ammonia. EPA's updated ammonia criteria included thirty-day average water quality objectives that are a function of temperature and pH, which can affect ammonia toxicity to fish. The objectives are thus expressed as equations. There are separate equations for waterbodies with and without early life stages of fish, which are more sensitive to ammonia. The more stringent equation applies to waterbodies with early life stages of fish. The 1999 Update also allows for the development of a water effects ratio (WER) to adjust the equation. WERs account for site-specific conditions that also affect ammonia toxicity. In the absence of site-specific information, a default WER of 1.0 is used. At the time of the LAR Nitrogen TMDL adoption in 2003, the Basin Plan did not specifically identify, which reaches in the Los Angeles Region, where early life stages of fish were present or absent. As such, the numeric targets and WLAs for ammonia in the original LAR Nitrogen TMDL assumed that early life stages of fish were absent in the Los Angeles River watershed.⁸³ Additionally, the numeric targets and WLAs for ammonia in the TMDL were calculated using the default WER value of "1" because a WER study was still under development.

In 2005 and 2007, the Los Angeles Water Board adopted seasonal, site-specific ammonia objectives for the San Gabriel, Los Angeles, and Santa Clara River Watersheds.⁸⁴ These objectives became effective on April 5, 2007 and April 23, 2009, respectively, changing the previous 30-day average ammonia objective in Chapter 3 of the Basin Plan for a subset of inland surface waters, including Reaches 3-5 of the LAR and Reach 3 of the Rio Hondo, upstream of Whittier Narrows Dam. The new site-specific objectives incorporated WERs for these reaches and defined seasonal periods of early life stages of fish presence and absence in these reaches.⁸⁵

In 2012, the LAR Nitrogen TMDL was revised to conform the numeric targets and WLAs with the updated seasonal, site-specific objectives for Los Angeles River Reaches 3-5, and Rio Hondo Reach 3, upstream of Whittier Narrows Dam. Specifically, the TMDL's thirty-day average numeric targets and associated WLAs for Los Angeles River Reaches 3-5, and Rio Hondo Reach 3 were changed to the site-specific equations for "early life stages (of fish) present" and "early life stages (of fish) absent" periods. These equations incorporate a site-specific WER value and are temperature and pH dependent. The TMDL notes that it would be consistent with the assumptions

⁸³ TMDL for Nitrogen Compounds and Related Effects, Los Angeles River and Tributaries, Staff report (May 2, 2003; Revised July 10 2003) p. 37.

⁸⁴ Resolution R07-005

⁸⁵ "The SSOs are based on the results of a WER study completed by the City of Los Angeles, County Sanitation Districts of Los Angeles County, and the City of Burbank. These SSOs, in addition to ammonia SSOs for the San Gabriel and Santa Clara River watersheds, were previously incorporated into the Basin Plan by resolution 2007-005, adopted by the Regional Board on June 7, 2007. By adopting the SSOs into the Basin Plan, they are now the applicable ammonia water quality objectives for the rivers and reaches to which they apply." (December 6, 2012, Final Staff Report p. 3.) See also Basin Plan page 3-14 and 3-15.

and requirements of the TMDL to translate the WLA into effluent limitations by using the past three years of temperature and pH data.⁸⁶

The Order calculates the 30-day average ammonia WQBELs in the LAR watershed using the site-specific, seasonal objectives for Los Angeles River Reaches 3-5, and Rio Hondo Reach 3, upstream of Whittier Narrows Dam. Three years of temperature and pH data was obtained from receiving water monitoring from the Donald C. Tillman Water Reclamation Plant (WRP), the Los Angeles-Glendale WRP, and the Whittier Narrows WRP. Based on these calculations the 30-day effluent limitations for total ammonia when “early life stages present” and when “early life stages absent” increased in the Los Angeles River Reaches 3-5 and Rio Hondo Reach 3. Although the revisions to the ammonia WQBELs in the Order allow increased loadings of ammonia, these changes do not constitute backsliding because the updated WQBELs are based on site-specific information that achieve the same intended level of protection. The revised WLAs are still based on the same ammonia criteria equations. The WER term in the equations has merely been updated to reflect site-specific conditions and recent data have been inserted into the equations to calculate the WQBELs.

But even if the changes described above were subject to CWA section 402(o)'s anti-backsliding provisions, the revisions to these WQBELs comply with CWA section 304(d)(4)(A). Section 303(d)(4)(A) of the CWA allows relaxation of effluent limits in non-attainment waters if “the cumulative effect of all such revised effluent limitations based on such total maximum daily load or waste load allocation will assure the attainment of such water quality standard, or (ii) the designated use which is not being attained is removed in accordance with regulations” established under the CWA. Here, the water quality objective itself was adjusted, and the revised TMDL reflects this. Any changes to WQBELs are recalculated as directed in the TMDL. Compliance with the WQBELs will therefore ensure the attainment of the site-specific objectives for ammonia in these four reaches of surface waters, within a reasonable time frame set forth in the implementation schedule.

d. Los Angeles River and Tributaries Metals TMDL

The 2012 Permit for the County of Los Angeles incorporated WQBELs consistent with the assumptions and requirements of the Los Angeles River and Tributaries Metals (LAR Metals TMDL).⁸⁷ In 2015, the Los Angeles Water Board reconsidered and revised the LAR Metals TMDL to incorporate site-specific water-effect ratios for calculating the copper water quality objectives and site-specific water quality objectives for lead for a number of reaches in the Los Angeles River watershed. (Resolution No. 15-004). The site-specific copper WERs and lead water quality objectives and revisions to the TMDL became effective on December 12, 2016. U.S. EPA withdrew the previously effective water quality criteria for lead from the California Toxics Rule (CTR) for the portions of the Los Angeles River watershed subject to the TMDL, effective November 15, 2018. The Order updates the WQBELs for copper and

⁸⁶ Basin Plan p. 7-91.

⁸⁷ The Los Angeles Water Board approved the LAR Metals TMDL in 2007 (Resolution No. R2007-0014). A TMDL revision applicable to POTWs was adopted in 2010 (R10-003). The revised TMDL became effective on November 3, 2011.

lead in the reaches identified in Table F-21 consistent with the assumptions and requirements of the revised LAR Metals TMDL. Although the revisions to these WQBELs allow increased loadings of copper and lead, the increased loadings do not constitute backsliding because the WQBELs provide the same level of intended protection and are no less stringent as described below.

i. Copper

The numeric targets and WLAs for the LAR Metals TMDL are based on the water quality objectives for copper in the CTR. The CTR water quality objectives for copper are expressed as equations, which include a term called a water effect ratio or WER. The WER reflects the effect that local site water constituents have on the toxicity of copper. The CTR equation includes a default WER of 1.0, which assumes that metals are equally toxic in local site water as they are in lab water. The WER may be adjusted using a properly conducted WER study. A WER greater than 1.0 means the local site water reduces the toxicity of copper and a WER less than 1.0 means that local site water increases the toxicity of copper. The numeric targets and WLAs for copper in the LAR Metals TMDL were based on a default WER value of 1.0.

The LAR Metals TMDL was revised in 2015 based on the results of a properly conducted WER study for Reaches 1, 2, 3, and 4 of the Los Angeles River, Compton Creek, Rio Hondo, Arroyo Seco, Verdugo Wash, Burbank Western Channel and Tujunga Wash.⁸⁸ The TMDL recalculated the numeric targets and WLAs for copper to reflect site-specific WERs for copper, as determined by the study.

The WQBELs in the Order are equal to the WLAs for copper in the revised LAR Metals TMDL. Incorporating WQBELs equal to the revised WLAs does not change the intended level of protection because the revised WLAs are still based on the same CTR equation for copper -- only the WER term in the equation has been updated to reflect site-specific conditions. The updated WQBELs merely reflect the fact copper is less toxic to aquatic life in the Los Angeles River receiving waters than it is in lab water.

ii. Lead

The numeric targets and WLAs for lead in the LAR Metals TMDL are based on the water quality objectives for lead in the CTR, which are based on a national toxicity dataset. U.S. EPA allows for the derivation of site-specific objectives using the Recalculation Procedure.⁸⁹ The Recalculation Procedure provides a method for adjusting the national dataset based on more recent toxicity studies.

The LAR Metals TMDL was revised in 2015 to incorporate recalculated lead water quality objectives based on the results of a special study that followed the Recalculation Procedure.⁹⁰ The study recalculated the acute

⁸⁸ Final Report: Copper Water-Effect Ratio Study to Support Implementation of the Los Angeles River and Tributaries Metals TMDL (2014)

⁸⁹ USEPA Water Quality Standards Handbook: Second Edition (1994)

⁹⁰ Final Lead Recalculation Report to Support Implementation of the Los Angeles River and Tributaries Metals TMDL (2014)

and chronic lead objectives for portions of the Los Angeles River using an expanded nation-wide dataset provided by U.S. EPA. The recalculated objectives were compared to toxicity data for species of interest in the Los Angeles River Watershed to ensure the objectives were protective of local species. The TMDL updated the numeric targets and WLAs based on the recalculated lead objectives.⁹¹ The resulting numeric targets and WLAs for lead were greater than the numeric targets and WLAs in the original LAR Metals TMDL. The WQBELs in the Order are based on the updated WLAs. Although the WQBELs for lead increased from the 2012 Los Angeles MS4 Permit, these effluent limitations are not less stringent. These effluent limitations are based on site-specific numeric targets and WLAs, which were based on an updated toxicity dataset and the recalculation of the water quality objectives following U.S. EPA guidelines. The study showed that the recalculated objectives for lead are protective of aquatic life, and the U.S. Fish and Wildlife Service agreed that the objectives would not likely adversely affect any listed threatened or endangered species or their critical habitat.⁹²

Conclusion. Even if anti-backsliding applies to the revised copper and lead WQBELs discussed above, each of these changes meets the anti-backsliding exception set forth in CWA section 303(d)(4)(A). Section 303(d)(4)(A) of the CWA allows relaxation of effluent limits in non-attainment waters if “the cumulative effect of all such revised effluent limitations based on such total maximum daily load or waste load allocation will assure the attainment of such water quality standard, or (ii) the designated use which is not being attained is removed in accordance with regulations” established under the CWA. These revisions were made in accordance with the revised WLAs in the revised TMDL, which will ensure the attainment of water quality standards for copper and lead. Attainment of these water quality standards will occur within a reasonable time frame set forth in the implementation schedule.

e. Middle Santa Ana River Watershed Bacterial Indicator TMDL

The Order removes the Middle Santa Ana River Watershed Bacterial Indicator TMDL (MSAR Bacteria TMDL) WQBELs applicable to the cities of Claremont’s and Pomona’s MS4. Claremont and Pomona are subject to regulations by the Los Angeles Water Board and Santa Ana Water Board. To streamline regulatory requirements, Water Code section 13228 authorizes persons regulated by more than one regional water board to request designation of a single regulator. In 2013, the Los Angeles Water Board and the Santa Ana Water Board agreed to designate the Santa Ana Water Board as the single regulator of discharges of bacteria by Claremont and Pomona through their MS4s to the receiving waters within the Middle Santa Ana River Watershed.⁹³ On September 13, 2013, the Santa Ana Water Board adopted Order No. R8-2013-0043 (NPDES No. CA8000410) to implement the MSAR Bacteria TMDL. Accordingly, the WQBELs implementing the MSAR Bacteria

⁹¹ Section 4.2, pp. 8-9 of the Staff Report.

TMDL are removed from the Order. Because the cities of Pomona and Claremont are still subject to these WQBELs through another permit, no backsliding has occurred.

3. WQBEL Revisions that Fall Within an Exception to Backsliding

a. Ballona Creek Metals TMDL

As previously discussed, the Ballona Creek Metals TMDL was reconsidered and revised in 2013. In addition to the changes to copper, lead and zinc set forth above, the revised 2013 Ballona Creek Metals TMDL removed WLAs for selenium because the receiving water is no longer considered impaired for selenium. In making this determination, the Los Angeles Water Board considered recent selenium data as well the data considered during the adoption of the Ballona Creek Metals TMDL in 2008. These data were evaluated pursuant to the State Water Board's Water Control Policy for Developing California's Clean Water Act Section 303(d) List (Listing Policy), which uses a weight of the evidence approach to evaluate whether to place waters on, or remove waters from, the 303(d) List. The reexamined data satisfied the delisting requirements in Table 4.1 of the Listing Policy and the Los Angeles Water Board approved removing selenium from the Ballona Creek Metals TMDL.

The Order therefore removes the selenium WQBELs for Ballona Creek Reach 2. Removal of the selenium WQBELs for Ballona Creek Reach 2 in the Order satisfies the anti-backsliding exception set forth in CWA section 303(d)(4)(B) because this reach is no longer impaired for selenium and MS4 discharges will not result in degradation. With the reconsideration of the TMDL, the Los Angeles Water Board determined that existing in stream beneficial uses and the level of water quality necessary to protect the beneficial uses would be maintained if selenium WLAs, and associated WQBELs, were removed. Even though there might be some discharges of selenium to Ballona Creek, any such discharges will be limited or minor with respect to the assimilative capacity of Ballona Creek and will not result in any long-term deleterious effects on water quality as shown in the water quality data assessment for the TMDL revision. (See, also, discussion in Fact Sheet, Part III.H, supra.) Furthermore, MS4 dischargers are still required to comply with receiving water limitations in Part V of the Order and are required to monitor for selenium in the Order. Continued monitoring for selenium ensures that any adverse changes in water quality with respect to selenium will be caught and corrected.

b. Ballona Creek Estuary Toxics TMDL

The 2012 Los Angeles County Permit incorporated numeric WQBELs consistent with the assumptions and requirements of the Ballona Creek Toxics TMDL (Resolution No. R05-008). In 2013, the Los Angeles Water Board reconsidered and revised this TMDL (Resolution No. R13-010). The revised TMDL became effective in 2015. The Order updates the numeric WQBELs consistent with the assumptions and requirements of the revised Ballona Creek Toxics TMDL. Specifically:

- the WQBELs for sediment for Chlordane and total DDTs were increased and
- the WQBELs for total PAHs were removed.

The rationale for these revisions is as follows:

i. Chlordane and DDTs

The numeric targets and WLAs for metals and organic pollutants in the Ballona Creek Estuary Toxics TMDL were originally based on National Oceanic and Atmospheric Administration's (NOAA) sediment quality guidelines. In 2009, the State Water Board adopted its Water Quality Control Plan for Enclosed Bays & Estuaries – Part 1 Sediment Quality (Sediment Quality Plan). The Sediment Quality Plan includes (1) a narrative sediment objective to protect benthic communities, and (2) a narrative sediment objective to protect human health. The Sediment Quality Plan established a methodology based on integrating multiple lines of evidence (MLOE) to determine whether the narrative sediment objective for benthic communities is achieved. This assessment is sometimes called a “direct effects” assessment for the direct effect of contaminants on benthic organisms and does not include an assessment of the “indirect effects” of contaminants transferring up the food chain to fish, which can impact human health.⁹⁴ The Sediment Quality Plan directed the State and Regional Water Boards to implement the narrative sediment objective to protect human health on a case-by-case basis, based upon a human health risk assessment.⁹⁵

During the reconsideration, the Los Angeles Water Board evaluated Ballona Creek Estuary using the MLOE approach in the Sediment Quality Plan. This evaluation indicated that at least one station in the Ballona Creek Estuary exceeded the sediment objectives for benthic communities.⁹⁶ The Los Angeles Water Board also considered the results of a Toxicity Identification Evaluation study conducted in 2010 (2010 TIE). This study found that the principal source of sediment toxicity in the Ballona Creek Estuary was pyrethroids. Based on these studies, the Los Angeles Water Board determined that total DDTs and chlordane were not causing “direct effect” impairments to the benthic community.⁹⁷ Nonetheless, monitoring data collected as part of the TMDL coordinated monitoring plan indicated that exceedances of total DDTs and chlordane targets in sediment were ongoing.⁹⁸ Total DDTs were present in limited fish sampling.⁹⁹ And in 2009, Ballona Creek was identified a fish consumption “red zone,” with 5 fish listed as “do not eat” and 14 fish with recommended consumption limitations.¹⁰⁰ The Los Angeles Water Board therefore conducted a human health risk assessment consistent with the Sediment Quality Plan to implement the narrative sediment objective to protect human health.¹⁰¹

¹⁰⁰ Staff report pp. 24-25

¹⁰¹ https://www.waterboards.ca.gov/water_issues/programs/bptcp/docs/sediment/sed_qlty_part1.pdf at p. 13.

The Sediment Quality Plan directed regional water boards to consider any applicable and relevant information, including but not limited to the California Environmental Protection Agency's Office of Environmental Health Hazard Assessment (OEHHA) policies for fish consumption and risk assessment. In 2008, OEHHA developed Fish Contaminant Goals for Chlordane and total DDTs.¹⁰² During the reconsideration of the Ballona Creek Toxics TMDL, the Los Angeles Water Board replaced the direct effects numeric targets for chlordane and total DDTs in sediment with indirect effects numeric targets for chlordane and total DDTs in sediment using OEHHA's Fish Contaminant Goals. The new numeric targets and resulting WLAs for chlordane and total DDTs increased.¹⁰³ The WQBELs for chlordane and DDTs in the Order have been adjusted accordingly.

The changes described above meet the anti-backsliding exception set forth in CWA section 303(d)(4)(A) because any relaxation of the WQBELs for chlordane and total DDTs in the Order was made as a result of the reconsidered TMDL. Although the waters remain impaired, the changes to the WQBELs are consistent with the assumptions and requirements of the WLAs in the revised TMDL. The revised TMDL's limits are designed to attain water quality standards, and the WQBELs ensure this will happen within a reasonable time frame.

ii. Total PAHs

In addition to the foregoing, the numeric targets and WLAs for total PAHs were removed from the Ballona Creek Estuary Toxics TMDL in the 2013 reconsideration. Removal was based on application of criteria in the Listing Policy to sediment samples collected since the adoption of the TMDL in 2005. The reexamined data satisfied the delisting requirements in Table 4.1 of the Listing Policy and the Los Angeles Water Board approved removing total PAHs from the Ballona Creek Toxics TMDL.

Removal of total PAHs from the Order satisfies the exception to anti-backsliding in CWA section 303(d)(4)(B). The waters here are no longer impaired for total PAHs, and MS4 discharges will not result in degradation. With the reconsideration of the TMDL, the Los Angeles Water Board determined that existing in stream beneficial uses and the level of water quality necessary to protect the beneficial uses would be maintained if total PAH WLAs, and associated WQBELs, were removed. There have been no exceedances in any of the samples collected and analyzed, but even if there might be some discharges, any such discharges will be limited or minor with respect to the assimilative capacity of Ballona Creek. (See, also, discussion in Fact Sheet, Part III.H, supra.) Furthermore, MS4 dischargers are still required to comply with receiving water limitations in Part V of the Order and are required to monitor for total PAHs in the Order. Continued monitoring for total PAHs

¹⁰² Fish Contaminant Goals and Advisory Tissue Levels for Common Contaminants in California Sport Fish: Chlordane, DDTs, Dieldrin, Methylmercury, PCBs, Selenium, and Toxaphene" (FCGs), at <https://oehha.ca.gov/fish/report/fish-contaminant-goals-and-advisory-tissue-levels-evaluating-methylmercury-chlordane>.

¹⁰³ The numeric targets, WLA, and LAs for total PCBs are more stringent after the revision to the TMDL.

in sediment will ensure that any adverse changes in water quality with respect to total PAHs in sediment will be caught and corrected.

c. Colorado Lagoon TMDL

The 2012 Los Angeles County Permit incorporated WQBELs for lead, zinc, total chlordane, dieldrin, total PAHs, total PCBs, and Total DDTs consistent with the assumptions and requirements of the Colorado Lagoon TMDL. The Order removes these WQBELs for two discharge points: Termino Avenue and Line M because these two storm drains were physically rerouted such that they no longer discharge into the Colorado Lagoon. These alterations, which were structural changes to the MS4 itself, are “material and substantial alterations or additions to the permitted facility” and justify the application of a less stringent effluent limitation under CWA section 402(o)(2)(A).

d. Revolon Slough and Beardsley Wash Trash TMDL

The 2010 Ventura County Permit incorporated WQBELs of zero trash consistent with the assumptions and requirements of the Revolon Slough and Beardsley Wash Trash TMDL (Resolution No. 2007-007; Revolon/Beardsley Trash TMDL). The Revolon/Beardsley Trash TMDL required MS4 responsible entities to address discharges of trash from **all** land uses with full capture systems, or other lawful manner.¹⁰⁴ The Order revises the WQBELs to apply to discharges from priority land uses only. The rationale for this revision is as follows.

In 2015, the State Water Board adopted the Trash Amendments. As discussed in Part IV.B of this Fact Sheet, the Trash Amendments established a prohibition on the discharge of trash in all Waters of the State. Implementation of this discharge prohibition focuses MS4 compliance efforts on high trash generation areas or “priority land uses.” The Trash Amendments do not apply to waterbodies with a TMDL in effect prior to the effective date of the Trash Amendments (December 2, 2015). However, the State Water Board directed the Los Angeles Water Board to reconsider whether its existing trash TMDLs could be aligned with the Trash Amendments to focus on priority land use areas only.

In 2018, the Los Angeles Water Board reconsidered the Revolon/Beardsley Trash TMDL in light of the statewide Trash Amendments. The revised TMDL became effective on May 6, 2020. The Los Angeles Water Board concluded that a focus on priority land use areas would attain the numeric target of zero trash in the Revolon Slough/Beardsley subwatershed as long as nonpoint source responsible entities implemented Minimum Frequency of Assessment and Collection Program (MFAC) programs in the impaired waters downstream to address any potential trash discharged from nonpriority land uses. The TMDL revised the implementation provisions for the WLAs to require full capture systems for storm drains that capture runoff from priority land uses. This amounts to a reduction in the amount of full capture systems installed in the subwatershed. The Order incorporates WQBELs consistent with the revised implementation provisions for the TMDL.

¹⁰⁴ See page 3 of Attachment A to Resolution No. 2007-007 (Revolon Slough and Beardsley Wash Trash TMDL).

The changes described above meet the anti-backsliding exception set forth in CWA section 303(d)(4)(A) because any relaxation of the WQBELs in the Order for trash are a result of the reconsidered TMDL. Although the waters remain impaired, the revised TMDL determined that implementation of full capture systems to address priority land uses only will attain the numeric target of zero trash for Revolon Slough and Beardsley Slough provided that nonpoint source responsible entities implement MFAC programs in the impaired waters downstream.¹⁰⁵ Changes to the WQBELs consistent with the assumptions and requirements of the revised TMDL will ensure attainment of the water quality standard and is therefore permissible consistent CWA section 303(d)(4)(a).

e. Malibu Creek Watershed Trash TMDL

The 2012 Los Angeles County Permit incorporated WQBELs of zero trash consistent with the assumptions and requirements of the Malibu Creek Watershed Trash TMDL (Resolution No. 2008-007; Malibu Trash TMDL). The Malibu Trash TMDL required MS4 responsible entities to address discharges of trash from **all** land uses with full capture systems, or other lawful manner.¹⁰⁶ The Order revises the WQBELs to apply to discharges from priority land uses only. The rationale for this revision is as follows.

The Malibu Trash TMDL was revised at the same time and in the same manner as the Revolon Slough/Beardsley Wash TMDL discussed above (Resolution No. R4-2018-006). The revised TMDL became effective on May 6, 2020. Similar to the Revolon Slough/Beardsley Wash TMDL, the Los Angeles Water Board concluded it was appropriate to align the Malibu Trash TMDL with the Statewide Trash Amendments because installation of full capture devices in the priority land use areas would attain the numeric target of zero trash in the Malibu Creek watershed as long as nonpoint source responsible entities implement MFAC programs are in place in the impaired waters downstream to address any potential trash discharged from nonpriority land uses.¹⁰⁷ The WQBELs of zero trash in the Order are limited to discharges from “priority land use areas” to Malibu Creek, Malibu Lagoon, Malibu Lake, Medea Creek (Reach 1 and Reach 2), Lindero Creek (Reach 1 and Reach 2), Lake Lindero, and Las Virgenes Creek of the Malibu Creek Watershed, instead of the whole Malibu Creek Watershed.

The changes described above meet the anti-backsliding exception set forth in CWA section 303(d)(4)(A) because any relaxation of the WQBELs in the Order for trash are a result of the reconsidered TMDL. Although the waters remain impaired, the revised TMDL determined that implementation full capture systems to address priority land uses only will attain the numeric target of zero trash for Malibu Creek Watershed provided that nonpoint source responsible entities implement MFAC programs in the impaired waters downstream.¹⁰⁸ Changes to the WQBELs consistent with the assumptions and requirements of the revised TMDL will ensure attainment of the water quality standard and is therefore permissible consistent CWA section 303(d)(4)(a).

¹⁰⁶ See page 3 of Attachment A to Resolution No. 2007-007 (Revolon Slough and Beardsley Wash Trash TMDL).

¹⁰⁷ Page 44 of the Staff Report.

¹⁰⁸ Page 44 of the Staff Report.

f. Upper Santa Clara River Chloride TMDL

The Order relieves Ventura County Permittees from compliance with the chloride limits in the Upper Santa Clara River Chloride TMDL for Reaches 4B and 5 of the Santa Clara River, because the MS4s are not discharging into those Reaches. Removal is consistent with both CWA section 303(d)(4)(A)(i) and section 402(o)(B)(i).

The TMDL for Chloride in the Upper Santa Clara River was originally adopted in 2003 and went into effect in 2005. It was revised in 2008 and 2014, and the revisions went into effect in 2009 and 2015, respectively.

In drafting the Order, the Los Angeles Water Board examined the evidence and found that Ventura County Permittees have no MS4s that discharge into the chloride impaired reaches of the Upper Santa Clara River. Reach 5 falls partially within Ventura County, but Ventura County Permittees do not have any MS4 discharges to the portion of Reach 5 that falls within Ventura County.¹⁰⁹ Therefore, the Order assigns chloride WQBELs for discharges to Reach 5 exclusively to Los Angeles County Permittees draining to Reach 5. For Reach 4B, although it is completely within Ventura County¹¹⁰, there are no MS4 discharges from Ventura County Permittees to Santa Clara River Reach 4B. Removal of the limits for Ventura County MS4 Facilities in the Order is therefore consistent with CWA section 303(d)(4) because removal will have no impact on the cumulative impact or effect of chloride loading in the Upper Santa Clara River. Put differently, the “cumulative effect” of this revised WLA for Ventura County Permittees will assure attainment of the water quality objectives, since they are not discharging through their MS4s to the Upper Santa Clara River.

g. U.S. EPA Established - Santa Clara River Reach 3 Chloride TMDL

The 2010 Ventura County MS4 Permit has a WQBEL of 80 mg/L for discharges of chloride to Santa Clara River Reach 3. The Order revises the WQBEL from 80 mg/L to 100 mg/L. Revisions to WQBELs in attainment waters are permitted provided the change is consistent with the antidegradation policy pursuant to CWA section 303(d)(4)(B). The revision of the chloride WQBEL is consistent with the antidegradation policies for the following reasons:

The Santa Clara River Reach 3 Chloride TMDL intended to assign a WLA for chloride equal to the applicable water quality objective in the Basin Plan. At the time this TMDL was established on June 18, 2003, the Basin Plan Objective for Santa Clara River Reach 3 was 80 mg/L for chloride. In 2004, the Los Angeles Water Board changed the water quality objective for Santa Clara River Reach 3 from 80 mg/L to 100 mg/L (Resolution R03-015, effective on 8/4/2004). The TMDL on page 20, Section 10: Implementation Recommendations, states the following: “EPA understands that the State is in the process of reviewing and revising upward the numeric water quality objective for chloride in Santa Clara River Reach 3. Based on our review of the data used to support the State’s listing of Reach 3 for chlorides on the 2002 California Section 303(d) list, it appears possible that this Reach would

¹⁰⁹ Ventura County GIS data and MS4 drainage area maps (July 15, 2016)

¹¹⁰ Ventura County GIS data and MS4 drainage area maps (July 15, 2016)

not exceed water quality standards if the objective is raised to 100 mg/L as proposed by the State. EPA believes it would be reasonable for the State to defer full implementation of the TMDL for Reach 3 until this objective change is completed. If the State does not complete its proposed action to raise the chloride objective for Reach 3, the State should determine the appropriate means of implementing the TMDL through its NPDES permitting decisions and other programs to address nonpoint sources for which allocations are included in this TMDL”. The change to the Water Quality Objective was inadvertently not considered during the issuance of the 2010 Ventura County MS4 Permit. The Santa Clara River Reach 3 WQBEL of 80 mg/L in the 2010 Ventura County MS4 Permit has been revised to 100 mg/L in the Order to align it with the water quality objective in the Basin Plan. This is consistent with the assumptions and requirements of the TMDL to implement the applicable water quality objective, which is currently being met (see Part VI.F.2.b of this Fact Sheet). Additionally, because compliance with the revised WQBEL still requires compliance with the applicable water quality objective for this reach it will not result in degradation and is consistent with the antidegradation policies. Therefore, this revision is permissible consistent CWA section 303(d)(4)(B).

h. Santa Clara River Estuary and Reaches 3, 5, 6 and 7 Indicator Bacteria TMDL

The 2012 Los Angeles County MS4 Permit incorporated WQBELs for *E. coli* for MS4 discharges to Santa Clara River Reaches 5, 6, and 7. The WQBELs were applied at the outfalls and Permittees were not allowed any exceedance days. For Los Angeles County Permittees, this Order incorporates the following exceedance days at the outfall for the daily maximum single sample objectives:

| Constituent | Daily Maximum Single Sample Objectives for Santa Clara River Reaches 5 and above (MPN or cfu) |
|----------------|---|
| <i>E. coli</i> | 235/100 mL |

| Location | Time Period | Interim Annual Allowable Exceedance Days of the Single Sample Objectives | | |
|---------------------------------------|--|--|-----------------|--------------------------------|
| | | Daily Sampling | Weekly Sampling | 3 Wet and 2 Dry weather events |
| Santa Clara River Reaches 5 and above | Dry Weather (November 1 to October 31) | 17 | 3 | 1 |
| | Wet Weather (November 1 to October 31) | 61 | 9 | 1 |

| Location | Time Period | Final Annual Allowable Exceedance Days of the Single Sample Objectives | |
|---------------------------------------|---|--|-----------------|
| | | Daily Sampling | Weekly Sampling |
| Santa Clara River Reaches 5 and above | Dry Weather (November 1 to October 31) | 5 | 1 |
| | Wet Weather (November 1 to October 31) | 16 | 3 |

The allowable exceedance days applied at the outfalls were erroneously omitted from the 2012 Los Angeles County MS4 Permit. Implementation of allowable exceedance days at the outfall in this permit is less stringent than the previous 2012 Los Angeles County MS4 Permit because Los Angeles County Permittees may exceed the daily maximum single sample objective per the allowable exceedance days as outlined in the above tables without violating the permit. However, allowing exceedance days is consistent with the TMDL and allowed pursuant to CWA section 303(d)(4)(A) for the following reason—when the TMDL was adopted it specifically contemplated application of exceedance days at the outfall in its implementation plan. Chapter 7, section 7-36 of the Basin Plan under the heading “Monitoring to Determine Compliance”, states, “Responsible jurisdictions and agencies shall assess compliance *at the outfall monitoring sites* identified in the implementation plan. Compliance shall be based on the allowable number of *exceedance days*...” (Basin Plan, p. 7-436.) Applying the allowable exceedance days to WQBELs measured at the outfalls is therefore consistent with the assumptions and requirements of the applicable TMDL WLAs and will ensure attainment of the water quality standard. As such, this revision is permissible under CWA section 303(d)(4)(A).

J. Human Right to Water Law

The Order is consistent with Water Code section 106.3 which establishes the policy of the State of California that every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. The Order implements Water Code section 106.3 and promotes the State Water Board’s resolution adopting the human right to water as a core value and directing its implementation in Water Board programs and activities (Resolution No. 2016-0010) by requiring receiving waters to meet adopted water quality standards that are designed to protect human health and ensure that water is safe for domestic use and by regulating discharges to minimize loading to attain the highest water quality which is reasonable, considering all demands being made on those waters and the total values involved. (Water Code, sections 13000, 13050, subdivisions (i)-(m), 13240, 13241, 13263; State Water Board Resolution No. 68-16.) The Order includes actions to improve conditions for economically distressed communities and persons experiencing homelessness.

K. Advancing Measures to Mitigate and Adapt to Climate Change

The predicted impacts of climate change in Southern California include an increase in temperatures, heightened frequency of extreme weather conditions including extreme precipitation events and drought, along with sea level rise. At the local scale, within urbanized areas, these changes may directly impact groundwater and surface water

supply; drainage, flooding, and erosion patterns; economically distressed communities; and ecosystems and habitat.

In recognition of the challenges posed by climate change, the State Water Board adopted on March 7, 2017 a resolution that requires a proactive approach to climate change in all State Water Board actions, including drinking water regulation, water quality protection, and financial assistance (Resolution No. 2017-0012). The resolution lays the foundation for a response to climate change that is integrated into all State Water Board actions, by giving direction to the State Water Board divisions and encouraging coordination with the Regional Water Boards. In conjunction with the State Water Board's Resolution, the Los Angeles Water Board adopted "A Resolution to Prioritize Actions to Adapt to and Mitigate the Impacts of Climate Change on the Los Angeles Region's Water Resources and Associated Beneficial Uses" (Resolution No. R18-004) on May 10, 2018. The resolution summarizes the steps taken so far to address the impacts of climate change within the Los Angeles Water Board and lists a series of steps to move forward. These include the identification of potential regulatory adaptation and mitigation measures that could be implemented on a short-term and long-term basis by each of the Los Angeles Water Board's programs to take into account, and assist in mitigating where possible, the effects of climate change on water resources and associated beneficial uses.

In addition, Executive Order N-10-19, signed on April 29, 2019, directs the California Natural Resources Agency (CNRA), the California Environmental Protection Agency (CalEPA), and the California Department of Food and Agriculture (CDFA) to prepare a water resilience portfolio that meets the needs of California's communities, economy, and environment, and expand and/or reassess the priorities in the California Water Action Plan. The order directs agencies to prioritize multi-benefit approaches, natural infrastructure, innovation and new technologies, regional approaches, integration across state government, and partnerships across governments.

The Order follows the guiding principles of the State and Los Angeles Water Boards resolutions (No. 2017-0012 and No. R18-004) as well as Executive Order N-10-19 by contributing to an adaptive climate change and water resilience strategy. Through multi-benefit regional projects, stormwater and non-stormwater runoff can be captured, infiltrated, and used to mitigate periodic drought conditions, reduce flood hazards and erosion rates, and recharge depleted groundwater aquifers and other water supply sources, all while reducing pollutant loads, maintaining beneficial uses in receiving waters and improving community health.

While not a requirement, to maximize these types of benefits when considering different possible approaches (management practices, locations, etc.) to achieve compliance, permittees should consider climate change offsets. The relevance of long-term implementation measures in the face of a changing climate may be considered, for example, by taking into account the results of regional climate change models in stormwater models used to develop Watershed Management Programs, or by considering BMP vulnerability to climate change when designing mitigation plans.

Overall, implementation of such a strategy has multiple benefits and may contribute to enhancing local water supply, creating drought buffer reserves, and restoring habitat and watershed health.

L. California Environmental Quality Act (CEQA)

The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (CEQA) (Public Resources Code, § 21100, et seq.) pursuant to California Water Code section 13389. (County of Los Angeles v. Cal. Water Boards (2006) 143 Cal.App.4th 985.)

M. Advancing Racial Equity

In accordance with the Water Boards' Racial Equity Initiative, formally launched on August 18, 2020, the Order requires all Permittees to meet water quality standards to protect public health and the environment, thereby benefitting all persons and communities within the Region. The Los Angeles Water Board is **committed** to developing and implementing policies and programs to advance racial equity and environmental justice so that race can no longer be used to predict life outcomes, and outcomes for all groups are improved.

N. Other Plans, Policies, and Regulations

The Order implements all other applicable federal regulations and State plans, policies, and regulations.

IV. RATIONALE FOR DISCHARGE PROHIBITIONS

A. Non-Stormwater Discharges

1. Regulatory Background

The CWA employs the strategy of prohibiting the discharge of any pollutant from a point source into waters of the United States unless the discharger of the pollutant(s) obtains an NPDES permit pursuant to CWA section 402. The 1987 amendments to the CWA included section 402(p) that specifically addresses NPDES permitting requirements for municipal discharges from MS4s. Section 402(p) prohibits the discharge of pollutants from specified MS4s to waters of the United States except as authorized by an NPDES permit and identifies the substantive standards for MS4 permits. The MS4 permits (1) "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers[]" and (2) "shall require [i] controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and [ii] such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." (CWA § 402(p)(3)(B)(ii-iii).)

On November 16, 1990, U.S. EPA published regulations to implement the 1987 amendments to the CWA (55 Fed. Reg. 47990 et seq. (Nov. 16, 1990)). The regulations establish minimum requirements for MS4 permits and address both stormwater and non-stormwater discharges from MS4s; however, the minimum requirements for each are significantly different. This is evident from U.S. EPA's preamble to the stormwater regulations, which states that "Section 402(p)(B)(3) [of the CWA] requires that permits for discharges from municipal separate storm sewers require the municipality to "effectively prohibit" non-stormwater discharges from the municipal storm sewer ... Ultimately, such non-stormwater discharges through a municipal separate storm sewer system must either be removed from the system or become subject to an NPDES permit." (55 Fed.Reg. 47990, 47995

(Nov. 16, 1990).¹¹¹ U.S. EPA states that MS4 Permittees are to begin to fulfill the “effective prohibition of non-storm water discharges” requirement by: (1) conducting a screening analysis of the MS4 to provide information to develop priorities for a program to detect and remove illicit discharges, (2) implementing a program to detect and remove illicit discharges, or ensure they are covered by a separate NPDES permit, and (3) to control improper disposal into the storm sewer. (40 CFR § 122.26(d)(2)(iv)(B).) These non-stormwater discharges therefore are not subject to the MEP standard. In its precedential decision on the 2012 Los Angeles County MS4 Permit (Order WQ 2015-0075), the State Water Board affirmed that “MEP is not the standard that governs non-storm water discharges.”¹¹²

2. Definition of Non-Stormwater

Neither the CWA nor federal regulations specifically define “non-stormwater.” The definition of “non-stormwater” is derived from the definition of “stormwater.” Federal regulations define “storm water” as “storm water runoff, snow melt runoff, and surface runoff and drainage.” (40 CFR § 122.26(b)(13).) While “surface runoff and drainage” is not defined in federal law, U.S. EPA’s preamble to the federal regulations demonstrates that the term is related to precipitation events such as rain and/or snowmelt. (55 Fed.Reg. 47990, 47995-96 (Nov. 16, 1990)). For example, U.S. EPA states:

In response to the comments [on the proposed rule] which requested EPA to define the term ‘storm water’ broadly to include a number of classes of discharges which are not in any way related to precipitation events, EPA believes that this rulemaking is not an appropriate forum for addressing the appropriate regulation under the NPDES program of such non-storm water discharges Consequently, the final definition of storm water has not been expanded from what was proposed.

(*Ibid.*) The stormwater regulations themselves identify numerous categories of discharges including landscape irrigation, diverted stream flows, discharges from drinking water supplier sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, and street wash water as “non-stormwater.” While these types of discharges may be regulated under stormwater permits, they are not considered stormwater discharges. (40 CFR § 122.26(d)(2)(iv)(B)). U.S. EPA states that, “in general, municipalities will not be held responsible for prohibiting some specific components of discharges or flows . . . through their municipal separate storm sewer system, *even though such components may be considered non-storm water discharges...*” (emphasis added). However, where certain categories of non-stormwater discharges are identified by the Permittee (or the Los Angeles Water Board) as needing to be addressed, they are no longer exempt and become subject to the effective prohibition requirement in CWA section 402(p)(3)(B)(ii). This review of the stormwater regulations and U.S. EPA’s discussion of the definition of stormwater in its preamble to these regulations strongly supports the interpretation that stormwater includes only precipitation-related discharges. Therefore, non-precipitation related discharges are not

¹¹¹ U.S. EPA further states that, “[p]ermits for such [non-storm water] discharges must meet applicable technology-based and water-quality based requirements of Sections 402 and 301 of the CWA.” (55 Fed. Reg. 47990, 48037 (Nov. 16, 1990)).

¹¹² State Water Board Order WQ 2015-0075, p. 62.

stormwater discharges and, therefore, are not subject to the MEP standard in CWA section 402(p)(3)(B)(iii). Rather, non-stormwater discharges shall be effectively prohibited pursuant to CWA section 402(p)(3)(B)(ii), as discussed further in the next two sections.

While federal regulations have no definition for “non-stormwater discharges,” “illicit discharges” defined in the regulations is the most closely applicable definition and the terms are often used interchangeably. “Illicit discharge” is defined by U.S. EPA as “any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit . . . and discharges resulting from firefighting activities.”¹¹³ The program must include among other elements a program to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the MS4. The program is to address all types of illicit discharges, however the federal regulations specifically identify the following categories of non-stormwater discharges to be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR § 35.2005(20)) to separate storm sewers, uncontaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water...¹¹⁴ Accordingly, federal regulations require that non-stormwater discharges be controlled if they are a significant source of pollutants and the permitting authority is expected to include permit conditions to prohibit or control specified categories of non-stormwater discharges if they are determined to be a source of pollutants to waters of the United States.

3. Non-Stormwater Regulation

Non-stormwater discharges from the MS4 that are not authorized by separate NPDES permits, nor specifically exempted, are subject to requirements under the NPDES program, including discharge prohibitions, technology-based effluent limitations and water quality-based effluent limitations (40 CFR § 122.44). U.S. EPA’s preamble to the stormwater regulations also supports the interpretation that regulation of non-stormwater discharges through an MS4 is not limited to the MEP standard in CWA section 402(p)(3)(B)(iii):

“Today’s rule defines the term ‘illicit discharge’ to describe any discharge through a municipal separate storm sewer system that is not composed entirely of storm water and that is not covered by an NPDES permit. Such illicit discharges are not authorized under the Clean Water Act. Section 402(p)(3)(B) requires that permits for discharges from municipal separate storm sewers require the municipality to ‘effectively prohibit’ non-storm water discharges from the municipal separate storm sewer...Ultimately, such non-storm water discharges through a municipal separate storm

¹¹³ *Id.*, § 122.26(b)(2). The preamble to the regulations states: “Today’s rule defines the term ‘illicit discharge’ to describe any discharge through a municipal separate storm sewer system that is not composed entirely of storm water and that is not covered by an NPDES permit.” (55 Fed. Reg. 47990, 47995 (Nov. 16, 1990))

¹¹⁴ 40 CFR § 122.26(d)(2)(iv)(B)(1).

sewer must either be removed from the system or become subject to an NPDES permit.” (55 Fed.Reg. 47990, 47995.)

In its 1990 rulemaking, U.S. EPA explained that the illicit discharge detection and elimination program requirement was intended to begin to implement the Clean Water Act’s provision requiring permits to “effectively prohibit non-stormwater discharges,” indicating that the illicit discharge detection and elimination program requirement did not constitute the full manifestation of this provision (55 Fed.Reg. 47990, 47995; see also 40 CFR § 122.26(d)(2)(i).)

U.S. EPA’s preamble to its 1990 Phase I MS4 regulations explain that the “effective prohibition” means that non-stormwater discharges to MS4s require separate NPDES permits, and that such permits must meet applicable requirements of CWA sections 402 and 301, including water quality-based requirements.¹¹⁵ In response to public comments suggesting that certain types of non-stormwater discharges should not be prohibited in such a manner because they did not pose significant environmental problems, U.S. EPA stated that “[it] disagrees that the above described flows will not pose, in every case, significant environmental problems.” U.S. EPA goes on to state that “[it] is clarifying that section 402(p)(3)(B) of the CWA (which requires permits for municipal separate storm sewers to ‘effectively’ prohibit non-storm water discharges) does not require permits for municipalities to prohibit certain discharges or flows of non-storm water to waters of the United States through municipal separate storm sewers in all cases.”¹¹⁶ U.S. EPA clarified that the permitting authority (i.e., the Los Angeles Water Board here) “may include permit conditions that either require municipalities to prohibit or otherwise control any of these types of discharges where appropriate.”¹¹⁷ In addition, U.S. EPA’s MS4 Permit Improvement Guide includes the following example of MS4 permit language addressing the Permittee’s authority to require compliance by Dischargers: “Authority to Require Compliance – Require compliance with conditions in the permittee’s ordinances, permits, contracts, or orders (i.e., hold dischargers accountable for their contributions of pollutants and flows).”¹¹⁸

Notably, the alternative to conditional exemptions to discharge prohibitions in the Order is a conservative interpretation of CWA section 402(p)(3)(B)(ii), which is to require Permittees to effectively prohibit *all* non-stormwater discharges. However, this alternative is more stringent than that provided in the Order (and previous permits) and, Permittees may incur more costs to implement a prohibition of all non-stormwater discharges than to implement or ensure implementation of specified BMPs to address non-stormwater discharges that are conditionally exempt from the discharge prohibition. An example of this is implementing an effective prohibition of landscape irrigation runoff as compared to implementing a local ordinance addressing landscape irrigation efficiency along with public outreach regarding use of drought tolerant landscaping and integrated pest management to minimize landscape irrigation runoff and associated pollutants.

4. Implementation of the Effective Prohibition on Non-Stormwater Discharges

Consistent with previous MS4 permits, Part III.A of the Order requires each Permittee, for the portion of the MS4 for which it is an owner or operator, to prohibit

¹¹⁵ *Id.*, at p. 48036-48037.

¹¹⁶ *Id.*, at p. 48037.

¹¹⁷ *Id.*, at p. 48037.

¹¹⁸ U.S. EPA. *MS4 Improvement Guide* (2010), p. 11.

non-stormwater discharges through the MS4 to receiving waters except where such discharges are specifically authorized or conditionally exempt. For nearly two decades, some permittees have raised concerns with the Los Angeles Water Board's use of "through the MS4" or similar language, alleging that the Los Angeles Water Board can only prohibit or regulate non-stormwater discharges "into" the MS4 and not "from" the MS4. The Los Angeles Water Board once again concludes that its usage of "through the MS4" is appropriate to implement the CWA's effective prohibition of non-stormwater discharges.

U.S. EPA regulations and its 1990 preamble to the Phase I MS4 regulations use the terms "into," "to," "through," and "from" the MS4 interchangeably when describing the federal requirement to effectively prohibit non-stormwater discharges. As noted previously, federal regulations define illicit discharges as "any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit..."¹¹⁹ U.S. EPA in its 1990 preamble states that "[t]hese [MS4] permits are to...effectively prohibit non-storm water discharges to the municipal separate storm sewer system," and that "[t]oday's rule defines the term 'illicit discharge' to describe any discharge through a municipal separate storm sewer that is not composed entirely of storm water and that is not covered by an NPDES permit. Such illicit discharges are not authorized under the CWA. Section 402(p)(3)(B) of the CWA requires that permits for discharges from municipal separate storm sewers require the municipality to 'effectively prohibit' non-storm water discharges from the municipal separate storm sewer... Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit."¹²⁰ Further on, U.S. EPA states that "[t]he CWA prohibits the point source discharge of non-storm water not subject to an NPDES permit through municipal separate storm sewers to waters of the United States."¹²¹ In addressing comments related to various types of non-stormwater discharges, U.S. EPA again uses "through" to describe the nature of the non-stormwater discharge prohibition, stating with regard to street wash waters that "such discharges...must be addressed by municipal management programs as part of the prohibition on non-storm water discharges through municipal separate storm sewer systems."¹²² Congress' intent and U.S. EPA's phraseology in its own regulations therefore support the Los Angeles Water Board's interpretation that there is no meaningful difference with these terms, and that permittees must have adequate legal authority to control non-stormwater discharges into and from a portion of an MS4 for which it is an owner or operator.

When commenting on a draft version of the 2012 Los Angeles County MS4 Permit, U.S. EPA supported the non-stormwater discharge prohibition, which has been carried over in this Regional MS4 Permit. U.S. EPA stated:

We understand that concerns have been raised specifically on Section III.A.1 of the draft permit which requires that the permittee prohibit certain non-stormwater discharges "through" the MS4 while Section 402(p)(3)(B)(ii) of the Clean Water Act requires that the permittee prohibit discharges "into" the MS4. We support the Board's proposed language

¹¹⁹ 40 CFR § 122.26(b)(2).

¹²⁰ 55 Fed. Reg. 47990, 47995 (Nov. 16, 1990).

¹²¹ *Id.*, at p. 47996.

¹²² *Id.*, at p. 47990, 47996.

on this issue. We would note that the preamble to EPA’s 1990 stormwater regulations (55 FR 47995) itself uses the word “through” in describing the discharges which are to be prohibited. We believe this is in recognition of the fact that a discharge “into” the MS4 is tantamount to a discharge “through” the MS4 to receiving waters since the principal purpose of an MS4 is conveyance of water.¹²³

Furthermore, the Los Angeles County Superior Court upheld the language in the 2001 Los Angeles County MS4 Permit and rejected the “into” versus “from” argument where the court stated:

[A]lthough this Court recognizes that it may not always be possible to prevent something from going into the system, it probably is the cheapest method. If something does not go in, then there is no concern about it coming out the other end. If the contaminant does not enter the system, there is no need to process it at the end of the system.¹²⁴

The court further stated that the permit’s “regulation of what goes ‘into’ the storm drain does not take away from the [Permittees’] rights and needs to control the process” and set regional controls.¹²⁵

Additionally, in Order WQ 2015-0075, the State Water Board agreed with the Los Angeles Water Board and found “the variation in language to be a distinction without a difference.” It concluded “[w]hether the Los Angeles MS4 Order prohibits non-storm water discharges *into the MS4* or *through the MS4 to receiving waters*, the intent and effect of the prohibition is to prevent non-exempt non-storm water discharges from reaching the receiving waters. The legal standard governing non-storm water – effective prohibition – is not altered because the Los Angeles MS4 Order imposes the prohibition at the point of entry into the receiving water rather than the point of entry into the MS4 itself. Instructively, U.S. EPA has used the terms “into,” “from,” and “through” interchangeably when describing the prohibition.”¹²⁶

5. Authorized and Conditionally Exempt Non-Stormwater Discharges

The Order carries over provisions from previous permits exempting a limited number of authorized and conditionally exempt non-stormwater discharges from the discharge prohibition. Authorized non-stormwater discharges are those that are separately regulated by an individual or general NPDES permit, or by WDRs or a conditional waiver of WDRs for non-stormwater discharges from agricultural lands. The conditionally exempt non-stormwater discharges are only exempt provided the discharge complies with the conditions set forth in the Order. In general, these conditions require Permittees to implement, or ensure that a discharger if not a named Permittee in the Order implements, BMPs to ensure that the non-stormwater discharges are not a source of pollutants to waters of the United States. Conditions established in the Order for each of the non-stormwater discharge

¹²³ U.S. EPA Comments on Draft MS4 Permit for Los Angeles County (July 23, 2012).

¹²⁴ *In re Los Angeles County Municipal Storm Water Permit Litigation* (Sup. Ct. Los Angeles County, March 24, 2005, Case No. BS 080548), Statement of Decision from Phase I Trial on Petitions for Writ of Mandate.

¹²⁵ *Id.*, at p. 17.

¹²⁶ State Water Board Order WQ 2015-0075, p. 61.

categories ensure the protection of receiving water quality and are considered common practices.

The list of authorized and conditionally exempt non-stormwater discharges is similar, but not identical, to the previous permits. The Order conforms the exemptions for Ventura County, Los Angeles County, and the City of Long Beach and most closely matches provisions in the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit. The primary changes are as follows:

- The Order carries over the 2010 Ventura County MS4 Permit's exemption for discharges from irrigated agriculture covered by WDRs or a conditional waiver of WDRs;
- The Order carries over the 2014 City of Long Beach MS4 Permit's exemption for short-term releases of potable water with no dyes or additives for filming purposes;
- The Order removes references to U.S. EPA from the exemption for temporary non-stormwater discharges authorized pursuant to section 104(a) or 104(b) of CERCLA because the federal response authorities in these sections has been delegated to a number of federal agencies including, but not limited to, U.S. EPA. For example, the Department of Defense, the Department of the Interior, and the Department of Transportation are all delegated with these federal response authorities;
- The Order does not carry over usage of the term "flows incidental to urban activities" from the 2010 Ventura County MS4 Permit to describe certain conditionally exempt discharges. Although the terminology is different, the categories of conditionally exempt discharges are the largely the same, except as described below.
- The Order eliminates the conditional exemptions in the 2010 Ventura County MS4 Permit for air conditioning condensate because the Los Angeles Water Board determined that these discharges were more appropriately regulated under a general permit. NPDES Permit No. CAG994003, Discharges of Nonprocess Wastewater to Surface Waters in Coastal Watershed of Los Angeles and Ventura Counties, was most recently reissued in 2014.
- The Order eliminates the conditional exemptions in the 2010 Ventura County MS4 Permit for gravity flows from foundation, footing, and crawl space drains because the Los Angeles Water Board determined that these discharges were more appropriately regulated under a general permit. NPDES Permit No. CAG994004, Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, was most recently reissued in 2018.
- The Order eliminates the non-stormwater action levels (NALs) included in the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit. These NALs had been included as a means to identify the potential need for additional controls for non-stormwater discharges in the future. The inclusion of NALs is redundant with other permit requirements such as the non-stormwater discharge prohibition and WQBELs for non-stormwater discharges.

6. Specific Provisions

Part III.A.2.a-e (Non-Stormwater Discharges Not Subject to Discharge Prohibition). These provisions identify the types of non-stormwater discharges that are not subject to the discharge prohibition. The intent of this provision is to exempt certain non-stormwater discharges through the MS4 because they are separately regulated by another NPDES permit or permit equivalent, they are emergency discharges, or they are natural flows. The State Water Board and Los Angeles Water Board general NPDES permits that are used to regulate authorized non-stormwater discharges that are routinely discharged through the MS4 are, for the most part, listed in Table F-22 below.

Table F-22. General NPDES Permits, WDRs and Conditional Waivers Applicable to Non-Stormwater Discharges

| NPDES Permit No. or Order No. | Applicable Types of Discharges |
|---|---|
| NPDES Permit No. CAG994003 – Discharges of Nonprocess Wastewater to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties | <ul style="list-style-type: none"> • Ground water seepage • Uncontaminated pumped ground water • Gravity flow from foundation drains, footing drains, and crawl space pumps • Air conditioning condensate • Discharges of cleaning wastewater and filter backwash |
| NPDES Permit No. CAG994004 – Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties | <ul style="list-style-type: none"> • Uncontaminated pumped ground water • Discharges from activities that occur at wellheads, such as well construction, well development (e.g., aquifer pumping tests, well purging), or major well maintenance • Gravity flow from foundation drains, footing drains, and crawl space pumps • Discharges of ground water from construction and project dewatering¹²⁷ |
| NPDES Permit No. CAG990002 – Discharges from Utility Vaults and Underground Structures to Surface Waters | <ul style="list-style-type: none"> • Uncontaminated pumped ground water • Gravity flow from foundation drains, footing drains, and crawl space pumps |
| NPDES Permit No. CAG674001 – Discharges from Hydrostatic Test Water to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties | <ul style="list-style-type: none"> • Discharges of low threat hydrostatic test water¹²⁸ |

¹²⁷ Discharges of ground water from construction and project dewatering include treated or untreated wastewater from permanent or temporary construction dewatering operations; ground water pumped as an aid in the containment and/or cleanup of a contaminant plume; ground water extracted during short-term and long-term pumping/aquifer tests; ground water generated from well drilling, construction or development and purging of wells; equipment decontamination water; subterranean seepage dewatering; incidental collected stormwater from basements; and other process and non-process wastewater discharges that meet the eligibility criteria and could not be covered under another specific general NPDES permit.

¹²⁸ Low threat hydrostatic test water means discharges resulting from the hydrostatic testing or structural integrity testing of pipes, tanks, or any storage vessels using domestic water or from the repair and maintenance of pipes, tanks, or reservoirs.

| | |
|--|---|
| <p>NPDES Permit No. CAG914001 – Discharges of Treated Groundwater from Investigation and/or Cleanup of Volatile Organic Compounds Contaminated-Sites to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties</p> | <ul style="list-style-type: none"> • Discharges of treated ground water from investigation and/or cleanup of volatile organic compound (VOC) contaminated sites |
| <p>NPDES Permit No. CAG834001 – Discharges of Treated Groundwater and Other Wastewaters from Investigation and/or Cleanup of Petroleum Fuel-Contaminated Sites to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties</p> | <ul style="list-style-type: none"> • Discharges of treated groundwater and other wastewaters from investigation and/or cleanup of petroleum fuel-related contamination arising from current and former leaking underground storage tank sites or similar operations |
| <p>NPDES Permit No. CAG994006 – Discharges of Groundwater from San Gabriel Valley Groundwater Basin to Surface Water in the Upper San Gabriel River and Rio Hondo Watersheds – Los Angeles County</p> | <ul style="list-style-type: none"> • Discharges from well startup operations and testing of groundwater treatment facilities in the San Gabriel Valley watersheds |
| <p>NPDES Permit No. CAG140001 – Drinking Water System Discharges to Waters of the U.S.</p> | <ul style="list-style-type: none"> • Discharges from drinking water systems¹²⁹ |
| <p>NPDES Permit No. CAG990004 – Biological and Residual Pesticide Discharges from Vector Control Applications</p> | <ul style="list-style-type: none"> • Discharges of residual pesticides from the application of minimal risk pesticides, which are pesticides that USEPA has exempted from FIFRA requirements when used only in the manner specified in 40 CFR section 152.25, including residuals from larvicides and adulticides that are currently registered in California and minimum risk pesticide products. |
| <p>NPDES Permit No. CAG990005 – Residual Aquatic Pesticide Discharges to Waters of the United States from Algae and Aquatic Weed Control Applications</p> | <ul style="list-style-type: none"> • Discharges of residues resulting from pesticide applications using products registered for use in California containing 2,4-D, acrolein, copper, diquat, endothall, fluridone, glyphosate, imazamox, imazapyr, penoxsulam, sodium carbonate peroxyhydrate, and triclopyr-based algaecides and aquatic herbicides, and adjuvants containing ingredients |

¹²⁹ Discharges covered by this permit include discharges from drinking water systems generated during the following activities: ground water supply well flushing or pump-to-waste; ground water well development, rehabilitation, and testing; ground water monitoring for purpose of supply well development, rehabilitation and testing; trench dewatering of drinking water during planned repairs; transmission system installation, cleaning, and testing; water treatment plant operations (excluding filter backwash that is discharged to a water of the U.S.); distribution system storage tank or reservoir releases; distribution system dewatering, flushing, and pressure testing; fire flow / fire hydrant testing; meter testing; automated water analyzers operations; pressure relief valves; and unscheduled activities that must be undertaken to comply with mandates of the Federal Drinking Water Act and California Health and Safety Code.

| | |
|---|--|
| | represented by the surrogate nonylphenol. |
| Order No. R4-2016-0143 – Conditional Waiver for Discharges from Irrigated Lands | <ul style="list-style-type: none"> • Discharges from irrigated agricultural lands, including lands planted for row, vineyard, pasture, field and tree crops, nurseries, nursery stock production, wholesale nurseries, and greenhouse operations with permeable floors, which are not subject to WDRs, including a MS4 permit or other NPDES permit |

The Order also exempts temporary non-stormwater discharges authorized pursuant to sections 104(a) or 104(b) of the federal Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). These discharges typically consist of short-term, high volume discharges resulting from the development or redevelopment of groundwater extraction wells, or federal or State-required compliance testing of potable water treatment plants, as part of a groundwater remediation action authorized under CERCLA. These discharges through the MS4 are only authorized if: (i) the discharge will comply with water quality standards identified as applicable or relevant and appropriate requirements (“ARARs”) under section 121(d)(2) of CERCLA; or (ii) the discharge is subject to either (a) a written waiver of ARARs pursuant to section 121(d)(4) of CERCLA or (b) a written determination that compliance with ARARs is not practicable considering the exigencies of the situation, pursuant to 40 CFR section 300.415(j). Exempting these discharges is appropriate because, as noted above, the discharges must comply with water quality standards, which are identified as ARARs, or must be subject to a written waiver of ARARs based on one or more factors identified in 42 U.S.C § 9621(d)(2) or determination that compliance with ARARs is not practicable given the urgency of the situation and scope of the action among other factors. Additionally, a decision to authorize a discharge through the MS4 to surface waters will not be made by U.S. EPA or another federal agency without first conducting a comprehensive evaluation of containment, treatment, reinjection, or re-use options for the water generated from the subject wells. If a decision to discharge through the MS4 is made, such authorization of the discharge under CERCLA will require that the discharger shall:

- a. Implement BMPs to minimize the rate and duration of the discharge and remove excessive solids and implement other on-site physical treatment where feasible;
 - i. Promote infiltration of discharged water in locations that will prevent or minimize degradation of groundwater quality;
 - ii. Notify the affected MS4 Permittees, including Ventura County Watershed Protection District and Los Angeles County Flood Control District, and the MS4 Permittee with land use authority over the discharge location, and the Los Angeles Water Board at least one week prior to a planned discharge (unless U.S. EPA determines in writing that exigent circumstances require a shorter notice period) and as soon as possible (but no later than 24 hours after the discharge has occurred) for unplanned discharges;

- iii. Monitor any pollutants of concern in the discharge;¹³⁰ and
- iv. Maintain records for all discharges greater than 100,000 gallons.¹³¹

The Order continues to unconditionally exempt non-stormwater discharges from emergency firefighting activities (i.e., flows necessary for the protection of life or property) from the discharge prohibition. Discharges from vehicle washing of firefighting vehicles, building fire suppression system maintenance and testing (e.g., sprinkler line flushing), fire hydrant maintenance and testing, and other routine maintenance activities are not considered emergency firefighting activities. Additionally, the Order distinguishes between emergency and non-emergency firefighting flows. Essential non-emergency firefighting flows are still eligible for a conditional exemption as discussed below.

Natural flows not subject to the non-stormwater discharge prohibition in the Order include natural springs, flows from riparian habitats and wetlands, diverted stream flows authorized by the State Water Board or the Los Angeles Water Board, uncontaminated groundwater infiltration, and rising groundwater where groundwater seepage is not otherwise covered by a NPDES permit. These discharges are not considered a potential source of pollutants.

Part III.A.3.(a-b) (Conditionally Exempt Non-Stormwater Discharges). These provisions identify the types of non-stormwater discharges that are conditionally exempt from the discharge prohibition. For non-stormwater discharges to be conditionally exempt from the discharge prohibition, the Permittees must identify appropriate BMPs, monitor and report on the non-stormwater discharges where applicable, and ensure implementation of effective control measures as discussed in subpart 7 below.

The Order separately identifies flows from non-emergency firefighting activities, discharges from drinking water supplier distribution systems, and potable wash water used to clean reservoir covers as “conditionally exempt essential” non-stormwater discharges rather than combining them into the same category as the other conditionally exempt non-stormwater discharges. In doing so, the Los Angeles Water Board recognizes that these discharges are essential public service discharge activities and are directly or indirectly required by other state or federal statutes and/or regulations as done in the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit. Note that the 2010 Ventura County MS4 Permit had an exemption for flows from firefighting activities but did not include a category for discharges from drinking water supplier distribution systems. Additionally, consistent with the California Ocean Plan, the Order imposes

¹³⁰ Pollutants of concern include, at a minimum, trash and debris, including organic matter, TSS, any pollutant being addressed by the groundwater remediation action under CERCLA, and any pollutant for which there is a Water Quality Based Effluent Limitation in Part IV of the Order applicable to discharges from the MS4 to the receiving water.

¹³¹ Records shall be maintained, as appropriate, on the: name of CERCLA authorized discharger, date and time of notification (for planned discharges), method of notification, location of discharge, discharge pathway, receiving water, date of discharge, time of the beginning and end of the discharge, duration of the discharge, flow rate or velocity, estimated total number of gallons discharged, type of pollutant removal equipment used, type of dechlorination equipment used if applicable, type of dechlorination chemicals used if applicable, concentration of residual chlorine if applicable, type(s) of sediment controls used, and field and laboratory monitoring data. Records shall be retained for three years, unless the Los Angeles Water Board requests a longer record retention period and shall be made available upon request by the MS4 Permittee or the Los Angeles Water Board.

additional requirements on conditionally exempt non-stormwater discharges for direct discharges to Areas of Special Biological Significance (ASBS).

If any of the conditionally exempt non-stormwater discharges are identified as being a potential source of pollutants, the Order contains a provision that the Los Angeles Water Board, based on an evaluation of monitoring data and other relevant information including TMDLs and antidegradation policies, may require that a discharger obtain coverage under a separate individual or general State Water Board or Los Angeles Water Board NPDES permit for the non-stormwater discharge or may require that the Permittee ensures that the discharger implements additional conditions specified or approved by the Executive Officer to ensure that the discharge is not a source of pollutants.

7. BMPs for Non-Stormwater Discharges

To eliminate adverse impacts from conditionally exempt non-stormwater discharges, Permittees are required to implement appropriate BMPs, or ensure that a discharger not named as a Permittee in the Order implements appropriate BMPs consistent with the requirements in Part III.A.5 of the Order. The Order contains language carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit that specifies certain conditions, including implementation of BMPs, for each category of conditionally exempt non-stormwater discharge that must be met in order for the non-stormwater discharge to be exempted from the non-stormwater discharge prohibition and thus allowed through the MS4. The 2010 Ventura County MS4 Permit also included similar conditions. The intent of these provisions is to ensure that Permittees implement BMPs consistent with common practice. The Los Angeles Water Board has included applicable guidance documents where appropriate.

One such example is that Permittees must develop and implement procedures to ensure that drinking water system owners/operators drinking water system owners/operators that may discharge amounts greater than 100,000 gallons to the Permittee's MS4: (1) provide notification at least 72 hours prior to a planned discharge and as soon as possible after an unplanned discharge; (2) monitor any pollutants of concern in the drinking water system discharge; (3) keep records; and (4) implement appropriate BMPs based on the American Water Works Association (California-Nevada Section) *Guidelines for the Development of Your Best Management Practices (BMP) Manual for Drinking Water System Releases* (2005) or equivalent industry standard BMP manual.

The Statewide Recycled Water Policy, adopted by the State Water Board through Resolution No. 2009-0011, and amended by Resolution No. 2013-0003 and Resolution No. 2018-0057, encourages the safe use of recycled water from wastewater sources that meets the definition in California Water Code section 13050(n), in a manner that implements state and federal water quality laws and protects public health and the environment. The conditions for non-stormwater discharges related to landscape irrigation using potable water and landscape irrigation using reclaimed water were carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit and emphasize the control of incidental runoff from landscape irrigation. Consistent with the Recycled Water Policy, the BMPs incorporated into the Order for potable landscape irrigation ensure that water is conserved, overspray and over irrigation

causing incidental runoff is minimized, and exposure to landscape related pollutants is minimized.

State Water Board Water Quality Order No. 2009-0006-DWQ, General Waste Discharge Requirements for Landscape Irrigation Uses of Municipal Recycled Water, is a general permit for producers and distributors of recycled water for landscape irrigation uses. As part of that general permit, the producers and distributors of recycled water for landscape irrigation are required to develop an Operations and Maintenance Plan (O&M Plan) that includes an Operations Plan and an Irrigation Management Plan. Therefore, any landscape irrigation discharges of reclaimed wastewater to the MS4 must comply with the relevant portion of the O&M Plan including the Irrigation Management Plan. By explicitly referencing the O&M requirement in that general permit, it centralizes the requirements for landscape irrigation using reclaimed wastewater and helps to ensure that procedures are in place for conserving water, minimizing incidental runoff, and minimizing exposure to landscape related pollutants.

Non-stormwater discharge provisions have been carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit for the dewatering of lakes to the MS4. The provisions for the dewatering of lakes including removing and legally disposing of all visible trash on the shoreline or on the surface of the lake and the cleaning of the MS4 inlet and outlet where the water will be discharged to the receiving water have been consistently incorporated into Los Angeles Water Board authorizations to discharge non-stormwater from lakes, reservoirs, and ponds. In addition, provisions for volumetrically and velocity controlling discharges as well as taking measurements to stabilize lake bottom sediments are carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit to the Order to ensure that turbidity in receiving waters due to the discharge is minimized. The permit provisions for the dewatering of lakes ensure the protection of receiving water quality.

Consistent with the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit, Basin Plan requirements for residual chlorine have been explicitly included in the conditions for drinking water supplier distribution system releases, dechlorinated/debrominated swimming pool/spa discharges, and dewatering of decorative fountains.¹³²

Specific BMPs for discharges from swimming pools/spas and the dewatering of decorative fountains have been carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit to the Order, including prohibiting the dewatering of swimming pools/spas or decorative fountains containing copper-based algaecides and requiring the implementation of controls to prevent introduction of pollutants prior to discharge. Swimming pool/spa discharges and decorative fountain water must be dechlorinated or debrominated using holding time, aeration, and/or sodium thiosulfate and if necessary, shall be pH adjusted to within the range of 6.5 and 8.5. The MS4 inlet and outlet must be inspected and cleaned out immediately prior to discharge to protect receiving water

¹³² Swimming pool discharges explicitly excludes discharges of cleaning wastewater and filter backwash. However, these discharges are considered exempt non-stormwater discharges if the discharge meets the eligibility requirements and obtains coverage under the Los Angeles Water Board's general permit for discharges of nonprocess wastewater to surface waters in coastal watersheds of Los Angeles and Ventura counties (NPDES Permit No. CAG994003).

quality. In addition, provisions for volumetrically and velocity controlling discharges are carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit to the Order to ensure that turbidity in receiving waters due to the discharge is minimized.

In addition to the specific inclusion of the Basin Plan water quality objective for residual chlorine, the Order allows discharges of drinking water supplier distribution system releases as long as specified BMPs are implemented. BMPs must be implemented to prevent introduction of pollutants to drinking water supplier distribution system releases prior to discharge to the receiving water. BMPs must be consistent with the American Water Works Association (California – Nevada Section) BMP Manual for Drinking Water System Releases or other equivalent industry standard BMP manual. This requirement therefore gives Permittees flexibility to design their own program by choosing their BMP manual to address non-stormwater discharges from drinking water supplier distribution systems. Similar to discharges from swimming pools/spas and dewatering of decorative fountains, drinking water supplier distribution system releases must be dechlorinated or debrominated using holding time, aeration, and/or sodium thiosulfate and if necessary, shall be pH adjusted to within the range of 6.5 and 8.5. The MS4 inlet and outlet must be inspected and cleaned out immediately prior to discharge to protect receiving water quality. BMPs such as sandbags or gravel bags, or other appropriate means shall be utilized to prevent sediment transport and all sediment shall be collected and disposed of in a legal and appropriate manner. Additional provisions for volumetrically and velocity controlling discharges are carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 permit to the Regional MS4 Permit to ensure that turbidity in receiving waters due to the discharge is minimized. The permit provisions for drinking water supply and distribution system releases, dechlorinated/debrominated swimming pool/spa discharges, and dewatering of decorative fountains ensures the protection of receiving water quality.

Potable wash water used to clean reservoir covers is included in the Order as a conditionally exempt non-essential non-stormwater discharge. This requirement and the corresponding BMPs were carried over from the 2014 City of Long Beach MS4 Permit. Provisions and BMPs for potable wash water used to clean reservoir covers is pursuant to The Final Long Term 2 Enhanced Surface Water Treatment Rule (EPA 815-R06-005 February 2006), which includes requirements for “Systems that store treated water in open reservoirs [where the systems] must either cover the reservoir or treat the reservoir discharge to inactivate 4-log virus, 3-log *Giardia lamblia*, and 2-log *Cryptosporidium*.”¹³³ The provisions and BMPs are also pursuant to the Safe Drinking Water Act (SDWA).

The Los Angeles Water Board evaluated and established a list of approved BMPs for various programs and activities through Los Angeles Water Board Resolution 98-08 that serves as appropriate BMPs for inclusion in the discharger and Permittees’ regulatory programs. Requirements for street/sidewalk wash water contained in Resolution 98-08 have been explicitly incorporated into the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit and

¹³³ U.S. EPA. Fact Sheet - Long Term 2 Enhanced Surface Water Treatment Rule. December 2005. EPA 815-F-05-009.

have been carried over to the Order. The inclusion of the requirements originally identified in Resolution 98-08 ensures the protection of receiving water quality.

Specific BMPs for discharges from non-commercial car washing have been carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit to the Order to prevent the introduction of pollutants prior to discharge. BMPs that must be implemented for the discharge of non-commercial vehicle wash water include minimizing the amount of water used by turning off nozzles or kinking the hose when not spraying a vehicle and by using a low-volume pressure washer; using biodegradable, phosphate free detergents and non-toxic cleaning products; where possible, washing vehicles on permeable surfaces where wash water can percolate into the ground; creating a temporary berm or block off the storm drains; using pumps or vacuums to direct water to pervious areas; and emptying buckets of soapy water or rinse water into the sanitary sewer system. These BMPs are common practice and ensure the protection of receiving water quality.

Discharges resulting from essential non-emergency firefighting activities have been carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit to the Order. Similar BMPs have been incorporated into other California MS4 permits. For example, both the Riverside County and Orange County MS4 permits require the development and implementation of a program to address pollutants from non-emergency firefighting flows. Rather than develop a program to address non-emergency firefighting discharges, Permittees may implement the BMPs contained in the Best Management Practices Plan for Urban Runoff Management for Participating Riverside County Fire Fighting Agencies or an equivalent guidance manual.

The inclusion of specific conditions for conditionally exempted non-stormwater discharges in the Order centralizes the requirements for non-stormwater discharges. Conditions established in the Order for each of the conditionally exempt non-stormwater discharge categories are common practice and have been incorporated into other area MS4 permits.

8. Permittee Requirements for Non-Stormwater Discharges

The Order includes specific requirements for Permittees related to targeted screening of MS4 outfalls for non-stormwater discharges, and monitoring and evaluation of significant non-stormwater discharges. Permittees are required to develop and implement procedures to ensure that all conditions required for conditionally exempt non-stormwater discharges are being implemented. These requirements were carried over from the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit to help clarify the responsibilities of the Permittees versus the responsibilities of the non-MS4 Permittee dischargers to the MS4. The development and implementation of these procedures helps to ensure compliance with the non-stormwater discharge prohibition and ensure that the non-stormwater discharges are not sources of pollutants.

9. Compliance Demonstration

A Permittee's implementation of program elements and control measures to effectively eliminate prohibited non-stormwater discharges will be considered as evidence of whether a Permittee is complying with the non-stormwater discharge prohibition in Part III.A of the Order. Where a Permittee is fully implementing its

Illicit Connections and Illicit Discharges Elimination Program, either pursuant to Part VIII.I of the Order, or by incorporation of customized actions into a WMP as approved by the Los Angeles Water Board (see Part IX.B of the Order), the Los Angeles Water Board would conduct a fact-specific analysis of the nature and source of the unauthorized non-stormwater discharge and the efforts of the Permittee to prohibit the discharge in support of any enforcement action under Part III.A of the Order.

B. Trash

1. Federal Requirements

Federal regulations identify the need to develop, implement, and enforce controls to reduce the discharge of pollutants from MS4s.¹³⁴ Federal regulations further specify that Permittees must include in their management program maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from MS4s.¹³⁵ The highlighting of floatables is pertinent since a significant portion of trash is characteristic of, and within the category of, floatable pollutants. Municipal trash management programs are discussed in federal documents including U.S. EPA's Stormwater Menu of BMPs fact sheet on Trash and Debris Management.¹³⁶ This fact sheet highlights source control and structural control techniques to manage trash.

2. Statewide Trash Amendments

On April 7, 2015, the State Water Board adopted Part 1 Trash Provisions (Trash Provisions) of the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California (ISWEBE Plan) and an amendment to the Ocean Plan to control trash. Together, these amendments are referred to as the Trash Amendments or Trash Provisions. The Trash Amendments establish a water quality objective, a prohibition on the discharge of trash, and implementation requirements to control trash. The Trash Amendments were approved by OAL on December 2, 2015 and by U.S. EPA on January 12, 2016.

3. Applicability

The Trash Amendments apply to all waters of the State, except waters in the Los Angeles Region in which a TMDL for trash was in effect prior to the effective date of the Trash Amendments.¹³⁷

¹³⁴ 40 CFR § 122.26(d)(2)(iv).

¹³⁵ *Id.*, subd. (d)(2)(iv)(A)(1).

¹³⁶ U.S. EPA. Trash and Debris Management, Public Education and Outreach on Stormwater Impacts: Education for Homeowners.

¹³⁷ While the Trash Amendments do not apply to waters addressed by existing trash TMDLs in the Los Angeles Region, the Trash Amendments directed the Los Angeles Water Board to reconsider the scope of its trash TMDLs, except for the Los Angeles River Watershed and Ballona Creek Trash TMDLs, within one year of the Trash Amendments' effective date. The Los Angeles Water Board held an initial public meeting to consider its trash TMDLs on November 28, 2016. On June 14, 2018 the Los Angeles Water Board adopted revisions to the Malibu Creek Watershed Trash TMDL and the Revolon Slough and Beardsley Wash Trash TMDL to align them with the Trash Amendments. On March 14, 2019 the Los Angeles Water Board adopted a resolution finding that the Santa Monica Bay Nearshore and Offshore Debris TMDL and the Machado Lake Trash TMDL could not be aligned with the Trash Amendments. On June 13, 2019 the Los Angeles Water Board adopted a resolution finding that the Ventura River Estuary

The Order incorporates the Trash Amendments in all areas not addressed by an existing trash TMDL. For areas addressed by an existing trash TMDL, the Order requires Permittees to comply with the appropriate TMDL-based trash WQBELS specified in Part IV.B.3 of the Order.

4. Implementation

The Trash Amendments require NPDES permits regulating MS4 permittees with regulatory authority over priority land uses (PLUs) to include provisions to prohibit the discharge of trash in Waters of the United States. Permittees may elect to comply with the trash prohibition under one of two compliance tracks. Under Track 1, a Permittee must install, operate, and maintain full capture systems for storm drains that capture runoff from priority land uses in their respective jurisdictions. Under Track 2, a Permittee must install, operate, and maintain any combination of full capture systems, multi-benefit projects, treatment controls and/or institutional controls. Permittees outside of or lacking land use authority over PLUs do not have to implement the trash prohibition unless directed to by the Los Angeles Water Board as described in the discussion of designated land use areas below.

Prior to the issuance of the Order, and as contemplated by the Trash Amendments, on August 18, 2017, the Los Angeles Water Board issued California Water Code Section 13383 Orders to Permittees whose jurisdictional areas are not fully addressed by an existing trash TMDL. These California Water Code Section 13383 Orders required Permittees to submit: (1) a letter identifying the Permittee's selected compliance option (Track 1 or Track 2) to comply with the Trash Provisions by November 20, 2017; and (2) supporting documents based on the compliance option selected by February 18, 2019. The supporting documents for Permittees selecting Track 1 included the following. For Permittees selecting Track 1, a jurisdictional or watershed map(s) identifying 1) all PLU areas discharging to the storm drain network; 2) any drainage areas addressed by existing trash TMDLs; 3) the corresponding storm drain network; 4) proposed locations of all certified full capture systems; and 5) proposed equivalent alternative land uses, documentation demonstrating that the substitution of equivalent alternative land uses has been approved by the Los Angeles Water Board Executive Officer, and corresponding storm drainage network, if applicable. The supporting documents for Permittees selecting Track 2 generally included a jurisdictional map(s) identifying the provisions 1-3 mentioned above as well as locations or land uses where a combination of controls will be implemented to achieve full capture system equivalency (see Attachment A for a definition of this term) and an assessment of trash levels for all PLUs and for other selected locations or land uses within the MS4s jurisdiction if proposing to implement any combination of controls in locations other than PLUs. In addition, Permittees selecting Track 2 were also required to submit an implementation plan that included requirements similar to the ones included in Part III.B.2.b of the Order. Table F-23 below, lists the Permittees that were issued a California Water Code Section 13383 Order and the compliance option that they selected in response to the Order. The Table also notes those Permittees that are outside of or lack jurisdiction over PLUs. All Permittees that selected either of the Tracks, also submitted the required supporting documents that were due by February 18, 2019. Only two cities selected Track 2, the cities of

Trash TMDL, Lake Elizabeth Trash TMDL, and Legg Lake Trash TMDL, could not be aligned with the Trash Amendments.

Gardena and Los Angeles. On April 8, 2019, the Los Angeles Water Board sent a correspondence to Track 1 Permittees clarifying that they could proceed implementing the provisions of the 13383 Order without requiring further approval. On June 26, 2019, the Los Angeles Water Board issued a conditional approval letter to the City of Gardena, requiring additional information and submittals in order to approve its implementation plan, which were due by March 31, 2021. In its implementation plan, the City of Los Angeles indicated that it is in compliance with the Trash Amendments; Board staff are in the process of reviewing the information provided by both cities.

Table F-23. Selected Compliance Option in Response to California Water Code Section 13383 Orders

| Permittee | Selected Compliance Option (Track 1 or Track 2) |
|-----------------------|--|
| Arcadia | Track 1 |
| Artesia | Track 1 |
| Azusa | Track 1 |
| Baldwin Park | Track 1 |
| Bellflower | Track 1 |
| Bradbury | Track 1 |
| Carson | Track 1 |
| Cerritos | Track 1 |
| Claremont | Track 1 |
| Compton | ¹³⁸ |
| County of Los Angeles | Track 1 |
| Covina | Track 1 |
| Diamond Bar | Track 1 |
| Downey | Track 1 |
| Duarte | Track 1 |
| El Monte | Track 1 |
| El Segundo | Track 1 |
| Gardena | Track 2 |
| Glendora | Track 1 |
| Hawaiian Gardens | Track 1 |
| Hawthorne | Track 1 |
| Industry | Track 1 |
| Inglewood | Track 1 |
| Irwindale | Track 1 |
| La Habra Heights | Track 1 |
| La Mirada | Track 1 |
| La Puente | Track 1 |
| La Verne | Track 1 |
| Lakewood | Track 1 |
| Lawndale | Track 1 |
| Lomita | Track 1 |

¹³⁸ On December 20, 2017, the City of Compton responded to the Los Angeles Water Board’s August 18, 2017’s 13383 Order and stated that the City is only subject to the Los Angeles River Watershed Trash TMDL. Board staff are still investigating the City’s claim.

| Permittee | Selected Compliance Option (Track 1 or Track 2) |
|--|--|
| Los Angeles | Track 2 |
| Los Angeles County Flood Control District | ¹³⁹ |
| Manhattan Beach | Track 1 |
| Monrovia | Track 1 |
| Norwalk | Track 1 |
| Paramount | Track 1 |
| Pico Rivera | Track 1 |

| Port Hueneme | Track 1 |
| Santa Paula | Track 1 |
| Simi Valley | Track 1 |
| Thousand Oaks | Track 1 |
| Ventura | Track 1 |
| Ventura County Watershed Protection District | ¹⁴¹ |
| Long Beach | Track 1 |

Both compliance tracks focus trash control efforts on PLUs. PLUs are areas that have been shown to generate a significant amount of trash and include high density residential, industrial, commercial, mixed urban, and public transportation stations. A compliance framework focused on PLUs allows MS4s to allocate trash-control resources to the highest priority areas.

¹³⁹The District has no jurisdictional authority over PLUs.

¹⁴⁰The City has no PLUs within its jurisdiction.

¹⁴¹The District has no jurisdictional authority over PLUs.

In some cases, non-priority land use areas may also generate a substantial amount of trash. Permittees may get approval from the Los Angeles Water Board to substitute one or more of the PLUs with an alternate land use area that generates trash at rates equivalent or greater than the PLU(s) being substituted. The Los Angeles Water Board may also determine that a non-priority land use or location generates a substantial amount of trash. Where this determination is made, the Los Angeles Water Board may require Permittees to adopt Track 1 or Track 2 control measures over these areas. The Order refers to these areas as “designated land use areas.” No designated land use areas for trash have been identified as of the issuance of the Order.

5. Implementation Schedule

The Trash Amendments require NPDES permits for MS4 permittees to contain provisions prohibiting the discharge of trash within ten years of the effective date of the first implementing permit, or no later than fifteen years from the effective date of the Trash Amendments (December 2, 2030). The Order is the first implementing permit for the Permittees; therefore, the Permittees must obtain full compliance with the Trash Amendments by December 2, 2030. Additional time for compliance may be authorized for designated land uses identified after the effective date of the Order. In no case may the time for compliance with the Trash Amendments for newly Designated Land Uses be more than 10 years.

Part III.B.2 of the Order incorporates the Trash Amendments requirements for Permittees with regulatory authority over PLUs, designated land uses, or equivalent alternate land uses. Specifically, Part III.B.2.a of the Order outlines the compliance methods and allows Permittees to change their compliance method by submitting a written request to the Los Angeles Water Board for approval of a modified jurisdictional map. Permittees changing their compliance method to Track 2 are also required to submit an Implementation Plan. Part III.B.2.b of the Order outlines provisions for Implementation Plan for Track 2; and Part III.B.2.c of the Order outlines provisions for jurisdictional map. Part III.B.2.d of the Order establishes the implementation schedule for complying with the discharge prohibition consistent with the Trash Amendments. This provision establishes an interim compliance deadline requiring 50% of all PLUs and/or approved equivalent alternate land uses to meet full capture (Track 1) or full capture system equivalency (Track 2) within 5 years and a final compliance deadline requiring 100% of all PLUs and/or approved equivalent alternate land uses to meet full capture (Track 1) or full capture system equivalency (Track 2) by no later than 10 years from the effective date of the Order or December 2, 2030, whichever is sooner. For designated land uses, it may not be feasible to expect compliance within ten years from the effective date of the Order. Hence, the final compliance date for a designated land use is no longer than 10 years from the Los Angeles Water Board’s written determination to designate a land use or location as a designated land use.

6. Previous Permit Requirements

Part VI.D.9.h.vii of the 2012 Los Angeles County MS4 Permit and Part VII.L.8.vii of the 2014 City of Long Beach MS4 Permit required Permittees to install trash excluders, or equivalent devices, on or in catch basins or outfalls to prevent the discharge of trash to the MS4 or receiving water no later than December 28, 2016 and March 28, 2018, respectively. Part 4.G.I.5.(e) of the 2010 Ventura County MS4 Permit also required the Permittees to comply with the same requirements no later

than July 8, 2012. This requirement only applied to areas not subject to a trash TMDL and identified as a “Priority A” area and did not apply to sites where the application of such BMP(s) alone would cause flooding. Priority A was defined as areas consistently generating the highest volumes of trash and/or debris. Alternatively, Permittees could implement alternative or enhanced BMPs that provide substantially equivalent removal of trash. The Statewide Trash Amendments closely align with the intent and scope of the requirements of the previous permits. Therefore, incorporation of Statewide Trash Amendments into the Order are not new requirements but rather a refinement of the existing requirements.

V. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

Clean Water Act section 402(p)(3)(B)(iii) requires MS4 permits to include “controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. The Clean Water Act generally requires NPDES permits to include technology-based effluent limitations and any more stringent water quality-based effluent limitations necessary to meet water quality standards. Both types of limitations are in the Order and are discussed below.

A. Technology-Based Effluent Limitations

Section 301(b)(1)(A) of the CWA and 40 CFR section 122.44(a) require that NPDES permits include technology-based effluent limitations and standards.¹⁴² In 1987, the CWA was amended to require that municipal stormwater discharges “reduce the discharge of pollutants to the maximum extent practicable.” (CWA § 402(p)(3)(B)(iii).) The “maximum extent practicable” (MEP) standard is the applicable federal technology-based standard that MS4 owners and operators must attain to comply, in part, with their NPDES permits.¹⁴³ 40 CFR section 122.26(d)(2)(iv) further details the MEP standard, which requires that MS4 owners and operators implement comprehensive pollutant control measures in a stormwater management program including management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. Permit requirements to implement the MEP standard are generally referred to, collectively, as best management practices or BMPs.

¹⁴² A technology-based effluent limitation is based on the capability of a model treatment method to reduce a pollutant to a certain concentration (NPDES Permit Writer’s Manual (September 2010), Appendix A). Technology-based effluent limitations generally are expressed numerically as the maximum amount of pollutant that may be discharged (either as a prohibition or as a concentration or mass; mass is usually normalized either based on production units or wastewater flow) but are sometimes narrative effluent limitations such as model best management practices for an industrial category like “Concentrated Aquatic Animal Production.” For example, model best management practices are identified for solids control, including the following, “[i]n order to minimize the discharge of accumulated solids from settling ponds and basins and production systems, identify and implement procedures for routine cleaning ..., and procedures to minimize any discharge of accumulated solids during the ... harvesting of aquatic animals in the production system” (NPDES Writers’ Manual (September 2010), p. 5-33). Technology-based requirements represent the minimum level of control that must be imposed in a permit issued under CWA § 402.

¹⁴³ Note that the MEP standard only applies to stormwater discharges from the MS4. Non-stormwater discharges are subject to a different standard – specifically, non-stormwater discharges through the MS4 must be effectively prohibited.

Examples of BMPs used to comply with the MEP standard include street sweeping, requiring erosion controls at construction sites (e.g., straw wattles, silt fences), and catch basin cleanouts.

The fundamental requirement that municipalities reduce pollutants in municipal stormwater discharges to the MEP remains a cornerstone of the mandate imposed on municipalities by the federal Clean Water Act and implementing NPDES regulations. Meeting the MEP standard is generally a result of emphasizing robust pollution prevention and control through various programs and structural measures. These pollution prevention and control methods require municipalities to take actions that will lessen the incidence of pollutants entering the storm drains by regulating the behavior and practices of the municipalities, their residents, and their businesses and controlling the discharge of pollutants through structural measures and treatment methods.

Neither Congress nor the U.S. EPA has specifically defined the term “maximum extent practicable.” Rather, the MEP standard is an ever evolving, flexible and advancing concept, which considers technical and economic feasibility. As knowledge and technology regarding controlling stormwater runoff continue to evolve, so too must the actions that are taken to comply with the standard. Congress established this flexible MEP standard so that administrative bodies would have “the tools to meet the fundamental goals of the Clean Water Act in the context of storm water pollution.”¹⁴⁴ This standard was designed to allow permit writers flexibility to tailor permits to the site-specific nature of MS4s and to use a combination of pollution controls that may be different in different permits.¹⁴⁵ The MEP standard is also expected to evolve in light of programmatic improvements, new source control initiatives, and technological advances that serve to improve the overall effectiveness of stormwater management programs in reducing pollutant loading to receiving waters.

In addition to regulations, U.S. EPA has issued guidance documents that discuss the type of BMPs that should be included in MS4 permits in order to reduce the discharge of pollutants in stormwater to the MEP.¹⁴⁶ Successive permits for the same MS4 must become more refined and detailed and require greater levels of specificity over time in defining what constitutes MEP, based on experience under the previous permit. For example, the 1990 Los Angeles County MS4 Permit provided a general requirement that Permittees develop and implement a plan with a schedule of implementation for BMPs to control pollutants from residential, commercial, and industrial sites to the MEP. To continue to address these land use areas, the 1996 Permit required Permittees to develop and implement a model system for prioritization of development projects and establish a list of recommended BMPs in a model program, referred to as a Standard Urban Storm Water Mitigation Plan (SUSMP). For new and re-development, the 2001 Los Angeles County MS4 Permit established numeric criteria, requiring the control of a specific volume of runoff from these priority development and redevelopment projects, i.e., the 85th percentile, 24-hour storm volume. In the 2012 Los Angeles County MS4 Permit, Permittees were required to prioritize onsite retention of this runoff and, only if that was infeasible, to use other means (such as flow-through treatment) of controlling that runoff volume. The 1994 Ventura County MS4 Permit provided a general

¹⁴⁵ In re City of Irving, Texas, Municipal Storm Sewer System (July 16, 2001) 10 E.A.D. 111 (E.P.A.), *6.

¹⁴⁶ See, e.g., U.S. EPA, *MS4 Permit Improvement Guide* (2010). Prior to issuance of the *MS4 Permit Improvement Guide*, U.S. EPA provided BMP “menus” for the required elements of a MS4 permittee’s stormwater management program as required by 40 CFR § 122.26(d)(2)(iv).

requirement that Permittees develop and implement source control BMPs and treatment control BMPs in the areas of land development, industrial, commercial, and construction sites. The 2000 Ventura County MS4 Permit required Permittees to develop and implement a comprehensive stormwater quality management program to reduce the discharge of stormwater pollutants to the MEP. In the 2010 Ventura County MS4 Permit, Permittees were required to implement LID strategies for new development and redevelopment, which would maintain pre-development hydrology and utilize natural controls to reduce stormwater pollution. This is consistent with U.S. EPA's intent that stormwater management programs evolve based on changing conditions from program development and implementation and corresponding improvements in water quality.¹⁴⁷ There is ample evidence of this evolution in stormwater management. Examples include the development of full capture trash control devices in response to the Los Angeles Region Trash TMDLs, innovative media filters for use in outfalls at the Boeing Santa Susana Field Laboratory that have potential municipal applications; and regional scale multi-benefit stormwater capture projects such as the Carriage Crest Park project, which captures stormwater from an 1,146-acre, multi-jurisdictional drainage area for treatment and reclamation at the adjacent wastewater treatment facility.

To provide clarification to the Regional Water Boards, the State Water Board's Office of Chief Counsel issued a memorandum dated February 11, 1993 regarding the "Definition of 'Maximum Extent Practicable'." In the memorandum, the State Water Board interpreted the MEP standard to entail "a serious attempt to comply," and that under the MEP standard, "practical solutions may not be lightly rejected." The memorandum states, "[i]n selecting BMPs which will achieve MEP, it is important to remember that municipalities will be responsible to reduce the discharge of pollutants in storm water to *the maximum extent practicable*. This means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive." The memorandum suggests several factors to be considered when choosing BMPs, including effectiveness, regulatory compliance, public acceptance, cost, and technical feasibility. The memorandum further states that, "[a]fter selecting a menu of BMPs, it is of course the responsibility of the discharger to insure that all BMPs are implemented."

The Order includes programmatic requirements in six areas pursuant to 40 CFR section 122.26(d)(2)(iv), including numeric design standards for stormwater runoff from new development and significant redevelopment consistent with the federal MEP standard (see State Water Board Order WQ 2000-11, the "LA SUSMP Order"). The Order also includes requirements for periodically evaluating and modifying or adding control measures, consistent with the concept that MEP is an evolving and flexible standard.

¹⁴⁷ See, 55 Fed. Reg. 47990, 48052 ("EPA anticipates that storm water management programs will evolve and mature over time."); 64 Fed. Reg. 68722, 68754; Dec. 8, 1999 ("EPA envisions application of the MEP standard as an iterative process."); Interim Permitting Approach for Water Quality-Based Effluent Limitations in Stormwater Permits (Sept. 1, 1996) ("The interim permitting approach uses BMPs in first-round storm water permits, and expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards."); Revisions to the November 22, 2002 Memorandum "Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on LAs" (Nov. 26, 2014) ("In subsequent stormwater permit terms, if the BMPs used during prior years were shown to be inadequate to meet the requirements of the Clean Water Act (CWA), including attainment of applicable water quality standards, the permit would need to contain more specific conditions or limitations.").

B. Water Quality-Based Effluent Limitations (WQBELs)

1. Basis for WQBELs

In addition to requiring that MS4 permits include technology-based requirements consistent with the MEP standard, section 402(p)(3)(B)(iii) of the CWA requires that MS4 permits include “such other provisions as the Administrator or the State determines appropriate for the control of [] pollutants.”¹⁴⁸ U.S. EPA interprets this provision to mandate “controls to reduce the discharge of pollutants to the maximum extent practicable, *and where necessary water quality-based controls.*”¹⁴⁹ U.S. EPA has reiterated that MS4 “permit conditions must provide for attainment of applicable water quality standards (including designated uses), allocations of pollutant loads established by a TMDL, and timing requirements for implementation of a TMDL.”¹⁵⁰ U.S. EPA Region IX has also affirmed the Water Boards’ position that MS4 discharges must meet water quality standards in a series of comment letters on MS4 permits issued by various California regional water boards.¹⁵¹ Likewise, the State Water Board has affirmed that MS4 permits must include requirements necessary to achieve compliance with the applicable technology-based standard of MEP and to achieve water quality standards.¹⁵² The permitting agency, be it the Los Angeles Water Board or U.S. EPA, must therefore include provisions in addition to those based on the MEP standard when it finds it is appropriate to do so and to exercise its discretion to determine what permit conditions are necessary to control pollutants in a specific geographic area.

Generally, discharge requirements designed to achieve water quality standards are referred to as water quality-based effluent limitations (WQBELs). A WQBEL is a restriction on the quantity or concentration of a pollutant that may be discharged from a point source into a receiving water that is necessary to achieve an applicable water quality standard in the receiving water.¹⁵³ As discussed more fully below, WQBELs may be expressed narratively or numerically.

Federal NPDES regulations require the permitting agency to include WQBELs for point source discharges that cause, have the reasonable potential to cause, or contribute to an excursion above water quality standards.¹⁵⁴ As the State Water

¹⁴⁸ The early iterations (issued from 1990-1996) of the previous MS4 permits for Permittees in Los Angeles and Ventura Counties relied solely upon requirements consistent with the MEP standard to work toward achieving water quality standards. Note that the MEP standard is distinct from a water quality-based standard; each has a different basis. Therefore, while from a practical point of view, the goal of all MS4 permits is to control pollutants in discharges to ultimately achieve water quality standards, water quality based standards are directly derived from this desired outcome, while the MEP standard is anticipated to be a way of working toward the desired outcome, but is not directly derived from it.

¹⁵¹ See, e.g., letter from Alexis Strauss, Acting Director, Water Division, U.S. EPA Region IX, to Walt Pettit, Executive Director, State Water Board, re: SWRCB/OCC File A-1041 for Orange County, dated January 21, 1998.

¹⁵² See, e.g., State Water Board Orders WQ 99-05, WQ 2001-15, and WQ 2015-0075.

¹⁵³ See 40 CFR § 122.2; NPDES Permit Writer’s Manual, Appendix A. A WQBEL is distinguished from a technology based effluent limitation (TBEL) in that the basis for the WQBEL is the applicable water quality standard for the receiving water, while the basis for the TBEL is generally the performance of the best available technology.

¹⁵⁴ 40 CFR § 122.44, subds. (d)(1)(i) and (d)(1)(iii).

Board explained in 2001, “Urban runoff is causing and contributing to impacts on receiving waters throughout the state and impairing their beneficial uses....It is not enough simply to apply the technology-based standards of controlling discharges of pollutants to the MEP....”¹⁵⁵ Nearly two decades later, this is still true.

In the Order, WQBELs are included where the Los Angeles Water Board or U.S. EPA has determined that discharges from the MS4 cause, have the reasonable potential to cause, or contribute to an excursion above water quality standards.¹⁵⁶ Reasonable potential can be demonstrated in several ways, one of which is through the TMDL development process. Where a point source is assigned a wasteload allocation (WLA)¹⁵⁷ in a TMDL, the analysis conducted in the development of the TMDL provides the basis for the Los Angeles Water Board or U.S. EPA’s determination that the discharge has the reasonable potential to cause or contribute to an exceedance of water quality standards in the receiving water. This approach is affirmed in U.S. EPA’s Permit Writer’s Manual, which states, “[w]here there is a pollutant with a WLA from a TMDL, a permit writer must develop WQBELs.”¹⁵⁸

The Los Angeles Water Board and U.S. EPA have each established numerous TMDLs to address water quality impairments in the Los Angeles Region. Through the process of developing these TMDLs and assigning wasteload allocations to MS4 discharges in the Los Angeles Region, the Los Angeles Water Board and U.S. EPA have established that MS4 discharges cause or contribute to exceedances of water quality standards. Given the number of Los Angeles Water Board and U.S. EPA established TMDLs for impaired waters in the Los Angeles Region, there is ample evidence that MS4 discharges are a continuing and significant source of pollutants to the impaired receiving waters notwithstanding implementation of stormwater management programs driven by the MEP standard for the last three decades.

Where a TMDL has been established for a particular waterbody, U.S. EPA’s NPDES regulations further require that, “when developing water quality-based effluent limits...the permitting authority shall ensure that effluent limits ... are consistent with the assumptions and requirements of any available wasteload allocation for the discharge...” (40 CFR § 122.44(d)(1)(vii)(B)). In its 2014 memorandum, *Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs*, U.S. EPA reaffirmed its 2002 interpretation that this regulation requires that “where a State or EPA has established a TMDL, NPDES permits *must* contain effluent limits and conditions consistent with the assumptions and requirements of the WLAs in the TMDL.”¹⁵⁹ This is inclusive of stormwater

¹⁵⁵ State Water Board Order WQ 2001-15, pp. 7-8.

¹⁵⁶ 40 CFR §§ 122.44(d)(1)(i)-(iii); 122.44(d)(1)(vii)(B)

¹⁵⁷ “Wasteload allocation” is defined as “[t]he portion of a receiving water’s loading capacity that is allocated to one if its existing or future point sources of pollution. WLAs constitute a type of water quality-based effluent limitation.” (40 CFR § 130.2(h)).

¹⁵⁸ NPDES Permit Writers’ Manual, p. 6-30.

¹⁵⁹ U.S. EPA, Memorandum, “Revisions to the November 22, 2002 Memorandum ‘Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs,’” (Nov. 26, 2014), p. 6 (emphasis added); see also U.S. EPA, Memorandum, “Establishing Total Maximum Daily Load Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs,” (Nov. 22, 2002).

permits – municipal, industrial and construction. U.S. EPA’s interpretation of its own regulation is entitled to deference. This requirement that WQBELs must be consistent with the assumptions and requirements of the WLAs means that the permit must include either an equivalent numeric effluent limit or “a measurable, objective BMP-based limit that is projected to achieve the WLA.”¹⁶⁰ When a narrative WQBEL in the form of a BMP-based limit is relied upon, “the permit’s administrative record needs to provide adequate demonstration that ... the BMPs ... will be sufficient to implement applicable WLAs. ... Improved knowledge of BMP effectiveness ... should be reflected in the demonstration and supporting rationale that implementation of the BMPs will attain water quality standards and be consistent with WLAs.”¹⁶¹ Even if this regulation could be read to preclude mandatory incorporation of wasteload allocations into an MS4 permit, effluent limitations consistent with those wasteload allocations are nevertheless required under Clean Water Act section 402(p)(3)(B)(iii)’s direction that the MS4 permit shall require “such other controls” as the permitting authority determines “appropriate for the control of such pollutants.”¹⁶²

Finally, California Water Code section 13377 requires that NPDES permits include effluent limitations necessary to implement water quality control plans, including TMDL requirements that have been incorporated into the water quality control plans.¹⁶³

Therefore, the Los Angeles Water Board has included WQBELs in the Order for all pollutants for which a TMDL WLA is assigned to the MS4 discharges and the WQBELs are consistent with the assumptions and requirements of available TMDL WLAs applicable to the Permittees.

2. Expression of WQBELs

While federal law requires the Los Angeles Water Board to include TMDL-based WQBELs in the Order, it does not specify how those WQBELs are to be expressed in MS4 permits. Rather, federal law requires the permitting authority to make that determination as appropriate and necessary for the control of the discharge. In MS4 permits, WQBELs may be expressed either in narrative form (e.g., as requirements to implement specified BMPs) or in numeric form (i.e., as numeric effluent limitations). In the latter, the choice of how to achieve the numeric effluent limitations is left to the permittee.¹⁶⁴ Both types of expression of the WQBELs are

¹⁶⁰ Ibid.

¹⁶² 33 U.S.C. § 1342(p)(3)(B)(iii). See, e.g., State Water Board Orders WQ 91-03, WQ 91-04, WQ 98-01, WQ 99-05, WQ 2001-15, and WQ 2015-0075.

¹⁶³ Water Code section 13263, subd. (a) likewise requires waste discharge requirements to implement any relevant water quality control plans that have been adopted. See also *State Water Res. Control Bd. Cases* (2006) 136 Cal. App. 4th 674, 730 (noting the obligation of the water boards to follow the program of implementation included in a water quality control plan).

¹⁶⁴ CWA § 402(p)(3)(B)(iii); 40 CFR § 122.44(k); U.S. EPA. Memorandum, Revisions to the November 22, 2002 Memorandum “Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs,” (Nov. 26, 2014), p. 6. (noting that WQBELs “could take the form of a numeric limit, or of a measurable, objective BMP-based limit that is projected to achieve the WLA”); see also *Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1166 (noting that the permitting authority has discretion regarding the nature and timing of requirements that it includes as MS4 permit conditions to attain water quality standards, and that these requirements may include numeric effluent limitations).

allowed and neither one is more stringent than the other because an equivalent level of implementation of BMPs or other control measures is necessary to comply in either expression of the WQBELs. For example, to address MS4 discharges of trash, the permitting authority may require permittees to implement specific pollutant control measures, such as installing certified full capture systems on storm drains that prevent nearly all trash from reaching receiving waters (e.g., screens that trap particles of a certain size), partial capture devices on storm drains that prevent most trash from reaching receiving waters, or non-structural institutional controls (e.g., street sweeping, sidewalk trash cans, and anti-litter educational and outreach programs), or a combination of these three measures. To comply with this narrative WQBEL expression, a permittee would need to demonstrate that it implemented the required control measures. Alternatively, the permitting authority may establish a numeric limit of zero trash discharged from the MS4. To comply with this numeric WQBEL expression, a permittee would still need to implement pollutant control measures on the ground, and these necessarily would include implementation of certified full capture systems, partial capture systems, or institutional controls, or any combination thereof. Functionally, compliance with either approach requires an equivalent level of implementation, although compliance with numeric WQBELs provides a greater level of flexibility. The Los Angeles Water Board, as the permitting authority, must choose one of these options for each TMDL wasteload allocation and, in doing so, must ensure attainment of the wasteload allocations within the timeframes established in the TMDLs. Whether the WQBELs are expressed narratively or numerically are simply different ways to achieve the same desired water quality outcome.

Although federal regulations authorize the use of BMP-based WQBELs in stormwater permits to control the discharge of pollutants, those federal regulations and U.S. EPA guidance also state that BMP-based WQBELs are appropriate where it is “infeasible” to develop a numeric effluent limitation.¹⁶⁵ At the public hearing for issuance of the 2012 Los Angeles County MS4 Permit, then Associate Director of the Water Division for U.S. EPA Region 9, confirmed that: “[T]he use of the term ‘feasible’ was to say is it feasible to translate the wasteload allocation into a numeric [effluent limitation]”¹⁶⁶

U.S. EPA has issued two memoranda, on November 22, 2002 (2002 U.S. EPA Memorandum) and November 26, 2014 (2014 U.S. EPA Memorandum), providing guidance to permitting authorities on translating TMDL wasteload allocations into WQBELs in NPDES permits for stormwater discharges.¹⁶⁷ The 2002 U.S. EPA Memorandum contemplated that “the NPDES permitting authority will review the information provided by the TMDL . . . and determine whether the effluent limit is appropriately expressed using a BMP approach (including an iterative BMP approach) or a numeric limit.”¹⁶⁸ U.S. EPA further stated that it “expects that most WQBELs for NPDES-regulated municipal . . . storm water discharges will be in the

¹⁶⁵ 40 CFR § 122.44(k).

¹⁶⁶ Transcript, Oct. 5, 2012, p. 225.

¹⁶⁷ In addition to the two memoranda, U.S. EPA published guidance titled “Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits” ((Sept. 1996) 61 Federal Register 57425), which recommended inclusion of BMPs in the first two to three rounds of permit issuance, and more specific BMPs or limitations in subsequent permits if the BMPs used during prior years were shown to be inadequate to meet the requirements of the Clean Water Act, including attainment of applicable water quality standards.

¹⁶⁸ 2002 U.S. EPA Memorandum, p. 5.

form of BMPs, and that numeric limits will be used only in rare instances.”¹⁶⁹ The 2014 U.S. EPA Memorandum updated aspects of the 2002 U.S. EPA Memorandum and constitutes U.S. EPA’s current guidance on this subject. After noting the increased information available to the permitting agencies after more than a decade of experience in setting wasteload allocations and WQBELs, the 2014 U.S. EPA Memorandum explained that:

Where the TMDL includes WLAs for stormwater sources that provide numeric pollutant loads, the WLA should, where feasible, be translated into effective, measurable WQBELs that will achieve this objective. This could take the form of a numeric limit, or of a measurable, objective BMP-based limit that is projected to achieve the WLA....The permitting authority’s decision as to how to express the WQBEL(s), either as numeric effluent limitations or as BMPs, with clear, specific, and measurable elements, should be based on an analysis of the specific facts and circumstances surrounding the permit, and/or the underlying WLA, including the nature of the stormwater discharge, available data, modeling results, and other relevant information.¹⁷⁰

Where a BMP-based approach to permit limitations is selected, the 2014 U.S. EPA Memorandum noted that the permit’s administrative record needs to provide an adequate demonstration that implementation of the BMPs required in the permit will attain water quality standards and be consistent with the WLAs.¹⁷¹

As stated in Part II.F of this Fact Sheet, the three previous Orders included WQBELs consistent with the assumptions and requirements of available TMDL WLAs assigned to the Permittees’ MS4 discharges.

Except for wasteload allocations associated with certain TMDLs established by U.S. EPA (discussed below), the Los Angeles Water Board has expressed WQBELs in the Order as numeric effluent limitations as the default standard, but alternatively allows permittees the option to demonstrate compliance narratively. Permittees may comply with the numeric WQBELs either by demonstrating compliance with the numeric WQBELs through monitoring or by implementing BMPs in approved Watershed Management Programs. Therefore, in essence, the Permit includes both numeric and narrative WQBELs. The Order contains both approaches to protect water quality and provide compliance flexibility for Permittees, while also following U.S. EPA guidance. Compliance with numeric WQBELs through monitoring and analysis of water samples collected from select representative MS4 discharge points is the default compliance standard. Alternatively, Permittees may develop and implement an approved Watershed Management Program whereby they propose and implement certain approved BMPs that computer modeling demonstrates will meet the applicable numeric WQBELs by specified timeframes.

In determining how to express the WQBELs, the Los Angeles Water Board has analyzed the specific facts and circumstances surrounding the Order and the underlying TMDL WLAs, including the nature of MS4 discharges in the Los Angeles Region, available data, modeling results, and other relevant information. In doing so, the Los Angeles Water Board concludes that WQBELs expressed numerically

¹⁶⁹ *Id.*, p. 2.

¹⁷⁰ 2014 U.S. EPA Memorandum, p. 6.

¹⁷¹ *Ibid.*

are appropriate and necessary in the Order to achieve the WLAs. MS4 discharges constitute a continuing and significant source of pollutants resulting in exceedances of water quality standards in the Los Angeles Region, as evidenced by the number of TMDLs established for impaired waters in the region and identification of MS4 discharges as a source of that impairment. To date, sole reliance on BMP-based requirements have been insufficient to resolve these exceedances. As such, the Los Angeles Water Board finds that WQBELs expressed numerically are necessary to address the historic and persistent exceedances of water quality standards in the Los Angeles Region.

Further, the Los Angeles Water Board concludes that numeric WQBELs are feasible. In the last 20 years, the Los Angeles Water Board and U.S. EPA have established 45 TMDLs for waterbodies in the Los Angeles Region in which WLAs are assigned to Phase I MS4 discharges. A significant part of developing each TMDL entailed analyzing pollutant sources and allocating loads to those sources using empirical relationships, quantitative modeling, and other relevant information. As noted by the State Water Board when reviewing the numeric WQBELs in the 2012 Los Angeles County MS4 Permit, "In many ways, the Los Angeles MS4 Order was uniquely positioned to incorporate numeric WQBELs because of the extensive TMDL development in the region in the past decade and the documented role of MS4 discharges in contributing to the impairments addressed by those TMDLs."¹⁷² Following the extensive work already conducted to develop the TMDLs, the Los Angeles Water Board continues to conclude that it is feasible to develop numeric WQBELs for MS4 discharges, and that the numeric WQBELs are consistent with the TMDL wasteload allocations. There is ample evidence that BMPs and other control measures can be designed proactively (through modeling) to divert, capture, and/or treat MS4 discharges such that it is possible for any such discharges to ultimately meet the numeric WQBELs according to established compliance schedules. The 7 WMPs and 12 EWMPs developed under the 2012 Los Angeles County MS4 Permit and, in particular, the Reasonable Assurance Analysis done in these WMPs/EWMPs demonstrate this. Further, given the variability in implementation of stormwater management programs across Permittees, numeric WQBELs create a measurable, objective, and accountable means of controlling MS4 discharges, while providing significant flexibility for Permittees to comply with the numeric WQBELs in any lawful manner, including by working with other Permittees as well as other government agencies and entities to implement cost-effective control measures.

While the Los Angeles Water Board finds that inclusion of numeric WQBELs in the Order is appropriate and necessary to achieve compliance with the TMDLs WLAs as required by federal law, at the same time, the Los Angeles Water Board also finds it appropriate to allow permittees to, alternatively and voluntarily, comply with the numeric WQBELs by implementing approved Watershed Management Programs comprised of a suite of BMP-based control measures. Watershed Management Programs must be accompanied by demonstrations, via computer modeling, that the BMPs will meet the numeric WQBELs. This alternative BMP-based option satisfies U.S. EPA's guidance that MS4 permits include "effective, measurable WQBELs...that is projected to achieve the WLA."¹⁷³

¹⁷² Order WQ 2015-0075, p. 59.

¹⁷³ 2014 U.S. EPA Memorandum, p. 6.

3. Interim and Final QBELs

Final QBELs are included in the Order based on the final WLAs assigned to MS4 discharges in all available TMDLs established for waterbodies in the Los Angeles Region.

MS4 permits can include compliance schedules for achieving final QBELs derived from TMDL WLAs, so long as the compliance schedule is consistent with the program of implementation for the TMDL established by the Los Angeles Water Board and approved through the State's basin plan amendment process (see Water Code §§ 13242, 13263, 13377). If a compliance schedule in an NPDES permit exceeds one year, it must include interim requirements and the dates for their achievement pursuant to 40 CFR section 122.47. As discussed later in this Fact Sheet, the Los Angeles Water Board is providing compliance schedules longer than one year for various pollutants consistent with TMDL programs of implementation. Where there is a program of implementation for a TMDL adopted by the Los Angeles Water Board and approved through the State's basin plan amendment process, interim QBELs are included in the Order based on interim WLAs established for MS4 discharges.

VI. RATIONALE FOR TOTAL MAXIMUM DAILY LOAD PROVISIONS

Pursuant to CWA section 402(p)(B)(3)(iii) and 40 CFR section 122.44(d)(1)(vii)(B), the Order includes requirements, including QBELs, that are consistent with and implement WLAs that are assigned to discharges from the Permittees' MS4s from 45 State-adopted and U.S. EPA-established TMDLs. Permittees are required to comply with the TMDL Provisions in Part IV.B and Attachments K through S of the Order, including QBELs and receiving water limitations which are consistent with the assumptions and requirements of the TMDL WLAs assigned to discharges from the Permittees' MS4s. A comprehensive list of TMDLs by WMA and the Permittees subject to each TMDL is included in Attachment J of the Order.

A. Clean Water Act Section 303(d) List and Relationship to TMDLs

Clean Water Act section 303(d)(1)(A) requires each State to conduct a biennial assessment of its waters and identify those waters that are not achieving water quality standards. These waters are identified as impaired on the State's Clean Water Act section "303(d) List" of water quality limited segments. Periodically, U.S. EPA approves the State's 303(d) List. Most recently, U.S. EPA approved the State's 2014 and 2016 303(d) List of impaired water bodies on April 6, 2018, which includes certain receiving waters in the Los Angeles Region. Numerous water bodies within Los Angeles and Ventura counties do not meet water quality standards or fully support beneficial uses and therefore have been included on the State's 303(d) List. For each 303(d) listed water body, the state or U.S. EPA is required to establish a Total Maximum Daily Load (TMDL), or implement alternative approaches as defined in U.S. EPA's *Long-Term Vision for Assessment, Restoration and Protection under the Clean Water Act Section 303(d) Program*, for each pollutant impairing the water quality in that water body.¹⁷⁴

B. TMDLs and Their Implementation Through NPDES Permits

A TMDL is a tool for facilitating attainment of water quality standards and is based on the relationship between pollution sources and in-stream water quality conditions,

¹⁷⁴ Alternative approaches to TMDLs include placement of a waterbody-pollutant combination in Category 4B of the 303(d) List or adoption of a Watershed Plan for nonpoint sources of pollution. Currently there are no alternative approaches adopted for the Los Angeles Region that apply to Phase I MS4 discharges.

thereby providing the basis to establish water quality-based controls. A TMDL specifies the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards and allocates the acceptable pollutant load to point and nonpoint sources. The elements of a TMDL are described in 40 CFR sections 130.2 and 130.7. A TMDL is defined as “the sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background.” (40 CFR § 130.2(i).) MS4 discharges are considered point source discharges.

Regulations further require that TMDLs must be set at “levels necessary to attain and maintain the applicable narrative and numeric water quality standards with seasonal variations and a margin of safety that takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality.” (40 CFR section 130.7(c)(1).) 40 CFR section 130.7 also states that TMDLs shall take into account critical conditions for stream flow, loading and water quality parameters. These controls should provide the pollution reduction necessary for a water body to attain water quality standards. Essentially, TMDLs serve as a backstop provision of the Clean Water Act designed to ensure attainment of water quality standards when other provisions, such as technology-based effluent limitations, have failed to achieve water quality standards.

Upon establishment of TMDLs by the State or the U.S. EPA, the State is required to incorporate, or reference, the TMDLs in the State Water Quality Management Plan. (40 CFR sections 130.6(c)(1) and 130.7.) The Los Angeles Water Board’s Basin Plan, and applicable statewide water quality control plans, serves as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Los Angeles Water Board. When adopting TMDLs as part of its Basin Plan, the Los Angeles Water Board includes, as part of the TMDL, a program for implementation of the WLAs for point sources and load allocations (LAs) for nonpoint sources.

TMDLs are not self-executing, but instead rely upon further Board orders to impose pollutant restrictions on discharges to achieve the TMDL’s WLAs. Section 402(p)(3)(B)(iii) of the Clean Water Act requires the Los Angeles Water Board to impose permit conditions, including: “management practices, control techniques and system, design and engineering methods, and *such other provisions as the Administrator of the State determines appropriate for the control of such pollutants.*” (emphasis added.) Section 402(a)(1) of the Clean Water Act also requires states to issue permits with conditions necessary to carry out the provisions of the Clean Water Act. Federal regulations also require that NPDES permits include water quality-based effluent limitations consistent with the assumptions and requirements of any available waste load allocation for the discharge. (40 CFR section 122.44(d)(1)(vii)(B).) U.S. EPA has consistently stated that this regulation applies to all permitted stormwater discharges, including MS4 permits.¹⁷⁵ Similarly, state law requires that the Los Angeles Water Board implement its Basin Plan when adopting waste discharge requirements (WDRs) and that NPDES permits apply “any more stringent effluent standards or limitations necessary to implement water quality control plans...” (Cal. Wat. Code, §§ 13263, 13377). In precedential State Water Board Order WQ 99-05, the State Water Board exercised its discretion under federal law by requiring MS4s to comply with water quality standards. In precedential Order WQ 2015-0075, the State Water Board reaffirmed that it would continue to require water quality standards compliance in MS4 permits. These

¹⁷⁵ U.S. EPA Memorandum, “Revisions to the November 22, 2002 Memorandum ‘Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those TMDLs,’” p. 6 (Nov. 26, 2014).

precedential orders are relevant as a TMDL, by its very nature, sets forth a plan for an impaired water body to achieve water quality standards.

An NPDES permit should include clear, specific, and measurable permit requirements, and where feasible, incorporate TMDL WLAs as numeric WQBELs.¹⁷⁶ Where a non-numeric permit limitation is selected, such as BMPs, the permit's fact sheet and administrative record must support the expectation that the BMPs are sufficient to achieve the WLAs.¹⁷⁷ (40 CFR § 124.8.) U.S. EPA has published guidance for establishing WLAs for stormwater discharges in TMDLs and their incorporation as numeric WQBELs, where feasible, in MS4 permits.¹⁷⁸

C. TMDL Provisions

As required, WQBELs and receiving water limitations included in the Order and Attachments K through S are consistent with the assumptions and requirements of the available WLAs assigned to MS4 discharges in the Los Angeles Region, which have been established in forty-five (45) TMDLs. The Los Angeles Water Board established thirty-five (35) TMDLs and U.S. EPA established ten (10) TMDLs that assign WLAs to MS4 Permittees within the counties of Los Angeles and Ventura. These TMDLs identify MS4 discharges as a source of pollutants to these water bodies and, as required, establish WLAs for MS4 discharges to reduce the amount of pollutants discharged to receiving waters. While the TMDLs established by the Los Angeles Water Board include a program of implementation, including actions to be taken and a time schedule for such actions, TMDLs established by U.S. EPA do not. To date, the Los Angeles Water Board adopted three programs of implementation pursuant to Water Code sections 13240 and 13242 for four (4) U.S. EPA-established TMDLs. The TMDLs and programs of implementation included in the Regional MS4 Permit, along with establishment, approval, and effective dates, are listed in Table F-24 below.

The 2010 Ventura County MS4 Permit incorporated WQBELs and other permit requirements for thirteen (13) TMDLs. The Regional MS4 Permit continues to include WQBELs for all these TMDLs. The Regional MS4 Permit also continues to include other permit requirements for these TMDLs, except for the Calleguas Creek Nitrogen Compounds and Related Effects TMDL (Calleguas Creek Nitrogen TMDL). The Calleguas Creek Nitrogen TMDL identifies stormwater discharges as a minor source of nitrogen to Calleguas Creek; therefore, the TMDL did not assign WLAs to MS4 dischargers. The 2010 Ventura County MS4 Permit thus did not include WQBELs for this TMDL and the Regional MS4 Permit continues to not include WQBELs for this TMDL. However, monitoring requirements for the Calleguas Creek Nitrogen TMDL were included in the 2010 Ventura County MS4 Permit. The monitoring data from 2009 to 2017 had an exceedance rate of less than 1% of Nitrate as Nitrogen plus Nitrite as Nitrogen (1 exceedance out of 108 samples) at the monitored outfalls. Therefore, the Regional MS4 Permit does not include monitoring requirements for the Calleguas Creek Nitrogen TMDL.

The 2012 Los Angeles County MS4 Permit included WQBELs, receiving water limitations, and other permit requirements for thirty-three (33) TMDLs. The Regional MS4 Permit continues to include WQBELs, receiving water limitations, and other permit

¹⁷⁸ U.S. EPA Memorandum, "Revisions to the November 22, 2002 Memorandum 'Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those TMDLs'," Nov. 26, 2014.

requirements for all these TMDLs, except for the Bacterial Indicator TMDLs for Middle Santa Ana River Watershed (Middle Santa Ana River Bacteria TMDL). On August 26, 2005, the Santa Ana Regional Water Quality Control Board (Santa Ana Water Board) established the Middle Santa Ana River Bacteria TMDL, which assigned WLAs to the cities of Claremont and Pomona. The cities of Claremont and Pomona are located within the Los Angeles Water Board's jurisdictional boundaries, but portions of their MS4 discharges drain to the Middle Santa Ana River Watershed. The 2012 Los Angeles County MS4 Permit contained WQBELs, receiving water limitations, and other permit requirements for the cities of Claremont and Pomona consistent with the Middle Santa Ana River Bacteria TMDL, but provided that the WQBELs, receiving water limitations, and other permit requirements would not be applicable during the effective dates of any NPDES permit that is issued by the Santa Ana Water Board. Pursuant to a valid and enforceable designation agreement between the Los Angeles Water Board and the Santa Ana Water Board under Water Code section 13228, dated May 31, 2013, the Santa Ana Water Board was designated as the regulator of discharges of bacteria from the cities of Claremont and Pomona through their MS4 to receiving waters within the Middle Santa Ana River Watershed. Therefore, the Regional MS4 Permit does not include WQBELs and other permit requirements implementing the Middle Santa Ana River Bacteria TMDL.

The 2014 City of Long Beach MS4 Permit included WQBELs and other permit requirements for nine (9) TMDLs, all of which continue to be included in the Regional MS4 Permit.

In addition, there are new TMDLs that the Los Angeles Water Board established, or U.S. EPA established, after the previous MS4 permits were issued. Table F-24 and Table F-25 below list all the TMDLs that are in the Order. Table F-25 indicates which TMDLs were in previous MS4 permits and which TMDLs are new to the Regional MS4 Permit.

D. Manner of TMDL Incorporation

The TMDLs incorporated into the Order express WLAs in different ways. In general, a WLA is a pollutant threshold that must be achieved in order to ensure that water quality standards are attained in the receiving water. The WLA may be expressed in terms of mass or concentration of a pollutant. However, in some cases, a WLA may be expressed as a receiving water condition such as an allowable number of exceedance days of the bacteria water quality objectives.

In the Order, TMDL WLAs have been translated into WQBELs and/or receiving water limitations that are consistent with the assumptions and requirements of the TMDL WLAs. The assumptions and requirements include, but are not limited to, numeric values and averaging periods. For those TMDLs that do not specify averaging periods for the WLAs, the averaging period for the WQBELs and/or receiving water limitations in the Order are based on the averaging period for the TMDL numeric targets. For each TMDL pollutant category, to the extent possible, the WLAs have been incorporated into the Order in a consistent manner. Some TMDLs specify alternative means of demonstrating compliance with WLAs; these alternative means of demonstrating compliance are included in the TMDL provisions in Part IV.B and Attachments K through S of the Order. The manner of incorporation for each TMDL pollutant category is discussed below in more detail.

A number of the TMDLs for various categories of pollutants such as bacteria, metals, and toxics establish WLAs that are assigned jointly to a group of Permittees whose stormwater and/or non-stormwater discharges are or may be commingled in the MS4 prior to discharge to the receiving water subject to the TMDL. TMDLs address commingled MS4 discharges by assigning a WLA to a group of MS4 Permittees based on co-location within the same subwatershed.

The applicability of TMDLs to Permittees as specified in Attachment J of the Order is consistent with the previous MS4 permits and the TMDLs. Where a TMDL assigns WLAs to categories of certain types of discharges or dischargers (e.g., MS4 permittees), but does not specifically name the “responsible Permittees”, current GIS data, drainage area boundaries, and other relevant information have been used to determine the applicability of a categorical WLA to individual Permittees.

1. Expression of Bacteria TMDLs as Permit Limitations

Ten bacteria TMDLs are incorporated into the Regional MS4 Permit as listed below:

- Harbor Beaches of Ventura County Bacteria TMDL (Attachment L)
- Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL (Attachment M)
- Santa Monica Bay Beaches Bacteria TMDL (Attachment O)
- Malibu Creek and Lagoon Bacteria TMDL (Attachment O)
- Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL (Attachment O)
- Marina del Rey Harbor Mothers’ Beach and Back Basins Bacteria TMDL (Attachment O)
- Los Angeles Harbor Bacteria TMDL (Attachment P)
- Los Angeles River Watershed Bacteria TMDL (Attachment Q)

- Long Beach City Beaches and Los Angeles River Estuary Indicator Bacteria TMDL – U.S. EPA Established TMDL (Attachment Q)
- San Gabriel River, Estuary and Tributaries Indicator Bacteria TMDL (Attachment R)

In general, the bacteria TMDLs express the WLAs as an allowable number of exceedance days of the bacteria water quality objectives within the water body; therefore, the WLAs are translated into receiving water limitations. In addition to the receiving water limitations, WQBELs for MS4 outfalls are established to allow the opportunity for Permittees to individually demonstrate compliance at an outfall or jurisdictional boundary, thus isolating the Permittee's pollutant contributions from those of other Permittees and from other pollutant sources to the receiving water. The WQBELs are based on the bacteria water quality objectives in the Basin Plan at the time the TMDL was established.¹⁷⁹ For the bacteria TMDLs that apply to marine and ocean waters,¹⁸⁰ the WQBELs are based on the multi-part bacteriological water quality objectives for total coliform, fecal coliform and enterococcus. For the bacteria TMDLs for freshwater,¹⁸¹ the WQBELs are based on the bacteria water quality objectives for *E. coli*. No exceedances of the WQBELs are permitted unless expressly authorized by the TMDL (e.g., Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL). The rationale for not allowing any exceedances of the WQBELs is that MS4 outfalls are monitored less frequently than the receiving waters, which are generally sampled at least weekly. According to the equations used to express WLAs as allowable exceedance days in the bacteria TMDLs, as the frequency of monitoring decreases, the allowable number of exceedance days approaches zero, such that water quality objectives must be met for each monitoring event. Given the frequency at which outfalls are monitored, the allowable number of exceedance days for outfalls is zero and

¹⁷⁹ In 2018, the State Water Board adopted statewide bacteria water quality objectives and implementation provisions to protect recreational users from the effects of pathogens in California water bodies (Bacteria Provisions). The Bacteria Provisions supersede numeric REC-1 water quality objectives for bacteria contained in a basin plan prior to the effective date of the Bacteria Provisions (February 4, 2019). The Los Angeles Water Board incorporated these Bacteria Provisions into the Basin Plan. The Bacteria Provisions did not change bacteria TMDLs established before February 4, 2019 and these TMDLs remain in effect. The Los Angeles Water Board may convene a public meeting to evaluate the effectiveness of these TMDLs in attaining the Bacteria Provisions at a later date.

¹⁸⁰ These include: Harbor Beaches of Ventura County Bacteria TMDL (Attachment L); Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL (discharges to the Santa Clara River Estuary and Santa Clara River Reaches 1 and 2) (Attachment M); Santa Monica Bay Beaches Bacteria TMDL (Attachment O); Malibu Creek and Lagoon Bacteria TMDL (discharges to the Lagoon) (Attachment O); Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL (discharges to the Estuary) (Attachment O); Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL (Attachment O); Los Angeles Harbor Bacteria TMDL (Attachment P); Long Beach City Beaches and Los Angeles River Estuary Indicator Bacteria TMDL – U.S. EPA Established TMDL (Attachment Q); and San Gabriel River, Estuary, and Tributaries Indicator Bacteria TMDL (discharges to the San Gabriel River Estuary) (Attachment R).

¹⁸¹ These include: Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL (discharges to Santa Clara River Reaches 3 and above) (Attachment M); Malibu Creek and Lagoon Bacteria TMDL (Malibu Creek discharges) (Attachment O); Ballona Creek, Ballona Estuary and Sepulveda Channel Bacteria TMDL (Ballona Creek and Sepulveda Channel discharges) (Attachment O); Los Angeles River Watershed Bacteria TMDL (Attachment Q); and the San Gabriel River, Estuary and Tributaries Indicator Bacteria TMDL (discharges to the San Gabriel River and tributaries) (Attachment R).

therefore no exceedances of the WQBELs are permitted unless otherwise specified.

The following TMDLs require additional discussion either because the manner of incorporation has changed from previous MS4 permits or information in the TMDL regarding the naming of responsible Permittees requires clarification.

Santa Monica Bay Beaches Bacteria TMDL, Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL, Los Angeles Harbor Bacteria TMDL, and Long Beach City Beaches and Los Angeles River Estuary Indicator Bacteria TMDL. A change that was made in the Order from the way these bacteria TMDLs were previously incorporated into the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit is the removal of open beach compliance locations. Since the Order regulates MS4 discharges, only sampling sites that are or could be impacted by an MS4 discharge are included as receiving water compliance locations. MS4 compliance locations are defined as sites that are within 400 yards of storm drain outfalls.¹⁸² Open beach sites are regulated under a different mechanism, such as the Nonpoint Source Program.

For the Santa Monica Bay Beaches Bacteria TMDL (SMB Bacteria TMDL) specifically, the removal of open beach compliance locations affects the calculation of the interim wet-weather single sample indicator bacteria receiving water limitations for each jurisdictional group. The SMB Bacteria TMDL's interim wet-weather milestones were based on a cumulative percentage reduction from the total wet-weather exceedance-day reductions required for each jurisdictional group. These reduction milestones were translated into the number of exceedance days to be reduced plus the number of annual allowable wet-weather exceedance days for each jurisdictional group. By July 15, 2018, the SMB Bacteria TMDL required each jurisdictional group to achieve a 50% cumulative percent reduction from the total wet-weather exceedance-day reductions required for each jurisdictional group as defined in Table 7-4.2b of the Basin Plan. Table 7-4.2b defines each jurisdictional group and the monitoring sites assigned to that group, which includes both open beach and MS4 compliance locations. The Order incorporates the SMB Bacteria TMDL interim wet-weather milestones as interim wet-weather receiving water limitations to be achieved by the effective date of the Order. For each jurisdictional group, the interim wet-weather receiving water limitations have been recalculated to remove open beach compliance locations. In addition, for MS4 compliance locations that are sampled weekly instead of daily, the interim wet-weather receiving water limitations have been scaled according to equation 8.2 in the Santa Monica Bay Beaches Wet-Weather Bacteria TMDL staff report dated November 7, 2002.

Santa Clara River Estuary and Reaches 3, 5, 6, and 7 Indicator Bacteria TMDL (SCR Bacteria TMDL). Unlike other bacteria TMDLs, the SCR Bacteria TMDL only provided values for allowable exceedance days when daily sampling is conducted and provided equations to calculate values for more or less frequent sampling. Interim annual allowable exceedance days of the single sample water quality objective are calculated for daily, weekly, and less than weekly (3 wet and 2 dry weather) sampling frequencies according to the equation included in Table 7-36.3 of the Basin Plan. Final annual allowable exceedance days are calculated for daily

¹⁸² "An Epidemiological Study of Possible Adverse Health Effects of Swimming in Santa Monica Bay." Santa Monica Bay Restoration Project.

and weekly sampling frequencies according to the equation included in Table 7-36.2 of the Basin Plan.

The SCR Bacteria TMDL identifies wet weather as the critical condition. However, the TMDL did not define the wet-weather period. Therefore, the wet-weather period for the SCR Bacteria TMDL is determined based on the same approach as the Santa Monica Bay Beaches Bacteria TMDL (a day with 0.1 inch of rain or greater and the three days following the rain event).¹⁸³

The Order identifies the City of Oxnard as one of the responsible Permittees for the SCR Bacteria TMDL even though the TMDL contains conflicting direction about the inclusion of the City of Oxnard. While the TMDL assigns WLAs to different general categories of pollutants¹⁸⁴, the implementation section of the TMDL does not specifically name the City of Oxnard as one of the entities responsible for MS4 WLAs.¹⁸⁵ However, the TMDL Staff Report does name the City of Oxnard as one of the entities responsible for MS4 WLAs¹⁸⁶ and shows the City as discharging to Reach 1 and Reach 2, which drain to the Estuary, in Figure 2-1 of the TMDL Staff Report¹⁸⁷. Therefore, including the City of Oxnard as a responsible Permittee for the SCR Bacteria TMDL is consistent with the assumptions and requirements of the TMDL.

The Order includes indicator bacteria WQBELs for MS4 dischargers that discharge to Reaches 3 or above based on allowable exceedance days for Reaches 3, 5, 6, and 7. Ventura County Permittees have not been assigned indicator bacteria WQBELs for discharges to Reaches 4B, 5, 6, and 7 because there are no MS4 discharges from Ventura County MS4 Permittees to these reaches. For Reaches 6 and 7, the drainage area for MS4 discharges is completely within Los Angeles County. Reach 5 partially falls within Ventura County, but Ventura County Permittees do not have any MS4 discharges to the portion of Reach 5 that falls within Ventura County¹⁸⁸. This is consistent with the TMDL Staff Report, which shows a map of the Santa Clara River Reach 5 subwatershed as draining mainly Los Angeles County.¹⁸⁹ Therefore, the Order assigns indicator bacteria WQBELs for discharges to Reach 5 exclusively to Los Angeles County Permittees draining to Reach 5. For Reach 4B, although it is completely within Ventura County¹⁹⁰, there are no MS4 discharges from Ventura County Permittees to Santa Clara River Reach 4B. The Order may be reopened to name Ventura County Permittees as responsible Permittees for Santa Clara River Reach 4B and 5 if there is future development of MS4 infrastructure and discharges to these reaches.

¹⁹⁰ Ventura County GIS data and MS4 drainage area maps (July 15, 2016)

2. Expression of Metals TMDLs as Permit Limitations

Six metals TMDLs are incorporated into the Regional MS4 Permit as listed below:

- Metals and Selenium in the Calleguas Creek, its Tributaries and Mugu Lagoon TMDL (Attachment N)
- Ballona Creek Metals TMDL (Attachment O)
- Los Angeles River and Tributaries Metals TMDL (Attachment Q)
- TMDLs for Metals and Selenium - San Gabriel River and Impaired Tributaries – U.S. EPA Established TMDL (Attachment R)
- Los Angeles Area Lakes TMDLs: Puddingstone Reservoir Mercury TMDL – U.S. EPA Established TMDL (Attachment R)
- Los Cerritos Channel TMDLs for Metals – U.S. EPA Established TMDL (Attachment S)

The following TMDLs require additional discussion because the manner of incorporation has changed from previous MS4 permits.

Los Angeles River and Tributaries Metals TMDL, Ballona Creek Metals TMDL, San Gabriel River and Impaired Tributaries Metals and Selenium TMDL, and Los Cerritos Channel Metals TMDL. These TMDLs assign mass-based WLAs to the Permittees during dry-weather and wet-weather conditions expressed as mass per day. For ease of implementation, these WLAs are incorporated into the Order as mass-based WQBELs as well as alternative concentration-based WQBELs. Demonstrating compliance with concentration-based values rather than mass-based values is more practical given the nature of monitoring requirements in the Order.

The TMDLs' dry-weather numeric targets are used for the alternative concentration-based dry-weather WQBELs. This approach is consistent with the assumptions and requirements of these TMDLs. The Los Angeles River and Tributaries Metals TMDL and Ballona Creek Metals TMDL both state that concentration-based permit limits equal to dry-weather reach-specific numeric targets may apply during dry weather.¹⁹¹ The San Gabriel River and Los Cerritos Channel TMDLs do not contain this explicit language, but as they follow the same calculation approach as the Los Angeles River and Ballona Creek TMDLs, the same approach for incorporation into permits may apply.

The wet-weather mass-based WLAs are expressed as equations. In the Order, the terms of these equations have been rearranged to express WQBELs as an "effective concentration" of a metal that when multiplied by the volume of flow in the river for the assessed day (i.e. the daily volume in liters) gives the calculated effluent limitation as a load.

$$\text{Effluent Limitation} = (\text{Effective Concentration}) \times (\text{daily volume})$$

As an example, the grouped wet-weather effluent limitation for cadmium in the Los Angeles River is a load expressed as kg/day:

¹⁹¹ Los Angeles Water Board. Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties. Chapter 7 p. 7-132 (Ballona Creek Metals TMDL) and p. 7-156 (Los Angeles and Tributaries Metals TMDL).

$$\text{Effluent Limitation} = \text{WER} \times (2.8 \times 10^{-9}) \times (\text{daily volume}) - 1.8$$

Setting the two equations equal and rearranging the variables to solve for the “effective concentration,” the equation becomes:

$$\begin{aligned} (\text{Effective Concentration}) \times (\text{daily volume}) \\ = \text{WER} \times (2.8 \times 10^{-9}) \times (\text{daily volume}) - 1.8 \end{aligned}$$

$$\text{Effective Concentration} = \frac{\text{WER} \times (2.8 \times 10^{-9}) \times (\text{daily volume}) - 1.8}{(\text{daily volume})}$$

$$\text{Effective Concentration} = \text{WER} \times (2.8 \times 10^{-9}) - \frac{1.8}{(\text{daily volume})}$$

This equation results in an effective concentration for cadmium expressed as kg/L; to convert to µg/L, apply the conversion factor 1 kg = 1 x 10⁹ µg:

$$\text{Effective Concentration} = \left[\text{WER} \times (2.8 \times 10^{-9}) - \frac{1.8}{(\text{daily volume})} \right] \left(\frac{1 \times 10^9 \mu\text{g}}{1 \text{ kg}} \right)$$

$$\text{Effective Concentration} \left(\frac{\mu\text{g}}{\text{L}} \right) = \text{WER} \times 2.8 - \frac{1.8 \times 10^9}{(\text{daily volume})}$$

The concentration WQBELs for the Los Angeles River and Tributaries Metals TMDL based on this methodology are the following:

$$\text{Cadmium} \left(\frac{\mu\text{g}}{\text{L}} \right) = \text{WER} \times 2.8 - \frac{1.8 \times 10^9}{(\text{daily volume})}$$

$$\text{Copper} \left(\frac{\mu\text{g}}{\text{L}} \right) = \text{WER} \times 15 - \frac{9.5 \times 10^9}{(\text{daily volume})}$$

$$\text{Lead} \left(\frac{\mu\text{g}}{\text{L}} \right) = \text{WER} \times 85 - \frac{3.2 \times 10^{10}}{(\text{daily volume})}$$

$$\text{Zinc} \left(\frac{\mu\text{g}}{\text{L}} \right) = \text{WER} \times 140 - \frac{8.3 \times 10^{10}}{(\text{daily volume})}$$

The Los Angeles River Metals TMDL defines wet weather as any day when the maximum daily flow instream is equal to or greater than 500 cfs at the Wardlow station. A flow of 500 cfs results in a daily volume of 1.22 x 10⁹ L. Using this daily volume, a WER default value of 1 except for copper, which has a site-specific WER of 3.97, in these equations result in the following effective concentrations:

$$\text{Cadmium: } 1 \times 2.8 - \frac{1.8 \times 10^9}{1.22 \times 10^9} = 1.32 \frac{\mu\text{g}}{\text{L}}$$

$$\text{Copper: } 3.97 \times 15 - \frac{9.5 \times 10^9}{1.22 \times 10^9} = 51.76 \frac{\mu\text{g}}{\text{L}}$$

$$\text{Lead: } 1 \times 85 - \frac{3.2 \times 10^{10}}{1.22 \times 10^9} = 58.77 \frac{\mu\text{g}}{\text{L}}$$

$$\text{Zinc: } 1 \times 140 - \frac{8.3 \times 10^{10}}{1.22 \times 10^9} = 71.97 \frac{\mu\text{g}}{\text{L}}$$

The equations for the wet-weather mass-based WQBELs for the Ballona Creek Metals TMDL, San Gabriel River Metals TMDL, and Los Cerritos Channel Metals TMDL are simpler than for the Los Angeles River Metals TMDL because they do not account for the allocations for wastewater treatment plants. Thus, when the equations for the Ballona Creek Metals TMDL, San Gabriel River Metals TMDL, and Los Cerritos Channel Metals TMDL are rearranged, the effective concentration is a value. As an example, the grouped wet-weather effluent limitation for copper in Ballona Creek is a load expressed as grams per day:

$$\text{Effluent Limitation} = \text{WER} \times (1.297 \times 10^{-5}) \times (\text{daily volume})$$

As in the previous example, the effluent limitation is expressed as an “effective concentration”:

$$\text{Effluent Limitation} = (\text{Effective Concentration}) \times (\text{daily volume})$$

Setting the two equations equal and rearranging the variables to solve for the “effective concentration” the equation becomes:

$$\begin{aligned} (\text{Effective Concentration}) \times (\text{daily volume}) \\ = \text{WER} \times (1.297 \times 10^{-5}) \times (\text{daily volume}) \end{aligned}$$

$$\text{Effective Concentration} = \frac{\text{WER} \times (1.297 \times 10^{-5}) \times (\text{daily volume})}{(\text{daily volume})}$$

$$\text{Effective Concentration} = \text{WER} \times 1.297 \times 10^{-5}$$

This equation results in an effective concentration for copper expressed as g/L; to convert to $\mu\text{g/L}$, apply the conversion factor $1 \text{ g} = 1 \times 10^6 \mu\text{g}$:

$$\text{Effective Concentration} = (\text{WER} \times 1.297 \times 10^{-5}) \left(\frac{1 \times 10^6 \mu\text{g}}{1 \text{ g}} \right)$$

$$\text{Effective Concentration} \left(\frac{\mu\text{g}}{\text{L}} \right) = \text{WER} \times 12.97$$

The concentration WQBELs for the Ballona Creek Metals TMDL based on this methodology are the following:

$$\text{Copper} \left(\frac{\mu\text{g}}{\text{L}} \right) = \text{WER} \times 12.97$$

$$\text{Lead} \left(\frac{\mu\text{g}}{\text{L}} \right) = \text{WER} \times 72.65$$

$$\text{Zinc} \left(\frac{\mu\text{g}}{\text{L}} \right) = \text{WER} \times 99.17$$

This methodology for determining effective concentrations to be used as the alternative wet-weather concentration-based WQBELs is consistent with the assumptions and requirements of these TMDLs because the equations are the same as the WLA equations assigned by the TMDLs; the terms have merely been rearranged for ease of compliance determination.

3. Expression of Nutrient TMDLs as Permit Limitations

Twelve nutrient TMDLs are incorporated into the Regional MS4 Permit as listed below:

- TMDL for Algae, Eutrophic Conditions, and Nutrients in the Ventura River and its Tributaries (Attachment K)
- Santa Clara River Nitrogen Compounds TMDL (Attachment M)
- Santa Clara River Lakes Nutrients TMDL (Lake Elizabeth) (Attachment M)
- TMDLs for Nutrients - Malibu Creek Watershed – U.S. EPA Established TMDLs (Attachment O)
- Malibu Creek and Lagoon TMDL for Sedimentation and Nutrients to Address Benthic Community Impairments – U.S. EPA Established TMDLs (Attachment O)
- Machado Lake Eutrophic, Algae, Ammonia, and Odors (Nutrient) TMDL (Attachment P)
- Los Angeles River Nitrogen Compounds and Related Effects TMDL (Attachment Q)
- LA Area Lakes TMDLs: Echo Park Lake Nutrient TMDL – U.S. EPA Established TMDL (Attachment Q)
- LA Area Lakes TMDLs: Peck Road Park Lake Nutrient TMDL – U.S. EPA Established TMDL (Attachment Q)
- LA Area Lakes TMDL: Legg Lake System Nutrient TMDL – U.S. EPA Established TMDL (Attachment Q)
- LA Area Lakes TMDLs: Lake Calabasas Nutrient TMDL – U.S. EPA Established TMDL (Attachment Q)
- LA Area Lakes TMDL: Puddingstone Reservoir Nutrient TMDL – U.S. EPA Established (Attachment R)

The following TMDLs require additional discussion either because the manner of incorporation has changed from previous MS4 permits or there is inconsistent information in the TMDL about the naming of responsible Permittees.

Santa Clara River Lakes Nutrients TMDL (Lake Elizabeth only). The *Santa Clara River Lakes Nutrients TMDL* assigns grouped WLAs to all MS4 discharges for Lake Elizabeth, Munz Lake, and Lake Hughes. Only WLAs for Lake Elizabeth were incorporated in Attachment M of the Order because there are no Permittee discharges subject to the Order into Lake Hughes or Lake Munz.¹⁹² The WLAs for MS4 discharges to Munz Lake and Lake Hughes were assigned to additional responsible entities in the future under Phase II of the U.S. EPA Stormwater Permitting Program; or the residual designation authority of the state under Clean Water Action section 402(p)(2)(E), and other applicable regulatory programs.¹⁹³

Los Angeles River Nitrogen Compounds and Related Effects TMDL. In the *Los Angeles River Nitrogen Compounds and Related Effects TMDL* (LAR Nitrogen

¹⁹² Total Maximum Daily Load for Nutrients in Elizabeth Lake, Munz Lake, and Lake Hughes in the Santa Clara River Watershed [Staff Report]. September 8, 2016. Table 4 pp. 16-17.

¹⁹³ Los Angeles Water Board. Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties. Chapter 7 pp. 7-564-565

TMDL) the total ammonia as nitrogen WLAs are dependent on the temperature and pH of receiving waters as well as the presence of early life stages (ELS) of fish. The WQBELs incorporated into the Regional MS4 Permit for total ammonia as nitrogen are based on the calculation procedure for translation of objectives into effluent limits in Chapter 3 of the Basin Plan, page 3-16 to 3-25. Following this procedure is consistent with the LAR Nitrogen TMDL, which states, "It would be consistent with the findings and assumptions of this TMDL to calculate total ammonia WLAs based on temperature and pH data from the most recent three years of monitoring data when incorporating WLAs into permits. In applying this approach, 90th percentile pH data shall be used to establish one-hour average WLAs and the 50th percentile of pH and temperature data shall be used to establish 30-day average WLAs. The procedure for translation of objectives into effluent limits specified in Chapter 3 of this Basin Plan, as amended by Resolution R02-011 and R04-022, shall be used to translate WLAs into effluent limitations." The three years of receiving water monitoring data used to calculate the ammonia WQBELs were from the Donald C. Tillman Water Reclamation Plant (WRP), the Los Angeles-Glendale WRP, and the Whittier Narrows WRP.

The Donald C. Tillman WRP is located at the Sepulveda Basin and discharges to Reach 5. There are receiving water monitoring stations in Reach 5 (Sepulveda Basin) and Reach 4 (below Sepulveda Basin). Monitoring data from receiving water monitoring stations RSW-LATT628 (Reach 5) and RSW-LATT630 (Reach 4) were used to calculate the ammonia site specific 30-day average limitations. The Los Angeles-Glendale WRP discharges to Los Angeles River Reach 3. Monitoring data from receiving water monitoring station RSW-LAGT650 (Reach 3) were used to calculate the ammonia site specific 30-day average limitations. Whittier Narrows WRP is located adjacent to Rio Hondo Reach 3 (above Whittier Narrows Dam). Monitoring data from receiving water monitoring station RSW-006 (Rio Hondo Reach 3) were used to calculate the ammonia site specific 30-day average limitations. For the three WRPs, the receiving water monitoring data from January 1, 2018 to December 31, 2020, were used to calculate the 50th percentile for pH and temperature values, which were used to calculate the ammonia WQBELs.

4. Expression of Salts TMDLs as Permit Limitations

Three salts TMDLs are incorporated into the Regional MS4 Permit as listed below:

- Santa Clara River Reach 3 Chloride TMDL – U.S. EPA Established TMDL (Attachment M)
- Upper Santa Clara River Chloride TMDL (Attachment M)
- Calleguas Creek Watershed Salts TMDL (Attachment N)

The following TMDLs require additional discussion either because the manner of incorporation has changed from previous MS4 permits or there is inconsistent information in the TMDL about the naming of responsible Permittees.

Santa Clara River Reach 3 Chloride TMDL. The SCR Reach 3 Chloride TMDL recommends incorporating WLAs as an instantaneous maximum. However, the WLAs were incorporated into Attachment M of the Order as a daily maximum. Based on the monitoring frequency required in the MRP of the Order, the daily maximum is effectively the same as an instantaneous maximum WQBEL.

Upper Santa Clara River Chloride TMDL. The *Upper Santa Clara River Chloride TMDL* (USCR Chloride TMDL) includes a 3-month rolling average WLA for chloride. However, the 2012 Los Angeles County MS4 Permit includes WLAs as an instantaneous maximum. Based on the monitoring frequency required in the MRP of the Order, the daily maximum is effectively the same as an instantaneous maximum. Therefore, consistent with the 2012 Los Angeles County MS4 Permit, the WLA for chloride is incorporated in Attachment M of the Order as a daily maximum WQBEL.

Although the USCR Chloride TMDL did not specifically list individual responsible Permittees, it assigned WLAs to “Other NPDES discharges.” Consistent with the SCR Bacteria TMDL, Ventura County Permittees have not been assigned chloride WQBELs for discharges to the upper reaches of the Santa Clara River (Reaches 4Band 5) because there are no MS4 discharges from Ventura County MS4 Permittees to these reaches.¹⁹⁴

Boron, Chloride, Sulfate, and TDS (Salts) in the Calleguas Creek Watershed TMDL (Calleguas Creek Salts TMDL). Among the other Permittees specifically named in the Calleguas Creek Salts TMDL, the Los Angeles Water Board has determined that the Cities of Oxnard and Simi Valley are responsible Permittees for this TMDL because their MS4s discharge to the subwatersheds to which the TMDL assigns WLAs (Pleasant Valley (Revolon) and Simi)¹⁹⁵. This determination was made based on current GIS information on MS4s and their drainage areas.

5. Expression of Toxic Pollutants and Sediment TMDLs as Permit Limitations

There are twenty-one (21) toxic pollutants and sediment TMDLs that are incorporated into the Regional MS4 Permit as listed below:

- Calleguas Creek OC Pesticides and PCBs TMDL (Attachment N)
- Calleguas Creek Toxicity TMDL (Attachment N)
- TMDLs for Pesticides, PCBs, and Sediment Toxicity in Oxnard Drain 3 – U.S. EPA Established (Attachment N)
- Santa Monica Bay TMDLs for DDTs and PCBs – U.S. EPA established (Attachment O)
- Ballona Creek Estuary Toxic Pollutants TMDL (Attachment O)
- Ballona Creek Wetlands TMDLs for Sediment and Invasive Exotic Vegetation – U.S. EPA established (Attachment O)
- Marina del Rey Harbor Toxic Pollutants TMDL (Attachment O)
- Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters Toxic Pollutants TMDL (Attachment P)
- Machado Lake Pesticides and PCBs TMDL (Attachment P)
- LA Area Lakes TMDLs: Echo Park Lake Chlordane, Dieldrin and PCBs TMDL – U.S. EPA Established (Attachment Q)
- LA Area Lakes TMDLs: Peck Road Park Lake Chlordane, Dieldrin, DDTs and PCBs TMDL – U.S. EPA Established (Attachment Q)
- LA Area Lakes TMDLs: Puddingstone Reservoir Chlordane, Dieldrin, DDTs and PCBs TMDLs – U.S. EPA Established (Attachment R)
- Colorado Lagoon OC Pesticides, PCBs, Sediment Toxicity, PAHs, and Metals TMDL (Attachment S)

¹⁹⁴ Ventura County GIS data and MS4 drainage area maps (July 15, 2016).

¹⁹⁵ Los Angeles Water Board. Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties. Chapter 7 p 7-273

The following TMDLs require additional discussion either because the manner of incorporation has changed from previous MS4 permits or there is inconsistent information in the TMDL about the manner of incorporation.

Organochlorine (OC) Pesticides, Polychlorinated Biphenyls (PCBs), and Siltation in Calleguas Creek, its Tributaries, and Mugu Lagoon TMDL (Calleguas Creek OC Pesticides and PCBs TMDL). The Calleguas Creek OC Pesticides and PCBs TMDL includes a siltation WLA, which is allocated to all NPDES permitted MS4s, including Caltrans. The WLA is expressed as a reduction from the baseline sediment yield to Mugu Lagoon. The TMDL states on page 7 that “the [waste] load allocation will apply after the baseline is established, as described in the Implementation Plan.” The TMDL Implementation Plan requires Ventura County Permittees to propose a baseline load per Special Study #1. Ventura County Permittees have completed Special Study #1. However, the study did not determine the baseline sedimentation yield but rather claimed that Mugu Lagoon is unimpaired for sedimentation based on habitat conversion and benthic community degradation. Mugu Lagoon has not been removed from the 303(d) list for sedimentation. Nonetheless, until a baseline sedimentation yield is calculated, it is not possible to incorporate the sedimentation WLA into the Order because of the way the WLA is expressed in the TMDL. Therefore, the siltation WLA for Mugu Lagoon is not incorporated into Attachment N of the Order. The Los Angeles Water Board will reopen the Order to incorporate a siltation WLA depending upon the decision regarding the impairment status of Mugu Lagoon.

Calleguas Creek Toxicity TMDL. The Toxicity, Chlorpyrifos, and Diazinon in the Calleguas Creek, its Tributaries, and Mugu Lagoon TMDL (Calleguas Creek Toxicity TMDL) includes 1-hour (acute) and 4-day (chronic) WLAs for both chlorpyrifos and diazinon. Based on the monitoring frequency required in the MRP of the Order, the daily maximum is effectively the same as the 1-hour and 4-day frequency. Hence, WLAs are incorporated as a daily maximum. Consistent with other Los Angeles Water Board-adopted toxics TMDLs, acute WLAs were interpreted to apply to wet weather and chronic WLAs were interpreted to apply to dry weather.

E. WQBELs for Trash

1. Previous Permit Requirements

The Los Angeles Water Board amended the 2001 Los Angeles County MS4 Permit (Order No. 01-182) on December 10, 2009 to incorporate provisions implementing the Los Angeles River Trash TMDL. At that time, the Los Angeles Water Board incorporated the WLAs from the Los Angeles River Trash TMDL into the 2001 Los Angeles County MS4 Permit as numeric WQBELs.¹⁹⁶ The 2001 Los Angeles County MS4 Permit stated: “Each Permittee identified in Appendix 7-1 shall comply with the interim and final effluent limitations set forth in Appendix 7-1 hereto.”¹⁹⁷ Appendix 7-1 expressed the numeric effluent limitations for trash as progressively decreasing allowable amounts of trash discharged from each applicable permittee’s jurisdictional area within the watershed. Each applicable permittee was

¹⁹⁶ See generally 2001 Permit, Part 7, pp. 79-84, Appendix 7-1, and Appendix 7-2. See also, 2001 Permit, Findings Related to the Incorporation of the Los Angeles River Trash TMDL, pp. 15-20; see also 2012 Permit, Fact Sheet, pp. F-13, F-23..

¹⁹⁷ 2001 Permit, Part 7, p. 79 and Appendix 7-1.

required to make annual reductions of its discharges of trash over a 7-year period (2010-2016), until the final effluent limitation of zero trash discharged from the MS4 was achieved. “Permittees shall achieve their final effluent limitation of zero trash discharge for the 2015-2016 storm year and every year thereafter.”¹⁹⁸ Consistent with the TMDL, the Los Angeles Water Board provided Permittees the option to be deemed in compliance with the numeric effluent limitations through the installation of certain BMPs (i.e., certified full capture devices).¹⁹⁹

In the 2012 Los Angeles County MS4 Permit, the Los Angeles Water Board carried over the effluent limitations and compliance deadlines, as well as the compliance approaches, established in the 2001 Los Angeles County MS4 Permit.²⁰⁰ Part A of Attachment O of the 2012 Los Angeles County MS4 Permit included the interim and final numeric WQBELs and compliance deadlines implementing the Los Angeles River Trash TMDL. Applicable permittees were required to “comply with the final water quality-based effluent limitation of zero trash discharged to the Los Angeles River no later than September 30, 2016 and every year thereafter.”²⁰¹ The 2012 Los Angeles County MS4 Permit also included provisions implementing 8 other trash TMDLs, including interim and final numeric WQBELs and compliance deadlines and provisions outlining the method of compliance for all trash TMDLs.

The 2014 City of Long Beach MS4 Permit included similar requirements for the Los Angeles River Trash TMDL. As discussed in Part II.F of this Fact Sheet, the 2012 Los Angeles County MS4 Permit was reopened in 2016 to incorporate revisions to the Los Angeles River Trash TMDL and Ballona Creek and Wetlands Trash TMDL. At the same time, the 2014 City of Long Beach MS4 Permit was also reopened to incorporate the same revisions to the Los Angeles River Trash TMDL. The 2010 Ventura County MS4 Permit included provisions for the Revolon Slough and Beardsley Wash Trash TMDL and the Ventura River Estuary Trash TMDL. These provisions in the Ventura County MS4 Permit included WLAs expressed as WQBELs of “zero trash”, compliance monitoring, and actions and special studies.

2. Manner of Trash TMDLs Incorporation

There are eleven (11) trash TMDLs that are incorporated into the Regional MS4 Permit, listed below, consistent with the assumptions and requirements of the TMDL WLAs.

- Ventura River Estuary Trash TMDL (Attachment K)
- Lake Elizabeth Trash TMDL (Attachment M)
- Revolon Slough and Beardsley Wash Trash TMDL (Attachment N)
- Santa Monica Bay Nearshore and Offshore Debris TMDL (Attachment O)
- Malibu Creek Watershed Trash TMDL (Attachment O)

¹⁹⁸ *Id.*, Part 7, Appendix 7-1, footnote 3.

¹⁹⁹ *Id.*, Part 7, pp. 79-84 and Appendix 7-2.

²⁰⁰ 2012 Permit, Part VI.E.5, pp. 151-157 and Attachment O, Part A, pp. O-1 to O-3.. See also *id.*, Fact Sheet, p. F-37 (“This Order carries over the final receiving water limitations and WQBELs that were included to implement the Marina del Rey Harbor Back Basins and Mothers’ Beach Bacteria TMDL and the Los Angeles River Trash TMDL, respectively, in the 2007 and 2009 amendments to Order No. 01-182.”).

²⁰¹ *Id.*, Part A.2, p. O-1..

- Ballona Creek Trash TMDL (Attachment O)
- Machado Lake Trash TMDL (Attachment P)
- Los Angeles River Watershed Trash TMDL (Attachment Q)
- Legg Lake Trash TMDL (Attachment Q)
- LA Area Lakes TMDLs: Echo Park Lake Trash TMDL – U.S. EPA Established (Attachment Q)
- LA Area Lakes TMDLs: Peck Road Park Lake Trash TMDL – U.S. EPA Established (Attachment Q)

The WLAs for trash are expressed as progressively decreasing allowable amounts of trash discharged from a Permittee’s jurisdictional area within the drainage area to the impaired water body. The Trash TMDLs require each Permittee to make annual reductions of its discharges of trash over a set period, until the numeric target of zero trash discharged from the MS4 is achieved. The Trash TMDLs specify a specific formula for calculating and allocating annual reductions in trash discharges from each jurisdictional area within a watershed. The formula results in specified annual amounts of trash that may be discharged from each jurisdiction into the receiving waters. Translation of the WLAs or compliance points described in the TMDLs into jurisdiction-specific load reductions from the baseline levels, as specified in the TMDL, logically results in the articulation of an annual limitation on the amount of a pollutant that may be discharged. The specification of allowable annual trash discharge amounts meets the definition of an “effluent limitation”, as that term is defined in subdivision (c) of section 13385.1 of the California Water Code. Alternatively, if Permittees choose to comply with the WLAs for trash by progressively installing full capture systems to address 100% of the drainage area to the impaired waterbody within their jurisdiction, the specification of the percentage of the drainage area (or percentage of catch basins) that must be addressed meets the definition of an “effluent limitation.” Specifically, the trash discharge limitations or, alternatively, percentage of area addressed by full capture systems constitute a “numeric restriction ... on the quantity [or] discharge rate ... of a pollutant or pollutants that may be discharged from an authorized location.”

3. Compliance Schedules for Trash TMDLs

Trash TMDL compliance schedules are incorporated into the Regional MS4 Permit consistent with the TMDLs. Note that the Santa Monica Bay Debris TMDL included a mechanism where Permittees would receive a three-year extension of the final TMDL implementation deadline if they adopted certain local ordinances. The cities of Manhattan Beach, Hermosa Beach, and Malibu adopted local ordinances to ban plastic bags, smoking in public places, and single use expanded polystyrene food packaging. Therefore, the final TMDL implementation deadline for these Permittees is extended from March 20, 2020 to March 20, 2023.

4. Trash TMDLs Compliance Methods

Part IV.B.3 of the Order sets forth the trash WQBELs, Permittees’ compliance options with respect to trash WBQELs, and additional trash TMDL provisions. The compliance options included in the Order are consistent with the compliance options included in the previous 2012 Los Angeles County and 2014 City of Long Beach MS4 Permits, with the exception of the following:

- a. Under the 2012 Los Angeles County and 2014 City of Long Beach MS4 Permits, a Permittee could request a less frequent assessment of its daily generation rate (DGR) subject to Executive Officer approval. Part IV.B.3.b.ii.(a)(1)(iii) of the Order, however, allows Permittees to reduce the frequency of DGR recalculation to every five years upon achieving full compliance with final WQBELs without the requirement for Executive Officer approval. This change was made due to the time and tracking costs associated with tracking and responding to such requests and does not affect requirements for annual reporting and, thus, the ability to assess compliance with the final WQBELs on an ongoing basis.
- b. Two trash TMDL compliance approaches included in previous MS4 permits, “Partial Capture Devices and Institutional Controls” and “Combined Compliance Approaches,” have been combined into the “Mass Balance Compliance Approach” detailed in Part IV.B.3.b.ii of the Order. This approach allows Permittees to comply with their interim and final effluent limitations using a combination of full capture systems, partial capture devices, and institutional controls. Furthermore, performance of full capture systems and partial capture devices (i.e., trash removal efficiency) may be accounted for in calculating the “Total Storm Year Trash Discharge,” using the forms provided in Attachment I of the Order. The change to combine the “Partial Capture Devices and Institutional Controls” and “Combined Compliance Approaches” from the previous permits does not constitute a change in trash TMDL compliance options.
- c. Additionally, the Order takes into account additional full capture system compliance options for the Malibu Creek Watershed Trash TMDL and the Revolon Slough and Beardsley Wash Trash TMDL. These additional full capture system compliance options are consistent with recent updates to these TMDLs, which are now in effect (See Table F-24). These compliance options allow Permittees to demonstrate compliance with the WQBELs by installing certified full capture systems on conveyances that collect drainage from priority land use areas as defined in the Trash Amendments.

F. U.S. EPA Established TMDLs

U.S. EPA has established ten TMDLs that include waste load allocations for MS4 discharges in Los Angeles and Ventura counties. These TMDLs are listed below with their effective dates:

- March 21, 2003 – TMDLs for Nutrients - Malibu Creek Watershed (Attachment O)
- June 18, 2003 – TMDL for Chloride in the Santa Clara River, Reach 3 (Attachment M)
- March 26, 2007 – TMDLs for Metals and Selenium - San Gabriel River and Impaired Tributaries (Attachment R)
- March 17, 2010 – Los Cerritos Channel TMDLs for Metals (Attachment S)
- October 6, 2011 – TMDLs for Pesticides, PCBs, and Sediment Toxicity in Oxnard Drain 3 (Attachment N)
- March 26, 2012 – Santa Monica Bay TMDLs for DDTs and PCBs (Attachment O)

- March 26, 2012 – Ballona Creek Wetlands TMDLs for Sediment and Invasive Exotic Vegetation (Attachment O)
- March 26, 2012 – Long Beach City Beaches and Los Angeles River Estuary TMDLs for Indicator Bacteria (Attachment Q)
- March 26, 2012 – Los Angeles Area Lakes TMDLs for Nitrogen, Phosphorus, Mercury, Trash, Organochlorine Pesticides and PCBs (Attachments O, Q, and R)
- July 2, 2013 – Malibu Creek and Lagoon TMDL for Sedimentation and Nutrients to Address Benthic Community Impairments (Attachment O)

As discussed above, in contrast to State-established TMDLs, U.S. EPA-established TMDLs do not contain a program of implementation. The Clean Water Act does not allow U.S. EPA to either adopt programs of implementation or establish implementation schedules for its TMDLs. Such decisions are generally left with the states. The Los Angeles Water Board may, and has in some cases, subsequently adopted a separate program of implementation as a Basin Plan Amendment for U.S. EPA-established TMDLs, including schedules of implementation, which can be included as compliance schedules in permits where applicable. Alternatively, considering the specific approach taken in the Regional MS4 Permit and specific facts pertaining to the U.S. EPA-established TMDLs, the Los Angeles Water Board can determine that no compliance schedule should be provided or may approve a schedule in a Watershed Management Program.

In the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit, Permittees subject to WLAs in U.S. EPA-established TMDLs were required to propose and implement best management practices (BMPs) that would be effective in achieving compliance with U.S. EPA-established numeric WLAs and a schedule to implement the proposed BMPs in their WMPs. The Los Angeles Water Board's approach in these two prior permits was based the fact that the TMDLs were being newly incorporated and, because they did not have State adopted programs of implementation, the numeric WLAs would take effect immediately. Further, through the WMP Provisions in these two permits, the Los Angeles Water Board created an alternative compliance pathway that provided a rigorous process for identifying BMPs and a schedule for implementing the BMPs that would ensure that the WLAs would be achieved. Therefore, the Los Angeles Water Board determined that it was appropriate to express the TMDL WLAs as narrative WQBELs and allow Permittees to propose BMPs to meet the numeric WLAs and a schedule that was as short as possible in a Watershed Management Program during the terms of these two permits. If Permittees did not propose such BMPs in their WMPs, and receive approval of their WMP, they were required to immediately comply with numeric WQBELs equivalent to the numeric WLAs.²⁰²

In developing the Order, the Los Angeles Water Board revisited, and is clarifying, its approach to U.S. EPA-established TMDL WLAs in the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit, which these permits anticipated the Los Angeles Water Board would do. In revisiting its approach, the Los Angeles Water Board considered (a) whether it had adopted a program of implementation for the TMDL pursuant to Water Code sections 13240 and 13242; (b) whether the WLAs for the U.S. EPA-established TMDL were equivalent to existing pollutant loads (thus

²⁰² Note that per 40 CFR § 130.2(h) "WLAs constitute a type of water quality-based effluent limitation [WQBEL]."

requiring no reductions); (c) whether Permittees were currently achieving the WLAs; and (d) whether load reductions are still required to meet the WLAs.

In some cases, the Los Angeles Water Board is allowing Permittees the option to continue implementing proposed BMPs per a specified schedule in a Watershed Management Program. In other cases, the Los Angeles Water Board is incorporating compliance schedules where it has adopted a program of implementation for the U.S. EPA TMDL. And, finally, in some cases, the Los Angeles Water Board has concluded that additional time to comply with the TMDL-based WQBELs is not needed. The manner of incorporation and compliance schedules for each of the U.S. EPA TMDLs is set forth and explained below.

1. U.S. EPA TMDLs with State Programs of Implementation

The Los Angeles Water Board adopted the following three separate programs of implementation to address four U.S. EPA-established TMDLs:

- Implementation Plan for the (a) TMDLs for Nutrients - Malibu Creek Watershed and the (b) Malibu Creek and Lagoon TMDL for Sedimentation and Nutrients to Address Benthic Impairments (effective date: May 16, 2017)
- Implementation Plan for the TMDLs for Metals and Selenium - San Gabriel River and Impaired Tributaries (effective date: October 13, 2014)
- Implementation Plan for the Los Cerritos Channel TMDLs for Metals (effective date: October 13, 2014)

For these U.S. EPA-established TMDLs, the WLAs are incorporated into the Order as numeric WQBELs and/or receiving water limitations with corresponding compliance schedules consistent with the TMDLs and programs of implementation adopted by the Los Angeles Water Board. Permittees have the option to address these U.S. EPA-established TMDLs in a Watershed Management Program in the same manner as Los Angeles Water Board-adopted TMDLs.

Through establishment of these state programs of implementation the Los Angeles Water Board has undergone a comprehensive evaluation of implementation strategies, cost considerations including the estimated cost of implementing the measures to achieve the WLAs, and the time required to fully implement control measures to achieve the final WLAs.

2. U.S. EPA TMDLs That Do Not Have State Programs of Implementation

The remaining six U.S. EPA established TMDLs do not have State programs of implementation. The Los Angeles Water Board's decision as to how to incorporate WQBELs and/or receiving water limitations for these six U.S. EPA established TMDLs is based on an evaluation of (1) whether the WLAs in the U.S. EPA-established TMDLs were based on existing MS4 loads and (2) whether Permittees were currently achieving WLAs.

a. U.S. EPA TMDLs Where WLAs Were Based on Existing MS4 Loads at Time of TMDL Adoption

After a fact-specific re-evaluation of how each U.S. EPA-established TMDL should be incorporated, the Los Angeles Water Board has determined that numeric WQBELs and/or receiving water limitations must be achieved by the effective date of the Order for the U.S. EPA-established TMDLs where the WLAs were established equal to existing MS4 pollutant loads. The following

TMDLs established by U.S. EPA have WLAs that are equivalent to existing MS4 pollutant loads at the time of TMDL adoption:

- Santa Monica Bay TMDLs for DDTs and PCBs²⁰³
- Ballona Creek Wetlands TMDLs for Sediment and Invasive Exotic Vegetation²⁰⁴
- Echo Park Lake Nutrients TMDL and Peck Road Park Lake Nutrients TMDL²⁰⁵

For these TMDLs, the U.S. EPA TMDL specifies that the WLAs are set equal to the existing pollutant loads at the time of TMDL adoption. Therefore, no reductions in pollutant loads should be required. Permittees must continue to maintain and not increase pollutant loads in MS4 discharges as compared to the WLAs. Accordingly, these WLAs are incorporated as numeric WQBELs and/or receiving water limitations that must be complied with as of the effective date of the Order. No compliance schedules or alternative to propose BMPs and schedules of implementation in Watershed Management Programs are provided.

b. U.S. EPA TMDLs Where Permittees Are Achieving WLAs

For U.S. EPA-established TMDLs where Permittees are currently achieving WLAs, the Los Angeles Water Board has also incorporated these WLAs as numeric WQBELs and/or receiving water limitations that must be complied with as of the effective date of the Order. The rationale for this manner of incorporation is further explained below.

The previous MS4 Permits required Permittees to propose and implement BMPs to achieve compliance with the WLAs. Therefore, the Los Angeles Water Board evaluated the Permittees' TMDL implementation strategies, monitoring data, and the time required to fully implement control measures to achieve the final WLAs in the WMPs and Annual Reports. Based on this information, the Los Angeles Water Board determined that Permittees will be able to comply immediately with the numeric WQBELs and/or receiving water limitations as of the effective date of the Order.

Based on this information, for the following TMDLs, the WLAs are incorporated as numeric WQBELs and/or receiving water limitations that must be complied with as of the effective date of the Order. No compliance schedules or alternative to propose BMPs and schedules of implementation in Watershed Management Programs are provided.

Santa Clara River Reach 3 Chloride TMDL. On June 18, 2003, U.S. EPA established the *TMDL for Chloride in the Santa Clara River Reach 3* (SCR Reach 3 Chloride TMDL). Based on outfall monitoring data (site IDs MO-SPA and MO-FIL) from October 2010 through May 2017, there were three

²⁰³ U.S. EPA. Santa Monica Bay Total Maximum Daily Loads for DDTs and PCBs. March 26, 2012. pp. 49-51.

²⁰⁴ U.S. EPA. Ballona Creek Wetlands Total Maximum Daily Loads for Sediment and Invasive Exotic Vegetation. March 26, 2012. pp. 73-74.

²⁰⁵ U.S. EPA. Los Angeles Area Lakes Total Maximum Daily Loads for Nitrogen, Phosphorus, Mercury, Trash, Organochlorine Pesticides and PCBs. March 26, 2012. pp. 6-17 and 4-18.

exceedances out of 51 samples of the 80 mg/L WQBEL²⁰⁶. Furthermore, recent monitoring data from January 2018 to January 2019 for these outfall sites indicate no exceedances out of 19 samples. For these reasons, the WLA in the SCR Reach 3 Chloride TMDL is incorporated in Attachment Q of the Order as a numeric WQBEL and no compliance schedule or option to propose BMPs and an implementation schedule in a Watershed Management Program is included. Thus, this numeric WQBEL must be complied with as of the effective date of the Order.

Echo Park Lake Trash TMDL and the Peck Road Park Lake Trash TMDL.

The Echo Park Lake Trash TMDL and Peck Road Park Lake Trash TMDL are part of the *Los Angeles Area Lakes TMDLs for Nitrogen, Phosphorus, Mercury, Trash, Organochlorine Pesticides and PCBs*. The Upper Los Angeles River EWMP 2017-18 Annual Report (p. 29) for the Echo Park Lake Trash TMDL states, “The target of zero trash established in the Echo Park Lake Trash TMDL was met at Echo Park Lake.” The Upper Los Angeles River EWMP is the only Watershed Management Program that addresses Echo Park Lake. Having achieved the TMDL WLA, Permittees are expected to maintain compliance.

The Rio Hondo/San Gabriel River EWMP proposed September 30, 2016 as the final compliance date to meet the Peck Road Park Lake Trash TMDL (Table 2-10, p. 59 of the EWMP), which has passed. The City of Irwindale reports in the 2017-18 Annual Report (p. 23) that they have achieved full compliance with the Peck Road Park Lake Trash TMDL. The City of El Monte in their WMP (pp. 1-57 to 1-58) states that the City does not discharge to Peck Road Park Lake. In summary, for the Peck Road Park Lake Trash TMDL Permittees have either proposed a compliance schedule for which the final deadline has passed or have reported full compliance in their latest annual reports; therefore, Permittees are expected to be in compliance and maintain compliance with the TMDL WLAs.

For these reasons, the WLAs in the Echo Park Lake Trash TMDL and Peck Road Park Lake Trash TMDL were incorporated in Attachment Q of the Order as numeric WQBELs that must be complied with as of the effective date of the Order. No compliance schedules or alternative to propose BMPs and additional schedules of implementation in Watershed Management Programs are provided.

c. Remaining U.S. EPA TMDLs

Some U.S. EPA-established TMDLs without state programs of implementation have WLAs that were not based on existing pollutant loads, therefore, they required pollutant load reductions; and Permittees may still not be meeting the WLAs.

The following U.S. EPA established TMDLs are included in the Order as narrative WQBELs whereby Permittees have the option of proposing BMPs that have a reasonable assurance of achieving the TMDL WLAs along with a schedule to implement the BMPs that is as short as possible in a Watershed Management Program. The State Water Board upheld this approach in WQ-

²⁰⁶ California Environmental Data Exchange Network (CEDEN). Accessed August 7, 2020. <https://ceden.waterboards.ca.gov/AdvancedQueryTool>.

2015-0075.²⁰⁷ The Los Angeles Water Board may, at its discretion, revisit this decision within the term of the Order or in a future permit, as more information is developed to support the inclusion of numeric WQBELs for these U.S. EPA-established TMDLs:

- TMDLs for Pesticides, PCBs, and Sediment Toxicity in Oxnard Drain 3
- Long Beach City Beaches and Los Angeles River Estuary Indicator Bacteria TMDL
- Los Angeles Area Lakes TMDLs for Nitrogen, Phosphorus, Mercury, Trash, OC Pesticides and PCBs
 - Legg Lake System Nutrient TMDL
 - Lake Calabasas Nutrient TMDL
 - Echo Park Lake Chlordane, Dieldrin and PCBs TMDL
 - Peck Road Park Lake Chlordane, Dieldrin, DDTs and PCBs TMDL
 - Puddingstone Reservoir Nutrient, Mercury, Chlordane, Dieldrin, DDTs and PCBs TMDLs

For these U.S. EPA established TMDLs, the Order allows Permittees subject to these TMDLs to propose and implement BMPs that will be effective in achieving the TMDL WLAs in a Watershed Management Program, subject to Los Angeles Water Board approval.²⁰⁸ Where these TMDLs were previously included in the 2012 Los Angeles County MS4 Permit and 2014 City of Long Beach MS4 Permit, some Permittees have already done so. In the case of Ventura County Permittees, the 2010 Ventura County MS4 Permit did not include the alternative to develop and implement a Watershed Management Program and, further, the one TMDL applicable to the Ventura County Permittees that is in this category is a TMDL that is newly incorporated into the Order.

For Permittees developing a Watershed Management Program, or revising an existing approved Watershed Management Program, Permittees must propose a schedule for implementing the BMPs that is as short as possible. The Los Angeles Water Board finds that, at this time, it is reasonable to include permit requirements for some of the U.S. EPA established TMDLs that allow Permittees to develop Watershed Management Programs that include BMPs, interim requirements and schedules for actions to achieve the TMDL WLAs. More detail on the required elements of a Watershed Management Program is included in Part X of this Fact Sheet. These Watershed Management Programs will facilitate a comprehensive planning process, including coordination among Permittees where necessary, on a watershed basis to identify the most effective watershed control measures and implementation strategies to achieve the TMDL WLAs much like a state program of implementation for a TMDL facilitates.

Based on the nature and timing of the proposed watershed control measures, the Los Angeles Water Board will consider appropriate actions on its part, which may include: (1) no action and continued reliance on permit

²⁰⁷ State Water Board Order WQ 2015-0075, pp. 59-61.

²⁰⁸ The requirements for Permittees who do not choose to participate in a WMP are set forth *infra*.

requirements that require implementation of the approved watershed control measures throughout the permit term per an approved Watershed Management Program; (2) adopting a program of implementation and corresponding schedule through the Basin Plan Amendment process and then incorporating a compliance schedule into this Order consistent with the State-adopted program of implementation; or (3) issuing a separate enforcement order (e.g., Time Schedule Order or Cease and Desist Order) to provide the necessary time to fully implement the watershed control measures to achieve the WQBELs.

Further detail on specific TMDLs is provided below, including limitations to schedules proposed in a Watershed Management Program.

Long Beach City Beaches and Los Angeles River Estuary Indicator Bacteria TMDL. The *Long Beach City Beaches and Los Angeles River Estuary Indicator Bacteria TMDL* (LB City Beaches and LA River Estuary Bacteria TMDL) addresses the Long Beach City Beaches that drain an area of 505 acres within the City of Long Beach. The TMDL, on page 6, refers to this drainage area as the “LBC beaches direct drainage” where there are five “sewersheds,” or storm drain basins that collect, convey, and discharge stormwater and dry weather flow from these basins to the impaired beaches. Flows from other adjacent areas are directed away from the Long Beach City Beaches.

To determine whether additional time for BMP implementation is appropriate for the Long Beach City Beaches during dry weather conditions, the Los Angeles Water Board considered the manner this TMDL was previously incorporated into the City of Long Beach MS4 Permit. Per Part VIII.G.1.c.iv.(1) of the 2014 City of Long Beach MS4 Permit, it states that “For the City of Long Beach City Beaches Bacteria TMDL established by U.S. EPA in 2012, for all locations with the exception of the Los Angeles River Estuary, in no case shall the time schedule to achieve the final numeric WLAs during dry weather exceed five years from the effective date of the Order”; five years from the effective date of the 2014 City of Long Beach MS4 Permit was March 28, 2019, which is a past deadline. Therefore, the Order requires the City of Long Beach to comply with numeric WQBELs and receiving water limitations during dry weather at the Long Beach City Beaches as of the effective date of the Order.

To determine whether additional time for BMP implementation is appropriate for the Long Beach City Beaches during wet weather conditions, the Los Angeles Water Board considered the factors discussed above along with other considerations such as the time needed to implement BMPs and information on the cost of implementing the BMPs. The Order requires Permittees participating in a WMP to propose a schedule for implementing BMPs to achieve WQBELs and receiving water limitations during wet weather at the Long Beach City Beaches that is as short as possible. Similarly, the Order requires Permittees participating in a WMP to propose a schedule for implementing BMPs to achieve geometric mean WQBELs and receiving water limitations at the Long Beach City Beaches consistent with the schedule proposed to achieve WQBELs and receiving water limitations at the Long Beach City Beaches during wet weather.

To determine whether additional time for BMP implementation is appropriate for the Los Angeles River Estuary, the Los Angeles Water Board considered the Estuary's geographic relationship to the Los Angeles River. The Los Angeles River Estuary is downstream of the waterbodies addressed by the Los Angeles Water Board-adopted Los Angeles River Bacteria TMDL. Therefore, it is appropriate to align implementation schedules for the Los Angeles River Estuary with the compliance schedules for the Los Angeles River Bacteria TMDL. For Permittees participating in a WMP, the Order requires Permittees to propose a schedule for implementing BMPs to achieve WQBELs and receiving water limitations for the Los Angeles River Estuary during dry weather not to exceed the compliance schedule for Segment A (Rosecrans Avenue to Willow Street) in Table Q – 1 of Attachment Q. Table Q-1 of Attachment Q includes dry weather compliance schedules for the Los Angeles River Bacteria TMDL where the schedule for Segment A was deemed most appropriate for the Los Angeles River Estuary. Likewise, for the Los Angeles River Estuary during wet weather, the proposed schedule for implementing BMPs to achieve WQBELs and receiving water limitations in the WMP shall not to exceed the final compliance deadline incorporated in the Order for the Los Angeles River Bacteria TMDL for wet weather (March 23, 2037). Similarly, the Order requires Permittees participating in a Watershed Management Program a to propose a schedule to comply with geometric mean WQBELs and receiving water limitations for the Los Angeles River Estuary consistent with the schedule proposed for wet weather.

Legg Lake System Nutrients TMDL. The Legg Lake System Nutrients TMDL is part of the *Los Angeles Area Lakes TMDLs for Nitrogen, Phosphorus, Mercury, Trash, Organochlorine Pesticides and PCBs*. Per Table 9-7 and pages 9-18 and 9-19 of the TMDL, the Legg Lake System Nutrients TMDL WLAs for total phosphorus are based on existing MS4 loads at the time of TMDL adoption. However, a load reduction is required to achieve the TMDL WLAs for total nitrogen. Considering that Permittees typically implement the same suite of BMPs to address nutrients, the Los Angeles Water Board determined that it is reasonable for Permittees to be provided with the same compliance options to achieve WQBELs and receiving water limitations for both total nitrogen and total phosphorous. Therefore, the Order incorporates WQBELs and receiving water limitations in Attachment Q consistent with the TMDL WLAs with the option of proposing BMPs and a schedule to implement the BMPs that is as short as possible.

G. Compliance Schedules for Achieving TMDL Requirements

A Regional Water Board may include a compliance schedule in an NPDES permit when the state's water quality standards or regulations include a provision that authorizes such schedules in NPDES permits.²⁰⁹ In California, TMDL programs of implementation²¹⁰ are typically adopted through amendments to a regional water

²⁰⁹ See *In re Star-Kist Caribe, Inc.*, (Apr. 16, 1990) 3 E.A.D. 172, 175, modification denied, 4 E.A.D. 33, 34 (EAB 1992).

²¹⁰ TMDL programs of implementation consist of those measures, along with a schedule for their implementation, that the Water Boards determine are necessary to correct an impairment. The NPDES implementation measures are thus required by Clean Water Act sections 303(d) and 402(p)(3)(B)(iii). State law also requires the Water Boards to implement basin plan requirements. (See Wat. Code §§ 13263, 13377; *State Water Resources Control Board Cases* (2006) 136 Cal.App.4th 189.)

board's basin plan. The TMDL program of implementation, which is part of the basin plan amendment, becomes a regulation upon approval by the State of California Office of Administrative Law (OAL).²¹¹ Pursuant to California Water Code sections 13240 and 13242, TMDL programs of implementation adopted by the Regional Water Board "shall include ... a time schedule for the actions to be taken [for achieving water quality objectives]," which allows for compliance schedules in future permits. This basin plan amendment becomes the applicable regulation that authorizes an MS4 permit to include a compliance schedule to achieve effluent limitations derived from TMDL WLAs.

Where a TMDL implementation schedule has been established through a basin plan amendment, it is incorporated into the Order as a compliance schedule to achieve interim and final WQBELs and corresponding receiving water limitations, in accordance with 40 CFR section 122.47. WQBELs must be consistent with the assumptions and requirements of any WLA, which includes applicable implementation schedules.²¹² California Water Code sections 13263 and 13377 state that waste discharge requirements must implement water quality controls plans (i.e., basin plans).²¹³ Therefore, permit compliance schedules for attaining WQBELs and receiving water limitations derived from WLAs must be based on a state-adopted TMDL programs of implementation and cannot exceed the maximum time that the implementation schedule allows.

In determining the TMDL implementation schedules, the Los Angeles Water Board considered numerous factors to ensure that the schedules are as short as possible. Factors examined include, but are not limited to, the size and complexity of the watershed; the pollutants being addressed; the number of responsible agencies involved; time for Permittees to negotiate memorandum of agreements; development of water quality management plans; the cost of compliance; identification of funding sources; determination of an implementation strategy based on the recommendations of water quality management plans and/or special studies; and time for the implementation strategies to yield measurable results. Implementation schedules may be altered based on the monitoring and reporting results as set forth in the individual TMDLs by revising the TMDL.

In many ways, the incorporation of interim and final WQBELs, receiving water limitations, and associated compliance schedules is consistent with the inclusion of TMDLs in previous permits in that progress toward compliance with the final effluent limitations may occur over the course of many years. However, because many of the waterbodies in the Los Angeles Region are impaired due to MS4 discharges, it is necessary to establish more specific provisions in order to: (i) ensure measurable reductions in pollutant discharges from the MS4, resulting in progressive water quality

²¹¹ See Gov. Code, § 11353, subd. (b). Every amendment to a Basin Plan, such as a TMDL and its program of implementation, requires approval by the State Water Board and OAL. When the TMDL and program of implementation is approved by OAL, it becomes a state regulation.

²¹² See 40 CFR § 122.44(d)(1)(vii)(B).

²¹³ Cal. Wat. Code, § 13263, subd. (a) ("requirements shall implement any relevant water quality control plans that have been adopted"); Cal. Wat. Code, § 13377 ("the state board or the regional boards shall . . . issue waste discharge requirements and dredged or fill material permits which apply and ensure compliance with all applicable provisions of the [CWA], thereto, together with any more stringent effluent standards or limitations necessary to implement waste quality control plans, or for the protection of beneficial uses, or to prevent nuisance"); see also, *State Water Resources Control Board Cases* (2006) 136 Cal.App.4th 189.

improvements, and (ii) establish a final date for completing implementation of BMPs and, ultimately, achieving WQBELs and receiving water limitations.

The compliance schedules established in the Order are consistent with the implementation schedules established in the individual TMDLs. The TMDL implementation deadlines for each TMDL are listed below in Table F-26. As previously noted, TMDLs established by U.S. EPA do not contain implementation schedules. Unless the Los Angeles Water Board has adopted a separate program of implementation and schedule as a Basin Plan amendment for a U.S. EPA-established TMDL, the implementation date in the table below is the date the TMDL was established by U.S. EPA.

Table F-26. TMDL Final Implementation Deadlines

| TOTAL MAXIMUM DAILY LOADS (TMDLs) | Final Implementation Deadline has passed | Final Implementation Deadline between years 1 and 5 (2021-2025) | Final Implementation Deadline between years 6 and 10 (2026-2030) | Final Implementation Deadline after 10 years (2031 and onwards) |

H. Considerations Regarding Extensions of TMDL Deadlines

Using mechanisms outside of the Order (e.g., Time Schedule Orders, Basin Plan Amendments to revise TMDL implementation schedules), for Los Angeles Water Board-adopted TMDL implementation schedules, the Los Angeles Water Board may consider providing additional time to implement measures to achieve WQBELs and receiving water limitations to more closely align with available funding from the Benefit Assessment Program, Safe, Clean Water Program, and other funding sources available to Permittees as summarized in Part XIII.D.3 of this Fact Sheet (Economic Considerations – Funding Sources).

1. Benefit Assessment Program

On April 14, 1992, the Ventura County Board of Supervisors approved the concept of a countywide NPDES permit program and the use of the Flood Management District (presently the Watershed Protection District) benefit assessment authority to finance it. On June 30, 1992, the Ventura County Board of Supervisors adopted a benefit assessment fee for stormwater and flood management in the unincorporated areas of Ventura County and the cities within the County, to be used in part to finance the implementation of a countywide NPDES municipal stormwater permit program. The Ventura County Permittees except for the City of Moorpark entered into an agreement with the Watershed Protection District to finance the activities related to the Ventura County MS4 Permit for shared and district-wide expenses. The Permittees are also given the option to use the Benefit Assessment Program to finance their respective activities related to reducing the discharge of pollutants from their MS4s under the MS4 Permit.

2. Safe, Clean Water Program

In November 2018, Los Angeles County voters approved Measure W, adopting the Safe, Clean Water Program, which will generate up to \$285 million per year from a special parcel tax on private property to capture, conserve, and treat stormwater to improve water quality, increase local water supply, and enhance communities. The County began dispersing revenues from the collected taxes. (See, Table F-20) The Safe, Clean Water Program will be reevaluated in 30 years. Fifty percent of the Safe, Clean Water Program funds will be allocated to the “Regional Program”, which will consist of projects and programs at the watershed scale to address stormwater from multiple municipalities. As of August 2020, the current projected revenue for the Regional Program is \$140.6 million per year. Forty percent of the funds will be allocated directly to municipalities as part of the “Municipal Program” for local stormwater projects and programs. As of August 2020, the current projected revenue for the Municipal Program is \$112.6 million per year. Ten percent of the Safe, Clean Water Program funds will be allocated to the “District Program” for general administration of the program including, but not limited to, technical assistance teams, watershed coordinators funded through the Regional Technical Resources Program (TRP), stormwater education programs, and District Projects.

The Los Angeles Water Board may decide to extend deadlines based on availability and distribution of Safe, Clean Water Program funding and other dedicated funding sources, on the funding allocation schemes contained in the Stormwater Investment Plans developed by each Watershed Area Steering Committee for the Regional Program funds, and funding allocations in the fiscal year plans developed by each municipality for the Municipal Program funds. Based

on a comparison of the locations of prioritized projects and those waterbodies with upcoming deadlines, the Los Angeles Water Board can determine if additional time is warranted to allow for Safe, Clean Water Program revenues to accrue to fund in part or total the projects needed to comply with WQBELs and receiving water limitations.

VII. RATIONALE FOR RECEIVING WATER LIMITATIONS

Clean Water Act section 402(p)(3)(B)(iii) requires MS4 permits to include “such other provisions as the Administrator or the State determines appropriate for the control of [] pollutants.” U.S. EPA interprets this provision to mandate “controls to reduce the discharge of pollutants to the maximum extent practicable, *and where necessary water quality-based controls.*”²³⁴ U.S. EPA has reiterated that MS4 “permit conditions must provide for attainment of applicable water quality standards (including designated uses), allocations of pollutant loads established by a TMDL, and timing requirements for implementation of a TMDL.”²³⁵ U.S. EPA Region IX has also affirmed the agency’s position that MS4 discharges must meet water quality standards in a series of comment letters on MS4 permits issued by various California regional water boards.²³⁶ Likewise, the State Water Board has affirmed that MS4 permits must include requirements necessary to achieve compliance with the applicable technology-based standard of MEP and to achieve water quality standards.²³⁷ The permitting agency, be it the Los Angeles Water Board or U.S. EPA, must therefore include provisions when it finds it is appropriate to do so to control pollutants in a specific geographic area. California Water Code section 13377 also requires that NPDES permits include limitations necessary to implement water quality control plans. Both the State Water Board and Los Angeles Water Board have previously concluded that discharges from the MS4 contain pollutants that have the reasonable potential to cause or contribute to excursion above water quality standards. As such, inclusion of receiving water limitations is necessary and appropriate to control MS4 discharges in the Los Angeles Region.

The inclusion of receiving water limitations is also consistent with the Ninth Circuit Court of Appeal’s ruling in *Defenders of Wildlife v. Browner* (191 F.3d 1159, 1166 (1999)) that the permitting authority has discretion regarding the nature and timing of requirements that it includes as MS4 permit conditions to attain water quality standards.

The Ninth Circuit Court of Appeals has explained that, “[w]ater quality standards are used as a supplementary basis for effluent limitations [guidelines] so that numerous dischargers, despite their individual compliance with technology based effluent limitations, can be regulated to prevent water quality from falling below acceptable levels” (*NRDC v. County of Los Angeles* (2011) 673 F.3d 880, 886). Receiving water limitations are included in the Order to ensure that individual and collective discharges from the MS4 do not cause or contribute to exceedances of water quality standards necessary to protect the beneficial uses of the receiving waters.

The receiving water limitations in the Order consist of all applicable numeric or narrative water quality objectives or criteria, or limitations to implement the applicable water quality

²³⁴ Phase I Stormwater Regulations, Final Rule, 55 Fed. Reg. 47990, 47994 (Nov. 16, 1990) (emphasis added); see also *Building Industry Ass’n of San Diego County v. State Water Resources Control Bd.* (2004) 124 Cal.App.4th 866, 882-887).

²³⁵ See, e.g., Phase II Stormwater Regulations, Final Rule, 64 Fed. Reg. 68722, 68737.

²³⁶ See, e.g., letter from Alexis Strauss, Acting Director, Water Division, U.S. EPA Region IX, to Walt Pettit, Executive Director, State Water Board, re: SWRCB/OCC File A-1041 for Orange County, dated January 21, 1998.

²³⁷ See, e.g., State Water Board Orders WQ 99-05, WQ 2001-15, and WQ 2015-0075.

objectives or criteria, for receiving waters as contained in Chapters 3 and 7 of the Basin Plan, or in water quality control plans or policies adopted by the State Water Resources Control Board, including Resolution No. 68-16, or in federal regulations, including but not limited to, 40 CFR sections 131.12 and 131.38. The water quality objectives in the Basin Plan and other State Water Board plans and policies have been approved by U.S. EPA and combined with the designated beneficial uses and the state's antidegradation policy constitute the water quality standards required under federal law.

The receiving water limitations provisions in the Order are carried over from the previous permits and are based on precedential State Water Board Orders WQ 98-01, WQ 99-05, and WQ 2015-0075. In Order 99-05, the State Water Board directed that all MS4 permits contain specific language explaining how receiving water limitations will be implemented. Since 2001, the Los Angeles Water Board has included this language in all MS4 permits. After re-examining the receiving water limitations and iterative process in MS4 permits statewide, in 2015, the State Water Board proclaimed the following:

As the storm water management programs of municipalities have matured, an increasing body of monitoring data indicates that many water quality standards are in fact not being met by many MS4s. The iterative process has been underutilized and ineffective to date in bringing MS4 discharges into compliance with water quality standards. Compliance with water quality standards is and should remain the ultimate goal of any MS4 permit. We reiterate and confirm our determination that provisions requiring compliance with receiving water limitations are "appropriate for the control of . . . pollutants" addressed in MS4 permits and that therefore, consistent with our authority under the Clean Water Act, we will continue to require compliance with receiving water limitations. (Order WQ 2015-0075, p. 14.)

Having determined that it will not depart from its prior precedent regarding compliance with water quality standards, the State Water Board directed that the "regional water boards shall continue to require compliance with receiving water limitations in municipal storm water permits through incorporation of receiving water limitations provisions consistent with State Water Board Order WQ 99-05." (*Id.*, p. 76.)

Thus, consistent with State Water Board Order 99-05, the Order includes three main provisions related to receiving water limitations. First, consistent with CWA section 402(p)(B)(3)(iii) and 40 CFR section 122.44(d)(1), it includes a provision stating that discharges from the MS4 that cause or contribute to an exceedance of receiving water limitations are prohibited. This is also in accord with the State Water Board's finding in Order WQ 98-01 ("The [State Water Board] agrees that the NPDES permit must prohibit discharges that "cause" or "contribute" to violations of water quality standards."). Second, it includes a provision stating that discharges from the MS4 of stormwater or non-stormwater, for which a Permittee is responsible, shall not cause or contribute to a condition of nuisance.²³⁸

Third, it includes a provision that states that Permittees shall achieve these two prohibitions "through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the storm water management program and its components and other requirements of this Order including any modifications." This third provision elucidates the process by which Permittees are expected to achieve the first two provisions and then outlines the so-called "iterative process" whereby certain actions are

²³⁸ Wat. Code, § 13377 ("the state board or the regional boards shall . . . issue waste discharge requirements and dredged or fill material permits which apply and ensure compliance with all applicable provisions of the [CWA], thereto, together with any more stringent effluent standards or limitations necessary to implement waste quality control plans, or for the protection of beneficial uses, or to prevent nuisance").

required when exceedances of receiving water limitations occur and discharges from the MS4 are implicated. This iterative process includes submitting a Receiving Water Limitations Compliance Report; revising the stormwater management program and its components to include additional BMPs, an implementation schedule and additional monitoring to address the exceedances; and implementing the revised stormwater management program. The inclusion of this protocol for estimating BMP effectiveness and taking additional actions such as implementing additional BMPs and/or modifying BMPs to improve their effectiveness when monitoring demonstrates that they are necessary to protect water quality is consistent with U.S. EPA's expectations for MS4 permits.²³⁹

The State and Los Angeles Water Boards have stated that each of the three provisions are independently applicable, meaning that compliance with one provision does not provide a "safe harbor" where there is non-compliance with another provision (i.e., compliance with the third provision does not shield a Permittee who may have violated the first or second provision from an enforcement action). Rather, the third provision is intended to ensure that the necessary stormwater management programs and controls are in place, and that they are modified by Permittees in a timely fashion when necessary, so that the first two provisions are achieved as soon as possible. U.S. EPA expressed the importance of this independent applicability in a series of comment letters on MS4 permits proposed by various regional water boards. At that time, U.S. EPA expressly objected to certain MS4 permits that included language stating, "permittees will not be in violation of this [receiving water limitation] provision ...[if certain steps are taken to evaluate and improve the effectiveness of the Drainage Area Management Plan (DAMP)]," concluding that this phrase would not comply with the CWA.²⁴⁰

The Receiving Water Limitations provisions of the 2001 Los Angeles County MS4 permit (Order No. 01-182) have been litigated twice, and in both cases the courts have upheld the language and the State and Los Angeles Water Boards' interpretation of it. Both courts ruled that the first two provisions are independently applicable from the third provision that establishes the "iterative process" requirements and no "safe harbor" exists.

The provisions were first litigated in 2005 where the Los Angeles County Superior Court stated, "In sum, the Regional [Water] Board acted within its authority when it included Parts 2.1 and 2.2 in the Permit without a 'safe harbor,' whether or not compliance therewith requires efforts that exceed the 'MEP' standard." (*In re L.A. Cnty. Mun. Storm Water Permit Litig.* (L.A. Super. Ct., No. BS 080548, Mar. 24, 2005) Statement of Decision from Phase I Trial on Petitions for Writ of Mandate, pp. 4-5, 7.) The Court of Appeal upheld the 2001 Los Angeles County MS4 Permit. (*County of Los Angeles et al. v. California State Water Resources Control Board et al.* (2006) 143 Cal.App.4th 985).

The provisions were again litigated in 2011. In that case, the Ninth Circuit Court of Appeals in *NRDC v. County of Los Angeles* (673 F.3d 880, 886) affirmed that the iterative process (in Part 2.3 of Order No. 01-182) does not "forgive" violations of the discharge prohibitions (in Parts 2.1 and 2.2 of Order No. 01-182). The court acknowledged that Part 2.3 clarifies that Parts 2 and 3 interact, but the court concluded that Part 2.3 "offers no textual support for the proposition that compliance with certain provisions shall forgive non-compliance with the

²³⁹ See, e.g., U.S. EPA 2014 memorandum, "Revisions to the November 22, 2002 Memorandum 'Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs'" dated November 26, 2014.

²⁴⁰ See, e.g., letter from Alexis Strauss, Acting Director, Water Division, USEPA Region IX, to Walt Pettit, Executive Director, State Water Board, re: SWRCB/OCC File A-1041 for Orange County, dated January 21, 1998.

discharge prohibitions.” The Ninth Circuit further concluded that, “[a]s opposed to absolving noncompliance or exclusively adopting the MEP standard, the iterative process ensures that if water quality exceedances ‘persist,’ despite prior abatement efforts, a process will commence whereby a responsible Permittee amends its SQMP. Given that Part 3 of the [2001] Permit states that SQMP implementation is the ‘minimum’ required of each Permittee, the discharge prohibitions serve as additional requirements that operate as enforceable water-quality-based performance standards required by the Regional Board.”

Additionally, in 2015, the State Water Board specifically addressed the issue of whether compliance with the “iterative process” in part 3 constituted compliance with parts one and two of the receiving water limitation provisions in precedential State Water Board Order WQ 2015-0075 (concerning the 2012 Los Angeles MS4 Permit).²⁴¹ Given “significant confusion” amongst permittees, the State Water Board clarified once again that compliance with the “iterative process” is not a “safe harbor” and that MS4 discharges that are causing or contributing to an exceedance of water quality standards are in violation of the permit.²⁴² The State Water Board also expressly rejected arguments that State Water Board Order WQ 2001-15 stands for the proposition that the iterative process is a “safe harbor.”²⁴³

VIII. RATIONALE FOR STANDARD PROVISIONS

Standard Provisions incorporated in the Order have been carried over from the previous MS4 permits.

A. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR section 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR section 122.42, are provided in Attachment D. Dischargers must comply with all standard provisions and with those additional conditions that are applicable under section 122.42.

B. Legal Authority

A Permittee must have adequate legal authority to implement its stormwater management program, including minimum control measures, and all equivalent actions if implemented through a Watershed Management Program (see 40 CFR section 122.26(d)(2)(i)(A)-(F) and 40 CFR section 122.26(d)(2)(iv)). Without adequate legal authority, the Permittee would be unable to perform many functions such as performing inspections, requiring remedies, and requiring installation of control measures. In addition, the Permittee would not be able to conduct enforcement, where necessary. Additionally, pursuant to 40 CFR sections 122.26(d)(1)(ii) and 122.26(d)(2)(iv), each Permittee must also maintain the necessary legal authority to control the contribution of pollutants to its MS4 and must include in its stormwater management program a comprehensive planning process that includes intergovernmental coordination, where necessary. As noted elsewhere, federal, state, regional or local entities not named as a Permittee in the Order may operate MS4 facilities and/or discharge to the Permittees’ MS4s and water bodies covered by the Order (e.g., California Department of Transportation). The abovementioned requirement is intended to address, in part, these circumstances.

²⁴¹ See generally discussion pages 10-12 of State Board Order WQ 2015-0075.

²⁴² *Id.* at 12.

²⁴³ *Id.* at p. 12, fn. 44.

C. Fiscal Resources

Section 122.26(d)(2)(vi) of Title 40 of the Code of Federal Regulations requires, for each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the stormwater management program, including monitoring program. The analysis is to include a description of the source(s) of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds. Additionally, 40 CFR section 122.42(c)(5) requires that annual reports for MS4 permits include annual expenditures and budget for year following each annual report. The inclusion of the requirement to perform a fiscal analysis annually in the Regional MS4 Permit was carried over from the previous permits. The annual fiscal analysis will show the allocated resources, expenditures, and staff resources necessary to comply with the Regional MS4 Permit, including implementation of the Permittee's Watershed Management Program, where applicable. The annual analysis is necessary to show that the Permittee has adequate resources to meet all Permit requirements. The analysis can also show year-to-year changes in funding for the MS4 program. A summary of the annual analysis must be reported in the annual report. This analysis will help the Los Angeles Water Board understand the resources that are dedicated to compliance with this permit including the implementation of Watershed Management Programs, and track how costs change over time. Permittees will provide their annual fiscal analysis in Attachment H (Annual Report Form) of the Order. Attachment H of the Order identifies a consistent reporting format for this fiscal analysis as recommended by the State Auditor in its Report 2017-118 on the State and Regional Water Boards MS4 programs. This reporting format is based on the statewide guidance, "Guidance for Obtaining Phase I Municipal Separate Storm Sewer System Permit (MS4) Compliance Costs," prepared by the State Water Board in response to the State Auditor's recommendation.²⁴⁴

D. Responsibilities of the Permittees

Because of the complexity and networking of the storm drain system and drainage facilities within the Los Angeles Region, the Los Angeles Water Board adopted a region-wide approach in permitting stormwater and urban runoff discharges. (See Part I.D of this Fact Sheet) Note that the 2010 Ventura County MS4 Permit was structured to assign certain requirements to the Principal Permittee (Ventura County Watershed Protection District) and other requirements to the other Ventura County Permittees. As this is a Regional MS4 Permit and applies to both Los Angeles County and Ventura County MS4 Permittees, the retention of a Principal Permittee as discussed in Part II.D of this Fact Sheet is no longer applicable. Accordingly, there are no separate requirements for the Principal Permittee in the Regional MS4 Permit. Consistent with the previous permits, the Regional MS4 Permit is structured to require all Permittees to comply with the requirements of the Order as applicable to its discharges. However, it does not hold a Permittee responsible for implementation of provisions applicable to other Permittees. Note that, in some cases, the Order includes specific requirements for Los Angeles County Permittees and others for Ventura County Permittees and, in some cases, the Order includes specific requirements for the two flood control districts. These cases are clearly indicated in the Order.

²⁴⁴ State Water Resources Control Board (2020) "Guidance for Obtaining Phase I Municipal Separate Storm Sewer System Permit (MS4) Compliance Costs." August 12, 2020.

Parts VI.D.4-5 of the Order requires inter- and intra-agency coordination to facilitate implementation of the Order. This requirement is based on 40 CFR section 122.26(d)(2)(iv), which requires “a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate [...]”

E. Public Review and Los Angeles Water Board Review

Public review and Los Angeles Water Board review provisions have been carried over from the previous permits. These provisions reflect federal and state requirements to make documents available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. § 552 (as amended)) and the Public Records Act (Cal. Government Code § 6250 et seq.). They also reflect the Los Angeles Water Board’s commitment to public participation during implementation of the Regional MS4 Permit.

F. Reopener and Modification Provisions

These provisions are based on 40 CFR sections 122.44, 122.62, 122.63, 122.64, 124.5, 125.62, and 125.64, and are also carried over from the previous permits. The Los Angeles Water Board may reopen the permit to modify permit conditions and requirements, as well as revoke, reissue, or terminate in accordance with federal regulations. Causes for such actions include, but are not limited to, endangerment to human health or the environment; acquisition of newly-obtained information that would have justified the application of different conditions if known at the time of Order adoption; to incorporate provisions as a result of new federal or state laws, regulations, plans, or policies (including TMDLs and other Basin Plan amendments); modification in toxicity requirements; violation of any term or condition in the Order; and/or minor modifications to correct typographical errors or require more frequent monitoring or reporting by a Permittee. The Order also includes two additional causes for modification, which have been carried over from prior permits, including: 1) where the revisions warrant a change to the provisions of the Order, the Los Angeles Water Board may modify the Order consistent with the assumptions and requirements of the revised WLA(s), including the program of implementation and schedule; and 2) to include provisions or modifications to WQBELs in Part IV and Attachments K-S in the Order prior to the final compliance deadlines, if practicable, that would allow an action-based, BMP compliance demonstration approach with regard to final WQBELs for stormwater discharges based on the Los Angeles Water Board’s evaluation of whether Watershed Management Programs in Part VI.C of the Order have resulted in attainment of interim WQBELs for stormwater and review of relevant research, including but not limited to data and information provided by Permittees and other stakeholders, on stormwater quality and the efficacy and reliability of control technologies.

G. Other Provisions

Other provisions in the Standard Provisions of the Order not specifically discussed above were carried over from the previous permits.

IX. RATIONALE FOR STORMWATER MANAGEMENT PROGRAMS AND MCMs

The required components of stormwater management programs and minimum control measures (MCMs) are specifically set forth in Part VIII.D through Part VIII.I of the Order. However, each of these six Parts have several overlapping requirements (including timelines

for implementation, municipal employee and contractor training and progressive enforcement), which are addressed in Part VIII.A through Part VIII.C of the Order.

A. General Requirements

1. Basis for Minimum Control Measures (MCMs)

40 CFR section 122.26(d)(2)(iv) establishes required elements of the Permittees' stormwater management program. The previous permits included six categories of minimum control measures (or MCMs) that are the baseline programmatic elements for meeting the requirements of 40 CFR section 122.26(d)(2)(iv). The minimum control measures require Permittees to implement BMPs that are considered necessary to reduce pollutants in stormwater to the MEP and to effectively prohibit non-stormwater discharges. In lieu of implementing the MCMs as described in Part VIII.A.1 of the Order, the Order allows Permittees to develop alternative BMPs to comply with 40 CFR section 122.26(d)(2)(iv) when implemented through a Watershed Management Program approved by the Los Angeles Water Board.

2. Timelines for Implementation

The timelines for implementation of MCMs are specified in Part VIII.A.2 of the Order where all Permittees must implement the MCMs no later than 6 months from the effective date of the Order or per specific timelines indicated in the Order. If participating in a Watershed Management Program, the MCMs are required to be integrated in the new or revised Watershed Management Program. Since Permittees have been implementing MCMs in the previous permits, they are expected to continue implementing their MCMs. Ventura County Permittees that elect to develop a Watershed Management Program shall continue to implement their existing stormwater management programs, including actions within each of the six categories of minimum control measures consistent with 40 CFR section 122.26(d)(2)(iv) until the Watershed Management Program is approved by the Los Angeles Water Board. Likewise, Los Angeles County Permittees that opt to continue implementing an approved Watershed Management Program shall continue to implement the six categories of MCMs as approved in their Watershed Management Program until any revision to their Watershed Management Program is approved by the Los Angeles Water Board.

3. Municipal Employee and Contractor Training

Municipal training requirements are necessary to implement CWA section 402(p)(3)(B)(ii) and (iii). The Los Angeles Water Board finds that specifying training requirements for municipal employees and contractors is necessary to prevent or minimize the potential discharge of pollutants through the MS4 to receiving waters as explained in the following paragraphs. Municipal employees whose jobs affect stormwater quality must be trained in stormwater management to ensure that non-stormwater discharges are effectively prohibited, the discharge of pollutants in stormwater is reduced to the maximum extent practicable, and other provisions to control pollutants in MS4 discharges are implemented as required. The Order retains municipal employee and contractor training requirements from the previous Los Angeles County, City of Long Beach, and Ventura County permits. Note that the previous permits included training requirements within each MCM. Specific requirements were included in the Public Agency Activities MCM, Illicit Connection and Illicit Discharge MCM, Construction MCM, and Planning and Land

Development MCM. For better organization, the Order includes these provisions under the General Provisions in Part VIII.A of the Order where training requirements apply to all municipal employees and contractors implementing the stormwater management program and includes specific training requirements for the Illicit Discharge Detection and Elimination (IDDE), Construction, and Industrial/Commercial Facilities MCMs.

U.S. EPA's MS4 Permit Improvement Guide supports the conclusion that municipal employee and contractor training requirements are necessary to meet federal requirements. U.S. EPA states, "[f]ederal stormwater regulations (see 40 C.F.R. 122.34(b)(6) and 40 C.F.R. 122.26(d)(2)(iv)(A)) require the operator of a regulated MS4 community to develop a program to... [t]rain employees on how to incorporate pollution prevention/good housekeeping techniques into municipal operations."²⁴⁵ The Guide includes example permit provisions that state, "[p]ermittees must develop an annual training program for appropriate employees involved in implementing pollution prevention and good housekeeping practices in the preceding Parts" and "[t]he permittee must provide oversight of contractor activities to ensure that contractors are using appropriate control measures and [standard operating procedures]."²⁴⁶ U.S. EPA also provides several examples of permits with similar training requirements.²⁴⁷ Moreover, U.S. EPA-issued MS4 permits commonly include pollution prevention training requirements for municipal staff.^{248,249,250}

Federal regulations identify the need for a program to reduce pollutants in discharges from MS4s associated with the application of pesticides, herbicides, and fertilizer.²⁵¹ Training programs for the application of pesticides and fertilizer are necessary to comply with these regulations. A municipal training program addresses these federal requirements, in part, by including "certifications and other measures for commercial applicators and distributors." Federal regulations for small MS4s explicitly outline the requirement for permits to include training provisions:

"The permit must identify the minimum elements and require the development and implementation of an operation and maintenance program that includes a training component and has the ultimate goal of preventing or reducing pollutant runoff from municipal operations. Using training materials that are available from EPA, the State, Tribe, or other organizations, the program must include employee training to prevent and reduce storm water pollution from activities such as park and open space maintenance, fleet and building

²⁵¹ 40 CFR § 122.26(d)(2)(iv)(A)(6).

maintenance, new construction and land disturbances, and storm water system maintenance.”²⁵²

Federal regulations at 40 CFR section 122.26(d)(2)(iv)(B)(6) require a description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials. The Order requires each Permittee to train field staff who may come into contact or observe illicit discharges on the identification and proper procedures for responding to and reporting illicit discharges. The previous Los Angeles County, City of Long Beach, and Ventura County permits had similar requirements. Municipal maintenance and repair activities are frequently conducted in areas where illicit connections and discharges occur. Therefore, municipal employees who are not assigned specifically to implement a municipality’s illicit discharge detection and elimination (IDDE) program are often good resources for reporting illicit connections and discharges.

The U.S. EPA MS4 Permit Improvement Guide states that, “Phase I MS4 regulations specify that several key elements be included in Phase I MS4 stormwater management programs [to control pollutants in stormwater discharges to the MS4 from industrial and commercial facilities]. These elements include: adequate legal authority to require compliance and inspect sites, inspection of priority industrial and commercial facilities, establishing control measure requirements for facilities that may pose a threat to water quality, and enforcing stormwater requirements. In order to implement these requirements, MS4 permits require the development of an inventory of facilities and prioritization protocol *and adequate staff training to ensure proper inspection and enforcement of requirements.*”²⁵³

40 CFR section 122.26(d)(2)(iv)(D)(4) requires that Permittees have appropriate educational and training measures for construction site operators.²⁵⁴ More specifically, 40 CFR section 122.26(d)(2)(iv)(D)(3) requires that Permittees have “procedures for identifying priorities for inspecting sites and enforcing control measures...”. An important element of such procedures is training for the individuals tasked with implementing the program. Therefore, the municipal employees and contractors training requirement in the Order is necessary to meet these federal requirements, by ensuring that Permittees are trained in technical standards for BMPs and that they make these technical standards readily available to the development community as educational and training measures. The U.S. EPA MS4 Permit Improvement Guide provides draft permit provisions that closely resemble the requirements for municipal employees and contractor training in the Order, including training for staff as well as third-party inspectors and plan reviewers.²⁵⁵

B. Progressive Enforcement

Progressive enforcement is a series of defined and reproducible enforcement actions whereby consequences of non-compliance increase with each incremental enforcement step. Progressive enforcement includes procedures to coordinate enforcement between the Los Angeles Water Board and Permittees. As the Los Angeles Water Board is the

²⁵² *Id.*, § 122.34(b)(6)(i).

²⁵³ U.S. EPA. *MS4 Permit Improvement Guide* (2010), Chapter 7, p. 85 (emphasis added).

²⁵⁴ *Id.*, subd. (d)(2)(iv)(D)(4).

²⁵⁵ U.S. EPA. *MS4 Permit Improvement Guide* (2010), Chapter 4, p. 46.

regulating agency for the NPDES program, it has the authority to step in when enforcement actions of a Permittee are unsuccessful in bringing dischargers into compliance. As such, progressive enforcement is an effective strategy to achieve timely compliance. Previous permits included requirements for Permittees to develop and implement a progressive enforcement strategy, which are carried over to the Order. The Order eliminates the provision in the 2010 Ventura County MS4 Permit that allows the Los Angeles Water Board and Permittees to form a stormwater task force. This provision was removed because the ability for coordinated enforcement between the Los Angeles Water Board and Permittees is adequately established through remaining provisions within Part VIII.B of the Order. Also note that the 2010 Ventura County MS4 Permit includes progressive enforcement requirements within the Industrial/Commercial Facilities MCM and Construction MCM. However, the Progressive Enforcement provisions under Part VIII.B of the Order follow the same structure of the 2012 Los Angeles County and 2014 City of Long Beach MS4 permits and are inclusive of the progressive enforcement requirements that were previously within the two abovementioned MCMs in the 2010 Ventura County MS4 Permit.

C. Modifications/Revisions

The Order requires each Permittee to modify its stormwater management programs, protocols, practices, and municipal codes to be consistent with the Order. This provision is necessary to ensure that each Permittee takes all the steps necessary to update the core and ancillary programs that are required to ensure compliance with the Order.

D. Public Information and Participation Program

1. Federal Requirements

The Los Angeles Water Board has incorporated the Public Information and Participation Program into the Regional MS4 Permit per the following federal requirements:

Clean Water Act section 402(p)(3)(B)(iii) requires that “[p]ermits for discharges from municipal storm sewers shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.”

NPDES regulations at 40 CFR section 122.26(d)(2)(iv) require as part of a stormwater management program “a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate.”

NPDES regulations at 40 CFR section 122.26(d)(2)(iv)(A)(6) provide that the proposed management program include “[a] description of a program to reduce to the maximum extent practicable, pollutants in discharges from MS4s associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-way’s and at municipal facilities.”

NPDES regulations at 40 CFR section 122.26(d)(2)(iv)(B)(6) provide that the proposed management program includes “[a] description of education activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials.”

40 CFR section 122.42(c) requires the owner or operator of an MS4 to submit an annual report that includes in part “(1) The status of implementing the components of the storm water management program that are established as permit conditions; (2) Proposed changes to the storm water management programs that are established as permit condition. Such proposed changes shall be consistent with §122.26(d)(2)(iii) of this part...” and “(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; ...”

2. General Provisions

Part VIII.D.1 of the Order requires continued implementation of public participation in the stormwater management program, consistent with 40 CFR section 122.26(d)(2)(iv). It is generally more cost-effective to have multiple Permittees coordinate using an existing program than have each individual Permittee develop its own local program. Therefore, Permittees are encouraged to participate in a County-wide public information and participation program (PIPP) or in one or more Watershed Group sponsored PIPPs supplemented with additional information specific to local needs. While the previous 2010 Ventura County MS4 Permit required coordination among Permittees, this Regional Permit covers numerous Permittees over a larger area, making it difficult to coordinate amongst all Permittees. As a result, the Los Angeles Water Board encourages but does not require forming partnerships and coordination among Permittees. This is consistent with by 40 CFR §§122.26(d)(2)(iv), which specifies intergovernmental coordination as part of the stormwater management program where necessary.

Previous 2012 Los Angeles County and 2010 City of Long Beach MS4 permits required the Public Information and Participation Program to include contact information and means for public reporting of clogged catch basin inlets, illicit discharges/dumping, faded or missing catch basin labels, and general stormwater and non-stormwater pollution prevention information. These requirements are redundant with requirements in the Illicit Discharge Detection and Elimination Program and are removed from the Public Information and Participation section.

3. Objectives

The objectives of the PIPP are to involve and engage a diversity of socioeconomic groups and ethnic communities by building an understanding of stormwater issues and strengthening support for programs and projects. These objectives are established in the permit to provide a compass for Permittees as they adapt their program to address new information, water quality priorities, and MS4 program priorities. Through broad community support, the program objective in Part VIII.D.2 of the Order would instill the methods for proper management and disposal of used oil and toxic materials such that pollution prevention becomes common knowledge in the community.

The Order also includes an objective to use effective strategies to educate and involve residents and population subgroups through culturally effective methods. To accomplish this objective, Permittees may rely on the existing framework of their program and build upon existing methods to reach cultural subgroups. For

example, existing materials may be translated to other languages or recurring events may be promoted through television and radio stations that cater to specific subgroups.

The objectives in the Regional MS4 Permit support the broader federal requirements discussed earlier in this Fact Sheet by encouraging behavior changes that reduce pollutants in stormwater and non-stormwater. The programs must reach the general population, but also must reach a portion of the population who might otherwise be overlooked. U.S. EPA support for this provision is evident in a similar provision in the U.S. EPA-issued permit for the Middle Rio Grande Watershed.²⁵⁶ In addition, *U.S. EPA, Tailoring Outreach Programs to Minority and Disadvantaged Communities and Children Fact Sheet*²⁵⁷ finds that, "[m]any residents of ethnically and culturally diverse communities don't speak English." English messages contained in public education outreach materials may not be effectively reaching a significant portion of some communities. In addition, some lower income communities may have less access to the internet and would be more reachable through TV, radio, and neighborhood newspapers than through webpages.²⁵⁸

4. Program Requirements

a. Community involvement in stormwater planning and program implementation and awareness of stormwater program needs (Part VIII.D.3.a of the Order).

An emerging challenge for municipal stormwater programs is to promote the public's understanding for the need for planning and funding of stormwater programs and projects. Stormwater programs are a key component of water quality protection and are a legal requirement. By educating and involving the public on stormwater planning needs, municipalities may gain public support for funding stormwater programs. Through stakeholder input, the Los Angeles Water Board recognizes that a lack of support in planning and funding are often obstacles to effective program implementation. This requirement is supported by the U.S. EPA Memorandum dated October 26, 2016 that identifies lack of funding as a limiting factor in implementing stormwater pollution programs. The memorandum further recommends long-term planning to secure adequate funding for infrastructure and stormwater controls. Public awareness of long-term planning and implementation is therefore a necessary step towards gaining support and funds for short-term and long-term program implementation. First step methods for involving the community may include town meetings, webinars, citizen advisory committees or focus groups. Once community support is strengthened, the Permittee may also develop and promote ballot funding measures for stormwater projects and thus meet several PIPP requirements and achieve program objectives.

²⁵⁶ NPDES Permit No. NMR04A000 issued to Middle Rio Grande Watershed, effective December 22, 2014. p. 48.

²⁵⁷ U.S. EPA. 2006. "Tailoring Outreach Programs to Minority and Disadvantaged Communities and Children." National Pollutant Discharge Elimination System (NPDES). May 24, 2006. As noted on the website <https://www.epa.gov/npdes/national-menu-best-management-practices-bmps-stormwater#edu>, U.S. EPA is currently updating this document.

²⁵⁸ See Internet/Broadband Fact Sheet. Pew Research Center, Internet and Technology. The center displays data showing lower internet use among non-white ethnic groups and lower income groups. <http://www.pewinternet.org/fact-sheet/internet-broadband/>. Accessed on May 11, 2016.

For example, this has been done successfully in Los Angeles County with the passage of Measure W, in Culver City with the passage of Measure CW, in the City of Los Angeles with the passage of Proposition O, and in the City of Santa Monica with the passage of Measure V.

U.S. EPA's *MS4 Permit Improvement Guide*²⁵⁹ suggests the inclusion of a requirement to establish a citizen's advisory group to participate in the development and implementation of the community's stormwater program, explaining that "[b]y listening to the public's concerns and coming up with solutions together, the permittee will gain the public's support and the community will become invested in the program." Furthermore, the U.S. EPA document *Evaluation of the Role of Public Outreach and Stakeholder Engagement in Stormwater Funding Decisions in New England: Lessons from Communities*²⁶⁰ describes benefits of engaging stakeholders in stormwater planning and funding that include, among other benefits: (1) providing a forum to share concerns and knowledge and (2) providing "[a]n opportunity to find the balance between costs and services that fee payers can support."

In Los Angeles County, this has been done on a regional basis through OurWaterLA, a diverse coalition of community leaders and organizations from across Los Angeles County, which was formed to support outreach to all residents in Los Angeles County about the importance of clean, safe, affordable and reliable water to the region's communities. OurWaterLA works to make water issues accessible by developing informational materials, bringing new partners to the coalition, and hosting workshops and community events throughout Los Angeles County. The coalition strives to listen and help communities understand their power to make neighborhoods greener and healthier while enhancing the local economy and quality of life. OurWaterLA was a key supporter of the passage of Measure W by the voters, which established a dedicated revenue stream for stormwater projects to improve water quality and local water supply and provide other community benefits. Citizen oversight committees have also been established to support implementation of some of the funding programs identified above, including Measure V and Proposition O. Coalitions and committees like these can be formed by Permittees to facilitate effective public participation in local and regional stormwater management programs.

b. Informational and Educational Activities (Part VIII.D.3.b of the Order).

The informational and educational activities requirements in previous permits for Ventura County, City of Long Beach, and Los Angeles County implemented federal requirements in 40 CFR sections 122.26(d)(2)(iv)(A) and (B)(6). This permit maintains the requirements from the previous permits, but allows for additional flexibility in how the Permittees may implement them. The Los Angeles Water Board recognizes that this flexibility will allow Permittees to focus resources and efforts on targeted pollutants and behaviors that are most problematic to individual communities or where efforts will result in the

²⁵⁹ U.S. EPA. 2010. *MS4 Permit Improvement Guide*. Apr. 2010. p. 22.

²⁶⁰ U.S. EPA. 2013. *Evaluation of the Role of Public Outreach and Stakeholder Engagement in Stormwater Funding Decisions in New England: Lessons from Communities*. EPA-100-K-13-0004. Office of Policy. June 2013. p. 27.

greatest improvements. These provisions support the broader federal requirements discussed earlier in this Fact Sheet.

For Part VIII.D.3.b of the Order, the Permittee has the flexibility of selecting activities and topics based on water quality priorities. Additionally, the Permittee may choose various methods for disseminating educational materials on pollution prevention or may promote pollution mitigation through public reporting of illicit discharges. In this way, the Permittee is expected to adapt the program efforts and resources to focus public education in targeted areas. This flexibility notwithstanding, the requirements implement federal regulations at 40 CFR sections 122.26(d)(2)(iv)(A) and 122.26(d)(2)(iv)(B)(6). The U.S. EPA *MS4 Permit Improvement Guide* supports flexibility in PIPP programs through example fact sheet language:

*The public education and outreach program must be tailored and targeted to specific water quality issues of concern in the relevant community. These community-wide and targeted issues must then guide the development of the comprehensive outreach program, including the creation of appropriate messages and educational materials. The permit includes a list of potential residential and commercial waste topics, but the permittee may also choose other issues that contribute significant pollutant loads to stormwater.*²⁶¹

The U.S. EPA-issued permit for Boise Area MS4²⁶² allows flexibility in that Permittees decide the effective methods and topics for prescribed target audiences. Similarly, the U.S. EPA-issued MS4 permit for the Rio Grande Watershed²⁶³ allows for Permittees to use a “tailored public education program using a mix of locally appropriate strategies, to target specific audiences and communities” and “[use] material or outreach programs directed toward targeted groups of commercial, industrial, and institutional entities likely to have significant storm water impacts.”

Resources for outreach methods and pollution prevention practices associated with Part VIII.D.3.b of the Order are available through U.S. EPA’s Non-point Source Toolbox available at <https://cfpub.epa.gov/npstbx/>.

5. Documentation, Tracking and Measurement of Effectiveness.

Part VIII.D.4 of the Order requires the Permittee to document and track selected activities and targets as well as report on the effectiveness of public information and participation activities. This enables the Los Angeles Water Board to ensure the program requirements are implemented. It also helps the Permittee to ascertain the most successful public participation efforts.

The previous 2010 Ventura County MS4 Permit required documentation of activities and strategies implemented and required effectiveness measurements on outreach to school children and the general public related to stormwater quality. The previous 2014 City of Long Beach and 2012 Los Angeles County MS4 permits

²⁶¹ U.S. EPA. 2010. *MS4 Permit Improvement Guide*. Apr. 2010. p. 20.

²⁶² NPDES permit (*IDS-027561*) issued to Ada County Highway District, Boise State University, City of Boise, City of Garden City. Drainage District #3, and the Idaho Transportation Department District #3. Effective February 1, 2013. pp. 30-32.

²⁶³ NPDES Permit No. NMR04A000 issued to Middle Rio Grande Watershed, effective December 22, 2014. p. 32.

required documentation and effectiveness information to be reported in annual reports. The Regional MS4 Permit requires Permittees to document the selected activities, dates of activities, methods, targeted behavior, targeted pollutant, targeted audience, cultural outreach effort, and the metric chosen to measure effectiveness of the activity. This information must be made available upon request to the Los Angeles Water Board and reported in annual reports.²⁶⁴

The Regional Permit includes a new requirement for all Permittees to develop metrics and evaluate the success of the program, based on chosen metrics, in educating, raising awareness, and changing behaviors. U.S. EPA emphasizes permit conditions related to MCMs must be clear, specific, and measurable.²⁶⁵ U.S. EPA-issued permits²⁶⁶ include clear, specific, measurable requirements to document and track effectiveness of public information and outreach activities. Additionally, several permit language examples in the *Compendium of MS4 Permitting Approaches*²⁶⁷ require Permittees to develop and/or use metrics to measure improved understanding of stormwater quality, support for the program, and pollutant management and disposal behaviors as defined by objectives in Part VIII.D.2 of the Order.

6. Annual Report Requirements.

Requirements to report PIPP activities in Attachment H (Annual Report Form) of the Order as well as effectiveness using metrics established in Part VIII.D.4 of the Order are based on federal requirements in 40 CFR 122.42(c)(1), (c)(2), and (c)(6) among others as identified in the Monitoring and Reporting Program (Attachment E). These reporting requirements ensure that Permittees evaluate the success of the program, in educating, raising awareness, and changing behaviors.

E. Industrial/Commercial Facilities Program

1. Background

Since the Nationwide Urban Runoff Program (NURP) study²⁶⁸ in the early 1980s, it has been demonstrated that sites of industrial activity have the potential to contribute higher quantities of pollutants in stormwater runoff when compared with other land uses. Data from the NURP study were analyzed further in the U.S. Geological Survey (USGS) Urban Storm Water Data Base for 22 Metropolitan Areas Throughout the United States study.²⁶⁹ The USGS report summarized additional monitoring data compiled during the mid-1980s, covering 717 storm events at 99 sites in 22 metropolitan areas, and documented problems associated with metals and sediment concentrations in urban stormwater runoff.

²⁶⁴ 40 CFR § 122.42(c)(4) requires “A summary of data, including monitoring data, that is accumulated throughout the reporting year;” 40 CFR § 122.42(c)(6) requires “A summary describing the number and nature of enforcement actions, inspections, and public education programs;”

²⁶⁵ Federal Register/ Vol. 79, No. 245/Monday, December 22, 2014/ Notices. P. 89320.

²⁶⁶ For example, see footnote , p. 14 and footnote , p. 45.

2. Legal Authority

The Permittee is ultimately responsible for discharges from its MS4. The Phase I regulations require, in part, that the applicant: (i) develop adequate legal authority, (ii) perform a source identification, and (iii) develop a management program to reduce the discharge of pollutants. (40 CFR section 122.26(d)(2).)

The U.S. EPA *MS4 Permit Improvement Guide* states that, “Phase I MS4 regulations specify that several key elements be included in Phase I MS4 stormwater management programs [to control pollutants in stormwater discharges to the MS4 from industrial and commercial facilities]. These elements include: adequate legal authority to require compliance and inspect sites, inspection of priority industrial and commercial facilities, establishing control measure requirements for facilities that may pose a threat to water quality, and enforcing stormwater requirements. In order to implement these requirements, MS4 permits require the development of an inventory of facilities and prioritization protocol and adequate staff training to ensure proper inspection and enforcement of requirements.”²⁷⁰

Federal regulations at 40 CFR section 122.26(d)(2)(ii) require MS4 operators to “[p]rovide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity.”

Per 40 CFR section 122.26(d)(2)(iv)(C), with regards to industrial controls, the management plan shall include the following.

“A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA),²⁷¹ and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:

- (1) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges.
- (2) Describe a monitoring program for storm water discharges associated with industrial facilities [..]”

Per 40 CFR section 122.26(d)(2)(ii), as part of the Source Identification requirements, the municipality is required to “Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity.”

In the preamble to the 1990 regulations, U.S. EPA clearly states the intended strategy for discharges of stormwater associated with industrial activity:

²⁷⁰ U.S. EPA. *MS4 Permit Improvement Guide* (2010), Chapter 7, p. 85 (emphasis added).

²⁷¹ See U.S. EPA’s Toxic Release Inventory (TRI) Program webpage at: <https://www.epa.gov/toxics-release-inventory-tri-program>

“...Municipal operators of large and medium municipal separate storm sewer systems are responsible for obtaining system-wide or area permits for their system’s discharges. These permits are expected to require that controls be placed on storm water discharges associated with industrial activity which discharge through the municipal system.”²⁷²

The U.S. EPA also notes in the preamble that “... municipalities will be required to meet the terms of their permits related to industrial dischargers.”²⁷³

Similarly, in the U.S. EPA’s Guidance Manual (Chapter 3.0), U.S. EPA specifies that MS4 applicants must demonstrate that they possess adequate legal authority to:

- a. Control construction site and other industrial discharges to MS4s;
 - i. Prohibit illicit discharges and control spills and dumping;
 - ii. Carry out inspection, surveillance, and monitoring procedures.

The document goes on to explain that "control," in this context means not only to require disclosure of information, but also to limit, discourage, or terminate a stormwater discharge to the MS4. Further, to satisfy its permit conditions, a Permittee may need to impose additional requirements on discharges from permitted industrial facilities, as well as discharges from industrial facilities and construction sites not required to obtain permits.

In the same Guidance Manual (Chapter 6.3.3), U.S. EPA states that the Permittee is ultimately responsible for discharges from their MS4. Consequently, the MS4 applicant must describe how the municipality will help the U.S. EPA and States authorized to implement the federal NPDES permit program to:

- a. Identify priority industries discharging to their systems;
 - i. Review and evaluate storm water pollution prevention plans (SWPPPs) and other procedures that industrial facilities must develop under general or individual permits;
 - ii. Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
 - iii. Inspect and monitor industrial facilities discharging storm water to the municipal systems to ensure these facilities are in compliance with their NPDES storm water permit, if required.

Therefore, Permittees are required to implement programs to control stormwater discharges associated with industrial activities and other commercial facilities identified as significant contributors of pollutants through the implementation of a mandatory baseline minimum set of source control BMPs; performance of an inspection program to verify the adequacy of BMP implementation in the field and compliance with municipal ordinances; and assist the Los Angeles Water Board in ensuring that industrial activities subject to regulations are covered by the State Water Board’s industrial stormwater general permit. Los Angeles Water Board will also assist the municipalities in case of instances of egregious non-compliance with the municipal ordinances and state and federal laws and regulations.

²⁷² Federal Register, Vol. 55, No. 222, November 16, 1990, pp. 47990-48091.

²⁷³ Ibid.

The provisions contained in the Order pertaining to the inspection and facility control program requirements for industrial and commercial facilities are also based on the requirements found in the previous permits. Those requirements, among others, were the subject of litigation between several permittees and the Los Angeles Water Board on the 2001 Los Angeles County MS4 permit (Order No. 01-182). In that case, the Los Angeles County Superior Court upheld the inspection and facility control program requirements for industrial/commercial facilities and construction sites. The Court found that requiring permittees to inspect commercial and industrial facilities and construction sites is authorized under the Clean Water Act. The Court further determined that “[t]he Permit contains reasonable inspection requirements for these types of facilities. [Citation.] Additionally, permittees have the fee authority to impose a fee on the facility operator or owner to recover the cost of these inspections. As part of the scope of inspection, the Permit requires each permittee to confirm that operators are effectively implementing Best Management Practices (BMPs) in compliance with County and municipal ordinances, Regional Board Resolution 90-08 and the Stormwater Quality Management Plans (SQMPs). [Citation.] Addressing pollution after it has entered the storm sewer system is not working to meet legislative goals. More work is required at the source of pollution, and that is partially the basis on which this Court finds that the Permit’s inspection requirements are reasonable, and not onerous and burdensome.” (*In re L.A. Cnty. Mun. Storm Water Permit Litig.* (L.A. Super. Ct., No. BS 080548, Mar. 24, 2005), Statement of Decision from Phase II Trial on Petitions for Writ of Mandate, p. 17.)

There is currently pending litigation concerning the permittees’ fee authority to pay for inspections of industrial, commercial, and construction sites. In 2003, several Los Angeles County MS4 permittees filed test claims with the Commission on State Mandates alleging the requirements to conduct inspections at industrial facilities, commercial facilities, and construction sites in the 2001 permit (Order No. 01-182) were unfunded state mandates subject to reimbursement by the state pursuant to article XIII B, section 6 of the California Constitution. In 2009, the Commission determined that the provisions imposed state mandates as the provisions were not specifically found in federal law, but found that the requirements were not reimbursable because the permittees could charge fees to fund the inspection requirements. Both the Water Boards and the permittees appealed various aspects of the Commission’s decision. That litigation remains pending on several issues, including the permittees’ challenge regarding their fee authority issue. To date, no court has ruled specifically on this issue. (*State of California Department of Finance, State Water Resources Control Board, and California Regional Water Quality Control Board, Los Angeles Region v. Commission on State Mandates; County of Los Angeles, et al., Real Parties in Interest* (Super. Ct. Los Angeles County, Case No. BS130730, B292446, app. pending).

3. Industrial/Commercial Facilities Program Implementation

The purpose of the Industrial/Commercial Facilities Pollutant Control Program is to ensure the implementation of adequate controls at all industrial and commercial sites in order to assist Permittees in achieving compliance with the water quality limitations for discharges from their MS4s. The applicable provisions in the Order are carried over from the prior MS4 permits. However, they have been slightly modified to better define the requirements. These provisions clarify the inventory requirements for all facilities that are critical sources of stormwater pollution, as

well as requirements for industrial facilities (i.e. facilities listed in Part VIII.E.2.a.i) of the Order and commercial facilities (i.e. facilities listed in Parts VIII.E.2.a.ii through iv).

Part VIII.E.2.b of the Order lists the minimum necessary information required to develop and maintain an effective list of all facilities that are critical sources of stormwater pollution.

For ease of compliance and more clear guidelines, the requirements for industrial facilities (i.e., facilities that require enrollment in the Industrial General Permit) have been separated from the other facilities. Part VIII.E.3 of the Order sets provisions specific to commercial facilities listed in Parts VIII.E.2.a.ii through iv of the Order and Part VIII.E.4 of the Order sets forth provisions specific to industrial facilities. While the requirements for all facilities include a business assistance program and facility inspections, the details of each component are tailored to the facility type. The commercial facilities' outreach and business assistance programs are tailored to raise awareness among commercial facility owners of their BMP requirements. The industrial facilities' business assistance program is tailored to raise awareness among industrial facility owners of the obligation to obtain and comply with permit requirements for their stormwater discharges. The inspection component for both commercial and industrial facilities is set forth to ensure effective implementation of BMPs to manage stormwater discharge from the facility. The Order also requires Permittees, during facility inspections, to confirm that industrial facilities are enrolled in the Industrial General Permit and have a current waste discharge identification (WDID) number. Inspection frequencies have been modified to start with more frequent inspections while giving the Permittee the opportunity to reduce the frequency for facilities that demonstrate compliance with the BMP requirements. This will give the Permittees the freedom to better utilize their resources by allocating them to areas of higher concern. Additionally, inspection frequencies for commercial facilities have been modified to require inspections of a facility every two years, ensuring that the first mandatory compliance inspection occurs no later than 2 years after the effective date of the Order. A minimum interval of 6 months between the compliance inspections is required. The scope of the inspections was clarified by listing possible BMPs that should be implemented at the facility to ensure that exposure of pollutants to stormwater is managed. The BMP categories are based on BMPs identified in the 2003 California Stormwater BMP Handbook, Industrial and Commercial as well as BMPs identified in Los Angeles Water Board Resolution No. 98-08.

Additionally, the provision for outreach is necessary to meet federal standards and federal requirements regarding stormwater management programs at 40 CFR section 122.26(d)(2)(iv), including subsections (A)(6) and (B)(6), which require educational outreach regarding pollutants in discharges of pesticides, herbicides, fertilizers, oil, and toxic materials.

Part VIII.E.6 of the Order sets requirements for a progressive enforcement procedure that outlines the minimum steps needed to enforce their municipalities' stormwater requirements. In recognition of some of the Permittees' concerns regarding the resource intensive efforts needed to elevate enforcement actions, a mechanism was provided through which Permittees can refer cases to the Los Angeles Water Board.

Due to the level of technicality of industrial and commercial facilities inspections, Part VIII.A.3 of the Order sets requirements for staff training. These requirements are set to ensure pertinent staff possess the appropriate knowledge of the program.

F. Planning and Land Development Program

1. Legal Authority

The permit application requirements described in 40 CFR section 122.26(d) have formed the foundation for MS4 permits and remain applicable as elements in a stormwater management program. 40 CFR section 122.26(d)(2)(iv) requires, in part, that the large and medium MS4 applicant develop a management program. Specifically, with regards to planning and land development and post-constructions controls, the management program shall include the following:

“(A) A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls. At a minimum, the description shall include:

(1) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;

(2) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed.

(3) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems...

(4) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible.”

2. Background

Land development and urbanization have been linked to the impairment of aquatic life beneficial uses in numerous studies. Poorly planned and constructed new development and re-development projects have the potential to impact the hydrology of the watershed and the water quality of the surface waters. Development without appropriate planning and controls often results in increased soil compaction, changes in vegetation and increased impervious surfaces. These conditions may lead to a reduction in groundwater recharge and changes in the flow regime of the surface water drainages. Historically, urban development has resulted in increased peak stream flows and flow duration, reduced base flows, and increased water temperatures. Pollutant loading in stormwater runoff often

increases due to post-construction activities and because the stormwater runoff is directly connected to the storm drain system or to the surface water body, without the benefit of filtration through soil and vegetation.

The Planning and Land Development Program provisions in the 2012 Los Angeles County, 2014 City of Long Beach, and 2010 Ventura County MS4 Permits require that Permittees impose requirements on development projects (including significant redevelopment projects) within their jurisdiction to address stormwater pollution and hydromodification impacts. These provisions establish:

- Water quality, flow reduction, and resources management criteria for applicable development projects within the Permittee's jurisdiction.
- Hydromodification mitigation criteria for applicable development projects within the Permittee's jurisdiction.
- Implementation requirements.

Except for some provisions that were updated and/or refined, the Order generally carries over the Planning and Land Development provisions included in the 2012 Los Angeles County, 2014 City of Long Beach, and 2010 Ventura County MS4 Permits.

3. Implementation

a. Priority Development Projects

Part VIII.F.1 of the Order establishes the term "Priority Development Projects" for new development and redevelopment projects subject to water quality, flow reduction, and resources management criteria. Although the term Priority Development Project was not used in the 2012 Los Angeles County, 2014 City of Long Beach, and 2010 Ventura County MS4 Permits, this change does not constitute a new requirement. The categories of development projects designated as Priority Development Projects are generally the same categories of new development and redevelopment projects that were subject to water quality, flow reduction, and resources management criteria in the previous permits. Part VIII.F.1.a.iv of the Order establishes that new development and redevelopment projects that create and/or replace 2,500 square feet or more of impervious area; discharge stormwater that is likely to impact a sensitive biological species or habitat; and are located in or directly to or are discharging directly to a "Sensitive Ecological Area" in Los Angeles County or an "Environmentally Sensitive Area" in Ventura County are Priority Development Projects. This is consistent with the 2012 Los Angeles County, 2014 City of Long Beach, and 2010 Ventura County MS4 Permits.

Part VIII.F.1.c of the Order includes exemptions from Priority Development Project Structural BMP Performance Requirements through implementation of an approved Local Ordinance Equivalence or an approved Regional Stormwater Mitigation Program. These exemptions were included in the 2012 Los Angeles County MS4 Permit and 2014 City of Long Beach MS4 Permit.

i. Hydromodification

Part VIII.F.2.a of the Order establishes hydromodification management requirements for Priority Development Projects within natural drainage systems for Los Angeles County Permittees and all development projects greater than 50 acres for Ventura County Permittees. This is the same

as the applicability requirements in the 2012 Los Angeles County, 2014 City of Long Beach, and 2010 Ventura County MS4 Permits. Under the 2012 Los Angeles County MS4 Permit, hydromodification requirements applied to all New Development and Redevelopment projects located in natural drainage systems. Under the 2010 Ventura County MS4 Permit, hydromodification requirements applied to all applicable New Development and Redevelopment projects identified in subpart 4.E.II of that permit (i.e., projects that would be referred to as Priority Development Projects under this Order), however hydromodification-specific controls are only required for projects disturbing lands areas of fifty acres or greater.

The hydromodification management control criteria outlined in Part VIII.F.2.c of the Order carry over the criteria included in the 2010 Ventura County MS4 Permit, 2012 Los Angeles County MS4 Permit, and 2014 City of Long Beach MS4 Permit.

ii. Implementation Requirements

Part VIII.F.3 of the Order establishes implementation requirements related to project coordination; maintenance agreements and transfers; and tracking, inspection, and enforcement of post-construction BMPs. These requirements are directly carried over from those included in the 2010 Ventura County MS4 Permit, 2012 Los Angeles County MS4 Permit, and 2014 City of Long Beach MS4 Permit.

b. Priority Development Project Structural BMP Performance Requirements

Part VIII.F.4 of the Order establishes requirements for Priority Development Projects for Permittees. Under these requirements, Permittees must require Priority Development Projects to retain a Stormwater Quality Design Volume (SWQDV). If retention of the SWQDV is infeasible or if there is an applicable groundwater replenishment opportunity, then Permittees may allow Priority Development Projects to use alternative compliance measures including: onsite biofiltration or onsite flow-based BMPs in conjunction with offsite infiltration projects, groundwater replenishment projects, or offsite retrofit projects. These requirements are generally consistent with the corresponding requirements in the 2012 Los Angeles County, 2010 Ventura County, and 2014 City of Long Beach MS4 Permits.

Part VIII.F.4.c.i of the Order provides that on-site biofiltration may be used as an alternative compliance measure. Unlike the 2012 Los Angeles County, 2010 Ventura County, and 2014 City of Long Beach MS4 Permits, the Order does not directly include design specifications for biofiltration systems but instead references the design specifications in the County of Los Angeles Department of Public Works' Low Impact Development Standards Manual and 2011 Ventura County Technical Guidance Manual. These specifications are generally consistent with the previous design specifications in Attachment H of the 2012 Los Angeles County MS4 Permit and 2011 Ventura County Technical Guidance Manual.

Part VIII.F.4.c.ii of the Order provides that on-site flow-based BMPs may be used as an alternative compliance measure for Permittees in situations where

on-site biofiltration is not technically feasible. This option was not included in the 2012 Los Angeles County, 2010 Ventura County, and 2014 City of Long Beach MS4 Permits. This alternative compliance measure option is included in the Order to give an on-site treatment option for projects in areas where on-site biofiltration is technically infeasible. The requirements are similar to the mitigation criteria in Part VIII.F.4.d of the Order, however the BMP must be certified for “Enhanced Treatment” under the Washington State Department of Ecology’s TAPE Program; or an appropriate future BMP certification program developed by the State of California.

Part VIII.F.4.d of the Order establishes water quality mitigation criteria for projects in cases where the priority development project is utilizing offsite mitigation or an offsite ground water replenishment project to comply with its structural BMP performance requirements. This ensures that there is treatment of stormwater runoff from the project site. The Order updates the mitigation requirements included in the 2012 Los Angeles County, 2010 Ventura County, and 2014 City of Long Beach MS4 Permits.

G. Construction Program

1. Background

Soil disturbing activities during construction and demolition exacerbate sediment losses. Sediment is a primary pollutant impacting beneficial uses of watercourses. Sediment also transports other pollutants such as nutrients, metals, and oils and greases. Sediments, and other construction activity pollutants must be properly controlled to reduce or eliminate adverse impacts.

Construction activities addressed by the Construction Program in the Order include the following:

- Any construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity.
- Construction activity related to residential, commercial, or industrial development on lands currently used for agriculture including, but not limited to, the construction of buildings related to agriculture that are considered industrial pursuant to U.S. EPA regulations, such as dairy barns or food processing facilities.
- Construction activity associated with linear underground/overhead project (LUPs) including, but not limited to, those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/borrow locations.
- Construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities.

- Activities resulting in storm water discharges from dredge spoil placement that occur outside of U.S. Army Corps of Engineers jurisdiction²⁷⁴ (upland sites) and that disturb one or more acres of land surface from construction activity. Construction projects that intend to disturb one or more acres of land within the jurisdictional boundaries of a CWA section 404 permit should contact the appropriate Regional Water Board to determine whether this permit applies to the project.

2. Legal Authority

With respect to construction site stormwater runoff control, federal regulations set forth requirements that include implementation of BMPs, site inspection, enforcement, and educational and training measures for construction site operators.

40 CFR section 126.26(d)(2)(iv)(D) requires “A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system...”

Per 40 CFR section 126.26(d)(2)(iv)(D)(2), the program must include “A description of requirements for nonstructural and structural best management practices.”

Per 40 CFR section 126.26(d)(2)(iv)(D)(3), the program must include “A description of procedures for identifying priorities for inspecting sites and enforcing control measures...”

Per 40 CFR section 126.26(d)(2)(iv)(D)(4), the program must include “A description of appropriate educational and training measures for construction site operators.”

40 CFR section 122.34(b)(4) states that with respect to construction site stormwater runoff control for small MS4s, which is analogous to that for large MS4s:

“(i) [the permittee] must develop, implement, and enforce a program to reduce pollutants in any storm water runoff to your small MS4 from construction activities that result in a land disturbance of greater than or equal to one acre. Reduction of storm water discharges from construction activity disturbing less than one acre must be included in your program if that construction activity is part of a larger common plan of development or sale that would disturb one acre or more. If the NPDES permitting authority waives requirements for storm water discharges associated with small construction activity in accordance with § 122.26(b)(15)(i), you are not required to develop, implement, and/or enforce a program to reduce pollutant discharges from such sites. (ii) Your program must include the development and implementation of, at a minimum: (A) An ordinance or other regulatory mechanism to require erosion and sediment controls, as well as sanctions to ensure compliance, to the extent allowable under State, Tribal, or local law; (B) Requirements for construction site operators to implement appropriate erosion and sediment control best management practices; (C) Requirements for construction site operators to

²⁷⁴ A construction site that includes a dredge and/or fill discharge to any water of the United States (e.g., wetland, channel, pond, or marine water) requires a permit from the U.S. Army Corps of Engineers pursuant to CWA section 404 and a Water Quality Certification from the Regional Water Board or State Water Board pursuant to CWA section 401.

control waste such as discarded building materials, concrete truck washout, chemicals, litter, and sanitary waste at the construction site that may cause adverse impacts to water quality; (D) Procedures for site plan review which incorporate consideration of potential water quality impacts; (E) Procedures for receipt and consideration of information submitted by the public, and (F) Procedures for site inspection and enforcement of control measures.”

The inspection requirements for construction sites contained in the Order are also based on the requirements found in the previous permits. As previously noted, the inspection requirements contained in the 2001 Los Angeles County MS4 permit (Order No. 01-182) for construction sites were the subject of litigation between several permittees and the Los Angeles Water Board. As provided in more detail above, the Los Angeles County Superior Court upheld the inspection requirements for industrial/commercial facilities and construction sites in Order No. 01-182, finding that the “[t]he Permit contains reasonable inspection requirements for these types of facilities” and also that permittees have the authority to impose a fee on the facility operator or owner to recover the cost of these inspections. (*In re L.A. Cnty. Mun. Storm Water Permit Litig.* (L.A. Super. Ct., No. BS 080548, Mar. 24, 2005), Statement of Decision from Phase II Trial on Petitions for Writ of Mandate, p. 17.) As previously noted above, there remains pending litigation on test claims filed by several Los Angeles County MS4 permittees concerning the permittees’ fee authority to pay for inspections of industrial, commercial, and construction sites. The matter is currently at the Court of Appeal. To date, however, no court has ruled specifically on the fee authority issue. (*State of California Department of Finance, State Water Resources Control Board, and California Regional Water Quality Control Board, Los Angeles Region v. Commission on State Mandates; County of Los Angeles, et al., Real Parties in Interest* (Super. Ct. Los Angeles County, Case No. BS130730, B292446, app. pending).

3. Construction Program Implementation

The purpose of the Construction Program is to ensure the implementation of adequate controls at all construction sites in order to assist Permittees in achieving compliance with the receiving water limitation provisions and WQBELs applicable to discharges from their MS4s. The applicable provisions in the Order are carried over from existing MS4 Permits. However, they have been slightly modified to better define the requirements.

For ease of compliance and more clear guidelines, the requirements for construction sites that disturb one acre or greater of land (or construction sites less than one acre that are part of a common plan of development totaling one acre or greater) have been separated from construction sites that disturb less than one acre and are not part of a common plan of development. Part VIII.G.4 of the Order sets provisions specific to sites that disturb less than one acre of land while Part VIII.G.5 of the Order sets provisions specific to sites that disturb one acre or greater of land or sites less than one acre that are part of a common plan of development totaling one acre or greater.

Part VIII.G.4.a of the Order states that Permittees shall require the implementation of effective BMPs at construction sites disturbing less than one acre. To better assist Permittees, this part includes a list of applicable BMPs. To ensure effective implementation of these BMPs, Part VIII.G.4.b of the Order requires Permittees to inspect these sites.

Part VIII.G.5.a.i of the Order states that Permittees shall verify enrollment in the Construction General Permit prior to issuing a grading or building permit. Also, Permittees shall require operators of these sites to prepare and submit a post-construction plan for the Permittee's review and approval. These post-construction requirements are based on some of the provisions listed in Part VIII.F of the Order. These provisions are not listed in the Construction General Permit.

Part VIII.G.5.b of the Order lists the minimum necessary information required to develop and maintain an effective list of all construction sites one acre or greater.

Part VIII.G.5.c of the Order requires inspection of these sites to verify enrollment in the Construction General Permit, implementation of appropriate BMPs, or implementation of proper post-construction BMPs. The requirement for Permittees to develop standard operation procedures for their inspection procedures has been removed since inspection requirements are streamlined as part of the inspection requirements of the Order. Similarly, the requirement for Permittees to require an Erosion and Sediment Control Plan (ESCP) has been removed since an ESCP include the elements of a Storm Water Pollution Prevention Plan (SWPPP). Therefore, these requirements shall be satisfied via SWPPPs.

Part VIII.G.6 of the Order requires that Permittees implement their Progressive Enforcement Policy set forth in Part VIII.B as it pertains to ensuring that construction site operators come into compliance with all stormwater requirements.

Due to the technical nature of construction activities and BMP implementation, Part VIII.A.3 of the Order sets requirements for staff training. These requirements are set to ensure pertinent staff possess the appropriate knowledge of the program.

H. Public Agency Activities Program

1. Federal Requirements

The Los Angeles Water Board has incorporated the Public Agency Activities Program into the Order per the following federal requirements:

Clean Water Act section 402(p)(3)(B)(ii) and (iii) require that “[p]ermits for discharges from municipal storm sewers ... shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.”

40 CFR section 122.26(d)(2)(iv)(A) requires that the stormwater management program is based on, among other items, “[a] description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls.” This section goes on to identify component areas to address structural and source control measures. The components related to the Public Agency Activities Program include 40 CFR sections 122.26(d)(2)(iv)(A)(1), (3), (4), and (6), and are described below.

40 CFR section 122.26(d)(2)(iv)(A)(1) states that the stormwater management program must include “[a] description of maintenance activities and a

maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;”

40 CFR section 122.26(d)(2)(iv)(A)(3) states that the stormwater management program must include “[a] description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities;”

40 CFR section 122.26(d)(2)(iv)(A)(4) states that the stormwater management program must include “[a] description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible;” and

40 CFR section 122.26(d)(2)(iv)(A)(6) states that the stormwater management program must include “[a] description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.”

40 CFR section 122.41(n) describes conditions under which an upset of treatment may constitute an affirmative defense to an action brought for noncompliance. At 40 CFR section 122.41(n)(1) “[u]pset means an exceptional incident in which there is unintentional and temporary noncompliance with technology-based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.” The regulation further provides for conditions of affirmative defense and requirements to demonstrate an upset at 40 CFR sections 122.41(n)(2) and (3): Within the Regional MS4 Permit, the provisions for Emergency Procedures in Part VIII.H.10. of the Order allow for an affirmative defense subject to the conditions of 40 CFR 122.41(n)(1), (2), and (3).

40 CFR section 122.42(c) requires the owner or operator of an MS4 to submit an annual report that includes in part “(1) The status of implementing the components of the storm water management program that are established as permit conditions; (2) Proposed changes to the storm water management programs that are established as permit condition. Such proposed changes shall be consistent with §122.26(d)(2)(iii) of this part; (3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under §122.26(d)(2)(iv) and (d)(2)(v) of this part; (4) A summary of data, including monitoring data, that is accumulated throughout the reporting year...” and “(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs...”

2. General Provisions

Permittees previously covered under the 2012 Los Angeles County MS4 Permit, the 2014 City of Long Beach MS4 Permit, and the 2010 Ventura County MS4 Permit must continue existing programs while updating those programs, as necessary, to comply with the requirements of the Order. The Order consolidates requirements among the three previous permits, updates requirements to reflect completed program elements, and provides additional flexibility for BMP implementation. The most notable changes from previous permits are discussed below.

3. Public Agency Facility and Activity Management

The requirements for BMP implementation address federal requirements in 40 CFR sections 122.26(d)(2)(iv)(A)(1), (3), and (6). In addition, 40 CFR section 122.44(k) authorizes BMP requirements in permits for stormwater subject to Clean Water Act section 402(p). The BMP requirements in this section are similar to those in other permits, including the U.S. EPA-issued permit for Washington, D.C., which requires proper operation and maintenance, inspections, and proper disposal of residual water from treatment control BMPs.²⁷⁵ Several examples in U.S. EPA's *Compendium of MS4 Permitting Approaches* require BMP implementation for municipal activities, often through development of a SWPPP.²⁷⁶

Part VIII.H.3 of the Order requires each Permittee implement BMPs (identified in the inventory in Part VIII.H.2 of the Order), which may be structural and/or nonstructural. For implemented BMPs, the Permittee must inspect, maintain, properly operate, and properly dispose of any residual water produced by a treatment control BMP.²⁷⁷ Municipal operations are often performed by contractors; therefore, the Order requires contractual requirements to ensure BMPs are properly implemented.

The previous 2010 Ventura County MS4 Permit prescribed specific BMPs, referenced to the *Caltrans Storm Water Quality Handbook Maintenance Staff Guide* or as approved by the Executive Officer.²⁷⁸ The Order allows the Permittee to determine appropriate BMPs corresponding to activities. In doing so, Permittees have flexibility to incorporate advanced techniques beyond those in the references. Nonetheless, the Los Angeles Water Board encourages Permittees to consult *Caltrans Storm Water Quality Handbook Maintenance Staff Guide* as guidance for selecting BMPs.

The Order removes requirements specific to flood management projects in the previous 2012 Los Angeles County and 2014 City of Long Beach MS4 permits because MCMs related to flood management projects and flood control procedures

²⁷⁵ NPDES Permit No. DC0000221 issued to the Government of the District of Columbia, as modified November 9, 2012, pp. 16-17).

²⁷⁶ Compendium of MS4 Permitting Examples, Part 1: Six Minimum Control Measures. Office of Wastewater Management, Water Permits Division. November 2016. 810-U-16-001. pp. 38-45.

²⁷⁷ See Attachment A (Definitions). Residual Water means "In the context of the Order, water remaining in a structural BMP subsequent to the drawdown or drainage period. The residual water typically contains high concentration(s) of pollutants." Treatment Control BMP means "Any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process."

²⁷⁸ Appendix B of the *Caltrans Storm Water Quality Handbook Maintenance Staff Guide*, May 2003, and its addenda.

are now included in the inventory required by revised Part VIII.H.2 of the Order and, as such, the Permittee is required to assign appropriate BMPs, considering impacts of flood management projects on the water quality of the receiving water bodies. Flood control management is largely outside the scope of the MS4 permit; therefore, additional BMP requirements are not retained from previous Orders.

The Order removes numeric limitations for residual water produced by treatment control BMPs that were included in previous permits for Los Angeles County, City of Long Beach, and Ventura County. The Order includes treatment control BMPs in the requirements for Public Agency Facility and Activity Management. The numeric limitations are unnecessary as there is no longer an option in the Order to discharge residual water from treatment BMPs to the MS4. Their removal streamlines the permit requirements and improves clarity.

4. Vehicle and Equipment Washing; Landscape, Park, and Recreational Facilities Management; Storm Drain Operation and Maintenance; Road Reconstruction, Streets and Road Pollutant Management, and Parking Facilities.

The specific BMPs in Parts VIII.H.4 through 9 of the Order are based on section 402(p)(3)(B) of the CWA, which mandates that a permit for discharges from MS4s must effectively prohibit the discharge of non-stormwater to the MS4; require controls to reduce pollutants in discharges from the MS4 to the maximum extent practicable (MEP) including BMPs control techniques, and system, design and engineering methods; and such other provisions as the State deems appropriate for the control of pollutants. The specific BMPs for Parts VIII.H.4 through 9 of the Order are commonly accepted practices that the Los Angeles Water Board considers necessary to control pollutants discharged to the MS4 to the maximum extent practicable. Vehicle wash water is a prohibited non-stormwater discharge; thus, requirements in Part VIII.H.4 of the Order are also necessary to comply with the prohibition. U.S. EPA included BMP requirements similar to those in Part VIII.H.5 of the Order (Landscape, Park, and Recreational Facilities Management) in MS4 permits for Washington, D.C.,²⁷⁹ and Boise Area,²⁸⁰ and Middle Rio Grande Watershed.²⁸¹ Similarly, U.S. EPA provides example requirements to label catch basins in the MS4 Improvement Guide. Street sweeping reduces debris and pollutants that may become entrained in stormwater and urban runoff. Additionally, street sweeping may reduce clogging of catch basins and extend the life of infiltration BMPs.²⁸²

The Permittee must implement specific BMPs for vehicle and equipment washing; landscape, park, and recreational facilities management; storm drain operation and maintenance; catch basin cleaning; road reconstruction; streets and road pollutant

²⁷⁹ NPDES permit (DC0000221) issued to Government of the District of Columbia, with final signed Modification #1, effective November 9, 2012. pp. 16-17.

²⁸⁰ NPDES permit (IDS-027561) issued to Ada County Highway District, Boise State University, City of Boise, City of Garden City. Drainage District #3, and the Idaho Transportation Department District #3. Effective February 1, 2013. p. 25.

²⁸¹ NPDES Permit No. NMR04A000 issued to Middle Rio Grande Watershed, effective December 22, 2014. p. 29.

²⁸² Urban Drainage and Flood Control District, 2010. Urban Storm Drainage Criteria Manual, Volume 3. Chapter 5, Fact Sheet S-11, available at https://udfcd.org/wp-content/uploads/uploads/vol3%20criteria%20manual/01_USDCM%20Volume%203.pdf. Last accessed June 20, 2018.

management; and parking facilities maintenance. The Order's requirements in these areas have been updated from the previous permits to be consistent with the Trash Amendments²⁸³ and to remove catch basin prioritization requirements already completed by the Permittees.

This Part of the Order does not require Permittees to quantify trash removed from catch basins, as was required in the 2010 Ventura County MS4 Permit, rather, the Order aligns trash requirements with the Statewide Trash Amendments. Trash requirements are included in Part III.B of the Order.

Previous permits for Los Angeles County, City of Long Beach, and Ventura County permits required that the public agency program address infiltration to sanitary sewers and related preventative maintenance. For the Order, these requirements are addressed as illicit connections and discharges in Part VIII.I of the Order to more closely align with federal requirements. Provisions for controls on infiltration to sanitary sewers and related preventative maintenance address federal requirements in 40 CFR section 122.26(d)(2)(iv)(B)(7) as a component of the IDDE program.

Parking areas were not specifically identified for additional BMPs in the previous Ventura County permit. The remaining BMP requirements under these Parts are retained from previous permits for Los Angeles County, City of Long Beach, and Ventura County, with a specification for parking areas with a sediment/gravel base. To provide a phased approach for parking area requirements to Ventura County Permittees, an applicability threshold for parking areas greater than 1 acre or any parking lot used for heavy vehicle storage was added.

5. Emergency Procedures

The provisions in Part VIII.H.10 of the Order are consistent with federal regulations in 40 CFR section 122.41(n) as described earlier in this Fact Sheet. Permittees are required to conduct repairs of essential public service systems and infrastructure in emergency situations. In these situations, a Permittee is allowed a self-waiver from implementing facility and activity specific BMPs identified in Part VIII.H.3 of the Order, as well as BMPs described in Part VIII.H.4 through 9 of the Order. An emergency includes only those situations included as conditions necessary for demonstration of an upset at 40 CFR section 122.41(n). For each claimed emergency, the Permittee shall submit to the Los Angeles Water Board a statement of the occurrence of the emergency, an explanation of the circumstances, and the measures that were implemented to reduce the threat to water quality, no later than required by applicable federal NPDES regulations.

6. Other Changes to Program Requirements

The Order discontinues cross references to other regulatory requirements that were provided in previous permits for Los Angeles County and the City of Long Beach. This change reduces unnecessary language, as it is naturally implied that Permittees are not exempt from other regulatory requirements within the Order (e.g., Development Construction, Planning and Land Development requirements)

²⁸³ Amendment to the Water Quality Control Plan for Ocean Waters of California (Ocean Plan) to Control Trash and Part 1 Trash Provisions of the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California (ISWEBE Plan). Final Resolution No. 2015-0019. The OAL approved the Trash Amendments on December 2, 2015. The U.S. EPA approved the Trash Amendments on January 12, 2016.

or general permit requirements (e.g., *General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities* [NPDES No. CAS000002] and/or the *General Permit for Storm Water Discharges Associated with Industrial Activities* [NPDES No. CAS000001]), if applicable).

The Order does not require the Public Agency Program to include an Inventory of Existing Development for Retrofitting Opportunities, as was required in the 2012 Los Angeles County and the 2014 City of Long Beach MS4 permits. The previous permit provisions addressed federal requirements in 40 CFR section 122.26(d)(2)(iv)(A)(4). This requirement has been completed by Los Angeles County and City of Long Beach Permittees and a similar requirement is included under the Planning and Land Development Program in the Order. The previous 2010 Ventura County MS4 Permit also contained a similar requirement related to identifying eligible public and private off-site mitigation project sites in the Planning and Land Development program.²⁸⁴

7. Documentation and Tracking

Federal regulations in 40 CFR section 122.44(k)(4) require the Permitting Authority to establish requirements for BMPs where “The practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purpose and intent of the CWA.” The regulation contains a footnoted reference to the *Guidance Manual for Developing Best Management Practices (BMPs)*,²⁸⁵ for additional technical information on BMPs and the elements of BMPs. As described in the Manual, recordkeeping involves collecting background information that is pertinent to the BMP plan or the BMP itself. California Water Code section 13383 authorizes the Los Angeles Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. The Order requires documentation and tracking as a form of recordkeeping that is integral to BMP implementation. Without documentation and tracking, the Permittee cannot effectively ensure proper BMP implementation that is protective of water quality. U.S. EPA-issued MS4 permits such as the one issued to the District of Columbia,²⁸⁶ routinely require documentation and tracking interconnected with clear, specific, measurable requirements.

The Permittee must document and track the Public Agency Activities Program through the inventory developed in Part VIII.H.2 of the Order. This inventory is a framework for setting up periodic facility assessments and for developing, where necessary, facility stormwater pollution prevention plans. Documenting and tracking of BMPs through the inventory help to ensure that public agency facilities are monitored and receiving water quality is protected.

Part VIII.H.2 of the Order addresses, in part, federal requirements in 40 CFR section 122.26(d)(2)(iv)(A)(1), (3), and (6). A public agency oversees numerous facilities and performs many activities and must therefore identify activities that may

²⁸⁴ Waste Discharge Requirements for Storm Water (Wet Weather) and Non-storm Water (Dry Weather) Discharges from the Municipal Separate Storm Sewer Systems Within the Ventura County Watershed Protection District, County of Ventura and the Incorporated Cities Therein. Order 09-0057, NPDES No. CAS004002. Issued May 7, 2009, Corrected January 13, 2010.

²⁸⁵ U.S. EPA, 1993. *Guidance Manual for Developing Best Management Practices (BMPs)*. Office of Water. EPA No. 833/B-93-004. October 1993.

²⁸⁶ NPDES permit (DC0000221) issued to Government of the District of Columbia, effective June 22, 2018. pp. 19-22.

result in discharges of pollutants to the MS4. As follows, the requirements in 40 CFR sections 122.26(d)(2)(iv)(A)(1), (3), and (6) effectively require such an inventory. The *MS4 Permit Improvement Guide* recommends an inventory that is similar to the requirements in the Order.²⁸⁷

Permittees must develop and maintain an inventory of public facilities that are potential sources of pollutants to the MS4. Permittees formerly covered under the 2012 Los Angeles County and 2014 City of Long Beach MS4 permits may use information from the Public Facilities Inventory developed under the previous permit to comply with this provision, provided that all requirements in Part VIII.H.2 of the Order are met. The previous 2010 Ventura County MS4 Permit did not require an inventory but required BMP implementation for specific activities and specific types of facilities as well as BMP documentation. Thus, the previous 2010 Ventura County MS4 Permit requirements are effectively similar to the Order's inventory requirement. Under the Order, activities with potential to discharge pollutants to the MS4 must be included in the inventory and must be associated with facilities where the activity occurs. The list of facility types to include in the inventory is retained from previous permits for Los Angeles County and the City of Long Beach and correspond to similar requirements in the 2010 Ventura County MS4 Permit; however, streets and roads; catch basins; and stormwater capture, control, and treatment devices are added to the inventory list. The Order consolidates information requirements from the three previous permits. The framework of this requirement is slightly different than the three previous permits, but results in equivalent requirements to implement BMPs.

The previous permit for the City of Long Beach required the Permittee to update the inventory twice during the permit term; whereas, the Regional MS4 Permit requires the inventory to be updated once per permit term. The Los Angeles Water Board believes that this change will allow for reduced burden, without diminishing the overall integrity of the inventory.

8. Annual Report Requirements

The reporting requirements for the Public Agency Activities Program in Attachment H (Annual Report Form) of the Order are based on federal requirements in 40 CFR 122.42(c) (1), (2), (3), (4) and (6) among others as identified in the Monitoring and Reporting Program (Attachment E) and are necessary to ensure program requirements are implemented.

I. Illicit Discharge Detection and Elimination Program

The title of this section has changed from Illicit Connections and Illicit Discharges Elimination Program in previous permits to Illicit Discharge Detection and Elimination (IDDE) Program. The change has been made to match federal regulation language.

1. Federal Requirements

The Los Angeles Water Board has incorporated the Illicit Discharge Detection and Elimination Program into the Regional MS4 Permit per the following federal requirements:

²⁸⁷ U.S. EPA. 2010. *MS4 Permit Improvement Guide*. April 2010. pp. 67-69.

Clean Water Act section 402(p)(3)(B)(ii) requires that “[p]ermits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers;...”

Federal regulations at 40 CFR section 122.26(d)(2)(iv)(B) require that the stormwater management program shall be based on “a description of a program, including a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer.” The proposed management program shall include “[a] description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal storm sewer system,” per subsection (1) of the above federal regulation.

Federal regulations at 40 CFR section 122.26(b)(2) define “illicit discharge” as “any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from firefighting activities.” Federal regulations at 40 CFR section 122.26(d)(2)(iv)(B)(1) state that the following non-stormwater discharges may be allowed if they are not determined to be a significant source of pollutants to the MS4: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration, uncontaminated pumped ground water, discharges from drinking water supplier distribution systems, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water. If, however, these discharges are determined to be a significant source of pollution then they must be prohibited.

Federal regulations at 40 CFR section 122.26(d)(2)(iv)(B)(1) through (7) provide the IDDE program requirements including a “description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system,” field screening, investigation procedures, spill prevention, public reporting, educational activities, and a description of controls to limit infiltration of seepage from municipal sanitary sewers.

2. General Provisions

Part VIII.I.1 of the Order implements federal requirements in Clean Water Act section 402(p)(3)(B)(ii) and 40 CFR section 122.26(d)(2)(iv)(B)(3). The Permittee must continue to implement their IDDE program, maintain it in written form, and update it, as necessary. The requirements in the IDDE program are retained from previous permits for Los Angeles County, City of Long Beach, and Ventura County and have been reworded for improved clarity. Many of the program components are monitoring and reporting efforts. As such, some requirements are included in the MRP for non-stormwater outfall-based screening and monitoring.

The Regional MS4 Permit considers the procedures in the MRP for the non-stormwater outfall-based screening and monitoring program as part of the IDDE program. These Regional MS4 Permit requirements address federal regulations at 40 CFR 122.26(d)(2)(iv)(B)(2), (5), and (6), which are program requirements for the IDDE that state the permittee must include in the IDDE program: “(2) [a] description of procedures to conduct on-going field screening activities during the life of the

permit, including areas or locations that will be evaluated by such field screens;” “(5) [a] description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers” and “(6) [a] description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials.”

3. Illicit Discharge Detection and Elimination

Clean Water Act section 402(p)(3)(B)(ii) requires MS4 permits to “effectively prohibit non-stormwater discharges into the storm sewers.” Parts VIII.I.2 and 3 of the Order implement the federal requirement, in part, by requiring the development of procedures to investigate and eliminate illicit discharges. In addition to the broad federal requirement, the Regional MS4 Permit requires a timeline of 72 hours to initiate the investigation. This timeline is retained from previous permits for Los Angeles County and the City of Long Beach but is slightly different from the previous 2010 Ventura County MS4 Permit requirement of “one business day.” Nonetheless, the Los Angeles Water Board believes “72 hours” is a clearer requirement. U.S. EPA encourages permit writers to include clear, specific, measurable requirements in permits as is evident through the Phase II remand rule²⁸⁸ and guidance documents.²⁸⁹

The previous Los Angeles and City of Long Beach permits include a requirement to notify upstream jurisdictions when an illicit discharge has been determined to have originated upstream of their jurisdictional boundary. Communication with upstream jurisdictions is essential to eliminating illicit discharges as the upstream entity might not be aware of the discharge leaving their MS4.

The Regional MS4 Permit retains the requirement that if a Permittee is unable to eliminate an ongoing illicit discharge, or other circumstances prevent the full elimination of an ongoing illicit discharge, the Permittee shall require diversion of the entire flow to the sanitary sewer or treatment. In the event of either above circumstance, the Permittee shall notify the Los Angeles Water Board in writing within 30 days, providing a written plan for review and comment. The goal of this requirement is to provide a permanent solution for ongoing illicit discharges. This requirement was not included in the previous 2010 Ventura County MS4 Permit but it is necessary as it supports the federal requirement to effectively prohibit non-stormwater discharges through the MS4.

The illicit connection requirements as stated in the previous 2012 Los Angeles County, 2014 City of Long Beach, and 2010 Ventura County MS4 permits, have been combined with illicit discharge requirements in Part VIII.I of the Order. Combining illicit discharges and illicit connections into one section streamlines the Regional MS4 Permit while still meeting the NPDES requirements stated in 40 CFR section 122.26 (d)(1)(v)(B). Illicit connections are often treated as illicit discharges,

²⁸⁸ U.S. EPA. 2016. National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System General Permit Remand Rule, 81 Federal Register, p 89326.

²⁸⁹ U.S. EPA. 2010. *MS4 Permit Improvement Guide*. April 2010. p.5.

as is evident in U.S. EPA-issued permits for Boise Area²⁹⁰ and District of Columbia.²⁹¹

The illicit connection screening requirements included in the three previous permits are discontinued in the Regional MS4 Permit. They have been removed to eliminate redundancy and streamline the permit. As illicit connections are a source of illicit discharges by performing illicit discharge screening and investigations the Permittee is fulfilling that requirement. If the Permittee eliminates the sources of illicit discharges, then they will eliminate illicit connections.

4. Infiltration from Sanitary Sewer to MS4 – Preventative Maintenance

The NPDES requirements of 40 CFR section 122.26(d)(2)(vi)(B)(7) require that the IDDE program include “A description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary.” The Sanitary Sewer Preventative Maintenance requirements were in the Public Agency Activity Program in the previous 2012 Los Angeles County and 2014 City of Long Beach MS4 permits but were not any section of the previous 2010 Ventura County MS4 Permit. Proper sanitary sewer preventative maintenance decreases the probability that a sanitary sewer line will back up, overflow, or leak, causing potential contact with the MS4 or directly to the receiving water. By moving these requirements into the IDDE section, the Regional Permit implements the above-mentioned requirements of 40 CFR 122.26(d)(2)(iv)(B)(7).

5. Spill Response

Federal regulations at 40 CFR section 122.26(d)(2)(iv)(B)(4) require a “description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer.” Spills, leaks, sanitary sewer overflows, and illicit dumping or discharges can introduce a range of pollutants into the storm system. A quick response to a spill can prevent the pollutant from reaching the MS4 or the receiving water. Often, a different entity might be responsible for spill response in a community (e.g., fire department); therefore, it is imperative that adequate communication exists between stormwater and spill response staff to ensure that spills are documented and investigated in a timely manner.

The language in the Regional MS4 Permit has been streamlined to maintain the federal requirements but allow for flexibility for each Permittee to design their program to best fit the needs of their community. Other U.S. EPA-issued permits, such as the one issued to the District of Columbia,²⁹² include a similar streamlined approach to spill response that states “the permittee shall continue to implement procedures to prevent, contain, and respond to spills that may discharge into the MS4. The permittee shall provide for the training of appropriate personnel in spill

²⁹⁰ NPDES permit (IDS-027561) issued to Ada County Highway District, Boise State University, City of Boise, City of Garden City. Drainage District #3, and the Idaho Transportation Department District #3. Effective February 1, 2013. p. 27 and 32.

²⁹¹ NPDES permit (DC0000221) issued to Government of the District of Columbia, with final signed Modification #1, effective November 9, 2012. pp. 35-36.

²⁹² NPDES permit (DC0000221) issued to Government of the District of Columbia, with final signed Modification #1, effective November 9, 2012. p. 25

prevention and response procedures.” Additionally, the U.S. EPA-issued permit for Boise Area²⁹³ also includes similar spill response requirements.²⁹⁴

6. Public Reporting of Non-Stormwater Discharges and Spills

Federal regulations at 40 CFR section 122.26(d)(2)(iv)(B)(5) require the permittee to develop a description of a program “to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewer.” The Permittee(s) needs to promote the program to help in the identification and termination of illicit discharges. The Regional MS4 Permit establishes requirements for the Permittees, individually or as a group, to develop public education campaigns and public reporting of illicit discharges.

The language used in this Regional MS4 Permit has been streamlined to allow for adaptation of new technology other than telephone hotlines, such as websites, cellular telephone applications, and social media. Permittees must provide the public with at least one way of reporting illicit discharges, spills, and observed water quality impacts associated with the MS4.

7. Documentation and Tracking

The Regional MS4 Permit retains the overall documentation and tracking requirements in Part VIII.I.8 of the Order from the 2012 Los Angeles County and 2014 City of Long Beach MS4 permits. These requirements are more specific than in the previous 2010 Ventura County MS4 Permit but are necessary to ensure that Permittees are effectively prohibiting non-stormwater discharges, as required by Clean Water Act section 402(p)(3)(B)(ii). Additionally, the *EPA MS4 Permit Improvement Guide*²⁹⁵ provides an example requirement to “track all investigations to document at a minimum the date(s) the illicit discharge was observed; the results of the investigation; any follow-up of the investigation; and the date the investigation was closed.” Other U.S. EPA issued permits, such as for the Boise Area,²⁹⁶ include similar approaches to IDDE, which require the Permittee to maintain a record documenting all complaints or reports of illicit discharges and responses take by the Permittee.

While the documentation requirements are less specific in some ways than those in the previous 2012 Los Angeles County and 2014 City of Long Beach MS4 permits, the requirements in the Regional MS4 Permit still meet the requirements of federal regulations. Specific documentation requirements are covered by Annual Reporting Requirements in the Regional MS4 Permit. The removal of specific requirements allows for flexibility, removes redundancy, and improves alignment

²⁹³ NPDES permit (IDS-027561) issued to Ada County Highway District, Boise State University, City of Boise, City of Garden City. Drainage District #3, and the Idaho Transportation Department District #3. Effective February 1, 2013. p. 29.

²⁹⁴ For example, a Permittee could follow the Cal OES: California Hazardous Materials Spill/Release Notification Guidance when reporting and addressing spills. The Booklet is a guidance document that summarizes emergency notification requirements including when to notify, who to notify, how to notify and what to include in the notification. (Anderson, Trevor et al. Cal OES Governor’s Office of Emergency Services. California Hazardous Materials Spill/Release Notification Guidance. February 2014.)

²⁹⁵ U.S. EPA. 2010. *MS4 Permit Improvement Guide*. April 2010. p. 33.

²⁹⁶ NPDES permit (IDS-027561) issued to Ada County Highway District, Boise State University, City of Boise, City of Garden City. Drainage District #3, and the Idaho Transportation Department District #3. Effective February 1, 2013. p. 24 - 25.

among the three permits by allowing the Permittees to adjust their program to be the most effective within their community while still meeting the federal requirement.

The Permittee must track all suspected sources of non-stormwater discharges, starting with sources suspected of being sanitary sewage. To streamline tracking requirements within the Regional MS4 Permit, tracking requirements have been added to Part VIII.1.8 of the Order. To meet the documentation and tracking requirements, the Permittees may use the outfall database inventory developed per the MRP, which contains information on non-stormwater discharge characterization at outfalls. Documenting and tracking of illicit discharges through the inventory help to ensure that all illicit discharges are investigated and addressed, and water quality is protected.

8. Annual Report Requirements

The reporting requirements in Attachment H (Annual Report Form) are based on federal requirements in 40 CFR section 122.42(c)(1), (4) and (6) and others as identified in the Monitoring and Reporting Program (Attachment E) and are necessary to ensure program requirements are implemented.

X. RATIONALE FOR WATERSHED MANAGEMENT PROGRAMS

The Watershed Management Program is a voluntary alternative compliance pathway that allows Permittees to implement permit requirements in an integrated manner on a watershed basis, including demonstrating compliance with numeric WQBELs by implementing BMPs.

A. Previous Permit Requirements

Watershed Management Program provisions were carried over from the 2012 Los Angeles County and the 2014 City of Long Beach MS4 permits to the Regional MS4 Permit. Furthermore, the Regional MS4 Permit incorporates requirements and recommendations in the State Board Order WQ 2020-0038. However, one notable change from these two permits is the elimination of the option to develop either a Watershed Management Program (WMP) or an Enhanced Watershed Management Program (EWMP). In the previous permits, Permittees developing WMPs and EWMPs were largely subject to the same requirements except in two respects: 1) Permittees developing a WMP were not required to maximize opportunities to capture the 85th percentile, 24-hour storm event but were required to conduct a Reasonable Assurance Analysis (RAA) for every waterbody-pollutant combination in the WMP, and 2) Permittees developing an EWMP were required to maximize opportunities to capture the 85th percentile, 24-hour storm event by implementing regional multi-benefit stormwater projects but were not required to conduct a RAA except in drainage areas where retention to the 85th percentile, 24-hour storm event was not feasible. The previous permits allowed Permittees to either develop a WMP or EWMP with the expectation that only Permittees that had geotechnical issues with capturing the runoff from the 85th percentile, 24-hour storm event would opt for a WMP. However, Permittees implementing both WMPs and EWMPs sought opportunities to capture the runoff from the 85th percentile, 24-hour storm events and Permittees implementing both WMPs and EWMPs faced geotechnical issues related to capturing the runoff from the 85th percentile, 24-hour storm event throughout the area covered by the WMP or EWMP. Therefore, in practice, there was little distinction between the WMPs and EWMPs. For this reason, the Regional MS4 Permit eliminates the distinction made between a WMP

and EWMP so that these programs are now all termed Watershed Management Programs.

The 2010 Ventura County MS4 Permit did not include WMPs as an alternative compliance pathway. Rather, the prior permit only included the separate compliance pathways for receiving water limitations in the receiving water limitation provisions and water quality based effluent limitations based on TMDL WLAs in the TMDL provisions. It did not provide the opportunity to comply with permit provisions in a watershed-based integrated manner through WMPs. Ventura County Permittees proposed inclusion of the Watershed Management Program for their next permit in their ROWD, stating that “[t]he Program supports the inclusion of a watershed management approach within the next Ventura County MS4 Permit, similar to the Watershed Management Programs (WMP) outlined in Part VI.C of the 2012 Los Angeles County NPDES Permit (LA Permit).”²⁹⁷ Therefore, this proposed approach was included for Ventura County Permittees in the Regional MS4 Permit.

B. General Rationale for All Watershed Management Programs

The WMPs are a voluntary alternative compliance pathway by which Permittees can meet the requirements in the Order, and are developed on a watershed or subwatershed basis. The purpose of the WMPs is to provide a framework for Permittees to implement the requirements of the Order in an integrated and collaborative fashion to address water quality priorities on a watershed scale, including complying with the requirements of Part V (Receiving Water Limitations), Part IV.B (Total Maximum Daily Load Provisions) and Attachments K through S, by customizing the control measures in Parts III.B (Prohibitions – Non-Stormwater Discharges) and Part VIII (Minimum Control Measures) of the Order. This watershed management paradigm is consistent with federal regulations that support the development of permit conditions, as well as the implementation of stormwater management programs, at a watershed scale (40 CFR §§ 122.26(a)(3)(ii), 122.26(a)(3)(v), and 122.26(d)(2)(iv)). U.S. EPA has issued a Watershed-Based NPDES Permitting Policy Statement (U.S. EPA, 2003) that defines watershed-based permitting as an approach that produces NPDES permits that are issued to point sources on a geographic or watershed basis. In this policy statement, U.S. EPA explains that, “[t]he utility of this tool relies heavily on a detailed, integrated, and inclusive watershed planning process.” U.S. EPA identifies a number of important benefits of watershed permitting, including more environmentally effective results; the ability to emphasize measuring the effectiveness of targeted actions on improvements in water quality; reduced cost of improving the quality of the nation’s waters; and more effective implementation of watershed plans, including TMDLs, among others.

Furthermore, the California Watershed Improvement Act of 2009 authorizes MS4 permittees statewide to develop and implement voluntary watershed improvement plans.²⁹⁸ State Water Board Order WQ 2015-0075, which upheld the 2012 Los Angeles County MS4 Permit with some modifications, clarifies that “[t]he California Watershed Improvement Act of 2009 grants authority to local government permittees regulated by an MS4 permit to develop and implement watershed improvement plans, but does not limit the authority of a regional water board to impose terms related to watershed management in an MS4 permit. Further, the terms of the Watershed Management Programs are largely consistent with the watershed improvement plans authorized by

²⁹⁷ Ventura Countywide Stormwater Quality Management Program. Report of Waste Discharge. January 2015.

²⁹⁸ Wat. Code, §§ 16100 to 16104.

the Act, so a permittee can comply with the Regional Permit while also using the authority provided by the California Watershed Improvement Act of 2009 if it so chooses.”²⁹⁹

Additionally, Public Law 115-436 Water Infrastructure Improvement Act approved on January 14, 2019 established section 402(s) of the Clean Water Act authorizing integrated plans that address both municipal wastewater and stormwater management as a potential compliance path that may be incorporated into an NPDES permit. Integrated planning is designed to help municipalities identify efficiencies in implementing requirements that arise from distinct permitting programs, particularly how best to make capital investments (Integrated Municipal Stormwater and Wastewater Planning Approach Framework, EPA, June 5, 2012). Under this law, an integrated plan can be used to implement any requirements relating to “a combined sewer overflow,” “a capacity, management, operation, and maintenance program for sanitary sewer collection systems,” “a municipal stormwater discharge,” “a municipal wastewater discharge,” and a “water quality-based effluent limitation to implement an applicable wasteload allocation in a total maximum daily load.” The integrated plan can include “a schedule of compliance, under which actions taken to meet any applicable water quality-based effluent limitation may be implemented” and “the implementation of projects, including innovative projects, to reclaim, recycle, or reuse water; and green infrastructure.” (33 USCA § 1342(s).) The integrated planning approach does not relax or change regulatory permitting standards, but rather recognizes existing flexibilities in the Clean Water Act to sequence and schedule compliance projects that may be relevant to multiple permitting programs. (*Id.* at subd. (s)(5).) While the watershed management programs authorized in the Order are not “integrated plans” as defined in section 402(s) of the Clean Water Act, these watershed level plans share many of the same underlying principles and advance the same goals that prompted the Los Angeles Water Board to adopt a watershed-based permitting approach for the Order. While all municipalities are encouraged to consider integrated planning approaches for their stormwater and wastewater management, municipalities participating in watershed management programs are particularly encouraged to use their watershed management programs as part of a larger integrated planning process where appropriate and useful.

Furthermore, SB 485 updated state law to expressly authorize the Sanitation Districts of Los Angeles County (LACSD) to use their facilities and expertise to help member agencies to meet MS4 permit requirements to specifically “divert, manage, treat, and discharge stormwater and dry weather runoff, as well as make beneficial use of the water.” (Health & Safety Code § 4730.68) Passage of this law will further facilitate innovative, watershed level approaches to stormwater management that are consistent with the watershed-based permitting approach in the Order.

The watershed-based permitting approach is supported by a number of state and nationwide studies regarding MS4 pollution (Little Hoover Commission, Clearer Structure, Cleaner Water: Improving Performance and Outcomes at the State Water Boards (January 22, 2009). In 2008, the National Research Council published a report stating: “The course of action most likely to check and reverse degradation of the nation’s aquatic resources would be to base all storm water and other wastewater discharge permits on watershed boundaries instead of political boundaries.” (National Research Council, Urban Stormwater Management in the U.S. (October 15, 2008)

²⁹⁹ State Water Board Order WQ 2015-0075, p. 8, footnote 30 (2015 AR, p. SB-AR-013203).

(emphasis in original).) The report acknowledged the challenges of such an approach would include “the inevitable limits of an urban municipality’s authority within a larger watershed”, but said the approach would be “essential” even though it would likely take years to implement.

As noted in subpart A above, the prior permits for Los Angeles County and the City of Long Beach included provisions related to the development and implementation of Watershed Management Programs as an alternative compliance pathway. However, the prior Ventura County Permit did not. The Order allows all Permittees, including those in Ventura County, to participate in WMPs as an alternative compliance pathway. There are many reasons supporting this approach, as set forth below.

First, a watershed-based structure for permit implementation is consistent with TMDLs for waterbodies in both Los Angeles and Ventura counties developed by the Los Angeles Water Board and U.S. EPA, which are established at a watershed or subwatershed scale. The majority of Los Angeles County Permittees have already been implementing approved Watershed Management Programs. Furthermore, Ventura County Permittees have already been collaborating on a watershed scale to develop and implement monitoring and implementation plans required by TMDLs.

Second, an emphasis on a watershed-based approach is appropriate and necessary at this stage in the region’s MS4 program to shift the focus of the Permittees from rote program development and implementation to more targeted, water quality driven planning and implementation. Addressing MS4 discharges on a watershed scale focuses on water quality results by emphasizing the receiving waters within the watershed. The conditions of the receiving waters drive management actions, which in turn focus on the measures to address pollutant contributions from MS4 discharges. The ultimate goal of the Watershed Management Programs is to ensure that MS4 discharges: (i) achieve applicable WQBELs that implement TMDLs, (ii) do not cause or contribute to exceedances of receiving water limitations, and (iii) for non-stormwater discharges from the MS4, are not a source of pollutants to receiving waters.

Third, after 30 years of program implementation, it is critical that the Permittees design and implement their permit requirements based on their improved knowledge of stormwater and urban runoff and its impacts on local receiving waters and by employing BMPs and other control measures that have been developed and refined over the past three decades. The Watershed Management Programs are driven by strategic planning and implementation, which will ultimately result in more cost-effective implementation. The Watershed Management Programs will provide permittees with the flexibility to prioritize and customize control measures to address the water quality issues specific to the watershed or subwatershed, consistent with federal regulations (40 CFR § 122.26(d)(2)(iv)).

Importantly, a focus on watershed implementation does not mean that the Permittees must expend funds unrelated to their MS4 discharges. Rather, the Permittees within each watershed are expected to collaborate to develop a watershed strategy to address the high priority water quality problems within each watershed. They have the option of implementing the strategy in the manner they find to be most effective at achieving the necessary water quality outcomes. Each Permittee can implement the strategy individually within its jurisdiction, or the Permittees can group together to implement the strategy throughout the watershed.

While the Order includes a new compliance pathway for addressing MS4 discharges on a watershed basis for Ventura County Permittees, the Order includes recognition of the

importance of continued program implementation on jurisdictional levels. The Order also acknowledges that jurisdictional and watershed efforts may be integrated to achieve water quality outcomes.

In the Order, the watershed management program provisions serve as the mechanism for this program integration. Since jurisdictional activities also serve watershed purposes, such activities can be integrated into the Permittees' Watershed Management Programs. Such opportunities for program integration inherently provide flexibility to the Permittees in implementing their programs. Program integration can be expanded or minimized as the Permittees see fit. Some Permittees may opt to continue jurisdiction-specific implementation for certain programs, while for other program areas more collaborative watershed scale implementation may be more effective. Permittees identify individual roles and responsibilities as part of the Watershed Management Program.

Permittees can customize the BMPs to be implemented, or required to be implemented, for new and re-development, construction, and existing development areas. Flexibility to determine which industrial or commercial sites are to be inspected is also provided to the Permittees. Educational approaches are also to be determined by the Permittees under the Order. Significant leeway is also provided to the Permittees in using methods to assess the effectiveness of their various runoff management programs. This flexibility is further extended to the monitoring program requirements, which allow the Permittees to develop monitoring approaches to several aspects of the monitoring program.

The challenge in drafting the Order was to provide the flexibility described above, while ensuring that the Order provides baseline requirements and is still enforceable. To achieve this, the Order prescribes baseline or default requirements, such as receiving water limitations, discharge prohibitions, TMDL provisions, and minimum control measures, while providing the Permittees with flexibility to propose customized actions as part of their watershed management program.

C. Schedule for Development or Revision of the Watershed Management Program

Timelines to submit a Watershed Management Program to the Los Angeles Water Board for approval are indicated in Part IX of the Order. To encourage community and stakeholder involvement in the development of the Watershed Management Programs, the Order requires that the draft Watershed Management Programs are made available for public review prior to approval by the Los Angeles Water Board or Executive Officer on behalf of the Los Angeles Water Board.

The deadlines for Ventura County Permittees to develop the WMP(s) considered various factors such as: the small number of Ventura County Permittees compared to Los Angeles County Permittees (12 compared to 87); the well-established collaboration among Ventura County Permittees through their Ventura Countywide Stormwater Quality Management Program; the significantly fewer applicable TMDLs (16 compared to 35); and their decade long experience implementing watershed based TMDL implementation plans to achieve the 2010 Ventura County MS4 Permit TMDL provisions including WQBELs. Therefore, the timeframe to submit the draft plan(s) is adequate and consistent with the WMP timeframe provided in the previous 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit.

The deadlines for Los Angeles County Permittees to submit a revised RAA and revised WMP were included in the Los Angeles 2012 MS4 Permit. These deadlines were established in State Water Board Order WQ 2015-0075. The State Board Order also

specified a date of June 30, 2021 for Los Angeles County Permittees under the 2012 Los Angeles County MS4 Permit to submit a revised RAA and revised WMP to the Los Angeles Water Board. Although the State Water Board Order did not amend the 2014 City of Long Beach MS4 Permit, the City of Long Beach was also subject to this deadline due to its participation in three WMPs under the 2012 Los Angeles County MS4 Permit (Lower Los Angeles River WMP, Lower San Gabriel River WMP, Los Cerritos Channel WMP). However, the Nearshore Watersheds WMP, which was developed pursuant to the 2014 City of Long Beach MS4 Permit, was not subject to the deadline in the State Water Board Order WQ 2015-0075. Nevertheless, the Order requires all Los Angeles County MS4 Permittees to update their WMPs to conform to the requirements of the Regional MS4 Permit Order (e.g. address new or revised TMDL deadlines) within 3 months of receipt of comments from the Los Angeles Water Board that revisions are necessary, or as otherwise directed by the Executive Officer.

D. Participation in Watershed Management Programs

1. Ventura County Permittees

Ventura County Permittees that elect to develop a Watershed Management Program or join an existing Watershed Management Program must submit a Notice of Intent (NOI) to the Los Angeles Water Board. During the development of the WMP, Ventura County Permittees are deemed in compliance with the receiving water limitations pursuant to Part V of the Order for the waterbody pollutant combinations that are identified in the NOI provided they continue to implement their existing stormwater management programs and comply with all other parts of the Order (e.g. discharge prohibitions, standard provisions, minimum control measures) as discussed in Part IX.F.4 of the Order.

Ventura County Permittees may request an extension of the deadlines for submission of the NOI, submission of a draft plan, and submission of a final plan. The extension is subject to approval by the Los Angeles Water Board or the Executive Officer. Ventura County Permittees that are granted an extension for any deadlines for development of the Watershed Management Program shall be subject to the baseline requirements in Part VIII of the Order and shall demonstrate compliance with all receiving water limitations pursuant to Part V of the Order until Ventura County Permittees have an approved Watershed Management Program in place. Likewise, Ventura County Permittees that do not opt to develop a Watershed Management Program are subject to the baseline stormwater management program requirements in the Order and must demonstrate compliance with applicable WQBELs and receiving water limitations through monitoring data collected from the Permittee's outfall(s) and/or receiving waters as described in Part VII of the Order.

2. Los Angeles County Permittees

Los Angeles County Permittees that were on baseline requirements of the 2012 Los Angeles County MS4 Permit may choose to join an existing Watershed Management Program but may not develop a new individual Watershed Management Program. The City of Long Beach under the 2014 City of Long Beach MS4 Permit can choose to join another existing Watershed Management Program. Los Angeles County Permittees that participated in a Watershed Management Program approved under the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit are presumed to be participating in the Watershed Management Program in this Order unless the Permittee notifies the Los Angeles

Water Board of its intent to discontinue its participation. Los Angeles County Permittees that do not elect to continue participation in a Watershed Management Program are subject to the baseline stormwater management program requirements in the Order and must demonstrate compliance with applicable WQBELs and receiving water limitations through monitoring data collected from the Permittee's outfall(s) and/or receiving waters as described in Part VII of the Order.

Los Angeles County Permittees that opt to continue implementing an approved Watershed Management Program were required to revise their RAA and submit a revised Watershed Management Program per the timelines indicated in the 2012 Los Angeles County MS4 Permit. No changes to this requirement have been proposed consistent with deadlines established pursuant to State Water Board Order WQ 2015-0075 and WQ 2020-0038. Until a revised Watershed Management Program is approved by the Los Angeles Water Board, Los Angeles County Permittees are required to continue implementing their existing Watershed Management Program. Also note that any WMP development related provisions added by the aforementioned State Water Board 2015 WQ Order to the 2012 Los Angeles County MS4 Permit, including a section in the Watershed Management Program provisions titled "Watershed Management Program Resubmittal Process" is now integrated in Part IX of the Regional MS4 Permit Order as applicable and appropriate in context of the Regional MS4 Permit.

E. Program Development

The goal of a Watershed Management Program is to facilitate cooperative implementation of strategies, control measures, and BMPs among Permittees and, potentially, other partners within a watershed or subwatershed to control discharges of pollutants from the MS4 to levels that achieve WQBELs and do not cause or contribute to exceedances of receiving water limitations, and which are also implement the MEP standard for stormwater discharges and the requirement to effectively prohibit non-storm discharges through the MS4 to receiving waters. Each Watershed Management Program must:

- Prioritize water quality issues resulting from stormwater and non-stormwater discharges through the MS4 to receiving waters within each Watershed Management Area,
- Identify and implement strategies, control measures, and BMPs to achieve applicable water quality-based effluent limitations and/or receiving water limitations, consistent with applicable compliance schedules in the Order,
- Execute an integrated monitoring and assessment program to determine progress towards achieving applicable limitations, and
- Modify strategies, control measures, and BMPs as necessary based on analysis of monitoring data collected pursuant to the MRP to ensure that applicable water quality-based effluent limitations and receiving water limitations and other milestones set forth in the Watershed Management Program will be achieved.

Watershed Management Programs must be developed using the Los Angeles Water Board's Watershed Management Areas (see Attachments B and C of the Order). Where appropriate, Watershed Management Areas may be separated into subwatersheds to focus water quality prioritization and implementation efforts by receiving water. Furthermore, Permittees have the flexibility to format their WMP as appropriate (e.g.,

Ventura County Permittees can submit one WMP with subchapters for each watershed; a group of Los Angeles County Permittees can submit one WMP that includes portions of two adjacent watersheds; Ventura and Los Angeles County Permittees can submit one WMP for a watershed that straddles the two counties).

Permittees must identify the water quality priorities within each Watershed Management Area that will be addressed by the Watershed Management Program consistent with 40 CFR section 122.26(d)(2)(iv) and Part IX of the Order. At a minimum, these priorities must include achieving some or all applicable water quality-based effluent limitations and/or receiving water limitations established pursuant to TMDLs and included in the Order.

The Watershed Management Program must include an evaluation of existing water quality conditions, including characterization of stormwater and non-stormwater discharges from the MS4 and receiving water quality, consistent with 40 CFR §§ 122.26(d)(1)(iv) and 122.26(d)(2)(iii), to support identification and prioritization/sequencing of management actions.

On the basis of the evaluation of existing water quality conditions, water body-pollutant combinations must be classified into one of the three categories listed in in Part IX.B.3 of the Order. If a Watershed Management Program does not identify a particular water body-pollutant combination, compliance with that water body-pollutant combination will not be covered under the Watershed Management Program and the Permittees have to demonstrate compliance with the baseline requirements (i.e., applicable receiving water limitations pursuant to Part V of the Order and with applicable interim and final water quality-based effluent limitations in Part IV and Attachments K-S of the Order for that water body-pollutant combination through monitoring collected from the Permittee's outfall(s) and/or receiving waters as described in Part VII of the Order).

Consistent with 40 CFR sections 122.26(d)(1)(iii) and 122.26(d)(2)(ii), Permittees must utilize existing information to identify known and suspected stormwater and non-stormwater pollutant sources in discharges to the MS4 and from the MS4 to receiving waters and any other stressors related to the highest water quality priorities (Categories 1 and 2). Based on the findings of the source assessment, the issues within each watershed must be prioritized and sequenced per the provisions in the Order.

Permittees must identify strategies, control measures, and BMPs to implement through their jurisdictional stormwater management programs, or collectively on a watershed scale, with the goal of creating an efficient program to focus individual and collective resources on watershed priorities, particularly achieving WQBELs and receiving water limitations addressed by the Watershed Management Program. The following provisions of the Order may be part of the watershed control measures within a Watershed Management Program:

- **Minimum Control Measures.** Permittees may assess the minimum control measures (MCMs) as defined in the Order to identify opportunities for focusing resources on the high priority issues in each watershed. For each of the 6 minimum control measures identified in the Order, Permittees may propose modifications that will achieve equivalent pollutant control given watershed priorities.
- **Non-Stormwater Discharge Measures.** Where Permittees identify non-stormwater discharges from the MS4 as a source of pollutants in the source assessment, the Watershed Control Measures must include strategies, control measures, and/or BMPs that will be implemented to effectively eliminate the source of pollutants.

These may include measures to prohibit the non-stormwater discharge to the MS4, additional BMPs to reduce pollutants in the non-stormwater discharge or conveyed by the non-stormwater discharge, or strategies to require the non-stormwater discharge to be separately regulated under a general NPDES permit. Note that the BMPs to comply with Part III.A (Prohibitions – Non-Stormwater Discharges) of the Order are customizable but the requirement to prohibit non-stormwater from being a source of pollutants is not customizable.

- **TMDL Control Measures.** Permittees must compile control measures that have been identified in TMDLs and corresponding implementation plans. If not sufficiently identified in previous documents, or if implementation plans have not yet been developed (e.g., EPA established TMDLs), the Permittees must evaluate and identify control measures to achieve water quality based effluent limitations and/or receiving water limitations established in the Order pursuant to these TMDLs.

As part of the Watershed Management Program, Permittees must conduct a Reasonable Assurance Analysis (RAA) that consists of an assessment (through quantitative analysis or modeling) to demonstrate that the activities and control measures (i.e., BMPs) identified in the Watershed Control Measures will achieve applicable water quality based effluent limitations and/or receiving water limitations with compliance deadlines during the permit term. The objective of the RAA shall be to demonstrate the ability of Watershed Management Programs to ensure that Permittees' MS4 discharges achieve applicable water quality-based effluent limitations and do not cause or contribute to exceedances of receiving water limitations.

Permittees must incorporate and, where necessary develop, interim requirements and compliance schedules into the plan consistent with 40 CFR section 122.47(a). Interim requirements and schedules shall be used to measure progress towards addressing the highest water quality priorities and achieving applicable water quality-based effluent limitations and/or receiving water limitations. Where the TMDL provisions do not include interim or final water quality based effluent limitations and/or receiving water limitations with compliance deadlines during the permit term, Permittees must identify interim requirements and compliance schedules to ensure significant progress toward achieving interim and final water quality based effluent limitations and/or receiving water limitations with deadlines beyond the permit term (40 CFR § 122.47(a)(3)).

Schedules must be developed for both the strategies, control measures and BMPs to be implemented by each individual Permittee within its jurisdiction and for those that will be implemented by multiple Permittees on a watershed scale. Schedules must be adequate for measuring progress throughout the permit term and incorporate deadlines as specified in Part IX.B.9 of the Order.

Where compliance schedules are not available (e.g., final TMDL deadlines), Permittees may request a Time Schedule Order as discussed in Part XI.E of this Fact Sheet. Permittees may propose a schedule in the Watershed Management Program that is longer than the compliance schedule set forth by the TMDL if a TSO has been approved by the Los Angeles Water Board for a waterbody pollutant combination in that TMDL.

F. Watershed Management Program Implementation

Each Permittee must implement the Watershed Management Program immediately after determination by the Los Angeles Water Board that the Watershed Management Program meets the requirements of the Order and is approved.

Permittees may request an extension of deadlines for achievement of interim milestones and final compliance deadlines established pursuant to Part IX.C.3 of the Order, only with the exception of those final compliance deadlines established in a TMDL program of implementation adopted through the state's basin plan amendment process. Permittees shall provide requests in writing sufficiently in advance of the deadline to allow the Los Angeles Water Board to evaluate the request and shall include in the request the justification for the extension. Extensions must be affirmatively approved by the Los Angeles Water Board.

G. Integrated Watershed Monitoring and Assessment

Clean Water Act section 402(a)(2) among other statutory and regulatory provisions as identified in the MRP (Attachment E) requires the permitting authority to prescribe conditions for MS4 permits to ensure compliance, including conditions on data and information collection, reporting, and such other requirements as appropriate. Consistent with this requirement, Permittees in each Watershed Management Area must develop an integrated monitoring program to assess the progress toward achieving the water quality based effluent limitations and/or receiving water limitations per the compliance schedules, and the progress toward addressing the highest water quality priorities for each Watershed Management Area. The integrated watershed monitoring and assessment program shall contain the basic elements (receiving water monitoring, stormwater outfall monitoring, non-stormwater outfall monitoring), and achieve the objectives of, the Monitoring and Reporting Program (MRP) (Attachment E of the Order).

Note that unlike the WMP which is voluntary, the development of an integrated monitoring program pursuant to the MRP is a requirement for all Permittees regardless of participation in a WMP. Therefore, participants in an integrated monitoring program do not have to match the participants in a Watershed Management Program. For example, if a Permittee indicates in their WMP NOI that they are leaving a Watershed Management Program, this does not automatically apply to the corresponding integrated monitoring program. The Permittee shall continue to be part of the existing integrated monitoring program unless the Permittee specifically provides the Los Angeles Water Board written notification. In such a case, Part III.D.1.d of the MRP applies.

H. Adaptive Management Process

Permittees in each Watershed Management Program must implement an adaptive management process, which is a periodic, comprehensive program evaluation, including re-analysis of data and/or modeling, and modification process to determine progress toward achieving WQBELs and receiving water limitations and to adapt the Watershed Management Program to become more effective at achieving WQBELs and receiving water limitations. Permittees shall submit the results in conjunction with their ROWD. In implementing the adaptive management process, Permittees shall consider the elements specified in Part IX.E of the Order. Note that in the 2012 Los Angeles County Permit and the 2014 City of Long Beach MS4 Permit, the adaptive management process was required to be implemented every 2 years and the results were submitted in conjunction with the Annual Report and the ROWD. Many Permittees in their ROWDs requested to decrease the adaptive management results submittal frequency. This is a reasonable request because requiring Permittees to implement the adaptive management process every 2 years is unnecessary given the multi-year nature of many projects and programs where the design, construction, and implementation often span

more than 2 years. Furthermore, Permittees are already reporting their progress on an annual basis through their Annual Reports and may propose modifications to their Watershed Management Programs at any point in response to this annual evaluation. Therefore, the Order requires Permittees to submit adaptive management results in conjunction with the ROWD (180 days prior to the Order expiration date) with the expectation that Permittees are implementing their adaptive management process throughout the implementation of their Watershed Management Program when necessary.

Permittees are required to report on the adaptive management process results per Part IX.E.4 of the Order. Based on the results of the adaptive management process, Permittees may propose any modifications necessary to improve the effectiveness of the Watershed Management Program as a separate submittal to the Los Angeles Water Board as necessary. Permittees must implement any modifications to the Watershed Management Program upon approval by the Los Angeles Water Board.

XI. RATIONALE FOR COMPLIANCE DETERMINATION PROVISIONS

The Order adds Part X, Compliance Determination for WQBELs and receiving water limitations. In the previous permits, there was no single compliance determination section. Rather, the previous permits included individual compliance determination provisions within many different sections and Permittees were required to read them all together to determine how their compliance would be determined.³⁰⁰ For better organization and for ease of determining compliance, the Order consolidates many of these provisions where appropriate, particularly those related to WQBELs and receiving water limitations, into one section to reduce redundancies and improve clarity.

Provisions specifying that compliance with the Watershed Management Program provisions in Part IX of the Order may constitute compliance with the receiving water limitation provisions in Part V of the Order were previously included in the 2012 Los Angeles County Permit and the 2014 Long Beach Permit. They were not previously included in the 2010 Ventura County Permit. In the Order, the Los Angeles Water Board continues to offer multiple paths to compliance with receiving water limitations. The number of TMDLs, and myriad water quality issues that the TMDLs address, is unprecedented anywhere else in California. The Los Angeles Water Board worked closely with U.S. EPA in implementing the requirements of the 1999 consent decree between U.S. EPA and several environmental groups when developing these TMDLs. As shown in Table F-24, the TMDLs implemented in the Order cover every coastal watershed in the Los Angeles Region. Most of these TMDLs were initially incorporated in the prior MS4 permits (Order No. R4-2010-0108, Order No. R4-2012-0175, and Order No. R4-2014-0024). The extensive and enforceable TMDL implementation programs, coupled with Permittee commitments to implement watershed solutions to address all impairments in regional waters, allowed this Board to incorporate alternative compliance mechanisms contingent upon implementation of approved Watershed Management Programs. This unique compliance mechanism provided an incentive and robust framework for Permittees in the 2012 Los Angeles County MS4 Permit and the 2014 Long Beach MS4 Permit to craft comprehensive pathways to achieve compliance with receiving water limitations – both those addressed by TMDLs and those not addressed by TMDLs. In the Order, the Los Angeles Water Board extends this approach to Ventura County Permittees that choose to take advantage of this compliance alternative.

³⁰⁰ For example, the 2012 Los Angeles County Permit included compliance related provisions in the following sections among others: interim and final WQBELs, Watershed Management Programs, Time Schedule Orders, and Monitoring and Reporting Program Requirements.

The Compliance Determination provisions in Part X of the Order are organized as follows. The first section addresses some general provisions related to compliance determination. The second section addresses WQBELs and receiving water limitations for pollutants other than trash. The third section addresses a WQBELs and receiving water limitations for trash. The fourth section addresses commingled discharges. The last section addresses Time Schedule Orders. Each of these sections are discussed in turn below.

A. General Compliance Provisions

Consistent with State precedent, compliance with water quality standards is and remains the ultimate goal of the Order.³⁰¹ To that end, the Order requires compliance with WQBELs and receiving water limitations. Pursuant to section 13360 of the Water Code, the Water Board may not dictate the manner of compliance. Permittees may comply with the WQBELs and receiving water limitations in the Order in any lawful manner. Part X.A.1 of the Order describes where compliance will be determined for these limitations. Part X.A.2 of the Order restates longstanding precedent that the so-called “iterative process” (as Part V.C of the Order is often referred to as) does not constitute compliance with receiving water limitations in Part V.A and V.B of the Order. This issue is discussed in greater detail in Part VII of this Fact Sheet.

B. WQBELs and Receiving Water Limitations for Pollutants Other Than Trash

As described in Parts V.B (WQBELs), VI (Rationale for TMDL Provisions), and VII (Rationale for Receiving Water Limitations) of this Fact Sheet, the Order incorporates WQBELs and receiving water limitations to ensure MS4 discharges do not cause or contribute to exceedances of water quality standards.

1. Compliance Paths

The Los Angeles Water Board is in a unique position to be able to offer multiple paths to compliance with WQBELs and receiving water limitations in the Order. Alternative compliance options, however, differ depending on whether the limitation is considered an “interim limitation” or “final limitation”.

For waterbody pollutant combinations addressed by TMDL, the compliance path is as follows. The Order includes requirements in Part IV to implement WLAs assigned to MS4 discharges from 45 TMDLs. The TMDL provisions in Part IV.B and Attachments K-S of the Order include WQBELs and/or receiving water limitations based on the applicable WLAs. TMDLs adopted through the State’s basin planning process are required to include programs of implementation pursuant to California Water Code section 13242, including implementation schedules, for attaining water quality standards. TMDLs adopted by U.S. EPA do not include implementation schedules; however, in some instances the Los Angeles Water Board has adopted an implementation schedule through the State’s basin planning process (see Part VI.F of this Fact Sheet).

The TMDL provisions in Part IV and Attachments K-S of the Order incorporate compliance schedules consistent with the associated TMDL implementation schedule to achieve the final WQBELs and/or receiving water limitations for the pollutants addressed by the TMDL. For EPA established TMDLs where there is no state program of implementation, Permittees must comply with the WQBELs as of the effective date of the Order in the following circumstances: 1) if the WLAs assigned to MS4 discharges was based on existing pollutant loads at the time the

³⁰¹ Order WQ 2015-0075, p. 14.

TMDL was established, meaning that no reduction in pollutant load was required or 2) Permittees are already in compliance with the WQBEL. (For additional information on the implementation of EPA established TMDLs in the Order see the discussion in Part VI.F of this Fact Sheet.) For all TMDLs with implementation schedules established in a state program of implementation, Permittees may comply with these provisions directly or through a Watershed Management Program as described in subparts 2 and 3 below. Compliance with TMDL implementation schedules may also be used as an alternative means to demonstrate compliance with the receiving water limitations in Part V of the Order for the waterbody-pollutant combination addressed by the TMDL as described in subpart 2 below.

For waterbody pollutant combinations not addressed by TMDL, Permittees are subject to the receiving water limitations in Part V of the Order. Permittees may comply with these provisions directly or through a Watershed Management Program as described below.

2. Alternative Demonstrations of Compliance with Certain Receiving Water Limitations Using a TMDL Implementation Schedule

The Los Angeles Water Board recognizes that, in the case of impaired waters subject to a TMDL, the permit's receiving water limitations for the pollutants addressed by the TMDL may be exceeded during the period of TMDL implementation. Therefore, the Order provides, in Part X.B.1.a, that a Permittee in full compliance with the applicable TMDL requirements in the Order, including the compliance schedules, shall be deemed in compliance with the receiving water limitations provisions in Part V of the Order for the particular pollutant-waterbody combination addressed by the TMDL. Permittees may take advantage of this compliance path without implementing a Watershed Management Program.

3. Alternative Demonstrations of Compliance Using A Watershed Management Program

The provisions in Part IX of the Order to allow Permittees to develop a Watershed Management Program to address certain TMDL provisions in Part IV.B and Attachments K-S of the Order as well as the receiving water limitations in Part V of the Order using watershed, regional, and jurisdictional strategies. Watershed Management Programs are discussed in greater detail in Part X of this Fact Sheet. As discussed in Part VI.F of this Fact Sheet, Watershed Management Programs may not be used to address Trash or pollutants addressed by a U.S. EPA TMDL that does not require a load reduction. For each of the drainage areas covered by a Watershed Management Program, the Watershed Management Program must either demonstrate that strategies, control measures, and BMPs cumulatively retain the runoff volume of the 85th percentile, 24-hour storm event for the drainage area tributary to the applicable receiving water, or for areas not addressed as aforementioned, shall include a Reasonable Assurance Analysis (RAA) to demonstrate that applicable WQBELs and receiving water limitations shall be achieved through implementation of other watershed control measures. The RAA must be quantitative and performed using a peer-reviewed model in the public domain. For WQBELs and receiving water limitations associated with a TMDL, the objective of the RAA is to demonstrate that the selected water quality control measures will achieve the applicable TMDL provisions. In the case of WQBELs and receiving water limitations not addressed by a TMDL implementation plan

(either because there is no TMDL or because its U.S. EPA TMDL without a state adopted program of implementation), the objective of the RAA is to demonstrate the ability of the selected water quality control measures in the Watershed Management Program to ensure that Permittees' MS4 discharges do not cause or contribute to exceedances of applicable WQBELs and receiving water limitations.

A Permittee opting to use a Watershed Management Program to comply with WQBELs and receiving water limitations in Part IV.B and Attachments K-S of the Order and/or the receiving water limitations Part V of the Order demonstrates compliance by implementing the applicable actions and schedules in its approved Watershed Management Program for a waterbody-pollutant combination. For waterbody-pollutant combinations addressed by a TMDL, any schedule in the Watershed Management Program must be consistent with any applicable compliance schedule in the permit, which is based on the TMDL implementation schedule, unless a TSO has been approved by the Los Angeles Water Board for a waterbody-pollutant combination in that TMDL. For pollutants not addressed by a TMDL, or where there is no TMDL implementation schedule, Permittees may incorporate control measures to address the exceedance provided that the Watershed Management Program incorporates a final date for achieving the applicable WQBEL and/or receiving water limitation.

Given the significant time and effort required to develop and implement a Watershed Management Program, the Order allows Permittees to be deemed in compliance with WQBEL(s) and/or receiving water limitation(s), irrespective of actual attainment of the applicable limitation. Permittees are only deemed in compliance with these limitations up until the final deadline for the achievement of the relevant WQBEL(s) and/or receiving water limitation(s) in the Watershed Management Program. Permittees may not be deemed in compliance with TMDL deadlines that have passed, unless a TSO has been approved by the Los Angeles Water Board for a waterbody-pollutant combination in that TMDL, or unless they have chosen to comply with TMDL-based requirements by retaining all non-stormwater runoff and the volume of stormwater runoff from the 85th percentile 24-hour storm and the Permittee is continuing to engage in monitoring and adaptive management through an approved Watershed Management Program.

A Permittee that fails to meet any requirement or date for its achievement related to implementation of an approved Watershed Management must directly comply with the provisions of Part IV.B, Part V, and Attachments K-S of the Order for the waterbody-pollutant combination(s) that should have been addressed by that requirement unless the Permittee requests and receives an extension through a modification of its Watershed Management Program or a Time Schedule Order as discussed below in Part XI.E. The Los Angeles Water Board understands that the implementation of the actions, milestones, and schedules in a Watershed Management Program may depend on a host of factors (e.g. funding, staff resources, etc.). As such, the Order adds provisions authorizing minor deviations from the actions, milestones, and schedules in an approved WMP provided certain conditions are met.

4. Direct Demonstrations of Compliance

Direct compliance with WQBELs and/or receiving water limitations is determined by verification through monitoring that the TMDL provisions in Part IV.B and Attachments K-S of the Order and/or the receiving water limitation provisions in

Parts V.A and B have been achieved. The Order provides Permittees with several means of demonstrating direct compliance with applicable WQBELs and receiving water limitations. In general, compliance is established by either showing that the discharge or the receiving water is in compliance with the applicable limit for a specific waterbody-pollutant combination or that there was no discharge from a Permittee's MS4 outfall(s) during the relevant time period. Additionally, in some instances compliance with receiving water limitations and/or WQBELs may be excused when the exceedance is the result of an authorized non-stormwater discharge identified in Part III.A.2 of the Order.

C. WQBELs and Receiving Water Limitations for Trash

For trash, a Permittee may demonstrate compliance with an applicable TMDL through one of any lawful means. Compliance options typically fall into one of four compliance options: Full Capture (Part IV.B.3.b.i of the Order), Mass Balance (Part IV.B.3.b.ii of the Order), Scientifically Based Alternative (Part IV.B.3.b.iii of the Order), or Minimum Frequency of Assessment and Collection (Part IV.B.3.b.iv of the Order). These provisions are discussed in further detail in Part VI.E of this Fact Sheet. For areas not subject to a TMDL and that are not addressed through a WMP, a Permittee may use compliance with the discharge prohibition as evidence of compliance with the receiving water limitations in Part V of the Order in priority land use areas, equivalent alternate land uses and designated land uses only.

D. Commingled Discharges

Due to the inherently complex and interconnected nature of MS4s, this permit assigns joint responsibility to Permittees to meet the requirements of the Order. "Joint responsibility" means that the Permittees that have commingled MS4 discharges are responsible for implementing programs in their respective jurisdictions, or within the MS4 for which they are an owner or operator, to meet the WQBELs and/or receiving water limitations assigned to such commingled MS4 discharges.

In these cases, federal regulations state that co-permittees need only comply with permit conditions relating to discharges from the MS4 for which they are owners or operators. (40 CFR § 122.26(a)(3)(vi).) Individual Permittees are only responsible for their contributions to the commingled discharge. The Order does not require a Permittee to individually ensure that a commingled MS4 discharge meets the applicable WQBELs included in the Order unless such Permittee is shown to be solely responsible for the exceedances.

Part X.D of the Order includes provisions identifying how Permittees with commingled discharges may clarify and distinguish their individual contributions and demonstrate that its MS4 discharge did not cause or contribute to an exceedance of an applicable WQBEL and/or receiving water limitation. If such a demonstration is made, though the Permittee's discharge may commingle with that of other Permittees, the Permittee would not be held jointly responsible for the exceedance of the applicable limitation. Individual Permittees who demonstrate compliance with the applicable at the limitations will not be held responsible for violations by non-compliant Permittees.

Given the interconnected nature of most Permittees' MS4s, Permittees are required to work cooperatively to control the contribution of pollutants from one portion of the MS4 to another portion of the system through inter-agency agreements or other formal arrangements as set forth in 40 CFR section 122.26(d)(2)(i)(D).

E. Time Schedule Orders

This section generally discusses under what circumstances a Time Schedule Order (TSO) may be requested. Under Water Code 13300, a Permittee may submit for the Los Angeles Water Board's consideration a time schedule setting forth the actions it will take to address an actual or threatened discharge of waste in violation of permit requirements. If the discharge of waste implicates a violation subject to the mandatory minimum penalty provisions in Water Code section 13385(h) or (i), a TSO issued pursuant to 13385(j)(3) may be considered. TSOs issued pursuant to Water Code sections 13300 and/or 13385(j)(3) do not provide protection from potential citizen suits. In the Order, TSOs will typically be considered where a Permittee determines that its MS4 discharge may not meet WQBELs and/or receiving water limitations in Part IV.B and Attachments K through S and Part V of the Order for which (1) final TMDL compliance deadlines have passed as listed in Table F-26, or (2) no compliance schedule has been provided in the Order. Nothing in this section prevents the Los Angeles Water Board from issuing a TSO pursuant to Water Code section 13300, when appropriate. During the term of the 2012 Los Angeles County MS4 Permit, the Los Angeles Water Board issued three TSOs for various Permittees to comply with bacteria requirements.³⁰²

Permittees may individually request a TSO or may jointly request a TSO with all Permittees subject to the WQBELs and/or receiving water limitations. Requests must be made far enough in advance to allow for evaluation of the request, submittal of additional information if necessary, drafting, public comment, and issuance by the Los Angeles Water Board, which may require a publicly noticed meeting. To ensure that enough information is provided to the Los Angeles Water Board to evaluate the request and, if appropriate, draft a TSO, Part X.E.5 of the Order specifies the information that must be included in the request.

Permittees are not guaranteed to receive a TSO or a WMP modification and Permittees should not rely on the certainty of a deadline extension. Permittees are strongly encouraged to implement control measures that will in fact get them into compliance with applicable deadlines.

The Los Angeles Water Board does not intend to take enforcement action against a Permittee for violations of specific WQBELs and/or receiving water limitations if a Permittee is fully complying with the requirements of a TSO to resolve exceedances of the WQBELs and/or receiving water limitations for the specific pollutant(s) in the MS4 discharge.

XII. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

The Monitoring and Reporting Program (MRP) (Attachment E of the Order) establishes monitoring, reporting, and recordkeeping requirements that implement the federal and state laws and/or regulations. Monitoring, and reporting of the monitoring results as well as other information on implementation of permit requirements are critical components of the Order. Monitoring is performed to determine compliance with the Order, identify sources of pollutants in MS4 discharges, assess and improve the effectiveness of BMPs and other pollutant control measures, and characterize pollutant loading in MS4 discharges and receiving water. "Without clear monitoring objectives and a detailed monitoring plan, it will

³⁰² TSO No. R4-2014-023 (later amended in TSO No. R4-2014-023-A01), TSO No. R4-2014-0142, and TSO No. R4-2015-0108.

be difficult for permittees and permitting authorities to evaluate the effectiveness of the municipal stormwater program.”³⁰³

The following provides the legal, factual, technical, and policy rationales for the monitoring and reporting requirements contained in the Order and MRP.

The structure of the MRP follows the 2012 Los Angeles County and the 2014 City of Long Beach MS4 Permits. For the most part, the substantive requirements from all three previous permits have been carried over to the MRP, and any significant changes are discussed below. Requirements in the MRP apply to all Permittees unless otherwise specified.

A. Legal Authorities Supporting Monitoring and Reporting

1. Authorities Supporting Monitoring and Reporting Generally

Sections 308(a) and 402(a)(2) of the federal Clean Water Act³⁰⁴, and 40 CFR sections 122.41(h), (j)-(l), 122.44(i), and 122.48 require that all NPDES permits specify monitoring and reporting requirements and establish substantive monitoring and reporting requirements for NPDES permits. Federal regulations applicable to large and medium MS4s also specify additional monitoring and reporting requirements. (40 CFR §§ 122.26(d)(2)(i)(F) & (d)(2)(iii)(D), 122.42(c).) California Water Code section 13383 further authorizes the Los Angeles Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements.³⁰⁵

The regulations specific to monitoring and reporting requirements for MS4 discharges are prescriptive and require the permitting agency to include requirements for both stormwater and non-stormwater effluent sampling at representative outfalls, representative receiving water monitoring, sampling of specific pollutants, monitoring at specified intervals (e.g., at least three storm events per year), use of analytical methods specified in 40 CFR Part 136, use of field collection methods (e.g., grab vs. composite samples), among other requirements.³⁰⁶

As the Ninth Circuit Court of Appeal stated in a case concerning the 2001 Los Angeles County MS4 Permit (Order No. 01-182): “First and foremost, the Clean Water Act *requires* every NPDES permittee to monitor its discharges into the navigable waters of the United States in a manner sufficient to determine whether

³⁰³ U.S. EPA, *MS4 Permit Improvement Guide*, p. 97 (April 2010, EPA 833-R-10-001); NPDES Permit Writers’ Manual (2010) at p. 8-2, section 8.1.1.

³⁰⁴ CWA § 308(a) mandates, in part, that “the Administrator shall require the owner or operator of any point source to (i) establish and maintain such records, (ii) make such reports, (iii) install, use, and maintain such monitoring equipment or methods (including where appropriate, biological monitoring methods), (iv) sample such effluents (in accordance with such methods, at such locations, at such intervals, and in such manner as the Administrator shall prescribe), and (v) provide such other information as he may reasonably require...” CWA § 402(a)(2) mandates that “[t]he Administrator shall prescribe conditions for such permits to assure compliance with the requirements of paragraph (1) of this subsection, including conditions on data and information collection, reporting, and such other requirements as he deems appropriate.”

³⁰⁵ See, In the Matter of the Petitions of The City of Oceanside, Fallbrook Public Utilities District, and the Southern California Alliance of Publicly Owned Treatment Works, For Review of WDR Order Nos. R9-2019-0166 [NPDES No. CA0107433] and R9-2019-0169 [NPDES No. CA0108031] (“Fallbrook”), State Water Board Order WQ 2021-0005, at p. 12-13, n. 31 (the plain language of section 13383 provides the Water Boards with authority to establish monitoring and reporting requirements for MS4 discharges).

³⁰⁶ 40 CFR § 122.26(d)(2).

it is in compliance with the relevant NPDES permit....That is, an NPDES permit is unlawful if a permittee is not required to effectively monitor its permit compliance.”³⁰⁷ The Court also stated:

But while otherwise more flexible than the traditional NPDES permitting system, nothing in the MS4 permitting scheme relieves permittees of the obligation to monitor their compliance with their NPDES permit in some fashion...Rather, EPA regulations make clear that while ms4 NPDES permits need not require monitoring of each stormwater source at the precise point of discharge, they may instead establish a monitoring scheme “sufficient to yield data which are *representative of the monitored activity*...”³⁰⁸

The federal authority described herein mandates that the Los Angeles Water Board impose a monitoring and reporting program on MS4 permittees that is sufficient to determine compliance with permit terms, as with all NPDES permittees.

In part, federal regulation requires MS4 Permittees, specifically, to “[c]arry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer,” including a “monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations) ...”³⁰⁹ The Regional MS4 Permit MRP requirements, including the receiving water monitoring during wet and dry weather and stormwater and non-stormwater outfall-based monitoring, are necessary to meet these federal requirements. Further, because the Los Angeles Region is characterized by two distinct periods, wet weather and dry weather, the frequency of monitoring required by the MRP, generally three wet weather events and two dry weather events per year, is necessary to meet federal requirements for representative data collection. The MRP provides definitions to guide data collection during wet weather conditions to ensure it is representative.

Additionally, federal regulations require that a program to detect and remove illicit discharges includes “on-going field screening activities during the life of the permit” and “procedures to be followed to investigate portions of the separate storm sewer system that ... based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges ... (such procedures may include: sampling procedures ...)...”³¹⁰ Therefore, the MRP provisions that pertain to non-stormwater screening and outfall monitoring requirements, are necessary to meet this federal requirement.

2. Monitoring Is Necessary to Assess BMP Effectiveness

Assessment of BMP implementation and effectiveness is specifically required by federal regulations at 40 CFR sections 122.26(d)(2)(v) and 122.42(c)(3).³¹¹ Specifically, section 122.26(d)(2)(v) requires an assessment of controls [BMPs]

³⁰⁷ *Natural Resources Defense Council v. County of Los Angeles* (9th Cir. 2013) 725 F.3d 1194, 1207, cert. den. (citing CWA § 402(a)(2) and 40 CFR §§ 122.44(i)(1) and 122.26(d)(2)(i)(F) (emphasis in original).)

³⁰⁸ *Id.*, at p. 1209 (citations omitted; emphasis in original) (citing CWA § 402(a)(2) and 40 CFR §§ 122.41(i)(1) and 122.48(b).)

³⁰⁹ 40 CFR § 122.26, subds. (d)(2)(i)(F) and (d)(2)(iii)(D).

³¹⁰ *Id.*, subd. (d)(2)(iv)(B)(2)-(3).

³¹¹ 40 CFR § 122.42(c) are the *additional* reporting requirements for MS4 permittees. MS4 permittees are also subject to all reporting requirements that apply to NPDES permittees generally.

proposed to be implemented as a result of the Permittees' stormwater quality management programs, while section 122.42(c)(3) requires that Permittees revise the assessment of their stormwater quality management program as necessary in each annual report based on actual program implementation outcomes (e.g., water quality monitoring data, reduction in non-stormwater discharges, changes in public behavior, BMP effectiveness data).³¹² Furthermore, 40 CFR section 122.41(h), which applies to all NPDES permits, including MS4 permits, requires that the permittee furnish to the permitting agency any information that it requests to determine compliance with the permit.

Additionally, a 2008 U.S. EPA publication, "Evaluating the Effectiveness of Municipal Stormwater Programs," states that "EPA stormwater regulations require that the effectiveness of the SWMP [Storm Water Management Program] be evaluated, including assessment of SWMP implementation, evaluation of BMP effectiveness, and the extent to which improvements in storm water outfall discharge quality have occurred."³¹³

Monitoring and reporting requirements to evaluate BMP effectiveness are included in U.S. EPA issued MS4 Permits issued to the District of Columbia³¹⁴, Middle Rio Grande,³¹⁵ and Boise/Garden City.³¹⁶ Inclusion of similar provisions in U.S. EPA-issued permits further supports the Los Angeles Water Board's determination that federal law requires the inclusion of monitoring and reporting requirements in the permit to evaluate BMP effectiveness.

Federal regulations direct tracking and reporting of "[t]he status of implementing the components of the storm water management program that are established as permit conditions;" "[a] summary of data, including monitoring data, that is accumulated throughout the reporting year;" and "[a] summary describing the number and nature of enforcement actions, inspections, and public education programs," among others.³¹⁷

Further, U.S. EPA's *MS4 Permit Improvement Guide* states:

An important part of any municipal storm water program is to document and track information on activities the permittee undertakes to comply with the Permit Requirements ... In addition, adequate tracking is necessary to generate and provide reports of program progress not only to the permitting authority, but to a permittee's internal management for planning and funding

³¹² Note also that 40 CFR § 122.34(d)(1) dictates that permits "must require the permittee to evaluate compliance with the terms and conditions of the permit, including the effectiveness of the components of its storm water management program, and the status of achieving the measurable requirements in the permit."

³¹³ U.S. EPA, *Evaluating the Effectiveness of Municipal Stormwater Programs*.

³¹⁴ See U.S. EPA, NPDES Permit No. DC0000221, *Authorization to Discharge Under the National Pollutant Discharge Elimination System, Municipal Separate Storm Sewer System Permit*, issued to the District of Columbia (Oct. 7, 2011), Part 6.2.1, pp. 39-40.

³¹⁵ See U.S. EPA, NPDES Permit No. NMR04A000, *Authorization to Discharge Under the National Pollutant Discharge Elimination System, Municipal Separate Storm Sewer System Permit*, issued to the Middle Rio Grande Watershed (Dec. 22, 2014), Parts III.A and III.B.3, pp. 1, 7 of Part III.

³¹⁶ See U.S. EPA, NPDES Permit No. IDS-027561, *Authorization to Discharge Under the National Pollutant Discharge Elimination System, Municipal Separate Storm Sewer System Permit*, issued to Ada County Highway District, Boise State University, City of Boise, City of Garden City, Drainage District #3, and the Idaho Transportation Department District #3 (Dec. 12, 2012), Part IV.C.3.c(ii)-(iii), p. 47.

³¹⁷ 40 CFR § 122.42(c)(1), (c)(4), and (c)(6).

purposes ... To assist the permittee in ensuring appropriate data is gathered and analyzed, the permitting authority should be very clear regarding annual reporting requirements.³¹⁸

U.S. EPA's guide also suggests the following model MS4 permit provision, "Within the first [insert time frame which corresponds to the development of the monitoring program e.g. first two years of permit], the permittee must develop a tracking system to track the information required in the permit as well as the information required to be reported in the annual report."³¹⁹

3. Federal Requirements for Non-Stormwater Outfall-Based Screening and Monitoring

Phase I (see 40 CFR 122.26 (d)(1)(v)(B) and (d)(1)(iv)(B)) and Phase II stormwater management programs (see 40 CFR 122.26(d)(2)(iv)(B)) are required to address illicit discharges into the MS4. An illicit discharge is defined as any discharge to a municipal separate storm sewer system that is not composed entirely of storm water, except allowable discharges pursuant to an NPDES permit (40 CFR 122.26(b)(2)). In addition to requiring permittee to have the legal authority to prohibit non-stormwater discharges from entering storm sewers (CWA Section 402(p)(3)(B)(ii)), MS4 permits must also require the development of a comprehensive, proactive Illicit Discharge Detection Elimination (IDDE) program."³²⁰

The Los Angeles Water Board has incorporated the Non-Stormwater Outfall-Based Screening and Monitoring Program and crossover requirements of the Illicit Discharge Detection and Elimination Program into the Regional MS4 Permit per the following federal requirements:

Clean Water Act section 402(p)(3)(B)(ii) states that permits "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers;..."

40 CFR section 122.26(d)(2)(i)(F) requires the applicant for a Phase I MS4 permit demonstrate they have legal authority to "carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer."

40 CFR section 122.26(d)(2)(iv)(B)(2) requires a program to detect and remove illicit discharges and improper disposal that includes "(2) A description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens;..."

40 CFR section 122.41(j)(1) states "samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity."

40 CFR section 122.42(c) requires the owner or operator of an MS4 to submit an annual report that includes in part "(1) The status of implementing the components of the storm water management program that are established as

³¹⁸ U.S. EPA, *MS4 Permit Improvement Guide*, Chapter 8, p. 96.

³¹⁹ *Id.*, at p. 95.

³²⁰ U.S. EPA. 2010. *MS4 Permit Improvement Guide*. Office of Water, Office of Wastewater Management, Water Permits Division. April. 2010. P. 24, Ch. 3.

permit conditions; (2) Proposed changes to the storm water management programs that are established as permit condition. Such proposed changes shall be consistent with §122.26(d)(2)(iii) of this part...”, “(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year...”, and “(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs...”

40 CFR section 122.48(b), requires that all permits shall specify “[r]equired monitoring including type, intervals, and frequency sufficient to yield data which are representative of the monitored activity including, when appropriate, continuous monitoring;...”

B. General Monitoring Provisions

As explained in Attachment D at Part III, all monitoring, sampling, sample preservation, and analyses must be conducted according to sufficiently sensitive test procedures approved under 40 CFR Part 136 for the analysis of pollutants, unless another test procedure is required under 40 CFR subchapter N or is otherwise specified in the Order for such pollutants. (40 CFR § 122.41(j)(4); 40 CFR § 122.21(e)(3); 79 Fed. Reg. 49001 (Aug. 19, 2014).) If a Permittee fails to use a lab that can conduct the most sensitive test method set forth in 40 CFR Part 136 for a particular pollutant, then the Permittee will be in violation of the monitoring and reporting requirements.

The General Monitoring Provisions section of the MRP carries over standard monitoring requirements from the previous permits with updates where necessary. The MRP requires Permittees to submit a written request for any modifications to monitoring and reporting requirements in the MRP including an approved Monitoring Program to the Executive Officer of the Los Angeles Water Board for approval. The previous 2012 Los Angeles County and the 2014 City of Long Beach MS4 Permits had similar requirements in Part IX.G.5 of Attachment E for non-stormwater discharges. This is also consistent with the standard practice in these two previous permits where Permittees would submit monitoring and reporting program modification requests to the Los Angeles Water Board for Executive Officer approval. The previous 2010 Ventura County MS4 Permit included prescribed monitoring requirements that were not customizable and, therefore, Permittees could not request substantive modifications. Rather, the EO on behalf of the Los Angeles Water Board could modify the MRP as necessary.

Analytical procedure requirements in the previous permits were updated in the MRP of the Order. The most important changes, which are reflected in Attachment E, include the following:

First, the MRP no longer requires Permittees to test for Aroclors. Instead, at a minimum, it requires analyzing all 55 PCBs congeners listed in Table A-7 of the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality Provisions, using a high-resolution EPA method.

The MRP also requires the laboratories analyzing monitoring samples to be certified by the State Water Board Environmental Laboratory Accreditation Program (ELAP), and requires that Permittees include quality assurance/quality control data with their reports. This provision is a standard requirement in NPDES permits. ELAP certified labs must

be compliant with lab methods in 40 CFR Part 136 therefore assuring the Los Angeles Water Board that data collected meets federal standards.³²¹

Part XIV.J of the MRP of the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit included a requirement for Permittees to provide to the Los Angeles Water Board upon request, standard operating procedures (SOP). For clarity, a requirement in the MRP of the Regional MS4 Permit was added requiring Permittees to continue to develop and maintain a SOP.

C. Monitoring Programs

The MRP requires the Los Angeles County Permittees to continue implementing their most recent Monitoring Program listed in Table E-1 of the MRP, and the Ventura County Permittees to amend their existing monitoring program to include additional TMDL and monitoring station requirements in a Monitoring Program consistent with the provisions of the MRP.

The MRP also allows Permittees to implement a customized monitoring program with the primary objective of allowing for the customization of the outfall monitoring programs and that achieves the five Primary Objectives set forth in Part I.A of the MRP and includes the elements set forth in Part I.C of the MRP. When proposing a customized monitoring program, the Permittees must provide sufficient justification for each element of the program that differs from the monitoring program as set forth in the MRP. The MRP provides options for each Permittee to individually develop and implement an Integrated Monitoring Program (IMP), or alternatively, Permittees may cooperate with other Permittees to develop a Coordinated Integrated Monitoring Program (CIMP). Both the IMP and CIMP are intended to facilitate the effective and collaborative monitoring of receiving waters, stormwater, and non-stormwater discharges and to report the results of monitoring to the Los Angeles Water Board.

The IMP and CIMP requirements within the MRP largely summarize the requirements and reinforce that, at a minimum, the IMP or CIMP must address all TMDL and non-TMDL monitoring requirements of the Order, including receiving water monitoring, stormwater outfall based monitoring, and non-stormwater outfall-based monitoring.

Both the IMP and CIMP approach provide opportunities to increase the cost efficiency and effectiveness of the Permittees monitoring program as monitoring can be designed, prioritized and implemented on a watershed basis. The IMP/CIMP approach allows the Permittees to prioritize monitoring resources between watersheds based on TMDL compliance schedules, and coordinate outfall-based monitoring programs and implement regional studies (if participating). Cost savings can also occur when Permittees coordinate their monitoring programs with other Permittees.

The previous 2012 Los Angeles County and the 2014 City of Long Beach MS4 Permits' IMPs and CIMPs, the City of Rolling Hills' non-stormwater Monitoring Program, and the two Board directed individual monitoring programs (for Compton and Gardena) are incorporated in Table E-1 of the MRP by reference. In the MRP, the cities of Compton and Gardena are required to develop an IMP or join a CIMP. The Los Angeles Water Board does not intend to issue a Board directive to these two Permittees unless their IMP is not approved. Los Angeles County Permittees including the City of Long Beach with an existing Monitoring Program(s) shall submit an updated Monitoring Program(s) to the Los Angeles Water Board for approval to incorporate the modifications in

³²¹ Sotelo, Christine. State Water Board California Environmental Laboratory Accreditation Program. Updates to California ELAP Field of Testing Forms. May 31, 2019.

requirements of the MRP, and specifically, to be consistent with the requirements in Attachments K through S of the Order. The most recent approved Monitoring Programs shall remain in effect until the Executive Officer of the Los Angeles Water Board approves the updated ones. If the updated and/or the new Monitoring Program(s) are disapproved, the Executive Officer of the Los Angeles Water Board will issue a monitoring directive for the Permittee(s).

Ventura County Permittees are required to submit a new IMP or CIMP or join an existing CIMP for Los Angeles Water Board approval. The TMDL Monitoring Plans listed in Table E-2 of the MRP, which are applicable to Ventura County Permittees, shall remain in effect until the Executive Officer of the Los Angeles Water Board approves the IMP(s) or CIMP(s). Approved TMDL Monitoring Plans by Watershed Management Area that were approved by the Executive Officer of the Los Angeles Water Board prior to the effective date of the Order are incorporated into the Order by reference. If the updated and/or the new Monitoring Program(s) are disapproved, the Executive Officer of the Los Angeles Water Board will issue a monitoring directive for the Permittee(s).

D. Monitoring Locations for Ventura County MS4 Permittees

1. Receiving Water Monitoring Location

The receiving water monitoring locations listed in Table E-3 of the MRP were in the previous 2010 Ventura County Permit. Ventura County Permittees shall include these locations in their IMP or CIMP and shall continue to monitor at these locations. Ventura County Permittees may propose additional and/or alternative receiving water monitoring locations in their IMP or CIMP. In addition, Ventura County Permittees shall propose a receiving water monitoring location in Malibu Creek subwatershed within Ventura County in their IMP or CIMP. The proposed location must be representative of the impacts from MS4 discharges. The 2010 Ventura County MS4 Permit did not have a receiving water station within Malibu Creek subwatershed. Therefore, to assess MS4 impacts on receiving water within the Malibu Creek subwatershed, the Los Angeles Water Board is adding a requirement to add a receiving water monitoring location for that subwatershed.

Mass Emission stations were designed to identify pollutant loads to the ocean, and long-term trends in pollutant concentrations, and characterize surface water quality in major receiving waters. The three Mass Emission stations are located in the major Ventura County watersheds: Calleguas Creek (ME-CC), Ventura River (ME-VR), and Santa Clara River (ME-SCR). Stations ME-CC and ME-VR were installed and monitored for the first time during the 2000/01 monitoring season, while ME-SCR was first installed and monitored during the 2001/02 monitoring season. High flows during January and February of 2005 resulted in the relocation of the ME-VR due to landslide activity and associated safety concerns to approximately one mile downstream from the historical ME-VR site to the Ojai Valley Sanitation District's Treatment Plant above the POTW outfall. The relocated station on the Ventura River (ME-VR2) was first monitored using portable sampling equipment in May 2005; and by September 2005 a permanent station was established. Stations ME-CC, ME-SCR, and ME-VR/ ME-VR2 were required to sample for 6 monitoring events per year, including a minimum of 2 dry weather samples during the permit term. The samples from stations ME-CC and ME-VR/ ME-VR2 are composed of flow-based composite and toxicity grab samples, and samples from station ME-SCR are composed of time-based composite samples and toxicity grab samples.

All three Mass Emission stations collected wet and dry weather water quality samples and analyzed for chronic toxicity.

2. Shoreline Monitoring Locations

The 2010 Ventura County MS4 Permit included various shoreline monitoring locations. The MRP of the Regional MS4 Permit also includes shoreline monitoring locations, which are listed in Table E-4 of the MRP. Note that some locations in the MRP are different from the previous Permit. These new monitoring sites were initially proposed by Ventura County MS4 Permittees in an email dated September 1, 2016 because they are considered “MS4 impacted sites.” MS4 impacted sites are defined as beaches that are within 400 yards³²² of municipal storm drain outfalls (not including discharges from creeks, rivers, or estuaries). In a meeting with Ventura County on July 15, 2016 Los Angeles Water Board staff concurred with Ventura County that the proposed monitoring stations were appropriate except shoreline monitoring location 42000 (Ormond Beach at J Street Drain, now Tsumas Creek). This location is not included in the MRP because MS4 discharges do not reach the ocean most of the year but are captured by the Ormond Beach lagoon. The Ormond Beach lagoon only breaches to the ocean in large storm events, and when it does, the outlet can move hundreds of yards up and down the beach. Also note that Ventura County Permittees are now required to monitor only for fecal coliform (or *E. coli*)³²³ and enterococcus consistent with the Ocean Plan Amendment for inclusion of Bacteria Provisions.

3. Stormwater Outfall-Based Monitoring Locations

The stormwater outfall monitoring locations listed in Table E-5 of the MRP were in the previous 2010 Ventura County Permit. Ventura County Permittees shall include these locations in their IMP or CIMP and continue to monitor at these locations. Ventura County Permittees may propose additional and/or alternative stormwater outfall monitoring locations in their IMP or CIMP. In addition, the Permittee(s) are required to propose an outfall monitoring location in Malibu Creek subwatershed within Ventura County in their IMP or CIMP. Monitoring at this proposed location is important to demonstrate compliance at the proposed receiving water location in Malibu Creek subwatershed within Ventura County.

E. Receiving Water Monitoring Requirements

General requirements are listed for all Permittees in this section. The requirements are similar to the previous 2012 Los Angeles County and the 2014 City of Long Beach MS4 Permits. Table E-6 of the MRP includes a suite of constituents that all Permittees are required to monitor. Ventura County Permittees were required to monitor for similar suite of constituents in their previous Attachment G of the 2010 Ventura County MS4 Permit. The purpose of receiving water monitoring is to measure the effects of stormwater and non-stormwater discharges from the MS4 to the receiving water, to identify water quality exceedances, to evaluate compliance with TMDL WLAs and receiving water limitations, and to evaluate whether water quality is improving, staying the same or declining.

³²² The 400-yard criterion is used by the Ventura County Environmental Health Department.

³²³ Appendix III of the Ocean Plan authorizes regional water boards to substitute testing for fecal coliform with *E. coli* when there is sufficient information “to support comparability with approved methods.” (Appendix III, Standard Operating Procedures, § 11, p. 92.)

1. Receiving Water Monitoring Stations

Receiving water monitoring is linked to outfall-based monitoring to gauge the effects of MS4 discharges on receiving water. Receiving water monitoring stations must be downstream of outfall monitoring stations.

The IMP, CIMP, or stand-alone receiving water monitoring program (in the case of a Board directed jurisdictional monitoring program) must include a map identifying proposed wet weather and dry weather monitoring stations. Receiving water monitoring stations may include historical mass emission stations, TMDL compliance monitoring stations, and other selected stations. The Permittee must describe how monitoring at the proposed locations will accurately characterize the effects of the discharges from the MS4 on the receiving water during both wet weather and dry weather, and meet other stated objectives. The proposed program must also state whether historical mass emission stations will continue to be monitored, and if not, provide sufficient justification for discontinuation of monitoring at the historical mass emissions stations, and describe the value of past receiving water monitoring data in performing trends analysis to assess whether water quality is improving, staying the same or declining.

2. Minimum Wet and Dry Receiving Water Monitoring Requirements

Receiving waters are to be monitored during both dry and wet weather conditions to assess the impact of non-stormwater and stormwater MS4 discharges on receiving waters. Wet weather and dry weather are defined in each watershed, consistent with the definitions in TMDLs approved within the watershed. In the previous 2012 Los Angeles County and the 2014 City of Long Beach MS4 permits, Permittees were required to conduct monitoring during three wet and two dry weather events. Ventura County Permittees were required to conduct monitoring during three wet and one dry weather events in their 2010 Permit. This Regional MS4 Permit retained the wet and dry weather definitions from the previous Los Angeles County and the City of Long Beach Permits. Wet weather receiving water monitoring is to commence as soon as possible (within 6 hours) of linked outfall monitoring to be reflective of potential impacts from MS4 discharges. At a minimum, the parameters to be monitored and the monitoring frequency are the same as those required for the linked outfalls.

3. Reporting Levels

The previous permits specified Minimum Levels (MLs) for monitoring stormwater constituents. MLs correspond to the approved analytical methods for reporting a sample result either from Appendix 4 of the SIP in accordance with section 2.4.2 of the SIP or established in accordance with section 2.4.3 of the SIP. The ML represents the lowest quantifiable concentration in a sample based on the proper application of method-based analytical procedures and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied in the computation of the Reporting Level (RL). The Method Detection Limit (MDL) is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is distinguishable from method blank results, as defined in 40 C.F.R. part 136, Appendix B.

In general, the MDL is lower than the RL (typically half the RL). In contrast to the previous permits where required MLs were specified, the Regional MS4 Permit no longer specifies required Reporting Levels (RLs) in the MRP. Rather, the Regional MS4 Permit specifies recommended Reporting Levels (RLs) in the MRP for monitoring stormwater constituents. This change from MLs to RLs allows the provision to be more user-friendly therefore streamlining Board staff data analysis efforts and related enforcement. Additionally, per Part II.H.1 of the MRP, Permittees are required to use the most sufficiently sensitive EPA-approved lab analytical methods available consistent with requirements in Attachment D of the Order (see, 40 CFR § 122.21(e)(3); 79 Fed. Reg. 49001 (Aug. 19, 2014).). Per Part II.H.7 of the MRP, recommended RLs are intended to serve as guidance for Permittees to choose the most sufficiently sensitive test method to attain RLs that are less than or equal to the lowest applicable water quality standard.

Information considered to incorporate recommended RLs in the MRP include previous permits' MLs, water quality goals³²⁴, and other information provided by labs. In determining what is the lowest water quality goal, standards that apply to drinking water and water for agricultural use were not considered because they do not apply to stormwater. On August 5, 2016, Ventura County Permittees as a follow-up item to the July 15, 2016 meeting with Board staff, provided information on the lowest MDLs and RLs that their labs can achieve. However, this information was not considered because Ventura County Permittees stated in a follow-up email on June 9, 2020 that they included drinking water and non-40 CFR methods to try to get RLs low enough to meet the Permit MLs. They further stated that some of the stormwater methods (e.g. EPA 625) frequently require dilutions due to the turbid nature of stormwater, so they often end up with RLs higher than quoted due to matrix issues.

To solicit more information about lab methods for stormwater samples, Board staff also looked at information from ELAP certified labs in Los Angeles County. Using information from the State Board's Drinking Water Program³²⁵, Board staff compiled a list of 14 ELAP certified labs within Los Angeles County. Board staff contacted each lab with a list of constituents in Table F-27 below and requested the labs to report their lowest MDL and RL values for stormwater samples along with the pertinent analytical method. Two of the 14 labs reported that they do not perform stormwater analysis. Of the twelve remaining labs, six labs did not respond. The other six labs³²⁶ responded by submitting the requested information. However, while six labs responded with the requested information, not all of them analyze all the constituents listed in Table F-27 below.

Board staff used the lowest MDL and RL values received from these labs to populate Table F-27 below. When water quality goal or lab information was

³²⁴ In this context, water quality goals include any objectives, criteria, targets, or limits within TMDLs, California Toxics Rule (CTR), Basin Plan, Ocean Plan, ISWEEB, and other water quality values found on the State Water Board Water Quality Goals searchable database at http://www.waterboards.ca.gov/water_issues/programs/water_quality_goals/search.shtml.

³²⁵ The State Board provides this information using an interactive GIS map at: <https://waterboards.maps.arcgis.com/apps/webappviewer/index.html?id=bd0bd8b42b1944058244337bd2a4ebfa>

³²⁶ Between April 2020 and June 2020, the six labs that submitted the requested information were Advanced Technology Laboratories, Alpha Scientific Corporation, American Scientific Laboratories, Enviro-Chem, Inc., Positive Lab Service, and Weck Laboratories, Inc.

unavailable, Board staff looked at RLs and MDLs in CEDEN data for the Surface Water Ambient Monitoring Program (SWAMP). For many constituents, the recommended RLs in the Regional MS4 Permit were set equal to the previous permit MLs. Where the water quality goal was lower than the previous permit ML, and a lab could achieve a lower RL using a more sensitive analytical method, the recommended RL was set equal to the lowest lab RL. However, for PCBs, the recommended RLs were set equal to the lowest water quality goals. The table below indicates the MLs in the previous permits, the recommended RLs included in the Regional MS4 Permit, and the basis for the recommended RL. Under “Basis for Recommended RL”, “no change” indicates that the recommended RL was set equal to the ML from the previous permits. The term “Lowest WQ Goal” indicates that the recommended RL was set equal to the lowest water quality goal. The term “Lowest Lab RL” was set equal to the lowest recommended RL considering the lowest MDL a lab could achieve.

The previous MS4 Permits required Total Suspended Solids (TSS) monitoring but did not require Suspended Sediment Concentration (SSC) to be monitored as part of the table of constituents below. However, studies conducted by the United States Geological Survey (USGS) have found that the TSS procedure may not capture the full range of sediment particle sizes contributing to sediment impairments.³²⁷ Therefore, both TSS and SSC are required to be monitored for in the MRP.

Also, note that dissolved phosphorus was replaced with orthophosphate as P (dissolved) in the MRP. In general, phosphorus exists in two main forms in water; dissolved (soluble) and particulate. Orthophosphate is the primary dissolved form of phosphorus that is more bioavailable to algae and aquatic plants.

With regards to PCBs, previous MS4 Permits required monitoring for Aroclors. Permittees in practice inconsistently monitored for Aroclors and/or congeners. Therefore, the Regional MS4 Permit MRP does not require Permittees to test for Aroclors (with subsequent reporting of total PCBs concentrations based on the sum of the Aroclor concentrations). Moreover, RLs for Aroclors are very high and detections are extremely rare. Additionally, the relevant total PCBs concentrations of concern for protection of human health and aquatic life are extremely low and detection of these low concentrations can only be achieved through using methods which analyze for individual PCB congeners (the various Aroclors were composed of mixes of multiple congeners in addition to other constituents at times). Thus, the MRP requires at a minimum analyzing all 55 PCBs congeners listed in Table A-7 of the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1, Sediment Quality Provisions. Furthermore, Permittees are encouraged to use a high resolution EPA-approved method which attains a reporting level of at least 0.00002 µg/L (20 pg/L) for ocean waters per congener, and 170 pg/L for non-ocean marine waters and freshwater per congener. Using a high-resolution EPA method along with analyzing for a minimum of 55 congeners will result in fewer non-detects, which will allow for the ability to conduct trend analyses of PCBs in the Region. In addition, higher resolution PCB monitoring using congeners will aid in “fingerprinting” potential sources through providing information on PCB homologs (those congeners with the same number of chlorines). The goal is to identify

³²⁷ Gray, John et, al. US Geological Survey. Comparability of Suspended-Sediment and Total Suspended Sediment Data. August 2000.

sources and eventually eliminate this highly persistent legacy pollutant from the watersheds.

Table F-27. Rationale for Recommended Reporting Levels (RLs) in the Regional MS4 Permit³²⁸

| CONSTITUENTS | Lowest Lab MDL in ELAP Certified Los Angeles County Labs | Lowest Lab RL in ELAP Certified Los Angeles County Labs | Lab Method for ELAP Certified Los Angeles County Labs | Lowest Water Quality Goal ³²⁹ | Previous Permits MLs | Regional MS4 Permit Recommended RLs | Basis for Recommended RL |
|-------------------------|--|---|---|--|--------------------------|-------------------------------------|--------------------------|
| CONVENTIONAL POLLUTANTS | mg/L | mg/L | - | mg/L | mg/L | mg/L | - |
| Oil and Grease | 0.28 Enviro Chem | 1 EnviroChem | EPA 1664A | - | 5 | 5 | No change |
| Total Phenols | 0.00016 Weck | 0.001 Weck | EPA 624.1 | - | 0.1 | 0.1 | No change |
| Cyanide | 0.0038 Weck | 0.005 Weck | EPA 335.4 | 0.0052 / 0.001 (CTR - freshwater / saltwater) | 0.005 | 0.005 | No change |
| pH | 0.1 Weck | 0.1 Weck | SM 4500H+ B | - | 0-14 | 0-14 units | No change |
| Temperature | - | - | - | - | N/A | N/A | No change |
| Dissolved Oxygen | 0.1 | 0.5 | SM 2580B | 5 (Basin Plan) | Sensitivity to 5 mg/L | N/A | Field measurement |

³²⁸ Table Abbreviations: CTR = California Toxics Rule; EPA Rec. = National Recommended Water Quality Criteria; ISWEBE = Inland Surface Waters, Enclosed Bays, and Estuaries (ISWEBE) Plan; TMDL = Total Maximum Daily Load; HH = Human Health; WQ = Water Quality.

³²⁹ Water quality goals include any objectives, criteria, targets, or limits within TMDLs, California Toxics Rule (CTR), Basin Plan, Ocean Plan, ISWEBE, and other water quality values found on the State Water Board Water Quality Goals searchable database at http://www.waterboards.ca.gov/water_issues/programs/water_quality_goals/search.shtml.

F. Stormwater Outfall-Based Monitoring Requirements

The primary purpose of outfall monitoring is to characterize the stormwater MS4 discharges from each Permittee's drainages within each subwatershed. Outfall-based monitoring is also conducted to assess compliance with WQBELs and receiving water limitations. Factors that may impact stormwater runoff volume include percent effective impervious cover (connected to the storm drain system), vegetation type, soil compaction and soil permeability.

Stormwater outfall monitoring is linked to receiving water monitoring (see Part XII.E of this Fact Sheet). Monitoring must be conducted at least three times per year during qualifying rain events, including the first rain event of the year and conducted concurrently (within 6 hours) before the commencement of the downstream receiving water monitoring. The MRP retained similar wet and dry weather definitions from the previous 2012 Los Angeles County and the 2014 City of Long Beach MS4 Permits. Note that the previous Ventura County Permit had a different wet and dry weather definition in comparison to the 2012 Los Angeles County and 2014 City of Long Beach MS4 Permits. However, to accommodate the differences between the previous permits, the Regional MS4 Permit MRP includes a provision allowing Permittees, if they choose, to propose their own weather condition definition for Executive Officer approval. This flexibility is necessary to accommodate the geographic and climate differences between Los Angeles County and Ventura County.

Monitoring is conducted for pollutants of concern including all pollutants with assigned WQBELs. Parameters to be monitored during wet weather include: flow, pollutants subject to a TMDL applicable to the receiving water, and pollutants listed on the Clean Water Act Section 303(d) list for the receiving water or a downstream receiving water. Flow is necessary to calculate pollutant loading.

For water bodies listed on the Clean Water Act section 303(d) list as being impaired due to sedimentation, siltation or turbidity, suspended sediment concentration (SSC) must be analyzed. Total suspended solids (TSS) and hardness must be analyzed when metals are monitored. TSS is the parameter most often required in NPDES permits to measure suspended solids.

For freshwater, the following field measurements are also required: pH, dissolved oxygen, temperature, and specific conductivity. Temperature and pH are parameters impacting the effect of pollutants in freshwater (i.e., ammonia toxicity is dependent on pH and temperature). Temperature and dissolved oxygen are interdependent and fundamental to supporting aquatic life beneficial uses. Specific conductivity is a parameter important to assessing potential threats to MUN and freshwater aquatic life beneficial uses.

Note that the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permits included requirements to monitor stormwater discharges for exceedances of municipal action levels (MALs). These requirements are discontinued in the Regional MS4 Permit. At this time, the Los Angeles Water Board has concluded that TMDL requirements and a robust monitoring program provide sufficient criteria to assess the impact of stormwater discharges and therefore, MALs are unnecessary.

Aquatic toxicity monitoring is required in the receiving water once per year during wet weather conditions. Aquatic toxicity is a direct measure of toxicity and integrates the effects of multiple synergistic effects of known and unidentified pollutants. When

samples are found to be toxic, a Toxicity Identification Evaluation (TIE) must be performed to identify the pollutants causing toxicity. If a toxicant or class of toxicants that is identified through a TIE conducted during wet weather at a receiving water monitoring location, then, Permittees must analyze for the toxicant(s) during the next scheduled sampling event in the discharge from the outfall(s) upstream of the receiving water location.

For many analytical procedures, 40 CFR Part 136 specifies that grab samples must be collected for pH, temperature, dissolved oxygen, and coliform bacteria. The MRP also allows the Permittees to collect specific conductivity and turbidity samples using grab sampling. Federal regulations specify that grab samples must be taken for the abovementioned parameters because they evaluate characteristics that may change during the time necessary for compositing. A grab sample is a single sample collected at a particular time and place that represents the composition of the stormwater only at that time and place. When the quality and flow of the stormwater being sampled is not likely to change over time, a grab sample is appropriate. A composite sample is a collection of individual samples obtained at regular intervals, usually based upon time or flow volume. A composite sample is desirable when the material being sampled varies significantly over time either as a result of flow or quality changes. Flow-proportional compositing is usually preferred when effluent flow volume varies appreciably over time.

Sampling requirements, including methods for collecting flow-weighted composite samples, are consistent with provisions set forth in 40 CFR section 122.21(g)(7), which establish specific requirements for collecting flow-weighted composite samples. Per these provisions, the aliquots for flow-weighted composite samples must be collected during a representative storm for the first 3 hours, or for the duration of the storm event if it is less than 3 hours long.

G. Non-Stormwater Outfall-Based Screening and Monitoring Requirements

The Non-Stormwater Outfall-Based Monitoring Program is a step-wise framework for identifying illicit discharges and connections and assessing whether Permittees are effectively prohibiting non-stormwater discharges to the MS4. Under previous MS4 Permits for the 2012 Los Angeles County and the 2014 City of Long Beach, Permittees developed a Non-Stormwater Outfall-Based Screening and Monitoring Program. The requirements in the Regional MS4 Permit allow Permittees to build upon past efforts to advance the program and focus monitoring on the most significant areas of non-stormwater quality concerns. Los Angeles County Permittees will continue to implement the existing program, making modifications to address new permit requirements. Ventura County Permittees are required to submit an IMP/CIMP and explain how the non-stormwater outfall-based screening and monitoring requirements in the MRP will be implemented. Figure F-1 below illustrates the general process for the Non-Stormwater Outfall-Based Screening and Monitoring Program. The previous permit for Ventura County addressed the need to eliminate illicit discharges through the Illicit Connection and Illicit Discharges program and the Dry Weather Monitoring Program. Several elements of these programs are similar to the Regional MS4 Permit requirements and in many cases Ventura County Permittees can integrate the new requirements into their existing efforts. The Regional MS4 Permit Non-Stormwater Screening and Monitoring Program requirements establish consistency among all Permittees.

Figure F-1. Non-Stormwater Outfall-Based Screening and Monitoring Program General Process

1. Objectives

The objectives listed in Part VII.A of the MRP are based on the federal requirements listed above, including but not limited to Clean Water Act section 402(p)(3)(B)(ii) and 40 CFR section 122.26(d)(2)(i)(F). The purpose of the Non-Stormwater Outfall-Based Screening and Monitoring Program is to identify and investigate where necessary non-stormwater discharges including illicit discharges, non-stormwater discharges conditionally exempt from the prohibition, and discharges that are issued a separate discharge permit. Program objectives are listed to provide Permittees with guide points as they design and implement their program. Many of the objectives from the previous 2012 Los Angeles County and the 2014 City of Long Beach MS4 Permits are retained but have been updated to build upon past efforts of Permittees. Although the previous permit for Ventura County did not list objectives for analogous programs (Dry-weather Monitoring Program and Illicit Discharge and Detection Program), objectives in Part VII.A of the MRP reflect elements of Ventura County Permittees' existing programs.

2. Screening and Monitoring Program Procedures and Requirements

Parts VII.B through E of the MRP implement federal requirements, including those in 40 CFR section 122.26(d)(2)(i)(F), which require inspection, surveillance, and monitoring to demonstrate compliance with permit conditions. The Non-Stormwater Outfall-Based Screening and Monitoring Program addresses the permit condition prohibiting the discharge of non-stormwater discharges through the MS4 to receiving waters based on Clean Water Act section 402(p)(3)(B)(ii). Requirements in Parts VII.B through E of the MRP are a series of systematic procedures for characterizing non-stormwater discharges and eliminating illicit discharges to ensure compliance with the effective prohibition. The Non-Stormwater Outfall-Based Screening and Monitoring Program is intended to maximize the use of the Permittee's resources by integrating the screening and monitoring process into existing or planned IMP/CIMP efforts of Los Angeles County Permittees including the City of Long Beach. It is also intended to rely on the illicit discharge source investigation and elimination requirements and MS4 mapping requirements for Los Angeles County Permittees including the City of Long Beach, and Ventura County Permittees. Finally, the Regional MS4 Permit builds upon dry-weather monitoring requirements in the previous Ventura County permit. Figure F-1 depicts the process of implementing Non-Stormwater Outfall-Based Screening and Monitoring Program elements.

To implement broader federal requirements for non-stormwater outfall-based screening and monitoring, the Regional MS4 Permit includes clear, specific, measurable requirements to achieve the objectives in Part VII.A of the MRP. U.S. EPA demonstrates examples of clear, specific, measurable requirements to control non-stormwater discharges in the *MS4 Permit Improvement Guide*.³³⁰ This guidance document contains examples of field screening, prioritizing source investigations, mapping (similar to inventory requirements in the Regional MS4 Permit), and monitoring. In addition, the *MS4 Program Evaluation Guidance Document*, describes important dry weather monitoring program components such as a database for tracking dry-weather outfall inspections and prioritized source

³³⁰ U.S. EPA. 2010. *MS4 Permit Improvement Guide*. Office of Water, Office of Wastewater Management, Water Permits Division. April. 2010. p. 24-34.

identification of dry-weather discharges.³³¹ The *Compendium of MS4 Permitting Approaches*³³² cites permit examples for inventory, prioritization for screening, and monitoring of non-stormwater discharges. Moreover, U.S. EPA issued MS4 permits to the Middle Rio Grande Area and Washington D.C. that require field screening for prioritized areas, comparable to the Regional Permit.³³³

As the monitored activity is dry weather MS4 discharges, the Regional MS4 Permit defines conditions of dry weather. The 0.1-inch requirement is consistent with U.S. EPA's determination of a "measurable" storm event, as indicated in 40 CFR section 122.26(d)(2)(iii)(2) and the NPDES Storm Water Sampling Guidance Document.³³⁴ MS4 permits commonly delineate wet and dry weather at 0.1 inch with 72 hours as a precedent dry period.³³⁵

3. Changes from the Previous Permits

Most of the requirements in Parts VII.B through E of the MRP are continued from previous 2012 Los Angeles County, 2014 City of Long Beach, and 2010 Ventura County MS4 permits. As described above in this Fact Sheet, the Los Angeles Water Board has determined that these requirements are necessary to comply with federal requirements. The previous 2010 Ventura County permit had a different framework than the Regional MS4 Permit requirements; therefore, some of the specific requirements in Parts VII.B through E of the MRP will require the Ventura County Permittees to perform new or different tasks. However, Ventura County Permittees as explained in subpart a below, have already performed activities under their previous permit requirements that will allow them to tailor their existing efforts to satisfy Regional MS4 Permit requirements. To synchronize programs among the three groups of Permittees, Parts VII.B through E of the MRP include separate schedules for Los Angeles County (including City of Long Beach) Permittees versus Ventura County Permittees, but the requirements are the same. Other changes from the three previous permits are intended to allow the program to progress beyond earlier screening efforts. The most notable differences are highlighted below.

a. Non-Stormwater Outfall-Based Screening and Monitoring Program

The previous 2010 Ventura County Permit addressed non-stormwater discharges through the IDDE program and through the dry-weather monitoring program. The IDDE program requirements required mapping and inventorying of outfalls and field screening for illicit connections to the storm drain system. Additionally, the previous 2010 Ventura County Permit's dry weather monitoring program required Permittees to select outfall sites for dry weather

³³⁵ For example, NPDES Permit No. CAS612008, issued to San Francisco Bay Region (Order No. R2-2015-0049, issued November 19, 2015, p. 125) and NPDES Permit No. DC0000221 issued to the Government of the District of Columbia, as modified November 9, 2012, p. 35).

monitoring based on certain criteria. Monitoring consisted of analytical testing, field measurements and observations at the selected outfall stations. The main difference between the Regional MS4 Permit and the previous Ventura County permit is that the Ventura County Permit focused on screening for illicit connections under the IDDE program, whereas the Regional MS4 Permit MRP, Part VII provides a system of requirements for all non-stormwater discharges. Depending on the nature of the illicit discharge information collected, Ventura County Permittees may have addressed the plan requirements in Part VII of the MRP. Therefore, the Regional MS4 Permit requires Ventura County Permittees to develop a Non-Stormwater Outfall-Based Screening and Monitoring Program in their IMP or CIMP that complies with requirements in Parts VII.B through E of the MRP. In this manner, Ventura County Permittees can build upon and advance their existing non-stormwater screening efforts to better control discharges of pollutants to the MS4.

For Los Angeles County Permittees, the non-stormwater program remains largely the same except that this Permit allows to further streamline the requirements.

b. Screening of Outfalls with Significant Non-Stormwater Discharge

Part VII.B of the MRP requires identification of significant non-stormwater MS4 discharges. Ventura County Permittees have already collected information under the IDDE program, which will enable them to distinguish significant non-stormwater discharges. This is a necessary step in prioritizing non-stormwater discharges for source identification.

The requirements in Part VII.B of the MRP are retained from the previous permits for Los Angeles County and the City of Long Beach. Part VII.B of the MRP establishes criteria for the Permittees to consider when delineating “significant” non-stormwater discharges and provides flexibility for other factors to be considered. Evidence of ongoing potential illegal dumping or illicit connections must be used along with other criteria based on field and/or laboratory measurements for defining a significant non-stormwater discharge. Where the Permittee uses other factors, they must provide a definition or a criterion for how a significant non-stormwater discharge will be determined. In particular, the thresholds for field measurements must be specified, (e.g., flow greater than 10 gallons per minute) and/or water quality data (e.g., bacteria counts exceeding a certain level) that will be used to determine whether the non-stormwater discharge is significant.

c. Source Investigation for Outfalls with Significant Non-Stormwater Discharge

Source investigation is ongoing among the Los Angeles County and City of Long Beach Permittees. This is an enhancement for Ventura County Permittees that is a necessary step in eliminating non-stormwater discharges and/or preventing the discharge of pollutants to the MS4. The step is necessary to focus efforts on non-stormwater dischargers with the greatest potential to affect water quality. Once prioritized, Permittees initiate source investigation efforts required under Part VII.C of the MRP.

The requirements in Part VII.C of the MRP are retained from the previous 2012 Los Angeles County and the 2014 City of Long Beach MS4 Permits. The

previous 2010 Permit for Ventura County included similar requirements in the IDDE program, with some differences in wording. Source investigation from Non-Stormwater Outfall-Based Monitoring Program is conducted simultaneously with IDDE procedures in Part VIII.I of the Order so that sources may be tracked from both an upstream and downstream direction.

Per Part VII.D.2 of the MRP, Permittees within Los Angeles County shall determine if re-screening is necessary for any of the previously screened outfalls with no significant non-stormwater discharge. Rather than requiring re-screening of all outfalls, the Regional MS4 Permit requires a review of dry weather receiving water monitoring data downstream of the outfalls and other relevant information to determine if re-screening is necessary for any of the previously screened outfalls that did not have significant non-stormwater discharge.

Part VII.D.1 of the MRP provides the schedule for Ventura County Permittees to screen their outfalls for significant non-stormwater discharges. This is shorter than what was provided in the previous 2012 Los Angeles County and 2014 City of Long Beach MS4 Permits where they had 3 years from the effective dates of the Orders respectively, to conduct source investigations for no less than 25% of the outfalls in the inventory and 5 years from the effective date of the aforementioned Orders to conduct source investigations for 100% of the outfalls in the inventory. However, the shorter interim schedule (i.e., 3 years for 50% of the outfalls) for Ventura County Permittees in comparison to Los Angeles County Permittees in the previous permits (i.e., 3 years for 25% of the outfalls) is reasonable considering the often isolated MS4 networks for each city in Ventura County and the significantly less number of outfalls in comparison to LA County Permittees.

d. Non-Stormwater Outfall-Based Monitoring

Part VII.E.2 of the MRP allows Los Angeles County Permittees 90 days after completing non-stormwater source investigation to begin monitoring the non-stormwater discharge. These 90 days is the same as previously allowed in the 2012 Los Angeles County and 2014 City of Long Beach MS4 Permits.

Non-stormwater monitoring for Los Angeles County and City of Long Beach Permittees is decreased from previous permits to allow the Permittees flexibility in directing program resources to where they are most effective. Previous requirements in the 2012 Los Angeles County and 2014 City of Long Beach MS4 permits required sampling at established frequencies unless granted alternative frequencies by the Executive Officer of the Los Angeles Water Board. The Regional MS4 Permit recognizes that in some instances, non-stormwater that has been fully characterized and investigated for illicit discharges remains static in quantity and quality, such that repeated sampling and analyses does not produce useful information. Nevertheless, illicit discharges may recur at any time. To provide monitoring relief while still being proactive in protecting water quality, the Regional MS4 Permit allows the Permittee to record field observations (e.g., visual, presence of odor, etc.), in lieu of analytical testing, for non-stormwater discharges that are: 1) to waters not subject to a TMDL, 2) have been fully characterized and investigated for illicit discharges, and 3) do not cause or contribute to exceedances of water quality standards. This approach is consistent with recommendations in the

EPA MS4 improvement Guide,³³⁶ which states that for dry weather flows, permit writers “may consider allowing permittees the flexibility to look for indicators of an illicit discharge before conducting water quality tests due to baseline flow (baseflow, groundwater flow, irrigation return flows) in certain areas. In these cases, permit writers could require that sensory indicators (i.e., odor, color, turbidity, and floatables) be evaluated.”

The previous 2010 permit for Ventura County required the Principal Permittee to select (based on certain criteria) and monitor five outfalls during dry weather at a frequency of once per year. The Regional MS4 Permit allows the Ventura County Permittees to assess their significant non-stormwater discharges and create a prioritization for conducting source identification.

Non-stormwater outfall-based monitoring requirements are also consistent with 40 CFR section 122.41(j)(1), which requires “samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity”. The Regional MS4 Permit requires grab samples be collected for non-stormwater outfall discharges. This is a change from the 2012 Los Angeles County and 2014 City of Long Beach MS4 Permits which required composite samples. Dry weather outfall flows are likely to be consistent in quality such that a grab sample would be representative of the discharge and would require less effort and/or equipment. The *EPA Permit Writer’s Manual* discusses the appropriateness of grab versus composite samples, stating “Grab samples are appropriate when the flow and characteristics of the wastestream being sampled are relatively constant.”³³⁷ In addition, the 2015 *EPA Multi-sector General Permit for Industrial Storm water Discharges Associated with Industrial Activity* requires grab samples for compliance monitoring, with the exception of some specific receiving waters.³³⁸

Previous permits for Los Angeles County and the City of Long Beach established Non-stormwater Action Levels (NALs) for non-stormwater to gauge potential impact to water quality and to identify the potential need for additional controls for non-stormwater discharges. The Regional MS4 Permit discontinues the use of action levels. During the previous permit term, the majority of Los Angeles County Permittees addressed non-stormwater outfall-based screening and monitoring through WMPs and EWMPs using means other than action levels. Based on practical knowledge gained through implementing the previous 2012 Los Angeles County and 2014 City of Long Beach MS4 permits, the Los Angeles Water Board believes that at this time, TMDL requirements and WQBELs provide sufficient criteria to assess the impact of non-stormwater discharges. This is also consistent with the Ventura Countywide Stormwater Quality Management Program’s³³⁹ reapplication

³³⁹ The Ventura Countywide Stormwater Quality Management Program is collective term for Ventura County Permittees which include the Ventura County Watershed Protection District, the County of Ventura, and the cities of Camarillo, Fillmore, Moorpark, Ojai, Oxnard, Port Hueneme, Santa Paula, Simi Valley, Thousand Oaks, and Ventura.

package which states that it “does not support the inclusion of NALs within the next Ventura County MS4 Permit.”³⁴⁰

H. TMDL Monitoring

Like other monitoring and reporting requirements, TMDL-related monitoring is also necessary to implement federal law. The Clean Water Act and its implementing regulations require monitoring and reporting as a major component of *all* NPDES permits, not just MS4 permits. As a condition of receiving a NPDES permit, a permittee agrees to monitor its discharges to ensure compliance with the permit’s terms.³⁴¹ Here, this would include any WQBELs or receiving water limitations based on TMDLs.

Further, MS4 permits issued by U.S. EPA support the conclusion that TMDL-related monitoring is a federal requirement for MS4 permits. For example, the District of Columbia MS4 Permit states under Section 5, Monitoring and Assessment of Controls, that the monitoring must meet several objectives, including “any additional necessary monitoring for purposes of source identification and wasteload allocation tracking. This strategy must align with the Consolidated TMDL Implementation Plan....monitoring must be adequate to determine if relevant WLAs are being attained within specified timeframes in order to make modifications to relevant management programs, as necessary.”³⁴²

Also note that other local agencies also have TMDL monitoring requirements. The MS4 permit issued to Caltrans requires that Caltrans conduct effluent and receiving water monitoring and implement a “Comprehensive TMDL Monitoring Plan.”³⁴³ The Industrial General Storm Water Permit requires industrial facilities to collect samples of their discharge and analyze them for various parameters, including “[a]dditional applicable industrial parameters related to receiving waters with 303(d) listed impairments or approved TMDLs...”³⁴⁴ The NPDES permit for stormwater discharges from Sentinel Peak Resources (Inglewood Oil Field) includes effluent limitations based on TMDLs and corresponding effluent and receiving water monitoring requirements.³⁴⁵

I. Outfall-Based Database

The requirements in the MRP with regards to maintaining an outfall-based database are similar to the previous 2012 Los Angeles County, the 2014 City of Long Beach and 2010 Ventura County Permits.

Per Part VIII.A of the MRP, the Permittee must continue to maintain a map or geographic database of storm drains, channels and outfalls to aid in the development of the outfall monitoring plan and to assist the Los Angeles Water Board in reviewing the logic and adequacy of the number and location of outfalls selected for monitoring. The map/database must include the storm drain network, receiving waters, other surface waters that may impact hydrology, including dams and dry weather diversions. In addition, the map must identify the location and identifying code for each major outfall within the Permittee's jurisdiction. The map must include overlays including jurisdictional boundaries, subwatershed boundaries and storm drain outfall catchment boundaries. The map must distinguish between storm drain catchment drainage areas and subwatershed drainage areas, as these may differ. In addition, the map must include overlays displaying land use, impervious area and effective impervious area (if available). To the extent known, outfalls that convey significant non-stormwater discharges per Part VII.B of the MRP, must also be identified on the map, and the map must be updated annually to include the total list of known outfalls conveying significant flow of non-stormwater discharge.

J. Aquatic Toxicity Monitoring Methods

Aquatic toxicity monitoring is required in receiving waters during both wet and dry weather conditions to determine whether designated beneficial uses are fully supported. Further, Attachment E requires additional monitoring at MS4 outfalls where aquatic toxicity is present above a certain effect level in downstream receiving waters to determine whether MS4 discharges are causing or contributing to the aquatic toxicity. In this situation, outfall monitoring must either entail monitoring for specific pollutants identified in a TIE in the downstream receiving water, or for aquatic toxicity itself, where the specific pollutants could not be identified through the TIE conducted on the downstream receiving water.

Based on the stated goals of the Clean Water Act, the U.S. EPA and individual states implement three approaches to monitoring water quality. These approaches include chemical-specific monitoring, toxicity testing, and bioassessments (USEPA 1991a).³⁴⁶ Each of the three approaches has distinct advantages and all three work together to ensure that the physical, chemical, and biological integrity of our waters are protected. Water quality objectives have been developed for only a limited universe of chemicals. For mixtures of chemicals with unknown interactions or for chemicals having no chemical-specific objectives, the sole use of chemical-specific objectives to safeguard aquatic resources would not ensure adequate protection. Aquatic life in southern California coastal watersheds are often exposed to nearly 100% effluent from wastewater treatment plants, urban runoff, or stormwater; therefore, toxicity testing and bioassessments are also critical components for monitoring programs as they offer a more direct and thorough confirmation of biological impacts. The primary advantage of using the toxicity testing approach is that this tool can be used to assess toxic effects (acute and chronic) of all the chemicals in aqueous samples of effluent, receiving water,

³⁴⁶ U.S. EPA. 1991a. Technical support document for water quality-based toxics control. Office of Water. Washington, DC. EPA/505/2-90-001.

or stormwater. This allows the cumulative effect of the aqueous mixture to be evaluated, rather than the toxic responses to individual chemicals.³⁴⁷

For freshwater, the MRP requires Permittee(s) to conduct chronic and acute toxicity tests on water samples, by methods specified in *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms* (EPA/821/R-02/013, 2002; Table IA, 40 CFR Part 136) and *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms* (EPA/821/R-02/012, 2002; Table IA, 40 CFR Part 136), or a more recent edition.

The Los Angeles Water Board has traditionally requested stormwater dischargers to use a list of three organisms – algae, crustacean, and fish - (specifically, *Selanastrum capricornutum*, *Ceriodaphnia dubia*, and *Pimephales promelas*) to screen for the most sensitive species to be used during toxicity testing. This list has been in use for many decades; however, *Selanastrum* was removed from the screening list due to its almost complete lack of sensitivity and two additional species were added to the MRP: the freshwater amphipod *Hyalella azteca* and the midge *Chironomus dilutes*. This is consistent with the approach being used at the San Francisco Regional Water Board where they have also noted that several emerging groups of pesticides, including fipronil, neonicotinoids, and pyrethroids, are increasingly dominating pesticide applications in urban and agricultural environments and the older list of test organisms do not respond to most of these pesticides. Now that urban uses of diazinon have been banned for a decade, highly toxic pyrethroids are more commonly found, and *Hyalella azteca* is the most sensitive species to that class of chemicals, while *Chironomus dilutes* is most sensitive to fipronil, which is being observed in urban waters in the State. *Pimephales* tended to be most sensitive to ammonia in the past and while ammonia may still at times occur for various reasons, detections at toxic concentrations of the chemical are reduced. *Ceriodaphnia* is most sensitive to organophosphate pesticides, such as diazinon, which is also less frequently detected at toxic concentrations due to its ban and subsequent reduced use.

During the first year of the permit term, to determine the most sensitive test species, the Permittee(s) shall conduct two wet weather and two dry weather toxicity tests with the species listed in the MRP for freshwater and non-ocean marine waters, as appropriate³⁴⁸. After this screening period, the results of the test species sensitivity screening shall be included in the IMP or CIMP and subsequent monitoring shall be conducted using the most sensitive test species. Sensitive test species determinations shall also consider the most sensitive test species used for proximal receiving water monitoring. The MRP requirements for the most sensitive test species screening are consistent with the previous 2010 Ventura County Permit's aquatic toxicity requirements. The previous 2012 Los Angeles County and the 2014 City of Long Beach MS4 Permits allowed the Permittees to use a sensitive test species that had already been determined, or if there was prior knowledge of potential toxicant(s), and a test species was sensitive to such toxicant(s). However, due to inconclusive results for toxicity testing, the MRP requires screening for the most sensitive species instead of allowing Permittees to choose species from existing studies.

For non-ocean marine waters, the MRP requires the Permittee(s) to conduct the chronic toxicity test in accordance with U.S. EPA's *Short-Term Methods for Estimating the*

³⁴⁷ U.S. EPA, EPA Regions 8, 9, and 10 Toxicity Training Tool, January 2010.

³⁴⁸ Southern California Coastal Water Research Project, Stormwater Monitoring Coalition: Toxicity Testing Laboratory Guidance Document- SCCWRP Technical Report 956, December 2016.

Chronic Toxicity of Effluent and Receiving Waters to West Coast Marine and Estuarine Organisms, First Edition, August 1995, (EPA/600/R-95/136), or *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms*, Third Edition, October 2002, (EPA/821-R-02-014), or a more recent edition. In contrast to the previous MS4 permits, the Regional MS4 Permit no longer requires ocean water aquatic toxicity monitoring because, in light of the other ocean monitoring requirements, and evaluation of data collected under prior permits, aquatic toxicity monitoring was not providing significant added value and the Board understands that aquatic toxicity monitoring is costly. All monitoring included in the Regional MS4 Permit, however, will result in appropriate data needed to evaluate water quality impacts of the discharges and ensure that beneficial uses are protected. Aquatic toxicity monitoring remains in non-marine ocean waters and inland estuarine and surface waters, which gives the Board the information it needs to evaluate toxicity. (See *In the Matter of the Petitions of the City of Oceanside, Fallbrook Public Utilities Dist. and the Southern California Alliance of Publicly Owned Treatment Works*, State Water Board Order WQ 2021-0005 at pp. 12, 13.)

Furthermore, the toxicity component of the MRP includes toxicity identification procedures so that pollutants that are causing or contributing to acute or chronic effects in aquatic life exposed to these waters can be identified and others can be discounted. TIEs are needed to identify the culprit constituents to be used to prioritize management actions. Where toxicants are identified in a MS4 discharge, the MRP requires a Toxicity Reduction Plan (TRE).

TRE development and implementation is directly tied to the integrated monitoring programs and watershed management program, to ensure that management actions and follow-up monitoring are implemented when problems are identified. Permittees are encouraged to coordinate TREs with concurrent TMDLs where overlap exists. If a TMDL is being developed or implemented for an identified toxic pollutant, much of the work necessary to meet the objectives of a TRE may already be underway, and information and implementation measures should be shared.

Overall, the toxicity monitoring program will assess the impact of stormwater and non-stormwater discharges on the overall quality of aquatic fauna and flora and implement measures to ensure that those impacts are eliminated or reduced. As stated previously, chemical monitoring does not necessarily reveal the totality of impacts of stormwater on aquatic life and habitat-related beneficial uses of water bodies. Therefore, toxicity requirements are a necessary component of the MS4 monitoring program.

The Los Angeles Water Board provided clarification and recommendations to Permittees for the monitoring programs under the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit regarding aquatic toxicity monitoring, particularly pertaining to the requirement to conduct chronic and acute toxicity tests in dry and wet weather conditions and requirements for conducting a TIE and outfall monitoring. Further clarification was necessary regarding requirements for follow-up monitoring when aquatic toxicity is present in downstream receiving waters. A memo dated August 7, 2015 was sent to all Los Angeles County MS4 Permittees including the City of Long Beach to provide additional clarification and applies to all monitoring directives and IMPs and CIMPs (in Los Angeles County) developed pursuant to Part VI.B of the previous 2012 Los Angeles County MS4 Permit and Part VII.B of the previous 2014 City of Long Beach MS4 Permit. This guidance is provided in Attachment G of the Order and thus now applies to all Permittees including Ventura County.

K. Regional Studies

The regional studies are optional in this Permit, and are similar to the previous Los Angeles County, the City of Long Beach and Ventura County Permits. Permittees are encouraged to continue to participate in the two regional studies listed below.

1. Southern California Storm Water Monitoring Coalition Watershed Monitoring Program

- a.** The Southern California Storm Water Monitoring Coalition (SMC) Regional Watershed Monitoring Program was initiated in 2008. This program is conducted in collaboration with the Southern California Coastal Water Research Project (SCCWRP), State Water Board's Surface Water Ambient Monitoring Program (SWAMP), three Southern California Regional Water Quality Control Boards (Los Angeles, Santa Ana, and San Diego) and several county stormwater agencies (Los Angeles, Ventura, Orange, Riverside, San Bernardino and San Diego). SCCWRP acts as the facilitator to organize the program and completes data analysis and report preparation.
- b.** The SMC monitoring program seeks to coordinate and leverage existing monitoring efforts to produce regional estimates of the condition of streams and rivers, improve data comparability and quality assurance, and maximize data availability, while conserving monitoring expenditures. The primary goal of this program is to implement an ongoing, large-scale regional monitoring program for southern California's coastal streams and rivers.
- c.** A comprehensive program was designed by the SMC, in which each participating group assesses its local watersheds and then contributes their portion to the overall regional assessment. Types of data being collected include water quality, physical habitat and riparian condition, and biological communities, including benthic invertebrates and algae. Sampling occurs in 17 coastal southern California watersheds between Ventura to the Tijuana Rivers. Sites are allocated each year based on current study design.

2. Southern California Bight Project

The Southern California Bight Project (SCBP) is an ongoing marine monitoring collaboration that was started in 2008 between the Southern California Coastal Water Research Project (SCCWRP) and nearly 100 participating organizations that examines how human activities have affected the health of 1,539 square miles of Southern California's coastal waters. The objective is to investigate the condition of marine ecosystems across both time and space.

L. Special Studies

The special studies included in Part XI of the MRP are optional for all Permittees in Los Angeles and Ventura counties. It is encouraged that Permittees consider conducting these special studies. The results of these studies may support future Basin Plan amendments to revise TMDLs and/or water quality standards.

M. Reporting Requirement Objectives

Part XII of the MRP outlines objectives for the Order's reporting requirements. These objectives are consistent with the previous MS4 permits.

N. Standard Monitoring and Reporting Provisions

Part XIII of the MRP and Attachment D of the Order includes standard monitoring and reporting provisions. These provisions are consistent with the previous MS4 permits.

O. Reporting Requirements

All reporting requirements in Attachments D, E, H, and I, were carried over from the previous MS4 permits.

1. Program Reports

The Annual Report requirement was required in the previous 2012 Los Angeles County, 2014 City of Long Beach and 2010 Ventura County MS4 Permits, per federal regulations. The Reporting Forms provide summary information to the Los Angeles Water Board on each Permittee's implementation of the minimum control measures (MCMs); participation in one or more Watershed Management Programs; the impact of each Permittee's stormwater and non-stormwater discharges on the receiving water; each Permittee's compliance with receiving water limitations and water quality based effluent limitations; and the effectiveness of each Permittee(s) control measures in reducing discharges of pollutants from the MS4 to receiving waters.

In addition, the Reporting Forms allow the Los Angeles Water Board to assess whether the quality of MS4 discharges and the health of receiving waters is improving, staying the same, or declining as a result of watershed management program efforts, and/or TMDL implementation measures, or other control measures and whether changes in water quality can be attributed to pollutant controls imposed on new development, re-development, or retrofit projects. The Reporting Forms provide Permittees a forum to discuss the effectiveness of its past and ongoing control measure efforts and to convey its plans for future control measures as well as a way to present data and conclusions in a transparent manner so as to allow review and understanding by the general public. Overall, the Reporting Forms allow Permittees to focus reporting efforts on watershed condition, water quality assessment, and an evaluation of the effectiveness of control measures.

Permittees must use the Reporting Forms contained in Attachment H of the Order (i.e., Annual Report Form and Watershed Management Program Progress Report Form). As attachments to the Annual Report Form, Permittees are also required to report on compliance with Trash TMDLs and Trash Discharge Prohibitions using the Trash TMDL Reporting Form and/or Trash Discharge Prohibition Reporting Form contained in Attachment I of the Order or a revised form approved by the Los Angeles Water Board. This option is included so that Permittees are not constrained to the reporting structure of the forms in Attachment I of the Order. Regardless of the reporting format, Permittees are required to report on all the elements within Attachment H and I of the Order.

In the previous permits, Ventura County Permittees developed their own Annual Report form while Los Angeles County Permittees including the City of Long Beach initially used Attachment U-4 (Individual Annual Report Form) from the 2001 Los Angeles County MS4 Permit for reporting on permit implementation. For the 2015/2016 reporting year and onwards, the Los Angeles Water Board provided Los Angeles County Permittees including the City of Long Beach an Individual Form and a Watershed Form for annual reporting. Although the Watershed Form was to

be filled out for Permittees participating in a Watershed Management Program, the Individual Form also contained overlapping questions that pertained to Permittees participating in a Watershed Management Program. To eliminate overlaps and simplify reporting, the Annual Report Forms provided by the Los Angeles Water Board have been revised for the Regional MS4 Permit. These forms still contain all of the elements in the previous forms, but questions have been refined to match the requirements of the Order. Additionally, Permittees participating in a Watershed Management Program will now report on the majority of their Watershed Management Program activities in a separate Watershed Management Program Progress Report form (see below).

The Program Reports shall be submitted electronically by the deadlines specified in Part XIV of the MRP. This is per 40 CFR Part 127 that requires Permittees to electronically report information. According to this requirement, Permittees are required to submit their reports through the Storm Water Multiple Application and Report Tracking System (SMARTS), which is compliant with U.S. EPA's Cross-Media Electronic Reporting Rule (40 CFR Part 3). However, until SMARTS is able to accommodate and accept all Permittee submittals, Permittees are required to submit their Program Reports and semi-annual monitoring data to the Los Angeles Water Board electronically via CDs, DVDs, flash drives, email, etc.

2. Watershed Management Program Progress Report

The Watershed Management Program Progress Report Form, contained in Attachment H, serves as reporting requirements for Watershed Management Program implementation and shall be completed by each Watershed Management Program. The items in this report are directly based on Annual Report requirements included in the previous 2012 Los Angeles County and 2014 City of Long Beach MS4 Permits and are refinements of reporting items contained in the previous Watershed Form used by Los Angeles County Permittees including the City of Long Beach.

Additionally, Part XIV.A.2 of Attachment E has been modified to include a requirement that each Permittee participating in a Watershed Management Program provide the Watershed Management Program Progress Report to the public, including through direct outreach and on its website or a website specifically dedicated for the Watershed Management Program group. This change was made to ensure greater accountability and transparency. The U.S. EPA similarly requires Permittees to post their progress reports on their websites (e.g., Washington, D.C. MS4 NPDES Permit, NPDES Permit No. DC0000221).

3. Monitoring Report

Part XIV.B of the MRP requires Permittees to submit a Monitoring Report twice a year that includes monitoring results and certification. Moreover, Permittees are required to annually submit summary of sampling events, a summary of exceedances of receiving water limitations and WQBELs, QA/QC, and a summary of aquatic toxicity monitoring. The Monitoring Report includes monitoring-related reporting requirements contained in the previous 2012 Los Angeles County, 2014 City of Long Beach, and 2010 Ventura County MS4 Permits.

Permittees must submit monitoring results for sampling events per the schedule indicated in the MRP. This schedule is the same as the 2012 Los Angeles County

and 2014 City of Long Beach MS4 Permits. The Order's reporting schedules are a refinement of the due dates in these previous permits.

In the 2012 Los Angeles County and 2014 City of Long Beach MS4 Permits, receiving water and outfall monitoring results were required to be submitted to the Los Angeles Water Board semi-annually. However, these permits did not identify an actual date for submittal. During permit implementation, Los Angeles County Permittees were directed by the Los Angeles Water Board to submit monitoring results for sampling events for the period, January 1 to June 30, one hundred and sixty-eight (168) days later on December 15; and monitoring results for sampling events for the period, July 1 to December 31, one hundred and sixty-six (166) days later on June 15.

In the 2010 Ventura County MS4 Permit, Permittees were required to submit monitoring data electronically to the Los Angeles Water Board: (1) 90 days from the sample collection date for mass emissions, major outfalls, aquatic toxicity, and TMDL compliance monitoring; and (2) 30 days from the sample collection date for beach water quality monitoring.

The Monitoring Report in the MRP includes a summary of the sampling events that is consistent with the requirements in the previous 2012 Los Angeles County, 2014 City of Long Beach and 2010 Ventura County MS4 Permits. This information will allow the Permittees and the Los Angeles Water Board to evaluate the effects of differing storm events in terms of stormwater runoff volume and duration and in-stream effects.

4. Receiving Water Limitations Compliance Report

The Receiving Water Limitations Compliance Report was required in the previous Los Angeles County, City of Long Beach and Ventura County MS4 Permits within the Receiving Water Limitations Provisions and is being carried over to the Regional MS4 Permit. Permittees participating in a Watershed Management Program are exempt from the requirement to submit this report under the conditions specified in Part XIV.C.4 of the MRP.

P. TMDL Reporting

Part XV of the MRP includes TMDL reporting requirements in the Basin Plan similar to Part XIX in the MRP of the 2012 Los Angeles County and 2014 City of Long Beach Permits. Additionally, it includes clarifying provisions to address unique situations where a Permittee has no MS4 infrastructure or MS4 discharge to waterbodies addressed in a TMDL.

XIII. CALIFORNIA WATER CODE SECTION 13241

California Water Code section 13241 requires the Los Angeles Water Board to consider certain factors when establishing water quality objectives, including:

- (a) Past, present, and probable future beneficial uses of water.
- (b) Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto.
- (c) Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area.
- (d) Economic considerations.

(e) The need for developing housing within the region.

(f) The need to develop and use recycled water.

The Los Angeles Water Board is not establishing any water quality objectives in the Order. However, California Water Code section 13263 requires the Board to take into consideration the provisions of section 13241 in prescribing waste discharge requirements, when such requirements are more stringent than what federal law requires.

In *City of Burbank v. State Water Resources Control Board* (2005) 35 Cal.4th 613, the California Supreme Court considered whether a regional water board must consider the provisions of section 13241 when issuing waste discharge requirements that serve as a NPDES permit by taking into account the costs a permittee will incur in complying with the permit requirements. The Court concluded that whether it is necessary to consider such cost information “depends on whether those restrictions meet or exceed the requirements of the federal Clean Water Act.” (*Id.* at p. 627.) The Court ruled that regional water boards may not consider the factors in section 13241, including economics, to justify imposing pollutant restriction that are less stringent than the applicable federal law requires. (*Id.* at pp. 618, 626-627 [“[Water Code s]ection 13377 specifies that [] discharge permits issued by California’s regional boards must meet the federal standards set by federal law. In effect, section 13377 forbids a regional board’s consideration of any economic hardship on the part of the permit holder if doing so would result in the dilution of the requirements set by Congress in the Clean Water Act...Because section 13263 cannot authorize what federal law forbids, it cannot authorize a regional board, when issuing a [] discharge permit, to use compliance costs to justify pollutant restrictions that do not comply with federal clean water standards”].) However, when the pollutant restrictions in an NPDES permit are more stringent than federal law requires, California Water Code section 13263 requires that the Water Boards consider the factors described in section 13241 as they apply to those specific restrictions.

The Los Angeles Water Board finds that each of the requirements in the Order are not more stringent than what federal law requires for the control of MS4 discharges of pollutants in the Los Angeles Region. The Board makes additional findings with respect to specific program areas throughout the Fact Sheet. Clean Water Act section 402(p)(3)(B) requires MS4 permits to include requirements to effectively prohibit non-stormwater discharges through the MS4 to receiving waters, as well as “controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” The permitting agency, be it the Los Angeles Water Board or U.S. EPA, must therefore include provisions when it finds it is appropriate to do so and to exercise its discretion to determine what permit conditions are necessary to control pollutants in a specific geographic area.

MS4 discharges in the Los Angeles Region are a continuing and significant source of pollutants to receiving waters, many of them impaired. As such, the Board finds that inclusion of all of the requirements in the Order are necessary and appropriate to control MS4 discharges in the Los Angeles Region including, but not limited to, requirements for non-stormwater discharges, technology and water quality-based effluent limitations, TMDLs, receiving water limitations, stormwater management program minimum control measures, and monitoring and reporting to ensure that the requirements of the Order are being met. See Parts IV, V, VI, VII, IX, and XII, in particular. To the extent the requirements in the Order may be more specific or detailed than those enumerated in federal regulations under 40 CFR § 122.26 or in U.S. EPA guidance, the requirements have been designed to be consistent with and within the federal statutory mandates described in Clean Water Act section

402(p)(3)(B) and the related federal regulations and guidance. Consistent with federal law, all the requirements in the Order could have been included in a permit adopted by U.S. EPA in the absence of California's delegated authority to issue NPDES permits. (See *Defs. of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1166.) Each of the requirements in the Order, especially when implemented together, constitute the critical means towards achieving the requirements and goals of the Clean Water Act. Therefore, since the Board determines that each of the requirements in the Order are not more stringent than what federal law requires, there is no legal requirement for the Board to consider the factors of California Water Code section 13241. The State Water Board recently confirmed this conclusion with respect to the 2012 Los Angeles County MS4 Order. (*In the Matter of Review of Approval of Watershed Management Programs and an Enhanced Watershed Management Program Submitted Pursuant to Los Angeles Regional Water Quality Control Board Order R4-2012-0175*, Order WQ 2020-0038, at p. 30, stating “[t]his requirement [to conduct a 13241 analysis], however, does not apply when the waste discharge requirements imposed by the regional board are not more stringent than required by federal law, as is the case here. (emphasis added) (footnotes omitted).”³⁴⁹ The Regional MS4 Permit does not contain any requirements that would result in a different conclusion here.

Further, the issue of whether numeric WQBELs are considered more stringent than what federal law requires, prompting a required consideration of the section 13241 factors, was the subject of recent litigation between the Board and some permittees, which was previously discussed in Part II.F. The Los Angeles Water Board disagrees that the inclusion of numeric WQBELs in the Order is more stringent than what federal law requires, as explained in Part V.B. This is supported by U.S. EPA in its guidance on incorporating TMDL WLAs for stormwater in NPDES permits, which explains that the permit's administrative record needs to demonstrate that WQBELs will achieve the WLAs, whether the WQBEL is expressed numerically or as a BMP.³⁵⁰

Notwithstanding the above, the Los Angeles Water Board has nevertheless considered the factors set forth in California Water Code section 13241 in issuing the Order. The Board's consideration of each of the factors is provided below. The Board has also considered all the evidence that has been presented to the Board regarding the section 13241 factors in issuing the Order. This includes specific costs of compliance information presented to the Board by Permittees and stakeholders, as well as specific cost information developed by the Board itself and that evidence is contained in the Administrative Record.

It is important to note that neither California Water Code section 13241 or section 13263 specifies the type or level of consideration required. Neither do these sections dictate what, if anything, a regional water board must do upon consideration of the factors. Several courts have interpreted the type of consideration required by California Water Code section 13241, primarily in the context of disputes over the “economic considerations” factor. In *City of Arcadia et al. v. State Water Resources Control Board and Los Angeles Regional Water*

³⁴⁹ In Order WQ 2020-0038, the State Water Board also found that the Los Angeles Water Board's consideration of costs of compliance for the 2012 Los Angeles MS4 Permit went “well beyond what is required of them by law to assess the costs associated with their permits and assist municipalities in creating a manageable pathway to address water quality concerns.” (Order WQ 2020-0038 at p. 30.)

³⁵⁰ U.S. EPA, Memorandum, “Revisions to the November 22, 2002 Memorandum ‘Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs,’” (Nov. 26, 2014), p. 6. See also, comment letter from U.S. EPA Region IX on the draft Regional MS4 Permit, dated April 28, 2021, in which U.S. EPA states, “[n]either the Clean Water Act nor the 2014 TMDL Memorandum suggest that expressing WLAs as NELs is any more or less stringent than BMPs.”

Quality Control Board (2006) 135 Cal.App.4th 1392 (“City of Arcadia I”), which involves a challenge to a trash TMDL, the Court of Appeal held that section 13241 does not specify a particular manner of compliance and thus the matter is within a regional water board’s discretion. (*Id.* at p. 1415.) Further, the court found that section 13241 does not define “economic considerations” and there is “no authority for the proposition that a consideration of economic factors under Water Code section 13241 must include an analysis of every conceivable compliance method or combinations thereof or the fiscal impacts on permittees.” (*Id.* at pp. 1415, 1417; State Water Board Order WQ 2020-0038 at p. 31.) In *City of Arcadia et al v. State Water Resources Control Board and Los Angeles Regional Water Quality Control Board* (2011) 191 Cal.App.4th 156 (“City of Arcadia II”), which involved a challenge to a triennial review of water quality standards,³⁵¹ the Court of Appeal held that section 13241 “does not specify how a water board must go about considering the specified factors. Nor does it require the board to make specific findings on the factors.” (*Id.* at p. 177; see also *California Association of Sanitation Agencies and City of Vacaville v. State Water Resources Control Board and Central Valley Regional Water Quality Control Board* (2008) 208 Cal.App.4th 1438, 1464-1465 [in a challenge to certain water quality objectives, the Court of Appeal found that there was no support for the municipalities’ contention that each and every component part of the Water Quality Objectives must be tied to an economic analysis].) In *City of Duarte v. State Water Resources Control Board* (2021) 60 Cal.App.5th 258, 272 (“City of Duarte”), relying on prior case law, the Court of Appeal again affirmed that the “manner in which the Water Control Boards consider and comply with Water Code section 13241 is within their discretion.” It also held that “...the Water Control Boards are charged with taking into account economic considerations, not merely costs of compliance with a permit ... economic considerations also include, among other things, the costs of not addressing the problems of contaminated water.” (*Id.* at p. 276.) Lastly, consideration of section 13241 does not require a “cost-benefit analysis.” (See State Water Board Order WQ 2020-0038 at p. 31.) In the 2001 Los Angeles County MS4 Permit litigation, the trial court held: “[w]here these statutes required ‘consideration’ of economics, the requirement is just that: a consideration. Water Code section 13241 does not require a ‘cost-benefit analysis,’ as Petitioners suggest. Economics is merely a factor to be considered.” (*In re Los Angeles County Municipal Storm Water Permit Litigation* (Super. Ct. Los Angeles County, 2005, No. BS 080548, Statement of Decision from Phase II Trial).) Further, in *City of Duarte*, the Court of Appeal held that the Los Angeles Water Board complied with Water Code section 13241 “as a matter of law” when adopting the 2012 Los Angeles County MS4 permit notwithstanding the absence of a cost-benefit analysis. (*City of Duarte*, supra, 60 Cal.App.5th at pp. 274-275.) The above case law demonstrates that the Los Angeles Water Board has broad discretion in how it considers the section 13241 factors.

Having considered the factors in California Water Code section 13241, the Los Angeles Water Board finds that the requirements in the Order are necessary to ensure the reasonable protection of beneficial uses of waterbodies in the Los Angeles Region and the prevention of nuisance. None of the factors of section 13241, including costs of compliance, is sufficient to justify failing to protect those beneficial uses. Nor is it sufficient to justify omitting any requirement in the Order, as the Board finds that doing so would unreasonably affect the designated beneficial uses of the region’s waters. Additionally, it would be wholly inconsistent with federal requirements to not include the requirements in the Order as the Board has deemed them necessary for the control of MS4 discharges in the Los Angeles Region. Where appropriate, the Board has provided Permittees with additional time to implement control measures to achieve final WQBELs and/or receiving water limitations. In addition, the Board

³⁵¹ 33 U.S.C. §1313(c)(1).

has provided significant flexibility for Permittees to choose how to implement the requirements of the Order, including by working with other Permittees to implement cost-effective control measures. The Order allows Permittees the flexibility to address critical water quality priorities, namely discharges to waters subject to TMDLs, but aims to do so in a focused and cost-effective manner while maintaining the level of water quality protection mandated by the Clean Water Act.

A. Past, Present, and Probable Future Beneficial Uses of Water

Chapter 2 of the Basin Plan identifies designated beneficial uses for surface water bodies in the Los Angeles Region, which are the receiving waters for MS4 discharges. The Basin Plan identifies whether the beneficial use is existing (i.e., attained on or after November 28, 1975 per 40 CFR section 131.3(e)) or a potential beneficial use. Beneficial uses are designated as a potential beneficial use for several reasons, including implementation of the State Water Board's policy entitled "Sources of Drinking Water Policy" (State Water Board Resolution No. 88-63); plans to put the water to such future use; potential to put the water to such future use; designation of a use by the Los Angeles Water Board as a regional water quality goal; or public desire to put the water to such future use.

The beneficial uses identified in the Basin Plan for the Los Angeles Region include water contact and non-contact recreation (REC-1 and REC-2), commercial and sport fishing (e.g., COMM), various types of aquatic life and wildlife habitats (e.g., WARM, COLD, WILD), groundwater recharge (GWR), drinking water supply (MUN), agricultural water supply (AGR), various types of industrial water supply (IND, PROC, POW), and navigation (NAV).³⁵² The Ocean Plan also identifies designated beneficial uses for ocean waters of the State that must be protected, including industrial water supply, water contact and non-contact recreation, including aesthetic enjoyment, navigation, commercial and sport fishing, mariculture, preservation and enhancement of designated Areas of Special Biological Significance (ASBS), rare and endangered species, marine habitat, fish migration, fish spawning and shellfish harvesting. The Los Angeles Region has several ASBS, one of which is within the area covered by the Regional MS4 Permit. This ASBS extends from Latigo Point in Los Angeles County to Mugu Lagoon in Ventura County.³⁵³

Beneficial uses of inland surface waters in the region generally include water contact recreation (REC-1) and WARM, COLD and/or COMM, reflecting the "swimmable/fishable" goal of section 101(a)(2) of the federal Clean Water Act. In addition, inland waters are usually designated as IND, PROC, REC-2, and WILD, and are sometimes designated as waters "that support habitats necessary, at least in part for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered" (RARE).³⁵⁴ Furthermore, many regional streams are primary sources of replenishment for major groundwater basins that supply water for drinking and other uses, and as such must be protected as waters used for recharge of groundwater (GWR). Beneficial uses of coastal waters in the Los Angeles Region, including bays, estuaries, lagoons, harbors, beaches, and the Pacific Ocean, include habitat for marine life and recreation, boating, shipping, and commercial and sport fishing. Beneficial uses of wetlands include many of the same uses designated for the rivers, lakes, and coastal water to which they are connected.

³⁵² Definitions of beneficial uses are contained in Chapter 2 of the Basin Plan.

³⁵³ Basin Plan, pp. 5-4 to 5-7.

³⁵⁴ Ibid.

In the 1990s, the Los Angeles Water Board contracted with California State University to survey and research beneficial uses of all waterbodies throughout the region and relied on these studies in the 1994 update to the Basin Plan. In 2014, the Los Angeles Water Board re-evaluated the current recreational beneficial use designations of the engineered channels in the Los Angeles River Watershed and resolved to retain the current recreational beneficial use designations (Resolution No. R14-011). Beneficial uses of the region's waterbodies are also described by others in documents including, but not limited to, the Los Angeles River Revitalization Master Plan, Lower LA River Revitalization Plan, Los Angeles River Master Plan, the Ballona Creek Trail and Bikeway Environmental and Recreational Enhancement Study, and the Matilija Dam Ecosystem Feasibility Study Final Report.

Beneficial uses of waters impacted by MS4 discharges covered by the Order are also discussed in Part II.A "Description of Receiving Waters and Watershed Management Areas" and Part II.B "Geographic Coverage and Watershed Management Areas" of this Fact Sheet.

As discussed in Part II.C and Part II.D, MS4 discharges of stormwater and non-stormwater convey myriad pollutants to surface waters in every watershed of the region, including bacteria, trash, metals, organic compounds (including various pesticides), and nutrients, among others. These pollutants have damaging effects on both human health and aquatic and riparian ecosystems. Water quality assessments conducted by the Los Angeles Water Board have identified impairment of beneficial uses of water bodies in the Los Angeles Region caused or contributed by these pollutants in MS4 discharges. As a result of these impairments, there are beach postings, fish consumption advisories, ecosystem and recreational impacts from trash and debris, and toxic conditions for aquatic life, among others. Forty-five TMDLs established by the Los Angeles Water Board and U.S. EPA identify MS4 discharges as one of the pollutant sources causing or contributing to impairments of beneficial uses. The requirements of the Order are necessary to protect and restore the past, present, and probable future beneficial uses of surface waters in the region.

B. Environmental Characteristics of the Hydrographic Unit Under Consideration, Including the Quality of Water Available Thereto

Environmental characteristics of each of the Watershed Management Areas (WMAs) covered by the Order, including the quality of water, is discussed in Part II.A and Part II.B of this Fact Sheet. Additional information can be found in the Los Angeles Region's *Watershed Management Initiative Chapter* and the State's Clean Water Act Section 303(d) List of impaired waters.

Watershed Management Initiative Chapter:

http://www.waterboards.ca.gov/losangeles/water_issues/programs/regional_program/watershed/index.shtml

Clean Water Act Section 303(d) List of impaired waters:

https://www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2014_2016.shtml

The quality of water in receiving waters as impacted by MS4 discharges has been routinely monitored by Permittees through the Monitoring and Reporting Programs under all three previous permits (Order No. R4-2010-0108, Order No. R4-2012-0175, and Order No. R4-2014-0024). An analysis of the monitoring data collected under the

three previous permits is provided in Part II.E of this Fact Sheet and in the MS4 Monitoring Data Review Report (July 2020 [Section 3]; November 2020 [Sections 8-11]) as well as in a series of three presentations to the Board at regularly scheduled Board meetings on May 18, 2018, July 12, 2018, and September 13, 2018.

C. Water Quality Conditions that Could Reasonably be Achieved Through the Coordinated Control of All Factors Which Affect Water Quality in the Area

Subsection (c) of section 13241 provides for the consideration of “[w]ater quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area.” As with the other factors in 13241, there is no formal guidance or interpretation on how this factor is to be specifically considered, especially in the context of issuing a permit for a particular type of discharge under Water Code section 13263. In the context of establishing water quality objectives, it is necessary to consider all factors that affect water quality, including an analysis of all sources of the applicable pollutant. However, this factor does not lend itself to being reconsidered later when issuing waste discharge requirements as water quality objectives have already been established and the focus during the permitting stage is regulating a particular type of discharge or a discharge from a specific source, and not all possible sources of pollutants to a receiving water. The water quality objectives implemented by the Order have already been established in the Basin Plan and other water quality control plans through a separate regulatory process, and those water quality objectives were deemed reasonable and achievable when they were promulgated in order to protect beneficial uses.

Some permittees have previously interpreted this factor as requiring the Los Angeles Water Board to determine that water quality conditions or specific permit requirements are “reasonably achievable” and that such a determination includes a consideration of economics or costs of compliance as part of the “reasonably be achieved” language in section 13241(c). No support has been provided to the Board for this interpretation. It is important to note for this analysis that this factor in section 13241(c) does not include a consideration of economics or costs of compliance. The Board interprets this factor as requiring a consideration of the water quality conditions that could reasonably be achieved by the Order from a technical or scientific standpoint only. A consideration of economics, including the costs of compliance, in this factor would be completely superfluous to the wholly separate consideration in section 13241(d) – “economic considerations” – which is discussed in Part XIII.D, below.

When it comes to the permitting stage, the Los Angeles Water Board is required to implement any relevant water quality control plans, including water quality objectives, in its permits. (Water Code § 13263(a).) In so doing, the Board “shall” (among other things) “take into consideration the beneficial uses to be protected, the water quality objectives reasonably required for that purpose,” “other waste discharges,” (*id.*), “together with any more stringent effluent standards or limitations necessary to implement water quality control plans, or for the protection of beneficial uses.” (Water Code § 13377.) The Board has previously established numerous TMDLs as part of its Basin Plan, including state programs of implementation and schedules for achievement of water quality objectives. In addition, USEPA has established several TMDLs for waters in the Los Angeles Region. USEPA established these TMDLs for the protection of beneficial uses. In addition, for several USEPA-established TMDLs, the Los Angeles Water Board has established state programs of implementation and schedules as part of its Basin Plan. The Los Angeles Water Board must therefore also include WQBELs in the permit to

implement the TMDLs and the WLAs established therein to achieve water quality objectives.

Through the prior establishment of the water quality objectives and TMDLs, the Board has found that such water quality conditions can reasonably be achieved, in many cases over time in accordance with implementation schedules, through the coordinated control of all factors which affect water quality in the area. To be sure, implementation of the TMDLs and associated WLAs are expected to reasonably achieve the water quality objectives in the Basin Plan and other water quality control plans if they are applied not only to MS4 discharges, but also to other discharges contributing to water quality impairment, such as industrial discharges and discharges from POTWs (see for example, the Los Angeles River Metals TMDL, which assigns a large portion of the responsibility for pollutant reductions to POTWs, and the Calleguas Creek Organochlorine Pesticides and PCBs TMDL, which assigns a large portion to agricultural dischargers). That said, permitting and regulation of MS4 discharges are a key component of achieving the water quality objectives in the Basin Plan and other water quality control plans. As noted in various places throughout this Fact Sheet, one of the key factors necessary to achieve the water quality objectives in the Los Angeles Region is proper control of MS4 discharges. Indeed, “urban runoff is causing and contributing to impacts on receiving waters throughout the state and impairing their beneficial uses.” (State Water Board Order WQ 2001-15, p. 7; State Water Board Order WQ 2015-0175, p. 15.) Accordingly, and as explained in further detail below, the Los Angeles Water Board finds that the conditions contained in this permit, including numeric WQBELs, are key to ensuring reasonable achievement of water quality objectives in the Los Angeles Region.

Coordinated Control of all Factors Affecting Water Quality

The Los Angeles Water Board and State Water Board regulate water quality in the Los Angeles Region through various permitting actions. The different types of surface water discharges that the Water Boards regulate include point sources such as POTWs, industrial facilities, dewatering activities, groundwater cleanup activities, and MS4 discharges of stormwater and non-stormwater; and nonpoint sources such as agricultural discharges and littering. These discharges are regulated through NPDES permits, waste discharge requirements, waivers of waste discharge requirements, and memorandums of understanding in accordance with State and federal law, regulation, and policy. These various permits and other regulatory mechanisms contain provisions and requirements to achieve water quality objectives and TMDLs, ranging from compliance with pollution prevention plans to compliance with effluent limitations. The regulatory mechanisms are issued as part of a watershed management approach, often according to a TMDL program of implementation, to ensure coordinated implementation by all sources at the watershed scale to attain water quality objectives. TMDLs in particular consider all the likely means of compliance, including a mix of treatment strategies and control measures to be implemented by all sources, which are reflected in the monitoring requirements, implementation schedules, and direction for incorporation of pollutant wasteload and load allocations into permits.

With respect to stormwater specifically, the Los Angeles Water Board and State Water Board regulate many types of stormwater discharges, including those of municipalities,

universities and other non-traditional Phase II discharges³⁵⁵, industrial sites³⁵⁶, construction sites³⁵⁷, and state agencies like Caltrans.³⁵⁸ The Phase II MS4 Permit effectively prohibits non-stormwater discharges and contains effluent and receiving water limitations. The Phase II MS4 Permit specifies the actions necessary to reduce the discharge of pollutants in stormwater to the MEP and comply with TMDLs, including participation in the watershed management programs of Phase I MS4 permittees³⁵⁹ or alternative plan to demonstrate reasonable assurance of compliance with WLAs. The Industrial General Permit contains non-stormwater prohibitions, effluent limitations expressed as numeric action levels and, TMDL requirements, including numeric effluent limitations, and receiving water limitations.³⁶⁰ The Construction General Permit contains non-stormwater prohibitions, effluent limitations expressed as numeric action levels, TMDL requirements, and receiving water limitations.³⁶¹ The Caltrans MS4 Permit effectively prohibits non-stormwater discharges and contains effluent and receiving water limitations, and categorical pollutant requirements to attain TMDLs within 20 years.³⁶²

The Permittees subject to the Order are not solely responsible for ensuring that water quality objectives in the receiving waters are met; rather, achieving and maintaining water quality objectives is a coordinated effort and all regulated dischargers must contribute. That said, as previously noted in Part II.E of this Fact Sheet, MS4 discharges are a significant source of pollutants to receiving waters and their regulation plays an important role in the achievement of water quality objectives. To not regulate discharges from MS4s -- from the Permittees subject to the Order in particular -- would place an undue burden on other types of discharges, especially since, as discussed in Part II.E of this Fact Sheet, MS4 discharges constitute a leading cause of water quality impairment in the Los Angeles Region.

Water Quality Objectives as Incorporated into the Order are Reasonably Achievable

When considering the achievability of water quality objectives from the singular perspective of the Order requirements, the application of the established water quality objectives to the Permittees' MS4 discharges is reasonably achievable.

Permittees can and do coordinate several factors that affect water quality under their jurisdiction. Generally, improvements in the quality of receiving waters impacted by MS4 discharges can be achieved by reducing the volume of stormwater or non-stormwater discharged into the MS4 to receiving waters; reducing pollutant loads to stormwater and

³⁵⁵ State Water Board, Order No. 2013-0001-DWQ (as amended by Orders WQ 2015-0133-EXEC, ORDER WQ 2016-0069-EXEC, WQ ORDER 2017-XXXX-DWQ, ORDER WQ 2018-0001-EXEC, AND ORDER WQ 2018-0007-EXEC), NPDES Permit for Stormwater Discharges from Small MS4s.

³⁶² Ibid. Page 31.

non-stormwater through source control/pollution prevention, including operational source control such as street sweeping and public education, controlling illicit connections and illicit discharges, and conducting inspections of industrial and commercial facilities; and removing pollutants that have been loaded into stormwater or non-stormwater before they enter receiving waters, through infiltration, treatment, or diversion to a sanitary sewer.

The Order is designed to reduce pollutants to waterbodies from MS4 discharges through the implementation of multi-faceted stormwater management programs at the municipal and watershed levels. Overall improvements in MS4 discharge quality are expected to occur over time with ongoing implementation of the requirements in the Order. Information obtained through the robust monitoring programs implemented through the previous permits; implementation of stormwater management measures by individual municipalities within a watershed since the issuance of the first MS4 permits in the Los Angeles Region; analysis during TMDL establishment, including source analysis, loading capacity analysis and linkage analysis; and available predictions from the RAAs of many Watershed Management Programs clearly demonstrate that water quality objectives can be reasonably achieved over time through the coordinated control of all factors that affect MS4 discharge impacts on receiving waters.

Since the issuance of the previous MS4 permits, municipalities both locally and nationally have gained considerable experience in the management of municipal stormwater and non-stormwater discharges. The technical capacity to monitor stormwater and its impacts on water quality has also increased. In many areas, monitoring of the impacts of stormwater on water quality has become more sophisticated and widespread. Better information on the effectiveness of stormwater controls to reduce pollutant loadings and address water quality impairments is now available. The International Stormwater BMP Database (<http://www.bmpdatabase.org/>) provides extensive information of the performance capabilities of stormwater controls and continues to be updated with new studies. Locally, the Southern California Stormwater Monitoring Coalition's California LID Evaluation and Analysis Network (SMC CLEAN) has developed a standard protocol for monitoring of BMPs³⁶³ and a guidance document for constructing, maintaining, and monitoring BMPs.³⁶⁴ The Southern California Coastal Water Research Project (SCCWRP) has analyzed BMP treatment effectiveness using monitoring data specifically from BMPs implemented in California³⁶⁵ and has made their findings readily available to Permittees and regulatory agencies through a web application.³⁶⁶

In fact, some of the many advances in how to effectively control stormwater and pollutants in stormwater have occurred locally within the Los Angeles Region and include the development of cost effective trash full capture devices; stormwater diversion, treatment and beneficial use facilities such as the Santa Monica Urban Runoff Recycling Facility (SMURRF) and Carriage Crest Park; stormwater capture, storage, and reuse facilities such as in Sun Valley; low impact development/site design practices;

and innovative/opportunistic culvert inlet multi-media filters. There are many other case studies of municipalities that have implemented innovative and effective stormwater management measures, many of which have been demonstrated through the implementation of Watershed Management Programs by Permittees in Los Angeles County.

In addition to the advances in monitoring and individual stormwater treatment technologies, there have been advances in watershed-wide planning and implementation of stormwater treatment technologies through state-of-the-art computer modeling. Historically, some have argued that while BMPs may be effective at treating stormwater on a small scale, their effectiveness at treating stormwater on a watershed scale is less certain. However, in recent years, there have been significant advances in the planning and design of watershed wide BMPs to achieve WQBELs and receiving water limitations. These advances are demonstrated by the 11 WMPs and 12 EWMPs submitted by groups of Permittees in compliance with the 2012 Los Angeles County and 2014 Long Beach MS4 Permits. Many of the WMPs and EWMPs were based on the Watershed Management Modeling System (WMMS) developed by Los Angeles County³⁶⁷ in 2010. WMMS is a comprehensive planning tool based on computer models that can simulate hydrologic and pollutant transport processes for all the major watersheds within Los Angeles County. WMMS further predicts the pollutant load reductions that can be achieved by the implementation of various stormwater treatment control technologies throughout the watersheds. This modeling system combines a watershed runoff and receiving water quality model (Loading Simulation Program in C++ (LSPC)) with a BMP performance model (System for Urban Stormwater Treatment and Analysis Integration (SUSTAIN)) to determine the most cost-effective combination of stormwater management measures to achieve desired water quality outcomes. Los Angeles County updated WMMS in 2020 (WMMS 2.0) based on more recent input and water quality calibration data to further refine and improve its predictive capabilities.³⁶⁸ Eight of the WMPs and 12 EWMPs all used WMMS or similar cutting edge modeling systems as part of their RAAs to characterize their current pollutant loading, determine the required reductions to meet WQBELs and receiving water limitations, and prescribe the number, location, and design specifications for BMPs that could meet their required load reductions to achieve water quality objectives within prescribed timeframes. These RAAs prove that the Permittees' MS4 discharges can reasonably achieve the required water quality conditions, either immediately or over time.

The Water Quality Objectives Incorporated in the Order Consider Local Conditions and Provide Flexibility in Implementation

The Order contains requirements based on water quality objectives and TMDLs, which, where appropriate, incorporate information regarding local conditions and flexibility such that they can reasonably be achieved by Permittees. The following paragraphs give examples of how local conditions are already incorporated into receiving water limitations and water quality-based effluent limitations for bacteria and metals, two of the most pervasive categories of pollutants found in MS4 discharges.

³⁶⁷ Los Angeles County Flood Control District and Los Angeles County Department of Public Works. 2020b. *Watershed Management Modeling System Version 2.0 Phase II Report: BMP Model and Optimization Framework*. Los Angeles County Department of Public Works, Stormwater Quality Division.

³⁶⁸ Ibid.

Bacteria

Bacteria TMDLs in the Los Angeles Region implement single sample water contact recreation bacteria water quality objectives by using a reference system/antidegradation approach. This approach ensures that “bacteriological water quality is at least as good as that of a [local] reference system and that no degradation of existing bacteriological water quality is permitted where existing bacteriological water quality is better than that of the selected reference system.”³⁶⁹ As a result of this approach, the Order’s bacteria receiving water limitations are expressed in the form of annual allowable exceedance days, which allow Permittees to exceed bacterial water quality objectives in receiving waters at the same frequency as a local reference water body. This approach takes into consideration natural sources of bacteria, which may cause or contribute to exceedance of the single sample water quality objectives.³⁷⁰

Additionally, engineered channels are subject to an exception called the high flow suspension, which suspends bacterial water quality objectives associated with REC-1 (water contact recreation) and REC-2 (non-contact water recreation) beneficial uses during days with rainfall greater than or equal to 0.5 inch and the 24 hours following the rain event. Receiving waters that are engineered channels in which this suspension applies include portions of Ballona Creek, Dominguez Channel, Los Angeles River, and San Gabriel River.³⁷¹ This exception, which is implicitly incorporated into the Order’s receiving water limitations, is also included in the Order’s compliance determination provisions (Part X.A.3) for clarity.

Furthermore, in the Ballona Creek watershed specifically, the Los Angeles Water Board removed the REC-1 use in Ballona Creek Reach 1 and revised the REC-1 use in Ballona Creek Reach 2 to Limited REC-1 based on the results of a Use Attainability Analysis. The analysis was conducted between March and August of 2002 to determine actual and potential recreational uses of the creek in conformance with 40 CFR § 131.10(g). The result of the remaining REC-2 use designation in Reach 1 and the new Limited REC-1 use designation in Reach 2 are higher single sample geometric mean limits for the bacteria water quality objectives to protect those uses.

Metals

Metals receiving water limitations and WQBELs are derived from 40 CFR section 131.38 (also known as the California Toxics Rule or CTR). The CTR specifies water quality objectives for metals as a function of water-effect ratios (WERs) which, by default, have a value of 1.0. The Los Angeles Water Board has approved several site-specific WERs in the Los Angeles River and Calleguas Creek watersheds, ranging in values from 1.32 to 9.69, that account for local water quality conditions that may influence the bioavailability and/or toxicity of metals. These site-specific WERs, all being greater than 1.0, have adjusted receiving water limitations and WQBELs, including those for MS4 discharges, to more accurately reflect the toxicity of metals to aquatic life in these receiving waters.

³⁶⁹ Basin Plan Chapter 3

³⁷⁰ Tiefenthaler, L.L., E.D. Stein, G.S. Lyon. 2008. Fecal Indicator Bacteria (FIB) levels during dry weather from southern California reference streams. Technical Report 542. Southern California Coastal Water Research Project. Costa Mesa, CA.

³⁷¹ Basin Plan Table 2-1a

Similarly, the Los Angeles Water Board adopted site specific water quality objectives for lead based on the results of a Permittee-led special study. The study recalculated the acute and chronic lead objectives for portions of the Los Angeles River using an expanded nation-wide dataset provided by USEPA following USEPA procedures. The Los Angeles Water Board revised the existing Los Angeles River Metals TMDL to update the numeric targets and WLAs, including those for MS4 discharges, based on the recalculated lead objectives. The resulting numeric targets and WLAs for lead were greater than those in the original TMDL.

Additionally, several metals TMDLs considered and, where appropriate, used site-specific metals translators. These translators represent the fraction of total recoverable metals in a receiving water that is in the dissolved form. Site-specific metals translators were used to calculate the metals waste load allocations in the metals TMDLs for Ballona Creek, Los Angeles River, Los Cerritos Channel, and San Gabriel River. These waste load allocations are incorporated into the Order as water quality-based effluent limitations.

Conclusion

Based on a consideration of all factors controlling water quality in the region, including the multiple types of discharges regulated by the Los Angeles Water Board and State Water Board, the multiple types of stormwater-specific discharges regulated by the Los Angeles Water Board and the State Water Board, the multiple actions that Permittees can take to reduce pollutants in their discharges, and the effectiveness of these actions as demonstrated by monitoring and the RAAs in existing watershed management programs, the Los Angeles Water Board finds that water quality conditions based on the requirements of this Order to implement water quality objectives can reasonably be achieved, even if such conditions are achieved over time (see Table F-26). The water quality objectives themselves have already been established and found to be reasonably achievable. In many cases, the Los Angeles Water Board has considered special studies and site-specific information to ensure that the water quality objectives are no more stringent than necessary to protect beneficial uses without degradation of water quality. The requirements of the Order based on these water quality objectives, including numeric WQBELs to implement TMDL WLAs, are reasonably achievable.

D. Economic Considerations

The Los Angeles Water Board recognizes that economic information, including cost information, is invaluable for informed decision-making and for the evaluation and improvement of policies and practices. Economic information is also critical for Permittees to manage their assets, implement cost-effective programs, and develop successful funding strategies to achieve overall improvements in water quality within the region.

The Legislature did not define “economic considerations” in California Water Code section 13241. As noted in *City of Arcadia I*, there is no reported court decision analyzing the “economic considerations” phrase of the statute. In *City of Burbank*, the California Supreme Court, “without discussion, concluded that in adopting Water Code section 13241 the Legislature intended ‘that a regional board consider the cost of compliance [with numeric pollutant restrictions] when setting effluent limitations in a wastewater discharge permit.’ (Italics added.)” (135 Cal.App.4th at 1415.) While the California Supreme Court assumed “economic considerations” includes costs of compliance, it did indicate that this factor is broader. (*City of Burbank*, 35 Cal.4th at 618 [noting that when a regional board is considering whether to make pollutant restrictions in a permit more

stringent than federal law requires, “California law allows the board to take into account economic factors, *including* the wastewater discharger's cost of compliance.” (emphasis added.)] As discussed in the introduction to this Part XIII, in *City of Duarte*, the Court of Appeal held that “...the Water Control Boards are charged with taking into account economic considerations, not merely costs of compliance with a permit ... economic considerations also include, among other things, the costs of not addressing the problems of contaminated water.” (*City of Duarte, supra*, 60 Cal.App.5th at 276.) Since the Los Angeles Water Board has broad discretion in how it considers this factor, the Board interprets this factor as not only requiring a consideration of the costs of compliance, but also other relevant economic factors such as the societal and environmental costs of not adequately controlling MS4 discharges and cost savings associated with capture and beneficial use of stormwater and non-stormwater to offset the need to purchase imported water.

Many of the costs that will be incurred by permittees as a result of implementing the Order are not fundamentally new. MS4 permits, and stormwater and urban runoff management programs to implement MS4 permit requirements, have been in place in the Los Angeles Region for 30 years. Since the MS4 permits issued in the 1990s, Permittees have been required to effectively prohibit non-stormwater (i.e., dry weather urban runoff) discharges that are a source of pollutants to receiving waters. Since the late 1990s and early 2000s, Permittees have been required to ensure that their MS4 discharges do not cause or contribute to an exceedance of water quality standards (also known as “receiving water limitations”) in receiving waters. Costs incurred by Permittees to implement the Order will largely be related to continued efforts to meet these longstanding requirements. Furthermore, all three prior permits included requirements to implement WQBELs consistent with the assumptions and requirements of applicable TMDL wasteload allocations. There are only a limited number of new TMDL-related requirements in the Order (see Table F-25). Nonetheless, as described below, the two methods used to project the cost of compliance assume that no costs have been incurred to date (i.e., expenditures incurred to date to implement TMDLs and WMPs/EWMPs have not been subtracted from the total projected costs). This was done for consistency and ease of calculation. As a result, projected costs are conservative overestimates.

The Los Angeles Water Board recognizes that these costs of compliance are significant and that many Permittees have limited resources to implement actions to address their MS4 discharges. Based on the economic considerations below, the Board has structured the permit as flexibly as possible to give Permittees the opportunity to sequence actions to address the highest water quality priorities; options to demonstrate compliance; the ability to customize their control measures based on local conditions, including the “minimum control measures”; sufficient time to comply (in many cases decades from the time the TMDL was established); opportunities to request time extensions based on economic factors among others; and the ability to collaborate and pool their resources to implement programs and projects to achieve compliance and to also collaborate and pool their resources to monitor their compliance. The inclusion of a voluntary watershed management program alternative compliance pathway allows Permittees to submit a plan, either individually or in collaboration with other Permittees, for Los Angeles Water Board approval that allows for actions to be customized and prioritized based on specific watershed conditions and needs. The Order also allows Permittees to customize monitoring requirements, which they may do individually, or in collaboration with other Permittees. Permittees can choose to implement the least expensive measures that are effective in meeting the requirements of the Order.

The Permittees' choices regarding how to comply can take into account the specific conditions within the watershed, such as:

- Types of pollutants targeted
- Site characteristics (e.g., existing infrastructure, land use, infiltration potential)
- Costs of controls
- Compliance schedules
- Current compliance rates
- Other socio-economic factors, technology, inflation, risks, regulatory framework

Further, the WMP/EWMP compliance alternative provided in the prior Los Angeles County MS4 Permit and City of Long Beach MS4 Permit, and which is included in the Order, allows Permittees to adapt their programs based on new data and information to be more cost-effective.

The Watershed Management Program proposed by the Rio Hondo/San Gabriel River Water Quality Group is an example of this. The Los Angeles County Permittees participating in this group are the cities of Arcadia, Bradbury, Duarte, Monrovia, and Sierra Madre, the County of Los Angeles, and the Los Angeles County Flood Control District. On April 21, 2016, the Los Angeles Water Board approved the Group's EWMP pursuant to the 2012 Los Angeles County MS4 Permit. At that time, the Group estimated that the cost for the entire program exceeded \$1.4 billion. On March 30, 2018, the Group submitted proposed modifications to its approved EWMP pursuant to the adaptive management provisions of the 2012 Los Angeles County MS4 Permit. The proposed revised EWMP entailed extensive and significant modifications to the approved EWMP, including an updated Reasonable Assurance Analysis, changes to watershed control measures, and changes to interim compliance deadlines. From March 2018 to December 2018, the Los Angeles Water Board worked closely with the Group on its proposed revisions. On December 17, 2018, the Group submitted its proposed revised EWMP. On April 2, 2019, the Los Angeles Water Board approved the modifications to the Group's EWMP proposed on December 17, 2018. The Group now estimates the cost of their revised program to be \$121.8 million, or approximately 9% of the original estimated cost. The deadlines for completion of these projects are 2026 for the San Gabriel River watershed portion, and 2028 for the Los Angeles River/Rio Hondo watershed portion.³⁷²

The Order also does not require permittees to fully implement all requirements within a single permit term; if Permittees demonstrate they are meeting established interim requirements and schedules that demonstrate progress toward final compliance, then they are complying during the term of the Order, i.e., Permittees do not have to comply with many final WQBELs and receiving water limitations during the 5-year term of the Order. Therefore, the costs to achieve final compliance will be spread out and incurred incrementally over several permit terms. Permittees may also request time schedule orders, where justified, to meet WQBELs and receiving water limitations where final compliance deadlines have passed, and Permittees need additional time to achieve compliance. Lastly, the Order includes several reopener provisions whereby the Board

³⁷² Rio Hondo/San Gabriel River Water Quality Group, Rio Hondo/San Gabriel River Revised Watershed Management Program, May 17, 2019. Note that approximately 30% of the original cost estimate was for implementation in the City of Azusa, which is no longer a participant in this group.

can modify the Order based on new information gleaned during the term of the Order and/or to modify the Order to reflect revisions to TMDLs, including schedules and final deadlines.

1. Los Angeles Water Board's Consideration of Projected Costs to Comply with the Order

The following is a high-level estimate of the possible range of projected costs to comply with the Order, including compliance with the WQBELs that have been incorporated consistent with available TMDL wasteload allocations. The Board notes that cost of compliance with the WQBELs is inextricably tied to compliance with the other requirements in the Order, including compliance with receiving water limitations, the prohibition on discharges of non-stormwater, and stormwater management program minimum control measures.

a. Sources of data. The costs of implementing the Order were examined by primarily utilizing three sources of data:

- i. Estimates of the cost of complying with TMDL wasteload allocations assigned to MS4 discharges, which the Board developed and considered during the establishment of each TMDL. (Used in Method 1.) These estimates were presented in TMDL Staff Reports. As this indicates, there are instances outside of the Order where the Board previously considered economics as it relates to Permittees' costs of compliance. In the case of TMDLs, these considerations resulted in many lengthy schedules for TMDL implementation, particularly for pollutants associated with stormwater (i.e., wet weather) discharges from MS4s. Similarly, the State Water Board considered costs when adopting the Trash Amendments, which included a new water quality objective for trash and implementation provisions, including a discharge prohibition, which have been incorporated into the Order.³⁷³
- ii. Estimates of the cost of fully implementing Watershed Management Programs and Enhanced Watershed Management Programs developed to comply with MS4 permit requirements. (Used in Method 2.)
- iii. Annual expenditure and budget data that are self-reported by the Permittees in their annual reports. (Used in Methods 1 and 2.)

b. Methods of Estimating Costs and Reported Costs. The Los Angeles Water Board used two methods to estimate a possible range of costs to comply with the Order.

Method 1: In the first method, the Los Angeles Water Board analyzed cost estimates that the Board had developed during the adoption of TMDLs and documented in TMDL Staff Reports. Note that for this method, we conservatively assume that no costs have already been incurred by Permittees. However, we know that Permittees have incurred costs associated with implementation of their programs such that the remaining cost for achieving final compliance under the Order is some fraction (less than 100%) of the original cost estimate.

³⁷³ State Water Board Resolution 2015-0019. [Amendment to the Water Quality Control Plan for Ocean Waters of California to Control Trash and Part 1 Trash Provisions of the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California](#). Web. 20 June 2019.

Method 2: In the second method, for Permittees in Los Angeles County, the Los Angeles Water Board staff compiled cost estimates of implementing structural BMPs presented in Watershed Management Programs and Enhanced Watershed Management Programs. For Permittees in Ventura County, Los Angeles County Permittees' anticipated costs were used to project costs to implement similar Watershed Management Programs in Ventura County. Note that in this method, similar to above, we apply the conservative assumption that little to no money has been spent during the prior and current permit terms to implement projects in the Watershed Management Programs and Enhanced Watershed Management Programs that were approved in 2015-2016 or, in the case of Ventura County Permittees, to implement projects to achieve TMDLs that were first incorporated into the 2009 Ventura County MS4 Permit.

Additional EWMP Development Costs: Estimates from Methods 1 and 2 were considered along with Ventura County's initial costs of developing EWMPs and WMPs. Ventura County currently does not participate in any EWMP or WMP but may develop EWMPs (now referred to as WMPs) in the next permit term. Ventura County conducted its own analysis in order to estimate development costs.³⁷⁴

Additional Stormwater Management Program Costs: Estimates from Methods 1 and 2 were considered along with Permittees' annual reported costs for existing elements of their stormwater management programs. These annual reported costs were tabulated based on the reported costs of implementing their stormwater management programs as well as costs associated with program management, monitoring programs, and a category described as "Other." Most of these annual reported costs are incurred in addition to structural BMP costs calculated in Methods 1 and 2. In these annual reported costs, some Permittees reported costs for capital projects, Regional Projects, Green Streets, and Restoration Projects, which were removed to avoid double counting. As noted below, there is wide variability in the Permittees' reported cost of compliance, which is not easily explained.³⁷⁵

c. Method 1: Projected Costs from TMDL Staff Reports

As noted above, in the first method for estimating the projected cost to comply with the Order, the Los Angeles Water Board used its analyses regarding costs of TMDL compliance.

As noted earlier, for the most part, the TMDL provisions in the Order are not new but rather continuing requirements from the prior three permits. Of the 45 TMDLs incorporated in the Order, only three are new for Los Angeles County Permittees, including the City of Long Beach, and six are new for Ventura County Permittees (see Table F-25). Nevertheless, the Los Angeles Water Board acknowledges Permittees will need to complete additional implementation actions during the term of the Order to make progress

³⁷⁴ Larry Walker Associates, "Preliminary Ventura County MS4 Permit Structural BMP Implementation Cost Estimate," dated June 1, 2017.

³⁷⁵ See Attachment (PG Environmental. Technical Memorandum: WA 1-67 – Task D – Revised Cost Analysis and Identification of Representative Permittees with Relatively Higher Costs. April 8, 2018; PG Environmental. Technical Memorandum: WA 1-67 – Task D3 – Analysis of Costs for Select MS4 Permittees. June 29, 2018.)

towards, and ultimately achieve, compliance with the TMDL provisions where final compliance deadlines have not yet passed and/or compliance has not yet been achieved.

As also noted earlier, the Board previously considered the cost of complying with TMDL wasteload allocations assigned to MS4 discharges during the establishment of each TMDL. The costs of complying with these TMDLs, including the WQBELs derived from the TMDL WLAs, which are incorporated into the Order, are not additive. For example, the costs estimated for compliance with a TMDL for one pollutant in a watershed, such as metals, can be applied to the costs to achieve compliance with a TMDL for another pollutant in the same watershed, such as pesticides, because the same implementation strategies can be used for both pollutants. Several MS4 permittees have recognized this opportunity in the multi-pollutant TMDL implementation plans they have submitted (e.g. Ballona Creek Metals/Bacteria TMDLs and Machado Lake Pesticides/Nutrients TMDLs). In other words, the estimated cost of complying with the Ballona Creek Metals TMDL can apply to metals, pesticides, PCBs, and bacteria. The costs for complying with trash TMDLs are based on different implementation strategies (e.g., full capture devices), but those strategies are effective at removing metals and toxic pollutants as well.³⁷⁶ Thus, the costs estimated for each TMDL should not be added to determine the cost of compliance with all TMDLs. The staff reports for the various TMDLs include this explanation, and also discuss the cost efficiencies that can be achieved by treating multiple pollutants. Further, as noted earlier, the Board's consideration of the cost of compliance in establishing each TMDL has resulted in lengthy implementation schedules to achieve water quality standards. These implementation schedules have been used to establish compliance schedules in the Order.

The Los Angeles Water Board compiled the cost of complying with TMDL wasteload allocations assigned to MS4 discharges in a staff memo titled "2020 Regional MS4 TMDL Compliance Costs," dated July 17, 2020 (TMDL Staff Report Cost Memo). Using costs estimated during the establishment of TMDLs, the TMDL Staff Report Cost Memo estimated the total capital cost of implementing the 45 TMDLs included in the Order to be \$5.0B with total annual operation and maintenance (O&M) costs of \$419.2M, yielding a total 20-year cost of \$13.4B in 2019 dollars, undiscounted. This estimate is broken down by watershed in Table F-28, below. The estimated cost by Permittee is available in the Administrative Record for the Order.

³⁷⁶ In connection with the Statewide Trash Amendments, the Los Angeles Water Board sent Permittees California Water Code Section 13383 Orders directing Permittees to notify the Los Angeles Water Board regarding how they intended to comply with the statewide trash control provisions. In so doing, Permittees have proposed a variety of implementation strategies (e.g., full capture devices as well as institutional controls), some of which may be effective at removing other pollutants as well and therefore may offset the cost of compliance with the TMDLs.

Table F-28. Estimated Costs of Implementing TMDLs Through the Order by Watershed (millions, 2019 dollars).

| Watershed | Capital Cost | Annual Operation and Maintenance Cost | Total 20-Year Cost |
|-------------------------------|---------------------|--|---------------------------|
| Ballona Creek | \$466.27 | \$61.40 | \$1,694.26 |
| Calleguas Creek | \$46.35 | \$2.90 | \$104.30 |
| Dominguez Channel | \$259.13 | \$1.21 | \$283.30 |
| Los Angeles River | \$2,297.78 | \$287.38 | \$8,045.42 |
| Los Cerritos Channel | \$322.24 | \$14.51 | \$612.42 |
| Machado Lake | \$18.87 | \$1.82 | \$55.27 |
| Malibu Creek | \$255.35 | \$6.46 | \$384.59 |
| Marina Del Rey | \$44.49 | \$0.04 | \$45.34 |
| Miscellaneous Ventura Coastal | \$4.86 | \$0.27 | \$10.32 |
| San Gabriel River | \$536.42 | \$26.82 | \$1,072.83 |
| Santa Clara River | \$163.65 | \$8.18 | \$327.35 |
| Santa Monica Bay | \$561.56 | \$5.73 | \$676.20 |
| Ventura River | \$27.81 | \$2.47 | \$77.24 |
| Total Cost | \$5,004.77 | \$419.20 | \$13,388.85 |

Source: Los Angeles Water Board analysis of TMDL Staff Reports

The TMDL Staff Report Cost Memo includes costs already incurred and costs expected to be incurred over the course of the TMDL implementation periods. The TMDL Staff Report Cost Memo does not include costs incurred from implementing the six stormwater management program elements, commonly referred to as “minimum control measures” or “MCMs.” Implementation of these requirements can be effective in reducing TMDL pollutants. For example, bacteria discharges can be reduced by implementing the effective prohibition on non-stormwater discharges as required by Clean Water Act section 402(p)(3)(B)(ii) and an illicit discharge detection and elimination program as required by “minimum control measures” established under 40 C.F.R. section 122.26(d)(2)(iv), which could largely, if not entirely, implement bacteria TMDLs, particularly during dry weather. The Order would include these requirements even in the absence of TMDLs, and their costs are therefore not included in the TMDL Staff Report Cost Memo. For purposes of considering Permittees’ cost of compliance, this estimate also does not include monitoring and reporting costs, which are included in Permittees’ annual reported costs presented further below, or costs for non-MS4-related TMDL implementation methods, such as dredging.

The projected cost estimates in the TMDL Staff Report Cost Memo were calculated by adding the costs estimated for each TMDL when they were established, accounting for costs which overlap in order to avoid double

counting. Many BMPs will implement multiple TMDLs at the same time so the cost of the BMP does not need to be included multiple times for each TMDL. For example, a BMP such as an infiltration project in the Los Angeles River watershed will reduce both bacteria and metals, as required by the Los Angeles River bacteria and metal TMDLs, therefore the cost is represented only once in this cost estimate.

For each watershed, TMDLs with overlapping BMPs and geography were identified, and the TMDL most costly to implement was chosen to represent the set of overlapping TMDLs. Where appropriate, MS4-related costs for the set of overlapping TMDLs were then added to costs of non-overlapping TMDLs implemented in the same watershed. For example, BMPs that implement trash TMDLs were assumed to not affect the progress of meeting other TMDLs. Therefore, for example, in the case of the Los Angeles River Watershed, the cost of implementing the bacteria and metal TMDLs (overlapping TMDLs) were added to the cost of implementing the trash TMDL (non-overlapping TMDL).

The TMDL Staff Report Cost Memo relied on cost estimates as included in the staff reports for Los Angeles Water Board-established TMDLs or the cost estimates as included in the staff reports for Los Angeles Water Board-established programs of implementation for U.S. EPA-established TMDLs. In some cases, costs for U.S. EPA-established TMDLs without Los Angeles Water Board-established programs of implementation were represented by an overlapping Los Angeles Water Board-developed TMDL. In other cases, the TMDL was based on “existing conditions,” meaning that pollutant limits were based on existing pollutant concentrations, which were attaining water quality standards, and no additional costs were included in the TMDL Staff Report Cost Memo for that TMDL. When ranges were given for potential costs, the average of the range was used. When multiple implementation options were presented in the TMDL Staff Report, the mid-priced treatment option was chosen, or if only two options were available, the more expensive option was used. For certain TMDLs, where a preferred method of compliance was presented or where a certain compliance option was the overwhelmingly selected option for compliance by MS4 Permittees (e.g., catch basin inserts for trash), the costs of that preferred method were used. All costs were adjusted to 2019 dollars based on the Federal Reserve GDP Implicit Price Deflator.³⁷⁷

d. Method 2: Projected Costs from EWMPs and WMPs

As noted above, in the second method for estimating projected costs of complying with the Order, for Permittees in Los Angeles County, the Los Angeles Water Board compiled projected cost estimates contained in Watershed Management Programs and Enhanced Watershed Management Programs.³⁷⁸ Permittees developing Watershed Management Programs were

³⁷⁷ U.S. Bureau of Economic Analysis, Gross Domestic Product: Implicit Price Deflator [GDPDEF], retrieved from FRED, Federal Reserve Bank of St. Louis; <https://fred.stlouisfed.org/series/GDPDEF>, April 14, 2020.

³⁷⁸ Los Angeles County Department of Public Works provided a Microsoft Excel spreadsheet of Permittees’ projected cost estimates from September 2015. Upon review by Board staff, discrepancies were found in their total projected cost estimate values, and thus, LA County’s projected cost estimate values are

not required to include a financial strategy; therefore, for some individual and group programs implementation cost estimates were not available. In these cases, “NR” is included in the tables below. For Permittees in Ventura County, Watershed Management Programs from similar jurisdictions in LA County were used to project compliance costs.³⁷⁹

i. Los Angeles County Permittees

Of the 87 Los Angeles County Permittees, the majority (83 out of 87³⁸⁰) elected to develop and implement Watershed Management Programs or Enhanced Watershed Management Programs as a compliance pathway for MS4 permit requirements. Of these 83 Permittees, most (80³⁸¹) have chosen to collaboratively develop and implement these programs. There are 12 Enhanced Watershed Management Programs and 7 Watershed Management Programs that are being implemented by groups of Los Angeles County Permittees. These programs include estimates of the projected costs associated with their full implementation.

For EWMPs, Board staff calculated total costs over a 20-year timeframe, as shown in Table F-29. Most groups presented breakdowns of capital and O&M costs. Some groups reported cost ranges, therefore low and high estimates were calculated. Values were converted to 2019 dollars using the Federal Reserve GDP Implicit Price Deflator. A few EWMPs explicitly reported dollar years, but most did not. For those that did not, staff assumed that the dollar year was the same as the year that the plan was submitted or the year that the most recent plan revision was submitted. Capital costs range from \$34.5M for North Santa Monica Bay to \$6.5B for Upper LA River. Annual O&M costs range from \$1.15M for North Santa Monica Bay to \$123.4 for Upper LA River. Total costs for all EWMPs were estimated to be \$19.8B to \$19.9B in 2019 dollars, undiscounted.

Table F-29. Permittees’ Projected Cost Estimates for EWMP Full Implementation (millions of dollars, 2019\$).

| EWMP Group | Capital (Low) | Capital (High) | Annual O&M (Low) | Annual O&M (High) | Total 20-Year Cost (Low) | Total 20-Year Cost (High) |
|---------------|---------------|----------------|------------------|-------------------|--------------------------|---------------------------|
| Ballona Creek | \$2,892.12 | \$2,892.12 | \$82.55 | \$82.55 | \$4,543.09 | \$4,543.09 |

not presented in this document. Instead, staff independently compiled cost estimates from Permittees’ EWMPs and WMPs, as noted above.

³⁷⁹ Larry Walker Associates, “Preliminary Ventura County MS4 Permit Structural BMP Implementation Cost Estimate,” dated June 1, 2017.

³⁸⁰ The cities of Compton, Gardena, Irwindale, and Rolling Hills opted not to develop and implement a Watershed Management Program or Enhanced Watershed Management Program. The City of Azusa has chosen to not continue its participation in a Watershed Management Program; however, the \$1.46B cost estimate in Table F-29, below, includes the estimate developed for the original program, of which they were a participating Permittee.

³⁸¹ The cities of El Monte, La Habra Heights, and Walnut each opted to develop an individual Watershed Management Program that only addresses their jurisdictional area. The City of Long Beach participates in several Watershed Management Programs with other Los Angeles County Permittees. Additionally, it developed an individual Watershed Management Program for the nearshore areas that are exclusively within its jurisdiction.

| EWMP Group | Capital (Low) | Capital (High) | Annual O&M (Low) | Annual O&M (High) | Total 20-Year Cost (Low) | Total 20-Year Cost (High) |
|--|---------------|----------------|------------------|-------------------|--------------------------|---------------------------|
| Dominguez Channel | \$1,340.65 | \$1,340.65 | \$15.39 | \$15.39 | \$1,648.41 | \$1,648.41 |
| Malibu Creek | \$201.54 | \$201.54 | \$3.86 | \$3.86 | \$278.71 | \$278.71 |
| Marina del Rey ^a | \$368.12 | \$368.12 | \$2.39 | \$2.39 | \$415.91 | \$415.91 |
| North Santa Monica Bay ^a | \$34.51 | \$34.51 | \$1.15 | \$1.15 | \$57.55 | \$57.55 |
| Palos Verdes Peninsula Cities | \$90.00 | \$129.50 | \$1.34 | \$1.52 | \$116.80 | \$159.90 |
| Rio Hondo/San Gabriel River ^b | NR | NR | NR | NR | \$121.80 | \$121.80 |
| Santa Monica Bay J2 & J3 ^a | \$660.02 | \$660.02 | \$4.82 | \$4.82 | \$756.38 | \$756.38 |
| South Bay Beach Cities | \$46.13 | \$95.48 | \$2.15 | \$3.33 | \$89.04 | \$162.00 |
| Upper LA River ^c | \$6,541.98 | \$6,541.98 | \$123.38 | \$123.38 | \$9,009.65 | \$9,009.65 |
| Upper San Gabriel River | \$1,216.34 | \$1,216.34 | \$44.31 | \$44.31 | \$2,102.59 | \$2,102.59 |
| Upper Santa Clara River ^d | \$669.12 | \$669.12 | NR | NR | \$669.12 | \$669.12 |
| Total | | | | | \$19,809.06 | \$19,925.11 |

a. Some EWMPs presented total O&M costs over 20 years. These values were divided by 20 to calculate annual O&M costs.

b. Rio Hondo/San Gabriel River presented total costs including 20 years of O&M but did not present the breakdown between capital and O&M costs.

c. Upper LA River presented varying O&M costs in their EWMP. These values were averaged to obtain an annual O&M cost.

d. Upper Santa Clara River explicitly did not present O&M costs and assumed that they would be managed with existing resources.

Source: Los Angeles Water Board Analysis

WMP costs were not presented with breakdowns between capital and O&M costs, nor was it clear in most WMPs over what timeframe their projected costs would occur. Only the East San Gabriel Valley Cities and Long Beach Nearshore WMPs mentioned any analysis timeframes, which were 22 years and 5 years, respectively. Therefore, only raw total costs from WMPs are presented in Table F-30. Consistent with EWMP costs, WMP costs were also converted to 2019 dollars using the Federal Reserve GDP Implicit Price Deflator. Total costs for WMPs were estimated to be \$1.1B to \$1.4B.

Table F-30. Permittees' Projected Cost Estimates for WMP Full Implementation (millions of dollars, 2019\$).

| WMP Group | Total Cost (Low) | Total Cost (High) |
|---|------------------|-------------------|
| Alamitos Bay | NR | NR |
| East San Gabriel Valley Cities ^{a,b} | \$55.96 | \$55.96 |

| WMP Group | Total Cost (Low) | Total Cost (High) |
|-------------------------------------|-------------------------|--------------------------|
| LA River Upper Reach 2 ^c | \$226.57 | \$226.57 |
| Long Beach Nearshore ^a | \$318.56 | \$392.89 |
| Los Cerritos Channel | \$356.18 | \$356.18 |
| Lower LA River | \$168.19 | \$314.15 |
| Lower San Gabriel River | \$37.15 | \$69.34 |
| Santa Monica Bay J7 | NR | NR |
| Total | \$1,163 | \$1,415 |

a. East San Gabriel Valley Cities and Long Beach Nearshore were the only groups to mention an analysis timeframe. East San Gabriel Valley Cities estimated costs over 22 years; Long Beach Nearshore estimated costs over 5 years.

b. Costs for East San Gabriel Valley Cities are from their Adaptive Management Report Addendum from December 2019. Their original WMP costs were \$251.4M to \$545.3M.

In a presentation to the Los Angeles Water Board on March 2, 2017, the LA River Upper Reach 2 WMP Permittees shared that their order-of-magnitude estimate for the capital cost of their six regional projects decreased from approximately \$210M to \$102M after evaluating site conditions. This reduced the overall cost of fully implementing the WMP by one third from approximately \$300M to \$200M.

Source: Los Angeles Water Board Analysis

The total estimated projected cost for each individual Los Angeles County Permittee participating in one or more of the 19 WMPs/EWMPs is provided where possible in Table F-31. Seven of the 12 EWMPs and three of the eight WMPs reported costs by jurisdiction. If the individual Permittee is an EWMP member, its costs usually comprise capital costs plus 20 years of O&M. Some EWMPs, however, presented capital costs only when they presented their costs by jurisdiction, which is noted in Table F-31. Also noted are WMP costs, which did not present any breakdown between capital and O&M costs. A few WMPs presented an analysis timeframe, which is also noted in Table F-31.

Table F-31. Permittees' Projected Cost Estimates for WMP/EWMP Full Implementation, by Permittee (millions, 2019\$)

| Los Angeles County Permittee | Total Cost | Description |
|-------------------------------------|-------------------|-----------------------------------|
| Agoura Hills | \$86.72 | Capital cost only |
| Alhambra | \$268.53 | Capital cost plus 20 years of O&M |
| Arcadia | NR | |

| Los Angeles County Permittee | Total Cost | Description |
|------------------------------|------------|--|
| Artesia | \$0.69 | WMP cost, breakdown unknown, 10-year timeframe |
| Azusa | -- | |
| Baldwin Park | \$187.52 | Capital cost plus 20 years of O&M |
| Bell | \$53.12 | WMP cost, breakdown, and timeframe unknown |
| Bell Gardens | \$45.42 | WMP cost, breakdown, and timeframe unknown |
| Bellflower | \$3.19 | WMP cost, breakdown unknown, 10-year timeframe |
| Beverly Hills | \$169.35 | Capital cost plus 20 years of O&M |
| Bradbury | NR | |
| Burbank | \$305.93 | Capital cost plus 20 years of O&M |
| Calabasas | \$180.10 | Capital cost only |
| Carson | \$252.88 | Capital cost only |
| Cerritos | \$4.13 | WMP cost, breakdown unknown, 10-year timeframe |

| West Covina | NR | |
| West Hollywood | \$98.66 | Capital cost plus 20 years of O&M |
| Westlake Village | \$32.45 | Capital cost only |
| Whittier | \$12.12 | WMP cost, breakdown unknown, 10-year timeframe |

- a. Individual Permittee projected cost estimates are not reported (“NR”) for those Permittees participating in the North Santa Monica Bay, Palos Verdes Peninsula Cities, Rio Hondo/San Gabriel River, and South Bay Beach cities EWMPs, as well as the Alamitos Bay, East San Gabriel Valley Cities, Los Cerritos Channel, and Santa Monica Bay Jurisdictional Group 7. Costs are also not available for the cities with individual WMPs, except for Long Beach. For Permittees that are not participating in a WMP or EWMP, “—” is indicated.
- b. Bellflower, Los Angeles, Los Angeles County, Los Angeles Flood Control District, and Signal Hill costs are underestimates because some EWMP/WMP groups that include them did not break down costs by jurisdiction.

Source: Los Angeles Water Board Analysis

ii. Ventura County Permittees

While the prior Ventura County MS4 Permit (Order No. R4-2010-0108) included requirements to implement WQBELs consistent with the assumptions and requirements of TMDL wasteload allocations assigned to MS4 discharges, it did not include provisions allowing Ventura County

Permittees to develop and implement watershed management programs as a compliance pathway for permit requirements. Therefore, Permittee estimates of projected costs specific to the watershed areas in Ventura County are not generally available. However, Ventura County Permittees have estimated projected costs based on information contained in EWMPs developed in Los Angeles County. The analysis and estimates are presented in a technical memorandum prepared by Larry Walker Associates for Ventura County Permittees, "Preliminary Ventura County MS4 Permit Structural BMP Implementation Cost Estimate," dated June 1, 2017.

The EWMPs considered include those for the Upper Santa Clara River, Malibu Creek (the portion within Los Angeles County only), Santa Monica Bay J2 and J3, Upper San Gabriel River, and North Santa Monica Bay Coastal Watersheds. According to the technical memorandum, these EWMPs were selected given their similarity to land use characteristics in Ventura County and to capture the various approaches to selecting the EWMP control measures used in Los Angeles County. As described in the technical memorandum, capital costs per acre of urban area treated were extracted from each of these Los Angeles County EWMPs. A series of unit cost summary statistics were computed including average (mean), median, 25th percentile and 75th percentile. The urban MS4 jurisdictional area for each Ventura County Permittee was multiplied by the 25th percentile unit cost and was assumed to represent the low end of the range of anticipated capital costs. Similarly, the urban MS4 jurisdictional area was multiplied by the 75th percentile unit cost and was assumed to represent the high end of range of expected capital costs. Based on this analysis, total projected capital cost estimates range from \$272M to \$2.0B in 2019 dollars for full implementation through 2040. The total estimated projected cost for each individual Ventura County Permittee is provided in Table F-32.

Table F-32. Ventura County Permittees' Projected Capital Cost Estimates for Full Implementation through 2040, by Permittee (millions, 2019\$).

| Permittee | 25th percentile EWMP Costs | 75th percentile EWMP Costs | Average EWMP Costs | Median EWMP Costs |
|---------------|----------------------------|----------------------------|--------------------|-------------------|
| Camarillo | \$23.40 | \$173.46 | \$88.56 | \$49.07 |
| Fillmore | \$3.56 | \$26.39 | \$13.47 | \$7.47 |
| Moorpark | \$13.00 | \$96.37 | \$49.20 | \$27.26 |
| Ojai | \$5.71 | \$42.34 | \$21.62 | \$11.98 |
| Oxnard | \$41.89 | \$310.56 | \$158.55 | \$87.85 |
| Port Hueneme | \$3.55 | \$26.35 | \$13.45 | \$7.45 |
| Ventura | \$33.43 | \$247.82 | \$126.52 | \$70.10 |
| Santa Paula | \$6.90 | \$51.15 | \$26.11 | \$14.47 |
| Simi Valley | \$42.20 | \$312.84 | \$159.71 | \$88.49 |
| Thousand Oaks | \$53.86 | \$399.29 | \$203.85 | \$112.95 |

| Permittee | 25th percentile EMWP Costs | 75th percentile EMWP Costs | Average EMWP Costs | Median EMWP Costs |
|--|----------------------------|----------------------------|--------------------|-------------------|
| Unincorporated County | \$44.93 | \$333.06 | \$170.04 | \$94.21 |
| Watershed Protection District ^a | - | - | - | - |
| Total Projected Cost Estimate | \$272.42 | \$2,019.62 | \$1,031.08 | \$571.29 |

Note: O&M costs and land acquisition costs (if they are necessary) are not included in the estimates.

- a. A projected cost estimate could not be computed for the Ventura County Watershed Protection District using this method, since the land area within the Watershed Protection District is already accounted for in the jurisdictional area of the 10 cities and unincorporated area of Ventura County.

Source: Larry Walker Associates, June 1, 2017, "Preliminary Ventura County MS4 Permit Structural BMP Implementation Cost Estimate"

The technical memorandum also separately included estimates of projected operation and maintenance (O&M) costs for the capital projects anticipated in the table above for each Ventura County Permittee. Total O&M costs range from \$9.5M to \$119.2M, as shown in Table F-33.

Table F-33. Ventura County Permittees' Projected Annual O&M Cost Estimates for Capital Projects (millions, 2019\$).

| Permittee | Watershed(s) | Low Annual O&M Cost Estimate | High Annual O&M Cost Estimate |
|--------------|---|------------------------------|-------------------------------|
| Camarillo | Calleguas Creek Watershed (CCW) | \$0.82 | \$10.23 |
| Fillmore | Lower Santa Clara River Watershed (LSCRW) | \$0.13 | \$1.56 |
| Moorpark | CCW | \$0.46 | \$5.69 |
| Ojai | Ventura River Watershed (VRW) | \$0.20 | \$2.50 |
| Oxnard | LSCRW, CCW, Coastal | \$1.47 | \$18.32 |
| Port Hueneme | CCW | \$0.12 | \$1.56 |
| Ventura | LSCRW, VRW | \$1.17 | \$14.62 |
| Santa Paula | LSCRW | \$0.24 | \$3.02 |
| Simi Valley | CCW | \$1.48 | \$18.46 |

| Permittee | Watershed(s) | Low Annual O&M Cost Estimate | High Annual O&M Cost Estimate |
|-----------------------|---|------------------------------|-------------------------------|
| Thousand Oaks | CCW, MCW | \$1.89 | \$23.56 |
| Unincorporated County | LSCRW, CCW, VRW, Malibu Creek Watershed (MCW), Coastal (Countywide) | \$1.57 | \$19.65 |
| Total | - | \$9.54 | \$119.16 |

Source: Larry Walker Associates, June 1, 2017, "Preliminary Ventura County MS4 Permit Structural BMP Implementation Cost Estimate"

Combining low and high estimates of capital costs and O&M costs yields total 20-year cost estimates of \$463.2M to \$4.4B for Ventura County, as shown in Table F-34.

Table F-34. Ventura County Permittees' Projected Total Cost Estimates for Capital Projects (millions, 2019\$).

| Permittee | 25th percentile EMWP Costs | 75th percentile EMWP Costs | Low Annual O&M Cost | High Annual O&M Cost | Low Total 20-Year Cost | High Total 20-Year Cost |
|--------------------------------------|----------------------------|----------------------------|---------------------|----------------------|------------------------|-------------------------|
| Camarillo | \$23.40 | \$173.46 | \$0.82 | \$10.23 | \$39.78 | \$378.16 |

Source: Larry Walker Associates, June 1, 2017, "Preliminary Ventura County MS4 Permit Structural BMP Implementation Cost Estimate"; Los Angeles Water Board Analysis

e. WMP Development Costs

In addition to costs of implementing structural BMPs, Permittees in Ventura County may incur initial costs to develop WMPs. Los Angeles County and the City of Long Beach have already undergone the development process for EWMPs and WMPs under their permits for 2012 and 2014, respectively. Thus, we present development costs for only Ventura County. Although Ventura County currently does not have any WMPs, the County estimated potential development costs were they to participate in the WMP process, as shown in Table F-35. Costs were inflated to 2019 dollars using the GDP implicit price deflator and assumed to be incurred in the next permit period. Potential development costs were based on the development process in the 2012 Los Angeles County MS4 Permit, which included creating a Work Plan (for EWMPs), preparing a draft WMP or EWMP, and preparing a final WMP or EWMP. Groups were also required to submit Notices of Intent and, in the case of Permittees developing an EWMP, Memoranda of Understanding to the Board at the beginning of the development process. Additionally, Permittees incur costs to develop companion CIMPs. While this process has been streamlined in this Order (e.g., elimination of Work Plan and MOU requirements, reduction in requirements for Notices of Intent), the projected costs were not reduced.

Table F-35. Ventura County WMP Development Costs (millions, 2019\$).

| Watershed | Overall |
|---|---------------|
| Coastal watersheds | \$0.26 |
| Calleguas Creek Watershed (CCW) | \$0.26 |
| Lower Santa Clara River Watershed (LSCRW) | \$0.26 |
| Malibu Creek Watershed (MCW) | \$0.68 |
| Ventura River Watershed (VRW) | \$0.68 |
| Total | \$2.14 |

Source: Larry Walker Associates, June 1, 2017, "Preliminary Ventura County MS4 Permit Structural BMP Implementation Cost Estimate"

The Ventura Countywide Stormwater Quality Management Program estimated development costs of about \$260,000 for smaller, less complex watersheds (Coastal, CCW, and LSCRW) and \$680,000 for more complex watersheds (MCW and VRW). Total estimated WMP development costs for Ventura County are \$2.14M.

f. Costs of Stormwater Management Program

In addition to the estimates of projected costs for TMDL implementation and projected costs from WMPs and EWMPs, it is generally assumed that Permittees will continue to incur costs similar to or less than those they have reported under Order Nos. R4-2010-0108, R4-2012-0175 and R4-2014-0024 to implement their stormwater management programs’ “minimum control measures” and conduct monitoring and reporting.³⁸² These costs have been reported by Permittees in their Annual Reports and, therefore, are captured by the cost estimates in Table F-36 and Table F-37. For LA County, annual total costs were averaged over three fiscal years, FY16/17-18/19. Over this more recent period, the cost reporting was more consistent across Permittees and reflects the costs, inclusive of enhanced “minimum control measures” in WMPs and EWMPs and CIMP, almost all of which were approved by FY15/16. For Ventura County, annual total costs were averaged over the term of the prior permit, from FY10/11-FY18/19. Structural BMP costs were removed from the tabulation, as these costs are accounted for in Methods 1 and 2. Due to different cost reporting formats for Ventura County and LA County, capital costs were omitted for Permittees in Ventura County, whereas for Permittees in LA County, costs for Distributed Projects and Green Streets, Regional Projects, and Restoration Projects were omitted.

i. Ventura County Permittees: For Ventura County Permittees, these projected annual stormwater program costs are provided in Table F-36 based on the average anticipated budgets reported in the Ventura Countywide Storm Water Quality Management Program Annual Reports during the term of the prior permit (i.e., FY10/11 through 18/19).³⁸³ Costs for each year were converted to 2019 dollars using the Federal GDP Implicit Price Deflator then averaged to calculate projected annual costs.

Table F-36. Estimated Annual Costs Incurred by Ventura County MS4 Permittees for Stormwater Programs (2019\$)

| Permittee | Watershed(s) | Projected Annual Stormwater Program Costs ^a |
|--------------|---------------------|--|
| Camarillo | CCW | \$1,442,616.9 |
| Fillmore | LSCRW | \$191,449.1 |
| Moorpark | CCW | \$509,800.0 |
| Ojai | VRW | \$124,773.8 |
| Oxnard | LSCRW, CCW, Coastal | \$2,170,929.7 |
| Port Hueneme | CCW | \$435,384.0 |

³⁸² For example, instrumenting outfalls with autosamplers is not a recurring activity and was conducted under the prior permits. Additionally, the Order’s minimum control measures provide more flexibility to the Permittees for implementation, relative to the prior permits, allowing Permittees to explore more cost-effective and efficient approaches to implementing their stormwater management programs.

³⁸³ These estimates were calculated by Los Angeles Water Board staff based on a review of the Ventura County Permittees’ Annual Reports.

| Permittee | Watershed(s) | Projected Annual Stormwater Program Costs ^a |
|-------------------------------|-------------------------------|--|
| Ventura | LSCRW, VRW, Coastal | \$1,601,130.5 |
| Santa Paula | LSCRW | \$130,806.0 |
| Simi Valley | CCW | \$2,057,068.4 |
| Thousand Oaks | CCW, MCW | \$1,427,586.4 |
| Unincorporated County | LSCRW, CCW, VRW, MCW, Coastal | \$2,851,452.0 |
| Watershed Protection District | LSCRW, CCW, VRW, MCW, Coastal | \$3,073,985.6 |
| Total | - | \$18,252,525.2^p |

- a. Projected costs based on analysis period FY10/11 through 18/19.
- b. Note that the total includes a separate line item for “Principal Co-Permittee” that was identified in the Annual Reports. As discussed in Part II.C of this Fact Sheet, the Principal Co-Permittee designation given to VCWPD is not being carried over to the Regional MS4 Permit. Where the anticipated budget for the Principal Co-Permittee addresses ongoing requirements under the Regional MS4 Permit, it is assumed that those will either be incurred by VCWPD or will be divided among all Ventura County Permittees in some manner.

Source: Los Angeles Water Board analysis of Ventura County Permittees’ Annual Reports

- ii. **Los Angeles County Permittees:** For Los Angeles County Permittees, these projected annual stormwater program costs are provided in Table F-37 based on the average expenditures reported in the Permittees’ Annual Reports from FY16/17-18/19 to account for enhanced MCMs in approved WMPs and EWMPs and monitoring in CIMPs, which were almost all approved by FY15/16. Costs for each year were converted to 2019 dollars using the Federal GDP Implicit Price Deflator then averaged to calculate projected annual costs.

Table F-37. Estimated Annual Costs Incurred by Los Angeles County Permittees for Implementation of Stormwater Programs (2019\$)

| Permittee | Projected Annual Stormwater Program Costs ^a |
|--------------|--|
| Agoura Hills | \$677,283 |

| Los Angeles County | \$49,739,440 |
| Los Angeles County Flood Control District | \$38,748,435 |
| Total | \$234,810,330 |

a. Projected costs based on analysis period FY 16/17 through 18/19.

Source: Los Angeles Water Board analysis of Los Angeles County Permittees' Annual Reports

Using the Stormwater Management Program costs reported by the Permittees, Los Angeles County Permittees expended a high of \$315 per capita per year (Bradbury) to a low of \$1.66 per capita per year (Carson) over the period 2016-2019.³⁸⁴ Ventura County Permittees expended a high of \$21.49 per capita per year (Camarillo) and a low of \$4.35 per capita per year (Santa Paula) over the period 2010-2019.³⁸⁵

³⁸⁴ For calculations, see Stormwater_Management_Program_Cost_Analysis_LAC_Final.xlsx in the Administrative Record; the cities of Industry, Irwindale and Vernon were not considered when presenting this range of per capita cost due to their very low populations relative to their land area.

³⁸⁵ For calculations, see Ventura_Storwmater_Management_Program_Cost_Final.xlsx in the Administrative Record

g. Summary of total costs estimated from Method 1, Method 2, and Stormwater Management Program Costs

A summary of total cost estimates of complying with the Order is presented in Table F-38 for Method 1 and Table F-39 for Method 2. Costs from Methods 1 and 2 were added to WMP development costs (for Ventura County Permittees) and Stormwater Management Program costs (for all Permittees). Calculating costs using Method 1, which analyzed structural BMP costs estimated in Staff Reports at the time of TMDL development, yielded a total compliance cost of about \$13.4B for structural BMPs. Combined with WMP development and Stormwater Management Program costs, total costs were estimated to be \$18.5B. With Method 2, which analyzed structural BMP costs presented in EWMPs and WMPs, total costs ranged from about \$21.4B to \$25.7B for structural BMPs. Adding WMP development and Stormwater Management Program costs yielded a total cost of \$26.5B to \$30.8B.

Table F-38. Total 20-Year MS4 Costs Estimated from Method 1 (millions, 2019\$)

| Method 1 Costs | TMDL Staff Report Costs | WMP Development | Stormwater Management Program | Total Projected MS4 Costs |
|----------------|-------------------------|-----------------|-------------------------------|---------------------------|
| LA County | – | – | \$4,696.21 | – |
| Ventura County | – | \$2.14 | \$365.05 | – |
| Total | \$13,388.85 | \$2.14 | \$5,061.26 | \$18,452.24 |

Source: Los Angeles Water Board Analysis

Table F-39. Total 20-Year MS4 Costs Estimated from Method 2 (millions, 2019\$)

| Method 2 Costs | EWMP/WMP Costs | | WMP Development | Stormwater Management Program | Total Projected MS4 Costs | |
|----------------|--------------------|--------------------|-----------------|-------------------------------|---------------------------|--------------------|
| | Low | High | | | Low | High |
| LA County | \$20,972.06 | \$21,340.11 | – | \$4,696.21 | \$25,668.27 | \$26,036.32 |
| Ventura County | \$463.17 | \$4,402.77 | \$2.14 | \$365.05 | \$828.22 | \$4,767.82 |
| Total | \$21,435.23 | \$25,742.88 | \$2.14 | \$5,061.26 | \$26,498.62 | \$30,806.27 |

2. Uncertainties in Projected Costs of Compliance

As set forth above, the projected costs, and actual costs, to implement stormwater programs are a significant issue for Permittees. However, it has been, and continues to be, difficult to ascertain the cost at a planning level of fully implementing decades-long stormwater and urban runoff management programs, especially where significant flexibility has been provided to the Permittees to comply both with regard to the manner of compliance and the timeframes for achieving compliance, including permit provisions that allow Permittees to request modifications to both how they achieve compliance and the timeframes for doing so.

There are myriad reasons for this, including but not limited to:

- Innovations in BMPs over time that reduce costs and/or increase pollutant removal;
- Changes in consumer products that reduce or eliminate pollutants in MS4 discharges;
- Limitations of modeling used to identify BMPs that need to be implemented to achieve required water quality outcomes, requiring water quality data for verification/periodic recalibration;
- Imprecise data at the planning stage on site-specific conditions for siting BMPs, which can significantly affect BMP sizing requirements as well as the types of BMPs that can be used at a site; and
- Evolving science and evaluation of local conditions that may support site-specific water quality objectives.

a. Actual Costs: Implementation of Water Quality Improvements Through EWMPs and WMPs

As noted earlier, costs are difficult to reliably estimate at the planning stage. Data collected thus far from some Los Angeles County Permittees participating in WMPs and EWMPs indicate that these initial planning-level projected costs were sometimes over-estimated. For example, Permittees implementing the Los Angeles River Upper Reach 2 WMP found that site-specific conditions (namely, infiltration rates) for their regional BMPs were much more favorable than anticipated, allowing them to significantly reduce the BMP footprint size. This, in turn, reduced the estimated cost of their proposed regional BMPs by half from \$209M to \$102M.³⁸⁶

Several other examples illustrate the same point:

- Ladera Park Stormwater Capture Project (Ballona Creek EWMP): The projected construction cost in the EWMP was \$7M, while the actual construction cost was \$4.9M, a savings of 30%.³⁸⁷
- Roosevelt Park Stormwater Capture Project (Upper LA River EWMP): The projected construction cost was \$33M, while the actual construction cost was \$9M, a savings of over 70%.³⁸⁸
- Carriage Crest Stormwater Capture Project (Dominguez Channel EWMP): The projected construction cost was \$8.7M for a BMP capacity of 9 acre-feet. During design, the BMP capacity was increased by threefold to 27 acre-feet. Additionally, the BMP type was modified from an infiltration project to a diversion to the adjacent wastewater reclamation facility. The actual construction cost for the BMP was \$15.6M.³⁸⁹ This equates to a reduction in the cost per acre-foot from \$967,000 to \$578,000.

³⁸⁶ Presentation by CWE and Tetra Tech on behalf of Permittees in the Los Angeles River Upper Reach 2 WMP, "Los Angeles River Upper Reach 2 Watershed Management Area: Watershed Management Program Implementation Status Update," presented at March 2, 2017 meeting of the Los Angeles Regional Water Quality Control Board. Note that the Permittees had proposed six regional BMPs; given favorable site conditions, the group was able to eliminate one of these BMPs, while still addressing permit requirements.

³⁸⁷ Los Angeles County Dept. of Public Works, "DRAFT: EWMP Planning Cost vs. Actual Cost for Unincorporated County Projects," handout at July 17, 2019 meeting with Los Angeles Water Board staff.

³⁸⁸ Ibid.

³⁸⁹ Ibid.

Permittees also have discretion in deciding how to comply with permit requirements, including requirements to comply with WQBELs and receiving water limitations. What is practicable in one community may not work in another because of differences in population, land use, hydrology, pollution sources, water uses, municipal infrastructure, and community priorities, among other things. For example, as discussed earlier, Permittees participating in the Rio Hondo/San Gabriel River EWMP were prompted to adapt their program to address an error in the initial modeling that overestimated the necessary load reduction for lead, which was identified when reviewing monitoring data, and to be more practicable for their communities by changing the suite of BMPs to be implemented while still addressing permit requirements. These changes reduced the estimated cost by over 90% from \$1.4B to \$121.7M.³⁹⁰ In other cases, however, site conditions may have been less favorable than anticipated, which can increase the cost. For example, the cost estimate for the Gates Canyon Stormwater Capture Project in the Malibu Creek EWMP was \$4.1M, while the actual construction cost was twice that amount at \$8.5M. This increase was because the original concept included an infiltration basin but due to geological constraints the project was modified to a water harvesting system with emergency bypass dry wells.³⁹¹

Furthermore, some EWMPs present assumed land acquisition costs in their cost functions that equate to \$5.6M-\$6.1M per acre for BMPs installed on private parcels³⁹², which would not need to be incurred if Permittees engage in public-private partnerships as municipalities elsewhere in the U.S. have begun doing within the last several years (further discussed in Part XIII.D.2.d of this Fact Sheet). This would result in substantial cost savings.

b. Difficulties in Estimating Costs

Many of the disparities between estimated and reported costs such as those described above are due to the difficulties in reliably estimating costs at the planning stage. Additionally, as noted earlier, reported costs of compliance for the same program element can vary widely from permittee to permittee. To date, standardized methods to estimate the costs of stormwater pollution reduction approaches, particularly on a watershed or subwatershed scale, have not been developed. While there are appropriate grounds for differences among MS4 permits, differences of a very wide margin are not easily explained.³⁹³ As noted, some cost estimates have been over-reported. In other

³⁹⁰ Rio Hondo/San Gabriel River Water Quality Group, "Rio Hondo/San Gabriel River Revised Watershed Management Program," May 17, 2019. It is noted that \$379M of the original cost, about 30%, was attributable to EWMP implementation in the City of Azusa, which discontinued its participation in the revised WMP.

³⁹¹ Los Angeles County Department of Public Works, "DRAFT: EWMP Planning Cost vs. Actual Cost for Unincorporated County Projects," handout presented at July 17, 2019 meeting with Los Angeles Water Board staff.

³⁹² Ballona Creek, Malibu Creek, Upper LA River, Upper Santa Clara River assumed a land acquisition cost of \$129 per square foot, or \$5.6M per acre. Upper San Gabriel River assumed a land acquisition cost of \$139.01 per square foot, or \$6.1M per acre.

³⁹³ Radulescu, Dan, and Xavier Swamikannu. [Review and Analysis of Budget Data Submitted by the Permittees for Fiscal Years 2000-2003](#). Los Angeles Regional Water Quality Control Board, January 2003. p. 2. Web. 20 June 2019.

cases, costs are reported that Permittees would have incurred regardless of their MS4 permit requirements. Not all reported program costs are solely attributable to compliance with requirements of the MS4 permit. Many program components, and their associated costs, existed before the first MS4 permits were issued in the 1990s. A 2005 State Water Board study found that certain reported costs included activities that provide separate and additional municipal benefits such as street sweeping and storm drain and channel cleaning and that the inclusion of these activities and their associated costs was not uniform across municipalities. These costs along with others like solid waste/litter collection costs are not solely or even principally attributable to MS4 permit compliance since these practices have long been implemented by municipalities. Also, some stormwater control measures may be integrated into multi-benefit projects serving many objectives (e.g., a public park whose mowing maintenance schedule is designed to maximize stormwater retention). Other measures may start out as stormwater control measures only to become expected by residents for their other benefits (e.g., dog waste bags at public parks). Therefore, the program cost related to complying with MS4 permit requirements is often some fraction of the total reported costs.

The State Water Board study also noted inherent limitations in the cost data quality. The most significant data quality limitation cited is that the costs provided by the municipalities were not sufficiently detailed or referenced to provide opportunity for independent review of the accuracy and completeness of the cost data. Similarly, the costs presented in the prior MS4 permits in the Los Angeles Region were not presented with supporting data or references so that they can be independently reviewed. Los Angeles Water Board staff often had to seek additional information and clarification from Permittees regarding their reported costs.³⁹⁴

Note that these issues were evaluated in detail in the 2012 Los Angeles County MS4 Permit Fact Sheet and in the State Water Board study. A key finding of the State Water Board study was that a significant portion (greater than 50%) of the costs attributed to stormwater compliance activities also provides additional municipal benefits.³⁹⁵ The remainder of program costs was either pre-existing or resulted from enhancement of pre-existing programs.³⁹⁶ The County of Orange found that an even lesser amount of program costs was solely attributable to MS4 permit compliance, reporting that the cost attributable to implementation of its Drainage Area Management Plan is less than 20 percent of the total budget. The remaining 80 percent is attributable to pre-existing programs.³⁹⁷

Despite these problems, the Board has endeavored to estimate the possible range of costs of compliance with the Order, including WQBELs as presented in Part XIII.D.1 above.

³⁹⁴ See select Annual Report review letters, for example.

c. Improvements in Cost Estimation & Reporting

There are several initiatives in progress to address the challenges of accurately quantifying and reporting the costs to implement stormwater programs, including an effort undertaken by the State Water Board's Office of Research Planning and Performance (ORPP)³⁹⁸ to provide guidance on estimation of costs to implement TMDLs and consistent tracking and reporting by municipalities of costs of permit compliance. The Environmental Finance Center (EFC)³⁹⁹ at California State University, Sacramento recently compiled existing resources on stormwater infrastructure costs and developed suggested guidance to explain best practices for estimating costs. EFC's effort evolved from the State Water Board study in 2005 and includes estimates of costs for permit compliance activities, technical resources that assist stormwater managers, and project costs for both green and grey infrastructure.

ORPP's guidance describes methods for obtaining information on compliance approaches and associated costs and for completing an independent analysis of costs. The guidance strives to promote greater consistency and transparency related to estimation of costs to implement TMDLs. ORPP notes that, even with improved guidance, precise cost estimation remains challenging and the level of precision possible may be low in many cases. For example, industry-wide, there is no uniform database of projects' components and costs to date.

ORPP's guidance as well as the EFC's initiative and others are improving the basis for cost reporting by municipalities and, as a result, the Water Boards' consideration of economics in issuing permits. Los Angeles Water Board staff has participated in developing the ORPP guidance and has provided input on the EFC's initiative, and has considered this information when drafting the Order and associated reporting requirements in Attachments E (Monitoring and Reporting Program or MRP) and H (Annual Report Form). Using this guidance, section 2 (Program Expenditures) of Attachment H requires that all Permittees report costs in a uniform manner based on clearly defined program categories and cost elements. See, also, Table 2.2 in Attachment H.

d. Increasing cost-effectiveness through public-private partnerships

Estimated compliance costs as presented in this Fact Sheet are based on current and past compliance methods. However, Permittees in the Los Angeles region could use relatively new financing and contracting mechanisms that fall under the umbrella of pay-for-performance, a form of public-private partnership, to contribute towards meeting MS4 requirements more cost-effectively while also implementing multi-benefit green infrastructure on private property without needing to acquire private land, which a number of local jurisdictions in the U.S. have done. These pay-for-

³⁹⁸ State Water Board, Office of Research Planning and Performance (ORPP), Guidance for Future Total Maximum Daily Load (TMDL) Municipal Storm Water Cost Estimation, April 16, 2019; State Water Board, ORPP, Guidance for Obtaining Phase I Municipal Separate Storm Sewer System Permit (MS4) Compliance Costs, December 19, 2019.

³⁹⁹ Environmental Finance Center at Sacramento State. 2020 May. Estimating Benefits and Costs of Stormwater Management, Part II: Evaluating Municipal Spending in California. <https://www.efc.csus.edu/reports/efc-cost-project-part-2.pdf>

performance models, also known as pay-for-success, incentivize contractors to find private properties on which to construct green infrastructure, leading to more distributed stormwater capture and benefits, as well as lower costs and faster project timelines than traditional BMP implementation. For example, Philadelphia's Green Acres Retrofit Program encourages contractors to develop portfolios of multiple projects, spreading out risk, and property owners can reduce their stormwater fee if they accept a project on their property. Another example is Prince George's County's Clean Water Partnership, a community-based public-private partnership that prioritizes local minority-owned contractors and develops a local workforce specializing in green infrastructure. These municipalities have used public-private partnerships to supplement gray stormwater infrastructure with green infrastructure, which could also reduce the need for gray infrastructure. By adapting elements of existing public-private partnerships from other parts of the U.S., Permittees in the Los Angeles region have opportunities to green urban landscape and meet MS4 requirements more quickly, cost-effectively, and in the manner that works best locally.

Public-private partnerships can be more cost-effective than traditional stormwater BMP implementation for several reasons. Public-private partnerships structured under a pay-for-performance model shifts risk from municipalities to private partners.⁴⁰⁰ While details of specific pay-for-performance models established by different municipalities vary, municipalities essentially pay private contractors for outcomes, such as when BMPs promised to capture a certain amount of stormwater are successfully completed. Municipalities are not involved in the specific design and management of the BMPs. Municipalities may choose to pay only after construction completion, or they may make payments at certain stages of construction. They may also structure payment models to pay contractors for operations and maintenance over certain time intervals if BMPs are shown to still be effective over those time intervals. In addition, because municipalities would solicit bids from multiple parties, this fosters competition and increases cost-effectiveness. For example, Prince George's County saved more than 40% on costs compared to traditional procurements.⁴⁰¹ And Philadelphia pays a maximum of \$90,000 per acre on private land in its Greened Acre Retrofit Program, compared to the \$250,000-\$300,000 per acre for green infrastructure on public land, a savings of 64%-70%.⁴⁰²

Public-private partnerships could also achieve faster BMP construction due to the nature of being located on private property. There would be fewer administrative steps compared to BMP implementation on public land. Also, projects on private property are more likely to be smaller, simpler projects that could be completed much faster than intensive, major projects on public

⁴⁰¹ WaterWorld. 2019. Prince George's County, Corvias complete stormwater partnership ahead of schedule, under budget. <https://www.waterworld.com/environmental/article/16218798/prince-georges-county-corvias-complete-stormwater-partnership-ahead-of-schedule-under-budget>

⁴⁰² Valderrama, Alisa and Paul Davis. 2015. How Philadelphia's Greened Acre Retrofit Program is catalyzing low-cost green infrastructure retrofits on private property. Natural Resources Defense Council. <https://www.nrdc.org/sites/default/files/philadelphia-green-infrastructure-retrofits-IB.pdf>

property that require specialized equipment and expertise. Furthermore, there is significantly more land that is private than public. Encouraging public-private partnerships would open up many more available locations for BMPs.

Public-private partnerships can be structured in a way to prioritize certain areas for green infrastructure and steer employment towards communities who need it most. Private properties with more impervious surface already present greater opportunity for green infrastructure installation, and higher levels of impervious surface are often correlated with lower levels of neighborhood income, so contractors would already find more green infrastructure opportunities in lower-income neighborhoods. In Los Angeles County, where property owners are subject to the Measure W parcel tax, the opportunity to reduce the tax could be an incentive for property owners to accept the installation of green infrastructure on their property, particularly for lower-income property owners. However, municipalities can offer further incentives, paying more for projects located in neighborhoods with higher need, as was done in a stormwater credit trading program in Washington, D.C.⁴⁰³ Municipalities can also offer to pay more for local and/or minority-owned contractors, as was done in Prince George's County, where greater than 80% of contracts went to local minority-owned businesses. This would provide areas with the greatest need, i.e. low-income, often non-white, and disproportionately impacted by the COVID-19 pandemic, with opportunities for green jobs and greener neighborhoods.⁴⁰⁴

3. Sources of Funding for Permittees and Potential Impacts to Funding Sources Due to COVID-19 and Recovery Efforts

Permittees are required to secure the resources necessary to meet the requirements of the Order, including those necessary to achieve the receiving water limitations and WQBELs. As discussed elsewhere in the Fact Sheet, these permit provisions are required by federal regulations. That said, the Los Angeles Water Board recognizes that in light of the recession caused by the COVID-19 pandemic, local governments around the country are facing significant challenges in financing and constructing stormwater management infrastructure required by the CWA and federal NPDES regulations. However, as of May 2021, the number of vaccinations completed continues to rise both in the region and around the country, and the Biden administration has proposed trillions in new infrastructure spending on top of the \$1.9 trillion dollar American Rescue Plan effective in March 2021, all of which improve the outlook for stormwater funding.

The pandemic brought extraordinary hardship, and it hit society unequally. The unemployment rates in Los Angeles and Ventura Counties in the spring of 2020 hit highs of 18.8% and 14.5%, respectively.⁴⁰⁵ Low-income residents experienced

⁴⁰³ Parrish, Janet. 2018. Off-Site Stormwater Crediting: Lessons from Wetland Mitigation. U.S. EPA. https://www.epa.gov/sites/production/files/2018-10/documents/off-site_stormwater_crediting_lessons_from_wetland_mitigation-2018-04.pdf

⁴⁰⁵ FRED. 2021. Unemployment Rate in Los Angeles County, CA. <https://fred.stlouisfed.org/series/CALOSA7URN>; FRED. 2021. Unemployment Rate in Ventura County, CA. <https://fred.stlouisfed.org/series/CAVENT2URN>

higher rates of unemployment than middle- and high-income residents, many of whom were able to work remotely and more easily avoid becoming infected by COVID-19.⁴⁰⁶ Jobs disappeared in leisure, hospitality, and entertainment, on which Los Angeles County relies heavily. The agricultural industry in Ventura County was also hit hard, and on average received less federal aid compared to growers in other parts of the country.⁴⁰⁷ Due to systemic inequities, COVID-19 has disproportionately hit African Americans and Latinos nationwide.⁴⁰⁸ This has occurred in Los Angeles as well, in addition to disproportionate impacts on the local Pacific Islander population.⁴⁰⁹ Before the pandemic, Permittee municipalities where these underserved communities comprise a significant portion of their populations already had constrained opportunities for revenue generation due to lower average incomes and tax bases.⁴¹⁰ Existing disadvantages in resources have been exacerbated by the pandemic because underserved communities bear a heavier burden in healthcare costs and deaths. In Los Angeles, areas with high poverty had almost four times the death rate on average than areas with low poverty.⁴¹¹ Furthermore, African Americans and Latinos were more likely to be laid off or furloughed because of the pandemic.⁴¹²

Despite the real hardships, at the macro level economic suffering was not as bad as feared in early predictions. As of May 2021, during the course of the pandemic, the federal government has put more than \$5 trillion into the economy.⁴¹³ Congress passed the American Rescue Plan, which extended unemployment benefits, sent stimulus checks to the public, and sent \$350 billion to state and local governments, with stormwater infrastructure being one of the many intended uses of this funding.⁴¹⁴ President Biden has also ordered that 40% of benefits from federal climate action go to underserved communities as part of the Justice40 initiative.⁴¹⁵

As of May 2021, predictions are that the California 2021-2022 budget will have a surplus of \$38B-\$75B.⁴¹⁶ Economists in 2021 have consistently revised their outlooks to be more optimistic, expecting unemployment to return to pre-pandemic levels in 2022.⁴¹⁷ As of March 2021, the unemployment rates in Los Angeles and Ventura Counties were 10.9% and 6.4%, respectively.⁴¹⁸ While this is a significant improvement compared to the early months of the pandemic, there is still a ways to go to full recovery. At the local level, Los Angeles property tax revenues from the past year were higher than expected, and it is likely that funding for Measure W will remain largely intact.⁴¹⁹ Los Angeles County is set to receive \$1.9 billion, and the city of Los Angeles is set to receive \$1.4 billion from the American Rescue Plan.⁴²⁰ These amounts are greater than LA County and the city of Los Angeles's previously projected budget deficits of \$935 million and \$750 million, respectively.⁴²¹ While the specific magnitude of the effect on municipal revenues is unclear as of May 2021, there will be continued or increased funding of state and federal grants that can be used towards stormwater projects. There has been increased spending by the general public as more people have received vaccinations and the economy has continued to reopen, which will increase local tax revenues.

The pandemic's economic impacts largely affect general funds, which present a limited and less reliable source of revenue. Permittees are compelled more than before to identify alternative sources such as fees, assessments, grants, and loans. In the past, municipalities throughout the State have been successful in securing alternative funding for stormwater services through fees, assessments, or special taxes, as well as through developer fees, and gas taxes.⁴²² Many Permittees have

⁴²² Generally, there is a willingness to pay for improvements in water quality. For example, U.S. EPA estimated household willingness to pay for improvements in freshwater quality to support fishing and boating to be \$182 to \$242 per year (adjusted for inflation using Bureau of Labor Statistics on-line CPI Inflation Calculator). (National Pollutant Discharge Elimination System – [Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges, Final Rule](#). Federal Register 64 (8 December 1999): p. 68793. Web. 20 June 2019.) This estimate can be considered conservative, since it does not include important considerations such as the benefits to marine waters, wildlife, or flood control. California State University - Sacramento's 2005 study corroborates U.S. EPA's estimates, reporting annual household willingness to pay for statewide clean water to be \$240 (adjusted for inflation using Bureau of Labor Statistics on-line CPI Inflation Calculator). (State Water Board, 2005. Currier, Brian

also taken steps to establish a stable funding source, which will help fund stormwater projects despite the current economic downturn. The following Parts XIII.D.3.a-e provide examples of these efforts. Part XIII.D.3.f of this Fact Sheet provides examples of state and federal grants and loans.

a. Los Angeles County Safe, Clean Water Program

In November 2018 Los Angeles County gained voter approval of Measure W, a special parcel tax of 2.5 cents per square foot of impermeable surface that will raise up to \$285 million annually to capture and clean up stormwater. Measure W required approval by a two-thirds majority to pass. The tax will help cities across Los Angeles County comply with the Order. It will also help make the region more water resilient in the face of drought and climate change, particularly in underserved communities that are often hit harder by environmental and public health stresses.⁴²³

Of the annual revenue, forty percent will be returned to the municipality of origin to create new local projects and programs and fund operation and maintenance. Table F-40 provides the estimated “local return” revenues that will be allocated to Los Angeles County Permittees based on the estimated annual revenue of \$285M. It is anticipated that a total of \$112.6M will go directly to municipalities through the local return.

| Calabasas | \$0.39M | La Verne | \$0.57M | Santa Clarita | \$3.25M |
| Carson | \$2.40M | Lakewood | \$1.10M | Santa Fe Springs | \$1.45M |
| Cerritos | \$0.94M | Lawndale | \$0.23M | Santa Monica | \$0.81M |
| Claremont | \$0.57M | Lomita | \$0.23M | Sierra Madre | \$0.15M |
| Commerce | \$0.99M | Long Beach | \$4.60M | Signal Hill | \$0.28M |
| Compton | \$1.21M | Los Angeles | \$36.74M | South El Monte | \$0.45M |
| Covina | \$0.74M | Lynwood | \$0.58M | South Gate | \$1.00M |
| Cudahy | \$0.17M | Malibu | \$0.39M | South Pasadena | \$0.25M |
| Culver City | \$0.52M | Manhattan Beach | \$0.41M | Temple City | \$0.45M |
| Diamond Bar | \$0.84M | Maywood | \$0.18M | Torrance | \$2.13M |
| Downey | \$1.44M | Monrovia | \$0.53M | Unincorporated | \$11.24M |
| Duarte | \$0.25M | Montebello | \$0.90M | Vernon | \$0.93M |
| El Monte | \$1.10M | Monterey Park | \$0.74M | Walnut | \$0.50M |
| El Segundo | \$0.57M | Norwalk | \$1.09M | West Covina | \$1.36M |
| Gardena | \$0.83M | Palos Verdes Estates | \$0.26M | West Hollywood | \$0.26M |
| Glendale | \$1.68M | Paramount | \$0.65M | Westlake Village | \$0.23M |
| Glendora | \$0.90M | Hawaiian Gardens | \$0.13M | Whittier | \$1.21M |

Fifty percent of the annual revenue will be spread across nine watershed areas to develop Stormwater Investment Plans and implement regional projects and programs, including a Technical Resources Program (TRP) that will provide technical assistance to underserved communities in developing feasibility studies, which are required before a project is considered for funding, and facilitating community and stakeholder engagement. Anticipated annual revenues available to each watershed area are provided in Table F-41.

⁴²⁴ <https://safecleanwaterla.org/wp-content/uploads/2020/09/SCW-Local-Return-Funds-by-Municipality-20200809.pdf>

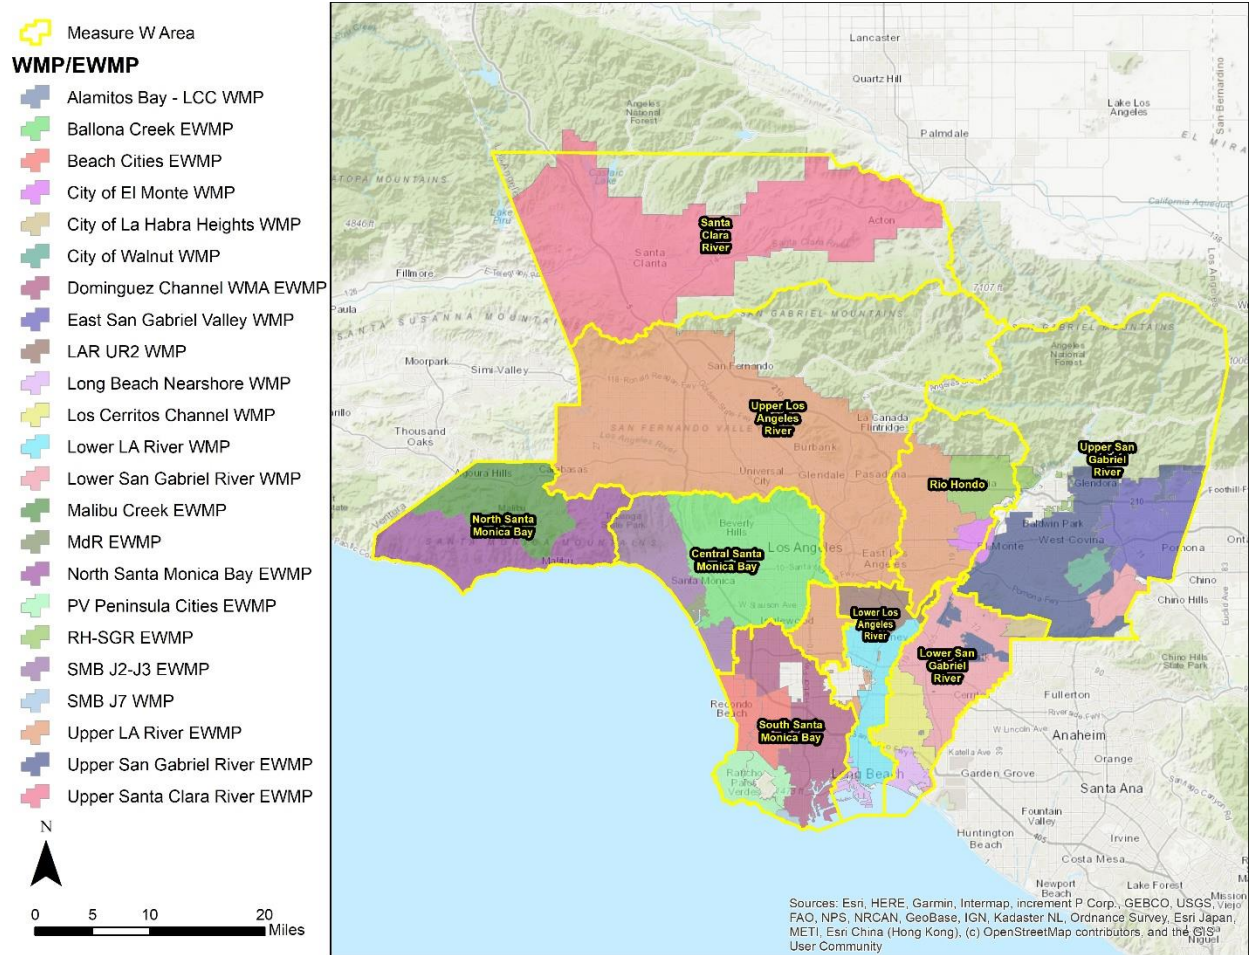

Table F-41. Estimated Annual Safe, Clean Water Program Regional Program Funds by Watershed Area

| Watershed Area | Estimated Annual Revenue (millions) |
|--------------------------|--|
| Central Santa Monica Bay | \$ 17.42 |
| Lower Los Angeles River | \$ 12.72 |
| Lower San Gabriel River | \$ 16.56 |
| North Santa Monica Bay | \$ 1.83 |
| Rio Hondo | \$ 11.49 |
| Santa Clara River | \$ 5.87 |
| South Santa Monica Bay | \$ 17.58 |
| Upper Los Angeles River | \$ 38.44 |
| Upper San Gabriel River | \$ 18.78 |
| REGIONAL TOTAL | \$ 140.6 |

Source: County of Los Angeles Safe, Clean Water Program (<https://safecleanwaterla.org/wp-content/uploads/2020/09/SCW-Regional-Return-Funds-by-Watershed-Area-20200809.pdf>)

Figure F-2 shows the overlap between the nine watershed areas and the Watershed Management Program and Enhanced Watershed Management Program areas.

Figure F-2. Map of Watershed Areas, Watershed Management Program Areas, and Enhanced Watershed Management Program Areas

The remaining ten percent of the annual revenues would be allocated to the Los Angeles County Flood Control District for administration of the program and other district water quality projects and programs.

The Los Angeles County Department of Public Works has evaluated the planning-level projected costs for full implementation of some of the Watershed Management Programs and Enhanced Watershed Management Programs, and the anticipated revenue from the Safe, Clean Water Program for corresponding watershed areas relative to the WMP/EWMP milestones. The preliminary working draft of their analysis suggests that, without any additional sources of funding and assuming the accuracy of the projected costs, significant additional time will be needed to meet most milestones. However, the projected costs used by the Los Angeles County Department of Public Works were higher than values from the Board staff analysis, presented above, and in many cases Permittees have succeeded in significantly lowering these projected costs at both a program scale and project scale. Additionally, as discussed below, Permittees have, and can continue to, leverage additional funds through partnerships with other entities and securing grants and/or low-interest loans.

In summary, the passage of Measure W, with nearly 70% of the vote in LA County, suggests strong support for improved water quality. The revenue generated will go toward funding the Permittees' WMPs and EWMPs, thereby significantly assisting in compliance with the Order.

b. Los Angeles County's Measure A

Los Angeles County voters in November 2016 approved Measure A, the Safe, Clean Neighborhood Parks and Beaches Measure, to support local parks, beaches, open space, and water resources with an annual parcel tax of 1.5 cents per square foot. The measure received overwhelming support, with the approval of 75% of voters. The county's Regional Park and Open Space District disburses the funding through grant programs, divided over multiple categories of projects. Category 3, the Protecting Open Space, Beaches, and Watersheds Program, has about \$7.4M annually for competitive grants. The program considers projects that capture stormwater and protect drinking water and waterbodies, as well as projects that provide multiple benefits, such as increasing recreational opportunities, protecting habitats, and improving public health.⁴²⁵

c. Culver City's Measure CW

During the November 8, 2016 Special Municipal Election, over two thirds of Culver City residents voted in favor of Measure CW, the Clean Water, Clean Beach Parcel Tax. Single family residential parcels are taxed \$99 annually, while each multi-family residential dwelling unit is taxed \$69 annually. Each parcel owner of a non-residential property is taxed \$1,096 per acre of land (or portion thereof) annually. The \$1,096 is pro-rated for non-residential parcels less than one acre. Charges first appeared on the tax statements in fall 2017. Funds raised by Measure CW will be used for improvements in water quality in Ballona Creek, Marina del Rey, and Santa Monica Bay. Measure CW is expected to generate about \$2 million per year, beginning in fall 2017. All Measure CW money will be used in Culver City to improve water quality through measures such as low-flow diversions, multi-benefit stormwater capture projects, green streets, and trash controls, among others. Measure CW was directly designed to pay for Culver City's cost of compliance with the Order, including Culver City's responsibilities in implementing programs and projects in the Ballona Creek and Marina del Rey EWMPs in which it is participating.⁴²⁶

d. Ventura County's Benefit Assessment Program

The Ventura County Watershed Protection District Benefit Assessment (BA) Program, which levies property fees, is authorized by the Ventura County Watershed Protection District Act, as amended by Chapter 438, Statutes of 1987 and Chapter 365, Statutes of 1988. The FY2019 Benefit Assessment for Watershed Protection is based on the rates established for Fiscal Year 1997. Those same rates were approved for Fiscal Years 1998-1999 through 2017-2018.

⁴²⁵ Los Angeles County Regional Park and Open Space District. 2017. Measure A Implementation – Park Funding 102 (Fall 2017). <https://rposd.lacounty.gov/2017/09/19/park-funding-102/>

⁴²⁶ <https://www.culvercity.org/city-hall/information/election-information/ballot-measure-information/clean-culver-city>.

The Board of Supervisors approved the same rates in compliance with Proposition 218 on June 12, 2018 for fiscal year 2018-2019. Based on these assessment rates, the annual revenue generated for MS4 permit compliance is provided in Table F-42. The total annual revenue available for MS4 permit compliance for FY 2018-2019 is \$3.1 M. An increase of the Benefit Assessment rates requires a vote.

Table F-42. Fiscal Year 2018/2019 Benefit Assessment Program Revenue for NPDES Compliance

| Permittee | Zone 1 | Zone 2 | Zone 3 | Zone 4 | Total |
|-------------------------------|------------------|--------------------|--------------------|------------------|--------------------|
| Ojai | \$34,115 | -- | -- | -- | \$34,115 |
| San Buenaventura | \$58,907 | \$195,448 | -- | -- | \$254,355 |

e. Other Los Angeles County Municipalities

In addition to Los Angeles County, Culver City and Ventura County, other municipalities within the Los Angeles region have secured funding that supports projects to improve water quality through the adoption of stormwater fees. Table F-43 identifies several of them.

Table F-43. Other Existing Municipal Stormwater Fees in the Los Angeles Region

| Permittee | Status | Monthly Unit Rate (Residential) | Funding Mechanism | Source |
|---------------------|---|----------------------------------|-------------------------------|--------|
| Beverly Hills | NI | \$35.12 (R-1), \$14.52 (R-4) | NI | OWP |
| Los Angeles (City) | Successful | \$2.33 | Special Tax – G.O. Bond | SCI |
| Monrovia | Successful | \$1.68 base + \$1.25/dwelling | Balloted | OWP |
| Rancho Palos Verdes | NI | \$7.17 | NI | WKU |
| Rancho Palos Verdes | Successful, then recalled and reduced | \$16.67 | Balloted | SCI |
| Santa Clarita | NA | \$2.00 | NI | WKU |
| Santa Clarita | Successful | \$1.75 | Balloted | SCI |
| Santa Monica | NA | NI | NI | WKU |
| Santa Monica | Successful | \$7.25 | Special Tax | SCI |

NI – Not Identified

NA – Not Available

OWP - Toolkit to Support Financial Planning for Municipal Stormwater Programs, U.S. EPA Region 9 Environmental Finance Center at Sacramento State, Office of Water Programs, 2018.

SCI - as tracked by SCI staff since 2002

WKU - Western Kentucky University Stormwater Utility Survey 2018

Note: Results are standardized to the best extent possible in combining the multiple sources, but not adjusted for inflation. Reported rates are for majority of residential customers for rate structures with multiple tiers and are shown as reported at time of passage or enactment (SCI or OWP sourced entries) or current year (WKU sourced).

f. State and Federal Funding Sources

Public agencies, both federal and state, recognize the importance of stormwater improvement projects. This section describes some sources of funding from grants and loans that have been provided in the past and will be provided in the future to help offset the costs of stormwater management and leverage ongoing funding sources such as those described above. The variety of grant programs that can support stormwater projects highlights the opportunities for creativity in incorporating stormwater BMPs into other infrastructure and community development projects, which will not only help achieve stormwater goals, but also open more avenues of funding.

Permittees in the Los Angeles Region have been receiving significant State funding through grant programs and interagency agreements with the California Department of Transportation, and so far there is no official indication that they will not continue doing so as several State-wide stormwater grant programs are expected to proceed in coming years. All Permittees have completed a Stormwater Resource Plan (SRP) or equivalent and have obtained concurrence on the SRP or equivalent from the State Water Board, making all Permittees eligible to compete for State funds to support additional stormwater projects identified in the SRP or equivalent.

The table below (Table F-44) summarizes the funds that had been allocated to stormwater management in Los Angeles County up to 2012.

Table F-44. Funds Allocated to Stormwater Management in Los Angeles County Up To 2012

| Source of Money | Dollars | % of total costs funded by State (only for those projects which included State funding) |
|---|---------------|---|
| Only State Board-awarded funding (Propositions 12, 13, 40, 50, and 84; and federal money, 319h, 205j, ARRA) | \$49,143,132 | 47% |
| Only State money from any State agency (propositions only, no federal); includes State Board, DWR, Coastal Conservancy, Fish & Game | \$67,461,699 | 58% |
| Prop A | \$4,981,772 | N/A |
| Prop O | \$508,678,258 | N/A |
| Measure V | \$9,107,959 | N/A |
| Total Public Funds (federal, State, local bonds and measures) expended on stormwater control projects | \$645,389,932 | N/A (information not available for projects funded by local bonds and measures) |

Source: Los Angeles County MS4 Permit Fact Sheet 2012

Since 2012, Permittees have received \$186.1M in state funding for 42 projects that will support Permittees' compliance with the Order. Specifically, between 2012 and 2015, Los Angeles County and Ventura County Permittees have received \$25.5M from Proposition 84 and the Drought Response Outreach Program for Schools (DROPS) for 18 projects. This funding covered over 70% of the total cost of the 18 projects. In 2016, Permittees received \$51M of Proposition 1 grant funding during Round 1 for 13 projects. The Proposition 1 grant funding is covering over 50% of the total cost of the 13 projects. In February 2021, \$18.6M was awarded to Permittees for five projects from Prop 1 Round 2 funding. Since 2012, Los Angeles County Permittees have also received over \$91M in funding from the State through Cooperative Implementation Agreements with the California Department of Transportation for 6 projects.

Permittees have also been awarded Prop 68 funding and may continue to compete for additional grant funding. According to the California Department of Fish and Wildlife, grants will not be canceled, and unspent funds will not be taken back by the state during the COVID-19 pandemic.⁴²⁷ In March 2020, the California Department of Parks and Recreation awarded about \$54 million from Proposition 68’s Statewide Park Program to Los Angeles County jurisdictions to develop new parks, multi-use paths, and improve existing facilities.⁴²⁸ In addition, in 2020 the California Natural Resources Agency awarded \$18.5 million for multi-benefit green infrastructure investments in or benefiting disadvantaged or severely disadvantaged communities through Proposition 68’s Green Infrastructure Grant Program.

Potential sources of future grant funding from state and federal programs are shown in Table F-45. In addition to Proposition 68 programs, a number of federal grant programs can be used to build stormwater infrastructure while also promoting economic development, resilience to climate change-induced hazards, green transportation alternatives, and urban greening.⁴²⁹ This highlights the increased funding opportunities that could come with projects that creatively incorporate stormwater BMPs. Some programs explicitly address the longstanding problem of underserved communities having greater need for green infrastructure but having fewer resources by explicitly prioritizing underserved communities, such as Proposition 68’s Statewide Park Program, the USDA Forest Service Urban and Community Forestry Program, and Economic Development Administration’s Public Works and Economic Adjustment Assistance programs

Table F-45. Potential Future State and Federal Grant Sources

| Grant Program | Source | Description |
|--------------------------------|---------------------------------------|---|
| Prop 68 Statewide Park Program | CA Department of Parks and Recreation | <ul style="list-style-type: none"> • \$395.3M was available for FY20/21 • For creating new parks and recreation opportunities in underserved communities |
| Prop 68 Regional Park Program | CA Department of Parks and Recreation | <ul style="list-style-type: none"> • \$23.1M was available for FY20/21 • Eligible projects: Acquisition for new or enhanced public access and use; development to create or renovate; trails, with preference given to multiuse trails over single-use trails; regional sports complexes; visitor and interpretive facilities; other types of recreation and support facilities in regional parks |

⁴²⁹ U.S. EPA. 2017. Federal and State Funding Programs – Stormwater & Green Infrastructure Projects. https://www.epa.gov/sites/production/files/2017-05/documents/federal-and-california-sw-funding-programs_0.pdf

| Grant Program | Source | Description |
|--|---|---|
| Community Development Block Grants (CDBG) | U.S Department of Housing and Urban Development | <ul style="list-style-type: none"> • Annual grants to cities and counties on a formula basis • Eligible to fund stormwater and green infrastructure because these projects can create jobs and economic activity • Detroit, MI and Chicago, IL have used CDBG funds for stormwater infrastructure |
| Building Resilient Infrastructure and Communities (BRIC) | Federal Emergency Management Agency | <ul style="list-style-type: none"> • Funding for projects that reduce risks from disasters and natural hazards; green infrastructure and restoration projects can be used to address stormwater pollution and mitigate flood risk from climate change and sea-level rise |
| Surface Transportation Block Grant - Transportation Alternatives Set-Aside | Federal Highway Administration | <ul style="list-style-type: none"> • Annual grants to states on a formula basis • Provides funding for “transportation alternatives,” including “offroad trail facilities for pedestrians, bicyclists, and other nonmotorized forms of transportation” and "environmental mitigation related to stormwater and habitat connectivity." Funding could be used to pay for green infrastructure components of trails and sidewalks such as permeable pavements • The Southeast Michigan Council of Governments used funding in 2015 from the state of Michigan to fund the Detroit – Inner Circle Greenway Railroad Acquisition, which included 1) installation of green infrastructure such as green streets and bioretention and 2) repurposing of 8.3 miles of abandoned railway near Detroit |
| USDA Forest Service Urban & Community Forestry Program | U.S. Forest Service | <ul style="list-style-type: none"> • One of the goals is to plant trees in environmental justice communities, "where suitable tree installations can provide equitable access to shade, reduce heat exposure, improve air quality, and reduce storm water flooding, solutions should bring together community members, planners, local and state government officials, urban foresters and resilience and sustainability professionals. |
| Public Works and Economic Adjustment Assistance programs | U.S. Economic Development Administration | <ul style="list-style-type: none"> • Funding to support development in economically distressed areas by fostering job creation and attracting private investment • Funding has previously been used for stormwater infrastructure |

| Grant Program | Source | Description |
|--|----------|---|
| Sewer Overflow and Stormwater Reuse Municipal Grants Program | U.S. EPA | <ul style="list-style-type: none"> • \$225M allotted (funds available in 2022) • Funding to support planning, design, and construction of facilities to intercept, transport, control, treat, or reuse municipal stormwater, and any other measures to manage, reduce, treat, or recapture stormwater |

Moreover, loan options with below-market interest rates are available for stormwater projects, as shown in Table F-46. The Clean Water State Revolving Fund can finance a wide variety of stormwater projects, with repayment beginning one year after completion of construction and a maximum repayment period of 30 years. In November 2020, U.S. EPA invited California to apply for \$500 million in Water Infrastructure Finance and Innovation Act (WIFIA) loans through the new state infrastructure financing authority WIFIA (SWIFIA) program.⁴³⁰ This would provide additional funds to the State Revolving Fund upon approval. The California Infrastructure and Economic Development Bank, or IBank, offers loans for a wide variety of infrastructure projects under its Infrastructure State Revolving Fund, including water projects, parks, streets, and many other types of infrastructure that can incorporate stormwater BMPs. IBank also supports water conservation and infrastructure projects through its Statewide Energy Efficiency Program. Furthermore, IBank offers subsidies to borrowers in communities with high unemployment and/or low median household income. Municipalities are also eligible for loans under the U.S. Department of Housing and Urban Development’s Section 108 Loan Authority. Amounts are available in amounts up to five times a municipality’s Community Development Block Grant, and funded projects can incorporate stormwater infrastructure.

Table F-46. Potential Future State and Federal Loan Sources

| Loan Program | Source | Description |
|--|---|---|
| Clean Water State Revolving Fund Program | State Water Resources Control Board | <ul style="list-style-type: none"> • Capable of financing projects from <\$1 million to >\$100 million • No upper limit for eligible project • Repayment begins 1 year after construction completion • Maximum financing term: 30 years |
| Infrastructure State Revolving Fund (ISRF) | California Infrastructure and Economic Development Bank (IBank) | <ul style="list-style-type: none"> • Financing available in amounts \$50,000-\$25,000,000 with loan terms for useful life of project up to maximum of 30 years • Subsidies eligible based on unemployment rate and median household income • No matching fund requirement • Funds wide variety of public infrastructure and economic expansion projects |

⁴³⁰ U.S. EPA. 2020, November 18. EPA invites California, Iowa, Rhode Island to Apply for \$695 Million in Water Infrastructure Loans. <https://www.epa.gov/newsreleases/epa-invites-california-iowa-rhode-island-apply-695-million-water-infrastructure-loans>

| Loan Program | Source | Description |
|---|---|---|
| Statewide Energy Efficiency Program (SWEET) | California Infrastructure and Economic Development Bank (IBank) | <ul style="list-style-type: none"> • Financing available in amounts \$500,000-\$30,000,000 • Funds projects to help meet CA's goals for greenhouse gas reduction, water conservation, and environmental preservation |
| Section 108 Loan Authority | U.S Department of Housing and Urban Development | <ul style="list-style-type: none"> • Amounts available to municipalities in amounts 5 times the municipalities' allocated Community Development Block Grant • For three types of development: economic development, public facilities, and housing rehabilitation • Projects can incorporate green infrastructure in design and construction. Milwaukee, WI installed green infrastructure in its redevelopment of Milwaukee Road Railroad Shops to manage stormwater on site. |

In conclusion, the Los Angeles Water Board recognizes that the costs of compliance with the Order are significant and that many Permittees have limited resources to implement actions to address their MS4 discharges. However, there are also a number of funding options that Permittees can pursue to assist with compliance. Based on a consideration of the cost of compliance, as discussed above, the Board has structured the permit as flexibly as possible to give Permittees the opportunity to sequence actions to address the highest water quality priorities; options to demonstrate compliance; the ability to customize their control measures; sufficient time to comply (in many cases decades from the time the TMDL was established); opportunities to request time extensions based on economic factors among others; and the ability to collaborate and pool their resources to implement programs and projects to achieve compliance and to also collaborate and pool their resources to monitor their compliance.

4. Environmental and Societal Costs of Not Controlling MS4 Discharges

Economic considerations of stormwater and urban runoff management programs tend to focus on costs incurred by municipalities in developing and implementing the programs. This is appropriate, since as discussed above, these costs are significant and present a challenge for Permittees. However, as far back as 2000, the Water Boards recognized that it is also important to consider the costs of water quality impairment; that is, the negative impact of pollution on the economy and the positive impact of improved water quality (see, for example, Order WQ 2000-11). So, while it is important to consider the cost of compliance, it is also important to consider the costs that would be incurred by not fully regulating or controlling MS4 discharges to receiving waters. Southern California's local economy thrives on a healthy environment, as does the health of its population. Failure to regulate discharges from the Los Angeles Region's MS4 will result in greater pollution of the rivers, streams, lakes, reservoirs, bays, harbors, estuaries, coastal shorelines

and wetlands, which makes implementation of the Order vital for the protection of the region's waterbodies and public health.

By way of example, Southern California's travel industry and ocean economy plays a vital role in the region's local economy. In 2016, "47.3 million visitors to L.A. County spent an all-time high of \$21.9 billion in the region."⁴³¹ Many of those tourists visit the beaches and on average, over 129 million beach visits occur each year in Southern California.⁴³² A study that looked at beach attendance and bathing rates in Southern California approximated that, depending on the season, 26% to 54% (on average 45%) of the beach attendees have physical contact with the coastal waters.⁴³³ Urban runoff in southern California has been found to cause illness in people swimming near storm drains.^{434, 435} One study of recreational exposures in marine water impacted by MS4 discharges following storm events in San Diego County estimated gastrointestinal illness risks at 1.2 illnesses (based on epidemiological study) and 1.5 illnesses (based on quantitative microbial risk assessment) per 1000 wet weather recreation events (surfing).⁴³⁶ Another study of south Huntington Beach and north Newport Beach found that an illness rate of about 0.8 percent among bathers at those beaches resulted in about \$3 million each year in health-related expenses.⁴³⁷ Extrapolation of such numbers to the beaches and other water contact recreation in the region could result in significant expenses to the public and to public health, while improvements in coastal water quality could result in a reduction of gastrointestinal illness locally and a concurrent savings in expenditures on related health care costs.

Likewise, stormwater runoff from MS4 discharges can significantly impact ocean water quality – and this, in turn, affects public health and the economy. The County of Los Angeles Public Health recommends "beach users ... avoid contact with ocean water for a period of 3 days after significant rainfall, especially near flowing storm drains, creek and rivers".⁴³⁸ Rain advisories can have a significant impact on the region's coastal economy. According to an estimate by Pendleton and Kildow (2006), the non-market value of a beach day is worth between \$15-\$50, or about \$19-63 in 2019 dollars, to the average beach visitor in California.⁴³⁹ These values

represent how much someone is willing to pay just for enjoying a day at the beach, not including travel and parking costs. Considering the popularity of Southern California beaches, the economic impact of each beach posting/closure day could be significant. Atiyah, et al. (2013) found that beaches in Santa Monica Bay and Malibu that installed storm drain diversions had an average increase in beach attendance of 610,324 visits per year compared to beaches without storm drain diversions, holding all other factors constant.⁴⁴⁰ As an illustrative example of the potential increase in monetized benefits to beach visitors resulting from installing storm drain diversions, multiplying the value of an average California beach day by the change in attendance yields annual benefits ranging between \$11.6 and \$38.5 million at the average beach in 2019 dollars. Changes in water quality not only affect benefits for beachgoers, but also for local businesses that depend on sales from beachgoers, as well as municipalities that rely on sales tax revenues. The average visitor to the beach spent about \$30 for each day visit in 2001, or about \$43 in 2019 dollars, at local businesses (excluding gas and auto expenditures).⁴⁴¹ This would mean that for the average beach with storm drain diversions, nearby businesses receive about \$26.2 million in additional annual revenue from beach visitors compared to beaches without storm drain diversions, holding all other factors constant. In addition, beach postings negatively affect local home values, potentially as far as several kilometers away.⁴⁴² Failure to regulate MS4 discharges will therefore result in great costs and foregone benefits to the regional economy.

5. Benefits of Stormwater Capture and Management

As set forth above, California Water Code section 13241 requires a consideration of economics; it does not require a “cost benefit analysis.” While a rigorous quantitative “cost benefit analysis” is not required and may not be possible, the costs of not controlling MS4 discharges – and the benefits that result from controlling MS4 discharges – are both relevant to the ultimate cost of compliance. This is because the costs of compliance may be offset by the benefits of stormwater and urban dry weather runoff management, which broadly include improvements in water quality, augmentation of local water supplies, increased economic benefits, enhancement of beneficial uses, and increased employment and income. Accordingly, a discussion of some of the additional benefits from controlling MS4 discharges is included here.

As an initial matter, it should be noted that there are significant economic benefits (some of which are quantifiable, and some which are not) from stormwater management. A 2004 study conducted by USC/UCLA that assessed the costs and benefits of implementing various approaches for achieving compliance with MS4 permits in the Los Angeles Region found that non-structural systems would provide \$7.42B in benefit, adjusted to 2019 dollars. If structural systems were determined to be needed, after adjusting to 2019 dollars, the study found that total benefits

⁴⁴⁰ Atiyah, Perla, Linwood Pendleton, Ryan Vaughn, and Neil Lessem. “[Measuring the effects of stormwater mitigation on beach attendance.](#)” Marine Pollution Bulletin. 72.1 (2013): 87-93. 15 July 2013. Web. 27 April 2020.

⁴⁴¹ California Division of Boating and Waterways, January 2002. California Beach Restoration Study. Page 3-7.

⁴⁴² Kung, Megan, Dennis Guignet, and Patrick Walsh. 2021. “Comparing Pollution Where You Live and Play.” Marine Resource Economics, forthcoming.

could reach \$23.9B.⁴⁴³ Monetized benefits in this study accounted for a number of benefits – reduced need for flood control, increases in property values, additional groundwater supplies, public willingness to pay for avoided stormwater pollution, cleaner streets, improved beach tourism, preservation of ecosystem services in the marine coastal zone, and cost savings from reduction of sedimentation in local harbors. However, recreational and public health uses were not quantified in this study, and much has changed in the Los Angeles Region since 2004, including an increase in population. Therefore, the benefits value is likely higher than \$23.9B.

a. Recreational and Public Health Benefits

As an example of a portion of recreational and public health benefits that can accrue from implementing the MS4 permit, we can examine the Los Angeles River, on which multiple entities have conducted research as part of revitalization efforts. Improving water quality at the river is crucial in transforming the river into an amenity that would attract residents and visitors, and the Upper LA River EWMP has stated that certain revitalization projects are key candidates for future integration with the EWMP process. Currently only portions of the river are being utilized for recreation. If the entire river could have the same amenities as a park in terms of being a location where people could walk, exercise, enjoy the outdoors, view wildlife, and engage in water recreation, the potential benefits would be significant. There are about 728,000 working adults who live or work within one mile of the Los Angeles River.⁴⁴⁴ The Trust for Public Land found that about 43% of adults in Los Angeles visited parks, trails, and recreation centers between 2015 and 2016, and that the average frequency of these visits was 1.13 times per week, or 59 times per year. Their analysis found that the average value for each visit was \$3.04, adjusted to 2019 dollars.⁴⁴⁵ Assuming that the same proportion of adults living and working near the river would go to a newly revitalized Los Angeles River for recreation, this would yield annual recreational benefits of \$55.9M. Furthermore, the public health benefits would be substantial. The difference in average annual medical care costs between active (those who do moderate to vigorous exercise) and inactive adults ages 18-64 is \$1,242 in 2019 dollars⁴⁴⁶, and 24% of LA residents use parks as their primary place for exercise.⁴⁴⁷ Although this percentage could potentially increase with the addition of more park space and a revitalized LA River, applying this percentage to the number of adults living and working nearby the LA River

yields annual health benefits of \$217M. These benefits values represent only a portion of potential total benefits, as the population value only comprises working adults and not children, seniors, or unemployed adults. Further research that includes seniors would likely result in substantial additional public health benefits, as the average annual medical care cost difference between an active and inactive person 65 and over is about \$2,490 in 2019 dollars, double the value for adults under 65.⁴⁴⁸

Installing green infrastructure would also deliver public health benefits by mitigating urban heat island effects, with greater returns on investment for installations located in inland areas lacking tree canopies and green spaces, which also tend to be lower-income and often non-white.⁴⁴⁹ In urban areas, buildings and pavement retain heat, making them hotter than surrounding non-urban areas, known as the urban heat island effect. Climate change will continue to exacerbate urban heat island effects, but they can be mitigated by pursuing urban greening practices. Nature-based solutions that incorporate trees and vegetation can decrease local temperatures, particularly if they are distributed throughout an area. Reduced temperatures during hot weather not only makes it more comfortable for people to recreate outside, but it can also save lives during extreme heat waves. De Guzman et al. (2020) found that relative to the average mortality rate, during an average five-day heat wave in Los Angeles County there are 4.1% more deaths on the first day and 11.9% more deaths on the fifth day.⁴⁵⁰ Using these results, they found that if Los Angeles County had tree coverage at 40%, as opposed to the baseline of 16%, during a September 2010 dry Santa Ana event there would have been a 29% reduction in mortality, equivalent to saving 23 lives. While the study only modeled mortality, it can reasonably be expected that hospitalizations and health conditions brought on by heat stress would be reduced with lower extreme temperatures as well. In addition to trees, other green infrastructure such as bioswales, rain gardens, and green roofs can also reduce temperatures.⁴⁵¹ In metropolitan areas nationwide, neighborhoods with lower median household incomes are associated with less urban tree cover.⁴⁵² In areas where the federal government historically redlined, current average

incomes tend to be lower and temperatures tend to be hotter because of historic disinvestment in these neighborhoods.⁴⁵³

b. Water Supply Cost Savings and Co-Benefits

Stormwater capture is an effective way for Permittees to achieve the goals of the CWA and the requirements of this permit by preventing the stormwater and associated pollutants from reaching receiving waters. Stormwater capture has also become the focus of intense interest in the wake of California's most recent 2012-2019 drought. The Water Boards have recognized the importance of treating stormwater as a valuable resource where capture and use can result in water supply cost savings, as well as multiple other benefits within a watershed. Among other efforts, the State Water Board's Strategy to Optimize Resource Management of Stormwater (STORMS) seeks to promote stormwater capture and use. STORMS' recent 2018 report *Enhancing Urban Runoff Capture and Use* points out that among a variety of benefits, "stormwater capture can also reduce reliance on imported water from distant sources, which reduces inter-basin (or inter-region) transfers and polluted runoff. Stormwater supports the fit-for-purpose water supply concept by satisfying less sensitive water demands, such as certain household, landscaping, and commercial needs, with mildly polluted water. Runoff from roads and driveways can be captured and harvested locally using distributed hybrid systems (for example, bioretention with an underdrain that feeds a cistern used for irrigation) configured to provide non-potable water for human use."⁴⁵⁴

The Order supports investment towards infrastructure for groundwater recharge to create a resilient local water supply. The potential for water usage from stormwater is significant, with Diringer et al. (2020) from Pacific Institute estimating that stormwater capture from paved surfaces and rooftops in urbanized Southern California and the Bay Area could add 420,000-630,000 acre-feet in average annual water supply, or about 6-10% of annual water usage in those areas in 2014.⁴⁵⁵ According to Porse et al. (2018), Los Angeles County "receives 55-60% of its annual water supplies from imported sources, which include northern California through the Sacramento-San Joaquin Delta, the Colorado River Basin, and the higher-altitude Owens Valley."⁴⁵⁶ The authors found that even after accounting for full-cycle costs, which include costs for all stages from the capture to end-use of water, stormwater capture can still be cheaper than importing water. Imported water costs around \$1,476-\$1,790 per acre foot, whereas the cost for existing large stormwater capture is \$995 per acre foot. As for proposed new large stormwater capture

⁴⁵⁶ Porse, Erik, et al. "The Economic Value of Local Water Supplies in Los Angeles." *Nature Sustainability*, Vol. 1, June 2018.

projects, including converting flood control infrastructure for multipurpose use, agencies in Los Angeles estimated total costs per acre foot ranging from \$1,110-\$2,727.⁴⁵⁷ The Southern California Water Coalition examined costs for 32 stormwater projects implemented across Southern California and found an even wider cost per acre foot range of \$59 to more than \$250,000 per acre foot, with a median of \$1,070. They found that projects that can annually capture larger amounts of stormwater have a lower cost per acre-foot, and costs differ by project type. Median costs for distributed projects were \$25,000 per acre foot, new centralized projects were \$6,900 per acre foot, and retrofit projects were \$600 per acre foot.⁴⁵⁸ Cost ranges from these studies (\$59-\$250,000/acre foot) are both lower and higher than the imported water cost range (\$1,476-\$1,790/acre foot), indicating that while stormwater projects costs can be more expensive, in many cases they may not need to be, particularly when agencies can think of creative stormwater solutions.

The Order gives Permittees the flexibility to develop multi-benefit stormwater management projects that will improve water quality while also providing benefits such as recharging of groundwater basins for local water supply and implementation of Low Impact Development (LID) policies and green streets policies. Regulating MS4 discharges would not only lead to water supply cost savings for residents, but also environmental, public health, and recreational benefits resulting from reduced stormwater pollution. Shimabuku et al. (2018) from Pacific Institute emphasizes that effective urban stormwater capture provides an opportunity for addressing multiple benefits including flood control, water quality impairments, improving water supply reliability, providing habitat, reducing urban temperatures, reducing energy use, creating community recreation spaces, and increasing property values.⁴⁵⁹

Diringer et al. (2020) conducted an analysis of stormwater capture project costs and benefits as they affect the cost of an acre-foot of water. They found that failing to consider the effects of co-benefits results in inflated net project costs. They gathered data from rounds 1 and 2 of Prop 1E and Prop 84 project proposals. Of a total of fifty projects, or 26 addressed urban runoff and 24 dealt with non-urban runoff. Most of the urban runoff projects the researchers considered were in Southern California. The authors found that after accounting for the projects' benefits, the net levelized cost for urban stormwater capture projects decreased from \$1,030 per acre foot to \$150 per acre foot, with some projects even yielding net benefits. Monetized benefits considered in their calculation include flood damage reduction, water quality, energy savings, community recreations, public use, property values, habitat value, CO2 equivalents, and avoided costs. Because many projects reported limited benefits categories, the overall net cost per acre foot would likely be even lower than \$150 when other co-benefits are considered.

There are a number of projects under development to recharge the region's basins. One such project was recently completed, the Piru Groundwater Basin

⁴⁵⁷ Ibid.

⁴⁵⁸ Southern California Water Coalition. Stormwater Capture: Enhancing Recharge and Direct Use Through Data Collection. April 2018. http://www.socalwater.org/wp-content/uploads/scwc-2018-stormwater-whitepaper_75220.pdf

⁴⁵⁹ "Stormwater Capture in California: Innovative Policies and Funding Opportunities," Morgan Shimabuku, Sarah Diringer, Heather Cooley; Pacific Institute; June 2018; p. 2.

recharge project, which will capture stormwater from 123 acres in the Ventura County unincorporated area of Piru. This project will result in approximately 25 AFY recharge to the basin.⁴⁶⁰ The Tujunga Spreading Grounds Enhancement Project is a collaborative project between the Los Angeles Department of Water and Power and the Los Angeles Flood Control District that will enhance the 150-acre Tujunga spreading grounds. This project will double the facility's recharge capacity and deliver 4 billion gallons of recharge to the groundwater basin and result in an increase in groundwater recharge to the San Fernando Groundwater Basin, increasing local water supply.⁴⁶¹ Furthermore, green street projects provide an opportunity for stormwater management to serve multiple benefits such as flood control, groundwater replenishment, pollutant removal, and create aesthetic green spaces for the local community. In the City of Los Angeles, Avalon Green Alley, a green street project, creates "1.8 acres of improved art and alleys and green alleys in a 35 acre neighborhood".⁴⁶² The green street project provides "stormwater retrofits in two alley segments including permeable pavers, dry wells and infiltration trenches that harvest rainwater flowing from a 6.04-acre sub-tributary to the Los Angeles River" and "is designed capture and infiltrate 1,381,608 gallons of stormwater into underground aquifers annually".⁴⁶³ Similar green street projects have been implemented in Ventura County such as in the Government Center's parking lot by means of pervious concrete gutters. Continuing such improvements under the MS4 permit would provide benefits from flood control, improved water quality, and cost savings from reduced imported water.

c. Ecosystem Services Benefits

In addition to the foregoing, Permittees and their residents will accrue various other environmental benefits resulting from the Order. For example, the 2018 STORMS report describes a range of benefits of capture and use, suggesting that "designing stormwater infrastructure to directly support ecosystems broadens the traditional approach to stormwater management. In this broader sense, retained stormwater can be put into soil where soil biota, macrophytes, and stream interflow systems improve water quality and ecosystems supported by baseflow or high groundwater. Ecosystem benefits include habitat improvement, increased food sources, carbon sequestration, pollutant uptake, reduced ozone (Nowak 2006), and reduced heat-island effects from plant growth. Improved baseflow results in decreased water temperatures and prolonged dry weather flows, and increased amounts and types of soil biota will aid in carbon sequestration and pollutant uptake (Klaus 2015). Local stormwater capture can also lead to energy-saving schemes that (1) capture water before it becomes contaminated with the pollutants on streets and in sewers; (2) rely on energy efficient processes for removing contaminants; (3) treat water only to the extent necessary for intended use (fit-for-purpose

⁴⁶³ *Ibid.*

water); and (4) obviate the need for diversion and large, centralized, energy-intensive treatment and distribution approaches.”⁴⁶⁴

d. Other Benefit Considerations

The Pacific Institute and the University of Santa Barbara’s Bren School of Environmental Science and Management elsewhere framed the topic of moving towards multiple benefit approaches for water management. The organizations plan to develop a systematic framework for identifying and incorporating the costs and benefits of water management strategies into decision making. They find a broader consideration of benefits associated with water management decisions will achieve broader project support, avoid unintended consequences, optimize resources, and cost sharing, and increase transparency.⁴⁶⁵

Such a framework would support a more robust consideration of potential economic benefits of stormwater management projects not considered in the Board’s economic analysis, such as:

- Reduced frequency, area, and impact of flooding - Stormwater capture BMPs that reduce runoff volumes and consequently flood volumes. The decrease in potential damage due to flooding provides economic benefit.
- Reduced cost of public infrastructure - On-site volume control with stormwater BMPs can downsize or eliminate stormwater conveyance infrastructure and provide public cost savings.
- Reduced pollution and water treatment costs and improved water quality - The reduction in runoff volume reduces erosion and pollutant delivery, thereby reducing the downstream costs of water treatment. The resulting improvements in water quality, stream channel stabilization, and aesthetics can also increase the value of riparian properties and increase utility of recreational visitors. The increased infiltration gained from stormwater BMPs can improve and sustain stream base flow conditions in some areas to better maintain downstream habitat.⁴⁶⁶
- Increased property values where green infrastructure and LID projects are implemented.

Other studies, too, have described the importance of co-benefits derived from proper stormwater management. For example, analysis for the San Diego Region Bacteria TMDLs found the contribution of co-benefits (non-bacteria water quality benefits) such as property value, riparian habitat and treatment of other water pollutants provide more than half of the total economic benefits.⁴⁶⁷ In a series of studies listed in a report created by the U.S. EPA in 2013, the benefit-to-cost ratios of four LID/GI projects in Sun Valley were listed. All four projects showed a benefit-to-cost ratio of greater than 1

indicating that, over the 50-year evaluation period, the benefits of these projects are higher than their cost.⁴⁶⁸

The Los Angeles Water Board assumes many of the benefits described in this section accrue to Permittees and their communities as a result of implementing their stormwater programs. The Board expects further program improvements, resulting from implementation of actions required by the Order, to increase benefits over time.

For example, the Order promotes:

- Employment and stimulus in the local economy, which are especially crucial during this recession caused by COVID-19. Economic Roundtable conducted a study in 2011 that found that job stimulus for every \$1 million invested in water efficiency projects was greater than traditional Los Angeles industries such as motion picture production and new home construction. The study found that 12.6 to 16.6 annualized jobs in recycled water, groundwater, stormwater, graywater systems, and water conservation projects were created for every \$1 million invested in these types of projects. The study also showed that approximately 74% of money invested in stormwater projects at the time of the study was spent locally, on businesses located within Los Angeles County. Furthermore, every million dollars invested in stormwater projects in Los Angeles stimulated an estimated \$1.99 million in total local sales due to multiplier effects of investing in the local economy. For example, cities pay people to work on stormwater projects, who then spend their incomes on housing, goods, and services.⁴⁶⁹ Building on the findings by Economic Roundtable, Los Angeles Alliance for a New Economy estimated that over 30 years, the Safe, Clean Water Program (Measure W) will create about 6,530 construction jobs and 1,347 O&M jobs, as well as about 1,559 annual indirect and induced jobs. This would yield about \$14B in overall regional economic benefits from \$9B in investment. Furthermore, many of these jobs created would be good-paying jobs that do not require an advanced degree, accessible to those in disadvantaged communities.⁴⁷⁰ Sustained increases in these occupations depend on Los Angeles' continued investment in water use efficiency projects.
- Use of nature-based solutions to mitigate and treat stormwater (e.g. implementation LID and GI regional projects). This technique alleviates the load on the existing stormwater conveyance infrastructure and reduces potential maintenance costs, while reducing localized flooding issues.
- Utilization of stormwater as a valuable resource to replenish our groundwater basins or for direct reuse. Imported water makes up approximately 70 to 75% of Southern California region's water supply, with local groundwater, local surface water, and reclaimed water making up the remaining 25 to 30%. The State of California Department of Finance projects that from 2020 to 2025, the population of Los Angeles County and

⁴⁶⁸ U.S. EPA, Case Studies Analyzing the Economic Benefits of Low Impact Development and Green Infrastructure Programs, EPA 841-R-13-004, August 2013.

⁴⁶⁹ Burns, Patrick and Flaming, Daniel. [Water Use Efficiency and Jobs](#). Economic Roundtable. December 2011.

⁴⁷⁰ Los Angeles Alliance for a New Economy (LAANE). Liquid Assets. [How Stormwater Infrastructure Builds Resilience, Health, Jobs, and Equity](#). March 2018.

Ventura County will increase by 2% and 2.6%, respectively. This population increase will be accompanied by an increase in water consumption. This increase will require larger volumes of imported water, which will be associated with higher costs. With stormwater used as a resource to replenish local groundwater basins, local reliance on imported water can be reduced, thereby controlling the costs incurred from importing water. A report prepared by the City of Signal Hill and Richard Watson & Associates states that the Metropolitan Water District forecasts water rates (Tier 1 rates for fully treated water) to increase from \$794/acre-foot (\$/AF) in 2012 to \$910/AF in 2015 and \$1,115 in 2020.

6. Conclusions

The Los Angeles Water Board has considered economics in issuing the Order and the specific requirements therein.

This consideration includes estimates of the possible range of costs of compliance with the Order, including the WQBELs, considering the likely and proposed means of compliance. It also includes the costs to the environment and society of not controlling MS4 discharges as well as the economic benefits of controlling MS4 discharges, including through stormwater capture. The range of costs of compliance as presented in Part XIII.D.2, Table F-38 and Table F-39 is \$21.3B to \$31.4B over 20 years. Even considering the highest cost in this range, the Board finds that the requirements in the Order are necessary to ensure the reasonable protection of beneficial uses. This is because these cost estimates are associated with implementation of permit requirements to achieve water quality objectives that were set at the levels necessary to provide reasonable protection of beneficial uses. These water quality objectives were either established by the U.S. EPA or approved by the U.S. EPA pursuant to CWA section 303(c). In most cases, the water quality objectives are those necessary to protect aquatic life and public health-related beneficial uses. The fundamental objective of the federal CWA, as set forth in section 101(a)(2), is “to restore and maintain the chemical, physical, and biological integrity of the Nation’s waters” and to achieve water quality that provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water. The NPDES Program, including the MS4 NPDES Program, is one of the principal regulatory tools for achieving this objective. The requirements in the Order also consider the magnitude and uncertainty in projected costs and include provisions to help defray these costs (e.g., allowances for time extensions).

Because of the difficulty in accurately projecting the cost of compliance with the Order as presented in the discussion above, and given that permit requirements extend decades into the future, the Los Angeles Water Board has incorporated provisions for adaptive management of programs as new information is gained as well as provisions that allow Permittees to request extensions for milestones based on technical, operational, and economic factors. The Los Angeles Water Board has also acknowledged that it can consider revisions to TMDLs including their schedules and final deadlines, where it determines it is appropriate, and then reflect those changes in the permit. Finally, the Board has acknowledged the currently available dedicated sources of funding for MS4 permit compliance, including the Benefit Assessment Program in Ventura County and the Safe, Clean Water Program in Los Angeles County, among others, and that it will consider how these

funds are allocated to priority projects to meet upcoming deadlines when considering any requests for extensions.

The Los Angeles Water Board has also provided the Permittees significant flexibility to choose how to implement the Order. The Order allows the Permittees the flexibility to address critical water quality priorities, namely discharges to waters subject to TMDLs, but aims to do so in a focused and cost-effective manner while maintaining the level of water quality protection mandated by the Clean Water Act. The Permittees can customize their control measures and choose to implement the least expensive measures that are effective in meeting the requirements of the Order. The Order also does not require the Permittee to fully implement all requirements within a single permit term. Where appropriate, the Board has provided Permittee with additional time outside of the permit term to implement control measures to achieve final WQBELs and Receiving Water Limitations.

Cost savings from customizing programs and shifting resources accordingly are also possible. The Permittees' affirmative steps to secure funding are noteworthy, and some other potential sources of funding are identified in the Board's economic considerations. However, the discussion of potential sources of funding is far from exhaustive. There are myriad opportunities to leverage funding; for example, Permittees could pursue low-interest loans through the State Revolving Fund that would allow access to greater sums of money needed in the near term for capital costs and pay these off over time with the ongoing revenues from dedicated funding sources. Additionally, there are a number of interrelated Propositions, including Measures W⁴⁷¹, H⁴⁷², A and M⁴⁷³ ("WHAM"), addressing stormwater/water resiliency, affordable housing, parks, and transportation, respectively, that can be creatively combined to implement multi-benefit stormwater projects. Finally, partnerships beyond the Permittees themselves should be more fully explored. Some Permittees have effectively tapped into funding or other in-kind resources from the California Department of Transportation, as mentioned above; private entities such as commercial businesses; and schools. However, this opportunity is far from fully utilized.

Stormwater capture is an effective way for Permittees to achieve the goals of the CWA and the requirements of this permit by preventing the stormwater and associated pollutants from reaching receiving waters. As noted above, the specific benefits of stormwater capture have also become the focus of intense interest in the wake of California's most recent 2012-2019 drought. The Water Boards have recognized the importance of treating stormwater as a valuable resource where capture and use can result in multiple benefits within a watershed. This consideration identifies benefits to the environment, people and the economy and clearly demonstrates the value of effective management of stormwater quality.

⁴⁷¹ Measure W led to the passage of the Safe Clean Water Program, described earlier in this section of the Fact Sheet.

⁴⁷² Measure H History. <https://homeless.lacounty.gov/history/>. N.D. Web. July 16, 2020. Measure H was expected to generate about \$355M (in 2017 dollars) annually for 10 years to provide homeless services, including increasing affordable/homeless housing.

⁴⁷³ Measure M: The Los Angeles County Traffic Improvement Plan Information Guide. August 2016. https://theplan.metro.net/wp-content/uploads/2016/10/factsheet_measurem.pdf. Web. July 13, 2020. Measure M was expected to generate an estimated \$860M annually (in 2017 dollars). It was also anticipated to add 465,690 new jobs across the region. One of the goals of Measure M is to reduce pollution.

Having considered economics along with the other factors in section 13241, the Los Angeles Water Board has also provided the Permittees with time to implement control measures to achieve interim and final WQBELs and Receiving Water Limitations. This time has been provided in various ways, including through compliance schedules that are consistent with the schedules of implementation established in TMDLs pursuant to California Water Code section 13242, compliance schedules proposed by Permittees and approved by the Los Angeles Water Board through Watershed Management Programs and Enhanced Watershed Management Programs for pollutants not addressed by TMDLs, and time schedule orders, where justified, for WQBELs and Receiving Water Limitations with final compliance deadlines that have passed. The Los Angeles Water Board is committed to continue to evaluate the costs of compliance as permit requirements are implemented and, as noted above, has included provisions that allow Permittees to request extension of deadlines, where warranted.

E. The Need for Developing Housing Within the Region

According to the U.S. Census, between April 1, 2010 to July 1, 2018, Los Angeles County and Ventura County experienced an estimated population increase of 2.9% and 3.3%, respectively.⁴⁷⁴ An increase in population creates a demand for more housing. Based on data from the California Department of Finance, both Los Angeles and Ventura counties have been experiencing an increase in population and housing units since 2010.⁴⁷⁵ An increase in population creates a higher demand for water, exacerbates usage of natural resources, and increases generation of waste and pollution. In order to conserve and protect the quantity and quality of our natural resources, development must be done systematically. To protect human health and the environment, create economic opportunities, and provide attractive and affordable neighborhoods, U.S. EPA encourages smart growth and low impact development.⁴⁷⁶ Stormwater management is an essential smart growth strategy. According to U.S. EPA, using smart growth and low impact development strategies, communities and developers can reduce runoff quantity, protect water quality, and conserve water by developing compactly, preserving ecologically critical open space, and using green infrastructure strategies.⁴⁷⁷

Improved stormwater management may also help reduce the region's historic reliance on imported water to meet population needs. For over 100 years, this region has relied on imported water to meet many of our water resource needs. Imported water makes up approximately 70 to 75% of the Southern California region's water supply, with local ground water, local surface water, and reclaimed water making up the remaining 25 to

⁴⁷⁶ According to U.S. EPA, “[s]mart growth’ covers a range of development and conservation strategies that help protect our health and natural environment and make our communities more attractive, economically stronger, and more socially diverse.” Principles of smart growth include, but are not limited to, use of compact building design, creating a range of housing opportunities and choices, and preserving open space and critical environmental areas. 30%.⁴⁷⁸ The Los Angeles Region imports approximately 50% of its water supply. Untreated MS4 discharges collect and transport pollution to our waterbodies and detrimentally affect their beneficial uses. However, when properly managed, MS4 discharges can be used as a resource.

The Order also helps address the water needs associated with the need for housing by controlling the quality and quantity of MS4 discharges and using it as a water resource for recycling and re-use. The low impact development (LID) requirements of the Order emphasize the necessity to balance growth with the protection of water quality. LID emphasizes cost effective, lot-level strategies that replicate the natural hydrology of the site and reduce the negative impacts of development. By avoiding the installation of more costly conventional stormwater management strategies and harnessing runoff at the source, LID practices enhance the environment while providing cost savings to both developers and local governments.

The Order also supports an integrated water resources approach that manages water resources by integrating wastewater, non-stormwater, stormwater, recycled water, and potable water planning through the capture and beneficial use of MS4 discharges on a regional scale. An integrated approach can preserve and augment local groundwater resources thereby reducing imported water needs and increasing local water resiliency. Local water resiliency increases the region's capacity to support increases in population and the accompanying need for housing.

F. The Need to Develop and Use Recycled Water

During the terms of the 2012 Los Angeles County, 2014 City of Long Beach, and 2010 Ventura County MS4 permits, California experienced a severe drought which lasted 376 weeks, starting from the year 2011 to 2019. The U.S. Drought Monitor characterizes the drought based on specific criteria where D4 is defined as exceptional drought, in which widespread crop and pasture losses and shortages of water create water emergencies. Per the U.S. Drought Monitor, "[t]he most intense period of drought occurred the week of July 29, 2014 where D4 affected 58.1% of California land."⁴⁷⁹ Along with the drought, Los Angeles and Ventura counties experienced wildfires, floods, extreme heat and more, which strained the region's resources and highlighted infrastructure inefficiencies. In contrast to the drought, the 2019 water year had above average rainfalls and in some cases even breaking daily rainfall records.⁴⁸⁰ Due to climate change, the region will only continue to experience more extreme weather events.

Furthermore, as mentioned in Part XIII.E above, which considers the need for developing housing within the region, according to the U.S. Census, between April 1, 2010 to July 1, 2018, the populations in Los Angeles County and Ventura County rose by 2.9% and 3.3%, respectively. This increase in population leads to an increase demand for water supply to meet the needs of the residents. Most of the water supplied to Los Angeles County is imported from the State Water Project, Colorado River, and

the Los Angeles Aqueduct.⁴⁸¹ Ventura County relies on local groundwater as well as imported water.⁴⁸² The interconnected effects of water quality and the health of our communities is also becoming increasingly apparent. Water shortages and the pumping of groundwater at a rate that depletes groundwater supply further demonstrates the need to develop a robust strategy that incorporates recycled water to build resiliency to the region's most pressing issues, while being protective of public health and the environment.

Initiatives for water resiliency have passed at the state and local levels. At the state level, in April 2015, Governor Brown issued Executive Order B-29-15, which outlined actions needed to respond to the severe drought, including mandated reductions in urban potable water usage by 25% statewide. In April 2019, Governor Newsom issued Executive Order N-10-19, ordering key agencies, including the California Environmental Protection Agency, to prepare a water resilience portfolio that meets the needs of California's communities, economy, and environment through the 21st century.⁴⁸³ The draft portfolio includes a number of recommendations related to making stormwater capture a growing share of local water supply.⁴⁸⁴ At the local level, the City of Los Angeles developed L.A.'s Green New Deal, which includes plans to recycle 100% of its wastewater by 2035 as well as source 70% of all water locally by 2035 and capture 150,000 acre-feet per year (AFY) of stormwater.⁴⁸⁵ In Ventura County, the Integrated Regional Water Management Plan was developed in 2014, in which the Watersheds Coalition of Ventura County is responsible for the implementation and planning at a regional level. Through this planning effort, Ventura County has leveraged its resources through collaborations with local agencies and organizations, and grant funding in order to implement multi-benefit projects.⁴⁸⁶ Along with government recognizing the water challenges the region is facing, residents also recognize the need to develop recycled water infrastructure and the importance of water resiliency with the passing of Measure W in Los Angeles County, which provides a dedicated funding source for multi-benefit stormwater capture projects through a parcel tax on impermeable areas.⁴⁸⁷

Historically, stormwater has not been considered a viable component of the regional water portfolio. However, if stormwater is captured and treated, a new resource could be added to local water supply and numerous benefits could be achieved. These include:

- Regional reduction in reliance on imported water;
- Aid in the restoration of area aquifers both from a supply and water quality point of view;
- Reduction in the need for extensive public works projects; and

- Improvement in the quality of impaired water bodies.

Municipalities across the region are now acknowledging the importance of recognizing stormwater as a resource and thus conducting watershed-based planning to implement multi-benefit solutions for stormwater management. Consistent with the Clean Water Act, which supports the implementation of stormwater management at a watershed scale, the 2012 Los Angeles County MS4 Permit and the 2014 City of Long Beach MS4 Permit contained provisions to allow for the abovementioned benefits to be achieved through the implementation of approved Watershed Management Programs. The Order further expands such provisions to Permittees in Ventura County. Watershed Management Programs allow Permittees the flexibility to implement requirements of the Order on a watershed scale through customized strategies, control measures, and BMPs to achieve multi-benefit solutions. Participation in a Watershed Management Program is voluntary and allows the Permittee to address the highest water quality priorities in consideration of particular socio-economic, land use, and geographic characteristics.

In addition, participation in Watershed Management Programs allows Permittees to consider the potential amount of dry weather urban runoff and precipitation and thus the amount of non-stormwater and stormwater available to capture. The exact volume of stormwater available for capture is dependent on the intensity and duration of storm events. Looking at land uses across the region and applying land use-specific runoff coefficients, the Los Angeles and San Gabriel Rivers Watershed Council estimates that, on average, about 601,000 acre-feet/year of runoff are discharged from the Los Angeles Region to the Pacific Ocean.⁴⁸⁸ The average annual rainfall in Ventura County is about 18 inches and has a total area of 1,843 square miles.⁴⁸⁹ It is not possible to capture all MS4 discharges; however, a significant portion could be captured and put to beneficial use. Capturing stormwater from a larger portion of the watershed could increase the volume of this “new” water even further.

Larger projects (and the corresponding savings) are also possible. The County of Los Angeles recharges stormwater already. While the scale of these recharge activities is limited compared to the volume of water potentially available to recharge, the value of the process is significant. For example, in 2000 “County conservation efforts captured 220,000 acre-feet of local stormwater runoff that was valued at \$80 million dollars.”⁴⁹⁰

The unknown effects of infiltrating stormwater to recharge groundwater have created some concern that such activities could introduce pollutants to the water supply. However, these concerns are likely overstated. The U.S. Bureau of Reclamation has found:⁴⁹¹

⁴⁸⁸ [Los Angeles and San Gabriel Rivers Watershed Council \(2010\) Water Augmentation Study: Research, Strategy, and Implementation Report, January 30, 2010.](https://www.usbr.gov/lc/socal/reports/LASGwtraugmentation/report.pdf) <https://www.usbr.gov/lc/socal/reports/LASGwtraugmentation/report.pdf>. Accessed on June 23, 2020.

⁴⁹⁰ Los Angeles County Department of Regional Planning. 2008. 2008 Draft General Plan-Planning Tomorrow’s Great Places.

⁴⁹¹ Los Angeles and San Gabriel River Watershed Council. 2010. Water Augmentation Study: Research, Strategy, and Implementation Report. <https://www.usbr.gov/lc/socal/reports/LASGwtraugmentation/report.pdf>. Accessed on June 23, 2020.

Based on the findings of the WAS research, decentralized stormwater management would provide a local and reliable supply of water that would not negatively impact groundwater quality. A decentralized approach could contribute up to 384,000 acre-feet of additional groundwater recharge annually if the first ¾" of each storm is infiltrated on all parcels, enough to provide water annually to approximately 1.5 million people. The value of this new water supply would be approximately \$311 million, using the MWD Tier 2 rate for 2010.

Recent studies in the urbanized area of Los Angeles County have also shown that in the process of infiltration through the soil, many contaminants are removed with no immediate impacts, and no apparent trends to indicate that stormwater infiltration will negatively impact groundwater.⁴⁹² Moreover, in groundwater basins with elevated concentrations of salts, utilizing recycled stormwater, which has low concentrations of salts, to recharge the aquifers may actually improve water quality. The value of this is difficult to quantify but is an additional benefit.

The Order addresses the need for recycled water by emphasizing stormwater capture for beneficial use as a means to control the discharge of pollutants from the MS4 to surface waters. The Order also supports the diversion of non-stormwater to wastewater reclamation facilities where it can be treated for beneficial reuse. State law and policy advocates greatly expanding the use of recycled water to help meet local demand and reduce the volumes of water that are imported from other regions. Increased utilization of recycled water will require looking beyond the traditional reclaimed wastewater and will require utilizing stormwater and non-stormwater that is wasted by conveyance in the MS4 to the ocean. Stormwater capture and use has not featured as prominently as municipal wastewater in the discussion of water recycling but is increasingly acknowledged as a valuable asset for augmenting local water supply. The use of recycled water can be accomplished in direct (such as irrigation projects) or indirect (such as infiltration) ways. Both direct and indirect methods can be completed on a variety of different scales. To maximize the benefits available from using recycled water, the direct and indirect projects will need to be completed on household, neighborhood, watershed, and regional scales. There is a growing number of projects in the region that can serve as examples of what may be accomplished through the development and implementation of recycled water projects.

Some successful examples of onsite stormwater capture are being demonstrated by TreePeople.⁴⁹³ TreePeople's demonstration projects range from small scale rainwater harvesting at single family home locations, to large scale watershed projects. At Tuxedo Green in Sun Valley, TreePeople redesigned the intersection with a flood control system that conveys most stormwater under, instead of into, the busy intersection. The water is stored in a 45,000-gallon cistern to be used for irrigating the landscaping at the new pocket park, which is planted with native and drought-tolerant species.

Another state of the art project was implemented by the City of Santa Monica called the Santa Monica Urban Runoff Recycling Facility (SMURRF).⁴⁹⁴ The project harnesses the urban runoff (primarily during the dry season) and treats it for various pollutants to create a source of high quality water for reuse in landscape irrigation, thus reducing the need

⁴⁹⁴ <http://c0133251.cdn.cloudfiles.rackspacecloud.com/Case%20Study%20%20Santa%20Monica%20Urban%20Runoff%20Recycling%20Facility%20SMURRF.pdf>.

for potable water. Because the facility captures the dry weather runoff before it reaches the Santa Monica Bay, it decreases a significant amount of pollutants from negatively impacting the Bay and associated beaches. The SMURRF is also open to the public and has several exhibits to raise public awareness of Santa Monica Bay pollution and the role of each individual in the watershed's health.

The County of Los Angeles Department of Public Works, Watershed Management Division has targeted the Sun Valley Watershed "...to solve the local flooding problem while retaining all stormwater runoff from the watershed, increasing water conservation, recreational opportunities, wildlife habitat, and reducing stormwater pollution."⁴⁹⁵ This aggressive plan involves several stakeholders and has implemented a variety of on-site BMPs as well as stormwater infiltration retrofits and diversions.

In Ventura County, the Ventura Countywide Stormwater Quality Management Program has implemented various stormwater quality improvement projects and BMPs. In the City of Moorpark, College View Dog Park diverts all stormwater to infiltration basins and can retain 100% of the water during average rainfall periods. Walnut Acres Park has both on-site and off-site infiltration capability. The City of Ventura implemented downtown parking lot retrofits including curb cuts, bioswales, and permeable pavers and have applied similar features for green street projects.⁴⁹⁶ A notable green street project was implemented at the Ventura County Government Center. This project implemented an innovative infiltration system through the installation of 4,805 linear feet of pervious concrete gutters to capture stormwater from the Government Center's parking lot. The captured stormwater is filtered through an infiltration trench that flows into dry wells for groundwater recharge. Furthermore, in the Ventura River Watershed, Happy Valley Bioswale was designed to mimic natural processes to remove pollutants in stormwater runoff. This filtration system includes a baffle box at the entrance which removes trash, sediments, and small particles and is followed by a natural soil and plant filtration system to further treat the stormwater and allows for a thriving habitat.⁴⁹⁷

With the issuance of the Order, stormwater capture projects such as the abovementioned will allow for further expansion on a watershed scale and create consistency within the region.

In addition, there are a number of Total Maximum Daily Loads (TMDLs) established by the Los Angeles Water Board that incorporate recycled water programs as potential implementation actions to meet TMDL requirements. These potential actions focus on both traditional water recycling and the newer stormwater recycling approaches. Such recycled water programs reduce reliance on potable water supplies by expanding water recycling and aiding in the reclamation of poor quality, unconfined groundwater supplies. The capture, treatment and use of stormwater could augment these techniques as well. On-site capture of stormwater helps prevent the water from being contaminated by urban by-products to begin with and the use of this high-quality resource could reduce the unnecessary use of potable water for non-potable needs.

XIV. STATE MANDATES

Article XIII B, section 6(a) of the California Constitution provides that whenever “any state agency mandates a new program or higher level of service on any local government, the state shall provide a subvention of funds to reimburse that local government for the costs of the program or increased level of service.” No provision of the Order constitutes an unfunded state mandate subject to subvention under Article XIII B, section (6)(a) of the California Constitution.

A. Renewal of the Permits Is Not a New Program Or Higher Level of Service

As a threshold matter, MS4 permitting is not a “program” as that term is used in Article XIII B, section (6). The California Supreme Court has defined a “program” for purposes of Article XIII B, section 6, as: (1) programs that carry out the governmental function of providing services to the public, or (2) laws which, to implement a state policy, impose unique requirements on local governments and do not apply generally to all residents and entities in the state. (*San Diego Unified School Dist. v. Commission on State Mandates* (2004) 33 Cal.4th 859, 874 (reaffirming the test set forth in *County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 56); *Lucia Mar Unified School District v. Honig* (1988) 44 Cal.3d 830, 835.)

An NPDES permit for MS4 discharges arises from the Clean Water Act, which forbids everyone – individuals, businesses, state governments, tribal governments, local governments, etc. – from discharging pollutants from point sources to waters of the United States without an NPDES permit. (33 U.S.C. §§ 1311(a), 402, 502(5); see also 40 C.F.R. §§ 122.21, 122.22, 123.25.) The Clean Water Act requires permitting of private and governmental (federal, state, and local) sources of stormwater and non-stormwater alike. (33 U.S.C. § 1342(p); 40 C.F.R. § 122.26.) The Permittees here must have a permit because they discharge pollutants, not because they operate an MS4. See, *County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 58 (“Although local agencies must provide benefits to their employees either through insurance or direct payment, they are indistinguishable in this respect from private employers. In no sense can employers, public or private, be considered to be administrators of a program”). All polluters, whether private or public, must get a permit. (See, e.g., *City of Richmond v. Com. on State Mandates*, (1998) 64 Cal.App.4th 1190, 1199 (new law made “the workers’ compensation death benefit requirements as applicable to local governments as they are to private employers,” and therefore did not impose a new program or higher level of service.)

To be sure, the permit conditions provide a public benefit, but that is not the same thing as providing services to the public. There is a critical distinction between a law or executive order that requires local governments to provide a public service, and one that address the conduct and happens to cover local governments – and other entities such as private industry – because they engage in the conduct. This principle is best illustrated by *County of Los Angeles v. Department of Industrial Relations* (1989) 214 Cal.App.3d 1538. There, the Department of Industrial Relations enacted statewide safety regulations that governed all public and private elevators. (*Id.*, at pp. 1540–1541.) The county argued that the regulations created a mandatory, reimbursable “program” because “all passenger elevators in all county buildings are necessary for the performance of peculiarly governmental functions” (*Id.*, at pp. 1545–1546, italics omitted.) Rejecting that argument, the court explained that “the critical question is whether the mandated program carries out the governmental function of providing services to the public, not whether the elevators can be used to obtain these services.”

(*Id.*, at p. 1546, italics omitted.) In other words, a state law providing that local governments have to comply with the same safety rules as everyone else does not constitute a state mandated “program.” The same is true here. The Permit does not require Permittees to operate an MS4. Rather, it implements a body of state law that provides that, if a local government operates an MS4, it must take steps to mitigate pollutant discharges, like all other polluters. The fact that the specific permit here is issued to local governments does not render the permit a program that carries out a “governmental function” particular to local government or a permit that imposes unique requirements on the local governments.

Even if an MS4 permit could be considered a “program,” the requirements of the Order do not constitute a *new* program or a *higher level* of service as compared to the requirements contained in the previous permits issued by the Los Angeles Water Board to the Permittees. The overarching requirement to impose controls to reduce the pollutants in discharges from MS4s is dictated by the Clean Water Act (33 U.S.C. § 1342(p)(3)(B)) and is not new to this permit cycle. The inclusion of new and advanced measures as the MS4 programs evolve and mature over time is specifically anticipated under the Clean Water Act (55 Fed. Reg. 47990, 48052 (Nov. 16, 1990); 61 Fed. Reg. 43761 (Aug. 26, 1996); USEPA “*Interim Permitting Approach for Water Quality Based Effluent Limitations in Storm Water Permits*,” EPA 833-D-96-001 (September 1996)) because the experience gained in implementation of existing permits and ongoing technological developments help direct appropriate adaptation of the programs to better address pollution. Such new and advanced measures refine existing measures to improve the effectiveness of the ongoing program and do not constitute a new program or higher level of service. And while the new or advanced measures may result in additional costs to the Permittees, resulting new costs is not the test for a higher level of service. “If the Legislature had intended to continue to equate ‘increased level of service’ with ‘additional costs,’ then the provision would be circular: ‘costs mandated by the state’ are defined as ‘increased costs’ due to ‘an increased level of service,’ which, in turn would be defined as ‘additional costs.’” (*County of Los Angeles v. Com. on State Mandates* (2003) 110 Cal.App.4th 1176, 1191, quoting *Workers’ Compensation Mandates Decision, supra*, 43 Cal.3d. at p. 55.)

B. The Permit Requirements Fall Under Several Exceptions to Mandates Rules

Even if some of the requirements imposed on the Permittees with this renewal could be considered a new program or higher level of service, the following exceptions to a finding of unfunded mandates preclude subvention here:

1. The permit provisions are required by the federal Clean Water Act and implementing regulations:

One of the exceptions to the subvention requirements is that, if the mandate imposes a requirement that is mandated by a federal law or regulation and results in costs mandated by the federal government, no subvention is required unless the statute or executive order mandates costs that exceed the mandate in that federal law or regulation. (Gov. Code, § 17556(c).) The Order implements federally mandated requirements under the federal Clean Water Act and implementing regulations and its requirements are therefore not subject to subvention of funds. This includes federal requirements to: (i) effectively prohibit non-stormwater discharges through the MS4 to receiving waters; (ii) reduce the discharge of pollutants in stormwater to the maximum extent practicable; (iii) include such other provisions as the permitting authority (here, the Los Angeles Water Board)

determines appropriate for the control of such pollutants; (iv) attain applicable TMDL wasteload allocations; and (v) conduct monitoring and reporting.

Non-stormwater discharge prohibition: Federal law requires that an MS4 permit effectively prohibit non-stormwater discharges through the MS4 to receiving waters. (33 U.S.C. § 1342(p)(3)(B)(ii).) The Order's requirements to achieve the effective prohibition of non-stormwater discharges are thus compelled by federal law.

TMDL requirements: The Clean Water Act requires TMDLs to be established for waterbodies that do not meet federal water quality standards. (33 U.S.C. § 1313(d).) The Clean Water Act also requires that MS4 permits include "such other provisions as the Administrator or the State determines appropriate for the control of [] pollutants." (33 U.S.C. § 1342(p)(3)(B)(iii).) U.S. EPA interprets this provision to mandate "controls to reduce the discharge of pollutants to the maximum extent practicable, and where necessary water quality-based controls."⁴⁹⁸

Once U.S. EPA or a state establishes a TMDL, federal law requires that NPDES permits must contain water quality-based effluent limitations (WQBELs) consistent with the assumptions and requirements of any applicable wasteload allocation. (40 C.F.R. § 122.44(d)(1)(vii)(B).) Indeed, TMDLs are developed for the purpose of specifying requirements for the achievement of water quality standards in impaired waters (33 U.S.C. § 1313(d); 40 C.F.R. § 130.7) The Order's requirements for attainment of TMDL wasteload allocations are therefore compelled by federal law. Several generations of the MS4 permits issued in California have prohibited discharges that cause or contribute to exceedances of water quality standards in the receiving water. TMDL provisions, including WQBELs, simply add a process for meeting this requirement, generally based on a compliance schedule.

Monitoring and reporting requirements: Federal law requires that NPDES permits incorporate monitoring and reporting provisions. (33 U.S.C. §§ 1318(a); 1342(a)(2); 40 C.F.R. §§ 122.26(d)(2)(i)(F); 122.41(h), (j)-(l); 122.42(c); 122.44(i); 122.48.) The Order's monitoring and reporting requirements are thus imposed pursuant to federal law.

Maximum Extent Practicable (MEP) standard: The Clean Water Act mandates that the Order "require controls to reduce the discharge of pollutants to the maximum extent practicable." (33 U.S.C. § 1342(p)(3)(B)(iii).) *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, as modified on denial of rehearing (Nov. 16, 2016) (*Department of Finance*) analyzed whether the Clean Water Act's MEP standard required four particular provisions concerning trash receptacles and inspections in the 2001 Los Angeles County MS4 permit. In concluding that the provisions were not required by federal law, the Supreme Court stated that, "[h]ad the Regional Board found when imposing the disputed permit conditions, that those conditions were the only means by which the maximum extent practicable standard could be implemented, deference to the board's expertise in reaching that finding would be appropriate." (*Department of Finance, supra*, 1 Cal.5th at p. 768.) The Supreme Court further stated that "[s]uch findings

⁴⁹⁸ Phase I Stormwater Regulations, Final Rule, 55 Fed. Reg. 47990, 47994 (Nov. 16, 1990) (emphasis added); see also *Building Industry Ass'n of San Diego County v. State Water Resources Control Bd.* (2004) 124 Cal.App.4th 866, 882-887; Phase II Stormwater Regulations, Final Rule, 64 Fed. Reg. 68722, 68737.

are “case specific, based among other things on factual circumstances.” (*Id.*, fn. 15.)

To be entitled to deference, regional water boards must make an express finding that the particular set of permit conditions finally embodied in a given permit is required to meet that federal standard and must support that finding with evidence. The Los Angeles Water Board expressly finds that the Order specifies requirements necessary for the Permittees to reduce the discharge of pollutants in MS4 discharges to the MEP. Parts IV and VIII establish program requirements for Stormwater Management Program Minimum Control Measures, including programs for public information and participation, industrial and commercial facilities, construction activities, planning and land development, public agency activities, and illicit discharge detection and elimination, among others pursuant to 40 CFR section 122.26(d)(2)(iv). The requirements of these programs represent structural and non-structural water quality control measures that are effective, technically feasible, and generally accepted as appropriate.

Part IX establishes elective program requirements related to Watershed Management Programs (WMP), which provide an alternative compliance path through the preparation of a WMP that allows the Permittees to prioritize water quality issues and propose the specific control measures to address the prioritized issues and achieve the receiving water limitations and numeric WQBELs in accordance with a time schedule. This allowance also provides Permittees with ample flexibility to select, in a customized fashion, the water quality control measures that will reduce pollutants in stormwater to the maximum extent practicable.

The Los Angeles Water Board finds that the programmatic requirements of the Order are necessary to meet the MEP standard. The mix of program elements reflects the necessary pollutant reduction expected by the demanding federal MEP standard, but also represents a balancing of competing interests such as effectiveness, regulatory compliance, public acceptance, cost, and technical feasibility. To the extent there may be multiple means of achieving pollutant reductions and that there could be trade-offs between program areas with potentially higher costs and greater pollutant reductions, the permit programs are structured to provide the optimum reduction of pollutants necessary to reduce pollutants to the maximum extent practicable. This finding is the expert conclusion of the principal state agency charged with implementing the NPDES program in California and therefore entitled to deference under *Department of Finance*.

Finally, the Supreme Court in *Department of Finance* suggested that the inclusion of equivalent or substantially similar provisions by the U.S. EPA in other permits may support a finding that the provisions are necessary to achieve MEP. (*Dept. of Finance, supra*, 1 Cal.5th at p. 772.) The Los Angeles Water Board has examined the following U.S. EPA issued permits, among others, and concluded that they contain equivalent and/or substantially similar provisions: Massachusetts MS4 General Permit, Washington D.C. MS4 Permit, Albuquerque MS4 Watershed Permit, Boise/Garden City MS4 Permit, and Guam MS4 Permit. Previous sections of the Fact Sheet identify the specific provisions that are similar in these U.S. EPA issued permits.

2. Permittees have authority to fund the costs through service charges, fees, or assessments:

Even if any of the permit provisions could be considered unfunded state mandates, under Government Code section 17556, subdivision (d), a state mandate is not subject to reimbursement if the local agency has the authority to fund the costs through service charges, fees, or assessments. (*Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 398.) Here, Permittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with the Order. Permittees certainly have fee authority under their police powers. (See, Cal. Const., art. XI, § 7; *Freeman v. Contra Costa County Water Dist.* (1971) 18 Cal.App.3d 404, 408 (“It cannot be denied that prevention of water pollution is a legitimate governmental objective, in furtherance of which the police power may be exercised.”); *Department of Finance v. Commission on State Mandates* (2021) 59 Cal.App.5th 546, 561-62 (holding in part that local governments have the authority sufficient to pay for inspection requirements for commercial and industrial facilities and construction sites to ensure compliance with various environmental regulations in an MS4 permit under their police powers for the prevention of water pollution). This Fact Sheet demonstrates that numerous activities contribute to the pollutant loading from the MS4. Local agencies can levy service charges, fees, or assessments on these activities, independent of real property ownership. (See, e.g., *Apartment Ass’n of Los Angeles County, Inc. v. City of Los Angeles* (2001) 24 Cal.4th 830, 842 (upholding inspection fees associated with renting property).) The authority of a local agency to defray the cost of a program without raising taxes indicates that a program does not entail a cost subject to subvention. (*Clovis Unified School Dist. v. Chiang* (2010) 188 Cal.App.4th 794, 812 [“To the extent a local agency or school district ‘has the authority’ to charge for the mandated program or increased level of service, that charge cannot be recovered as a state-mandated cost.”], quoting *Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 401; *County of Fresno v. State of California* (1991) 53 Cal.3d 482, 487-488.)

Permittees have argued in the past that their fee or taxation authority is constrained by article XIII D, section 6, of the California Constitution, also known as Proposition 218. (Cal. Const., art. XIII D, § 6, subd. (c); see also *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351, 1358-1359.) However, Proposition 218 is not an impediment to Permittees’ fee authority.⁴⁹⁹ The Constitution has an exception to the voter approval requirements of Proposition 218, “for fees or charges for sewer, water, and refuse collection services.” (Cal. Const. Article XIII D, section 6, subd. (c).) In recent years, the Legislature enacted two important pieces of legislation confirming fee authority without the need for voter approval. In Assembly Bill 2043 (2014), effective January 1, 2015, the Legislature amended the definition of “water” for purposes of articles XIII C and XIII D to mean “water from any source.” (Gov. Code, § 53750, subd. (n), amended by Assembly Bill 2043 (Stats. 2014, ch. 78, § 2.) In doing so, the Legislature stated that its act “is declaratory of existing law.” (Stats. 2014, ch. 78, § 1(c).) With Senate Bill 231 (2017), effective January 1, 2018, the Legislature “reaffirm[ed] and reiterate[d]” that the definition of “sewer” for purposes of article XIII D includes:

⁴⁹⁹ Such authority is also undiminished by Proposition 26, which specifically excludes assessments and property-related fees imposed in accordance with Proposition 218 from the definition of taxes. (Cal. Const., art. XIII C, § 1, subd. (e)(7).)

systems, all real estate, fixtures, and personal property owned, controlled, operated, or managed in connection with or to facilitate sewage collection, treatment, or disposition for sanitary or drainage purposes, including lateral and connecting sewers, interceptors, trunk and outfall lines, sanitary sewage treatment or disposal plants or works, drains, conduits, outlets for surface or storm waters, and any and all other works, property, or structures necessary or convenient for the collection or disposal of sewage, industrial waste, or surface or storm waters.

(Gov. Code, § 53750, subd. (f), and § 53751, subd. (i), added by Senate Bill 231, Stats. 2017, ch. 536, § 2 (emphases added).) These legislative actions confirm that the Permittees have authority to raise fees or charges, without voter approval, for costs related to their MS4s.

In addition, Health and Safety Code section 5471, subdivision (a), gives dischargers fee authority for “services and facilities furnished...in connection with its water, sanitation, *storm drainage*, or sewerage system.” (Health & Safety Code, § 5471, subd. (a) (emphasis added).) Similarly, Public Resources Code section 40059, subdivision (a)(1), also confers fee authority on counties, cities, districts, or other local governmental agencies for “[a]spects of solid waste handling which are of local concern, including, but not limited to, frequency of collection, means of collection and transportation, level of services, charges and fees, and nature, location, and extent of providing solid waste handling services.”

The ability of the Permittees to levy fees, assessments, or service charges to pay for compliance with the requirements of the Order cannot be disputed. In addition to the general authority above, some of the Permittees have specific authority to levy funds to pay for permit compliance. By way of example, the Ventura County Board of Supervisors approved the concept of a countywide NPDES permit program and the use of the Flood Management District (presently the Watershed Protection District) benefit assessment authority to finance it in April 1992. On June 30, 1992, the Ventura County Board of Supervisors adopted a benefit assessment fee for stormwater and flood management in the unincorporated areas of Ventura County and the cities within the County, to be used in part to finance the implementation of a countywide NPDES municipal stormwater permit program. The Ventura County MS4 Permittees entered into agreement with the Watershed Protection District to finance the activities related to the Ventura County MS4 Permit for shared and district-wide expenses. The Permittees are also given the option to use the Benefit Assessment Program to finance their respective activities related to reducing the discharge of pollutants from their MS4s under the MS4 Permit. Therefore, the Ventura County Watershed Protection District (VCWPD), through the Benefit Assessment Program, has the authority to impose a fee or charge for implementation of this permit. Furthermore, in 2005, the Legislature authorized the VCWPD to increase property related fees to fund storm drainage service and facilities within its jurisdiction.⁵⁰⁰ The VCWPD has statutory authorization to levy an ad valorem tax upon all taxable property, an assessment upon all taxable real property in the district, or a fee imposed pursuant to Article XIII D of the California Constitution, to pay the costs and expenses of the district.⁵⁰¹

⁵⁰⁰ Ventura County Watershed Protection Act, California Water Code Appendix, Chapter 46, § 46-12.

⁵⁰¹ Ibid.

The LACFCD also has specific statutory authority to levy a tax, fee, or charge to comply with the requirements of the Order, including implementation of approved WMPs. The LACFCD is authorized:

To levy a tax, in compliance with the applicable provisions of Article XIII C of the California Constitution, or impose a fee or charge, in compliance with the applicable provisions of Article XIII D of the California Constitution, to pay the costs and expenses of carrying out projects and programs to increase stormwater capture and reduce stormwater and urban runoff pollution in the district in accordance with criteria established by the ordinance adopted pursuant to subsection 8c. Projects and programs funded by the revenues from the tax, fee, or charge may include projects providing multiple benefits that increase water supply, improve water quality, and, where appropriate, provide community enhancements such as the greening of schools, parks, and wetlands, and increased public access to rivers, lakes, and streams.⁵⁰²

Revenues derived from any tax, fee, or charge imposed would be subject to specific allocations. Forty percent of any revenues derived from any LACFCD tax, fee, or charge is to be allocated to cities within the boundaries of the district and to the County of Los Angeles for implementation, operation and maintenance, and administration of project and programs within their respective jurisdictions. Fifty percent shall also be allocated to pay for the implementation, operation and maintenance, and administration of watershed-based projects and programs, including WMPs.⁵⁰³

Finally, even if voter approval may be required prior to levying fees, that does not mean that a local agency lacks the authority to levy fees. In *Paradise Irrigation Dist. v. Commission on State Mandates* (2019) 33 Cal.App.5th 174, 182, the Court considered whether the majority protest procedure added by Proposition 218 deprived local agencies of authority to impose fees for water service. Article XIII D, section 6(a) requires a local agency to identify parcels subject to a new fee, calculate the fee amount, and provide notice to affected property owners. (Cal. Const., art. XIII D, § 6, subd. (a)(1).) If a majority of the property owners submit written protests against the fee, the fee may not be imposed. (*Id.*, subd. (a)(2).) The Court held that the “majority protest procedures are properly construed as a power-sharing arrangement between the districts and their customers, rather than a deprivation of fee authority.” (33 Cal.App.5th at p. 182.) It explained that, when considering how voter powers affect the ability of local governments to impose fees, courts “presume local voters will give appropriate consideration and deference to state mandated requirements” (*Id.* at p. 194, citing *Bighorn-Desert View Water Agency v. Verjil* (2006) 39 Cal.4th 205, 220.) “Although this power-sharing arrangement has the potential for conflict, we must presume that both sides will act reasonably and in good faith.” (*Id.*, at p. 192.) Further, the fact that, “as a matter of practical reality, the majority protest procedure allows water customers to defeat the District’s authority to levy fees” was not dispositive; “the inquiry into fee authority constitutes an issue of law rather than a question of fact.” (*Id.* at p. 195, citing *Connell, supra*, 59 Cal.App.4th at p. 401.) “Fee authority is a matter governed by statute rather than by factual considerations of practicality;” it

⁵⁰² Cal. Wat. Code, § App. § 28-2, subd. 8a.

⁵⁰³ *Id.*, subd. 8b.

is not controlled by whether municipalities have tried and failed to levy fees. (*Id.*) If there is statutory authority to levy fees, then there is no right to subvention. (*Id.*)

XV. PUBLIC PARTICIPATION

The Los Angeles Water Board has considered the issuance of WDRs that will serve as an NPDES permit for MS4 discharges within the Los Angeles Region. The Los Angeles Water Board staff has encouraged public participation in the permit development process. Over a period of three years from May 2018 to May 2021, the Los Angeles Water Board has held multiple listening sessions, workshops, and Board meeting agenda items focusing on issues pertinent to Permittees in both counties. Additionally, Board staff have met with Permittees and interested stakeholders upon request. The following information is provided pursuant to 40 CFR § 124.8(b)(6) and (7).

A. Permittee and Stakeholder Participation in Permit Issuance Process

1. Notification: Intent to Issue a Region-Wide Phase I MS4 Permit

On September 5, 2017, the Los Angeles Water Board sent a letter to all Permittees in the Los Angeles Region to announce the Board's intent to issue a region-wide Phase I MS4 Permit.

2. Working Proposal

On December 10, 2019, the Los Angeles Water Board released a staff Working Proposal to Permittees in the Los Angeles Region and key stakeholders for discussion purposes. This staff working proposal did not constitute either a "draft permit" or a "proposed permit" as defined in Title 40 Code of Federal Regulations (40 CFR) sections 122.2 or 124.6. The Working Proposal allowed Permittees and stakeholders to provide oral and written input that would facilitate future discussion at board meetings/workshops and aid Board staff in developing the tentative draft permit.

3. Board Meetings and Workshops

The Los Angeles Water Board on many occasions starting in May 2018 had an item on its Meeting agenda to solicit comments and feedback from the Board, Permittees, and stakeholders on the issuance of the Regional MS4 Permit. Board staff has also presented on specific topics during public workshops, some of which were held at a regularly scheduled Board Meeting or special Board meeting (Board Workshop). Most of the meeting and workshop dates are summarized as follows:

a. Board Workshop: May 10, 2018

Board staff presented their monitoring data analysis for the Los Angeles River, San Gabriel River, and Los Cerritos Channel/Alamitos Bay Watersheds and discussed solutions to improve data reporting in the Regional MS4 Permit.

b. Board Meeting: June 14, 2018

The Los Angeles Water Board had an agenda item to facilitate continued discussion of the Regional MS4 Permit ("MS4 standing item"). The purpose of the "MS4 standing item" was to provide a forum for Board members to discuss, and for Permittees and stakeholders to provide comments on, any aspect of the Regional MS4 Permit. This noticed item provided Permittees and other stakeholders with the opportunity to communicate directly with the Board regarding their interests and concerns about the current permits or pending issuance of the Regional MS4 Permit. The MS4 standing item also provided

an opportunity for the Board to provide input to staff on permit implementation or development. No action or voting took place during these items.

c. Board Workshop: July 12, 2018

Board staff presented their monitoring data analysis for the Upper Santa Clara River, Santa Monica Bay, and Dominguez Channel and Harbors Watersheds and the permit issuance timelines. Additionally, Board staff introduced the specific concepts to include in the Regional MS4 Permit such as new/revised TMDLs, Statewide Trash Amendments, and providing Ventura County Permittees the option to participate in a WMP.

d. Board Workshop: September 13, 2018

Board staff presented their monitoring data analysis for all the watersheds within Ventura County, Permittee-reported costs of implementing the 2010 Ventura County MS4 Permit, and the permit issuance timelines. The Board discussed the regional permit approach as it related to Ventura County Permittees.

e. Board Meeting: October 11, 2018

The Los Angeles Water Board had a standing MS4 item.

f. Board Meeting: November 8, 2018

The Los Angeles Water Board had a standing MS4 item.

g. Board Meeting: March 14, 2019

The Los Angeles Water Board had a standing MS4 item.

h. Board Workshop: April 11, 2019

Board staff addressed economic considerations with regard to issuance of a Regional MS4 Permit based on specific Permittee-reported costs of compliance with the previous permits and summarized some state funding sources. Permittees and stakeholders also provided information on the cost of compliance and funding related topics, such as cost reporting guidance, stormwater utility program management, and available funds from the Los Angeles County Safe Clean Water Program and Ventura County Watershed Protection District Benefit Assessment Program.

i. Board Meeting: June 13, 2019

The Los Angeles Water Board had a standing MS4 item.

j. Board Meeting: July 11, 2019

The Los Angeles Water Board had a standing MS4 item.

k. Board Meeting: September 12, 2019

The Los Angeles Water Board had a standing MS4 item.

l. Board Meeting: October 10, 2019

The Los Angeles Water Board had a standing MS4 item.

m. Board Meeting: November 14, 2019

Board staff presented a summary of stakeholder engagement, including the employment of a professional facilitator to better understand the interests, needs and perspectives of stakeholders and to explore areas of mutual agreement that could be reflected in the Regional MS4 Permit.

n. Board Meeting: December 12, 2019

The Los Angeles Water Board had a standing MS4 item.

o. Public Workshop: January 7, 2020

Los Angeles Water Board hosted a facilitated stakeholder workshop to discuss the Working Proposal and issues such as what constitutes permit success, addressing cost/timeline challenges, and measuring progress under the new permit.

p. Board Meeting: February 13, 2020

The Los Angeles Water Board had a standing MS4 item and presented on the types of comments received on the Working Proposal. Comments discussed included changes proposed to the Minimum Control Measures, monitoring and reporting requirements, watershed management programs, and TMDLs.

q. Board Meeting: May 14, 2020

The Los Angeles Water Board had a standing MS4 item and presented on the options to consider an extension for the near-term TMDL final compliance deadlines.

r. Board Meeting: July 2, 2020

The Los Angeles Water Board had a special board meeting to discuss the schedule for adopting the Regional MS4 Permit with consideration of key issues such as the economic impacts of the COVID-19 pandemic, TMDL final compliance deadlines, and inclusion of narrative/BMP-based effluent limitations versus numeric effluent limitations in the permit.

s. Board Meeting: July 9, 2020

The Los Angeles Water Board had a standing MS4 item.

t. Board Meeting: September 10, 2020

The Los Angeles Water Board had an MS4 standing item. Board staff presented information on: changes that were made in the tentative draft in response to comments received on the Working Proposal; the manner of TMDL incorporation; the status of the TMDL final deadlines extension project; economic considerations; and the proposed State Water Board Order on the WMPs and EWMP petitions.

u. Board Meeting: October 8, 2020

The Los Angeles Water Board had an MS4 standing item. Permittees and other stakeholders presented and provided oral comments on the Tentative Regional MS4 Permit.

v. Public Workshop: October 15, 2020

The Los Angeles Water Board held a public workshop to discuss the manner of TMDL incorporation in the Regional MS4 Permit. All Board Members attended. Board staff presented the basis for the proposed manner of TMDL incorporation in the Regional MS4 Permit. Permittees and other stakeholders presented and provided comments on the proposed manner of TMDL incorporation and alternatives.

w. Public Workshop: November 19, 2020

The Los Angeles Water Board held a public workshop to discuss monitoring and reporting requirements in the Regional MS4 Permit. Several Board Members attended. Board staff presented on monitoring and reporting requirements and then held a question-and-answer session.

x. Board Workshop: December 10, 2020

The Los Angeles Water Board held a Board workshop to follow-up on the October 15 and November 19, 2020 workshops. Board staff discussed the proposed manner of TMDL incorporation in comparison with that of other MS4 permits issued state-wide and by U.S. EPA. Permittees and other stakeholders also provided comments on the proposed manner of TMDL incorporation and alternatives.

y. Board Meeting: March 11, 2021

The Los Angeles Water Board had an MS4 standing item. Permittees and other stakeholders presented and provided comments on the Tentative Regional MS4 Permit.

z. Board Meeting: May 13, 2021

The Los Angeles Water Board had an MS4 standing item. Permittees and other stakeholders presented and provided comments on the Tentative Regional MS4 Permit.

aa. Public Workshop: June 22, 2021

The Los Angeles Water Board held a public workshop to discuss Permittee and stakeholder comments on the Revised Tentative Regional MS4 Permit for Permittees in Los Angeles and Ventura Counties. The first part of the workshop was dedicated to Ventura County Permittees' and stakeholders' comments on particular issues of concern and the Regional Board staff's responses thereto. The second part of the workshop was dedicated to Los Angeles County Permittees' and stakeholders' comments and the Regional Board staff's responses thereto.

4. Meetings with Permittees and Interested Persons

The Los Angeles Water Board staff met with various Permittees and stakeholders upon request. Most of these meetings are summarized below.

a. Meeting: January 25, 2016

The Los Angeles Water Board had a teleconference with the San Gabriel Valley Council of Governments to discuss submission of the ROWD, general questions about the permit issuance process, and general questions about what changes or continuation of permit provisions to expect.

b. Meeting: May 2, 2016

The Los Angeles Water Board held a kick-off meeting with Ventura County Permittees to discuss the preliminary schedule for permit development; identify potential alternative permit structures; and outline some of the major technical and policy aspects of permit development. Twenty-three individuals attended the meeting out of which eight represented the Los Angeles Water Board and the other fifteen represented Ventura County Permittees. After a presentation by Permittees on accomplishments, lessons learned, and permit renewal goals, Permittees had an opportunity to ask questions of staff, raise concerns, and explain their expectations for the new permit.

c. Meeting: May 16, 2016

The Los Angeles Water Board held a meeting with Ventura County Permittees on TMDLs and the Watershed Management Program. Twenty-three individuals attended the meeting out of which ten represented the Los Angeles Water Board, one represented the State Water Board, and the other twelve represented Ventura County Permittees. Permittees proposed a list of TMDLs to incorporate into the permit. Meeting attendees also discussed the structure of the Watershed Management Program and provisions such as the pollutant prioritization process and the use of existing TMDL implementation plans.

d. Meeting: June 8, 2016

The Los Angeles Water Board held a meeting with Ventura County Permittees on time schedule orders (TSOs) and the TSO issuance process in consideration of permit issuance timelines. Eleven individuals attended the meeting out of which three represented the Los Angeles Water Board and the other eight represented Ventura County Permittees.

e. Meeting: July 15, 2016

Ventura County Permittees held a meeting with the Los Angeles Water Board to discuss the monitoring and reporting program and follow-up on items from the previous meeting. Twenty-one individuals attended out of which five represented the Los Angeles Water Board and the other sixteen represented Ventura County Permittees. Meeting attendees discussed pre-meeting materials that were provided by the Permittees giving their recommendations on provisions of the Watershed Management Program and TMDLs. Additionally, meeting attendees discussed the following items in the monitoring and reporting program: receiving water monitoring sites, constituents to be monitored, and stormwater monitoring program constituents table and requested Permittees' feedback.

f. Meeting: August 1, 2016

The Los Angeles Water Board had a teleconference with Ventura County Permittees to discuss minimum control measures (MCMs). Seventeen individuals participated in the teleconference where five represented the Los Angeles Water Board, one represented the State Water Board, and the other eleven represented Ventura County Permittees. Meeting attendees discussed pre-meeting materials where Permittees proposed changes to the MCMs in their previous permit.

g. Meeting: October 20, 2016

The Los Angeles Water Board had a teleconference with Ventura County Permittees to provide a status update on the permit issuance process.

h. Meeting: August 29, 2017

The Los Angeles Water Board held a meeting with City of Los Angeles to introduce the concept of issuing a Regional MS4 Permit. Thirteen individuals attended out of which eight represented the Los Angeles Water Board and five represented City of Los Angeles.

i. Meeting: August 31, 2017

The Los Angeles Water Board held a meeting with Ventura County Permittees to introduce the concept of issuing a Regional MS4 Permit. Six individuals attended out of which four represented the Los Angeles Water Board and two represented Ventura County Permittees.

j. Meeting: September 5, 2017

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to introduce the concept of issuing a Regional MS4 Permit. Five individuals attended out of which four represented the Los Angeles Water Board and one represented Los Angeles County and LACFCD.

k. Meeting: September 21, 2017

Ventura County Permittees held a meeting with the Los Angeles Water Board to present to Ventura County Public Works Directors information about the permit renewal process, the Regional MS4 Permit concept, costs, funding, and the Statewide Trash Amendments. Twenty-eight individuals attended out of which three represented the Los Angeles Water Board and twenty-five represented Ventura County Permittees.

l. Meeting: December 19, 2017

The Los Angeles Water Board had a teleconference with the City of Long Beach to introduce the concept of issuing a Regional MS4 Permit. Eight individuals attended out of which four represented the Los Angeles Water Board and four represented the City of Long Beach.

m. Meeting: April 10, 2018

The City of Long Beach held a meeting with the Los Angeles Water Board to discuss the issuance of a Regional MS4 Permit and the City of Long Beach's ROWD. Eleven individuals attended out of which four represented the Los Angeles Water Board and seven represented the City of Long Beach.

n. Meeting: August 7, 2018

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD. Los Angeles County and LACFCD proposed TSO-related fact sheet language for the Regional MS4 Permit. Six individuals attended out of which three represented the Los Angeles Water Board and three represented Los Angeles County and LACFCD.

o. Meeting: August 10, 2018

The Los Angeles Water Board held a meeting with Ventura County Permittees to discuss the addition of receiving water and outfall stations in the Malibu Creek subwatershed and the non-stormwater screening and outfall monitoring program proposals for the Regional MS4 Permit. Six individuals attended out of which three represented the Los Angeles Water Board and three represented Ventura County Permittees.

p. Meeting: August 15, 2018

The Los Water Board staff held a meeting with Los Angeles County and LACFCD. Los Angeles County and LACFCD proposed regional project downstream solutions and also proposed adding language for the Regional MS4 Permit fact sheet discussing the Biotic Ligand Model (BLM). Seven individuals attended out of which three represented the Los Angeles Water Board and four represented Los Angeles County and LACFCD.

q. Meeting: September 10, 2018

The Los Angeles Water Board held public Listening Session with San Gabriel Valley Council of Governments Water Policy Committee (SGVCOG). The Los Angeles Water Board listened to and discussed cost concerns for current WMP/EWMP implementation and timeline for the Regional MS4 Permit issuance. Eighteen individuals were present out of which two were Los Angeles Water Board Members, four were Board staff, and four represented the SGVCOG. Additionally, eight public observers attended representing various Permittees, non-governmental organizations (NGOs), and other stakeholders.

r. Meeting: September 19, 2018

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss future workshops of the Regional MS4 Permit and the state-wide bacteria provisions. Four individuals attended out of which two represented the Los Angeles Water Board and two represented Los Angeles County and LACFCD.

s. Meeting: October 26, 2018

The Los Angeles Water Board held a meeting with NGOs to discuss the Regional MS4 Permit, specifically on incorporation of robust development/redevelopment standards such as capturing the 90th or 95th percentile rainfall, potential incorporation of BLM, and provide a public platform for Permittee monitoring data. Eight individuals attended out of which four represented the Los Angeles Water Board and the other four represented Heal the Bay, Los Angeles Waterkeeper (LA Waterkeeper), and Natural Resources Defense Council (NRDC).

t. Meeting: December 19, 2018

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss the Regional MS4 Permit issuance process and the Safe, Clean Water Program. Four individuals attended out of which two represented the Los Angeles Water Board and two represented Los Angeles County and LACFCD.

u. Meeting: January 18, 2019

The Los Angeles Water Board held a meeting with the NGOs to discuss Los Angeles County monitoring data. Seven individuals attended out of which four represented the Los Angeles Water Board and the other three represented Heal the Bay, LA Waterkeeper, and NRDC.

v. The Las Virgenes – Malibu Council of Governments Governing Board Meeting: February 19, 2019

The Las Virgenes – Malibu Council of Governments Governing Board held a public Listening Session with the Los Angeles Water Board. The Los Angeles Water Board listened to and answered queries about the Regional MS4 Permit issuance timelines, concerns about funds from the Safe, Clean Water Program in relation to EWMP compliance schedules, and future special studies on natural sources. More than 22 individuals attended out of which two were Board Members, four were Board staff, and sixteen represented the Las Virgenes – Malibu Council of Governments Governing Board and the Malibu Creek EWMP group members. Public observers included NGOs and other stakeholders.

w. Meeting: February 20, 2019

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss the Safe, Clean Water Program. Eight individuals attended out of which four represented the Los Angeles Water Board and four represented Los Angeles County and LACFCD.

x. Meeting: February 26, 2019

The Los Angeles Water Board held a meeting with several Los Angeles County Permittees. Fifteen individuals attended out of which three represented the Los Angeles Water Board, and twelve represented Larry Walker Associates (LWA), Richard Watson & Associates (RWA), City of Los Angeles, and Los Angeles County. LWA proposed compliance mechanisms and Regional MS4 Permit language for addressing bacteria.

y. Meeting: March 8, 2019

The Los Angeles Water Board held a meeting with the NGOs to discuss the Regional MS4 Permit to discuss these organizations' request for a shorter permit. Eleven individuals attended out of which three represented Los Angeles Water Board, two represented State Water Board, and the other six were from Heal the Bay, LA Waterkeeper, and NRDC.

z. Meeting: March 20, 2019

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD. Los Angeles County and LACFCD proposed Regional MS4 Permit language for the Safe, Clean Water Program, discussed the upcoming April 2019 Board workshop, and proposed reconsidering TMDLs rather than requesting TSOs to extend TMDL compliance schedules. Seven individuals attended out of which two represented the Los Angeles Water Board and five represented Los Angeles County and LACFCD.

aa. Meeting: June 19, 2019

The Los Angeles Water Board held a meeting with the NGOs to discuss the Regional MS4 Permit timelines, removal of the WMP/EWMP distinction in the Regional MS4 Permit, and annual report proposals for reporting on compliance with regional projects in the WMP/EWMP. Nine individuals were in attendance out of which four represented the Los Angeles Water Board and the other five represented Heal the Bay, LA Waterkeeper, and NRDC.

bb. Meeting: June 25, 2019

Ventura County Permittees held a public Listening Session with the Los Angeles Water Board. The Los Angeles Water Board listened to and discussed WMP development and implementation concerns, cost concerns, compliance with wet weather bacteria TMDLs, and permit issuance timelines. Thirty individuals attended out of which three were Los Angeles Water Board Members, four were Board staff, twenty-one represented Ventura County Permittees, and two were public observers representing CASQ Engineering and the Las Virgenes Municipal Water District.

cc. Meeting: July 8, 2019

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss cost analysis of some EWMPs with consideration of funds from the Safe, Clean Water Program. Los Angeles County and LACFCD also proposed specific TMDLs for the Board to reconsider. Eight individuals attended out of which four represented the Los Angeles Water Board and four represented Los Angeles County and LACFCD.

dd. Meeting: July 17, 2019

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to present information about planning versus actual costs on specific regional projects and continue the discussion on TMDL reconsiderations and cost analysis of some EWMPs with consideration of funds from the Safe, Clean Water Program. Four individuals attended out of which two represented the Los Angeles Water Board and two represented Los Angeles County and LACFCD.

ee. Meeting: August 22, 2019

The Los Angeles Water Board held a meeting with City of Los Angeles to discuss the Regional MS4 Permit issuance timeline, Safe, Clean Water Program, and TMDL final compliance deadlines. Five individuals attended out of which three represented the Los Angeles Water Board and two represented City of Los Angeles.

ff. Meeting: August 26, 2019

The Los Angeles Water Board held a meeting with Ventura County Permittees to discuss the Los Angeles County Permit markup provided to us in 2016 proposing permit language, permit issuance process, and follow-up on the previous meeting with the Ventura County public works directors. Fourteen individuals attended out of which four represented the Los Angeles Water Board and ten represented Ventura County Permittees.

gg. Meeting: August 28, 2019

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss priority TMDLs for Board's reconsideration, upcoming presentations at Board meetings on regional projects, and permit issuance schedule. Nine individuals attended out of which four represented the Los Angeles Water Board and five represented Los Angeles County and LACFCD.

hh. Meeting: September 9, 2019

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss economic considerations, including the cost of compliance, for the Regional MS4 Permit, LACFCD's dashboard for regional projects, and suggestions for the regional permit requirements. Three individuals attended out of which one represented the Los Angeles Water Board and two represented Los Angeles County and LACFCD.

ii. Meeting: September 10, 2019

The Los Angeles Water Board held a meeting with the NGOs to discuss Permittees' progress implementing their EWMPs and propose annual report language for reporting on compliance with multi-year efforts in EWMPs. Five individuals were in attendance out of which two represented the Los Angeles Water Board and the other three represented Heal the Bay, LA Waterkeeper, and NRDC.

jj. Meeting: September 18, 2019

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss the alignment of Marina del Rey TMDLs with Measure W funding, the regional permit reissuance process, and the upcoming NGO EWMP Report. Six individuals attended out of which two represented the Los Angeles Water Board and four represented Los Angeles County and LACFCD.

kk. Meeting: September 18, 2019

The Los Angeles Water Board had a teleconference with Ventura County, VCWPD, and the City of Agoura Hills to discuss the compliance with Malibu Creek TMDL requirements and the Medea/Palo Comado Stormwater Treatment System in the City of Agoura Hills. Seven individuals were in attendance out of which two represented the Los Angeles Water Board, two represented the City of Agoura Hills, two represented VCWPD, and one represented Ventura County.

II. Meeting: October 1, 2019

The Los Angeles Water Board held a meeting with Ventura County Permittees to discuss the Reasonable Assurance Analysis (RAA), source identification component of a WMP, timelines to develop a WMP, upcoming Malibu Creek Bacteria TMDL TSO request, usage of existing TMDL implementation plans for WMP proposals, and regional permit issuance schedule. Fourteen individuals attended out of which three represented the Los Angeles Water Board and eleven represented Ventura County Permittees.

mm. Meeting: October 16, 2019

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss possible extension of TMDL compliance deadlines, regional permit reissuance process, and Los Angeles County's dashboard of completed regional stormwater projects and green infrastructure projects. Ten individuals were in attendance out of which five represented the Los Angeles Water Board and five represented Los Angeles County and LACFCD.

nn. Meeting: November 20, 2019

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss the regional permit reissuance process and possible extension of TMDL compliance dates. Ten individuals were in attendance out of which five represented the Los Angeles Water Board and five represented Los Angeles County and LACFCD.

oo. Meeting: December 16, 2019

The Los Angeles Water Board held a meeting with City of Los Angeles to discuss the Ballona Creek TSO extension request and the Working Proposal of the Regional MS4 Permit. Eleven individuals were in attendance out of which five represented the Los Angeles Water Board and six represented City of Los Angeles.

pp. Meeting: December 17, 2019

The Los Angeles Water Board held a facilitated meeting with the NGOs to discuss the Regional MS4 Permit. Ten individuals were in attendance out of which four represented the Los Angeles Water Board, two represented Heal the Bay, one represented NRDC, and three represented LA Waterkeeper.

qq. Meeting: December 17, 2019

The Los Angeles Water Board held a facilitated meeting with NRDC, City of Los Angeles, San Gabriel Valley Council of Governments (SGVCOG), Los Angeles County/LACFCD, and Ventura County to discuss the Regional MS4 Permit. Fourteen individuals were in attendance out of which four represented the Los Angeles Water Board, one represented NRDC, three represented City of Los Angeles, two represented City of Monrovia/SGVCOG, two represented Los Angeles County/LACFCD, and two represented Ventura County.

rr. Meeting: January 21, 2020

The Los Angeles Water Board held a meeting with Los Angeles County and LACFCD to discuss permit reissuance schedules, TMDL reconsiderations for time extensions, and updates on Measure W. Nine individuals attended out of which five represented the Los Angeles Water Board and four represented Los Angeles County and LACFCD.

ss. Meeting: January 22, 2020

The Los Angeles Water Board held a meeting with NGOs to discuss the Regional MS4 Permit Staff Working Proposal and solicit feedback. Eight individuals attended out of which four represented the Los Angeles Water Board, and the other four represented Heal the Bay, LA Waterkeeper, and NRDC.

tt. Meeting: January 23, 2020

The Los Angeles Water Board held a meeting with City of Los Angeles to discuss the Regional MS4 Permit Staff Working Proposal and solicit feedback. The City of Los Angeles specifically discussed suggestions for the Watershed Management NOI submittal schedule and content, monitoring and reporting requirements, Planning and Land Development MCM, trash reporting requirements, Industrial/Commercial Facilities Program MCM, Illicit Discharge Detection and Elimination Program MCM, and filming BMPs under the non-stormwater discharge prohibitions. Fourteen individuals attended out of which seven represented the Los Angeles Water Board and the other seven represented the City of Los Angeles.

uu. Meeting: January 27, 2020

The Los Angeles Water Board held a meeting with The Nature Conservancy to discuss the Regional MS4 Permit Staff Working Proposal and solicit feedback. The Nature Conservancy discussed suggestions on how to incorporate and encourage nature-based solutions into the Regional MS4 Permit. Six individuals attended out of which three represented the Los Angeles Water Board and the other three were from The Nature Conservancy.

vv. Meeting: January 28, 2020

The Los Angeles Water Board held a meeting with Ventura County Permittees to discuss the Regional MS4 Permit Staff Working Proposal and solicit feedback. Ventura County Permittees specifically discussed suggestions to edit timelines for WMP submittals, Statewide Trash Amendment provisions, TMDLs, MCMs, and monitoring. Twenty individuals attended out of which eight represented the Los Angeles Water Board and the other twelve represented Ventura County Permittees.

ww. Meeting: February 19, 2020

The Los Angeles Water Board held a meeting with Los Angeles County and the LACFCD to discuss permit reissuance timelines, TMDL extension requests, and Measure W fund distribution status. Eight individuals attended out of which five represented the Los Angeles Water Board and the other three represented Los Angeles County and LACFCD.

xx. Meeting: February 21, 2020

The Los Angeles Water Board held a meeting with NGOs to discuss permit reissuance timelines and general comments on the Working Proposal of the Regional MS4 Permit. Eight individuals attended out of which five represented the Los Angeles Water Board and the other three represented Heal the Bay, LA Waterkeeper, and NRDC.

yy. Meeting: March 2, 2020

The Los Angeles Water Board held a meeting with the City of Los Angeles to discuss TSO implementation progress and the challenges of implementing the MS4 permit. Six individuals attended out of which four represented the Los Angeles Water Board and the other two represented City of Los Angeles.

zz. Meeting: March 18, 2020

The Los Angeles Water Board held a teleconference with Los Angeles County and the LACFCD to discuss the status of the Regional MS4 Permit considering the COVID-19 pandemic. Six individuals attended out of which two represented the Los Angeles Water Board and the other four represented Los Angeles County and LACFCD.

aaa.Meeting: April 15, 2020

The Los Angeles Water Board held a teleconference with Los Angeles County and the LACFCD to discuss the status of the Regional MS4 Permit, share updates on monitoring and project implementation considering the COVID-19 pandemic, and discuss the status of Measure W. Nine individuals attended out of which five represented the Los Angeles Water Board and the other four represented Los Angeles County and LACFCD.

bbb. Meeting: April 21, 2020

The Los Angeles Water Board held a teleconference with the City of La Habra Heights to discuss the Regional Permit and concerns from the City, which included TMDL compliance and comingling discharges. Ten individuals attended out of which five represented the Los Angeles Water Board and the other five represented the City of La Habra Heights.

ccc.Meeting: April 23, 2020

The Los Angeles Water Board held a teleconference with the City of Los Angeles to discuss the issuance schedule of the Regional MS4 Permit, TMDL compliance date related comments on the Regional MS4 Permit working proposal, the Inner Cabrillo Beach Bacteria TSO, and the Ballona Creek Bacteria TSO. Ten individuals attended out of which five represented the Los Angeles Water Board and the other five represented City of Los Angeles.

ddd. Meeting: May 28, 2020

The Los Angeles Water Board held a teleconference with the City of Los Angeles to discuss the extension of TMDL compliance schedules alongside Regional MS4 Permit issuance, the Inner Cabrillo Beach Bacteria TSO, and questions on shoreline monitoring considering the pandemic. Eight individuals attended out of which three represented the Los Angeles Water Board and the other five represented City of Los Angeles.

eee.Meeting: June 2, 2020

The Los Angeles Water Board held a videoconference with Los Angeles County and the LACFCD to discuss the status of the Regional MS4 Permit including a tentative issuance timeline and workshop opportunities, share updates on project implementation considering the COVID-19 pandemic, and discuss the status of Measure W. Eight individuals attended of which three represented the Los Angeles Water Board and the other five represented Los Angeles County and LACFCD.

fff. Meeting: June 8, 2020

The Los Angeles Water Board held a Listening Session with the Los Angeles River Upper Reach 2 Group to discuss their comment letter of February 5, 2020 on the Working Proposal and some of the responses to those comments.

Fourteen individuals attended out of which two represented the Los Angeles Water Board and the other twelve represented the Los Angeles River Upper Reach 2 Group.

ggg. Meeting: June 25, 2020

The Los Angeles Water Board held a videoconference with the City of Los Angeles to discuss the Regional MS4 Permit schedule and Measure W projects. Eight individuals attended out of which four represented the Los Angeles Water Board and the other four represented the City of Los Angeles.

hhh. Meeting: July 23, 2020

The Los Angeles Water Board held a videoconference with the City of Los Angeles to discuss EWMP implementation target load reduction/volume capture goals and the associated costs and schedules. Nine individuals attended out of which four represented the Los Angeles Water Board and the other five represented the City of Los Angeles.

iii. Meeting: August 27, 2020

The Los Angeles Water Board held a videoconference with the City of Los Angeles to discuss the Tentative Regional MS4 Permit, the TMDL deadline extension project, the upcoming Board meeting, and potential customization of the Industrial/Commercial Facilities MCM in the revised WMP. Nine individuals attended out of which four represented the Los Angeles Water Board and the other five represented the City of Los Angeles.

jjj. Meeting: August 27, 2020

The Los Angeles Water Board held a videoconference with Los Angeles County and the LACFCD to discuss TMDL deadline extensions and updates on the Safe Clean Water Program. Eight individuals attended out of which four represented the Los Angeles Water Board and the other four represented Los Angeles County and LACFCD.

kkk. Meeting: September 8, 2020

The Los Angeles Water Board held a videoconference with Ventura County Permittees to discuss changes between the Working Proposal and tentative draft, the manner of TMDL incorporation in the permit, and future workshops. Seventeen individuals attended out of which five represented the Los Angeles Water Board and the other twelve represented Ventura County Permittees.

III. Meeting: September 9, 2020

The Los Angeles Water Board held a videoconference with Los Angeles County and the LACFCD to discuss the Tentative Draft permit and TMDL deadline extensions. Nine individuals attended out of which four represented the Los Angeles Water Board and the other five represented Los Angeles County and LACFCD.

mmm. Meeting: September 22, 2020

The Los Angeles Water Board held a videoconference with Heal the Bay, LA Waterkeeper, and NRDC to discuss the Regional MS4 Permit Annual Report requirements and the future Manner of TMDL incorporation workshop. Nine individuals attended out of which four represented the Los Angeles Water

Board and the other five represented Heal the Bay, LA Waterkeeper, and NRDC.

nnn. Meeting: September 23, 2020

The Los Angeles Water Board held a videoconference with the City of Los Angeles to discuss the Industrial/Commercial MCM and permit language about Measure W. Ten individuals attended out of which four represented the Los Angeles Water Board and the other six represented the City of Los Angeles.

ooo. Meeting: October 21, 2020

The Los Angeles Water Board held a videoconference with Los Angeles County and the LACFCD to discuss TMDL deadline extensions, the Safe Clean Water Program, and share updates on WMMS and WRAMPS. Ten individuals attended out of which four represented the Los Angeles Water Board and the other six represented Los Angeles County and LACFCD.

ppp. Meeting: November 18, 2020

The Los Angeles Water Board held a videoconference with Los Angeles County and the LACFCD to discuss TMDL deadline extensions and the upcoming MS4 workshop on monitoring and reporting. Nine individuals attended out of which four represented the Los Angeles Water Board and the other five represented Los Angeles County and LACFCD.

qqq. Meeting: November 30, 2020

The Los Angeles Water Board held a videoconference with The Nature Conservancy to discuss comments on the Planning and Land Development MCM. Six individuals attended out of which four represented the Los Angeles Water Board and the other two represented The Nature Conservancy.

rrr. Meeting: December 16, 2020

The Los Angeles Water Board held a videoconference with Los Angeles County and LACFCD to discuss TMDL manner of incorporation into the Regional MS4 Permit and reopener language in the TMDL Basin Plan Amendments for the TMDLs being considered under the TMDL deadline extension project. Nine individuals attended out of which five represented the Los Angeles Water Board and the other four represented Los Angeles County and LACFCD.

sss. Meeting: December 17, 2020

The Los Angeles Water Board held a videoconference with City of Los Angeles to discuss potential impacts on the State Board Water Quality Order addressing the WMP/EWMP petitions, potential revisions to the RAA limiting pollutant approach, and timeline for aquatic toxicity test species sensitivity screening. Eight individuals attended out of which four represented the Los Angeles Water Board and the other four represented City of Los Angeles.

ttt. Meeting: January 20, 2021

The Los Angeles Water Board held a videoconference with Los Angeles County and LACFCD to follow-up on the schedule for the TMDL BPA extension project and any outstanding issues with regards to the Regional

MS4 Permit. Ten individuals attended out of which four represented the Los Angeles Water Board and the other six represented Los Angeles County and LACFCD.

uuu. Meeting: January 28, 2021

The Los Angeles Water Board held a videoconference with the City of Los Angeles to discuss the TMDL Basin Plan Amendment extension project, the Regional MS4 Permit adoption schedule, trash reporting forms, and future revisions to the City's WMP. Nine individuals attended out of which three represented the Los Angeles Water Board and the other six represented the City of Los Angeles.

vvv. Meeting: February 3, 2021

The Los Angeles Water Board held a videoconference with VCWPD, Los Angeles County/LACFCD, City of Los Angeles, City of Monrovia, a consultant representing the Los Cerritos Channel Watershed Management Group, and consultants from Larry Walker Associates representing Ventura County Permittees. Participants discussed the manner of TMDL incorporation in the permit (BMP versus numeric effluent limits approach), TMDL time extensions, and the schedule for permit adoption. Fifteen individuals attended out of which five represented the Los Angeles Water Board, one represented VCWPD, two represented the City of Monrovia, one represented the Los Cerritos Channel Watershed Management Group, two represented the City of Los Angeles, two represented Ventura County Permittees, and two represented Los Angeles County/LACFCD.

www. Meeting: February 17, 2021

The Los Angeles Water Board held a videoconference with Los Angeles County and LACFCD to follow-up with the TMDL Final Compliance Deadline Extension Project and the schedule for the Regional MS4 Permit. Nine individuals attended out of which five represented the Los Angeles Water Board and the other four represented Los Angeles County and LACFCD.

xxx. Meeting: February 25, 2021

The Los Angeles Water Board held a videoconference with the City of Los Angeles to discuss the Regional MS4 Permit adoption schedule, the Ballona Creek TSO, and requested continued support from the Board for City of Los Angeles's regional projects under the Safe, Clean Water Program. Nine individuals attended out of which three represented the Los Angeles Water Board and the other six represented the City of Los Angeles.

yyy. Meeting: February 25, 2021

The Los Angeles Water Board held a videoconference with the Upper Los Angeles River EWMP Group to discuss updates to the EWMP RAA and the impact of the State Board Order WQ 2020-0038 on the Regional MS4 Permit. Ten individuals attended out of which three represented Los Angeles Water Board and the other seven represented the Upper Los Angeles River Group.

zzz. Meeting: March 17, 2021

The Los Angeles Water Board held a videoconference with Los Angeles County and LACFCD to discuss the schedule for the Regional MS4 Permit

adoption and the next steps for the TMDL Final Compliance Deadline Extension Project. Eight individuals attended out of which four represented the Los Angeles Water Board and the other four represented Los Angeles County and LACFCD.

aaaa. Meeting: March 24, 2021

The Los Angeles Water Board held a videoconference with Los Angeles County, LACFCD, and various consultants representing different WMPs to discuss proposed updates to the WMP RAA in consideration of the State Board Order WQ 2020-0038. Thirteen individuals attended out of which four represented the Los Angeles Water Board, three represented Los Angeles County and LACFCD, and the other six represented various consultants representing different WMPs.

bbbb. Meeting: March 30, 2021

The Los Angeles Water Board held a videoconference with the City of Los Angeles to discuss the schedule for the Regional MS4 Permit adoption and the next steps for the TMDL Final Compliance Deadline Extension Project. Eight individuals attended out of which four represented the Los Angeles Water Board and the other four represented the City of Los Angeles.

cccc. Meeting: March 30, 2021

The Los Angeles Water Board held a videoconference with Ventura County/VCWPD, Los Angeles County/LACFCD, City of Los Angeles, City of Monrovia, a consultant representing the Los Cerritos Channel Watershed Management Group, and consultants from Larry Walker Associates representing Ventura County Permittees. This was a follow-up meeting to discuss concerns about the manner of TMDL incorporation in the Regional MS4 Permit. Twelve individuals attended out of which four represented the Los Angeles Water Board, two represented the City of Monrovia, one represented the City of Los Angeles, one represented Los Angeles County/LACFCD, one represented Ventura County/VCWPD, one represented the Los Cerritos Channel Watershed Management Group, and two represented Ventura County Permittees.

dddd. Meeting: April 19, 2021

The Los Angeles Water Board held a videoconference with the Upper Los Angeles River EWMP Group to discuss updates to the EWMP RAA in consideration of the State Board Order WQ 2020-0038 on the Regional MS4 Permit. Eleven individuals attended out of which four represented the Los Angeles Water Board and seven represented the Upper Los Angeles River EWMP Group.

eeee. Meeting: April 21, 2021

The Los Angeles Water Board held a videoconference with Ventura County Permittees to discuss past TMDL final compliance deadlines for the Ventura River Algae TMDL and Kidde and Hobie Beach Bacteria TMDL, benefits of participating in a WMP, and questions about how water quality exceedances trigger enforcement action. Seventeen individuals attended out of which four represented the Los Angeles Water Board and thirteen represented Ventura County Permittees.

ffff. Meeting: April 27, 2021

The Los Angeles Water Board held a videoconference with The Nature Conservancy to discuss the Planning and Land Development MCM in the Tentative Regional MS4 Permit. Six individuals attended out of which four represented the Los Angeles Water Board and two represented The Nature Conservancy.

gggg. Meeting: April 27, 2021

The Los Angeles Water Board held a videoconference with the City of Los Angeles to discuss the schedule for the Regional MS4 Permit issuance, TMDL extensions (e.g., TMDL revision, TSOs), and coordination with Caltrans MS4 on upcoming WMP projects. Nine individuals attended out of which three represented the Los Angeles Water Board and six represented the City of Los Angeles.

hhhh. Meeting: April 29, 2021

The Los Angeles Water Board held a videoconference with the East San Gabriel Valley Group (ESGV Group) to discuss the implications of the 2020 State Board Order, options for participating in the Watershed Management Program, and Trash Discharge Prohibitions requirements and reporting. Five individuals attended out of which two represented the Los Angeles Water Board, one was a consultant Colbert Environmental Group representing the ESGV Group, and two represented the City of Claremont.

iiii. Meeting: May 6, 2021

The Los Angeles Water Board held a videoconference with Los Angeles County/LACFCD and various consultants represented different WMP Groups to discuss the updated RAA approach to address concerns resulting from the State Board Order WQ 2020-0038 and the WMP project implementation schedule. Fifteen individuals attended out of which four represented the Los Angeles Water Board, three represented Los Angeles County/LACFCD, and eight consultants represented various Permittees.

B. Notification to Permittees and Interested Parties

The Los Angeles Water Board notified the Dischargers and interested agencies and persons of its intent to prescribe WDRs for the discharges and provided an opportunity to submit written comments, evidence, and recommendations on the draft permit, including the monitoring and reporting program and fact sheet. Notification was provided through the following: Email to the Los Angeles Water Board's MS4 Lyris lists and email to the Permittee and stakeholder mailing list on August 24, 2020.

The public had access to the agenda and any changes in dates and locations through the Los Angeles Water Board's website at https://www.waterboards.ca.gov/losangeles/board_info/agenda/

C. Written Comments

Parties and interested persons were invited to submit written comments and evidence concerning the tentative WDR as provided through the notification process. Comments and evidence were due by mail or email to the Executive Officer at the Los Angeles Water Board at:

Los Angeles Regional Water Quality Control Board
320 W. 4th Street, Suite 200
Los Angeles, CA 90013-2343

MS4stormwaterRB4@waterboards.ca.gov

To be fully responded to by staff and considered by the Los Angeles Water Board, the written comments and evidence were due by 5:00 p.m. on December 7, 2020.

D. Public Hearing

The Los Angeles Water Board held a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date: July 8, 9, 16, and 23, 2021
Time: 9:00 a.m. each day
Location: Video and Teleconference Meeting Only

Parties and interested persons were invited to attend. At the public hearing, the Los Angeles Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony was requested in writing.

E. Reconsideration of Waste Discharge Requirements

Any person aggrieved by this action of the Los Angeles Water Board may petition the State Water Board to review the action in accordance with Water Code section 13320 and California Code of Regulations, title 23, sections 2050 and following. The State Water Board must receive the petition by 5:00 p.m., within 30 calendar days of the date of adoption of the Order at the following address, except that if the thirtieth day following the adoption date of the Order falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

Or by email at waterqualitypetitions@waterboards.ca.gov

For instructions on how to file a petition for review, see http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml

F. Information and Copying

The Reports of Waste Discharge, other supporting documents, and comments received are on file and may be inspected and copied at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday, by appointment. Appointments may be made by following the instructions on the Los Angeles Water Board's website under "Contact Us," "Public Records Center" at:

https://www.waterboards.ca.gov/losangeles/resources/public_records_center.html

G. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should subscribe to the Los Angeles Water Board's "Region

4 SW Regional Phase I MS4 Permit" Email List at:
https://www.waterboards.ca.gov/losangeles/resources/email_subscriptions/.

H. Additional Information

Requests for additional information or questions regarding the Order should be directed to the Unit Chief of the Municipal Storm Water Permitting Unit. The contact name, phone number, and email address are available on the Los Angeles Water Board website:

https://www.waterboards.ca.gov/losangeles/water_issues/programs/stormwater/

ATTACHMENT G - AQUATIC TOXICITY: TIE AND TRE REQUIREMENTS

Requirements for follow-up monitoring in four **receiving water** scenarios where toxicity is present:

- Toxicity is present, but not above the TIE trigger as defined in Attachment E, Part IX.J.1;
- Toxicity is present above the TIE trigger and the TIE identifies the constituent(s) causing the toxicity;
- Toxicity is present above the TIE trigger during wet weather, but the TIE is inconclusive; and
- Toxicity is present above the TIE trigger during dry weather, but the TIE is inconclusive.

This attachment also addresses the several scenarios once **outfall** toxicity testing has been triggered.

An inconclusive TIE is defined as a TIE for which the cause of toxicity cannot be attributed to a constituent or class of constituents (e.g., metals, insecticides, etc.) that can be targeted for monitoring even after conducting appropriate Phase I and Phase II TIE treatments. This outcome may result from either non-persistent toxicity such that the TIE treatments cannot be successfully completed on the toxic sample, or from the inability with available Phase I and Phase II TIE treatments to isolate the constituent or class of constituents causing the toxicity. If the TIE is inconclusive due to non-persistent toxicity, Permittees shall identify and implement actions during the subsequent upstream and/or outfall toxicity sampling event to improve the likelihood of a conclusive TIE, while also following the steps below. Where a TIE is inconclusive due to the inability to determine the constituent(s) causing the toxicity, Permittees shall evaluate further steps to improve the TIE

An **inconclusive TIE** is one for which the cause of toxicity cannot be identified after the conclusion of TIE Phases I and II.

outcome including sensitive species selection, QA/QC, and the need to conduct Phases I through III of a TIE, among others.

If a TIE is inconclusive:

- ✓ Check QA/QC
- ✓ Evaluate sensitive species selection
- ✓ Initiate future TIEs earlier (to address non-persistent toxicity)
- ✓ Conduct all phases of TIE

TRIGGERS FOR ADDING TOXICITY MONITORING TO UPSTREAM RECEIVING WATER MONITORING / OUTFALL MONITORING:

1. If toxicity is present as determined based on a fail of the Test of Significant Toxicity (TST) t-test as specified in the Permit (Attachment E, Part IX.H.4) during wet or dry weather, but not above the TIE trigger (which is defined as when the survival or sublethal endpoint demonstrates a ≥ 50 Percent Effect at the IWC as per Attachment E, Part IX.J.1), then:

- a. Toxicity monitoring will be added to the next existing upstream receiving water site(s) during the same condition (wet or dry weather) for which toxicity was determined to be present. Monitoring for toxicity at the next existing upstream receiving water site(s) will occur during the next monitoring event that is at least 30 days following the original toxicity sample collection. Toxicity monitoring at individual receiving water sites will continue until (1) the deactivation criterion (i.e., two consecutive samples that pass the

- pass/fail TST t-test during the same condition) is met at the receiving water site or (2) a TIE is triggered and conclusively identifies the constituent or class of constituents causing toxicity, in which case the process outlined Part 2 below is followed. OR
- b. If there is no upstream receiving water monitoring site already established as part of the monitoring program, continue receiving water toxicity monitoring at the original site until (1) the deactivation criterion (i.e., two consecutive samples that pass the pass/fail TST t-test during the same condition) is met at the original receiving water site or (2) a TIE is triggered at the original site and conclusively identifies the constituent or class of constituents causing toxicity, in which case the process outlined in Part 2 below is followed. Also, conduct a TRE outlined in Attachment E, Part IX.K to identify, to the extent practicable, the source(s) of toxicity with the goal of identifying cause(s) of toxicity, paying particular attention to sources of potential constituent(s) causing toxicity (e.g., fipronil).
 - i. If there is no upstream receiving water monitoring site already established as part of the monitoring program and toxicity is present during dry weather, actions taken as part of the non-stormwater program (e.g., source identification and elimination or treatment of unauthorized non-stormwater discharges that are a source of pollutants) should be utilized to support the TRE.
 - ii. If there is no upstream receiving water monitoring site already established as part of the monitoring program and toxicity is present during wet weather, consider the following actions to support TRE: evaluating land uses and potential associated source(s) in the drainage area, evaluation of other permitted discharges, and evaluation of inspection activities. AND
 - c. If there is no upstream receiving monitoring site already established as part of the monitoring program and more than one occurrence of a fail of the TST t-test occurs at the original receiving water site within 3 years, then evaluate opportunities to conduct toxicity monitoring at upstream receiving water sites (either newly established or sites utilized by other monitoring programs), including tributaries.
2. If toxicity is present at a level exceeding the TIE trigger and the TIE identifies the constituent or class of constituents causing toxicity, then:
- a. Do not add toxicity monitoring to upstream sites. AND
 - b. During the same condition, add the identified constituent or constituents within the class of constituents¹ to the monitoring site where toxicity was identified, the upstream receiving water site(s), and upstream outfall site(s) starting with the next monitoring event that is at least 45 days following the toxicity sample collection. Monitoring for the identified constituent(s) will continue until the deactivation criterion (i.e., two consecutive samples do not exceed Receiving Water Limitations (RWLs), Water Quality-Based Effluent Limitations (WQBELs), or other appropriate threshold or guideline if there is no numeric RWL or WQBEL, for the identified constituents during the same condition) is met at the individual site. Where constituent(s) are identified in the outfall(s) above the RWL(s), WQBEL(s), or other appropriate threshold or guideline, commence TRE at each corresponding outfall location per Attachment E, Part IX.K.
 - c. No more than two TIEs are required at one receiving water site during the permit term if the TIEs identify the same constituent or class of constituents as the cause of toxicity.
3. If toxicity is present at a level exceeding the TIE trigger during wet weather and the TIE is inconclusive, then:
- a. Add toxicity monitoring to the next existing upstream receiving water site(s) during the next monitoring event that is at least 45 days following the original toxicity sample

¹ Using appropriate detection limits

- collection. Toxicity monitoring at individual receiving water site(s) will continue until (1) the deactivation criterion (i.e., two consecutive samples that pass the pass/fail TST t-test during the same condition) is met at the receiving water site or (2) a TIE is triggered and conclusively identifies the constituent or class of constituents causing toxicity, in which case the process outlined in Part 2 above is followed. AND
- b. The second inconclusive TIE in 3 years during wet weather would trigger outfall toxicity testing at upstream outfall sites (i.e., (1) outfall sites located between the receiving water site and the nearest upstream receiving water site located on the same waterbody and (2) outfall sites located on tributaries that have a confluence with the waterbody where the confluence is located between the receiving water site and the nearest upstream receiving water site located on the same waterbody) following the process outlined below in “Steps Related Outfall Toxicity Testing” during the next monitoring event that is at least 45 days following the original toxicity sample collection.
OR
 - c. As an alternative to the outfall monitoring described in Part 3.b above, Permittees may propose an alternative approach any time after the first inconclusive TIE, which could include utilizing upstream receiving water sites (either newly established or sites utilized by other monitoring programs), including tributaries, additional outfall sites, and/or different outfall sites. However, the outfall monitoring approach described in Part 3.b above must be followed until Los Angeles Water Board EO approval of the alternative approach.
4. If toxicity is present at a level exceeding the TIE trigger during dry weather and the TIE is inconclusive, then:
- a. Add toxicity monitoring to the next existing upstream receiving water site(s) during the next monitoring event that is at least 45 days following the original toxicity sample collection. Toxicity monitoring at individual receiving water site(s) will continue until (1) the deactivation criterion (i.e., two consecutive samples that pass the pass/fail TST t-test during the same condition) is met at the receiving water site or (2) a TIE is triggered and conclusively identifies the constituent or class of constituents causing toxicity, in which case the process outlined in Part 2 above is followed during the next monitoring event that is at least 45 days following the original toxicity sample collection. AND
 - b. Add toxicity testing to upstream outfall sites (i.e., (1) outfall sites located between the receiving water site and the nearest upstream receiving water site located on the same waterbody and (2) outfall sites located on tributaries that have a confluence with the waterbody where the confluence is located between the receiving water site and the nearest upstream receiving water site located on the same waterbody) following the process outlined below in “Steps Related Outfall Toxicity Testing” during the next monitoring event that is at least 45 days following the original toxicity sample collection.
OR
 - c. As an alternative to the outfall monitoring described in Part 4.b above, Permittees may propose an alternative approach any time after the first inconclusive TIE, which could include utilizing upstream receiving water sites (either newly established or sites utilized by other monitoring programs), including tributaries, additional outfall sites, and/or different outfall sites. However, the outfall monitoring approach described in Part 4.b above must be followed until Los Angeles Water Board EO approval of the alternative approach.

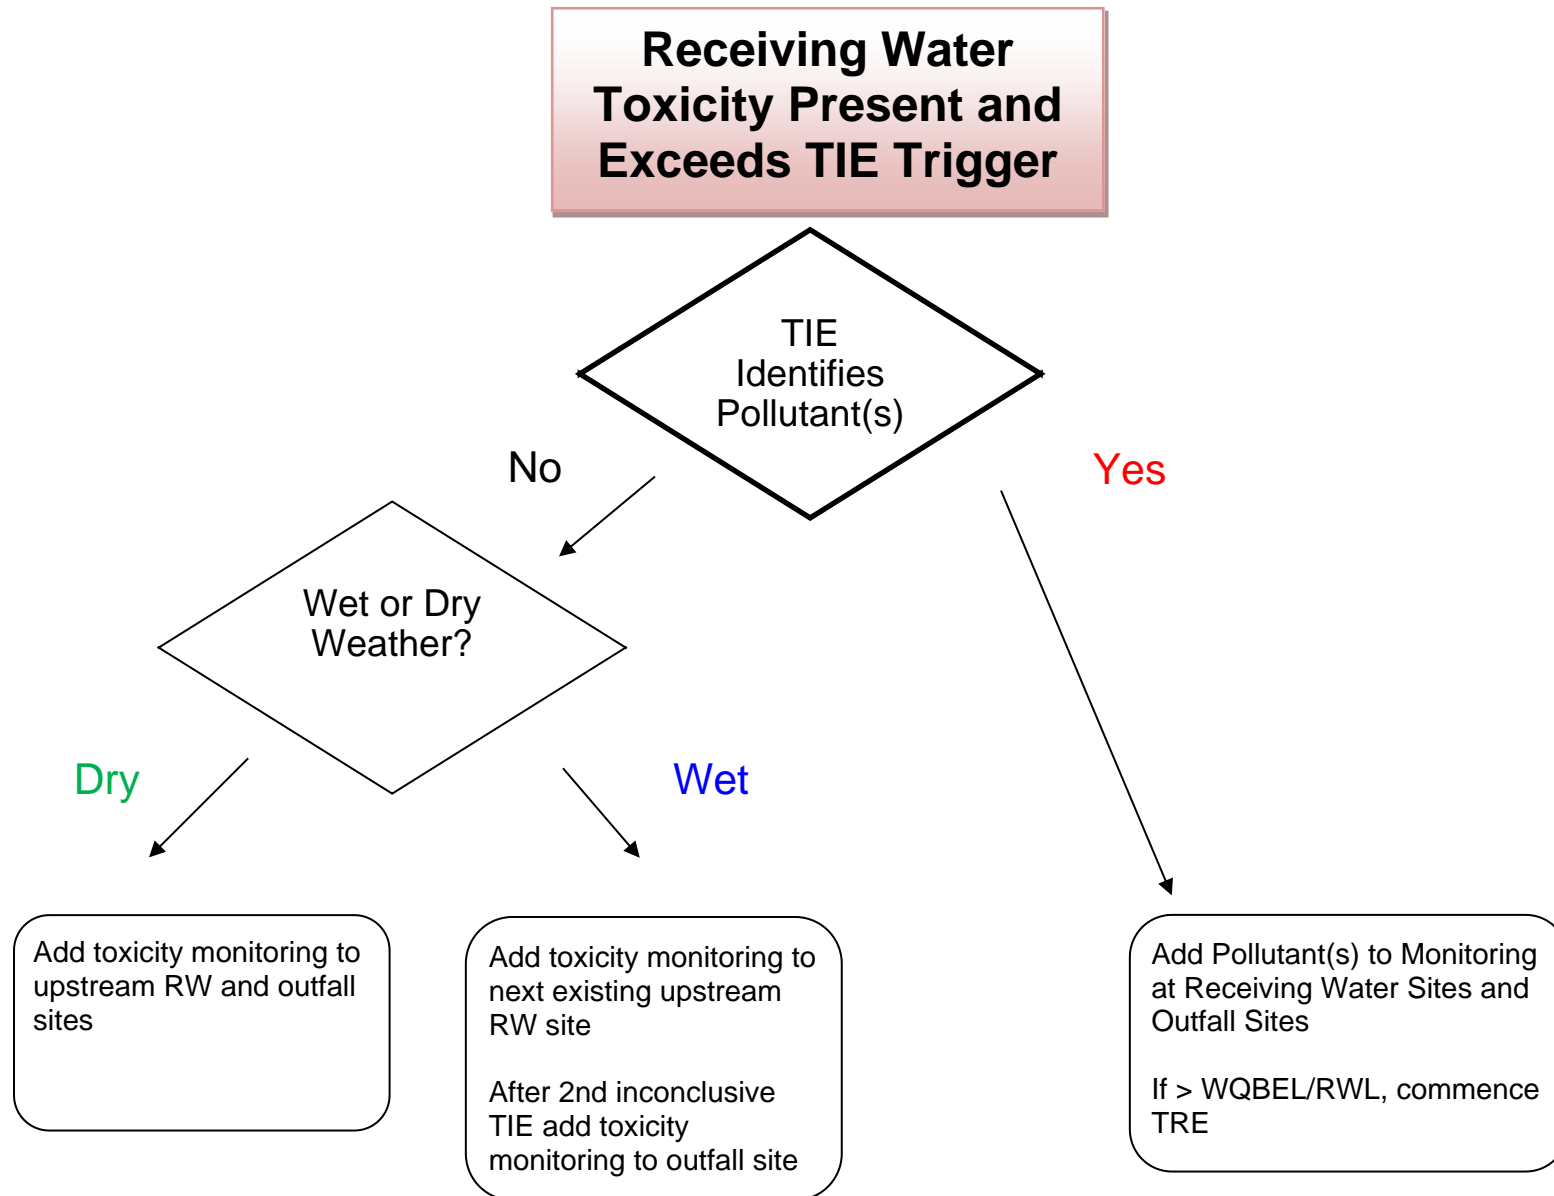

STEPS RELATED TO OUTFALL TOXICITY TESTING ONCE TRIGGERED:

1. If toxicity is not present as determined based on pass of the TST t-test as specified in the Permit, then continue toxicity testing during the same condition (i.e. wet or dry weather) until (1) meeting the deactivation criterion (i.e., two consecutive samples that pass the pass/fail

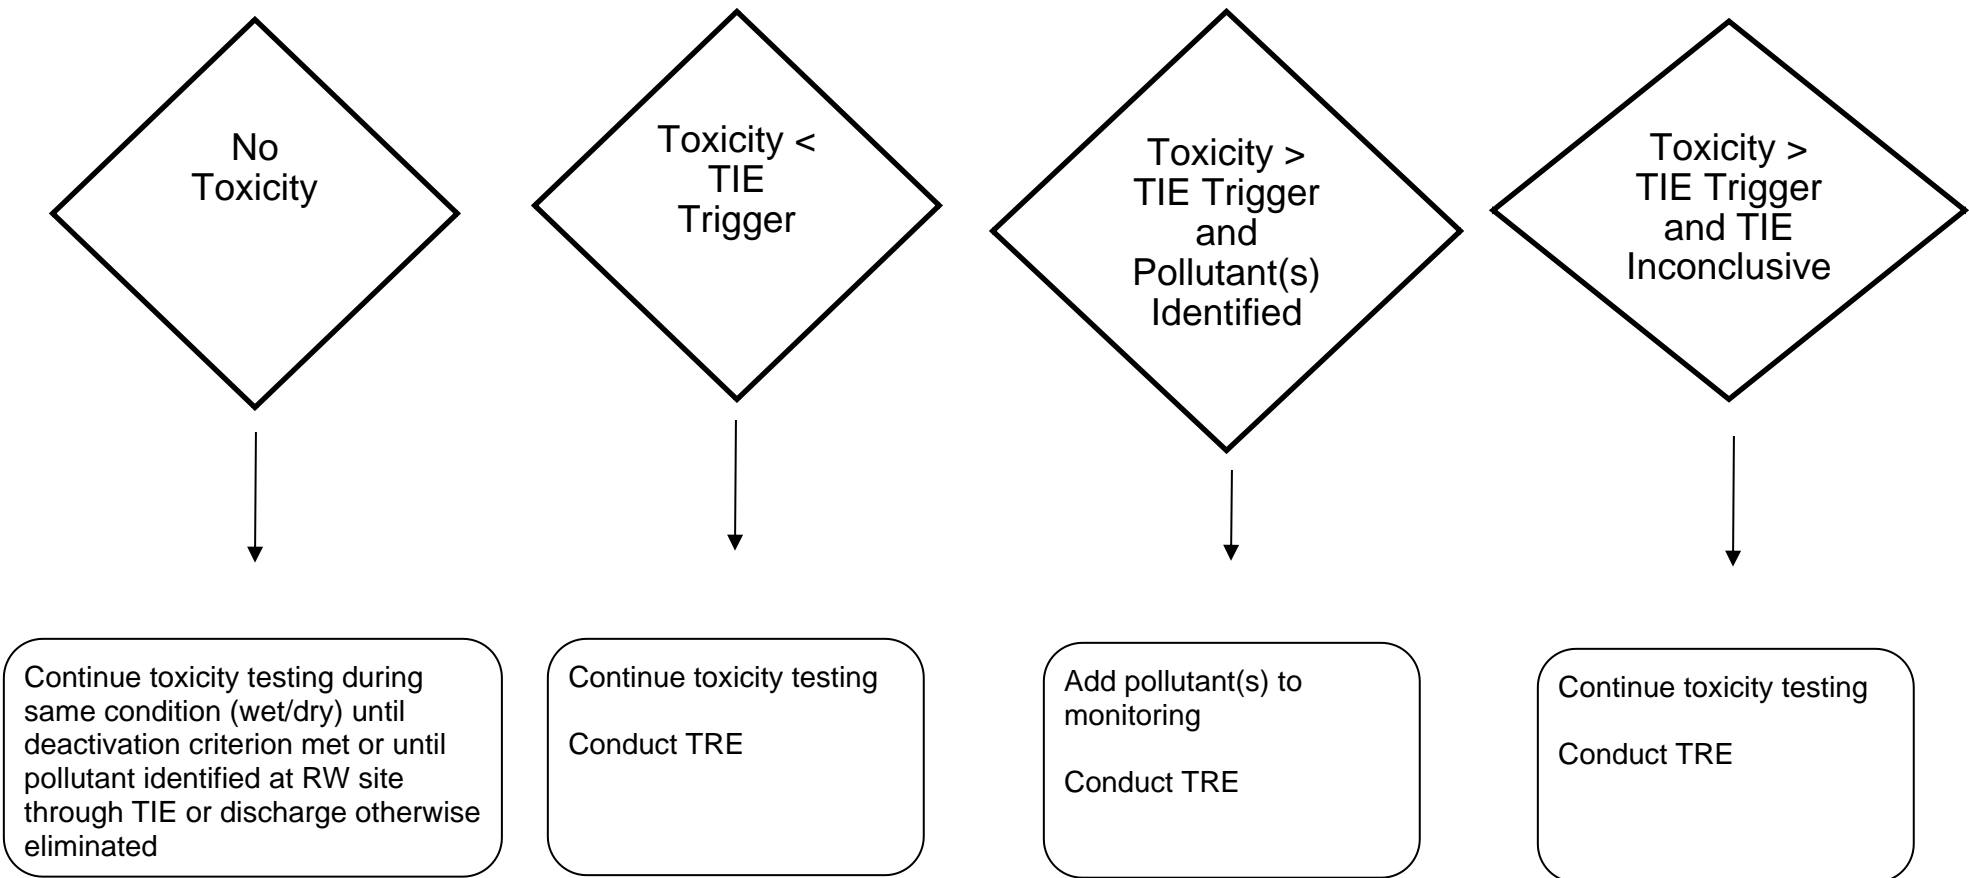

- TST t-test during the same condition), or (2) a TIE conducted at the downstream receiving water site conclusively identifies the constituent or class of constituents causing toxicity, or (3) the discharge is eliminated.
2. If toxicity is present as determined based on fail of the TST t-test as specified in the Permit, but not above the TIE trigger, then continue toxicity testing during the same condition until (1) meeting the deactivation criterion (i.e., two consecutive samples that pass the pass/fail TST t-test during the same condition), or (2) a TIE conducted at a downstream receiving water site conclusively identifies the constituent or class of constituents causing toxicity, or (3) the discharge is eliminated. Concurrently conduct a TRE in Attachment E, Part IX.K to identify, to the extent practicable, the source(s) of toxicity with the goal of addressing cause(s) of toxicity, paying particular attention to sources of potential constituent(s) causing toxicity (e.g., fipronil).
 - a. If toxicity is present in the non-stormwater discharge, actions taken as part of the non-stormwater program (e.g., source identification and elimination or treatment of unauthorized non-stormwater discharges that are a source of pollutants) should be utilized to support the TRE.
 - b. If toxicity is present in the stormwater discharge, consider the following actions to support the TRE: evaluating land uses and potential associated source(s) in the drainage area, evaluation of other permitted discharges, and evaluation of inspection activities.
 3. If toxicity is present at a level exceeding the TIE trigger and the TIE identifies the constituent or class of constituents causing toxicity, then:
 - a. Discontinue toxicity testing at the outfall. AND
 - b. Add the identified constituent or constituents within the identified class of constituents² during the same condition starting with the next monitoring event that is at least 45 days following the toxicity sample collection and monitor for those constituents at the outfall until meeting the deactivation criterion for those constituents (i.e., two consecutive samples do not exceed RWLs, WQBELs, or other appropriate threshold or guideline if there is no numeric RWL or WQBEL, for identified constituents), while simultaneously performing a TRE for the constituent(s) causing toxicity per Attachment E, Part IX.K.
 4. If toxicity is present at a level exceeding the TIE trigger and the TIE is inconclusive, then continue toxicity testing during the same condition until (1) meeting the deactivation criterion (i.e., two consecutive samples that pass the pass/fail TST t-test during the same condition), or (2) a TIE identifies the constituent or class of constituents causing toxicity (proceed with following the process outlined in Part 3, above), or (3) eliminate the discharge. Concurrently conduct a TRE in Attachment E, Part IX.K to identify, to the extent practicable, the source(s) of toxicity with the goal of addressing cause(s) of toxicity, paying particular attention to identifying sources of potential constituent(s) causing toxicity that may not have been evaluated in the TIE (e.g., fipronil).
 - a. If the TIE is inconclusive in the non-stormwater discharge, actions taken as part of the non-stormwater program (e.g., source identification and elimination or treatment of unauthorized non-stormwater discharges that are a source of pollutants) should be utilized to support the TRE.
 - b. If the TIE is inconclusive in the stormwater discharge, consider the following actions to support the TRE: evaluating land uses and potential associated source(s) in the drainage area, evaluation of other permitted discharges, and evaluation of inspection activities.

ATTACHMENT H – REPORTING FORMS

[WMP Name]

Reporting Period [MDY-MDY]

**Regional Phase I MS4 NPDES Permit
Order No. R4-2021-0105
NPDES No. CAS004004**

**Watershed Management Program Progress Report Form
Reporting Period [MDY-MDY]**

| | |
|--|--|
| Watershed Management Program Name | |
| Participating Permittee(s) | |
| Date of Watershed Management Program Progress Report | |
| Initial Approval Date of Watershed Management Program (according to Table 12 or Part IX.G.3 of the Order) | |

Note that Permittees will not be able to propose modifications to their WMP in the Watershed Management Program Progress Report Form. Any modification(s) shall be requested in writing explaining the nature of the proposed modification and justification for consideration by the Los Angeles Water Board [*Order – IX.C and IX.E.2*].

1.1 **Watershed Control Measure Milestone Progress.** Summarize the progress on all Watershed Control Measure requirements and dates for their achievement (milestones) identified in your WMP that were required to be achieved by the end of this Reporting Period. The milestones for specific projects may be reported as cumulative number of projects to be implemented (e.g., “Recipes for Compliance”; installation of prescribed volume of BMP capacity by a certain date; Percent Load Reduction of bacteria pollutant by a certain date), cumulative storm volume addressed¹ by control measures (e.g., LID, new/re-development projects, regional projects), or other metric. However, progress must be reported as percent completion of the selected milestone metric. If any milestones were not achieved, give a clear description of the action/milestone, explain the delay in control measure implementation, and provide the revised action/milestone. The summary must also include a list of (a) Permittees and non-Permittees collaborated with for achievement of milestones, (b) funding sought, (c) funding obtained, (d) technical assistance received (e.g., through the Safe Clean Water Program Watershed Area Steering Committee), (e) additional local community co-benefits such as clean streets (including, without limitation, street sweeping, litter abatement, etc.), more parks and green spaces, reduced heat island effect, reduced flooding, water supply augmentation, neighborhood beautification, and job creation, and (f) other co-benefits and resources accruing to disadvantaged communities as identified on CalEnviroScreen². The format for this item is a text box but you are encouraged to provide this information in an appropriate format as an attachment with spreadsheets, graphs, and/or other elements that would concisely convey the required information.

(Provide information within this space or as an attachment)

¹ Includes the volume of water captured, infiltrated, retained, treated, diverted or otherwise addressed by a watershed control measure.

² <https://oehha.ca.gov/calenviroscreen>

1.2 **Watershed Control Measures Completed.** Complete Table 1a, on an Excel spreadsheet. Include all watershed control measures (aside from minimum control measures specified in Part VIII of the Order) in the Watershed Management Program completed since the effective date of the Order for Ventura County Permittees, since March 28, 2014 for the City of Long Beach, and since December 28, 2012 for other Los Angeles County Permittees. This table is cumulative—i.e., the table should include all the control measures completed from the time of the aforementioned dates to the end of this reporting period. Structural control measures as well as non-structural control measures (e.g., enhanced MCMs such as incentive programs, outreach and conservation programs, etc.) should be included in this table. If information is not available for a particular field, the field should indicate “Not Applicable” (N/A) [Order – IX].

Table 1a: Watershed Control Measures Completed

| Project Name | Previous Project Name(s) if Changed | Permittee(s) | Subwatershed | Project Type ³ | Description | Latitude ⁴ | Longitude ⁵ | Required Completion Date in WMP | Actual Completion Date | Capital Costs [\$] | Cumulative O&M Costs [\$] | Funding Source(s) | Project Footprint ⁶ [Acres] | Drainage Area ⁷ [Acres] | Projected Storage Capacity in WMP [Acre-feet] | Actual Storage Capacity ⁸ [Acre-feet] | Cumulative Volume Addressed ⁹ [Acre-feet] |
|--------------|-------------------------------------|--------------|--------------|---------------------------|-------------|-----------------------|------------------------|---------------------------------|------------------------|--------------------|---------------------------|-------------------|--|------------------------------------|---|--|--|
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

³ Choose from Regional Infiltration Facility, Regional Treatment Facility, Green Street, Diversion to Sewer, Non-Structural, or Other (specify). For Regional Treatment Facility projects, include a description of the treatment process and design specifications in section 1.2a. For Green Street projects, include linear miles of the green street in section 1.2a.

⁴ Use decimal degrees (DD) format.

⁵ Use decimal degrees (DD) format.

⁶ The area footprint of the project.

⁷ The area tributary to the project.

⁸ The project’s physical storage capacity to hold water. For example, for a regional infiltration facility, this would be the storage volume of the storage units plus the void space of backfill materials.

⁹ Includes the cumulative volume of water captured, infiltrated, retained, treated, diverted, or otherwise addressed by the project.

1.2a) Additional Information. Provide additional information regarding the Watershed Control Measures completed (e.g., other compliance metrics and a list of (a) Permittees and non-Permittees collaborated with for achievement of milestones, (b) funding sought, (c) funding obtained, (d) technical assistance received (e.g., through the Safe Clean Water Program Watershed Area Steering Committee), (e) additional local community co-benefits such as clean streets (including, without limitation, street sweeping, litter abatement, etc.), more parks and green spaces, reduced heat island effect, reduced flooding, water supply augmentation, neighborhood beautification, and job creation, and (f) other co-benefits and resources accruing to disadvantaged communities as identified on CalEnviroScreen).

(Provide information within this space or as an attachment)

1.3 **Watershed Control Measures Planned and In Progress.** Complete Table 1b, on an Excel spreadsheet. Include all watershed control measures (aside from minimum control measures specified in Part VIII of the Order) in the Watershed Management Program that are planned and in progress. Structural control measures as well as non-structural control measures (e.g., enhanced MCMs such as incentive programs, outreach and conservation programs, etc.) should be included in this table. If information is not available for a particular field, the field should indicate “Not Applicable” (N/A) [*Order – IX*].

Table 1b: Watershed Control Measures Planned and In Progress

| Project Name | Permittee(s) | Subwatershed | Project Type ¹⁰ | Description | Latitude ¹¹ | Longitude ¹² | Required Completion Date in WMP | Estimated Completion Date | Estimated Capital Costs [\$] | Estimated Annual O&M Costs [\$] | Funding Source(s) | Project Footprint ¹³ [Acres] | Drainage Area ¹⁴ [Acres] | Projected Storage Capacity in WMP ¹⁵ [Acre-feet] | Status ¹⁶ | |
|--------------|--------------|--------------|----------------------------|-------------|------------------------|-------------------------|---------------------------------|---------------------------|------------------------------|---------------------------------|-------------------|---|-------------------------------------|---|----------------------|--|
| | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | |

¹⁰ Choose from *Regional Infiltration Facility, Regional Treatment Facility, Green Street, Diversion to Sewer, Non-Structural, or Other*. For Regional Treatment Facility projects, include a description of the treatment process and design specifications in section 1.3a.

¹¹ Use decimal degrees (DD) format.

¹² Use decimal degrees (DD) format.

¹³ The area footprint of the project.

¹⁴ The area tributary to the project.

¹⁵ The project’s physical storage capacity to hold water. For example, for a regional infiltration facility, this would be the storage volume of the storage units plus the void space of backfill materials.

¹⁶ Description of the project’s status. This may include the project implementation phase (e.g., funding, design, construction).

[WMP Name]

Reporting Period [MDY-MDY]

1.3a) Additional Information. Provide additional information regarding the Watershed Control Measures planned and in progress (e.g., other compliance metrics and a list of (a) Permittees and non-Permittees collaborated with for achievement of milestones, (b) funding sought, (c) funding obtained, (d) technical assistance received (e.g., through the Safe Clean Water Program Watershed Area Steering Committee), (e) additional local community co-benefits such as clean streets (including, without limitation, street sweeping, litter abatement, etc.), more parks and green spaces, reduced heat island effect, reduced flooding, water supply augmentation, neighborhood beautification, and job creation, and (f) other co-benefits and resources accruing to disadvantaged communities as identified on CalEnviroScreen).

(Provide information within this space or as an attachment)

1.4 **Water Body Pollutant Combination (WBPC) Compliance.** Complete Table 1c on an Excel spreadsheet for all WBPCs identified in the Watershed Management Program. If information is not available for a particular field, the field should indicate “Not Applicable” (N/A) [Order – X].

Table 1c: WBPC Compliance

| WBPC Category (1, 2, or 3) | Pollutant | Receiving Water | Weather Condition (Wet, Dry, N/A) | Interim or Final | Deadline | Deadline Met? (Yes, No, N/A) | Method of Compliance ¹⁷ |
|----------------------------|-----------|-----------------|-----------------------------------|------------------|----------|------------------------------|------------------------------------|
| | | | | | | | |

1.5 **Additional Information.** Attach any additional information or reports pertinent to the WMP to this report. Provide a brief summary of these attachments below.

(Provide information within this space or as an attachment)

¹⁷ Choose between the following four options: (1) outfall monitoring, (2) receiving water monitoring, (3) no direct or indirect discharge from MS4 to the applicable receiving water, or (4) full compliance of an approved WMP. If selecting option (4), reference applicable projects in Table 1a and 1b.

**Regional Phase I MS4 NPDES Permit
Order No. R4-2021-0105
NPDES No. CAS004004**

**Annual Report Form
Reporting Year [XX-XX]**

Sections 2-8 of this form include items to be reported individually by each Permittee for this reporting year unless otherwise indicated.

| | |
|----------------------------------|--|
| Permittee Name | |
| Permittee Program Contact | |
| Title | |
| Address | |
| City | |
| Zip Code | |
| Phone | |
| Email | |

2. Legal Authority and Certification

Complete the items on this page.

2.1 Answer the following questions on Legal Authority [Order – VI.B.2].

| Question | Yes | No |
|--|--------------------------|--------------------------|
| Is there a current statement certified by the Permittee’s chief legal counsel that the Permittee has the legal authority within its jurisdiction to implement and enforce each of the requirements contained in 40 CFR § 122.26(d)(2)(i)(A-F) and the Order? | <input type="checkbox"/> | <input type="checkbox"/> |
| Has the above statement been developed or updated within this reporting year? If yes, attach the updated legal authority statement to this report. | <input type="checkbox"/> | <input type="checkbox"/> |

2.2 Complete the required certification below [Attachment D – V.B.5].

“I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.”

Signature of either a principal executive officer, ranking elected official, or by a duly authorized representative of a principal executive officer or ranking elected official. A person is a duly authorized representative only if:

- a. The authorization is made in writing by a principal executive officer or ranking elected official.
- b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.)
- c. The written authorization is submitted to the Regional Board.

If an authorization of a duly authorized representative is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization will be submitted to the Regional Board prior to or together with any reports, information, or applications, to be signed by an authorized representative.

Signature

Title

Date

3. Program Expenditures

Complete the following items in this section.

3.1 Source(s) of funds used in this reporting year, and proposed for the next reporting year, to meet necessary expenditures on the Permittee's stormwater management program [Order – VI.C.2].

(Provide information within this space)

3.2 Complete the table below on program expenditures for this reporting year [Attachment D – VII.A.5]. Enter “0” for any fields that do not apply.

| Category | | Capital Expenditures ¹ | Land Costs | Personnel Cost | Consultant (s) Cost | Overhead Costs | Construction Costs | Permit(s), Operation, and Maintenance (O&M) Costs | Total Expenditures for this Reporting Year | Program Budget for Next Reporting Year |
|--|--|-----------------------------------|------------|----------------|---------------------|----------------|--------------------|---|--|--|
| (1) Program Management² | | | | | | | | | | |
| (2) NPDES MS4 Permit Fees | | | | | | | | | | |
| (3) Minimum Control Measures (MCMs) | PIPP | | | | | | | | | |
| | Industrial / Commercial Facilities Program | | | | | | | | | |
| | Planning & Land Development Program³ | | | | | | | | | |
| | Construction Program | | | | | | | | | |
| | Public Agency Activities Program | | | | | | | | | |
| | IDDE Program | | | | | | | | | |
| | Additional Institutional BMPs / “Enhanced” MCMs | | | | | | | | | |

¹ Exclude land costs.

² Including but not limited to program management plans, mail, legal support, travel, conferences, printing, producing manuals and handbooks, annual/semi-annual reporting, development and maintenance of any electronic databases required by this permit including GIS, and other non-labor costs.

³ Including but not limited to environmental review, development project approval and verification, and permitting and licensing costs specific to the provisions of the Order that are beyond the scope of a normal plan review, permitting, and inspection process.

| Category | | Capital Expenditures ¹ | Land Costs | Personnel Cost | Consultant (s) Cost | Overhead Costs | Construction Costs | Permit(s), Operation, and Maintenance (O&M) Costs | Total Expenditures for this Reporting Year | Program Budget for Next Reporting Year |
|--|---|-----------------------------------|------------|----------------|---------------------|----------------|--------------------|---|--|--|
| (4) TMDL Implementation Plan / Watershed Management Program Development⁴ | | | | | | | | | | |
| (5) Projects⁵ | Distributed Projects and Green Streets | | | | | | | | | |
| | Regional Projects | | | | | | | | | |
| | Other Structural BMPs | | | | | | | | | |
| (6) Trash Compliance | Trash TMDLs⁶ | | | | | | | | | |
| | Discharge Prohibitions - Trash⁷ | | | | | | | | | |

⁴ Include costs for development and/or revision of Implementation Plans (e.g., TMDL Implementation Plan, Watershed Management Programs including Reasonable Assurance Analysis). Specify which plans these are in Section 3.3.

⁵ If a Permittee is implementing a project collaboratively, the Permittee should only include the portion of the project cost that it is assuming.

⁶ Includes full capture, partial capture, and institutional controls used to comply with trash TMDLs.

⁷ Includes full capture, partial capture, and institutional controls used to comply with Statewide Trash Provisions.

| Category | | Capital Expenditures ¹ | Land Costs | Personnel Cost | Consultant (s) Cost | Overhead Costs | Construction Costs | Permit(s), Operation, and Maintenance (O&M) Costs | Total Expenditures for this Reporting Year | Program Budget for Next Reporting Year |
|-------------------------------|---|-----------------------------------|------------|----------------|---------------------|----------------|--------------------|---|--|--|
| (7) Monitoring | Monitoring Plan Development⁸ | | | | | | | | | |
| | Outfall and Receiving Water Quality Monitoring | | | | | | | | | |
| | BMP Effectiveness Monitoring | | | | | | | | | |
| | Regional Studies⁹ | | | | | | | | | |
| | Special Studies¹⁰ | | | | | | | | | |
| (8) Other¹¹ | | | | | | | | | | |
| TOTAL | | | | | | | | | | |

3.3 Additional Information: Please add any additional comments on stormwater expenditures below.

(Provide information within this space)

⁸ Includes costs to develop and/or revise monitoring plans (e.g., TMDL Monitoring Plan, IMP, CIMPs, non-stormwater screening and monitoring program). Specify which plans these are in Section 3.3.

⁹ Includes costs to comply with Part X (Regional Studies) of the Attachment E-MRP.

¹⁰ Includes costs to comply with Part XI (Special Studies) of the Attachment E-MRP.

¹¹ Enter costs in this table but specify what this “Other” category consists of in Section 3.3.

4. Non-Stormwater Discharge Prohibitions

Complete the following items in this section.

4.1 Provide an assessment of the effectiveness of the Permittee’s control measures in effectively prohibiting non-stormwater discharges into the MS4 to the receiving water [Order – III.A].

(Provide information within this space)

4.2 Describe sources of non-stormwater discharges determined to be a NPDES permitted discharge, a discharge subject to CERCLA, a conditionally exempt non-stormwater discharge, or entirely comprised of natural flows [Order - III.A.2].

(Provide information within this space)

4.3 Check all that apply [Order – III.A.4].

| | |
|--|--------------------------|
| There has been non-stormwater discharge(s) to an ASBS | <input type="checkbox"/> |
| The non-stormwater discharge(s) to the ASBS caused or contributed to an exceedance receiving water limitations, WQBELs, water quality objectives in Chapter II of the Ocean Plan, or an undesirable alteration in natural ocean water quality in an ASBS | <input type="checkbox"/> |
| Additional BMPs were implemented to address the exceedances above | <input type="checkbox"/> |

4.4 If you had non-stormwater discharge(s) to an ASBS that caused or contributed to an exceedance receiving water limitations, WQBELs, water quality objectives in Chapter II of the Ocean Plan, or an undesirable alteration in natural ocean water quality in an ASBS, describe what additional BMPs were implemented to address these exceedances. How effective were those BMPs in addressing the exceedances? [Order - III.A.4.b]

(Provide information within this space)

4.5 Did you develop and implement procedures to ensure that a discharger, if not a named Permittee in this Order, fulfilled the requirements of Part III.A.5.a.i-vi? If so, provide a link to where the procedures may be found or attach to this Annual Report [Order – III.A.5.a].

(Provide information within this space)

4.6 Did you organize and maintain records of all notifications, local permits, and non-stormwater discharges greater than 100,000 gallons in an electronic database? (Yes or No) [Order – III.A.5.b]

(Provide information within this space)

4.7 Did you determine that any of the conditionally exempt non-stormwater discharges, with the exception of essential non-stormwater discharges, identified per Part III.A.5.c of the Order is a source of pollutants that causes or contributes to an exceedance of applicable receiving water limitations and/or water quality-based effluent limitations? If so, how many of the conditionally exempt non-stormwater discharges in Part III.A.3.b of the Order did you determine to be sources of pollutants that caused or contributed to an exceedance of receiving water limitations or WQBELs? If you made that determination, which type(s) of non-stormwater discharges in Part III.A.3.b were sources of pollutants? [Order – III.A.6]

(Provide information within this space)

4.8 If you answered yes to the question 4.7 above, check all that apply [Order – III.A.6].

| | |
|---|--------------------------|
| Effectively prohibit the non-stormwater discharge into the MS4 | <input type="checkbox"/> |
| Impose conditions in addition to those in Table 5 of the Order, subject to approval by the Los Angeles Water Board Executive Officer, on the non-stormwater discharge such that it will not be a source of pollutants | <input type="checkbox"/> |
| Require diversion of the non-stormwater discharge to the sanitary sewer | <input type="checkbox"/> |
| Require treatment of the non-stormwater discharge prior to discharge to the receiving water | <input type="checkbox"/> |

5. Non-Stormwater Outfall Screening and Monitoring

Complete the following items in this section.

5.1 Complete the tables below regarding your Non-Stormwater Outfall-Based Screening and Monitoring Program [Attachment E – VII].

| Receiving Water | No. of Outfalls within your Jurisdiction | No. of Outfalls Screened during this Reporting Year | No. of Screening Events During This Reporting Year | Outfalls with Significant Non-Stormwater Discharges ¹² | | | |
|----------------------|--|---|--|---|--------------|---|-----------------------|
| | | | | Total Confirmed | Total Abated | Total Attributed to Allowable Sources ¹³ | Total Being Monitored |
| [RW 1] | | | | | | | |
| (add rows as needed) | | | | | | | |
| Total | | | | | | | |

| Method of Abatement | Total No. |
|---------------------------------|-----------|
| Low Flow Diversion (LFD) | |
| Illicit Discharges Eliminated | |
| NPDES Permitted | |
| Retention | |
| Discharge No Longer Observed | |
| Other (describe in Section 5.3) | |

5.2 Los Angeles County Permittees: Did you consider dry weather receiving water monitoring data downstream of the outfalls and other relevant information to determine if re-screening is necessary for any of the previously screened outfalls that did not have significant non-stormwater discharge? If so, explain how many outfalls require re-screening and when re-

¹² “Significant Non-Stormwater Discharges” as identified by the Permittee per Part VII.B of the Attachment E - MRP.

¹³ “Allowable Sources” refers to the discharges exempt from the Prohibition of Non-Stormwater Discharges listed in Part III.A.2 of the Order.

screening will be completed. If applicable, describe any changes made to the program [Attachment E – VII.D.2].

(Provide information within this space)

5.3 Additional Information. If desired, provide additional information regarding Non-Stormwater Outfall Screening and Monitoring.

(Provide information within this space)

6. Minimum Control Measures

Complete the following items in this section.

6.1 General Provisions [Order – VIII.A.3]

Did you train all your employees in targeted positions (whose interactions, jobs, and activities affect stormwater quality) on the requirements of the Minimum Control Measures in this Order, or did you ensure contractors performing privatized/contracted municipal services are appropriately trained to: (a) Promote a clear understanding of the potential for activities to pollute stormwater, (b) Identify opportunities to require, implement, and maintain appropriate BMPs in their line of work? (Yes or No)

(Provide information within this space)

6.2 Public Information and Participation Program [Order - VIII.D]

Complete the following item regarding the Public Information and Participation Program.

6.2a) Summarize opportunities created for public engagement in stormwater planning and program implementation to raise public awareness of stormwater program benefits and needs (e.g., *Don't Trash California* campaign). Note whether activities were performed by the jurisdiction or as part of a watershed, regional, or county-wide group [*VIII.D.3.a*].

(Provide information within this space)

6.2b) Summarize educational activities and public information activities to facilitate stormwater and non-stormwater pollution prevention and mitigation. What pollutants were targeted? What audiences were targeted? Note whether activities were performed by the jurisdiction or as part of a watershed, regional, or county-wide group [*VIII.D.3.b*].

(Provide information within this space)

6.2c) In selecting targeted pollutants for public information/education topics, did you consider the proper management and disposal of (1) vehicle wastes (e.g., used oil, used tires); (2) household waste materials (i.e., trash and household hazardous waste, including personal care products, pharmaceuticals, and household cleaners); (3) pesticides, herbicides, and fertilizers; (4) green waste; and (5) animal wastes? (Yes or No) If no, what other materials were considered? [*VIII.D.3.b.i*]

(Provide information within this space)

6.2d) Which of the following methods were selected to distribute public information/ educational materials? [VIII.D.3.b.ii]

| Category | Yes | No |
|--|--------------------------|--------------------------|
| Internet-based platforms (e.g., stormwater websites, social media websites and applications) | <input type="checkbox"/> | <input type="checkbox"/> |
| Commercial points-of-purchase (e.g., automotive parts stores, home improvement centers/ hardware stores/ paint stores, landscape / gardening centers, pet shops) | <input type="checkbox"/> | <input type="checkbox"/> |
| Schools (K- 12) | <input type="checkbox"/> | <input type="checkbox"/> |
| Radio/television | <input type="checkbox"/> | <input type="checkbox"/> |
| Community events | <input type="checkbox"/> | <input type="checkbox"/> |
| Other (specify) | <input type="checkbox"/> | <input type="checkbox"/> |

6.2e) Did you document and track information on the implemented Public Information and Participation activities including activity, date(s), method of dissemination, targeted behavior, targeted pollutant, targeted audience, culturally effective method(s), other information necessary for the metrics identified in Part VIII.D.4.a of the Order, and metric for measuring effectiveness? (Yes or No) [VIII.D.4.b]

(Provide information within this space)

6.2f) What metrics did you use to measure the effectiveness in achieving the objectives of the Public Information and Participation Program? Considering those metrics, is your Public Information and Participation program effective? Explain [VIII.D.4.a].

(Provide information within this space)

6.2g) Additional Information. If desired, provide additional information regarding implementation of the Public Information and Participation Program.

(Provide information within this space)

6.3 Industrial and Commercial Facilities Program [Order – VIII.E]

Complete the following items regarding the Industrial and Commercial Facilities Program.

6.3a) Watershed-Based Inventory:

| Question | Yes | No |
|---|--------------------------|--------------------------|
| Have you updated your watershed-based inventory or database of all industrial and commercial facilities within your jurisdiction that are critical sources ¹⁴ of stormwater pollution identified in Part VIII.E.2 of the Order (inventory shall be updated at least once every 2 years)? | <input type="checkbox"/> | <input type="checkbox"/> |

6.3b) If you answered yes to question 6.3a above, what is the total number of facilities in your inventory list?

(Provide information within this space)

6.3c) If you answered no to question 6.3a above, when will you update the inventory list?

(Provide information within this space)

6.3d) Commercial Facilities [VIII.E.3]:

| Question | Response |
|---|----------|
| In implementing the Outreach Program, how many commercial facilities did you reach out to during this reporting year? | |
| In implementing the Business Assistance Program, how many commercial facilities did you assist during this reporting year? | |
| How many commercial facilities did you inspect during this reporting year? | |
| Of the commercial facilities inspected during this reporting year, how many were the first, second, third, etc. round of inspections? For example, report x number of first-round inspections, y number of second-round inspections, z number of third-round inspections, etc. Each round of inspections corresponds to the requirement to conduct an inspection every two years. | |
| How many of the total commercial facility inspections had stormwater violation(s) during this reporting year? | |

¹⁴ Part VIII.E.2.a of the Regional MS4 Permit summarizes “critical sources” to be tracked.

6.3e) Industrial Facilities [VIII.E.4]:

| Question | Response |
|---|----------|
| How many facilities from question 6.3b are industrial facilities with SIC codes that require enrollment in the IGP? (in this reporting year)? | |
| How many industrial facilities did you report to the Los Angeles Water Board as non-filers during this reporting year? | |
| In implementing the Business Assistance Program, how many industrial facilities did you assist during this reporting year? | |
| How many Industrial facilities did you inspect during this reporting year? | |
| Of the commercial facilities inspected during this reporting year, how many were the first, second, third, etc. round of inspections? For example, report x number of first-round, y number of second-round, and z number of third-round, etc. Each round of inspections corresponds to the requirement to conduct an inspection every two years. | |
| How many of the total industrial facility inspections had stormwater violation(s) during this reporting year? | |

6.3f) Enforcement Actions: Describe the number and nature of any enforcement actions taken related to the industrial and commercial facilities program [VIII.E.6].

(Provide information within this space)

6.3g) Additional Information. If desired, provide additional information regarding implementation of the Industrial and Commercial Facilities Program.

(Provide information within this space)

6.4 Planning and Land Development Program [VIII.F]

Complete the following items regarding the Planning and Land Development Program.

6.4a) Priority Development Projects: Complete the table below for Priority Development Projects as of the end of this Reporting Year [VIII.F.1].

| Development Type | Number of Priority Development Projects Completed During This Reporting Year | Number of Priority Development Projects In-Progress |
|------------------|--|---|
| New Development | | |
| Redevelopment | | |

6.4b) Use of Alternative Compliance Measures for Priority Development Projects. Provide the number of Priority Development Projects completed during this Reporting Year that utilized alternative compliance measures per Part VIII.F.4.b of the Order.

| Category | Number of Projects |
|------------------------------------|--------------------|
| On-site Biofiltration | |
| On-site Flow-based BMPs | |
| Off-site Infiltration | |
| Groundwater Replenishment Projects | |
| Off-site Retrofit Projects | |
| Other | |

6.4c) Exemptions to Priority Development Project Performance Requirements. If the Permittee is implementing an approved Local Ordinance Equivalence or an approved Regional Stormwater Mitigation Program per Part VIII.F.1.c, describe the area covered by these exemptions; and the number and names of Priority Development Projects that were exempted from the Order’s Priority Development Project Structural BMP Performance Requirements.

(Provide information within this space)

6.4d) Priority Development Project Greater Than 50 Acres. If applicable, provide information on any Priority Development Projects with a project area greater than 50 acres that were completed during this Reporting Year or are currently in-progress. Information should include the name and location of the project(s) and whether the project(s) are new development or redevelopment.

(Provide information within this space)

6.4e) Hydromodification Management: If applicable, provide information on the name, location, and nature of any projects requiring hydromodification controls that were completed or in-progress within this Reporting Year [VI.F.2].

(Provide information within this space)

6.4f) Exemptions to Hydromodification Controls: Are there any areas where assessments of downstream channel conditions and proposed discharge hydrology indicate that adverse hydromodification effects to beneficial uses of Natural Drainage Systems are

unlikely, per Part VIII.F.2.b? If so, what are the numbers and names of the New Development and Redevelopment projects exempt from implementation of hydromodification controls?

(Provide information within this space)

6.4g) Tracking, Inspection and Enforcement of Post-Construction BMPs: Describe the number and nature of any enforcement actions taken related to the planning and land development program [VIII.F.3.c.v].

| Question | Yes | No |
|--|--------------------------|--------------------------|
| Does your program implement a GIS or other electronic system for tracking Priority Development Projects and Hydromodification Management Projects that at a minimum contains all the information required by Permit? | <input type="checkbox"/> | <input type="checkbox"/> |
| Does your program inspect all Priority Development Projects and Hydromodification Management Projects upon completion of construction and prior to issuance of occupancy certifications to ensure proper installation of post-construction BMPs? | <input type="checkbox"/> | <input type="checkbox"/> |

6.4h) Additional Information. If desired, provide additional information regarding implementation of the Planning and Land Development Program.

(Provide information within this space)

6.5 Construction Program [Order – VIII.G]

Complete the following items regarding the Construction Program.

6.5a) Complete the table below. Only report numbers for sites less than 1 acre.

| Question | Response |
|---|----------|
| How many new sites of less than one acre commenced their activities during this reporting year? | |
| How many sites of less than one acre did you inspect during this reporting year? | |
| How many (if any) of the sites from the previous question had a BMP violation [VIII.G.4.b]? | |

6.5b) Complete the table below. Only report numbers for sites 1 acre or greater and construction sites less than 1 acre that are part of a common plan of development totaling 1 acre or greater.

| Question | Response |
|--|----------|
| What is the date of the latest update made to the site inventory [VIII.G.5.b]? | |

| Question | Response |
|---|----------|
| How many new sites of 1 acre or greater commenced their activities during this reporting year? | |
| How many sites of 1 acre or greater did you report to the Los Angeles Water Board as non-filers [VIII.G.5.a]? | |
| How many post-construction plans were reviewed during this reporting year [VIII.G.5.a]? | |
| How many of the plans from the previous question were approved during this reporting year? | |
| How many (if any) sites of 1 acre or greater did you inspect during this reporting year [VIII.G.5.c]? | |
| How many (if any) of the inspected sites were in violation of construction BMPs? | |
| How many (if any) of the inspected sites were in violation of post-construction plans? | |
| How many of the sites from the previous two questions were reported to the Los Angeles Water Board along with an inspection report? | |

6.5c) Enforcement Actions: Describe the number and nature of any enforcement actions taken related to the development construction program [VIII.G.6].

(Provide information within this space)

6.5d) Additional Information. If desired, provide additional information regarding implementation of the Construction Program.

(Provide information within this space)

6.6 Public Agency Activities Program [VIII.H]

Complete the following items regarding the Public Agency Activities Program.

6.6a) Answer the following questions regarding the Public Agency Activities Program.

| Question | Response |
|--|---|
| Did you maintain an updated inventory or database of all your owned or operated (i.e., public) facilities and activities within your jurisdiction that are potential sources of stormwater pollution? [VIII.H.2] | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| For the above inventory, what is the date of the latest update [VIII.H.2.c]? | |

| Question | Response |
|---|---|
| How many treatment control BMPs including post-construction control treatment BMPs do you own? [VIII.H.2.b.vi] | |
| For the above, how many inspections were conducted during this reporting year? [VIII.H.3.e] | |
| How many storm drain inlets do you own? | |
| How many of the above are labeled with a legible “no dumping” message? [VIII.H.6.c.i] | |
| Did you inspect the legibility of all the stencils or labels nearest each inlet prior to the wet season during this reporting year? [VIII.H.6.c.ii] | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| If yes for the above, how many illegible stencils and labels were recorded? | |
| For the illegible stencils and labels recorded above, how many were re-stenciled and re-labeled within 180 days of inspection? For those not re-stenciled and re-labeled, explain why not. [VIII.H.6.c.iii] | |
| Did you visually monitor owned open channels and other drainage structures for trash and debris at least annually? [VIII.H.6.d.i] | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| How many miles of open channels do you own? | |
| Did you remove trash and debris from your open channels a minimum of once per year before the wet season? [VIII.H.6.d.ii] | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| How many parking lots exposed to stormwater do you own that meet either criteria listed in Part VIII.H.9? | |
| Did you inspect Permittee-owned parking lots exposed to stormwater that meet either criteria listed in Part VIII.H.9 at least twice per month? | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| For the above, how many inspections were conducted during this reporting year? [VIII.H.9] | |
| For the owned parking lots exposed to stormwater, how many cleanings were conducted in total for this reporting year? [VIII.H.9] | |

6.6b) Street Sweeping: Complete the table below [VIII.H.8].

| | Total Miles of Street ¹⁵ in Priority Category | Frequency of Street Sweeping (e.g., Twice a Month, Monthly, Annually) | Additional Notes |
|------------|--|---|------------------|
| Priority A | | | |
| Priority B | | | |
| Priority C | | | |

¹⁵ Permittees shall report the length of street swept in the “total miles of street” and/or “total curb miles of street”, depending on data availability.

6.7 Illicit Discharge Detection and Elimination (IDDE) Program [Order – VIII.I]

Complete the following items regarding the Illicit Discharge Detection and Elimination Program.

6.7a) IDDE Investigations: Complete the table below. Include illicit discharges detected through other inspection programs.

| | Number of Reported Illicit Discharges | Number of Investigations | Number Eliminated | Number Permitted or Exempt | If Not Eliminated or Permitted / Exempt, Explain. |
|---------------------------|---------------------------------------|--------------------------|-------------------|----------------------------|---|
| Illicit Discharges | | | | | |

6.7b) Enforcement Actions: Describe the number and nature of any enforcement actions taken related to illicit discharge detection and elimination program [Order – VIII.I.7].

(Provide information within this space)

6.7c) What means were provided to the public for public reporting of illicit discharges and other water quality impacts from stormwater and non-stormwater discharges into or from MS4s? [VIII.I.6]

| Category | Yes | No |
|-----------------------------------|--------------------------|--------------------------|
| Telephone hotline | <input type="checkbox"/> | <input type="checkbox"/> |
| Email address | <input type="checkbox"/> | <input type="checkbox"/> |
| Web-based form / reporting portal | <input type="checkbox"/> | <input type="checkbox"/> |
| Other (specify) | <input type="checkbox"/> | <input type="checkbox"/> |

6.7d) Did you document all public reports of illicit discharges and track all investigations? If no, explain why. [Order – VIII.I.8]

(Provide information within this space)

6.7e) Additional Information. If desired, provide additional information regarding implementation of the Illicit Discharge Detection and Elimination Program.

(Provide information within this space)

7. Trash Reporting

Complete the following items in this section.

7.1 Trash TMDL Compliance [Order – IV.B.3]

7.1a) If you are subject to Trash TMDLs, complete and attach the provided “Trash TMDL Reporting Forms” in Attachment I of the Order for each applicable Trash TMDL. Report your compliance with the applicable interim and/or final Effluent Limits for trash below. If compliance with the applicable interim and/or final Effluent Limits for trash has not been achieved, explain why.

(Provide information within this space)

7.1b) Mark the compliance approach you have implemented for any applicable Trash TMDLs.

- Full Capture Systems
- Mass Balance
- Scientifically Based Alternative
- Minimum Frequency of Assessment and Collection

7.1c) Complete the table below regarding the catch basins within your jurisdiction.

| | Retrofitted with Full Capture Systems | Retrofitted with Partial Capture Devices | Retrofitting Infeasible | Not Retrofitted | Total Number of Catch Basins within Jurisdiction |
|------------------|--|---|--------------------------------|------------------------|---|
| Owned | | | | | |
| Not Owned | | | | | |
| Total | | | | | |

(Provide additional information within this space)

7.1d) If relying on full capture systems, are the maintenance records of the full capture systems within your jurisdiction up-to-date and available for inspection by the Los Angeles Water Board? [Order – IV.B.3.b.i.(c)]

(Provide information within this space)

7.1e) If implementing a Plastic Pellet Monitoring and Reporting Plan (PMRP), report any known spills (including names and locations) from preproduction plastic (i.e., plastic pellet) generating, transfer, processing, and storage facilities within this reporting year, explain the actions taken for cleanup, and describe the measures taken to prevent future incidents.

(Provide information within this space)

- 7.1f) If implementing a PMRP, how many new preproduction plastic generating, transfer, processing, and storage facilities have been added in Permittee’s jurisdiction within this reporting year that have not been addressed in the PMRP?

(Provide information within this space)

7.2 Trash Discharge Prohibitions Compliance [Order – III.B]

7.2a) For areas not addressed by a Trash TMDL, and for Permittees that have regulatory authority over Priority Land Uses (PLUs) or Designated Land Uses, indicate the compliance method that was selected in response to the Los Angeles Water Board’s 13383 Order issued on August 18, 2017 as the method to comply with the prohibition of discharge in PLUs within Permittee’s jurisdiction.

- Track 1 (Complete items 7.2b – 7.2e)
- Track 2 (Complete items 7.2f – 7.2l)

7.2b) If using Track 1 compliance, complete the table below regarding the catch basins within PLUs, designated land uses, and equivalent alternate land uses in your jurisdiction.

| | Retrofitted with Full Capture Systems | Retrofitting Infeasible | Not Retrofitted | Total Number of Catch Basins within Jurisdiction |
|------------------|--|--------------------------------|------------------------|---|
| Owned | | | | |
| Not Owned | | | | |
| Total | | | | |

(Provide additional information within this space)

7.2c) If using Track 1 compliance, complete and attach the “Trash Discharge Prohibitions Reporting Form” provided in Attachment I of the Order for PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction.

(Provide information within this space)

7.2d) If using Track 1 compliance, provide a map showing the location and drainage area in PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction served by full capture systems.

(Provide information within this space)

7.2e) If using Track 1 compliance, did you properly operate and maintain all full capture systems in PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction?

(Provide information within this space)

7.2f) If using Track 2 compliance, complete the table below regarding the catch basins within PLUs, designated land uses, and equivalent alternate land uses in your jurisdiction.

| | Retrofitted with Full Capture Systems | Retrofitted with Partial Capture Devices | Not Retrofitted | Total Number of Catch Basins within Jurisdiction |
|------------------|--|---|------------------------|---|
| Owned | | | | |
| Not Owned | | | | |
| Total | | | | |

(Provide additional information within this space)

7.2g) If using Track 2 compliance, provide a map of the location and drainage area in PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction served by full capture systems, multi-benefit projects, other treatment controls, and/or institutional controls.

(Provide information within this space)

7.2h) If using Track 2 compliance, did you properly operate and maintain all full capture systems, multi-benefit projects, treatment controls, and/or institutional controls in PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction?

(Provide information within this space)

7.2i) If using Track 2 compliance, explain what type of and how many treatment controls, institutional controls, and/or multi-benefit projects have been used and in what locations?

(Provide information within this space)

7.2j) If using Track 2 compliance, what is the effectiveness of the total combination of treatment controls, institutional controls, and multi-benefit projects employed? Explain the metric to measure the effectiveness.

(Provide information within this space)

7.2k) If using Track 2 compliance, explain whether the amount of trash discharged from the MS4 decreased from the previous year. If so, by how much? If not, explain why. To determine the amount of trash discharged from the MS4 and to report on progress towards achieving the interim/ final compliance, provide the results of the trash levels using the methodology identified in the Trash Implementation Plan (e.g., Visual Trash Assessment Approach or other equivalent trash assessment methodology).

(Provide information within this space)

7.2l) If using Track 2 compliance, explain whether the amount of trash in the MS4's receiving water(s) decreased from the previous year. If so, by how much? If not, explain why.

(Provide information within this space)

8. Additional Information (Optional)

Provide any additional information in this section.

You may use this section to report any additional information not specified in Sections 2-7 such as information better presented outside of the report form structure, data limitations that prevented the required information from being obtained, and additional detailed summary table describing control measures.

(Provide information within this space and/or reference any attachment(s))

[WMP Name]

Reporting Period [MDY-MDY]

**Regional Phase I MS4 NPDES Permit
Order No. R4-2021-0105
NPDES No. CAS004004**

**Watershed Management Program Progress Report Form
Reporting Period [MDY-MDY]**

| | |
|--|--|
| Watershed Management Program Name | |
| Participating Permittee(s) | |
| Date of Watershed Management Program Progress Report | |
| Initial Approval Date of Watershed Management Program (according to Table 12 or Part IX.G.3 of the Order) | |

Note that Permittees will not be able to propose modifications to their WMP in the Watershed Management Program Progress Report Form. Any modification(s) shall be requested in writing explaining the nature of the proposed modification and justification for consideration by the Los Angeles Water Board [*Order – IX.C and IX.E.2*].

1.1 **Watershed Control Measure Milestone Progress.** Summarize the progress on all Watershed Control Measure requirements and dates for their achievement (milestones) identified in your WMP that were required to be achieved by the end of this Reporting Period. The milestones for specific projects may be reported as cumulative number of projects to be implemented (e.g., “Recipes for Compliance”; installation of prescribed volume of BMP capacity by a certain date; Percent Load Reduction of bacteria pollutant by a certain date), cumulative storm volume addressed¹ by control measures (e.g., LID, new/re-development projects, regional projects), or other metric. However, progress must be reported as percent completion of the selected milestone metric. If any milestones were not achieved, give a clear description of the action/milestone, explain the delay in control measure implementation, and provide the revised action/milestone. The summary must also include a list of (a) Permittees and non-Permittees collaborated with for achievement of milestones, (b) funding sought, (c) funding obtained, (d) technical assistance received (e.g., through the Safe Clean Water Program Watershed Area Steering Committee), (e) additional local community co-benefits such as clean streets (including, without limitation, street sweeping, litter abatement, etc.), more parks and green spaces, reduced heat island effect, reduced flooding, water supply augmentation, neighborhood beautification, and job creation, and (f) other co-benefits and resources accruing to disadvantaged communities as identified on CalEnviroScreen². The format for this item is a text box but you are encouraged to provide this information in an appropriate format as an attachment with spreadsheets, graphs, and/or other elements that would concisely convey the required information.

(Provide information within this space or as an attachment)

¹ Includes the volume of water captured, infiltrated, retained, treated, diverted or otherwise addressed by a watershed control measure.

² <https://oehha.ca.gov/calenviroscreen>

1.2 **Watershed Control Measures Completed.** Complete Table 1a, on an Excel spreadsheet. Include all watershed control measures (aside from minimum control measures specified in Part VIII of the Order) in the Watershed Management Program completed since the effective date of the Order for Ventura County Permittees, since March 28, 2014 for the City of Long Beach, and since December 28, 2012 for other Los Angeles County Permittees. This table is cumulative—i.e., the table should include all the control measures completed from the time of the aforementioned dates to the end of this reporting period. Structural control measures as well as non-structural control measures (e.g., enhanced MCMs such as incentive programs, outreach and conservation programs, etc.) should be included in this table. If information is not available for a particular field, the field should indicate “Not Applicable” (N/A) [Order – IX].

Table 1a: Watershed Control Measures Completed

| Project Name | Previous Project Name(s) if Changed | Permittee(s) | Subwatershed | Project Type ³ | Description | Latitude ⁴ | Longitude ⁵ | Required Completion Date in WMP | Actual Completion Date | Capital Costs [\$] | Cumulative O&M Costs [\$] | Funding Source(s) | Project Footprint ⁶ [Acres] | Drainage Area ⁷ [Acres] | Projected Storage Capacity in WMP [Acre-feet] | Actual Storage Capacity ⁸ [Acre-feet] | Cumulative Volume Addressed ⁹ [Acre-feet] |
|--------------|-------------------------------------|--------------|--------------|---------------------------|-------------|-----------------------|------------------------|---------------------------------|------------------------|--------------------|---------------------------|-------------------|--|------------------------------------|---|--|--|
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

³ Choose from Regional Infiltration Facility, Regional Treatment Facility, Green Street, Diversion to Sewer, Non-Structural, or Other (specify). For Regional Treatment Facility projects, include a description of the treatment process and design specifications in section 1.2a. For Green Street projects, include linear miles of the green street in section 1.2a.

⁴ Use decimal degrees (DD) format.

⁵ Use decimal degrees (DD) format.

⁶ The area footprint of the project.

⁷ The area tributary to the project.

⁸ The project’s physical storage capacity to hold water. For example, for a regional infiltration facility, this would be the storage volume of the storage units plus the void space of backfill materials.

⁹ Includes the cumulative volume of water captured, infiltrated, retained, treated, diverted, or otherwise addressed by the project.

1.2a) Additional Information. Provide additional information regarding the Watershed Control Measures completed (e.g., other compliance metrics and a list of (a) Permittees and non-Permittees collaborated with for achievement of milestones, (b) funding sought, (c) funding obtained, (d) technical assistance received (e.g., through the Safe Clean Water Program Watershed Area Steering Committee), (e) additional local community co-benefits such as clean streets (including, without limitation, street sweeping, litter abatement, etc.), more parks and green spaces, reduced heat island effect, reduced flooding, water supply augmentation, neighborhood beautification, and job creation, and (f) other co-benefits and resources accruing to disadvantaged communities as identified on CalEnviroScreen).

(Provide information within this space or as an attachment)

1.3 **Watershed Control Measures Planned and In Progress.** Complete Table 1b, on an Excel spreadsheet. Include all watershed control measures (aside from minimum control measures specified in Part VIII of the Order) in the Watershed Management Program that are planned and in progress. Structural control measures as well as non-structural control measures (e.g., enhanced MCMs such as incentive programs, outreach and conservation programs, etc.) should be included in this table. If information is not available for a particular field, the field should indicate “Not Applicable” (N/A) [Order – IX].

Table 1b: Watershed Control Measures Planned and In Progress

| Project Name | Permittee(s) | Subwatershed | Project Type ¹⁰ | Description | Latitude ¹¹ | Longitude ¹² | Required Completion Date in WMP | Estimated Completion Date | Estimated Capital Costs [\$] | Estimated Annual O&M Costs [\$] | Funding Source(s) | Project Footprint ¹³ [Acres] | Drainage Area ¹⁴ [Acres] | Projected Storage Capacity in WMP ¹⁵ [Acre-feet] | Status ¹⁶ |
|--------------|--------------|--------------|----------------------------|-------------|------------------------|-------------------------|---------------------------------|---------------------------|------------------------------|---------------------------------|-------------------|---|-------------------------------------|---|----------------------|
| | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | |

¹⁰ Choose from *Regional Infiltration Facility, Regional Treatment Facility, Green Street, Diversion to Sewer, Non-Structural, or Other*. For Regional Treatment Facility projects, include a description of the treatment process and design specifications in section 1.3a.

¹¹ Use decimal degrees (DD) format.

¹² Use decimal degrees (DD) format.

¹³ The area footprint of the project.

¹⁴ The area tributary to the project.

¹⁵ The project’s physical storage capacity to hold water. For example, for a regional infiltration facility, this would be the storage volume of the storage units plus the void space of backfill materials.

¹⁶ Description of the project’s status. This may include the project implementation phase (e.g., funding, design, construction).

[WMP Name]

Reporting Period [MDY-MDY]

1.3a) Additional Information. Provide additional information regarding the Watershed Control Measures planned and in progress (e.g., other compliance metrics and a list of (a) Permittees and non-Permittees collaborated with for achievement of milestones, (b) funding sought, (c) funding obtained, (d) technical assistance received (e.g., through the Safe Clean Water Program Watershed Area Steering Committee), (e) additional local community co-benefits such as clean streets (including, without limitation, street sweeping, litter abatement, etc.), more parks and green spaces, reduced heat island effect, reduced flooding, water supply augmentation, neighborhood beautification, and job creation, and (f) other co-benefits and resources accruing to disadvantaged communities as identified on CalEnviroScreen).

(Provide information within this space or as an attachment)

1.4 **Water Body Pollutant Combination (WBPC) Compliance.** Complete Table 1c on an Excel spreadsheet for all WBPCs identified in the Watershed Management Program. If information is not available for a particular field, the field should indicate “Not Applicable” (N/A) [Order – X].

Table 1c: WBPC Compliance

| WBPC Category (1, 2, or 3) | Pollutant | Receiving Water | Weather Condition (Wet, Dry, N/A) | Interim or Final | Deadline | Deadline Met? (Yes, No, N/A) | Method of Compliance ¹⁷ |
|----------------------------|-----------|-----------------|-----------------------------------|------------------|----------|------------------------------|------------------------------------|
| | | | | | | | |

1.5 **Additional Information.** Attach any additional information or reports pertinent to the WMP to this report. Provide a brief summary of these attachments below.

(Provide information within this space or as an attachment)

¹⁷ Choose between the following four options: (1) outfall monitoring, (2) receiving water monitoring, (3) no direct or indirect discharge from MS4 to the applicable receiving water, or (4) full compliance of an approved WMP. If selecting option (4), reference applicable projects in Table 1a and 1b.

**Regional Phase I MS4 NPDES Permit
Order No. R4-2021-0105
NPDES No. CAS004004**

**Annual Report Form
Reporting Year [XX-XX]**

Sections 2-8 of this form include items to be reported individually by each Permittee for this reporting year unless otherwise indicated.

| | |
|----------------------------------|--|
| Permittee Name | |
| Permittee Program Contact | |
| Title | |
| Address | |
| City | |
| Zip Code | |
| Phone | |
| Email | |

2. Legal Authority and Certification

Complete the items on this page.

2.1 Answer the following questions on Legal Authority [Order – VI.B.2].

| Question | Yes | No |
|--|--------------------------|--------------------------|
| Is there a current statement certified by the Permittee’s chief legal counsel that the Permittee has the legal authority within its jurisdiction to implement and enforce each of the requirements contained in 40 CFR § 122.26(d)(2)(i)(A-F) and the Order? | <input type="checkbox"/> | <input type="checkbox"/> |
| Has the above statement been developed or updated within this reporting year? If yes, attach the updated legal authority statement to this report. | <input type="checkbox"/> | <input type="checkbox"/> |

2.2 Complete the required certification below [Attachment D – V.B.5].

“I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.”

Signature of either a principal executive officer, ranking elected official, or by a duly authorized representative of a principal executive officer or ranking elected official. A person is a duly authorized representative only if:

- a. The authorization is made in writing by a principal executive officer or ranking elected official.
- b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.)
- c. The written authorization is submitted to the Regional Board.

If an authorization of a duly authorized representative is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization will be submitted to the Regional Board prior to or together with any reports, information, or applications, to be signed by an authorized representative.

Signature

Date

3. Program Expenditures

Complete the following items in this section.

3.1 Source(s) of funds used in this reporting year, and proposed for the next reporting year, to meet necessary expenditures on the Permittee's stormwater management program [*Order – VI.C.2*].

(Provide information within this space)

3.2 Complete the table below on program expenditures for this reporting year [Attachment D – VII.A.5]. Enter “0” for any fields that do not apply.

| Category | | Capital Expenditures ¹ | Land Costs | Personnel Cost | Consultant (s) Cost | Overhead Costs | Construction Costs | Permit(s), Operation, and Maintenance (O&M) Costs | Total Expenditures for this Reporting Year | Program Budget for Next Reporting Year |
|--|--|-----------------------------------|------------|----------------|---------------------|----------------|--------------------|---|--|--|
| (1) Program Management² | | | | | | | | | | |
| (2) NPDES MS4 Permit Fees | | | | | | | | | | |
| (3) Minimum Control Measures (MCMs) | PIPP | | | | | | | | | |

| | IDDE Program | | | | | | | | | |
| | Additional Institutional BMPs / “Enhanced” MCMs | | | | | | | | | |

¹ Exclude land costs.

² Including but not limited to program management plans, mail, legal support, travel, conferences, printing, producing manuals and handbooks, annual/semi-annual reporting, development and maintenance of any electronic databases required by this permit including GIS, and other non-labor costs.

³ Including but not limited to environmental review, development project approval and verification, and permitting and licensing costs specific to the provisions of the Order that are beyond the scope of a normal plan review, permitting, and inspection process.

| Category | | Capital Expenditures ¹ | Land Costs | Personnel Cost | Consultant (s) Cost | Overhead Costs | Construction Costs | Permit(s), Operation, and Maintenance (O&M) Costs | Total Expenditures for this Reporting Year | Program Budget for Next Reporting Year |
|--|---|-----------------------------------|------------|----------------|---------------------|----------------|--------------------|---|--|--|
| (4) TMDL Implementation Plan / Watershed Management Program Development⁴ | | | | | | | | | | |
| (5) Projects⁵ | Distributed Projects and Green Streets | | | | | | | | | |
| | Regional Projects | | | | | | | | | |
| | Other Structural BMPs | | | | | | | | | |
| (6) Trash Compliance | Trash TMDLs⁶ | | | | | | | | | |
| | Discharge Prohibitions - Trash⁷ | | | | | | | | | |

⁴ Include costs for development and/or revision of Implementation Plans (e.g., TMDL Implementation Plan, Watershed Management Programs including Reasonable Assurance Analysis). Specify which plans these are in Section 3.3.

⁵ If a Permittee is implementing a project collaboratively, the Permittee should only include the portion of the project cost that it is assuming.

⁶ Includes full capture, partial capture, and institutional controls used to comply with trash TMDLs.

⁷ Includes full capture, partial capture, and institutional controls used to comply with Statewide Trash Provisions.

| Category | | Capital Expenditures ¹ | Land Costs | Personnel Cost | Consultant (s) Cost | Overhead Costs | Construction Costs | Permit(s), Operation, and Maintenance (O&M) Costs | Total Expenditures for this Reporting Year | Program Budget for Next Reporting Year |
|-------------------------------|---|-----------------------------------|------------|----------------|---------------------|----------------|--------------------|---|--|--|
| (7) Monitoring | Monitoring Plan Development⁸ | | | | | | | | | |
| | Outfall and Receiving Water Quality Monitoring | | | | | | | | | |
| | BMP Effectiveness Monitoring | | | | | | | | | |
| | Regional Studies⁹ | | | | | | | | | |
| | Special Studies¹⁰ | | | | | | | | | |
| (8) Other¹¹ | | | | | | | | | | |
| TOTAL | | | | | | | | | | |

3.3 Additional Information: Please add any additional comments on stormwater expenditures below.

(Provide information within this space)

⁸ Includes costs to develop and/or revise monitoring plans (e.g., TMDL Monitoring Plan, IMP, CIMPs, non-stormwater screening and monitoring program). Specify which plans these are in Section 3.3.

⁹ Includes costs to comply with Part X (Regional Studies) of the Attachment E-MRP.

¹⁰ Includes costs to comply with Part XI (Special Studies) of the Attachment E-MRP.

¹¹ Enter costs in this table but specify what this “Other” category consists of in Section 3.3.

4. Non-Stormwater Discharge Prohibitions

Complete the following items in this section.

4.1 Provide an assessment of the effectiveness of the Permittee’s control measures in effectively prohibiting non-stormwater discharges into the MS4 to the receiving water [Order – III.A].

(Provide information within this space)

4.2 Describe sources of non-stormwater discharges determined to be a NPDES permitted discharge, a discharge subject to CERCLA, a conditionally exempt non-stormwater discharge, or entirely comprised of natural flows [Order - III.A.2].

(Provide information within this space)

4.3 Check all that apply [Order – III.A.4].

| | |
|--|--------------------------|
| There has been non-stormwater discharge(s) to an ASBS | <input type="checkbox"/> |
| The non-stormwater discharge(s) to the ASBS caused or contributed to an exceedance receiving water limitations, WQBELs, water quality objectives in Chapter II of the Ocean Plan, or an undesirable alteration in natural ocean water quality in an ASBS | <input type="checkbox"/> |
| Additional BMPs were implemented to address the exceedances above | <input type="checkbox"/> |

4.4 If you had non-stormwater discharge(s) to an ASBS that caused or contributed to an exceedance receiving water limitations, WQBELs, water quality objectives in Chapter II of the Ocean Plan, or an undesirable alteration in natural ocean water quality in an ASBS, describe what additional BMPs were implemented to address these exceedances. How effective were those BMPs in addressing the exceedances? [Order - III.A.4.b]

(Provide information within this space)

4.5 Did you develop and implement procedures to ensure that a discharger, if not a named Permittee in this Order, fulfilled the requirements of Part III.A.5.a.i-vi? If so, provide a link to where the procedures may be found or attach to this Annual Report [Order – III.A.5.a].

(Provide information within this space)

4.6 Did you organize and maintain records of all notifications, local permits, and non-stormwater discharges greater than 100,000 gallons in an electronic database? (Yes or No) [Order – III.A.5.b]

(Provide information within this space)

4.7 Did you determine that any of the conditionally exempt non-stormwater discharges, with the exception of essential non-stormwater discharges, identified per Part III.A.5.c of the Order is a source of pollutants that causes or contributes to an exceedance of applicable receiving water limitations and/or water quality-based effluent limitations? If so, how many of the conditionally exempt non-stormwater discharges in Part III.A.3.b of the Order did you determine to be sources of pollutants that caused or contributed to an exceedance of receiving water limitations or WQBELs? If you made that determination, which type(s) of non-stormwater discharges in Part III.A.3.b were sources of pollutants? [Order – III.A.6]

(Provide information within this space)

4.8 If you answered yes to the question 4.7 above, check all that apply [Order – III.A.6].

| | |
|---|--------------------------|
| Effectively prohibit the non-stormwater discharge into the MS4 | <input type="checkbox"/> |
| Impose conditions in addition to those in Table 5 of the Order, subject to approval by the Los Angeles Water Board Executive Officer, on the non-stormwater discharge such that it will not be a source of pollutants | <input type="checkbox"/> |
| Require diversion of the non-stormwater discharge to the sanitary sewer | <input type="checkbox"/> |
| Require treatment of the non-stormwater discharge prior to discharge to the receiving water | <input type="checkbox"/> |

5. Non-Stormwater Outfall Screening and Monitoring

Complete the following items in this section.

5.1 Complete the tables below regarding your Non-Stormwater Outfall-Based Screening and Monitoring Program [Attachment E – VII].

| Receiving Water | No. of Outfalls within your Jurisdiction | No. of Outfalls Screened during this Reporting Year | No. of Screening Events During This Reporting Year | Outfalls with Significant Non-Stormwater Discharges ¹² | | | |
|----------------------|--|---|--|---|--------------|---|-----------------------|
| | | | | Total Confirmed | Total Abated | Total Attributed to Allowable Sources ¹³ | Total Being Monitored |
| [RW 1] | | | | | | | |
| (add rows as needed) | | | | | | | |
| Total | | | | | | | |

| Method of Abatement | Total No. |
|---------------------------------|-----------|
| Low Flow Diversion (LFD) | |
| Illicit Discharges Eliminated | |
| NPDES Permitted | |
| Retention | |
| Discharge No Longer Observed | |
| Other (describe in Section 5.3) | |

5.2 Los Angeles County Permittees: Did you consider dry weather receiving water monitoring data downstream of the outfalls and other relevant information to determine if re-screening is necessary for any of the previously screened outfalls that did not have significant non-stormwater discharge? If so, explain how many outfalls require re-screening and when re-

¹² “Significant Non-Stormwater Discharges” as identified by the Permittee per Part VII.B of the Attachment E - MRP.

¹³ “Allowable Sources” refers to the discharges exempt from the Prohibition of Non-Stormwater Discharges listed in Part III.A.2 of the Order.

screening will be completed. If applicable, describe any changes made to the program [Attachment E – VII.D.2].

(Provide information within this space)

5.3 Additional Information. If desired, provide additional information regarding Non-Stormwater Outfall Screening and Monitoring.

(Provide information within this space)

6. Minimum Control Measures

Complete the following items in this section.

6.1 General Provisions [Order – VIII.A.3]

Did you train all your employees in targeted positions (whose interactions, jobs, and activities affect stormwater quality) on the requirements of the Minimum Control Measures in this Order, or did you ensure contractors performing privatized/contracted municipal services are appropriately trained to: (a) Promote a clear understanding of the potential for activities to pollute stormwater, (b) Identify opportunities to require, implement, and maintain appropriate BMPs in their line of work? (Yes or No)

(Provide information within this space)

6.2 Public Information and Participation Program [Order - VIII.D]

Complete the following item regarding the Public Information and Participation Program.

6.2a) Summarize opportunities created for public engagement in stormwater planning and program implementation to raise public awareness of stormwater program benefits and needs (e.g., *Don't Trash California* campaign). Note whether activities were performed by the jurisdiction or as part of a watershed, regional, or county-wide group [VIII.D.3.a].

(Provide information within this space)

6.2b) Summarize educational activities and public information activities to facilitate stormwater and non-stormwater pollution prevention and mitigation. What pollutants were targeted? What audiences were targeted? Note whether activities were performed by the jurisdiction or as part of a watershed, regional, or county-wide group [VIII.D.3.b].

(Provide information within this space)

6.2c) In selecting targeted pollutants for public information/education topics, did you consider the proper management and disposal of (1) vehicle wastes (e.g., used oil, used tires); (2) household waste materials (i.e., trash and household hazardous waste, including personal care products, pharmaceuticals, and household cleaners); (3) pesticides, herbicides, and fertilizers; (4) green waste; and (5) animal wastes? (Yes or No) If no, what other materials were considered? [VIII.D.3.b.i]

(Provide information within this space)

6.2d) Which of the following methods were selected to distribute public information/ educational materials? [VIII.D.3.b.ii]

| Category | Yes | No |
|--|--------------------------|--------------------------|
| Internet-based platforms (e.g., stormwater websites, social media websites and applications) | <input type="checkbox"/> | <input type="checkbox"/> |
| Commercial points-of-purchase (e.g., automotive parts stores, home improvement centers/ hardware stores/ paint stores, landscape / gardening centers, pet shops) | <input type="checkbox"/> | <input type="checkbox"/> |
| Schools (K- 12) | <input type="checkbox"/> | <input type="checkbox"/> |
| Radio/television | <input type="checkbox"/> | <input type="checkbox"/> |
| Community events | <input type="checkbox"/> | <input type="checkbox"/> |
| Other (specify) | <input type="checkbox"/> | <input type="checkbox"/> |

6.2e) Did you document and track information on the implemented Public Information and Participation activities including activity, date(s), method of dissemination, targeted behavior, targeted pollutant, targeted audience, culturally effective method(s), other information necessary for the metrics identified in Part VIII.D.4.a of the Order, and metric for measuring effectiveness? (Yes or No) [VIII.D.4.b]

(Provide information within this space)

6.2f) What metrics did you use to measure the effectiveness in achieving the objectives of the Public Information and Participation Program? Considering those metrics, is your Public Information and Participation program effective? Explain [VIII.D.4.a].

(Provide information within this space)

6.2g) Additional Information. If desired, provide additional information regarding implementation of the Public Information and Participation Program.

(Provide information within this space)

6.3 Industrial and Commercial Facilities Program [Order – VIII.E]

Complete the following items regarding the Industrial and Commercial Facilities Program.

6.3a) Watershed-Based Inventory:

| Question | Yes | No |
|---|--------------------------|--------------------------|
| Have you updated your watershed-based inventory or database of all industrial and commercial facilities within your jurisdiction that are critical sources ¹⁴ of stormwater pollution identified in Part VIII.E.2 of the Order (inventory shall be updated at least once every 2 years)? | <input type="checkbox"/> | <input type="checkbox"/> |

6.3b) If you answered yes to question 6.3a above, what is the total number of facilities in your inventory list?

(Provide information within this space)

6.3c) If you answered no to question 6.3a above, when will you update the inventory list?

(Provide information within this space)

6.3d) Commercial Facilities [VIII.E.3]:

| Question | Response |
|---|----------|
| In implementing the Outreach Program, how many commercial facilities did you reach out to during this reporting year? | |
| In implementing the Business Assistance Program, how many commercial facilities did you assist during this reporting year? | |
| How many commercial facilities did you inspect during this reporting year? | |
| Of the commercial facilities inspected during this reporting year, how many were the first, second, third, etc. round of inspections? For example, report x number of first-round inspections, y number of second-round inspections, z number of third-round inspections, etc. Each round of inspections corresponds to the requirement to conduct an inspection every two years. | |
| How many of the total commercial facility inspections had stormwater violation(s) during this reporting year? | |

¹⁴ Part VIII.E.2.a of the Regional MS4 Permit summarizes “critical sources” to be tracked.

6.3e) Industrial Facilities [VIII.E.4]:

| Question | Response |
|---|----------|
| How many facilities from question 6.3b are industrial facilities with SIC codes that require enrollment in the IGP? (in this reporting year)? | |
| How many industrial facilities did you report to the Los Angeles Water Board as non-filers during this reporting year? | |
| In implementing the Business Assistance Program, how many industrial facilities did you assist during this reporting year? | |
| How many Industrial facilities did you inspect during this reporting year? | |
| Of the commercial facilities inspected during this reporting year, how many were the first, second, third, etc. round of inspections? For example, report x number of first-round, y number of second-round, and z number of third-round, etc. Each round of inspections corresponds to the requirement to conduct an inspection every two years. | |
| How many of the total industrial facility inspections had stormwater violation(s) during this reporting year? | |

6.3f) Enforcement Actions: Describe the number and nature of any enforcement actions taken related to the industrial and commercial facilities program [VIII.E.6].

(Provide information within this space)

6.3g) Additional Information. If desired, provide additional information regarding implementation of the Industrial and Commercial Facilities Program.

(Provide information within this space)

6.4 Planning and Land Development Program [VIII.F]

Complete the following items regarding the Planning and Land Development Program.

6.4a) Priority Development Projects: Complete the table below for Priority Development Projects as of the end of this Reporting Year [VIII.F.1].

| Development Type | Number of Priority Development Projects Completed During This Reporting Year | Number of Priority Development Projects In-Progress |
|------------------|--|---|
| New Development | | |
| Redevelopment | | |

6.4b) Use of Alternative Compliance Measures for Priority Development Projects. Provide the number of Priority Development Projects completed during this Reporting Year that utilized alternative compliance measures per Part VIII.F.4.b of the Order.

| Category | Number of Projects |
|------------------------------------|--------------------|
| On-site Biofiltration | |
| On-site Flow-based BMPs | |
| Off-site Infiltration | |
| Groundwater Replenishment Projects | |
| Off-site Retrofit Projects | |
| Other | |

6.4c) Exemptions to Priority Development Project Performance Requirements. If the Permittee is implementing an approved Local Ordinance Equivalence or an approved Regional Stormwater Mitigation Program per Part VIII.F.1.c, describe the area covered by these exemptions; and the number and names of Priority Development Projects that were exempted from the Order’s Priority Development Project Structural BMP Performance Requirements.

(Provide information within this space)

6.4d) Priority Development Project Greater Than 50 Acres. If applicable, provide information on any Priority Development Projects with a project area greater than 50 acres that were completed during this Reporting Year or are currently in-progress. Information should include the name and location of the project(s) and whether the project(s) are new development or redevelopment.

(Provide information within this space)

6.4e) Hydromodification Management: If applicable, provide information on the name, location, and nature of any projects requiring hydromodification controls that were completed or in-progress within this Reporting Year [VI.F.2].

(Provide information within this space)

6.4f) Exemptions to Hydromodification Controls: Are there any areas where assessments of downstream channel conditions and proposed discharge hydrology indicate that adverse hydromodification effects to beneficial uses of Natural Drainage Systems are

unlikely, per Part VIII.F.2.b? If so, what are the numbers and names of the New Development and Redevelopment projects exempt from implementation of hydromodification controls?

(Provide information within this space)

6.4g) Tracking, Inspection and Enforcement of Post-Construction BMPs: Describe the number and nature of any enforcement actions taken related to the planning and land development program [VIII.F.3.c.v].

| Question | Yes | No |
|--|--------------------------|--------------------------|
| Does your program implement a GIS or other electronic system for tracking Priority Development Projects and Hydromodification Management Projects that at a minimum contains all the information required by Permit? | <input type="checkbox"/> | <input type="checkbox"/> |
| Does your program inspect all Priority Development Projects and Hydromodification Management Projects upon completion of construction and prior to issuance of occupancy certifications to ensure proper installation of post-construction BMPs? | <input type="checkbox"/> | <input type="checkbox"/> |

6.4h) Additional Information. If desired, provide additional information regarding implementation of the Planning and Land Development Program.

(Provide information within this space)

6.5 Construction Program [Order – VIII.G]

Complete the following items regarding the Construction Program.

6.5a) Complete the table below. Only report numbers for sites less than 1 acre.

| Question | Response |
|---|----------|
| How many new sites of less than one acre commenced their activities during this reporting year? | |
| How many sites of less than one acre did you inspect during this reporting year? | |
| How many (if any) of the sites from the previous question had a BMP violation [VIII.G.4.b]? | |

6.5b) Complete the table below. Only report numbers for sites 1 acre or greater and construction sites less than 1 acre that are part of a common plan of development totaling 1 acre or greater.

| Question | Response |
|--|----------|
| What is the date of the latest update made to the site inventory [VIII.G.5.b]? | |

| Question | Response |
|---|----------|
| How many new sites of 1 acre or greater commenced their activities during this reporting year? | |
| How many sites of 1 acre or greater did you report to the Los Angeles Water Board as non-filers [VIII.G.5.a]? | |
| How many post-construction plans were reviewed during this reporting year [VIII.G.5.a]? | |
| How many of the plans from the previous question were approved during this reporting year? | |
| How many (if any) sites of 1 acre or greater did you inspect during this reporting year [VIII.G.5.c]? | |
| How many (if any) of the inspected sites were in violation of construction BMPs? | |
| How many (if any) of the inspected sites were in violation of post-construction plans? | |
| How many of the sites from the previous two questions were reported to the Los Angeles Water Board along with an inspection report? | |

6.5c) Enforcement Actions: Describe the number and nature of any enforcement actions taken related to the development construction program [VIII.G.6].

(Provide information within this space)

6.5d) Additional Information. If desired, provide additional information regarding implementation of the Construction Program.

(Provide information within this space)

6.6 Public Agency Activities Program [VIII.H]

Complete the following items regarding the Public Agency Activities Program.

6.6a) Answer the following questions regarding the Public Agency Activities Program.

| Question | Response |
|--|---|
| Did you maintain an updated inventory or database of all your owned or operated (i.e., public) facilities and activities within your jurisdiction that are potential sources of stormwater pollution? [VIII.H.2] | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| For the above inventory, what is the date of the latest update [VIII.H.2.c]? | |

| Question | Response |
|---|---|
| How many treatment control BMPs including post-construction control treatment BMPs do you own? [VIII.H.2.b.vi] | |
| For the above, how many inspections were conducted during this reporting year? [VIII.H.3.e] | |
| How many storm drain inlets do you own? | |
| How many of the above are labeled with a legible “no dumping” message? [VIII.H.6.c.i] | |
| Did you inspect the legibility of all the stencils or labels nearest each inlet prior to the wet season during this reporting year? [VIII.H.6.c.ii] | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| If yes for the above, how many illegible stencils and labels were recorded? | |
| For the illegible stencils and labels recorded above, how many were re-stenciled and re-labeled within 180 days of inspection? For those not re-stenciled and re-labeled, explain why not. [VIII.H.6.c.iii] | |
| Did you visually monitor owned open channels and other drainage structures for trash and debris at least annually? [VIII.H.6.d.i] | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| How many miles of open channels do you own? | |
| Did you remove trash and debris from your open channels a minimum of once per year before the wet season? [VIII.H.6.d.ii] | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| How many parking lots exposed to stormwater do you own that meet either criteria listed in Part VIII.H.9? | |
| Did you inspect Permittee-owned parking lots exposed to stormwater that meet either criteria listed in Part VIII.H.9 at least twice per month? | <input type="checkbox"/> Yes <input type="checkbox"/> No |
| For the above, how many inspections were conducted during this reporting year? [VIII.H.9] | |
| For the owned parking lots exposed to stormwater, how many cleanings were conducted in total for this reporting year? [VIII.H.9] | |

6.6b) Street Sweeping: Complete the table below [VIII.H.8].

| | Total Miles of Street ¹⁵ in Priority Category | Frequency of Street Sweeping (e.g., Twice a Month, Monthly, Annually) | Additional Notes |
|-------------------|--|---|------------------|
| Priority A | | | |
| Priority B | | | |
| Priority C | | | |

¹⁵ Permittees shall report the length of street swept in the “total miles of street” and/or “total curb miles of street”, depending on data availability.

6.7 Illicit Discharge Detection and Elimination (IDDE) Program [Order – VIII.1]

Complete the following items regarding the Illicit Discharge Detection and Elimination Program.

6.7a) IDDE Investigations: Complete the table below. Include illicit discharges detected through other inspection programs.

| | Number of Reported Illicit Discharges | Number of Investigations | Number Eliminated | Number Permitted or Exempt | If Not Eliminated or Permitted / Exempt, Explain. |
|---------------------------|---------------------------------------|--------------------------|-------------------|----------------------------|---|
| Illicit Discharges | | | | | |

6.7b) Enforcement Actions: Describe the number and nature of any enforcement actions taken related to illicit discharge detection and elimination program [Order – VIII.1.7].

(Provide information within this space)

6.7c) What means were provided to the public for public reporting of illicit discharges and other water quality impacts from stormwater and non-stormwater discharges into or from MS4s? [VIII.1.6]

| Category | Yes | No |
|-----------------------------------|--------------------------|--------------------------|
| Telephone hotline | <input type="checkbox"/> | <input type="checkbox"/> |
| Email address | <input type="checkbox"/> | <input type="checkbox"/> |
| Web-based form / reporting portal | <input type="checkbox"/> | <input type="checkbox"/> |
| Other (specify) | <input type="checkbox"/> | <input type="checkbox"/> |

6.7d) Did you document all public reports of illicit discharges and track all investigations? If no, explain why. [Order – VIII.1.8]

(Provide information within this space)

6.7e) Additional Information. If desired, provide additional information regarding implementation of the Illicit Discharge Detection and Elimination Program.

(Provide information within this space)

7. Trash Reporting

Complete the following items in this section.

7.1 Trash TMDL Compliance [Order – IV.B.3]

7.1a) If you are subject to Trash TMDLs, complete and attach the provided “Trash TMDL Reporting Forms” in Attachment I of the Order for each applicable Trash TMDL. Report your compliance with the applicable interim and/or final Effluent Limits for trash below. If compliance with the applicable interim and/or final Effluent Limits for trash has not been achieved, explain why.

(Provide information within this space)

7.1b) Mark the compliance approach you have implemented for any applicable Trash TMDLs.

- Full Capture Systems
- Mass Balance
- Scientifically Based Alternative
- Minimum Frequency of Assessment and Collection

7.1c) Complete the table below regarding the catch basins within your jurisdiction.

| | Retrofitted with Full Capture Systems | Retrofitted with Partial Capture Devices | Retrofitting Infeasible | Not Retrofitted | Total Number of Catch Basins within Jurisdiction |
|------------------|--|---|--------------------------------|------------------------|---|
| Owned | | | | | |
| Not Owned | | | | | |
| Total | | | | | |

(Provide additional information within this space)

7.1d) If relying on full capture systems, are the maintenance records of the full capture systems within your jurisdiction up-to-date and available for inspection by the Los Angeles Water Board? [Order – IV.B.3.b.i.(c)]

(Provide information within this space)

7.1e) If implementing a Plastic Pellet Monitoring and Reporting Plan (PMRP), report any known spills (including names and locations) from preproduction plastic (i.e., plastic pellet) generating, transfer, processing, and storage facilities within this reporting year, explain the actions taken for cleanup, and describe the measures taken to prevent future incidents.

(Provide information within this space)

7.1f) If implementing a PMRP, how many new preproduction plastic generating, transfer, processing, and storage facilities have been added in Permittee’s jurisdiction within this reporting year that have not been addressed in the PMRP?

(Provide information within this space)

7.2 Trash Discharge Prohibitions Compliance [Order – III.B]

7.2a) For areas not addressed by a Trash TMDL, and for Permittees that have regulatory authority over Priority Land Uses (PLUs) or Designated Land Uses, indicate the compliance method that was selected in response to the Los Angeles Water Board’s 13383 Order issued on August 18, 2017 as the method to comply with the prohibition of discharge in PLUs within Permittee’s jurisdiction.

- Track 1 (Complete items 7.2b – 7.2e)
- Track 2 (Complete items 7.2f – 7.2l)

7.2b) If using Track 1 compliance, complete the table below regarding the catch basins within PLUs, designated land uses, and equivalent alternate land uses in your jurisdiction.

| | Retrofitted with Full Capture Systems | Retrofitting Infeasible | Not Retrofitted | Total Number of Catch Basins within Jurisdiction |
|------------------|--|--------------------------------|------------------------|---|
| Owned | | | | |
| Not Owned | | | | |
| Total | | | | |

(Provide additional information within this space)

7.2c) If using Track 1 compliance, complete and attach the “Trash Discharge Prohibitions Reporting Form” provided in Attachment I of the Order for PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction.

(Provide information within this space)

7.2d) If using Track 1 compliance, provide a map showing the location and drainage area in PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction served by full capture systems.

(Provide information within this space)

7.2e) If using Track 1 compliance, did you properly operate and maintain all full capture systems in PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction?

(Provide information within this space)

7.2f) If using Track 2 compliance, complete the table below regarding the catch basins within PLUs, designated land uses, and equivalent alternate land uses in your jurisdiction.

| | Retrofitted with Full Capture Systems | Retrofitted with Partial Capture Devices | Not Retrofitted | Total Number of Catch Basins within Jurisdiction |
|------------------|--|---|------------------------|---|
| Owned | | | | |
| Not Owned | | | | |
| Total | | | | |

(Provide additional information within this space)

7.2g) If using Track 2 compliance, provide a map of the location and drainage area in PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction served by full capture systems, multi-benefit projects, other treatment controls, and/or institutional controls.

(Provide information within this space)

7.2h) If using Track 2 compliance, did you properly operate and maintain all full capture systems, multi-benefit projects, treatment controls, and/or institutional controls in PLUs, designated land uses, and equivalent alternate land uses within your jurisdiction?

(Provide information within this space)

7.2i) If using Track 2 compliance, explain what type of and how many treatment controls, institutional controls, and/or multi-benefit projects have been used and in what locations?

(Provide information within this space)

7.2j) If using Track 2 compliance, what is the effectiveness of the total combination of treatment controls, institutional controls, and multi-benefit projects employed? Explain the metric to measure the effectiveness.

(Provide information within this space)

7.2k) If using Track 2 compliance, explain whether the amount of trash discharged from the MS4 decreased from the previous year. If so, by how much? If not, explain why. To determine the amount of trash discharged from the MS4 and to report on progress towards achieving the interim/ final compliance, provide the results of the trash levels using the methodology identified in the Trash Implementation Plan (e.g., Visual Trash Assessment Approach or other equivalent trash assessment methodology).

(Provide information within this space)

7.2l) If using Track 2 compliance, explain whether the amount of trash in the MS4's receiving water(s) decreased from the previous year. If so, by how much? If not, explain why.

(Provide information within this space)

8. Additional Information (Optional)

Provide any additional information in this section.

You may use this section to report any additional information not specified in Sections 2-7 such as information better presented outside of the report form structure, data limitations that prevented the required information from being obtained, and additional detailed summary table describing control measures.

(Provide information within this space and/or reference any attachment(s))

ATTACHMENT I – TRASH REPORTING FORMS

| Notations: | | | | | | | | | |
| Form | Either report compliance using Priority Land Use (PLU), designated land uses, and equivalent alternate land use areas served by FCSs (Columns 2 through 4) and/or number of catch basins in PLU, designated land uses, and equivalent alternate land use areas served by FCSs (Columns 5 through 7). Continue to add to this form for each annual reporting period. | | | | | | | | |
| Column 1: | Reporting Year: The reporting year per Attachment E- Part XIV.A | | | | | | | | |
| Column 2: | Total PLU, designated land uses, and equivalent alternate land use area of jurisdiction (square kilometers) | | | | | | | | |
| Column 3: | Total PLU, designated land uses, and equivalent alternate land use area of jurisdiction served by FCSs (square kilometers) | | | | | | | | |
| Column 4: | Percentage of PLU, designated land uses, and equivalent alternate land use area of jurisdiction served by FCSs (Col. 4/Col. 3) | | | | | | | | |
| Column 5: | Total number of catch basins (CBs) in PLUs, designated land uses, and equivalent alternate land use within jurisdiction | | | | | | | | |
| Column 6: | Total number of catch basins (CBs) in PLUs, designated land uses, and equivalent alternate land use served by FCSs within jurisdiction | | | | | | | | |
| Column 7: | Percentage of CBs in PLUs, designated land uses, and equivalent alternate land use served by FCSs within jurisdiction (Col. 6/Col. 5) | | | | | | | | |
| Column 8: | Required Trash Abatement: Part III.B.2.d of the Order | | | | | | | | |
| Column 9: | Compliance: Yes, if Col. 4 and/or Col. 7 is greater than Col. 8; No, if Col. 4 and/or Col. 7 is less than Col.8 | | | | | | | | |
| Column 10: | Provide comments, if necessary. | | | | | | | | |

| Notations: | | | | | | | | | | | | | | | |
| Form | Report compliance by reporting the corrected storm year trash discharge in Col. 11, which accounts for areas addressed by full capture systems (Cols. 6-7) and partial capture devices (Cols. 3-5). Continue to add to this form for each reporting year. Where information on areas for Cols. 2, 3, and 6 are unavailable; the total number of catch basins and number of catch basins served by PCDs and FCSS may be used if catch basins serve as a reasonable approximation of area. | | | | | | | | | | | | | | |
| Column 1: | Reporting Year: The reporting year per Attachment E- Part XIV.A | | | | | | | | | | | | | | |
| Column 2: | Total Area (or # of CBs): The area within the jurisdiction (or number of CBs) for which the Trash TMDL is applicable. | | | | | | | | | | | | | | |
| Column 3: | Area (or # of CBs) Served by PCDs: The area (or # of CBs) served by partial capture devices with an associated removal efficiency input in Col. 4 | | | | | | | | | | | | | | |
| Column 4: | PCD Efficiency: The percentage of trash removed by the partial capture device serving the area in Col. 3. Automatic retractable screens (ARS) may use an efficiency of 0.86. | | | | | | | | | | | | | | |
| Column 5: | % Reduction from PCDs: (Col. 3/Col. 2) x (Col. 4) | | | | | | | | | | | | | | |
| Column 6: | Area (or # of CBs) Served by FCSS: The area (or number of CBs) served by Full Capture Systems | | | | | | | | | | | | | | |
| Column 7: | % Reduction from FCS: (Col. 6/Col. 2) | | | | | | | | | | | | | | |
| Column 8: | % Reduction from Structural Controls: Col. 5 + Col. 7 | | | | | | | | | | | | | | |

**Mass Balance:

Attachment I -
 Trash TMDL Reporting Form
 Regional MS4 Permit
 Permittee: _____

**Mass Balance:
 Individual Storm Event and
 Total Storm Year Trash Discharge**

Reporting Year: _____
 Applicable Trash TMDL: _____

| | | | | | | | |
|---|---|---------------------|---------------------|---------------------------------|---|-----------------------------|----------|
| Rain Gage Station ID _____ | | | | | | | |
| Total Trash Discharged by Storm Event | | | | | | | |
| Col. 1 | Col. 2 | Col. 3 | Col. 4 | Col. 5 | Col. 6 | Col. 7 | Col. 8 |
| DGR | Date of Last Street Sweeping | Date of Storm Event | Precipitation Depth | Days since Last Street Sweeping | Amount of Trash Recovered from Catch Basins | Storm Event Trash Discharge | Comments |
| Notations: | | | | | | | |
| Form | Add additional rows for storm events, if necessary. | | | | | | |
| Rain Gage Station ID: Name of rain gage station used, indicate only the station number. | | | | | | | |
| Total Storm Year Trash Discharge= Sum of individual storm event discharges for reporting period (July 1-June 30). | | | | | | | |
| Column 1: | DGR for Jurisdiction from DGR Sampling Data worksheet. | | | | | | |
| Column 2: | Date of last street sweeping (if entire jurisdiction is swept on one day). If there are multiple street sweeping days, use "Street Sweeping Days" sheet to calculate weighted average of days since last street sweeping for column 5. | | | | | | |
| Column 3: | Date of storm event with 0.25 inch or more of rainfall. | | | | | | |
| Column 4: | Depth of rainfall taken from nearest rain gage station (in.). | | | | | | |
| Column 5: | Number of days between date of last street sweeping and storm event. For each day of a storm event that generates precipitation greater than 0.25 inch, the Permittee shall calculate a storm event discharge. When more than one storm event occurs prior to the next street sweeping the discharge shall be calculated from the date of the last storm event discharge calculation. | | | | | | |
| Column 6: | Amount of trash recovered from catch basins, if any (lb. or gal.). | | | | | | |
| Column 7: | Storm Event Discharge = Col. 1 x Col. 5 - Col. 7 [trash discharged by the storm event], lbs. or gal. | | | | | | |
| Column 8: | Provide comments, if necessary. | | | | | | |
| | | | | | | | |

 DGR Sampling Data**

| Note: Sampling must be conducted during any 30-day period, starting June 22nd through September 22nd of each year. | | | | | | | | | |
|--|--|---|------------------------------|---|-----------------------------|---|--|--|----------|
| Col. 1 | Col. 2 | Col. 3 | Col. 4 | Trash Collection for Calculation of Daily Generation Rate (DGR) | | | | | Col. 10 |
| Land Use Category | Total Area within Jurisdiction | Representative Area for DGR Calculation | Date of Last Street Sweeping | Date of DGR Sampling | Length of Collection Period | Trash Collection from Representative Area (lb. or gal.) | Trash Cleaned Out from Catch Basin(s) within the Representative Area (lb. or gal.) | Total Trash Generated within Representative Area | Comments |
| Notations: * Total collection period must equal 30 days for each representative land use area. | | | | | | | | | |
| Form | | | | | | | | | |
| Column 1: | Land Use Category - Categories based on Baseline Monitoring Program conducted by LACDPW baseline monitoring group. Alternatively, describe land use type as designated by the Permittee. | | | | | | | | |
| Column 2: | Total area of said land use within jurisdiction (fill in once in gray-highlighted row for each land use category). Total area may be accounted for using other approved measurement units, e.g. curb miles. | | | | | | | | |
| Column 3: | Representative area for DGR calculation (fill in once in gray-highlighted row for each land use category). Representative area may be accounted for using other approved measurement units, e.g. curb miles. Collectively, the areas used for DGR calculation should be representative, proportionally, of the land uses within the jurisdiction and must be approved by the EO prior to the 30-day collection period. | | | | | | | | |
| Column 4: | Date of last street sweeping. | | | | | | | | |
| Column 5: | Date of DGR sampling (direct measurement of deposited trash) - The DGR collection period(s) must fall between June 22nd and September 22nd. | | | | | | | | |
| Column 6: | Length of Collection Period in days - The DGR collection period must be 30 days, total, for each representative land use area. | | | | | | | | |
| Column 7: | Trash collection from representative area through street sweeping or other method, lb. or gal. | | | | | | | | |
| Column 8: | Trash cleaned out from catch basins within the representative area (lb. or gal.). Trash accumulated in the CBs during the DGR collection period must be included in the total trash generated. Where CBs are closed off such that no trash can enter them for the purpose of DGR sampling, this value will be zero (0). | | | | | | | | |
| Column 9: | Total amount of trash generated in representative area (sum of Col. 7 and Col. 8), lb. or gal. | | | | | | | | |
| Column 10: | Provide comments, if necessary. | | | | | | | | |

| | | | | | | | | | |
| | | | | | | | | | |
| Notations: | | | | | | | | | |
| Form | Either report compliance using land area served by FCSs (Columns 2 through 4) and/or number of catch basins served by FCSs (Columns 5 through 7). | | | | | | | | |
| | Continue to add to this form for each reporting year. | | | | | | | | |
| Column 1: | Reporting Year: The reporting year per Attachment E- Part XIV.A | | | | | | | | |
| Column 2: | Total land area of jurisdiction (square kilometers). | | | | | | | | |
| Column 3: | Total land area of jurisdiction served by certified full capture systems (square kilometers). | | | | | | | | |
| Column 4: | Percentage of total land area of jurisdiction served by FCSs (Col. 4/Col. 3). | | | | | | | | |
| Column 5: | Total number of catch basins (CBs) within jurisdiction. | | | | | | | | |
| Column 6: | Total number of catch basins (CBs) served by FCSs within jurisdiction. | | | | | | | | |
| Column 7: | Percentage of CBs served by FCSs within jurisdiction (Col. 6/Col. 5) | | | | | | | | |
| Column 8: | Required Trash Abatement: Attachments K-S of the Order, with respect to the corresponding Trash TMDL(s) in Permittee's jurisdiction. | | | | | | | | |
| Column 9: | Compliance: Yes, if Col. 4 or Col. 7 is greater than Col. 8; No, if Col. 4 or Col. 7 is less than Col. 8. | | | | | | | | |
| Column 10: | Provide comments, if necessary. | | | | | | | | |
| | | | | | | | | | |

| | | | | | | | | | | |
| Notations: | | | | | | | | | | |
| Form | Insert additional rows, as necessary. | | | | | | | | | |
| Column 1: | Indicate certified full capture system (FCS) installed | | | | | | | | | |
| Column 2: | Name FCS street location and indicate whether: WS - west side; ES - east side; NS - north side; SS - south side | | | | | | | | | |
| Column 3: | Name the nearest cross street location of the FCS | | | | | | | | | |
| Column 4: | FCS Owned by: Co - County of L.A./ Ventura; Flood - L.A. County Flood Control District/ Ventura County Watershed Protection District; Ci - City; Ca - Caltrans; Pr - Private; Oth - Others | | | | | | | | | |
| Column 5: | FCS Maintained by: Co - County of L.A./ Ventura; Flood - L.A. County Flood Control District/ Ventura County Watershed Protection District; Ci - City; Ca - Caltrans; Pr - Private; Oth - Others | | | | | | | | | |
| Column 6: | Provide the date when FCS was installed | | | | | | | | | |
| Column 7: | Indicate County or City assigned catch basin (CB) identification (ID) numbers | | | | | | | | | |
| Column 8: | Type of CB based on Standard Plan for Public Works Construction from Greenbook Committee, Public Works Standards, Inc. (i.e., 300-2; 301-2; 302-2; 303-2; etc.) | | | | | | | | | |
